Use bituminous material conforming to [AASHTO M 81] [AASHTO M 82] [AASHTO M 226] or [ASTM D946/D946M] [ASTM D977] [ASTM D2027/D2027M] [ASTM D2028/D2028M] [ASTM D2397/D2397M] [ASTM D3381/D3381M], [grade [_____]] [penetration grade [____]]

2.2 AGGREGATE FOR SEAL COAT

**************************************************************************
NOTE: The aggregate gradation to be used will be retained in Table I and the remaining gradations deleted. Specify a maximum moisture content of 3 percent when asphalt emulsion is used and 1 percent when other asphalt types are used.

**************************************************************************
Use aggregate consisting of crushed stone, crushed gravel, crushed slag, sand and screenings. Use aggregate with a moisture content [of not greater than [1] [3] percent] [such that the aggregate will readily bond with the bituminous material]. Drying may be required, as directed. Use aggregate
conforming to the gradation shown in TABLE I. Allowable aggregate gradation tolerances are given in TABLE II.

</tbody>
</table>

2.2.1 Coarse Aggregate

Use coarse aggregate consisting of clean, sound, durable particles meeting the following requirements.

2.2.1.1 Film Retention

Use aggregate that exhibits not less than 95 percent retention of bituminous film (ASTM D3625/D3625M).

2.2.1.2 Particle Shapes

Use aggregate that has no more than 20 percent by weight of flat and elongated particles on any sieve when determined in accordance with ASTM D4791. A flat particle is one having a ratio of width to thickness greater than 3; an elongated particle is one having a ratio of length to width greater than 3.

2.2.1.3 Weight Loss

Use aggregate with a percent weight loss not exceeding 40 after 500 revolutions, as determined in accordance with ASTM C131/C131M.

2.2.1.4 Friable Particles

Use aggregate with no more than 0.1 percent of the total weight of aggregate sample consisting of friable particles when tested in accordance with ASTM C142/C142M.
2.2.1.5 Crushed Slag

Use crushed slag aggregate with a dry weight not less than 1200 kg/cubic meter 75 pcf, as determined in accordance with ASTM C29/C29M.

2.2.1.6 Crushed Aggregate

Crushed aggregate retained on the 4.75 mm No. 4 sieve and each coarser sieve must contain at least 75 percent by weight of crushed pieces having one or more fractured faces with the area of each face equal to at least 75 percent of the smaller midsectional area of the aggregate particle. When two fractures are contiguous, the angle between the planes of fractures must be at least 30 degrees to count as two fractured faces.

2.2.2 Fine Aggregate

Use fine aggregate consisting of clean, sound, durable particles of crushed stone, slag, or crushed gravel. Use aggregate that meet the requirements for stripping, abrasion resistance and percent friable particles as specified for coarse aggregate.

2.3 EMULSIFIED ASPHALT FOR FOG SEAL

**************************************************************************
NOTE: In a majority of applications, the cationic (CSS-1h) is preferable to the anionic (SS-1h) for use as fog seal. Cationic emulsion will cure at a faster rate than anionic and is more suitable where high humidity prevails.
**************************************************************************

Use emulsified asphalt for Fog Seal conforming to ASTM D977, [SS-1] [SS-1h] [_____] for anionic and ASTM D2397/D2397M [CSS-1] [CSS-1h] [_____] for cationic materials.

2.4 WATER

Provide fresh, clean, and potable water.

PART 3 EXECUTION

3.1 PREPARATION OF SURFACE

**************************************************************************
NOTE: If the surface to be treated requires repairs, the method of repairs and extent of work involved should be shown or described.
**************************************************************************

Removal of paint and rubber deposits are generally accomplished by high pressure water blasting but care must be used to ensure that the water pressure does not significantly damage the asphalt pavement surface. Few approved chemicals are effective and sandblasting is not permitted by air pollution regulations at some locations. Mechanical abrasion generally causes damage to the pavement.

Bracketed sentence at the end of this paragraph
UFGS

applies to Fog Seal; remove when not used in the project.

**************************************************************************

Repair damaged surface and fill cracks before starting work. Immediately before starting work, remove all loose material, dirt, clay, or other objectionable material from the surface to be treated with power brooms or power blowers, if needed. Paint firmly bonded to the surface may remain. Do not mix material removed from the surface with the cover aggregate. [When necessary to achieve a clean surface for fog application, flushing with water will be permitted.]

3.2 SEAL COAT APPLICATION

3.2.1 Rate

Spread the bituminous material in the quantities shown in TABLE III. The exact quantities within the range specified, which may be varied to suit field conditions, will be determined by the Contractor and approved by the Contracting Officer prior to use. The bituminous quantities may have to be increased when the pavement has rough surface texture and may have to be decreased when the pavement surface is very tight.

<table>

</tr>
<tr>
<td>3</td>
<td>0.45-0.60/0.10-0.15</td>
<td>5-8/10-15</td>
</tr>
</tbody>
</table>

3.2.2 Temperature

Apply asphalt at a temperature that will provide an application viscosity between 10 and 60 seconds, Saybolt Furol, or between 20 and 120 square mm/sec 20 and 120 centistokes, kinematic. Furnish the temperature/viscosity relationship to the Contracting Officer.

3.2.3 Application of Bituminous Material

Following the preparation and inspection of the pavement surface, apply the seal coat material at the specified application rates. Uniformly apply the bituminous material in a single pass of the distributor and with either a double or triple lap spray over the surface to be sealed. Spread building paper on the surface for a sufficient distance back from the ends of each application so that flow through the spray bar may be started and stopped on the paper and so that all sprays will be operating at the proper pressure on the surface to be sealed. Immediately after the bituminous material application, remove the building paper. Apply bituminous material to all areas missed with the distributor. No smoking, fires, or flames, other than the heaters that are a part of the equipment, will be permitted within 8 meters 25 feet of heating, distributing, and transferring operations of bituminous material other than bituminous emulsions.
3.2.4 Aggregate Application Rate

Spread the aggregate in the quantities shown in TABLE III. The exact quantities within the range specified, which may be varied to suit field conditions, will be determined by the Contractor, and approved by the Contracting Officer prior to use. The aggregate weights shown in this table are those of aggregate having a specific gravity of 2.65. If the specific gravity of the aggregate to be used is less than 2.55 or greater than 2.75, make adjustments in the number of kilograms of aggregate required per square meter to insure a constant volume of aggregate per square meter of treatment.

3.2.5 Application of Aggregate

**************************************************************************
NOTE: When using cutback asphalt, the asphalt cools to the temperature of the surface to which it is applied in approximately 1 1/2 minutes. In the case of emulsified asphalt, breaking of the emulsion occurs in 3 to 4 minutes. No bituminous material should be down more than the following number of minutes before it is covered with aggregate:

<table>
<thead>
<tr>
<th>Material</th>
<th>Minutes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cutback Asphalt</td>
<td>1 to 1-1/2</td>
</tr>
<tr>
<td>Emulsified Asphalt</td>
<td>3 to 4</td>
</tr>
<tr>
<td>Asphalt Cement</td>
<td>1</td>
</tr>
</tbody>
</table>
**************************************************************************

Spread the specified quantity of cover aggregate uniformly over the bituminous material. Provide sufficient aggregate on trucks at the work site to cover the distributor load of bituminous material before the bituminous material is applied. No bituminous material may be down more than [3 to 4] minutes before it is covered with aggregate. Uniformly spread aggregate with aggregate-spreading equipment. Lightly recover areas having insufficient cover with additional aggregate by hand during the operations whenever necessary.

3.2.6 Rolling and Brooming

Begin rolling operations immediately following the application of cover aggregate. Perform rolling using pneumatic-tired rollers. Operate the rollers at a speed that will not displace the aggregate. Continue rolling until the aggregate is uniformly distributed and keyed into the bituminous material. Sweep off the surface and remove all surplus aggregate not less than 24 hours nor more than 4 days after rolling is completed. Immediately prior to opening to traffic, roll the entire treated area with a self-propelled pneumatic-tired roller.

3.3 FIELD QUALITY CONTROL - SEAL COAT

3.3.1 Tests

Perform field tests in sufficient numbers to assure that the specifications are being met. Submit copies of the test results, within 24 hours of the completion of the test. Submit certified copies of the aggregate test
results, not less than [30] [_____] days before the material is required in
the work and certified copies of the bituminous materials test reports
indicating compliance with applicable specified requirements, not less than
[30] [_____] days before the material is required in the work. Provide a
copy of the calibration test results before the bituminous distributor and
aggregate spreader are used on the job. Testing is the responsibility of
the Contractor. Perform test using an approved commercial laboratory. The
following number of tests, if performed at the appropriate time, will be
the minimum acceptable for each type of operation.

3.3.1.1 Gradation

Perform gradation tests in accordance with ASTM C136/C136M. Perform a
minimum of three gradations for each day's run. Repeat the gradation test
when the source of materials is changed. When deficiencies are found,
retest the material already placed to determine the extent of the
unacceptable material. Replace all in-place unacceptable material at no
additional expense to the Government.

3.3.1.2 Abrasion Resistance

Perform abrasion resistance tests in accordance with ASTM C131/C131M.
Perform one test prior to start of work. If sources of aggregate are
changed, conduct an abrasion resistance test prior to using another source.

3.3.1.3 Stripping

Perform stripping test on aggregate from each source, in accordance with
ASTM D3625/D3625M, prior to incorporation into the work and when the source
is changed.

3.3.2 Bituminous Material Sample

Obtain a sample of the bituminous material used under the supervision of
the Contracting Officer. The sample will be retained by the Government.

3.4 TRIAL APPLICATION - SEAL COAT

Prior to applying the seal coat, place a test section at least 30 meters
100 feet long by 6 meters 20 feet wide using the approved job materials and
roll them in accordance with the specified requirements. Perform tests to
determine the application rates of the bitumen and aggregate. If the tests
indicate that the seal coat test section does not conform to the
specification requirements, make necessary adjustments to the application
equipment and to the spreading and rolling procedures, and construct
additional test sections for conformance to the specifications. Where test
sections do not conform to specification requirements, remove seal coat at
no expense to the Government; no separate payment will be made for seal
ccoat materials and labor, either in placement or removal of any test
section. Perform quality control sampling and testing during construction
as required in paragraph FIELD QUALITY CONTROL above.

3.5 FOG SEAL APPLICATION

3.5.1 Sample Application

********************************************************************
NOTE: In some localities an incompatibility may
exist between the asphaltic emulsion and the water
********************************************************************
to be used for dilution due to their characteristics. Clear, potable water should be used, and if there is any doubt with the compatibility of the water and the asphalt emulsion, add the following to this paragraph: Prior to commencing work, combine 0.24 liter one half pint of the proposed asphalt emulsion and 0.24 liter one half pint of the proposed water, agitate, and allow to sit for a period of 24 hours to test their compatibility. If they prove to be incompatible, provide an approved chemical treatment for all water used for dilution or a different and compatible source of water.

**************************************************************************

Determine the required application rate from a sample installation. Select an area of the prepared pavement at least 90 m 300 feet long and as wide as the distributor spray bar. Dilute emulsified asphalt with an equal part of water or as agreed to by the Contracting Officer. Apply the water diluted asphalt emulsion in at least three test sections; each a minimum of 30 m 100 feet long. Make trial applications at residual rates of 0.36, 0.63, and 0.90 L/square meter 0.08, 0.14, and 0.20 gallons/square yard. The trial application rates may be modified if approved by the Contracting Officer. Additional trial applications may be made if warranted by pavement surface conditions. Use the rate which has been satisfactorily applied without leaving an excess of asphalt residue on the surface and has been approved, for the fog seal.

3.5.2 Application Inspection

Inspect application of fog seal for uniformity. During application, take one sample for each 400 square meters 500 square yards of surface area to receive emulsified asphalt. Weigh samples to determine conformance with application rate.

3.5.3 Inspection Reports

Furnish a written report citing climatic temperature during application of fog seal, emulsion temperature during application, rate of emulsion application, and any significant observations.

3.5.4 Application

Following preparation of the surface, apply the water diluted asphalt emulsion at the rate determined from the trial application. Maintain application temperature of emulsified asphalt between 24 and 71 degrees C 75 and 160 degrees F. To obtain uniform application of the fog seal at the junction of previous and subsequent applications, spread building paper on the surface of the applied material for a sufficient distance back from the ends of each application so that flow from the spray bar may be started and stopped on the paper, and so that all sprayers will operate at full force. Immediately after application, remove and properly dispose of the building paper. Treat spots unavoidably missed with the hand spray equipment. Base bids on application of diluted emulsion at 0.63 L/square meter 0.14 gsy. If the actual amount required is more or less than 0.63 L/square meter 0.14 gsy, an adjustment in the contract price will be made as provided by the contract.
3.6 SITE PROTECTION

During applications, protect adjacent buildings, structures, vehicles, manhole covers, inlet grates, and trees to prevent being spattered or marred.

3.7 TRAFFIC CONTROL

Protect freshly placed coatings from damage by traffic. Provide sufficient warning signs and barricades to prevent traffic over freshly treated surfaces. Protect treated areas from traffic for at least 24 hours after final application of coatings, or for such time as necessary to prevent picking up. Provide warning signs and barricades for proper traffic control, in accordance with MUTCD.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for Polymer Concrete Micro-Overlay (PCMO) for fuel and abrasion resistant wearing surfaces.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
characteristics of the surface by patterning the PCMO. Colored PCMO may be used for taxiway markings, stop bars and/or directional designations on both asphalt or concrete. PCMO may also be used on roads and parking lots for friction enhancement or for delineation of crosswalks, bus areas or pedestrian areas as well as a fuel and abrasion resistant wearing surface.

This guide specification only pertains to the polymer concrete micro-overlay aspects of the project and not to any surface preparation requirements. Surface preparation requirements should be covered by either including them in this guide specification or by adding pertinent sections to the project documents.

This specification utilizes a Quality Assurance and Quality Control (QA/QC) construction management philosophy. Quality Assurance refers to the actions performed by the Government to assure the final product meets the job requirements. Results of QA testing are the basis for pay. Quality Control refers to the actions of the Contractor to monitor the construction and production processes and to correct these processes when out of control. Results of QC testing are reported daily on the process control charts maintained by the Contractor. Quality Control is covered in paragraph CONTRACTOR QUALITY CONTROL.

1.1 UNIT PRICES

NOTE: Delete this paragraph when lump sum payment is desired.

1.1.1 Measurement

Measure the quantity of PCMO, per square meter square yard placed and accepted, for the purposes of assessing payment.

1.1.2 Payment

NOTE: Delete this paragraph when lump sum payment is desired.

Quantities of PCMO mixture, determined as specified above will be paid for at respective contract unit prices. Payment will constitute full compensation for furnishing all materials, equipment, plant, surface preparation, and tools; and for all labor and other incidentals necessary to complete the required work.
1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN CONCRETE INSTITUTE (ACI)

ASTM INTERNATIONAL (ASTM)

ASTM C1583/C1583M (2013) Standard Test Method for Tensile Strength of Concrete Surfaces and the Bond Strength or Tensile Strength of Concrete Repair and Overlay Materials by Direct
Tension (Pull-off Method)

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

1.4 QUALITY CONTROL

1.4.1 Qualifications
Perform sampling and testing using an approved commercial testing laboratory or on-site facility that is accredited in accordance with ASTM C1077. Do not start work requiring testing until the facilities have been inspected and approved. The Government will inspect all laboratories requiring validation for equipment and test procedures prior to the start of any concreting operations for conformance to ASTM C1077. Schedule and provide payment for laboratory inspections. Additional payment or a time extension due to failure to acquire the required laboratory validation is not allowed. Maintain this certification for the duration of the project.

1.4.2 Quality Control Plan
Develop and submit a Quality Control Plan. Do not produce PCMO for payment until the quality control plan has been approved. Address all elements that affect the quality of the PCMO including, but not limited to:

a. Mix Design.
b. Aggregate Grading.
c. Quality of Materials.
e. Preparation of Existing Pavement Surface

1.4.3 Manufacturer Representative
At the beginning of job site operations, provide an independent technical
consultant with a minimum of 3 years experience in the use of PCMO and knowledge of the materials, procedures, and equipment described in this specification. The consultant will assist in the proper mixing of the component materials and application of the PCMO. Submit manufacturer representative resume documenting this experience prior to the start of operations.

1.5 PROJECT/SITE CONDITIONS

1.5.1 Environmental Requirements

Do not apply PCMO when the surface is wet unless permitted by the manufacturer or when the humidity or impending weather conditions will not allow proper curing. Apply PCMO only when the atmospheric or pavement temperature is 7.5 degrees C 45 degrees F and rising and is expected to remain above 7.5 degrees C 45 degrees F for 24 hours, unless otherwise directed. Pavement temperatures exceeding 50 degrees C 130 degrees F are not recommended for PCMO application. Ideal conditions for placement are air temperatures between 15 and 32 degrees C 60 and 90 degrees F and humidity levels between 50 and 60 percent.

1.6 ACCEPTANCE

1.6.1 Tolerances

Acceptance of PCMO mixture is based on compliance with the tolerances presented in Table 1. Remove and replace PCMO represented by the failing tests or submit repair plan for approval.

<table>
<thead>
<tr>

</tbody>
</table>

1.6.2 Test Section

**NOTE:** The test section is used to determine the exact application rate, quality of the mixture in place, and the performance of the equipment.

The application rate depends on the pavement surface texture, desired PCMO thickness, PCMO aggregate size, and equipment used during PCMO placement. If operational conditions preclude placement of a test
section on the pavement to be seal coated, apply on a pavement with similar surface texture.

Prior to full production, prepare a quantity of mixture in the proportions shown in the approved mix design and in sufficient amount to place a test section a minimum of 37 square m [400 square feet] at the rate specified in the job mix formula. Locate the proposed test section on a representative section of the pavement. The test application rate depends on the condition of the pavement surface. Use the test section to verify the adequacy of the mix design and to determine the actual application rate for the project. Use the same equipment and method of operations on the test section as will be used on the remainder of the work. Acceptance of the test section is based on compliance with the Tolerances listed in Table 1. If the test section should prove to be unsatisfactory, make the necessary adjustments to the mix composition, application rate, placement operations, and equipment. Place additional test sections and evaluate. Do not begin full production without approval. Schedule a minimum of 1 day following the placement of the test section prior to job mix approval to allow for proper curing, and an overall assessment of the PCMO test section.

1.6.2.1 Fuel Resistance

[Submit test results, performed in accordance with the test method given in Appendix A, showing that the PCMO mixture meets the tolerances of Table 1.]

[Conduct fuel resistance testing on the test section in accordance with Appendix B. If the fuel resistance test results meet the tolerances of Table 1, the test section may remain as part of the project pavement. If the test section fails the tolerances, remove the test section, construct another test section, and retest.]}

1.6.2.2 Skid Resistance

Evaluate the skid resistance of the test section using a ribbed tire (R), traveling at 65 kilometers per hour [40 miles per hour] over a wetted PCMO in accordance with ASTM E274/E274M. Report the result as SN(65)R SN40R and meet the tolerances of Table 1.

1.6.2.3 Bond To Substrate

Evaluate the bond strength of the PCMO to the prepared pavement substrate in accordance with ASTM C1583/C1583M. Report the failure mode and meet the tolerances of Table 1.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The work consists of placing one or more applications of a polymer concrete micro overlay, with mineral or synthetic aggregate, applied on an existing,
previously prepared bituminous or concrete surface. Requirements for the mixing and placement equipment are specific to the manufacturer's product and are not specified herein.

2.2 CEMENT

Provide cement for PCMO conforming to ASTM C150/C150M for Type I, II, I/II or III Portland Cement. Submit copies of certified test data.

2.3 WATER

Provide potable water free from harmful soluble salts. Control the temperature of the water added during mixing to a minimum of 10 degrees C or 50 degrees F and not above 32 degrees C or 90 degrees F. Control the pH of the water added during mixing to the requirements of the manufacturer.

2.4 AGGREGATES

Provide aggregate which is either a natural or manufactured aggregate composed of clean, hard, durable, uncoated particles, free from lumps of clay and all organic matter, meeting the quality requirements of ASTM C33/C33M or ASTM D242/D242M. Submit all aggregate test results and samples at least 14 days prior to start of construction.

2.5 MIX DESIGN

**************************************************************************
NOTE: For laboratory fuel resistance testing, include the bracketed item specifying Appendix A.
**************************************************************************

Submit proposed JMF [including fuel resistance test results in accordance with Appendix A]. Develop the mix design and submit the recommended formulation of water, polymer, and cement/aggregate blend and estimated application rate proposed for use at least 14 days prior to the start of operations. Submit a service record of five years successful performance for a similar JMF on comparable substrate equal to or exceeding the proposed exposure and traffic conditions for the related use. Include photographs and written report addressing pinholes, air bubbles, lumps or other visible defects in accordance with ACI 201.1R. Submit service record performed by a third party engineer, petrographer, or concrete materials engineer. Exact application rates cannot be determined until the test section is placed due to the variability in surface textures of asphalt pavement. The specific JMF selected will be submitted in writing and approved prior to the start of the project.

2.5.1 Composition

Provide PCMO consisting of a polymer, water, cement, additives, and aggregate [and/or fibers] in the specified proportions and according to the specific manufacturer's requirements. Develop a job mix formula (JMF) suitable to the range of different PCMO products available, the local climatic zone, local temperature during application, and pavement surface conditions.

2.5.2 Mix Design Report

Perform trial design batches, mixture proportioning studies, testing, and submit test results demonstrating that the proposed mixture proportions
produce PCMO of the qualities indicated. Submit test results in a mix design report to include:

- Coarse and fine aggregate gradations and plots.
- Coarse aggregate quality test results, including deleterious materials.
- Fine aggregate quality test results.
- Mill certificates for cement.
- Recommended proportions and volumes for proposed mixture.
- Narrative discussing methodology on how the mix design was developed.

2.5.3 Adjustments to JMF

Maintain the JMF in effect until a new formula is approved in writing. Should a change in sources of any materials be made, do not use new material until a new mix design has been performed and approved.

2.6 TESTS, INSPECTIONS, AND VERIFICATIONS

2.6.1 Certifications

Submit Safety Data Sheets (SDS) and certificate of analyses (COA) or quality control certificates (QCC) verifying the composition of each separate material employed in the PCMO without revealing proprietary information. Submit COA/QCC documentation traceable to the batch/lot of materials received from the supplier of each proposed component of the PCMO. Clearly mark batch/lot identification on all packaging to be traceable to a specific COA/QCC for that particular batch.

PART 3 EXECUTION

3.1 PREPARATION OF THE UNDERLYING SURFACE

******************************************************************************

NOTE: In order to ensure adequate adhesion and minimize cracking and curling, allow the pavement surface to cure prior to application of the seal coat. Experience has shown that a minimum of 30 days and an average of approximately 90 days of hot weather (daytime temperatures of 21 degrees C 70 degrees F) are needed for adequate curing of a HMA surface prior to application of a PCMO.

This guide specification only pertains to the polymer concrete micro-overlay aspects of the project and not to any surface preparation requirements. Address surface preparation requirements by either including them in this guide specification or by adding pertinent sections to the project documents.

******************************************************************************

Prior to placing PCMO, clean the surface of the pavement to remove dust, dirt, other loose foreign matter, grease, oil, any type of objectionable surface film, or thermoplastic or painted pavement markings, using a vacuum sweeper or a combination of wire brushes and a power blower. Where vegetation exists in cracks, remove the vegetation and clean the cracks to a depth of 50 mm 2 inches where practical. Treat those cracks with a concentrated solution of an approved herbicide. [Clean, rout, and repair cracks in accordance with Section 32 01 17.61 SEALING OF CRACKS IN ASPHALT]
PAVING. Remove bituminous pavement surfaces softened by petroleum derivatives, or that have failed due to any other cause, to the full depth of the damage and replace with new bituminous concrete similar to that of the existing pavement. Maintain areas of the pavement surface to be sealed with PCMO in a firm consolidated condition, and sufficiently cured so that there is no concentration of oils on the surface. Allow a period of a minimum of 30 days to elapse between the placement of a bituminous surface course and the application of the seal coat unless detergent washing is chosen as an alternative to the time requirement. After the 30 day curing period or detergent washing, verify the surface is suitable by pouring a cup of water on the pavement surface (on a warm day) and observing if any oils appear in the standing water. If oils appear, the surface is not sufficiently cured to accept a seal coat.

3.2 APPLICATION

Continuously agitate the mixture from the initial mixing until its application on the pavement surface. Maintain the distributor or applicator, pumps, and all tools in a satisfactory working condition. Apply a primer prior to placement of PCMO, if recommended by the manufacturer. Apply the PCMO seal coat at the application rate determined from the test section. When an area will be subjected to significant fuel spillage, place a double coat of PCMO in the appropriate area at an approved application rate. The application rate for the second coat of PCMO can vary significantly from the underlying PCMO coat due to changes in the surface texture of the surface after PCMO application.

3.2.1 Calibration

Furnish all equipment, materials, and labor necessary to calibrate the equipment so that it will produce and apply a mix that conforms to the job mix design. Make all calibrations with the approved job materials prior to applying the PCMO to the pavement as part of the test section. Submit a copy of the calibration test results.

3.2.2 Curing

Permit the mixture to cure for a minimum of 24 hours, after the final application, before opening to traffic. Repair any damage to the uncured mixture due to early traffic.

3.3 JOINTS

Overlap all joints with the adjacent PCMO section and maintain a similar texture as other sections of the PCMO.

3.4 FIELD QUALITY CONTROL

3.4.1 QC Monitoring

Document each batch of material prepared for placement, and keep written records of the weights of cement, aggregate, polymer emulsion, and water used for each batch. In addition, keep records of air temperature, pavement temperature, wind velocity (speed and direction), and humidity. Submit all QC test results on a daily basis, as the tests are performed.

3.4.2 Sampling

Perform sieve analyses on aggregates a minimum of once for each half-days's
production. Conduct tests in accordance with ASTM C117 and ASTM C136/C136M.

3.5 APPENDICES
APPENDIX A

LABORATORY FUEL RESISTANCE TEST

1. Scope. This method determines the resistance of the PCMO to kerosene.

2. Apparatus.
   a. Two 150 X 150 mm 6 X 6 inch square 16 gauge sheet metal masks with a 100 by 100 mm 4 by 4 inch square center removed.
   b. One 150 X 150 mm 6 X 6 inch unglazed white ceramic tile with an absorption rate of 10-18 percent (according to ASTM C67/C67M).
   c. Brass ring, 50 mm 2 inch diameter and 50 mm 2 inch high.
   d. Kerosene meeting requirements of ASTM D3699.
   e. Silicone rubber sealant or fast-setting epoxy.

3. Procedure
   a. Immerse the ceramic tile in distilled water for a minimum of ten minutes.
   b. Remove excess water from the tile to produce a damp surface before applying the seal coat.
   c. Using the mask described in 2.a apply one layer of the PCMO blend (mixed as specified). Spread even with the top of the mask using a spatula or other straight edge.
   d. Allow the sample to cure for 24 hours at 24 degrees C + 1 77 + 2 degrees and 50 + 10 percent relative humidity.
   e. If a two-layer application is specified, position a second mask on top of the first mask. Apply a second coat of PCMO emulsion mixture. Spread even with the top of the second mask.
   f. Cure as in step 3.d.
   g. After curing, affix the brass ring to the seal coat on the tile with silicone rubber or epoxy. Epoxy often adheres better to the PCMO than silicone.
   h. Fill the brass ring with kerosene. Add a small amount of coloring to the kerosene, asphalt works well for this. The coloring may be necessary to determine if the kerosene breached the PCMO surface.
   i. After 24 hours, remove the kerosene from the brass ring, blot dry and immediately examine the film for softness and loss of adhesion. Immediately after the film is examined, break the tile in half, exposing that part of the tile whose film was subjected to the kerosene.
   j. Evaluate for penetration of kerosene through the sealer and loss of adhesion.

4. Report. Report the results as pass or fail. Visible evidence of leakage through or discoloration in the tile constitutes failure of the test.
APPENDIX A

LABORATORY FUEL RESISTANCE TEST

5. Criterion. A "pass" rating in the fuel resistance test is required.
APPENDIX B

FIELD FUEL RESISTANCE TEST

1. Scope. This field method is recommended to verify the resistance of the PCMO to aviation fuel. This procedure is adapted from a field test proposed for use with coal-tar materials. Some slight modifications to the method have been made to accommodate PCMO. This test is best conducted in conditions of little wind and moderate temperatures (around 21-24 degrees C 70-75 degrees F).

2. Apparatus
   a. A 150 mm 6-inch diameter metal, glass, or PVC pipe at least 76 mm 3 inches long.
   b. A lid for the pipe.
   c. RTV silicone rubber sealant or fast-setting epoxy for affixing the pipe to the pavement surface.
   e. A ruler.

3. Procedure
   a. Locate a clean, flat surface on the pavement to be tested.
   b. Place the pipe on the pavement surface and seal the edge with silicone or epoxy. Firmly mold the adhesive between the pipe and the surface of the pavement to prevent leakage.
   c. Allow the sealant/adhesive to cure for 24 hours.
   d. Pour approximately one inch of aviation fuel or kerosene inside the pipe. Determine baseline of fluid by placing the ruler inside the pipe and measuring the distance from the surface of the fluid to the top of the pipe. Record this distance. Place the lid on the top of the pipe.
   e. After 30 minutes remove the lid and measure the distance from the top of the fluid to the top of the pipe. Record this distance. Any discoloration of the fuel or softening of the PCMO surface should be recorded.
   f. If seepage occurs between the bottom of the pipe and the pavement surface through the adhesive, the test is invalid. Retest in a different location.

4. Report. Report the distance from the surface of the fluid to the top of the pipe immediately after placing the fluid and after 30 minutes. Determine the difference between the two readings. If less than 5 mm 0.2 inches of fluid has penetrated the surface, a 'Pass' rating is given. If more than 5 mm 0.2 inches of fluid penetrates the surface, the pavement surface is deemed 'Failed' and may be unacceptable for fuel resistance. If any discoloration of the fuel or softening of the PCMO surface is evident, the PCMO surface is deemed 'Failed' and may be unacceptable for fuel resistance.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for Portland cement concrete paving jobs such as roads, streets, sidewalks, and parking lots.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The extent and location of the work to be accomplished should be indicated on the project drawings, or included in the project specifications.

Portland cement pavements for airfields and special military vehicles, identified in UFC 3-201-01 (2018), paragraph 4-1, Surface and Unsurfaced Road And Site Pavement, are not included in this specification. Specify airfield and special military vehicle Portland cement concrete paving using Section 32 13 14.13 CONCRETE PAVING FOR AIRFIELDS AND OTHER HEAVY DUTY PAVEMENTS. Consult agency Subject Matter Expert (SME) for appropriate use of this guide specification.
PART 1   GENERAL

1.1   UNIT PRICES

**************************************************************************
NOTE: If lump sum payment is used, delete the following paragraphs on Measurement and Payment.
**************************************************************************

1.1.1 Measurement

The quantity of concrete to be paid for will be the volume of concrete in cubic meters yards including monolithic curb, where required, placed in the completed and accepted pavement. Concrete will be measured in place in the completed and accepted pavement only within the neat line dimensions shown in the plan and cross section. No deductions will be made for rounded edges or the space occupied by embedded items or voids.

1.1.2 Payment

Payment will be made at the contract price per cubic meter yard for the scheduled item. Payment will constitute full compensation for furnishing all materials, equipment, plant and tools, and for all labor and other incidentals necessary to complete the concrete pavement.

1.2   REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN CONCRETE INSTITUTE (ACI)

ASTM INTERNATIONAL (ASTM)

ASTM A615/A615M (2020) Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force,
and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-03 Product Data**
- Curing Materials
- Reinforcement
- Epoxy Resin

1.4 QUALITY CONTROL

1.4.1 NRMCA Certificate of Conformance

Provide a batching and mixing plant consisting of a stationary-type central mix plant, including permanent installations and portable or relocatable plants installed on stable foundations. Provide a plant designed and operated to produce concrete within the specified tolerances, with a minimum capacity of 200 cubic meters 250 cubic yards [_____] per hour. Submit NRMCA Certificate of Conformance that conforms to the requirements of NRMCA QC 3 including provisions addressing:

1. Material Storage and Handling
2. Batching Equipment
3. Central Mixer
4. Ticketing System
5. Delivery System

1.4.2 Qualifications

1.4.2.1 Laboratory Accreditation

Perform sampling and testing using an approved commercial testing laboratory or on-site facilities that are accredited in accordance with ASTM C1077. Do not start work requiring testing until the facilities have been inspected and approved. The Government will inspect all laboratories requiring validation for equipment and test procedures prior to the start of any concreting operations for conformance to ASTM C1077. Schedule and provide payment for laboratory inspections. Additional payment or a time extension due to failure to acquire the required laboratory validation is not allowed. Maintain this certification for the duration of the project.

1.4.2.2 Field Technicians

Provide field technicians meeting one of the following criteria:

a. Have at least one National Ready Mixed Concrete Association (NRMCA) certified concrete craftsman and at least one American Concrete Institute (ACI) Flatwork Finisher Certified craftsman on site, overseeing each placement crew during all concrete placement.

b. Have no less than three NRMCA certified concrete installers and at least two American Concrete Institute (ACI) Flatwork Finisher Certified installers on site working as members of each placement crew during all concrete placement.

1.4.3 Batch Tickets

Submit batch tickets for each load of ready-mixed concrete in accordance with ASTM C94/C94M.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver concrete paving in accordance with ASTM C94/C94M.
1.6 ACCEPTANCE

1.6.1 Tolerances

Acceptance of Portland cement concrete pavement is based on compliance with the tolerances presented in Table 1. Remove and replace concrete pavement represented by the failing tests or submit repair plan for approval.

1.6.2 Test Section

Construct a minimum [_____] 37 square meters 400 square feet test section to demonstrate typical joints, surface finish, texture, color, thickness, and standard of workmanship using the mixture proportions, materials, and equipment as proposed for the project. Test in accordance with requirements in FIELD QUALITY CONTROL.

When a test section does not meet one or more of the tolerances in Table 1, remove and reconstruct the test section. If the test section is acceptable, it may be incorporated into the project.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Cementitious Materials

**************************************************************************
NOTE: Coal fly ash, slag, and silica fumes are EPA designated recovered products to be ingredients in concrete and cement. Use materials with recycled content where appropriate for use. The following section allows a percentage range of supplementary cementitious materials (SCM). Consult agency SME for guidance on choice.

Select sentence in brackets to specify SCM content.

[Provide cementitious materials in concrete mix with 20 to 50 percent non-portland cement pozzolanic materials [or slag] by weight.]

2.1.1.1 Portland Cement

Conforming to ASTM C150/C150M, Type I or II [III, for high early concrete] [or V] [low alkali].

2.1.1.2 Blended Cement

Provide blended cement conforming to ASTM C595/C595M, Type IP or IS, including the optional requirement for mortar expansion [and sulfate soundness]. Provide pozzolan added to the Type IP blend consisting of ASTM C618 Class F or Class N and that is interground with the cement clinker. Include in written statement from the manufacturer that the amount of pozzolan in the finished cement does not vary more than plus or minus 5 mass percent of the finished cement from lot to lot or within a lot. The percentage and type of mineral admixture used in the blend are not allowed to change from that submitted for the aggregate evaluation and mixture proportioning. The requirements of paragraph Supplementary Cementitious Materials (SCM) Content do not apply to the SCM content of blended cement.

2.1.1.3 Fly Ash and Pozzolan

Conforming to ASTM C618, Type F, or N, with a loss on ignition not exceeding 3 percent [6] percent. Include test results in accordance with ASTM C618.

2.1.1.4 Ultra Fine Fly Ash and Ultra Fine Pozzolan

Ultra Fine Fly Ash (UFA) and Ultra Fine Pozzolan (UFP) conforming to ASTM C618, Class F or N, and the following additional requirements:

a. The strength activity index at 28 days of age at least 95 percent of the control specimens.

b. The average particle size not exceeding 6 microns.

2.1.1.5 Silica Fume

**************************************************************************
NOTE: Silica Fume is only used for OCONUS projects where Class F fly ash and slag cement are not available, and when approved by the TSMCX, AFCEC pavement SME, or NAVFAC. Delete this paragraph here and where encountered throughout the remainder of this section.
**************************************************************************

Provide silica fume that conforms to ASTM C1240, including the optional limits on reactivity with cement alkalis. Provide silica fume as a dry, densified material or as a slurry. Provide the services of a manufacturer's technical representative, experienced in mixing, proportioning, placement procedures, and curing of concrete containing silica fume, at no expense to the Government. This representative is required to be present on the project prior to and during at least the first 4 days of concrete production and placement using silica fume.

2.1.1.6 Slag

Conforming to ASTM C989/C989M, Slag Cement (formerly Ground Granulated Blast Furnace Slag) Grade 100 or 120. Include test results in accordance with ASTM C989/C989M.

2.1.1.7 Supplementary Cementitious Materials (SCM) Content

**************************************************************************
NOTE: Select first sentence in brackets for mandatory use of SCMs. Select second sentence in brackets for optional use of SCMs. Consult agency SME for guidance on choice.
**************************************************************************

[Include one of the SCMs listed in Table 2 within the range specified therein, whether or not the aggregates are found to be reactive in accordance with the paragraph Alkali Reactivity Test.] [Use of one of the SCMs listed below is optional, unless the SCM is required to mitigate ASR. The use of SCMs is encouraged in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.]

2.1.2 Water

Water conforming to ASTM C1602/C1602M.

2.1.3 Aggregate

2.1.3.1 Durability

Evaluate and test all fine and coarse aggregates to be used in all concrete for durability in accordance with ASTM C88. Provide fine and coarse aggregates with a maximum of 18 percent loss when subjected to 5 cycles using Magnesium Sulfate or a maximum of 12 percent loss when subjected to 5 cycles of Sodium Sulfate.

2.1.3.2 Alkali Reactivity Test

**************************************************************************
NOTE: Documentation of alkali reactivity testing is required for all aggregate sources.
**************************************************************************

Evaluate and test fine and coarse aggregates to be used in all concrete for alkali-aggregate reactivity. Test all size groups and sources proposed for use.

a. Evaluate the fine and coarse aggregates separately, using ASTM C1260. Reject individual aggregates with test results that indicate an expansion of greater than 0.08 percent after 28 days of immersion in 1N NaOH solution, or perform additional testing as follows: utilize the proposed low alkali portland cement, blended cement, or SCM in combination with each individual aggregate. Test in accordance with ASTM C1567. Determine the quantity that meets all the requirements of these specifications and that lowers the expansion equal to or less than 0.08 percent after 28 days of immersion in a 1N NaOH solution. Base the mixture proportioning on the highest percentage of SCM required to mitigate ASR-reactivity.

b. If any of the above options does not lower the expansion to less than 0.08 percent after 28 days of immersion in a 1N NaOH solution, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing for evaluation and acceptance.

2.1.3.3 Fine Aggregates

Conforming to the quality and gradation of ASTM C33/C33M.
2.1.3.4 Coarse Aggregates

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Select sentence in brackets for mandatory use of recycled materials. Consult agency SME for guidance.
**************************************************************************

Coarse aggregate consisting of crushed or uncrushed gravel, crushed stone, or a combination thereof.[ Provide coarse aggregate with a minimum of [25][_____] percent recycled porcelain, concrete, stone, or other recycled material complying with ASTM D6155.] Provide aggregates, as delivered to the mixers, consisting of clean, hard, uncoated particles. Wash coarse aggregate sufficient to remove dust and other coatings. Provide fine aggregate consisting of natural sand, manufactured sand, or a combination of the two, and composed of clean, hard, durable particles. Provide both coarse and fine aggregates meeting the requirements of ASTM C33/C33M.  

**************************************************************************
NOTE: Fill in the blank according to the size aggregate available in the project area, and the type of paving. Use nominal maximum aggregate size of 37.5 mm 1-1/2 inch. Subject to approval of the agency pavement SME, a 25 mm 1-inch nominal maximum aggregate size may be used to avoid durability problems associated with some larger size aggregate.
**************************************************************************

Select class 4M for exterior concrete exposed to frequent wetting in moderate weathering regions.  Select class 4S for exterior concrete exposed to frequent wetting in severe weathering regions.

**************************************************************************
NOTE: Fill in the blank according to the size aggregate available in the project area, and the type of paving. Use nominal maximum aggregate size of 37.5 mm 1-1/2 inch. Subject to approval of the agency pavement SME, a 25 mm 1-inch nominal maximum aggregate size may be used to avoid durability problems associated with some larger size aggregate.
**************************************************************************

a. Gradation: Provide coarse aggregate with a nominal maximum size of [37.5] [_____] mm [1.5] [_____] inches. Grade and provide the individual aggregates in two or more size groups meeting the individual grading requirements of ASTM C33/C33M, Size No. 4 (37 mm to 19 mm 1.5 to 0.75 inch) and Size No. 67 (19 mm to No. 40. 75 inch to No. 4).

b. Quality: Conforming to ASTM C33/C33M, Class [4M] [4S].

2.1.4 Chemical Admixtures

2.1.4.1 Water Reducing Admixtures

Provide admixture conforming to ASTM C494/C494M: Type A, water reducing; Type B, retarding; Type C, accelerating; Type D, water-reducing and retarding; and Type E, water-reducing and accelerating admixture. Do not use calcium chloride admixtures. ASTM C494/C494M Type S specific performance admixtures and ASTM C1017/C1017M flowable admixtures are not allowed.
2.1.4.2 Air Entraining Admixture

2.1.4.3 High Range Water Reducing Admixture

**************************************************************************
NOTE: High Range Water Reducing Admixtures are permitted only for OCONUS projects when using Silica Fume. Retain first bracketed sentence for CONUS projects. Retain the second paragraph for OCONUS projects.
**************************************************************************

[ASTM C494/C494M Type F and G high range water reducing admixtures are not allowed.] [Provide a high-range water-reducing admixture that meets the requirements of ASTM C494/C494M, Type F or G, that is free from chlorides, alkalis, and is of the synthesized, sulfonated complex polymer type. Add the HRWRA to the concrete as a single component at the batch plant. Add the admixture to the concrete mixture only when its use is approved or directed, and only when it has been used in mixture proportioning studies to arrive at approved mixture proportions. Submit certified copies of the independent laboratory test results required for compliance with ASTM C494/C494M.]

2.1.5 Reinforcement

2.1.5.1 Dowel Bars

Dowel bars conforming to ASTM A615/A615M, [Grade 300] [Grade 420] [Grade 40] [Grade 60] for plain billet-steel bars of the size and length indicated. Remove all burrs and projections from the bars. [Epoxy coat in accordance with ASTM A775/A775M.]

2.1.5.2 Tie Bars

Billet or axle steel deformed bars conforming to ASTM A615/A615M or ASTM A966/A966M [Grade 300] [Grade 420] [Grade 40] [Grade 60]. [Epoxy coat in accordance with ASTM A775/A775M.]

2.1.5.3 Reinforcement

Deformed steel bar mats conforming to ASTM A184/A184M. Bar reinforcement conforming to [ASTM A615/A615M] [ASTM A966/A966M], [Grade 300] [Grade 420] [Grade 40] [Grade 60]. [Epoxy coat in accordance with ASTM A775/A775M.]

2.1.6 Curing Materials

Provide curing materials consisting of:

2.1.6.1 White-Burlap-Polyethylene Sheet

Conforming to ASTM C171, 0.10 mm 0.004 inch thick white opaque polyethylene bonded to 0.31 kg per meter 10 oz/linear yard (1.0 meter) (40 inch) wide burlap.

2.1.6.2 Liquid Membrane-Forming Compound

Conforming to ASTM C309, white pigmented, Type 2, Class B, free of paraffin

SECTION 32 13 13.06 Page 16
2.1.6.3 Liquid Chemical Sealer-Hardener Compound

Compound consisting of magnesium fluosilicate which when mixed with water seals and hardens the surface of the concrete. Do not use on exterior slabs exposed to freezing conditions.

2.1.7 Joint Fillers and Sealants

Provide as specified in Section [32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT][32 13 73.19 COMPRESSION CONCRETE PAVING JOINT SEALANT]. [Match new joints with existing alignment.]

2.1.8 Biodegradable Form Release Agent

**************************************************************************
NOTE: Concrete release fluids are recognized as a biobased material. Use materials with biobased content where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying product biobased content requirements. A resource that can be used to identify products with bio-based content is the "Catalog" tab within the USDA's "Biopreferred" website at https://www.biopreferred.gov/BioPreferred/. Other products with biobased content are also acceptable when meeting all requirements of this specification.
**************************************************************************

Provide form release agent that is colorless and biodegradable. Provide product that does not bond with, stain, or adversely affect concrete surfaces and does not impair subsequent treatments of concrete surfaces. Provide form release agent with a minimum of 87 percent biobased material and does not contain diesel fuel, petroleum-based lubricating oils, waxes, or kerosene.

2.1.9 Epoxy Resin

Provide epoxy-resin materials that consist of two-component materials conforming to the requirements of ASTM C881/C881M, Class as appropriate for each application temperature to be encountered, except that in addition, the materials meet the following requirements:

a. Type IV, Grade 3, for use for embedding dowels and anchor bolts.

b. Type III, Grade as approved, for use as patching materials for complete filling of spalls and other voids and for use in preparing epoxy resin mortar.

c. Type IV, Grade 1, for use for injecting cracks.

d. Type V, Grade as approved, for bonding freshly mixed portland cement concrete or mortar or freshly mixed epoxy resin concrete or mortar to hardened concrete.
2.1.10 Joint Materials

**************************************************************************
NOTE: Edit as appropriate for project requirements. Coordinate with Section 32 01 19.61
SEALING OF JOINTS IN RIGID PAVEMENT for Army projects and Section 32 13 73.19 COMPRESSION
CONCRETE PAVING JOINT SEALANT for all other projects.
**************************************************************************

2.1.10.1 Expansion Joint Materials

Provide preformed expansion joint filler material conforming to [ASTM D1751]
[or][ASTM D1752 Type [II] [III]]. Provide expansion joint filler that is
19 mm 3/4 inch thick, unless otherwise indicated, and provided in a single
full depth piece.

2.1.10.2 Slip Joint Material

Provide slip joint material that is 6 mm 1/4 inch thick expansion joint
filler, unless otherwise indicated, conforming to paragraph EXPANSION JOINT MATERIAL.

2.2 MIX DESIGN

Proportion concrete mix in accordance with ACI 211.1 except as modified
herein.

2.2.1 Specified Concrete Properties

**************************************************************************
NOTE: This specification is based on a flexural strength basis. Specify the design strength based on
local or state DOT experience in the area. For small jobs 75 cubic meters or less 100 cubic yards
or less, compressive strength may be used. In that case modify these paragraphs to reflect a
compressive strength basis.

NOTE: Allowable Air Content: Select 5.5 percent air content for maximum aggregate size of 37.5 mm 1
1/2 inches, and 6 percent air content for maximum aggregate size of 25 mm one inch. Maximum
water-cementitious material ratio should be 0.45 for exposure to moisture and freeze-thaw cycling or 0.40
for reinforcement corrosion protection and exposure to deicing salts.
**************************************************************************

2.2.1.1 Flexural Strength

Provide concrete with a minimum flexural strength of [4.48][_____]MPa
[650][_____] psi at 28 days of age.

2.2.1.2 Air Entrainment

Provide an entrained air content of [5.5] [6.0] percent.
2.2.1.3 Slump

[For fixed form and hand placement, provide a maximum slump of 75 mm 3 inches.] [For slipformed pavement, at the start of the project, select a maximum allowable slump which will produce in-place pavement meeting the specified tolerances for control of edge slump. The selected slump is applicable to both pilot and fill-in lanes.]

2.2.1.4 Water/Cementitious Materials Ratio

Maximum allowable water-cementitious material ratio is [0.40] [0.45]. The water-cementitious material ratio is based on absolute volume equivalency, where the ratio is determined using the weight of cement for a cement only mix, or using the total volume of cement plus pozzolan converted to an equivalent weight of cement by the absolute volume equivalency method described in ACI 211.1.

2.2.1.5 Albedo

**************************************************************************
NOTE: The urban heat island effect forms as vegetation is replaced by low reflectivity materials such as dark colored paving. These surfaces absorb, rather than reflect, the sun's heat, causing surface temperatures and urban ambient temperatures to be 1 to 6 degrees C 2 to 10 degrees F hotter than surrounding rural areas.

Mitigation of heat island effect is not required by UFC 1-200-02 but may be desired for sustainability reasons. The albedo requirements below for roads and parking lot paving are most beneficial in ASHRAE climate zones 1 through 5. Retain the following section when needed to meet project requirements.
**************************************************************************

[ Provide an Albedo with a minimum initial Solar Reflectance of at least 0.33 as tested in accordance with ASTM C1549.

]2.2.2 Mix Design Report

Perform trial design batches, mixture proportioning studies, testing, and include test results demonstrating that the proposed mixture proportions produce concrete of the qualities indicated. An existing mix design may be submitted if developed within the previous 12 months. Submit test results in a mix design report to include:

a. Coarse and fine aggregate gradations and plots.

b. Coarse and fine aggregate quality test results, include deleterious materials and ASR testing.

c. Mill certificates for cement and supplemental cementitious materials.

d. Certified test results for all proposed admixtures.

e. Specified flexural strength, slump, and air content.

f. Recommended proportions and volumes for proposed mixture and each of
three trial water-cementitious materials ratios.

g. Individual beam breaks.

h. Flexural strength summaries and plots.

i. Historical record of test results, documenting production standard deviation (if available).

j. Narrative discussing methodology on how the mix design was developed.

2.2.3 Mix Verification

Mix verification tests may be performed by the Government. Provide quantities of cementitious materials, aggregates and admixtures as requested.

2.3 EQUIPMENT

2.3.1 Batching and Mixing

******************************************************************************
NOTE: Edit bracketed items according to whether use of truck mixers is to be permitted. Truck mixers should not be permitted for mixing concrete if slipform paving is permitted for pavement thicker than 200 mm 8 inches.
******************************************************************************

Provide [stationary mixers] [truck mixers]. Provide a batch plant conforming to ASTM C94/C94M and as specified. Do not weigh water or measure cumulatively with another ingredient. Batch all concrete materials in accordance with ASTM C94/C94M requirements. Verify batching, mixers, mixing time, permitted reduction of mixing time, and concrete uniformity in accordance with the requirements of ASTM C94/C94M, and document in the initial weekly QC Report.[ Do not use truck mixers for mixing slipformed concrete. Provide only truck mixers designed for mixing or transporting paving concrete with extra large blading and rear opening specifically for low-slump paving concrete and conforming to the requirements of ASTM C94/C94M.]

2.3.2 Transporting Equipment

Provide transporting equipment in conformance with ASTM C94/C94M and as specified herein. Transport concrete to the paving site in rear-dump trucks, in truck mixers designed with extra large blading and rear opening specifically for low slump concrete, or in agitators. Do not permit bottom-dump trucks for delivery of concrete.

2.3.3 Delivery Equipment

When concrete transport equipment cannot operate on the paving lane, provide side-delivery transport equipment consisting of self-propelled moving conveyors to deliver concrete from the transport equipment and discharge it in front of the paver. Do not permit front-end loaders, dozers, or similar equipment to distribute the concrete.
2.3.4 Paver-Finisher

Provide a heavy-duty, self-propelled paver-finisher machine designed specifically for paving and finishing high quality pavement and capable of spreading, consolidating, and shaping the plastic concrete to the desired cross section in one pass. [Provide a paver-finisher weighing at least 3280 kg/m 2200 lb/foot of lane width, and powered by an engine having at least 15000 W/meter 6.0 horsepower/foot of lane width.] Equip the paver-finisher with a full width "knock-down" auger, capable of operating in both directions, which will evenly spread the fresh concrete in front of the screed or extrusion plate. Gang-mount immersion vibrators at the front of the paver on a frame equipped with suitable controls so that all vibrators can be operated at any desired depth within the slab or completely withdrawn from the concrete. Automatically control the vibrators so they will be immediately stopped as forward motion of the paver ceases. Space the immersion vibrators across the paving lane as necessary to properly consolidate the concrete, but limit the clear distance between vibrators not to exceed 750 mm 30 inches, and the outside vibrators not to exceed 300 mm 12 inches from the edge of the lane. Vibrators may be pneumatic, gas driven, or electric, and operated at frequencies within the concrete between 6,000 and 7,000 vibrations per minute, with an amplitude of vibration such that noticeable vibrations occur at 450 mm 1.5 foot radius when the vibrator is inserted in the concrete to the depth specified. Equip the paver-finisher with a transversely oscillating screed or an extrusion plate to shape, compact, and smooth the surface.

2.3.4.1 Paver-Finisher with Fixed Forms

Equip the paver-finisher with wheels designed to ride the forms, keep it aligned with the forms, and to prevent deformation of the forms.

2.3.4.2 Slipform Paver-Finisher

Provide a track-mounted slipform paver-finisher with automatic controls and padded tracks. Electronically reference horizontal alignment to a taut wire guideline. Electronically reference vertical alignment on both sides of the paver to a taut wire guideline, to an approved laser control system, or to a ski operating on a completed lane. Do not control from a slope-adjustment control or from the underlying material.

2.3.4.3 Other Types of Finishing Equipment

**************************************************************************
NOTE: Edit bracketed item according to whether use of bridge deck finishers is desired, and based on thickness of pavement and surface smoothness tolerances required.
**************************************************************************

[Bridge deck finishers are permitted for pavements 250 mm 10 inches or less in thickness. ]Heavy duty vibratory truss screeds may be approved for use if successfully demonstrated on the test section to consolidate the slab full depth and without segregation. Clary screeds, rotating tube floats, or laser screeds will not be allowed on the project. Provide hand floats that are not less than 3.65 m 12 feet long and 150 mm 6 inches wide and stiffened to prevent flexing and warping.
2.3.4.4 Work Bridge

Provide a self-propelled work bridge capable of spanning the paving lane and supporting the workmen without excessive deflection.

2.3.5 Texturing Equipment

**************************************************************************

NOTE: Edit the following paragraphs and delete non-applicable texturing methods to correlate with the drawings and with paragraph TEXTURING in PART 3. Do not specify artificial turf drag for Air Force projects.

**************************************************************************

Provide texturing equipment as specified below.

2.3.5.1 Fabric Drag

[Clean, reasonably new burlap ][Artificial turf fabricated of a plastic material ]measuring from 0.91 to 3 m 3 to 10 feet long, 600 mm 2 feet wider than the width of the pavement, and securely attached to a separate wheel mounted frame spanning the paving lane or to one of the other similar pieces of equipment. Select dimension of burlap drag so that at least 0.91 m 3 feet of the material is in contact with the pavement.

2.3.5.2 Deep Texturing Equipment

Provide texturing equipment consisting of [a stiff bristled broom] [a comb with spring wire tines] [spring strips] which will produce true, even grooves. Mount this drag in a wheeled frame spanning the paving lane and constructed to mechanically pull the drag in a straight line across the paving lane perpendicular to the centerline.

2.3.6 Curing Equipment

Provide equipment for applying membrane-forming curing compound mounted on a self-propelled frame that spans the paving lane. Constantly agitate the curing compound reservoir mechanically (not air) during operation and provide a means for completely draining the reservoir. Provide a spraying system that consists of a mechanically powered pump which maintains constant pressure during operation, an operable pressure gauge, and either a series of spray nozzles evenly spaced across the lane to provide uniformly overlapping coverage or a single spray nozzle which is mounted on a carriage which automatically traverses the lane width at a speed correlated with the forward movement of the overall frame. Protect all spray nozzles with wind screens. Calibrate the spraying system in accordance with ASTM D2995, Method A, for the rate of application required in subpart CURING AND PROTECTION. Provide hand-operated sprayers powered by compressed air supplied by a mechanical air compressor. Immediately replace curing equipment if it fails to apply an even coating of compound at the specified rate.

2.3.7 Sawing Equipment

Provide equipment for sawing joints and for other similar sawing of concrete consisting of standard diamond-type concrete saws mounted on a wheeled chassis which can be easily guided to follow the required alignment. Provide diamond tipped blades. If demonstrated to operate
properly, abrasive blades may be used. Provide spares as required to maintain the required sawing rate. Early-entry saws may be used, subject to demonstration and approval. No change to the initial sawcut depth is permitted.

2.3.8 Straightedge

Furnish one 4 m 12 foot straightedge constructed of aluminum or magnesium alloy, having blades of box or box-girder cross section with flat bottom, adequately reinforced to insure rigidity and accuracy. Provide handles for operation on the pavement.

PART 3 EXECUTION

3.1 PREPARATION FOR PAVING

3.1.1 Weather Limitations

When windy conditions during paving appear probable, have equipment and material at the paving site to provide windbreaks, shading, fogging, or other action to prevent plastic shrinkage cracking or other damaging drying of the concrete.

3.1.1.1 Inclement Weather

Do not commence placing operations when heavy rain or other damaging weather conditions appear imminent. At all times when placing concrete, maintain on-site sufficient waterproof cover and means to rapidly place it over all unhardened concrete or concrete that might be damaged by rain. Suspend placement of concrete whenever rain, high winds, or other damaging weather commences to damage the surface or texture of the placed unhardened concrete, washes cement out of the concrete, or changes the water content of the surface concrete. Immediately cover and protect all unhardened concrete from the rain or other damaging weather. Completely remove and replace any slab damaged by rain or other weather full depth, by full slab width, to the nearest original joint.

3.1.1.2 Hot Weather

Maintain required concrete temperature in accordance with ACI 305R to prevent evaporation rate from exceeding 0.98 kg of water per square meter 0.2 pound of water per square foot of exposed concrete per hour. Cool ingredients before mixing, place concrete during cooler night time hours, or use other suitable means to control concrete temperature and prevent rapid drying of newly placed concrete. Water is not allowed to be added after the initial introduction of mixing water except, when on arrival at the job site, the slump is less than specified and the water-cement ratio is less than that given as a maximum in the approved mixture. Additional water may be added to bring the slump within the specified range provided the approved water-cement ratio is not exceeded. Inject water into the head of the mixer (end opposite the discharge opening) drum under pressure, and turn the drum or blades a minimum of 30 additional revolutions at mixing speed. The addition of water to the batch at any later time is not allowed. After placement, use fog spray, apply monomolecular film, or use other suitable means to reduce the evaporation rate. Start curing when surface of fresh concrete is sufficiently hard to permit curing without damage. Cool underlying material by sprinkling lightly with water before placing concrete. Follow practices found in ACI 305R.
3.1.1.3 Prevention of Plastic Shrinkage Cracking

During weather with low humidity, and particularly with high temperature and appreciable wind, develop and institute measures to prevent plastic shrinkage cracks from developing. If plastic shrinkage cracking occurs, halt further placement of concrete until protective measures are in place to prevent further cracking. Periods of high potential for plastic shrinkage cracking can be anticipated by use of ACI 305R. In addition to the protective measures specified in the previous paragraph, the concrete placement may be further protected by erecting shades and windbreaks and by applying fog sprays of water, the addition of monomolecular films, or wet covering. Apply monomolecular films after finishing is complete, do not use in the finishing process. Immediately commence curing procedures when such water treatment is stopped.

3.1.1.4 Cold Weather

Do not place concrete when ambient temperature is below 5 degrees C or 40 degrees F or when concrete is likely to be subjected to freezing temperatures within 24 hours. When authorized, when concrete is likely to be subjected to freezing within 24 hours after placing, heat concrete materials so that temperature of concrete when deposited is between 18 and 27 degrees C and 65 and 80 degrees F. Methods of heating materials are subject to approval. Do not heat mixing water above 74 degrees C.

Remove lumps of frozen material and ice from aggregates before placing aggregates in mixer. Follow practices found in ACI 306R.

3.1.2 Conditioning of Underlying Material

Verify the underlying material, upon which concrete is to be placed is clean, damp, and free from debris, waste concrete or cement, frost, ice, and standing or running water. Prior to setting forms or placement of concrete, verify the underlying material is well drained and has been satisfactorily graded by string-line controlled, automated, trimming machine and uniformly compacted in accordance with the applicable Section of these specifications. Test the surface of the underlying material to crown, elevation, and density in advance of setting forms or of concrete placement using slip-form techniques. Trim high areas to proper elevation. Fill and compact low areas to a condition similar to that of surrounding grade, or fill with concrete monolithically with the pavement. Low areas filled with concrete are not to be cored for thickness to avoid biasing the average thickness used for evaluation and payment adjustment. Rework and compact any underlying material disturbed by construction operations to specified density immediately in front of the paver. If a slipform paver is used, continue the same underlying material under the paving lane beyond the edge of the lane a sufficient distance that is thoroughly compacted and true to grade to provide a suitable trackline for the slipform paver and firm support for the edge of the paving lane.

3.1.3 Forms

******************************************************************************

NOTE: Delete bracketed sentences on overlay pavements if not applicable.
******************************************************************************

Use steel forms, except that wood forms may be used for curves having a radius of 45 m 150 feet or less, and for fillets. Forms may be built up with metal or wood, added only to the base, to provide an increase in depth
of not more than 25 percent. Provide forms with the base width not less than eight-tenths of the vertical height of the form, except that for forms 200 mm 8 inches or less in vertical height, provide forms with a base width not less than the vertical height of the form. Provide wood forms adequate in strength and rigidly braced for curves and fillets. Set forms on firm material cut true to grade so that each form section when placed will be firmly in contact with the underlying layer for its entire base. Do not set forms on blocks or on built-up spots of underlying material. Set and secure forms in place with stakes or by other approved methods for overlay pavements and for other locations where forms are set on existing pavements. Carefully drill holes in existing pavements for form stakes without cracking or spalling the existing pavement. Prior to setting forms for paving operations, demonstrate the proposed form setting procedures at an approved location and do not proceed further until the proposed method is approved. Before placing the concrete, coat the contact surfaces of forms[ except existing pavement sections where bonding is required,] with a non-staining mineral oil, non-staining form coating compound, biodegradable form release agent, or two coats of nitro-cellulose lacquer.[ When using existing pavement as a form, clean existing concrete and then coat with asphalt emulsion bondbreaker before concrete is placed.] Check and correct grade elevations and alignment of the forms immediately before placing concrete.

3.1.4 Reinforcement

3.1.4.1 Dowel Bars

**************************************************************************
NOTE: For projects which require dowel bars or coated dowel bars, show location, size, and tolerances on the drawings. Include sentence in brackets for coated dowel bars. Delete references to slipform paving installation of dowels and tie bars if slipform paving is not allowed. Delete references to installation in contraction joints if not required. Delete bracketed references to tie bars, if tie bars are not used.
**************************************************************************

Install dowels with horizontal and vertical alignment plus or minus 25 mm 1 inch. Except as otherwise specified, maintain location of dowels within a skew alignment of 6 mm over 300 mm length 1/4 inch over 1 foot length. [Reject coatings which are perforated, cracked or otherwise damaged. While handling avoid scuffing or gouging of the coatings. ] Omit [Dowels] [and tie bars] when the center of the [dowel] [tie bar] is located within a horizontal distance from an intersecting joint equal to or less than one-fourth of the slab thickness. Maintain dowels in position during concrete placement and curing. Before concrete placement, thoroughly grease the entire length of each dowel secured in a dowel basket or fixed form.

3.1.4.2 Tie Bars

**************************************************************************
NOTE: When tie bars are required in the contract, indicate location on drawings. Show bar size, spacing, and placement tolerances required and method of support.
**************************************************************************
Install bars, accurately aligned horizontally and vertically, and to the tolerances shown on the drawings, at indicated locations. [For slipform construction, insert bent tie bars by hand or other approved means.]

3.1.4.3 Setting Slab Reinforcement

**************************************************************************
NOTE: For contracts which require reinforcing steel, specify the type, size and material of reinforcement. Delete bracketed item if CRCP is not being constructed.
**************************************************************************

Position reinforcement on suitable chairs prior to concrete placement. At expansion, contraction and construction joints, place the reinforcement as indicated. Clean reinforcement free of mud, oil, scale or other foreign materials. Place reinforcement accurately and wire securely. Lap splices 300 mm 12 inches minimum. Maintain the bar spacing from ends and sides of slabs and joints as indicated. [If reinforcing for Continuously Reinforced Concrete Pavement (CRCP) is required, submit the entire operating procedure and proposed equipment for approval.]

3.2 MEASURING, MIXING, CONVEYING, AND PLACING CONCRETE

3.2.1 Measuring

Conform to ASTM C94/C94M.

3.2.2 Mixing

Conform to ASTM C94/C94M, except as modified herein. Begin mixing within 30 minutes after cement has been added to aggregates. When the air temperature is greater than 29.4 degrees C 85 degrees F, place concrete within 60 minutes. With approval, a hydration stabilizer admixture meeting the requirements of ASTM C494/C494M Type D, may be used to extend the placement time to 90 minutes. Additional water may be added to bring slump within required limits as specified in ASTM C94/C94M, provided that the specified water-cement ratio is not exceeded.

3.2.3 Conveying

Conform to ASTM C94/C94M.

3.2.4 Placing

Do not exceed a free vertical drop of 1.5 m 5 feet from the point of discharge. Deposit concrete either directly from the transporting equipment or by conveyor on to the pre-wetted subgrade or subbase, unless otherwise specified. Deposit the concrete between the forms to an approximately uniform height. Place concrete continuously at a uniform rate, without damage to the grade and without unscheduled stops except for equipment failure or other emergencies. If an unscheduled stop occurs within 3 m 10 feet of a previously placed expansion joint, remove concrete back to joint, repair any damage to grade, install a construction joint and continue placing concrete only after cause of the stop has been corrected.
3.3 PAVING

Construct pavement with paving and finishing equipment utilizing [fixed forms] [slipforms].

3.3.1 Paving Plan

Submit for approval a paving plan identifying the following items:

a. A description of the placing and protection methods proposed when concrete is to be placed in or exposed to hot, cold, or rainy weather conditions.

b. A detailed paving sequence plan and proposed paving pattern showing all planned construction joints.

c. Plan and equipment proposed to control alignment of formed or sawn joints within the specified tolerances.

3.3.2 Required Results

Operate the paver-finisher to produce a thoroughly consolidated slab throughout, true to line and grade within specified tolerances. Adjust the paver-finishing operation to produce a surface finish free of irregularities, tears, voids of any kind, and other discontinuities, with only a minimum of paste at the surface. Do not permit multiple passes of the paver-finisher. Produce a finished surface requiring no hand finishing, other than the use of cutting straightedges, except in very infrequent instances. Do not apply water, other than true fog sprays (mist), to the concrete surface during paving and finishing.

3.3.3 Operation

When the paver is operated between or adjacent to previously constructed pavement (fill-in lanes), make provisions to prevent damage to the previously constructed pavement, including keeping the existing pavement surface free of debris, and placing rubber mats beneath the paver tracks. Operate transversely oscillating screeds and extrusion plates to overlap the existing pavement the minimum possible, but in no case more than 200 mm 8 inches.

3.3.4 Consolidation

Immediately after spreading concrete, consolidate full depth with internal type vibrating equipment along the boundaries of all slabs regardless of slab thickness, and interior of all concrete slabs. For pavements less than 250 mm 10 inches thick, operate vibrators at mid-depth parallel with or at a slight angle to the base course. For thicker pavements, angle vibrators toward the vertical, with vibrator tip preferably about 50 mm 2 inches above the base course, and top of vibrator a few mm inches below pavement surface. Automatically control the vibrators or tamping units in front of the paver so that they stop immediately as forward motion ceases. Limit duration of vibration to that necessary to produce consolidation of concrete. Do not permit excessive vibration. Vibrate concrete in small, odd-shaped slabs or in locations inaccessible to the paver mounted vibration equipment with a hand-operated immersion vibrator operated from a bridge spanning the area. Do not operate vibrators at one location for more than 15 seconds. Do not use vibrators to transport or spread the concrete.
3.3.5 Fixed Form Paving

Spread and strike off concrete with the paver. Shape the concrete to the specified and indicated cross section in one pass, and finish the surface and edges so that only a very minimum amount of hand finishing is required. Use single spud hand vibrators to consolidate the concrete adjacent to fixed forms as required to achieve a void-free formed edge. Do not allow vibrators to contact reinforcement, forms, or the grade during vibration.

3.3.6 Slipform Paving

**************************************************************************
NOTE: Retain slipform paving as an option unless the designer has specific, valid reasons for deleting it. Be sure all other paragraphs correlate with choice made here.
**************************************************************************

Shape the concrete to the specified and indicated cross section in one pass, and finish the surface and edges so that only a very minimum amount of hand finishing is required. Do not install dowels by dowel inserters attached to the paver or by any other means of inserting the dowels into the plastic concrete. If a keyway is required, install a 0.45 to 0.55 mm 26 gauge thick metal keyway liner as the keyway is extruded. Protect the keyway liner to remain in place and become part of the joint.

3.4 JOINTS

**************************************************************************
NOTE: Delete references to slipform paving installation of dowels and tie bars if slipform paving is not allowed. Delete references to installation in contraction joints if not required. Delete bracketed references to tie bars, if tie bars are not used.
**************************************************************************

3.4.1 Contraction Joints

Hold [dowels] and [tie bars] in longitudinal and transverse contraction joints within the paving lane securely in place by means of rigid metal basket assemblies. Weld the [dowels] and [tie bars] to the assembly or hold firmly by mechanical locking arrangements that will prevent them from becoming distorted during paving operations. Anchor the basket assemblies securely in the proper location.

3.4.2 Construction Joints - Fixed Form Paving

Install [dowels] and [tie bars] by the bonded-in-place method, supported by means of devices fastened to the forms. Do not permit installation by removing and replacing in preformed holes.

3.4.3 Dowels Installed In Hardened Concrete

Install by bonding the dowels into holes drilled into the hardened concrete. Drill holes into the hardened concrete approximately 3 mm 1/8 inch greater in diameter than the dowels. Bond the dowels in the drilled
holes using epoxy resin injected at the back of the hole before installing the dowel and extruded to the collar during insertion of the dowel so as to completely fill the void around the dowel. Application by buttering the dowel is not permitted. Hold the dowels in alignment at the collar of the hole, after insertion and before the epoxy resin hardens, by means of a suitable metal or plastic collar fitted around the dowel. Check the vertical alignment of the dowels by placing the straightedge on the surface of the pavement over the top of the dowel and measuring the vertical distance between the straightedge and the beginning and ending point of the exposed part of the dowel. Where tie bars are required in longitudinal construction joints of slipform pavement, install bent tie bars at the paver, in front of the transverse screed or extrusion plate. If tie bars are required, construct a standard keyway and install the bent tie bars into the plastic concrete through a 0.45 to 0.55 mm 26 gauge thick metal keyway liner. Do not install tie bars in preformed holes. Protect the keyway liner and maintain in place and become part of the joint. Before placement of the adjoining paving lane, straighten the tie bars, without spalling the concrete around the bar.

3.5 FINISHING CONCRETE

Start finishing operations immediately after placement of concrete. Use finishing machine, except hand finishing may be used in emergencies and for concrete slabs in inaccessible locations or of such shapes or sizes that machine finishing is impracticable. Immediately halt any operations which produce more than 3 mm 1/8 inch of mortar-rich surface (defined as deficient in plus 4.75 mm U.S. No. 4 sieve size aggregate) and modify the equipment, mixture, or procedures. Finish pavement surface on both sides of a joint to the same grade. Finish formed joints from a securely supported transverse bridge. Provide hand finishing equipment for use at all times.

3.5.1 Machine Finishing

Strike off and screed concrete to the required [crown] [slope] and cross-section by a power-driven transverse finishing machine. A transverse rotating tube or pipe is not permitted. Maintain elevation of concrete such that, when consolidated and finished, pavement surface will be adequately consolidated and at the required grade. Equip finishing machine with a screed which is readily and accurately adjustable for changes in pavement [crown] [slope] and compensation for wear and other causes. Do not permit excessive operation over an area, which will result in an excess of mortar and water being brought to the surface.

3.5.1.1 Equipment Operation

Maintain the travel of machine on the forms without lifting, wobbling, or other variation of the machine which tend to affect the precision of concrete finish. Keep the tops of the forms clean by a device attached to the machine. Maintain a uniform ridge of concrete ahead of the front screed for its entire length.

3.5.1.2 Joint Finish

Before concrete is hardened, correct edge slump of pavement, exclusive of edge rounding, in excess of 6 mm 0.25 inches. Finish concrete surface on each side of construction joints to the same plane, and correct deviations before newly placed concrete has hardened.
3.5.1.3 Hand Finishing

Strike-off and screed surface of concrete to elevations slightly above finish grade so that when concrete is consolidated and finished, the pavement surface is at the indicated elevation. Vibrate entire surface until required compaction and reduction of surface voids is secured with a strike-off template. After initial finishing, further smooth and consolidate concrete by means of hand-operated longitudinal floats.

3.5.2 Texturing

**************************************************************************

NOTE: Select type of texturing required by the using service, retain that subparagraph, and delete the others. If no guidance is given, the usual default method should be burlap drag. Edit bracketed sentence as appropriate.

Select the type of texturing for roads. Consider climatic conditions for exposed concrete. When required, specify surfaces to receive brooming.

1. Specify wire brooming for non-skid concrete surface textures. Permit steel or new fiber brooms.

2. Specify broomed finish, if required in lieu of burlap drag finish. Broomed finish may cause excessive tire wear and is not recommended, except for special conditions in which light mechanical brooming may be desirable.

3. Additional information is published by American Concrete Paving Association (ACPA) in Technical Bulletins No. 6 (1969) and No. 19 (1975), Interim Recommendations for the Construction of Skid-Resistant Concrete Pavement and Guideline for Texturing of Portland Cement Concrete Highway Pavements, respectively.

**************************************************************************

Before the surface sheen has disappeared and before the concrete hardens, provide a texture to the surface of the pavement as described herein. After curing is complete, thoroughly broom all textured surfaces to remove all debris. Finish the concrete in areas of recesses for tie-down anchors, lighting fixtures, and other outlets in the pavement to provide a surface of the same texture as the surrounding area.

3.5.2.1 Burlap Drag Finish

[ Before concrete becomes non-plastic, finish the surface of the slab by dragging a strip of clean, wet burlap on the surface. Drag the surface so as to produce a finished surface with a fine granular or sandy texture without leaving disfiguring marks. Keep the burlap clean and saturated during use.

] 3.5.2.2 Brooming

[ Finish the surface of the slab by brooming the surface with a new wire broom at least 450 mm 18 inches wide. Gently pull the broom over the
surface of the pavement from edge to edge just before the concrete becomes non-plastic. Slightly overlap adjacent strokes of the broom. Broom perpendicular to centerline of pavement so that corrugations produced will be uniform in character and width, and not more than $2 \text{ mm } 1/16 \text{ inch}$ in depth. Maintain broomed surface free from porous spots, irregularities, depressions, and small pockets or rough spots such as may be caused by accidentally disturbing particles of coarse aggregate embedded near the surface.

3.5.2.3 Wire-Comb Texturing

Apply surface texture transverse to the pavement center line using a mechanical wire comb drag capable of traversing the full width of the pavement in a single pass at a uniform speed and with a uniform pressure. Overlap successive passes of the comb the minimum necessary to obtain a continuous and uniformly textured surface, with scores $2 \text{ to } 5 \text{ mm } 1/16 \text{ to } 3/16 \text{ inch}$ deep, $1.5 \text{ to } 3 \text{ mm } 1/16 \text{ to } 1/8 \text{ inch}$ wide, and spaced $10 \text{ mm } 3/8 \text{ inch}$ apart.

3.5.2.4 Surface Grooving

Groove the areas indicated on the drawings with a spring tine drag producing individual grooves $6 \text{ mm } 1/4 \text{ inch}$ deep and $6 \text{ mm } 1/4 \text{ inch}$ wide at a spacing between groove centerlines of $50 \text{ mm } 2 \text{ inches}$. Cut these grooves perpendicular to the centerline. Before grooving begins, allow the concrete to stiffen sufficiently to prevent dislodging of aggregate. Do not cut grooves within $150 \text{ mm } 6 \text{ inches}$ of a transverse joint or crack.

3.5.3 Edging

At the time the concrete has attained a degree of hardness suitable for edging, carefully finish slab edges, including edges at formed joints, with an edge having a maximum radius of $3 \text{ mm } 1/8 \text{ inch}$. When brooming is specified for the final surface finish, edge transverse joints before starting brooming, then operate broom to obliterate as much as possible the mark left by the edging tool without disturbing the rounded corner left by the edger.] Clean by removing loose fragments and soupy mortar from corners or edges of slabs which have crumbled and areas which lack sufficient mortar for proper finishing. Refill voids solidly with a mixture of suitable proportions and consistency and refinish. Remove unnecessary tool marks and edges. Smooth remaining edges true to line.

3.6 CURING AND PROTECTION

Protect concrete adequately from injurious action by sun, rain, flowing water, [frost,] mechanical injury, tire marks and oil stains, and do not allow it to dry out from the time it is placed until the expiration of the minimum curing periods specified herein. Do not use membrane-forming compound on surfaces where its appearance would be objectionable, on surfaces to be painted, where coverings are to be bonded to concrete, or on concrete to which other concrete is to be bonded.

3.6.1 Moist Curing

**************************************************************************
NOTE: For OCONUS projects using Silica Fume, specify a minimum 24-hour moist cure before applying membrane curing compound.
**************************************************************************
Maintain concrete to be moist-cured continuously wet for the entire curing period, or until curing compound is applied, commencing immediately after finishing. If forms are removed before the end of the curing period, provide curing on unformed surfaces, using suitable materials. Cure surfaces by ponding, by continuous sprinkling, by continuously saturated burlap or cotton mats, or by continuously saturated plastic coated burlap. Provide burlap and mats that are clean and free from any contamination and completely saturated before being placed on the concrete. Lap sheets to provide full coverage. Provide an approved work system to ensure that moist curing is continuous 24 hours per day and that the entire surface is wet.

3.6.2 White-Burlap-Polyethylene Sheet

Wet entire exposed surface thoroughly with a fine spray of water, saturate burlap but do not have excessive water dripping off the burlap and then cover concrete with White-Burlap-Polyethylene Sheet, burlap side down. Lay sheets directly on concrete surface and overlap 300 mm 12 inches. Make sheeting not less than 450 mm 18 inches wider than concrete surface to be cured, and weight down on the edges and over the transverse laps to form closed joints. Repair or replace sheets when damaged during curing. Check daily to assure burlap has not lost all moisture. If moisture evaporates, resaturate burlap and re-place on pavement (limit re-saturation and re-placing to less than 10 minutes per sheet). Leave sheeting on concrete surface to be cured for at least 7 days.

3.6.3 Liquid Membrane-Forming Compound Curing

Apply compound immediately after surface loses its water sheen and has a dull appearance and before joints are sawed. Agitate curing compound thoroughly by mechanical means during use and apply uniformly in a two-coat continuous operation by suitable power-spraying equipment. Apply a total coverage for the two coats at least 4 liters one gallon of undiluted compound per 20 square meters 200 square feet to produce a uniform, continuous, coherent film that will not check, crack, or peel and free from pinholes or other imperfections. The application of curing compound by hand-operated, mechanical powered pressure sprayers is permitted only on odd widths or shapes of slabs and on concrete surfaces exposed by the removal of forms. When the application is made by hand-operated sprayers, apply a second coat in a direction approximately at right angles to the direction of the first coat. Apply an additional coat of compound immediately to areas where film is defective. Respray concrete surfaces that are subject to heavy rainfall within 3 hours after curing compound has been applied in the same manner.

3.6.4 Protection of Treated Surfaces

After the initial saw cut is complete and the slurry has been removed, reapply the area with curing compound or restore the white burlap polyethylene sheet to maintain a continuous curing environment in the area of the sawn joints. Keep concrete surfaces to which liquid membrane-forming compounds have been applied free from vehicular traffic and other sources of abrasion for not less than 72 hours. Foot traffic is allowed after 24 hours for inspection purposes. Maintain continuity of coating for entire curing period and repair damage to coating immediately.
3.7 FIELD QUALITY CONTROL

3.7.1 Sampling

Collect samples of fresh concrete in accordance with ASTM C172/C172M during each working day as required to perform tests specified herein. Make test specimens in accordance with ASTM C31/C31M.

3.7.2 Consistency Tests

Perform concrete slump tests in accordance with ASTM C143/C143M. Take samples for slump determination from concrete during placement. Perform tests at the beginning of a concrete placement operation and for each batch (minimum) or every 16 cubic meters 20 cubic yards (maximum) of concrete to ensure that specification requirements are met. In addition, perform tests each time test beams are made.

3.7.3 Flexural Strength Tests

Test for flexural strength in accordance with ASTM C78/C78M. Fabricate and cure four test specimens in accordance with ASTM C31/C31M for each set of tests. Test two specimens at 7 days, and the other two at 28 days. Concrete strength will be considered satisfactory when the minimum of the 28-day test results equals or exceeds the specified 28-day flexural strength, and no individual strength test is less than the tolerance indicated on Table 1. If the ratio of the 7-day strength test to the specified 28-day strength is less than 65 percent, make necessary adjustments for conformance. Fabricate, cure and test a minimum of one set of four beams for each shift of concrete placement. Remove concrete which is determined to be defective, based on the strength acceptance criteria therein, and replace with acceptable concrete.

3.7.4 Air Content Tests

Test air-entrained concrete for air content at the same frequency as specified for slump tests. Determine percentage of air in accordance with ASTM C231/C231M on samples taken during placement of concrete in forms.

3.7.5 Surface Testing

**********************************************************************************************************
NOTE: Edit these paragraphs as appropriate to the project. If it is desired to restrict surface smoothness testing and evaluation to either straightedge method or profilograph method, retain the one and delete the other; otherwise, retain both as an option. When the profilograph method is allowed, and there are areas with dimensions less than 60 m 200 feet in any direction, retain the straightedge method for these short runs.
Typically, a profilograph is used to measure longitudinal smoothness and a straightedge is used for transverse smoothness.
**********************************************************************************************************

Use the profilograph method for all longitudinal testing, except for paving lanes less than 60 m 200 feet in length. Use the straightedge method for transverse testing, for longitudinal testing where the length of each pavement lane is less than 60 m 200 feet, and at the ends of the paving
limits for the project. Smoothness requirements do not apply over crowns, drainage structures, or similar penetrations. Maintain detailed notes of the testing results and submit a copy to the Government after each day's testing.

3.7.5.1 Straightedge Testing Method

Test the surface of the pavement with the straightedge to identify all surface irregularities exceeding the tolerances specified in Table 1. Test the entire area of the pavement in both a longitudinal and a transverse direction on parallel lines approximately 4.5 m (15 feet) apart. Hold the straightedge in contact with the surface and move ahead one-half the length of the straightedge for each successive measurement. Determine the amount of surface irregularity by placing the straightedge on the pavement surface and allowing it to rest upon the two highest spots covered by its length and measuring the maximum gap between the straightedge and the pavement surface, in the area between these two high points.

3.7.5.2 Profilograph Testing Method

Perform profilograph testing using approved California profilograph and procedures described in ASTM E1274. Utilize electronic recording and automatic computerized reduction of data equipment to indicate "must-grind" bumps and the Profile Index for each 0.1 km (0.1 mile) segment of the day's paving. Accommodate grade breaks on parking lots by breaking the profile segment into short sections and repositioning the blanking band on each section. Provide the "blanking band" of 5 mm (0.2 inch) wide and the "bump template" span 25 mm (1 inch) with an offset of 10 mm (0.4 inch). Count the profilograph testing of the last 9.1 m (30 feet) of a paving lane in the longitudinal direction from each day's paving operation on the following day's continuation lane. Compute the profile index for each pass of the profilograph (3 per lane) in each 0.1 km (0.1 mile) segment. The profile index for each segment is the average of the profile indices for each pass in each segment. Scale and proportion profilographs of unequal lengths to an equivalent 0.1 km (0.1 mile) as outlined in the ASTM E1274. Submit a copy of the reduced tapes to the Government at the end of each day's testing.

3.7.5.3 "Bumps" (Must Grind Areas)

Reduce any bumps ("must grind" areas) shown on the profilograph trace which exceed 10 mm (0.4 inch) in height by diamond grinding in accordance with subparagraph Diamond Grinding until they do not exceed 7.5 mm (0.3 inch) when retested. Taper such diamond grinding in all directions to provide smooth transitions to areas not requiring diamond grinding.

3.7.5.4 Diamond Grinding

Those performing diamond grinding are required to have a minimum of three years experience in diamond grinding of rigid concrete pavements. In areas not meeting the specified limits for surface smoothness and plan grade, reduce high areas to attain the required smoothness and grade, except as depth is limited below. Reduce high areas by diamond grinding the hardened concrete with an approved equipment after the concrete is at a minimum age of 14 days. Perform diamond grinding by sawing with an industrial diamond abrasive which is impregnated in the saw blades. Assemble the saw blades in a cutting head mounted on a machine designed specifically for diamond grinding that produces the required texture and smoothness level without damage to the concrete pavement or joint faces. Provide diamond grinding equipment with saw blades that are 3 mm (1/8-inch) wide, a minimum of 60
blades per 300 mm 12 inches of cutting head width, and capable of cutting a path a minimum of 0.9 m 3 ft wide. Diamond grinding equipment that causes ravels, aggregate fractures, spalls or disturbance to the joints is not permitted. The maximum area corrected by diamond grinding the surface of the hardened concrete is 10 percent of the total area of a day's production. The maximum depth of diamond grinding is 6 mm 1/4 inch.

Provide diamond grinding machine equipped to flush and vacuum the pavement surface. Dispose of all debris from diamond grinding operations off Government property. Prior to diamond grinding, submit a Diamond Grinding Plan for review and approval. At a minimum, include the daily reports for the deficient areas, the location and extent of deficiencies, corrective actions, and equipment. Remove and replace all pavement areas requiring plan grade or surface smoothness corrections in excess of the limits specified in Table 1. Retexture pavement areas given a wire comb or tined texture, areas exceeding 2 square meters 25 square feet that have been corrected by diamond grinding by transverse grooving using an approved grooving machine of standard manufacture. Provide grooves that are 6 mm 1/4 inch deep by 6 mm 1/4 inch wide on 37 mm 1-1/2 inch centers and carried into, and tapered to zero depth within the non-corrected surface, or match any existing grooves in the adjacent pavement. All areas in which diamond grinding has been performed are subject to the thickness tolerances specified in Table 1.

3.7.6 Plan Grade Testing and Conformance

Within 5 days after each day's paving, test the finished surface of the pavement area by running lines of levels at intervals corresponding with every longitudinal and transverse joint to determine the elevation at each joint intersection. Record the results of this survey and submit a copy to the Government at the completion of the survey.

3.7.7 Edge Slump

Test the pavement surface to determine edge slump immediately after the concrete has hardened sufficiently to permit walking thereon. Perform testing with a minimum 4 m 12 foot straightedge to reveal irregularities exceeding the edge slump tolerance specified in Table 1. Determine the vertical edge slump at each free edge of each slipformed paving lane constructed. Place the straightedge transverse to the direction of paving and the end of the straightedge located at the edge of the paving lane. Record measurements at 1.5 to 3.0 m 5 to 10 foot spacings, as directed, commencing at the header where paving was started. Initially record measurements at 1.5 m 5 foot intervals in each lane. When no deficiencies are present after 5 measurements, the interval may be increased. The maximum interval is 3.0 m 10 feet. When any deficiencies exist, return the interval to 1.5 m 5 feet. In addition to the transverse edge slump determination above, at the same time, record the longitudinal surface smoothness of the joint on a continuous line 25 mm 1 inch back from the joint line using the minimum 4 m 12 foot straightedge advanced one-half its length for each reading. Perform other tests of the exposed joint face to ensure that a uniform, true vertical joint face is attained. Properly reference all recorded measurements in accordance with paving lane identification and stationing, and submit a report within 24 hours after measurement is made. Identify areas requiring replacement within the report.

3.7.8 Test for Pavement Thickness

Take full depth cores of 102 millimeter 4 inch diameter of concrete
pavement every [_____] square meters square feet in accordance with ASTM C42/C42M. Measure thickness in accordance with ASTM C1542/C1542M. Record and submit testing, inspection, and evaluation of each core for surface paste, uniformity of aggregate distribution, segregation, voids, cracks, and depth of reinforcement or dowel (if present). Moisten the core with water to visibly expose the aggregate and take a minimum of three photographs of the sides of the core, rotating the core approximately 120 degrees between photographs. Include a ruler for scale in the photographs. Submit plan view of location for each core.

3.7.9 Reinforcement

Inspect reinforcement prior to installation to verify it is free of loose flaky rust, loose scale, oil, mud, or other objectionable material.

3.7.10 Dowels

Inspect dowel placement prior to placing concrete to verify that dowels are of the size indicated, and are spaced, aligned and painted and oiled as specified. Do not permit dowels to exceed the tolerances shown in paragraph: DOWEL BARS.

**************************************************************************
NOTE: Suggestions for improvement of this specification will be welcomed using the Navy "Change Request Forms" subdirectory located in SPECSINTACT in Jobs or Masters under "Forms/Documents" directory or DD Form 1426.
Suggestions should be forwarded to:

APPENDIX A Example of Computations

APPENDIX B Procedure for Molding RCC Test Specimen for Flexural Strength Testing Using a Vibrating Hammer:

APPENDIX C RCC Pavement Mixture Proportioning Method

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for roller compacted concrete (RCC) pavements for roads, streets, parking areas, repair yards, open-storage areas, and other utility grade pavements. For DOD projects, RCC cannot be used for airfield pavement unless approved by the USACE Transportation Systems Center or the appropriate DOD service.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Use guidance found in Appendix D of UFC 3-250-04FA when preparing contract specifications for RCC pavement construction.

Insert name and location of project. Tailor specifications for the specific site conditions, available materials, design requirements and construction practices.
NOTE: It is necessary for the Designer to carefully correlate and edit the bid items, measurement and payment paragraphs, and all the technical paragraphs so use of Portland cement, pozzolan, Portland-pozzolan cement, and ground granulated blast furnace slag will be well coordinated. Do not permit use of ground slag with pozzolan or Portland-pozzolan cement. Either use no separate pozzolan or use only a reduced amount if Portland-pozzolan cement is used.

Unit price bid items are recommended when the quantity of RCC and or the quantity of cementitious materials is not known or likely to be variable. If the quantity could range beyond 15 percent of the bid item, split bid items should be used. If quantities are known at the time of bidding, lump sum bid items are recommended.

1.1.1.1 Concrete Quantity

The quantity of concrete to be paid for will be the number of cubic meters, rounded to the nearest tenth of a cubic meter yard, placed in the completed and accepted pavements, including the accepted test section. Payment will not be made for wasted concrete, for concrete used for the convenience of the Contractor, or for concrete outside the neat lines shown on the drawing. Concrete will be measured in the completed and accepted pavements in accordance with the dimensions shown in the plan and cross section. No deductions will be made for rounded or beveled edges or the space occupied by pavement reinforcement, dowel bars, tie bars, or electrical conduits, nor for any void, drainage, or other structure extending into or through the pavement slab measuring one cubic meter 3 cubic feet or less in volume. No other allowance for concrete will be made unless placed in specified locations in accordance with written instructions previously issued by the Contracting Officer.

1.1.1.2 Payment for Concrete Quantity

The quantity of concrete measured as specified above, will be paid for at the contract unit price when placed in completed and accepted pavements or, where appropriate, at reduced prices adjusted in accordance with paragraph PAYMENT ADJUSTMENT. The unit price will include the cost of labor and materials and the use of equipment and tools required to complete the work, except the cement, pozzolan, or ground granulated blast furnace slag that
is specified for separate payment.

1.1.1.2 Cement Quantity

1.1.1.2.1 Measurement of Cement Quantity

The quantity of cement to be paid for will be the number of metric tons of cement used in the completed and accepted pavements. Payment will not be made for wasted cement or for cement used for the convenience of the Contractor. The quantity to be paid for will be determined by multiplying the weight in kg pounds of cement required by the mixture proportions per cubic m yard by the number of cubic m yards of the various mixtures placed and measured for payment, then dividing by 1000 2000 and rounding off to the nearest tenth of a metric ton ton.

1.1.1.2.2 Payment for Cement Quantity

The quantity of cement, determined as specified above, will be paid for at the contract unit price, which includes all costs of handling, hauling, and storage at the site.

1.1.1.3 Pozzolan Quantity

1.1.1.3.1 Measurement of Pozzolan Quantity

The quantity of pozzolan paid for will be the number of metric tons tons used as a cementitious material in the completed and accepted pavements. Payment will not be made for wasted pozzolan or for pozzolan used for the convenience of the Contractor. The quantity to be paid for will be determined by multiplying the weight in kilogram per cubic meter pounds/cubic yard of pozzolan used as a cementitious material, and required by the mixture proportions by the number of cubic m yards of the various mixtures placed and measured for payment, then dividing by 1000 2000 and rounding off to the nearest tenth of a metric ton ton. Payment will not be made for pozzolan used strictly as a Contractor's option to compensate for lack of fines in the aggregate.

1.1.1.3.2 Payment for Pozzolan Quantity

The quantity of pozzolan, determined as specified above, will be paid for at the contract unit price, which includes costs of delivery, handling, and storage at the site.

1.1.1.4 Ground Granulated Blast Furnace Slag (GGBFS)

**************************************************************************
NOTE: If ground granulated blast furnace slag is not locally and readily available, remove this paragraph and all further reference to the material.
**************************************************************************

1.1.1.4.1 Measurement of GGBFS Quantity

The quantity of GGBFS to be paid for will be the number of metric tons tons of GGBFS used in the completed and accepted pavements. Payment will not be made for wasted ground iron blast furnace slag or for GGBFS used for the convenience of the Contractor. The quantity to be paid for will be determined by multiplying the weight in kg pounds of GGBFS required by the mixture proportions per cubic meter yard by the number of cubic meters yards
of the various mixtures placed and measured for payment and then dividing by 1,000 and rounding off to the nearest tenth of a metric ton.

1.1.1.4.2 Payment for GGBFS Quantity

The quantity of GGBFS, determined as specified above, will be paid for at the contract unit price, which includes costs of handling, hauling, and storage at the site.

1.1.1.5 Portland-Pozzolan Cement

The quantity of Portland-pozzolan cement to be paid for will be the number of metric tons of Portland-pozzolan cement used in the completed and accepted pavements. Payment will not be made for wasted Portland-pozzolan cement or for Portland-pozzolan cement used for the convenience of the Contractor. The quantity to be paid for will be determined by multiplying the weight in kg by the number of cubic meters of the various RCC mixtures placed and measured for payment, then dividing by 1,000 and rounding off to the nearest tenth of a metric ton.

1.1.1.5.2 Payment for Portland-Pozzolan Cement

The quantity of Portland-pozzolan cement, determined as specified above, will be paid for at the contract unit price, which includes costs of handling, hauling, and storage at the site.

1.1.1.6 RCC Lump Sum Contract

The quantity of RCC will be paid for and included in the lump-sum contract price. The lump sum payment will be for the completed RCC pavement in place at the location(s) as shown on the drawings and includes all incidental work and materials necessary for the completed pavement. If less than 100 percent payment is due based on the pay factors stipulated in paragraph: PAYMENT ADJUSTMENTS, use a unit price of $200.00 per cubic meter for purposes of calculating the payment reduction.

1.1.2 Payment Adjustments

NOTE: If payment adjustment are not used, the specification will have to be edited to delete references to payment adjustments. In addition to other items, there will have to be inserted, at some
appropriate location, the acceptance criteria to be used for surface smoothness and thickness, which are presently covered only in this paragraph.

Do not, under any conditions, reduce the requirements for density, surface smoothness, surface texture, or thickness or the testing required for those items. Do not, under any conditions, reduce the requirements for daily calibration of the nuclear density meter.

1.1.2.1 General Considerations

Adjustment in payment for individual lots of RCC pavement will be made in accordance with the following paragraphs for all RCC pavement. The parameters to be measured are aggregate gradation, pavement thickness, density, surface smoothness, and surface texture. No adjustment in payment will be made for cementitious materials. Unless otherwise specified, comply with testing specified in paragraph: Contractor Quality Control. Complete and report all tests within 24 hours after completion of construction of each lot.

1.1.2.2 Percent Payment/Acceptance of Lots

a. When a lot of material fails to meet the specification requirements for 100 percent payment as outlined in the following paragraphs, remove and replace that lot, or accept at a reduced price, as specified herein. The lowest computed payment factor for any pavement characteristic (i.e., gradation, density, surface smoothness, thickness, and surface texture) discussed below will be the actual percent payment for that lot. Payment factors based on different criteria of the same lot will not be multiplied together to get a lower payment factor. The actual percent payment is applied to the bid price and to the quantity of RCC pavement placed in the lot to determine actual payment.

b. At the end of the project, an average of all lot pay factors will be calculated. If this average lot pay factor exceeds 95.0 percent and no individual lot has a pay factor less than 75.1 percent, then the percent payment for the entire project will be 100 percent of the unit bid price. If the average lot pay factor is less than 95.0 percent, then each lot will be paid for at the unit price multiplied by the lot's pay factor.

1.1.2.3 Density

1.1.2.3.1 Field Density

a. To evaluate field density for acceptance, 4 nuclear density gauge tests to determine wet density will be performed at random locations on the interior of the paving lane immediately behind final rolling operations, and 4 similar tests will be performed at random locations on fresh joints and 4 at random locations on cold joints, if such exist, for each sublot, and each set will be averaged for the sublot. Field density for each sublot will be compared with the target density for that lot. The locations of the tests on fresh joints will be alternated from side to side of the joint and will be between 75 and 130 mm 3 and 5 inches from the joint.
b. For cold joints, it is expected that the primary (originally placed) lane will be placed with one sublot and the secondary lane with another sublot. The cold joint evaluation for each of these sublots will be based on 4 density tests made for each sublot being evaluated on that sublot's side of the cold joint. These tests will be between 75 and 130 mm (3 and 5 inches) from the proposed (sawed) joint line on the originally placed side of the cold joint and between 75 and 130 mm (3 and 5 inches) from the actual joint on the secondary placement side.

1.1.2.3.2 Target Density

Determine, for each lot, the laboratory maximum wet density of an RCC sample tested in accordance with ASTM D1557 based on a one-point wet density test and as described for moisture-density testing in paragraph CONTRACTOR QUALITY CONTROL. This procedure for determining the target density will be repeated for each lot and as necessary whenever the mixture proportions or materials change. Since the "target density" for a lot will not be known until after the beginning of construction of the lot, use the "target density" of the previous lot for quality control until the new "target density" is obtained.

1.1.2.3.3 Computed Percent Payment for Density

a. The average field densities for the sublots for lane interior and for each type of joint will in turn be averaged to determine the lot density for the lane interior, for fresh joints, and, if such exist, for cold joints. These lot average field densities will be compared with Table 1 and used to calculate the computed percent payment based on field density as described below.

b. First, the percent payment deduction for lane interior density, for fresh joint density, and for cold joint density will each be computed by subtracting the percent payment values found in Table 1 from 100.

c. Second, the weighted percent payment deduction for fresh joint density will be computed by multiplying the percent payment deduction for fresh joint density, as computed above, by the ratio of the total amount of RCC pavement in the fresh joint strip to the total amount of RCC pavement in the entire area of the lot. The area of fresh joint strip will be considered to be 3 m (10 feet) wide times the length of completed fresh longitudinal construction joint in the lot, but not to exceed the total lot size.

d. Third, the weighted percent payment deduction for cold joint density will be computed by multiplying the percent payment deduction for cold joint density, as computed above, by the ratio of the total amount of RCC pavement in the cold joint strip to the total amount of RCC pavement in the entire area of the lot. The area of cold joint strip will be considered to be 1.5 m (5 feet) wide times the length of each half of the cold joint (each side of the joint) completed with the lot being evaluated, but not to exceed the lot size. (Although not probable, it could be possible that, for a full lot, both sides of a cold joint can be constructed in the same lot).

e. Finally, the percent payment deduction for the lane interior, the weighted percent payment deduction for fresh joint density, and the weighted percent payment deduction for cold joint density will be compared and the greatest value selected. This selected percent payment deduction will be subtracted from 100 to obtain the computed...
percent payment based on field density.

1.1.2.4 Surface Smoothness

Use the straightedge method for longitudinal and transverse testing. Where drawings show required deviations from a plane surface (for example crowns, drainage inlets), finish the surface to meet the approval of the Contracting Officer. Record detailed notes of the results of the testing and furnish a copy to the Contracting Officer after each day's testing.

1.1.2.4.1 Smoothness Requirements

******************************************************************************
NOTE: Smoothness requirements can be relaxed for RCC applications on roads design for tanks.
******************************************************************************

Straightedge Testing: Provide a finished surface of the pavement that has no abrupt change of 9.5 mm 3/8 inch or more, and a pavement that is within the limits specified hereinafter when checked with an approved 4 m 12 foot straightedge. Provide a pavement surface with variation from the specified straight edge not greater than 9.5 mm 3/8 inch in either the longitudinal or transverse direction.

1.1.2.4.2 Testing Method

After completion of the final rolling of a lot, test the entire surface of the pavement in each lot in such a manner as to reveal all surface irregularities exceeding the tolerances specified above. If any pavement areas are ground, retest these areas immediately after diamond grinding.
Test the entire area of the pavement in both a longitudinal and a transverse direction on parallel lines. Test the transverse lines 25 feet or less apart, as directed. Test the longitudinal lines at the centerline of each paving lane shown on the drawings, regardless of whether the contractor is allowed to pave two lanes at a time, and test at the 1/8th point in from each side of the lane. Test all other areas having obvious deviations. Test continuously across all joints in the longitudinal direction. For pilot lanes, carry testing in the transverse direction to the construction joint lines and for adjacent lanes carry the straightedge across construction joints, and apply the readings in this area to the adjacent lane. Record the location and deviation from straightedge for all measurements.

1.1.2.4.3 Payment Adjustment for Smoothness

When between 5.0 and 10.0 percent of all measurements made within a lot exceed the tolerance specified in paragraph "Smoothness Requirements" above, after any reduction of high spots or removal and replacement, the computed percent payment based on surface smoothness will be 95 percent. When more than 10.0 percent and less than 15.0 percent of all measurements exceed the tolerance, the computed percent payment will be 90 percent. When between 15.0 and 20.0 percent of all measurements exceed the tolerance, the computed percent payment will be 75 percent. Remove and replace all pavement within the lot, at no additional cost to the Government, when 20.0 percent or more of the measurements exceed the tolerance.

1.1.2.5 Thickness

a. The computed percent payment for thickness for the lot will be 100 percent if no core taken for that lot is deficient in thickness by 6 mm 1/4 inch or more. Acquire all cores in accordance with ASTM C42/C42M and test in accordance with ASTM C174/C174M.

   (1) When the measurement of any core indicates that the pavement is deficient in thickness by 6 mm 1/4 inch or more, drill and test additional cores parallel to the center line of the lane at 8 m 25 foot intervals on each side of the deficient core until the cores indicate that the deficiency in thickness is less than 6 mm 1/4 inch.

   (2) When the deficiencies in thickness for a series of cores are between 6 and 13 mm 1/4 and 1/2 inch, the average thickness will be established from an average of all core thicknesses, considering any core less than 6 mm 1/4 inch deficient as being full depth.

   (3) Remove and replace any areas 13 mm 1/2 inch or more deficient in thickness, re-core and include in the measurements before the final calculation of computed percent payment for the lot is made.

b. The computed percent payment for thickness for the lot will then be determined as follows: the proportional part of the total lot area (expressed in percent) for Categories I and II in Table 2 will be multiplied by their respective percent payment from the table and the 2 products then added to obtain the computed percent payment for the lot.

c. Use the full paving lane width and midway between cores having thicknesses, representing different categories, for calculating area of
pavement and the percent payment calculations. Remove and replace any pavement area represented by cores with a deficiency in thickness of 13 mm (1/2 inch) or more before any payment calculations are made. The area represented by the core is to be bound by the full paving lane width and a transverse line midway between the cores adjacent to the core in question, or the regularly scheduled transverse joint should such a joint fall between the cores.

d. If the Contractor believes that the cores and measurement taken are not sufficient to indicate fairly the actual thickness of the pavement, additional cores can be taken and measured provided the Contractor will bear the extra cost of drilling the cores. When surface grinding is required that results in thickness deficiencies, the final surface will be considered in evaluation for thickness.

</tr>
</tbody>
</table>

1.1.2.6 Surface Texture

a. The surface texture of each lot will be visually examined by a representative of the Contractor's Quality Control immediately after construction to determine compliance with the surface texture requirements in paragraph RCC PAVEMENT PERFORMANCE REQUIREMENTS. The classification of the surface texture of any area of the pavement as acceptable or deficient will be made on the basis of comparison with a selected portion of the test section which has been chosen and marked as having an acceptable surface texture as determined by the Contracting Officer. The computed percent payment for surface texture requirements for the lot will be determined as shown in Table 3.

b. Regardless of payment, removed and replaced full depth with suitable pavement at no cost to the Government any area of any size of extremely poor surface texture as determined by the Contracting Officer. No payment calculations will be made until all such defective material is removed and replaced.

1.3 EQUIPMENT, TOOLS, AND MACHINES

1.3.1 General Requirements

**************************************************************************

SECTION 32 13 13.17  Page 16
a. The work covered by this section consists of furnishing all plant, material, and equipment, and performing all labor for the manufacturing, transporting, placing, compacting, finishing, joint sawing, sealing, and curing of roller-compacted concrete (RCC) pavement.

b. Provide access to the Contracting Officer at all times to all parts of the mixing and paving plant, placement site, and materials sources for inspection, sampling, and testing to assure compliance with the specifications.

1.4 QUALITY CONTROL

NOTE: Where they are available, specify only ACI certified personnel. Check the American Concrete Institute (ACI) website for local availability (www.concrete.org/Certification).

1.4.1 Contractor Quality Control Staff

NOTE: This submittal requires verification that the laboratory has passed COE laboratory validation. USACE validation does not apply to navy projects. Such validation does not preclude specific facility and staff qualifications specified.

A detailed plan of the proposed facility, equipment, procedures and qualifications at least 14 days prior to placement of the test section. Include:

a. Qualifications of Contractor CQC Staff
b. USACE Laboratory accreditation documents and staff certifications
c. Equipment list and calibration certificates
d. Nuclear gage license and calibration curves

Provide Contractor Quality Control personnel, that are assigned to concrete construction, American Concrete Institute (ACI) certified in the following grade (or have written evidence acceptable to the Contracting Officer of having completed similar qualification programs):

a. CQC personnel responsible for inspection of concrete paving operations: ACI Concrete Transportation Inspector.
b. Lead Foreman or Journeyman of the Concrete Placing, Finishing, and Curing Crews: ACI Concrete Flatwork Technician/Finisher.
c. Field Testing Technicians: ACI Concrete Field Testing Technician, Grade I.
d. Laboratory Testing Technicians: ACI Concrete Strength Testing Technician and Laboratory Testing Technician, Grade I or II.

1.4.2 Other Staff

Submit for approval, the qualifications and resumes for the following staff:

a. Petrographer: Bachelor of Science degree in geology or petrography, trained in petrographic examination of concrete aggregate according to ASTM C294 and ASTM C295/C295M and trained in identification of the specific deleterious materials and tests identified in this specification. Resume with detail of education, training and experience related to the project-specific test methods and deleterious materials. Submit resumes at least 20 days before petrographic and deleterious materials examination is to commence.

b. Concrete Batch Plant Operator: National Ready Mix Concrete Association (NRMCA) Plant Manager certification at the Plant Manager level.

1.4.3 Laboratory Accreditation

Provide laboratory and testing facilities to support quality control which is accredited in accordance with ASTM C1077, including ASTM C78/C78M and ASTM C1260 and includes onsite temperature-controlled concrete curing facilities. Submit for approval a current accreditation which includes the required and optional test methods, as specified throughout this Section.

a. Provide aggregate testing and mixture proportioning studies performed by a commercial laboratory. Accreditation of the commercial laboratory by an independent evaluation authority, indicating conformance to ASTM C1077, including all applicable test procedures.

b. Acceptance Testing: Furnish all materials, labor, and facilities required for molding, curing, testing, and protecting test specimens at the site and in the laboratory. Utilize steel molds for molding the beam specimens. Furnish and maintain boxes or other facilities suitable for storing and curing the specimens at the site while in the mold within the temperature range stipulated by ASTM C31/C31M. Provide flexural loading equipment in accordance with ASTM C78/C78M.

c. Contractor Quality Control: Utilize only an approved, independent, commercial laboratory for sampling and testing, except for testing cementitious materials and admixtures, the manufacturer's laboratory can be use.

d. Laboratory Inspection: The Contracting Officer or his/her representative will inspect the laboratory equipment and test procedures prior to the start of concreting operations for conformance to ASTM C1077. The laboratory certification is required for the duration of the project.

1.4.4 Allowable Tolerances

******************************************************************************
NOTE: Table 5 is a comprehensive listing of geometric and testing limits and corresponding allowable variations. Edit those values as appropriate for the project. Edit line items as appropriate. Where payment adjustment is not to be
Comply with the limits for parameters shown in Table 5. The table identifies specified limits and allowable tolerances from these limits.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Batching and Mixing Plant

Transporting and Placing Methods

Test Section

Placement Schedule

Contractor Quality Control

SD-03 Product Data
1.6 QUALITY ASSURANCE

1.6.1 Sampling and Testing

The Government may sample and test aggregates and concrete during construction and inspect production and placement facilities and equipment to determine compliance with the specifications as specified herein and as otherwise considered appropriate. Provide facilities and labor as may be necessary for procurement of representative test samples. Testing performed by the Government will not relieve the Contractor from the quality control testing requirements specified.

1.7 DELIVERY, STORAGE, AND HANDLING

1.7.1 Bulk Cementitious Materials

**************************************************************************
** NOTE: Cement storage consists of dedicated plant silos for each cementitious material. In addition, higher capacity storage tankers (aka guppies, pigs) are often stored on site. Cementitious materials are usually truck hauled from the closest terminal or rail cars can be used as a temporary terminal. Provide Dual silos containing a clear air space between silo sidewalls to prevent cross contamination. **
**************************************************************************

Furnish cementitious material in bulk. Provide all cementitious materials in bulk at a temperature, as delivered for storage at the site, not exceeding 65 degrees C 150 degrees F. Provide separate facilities for unloading, transporting, storing, and handling of each type of cementitious material.

1.7.1.1 Transporting Cementitious Materials

When bulk cementitious material is not unloaded from primary carriers directly into weather-tight hoppers at the batching plant, transportation
from the railhead, mill, or intermediate storage to the batching plant in adequately designed weather-tight trucks, conveyors, or other means that will completely protect the cementitious material from exposure to moisture.

1.7.1.2 Storage of Cementitious Materials

Immediately upon receipt at the site of the work, store cementitious materials in a dry and properly ventilated structure. Provide storage facilities to permit easy access for inspection and identification. To prevent cement from becoming unduly aged after delivery, use any cement that has been stored at the site for 60 days or more before using cement of lesser age.

1.7.2 Aggregate Materials

1.7.2.1 Storage

Store aggregate at the site of the mixing plant, avoiding breakage, segregation, or contamination by foreign materials. Store each size of aggregate from each source separately in free-draining stockpiles. Provide free-draining storage for aggregate at least 24 hours immediately prior to use.

1.7.2.2 Handling

Handle aggregate preventing segregation or degradation. Keep vehicles used for stockpiling or moving aggregate clean of foreign materials.

PART 2 PRODUCTS

2.1 BATCHING AND MIXING PLANT

2.1.1 Location of Plant

**************************************************************************
NOTE: The mixing plant should be on the construction site or as close as possible, but should be no further than 15 minutes haul time from the placing site. This is especially true if the project is on a military facility. The security delays at entrances are prohibitive.

Time for this Submittal is intended to provide advance information to the field staff so that timely plant inspection can be done.
**************************************************************************

Submit details and data on the RCC Batching and Mixing Plant a minimum of 30 days in advance of RCC test section construction and prior to plant assembly. Locate the mixing plant onsite as indicated on the drawings. Include as a minimum the following:

a. Detailed layout of aggregate stockpiles and RCC batching equipment.

b. Equipment manufacturer's literature on the Batching and Mixing Plant prior to plan assembly including manufacturer's literature showing that the equipment meets all requirements specified herein and to include but not limited to:
(1) Cementitious material storage, handling, and controls

(2) Aggregate handling controls

(3) Water system controls

(4) Mixers and controls

(5) Re-screening systems

(6) Cooling systems

(7) Plant conveyors, bins, and feeders

(8) If truck mixers are used, a certified copy of the NRMCA QC Manual Section 3 Concrete Plant Certification Checklist and Calibration documentation on all measuring and weighing devices, submitted prior to uniformity testing.

2.1.2 Type of Plant

**************************************************************************
NOTE: Plant capacity should be governed by the laydown pattern or the size of the job to help eliminate or minimize cold joints.
**************************************************************************

Design and operate the mixing plant to produce an RCC mixture within the specified tolerances. Use a stationary-type plant having a twin-shift pug mill mixer and either weigh-batch type or continuous type with a minimum rated capacity of [230] tons 250 tons per hour. Use a plant equipped with positive means for controlling and adjusting the mixing time (amount of mixing), maintaining the time of mixing constant, and maintaining the speed of rotation of the pug mill shafts constant.

2.1.3 Cementitious Material Feed Unit

Use suitable equipment, incorporating either weighing or volumetric measurements, to separately batch or feed the required percentage of each cementitious material in the mixture within tolerances specified. Use silos and feeders equipped and operated so that no caking of material or variation in feed will occur, including use of any necessary air pressure or vacuum vents on the silos. Provide provisions for readily sampling each cementitious material.

2.1.4 Aggregate Bins

Provide aggregate bins for aggregate storage, one for each size group with each bin having sufficient capacity to supply the mixer continuously operating at full capacity. Arrange the bins to ensure separate storage of appropriate fractions of aggregate, and each compartment provided with some means of preventing spilling of material into other bins. Unless the aggregate in the bin is readily visible to operating personnel, equip each aggregate bin with mechanical or electrical telltales to indicate when the aggregate in the bin is below level to permit accurate proportioning to mixing unit. Construct each bin so that a representative sample may be readily and safely obtained from each bin discharge during plant operations. Provide appropriate means for separately storing, metering, and feeding into the mixer when the use of blended material is necessary.
2.1.5 Water Control Units

Provide satisfactory means, incorporating either weighing, metering, or volumetric measurements, to batch or feed the required quantity of water in the mixture within tolerances specified. Provide adjusting controls that are convenient to and capable of easy and accurate operation by the mixer operator. When metering controls the quantity of water, provide capability for a fixed quantity of water delivered through the meter to be readily checked by weight or volume. A water storage tank is required to prevent surge drawdown effect.

2.1.6 Batching or Feeding Tolerances

Provide batching or feeding to conform to the mixture proportions directed within the tolerances in Table 4. For batch-type plants, the variation is in percent by weight from batch weight of each material based on the mixture proportions directed. For continuous feeding and mixing plants, the variation is in percent by weight from the mixture proportions of each material designed to be in a total timed sample obtained from a designated location in the plant.

2.1.7 Additional Requirements for Batch-Type Mixing Plants

a. Plant Scales: Utilize plant scales conforming to requirements of NRMCA CPMB 100, with modifications as follows: Use plant scales for any weigh box or hopper that are of either beam or springless-dial type and sensitive to 0.5 percent of maximum load required. Beam-type scales having a separate beam for each size aggregate, with a single pointer actuated for each beam and a tare beam for balancing hopper.

b. Weigh Box or Hopper for Aggregates: Provide weigh box or hopper for aggregates that conform to requirements of NRMCA CPMB 100, with modifications as follows: Means for weighing each bin size of aggregate in a weigh box or hopper suspended on scales, ample in size to hold a full batch without running over. The gate design on both the bins and the hoppers are required to prevent leakage of aggregate when closed. On manually or semi-automatically operated plants, provide an interlocking device to prevent opening more than one gate at a time. The interlocking device is not required on automatic plants designed for simultaneous weighing of all sizes of aggregate while the plant is operating under automatic control.
c. Weigh Hoppers for Cementitious Materials: Weigh hoppers for cementitious materials are to conform to requirements of NRMCA CPMB 100, with modifications as follows: Provide weigh hoppers with sufficient capacity to hold not less than 10 percent in excess of the weight of the cementitious material required for one batch. Portland cement and pozzolan may both be weighed cumulatively in the same hopper on the same scale, provided the Portland cement is weighed first, or the Portland cement and pozzolan may be weighed in separate hoppers on separate scales. Suspend the hopper on dial or beam scales equipped with a pointer so the tare weight of the hopper is shown for each weighing; net weight of cementitious material is to be measured within 1 percent of the weight required.

d. Mixer Unit: Utilize a stationary mixer of the twin pug mill-type capable of producing a uniform mixture within tolerances specified for batch method mixer. Use a mixer with the following properties:

(1) A time lock, accurate within 5 seconds, to control operation of the complete mixing cycle by locking the weigh hopper gate after mixer is charged until closing of mixer gate throughout dry- and wet-mixing periods. The dry-mixing period is defined as the interval of time between the opening of the weigh hopper and the application of water. The wet-mixing period is the interval between application of water and the opening of the mixer gate.

(2) Control of mixing time capable of being set at intervals of not more than 5 seconds throughout cycles up to 3 minutes.

(3) A mechanical batch counter installed as part of the timing device and be designed to preclude register of dry batches or of any material run through during operation of pull bins.

2.1.8 Additional Requirements for Continuous-Mixing Plants

a. Provide aggregate feed with the following properties for each bin:

(1) Feed rate controlled by a variable speed belt, gate remotely operated from the central control panel, calibrated to accurately deliver any specified quantity of material within the required tolerance.

(2) Feed rate readily adjustable from the control panel to change aggregate proportions or to compensate for changes in moisture content.

(3) Feed rate controls automatically maintain the established proportions of aggregate when the combined aggregate delivery is increased or decreased.

(4) Combined aggregate belt feeding equipped with an approved belt scale that operate automatic controls, either electronic or
mechanical, which will maintain the established proportion of each cementitious material and water as ratios of the total aggregate, with provisions for readily changing the proportions at the control panel.

(5) Capability for storing, metering, and feeding blend material as a separate material when use of blending material is necessary.

b. Provide cementitious material control with the following properties:

(1) Approved system to separately meter the required amount of each cementitious material in the mix within the tolerance specified.

(2) Metering by readily adjustable vane feeders or other approved positive metering devices.

(3) Metering and feed designed and controlled so that the cementitious material is uniformly fed into the mixer or into the stream of aggregate on the feeder belt, all with necessary controls to prevent loss of cementitious material as dust or in any other form.

(4) Control of the quantity of each cementitious material automatically linked to the aggregate belt scales.

(5) A provision so the amount of each cementitious material delivered can be readily sampled and checked by weight.

c. Provide a mixer unit with the following properties:

(1) Blades adjustable for angular position on shafts and reversible to retard flow of the mixture.

(2) A manufacturer's plate indicating net volumetric contents of mixer at several heights permanently inscribed on the wall and the rate of feed of aggregate per minute at plant-operating speed.

d. Provide a discharge hopper having a capacity of at least one metric ton equipped with dump gates to assure rapid and complete discharge without segregation.

2.2 MATERIAL SOURCES

Certified copies of laboratory test reports and sources for cement, supplementary cementitious materials (SCM), aggregates, admixtures, curing compound, epoxy, and proprietary patching materials proposed for use on this project. Perform all aggregate tests no earlier than 9 months prior to contract award.

2.2.1 Aggregate Sources

**************************************************************************

NOTE: The specification provides in Table 6, a complete list of material properties that the aggregate must have to be used on the project. It is the Contractor's responsibility to find sources that meet those requirements prior to the start of work and throughout the work.

Where complete testing has been done to determine
acceptable sources, it may be expedient to list the sources that have been tested and are acceptable.

Where it is intended that a specific source or sources be used exclusively, they should be listed and so stated.

Performance testing of aggregate will require at least 90 days to perform the required freezing and thawing tests. Requirements for Contractor testing or design phase government testing of aggregate quality should be evaluated based on project schedule requirements.

Where service records are acceptable in lieu of performance testing, satisfactory service record for an aggregate will be determined based on the aggregate's ability to resist degradation under traffic and/or climatic conditions similar to that expected during its use. If performance data indicate that an aggregate is susceptible to one or more of the above mentioned problems, that source of aggregate will be rejected.

****************************************************************************************

Locate and test the sources from which the aggregates are to be obtained. Provide all aggregate for each nominal size group of aggregates from a single aggregate source and that meet specified quality requirements. Complete aggregate quality testing prior to performing mixture proportion studies.

2.2.2 Portland Cement Source

******************************************************************************

NOTE: Confirm that required portland cement is available in the required quantity from a single source.

******************************************************************************

Provide portland cement from sources actively producing portland cement that have a documented record of consistent physical and chemical properties meeting the specified provisions of ASTM C150/C150M. Provide all portland cement for the project from a single source. A second source of portland cement may be used if documentation is provided that the primary source cannot provide for the entire project needs. Test additional trial mixtures to confirm mixture performance.

2.2.3 Aggregate Samples

Provide facilities for obtaining representative test samples for Government testing. Obtain samples of aggregates during paving at the point of batching. Additional tests and analyses of aggregates at various stages in the processing and handling operations may be made by the Government at the discretion of the Contracting Officer.

2.2.4 Pozzolan Source

******************************************************************************

Note: Confirm that required pozzolan is available
in the required quantity from a single source.

Provide pozzolan from sources actively producing pozzolan that have a documented record of consistent physical and chemical properties meeting the specified provisions of ASTM C618. Submit production tests for the past 2 years to verify acceptable performance. Provide all pozzolan for the project from a single source.

2.2.5  Ground Granulated Blast Furnace Slag Source

NOTE: Confirm that required GGBFS is available in the required quantity from a single source.

Provide GGBFS from sources actively producing GGBFS that have a documented record of consistent physical and chemical properties meeting the specified provisions of ASTM C989/C989M. Submit production tests for the past 2 years to verify acceptable performance. Provide all GGBFS for the project from a single source.

2.3  CEMENTITIOUS MATERIALS

2.3.1  Portland Cement

NOTE: The option of Type I or Type II portland cement should normally be specified, but only type II portland cement should be required when moderate resistance to sulfate attack is needed. Low alkali cements should be required when alkali reactive aggregates are used in the concrete. The false set requirement should be added if a history of false set exists for the area. Portland cement may also be specified using performance specification ASTM C1157.

Provide portland cement conforming to ASTM C150/C150M, Type I or II. Use low alkali cement if the proposed aggregates are found to have greater than 0.04 percent expansion when tested in accordance with paragraph: Alkali-Silica Reactivity.

2.3.2  Pozzolan

NOTE: The supplemental requirements for limit on alkalies and limit on reactivity in brackets should be specified any time low alkali cement is specified or if class C pozzolan is permitted. Class C pozzolan should not be used if there is potential for sulfate attack. The supplemental requirements a-c should be used if there is potential for sulfate attack.

Utilize fly ash conforming to the requirements of ASTM C618, Class F with a loss on ignition not exceeding 4 percent, including the optional
requirements for drying shrinkage, uniformity, and effectiveness in controlling Alkali-Silica reaction. Use class F fly ash for use in mitigating Alkali-Silica Reactivity with a Calcium Oxide (CaO) content of less than 8 percent.

2.3.3 Portland-Pozzolan Cement

**************************************************************************
NOTE: The optional requirement for mortar expansion should be specified when the Portland-pozzolan cement will be used with alkali-reactive aggregate.

If portland-pozzolan cement is not locally and readily available, remove this paragraph and all other references to the material in this specification.
**************************************************************************

Utilize portland-pozzolan cement conforming to the requirements of ASTM C595/C595M, Type IP.

2.3.4 Ground Granulated Blast Furnace Slag

**************************************************************************
NOTE: If ground granulated blast furnace slag is not locally and readily available, remove this paragraph and all other references to the material in this specification. Select the appropriate grade of GGBFS.
**************************************************************************

Utilize ground granulated blast furnace slag conforming to the requirements of ASTM C989/C989M, grade 100 or 120.

2.4 WATER

Provide water conforming to the requirements of COE CRD-C 400 that is clean, fresh, and free from injurious amounts of oil, acid, salt, alkali, organic matter, and other substances deleterious to the hardening of concrete, subject to approval. Water that meets local drinking water standards and has no pronounced taste or odor may be used without testing.

2.5 CURING MATERIALS

a. Utilize impervious-Sheet materials conforming to ASTM C171. The type is optional.

b. Utilize membrane-forming curing compound conforming to ASTM C309, Type 2.

2.6 AGGREGATES

**************************************************************************
NOTE: Modify the 90 percent limits if local information indicates that available aggregates cannot comply with this requirement and it is in the government's best interest to allow such a variation.
**************************************************************************

If the desire is to use State approved aggregates
UFGS sources, revise the table values to match the state requirements and add supplemental line items as necessary.

Furnish, separately, both fine and coarse aggregates that meet requirements of these specifications. The coarse aggregate may consist of one or more nominal size groups each consisting of at least 90 percent by weight of aggregate retained on the 4.75 mm No. 4 sieve, and if used, provide fine aggregate and blending material having at least 90 percent by weight of aggregate passing the 4.75 mm No. 4 sieve.

2.6.1 Coarse Aggregate

NOTE: Crushing the gravel tends to improve quality and bond characteristics and generally results in higher flexural strength of concrete and a more stable mixture under compaction. When mixture proportioning studies or local experience indicates that low flexural strength will be attained by using an uncrushed gravel, the possibility of attaining higher strength by crushing the gravel should be investigated. When desirable to require all the coarse aggregate to be crushed, modify the paragraph by deleting uncrushed gravel and adding the sentence in brackets.

If history of aggregate sources in the project area indicates lower concrete strengths are caused if dust and other coatings are not washed from the aggregate, then the option in brackets for washing aggregate should be considered if economically justified.

Provide crushed or uncrushed gravel, crushed stone, or a combination thereof for coarse aggregate. Provide crushed gravel which contain not less than 60 percent by weight of crushed particles size having at least one freshly fractured face, in each sieve. Provide coarse aggregates that consist of clean, hard, uncoated particles meeting the specified requirements of ASTM C33/C33M and deleterious substances for Class 5S. Provide aggregate particles generally spherical or cubical in shape.

2.6.2 Fine Aggregate

2.6.2.1 General Requirements

Provide natural sand, manufactured sand, or a combination of the two meeting the requirements of TABLE 6 - QUALITY LIMITS FOR AGGREGATE for the fine aggregate. Where necessary to meet grading requirements, a fine blending material may be used. Provide aggregate particles generally spherical or cubical in shape and composed of clean, hard, durable particles meeting the requirements of ASTM C33/C33M.

2.6.2.2 Blending Material

To meet the specified gradation, additional fines (minus 0.150 and 0.075 mm No. 100 and No. 200 sieve size material), if necessary, can be provided at
the Contractor's expense by adding to the aggregates a fine blending sand or pozzolan (fly ash). If pozzolan is used, provide the same material as furnished for cementitious material in accordance with paragraph CEMENTITIOUS MATERIALS. If pozzolan is used for blending additional fines, batch or feed the material together with pozzolan used as cementitious material. If used, provide clean, hard, siliceous material for blending sand meeting all quality requirements specified herein for fine aggregate. Furnish the blending sand as a separate material to the mixer.

**************************************************************************
NOTE: Edit Deleterious Table according to use of RCC pavement. Use ASTM C33/C33M limits for roads, streets, and open storage areas. Include test within brackets for airfield paving.
**************************************************************************

2.6.3 Alkali-Silica Reactivity

**************************************************************************
NOTE: Use these paragraphs for regions where aggregates have a history of high alkali-silica reactivity. This requirement is more restrictive than the procedure required in Table 3.
**************************************************************************

Evaluate and test fine and coarse aggregates to be used in all concrete for alkali-aggregate reactivity in accordance with ASTM C1260. Test both coarse aggregate size groups if from different sources. Evaluate the fine and coarse aggregates separately and in combination matching the proposed mix design proportioning. Provide test results of each individual group and combination having a measured expansion less than 0.08 percent at 28 days after casting. Should the test data indicate an expansion equal to or greater than 0.08 percent, reject the aggregate(s) or perform additional testing in accordance with ASTM C1567 using one of the following options listed below. If any of the above options does not lower the expansion to less than 0.08 percent at 28 days after casting, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing to the Contracting Officer for evaluation and acceptance. Any changes in aggregate sources or mix proportioning will require retesting of the aggregate(s) as stated above.

2.6.3.1 Class F Fly Ash Option

Utilize the Contractor's proposed low alkali portland cement and Class F fly ash pozzolan in combination with the proposed aggregate percentage for the test proportioning. Use Class F fly ash pozzolan in the range of 20 percent to 40 percent of the total cementitious material by mass. Determine the quantity that will meet all the requirements of these specifications and that will lower the expansion to less than 0.08 percent at 28 days after casting.

2.6.3.2 GGBF Option

Utilize the Contractor's proposed low alkali portland cement and ground granulated blast furnace (GGBF) slag in combination with the proposed aggregate percentage for the test proportioning. Use GGBF slag in the range of 40 percent to 50 percent of the total cementitious material by mass. Determine the quantity that will meet all the requirements of these
specifications and that will lower the expansion to less than 0.08 percent at 28 days.

2.6.4 Aggregate Gradation

**************************************************************************
NOTE: The combined aggregate grading is the property that must be evaluated and controlled. However, aggregates are stockpiled and handled in size groups that are typically fine aggregate 5 to 0 mm, No. 4 to 0, 19 to 5 mm 3/4-inch to No. 4, and 38 to 19 mm 1.5 to 3/4 inch. This section requires that the Contractor designate the size groups, the gradings of each size group, and the proportion of each size group such that the combined grading is met. Typically the grading of each size group is monitored and controlled with little regard for the combined grading. This specification requires that the combined grading also be monitored and controlled.
**************************************************************************

Provide a combined aggregate consisting of a minimum of at least two nominal size groups of coarse and fine aggregate with blending material, if necessary, as previously described. Provide each nominal aggregate size group with a gradation such that the two or more materials can be combined in proportions that will produce a combined gradation within the specified limits. Batch separately each size group of aggregate and blending material and feed separately to the mixer. The specified grading limits are determined in a 2 part process:

a. Determining the initial combined aggregate grading

b. Determining the base grading limit

2.6.4.1 Initial Combined Aggregate Grading Limits

Combine nominal aggregate size groups to produce a uniform distribution of aggregate particles forming a smooth, well-graded curve. Provide a selected aggregate blend that falls within the limits specified in the Table 7 - Initial Combined Aggregate Grading Limits. Utilize sSieve analysis of fine and coarse aggregates in accordance with (ASTM C136/C136M, ASTM C117) to develop the Contractor's selected aggregate blend and initial grading.

2.6.4.2 Base Aggregate Grading Limits

After testing is completed and the aggregate blend meeting the initial combined aggregate grading shown in Table 7 is selected, and after mix proportions and properties are determined using the selected blend, the base grading limits of each nominal size group of aggregate to be used during production is established. Utilize the base grading limit for each nominal aggregate size group, including any necessary blending material, in the mix proportioning study with tolerances shown in Table 8 applied to each individual sieve size. The base grading limit for each aggregate size group is used for acceptance of aggregates entering the mixer.

2.7 ADMIXTURES

If used, provide water-reducing and retarding admixtures in accordance with ASTM C494/C494M, Type B or D.

2.8 EQUIPMENT

2.8.1 Paver Requirements

----------------------------------------------------------------------
NOTE: This specification prohibits the use of traditional asphalt concrete pavers. Those are

SECTION 32 13 13.17 Page 33
pavers that consolidate the material using a vibrating screed plate. The specified paver, also used for asphalt concrete, utilizes one or more tamping bars that compacts the material before exiting the machine. Much higher degree of compaction is attained by this type of machine.

**************************************************************************

Provide heavy-duty, track-equipped paver machines of the self-propelled type, similar to laydown machines (pavers) used for asphalt concrete or soil-cement construction. Provide pavers that are:

a. Equipped with hoppers, distributing screws, vibrating screed and have 2 tamping bars, adjustable screeds capable of being operated both manually and automatically, and equalizing devices.

b. Equipped with dual tamping bars and high density vibrating screeds capable of placing the RCC mix to at least 90 percent of the required density and of suitable weight and stability to spread and finish the concrete to the indicated thickness, smoothness, and surface texture requirements.

c. Confine edges of lanes to true lines without use of stationary side forms and place the concrete to the required thickness, free from segregation.

d. Equipped with interchangeable side forms (shoes) which form the edge of the pavement lane from vertically to 15 degrees from vertical.

e. Designed to operate forward at variable speeds and in reverse.

2.8.2 Paver Control

Provide a paver with automatic control of both line and grade by means of electronic controls operating from stationary stringlines on both sides of the paver. However, as appropriate, a short ski riding on an adjacent paved lane may be used in lieu of one of the stringlines. Laser control devices may be used in lieu of a stringline provided the entire process is approved by Contracting Officer. Electronic radar sensing devices may be used as screed control provided the base layer immediately below the RCC layer has been mechanically trimmed using stringlines or laser control devices. Upon final compaction and approval of the base layer, no vehicles or construction equipment are to be placed upon the area to receive RCC.

2.8.3 Compaction Equipment

2.8.3.1 Vibratory Rollers

Provide vibratory rollers that are self-propelled, double-drum, steel-wheeled. Light, walk behind, plate type or similar sized vibratory rollers will be allowed to compact the RCC. Within the range of the operational capability of the equipment, the Contracting Officer may direct or allow variations within the specified range to the frequency, amplitude, and speed of operation which result in the required density and satisfactory surface texture at the fastest production rate. Use at least one self-propelled vibratory roller, in good operating condition and meeting these requirements, full time for each paver used full time. Adjust, modify, or replace any rollers that pick up material from the surface of the pavement. Provide vibratory roller having the following
features:

a. An average operating weight per drum of at least 2.7 kg/mm 150 pounds/lineal inch of drum.

b. A dynamic impact to the surface through the drums by means of revolving weights, eccentric shafts, or other equivalent methods.

c. A vibrating frequency of at least 1,500 cycles per minute.

d. An amplitude between 0.38 and 1.02 mm 0.015 and 0.040 inch at the operating frequency used.

e. Controls that permit ready variation of the amplitude at a minimum of two settings over at least 50 percent of the above range.

f. Drum diameter between 1219 and 1676 mm 48 and 66 inches and between 1676 to 2438 mm 66 to 96 inches in width.

g. Each drum equipped with an operating scraper and pad.

h. Equipped with a means of keeping the drums damp during operation.

2.8.3.2 Rubber-Tired Roller

Provide rubber-tired roller having the following features:

a. Smooth tires, nonoscillating wheels and a tire pressure adjustable between a minimum of 345 and a maximum of 620 kPa 50 and a maximum of 90 psi and with a total load between 1400 and 2000 kg 3,000 and 4,500 pounds per wheel.

b. 2 axles with at least 3 wheels per axle, offset so the front and back tires do not track in the same path.

2.8.3.3 Finish Roller

Utilize a smooth-wheeled tandem roller with a weight of 5 to 9 metric tons. The vibratory roller may be used without vibration as a finish roller to remove surface blemishes. Utilize a finish roller with the steel wheel coated with neoprene rubber.

2.8.4 Straightedge

Provide one 3.6 meter 12 foot straightedge for each paving spreader for testing the finished surface. Make straightedges available for Government use upon request. Utilize straightedges constructed of aluminum or other lightweight metal and having blades of box or box-girder cross section with flat bottom reinforced to ensure rigidity and accuracy; and handles to facilitate movement on the pavement.

2.8.5 Nuclear Density Gauge

Furnish one operable and properly calibrated nuclear density gauge for each paver conforming to ASTM C1040/C1040M, Method A, and be of a single-probe type. Make the nuclear density gauge available for Government use upon request.
2.8.6 Curing Equipment

Provide equipment for applying membrane-forming curing compound with the following features and configuration:

a. Be mobile, self-propelled, and pneumatically wheeled.

b. The curing compound reservoir equipped with constantly mechanically (not air) agitation during operation and a means for completely draining the reservoir.

c. A spraying system consisting of a mechanically powered pump which will maintain constant pressure during operation and an operable pressure gauge.

d. Either a series of spray nozzles evenly spaced to give uniformly overlapping coverage or a single spray nozzle which is mounted on a carriage which automatically traverses the lane width at a speed correlated with the forward movement of the overall frame.

e. All spray nozzles protected with wind screens.

2.9 SAWING EQUIPMENT

***************************************************************************
NOTE: Retain bracketed sentence as necessary to correlate with paragraph Removal of Existing Pavement Slab. Otherwise delete. Also delete wheel saw option on Navy projects.
***************************************************************************

Provide equipment for sawing joints and for other similar sawing with the following features and configuration:

a. Standard diamond-type concrete saws mounted on a wheeled chassis which can be easily guided to follow the required alignment.

b. Diamond tipped blades. If demonstrated to operate properly, abrasive blades may be used.

c. Provide spares as required to maintain the required sawing rate.

d. Wheel saws with large diameter tungsten carbide tipped blades mounted on a heavy-duty chassis which produce a saw kerf at least 38 mm 1-1/2 inch wide to be used in the removal of concrete.

e. Saws capable of sawing to the full depth required.

f. Early-entry saws may be used, subject to demonstration and approval of the Contracting Officer. The initial sawcut depth can not be changed.

2.10 SPECIFIED CONCRETE STRENGTH AND OTHER PROPERTIES

***************************************************************************
NOTE: Designer to fill in blanks as appropriate. Specified strength is based on flexural strength used in the structural design of the pavement or a correlation of cylinders to beams should be used. The flexural strength range for RCC is typically in
the range of 450 psi to 600 psi 2.7 to 4.2 MPa at 90 days of age. Designer to ensure that this strength is attainable with the available aggregates. Specify strength at 90 days. Alternate strength ages may be modified to 28 or 56 days. Consult the Transportation Systems Center for more guidance. Edit this and succeeding paragraphs to ensure the strength age is the same.

2.10.1 Specified Flexural Strength

NOTE: Use the Tailoring Option "Beams", or "Cylinders/Beams", to specify flexural strength for concrete. Use "Splitting Tensile" if specifying strength by cylinders only. Pavement design is mostly based on the flexural strength of the mixture. Field control of mixtures is most easily done by evaluating compressive strength. One purpose of the mix design program is to correlate flexural strength and compressive strength of the mixture. It is important to not overspecify strength because that will result in mixtures that generate higher heat and may result in more cracking than would otherwise occur. Consequently overdesign strength values should be added to the extent required but not be excessive. It should be added to the specified strength and no separate provision made for computing overdesign strength. Suggest that 10 percent should be added to design compressive and flexural strengths.

Specified flexural strength, R, for RCC is 3.8 MPa 550 psi at 28 days as determined by equivalent flexural strength, as specified in paragraph: Mixture Proportioning for Flexural Strength. Maximum allowable water-binder (cementitious material) ratio is 0.45. The water-binder (cementitious material) ratio will be the equivalent water-cement ratio as determined by conversion from the volume ratio of water to cement plus SCM by the absolute volume equivalency method described in ACI 211.1. ACI 211.1 can be supplemented with ACI 211.3R or ACI 327R.

2.10.2 Concrete Strength for Final Acceptance

NOTE: Use the Tailoring Option "Beams", or "Cylinders/Beams", to specify flexural strength for concrete. Use "Splitting Tensile" if specifying strength by cylinders only.

The strength of the concrete will be considered acceptable when the equivalent 28 day flexural strengths for each lot are above the 'Specified Flexural Strength' as determined by correlation with 14-day flexural strength tests specified in paragraph: Mixture Proportioning for Flexural Strength. The strength of the concrete will be considered acceptable when the average equivalent 28-day flexural strengths for each lot are above the 'Specified Flexural Strength' as determined by correlation with 14-day
compressive strength tests specified in paragraph: Mixture Proportioning for Flexural Strength and no individual set (2 specimens per sublot) in the lot are 170 kPa 25 psi or more below the equivalent 'Specified Flexural Strength'. Remove and replace any lot or sublot, respectively, that fails to meet the above criteria at no additional cost to the Government.

2.11 MIXTURE PROPORTIONING

**************************************************************************

NOTE: Mixture proportioning studies include aggregate quality testing which may take considerable time. The mixture trial phase and follow up testing will require several months. Consider these time limits in selection when the submittal is required. Generally, mixture proportioning studies through 28-day test results require at least 60 days to perform. If later age strength results are necessary, more time is necessary.

**************************************************************************

At least 45 days in advance of RCC test section construction and prior to plant assembly. Include:

a. Laboratory report on mixture design studies following proportioning method as outlined in Appendix C.

b. Source information on all proposed RCC mix materials.

c. Laboratory report of coarse and fine aggregate quality tests including individual and combined gradations and ASR testing.

d. Certified test results for chemical admixtures.

e. Mill certificates for portland cement and supplemental cementitious materials.

f. Individual beam and cylinder strength data results.

g. Compressive strength summaries and plots

h. Correlation ratios for acceptance testing and CQC testing, 28 day strength test results.

The Contractor is responsible for all activities leading to development of the RCC pavement mix design. The work includes sampling aggregates, collecting materials, and laboratory testing and evaluations. The Contractor will be responsible for initial mixture proportions by the laboratory mixture proportioning trials. With approval of the Contracting Officer, the Contractor may make minor adjustments to the mixture proportions during construction as necessary to achieve the desired properties.

2.12 Composition

**************************************************************************

NOTE: A typical range for most applications is 250 (min) to 350 (max) kg/cubic meter (400 (min) to 600 (max) lbs/cubic yard) of cementitious material and
15 to 25 percent pozzolan by absolute volume replacement of cementitious material. Add sentence in last set of brackets on ground slag only if it will be used. Actual proportions will be determined by the testing laboratory.

Provide RCC composed of portland cement, water, and fine and coarse aggregates, including any necessary fine blending material. Pozzolans may be used in the RCC composition. The cementitious materials used may be portland cement in combination with a pozzolan or, at the Contractor's option, cementitious material may be portland-pozzolan cement or portland cement in combination with ground granulated blast furnace slag. A retarding admixture may be used, if ambient temperatures above [27] [_____] degrees C [80 degrees F] are anticipated during placement. Government approval in writing is required to use any other admixtures demonstrated to be beneficial and used in the mixture proportioning studies. All materials used in the mixture proportioning studies are to be representative of those proposed for use on the project.

2.13 Criteria for Mixture Proportions

Proportion the RCC mixture based on the following criteria:

a. Provide a RCC mixture with workability appropriate for the paving machine to achieve the required density, thickness, smoothness, grade, and finish texture.

b. The strength of the concrete will be considered acceptable when the equivalent 28 day flexural strengths for each lot are above the 'Specified Flexural Strength' as determined by correlation with 14-day flexural strength tests specified in paragraph: Mixture Proportioning for Flexural Strength,

c. Minimize the volume of Portland cement.

d. The mixture may contain pozzolan at a minimum replacement of 20 percent of the volume of cementitious materials.

e. The mixture may contain granulated ground blast furnace slag.

2.14 Mixture Proportioning for Flexural Strength

NOTE: The first Tailoring Option, "Beams", includes items a through j; the second option "Cylinders/Beams" includes the second listing of items 1 through 10.

Select the total mixture proportions using the procedure detailed in Appendix C at the end of this Section. Determine Compressive and flexural strength performance for each trial mixture by testing 3 nominal 150 by 300 mm 6 by 12-inch cylinders and 3 nominal 150 by 500 mm 6 by 6 by 20-inch beams each at 7, 14, 28, days.

a. Strength: Proportion a minimum of three trial mixes at approximately 2 percent above and below the cementitious material content initially selected to meet the target project design flexural strength.
b. Workability: Adjust the paste volume for each of the trial mixes to produce workability approximately 10 seconds higher and 10 seconds lower than the target workability level. Base the subsequent moisture variations on observed performance during compaction of specimens.

c. Pozzolan: If pozzolan is used, proportion two additional 2 trial mixes during the trial mix design study to establish the effects of the pozzolan addition. Using the cementitious material content selected to meet the target project flexural design, proportion two additional mixes varying the percentage of pozzolan by plus 5 percent and minus 5 percent from the selected proportioning. Replacement is calculated by volume of cementitious material. If ground granulated blast furnace slag is used the proportions will vary between 25 and 50 percent by absolute volume of the cementitious material, depending on the temperature during placing. No pozzolan or portland-pozzolan cement will be used if ground granulated blast furnace slag is used.

d. Aggregate Fines: Using the cementitious material content selected to meet the target project design, proportion two additional mixes with fines content (materials passing 0.075 mm No. 200 sieve) at 2 percent above and below the target blend.

e. Select the final mixture proportions from the performance data of the trial mixtures that best meets the mix performance criteria. The Contracting Officer may direct further adjustments to the mix proportions before and during placement.

2.14.1 Concrete Strength

a. Fabricate all beams and cylinders for each mixture from the same batch or blend of batches. Fabricate beams in accordance to Appendix B and cure all beams and cylinders in accordance with ASTM C192/C192M, using 152 x 152 mm 6 x 6 inch steel beam forms and 152 x 305 mm 6 x 12 inch single-use cylinder forms.

b. Cure test beams from each mixture for 7, 14, and 28 day flexural tests; 3 beams to be tested per age.

c. Cure test cylinders from each mixture for 7, 14, and 28 day compressive strength tests; 3 cylinders to be tested per age.

d. Test beams in accordance with ASTM C78/C78M, cylinders in accordance with ASTM C39/C39M.

e. Using the average strength for each w/c at each age, plot all results from each of the three mixtures on separate graphs for w/c versus:

(1) 7-day flexural strength
(2) 14-day flexural strength
(3) 28-day flexural strength

(4) 7-day compressive strength
(5) 14-day compressive strength
(6) 28-day compressive strength

f. From these graphs select a w/c that will produce a mixture giving a 28 day flexural strength equal to the required strength determined in accordance with paragraph "Average CQC Flexural Strength Required for
Mixtures”.

g. Using the above selected w/c, select from the graphs the expected 7, 14, and 28 day flexural strengths and the expected 7, 14, and 28 day compressive strengths for the mixture.

h. From the above expected strengths for the selected mixture determine the following Correlation Ratios:

(1) Ratio of the 14-day compressive strength of the selected mixture to the 28 day flexural strength of the mixture (for acceptance).

(2) Ratio of the 7-day compressive strength of the selected mixture to the 28 day flexural strength of the mixture (for CQC control).

i. If there is a change in materials, make additional mixture design studies using the new materials and determine a new correlation ratios.

j. Obtain Contracting Officer approval of the mixture proportions prior to placement of any concrete pavement. Provide a water-binder (cementitious materials) ratio for approval that does not exceed the maximum value specified in paragraph: "Specified Flexural Strength" and do not increase ratio without the Contracting Officer's written approval.

a. Fabricate all beams for each mixture from the same batch or blend of batches. Fabricate and cure all beams in accordance with ASTM C192/C192M, using 152 x 152 mm 6 x 6 inch steel beam forms.

b. Cure test beams from each mixture for 7, 14, and 28 day flexural tests; 4 beams to be tested per age.

c. Test beams in accordance with ASTM C78/C78M.

d. Using the average strength for each w/c at each age, plot all results from each of the three mixtures on separate graphs for w/c versus:

(1) 7-day flexural strength
(2) 14-day flexural strength
(3) 28-day flexural strength

e. From these graphs select a w/c that will produce a mixture giving a 28 day flexural strength equal to the required strength determined in accordance with paragraph "Average CQC Flexural Strength Required for Mixtures".

f. Using the above selected w/c, select from the graphs the expected 7, 14, and 28 day flexural strengths.

g. From the above expected strengths for the selected mixture, determine the Ratio of the 7-day flexural strength of the selected mixture to the 28 day flexural strength of the mixture (for CQC control).

h. From the above expected strengths for the selected mixture, determine the Ratio of the 14-day flexural strength of the selected mixture to the 28 day flexural strength of the mixture (for acceptance).

i. If there is a change in materials, provide additional mixture design studies made using the new materials and determine a new Correlation
Ratios.

j. Obtain Contracting Officer approval of the Contractor's mixture proportions prior to placement of any concrete pavement. Provide an approved water-cementitious materials ratio that does not exceed the maximum value specified in paragraph: "Specified Flexural Strength" and do not increase ratio without the Contracting Officer's written approval.

PART 3 EXECUTION

3.1 PRE-PLACEMENT ACTIONS

Complete the following activities prior to the commencement of pavement placement.

3.1.1 Test Strips

Place as many test strips as necessary to adjust contractor's RCC mixture to allow evaluation of the placing characteristics and texture of the mixture and to make necessary adjustments prior to placing the test section. The test strips may be in the vicinity of the onsite plant or off site. The Contracting Officer or his Representative is to be notified 7 days in advance of the start of the test strip placement and is required to be present to observe equipment and the placement process. Construct the strips one paver width wide and 9-12 m a minimum of 60 feet in length. Perform Removal of the onsite strips in coordination with the Contracting Officer or his representative at no additional cost to the Government.

3.1.2 Test Section

******************************************************************************

NOTE: For non-critical pavement areas, the test section may be included into the actual pavement area. For critical areas, the test section should be constructed in a separate area near the jobsite, with similar conditions and pavement section to the actual construction site.

The test section should demonstrate ALL the required elements specified and should be done after calibration of the mixing plant.

The requirement of building the test section 10 days before the main construction begins may be lengthened or shortened in the project specifications, depending on the confidence of the designer in the ability to obtain the design flexural strength in the test section.

If the test section will be included into the actual pavement area, this paragraph should be modified to state that the test section will be removed if it is unacceptable.

******************************************************************************

A detailed plan of the proposed test section layout, location and placement sequence at least 14 days prior to placement of the test section. At a minimum include:
a. Cold and hot weather protection methods
b. Paving sequence
c. Joint pattern
d. Curing equipment
e. Smoothness testing methods
f. Density measurement equipment and procedures
g. Diamond grinding equipment and procedures

At least 10 days but not more than 30 days prior to construction of the pavement, construct a test section near the job site at the location designated on the contract plans. Notify the Contracting Officer at least 5 days in advance of the date of test section construction. Place the test section in portions as directed by the Government. Remove all test sections unacceptable to the Contracting Officer at the Contractor's expense.

a. Timing: Two separate days are to be used for construction of the test section. The test section will provide the Contractor the opportunity to develop and demonstrate that the proposed techniques of mixing, hauling, placing, compacting, finishing and curing, and the preparation of the construction joints meet the contract requirements. Prior to placing the test section, complete the uniformity testing and calibrate the mixing plant.

b. Features: Use the same equipment, materials, and construction techniques on the test section as will be used in all subsequent work. Provide base course preparation, concrete production, placing, compacting, curing, construction of joints, and all testing in accordance with applicable provisions of this specification. Construct the test section to:

(1) Be no less than two adjacent paving lanes each 30 m 100 feet long
(2) Be the designated thickness and number of lifts
(3) Use the same lane width proposed for use in the project
(4) Include at least one cold transverse joint.
(5) Include one longitudinal cold construction joint that is at least 12 hours old before placing the adjacent lane.

c. Operational Demonstration: Demonstrate the ability to meet the specified requirements for:

(1) Plant operations and paving start-up procedures
(2) The RCC laydown method and production rate
(3) The rolling pattern and method for the mat, and fresh and cold construction joints
(4) Cold joint preparation

(5) Saw-cutting

(6) Initial saw cutting and saw cutting for joint reservoir widening and joint sealant installation

(7) RCC testing and evaluation methods.

d. Adjustments During Test Placement: Be prepared to make adjustments to various aspects of the test section placement as directed by the Contracting Officer. Adjustments include:

(1) Varying the amplitude and frequency of the roller to identify the optimums

(2) Varying the rolling pattern of the all rollers to determine the best pattern

(3) Varying the mixture proportions other than water

(4) Varying the water content, as necessary, to arrive at the appropriate content

e. Testing: Remove six 150 mm 6-inch diameter cores full depth, from points selected in the test section by the Contracting Officer 5 days after completion of the test section. Obtain cores in accordance with ASTM C42/C42M. Perform a visual examination of the cores for consolidation. Use the RCC cores to define the affected pavement limits for cores showing signs of large air voids other than normal entrapped air voids, a layer of paste greater than 6 mm 1/4 inch at the top of the core, rock pockets or aggregate segregation. Remove and replace pavements within these defined limits as stated above at no additional cost to the Government. Test compressive strength of the cores in accordance to ASTM C39/C39M at 7, 14, and 28 days of age.

f. Acceptance: The acceptability of the test section is determined by all specified performance factors, density, thickness, strength, surface smoothness, and surface texture. Failure to construct an acceptable test section will necessitate construction of additional test sections at no additional cost to the Government. Remove test sections if outside the paving limits after completion of the test section evaluations and with the approval of the Contracting Officer. Submit all test results in report form and obtain the Contracting Officer approval, prior to starting full production.

3.1.3 Subgrade Preparation

******************************************************************************
NOTE: Designer will include the title of the applicable specification section used for base course or subgrade, and delete inappropriate sections.
******************************************************************************

Condition all previously constructed material underlying the RCC pavement as specified in Section 32 11 20 [BASE COURSE FOR RIGID][ AND ] [SUBBASES FOR FLEXIBLE] PAVING. Correct all deficiencies in the underlying material prior to placing RCC concrete on a cleaned and moistened surface, as
3.1.4 Grade Control

Establish and maintain lines and grades shown on contract drawings for each pavement category of the contract by means of line and grade stakes. Establish and control the finished pavement gradelines and elevations shown at the site of work in accordance with bench mark elevations shown on the contract drawings. Finish the surface of the underlying material to the necessary grade such that when the required thickness of RCC is placed, the pavement surface will meet the indicated grade. Construct the finished and completed RCC pavement to the lines, grades, cross section, and dimensions indicated.

3.2 TRANSPORTING AND PLACING METHODS

**************************************************************************
NOTE: The Submittal is to be reviewed in advance of the test section construction. The test section is where the Contractor demonstrates the proposed processes. The processes may change as a result of the test section and the resubmittal documents that change.
**************************************************************************

Provide initial submittal 30 days in advance of the test section construction. A resubmittal is to be done after completion of a successful test section at least 10 days in advance to the RCC Pavement full production placement.

a. Provide narrative, equipment, crew list, and manufacturer's literature for the following operations for normal and adverse weather conditions:

(1) Transporting RCC from plant to placement area

(2) RCC feeders to the laydown equipment

(3) Laydown equipment

(4) Grade and alignment control

(5) Compaction

(6) Curing

b. Instructions on adjustment and operating procedures including corrective action(s) necessary to assure a tight, smooth surface on the RCC pavement, free of tears and other surface imperfections, including surface pitting.

Haul concrete from the mixer to the placing site in dump trucks. Dump the trucks directly into the hopper of the paver or into an approved secondary material distribution system which deposits material into the paver hopper. Do not dump RCC directly onto the prepared subgrade or adjacent areas. Schedule deliveries so that concrete will be spread and rolled within the time limit specified in paragraph COMPACTON and spreading and rolling of all mixture prepared for 1 day's run can be completed during daylight unless artificial lighting is provided. Loads that have become

SECTION 32 13 13.17 Page 45
visibly contaminated or have become wet by rain will be rejected. Hauling over freshly placed concrete will not be permitted. Remove RCC not meeting these specifications from the placement area and disposed of at a location designated by the Contracting Officer.

3.3 BATCHING AND MIXING

Operate the plant to produce a uniform and homogeneous mixture with the proportions developed during the mixture proportioning process and otherwise approved. Batch or feed all materials separately used in the mixture, except that fly ash used as aggregate fines that are to batched or fed with fly ash used as cementitious material.

3.3.1 Mixing

Convey the aggregates, cementitious materials, water, and admixtures to the mixer in proportions, as required. In batch mixing, dry-mixed at least 15 seconds the aggregates and cementitious materials charged into the mixer. Add water and continue mixing as required to obtain a homogeneous mixture. Adjust the paddles of the pug mill, as necessary, to provide the required mixing time and to provide a thorough mixing. Maintain the shaft speed of the pug mill at the speed recommended by the manufacturer. Maintain the RCC mixture below the tips of the paddles of the pug mill mixer when paddles are in vertical position. Maintain the mixer and mixer paddle surfaces free of hardened concrete and other contamination. Replace mixer paddles when the dimensions are worn down more than 10 percent from new paddles of the same type and manufacture. Keep new paddles onsite for comparison.

3.3.2 Water Content

**************************************************************************

NOTE: Mixture workability is a major factor in achieving the required density and the most desirable surface texture. Periodic water content adjustments are necessary to compensate for stockpile moisture variations or variable aggregate properties. Typically these adjustments are minor and it is normal that the Contractor have the latitude to make the adjustments as required. Otherwise a timely response to an observed condition cannot be made.

**************************************************************************

The initial or start-up water content will be approved by the Contracting Officer based on results of the mixture proportioning trials. After startup, control the total water content of the mix as necessary to meet all requirements stated herein. Vary the water content at frequent intervals, as necessary and as considered appropriate, because of placing and compacting operations. In general, base water content on:

a. The action of the vibratory roller on the freshly placed concrete

b. The field density test results attained in the pavement

c. The texture of the RCC surface being produced
3.3.3 Mixture Uniformity Testing

Perform mixture uniformity testing, prior to the production and placement of any RCC, to evaluate the batching and mixing process. Use the same RCC mix proportions, materials, and mixing equipment for testing as proposed for use on the project. Perform all mixture uniformity testing in accordance with COE CRD-C 55 as modified herein and paragraph CONTRACTOR QUALITY CONTROL.

3.3.3.1 Mixer Regular Uniformity Testing

a. Perform regular uniformity testing on three separate samples or batches representing full-production batch of concrete. For continuous mix plants, take samples during full plant production at 1 minute intervals.

b. Before uniformity data are available, use at least 75 seconds for the mixing time for each batch after all solid materials are in the mixer, and provided that all of the mixing water is introduced before one-fourth of the mixing time has elapsed.

c. Batch RCC that meets the limits of the five uniformity requirements listed in Table 9 below. For regular testing, perform all five tests on each of three batches of concrete. The range for determining acceptability is the range of test results for each of the three samples representing the single batch. The range for regular testing is the average of the ranges of the three batches. If more than one mixer is used and all are identical in terms of make, type, capacity, condition, speed of rotation, the results of tests on one of the mixers may apply to the others, subject to the approval of the Contracting Officer.

3.3.3.2 Abbreviated Uniformity Testing

When abbreviated testing is performed, batch the concrete to meet only those requirements in Table 9 listed for abbreviated testing. Use the same concrete proportions for uniformity tests that are to be used on the project. Perform five required tests on a single batch of concrete for abbreviated testing. The range for abbreviated testing is equal to the range for one batch. If more than one mixer is used and all are identical in terms of make, type, capacity, condition, speed of rotation, the results of tests on one of the mixers can apply to the others, subject to the approval of the Contracting Officer. Perform all mixer performance (uniformity) testing in accordance with COE CRD-C 55 and with paragraph titled TESTING AND INSPECTION FOR CONTRACTOR QUALITY CONTROL.

3.4 PLACING AND SPREADING

3.4.1 Placing

**************************************************************************
NOTE: Placement Schedule may be deleted if it is duplicated in the overall project schedule.
**************************************************************************

a. Placement Schedule: Schedule of paving operations, at least 15 days prior to start of paving unless otherwise specified.

b. Timing: Place mixture as nearly continuous as possible, with an absolute minimum of stops and starts; control speed of placing to permit proper rolling. Control the timing of placement so that all RCC mixture is placed and rolled within the time limit specified in paragraph COMPACTION. Except as specified below, for certain extremely small odd-shaped isolated areas, place and spread all concrete with the paver.

c. Charging: Do not allow the level of concrete in the paver hopper to approach empty between loads. Maintain concrete mix above the auger shaft during paving.

**************************************************************************
NOTE: If the total pavement thickness is greater than 250 mm 10 inches, use the first statement in brackets regarding lift thickness; otherwise, the second statement should be used.
**************************************************************************

d. Setup: Adjust the paver and the speed to prevent segregation, to meet the surface requirements, and to produce a depth that, when compacted, the surface will conform to cross section, grade, and contour indicated. Do not place a layer of RCC in excess of 250 mm 10 inches or less than 100 mm 4 inches in compacted thickness.

e. Edges: Construct each edge of each lane with a sloped face of 15 degrees from vertical configuration, as directed. Utilize an edge shoe constructed so that it is within 19 mm 3/4 inch of the compacted base surface.

f. Lanes: Place mixture in consecutive adjacent lanes having a minimum width of 3 m 10 feet and a maximum width of 6 m 20 feet. A wider lane may be approved by COR to prevent edge lanes less than 3 m 10 feet in width. If more than 60 minutes should elapse between placements in adjacent lanes, the construction joint is considered a "cold joint" and treatment as specified herein for cold joints is to be provided. Limit the time elapse between placement of lifts to 60 minutes on multi-lift construction. During extremely hot weather, both of these limits will
be decreased by the Contracting Officer as specified in paragraph: Placing During Hot Weather or as otherwise considered appropriate. Where practical, place each lane of such length that the succeeding lane can be placed without the use of a cold joint.

g. Joints: Utilize pavers in sufficient numbers and operated in staggered formation to assist in achieving the above requirement and to produce multilane construction in one construction operation to minimize cold construction joints. Otherwise, the joint is to be constructed as a cold joint. Utilize a separate paver for placement of each lift of pavement in multi-lift construction. Obtain COR approval for the length of a lane that is to be followed by another lane. Decrease or increase this length of lane as required by air temperatures, wind, and other climatic conditions existing at the time of placement. Construct longitudinal joints and edges to true line markings. Establish lines parallel to the centerline of an area to be paved.

h. Control of Water: Discontinue placing concrete during rain except for light mists that do not cause intermixing of cement and water slurry on the surface. Place concrete in a pattern so that curing water from previous placements will not pose a runoff problem on the fresh surface or base course.

3.4.2 Placing Adjacent Lanes

Complete fresh longitudinal construction joints between separate lanes of concrete pavement within the time limitations in the paragraph PLACING AND SPREADING. Treat other longitudinal joints as "cold joints." Construct joints to assure continuous bond between old and new sections of pavement. Utilize extra passes of the vibratory roller and other compaction and hand finishing as necessary to assure specified full depth compaction and surface finish.

3.4.3 Special Requirements for Placing Lanes Succeeding Initial Lanes

For longitudinal construction joints, locate the screed of the paver to overlap the previously placed lane 25 to 50 mm 1 to 2 inches and to be sufficiently high so that compaction will produce a smooth, dense joint, without offset. Remove any excess concrete, placed on the edge of the previously placed lane by the paver, by carefully using a lute by hand to push back concrete to the edge of the lane being placed, so none will remain on the surface of the previously placed lane. If necessary, when the quantity of concrete on the edge of the previously placed lane plus uncompacted material in the lane being placed exceeds that required to produce a smooth, dense joint, remove and waste the excess concrete by approved methods.

3.4.4 Handwork

Correct any paving operations that require significant handwork, other than as specified above, before restarting. Broadcasting or fanning of concrete mixture over areas being compacted will not be permitted. Suspend spreading operation, when segregation occurs in the concrete during placement, until the cause is determined and corrected. Remove segregated coarse aggregate from the surface prior to compaction. Correct irregularities in alignment of the pavement left by the mechanical spreader by hand trimming directly behind the spreader before rolling. Distortion of pavement during edge trimming are not permitted.
3.4.5 Placing Odd-Shaped Areas

In isolated instances involving very small, odd-shaped areas where use of machine spreading is impractical, spread concrete by hand. Spread concrete in a manner to prevent segregation. Spread mixture uniformly with shovels in a loose layer of thickness that, when compacted, will conform to density, grade, thickness, and surface texture requirements.

3.4.6 Placing During Cold Weather

Discontinue placement when the air temperature reaches 5 degrees C (40 degrees F) and is falling and do not resume until the air temperature reaches 2 degrees C (35 degrees F) and is rising. Do not place RCC on any surface containing frost or frozen material. Make provisions to protect the concrete from freezing during the specified curing period. Heat mixing water and/or aggregates, as necessary, to produce concrete having a temperature between 10 and 30 degrees C (50 and 85 degrees F) as placed. Methods and equipment for heating are to be as approved by COR. Utilize aggregates free of ice, snow, and frozen lumps before entering the mixer. Provide coverings and other means for maintaining the RCC at a temperature of at least 10 degrees C (50 degrees F) for not less than 72 hours after placing and at a temperature above freezing for the remainder of the curing period. Remove and replace concrete damaged by freezing as directed.

3.4.7 Placing During Hot Weather

Take the following precautions, during periods of hot weather when the maximum daily air temperature is likely to exceed 30 degrees C (85 degrees F):

a. Utilize a 45 minute maximum period between placing succeeding lifts or lanes.

b. Sprinkle the underlying material with water immediately before placing the concrete.

**************************************************************************

NOTE: The maximum placing temperature at which concrete should be placed is dependent on the minimum temperatures that can occur in the region. For simplicity, 3 regions have been established based on average ambient air temperatures (AAAT). When air temperatures during RCC placement in these regions exceed 30 degrees C (85 degrees F), one of the following maximum concrete temperatures should be required:

- AAAT <40 degrees, concrete temperat. <70 degrees F
- AAAT <50 degrees, concrete temperat. <80 degrees F
- AAAT <60 degrees, concrete temperat. <90 degrees F

**************************************************************************

c. Place the concrete at the coolest temperature practicable, to ensure the concrete when placed is less than 32 degrees C (90 degrees F).

d. Apply a waterfog or mist, not streams of water to the finished surfaces of the newly laid pavement to keep damp, with approved spraying equipment until the pavement is covered by the curing medium.

When the Contracting Officer determines heat or wind to be excessive,
immediately take additional measures, as necessary, to protect the concrete surface. Construct wind screens, more effective fog sprays, and similar measures commencing immediately behind the paver. If these measures are not effective, immediately stop paving operations until satisfactory placement conditions exist.

3.5 COMPACTION

**************************************************************************
NOTE: Do not, under any conditions, reduce the requirements for use of vibratory rollers operating in the vibratory mode or for use of electronic controls and stringlines or lasers.
**************************************************************************

Accomplish compaction by self-propelled, vibratory, steel-wheeled rollers and rubber-tired rollers. Do not operate rollers in the vibratory mode when not moving. Vary the frequency and amplitude of vibration, as needed or directed, within the range specified. Keep the surfaces of roller drums and wheels clean at all times.

3.5.1 Timing

Begin rolling within 10 minutes of spreading and, except for fresh joints, complete rolling within 45 minutes of start of mixing, except during hot or dry weather conditions. In hot or dry weather, begin rolling within 5 minutes of spreading and, except for joints, complete rolling within 30 minutes of start of mixing. Delays in rolling freshly laid mixture will not be permitted.

3.5.2 Initial Rolling

Initial rolling consist of vibratory passes of the vibratory roller. This requirement for vibratory rolling is not to be relaxed. Initial static passes may be necessary before the vibratory rolling to "set" the pavement surface before vibratory compaction is started. Count a round trip over the same material as 2 complete passes (i.e., from point A to point B and return to point A by the same route are 2 complete passes).

3.5.3 Deficiency Evaluation

After initial vibratory rolling, conduct preliminary tests and examination of density, crown, grade, smoothness, and surface texture under the supervision of the Contracting Officer. Correct deficiencies before rolling is continued, so that the finished surface will conform to requirements for grade, surface texture, and smoothness specified herein. Make further smoothness checks as directed by the Contracting Officer.

3.5.4 Vibratory Rolling and Testing

Continue rolling with the vibratory roller in vibratory mode, if necessary, until the specified wet field density as a percentage of the "Target Density," maximum wet density is attained in the lane interior, at fresh joints, and at cold joint. Perform nuclear density testing in accordance with paragraph CONTRACTOR QUALITY CONTROL.

3.5.5 Final Rolling

Stop rolling with a steel wheeled vibratory roller when the specified
density is attained. All additional rolling beyond the vibratory passes required to produce the specified field density are at the Contractor's expense. As soon as rolling with the vibratory roller is complete, provide at least two additional passes of a rubber-tired roller with tire pressure and loading per wheel at the midpoint of the range previously specified, unless otherwise directed. Follow these passes by 2 complete passes of the finish roller with a neoprene coated steel wheel.

3.5.6 Operation of Rollers and Tampers

Adjust the speed of rollers to be slow enough to avoid displacement of the concrete but not more than \(2.5 \text{ km/hr} \ 1.5 \text{ mph}\). Immediately correct any displacement of concrete resulting from reversing direction of roller or from any other cause. Vary slightly in length alternate passes of roller and overlap sufficiently to provide full coverage over the surface. Utilize additional rollers if pavement density specified is not attained and/or if paving operations are getting ahead of rolling. Do not alter paving operations to accommodate a lack of rollers. Thoroughly compacted places inaccessible to large vibratory rollers with walk-behind rollers and hand-tampers to the required density, using multiple thin lifts, as necessary. Take additional field density tests for hand-tampered areas to check for required density.

3.5.7 Rolling Pattern

a. Commence rolling at the outer edge of the lane, followed by the other edge, and then the center. On subsequent adjacent lanes, begin rolling at the outer edge. Extend rolling of the first pass along each edge to within approximately \(450 \text{ mm} \ 18 \text{ inches}\) of the edge except as otherwise approved or directed.

b. If there will be a subsequent lane placed along an edge and the joint will be constructed as a "fresh" joint, the roller is to go no closer than the \(450 \text{ mm} \ 18 \text{ inches}\) to the outer edge until the subsequent lane is placed.

c. If there will be a subsequent lane and the joint will be treated as a "cold" construction joint, or if the edge will be the final edge of the pavement, roll the outer \(450 \text{ mm} \ 18 \text{ inches}\) after rolling of the center of the lane.

d. If the edge abuts a previously placed strip, either as a "fresh" joint or as a "cold" joint, roll the uncompacted joint area after the center of the lane. Provide additional passes of the vibratory roller and rubber-tired roller to this joint area, as necessary, to produce the specified compaction in the joint area.

e. Utilize approved hand-finishing operations, as necessary to produce a tight surface at the joint, meeting the specified surface tolerances in Table 3. Utilize a consistent rolling pattern throughout production.

3.6 JOINTS

Provide a detailed plan of the proposed paving pattern showing all planned construction, contraction and expansion joints. Place all longitudinal and transverse construction joints on a 30 foot grid that are perpendicular to the finished layout of the pavement. The joint area is considered the RCC material within \(305 \text{ mm} \ 12 \text{ inches}\) of the joint. Construct joints to:
a. Be straight and continuous from edge to edge of the pavement.

b. Be made to ensure continuity in smoothness and grade between old and new sections of pavement, as specified hereinafter.

c. Have the same texture, full-depth density, and smoothness as specified for other sections of pavement or as specified for joints.

d. Be cleaned by brushing or cut back with approved power saw, as directed, regardless of age, contact surfaces of previously constructed strips that have become coated with dust, sand, or other objectionable material.

3.6.1 Longitudinal Construction Joints

Any construction joints in which the density fails to meet the specified limits is to be trimmed by sawing the edge of the hardened concrete with a power concrete saw, not earlier than 24 hours age.

a. Make the sawcut at least 150 mm 6 inches from the original edge, and more if necessary to produce an acceptable joint.

b. Make the sawcut the full depth of the pavement to produce a face within 15 degrees of vertical, free of all loose or uncompacted material.

c. Carefully remove the outer portion to prevent any damage to the sawed face. Resaw edge if damage occurs.

d. If necessary, utilize additional rolling to assure that full depth density and surface texture is attained.

3.6.2 Transverse Construction Joints

a. When a transverse construction joint is required, operate the roller to pass over the end of the freshly placed concrete.

b. Cut the tapered end of the strip, with a power concrete saw to full depth of the lift and the excess material removed.

c. In continuing placement of the strip, position the paver on the transverse joint so that sufficient fresh concrete will be spread to obtain a joint which will conform to required full-depth density and smoothness specified, after rolling. When necessary, hand finish the fresh mixture at the joints and provide additional rolling to assure that specified full-depth density and surface finish is attained.

3.6.3 Joints in Multi-lift Construction

**************************************************************************
NOTE: Delete this paragraph if only one course construction is to be used in the project. Delete bracketed statement if all lift joints are to receive bedding mortar.
**************************************************************************

a. Place the top layer so that longitudinal joints in that layer will coincide with joints in the lower layers of the pavement.

b. Place the transverse joints in the top layer to coincide with
transverse joints in the lower layers of the pavement.

3.6.4 Slip Joints

Construct slip joints between roller-compacted and conventional concrete where no expansion joint is required and as shown on the contract drawings. For either RCC or PCC, coat the edge of the initial placement with a bituminous product, a minimum of 3 mm 1/8 inch thick, prior to placing the next material. If RCC is placed prior to conventional concrete, sawcut the RCC full depth at the joint line and remove excess RCC material. Prepare the joint for sealing as described below. Provide a full depth expansion joint, in lieu of a slip joint, for any mismatched joints or three sided joint. Utilize a thickened edge type joint for the pcc side.

3.6.5 Sawing of Contraction Joints

**************************************************************************
NOTE: Sawing of transverse contraction joints is recommended because of appearance and ease of sealing. However, in the past much RCC pavement has been allowed to crack naturally without benefit of sawing. These natural cracks normally occur at 12 to 20 m (30 to 70 ft) spacing. Saw joints for hardstands, streets, and roads. Sawing of transverse joints on tank trails may be deleted. Delete this paragraph if all sawed joints are not being used and modify paragraph Sealing Joints and Cracks accordingly. The bracketed statement should be included if longitudinal construction joints are to be sawed and sealed.
**************************************************************************

  a. Saw transverse contraction joints at 12 m 30 foot spacing or as otherwise indicated. Saw longitudinal construction joints between lanes to form a reservoir for joint sealant in the same manner as specified below.

**************************************************************************
NOTE: Very early age sawing is commonly done for conventional concrete pavements. It is also appropriate for RCC pavements where sawn joints is desired. Specialized equipment is necessary for sawcutting to be done at very early ages so that damage to the joint and pavement is prevented.
**************************************************************************

  b. Timing for Sawing. Accomplish initial joint sawing where indicated by using a 3 mm 1/8 inch blade to the depth indicated. Vary the time of sawing depending on existing and anticipated weather conditions and to prevent uncontrolled cracking of the pavement. Commence sawing of the joints as soon as the concrete has hardened sufficiently to permit sawing the concrete without chipping, spalling, or tearing. Conduct sawing operations as required during both day and night regardless of weather conditions. If water-curing is required, discontinue only in small areas to facilitate sawing.

  c. Cracking. Before sawing a joint, examine the concrete closely for cracks, and the joint is not to be sawed if a crack has occurred within
3 m 10 feet from the planned joint location. Discontinue sawing when a crack develops ahead of the saw cut.

d. Spacing and Alignment. Saw all joints at the required spacing consecutively in the sequence of the concrete placement. Use a chalk-line or other suitable guide to mark the alignment of the joint. Do not vary the saw cut more than 13 mm 1 inch from the true joint alignment from edge to edge of the pavement area, and do not have abrupt offsets.

e. Undercutting. Inspect the sawed faces of joints for undercutting or washing of the concrete due to the early sawing, and delay sawing if undercutting is sufficiently deep to cause structural weakness or excessive roughness in the joint.

**************************************************************************
NOTE: Installation of the final joint seal or sealant, if required, should be done after completion of the curing period. To minimize costs, it is always preferable that the sealing subcontractor be able to install all the seals or sealant at one time rather than to mobilize several times. Sealing as soon as practical is desirable so that continued construction operations don't damage or contaminate joints.
**************************************************************************

f. Joint Widening. After expiration of the curing period and no later than 21 days, widen the joint by sawing the upper portion of the groove to the width and depth indicated to form a reservoir for the joint sealer.

g. Cleaning Joint. Immediately after initial and final sawing of the joint, thoroughly flushed the saw cut and adjacent concrete surface with water until all waste from sawing is removed from the joint. Upon sawing the initial sawcut, install a temporary seal in the joint until the end of the curing period.

h. Equipment. Provide sawing equipment that is adequate in the number of units and the power to complete the sawing at the required rate. Provide, at the job site, an ample supply of saw blades before concrete placement is started, and at least one standby sawing unit in good working order during the sawing operation.

3.6.6 Routing Cracks

Thirty to 45 days after placement of concrete, route all random cracks which have been opened to 3 mm 1/8 inch or more and seal as specified in Section 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT. Immediately after routing, clean and seal all random cracks. Accomplish routing with a vertical spindle type rotary router mounted on a rigid chassis so that the spindle will caster to minimizing spalling.

3.6.7 Sealing Joints

Seal construction and contraction joints as specified in Section 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT.
3.7 CURING AND PROTECTION

**************************************************************************
NOTE: It is not practical to moist cure surfaces where water runoff may effect adjacent construction operations. In most cases it is preferable that RCC surfaces be cured by a membrane curing compound.
**************************************************************************

3.7.1 General

a. Continuously protect concrete against loss of moisture and rapid temperature changes for at least 7 days from the completion of finishing operations. Have all equipment needed for adequate curing and protection of the concrete on hand and ready for use before actual concrete placement begins. If any selected method of curing does not afford the proper curing and protection against concrete cracking, remove and replace the damaged pavement, and implement another method of curing as directed.

b. Calibrate the spraying system in accordance with ASTM D2995, Method A, for the rate of application required in paragraph: Membrane Curing. If required, utilize hand-operated sprayers operated by compressed air supplied by a mechanical air compressor which are allowed by paragraph: Membrane Curing. If the curing equipment fails to apply an even coating of compound at the specified rate, replace equipment immediately.

3.7.2 Membrane Curing

a. Timing. Apply a uniform coating of white-pigmented, membrane-forming, curing compound to the entire exposed surface of the concrete and the edge surfaces as soon as the free water has disappeared from the surface. Do not allow the concrete to dry before the application of the membrane. If any drying has occurred, moisten the surface of the concrete with a fine spray of water, and apply the curing compound as soon as the free water disappears.

b. Coverage. Apply the curing compound to the finished surfaces by means of an approved automatic self-propelled spraying machine. Apply the curing compound with an overlapping coverage that will give two-coat application coverage of 93 square m/L 400 square feet/gallon per coat, plus or minus 5.0 percent for each coat. A one-coat application may be applied provided a uniform overlapping application and coverage of 47 squarem/L 200 square feet/gallon, plus or minus 5.0 percent is obtained.

c. Manual Application. The application of curing compound by hand-operated, mechanical powered pressure sprayers will be permitted only on odd widths or shapes of slabs and on concrete surfaces exposed by the removal of forms. When the application is made by hand-operated sprayers, apply a second coat in a direction approximately at right angles to the direction of the first coat. If pinholes, abrasions, or other discontinuities exist, apply an additional coat to the affected areas within 30 minutes.

d. Protection. Adequately protect concrete surfaces to which membrane-curing compounds have been applied from pedestrian and vehicular traffic and from any other possible damage to the continuity of the membrane during the entire curing period, except as required for
joint-sawing operations and surface tests.

e. Membrane Damage. Resprayed by the method and at the coverage specified above, any concrete surfaces that are subjected to heavy rainfall within 3 hours after the curing compound has been applied or any areas where the curing compound is damaged by subsequent construction operations within the curing period.

3.7.3 Burlap

Utilize burlap covers of 2 or more layers of burlap having a combined weight of 4746 gm or more/sq m 14 ounces or more/square yard in a dry condition. Utilize burlap that is either new or used exclusively for curing concrete. Apply burlap strips having a length after shrinkage of at least 305 mm 1 foot greater than necessary to cover the entire width and edges of the pavement. Overlay mats at least 150 mm 6 inches. Before placing mats thoroughly wet and keep mats continuously wet and in intimate contact with the surface and edges of the pavement area for the entire curing period.

3.7.4 Protection of Pavement

After final rolling of the pavement, no vehicular traffic or equipment is permitted until the end of the curing period, except for approved curing equipment having wheel loads not exceeding 2000 kg 4,500 pounds. Maintain a supply of plastic sheeting meeting the requirements of ASTM C171 and keep readily available to cover pavement less than 12 hours old if rainfall occurs.

3.8 TREATMENT OF DEFECTIVE PAVEMENT

Remove and replace defective pavements unless the deficiency is subject to payment adjustments. RCC mixtures that are improperly proportioned or become contaminated are considered defective pavements. Skin patching of an area that has been rolled are not permitted. No additional payment will be made for the repair or removal and replacement of defective pavement. Except as noted below, the following defects will require complete removal and replacement or pay adjustment. Remove and replace any defects greater than allowed for pay adjustment.

a. Reduced thickness of pavement.
b. Surface texture.
c. Smoothness.
d. Density.
e. Horizontal Alignment.

3.8.1 Pavement Removal and Replacement

Delineated defective areas to be replaced by sawing full depth of the pavement around the perimeter of the defective area. Remove the delineated area to the full pavement depth of the course without damaging the adjacent pavement. Delineated areas are to have a length or width no less than 3 m 10 feet. Adjacent slabs or portion of a slab that remains in the pavement abutting the replacement area are to have a length or width no less than 2.5 m 8 feet when measured from a joint or edge. Create a clean vertical face of the existing concrete to pave against. Conventional concrete or RCC may be used at the Contractor's option to fill the void. Construct new slabs that conform to all requirements of smoothness, surface texture, density, thickness, and concrete quality, as stated herein. Construct and seal longitudinal and transverse joints in the new slab in accordance with
the original plans, if required for the adjacent slab.

3.8.2 Mix Proportion Variations

Variation in aggregate grading of mix proportioning are subject to pay adjustment. Remove and replace pavement sections where grading variations are greater than allowed for pay adjustment or variations in other mixture constituents beyond the specified tolerances.

3.8.3 Grade Variations

Mark and remove high spots indicated by the testing straight edge in excess of applicable tolerance or reduced by rubbing with a carborundum brick and water. Discontinue rubbing as soon as contact with the coarse aggregate is made. If high spots cannot be removed in the above manner because of disturbing the coarse aggregate, corrected by an approved surface-grinding machine after the RCC is 14 days old or remove and replace the defective pavement. When grinding of 13 mm 1/2 inch or more would be required, remove and replace the pavement.

3.9 CONTRACTOR QUALITY CONTROL

The Contractor is responsible for sampling and testing aggregates, cementitious materials, and RCC to determine compliance with the specifications. Provide facilities and labor as necessary for procurement of representative test samples. Furnish sampling platforms and belt templates to obtain representative samples of aggregates from charging belts at the concrete plant. Obtain samples of RCC at the point of delivery to the paver. Perform the inspection and tests described below, and based upon the results of these inspections and tests, take the action required and submit reports as required. Perform this testing regardless of other testing performed by the Government, either for pay adjustment purposes or for any other reason.

3.9.1 Laboratory Accreditation

Provide laboratory and testing facilities at the expense of the Contractor. Utilize laboratories that are accredited in accordance with ASTM C1077, including ASTM C78/C78M and ASTM C1260. The accreditation are to be current and include the required and optional test methods, as specified throughout this Section.

a. Aggregate Testing and Mix Proportioning: Utilize a commercial laboratory for aggregate testing and mixture proportioning studies

b. Contractor Quality Control: Utilize an approved, onsite, independent, commercial laboratory for all sampling and testing be performed or the manufacturer's laboratory for cementitious materials and admixtures.

c. Laboratory Inspection: The Government will inspect the laboratory equipment and test procedures prior to the start of concreting operations for conformance to ASTM C1077. Maintain any certifications at the laboratory for the duration of the project.

3.9.2 Reports

Report all results of tests conducted at the project site on the same day tested and deliver to the Contracting Officer. These requirements do not relieve the Contractor of the obligation to report certain failures.
immediately as required in preceding paragraphs. Confirmed in writing in the routine reports, such reports of failure and the action taken. The Contracting Officer has the right to examine all Contractor quality control records at any time.

3.9.3 Lots and Sublots

**************************************************************************

NOTE: The lot size can be specified on the basis of time (i.e., 4 hours, 1 shift, etc.) or amount of production (i.e., 500 cu m (665 cu yd), 1000 cu m (1333 cu yd), etc.). If the lot size is based on the amount of production, it normally should be selected to be approximately equal to the amount of RCC expected to be produced in 1 shift of operation. The lot size should not exceed 1500 cu m (2000 cu yd) of RCC. When a lump sum contract is used, the lot size becomes the total job; thus, the percent payment is applied to the contract price. The following paragraphs will be edited accordingly.

Delete this paragraph if the project is small or control based on lots is not appropriate. Revise QC table where lots and sublots are identified.

**************************************************************************

Areas to be tested and quantities for which payment is to be adjusted will be based on pavement areas subdivided into lots and lots subdivided into sublots. A lot will be that quantity of construction that will be evaluated for compliance with specification requirements. A lot will be equal to [375][_____] cu m 10 hours production. Sublots are designated and defined for the specific parameter to be tested. Thickness, surface smoothness, and surface texture determinations will be made on the lot as a whole. In order to evaluate field density, each lot will be divided into 4 equal sublots. All samples and test locations will be selected randomly, using commonly recognized methods of assuring randomness conforming to ASTM D3665 and employing tables of random numbers or computer programs.

3.9.4 Additional Sampling and Testing

**************************************************************************

NOTE: Add bid items for requirements that may need additional testing.

**************************************************************************

The Contracting Officer will request additional samples and tests for any area that appears to deviate from the specification requirements. The Contractor will pay for the cost of any additional testing if tests verify deficient material. If tests verify that materials conform to the specifications, payment will be made under the appropriate bid item. Testing in these areas will be in addition to the lot testing, and the requirements for these areas will be the same as those for a lot.

3.9.5 Testing and Evaluation

**************************************************************************

NOTE: In Table 10 modify testing items and frequency of testing to fit project specific conditions.
Based upon the results of these tests, take the action and submit reports as required in Table 10, and any additional tests to ensure that the requirements of these specifications are met.

### 3.9.6 Calibration of Mixing Plant

Check the accuracy of proportioning for continuous plants by simultaneously securing timed samples of the cementitious materials and the combined aggregate as they are fed to the mixer and weighing each as appropriate.

### 3.9.7 Field Density Testing

**NOTE:** For record, nuclear density gauge readings of
moisture content and density should be taken at 50 mm 2 inch intervals to the thickness of the pavement minus 50 mm2 inches, although the deepest reading only will be the basis for acceptance. The deepest readings of the nuclear density gauges of the Contractor and Government should be checked for agreement. The deepest reading should be approximately 50 mm2 inches less than the depth of the pavement slab.

a. Furnish one operable and properly calibrated single probe nuclear density gauge meeting the requirements of ASTM C1040/C1040M for each paver. Submit a copy of the State license authorizing the use of a nuclear gage, and manufacturer certification that operators have completed an approved safety and gage operation training session. For each gage to be used on site, provide the date of calibration, the calibrating organization, list of calibration standards, and the calibration curve. Include a description of the nuclear density gauge apparatus proposed for use, the manufacturer's literature and the latest manufacturer's calibration results of the nuclear density gauge in the submittal.

b. Determined the maximum wet density or "target density" by ASTM D1557 using a 150 mm 6-inch mold.

c. Perform the density test using a single probe nuclear density gauge operating in the direct transmission mode so density of the full depth of the pavement can be measured. Include test readings at a depth of 2" above the bottom of the lift being placed mm. Report both wet and dry densities, and all individual readings. Determine moisture content at the same depths. Report wet field density as a percentage of the "Target Density" maximum laboratory wet density as determined for that lot. Fill all holes left in the concrete as a result of nuclear density testing with a commercially available pre-packaged nonshrink grout that meets the requirements of ASTM C1107/C1107M.

d. Take additional tests as directed, particularly during start-up and when problems with attaining required density occur. Upon request, provide a nuclear density gauge for Government use.

e. See Appendix A, at the end of this Section for sample density computations. If any nuclear density gauge reading is below 97.8 percent for interior or fresh joint or below 95.8 percent for a cold joint, perform another test within a 1.5 to 2.4 m 5 to 8 foot radius of the previous testing location. If this adjacent reading is also below the density requirements, immediately notified the Contracting Officer, and apply additional vibratory roller passes across the full lane width between the last testing location that produced an acceptable reading and the paver. If additional vibratory roller passes cause the density to decrease or cause the surface texture and appearance to deteriorate in the opinion of the Contracting Officer, discontinue the paving operation until appropriate adjustments are made to the moisture content of the mixture, to the operation of the paver, to rolling procedures, or other operations to assure that the specified density and surface requirements can be achieved.
3.9.8 Concrete Strength

Contractor Quality Control is responsible for the following steps for concrete strength determination:

a. Correlation of Beams and Cylinders in Laboratory, Cylinders in Field

   (1) Take samples for strength tests at the paving site. Fabricate test cylinders in accordance to ASTM C1435/C1435M and cure test cylinders in accordance with ASTM C31/C31M; test them in accordance with ASTM C39/C39M.

   (2) Fabricate and cure 2 test cylinders per sublot from the same batch or truckload and at the same time acceptance cylinders are fabricated and test them for compressive strength at 7-day age.

   (3) Average all 8 compressive tests per lot. Convert this average 7-day compressive strength per lot to equivalent 28 day flexural strength using the Correlation Ratio determined during mixture proportioning studies. See Appendix B at the end of this Section.

   **************************************************************************
   **NOTE: Adjust ages to match design requirement.**
   **************************************************************************

   (4) Compare the equivalent 28 day flexural strength from the conversion to the Average Flexural Strength Required for Mixtures from paragraph of same title.

   **************************************************************************
   **NOTE: Adjust ages to match design requirement.**
   **************************************************************************

   (5) If the equivalent average 28 day strength for the lot is below the Average Flexural Strength Required for Mixtures by 138 Pa 20 psi flexural strength or more, at any time, adjust the mixture to increase the strength, as approved.

   **************************************************************************
   **NOTE: Adjust ages to match design requirement.**
   **************************************************************************

   (6) The Contractor's CQC testing agency is responsible for maintaining up-to-date control charts for strength, showing the 7-day CQC compressive strength, the 14-day compressive strength (from acceptance tests) and the 28 day equivalent flexural strength of each of these for each lot.

3.9.9 Surface-Smoothness Determination (Straightedge Testing)

a. Furnish one 3.7 m 12 ft straightedge for each paving spreader for testing the finished surface. Provide straightedges for Government's representative use upon request. Provide straightedges constructed of aluminum or other lightweight metal and blades of box or box-girder cross section with flat bottom reinforced to ensure rigidity and accuracy. Provide straightedges with handles to facilitate movement on the pavement.

b. Test the surface of the pavement with an approved straightedge
immediately after rolling is complete in each area, but not later than 1 hour after the concrete has been placed or test with other approved device that will reveal all surface irregularities varying from the testing edge exceeding tolerances specified in Table 5-LIMITS AND ALLOWABLE VARIATIONS. Test the entire area of the pavement involved in both a longitudinal and a transverse direction on parallel lines 3 m 10 feet or less apart. Hold the straightedge in contact with the surface and moved ahead one-half the length of the straightedge for each successive measurement. Carry straigntedge testing continuously across joints. Perform the testing in the presence of the Contracting Officer.

3.9.10 Surface Texture

After all rolling and curing is complete, provide a smooth and uniform final surface texture over the whole area of the pavement. Provide a final surface that is totally free of any surface pitting, voids or indentations, pockmarks, surface tears, check cracking, segregation or rock pockets, pumped areas, aggregate drag marks, areas loosened by construction operations, and areas where fines have been washed away during the curing process.

3.9.11 Determine Pavement Thickness

Drill 150 mm 6 inch diameter cores from points in the pavement within 7 days after placement of the pavement. A minimum of one core per sublot will be taken from locations selected in a random fashion by the Contracting Officer. After the first 2 lots and the thickness of all cores meet the required specified thickness and examination of the cores show good consolidation with appropriate orientation of aggregates and there are no excessive voids 102 mm 4 inch diameter cores may be used. Refill core holes with a commercially available pre-packaged nonshrink grout meeting the requirements of ASTM C1107/C1107M. Cores will become the property of the Government and may be tested for strength determination or other properties as considered appropriate.

3.9.12 Inspection During Placing

The placing foremen is responsible for supervising all placing operations and for measuring and recording concrete temperatures, ambient temperature, weather conditions, time of placement, yardage placed, and method and location of placement.

a. Cold-Weather Placing. At least once during each shift, inspect all areas subject to cold-weather protection. Record all deficiencies. During removal of protection, measure the concrete and ambient temperatures at least hourly.

b. Hot-Weather Placing and Initial Curing at All Times. When the maximum daily air is likely to exceed 30 degrees C 85 degrees F, take and record the temperature of the concrete mixture at 30-minute intervals during hot-weather placement. Inspect the surface of the base course to ensure that it is sprinkled with water immediately before the concrete is placed and any deficiencies noted. Regardless of ambient temperature, inspect the finished concrete to ensure that it is kept damp until the curing medium is applied and any deficiencies noted and immediately brought to the attention of the Contracting Officer. Correct any deficiencies immediately.

c. Temperature Protection. Notify the Contracting Officer whenever the
concrete temperature is not within specifications limits during the period of protection or protection removal fails to comply with the specifications requirements, and take immediate steps to correct the situation. Regardless of the ambient temperature, stop mixing and placing operations, and notify the Contracting Officer when the temperature of the concrete mixture exceeds 32 degrees C 90 degrees F.

d. Curing Operation. Inspect the curing operation to assure that the surface of the pavement is kept very moist (or wet) continuously until the end of the curing period. Notify the Contracting Officer when any pavement surface is allowed to dry before the end of the curing period, and take immediate steps to correct the situation.
APPENDIX A

Example of Computations

1.0 Field Density.
The calculation of computed percent payment based on field density is illustrated below for a typical set of field tests on the lane interior and on the fresh and cold joints in a typical lot. Assume the following test results for field density made on the lot:

   a. Average lane interior density: 98.0 percent (of target density)
   b. Average fresh joint density: 97.7 percent (of target density)
   c. Average cold joint density: 95.4 percent (of target density)
   d. Total area of lot: 2,790 sq m 30,000 sq ft (3,333 sq yd)
   e. Length of completed fresh longitudinal construction joint: 610 m (2000 ft) (Paving lane on each side of joint complete)
   f. Length of cold longitudinal construction joint: 228 m (750 ft) (Paving lane on one side of joint constructed with this lot)

Step 1: Determine percent payment based on lane interior density and on fresh joint and on cold joint density, using Table 1.

   a. Lane interior density of 98.0 percent: 100.0 percent payment
   b. Fresh joint density of 97.7 percent: 98.2 percent payment
   c. Cold joint density of 95.4 percent: 86.5 percent payment

Step 2: Determine percent payment deduction based on lane interior density and on both fresh and cold joint density by subtracting each percent payment from 100.

   a. Lane interior: 100 percent - 100.0 percent = 0.0 percent deduction
   b. Fresh joint: 100 percent - 98.2 percent = 1.8 percent deduction
   c. Cold joint: 100 percent - 86.5 percent = 13.5 percent deduction

Step 3: Determine ratio of fresh joint strip area to lane interior area (total paved area in the lot).

   Multiply the length of completed fresh longitudinal construction joint by the specified 3 m 10 ft width and divide by the lane interior area (total paved area in the lot):

   \[ \frac{610 \, \text{m} \times 3 \, \text{m}}{2790 \, \text{sq m}} = \frac{2000 \, \text{ft} \times 10 \, \text{ft}}{30000 \, \text{sq ft}} = 0.6667 \text{ ratio of fresh joint strip area to lane interior area} \]

Step 4: Determine the weighted percent payment deduction for fresh joint density:

   Multiply percent payment deduction for fresh joint density by ratio of fresh joint strip area to lane interior area:
1.8 percent \times 0.6667 = 1.2 percent weighted percent payment deduction for fresh joint density

Step 5: Determine ratio of cold joint strip area to lane interior area (total paved area in the lot):

Multiply the length of completed cold longitudinal construction joint (one side) by the specified 1.5 m 5 ft width and divide by the lane interior area (total paved area in the lot):

\[
228 \text{ m} \times 1.5 \text{ m} / 2790 \text{ sq ft} = 0.125 \text{ ratio of cold joint strip area to lane interior area}
\]

Step 6: Determine the weighted percent deduction for cold joint density:

Multiply percent payment deduction for cold joint density by ratio of cold joint strip area to lane interior area:

\[
13.5 \text{ percent} \times 0.125 = 1.7 \text{ percent payment deduction for cold joint density}
\]

Step 7: Compare weighted percent payment deduction for fresh joint area, for cold joint area, and for lane interior density, and select the larger:

a. Percent payment deduction for lane interior density: 0.0 percent
b. Weighted percent payment deduction for fresh joint density: 1.2 percent
c. Weighted percent payment deduction for cold joint density: 1.7 percent
d. Select the larger = 1.7 percent

Step 8: Determine computed percent payment based on field density by subtracting the larger value from Step 7 from 100:

\[
100 - 1.7 \text{ percent} = 98.3 \text{ percent computed percent payment based on field density.}
\]

2.0 Thickness
A lot in which 18 percent of the area is deficient in thickness by an average of 10 mm 3/8 inch (Category II) will have a computed percent payment for thickness of:

<table>
<thead>
<tr>
<th>Category</th>
<th>Proportion of Total Lot Area</th>
<th>Percent Payment From Table 2</th>
<th>Weighted Percent Payment</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>(1.0-0.18) = 0.82</td>
<td>\times 100</td>
<td>82.0</td>
</tr>
<tr>
<td>II</td>
<td>0.18</td>
<td>\times 65</td>
<td>11.7</td>
</tr>
</tbody>
</table>

Computed Percent Payment for Total Lot = 93.7
APPENDIX B

Procedure for Molding RCC Test Specimen for Flexural Strength Testing Using a Vibrating Hammer:

A-1 Field of Application

The procedure is for molding RCC test specimens using a vibrating hammer for third-point flexural-strength testing. Utilize a maximum aggregate size of not to exceed 25 mm (1 inch).

A-2 Equipment

1. Rectangular steel molds with inside measurements of 100 x 100 x 400 mm (6-inch x 6-inch x 16-inch).

2. Utilize a vibrating hammer, conforming to ASTM C1435/C1435M, having a 10 ± 2 kg weight, having a minimum power input of 900W and being capable of providing 2000 impacts/minute.

3. Removable steel collar to contain the last layer of RCC.

4. Steel compaction plate with a minimum thickness of 15 mm (0.6-inch) that can fit into the rectangular mold.

5. Steel finishing plate with a minimum thickness of 15 mm (0.6-inch) that can fit into the rectangular mold.

A-3 Molding Specimens for Flexural-Strength Testing

1. Produce specimens within 20 min of collecting the sample.

2. Using the wet density of the RCC, weigh a quantity of fresh concrete corresponding to the volume of the test specimen to be produced.

3. Use a flat shovel to fill the mold to the halfway point, moving the shovel along the rim of the mold to distribute the concrete evenly and keeping segregation to a minimum. A tamping rod can be used to spread the concrete evenly within the mold prior to consolidation.

4. Compact the concrete until the mold is half full. Install the collar. Put in the remaining concrete and compact it.

5. Remove the collar, place the steel plate on top of the mold, and complete consolidation by applying the compactor to the steel plate.

6. Spray all concrete surfaces with an evaporation retarder. Immediately cover the specimens with a nonabsorbent, nonreactive plate to retard evaporation.

7. Store the specimens on a rigid, level surface protected from sunlight, vibration, and other disturbances in an environment maintained at a temperature of 15 to 25°C (60 to 77°F). The specimens should be removed from the molds 24 ± 4 h after fabrication and moist-cured at a temperature of 21 to 25°C (70 to 77°F) so that they are constantly covered with a thin coating of moisture until time of testing. Do not expose specimens to running water.

A-4 Flexural-Strength Testing

Perform flexural testing in accordance with ASTM C78/C78M.

  3.16.4  Reports

-- End of Section Table of Contents --
NOTE: This specification is for concrete pavements exposed to temperatures of 482 degrees C (900 degrees F) or higher, referred to herein as High Temperature Concrete. Heat Resistant recommendations exist for concrete exposed to moderate temperatures of 149 to 482 degrees C (300 to 900 degrees F) per ETL 14-2 but are also applicable to the specification. Those responsible for design and construction of High Temperature Concrete pavement should familiarize themselves with the most current criteria pertaining to High Temperature Concrete. The most current criteria may be obtained from the cognizant Corps of Engineers Transportation Systems Center (TSMCX), the Air Force Civil Engineer Center (AFCEC) pavement Subject Matter Expert (SME), or Naval Facilities Engineering Command (NAVFAC, Echelon III) Pavement Engineer.

This specification is based on ETL 14-4, Vertical Landing Zone (VLZ) and Other Airfield Pavement Design and Construction Using High Temperature Concrete and NAVFAC EXWC Technical Report - traprock Aggregate Characterization for High Temperature Concrete.

Tailoring options are for both traprock & lightweight aggregates (TRAPROCK & LIGHTWEIGHT), traprock aggregate only (TRAPROCK), lightweight aggregate only (LIGHTWEIGHT), US customary and metric units. To properly tailor this specification, choose one of the three Tailoring options and hide the other two. For instance, if you chose TRAPROCK & LIGHTWEIGHT to show both, you would hide the individual Tailoring options for TRAPROCK and LIGHTWEIGHT. When tailoring for traprock or lightweight, check for bracketed items to edit. Use the traprock tailoring option whenever possible. Traprock aggregates require deleterious
materials and Alkali-Silica Reaction testing similar to normal airfield concrete; lightweight aggregates are a manufactured product to ASTM C330/C330M standards and do not require deleterious or Alkali-Silica Reaction testing.

This specification includes the ability to place the thigh temperature concrete via hand placement with a vibrating truss screed, or a fixed or slipform paver. Continuously reinforced concrete placements must always be performed with a vibrating truss screed. It is encouraged to avoid using a slipform paver, however there are some plain jointed applications where this method of placement would be advantageous.

This specification is to be used only with the written approval of the cognizant Corps of Engineers Transportation Systems Center (TSMCX), the Air Force Civil Engineer Center (AFCEC) pavement Subject Matter Expert (SME), or Naval Facilities Engineering Command (NAVFAC, Echelon III) Pavement Engineer.

If used on Design/Build projects, this section must be prepared by the Government RFP preparer. Edit this guide specification for project specific requirements by deleting non applicable paragraphs only. For bracketed items, choose applicable item(s) or insert appropriate information. No further edited by the contractor's designer of record, unless specifically stated otherwise in the contract documents is authorized.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

***************************************************************

PART 1   GENERAL

***************************************************************

NOTE: In preparing contract specifications for concrete pavement, the designer will use UFC 3-250-04 STANDARD PRACTICE FOR CONCRETE PAVEMENTS for guidance. State highway specifications may not
Specifications developed for Corps of Engineers managed projects must be edited in accordance with ER 1110-34-1 Engineering and Design Transportation Systems Mandatory Center of Expertise (Section 11, 12, App A, B, C).

Contact the Corps of Engineers Transportation Systems Center (TSMCX), the Air Force Civil Engineer Center (AFCEC) pavement Subject Matter Expert (SME), or Naval Facilities Engineering Command (NAVFAC) for guidance on interpreting and editing this specification section.

This specification section is structured for Contractor sampling and testing of materials and mixture proportioning. If Government sampling, testing and mixture proportioning is required, contact the TSMCX, AFCEC pavement SME, or NAVFAC for specification language.

**************************************************************************

1.1 UNIT PRICES

**************************************************************************

NOTE: For Lump Sum payment, include concrete unit price from Government estimate in paragraph PAYMENTS to provide cost basis for calculating payment reduction.

**************************************************************************

1.1.1 Measurements

The quantity of concrete to be paid for will be the volume of concrete in cubic meters yards including thickened edges [monolithic curb], where required, placed in the completed and accepted pavement. Concrete will be measured in place in the completed and accepted pavement only within the neat line dimensions shown in the plan and cross section. No deductions will be made for rounded or beveled edges or the space occupied by pavement reinforcement, dowel bars, or electrical conduits, nor for any void, or other structure extending into or through the pavement slab, measuring 0.1 cubic meter 3 cubic feet or less in volume. No other allowance for concrete will be made unless placed in specified locations in accordance with the approved contract modification. The quantity of other materials specified herein, and used in the construction of the work covered by this section, will not be measured for payment, but will be considered a subsidiary obligation, covered under the price per cubic meter yard for concrete. Joint sealing materials are covered in Section 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT or Section 32 13 73.19 COMPRESSION CONCRETE PAVING JOINT SEALANT.

1.1.2 Payments

**************************************************************************

NOTE: Use the applicable paragraph from the two choices below and delete the other.

If this specification is used for the to construct a
UFGS certified F-35B landing or hover point, typical of Vertical Landing Pads and LHA Simulators, use Lump Sum.

This specification is not intended to be used as the primary pavement of Runways and Taxiways unless there is a specific operational need to do so. The use of Unit Price should be limited to large areas such as Aprons in support of MV-22 operations.

**************************************************************************

1.1.2.1 Unit Price

The quantity of concrete measured as specified above will be paid for at the contract unit price when placed in completed and accepted pavements. Payment will be made at the contract price for cubic meter yard for the scheduled item, with necessary adjustments as specified below. Payment will constitute full compensation for providing all materials, equipment, plant and tools, and for all labor and other incidentals necessary to complete the concrete pavement, except for other items specified herein for separate payment.

1.1.2.2 Lump Sum

The quantity of concrete will be paid for and included in the lump-sum contract price. If less than 100 percent payment is due based on the pay factors stipulated below, a unit price of [_____] per cubic meter yard will be used for purposes of calculating the payment reduction.

1.1.3 Payment of Lots

When a lot of material fails to meet the specification requirements, that lot will be accepted at a reduced price or be removed and replaced. The lowest computed percent payment determined for any pavement characteristic discussed below (for example, thickness, grade, and surface smoothness) becomes the actual percent payment for that lot. The actual percent payment will be applied to the unit price and the measured quantity of concrete in the lot to determine actual payment. Use results of strength tests to control concreting operations. Strength will be evaluated, but will not be considered for payment adjustment. Remove and replace any pavement not meeting the required 'Concrete Strength for Final Acceptance' at no additional cost to the Government.

1.1.4 Payment Adjustment for Smoothness

1.1.4.1 Straightedge Testing

Record location and deviation from straightedge for all measurements. When more than 5.0 and less than or equal to 10.0 percent of all measurements made within a lot exceed the tolerance specified in paragraph SURFACE SMOOTHNESS, after any reduction of high spots or removal and replacement, the computed percent payment based on surface smoothness will be 95 percent. When more than 10.0 percent and less than or equal to 15.0 percent of all measurements exceed the tolerance, the computed percent payment will be 90 percent. When more than 15.0 and less than or equal to 20.0 percent of all measurements exceed the tolerance, the computed percent payment will be 75 percent. Remove and replace the lot when more than 20.0 percent of the measurements exceed the tolerance, at no additional cost to the Government.
1.1.4.2 Profilograph Testing

Record location and data from all profilograph measurements. When the Profile Index of a 0.1 km 0.1 mile segment of a lot exceeds the tolerance specified in paragraph SURFACE SMOOTHNESS by 16 mm per km 1.0 inch per mile but less than 32 mm per km 2.0 inches per mile, after any reduction of high spots or removal and replacement, the computed percent payment based on surface smoothness will be 95 percent. When the Profile Index exceeds the tolerance by 32 mm per km 2.0 inches per mile but less than 47 mm per km 3.0 inches per mile, the computed percent payment will be 90 percent. When the Profile Index exceeds the tolerance by 47 mm per km 3.0 inches per mile but less than 63 mm per km 4.0 inches per mile, the computed percent payment will be 75 percent. Remove and replace the lot when the Profile Index exceeds the tolerance by 63 mm per km 4.0 inches per mile or more, at no additional cost to the Government.

1.1.5 Payment Adjustment for Plan Grade

When more than 5.0 and less than or equal to 10.0 percent of all measurements made within a lot are outside the specified tolerances, the computed percent payment for that lot will be 95 percent. When more than 10.0 percent but less than 50 percent are outside the specified tolerances, the computed percent payment for the lot will be 75 percent. Remove and replace the deficient area where the deviation from grade exceeds the specified tolerances by 50 percent or more, at no additional cost to the Government.

1.1.6 Payment Adjustment for Thickness

Using the Average Thickness of the lot, determine the computed percent payment for thickness by entering the following table:

<table>
<thead>
<tr>
<th>Deficiency in Thickness Determined by cores</th>
<th>Pavements Equal To or Greater Than 200 mm 8 inches Thick</th>
<th>Pavements Less Than 200 mm 8 inches Thick</th>
</tr>
</thead>
<tbody>
<tr>
<td>millimeters inches</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| 0.00 to 6.2 0.00 to 0.24                  | 100                                                      | 100                                      |
| 6.3 to 12.5 0.25 to 0.49                  | 75                                                       | 65                                       |
| 12.6 to 18.9 0.50 to 0.74                 | 50                                                       | 0                                        |
| 19.0 0.75 or greater                     | 0                                                       | 0                                        |

Where 0 percent payment is indicated, remove the entire lot and replace at no additional cost to the Government. Where either of the two cores from a sublot show a thickness deficiency of 19 mm 0.75 inch or greater, [13 mm 0.50 inch for pavements 200 mm 8 inches or less in thickness] drill two more cores in the sublot and compute the average thickness of the four cores. If this average shows a thickness deficiency of 19 mm 0.75 inch or more [13 mm 0.50 inch for pavements 200 mm 8 inches or less in thickness]
remove the entire sublot.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SUBMITTALS

***********************************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets
following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

1.4 QUALITY CONTROL

1.4.1 Contractor Quality Control Staff

Reference Section 01 45 00.00 10 QUALITY CONTROL for Contractor personnel qualification requirements. Submit American Concrete Institute certification for Contractor Quality Control Staff. Qualifications and resumes for petrographer, surveyor, concrete batch plant operator, and profilograph operator. All Contractor Quality Control personnel assigned to concrete construction are required to be American Concrete Institute (ACI) certified in the following grade:

a. The minimum requirements for the CQC System Manager consist of being a graduate engineer or a graduate of construction management, with a minimum of 5 years airfield construction experience and a minimum of 1 year experience as a CQC System Manager on an airfield construction project.

b. CQC personnel responsible for inspection of concrete paving operations: ACI Concrete Transportation Inspector. The ACI Concrete Transportation Inspector is required to be present at the paving site during all paving operations, with the exception of the initial saw cutting operation. The QC manager is required to be present during initial saw cutting operations.

c. CQC staff is required to oversee all aspects of sawing operations (sawing, flushing, vacuuming, checking for random cracking, lighting).
d. Lead Foreman or Journeyman of the Concrete Placing, Finishing, and Curing Crews: ACI Concrete Flatwork Technician/Finisher.

e. Batch Plant Manufacturer’s Representative: A representative from the batch plant manufacturer is required to be on-site to inspect and make necessary adjustments to all components of the batch plant including but not limited to aggregate bin weighing operations, water metering, cement and fly ash weighing devices. All necessary inspections and adjustments by the manufacturer representative is required to be performed prior to uniformity testing. Submit a written Batch Plant Manufacturer's Inspection Report signed by the representative noting all inspection items and corrections and stating the batch plant is capable of producing the volume of concrete as required herein.

f. Field Testing Technicians: ACI Concrete Field Testing Technician, Grade I.

g. Slipform Paving Equipment Manufacturer’s Representative: A representative of the slipform paving equipment manufacturer is required to be on-site to inspect and make corrections to the paving equipment to ensure proper operations. Perform a complete and full hydraulic flow test of the vibrator system prior to the test section being placed. Submit a written Slipform Paver Manufacturer's Inspection Report signed by the manufacturer's representative noting all inspections, corrections, and flow tests have been performed and the paver is in a condition to perform the required work.

h. Laboratory Testing Technicians: ACI Concrete Strength Testing Technician and Laboratory Testing Technician, Grade I or II.

1.4.2 Other Staff

Submit for approval, the qualifications and resumes for the following staff:

a. Petrographer: Bachelor of Science degree in geology or petrography, trained in petrographic examination of concrete aggregate according to ASTM C294 and ASTM C295/C295M and trained in identification of the specific deleterious materials and tests identified in this specification. Detail the education, training and experience related to the project-specific test methods and deleterious materials in the Resume and submit at least 20 days before petrographic and deleterious materials examination is to commence.

b. Licensed Surveyor: Perform all survey work under the supervision of a Licensed Surveyor.

c. Concrete Batch Plant Operator: National Ready Mix Concrete Association (NRMCA) Plant Manager certification.

d. Profilograph Operator: Certification by equipment manufacturer or a state Department of Transportation.

1.4.3 Laboratory Accreditation and Validation

**************************************************************************
NOTE: The USACE validation letter requirement does not apply to the Navy.
**************************************************************************
Provide laboratory and testing facilities. Submit accreditation of the commercial laboratory by an independent evaluation authority, indicating conformance to ASTM C1077, including all applicable test procedures. The laboratories performing the tests are required to be accredited in accordance with ASTM C1077, including ASTM C78/C78M and ASTM C1260. Provide current accreditation and include the required and optional test methods, as specified. In addition, all contractor quality control testing laboratories performing acceptance testing require USACE validation by the Material Testing Center (MTC) for both parent laboratory and on-site laboratory. Validation on all laboratories is required to remain current throughout the duration of the paving project. Contact the MTC manager listed at http://www.erdc.usace.army.mil/Media/FactSheets/FactSheetArticleView/tabid/9254/Article/ for costs and scheduling. Provide on-site temperature-controlled concrete curing facilities.

1.4.3.1 Aggregate Testing and Mix Proportioning

Aggregate testing and mixture proportioning studies are required to be performed by a commercial laboratory.

1.4.3.2 Acceptance Testing

Provide all materials, labor, and facilities required for molding, curing, testing, and protecting test specimens at the paving site and in the laboratory. Provide steel molds for molding the beam specimens. Provide and maintain boxes or other facilities suitable for storing and curing the specimens at the paving site while in the mold within the temperature range stipulated by ASTM C31/C31M. Provide flexural loading equipment in accordance with ASTM C78/C78M.

1.4.3.3 Contractor Quality Control

All sampling and testing is required to be performed by an approved, on-site, independent, commercial laboratory, or for cementitious materials and admixtures, the manufacturer's laboratory.

1.4.3.4 Laboratory Inspection

The Government will inspect all laboratories requiring validation for equipment and test procedures prior to the start of any concreting operations for conformance to ASTM C1077. Schedule and provide payment for laboratory inspections. Additional payment or a time extension due to failure to acquire the required laboratory validation is not allowed. The laboratory is to maintain this certification for the duration of the project.

1.4.4 Preconstruction Testing of Materials

******************************************************************************
NOTE: Designer must edit this paragraph and following subparagraphs as appropriate. For Design Build Contracts the testing must be performed by the Contractor utilizing an approved petrographer and commercial testing laboratory. Delete any subparagraphs which are not applicable. Fill in blanks as appropriate.
******************************************************************************
All sampling and testing is required to be performed. Use an approved commercial laboratory or, for cementitious materials and chemical admixtures, a laboratory maintained by the manufacturer of the material. Materials are not allowed to be used until notice of acceptance has been given. Additional payment or extension of time due to failure of any material to meet project requirements, or for any additional sampling or testing required is not allowed. Additional tests may be performed by the Government; such Government testing does not relieve any required testing responsibilities.

1.4.4.1 Aggregates

**************************************************************************
NOTE: Delete 'test section' for Design-Bid-Build projects. Delete 'contract award' for Design-Bid projects.
**************************************************************************

Sample aggregates in the presence of a Government Representative. Obtain samples in accordance with ASTM D75/D75M and be representative of the materials to be used for the project. Perform all aggregate tests no earlier than 120 days prior to [contract award][test section]. Submit test results a minimum of 7 days before commencing mixture proportioning studies.

1.4.4.2 Chemical Admixtures, Curing Compounds and Epoxies

At least 30 days before the material is used, submit certified copies of test results for the specific lots or batches to be used on the project. Provide test results less than 6 months old prior to use in the work. Retest chemical admixtures that have been in storage at the project site for longer than 6 months or that have been subjected to freezing, and rejected if test results do not meet manufacturer requirements.

1.4.4.3 Cementitious Materials

Cement, slag cement, [and pozzolan ]will be accepted on the basis of manufacturer's certification of compliance, accompanied by mill test reports showing that the material in each shipment meets the requirements of the specification under which it is provided. Provide mill test reports no more than 1 month old, prior to use in the work. Do not use cementitious materials until notice of acceptance has been given. Cementitious materials may be subjected to testing by the Government from samples obtained at the mill, at transfer points, or at the project site. If tests prove that a cementitious material that has been delivered is unsatisfactory, promptly remove it from the project site. Retest cementitious material that has not been used within 6 months after testing, and reject if test results do not meet manufacturer requirements.

1.4.4.4 Multifilament Polypropylene Fibers

**************************************************************************
NOTE: Retain this paragraph for High Temperature Concrete supporting F-35B operations. Delete this paragraph if High Temperature Concrete is only intended to be used by V-22 aircraft.
**************************************************************************

Deletion of this paragraph will preclude any F-35B vertical landing operations on this High Temperature Concrete.
Concrete.

Multifilament polypropylene fibers will be accepted on the basis of the manufacturer's certification of compliance, accompanied by test reports showing that the material in each shipment meets the requirements of the specification under which it is furnished. Test reports must be no older than 6 months, prior to use in the work. Fibers may be subjected to check testing by the Government from samples obtained at the manufacturer site, at transfer points, or at the project site. Promptly remove all unsatisfactory fiber material that has been delivered to the site. Retest fibers that have not been used within 6 months after initial testing at the Contractor's expense. The Government can reject fiber material if results are not satisfactory.

1.4.5 Testing During Construction

During construction, the Contractor is responsible for sampling and testing aggregates, cementitious materials, and concrete as specified herein. The Government will sample and test concrete and ingredient materials as considered appropriate. Provide facilities and labor as may be necessary for procurement of representative test samples. Testing by the Government will in no way relieve the Contractor of the specified testing requirements.

NOTE: Purpose of test batches and test sections is for Contractor to optimize mixture to placement conditions. Traprock usually will only require a few of the 10 test patches. Test batches are required, as it is important that the mix have sufficient paste to close concrete surface. Traprock mixtures are very similar to normal weight airfield concrete, with the exception of fibers influencing the finishing of the surface. Finishing concrete with lightweight aggregates requires additional mixture optimization efforts to meet requirements and will likely use all 10 batches. Test batches are not required to be cured. Test sections are vital for High Temperature Concrete as sequencing of forming, steel placement, use of telebelt and developing surface finishing techniques are critical prior to actual placement.

1.4.6 Test Batches and Sections

NOTE: Use Test Sections for Continuously Reinforced Concrete paragraph in areas where CRC is required, such as for F-35B Vertical Landing Pad Landing Zones or other areas that may experience high jet blast pressures. Seek Echelon III guidance where other areas may be applicable.

For continuously reinforced concrete used for isolated areas that necessitate an absence of joints, such as vertical landing pads, use the first bracketed paragraph.
For plain jointed concrete used for large areas, such as aprons, use the second bracketed paragraph.

Coordinate with the End User regarding the location of the test batches and test sections. The intent for test batches and test sections is to simulate production paving, thus delivery distance, smoothness of the roads, access through ECP’s, etc. may not be fully understood if the Test Batches and Test Sections are selected at a locations which do not represent what will be experienced during production paving.

**************************************************************************

a. At least 10 days but not more than 90 days prior to construction of the concrete pavement, conduct trial batches and build two test sections as described herein. Provide a dedicated concrete batch plant for the Test Batch, Test Section and Production Paving production while batching is being conducted for that day. To avoid cross contamination, it is not permissible to produce other loads of other concrete between loads of High Temperature Concrete.

b. Prepare up to five, 3.8 cubic meter 5 cubic yard traprock batches, five, 3.8 cubic meter 5 cubic yard light weight batches or ten, 3.8 cubic meter 5 cubic yard light weight batches of High Temperature Concrete to optimize mix proportions to field conditions. Start test Batches no sooner than 60 days and completed no later than 30 days prior to production paving. Prepare batches in the presence and to the satisfaction of the Government. Batches may be placed at or near batch plant to improve coordination of mix proportion adjustment. Conduct test batches at or near the batch plant to simulate travel time to site. Place batches in forms, nominally 3 m x 3 m 10 feet by 10 feet and 300 mm 12 inches thick. Provide hand-held vibrators, strike-off and hand floats similar to what will be used for production and paving. It is not required to cure test batch pads; this enables observation of time to any potential cracking.

c. Fabricate and cure six beams and six cylinders per test batch in accordance with ASTM C1231/C1231M, using 150 mm x 150 mm 6 x 6 inch steel forms and 150 mm x 300 mm 6 x 12 inch single-use or steel cylinder forms. Cure and test 2 beams and 2 cylinders at 3, 7 and 28 days. Test beams in accordance with ASTM C78/C78M, cylinders in accordance with ASTM C39/C39M. Extract two 150 mm 6 inch diameter cores from selected pads. Contracting Officer may reduce the amount of testing.

d. Concrete loads that are rejected due to noncompliance of this specification, including temperature, slump and water/cement ratio, do not count as part of the ten test batches.

[1.4.6.1 Test Sections - Continuously Reinforced Concrete]

Construct two test sections near the job site at a location agreed upon with Contracting Officer, but not as part of the production pavement area. Commence test section paving after Government and Contractor have agreed upon target proportions from Test Batches. Use the test sections to develop and demonstrate to the satisfaction of the Contracting Officer the proposed techniques of SSD stockpile moisture content determination during
production paving, mixing, hauling, placing, consolidating, finishing, brooming, curing, initial saw cutting, start-up procedures, testing methods, plant operations, and the preparation of the construction joints. Include use of proposed conveyor at maximum extension necessary for production paving. Variations in mixture proportions can only be made in the presence of the Contracting Officer. Calibrate and operate the mixing plant prior to start of placing the test section. Use the same equipment, materials, and construction techniques on the test section as will be used in all subsequent work, including reinforcing steel. Provide base course preparation of six inch thick layer of the same granular base, concrete production, placing, consolidating, curing, construction of joints, and all testing in accordance with applicable provisions of this specification. Within three days after completion of each test section, provide up to six cores 150 mm 6 inch diameter by full depth cut from points selected in the test section by the Government. The cores will be evaluated by the Government. Construct the test section meeting all specification requirements and being acceptable to the Contracting Officer in all aspects, including surface texture. Failure to follow specification requirements will necessitate construction of additional test sections at no additional cost to the Government. Do not commence production paving until the results on aggregates and concrete, concrete has reached the specified 28 day strength, and evaluation of the cores, and all pavement measurements for actual plan grade, surface smoothness and thickness have been submitted and approved by the Contracting Officer.

a. First Test Section

Construct the first test section to consist of one paving lane at least 30 m 100 feet long and constructed 300 mm 12 inches thick on a 150 mm 6 inch thick layer of the same granular base prepared and compacted as required for the production paving. Provide a lane width of 20 feet. Wet cure pilot lane for 14 days.

b. Second Test Section

Construct a second test section lane adjacent to the first lane with the same dimensions as the first test lane after the minimum wet cure time of first lane per paragraph WET CURING. Purpose is to further evaluate joint construction methods, differential shrinkage and Contractor's work sequencing. Provide a header at the end of the lane. To demonstrate an unplanned transverse construction joint, provide a split header with reinforcement protruding. All requirements for the test section are applicable, as appropriate. Wet cure fill-in lane.

c. Cracks in Test Sections

Cracks are expected to, but do not always, develop in test sections. If cracks do occur in test section lanes, inform Contracting Officer to notify cognizant Corps of Engineers Transportation Systems Center (TSMCX), the Air Force Civil Engineer Center (AFCEC) pavement Subject Matter Expert (SME), or Naval Facilities Engineering Command (NAVFAC, Echelon III) Pavement Engineer.

[1.4.6.2 Test Section - Plain Jointed Concrete]

**************************************************************************
NOTE: Use Test Sections for Non-Continuously Reinforced Concrete paragraph for areas that only
necessitate jointed heat resistant concrete. This may be applicable for F-35B Vertical Landing Pad Safety Zones, parking, warmup, and holding areas. Test section areas may be reduced to half a lot where areas are small like the F-35B Vertical Landing Zones.

If test section is not to be part of the production pavement area, delete the two bracketed sentences referring to test sections constructed as part of production pavement and production lot payment.

**************************************************************************

Up to 10 days, but not more than 60 days, prior to construction of the concrete pavement, construct a test section [near the job site, but not as part of the production pavement area. ] [as part of the production paving area at an outer edge as indicated on the drawings. ] Construct test section of the same depth as the course which it represents. The underlying grade or pavement structure upon which the test section is to be constructed is required to be the same as the remainder of the course represented by the test section. The equipment used in construction of the test section is required to be the same equipment to be used on the remainder of the course represented by the test section. Use the test section to develop and demonstrate the proposed techniques of mixing, hauling, placing, consolidating, finishing, curing, initial saw cutting, start-up procedures, testing methods, plant operations, and the preparation of the construction joints. Perform variations in mixture proportions, other than water, if directed. Operate and calibrate the mixing plant prior to start of placing the test section. Use the same equipment, materials, and construction techniques on the test section proposed for use in all subsequent work. Perform base course preparation, concrete production, placing, consolidating, curing, construction of joints, and all testing in accordance with applicable provisions of this specification. Three days after completion of the test section, provide eight cores at least 150 mm 6 inches in diameter by full depth cut from points selected in the test section by the Government. Construct the test section meeting all specification requirements and being acceptable in all aspects, including surface texture, thickness, grade, and longitudinal and transverse joint alignment. Failure to construct an acceptable test section necessitates construction of additional test sections at no additional cost to the Government. [ Remove test sections allowed to be constructed as part of the production pavement which do not meet specification requirements at no expense to the Government. ] If slipform paving is performed and is unable to construct an acceptable test section, repair or replace the slipform paving equipment, or paving completed using fixed-forms and equipment compatible with them and allowed by the specification. Do not commence production paving until the results on aggregates and concrete, including evaluation of cores, and all pavement measurements for edge slump, joint face deformation, actual plan grade, surface smoothness and thickness have been submitted and approved. [ Pavement accepted as a production lot will be evaluated and paid as specified in PART 1 GENERAL.]

1.4.6.2.1 Pilot Lane

Construct the test section consisting of one paving lane at least 130 m 400 feet long and to the same thickness as the thickest portion of pavement shown on the Drawings. Construct at the same lane width as that required for use in the project. Provide at least one transverse construction joint in the test section. If [keyed or ] doweled longitudinal construction
joints are required in any of the production pavements, install them full length along one side of the test lane throughout the test section.  [If both keys and dowels are required, install each in half of the test section.] Construct the test section on two separate days.

1.4.6.2.2  Fill-In Lane

Consider the first 130 m 400 feet of the initial production fill-in lane as a fill-in lane test section for purposes of testing and evaluation. All requirements for the test section are applicable. Obtain cores from the fill-in lane side of the longitudinal construction joint with the pilot lane.

1.4.7  Acceptability of Work

The materials and the pavement itself will be accepted on the basis of production testing. The Government may make check tests to validate the results of the production testing. If the results of the production testing vary by less than 2.0 percent of the Government’s test results, the results of the production testing will be used. If the results of the Government and production tests vary by 2.0 percent, but less than 4.0 percent, the average of the two will be considered the value to be used. If these vary by 4.0 percent or more, carefully evaluate each sampling and testing procedure and obtain another series of Government and production tests on duplicate samples of material. If these vary by 4.0 percent or more, use the results of the tests made by the Government and the Government will continue check testing of this item on a continuous basis until the two sets of tests agree within less than 4.0 percent on a regular basis. Testing performed by the Government does not relieve the specified testing requirements.

1.4.8  Acceptance Requirements

******************************************************************************
NOTE: The lot size can be specified on the basis of time or volume of production. Normally, it is most practical for construction oversight if a lot is made equal to one shift, but not over 10 hours. If the lot size is based on the amount of production, it is to be selected to be approximately equal to the amount of concrete pavement produced in one shift (one day) of operation. The lot size must never exceed 750 cubic meters 1000 cubic yards of concrete pavement. When the total job does not exceed 750 cubic meters 1000 cubic yards, the lot size becomes the total job. Edit the following paragraphs accordingly. Do not change terminology (for instance computed percent payment, actual percent payment).

For continuously reinforced concrete used for isolated areas that necessitate an absence of joints, such as vertical landing pads, use the first bracketed paragraph.

For plain jointed concrete used for large areas, such as aprons, use the second bracketed paragraph.
******************************************************************************
1.4.8.1 Pavement Lots - Continually Reinforced Concrete

A lot will be that quantity of construction that will be evaluated for acceptance with specification requirements. A lot will be equal to one shift of production, not to exceed 76 cubic meters 100 cubic yards for continuously reinforced areas. For non-continuously reinforced areas, a lot is equal to one shift of production, not to exceed 230 cubic meters 300 cubic yards. Each lot will be divided into two equal sublots. Grade and surface smoothness determinations will be made on the lot as a whole. All samples locations are to be selected on a random basis in accordance with ASTM D3665.

1.4.8.2 Pavement Lots - Plain Jointed Concrete

A lot is that quantity of construction to be evaluated for acceptance with specification requirements. A lot is equal to one shift of production not to exceed 750 cubic meters 1000 cubic yards. In order to evaluate thickness, divide each lot into four equal sublots. A sublot is equal to one shift of production not to exceed 190 cubic meters 250 cubic yards. Grade determinations will be made on the lot as a whole. Surface smoothness determinations will be made on every 0.1 km 0.1 mile segment in each lot. Select sample locations on a random basis in accordance with ASTM D3665. When operational conditions cause a lot to be terminated before the specified four sublots have been completed, use the following procedure to adjust the lot size and number of tests for the lot. Where three sublots have been completed, they constitute a lot. Where one or two sublots have been completed, incorporate them into the next lot (except for the last lot), and the total number of sublots used and acceptance criteria adjusted accordingly.

1.4.8.3 Evaluation

Provide all sampling and testing required for acceptance and payment adjustment, including batch tickets with all required acceptance testing. Individuals performing sampling, testing and inspection duties are required to meet the Qualifications. The Government reserves the right to direct additional samples and tests for any area which appears to deviate from the specification requirements. Testing in these areas are in addition to the sublot or lot testing, and the requirements for these areas are the same as those for a sublot or lot. Provide facilities for and, where directed, personnel to assist in obtaining samples for any Government testing.

1.4.8.4 Additional Sampling and Testing

The Contracting Officer reserves the right to direct additional samples and tests for any area which appears to deviate from the specification requirements. Testing in these areas will be in addition to the sublot or lot testing, and the requirements for these areas will be the same as those for a sublot or lot. Provide facilities for and, where directed, personnel to assist in obtaining samples for any Government testing.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Bulk Cementitious Materials

Provide all cementitious materials in bulk at a temperature, as delivered to storage at the site, not exceeding 65 degrees C 150 degrees F. Provide sufficient cementitious materials in storage to sustain continuous operation of the concrete mixing plant while the pavement is being placed.
Provide separate facilities to prevent any intermixing during unloading, transporting, storing, and handling of each type of cementitious material.

1.5.2 Aggregate Materials

Store aggregate at the site of the batching and mixing plant avoiding breakage, segregation, intermixing or contamination by foreign materials. Store each size of aggregate from each source separately in free-draining stockpiles. Provide a minimum 0.6 m 24 inch thick sacrificial layer left undisturbed for each aggregate stored on ground. Provide free-draining storage for fine aggregate and the smallest size coarse aggregate for at least 24 hours immediately prior to use. Maintain sufficient aggregate at the site at all times to permit continuous uninterrupted operation of the mixing plant at the time concrete pavement is being placed. Do not allow tracked equipment on coarse aggregate stockpiles.

Any aggregate, coarse or fine, that is not approved for High Temperature Concrete, that is observed or detected in a stockpile must constitute rejection of the complete stockpile. Any debris, mud, dirt, organic matter, trash, garbage or any other material that Contracting Officer deems detrimental to the High Temperature Concrete, regardless of the quantity, must constitute rejection of the stockpile. Ensure that batch plant loaders, hoppers, conveyors, weigh hoppers, drums, mixers, conveyors, haul truck beds, delivery truck beds, rail cars, delivery containers, and other equipment are cleaned, washed and be free of any non-High Temperature Concrete aggregate. Any unapproved material in the High Temperature Concrete is considered noncompliant and rejection, removal and replacement of the entire affected lot is required at Contractor's expense. Instruct loader operators not to disturb the bottom 300 mm 12 inch layer of aggregate. Post a sign at the working face of each stockpile. If all the aggregate for the project will not be stockpiled at one time then access from all sides of the stockpile for charging the batch plant is required. Stockpile and continuously water all lightweight aggregates for a planned day's placement by sprinklers for 7 days prior to paving. Stockpile and continuously water manufactured traprock sands for a planned day's placement by sprinklers for 7 days prior to paving. Stockpile and continuously water all lightweight aggregates and manufactured traprock sands for a planned day's placement by sprinklers for 7 days prior to paving. Spraying by water trucks or hand-held hoses is supplemental but does not replace continuous sprinkler operation. Maintain sufficient watered aggregate at the site at all times to permit continuous uninterrupted operation of the mixing plant at the time concrete pavement is being placed. Tracked equipment is not permitted on aggregate stockpiles. Protect all aggregate from contamination of other stockpiles, materials or deleterious material considered objectionable to Government. Reject all unsatisfactory stockpiles.

[1.5.3 Multifilament Polypropylene Fibers

*****************************************************************************************************************************************************************************************************************************************************************************

NOTE: Retain this paragraph for High Temperature Concrete supporting F-35B operations. Delete this paragraph if High Temperature Concrete is only intended to be used by V-22 aircraft.

Deletion of this paragraph will preclude any F-35B vertical landing operations on this High Temperature Concrete.

*****************************************************************************************************************************************************************************************************************************************************************************

SECTION 32 13 13.43  Page 28
Furnish all fibers in bulk or water soluble bags added at the plant. Store fibers in a dry and protected location and protected from damage.

1.5.4 Other Materials

Store reinforcing bars and accessories above the ground on supports. Store all materials to avoiding contamination and deterioration.

PART 2 PRODUCTS

**************************************************************************
NOTE: Delete any reference to any products which are not to be used on the project. Coordinate all product requirements with the appropriate agency's Pavements or Materials Engineer.
**************************************************************************

2.1 SYSTEM DESCRIPTION

This section is intended to stand alone for construction of High Temperature Concrete airfield pavement for applied pavement temperatures of 482 degrees Celsius 900 degrees Fahrenheit or above. However, where the construction covered herein interfaces with other sections, construct each interface to conform to the requirements of both this section and the other section, including tolerances for both. Aggregates for High Temperature Concrete are defined as either lightweight (produced from expanded slate or shale) or traprock. This specification is for light weight aggregate only. This specification is for traprock aggregate only. This specification is for lightweight and traprock aggregates. Aggregates for High Temperature Concrete require additional modified testing and time for materials testing compared to normal weight concrete. High temperature concrete aggregates are very specific. Contractor to enact additional precautions to avoid cross-contamination with other materials during transportation (rail cars, trucks, containers clean of other materials), during stockpiling, and not laying tools directly on ground during placing and finishing. Contractor must note there are substantial scheduling requirements for test lanes, placing sequence, wet curing, joint sealing, sodium silicate application, and pavement markings. It requires approximately 100 days for materials sampling through test section paving and another 100 days for placement through sodium silicate application. Where the construction covered herein interfaces with other sections, the construction at each interface must conform to the requirements of either this section or the other section, whichever has the more stringent tolerances.

2.1.1 Surface Smoothness

**************************************************************************
NOTE: Edit these paragraphs as appropriate to the project. If it is desired to restrict surface smoothness testing and evaluation to either straightedge method or profilograph method, retain the one and delete the other; otherwise, retain both as a Contractor's option. Require use of the profilograph method for airfield taxiways and runways. When the profilograph method is allowed, and there are areas with dimensions less than 60 m (200 feet) in any direction, retain the straightedge method for these short runs. Profilograph is
typically used to measure longitudinal smoothness and straightedge for transverse smoothness. Aircraft arresting systems require straightedge for longitudinal and transverse smoothness.

Use the profilograph method for all longitudinal testing, except for paving lanes less than 60 m 200 feet in length. Use the straightedge method for transverse testing, for longitudinal testing where the length of each pavement lane is less than 60 m 200 feet, within 60 m 200 feet on both the approach and departure sides of an aircraft arresting gear, and at the ends of the paving limits for the project. Smoothness requirements do not apply over crowns, drainage structures, or similar penetration. Maintain detailed notes of the testing results and provide a copy to the Government after each day's testing.

2.1.1.1 Straightedge Testing

2.1.1.1.1 For Certified Vertical Landing Spots

Provide the finished surfaces of the pavements with no abrupt change of 3 mm 1/8 inch or more, and all pavements within the limits specified when checked with an approved 4 m 12 foot straightedge. Provide vertical landing spots with a variation from the specified straight edge not greater than 3 mm 1/8 inch in the longitudinal direction and not greater than 3 mm 1/8 inch in the transverse direction.

2.1.1.1.2 For All Other Areas

Provide the finished surfaces of the pavements with no abrupt change of 6 mm 1/4 inch or more, and all pavements within the limits specified when checked with an approved 4 m 12 foot straightedge. Provide runways and taxiways with a variation from the specified straight edge not greater than 3 mm 1/8 inch in the longitudinal direction and not greater than 6 mm 1/4 inch in the transverse direction. Provide runway pavement within 60 m 200 feet on both the approach and departure sides of an aircraft arresting gear with a variation in the longitudinal direction from the specified straightedge not more than plus or minus 3 mm 1/8 inch. Provide all other airfield areas with a variation from a straight edge not greater than 6 mm 1/4 inch in either the longitudinal or transverse direction.

2.1.1.2 Profilograph Testing

Provide the finished surfaces of the pavements with no abrupt change of 6 mm 1/4 inch or more, and each 0.1 km 0.1 mile segment of each pavement lot with a Profile Index not greater than specified when tested with an approved California-type profilograph. Provide runways and taxiways with a Profile index not greater than 110 mm per km 7 inches per mile in the longitudinal direction. Provide runway and taxiway transverse smoothness measured with the straightedge method and the straightedge requirements apply. Provide all other airfield areas with a Profile Index not greater than 140 mm per km 9 inches per mile in the longitudinal direction.
Provide roads, streets, tank hardstands, vehicular parking areas and open storage areas with a Profile index not greater than 140 mm per km 9 inches per mile in the longitudinal direction.

2.1.1.3 Bumps ("Must Grind" Areas)

Reduce any bumps ("must grind" areas) shown on the profilograph trace which exceed 10 mm 0.4 inch in height by diamond grinding in accordance with subparagraph DIAMOND GRINDING OF PCC SURFACES below until they do not exceed 7.5 mm 0.3 inch when retested. Taper such diamond grinding in all directions to provide smooth transitions to areas not requiring diamond grinding.

2.1.1.4 Testing Method

After the concrete has hardened sufficiently to permit walking thereon, but not later than 48 hours after placement, test the entire surface of the pavement in each lot in such a manner as to reveal all surface irregularities exceeding the tolerances specified above. If any pavement areas are diamond ground, retest these areas immediately after diamond grinding. Test the entire area of the pavement in both a longitudinal and a transverse direction on parallel lines. Perform the transverse lines 4.5 m 15 feet or less apart, as directed. Perform the longitudinal lines at the centerline of each paving lane shown on the drawings, regardless of whether multiple lanes are allowed to be paved at the same time, and at the 1/8th point in from each side of the lane. Also test other areas having obvious deviations. Perform longitudinal testing lines continuous across all joints. Perform transverse testing lines for pilot lanes carried to construction joint lines and for fill-in lanes carried 600 mm 24 inches across construction joints, and the readings in this area applied to the fill-in lane. Perform straightedge testing of the longitudinal edges of slipformed pilot lanes before paving fill-in lanes as specified below.

2.1.1.4.1 Straightedge Testing

Hold the straightedge in contact with the surface and moved ahead one-half the length of the straightedge for each successive measurement. Determine the amount of surface irregularity by placing the freestanding (unleveled) straightedge on the pavement surface and measuring the maximum gap between the straightedge and the pavement surface. Determine measurements along the entire length of the straight edge.

2.1.1.4.2 Profilograph Testing

Perform profilograph testing using approved California profilograph and procedures described in ASTM E1274. Utilize electronic recording and automatic computerized reduction of data equipment to indicate "must-grind" bumps and the Profile Index for each 0.1 km 0.1 mile segment of the pavement lot. Accommodate grade breaks on aprons (parking lots) by breaking the profile segment into short sections and repositioning the blanking band on each section. Provide the "blanking band" of 5 mm 0.2 inch wide and the "bump template" span 25 mm 1 inch with an offset of 10 mm 0.4 inch. Count the profilograph testing of the last 9.1 m 30 feet of a paving lane in the longitudinal direction from each day's paving operation on the following day's continuation lane. Compute the profile index for each pass of the profilograph (3 per lane) in each 0.1 km 0.1 mile segment. The profile index for each segment is the average of the profile indices for each pass in each segment. Scale and proportion profilograph's of unequal lengths to an equivalent 0.1 km 0.1 mile as outlined in the ASTM E1274.
Provide a copy of the reduced tapes to the Government at the end of each day's testing.

2.1.2 Edge Slump and Joint Face Deformation

2.1.2.1 Edge Slump

When slip-form paving is used, provide a maximum of 15.0 percent of the total free edge of each pavement panel with a maximum edge slump of 6 mm 1/4 inch and none of the free edge of the pavement lot with an edge slump exceeding 9 mm 3/8 inch. (A pavement panel is defined as a lane width by the length between two adjacent transverse contraction joints. The total free edge of the pavement is the cumulative total linear measurement of pavement panel edge originally constructed as non-adjacent to any existing pavement; for example, 30 m 100 feet of pilot lane originally constructed as a separate lane, would have 60 m 200 feet of free edge; 30 m 100 feet of fill-in lane would have no free edge). The area affected by the downward movement of the concrete along the pavement edge is a maximum of 450 mm 18 inches back from the edge.

2.1.2.2 Joint Face Deformation

In addition to the edge slump limits specified above, provide a vertical joint face with a surface within the maximum limits shown below:

<table>
<thead>
<tr>
<th>Measurement (a)</th>
<th>Offset from Straightedge Applied Longitudinally to Pavement Surface</th>
<th>Offset from Straightedge Applied Longitudinally to Vertical Face</th>
<th>Offset from Straightedge Applied Top to Bottom Against the Joint Face</th>
<th>Abrupt Offset in Any Direction</th>
<th>Offset of Joint Face from True Vertical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Airfield Pavement</td>
<td>3 mm 1/8 inch</td>
<td>6 mm 1/4 inch</td>
<td>9 mm 3/8 inch</td>
<td>3 mm 1/8 inch</td>
<td>8 mm per 100 mm 1 inch per 12 inches</td>
</tr>
<tr>
<td>All Other Pavement</td>
<td>6 mm 1/4 inch</td>
<td>All other items same as airfield pavement</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(a) Measurement is taken by placing the straightedge longitudinally on
(b) Measurement is taken by applying the straightedge longitudinally
(c) Measurement places a 9.5 mm 3/8 inch spacer attached to a straightedge and spaced approximately equal to the thickness of the concrete being measured. The offset from straightedge with spacers is measured by placing the spacers against the top and bottom of the vertical concrete face.

(d) An abrupt offset in the joint face occurring along a short distance. Check for abrupt offsets at any location that an abrupt offset appears to be a possible issue.
<table>

<tr>
<th>Offset from Straightedge Applied Longitudinally to Pavement Surface (a)</th>
<th>Offset from Straightedge Applied Longitudinally to Vertical Face (b)</th>
<th>Offset from Straightedge Applied Top to Bottom Against the Joint Face (c)</th>
<th>Abrupt Offset in Any Direction (d)</th>
<th>Offset of Joint Face from True Vertical (e)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(e) Measurement of the offset from the joint face to a level in the true vertical position against the joint face.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2.1.2.3 **Slump Determination**

Test the pavement surface to determine edge slump immediately after the concrete has hardened sufficiently to permit walking thereon. Perform testing with a minimum 4 m 12 foot straightedge to reveal irregularities exceeding the edge slump tolerance specified above. Determine the vertical edge slump at each free edge of each slipformed paving lane constructed. Place the straightedge transverse to the direction of paving and the end of the straightedge located at the edge of the paving lane. Record measurements at 1.5 to 3.0 m 5 to 10 foot a spacing, as directed, commencing at the header where paving was started. Initially record measurements at 1.5 m 5 foot intervals in each lane. When no deficiencies are present after 5 measurements, the interval may be increased. The maximum interval is 3.0 m 10 feet. When any deficiencies exist, return the interval to 1.5 m 5 feet. In addition to the transverse edge slump determination above, at the same time, record the longitudinal surface smoothness of the joint on a continuous line 25 mm 1 inch back from the joint line using the minimum 4 m 12 foot straightedge advanced one-half its length for each reading. Perform other tests of the exposed joint face to ensure that a uniform, true vertical joint face is attained. Properly reference all recorded measurements in accordance with paving lane identification and stationing, and a report submitted within 24 hours after measurement is made. Identify areas requiring replacement within the report.

2.1.2.4 **Excessive Edge Slump**

When edge slump exceeding the limits specified above is encountered on either side of the paving lane, record additional straightedge measurements to define the linear limits of the excessive slump. Remove and replace concrete slabs having excessive edge slump or joint deformation to the next transverse joint in conformance with paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS. Discontinue use of slip-form paving equipment and procedures that fail to consistently provide edges within the specified tolerances on edge slump and joint face deformation construct by means of standard paving procedures using fixed forms.

2.1.3 **Plan Grade**

Within 5 days after paving of each lot, test the finished surface of the pavement area by running lines of levels at intervals corresponding with every longitudinal and transverse joint to determine the elevation at each joint intersection. Record the results of this survey and provide a copy to the Government at the completion of the survey of each lot. Provide finished surfaces of all airfield pavements that vary less than 13 mm 1/2 inch above or below the plan grade line or elevation indicated. Provide surfaces of [_____] that vary less than 19 mm 3/4 inch. The above deviations from the approved grade line and elevation are not permitted in
areas where closer conformance with the planned grade and elevation is required for the proper functioning of appurtenant structures. Provide finished surfaces of new abutting pavements that coincide at their juncture. Provide horizontal control of the finished surfaces of all airfield pavements that vary not more than 13 mm 1/2 inch from the plan alignment indicated.

2.1.4 Flexural Strength

**************************************************************************
NOTE: Normally, concrete for airfield pavement is to be proportioned and accepted on the basis of 90-day flexural strength. If it is desired to use 28-day strength for design of airfield pavement, approval must be obtained through the TSMCX, AFCEC pavement SME, or NAVFAC.

The designer may choose the first Option "Cylinders/Beam" or the second Option "Beams" for strength testing.
**************************************************************************
Submit certified copies of laboratory test reports and sources for cement, supplementary cementitious materials (SCM), aggregates, admixtures, curing compound, epoxy, and proprietary patching materials proposed for use on this project. Each lot of pavement will be evaluated for acceptance in accordance with the following procedures.

2.1.4.1 Sampling and Testing

For acceptance, obtain one composite sample of concrete from each sublot in accordance with ASTM C172/C172M from one batch or truckload. [Fabricate and cure test cylinders 152 x 305 mm 6 x 12 inches in accordance with ASTM C31/C31M, and tested in accordance with ASTM C39/C39M. Test two test cylinders per sublot (8 per lot) at 14 days.] [Fabricate and cure test beams 152 x 152 mm 6 x 6 inches in accordance with ASTM C31/C31M; and tested in accordance with ASTM C78/C78M.]

2.1.4.2 Computations

Average the eight 14-day strength tests for the lot. Use the average strength in accordance with paragraph CONCRETE STRENGTH FOR FINAL ACCEPTANCE.

2.1.5 Thickness

Each lot of pavement will be evaluated for acceptance and payment adjustment in accordance with the following procedure:

a. Contractor must maintain positive control of grades, and Contractor must also use surveyed elevations at the top of concrete and the top of the layer directly beneath the concrete elevation. Measure elevations on a grid measuring a maximum of 6 m by 6 m 20 feet by 20 feet. Contracting Officer may require additional surveyed elevations.

b. Prior to placing concrete, stringline across forms and measure proposed thickness of concrete. Correct any deficiencies prior to placement. Stringline measurements must be on a maximum 6 m 20 foot spacing with at least 4 measurements between forms at each stringline position.
c. Do not extract cores from High Temperature Concrete production paving lanes unless explicitly directed in writing from Contracting Officer.

2.1.6 Evaluation of Cores

Record and submit testing, inspection, and evaluation of each core for surface paste, uniformity of aggregate distribution, segregation, voids, cracks, and depth of reinforcement or dowel (if present). Moisten the core with water to visibly expose the aggregate and take a minimum of three photographs of the sides of the core, rotating the core approximately 120 degrees between photographs. Include a ruler for scale in the photographs. Provide plan view of location for each core.

2.1.7 Diamond Grinding of PCC Surfaces

Those performing diamond grinding are required to have a minimum of three years experience in diamond grinding of airfield pavements. In areas not meeting the specified limits for surface smoothness and plan grade, reduce high areas to attain the required smoothness and grade, except as depth is limited below. Reduce high areas by diamond grinding the hardened concrete with an approved equipment after the concrete is at a minimum age of 14 days. Perform diamond grinding by sawing with an industrial diamond abrasive which is impregnated in the saw blades. Assemble the saw blades in a cutting head mounted on a machine designed specifically for diamond grinding that produces the required texture and smoothness level without damage to the concrete pavement or joint faces. Provide diamond grinding equipment with saw blades that are 3 mm 1/8-inch wide, a minimum of 60 blades per 300 mm 12 inches of cutting head width, and capable of cutting a path a minimum of 0.9 m 3 ft wide. Diamond grinding equipment that causes ravel, aggregate fractures, spalls or disturbance to the joints is not permitted. The maximum area corrected by diamond grinding the surface of the hardened concrete is 10 percent of the total area of any sublot. The maximum depth of diamond grinding is 6 mm 1/4 inch. Provide diamond grinding machine equipped to flush and vacuum the pavement surface. Dispose of all debris from diamond grinding operations off Government property. Prior to diamond grinding, submit a Diamond Grinding Plan for review and approval. At a minimum, include the daily reports for the deficient areas, the location and extent of deficiencies, corrective actions, and equipment. Remove and replace all pavement areas requiring plan grade or surface smoothness corrections in excess of the limits specified above in conformance with paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS. All areas in which diamond grinding has been performed are subject to the thickness tolerances specified in paragraph THICKNESS, above.

Prior to production diamond grinding operations, perform a test section at the approved location. Perform a test section that consists of a minimum of two adjacent passes with a minimum length of 12 m 40 feet to allow evaluation of the finish, transition between adjacent passes, and the results of crossing a transverse joint. Production diamond grinding operations are not to be performed prior to approval.

2.2 CEMENTITIOUS MATERIALS

******************************************************************************************************************************************
NOTE: Edit these paragraphs as appropriate for the particular project. Guidance for use of cementitious materials should be sought from the

SECTION 32 13 13.43  Page 35
Pavement Materials engineer or from the TSMCX, Air Force MAJCOM paving engineers, or NAVFAC, especially for areas subject to alkali-aggregate reactivity, or sulfate attack.

When sulfate bearing soil or water is encountered, specify Type II cement for moderate sulfate concentration and consider requiring use of fly ash for partial replacement. Do not specify Type I or III cement. See UFC 3-250-04FA for guidance. Specify limit on false set if it is a problem in the area.

Provide cementitious materials of portland cement in combination with supplementary cementitious materials (SCM), and must conform to appropriate specifications listed below. New submittals are required when the cementitious materials sources or types change.

2.2.1 Portland Cement

Portland cement must conform to ASTM C150/C150M, Type I or II, low alkali including false set requirements.

2.2.2 Pozzolan

2.2.2.1 Fly Ash

NOTE: Class C fly ash is not permitted for paving concrete.

Use loss on ignition not exceeding 3 percent for frost areas to reduce carbon interference with air entraining admixture.

Provide fly ash that conforms to ASTM C618, Class F, including the optional requirements for uniformity and effectiveness in controlling Alkali-Silica reaction with a loss on ignition not exceeding [3][6] percent. Provide Class F fly ash for use in mitigating Alkali-Silica Reactivity with a total equivalent alkali content less than 3 percent.

2.2.3 Supplemental Cementitious Materials (SCM) Content

NOTE: Use first tailoring option for Navy projects. Use second tailoring option for Army/Air Force projects.

[Provide a concrete mix that contain one of the SCMs listed in Table 2 within the range specified therein, whether or not the aggregates are found to be reactive in accordance with paragraph ALKALI SILICA REACTIVITY.] [Use of one of the SCMs listed below is optional, unless the SCM is required to mitigate ASR. The use of SCMs is encouraged in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.]

### 2.3 AGGREGATES

******************************************************************************
NOTE: Provide aggregates meeting the requirements of this specification. If aggregate sources in the project area do not meet the requirements of this specification, provide aggregates from sources outside the project area that do meet the requirements of this specification.
******************************************************************************

### 2.3.1 Aggregate Sources

******************************************************************************
NOTE: Note that the workability box for lightweight aggregate is larger than for traprock and normal weight concrete. This is because more workability is necessary to close lightweight aggregate concrete mixture pavement surface.
******************************************************************************

Conduct aggregate sampling for testing no more than 120 days prior to test batching unless otherwise stated.

#### 2.3.1.1 Combined Aggregate Gradation

In addition to the grading requirements specified for coarse aggregate and for fine aggregate, the combined aggregate grading must meet the following requirements for Workability and Coarseness factors, Percent Retained Chart, and 0.45 Power Curve. Coarse, intermediate and fine aggregate gradations are commonly required. Deliver coarse and fine aggregate as individual materials to batch plant.

a. The materials selected and the proportions used must be such that when the Coarseness Factor (CF) and the Workability Factor (WF) are plotted on a diagram as described in 3 3 3 and 4. below, the point thus determined must fall within the parallelogram described therein.

(1) Determine the Coarseness Factor (CF) from the following equation:

\[
CF = \frac{(\text{cumulative percent retained on the } 9.5 \text{ mm sieve})(100)}{(\text{cumulative percent retained on the } 2.36 \text{ mm sieve})} \cdot \frac{(\text{cumulative percent retained on the } 3/8 \text{ in. sieve})(100)}{(\text{cumulative percent retained on the No. 8 sieve})}
\]

(2) The Workability Factor WF is defined as the percent passing the 2.36 mm No. 8 sieve based on the combined gradation. Adjust the WF upwards only, by 2.5 percentage points for each 42 kg 94 pounds of cementitious material per cubic meter yard greater than 335 kg.
UFGS

per cubic meter 564 pounds per cubic yard.

(3) For light weight aggregate only, a diagram must be plotted using a rectangular scale with WF on the Y-axis with units from 20 (bottom) to 45 (top), and with CF on the X-axis with units from 80 (left side) to 30 (right side). On this diagram a parallelogram must be plotted with corners at the following coordinates (CF-75, WF-28), (CF-75, WF-43), (CF-45, WF-32.5), and (CF-45, WF-47.5). If the point determined by the intersection of the computed CP and WF does not fall within the above parallelogram, the grading of each size of aggregate used and the proportions selected must be changed as necessary.

(3) For traprock aggregate only, a diagram must be plotted using a rectangular scale with WF on the Y-axis with units from 20 (bottom) to 45 (top), and with CF on the X-axis with units from 80 (left side) to 30 (right side). On this diagram a parallelogram must be plotted with corners at the following coordinates (CF-75, WF-28), (CF-75, WF-40), (CF-45, WF-32.5), and (CF-45, WF-44.5). If the point determined by the intersection of the computed CP and WF does not fall within the above parallelogram, the grading of each size of aggregate used and the proportions selected must be changed as necessary.

(4) For traprock aggregate only, a diagram must be plotted using a rectangular scale with WF on the Y-axis with units from 20 (bottom) to 45 (top), and with CF on the X-axis with units from 80 (left side) to 30 (right side). On this diagram a parallelogram must be plotted with corners at the following coordinates (CF-75, WF-28), (CF-75, WF-40), (CF-45, WF-32.5), and (CF-45, WF-44.5). If the point determined by the intersection of the computed CP and WF does not fall within the above parallelogram, the grading of each size of aggregate used and the proportions selected must be changed as necessary.

b. Percent Retained Chart. Design the percent retained chart to meet the following criteria:

(1) The highest peak (the maximum percent retained) must be on the 9.5 mm 3/8 inch sieve or larger. The proportions must also have at least 60 percent of the total aggregate mass be retained on the 4.75 mm No. 4 sieve.

(2) There can only be at least 4 points difference between the two highest peaks.

(3) There can be no more than one low point between any two peaks. If there are two low points, the mixture is gap graded; if there are...
three or more low points, the mixture is severely gap graded and will not function as an airfield concrete mixture.

c. 0.45 Power Curve. The 0.45 power curve upper limit is defined as a line from the origin (0,0) to 100 percent at the 19 mm 3/4 inch sieve. The 0.45 power curve lower limit is defined as a line starting at 21 percent at the 1.18 mm No. 16 sieve to 100 percent at the 37.5 mm 1.5 inch sieve. The combined gradation must plot within the upper and lower limits of the 0.45 Power Curve.

d. Some aggregate combinations may not be able to achieve all criteria. In this case, if the Workability and Coarseness factors plot correctly, the 0.45 Power Curve criteria is achieved, Criteria b.1 and b.2 of the Percent Retained Chart are achieved, and the mixture is demonstrated it can be placed, consolidated and finished to meet specification requirements, then the third Percent Retained Chart criteria, b.3, can be relaxed from specification requirements provided there are no more than two low points between any two peaks.

e. Combined gradation of all the aggregates, coarse and fine, must have no more than 10 percent passing the 0.150 mm No. 100 sieve.

2.3.1.2 Alkali-Silica Reactivity for Traprock

Evaluate and test fine and coarse traprock aggregates to be used in all concrete for alkali-aggregate reactivity. Test all coarse aggregate size groups.

a. Separately evaluate the fine and coarse aggregates using ASTM C1260. Test results of the individual aggregates must have a measured expansion equal to or less than 0.08 percent after 28 days of immersion in a 1N NaOH solution. Should the test data indicate an expansion of greater than 0.08 percent, reject the aggregate(s) or additional testing must be performed as follows: utilize the Contractor’s proposed low alkali portland cement, blended cement, and/or SCM in combination with each individual aggregate. If only SCMs are being evaluated, the testing accordance with ASTM C1567. Determine the quantity that will meet all the requirements of these specifications and that will lower the expansion equal to or less than 0.08 percent after 28 days of immersion in a 1N NaOH solution. Base mixture proportioning on the highest percentage of SCM required to mitigate ASR-reactivity.

b. If any of the above options does not lower the expansion to less than 0.08 percent after 28 days of immersion in a 1N NaOH solution, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing to the Contracting Officer for evaluation and acceptance.

2.3.1.3 Durability Testing for Traprock

**************************************************************************
NOTE: Use first Tailoring Option for Army and Air Force; second option is for Navy projects only.
**************************************************************************

[Provide aggregate with a satisfactory service record in freezing and thawing of at least 5 years successful service in three concrete paving projects. Include a condition survey of the existing concrete and a review of the concrete-making materials, including coarse aggregates, cement, and
mineral admixtures in the service record. Consider the previous aggregate source and test results, cement mill certificate data, mineral admixture chemical and physical composition, and the mix design (cement factor and water-cementitious material ratio) in the review. Provide service record performed by an independent third party professional engineer, petrographer, or concrete materials engineer along with their resume. Include photographs and a written report addressing D-cracks and popouts in accordance with ACI 201.1R in the service record. Provide coarse aggregate with a durability factor of 80 or more when subjected to freezing and thawing of specimens prepared in accordance with ASTM C1646/C1646M and tested in accordance with ASTM C666/C666M, Procedure A, when a coarse aggregate size group or source proposed for use does not have a satisfactory demonstrable service record. Test all coarse aggregate size groups and sources proposed for use individually.

Evaluate and test all fine and coarse aggregates to be used in all concrete for durability in accordance with ASTM C88. Provide fine and coarse aggregates with a maximum of 18 percent loss when subjected to 5 cycles using Magnesium Sulfate or a maximum of 12 percent loss when subjected to 5 cycles if Sodium Sulfate is used.

2.3.1.4 Alkali-Silica Reactivity for Traprock

Evaluate and test fine and coarse traprock aggregates to be used in all concrete for alkali-aggregate reactivity. Test both coarse aggregate size groups.

a. Separately evaluate the fine and coarse aggregates using ASTM C1260. Test results of the individual aggregates must have a measured expansion equal to or less than 0.08 percent after 28 days of immersion in a 1N NaOH solution. Should the test data indicate an expansion of greater than 0.08 percent, reject the aggregate(s) or additional testing must be performed as follows: utilize the Contractor's proposed low alkali portland cement, blended cement, and/or SCM in combination with each individual aggregate. If only SCMs are being evaluated, the test in accordance with ASTM C1567. Determine the quantity that will meet all the requirements of these specifications and that will lower the expansion equal to or less than 0.08 percent after 28 days of immersion in a 1N NaOH solution. Base mixture proportioning on the highest percentage of SCM required to mitigate ASR-reactivity.

b. If any of the above options does not lower the expansion to less than 0.08 percent after 28 days of immersion in a 1N NaOH solution, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing to the Contracting Officer for evaluation and acceptance.

2.3.1.5 Durability Testing for Traprock

**************************************************************************
NOTE: Use first Tailoring Option for Army and Air Force; second option is for Navy projects only.**************************************************************************

Provide aggregate with a satisfactory service record in freezing and thawing of at least 5 years successful service in three concrete paving projects. Include a condition survey of the existing concrete and a review of the concrete-making materials, including coarse aggregates, cement, and mineral admixtures in the service record. Consider the previous aggregate source and test results, cement mill certificate data, mineral admixture
chemical and physical composition, and the mix design (cement factor and water-cementitious material ratio) in the review. Provide service record performed by an independent third party professional engineer, petrographer, or concrete materials engineer along with their resume. Include photographs and a written report addressing D-cracks and popouts in accordance with ACI 201.1R in the service record. Provide coarse aggregate with a durability factor of 80 or more when subjected to freezing and thawing of specimens prepared in accordance with ASTM C1646/C1646M and tested in accordance with ASTM C666/C666M, Procedure A, when a coarse aggregate size group or source proposed for use does not have a satisfactory demonstrable service record. Test all coarse aggregate size groups and sources proposed for use individually. Evaluate and test all fine and coarse aggregates to be used in all concrete for durability in accordance with ACI 201.1R. Provide fine and coarse aggregates with a maximum of 18 percent loss when subjected to 5 cycles using Magnesium Sulfate or a maximum of 12 percent loss when subjected to 5 cycles if Sodium Sulfate is used.

2.3.2 Coarse Aggregate

Aggregates, as delivered to the mixers, must consist of clean, uncoated particles. Contractor is required to conduct all testing identified in this specification.

2.3.2.1 Material Composition

Coarse aggregate used for High Temperature Concrete must consist of lightweight aggregate. Lightweight aggregate is defined as expanded slate or expanded shale meeting the requirements at the manufacturing facility of ASTM C330/C330M and is produced in a rotary kiln operated at 1,149 degrees C or 2,100 degrees F or more. Conduct ASTM C330/C330M tests within 30 days prior to delivery to batch plant, except for freeze/thaw testing which must have been completed within 12 months prior to delivery. Freeze-thaw specimens can be coated on all sides using the same sodium silicate solution that will be used in on the pavement. Coarse aggregate must not show more than 40 percent loss when subjected to the Los Angeles abrasion test in accordance with ASTM C131/C131M. The sodium sulfate soundness loss must not exceed 12 percent, or the magnesium sulfate soundness loss must not exceed 18 percent after five cycles when tested in accordance with ASTM C88. Coarse aggregate used for High Temperature Concrete consist of a fine-grained aggregate composed of unweathered diabase or basalt as classified per ASTM C294 and meeting the requirements of ASTM C33/C33M except as specified herein. Identify and confirm coarse aggregate material meets the material specifications via ASTM C295/C295M and be coarse aggregate must not show more than 40 percent loss when subjected to the Los Angeles abrasion test in accordance with ASTM C131/C131M. The sodium sulfate soundness loss must not exceed 12 percent, or the magnesium sulfate soundness loss must not exceed 18 percent after five cycles when tested in accordance with ASTM C88. Coarse aggregate used for High Temperature Concrete must have coarse aggregate showing no more than 40 percent loss when subjected to the Los Angeles abrasion test in accordance with ASTM C131/C131M, sodium sulfate soundness loss must not exceed 12 percent, or the magnesium sulfate soundness loss must not exceed 18 percent after five cycles when tested in accordance with ASTM C88 and must consist of one of the following materials:

a. Coarse aggregate used for High Temperature Concrete must consist of lightweight aggregate. Lightweight aggregate is defined as expanded slate or expanded shale meeting the requirements at the manufacturing
facility of ASTM C330/C330M and is produced in a rotary kiln operated at 1,149 degrees C 2,100 degrees F or more. Conduct ASTM C330/C330M tests within 30 days prior to delivery to batch plant, except for freeze/thaw testing which must have been completed within 12 months prior to delivery. Freeze-thaw specimens can be coated on all sides using the same sodium silicate solution that will be used in on the pavement.

b. Coarse aggregate used for High Temperature Concrete must consist of a fine-grained trap rock aggregate composed of unweathered diabase or basalt as classified per ASTM C294 and meeting the requirements of ASTM C33/C33M except as specified herein. Coarse aggregate material must be identified and confirmed that it meets the material specifications via ASTM C295/C295M.

2.3.2.2 Particle Shape Characteristics

Provide particles of the coarse aggregate that are generally spherical or cubical in shape. The quantity of flat particles and elongated particles in any size group coarser than the 9.5 mm 3/8 inch sieve are not allowed to exceed 20 percent by weight as determined by the Flat Particle Test and the Elongated Particle Test of ASTM D4791. A flat particle is defined as one having a ratio of width to thickness greater than 3; an elongated particle is one having a ratio of length to width greater than 3.

2.3.2.3 Size and Grading

**************************************************************************
NOTE: Designer must research lightweight aggregate manufacturers and specify the largest nominal aggregate size available. Normally in CONUS, expanded slate is currently only available in eastern US with a 19 mm 3/4 inch nominal maximum size. Expanded shales are commonly available elsewhere CONUS with a 12.5 mm 1/2 inch nominal maximum size. All sizes are based on the nominal maximum size and all aggregates must meet the individual grading requirements of ASTM C33/C33M and ASTM C330/C330M. OCONUS sources need to be researched. Industry website is http://www.escsi.org.
**************************************************************************

For traprock aggregate, the Contractor must select either a 19 mm 3/4 inch or 25 mm 1 inch nominal maximum size aggregate. Grade and provide the individual aggregates in two size groups meeting the individual grading requirements of ASTM C33/C33M. For lightweight aggregate the nominal maximum size is [19 mm3/4 inch][12.5 mm1/2 inch]. Grade and provide the individual aggregates in two size groups meeting the individual grading requirements of ASTM C330/C330M. For traprock aggregate, the Contractor must select either a 19 mm 3/4 inch or 25 mm 1 inch nominal maximum size aggregate. Grade and provide the individual aggregates in two size groups meeting the individual grading requirements of ASTM C33/C33M. For lightweight aggregate, the nominal maximum size is [19 mm3/4 inch][12.5 mm 1/2 inch]. Grade and provide the individual aggregates in two size groups meeting the individual grading requirements of ASTM C330/C330M. Nominal maximum size is defined as the largest standard sieve size with 3 to 10 percent retained by weight. The individual aggregates are required to be
graded and furnished in size groups to meet the coarseness and workability factor criteria for the Contractor-proposed combined gradation.

2.3.2.4 Deleterious Materials - Traprock

**************************************************************************
NOTE: In Table 5 select columns showing appropriate percentage by weight in accordance with the following. Delete the inapplicable column in the table and the heading of the column used.

<table>
<thead>

---

**a.** Shale is defined as a fine-grained, thinly laminated or fissile sedimentary rock. It is commonly composed of clay or silt or both. It has been indurated by compaction or by cementation, but not so much as to have become slate.

**b.** Limit for material finer than 0.075 mm No. 200 sieve is allowed to be increased to 1.5 percent for crushed aggregates if the fine material consists of crusher dust that is essentially free from clay or shale. Use XRD or other appropriate techniques as determined by petrographer to quantify amount and justify increase.

**c.** The separation medium must have a density of 2.0 Mg/cubic meter Sp. Gr. of 2.0.

**d.** Clay ironstone is defined as an impure variety of iron carbonate, iron oxide, hydrous iron oxide, or combinations thereof, commonly mixed with clay, silt, or sand. It commonly occurs as dull, earthy particles, homogeneous concretionary masses, or hard-shell particles with soft interiors. Other names commonly used for clay ironstone are "chocolate bars" and limonite concretions.

**e.** Chert is defined as a rock composed of quartz, chalcedony or opal, or...
any mixture of these forms of silica. It is variable in color. The texture is so fine that the individual mineral grains are too small to be distinguished by the unaided eye. Its hardness is such that it scratches glass but is not scratched by a knife blade. It may contain impurities such as clay, carbonates, iron oxides, and other minerals. Cherty stone is defined as any type of rock (generally limestone) that contains chert as lenses and nodules, or irregular masses partially or completely replacing the original stone.

f. Claystone, mudstone, or siltstone, is defined as a massive fine-grained sedimentary rock that consists predominantly of indurated clay or silt without laminations or fissility. It may be indurated either by compaction or by cementation.

2. Shaly limestone is defined as limestone in which shale occurs as one or more thin beds or laminae. These laminae may be regular or very irregular and may be spaced from a few inches down to minute fractions of an inch. Argillaceous limestone is defined as a limestone in which clay minerals occur disseminated in the stone in the amount of 10 to 50 percent by weight of the rock; when these make up from 50 to 90 percent, the rock is known as calcareous (or dolomitic) shale (or claystone, mudstone, or siltstone).

2.3.2.5 Testing Sequence/Deleterious Materials - Traprock Only

No extension of time or additional payment due to any delays caused by the testing, evaluation, or personnel requirements is allowed. The minimum test sample size of the coarse aggregate is 90 kg (200 pounds) for the 19 mm (3/4 inch) and larger maximum size and 12 kg (25 pounds) for the 4.75 to 19 mm (No. 4 to 3/4 inch) coarse aggregate. Provide facilities for the ready procurement of representative test samples. The testing procedure on each sample of coarse aggregate for compliance with limits on deleterious materials is as follows:

Step 1: Wash each full sample of coarse aggregate for material finer than the 0.075 mm (No. 200) sieve. Discard material finer than the 0.075 mm (No. 200) sieve.

Step 2: Test remaining full sample for clay lumps and friable particles and remove.

Step 3. Test remaining full sample for chert and cherty stone with SSD density of less than 2.40 specific gravity. Remove lightweight chert and cherty stone. Retain other materials less than 2.40 specific gravity for Step 4.

Step 4: Test the materials less than 2.40 specific gravity from Step 3 for lightweight particles (Sp. Gr. 2.0) and remove. Restore other materials less than 2.40 specific gravity to the sample.

Step 5: Test remaining sample for clay-ironstone, shale, claystone, mudstone, siltstone, shaly and argillaceous limestone, and remove.

Step 6: Test a minimum of one-fifth of remaining full sample for other soft particles.
### 2.3.2.6 Deleterious Materials - Traprock

**NOTE:** In Table 5 select columns showing appropriate percentage by weight in accordance with the following. Delete the inapplicable column in the table and the heading of the column used.

**Notes:**

a. Shale is defined as a fine-grained, thinly laminated or fissile sedimentary rock. It is commonly composed of clay or silt or both. It has been indurated by compaction or by cementation, but not so much as to have become slate.

b. Limit for material finer than 0.075 mm No. 200 sieve is allowed to be increased to 1.5 percent for crushed aggregates if the fine material consists of crusher dust that is essentially free from clay or shale. Use XRD or other appropriate techniques as determined by petrographer to quantify amount and justify increase.

c. The separation medium must have a density of 2.0 Mg/cubic meter Sp. Gr. of 2.0.

d. Clay ironstone is defined as an impure variety of iron carbonate, iron oxide, hydrous iron oxide, or combinations thereof, commonly mixed with clay, silt, or sand. It commonly occurs as dull, earthy particles, homogeneous concretionary masses, or hard-shell particles with soft interiors. Other names commonly used for clay ironstone are "chocolate bars" and limonite concretions.

e. Chert is defined as a rock composed of quartz, chalcedony or opal, or any mixture of these forms of silica. It is variable in color. The texture is so fine that the individual mineral grains are too small to be distinguished by the unaided eye. Its hardness is such that it
scratches glass but is not scratched by a knife blade. It may contain
impurities such as clay, carbonates, iron oxides, and other minerals.
Cherty stone is defined as any type of rock (generally limestone) that
contains chert as lenses and nodules, or irregular masses partially or
completely replacing the original stone.

f. Claystone, mudstone, or siltstone, is defined as a massive fine-grained
sedimentary rock that consists predominantly of indurated clay or silt
without laminations or fissility. It may be indurated either by
compaction or by cementation.

g. Shaly limestone is defined as limestone in which shale occurs as one or
more thin beds or laminae. These laminae may be regular or very
irregular and may be spaced from a few inches down to minute fractions
of an inch. Argillaceous limestone is defined as a limestone in which
clay minerals occur disseminated in the stone in the amount of 10 to 50
percent by weight of the rock; when these make up from 50 to 90
percent, the rock is known as calcareous (or dolomitic) shale (or
claystone, mudstone, or siltstone).

h. Perform testing in accordance with the referenced test methods, except
that the minimum sample size is specified below.

2.3.2.7 Testing Sequence/Deleterious Materials - Traprock Only

No extension of time or additional payment due to any delays caused by the
testing, evaluation, or personnel requirements is allowed. The minimum
test sample size of the coarse aggregate is 90 kg 200 pounds for the 19 mm
3/4 inch and larger maximum size and 12 kg 25 pounds for the 4.75 to 19 mm
No. 4 to 3/4 inch coarse aggregate. Provide facilities for the ready
procurement of representative test samples. The testing procedure on each
sample of coarse aggregate for compliance with limits on deleterious
materials is as follows:

Step 1: Wash each full sample of coarse aggregate for material finer
than the 0.075 mm No. 200 sieve. Discard material finer than the 0.075
mm No. 200 sieve.

Step 2: Test remaining full sample for clay lumps and friable
particles and remove.

Step 3. Test remaining full sample for chert and cherty stone with SSD
density of less than 2.40 specific gravity. Remove lightweight chert
and cherty stone. Retain other materials less than 2.40 specific
gravity for Step 4.

Step 4: Test the materials less than 2.40 specific gravity from Step 3
for lightweight particles (Sp. GR. 2.0) and remove. Restore other
materials less than 2.40 specific gravity to the sample.

Step 5: Test remaining sample for clay-ironstone, shale, claystone,
mudstone, siltstone, shaly and argillaceous limestone, and remove.

Step 6: Test a minimum of one-fifth of remaining full sample for other
soft particles.
2.3.3 Fine Aggregate

2.3.3.1 Composition

**************************************************************************
NOTE: For TRAPROCK and TRAPROCK & LIGHTWEIGHT tailoring options; use the bracketed sentence for High Temperature Concrete supporting F-35B aircraft.

The use of natural sands will preclude any future utilization of the High Temperature Concrete for F-35B vertical landing operations. Delete bracket reference to the use of natural sand if intended use of pavement is for F-35B Aircraft.
**************************************************************************

Lightweight fine aggregate must consist of the same high temperature material as the coarse aggregates, and composed of clean, hard, durable particles meeting the requirements at the manufacturing facility of ASTM C330/C330M for expanded slate or expanded shale. Conduct ASTM C330/C330M tests within 30 days prior to delivery to batch plant, except for freeze/thaw testing which must have been completed within 12 months prior to delivery. Each type of fine aggregate is required to be stockpiled and batched separately. Produce fine aggregate in a rotary kiln operated at 1,149 degrees C 2,100 degrees F. Particles of the fine aggregate are required to be generally spherical or cubical in shape.

[Traprock fine aggregate must meet requirements of paragraph DELETERIOUS MATERIALS FOR TRAPROCK FINE AGGREGATE to include the parent material consisting of a fine-grained trap rock aggregate composed of unweathered diabase or basalt as classified per ASTM C294][Provide fine aggregate consisting of manufactured sand[, natural sand, or a combination of the two,] and composed of clean, hard, durable particles meeting the requirements of ASTM C33/C33M]. Stockpile and batch each type of fine aggregate separately. Provide fine aggregate with particles that are generally spherical or cubical in shape. Lightweight fine aggregate must consist of the same high temperature material as the coarse aggregates, and composed of clean, hard, durable particles meeting the requirements at the manufacturing facility of ASTM C330/C330M for expanded slate or expanded shale. Conduct ASTM C330/C330M tests within 30 days prior to delivery to batch plant, except for freeze/thaw testing which must have been completed within 12 months prior to delivery. Each type of fine aggregate is required to be stockpiled and batched separately. Produce fine aggregate in a rotary kiln operated at 1,149 degrees C 2,100 degrees F. Particles of the fine aggregate are required to be generally spherical or cubical in shape.

[Traprock fine aggregate must meet requirements of paragraph DELETERIOUS MATERIALS FOR TRAPROCK FINE AGGREGATE to include the parent material consisting of a fine-grained trap rock aggregate composed of unweathered diabase or basalt as classified per ASTM C294][Provide fine aggregate consisting of manufactured sand[, natural sand, or a combination of the two,] and composed of clean, hard, durable particles meeting the requirements of ASTM C33/C33M]. Stockpile and batch each type of fine aggregate separately. Provide fine aggregate with particles that are generally spherical or cubical in shape.
2.3.3.2 Grading

Grading of the fine aggregate, as delivered to the mixer, must conform to the requirements of ASTM C33/C33M for traprock and ASTM C330/C330M for lightweight aggregate ASTM C33/C33M for traprock ASTM C330/C330M for lightweight aggregate. Select a gradation not to exceed the combined gradation limits for the amount passing the 0.150 mm No. 100 sieve.

2.3.3.3 Deleterious Materials for Traprock Fine Aggregate

The amount of deleterious material in the fine aggregate must not exceed the following limits by mass:

<table>
<thead>
<tr>
<th>Material</th>
<th>Percentage by Mass</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clay lumps and friable particles ASTM C142/C142M</td>
<td>1.0</td>

</tr>
</tbody>
</table>

2.4 CHEMICAL ADMIXTURES

2.4.1 General Requirements

Chemical admixtures may only be used when the specific admixture type and manufacturer is the same material used in the mixture proportioning studies. Provide air-entraining admixture conforming to ASTM C260/C260M. An accelerating admixture conforming to ASTM C494/C494M, Type C, may be used only when specified in paragraph MIXTURE PROPORTIONS below provided it is not used to reduce the amount of cementitious material. Calcium chloride and admixtures containing calcium chloride are not allowed. Provide retarding or water-reducing admixture that meet the requirements of ASTM C494/C494M, Type A, B, or D, except that the 6-month and 1-year compressive strength tests are waived. ASTM C494/C494M, Type F and G high range water reducing admixtures and Type S specific performance admixtures are not allowed. ASTM C1017/C1017M flowable admixtures are not allowed.
[2.5 MULTIFILAMENT POLYPROPYLENE FIBERS

**************************************************************************

NOTE: Retain this paragraph for High Temperature Concrete supporting F-35B operations. Delete this paragraph if High Temperature Concrete is only intended to be used by V-22 aircraft.

Deletion of this paragraph will preclude any F-35B vertical landing operations on this High Temperature Concrete.

**************************************************************************

Multifilament polypropylene fibers must have a length between 9.5 and 19 mm (0.375 and 0.75 inches) and either a maximum diameter of 0.4 mm (0.0157 inches) or maximum average 10 denier weight. The concrete mix must contain 1.78 kg (3 lb per cubic yard) per cubic meter to prevent spalling. Add the fibers to the concrete mixture at the batch plant. Fibers must be multifilament polypropylene meeting ASTM C1116/C1116M, Standard Specification for Fiber-Reinforced Concrete. Submit certified copies of the laboratory test results showing length, and diameter or denier.

2.6 CURING MATERIALS

2.6.1 Impervious Sheet

Impervious sheet materials must conform to ASTM C171.

2.6.2 Burlap and Cotton Mat

Burlap and cotton mat used for curing must conform to AASHTO M 182.

2.6.3 Membrane Forming Curing Compound

Membrane forming curing compound is prohibited from use wherever sodium silicate surface sealer is to be applied. Therefore membrane forming curing compound is limited only to vertical faces of pilot lane paving. Provide membrane forming curing compound that conforms to COE CRD-C 300 and is white pigmented.

2.7 WATER

Water for mixing and curing is required to be fresh, clean, potable, and free of injurious amounts of oil, acid, salt, or alkali, except that non-potable water, or water from concrete production operations, may be used if it meets the requirements of ASTM C1602/C1602M.

2.8 REINFORCING

**************************************************************************

NOTE: Edit these paragraphs to conform to project requirements. Delete those not needed. Add epoxy-coated bars (ASTM A775/A775M) or low-alloy bars (ASTM A 706/A 706M) when required by design.

**************************************************************************

All reinforcement is required to be free from loose, flaky rust, loose scale, oil, grease, mud, or other coatings that might reduce the bond with concrete. Removal of thin powdery rust and tight rust is not required.
However, reinforcing steel which is rusted to the extent that it does not conform to the required dimensions or mechanical properties must not be used.

[2.8.1 Reinforcing Bars for Continuously Reinforced Concrete

a. Reinforcing bars must conform to ASTM A722/A722M Type 2, 25 mm 1 inch nominal diameter threaded bars with a minimum yield strength of 827 MPa 120,000 psi (Dywidag, Williams and Skyline Steel are possible sources, Grade 150) and conform to requirements shown on plans.

b. Reinforcement support is required to be continuous mesh supports or numerous chairs, and is required to be steel and support to height as shown on plans. Any sag or displacement of steel reinforcement during concrete placement is cause for rejection of paving lane with removal and replacement at Contractor's expense.

][2.8.2 Reinforcing Bars and Bar Mats for Non-Continuously Reinforced Concrete

Provide reinforcing bars conforming to ASTM A615/A615M, billet-steel] [ASTM A996/A996M, rail and axle steel], Grade 60 [_____]. Provide bar mats conforming to ASTM A184/A184M. The bar members may be billet rail or axle steel.

][2.8.3 Welded Wire Reinforcement for Non-Continuously Reinforced Concrete

Provide welded wire reinforcement that is deformed or smooth, conforming to ASTM A1064/A1064M or ASTM A185/A185M, and is provided in flat sheets.

]2.9 JOINT MATERIALS

**************************************************************************

NOTE: Studies have shown that various joint sealant techniques perform better with varying degrees of temperature and pressure exposure. In Vertical Landing Pad Safety Zones self-leveling silicone sealant meeting ASTM D5893/D5893M perform better whereas elastomeric joint sealant ignites under the extreme heat. However, elastomeric joint sealant meeting ASTM D2628/D2628M tends to perform better than self-leveling silicone sealant when exposed to temperatures less than 500 degrees Fahrenheit.

Use first bracket for self-leveling silicone sealant meeting ASTM D5893/D5893M for the vicinity to extreme temperature exposure like the Vertical Landing Pad Safety Zone.

Use second bracket for elastomeric joint sealant meeting ASTM D2628/D2628M temperature exposure less than 500 degrees Fahrenheit like parking aprons, warm up areas, etc.

**************************************************************************

[Joint filler and sealant materials is required as shown on plans and Specification 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT. Use only self-leveling silicone sealant meeting ASTM D5893/D5893M. Submit proposed methods and/or sacrificial materials for forming joint seal reservoir above
expansion board.

[Joint filler and sealant materials is required as shown on plans and Specification 32 13 73.19 COMPRESSION CONCRETE PAVING JOINT SEALANT. Use only elastomeric joint sealant meeting ASTM D2628.]

2.9.1 Dowels

Provide dowels in single piece bars fabricated or cut to length at the shop or mill before delivery to the site. Dowels are to be free of loose, flaky rust and loose scale and be clean and straight. Dowels may be sheared to length provided that the deformation from true shape caused by shearing does not exceed 1 mm 0.04 inch on the diameter of the dowel and does not extend more than 1 mm 0.04 inch from the end of the dowel. Dowels are required to be plain (non-deformed) steel bars conforming to ASTM A615/A615M, Grade 40 or 60; ASTM A996/A996M, Grade 50 or 60. Dowel bars are required to be epoxy coated in conformance with ASTM A775/A775M, to include the ends. Provide grout retention rings that are fully circular metal or plastic devices capable of supporting the dowel until the epoxy hardens. Dowel sleeves or inserts are not permitted.

2.9.2 Dowel Bar Assemblies

Provide dowel bar assemblies that consist of a framework of metal bars or wires arranged to provide rigid support for the dowels throughout the paving operation, with a minimum of four continuous bars or wires extending along the joint line. Provide dowels that are welded to the assembly or held firmly by mechanical locking arrangements that prevent them from rising, sliding out, or becoming distorted during paving operations.

2.9.3 Expansion Joint Materials

Expansion joint filler is required to be a preformed material conforming to ASTM D1752 Type II or Type III. Expansion joint filler is required to be 19 mm 3/4 inch thick, unless otherwise indicated. Expansion joint filler is required to be furnished in a single full depth piece.

2.10 EPOXY RESIN

Provide epoxy-resin materials that consist of two-component materials conforming to the requirements of ASTM C881/C881M, Class as appropriate for each application temperature to be encountered, except that in addition, the materials meet the following requirements:

a. Material for use for embedding dowels and anchor bolts be Type IV, Grade 3.

b. Material for use as patching materials for complete filling of spalls and other voids and for use in preparing epoxy resin mortar be Type III, Grade as approved.

c. Material for use for injecting cracks be Type IV, Grade 1.

d. Material for bonding freshly mixed portland cement concrete or mortar or freshly mixed epoxy resin concrete or mortar to hardened concrete be Type V, Grade as approved.

2.11 EQUIPMENT

All plant, equipment, tools, and machines used in the work are required to
be maintained in satisfactory working conditions at all times. Submit the following:

a. Details and data on the batching and mixing plant prior to plant assembly including manufacturer's literature showing that the equipment meets all requirements specified herein.

**************************************************************************
NOTE: For OCONUS projects, contact NRMCA (http://www.nrmca.org) concerning approved engineers available in the geographic area.
**************************************************************************

b. Obtain National Ready Mixed Concrete Association (NRMCA) certification of the concrete plant, at no expense to the Government. Provide inspection report of the concrete plant by an engineer approved by the NRMCA. A list of NRMCA approved engineers is available on the NRMCA website at http://www.nrmca.org. Submit a copy of the NRMCA QC Manual Section 3 Concrete Plant Certification Checklist, NRMCA Certificate of Conformance, and Calibration documentation on all measuring and weighing devices prior to uniformity testing.

c. A description of the equipment proposed for transporting concrete mixture from the central mixing plant to the paving equipment.

d. A description of the equipment proposed for the machine and hand placing, consolidating and curing of the concrete mixture. Manufacturer's literature on the paver and finisher, together with the manufacturer's written instructions on adjustments and operating procedures necessary to assure a tight, smooth surface on the concrete pavement. The literature is required to show that the equipment meets all details of these specifications.[ Include detailed information on automatic laser controlled systems if proposed for use.]

2.11.1 Batching and Mixing Plant

**************************************************************************
NOTE: The batching and mixing plant must be on the construction site or as close as possible, but must be no farther than 15 minutes haul time from the placing site during all periods of the work day. Verify the availability of water and electrical power for sites on Government land. On Navy projects, specify an off-site batch plant. Edit bracketed items as appropriate.

Plant capacity must be governed by the laydown pattern or the size of the job to prevent delay of paving operations.
**************************************************************************

2.11.1.1 Location

Locate the batching and mixing plant [on project site as indicated on the drawings] [off Government premises no more than 15 minutes haul time from the placing site]. [ Water and electrical power [are] [are not] available on the project site.] Provide operable telephonic or radio communication between the plant and the placing site at all times concreting is taking place.
2.11.1.2 Type and Capacity

Provide a batching and mixing plant consisting of a stationary-type central mix plant, including permanent installations and portable or relocatable plants installed on stable foundations. Provide a plant designed and operated to produce concrete within the specified tolerances, with a minimum capacity of **200 cubic meters** (or **250 cubic yards** [___]) per hour, that conforms to the requirements of **NRMCA QC 3** including provisions addressing:

1. Material Storage and Handling
2. Batching Equipment
3. Central Mixer
4. Ticketing System
5. Delivery System

2.11.1.3 Tolerances

<table>
<thead>
<tr>
<th>Materials</th>
<th>Percentage of Required Mass</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cementitious Materials</td>
<td>plus or minus 1</td>
</tr>
<tr>
<td>Aggregate</td>
<td>plus or minus 2</td>
</tr>
<tr>
<td>Water</td>
<td>plus or minus 1</td>
</tr>
<tr>
<td>Admixture</td>
<td>plus or minus 3</td>
</tr>
</tbody>
</table>

For volumetric batching equipment for water and admixtures, the above numeric tolerances apply to the required volume of material being batched. Dilute concentrated admixtures uniformly, if necessary, to provide sufficient volume per batch to ensure that the batchers consistently operate within the above tolerance.

2.11.1.4 Moisture Control

Provide a plant capable of ready adjustment to compensate for the varying moisture contents of the aggregates and to change the quantities of the materials being batched. Provide an electric moisture meter complying with the provisions of **COE CRD-C 143** for measuring of moisture in the fine aggregate. Provide a sensing element arranged so that measurement is made near the batcher charging gate of the fine aggregate bin or in the fine aggregate batcher.

2.11.2 Concrete Mixers

Stationary or truck mixers or approved horizontal shaft concrete mixers are permitted. Pugmills are not allowed. Mixers are required to be capable of combining the materials into a uniform mixture and of discharging this mixture without segregation. The mixers are not be charged in excess of the capacity recommended by the manufacturer. Operate the drum or mixing blade speed designated by the manufacturer. Maintain the mixers in satisfactory operation condition. Keep mixer drums free of hardened concrete. Replace mixer blades or paddles when worn down more than 10 percent of their depth when compared with the manufacturer's dimension for new blades or paddles.
2.11.2.1 Stationary

Stationary mixers are required to be drum mixers. Mixers with a device to lock the discharge mechanism until the prescribed mixing time has elapsed in required.

2.11.2.2 Mixing Time and Uniformity for Stationary Mixers

For stationary mixers, the mixing time for each batch after all solid materials are in the mixer[, including fibers,] is determined in accordance with CRD-C-55 for stationary mixers and ASTM C 94 for truck mixers. For all mixtures, the minimum mixing time is 65 seconds; extend as necessary to achieve uniformity[, and dispersal of multifilament polypropylene fiber]. Immediately prior to any change in mixing time a mixer performance tests at the new mixing times is required. If using traprock, conduct the Regular Test sequence with approved mix; if using lightweight aggregate, conduct the Regular Test sequence on normal weight concrete (or provide results from normal weight concrete on this project if using the same approved batch plant). For initial determination of the mixing time conduct the Regular Test sequence first. When regular testing is performed, the concrete must meet the limits of any five of the six uniformity requirements listed in Table 1 below. Before batching of High Temperature Concrete per paragraph TEST BATCHES uniformity testing for normal weight concrete is required to conducted, submitted and approved.

2.11.2.3 Abbreviated Test

Conduct the Abbreviated Test sequence for production concrete verification at the frequency specified in Table 6. When abbreviated testing is performed, the concrete is required to meet only those requirements listed for abbreviated testing. Use the projects approved mix design proportions for uniformity testing. For regular testing perform all six tests on three batches of concrete. The range for regular testing is the average of the ranges of the three batches. Abbreviated testing consists of performing the three required tests on a single batch of concrete. The range for abbreviated testing is the range for one batch. If more than one mixer is used and all are identical in terms of make, type, capacity, condition, speed of rotation, the results of tests on one of the mixers apply to the others, subject to the approval. Perform all mixer performance (uniformity) testing in accordance with COE CRD-C 55 and with paragraph TESTING AND INSPECTION FOR CONTRACTOR QUALITY CONTROL in PART 3.

2.11.2.4 Truck

Truck mixers are not allowed for mixing or transporting slipformed paving concrete. Provide only truck mixers designed for mixing or transporting paving concrete with extra large blading and rear opening specifically for low-slump paving concrete. Provide truck mixers, the mixing of concrete therein, and concrete uniformity and testing thereof that conform to the requirements of ASTM C94/C94M. Determine the number of revolutions between 70 to 100 for truck-mixed concrete and the number of revolutions for shrink-mixed concrete by uniformity tests as specified in ASTM C94/C94M and in requirements for mixer performance stated in paragraph TESTING AND INSPECTION FOR CONTRACTOR QUALITY CONTROL in PART 3. If requirements for the uniformity of concrete are not met with 100 revolutions of mixing after all ingredients including water are in the truck mixer drum, discontinue use of the mixer until the condition is corrected. Water is not allowed to be added after the initial introduction of mixing water except, when on arrival at the job site, the slump is less than specified and the water-cement ratio is less than that given as a maximum in the approved mixture. Additional water may be added to bring the slump within the specified range provided the approved water-cement ratio is not exceeded. Inject water into the head of the mixer (end opposite the discharge opening) drum under pressure, and turn the drum or blades a minimum of 30 additional revolutions at mixing speed. The addition of water to the batch at any later time is not allowed.

[Perform mixer performance (uniformity) tests for truck mixers in accordance with ASTM C94/C94M.]

2.11.3 Transporting Equipment

Transport slipform concrete to the paving site in non-agitating equipment conforming to ASTM C94/C94M or in approved agitators. Transport fixed form concrete in approved truck mixers designed with extra large blading and rear opening specifically for low slump concrete. Provide transporting equipment designed and operated to deliver and discharge the required concrete mixture completely without segregation.

2.11.4 Transfer and Spreading Equipment

**************************************************************************

NOTE: A transfer spreader is required for all paving projects.

**************************************************************************
A telescoping conveyor for conveying concrete (transfer spreader belt placers not allowed) is required equipment for transferring concrete from the transporting equipment to the paving lane in front of the vibrating truss. The telescoping conveyor will accept the concrete outside the paving lane and will transfer and deposit it evenly across the paving lane in front of the vibrating truss to a depth which permits the vibrating truss to operate efficiently. High Temperature Concrete may also be discharged directly from ready mix trucks provided the concrete is deposited in its final location within 1 m 3.28 feet radially from the end of the chute. Direct discharge from mixer trucks with specified low slump requires coordination of formwork and placement phasing. Do not allow haul trucks or equipment onto High Temperature Concrete unless joints have temporary backer rod inserted, surface is clean from any debris, concrete has reached 28 day strength, and protective matting is placed between truck wheels and concrete surface (curing materials are insufficient protective matting).

2.11.5 Vibrating Truss - For Continuously Reinforced Concrete

a. General: It is required that the vibrating truss screed has a triangular cross-section using a rotating eccentric weight type vibrator. Use three, 37.5 mm 1.5 inch diameter or larger spud vibrators, with a fourth vibrator at the site on standby to achieve or supplement consolidation of High Temperature Concrete. Ensure a vibrator is inserted between every grid of reinforcement and where workers have stepped in fresh concrete. Roller screeds or other types of paving and finishing equipment are not permitted.

2.11.6 Paver-Finisher - For Non-Continuously Reinforced Concrete

**************************************************************************
NOTE: The following subparagraphs apply to both fixed-form and slip-form paver-finishers. FIXED FORMS is applicable to fixed-form paver-finishers and SLIPFORM is applicable to slip-form paver-finishers.
**************************************************************************

Provide paver-finisher consisting of a heavy-duty, self-propelled machine designed specifically for paving and finishing high quality pavement, with a minimum weight of 3280 kg per m 2200 pounds per foot of lane width, and powered by an engine having a minimum 15,000 W per m 6.0 horsepower per foot of lane width. The paver-finisher is required to spread, consolidate, and shape the plastic concrete to the desired cross section in one pass. The mechanisms for forming the pavement are required to be easily adjustable in width and thickness and for required crown. In addition to other spreaders required by paragraph above, the paver-finisher equipped with a full width knock-down auger or paddle mechanism, capable of operating in both directions, which evenly spreads the fresh concrete in front of the screed or extrusion plate.

2.11.6.1 Vibrators

**************************************************************************
NOTE: Retain bracketed electronic vibrator monitoring equipment statement for airfield paving.
**************************************************************************
Provide gang mounted immersion vibrators at the front of the paver on a frame equipped with suitable controls so that all vibrators can be operated at any desired depth within the slab or completely withdrawn from the concrete, as required. Provide vibrators that are automatically controlled to immediately stop as forward motion of the paver ceases. [ Equipped the paver-finisher with an electronic vibrator monitoring device displaying the operating frequency of each individual internal vibrator with a readout display visible to the paver operator that operates continuously while paving, and displays all vibrator frequencies with manual or automatic sequencing among all individual vibrators. Discontinue paving if the vibrator monitoring system fails to operate properly during the paving operation. ] Provide the spacing of the immersion vibrators across the paving lane as necessary to properly consolidate the concrete, with a maximum clear distance between vibrators of 750 mm 30 inches and outside vibrators a maximum of 300 mm 12 inches from the lane edge. Operate spud vibrators at a minimum frequency of 135 Hz 8000 impulses per minute and a minimum amplitude of 0.75 mm 0.03 inch, as determined by COE CRD-C 521.

2.11.6.2 Screed or Extrusion Plate

Equipped the paver-finisher with a transversely oscillating screed or an extrusion plate to shape, compact, and smooth the surface and finish the surface that no significant amount of hand finishing, except use of cutting straightedges, is required. Provide a screed or extrusion plate constructed to adjust for crown in the pavement. Provide adjustment for variation in lane width or thickness and to prevent more than 200 mm 8 inches of the screed or extrusion plate extending over previously placed concrete on either end when paving fill-in lanes. Repair or replace machines that cause displacement of properly installed forms or cause ruts or indentations in the prepared underlying materials and machines that cause frequent delays due to mechanical failures as directed.

2.11.6.3 Longitudinal Mechanical Float

A longitudinal mechanical float may be used. If used, provide a float that is specially designed and manufactured to smooth and finish the pavement surface without working excess paste to the surface that is rigidly attached to the rear of the paver-finisher or to a separate self-propelled frame spanning the paving lane. Provide float plate at least 1.5 m 5 feet long by 200 mm 8 inches wide and automatically be oscillated in the longitudinal direction while slowly moving from edge to edge of the paving lane, with the float plate in contact with the surface at all times.

2.11.6.4 Other Types of Finishing Equipment

Clary screeds, other rotating tube floats, or bridge deck finishers are not allowed on mainline paving, but may be allowed on irregular or odd-shaped slabs, and near buildings or trench drains, subject to approval. Provide bridge deck finishers with a minimum operating weight of 3400 kg 7500 pounds that have a transversely operating carriage containing a knock-down auger and a minimum of two immersion vibrators. Only use vibrating screeds or pans for isolated slabs where hand finishing is permitted as specified, and only where specifically approved.

2.11.6.5 Fixed Forms

Provide paver-finisher equipped with wheels designed to ride the forms, keep it aligned with the forms, and spread the load so as to prevent deformation of the forms. Provide paver-finishers traveling on guide rails
located outside the paving lane that are equipped with wheels when
traveling on new or existing concrete to remain. Alternatively, a modified
slipform paver that straddles the forms may be used. Provide a modified
slipform paver which has the side conforming plates removed or rendered
ineffective and travels over or along pre-placed fixed forms.

2.11.6.6 Slipform

The slipform paver-finisher is required to be automatically controlled and
crawler mounted with padded tracks so as to be completely stable under all
operating conditions and provide a finish to the surface and edges so that
no edge slump beyond allowable tolerance occurs. Provide suitable moving
side forms that are adjustable and produce smooth, even edges,
perpendicular to the top surface and meeting specification requirements for
alignment and freedom from edge slump.

2.11.7 Texturing Equipment

**************************************************************************
NOTE: Designer must select type of texturing
desired, retain that subparagraph, and delete the
others. A genuine effort must be made to determine
the type of texturing, if any, desired by the using
service. If no guidance is given, the usual default
method must be burlap drag. If other than a burlap
drag textured finish is required, edit the
appropriate paragraph(s) as shown below.

For Air Force airfield paving projects, do not
specify artificial turf, wire comb, or surface
grooving textures. For Navy airfield paving
projects, do not specify wire comb or surface
grooving textures. Use Section 32 01 18.71 GROOVING
OF AIRFIELD PAVING, to specify saw-cut grooves.

Spring tine grooving is limited to use on roads and
streets only.
**************************************************************************

Provide texturing equipment as specified below. Before use, demonstrate
the texturing equipment on a test section, and modify the equipment as
necessary to produce the texture directed.

[2.11.7.1 Burlap Drag]

Securely attach a burlap drag to a separate wheel mounted frame spanning
the paving lane or to one of the other similar pieces of equipment.
Provide length of the material between 600 to 900 mm 24 to 36 inches
dragging flat on the pavement surface. Provide burlap drag with a width at
least equal to the width of the slab. Provide clean, reasonably new burlap
material, completely saturated with water before attachment to the frame,
always re-saturate before start of use, and kept clean and saturated during
use. Provide burlap conforming to AASHTO M 182, Class 3 or 4.

}[2.11.7.2 Broom

Apply surface texture using an approved mechanical stiff bristle broom drag
of a type that provides a uniformly scored surface transverse to the
pavement center line. Provide broom capable of traversing the full width
of the pavement in a single pass at a uniform speed and with a uniform pressure that results in scores uniform in appearance and approximately 1.5 mm 1/16 inch in depth but not more than 3 mm 1/8 inch in depth.

][2.11.7.3 Artificial Turf

Provide full-width artificial turf drag with the leading transverse edge securely fastened to a lightweight pole on a traveling bridge. Provide a minimum of 600 mm 2 feet of the artificial turf in contact with the concrete surface during texturing operations that results in corrugations uniform in appearance and approximately 2 mm 1/16 inch in depth. A variety of different types of artificial turf are available and approval of any one type will be done only after it has been demonstrated to provide a satisfactory texture. One type that has provided satisfactory texture consists of 7,200 approximately 0.85-inch-long polyethylene turf blades per square foot.

][2.11.8 Sawing Equipment

******************************************************************************
NOTE: Retain bracketed sentence as necessary to correlate with paragraph REMOVAL OF EXISTING PAVEMENT SLAB in PART 3. Otherwise delete. Also delete wheel saw option on Navy projects.
******************************************************************************

Provide equipment for sawing joints and for other similar sawing of concrete consisting of standard diamond-type concrete saws mounted on a wheeled chassis which can be easily guided to follow the required alignment. Provide diamond tipped blades. If demonstrated to operate properly, abrasive blades may be used. Provide spares as required to maintain the required sawing rate. [Provide wheel saws used in the removal of concrete with large diameter tungsten carbide tipped blades mounted on a heavy-duty chassis which produce a saw kerf at least 40 mm 1-1/2 inches wide. ]Provide saws capable of sawing to the full depth required. Early-entry saws may be used, subject to demonstration and approval. No change to the initial sawcut depth is permitted.

][2.11.9 Straightedge

Provide and maintain at the job site, in good condition, a minimum 4 m 12 foot straightedge for each paving train for testing the hardened portland cement concrete surfaces. Provide straightedges constructed of aluminum or magnesium alloy and blades of box or box-girder cross section with flat bottom, adequately reinforced to insure rigidity and accuracy. Provide straightedges with handles for operation on the pavement.

2.11.10 Work Bridge

Provide a self-propelled working bridge capable of spanning the required paving lane width where workmen can efficiently and adequately reach the pavement surface.

2.12 SPECIFIED CONCRETE STRENGTH AND OTHER PROPERTIES

******************************************************************************
NOTE: Specified concrete strength of 550 psi is readily attainable with lightweight aggregates at 28 days. Do not specify higher strength as that may
not be achieved in 28 days. Although traprock mixtures are similar to normal weight concrete with higher strengths of 650 psi common, do not specify higher strength.

2.12.1 Specified Flexural Strength - For Lightweight Aggregate

Specified flexural strength, $R$, for High Temperature Concrete is 3.8 MPa 550 psi at 28 days. Maximum allowable water-cementitious material ratio is 0.45. The water-cementitious material ratio will be the equivalent water-cement ratio as determined by conversion from the weight ratio of water to cement plus SCM by the mass equivalency method described in ACI 211.2, ACI 213R and ACI 325.14R for expanded slate or expanded shale. The concrete must have air-entrained with a total air content of 6 percent plus or minus 1.5 percentage points, at the point of placement. Determine air content in accordance with ASTM C173/C173M. The required slump of the concrete at the point of placement is 50 to 100 mm 2 to 4 inches.

2.12.2 Specified Flexural Strength - For Traprock Aggregate

Specified flexural strength, $R$, for High Temperature Concrete is 4.5 MPa 650 psi at 28 days. Maximum allowable water-cementitious material ratio is 0.45. The water-cementitious material ratio will be the equivalent water-cement ratio as determined by conversion from the weight ratio of water to cement plus SCM by the mass equivalency method described in ACI 211.1 and ACI 325.14R. The concrete must have air-entrained with a total air content of 6 percent plus or minus 1.5 percentage points, at the point of placement. Determine air content in accordance with ASTM C173/C173M. The required slump of the concrete at the point of placement is 50 to 100 mm 2 to 4 inches.

2.12.3 Specified Flexural Strength - For Lightweight Aggregate

Specified flexural strength, $R$, for High Temperature Concrete is 3.8 MPa 550 psi at 28 days. Maximum allowable water-cementitious material ratio is 0.45. The water-cementitious material ratio will be the equivalent water-cement ratio as determined by conversion from the weight ratio of water to cement plus SCM by the mass equivalency method described in ACI 211.2, ACI 213R and ACI 325.14R for expanded slate or expanded shale. The concrete must have air-entrained with a total air content of 6 percent plus or minus 1.5 percentage points, at the point of placement. Determine air content in accordance with ASTM C173/C173M. The required slump of the concrete at the point of placement is 50 to 100 mm 2 to 4 inches.

2.12.4 Specified Flexural Strength - For Traprock Aggregate

Specified flexural strength, $R$, for High Temperature Concrete is 4.5 MPa 650 psi at 28 days. Maximum allowable water-cementitious material ratio is 0.45. The water-cementitious material ratio will be the equivalent water-cement ratio as determined by conversion from the weight ratio of water to cement plus SCM by the mass equivalency method described in ACI 211.1 and ACI 325.14R. The concrete must have air-entrained with a total air content of 6 percent plus or minus 1.5 percentage points, at the point of placement. Determine air content in accordance with ASTM C173/C173M. The required slump of the concrete at the point of placement is 50 to 100 mm 2 to 4 inches.
2.12.5 Water-Cementitious Materials Ratio

Maximum allowable water-cementitious material ratio is 0.45. The water-cementitious material ratio is the equivalent water-cement ratio as determined by conversion from the weight ratio of water to cement plus SCM by the mass equivalency method described in ACI 211.1.

2.12.6 Air Content

Provide concrete that is air-entrained with a total air content of [4.0] [6.0] [6.5] plus or minus 1.5 percentage points, at the point of placement. Determine air content in accordance with ASTM C231/C231M.

2.12.7 Slump

The maximum allowable slump of the concrete at the point of placement is 50 mm 2 inches for pavement constructed with fixed forms. For slipformed pavement, at the start of the project, select a slump which produces in-place pavement meeting the specified tolerances for control of edge slump. The selected slump is applicable to both pilot and fill-in lanes.

2.12.8 Concrete Temperature

The temperature of the concrete as delivered is required to conform to the requirements of paragraphs PAVING IN HOT WEATHER and PAVING IN COLD WEATHER, in PART 3. Determine the temperature of concrete in accordance with ASTM C1064/C1064M.

2.12.9 Concrete Strength for Final Acceptance

The strength of the concrete will be considered acceptable when the average 28-day flexural strengths for each lot is above the 'Specified Flexural Strength', and no individual beam in the lot is 170 kPa 25 psi or more below the equivalent 'Specified Flexural Strength'. Removed and replaced at no additional cost to the Government any lot or sublot, respectively, that fails to meet the above criteria.

2.13 MIXTURE PROPORTIONS

2.13.1 Composition

Allowable constituents of concrete are cementitious material, water, fine and coarse aggregates, [fibrillated polypropylene fibers, ]and admixtures. Supplementary Cementitious Materials (SCM) choice and usage must conform with paragraph SUPPLEMENTAL CEMENTITIOUS MATERIALS (SCM) CONTENT. The total cementitious material content is required to be at least 310 kg per cubic meter 517 pounds per cubic yard for traprock and 447 kg per cubic meter 752 pounds per cubic yard for lightweight aggregate 310 kg per cubic meter 517 pounds per cubic yard for traprock 447 kg per cubic meter 752 pounds per cubic yard for lightweight aggregate. Admixtures consist of air entraining admixture and may also include, as approved, accelerator, retarder, and water-reducing admixture.

2.13.2 Proportioning Studies

Trial design batches, mixture proportioning studies, and testing requirements are the responsibility of the Contractor. Submit for approval the Preliminary Proposed Proportioning to include items a., b., and i. below a minimum of 7 days prior to beginning the mixture proportioning.
study. Trial mixtures having proportions, slumps, and air content suitable for the work based on methodology described in ACI 211.2, ACI 213R and ACI 325.14R for expanded slate or expanded shale, modified as necessary by manufacturer's recommendations to accommodate flexural strength and workability. Trial mixtures having proportions, slumps, and air content suitable for the work based on methodology described in ACI 211.2, ACI 213R and ACI 325.14R for expanded slate or expanded shale, or ACI 211.1 and ACI 325.14R for trap rock, modified as necessary by manufacturer's recommendations to accommodate flexural strength and workability. Trial mixtures having proportions, slumps, and air content suitable for the work based on methodology described in ACI 211.1 and ACI 325.14R for trap rock, modified as necessary by manufacturer's recommendations to accommodate flexural strength and workability.

2.13.2.1 Determination of Moisture Properties Coarse and Fine Lightweight Aggregates and Fine Traprock Aggregate

Use the following procedures to determine the moisture properties of lightweight aggregate, coarse and fine, and manufactures traprock fines:

Saturated Surface Dry (SSD) Specific Gravity:

a. Obtain sample and oven dry (not microwave) at 110 degrees C 230 degrees F until constant weight, which may take several days.

b. Submerge sample in water container for 7 days

c. Determine soaked sample Bulk Specific Gravity

d. Towel dry, no water sheen, determine SSD Specific Gravity

Free Water on Aggregates (NY 703-19 E):

Conduct the following procedures a minimum of three times for the project: prior to developing the laboratory mixtures, when build stockpiles, and when replenish stockpiles.

a. Obtain minimum of two stockpile samples after continuous watering has ensured aggregates have reached 100 percent absorption.

b. Determine moisture content of one sample by drying to constant weight.

c. Determine moisture content of second sample after first towel drying to surface dry condition.

d. Difference of two moisture contents is free water on aggregates.

e. General targets for production are 1-3 percent free moisture on coarse aggregate and 6-10 percent free moisture on fine aggregate.

Prior to conducting any High Temperature Concrete batching, determine the stockpile free moisture content prior to first batch of day and at frequency indicated in paragraph TESTING AND INSPECTION REQUIREMENTS.

2.13.2.2 Water-Cementitious Materials Ratio

Perform at least three different water-cementitious materials ratios, which produce a range of strength encompassing that required on the project.
maximum allowable water-cementitious material ratio required in paragraph SPECIFIED FLEXURAL STRENGTH, above is the equivalent water-cementitious materials ratio. The maximum water-cementitious materials ratio of the approved mix design becomes the maximum water-cementitious materials ratio for the project, and in no case exceeds 0.45.

2.13.2.3 Trial Mixture Studies

Perform separate sets of trial mixture studies made for each combination of cementitious materials and each combination of admixtures proposed for use. No combination of either are to be used until proven by such studies, except that, if approved in writing and otherwise permitted by these specifications, an accelerating or retarding admixture may be used without separate trial mixture study. Perform separate trial mixture studies for each placing method (slip form, fixed form, or hand placement) proposed. Report the temperature of concrete in each trial batch. Design each mixture to promote easy and suitable concrete placement, consolidation and finishing, and to prevent segregation and excessive bleeding. Proportion laboratory trial mixtures for maximum permitted slump and air content.

2.13.3 Example High Temperature Concrete Mix Designs

The Contractor is responsible to develop the High Temperature Concrete mixture proportions for the project. The Contractor must select the aggregates for use, develop and adapt the mixture based upon mixing and paving methods, site temperature and humidity for time of placement. Government personnel resources are available at no charge to Contractor for consultation after contract award, and will be present during test batches, test sections and production paving. The following mix design was used with 100 percent expanded slate lightweight aggregates at Eglin AFB in December 2010. This mixture design is only provided for information and is not a project requirement nor assurance that it will meet project specifications for any particular material, method, site or climate.

2.13.3.1 Example Traprock Aggregate Mix Design

The following mix design was used for laboratory studies by NAVFAC EXWC. It uses the Carolina Sunrock aggregates. This mixture design is only provided for information and is not a project requirement nor assurance that it will meet project specifications for any particular material, method, site or climate.

[2.14] SURFACE CLEANING SOLUTIONS

**************************************************************************
NOTE: In order to prepare the surface of existing concrete or new concrete which has POL spillage, POL stains must be removed to ensure penetration of surface sealer solution. This paragraph is optional for new construction and may be deleted.
**************************************************************************

To remove existing POL stains from the concrete surface prior to surface sealer solution application, use one of the following:

a. A mixture of dishwashing (Dawn or Simple Green) detergent and hot water
b. Trisodium phosphate (TSP)
c. Sodium hydroxide if TSP is not available or permitted
d. Sodium carbonate (washing soda)
e. Phosphoric acid cleaner
f. Bio-remediation via Eximo (CAF Environmental Solutions) or G Force (Winsol Laboratories)

[2.15] SURFACE SEALER SOLUTION

Surface sealer is required to be a colorless, water-based solution containing at least 9 percent sodium silicate at time of application.

PART 3 EXECUTION

3.1 PREPARATION FOR PAVING

Before commencing paving, perform the following. If used, place cleaned,
coated, and adequately supported forms. Have any reinforcing steel needed at the paving site; all transporting and transfer equipment ready for use, clean, and free of hardened concrete and foreign material; equipment for spreading, consolidating, screeding, finishing, and texturing concrete at the paving site, clean and in proper working order; and all equipment and material for curing and for protecting concrete from weather or mechanical damage at the paving site, in proper working condition, and in sufficient amount for the entire placement.

3.1.1 Weather Prevention

When windy conditions during paving appear probable, have equipment and material at the paving site to provide windbreaks, shading, fogging, or other action to prevent plastic shrinkage cracking or other damaging drying of the concrete.

3.1.2 Proposed Techniques

**************************************************************************
NOTE: Include joint layout and typical detail of joint/reinforcing/dowel bar size and spacing in drawings and coordinate with paragraph PLACING REINFORCING STEEL. Insert office title for approval of joint plan changes.
**************************************************************************

Submit for approval the following items:

a. A description of the placing and protection methods proposed when concrete is to be placed in or exposed to hot, cold, or rainy weather conditions.

b. A detailed paving sequence plan and proposed paving pattern showing all planned construction joints; transverse and longitudinal reinforcing bar size and spacing; and identifying pilot lanes and hand placement areas. Place the five continuously reinforced High Temperature Concrete lanes in a minimum of three pours and in the following sequence: place the center lane first; then the two adjacent lanes, then the two outside lanes. This paving sequence allows installation of threaded reinforcing steel and couplers. Without written approval of the Contracting Officer, no deviation from the jointing pattern shown on the drawings are allowed.

c. Plan and equipment proposed to control alignment of sawn joints within the specified tolerances.

d. Data on the curing equipment, media and methods to be used.

e. Pavement demolition work plan, presenting the proposed methods and equipment to remove existing pavement and protect pavement to remain in place.

f. Data on profilograph and methods to measure pavement smoothness.
3.2 CONDITIONING OF UNDERLYING MATERIAL

3.2.1 General Procedures

Verify the underlying material, upon which concrete is to be placed is clean, damp, and free from debris, waste concrete or cement, frost, ice, and standing or running water. Prior to setting forms or placement of concrete, verify the underlying material is well drained and have been satisfactorily graded by string-line controlled, automated, trimming machine and uniformly compacted in accordance with the applicable Section of these specifications. Test the surface of the underlying material to crown, elevation, and density in advance of setting forms or of concrete placement using slip-form techniques. Trim high areas to proper elevation. Fill and compact low areas to a condition similar to that of surrounding grade, or filled with concrete monolithically with the pavement. Low areas filled with concrete are not to be cored for thickness to avoid biasing the average thickness used for evaluation and payment adjustment. Rework and compact any underlying material disturbed by construction operations to specified density immediately in front of the paver. If a slipform paver is used, continue the same underlying material under the paving lane beyond the edge of the lane a sufficient distance that is thoroughly compacted and true to grade to provide a suitable trackline for the slipform paver and firm support for the edge of the paving lane.

3.2.2 Traffic on Underlying Material

NOTE: Transporting equipment must not be allowed to operate on the prepared underlying material for airfield paving. Operating hauling equipment in the paving lane will cause the paver to stop frequently, producing a discontinuity in the pavement surface. Edit bracketed items as appropriate and coordinate with Part 2, subparagraph TRANSFER AND SPREADING EQUIPMENT.

After the underlying material has been prepared for concrete placement, equipment is not permitted thereon with exception of the paver. Subject to specific approval, crossing of the prepared underlying material at specified intervals for construction purposes may be permitted, provided rutting or indentations do not occur. Rework and repair the surface before concrete is placed. Transporting equipment is not to be allowed to operate on the prepared and compacted underlying material in front of the paver-finisher. Equipment may be allowed to operate on the underlying material only if approved and only if no damage is done to the underlying material and its degree of compaction. Correct any disturbance to the underlying material that occurs, as approved, before the paver-finisher or the deposited concrete reaches the location of the disturbance and replace the equipment or change procedures to prevent any future damage.

3.3 WEATHER LIMITATIONS

3.3.1 Placement and Protection During Inclement Weather

Do not commence placing operations when heavy rain or other damaging weather conditions appear imminent. At all times when placing concrete, maintain on-site sufficient waterproof cover and means to rapidly place it
over all unhardened concrete or concrete that might be damaged by rain. Suspend placement of concrete whenever rain, high winds, or other damaging weather commences to damage the surface or texture of the placed unhardened concrete, washes cement out of the concrete, or changes the water content of the surface concrete. Immediately cover and protect all unhardened concrete from the rain or other damaging weather. Completely remove any slab damaged by rain or other weather full depth, by full slab width, to the nearest original joint, and replaced as specified in paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS below, at no expense to the Government.

3.3.2 Paving in Hot Weather

******************************************************************************
NOTE: Additional information concerning hot weather concreting may be obtained from ACI 305R. Do not delete this paragraph or the next paragraphs dealing with weather.
******************************************************************************

When the ambient temperature during paving is expected to exceed 32 degrees C 90 degrees F, properly place and finish the concrete in accordance with procedures previously submitted, approved, and as specified herein. Provide concrete that does not exceed the temperature shown in the table below when measured in accordance with ASTM C1064/C1064M at the time of delivery. Cooling of the mixing water or aggregates or placing in the cooler part of the day may be required to obtain an adequate placing temperature. Cool steel forms and reinforcing as needed to maintain steel temperatures below 49 degrees C 120 degrees F. Cool or protect transporting and placing equipment if necessary to maintain proper concrete placing temperature. Keep the finished surfaces of the newly laid pavement damp by applying a fog spray (mist) with approved spraying equipment until the pavement is covered by the curing medium.

3.3.3 Prevention of Plastic Shrinkage Cracking

During weather with low humidity, and particularly with high temperature and appreciable wind, develop and institute measures to prevent plastic shrinkage cracks from developing. If plastic shrinkage cracking occurs, halt further placement of concrete until protective measures are in place to prevent further cracking. Periods of high potential for plastic shrinkage cracking can be anticipated by use of ACI 305R. In addition to the protective measures specified in the previous paragraph, the concrete placement may be further protected by erecting shades and windbreaks and by applying fog sprays of water, the addition of mono-molecular films, or wet covering. Apply mono-molecular films after finishing is complete, do not use in the finishing process. Immediately commence curing procedures when such water treatment is stopped. Repair plastic shrinkage cracks in accordance with paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY
3.3.4 Paving in Cold Weather

Cold weather paving is required to conform to ACI 306R. Use special protection measures, as specified herein, if freezing temperatures are anticipated or occur before the expiration of the specified curing period. Do not begin placement of concrete unless the ambient temperature is at least 2 degrees C (35 degrees F) and rising. Thereafter, halt placement of concrete whenever the ambient temperature drops below 5 degrees C (40 degrees F). When the ambient temperature is less than 10 degrees C (50 degrees F), the temperature of the concrete when placed is required to be not less than 10 degrees C (50 degrees F) nor more than 25 degrees C (75 degrees F). Provide heating of the mixing water or aggregates as required to regulate the concrete placing temperature. Materials entering the mixer are required to be free from ice, snow, or frozen lumps. Do not incorporate salt, chemicals or other materials in the concrete to prevent freezing. [If allowed under paragraph MIXTURE PROPORTIONS in PART 2, an accelerating admixture may be used when the ambient temperature is below 10 degrees C (50 degrees F).] Provide covering and other means for maintaining the concrete at a temperature of at least 10 degrees C (50 degrees F) for not less than 72 hours after placing, and at a temperature above freezing for the remainder of the curing period. Remove pavement slabs, full depth by full width, damaged by freezing or falling below freezing temperature to the nearest planned joint, and replace as specified in paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS, at no expense to the Government.

3.4 CONCRETE PRODUCTION

******************************************************************************
NOTE: Designer must correlate these paragraphs with paragraph EQUIPMENT. Delete item in brackets if truck mixers are not permitted.
******************************************************************************

Provide batching, mixing, and transporting equipment with a capacity sufficient to maintain a continuous, uniform forward movement of the paver of not less than 0.8 m (2.5 feet) per minute. Deposit concrete transported in non-agitating equipment in front of the paver within 45 minutes from the time cement has been charged into the mixing drum, except that if the ambient temperature is above 32 degrees C (90 degrees F), the time is reduced to 30 minutes. Deposit concrete transported in truck mixers in front of the paver within 90 minutes from the time cement has been charged into the mixer drum of the plant or truck mixer. If the ambient temperature is above 32 degrees C (90 degrees F), the time is reduced to 60 minutes. Accompany every load of concrete delivered to the paving site with a batch ticket from the operator of the batching plant. Provide batch ticket information required by ASTM C94/C94M on approved forms. In addition provide design quantities in mass or volume for all materials, batching tolerances of all materials, and design and actual water cementitious materials ratio on each batch delivered, [the water meter and revolution meter reading on truck mixers] and the time of day. Provide batch tickets for each truck delivered as part of the lot acceptance package to the placing foreman to maintain on file and deliver them to the Government weekly.
3.4.1 Batching and Mixing Concrete

Maintain scale pivots and bearings clean and free of rust. Remove any equipment which fails to perform as specified immediately from use until properly repaired and adjusted, or replaced.

3.4.2 Transporting and Transfer - Spreading Operations

Operate non-agitating equipment only on smooth roads and for haul time less than 15 minutes. Deposit concrete as close as possible to its final position in the paving lane. Operate all equipment to discharge and transfer concrete without segregation. Dumping of concrete in discrete piles is not permitted. No transfer or spreading operation which requires the use of front-end loaders, dozers, or similar equipment to distribute the concrete are permitted.

3.5 PAVING - FOR CONTINUOUSLY REINFORCED CONCRETE

3.5.1 General Requirements - for Continuously Reinforced Concrete

Construct pavement with paving and finishing equipment utilizing rigid fixed forms. Utilize paving and finishing equipment and procedures capable of constructing paving lanes of the required width. Control and coordinate paving equipment and its operation with all other operations, such that the vibrating truss has a continuous forward movement, at a reasonably uniform speed, from beginning to end of each paving lane, except for inadvertent equipment breakdown. Failure to achieve this must require the Contractor to halt operations, regroup, and modify operations to achieve this requirement. Workmen with foreign material on their footwear or construction equipment that might deposit foreign material are not permitted to walk or operate in the plastic concrete. Provide clean matting to lay tools not in use and workers to stand to prevent contamination of the High Temperature Concrete.

3.5.2 Consolidation - for Continuously Reinforced Concrete

Consolidate concrete with three hand-held spud vibrators across the paving lane. Insert the vibrators into the concrete to a depth that will provide the best full-depth consolidation. Insert a vibrator into every reinforcement grid and in worker's footsteps. Vibrators may be used and operated from a bridge spanning the area. Vibrators are not to be used to transport or spread the concrete. Hand-operated vibrators are not to be operated in the concrete at one location for more than 20 seconds. Any evidence of inadequate consolidation (honeycomb along the edges, large air pockets, or any other evidence) must require the immediate stopping of the paving operation and approved adjustment of the equipment or procedures.

3.5.3 Operation - for Continuously Reinforced Concrete

When the vibrating truss approaches a header at the end of a paving lane, maintain a sufficient amount of concrete ahead of the vibrating truss to provide a roll of concrete which will spill over the header. Ensure the required amount of extra concrete sufficient to prevent any slurry that is formed and carried along ahead of the vibrating truss from being deposited adjacent to the header is present. Provide additional consolidation adjacent to the headers by hand-held vibrators. When the vibrating truss is operated between or adjacent to previously constructed pavement (fill-in lanes), make provisions to prevent damage to the previously constructed pavement. At all times, keep the overlapping area of existing pavement
surface completely free of any loose or bonded foreign material as the vibrating truss operates across it.

3.5.4 Required Results - for Continuously Reinforced Concrete

Adjust, operate, and coordinate the vibrating truss, and its hand placed equipment together with its operating procedures with the concrete mixture being used to produce a thoroughly consolidated slab throughout, true to line and grade within specified tolerances. The vibrating truss operation must produce a surface finish free of irregularities, tears, voids of any kind, and any other discontinuities. The vibrating truss must make only one pass across the pavement; multiple passes will not be permitted. The equipment and its operation must produce a finished surface as specified and requiring no excessive hand finishing other than the use of cutting straightedges. If any equipment or operation fails to produce the above results, stop the paving, replace or properly adjust the equipment. Appropriately modify the operation or mixture proportions in order to produce the required results before recommencing paving. Apply no water, other than approved fog sprays, to the concrete or the concrete surface during paving and finishing.

3.5.5 Forms for Fixed-Form Paving - for Continuously Reinforced Concrete

**************************************************************************
NOTE: Fixed-form paving is mandatory for high temperature concrete with fibers and continuous reinforcement.
**************************************************************************

a. Furnish straight forms made of steel in sections not less than 3 m 10 feet in length. Use flexible or curved forms of proper radius for curves of 31 m 100-foot radius or less. Make wood forms for curves and fillets of well-seasoned, surfaced plank or plywood, straight, and free from warp or bend. Furnish wood forms adequate in strength and rigidly braced. Forms must have a depth equal to the pavement thickness at the edge. Where the project requires several different slab thicknesses, forms may be built up by bolting or welding a tubular metal section or by bolting wood planks to the bottom of the form to completely cover the underside of the base of the form and provide an increase in depth of not more than 25 percent. The base width of the one-piece or built-up form cannot be less than eight-tenths of the vertical height of the form, except than forms 200 mm 8 inches or less in vertical height must have a base width not less than the vertical height of the form. Maximum vertical deviation of top of any side form, including joints, must not vary from a true plane more than 3 mm 1/8 inch in 3 m 12 feet, and the upstanding leg must not vary more than 6 mm 1/4 inch.

b. Tightly lock form sections. Restrict form sections from play or movement in any direction. Provide forms with adequate devices for secure settings so that in place they will withstand, without visible spring or settlement, the impact and vibration of the consolidating and finishing equipment.

c. Set forms for full bearing on foundation for entire length and width and in alignment with edge of finished pavement. Support forms during entire operation of placing, compaction, and finishing so that forms will not deviate vertically more than 3 mm 0.01 foot from required grade and elevations indicated. Check conformity to the alignment and grade elevations shown on the drawings. Immediately make necessary
3.5.5.1 Form Removal - for Continuously Reinforced Concrete

Remove forms for preparation to place adjacent lanes at a time in accordance with paragraph WET CURING, but no sooner than 24 hours after the end of the placement. Cover in burlap and polyethylene and keep wet concrete edges exposed after form removal until the adjacent concrete is placed or the 14 day wet curing period is achieved, as appropriate for the edge location. When conditions are such that the early strength gain of the concrete is delayed, leave the forms in place for a longer time, as directed. Remove forms by procedures that do not injure the concrete. Do not use bars or heavy metal tools directly against the concrete in removing the forms. Promptly repair any concrete found to be defective after form removal using procedures specified hereinafter or as directed.

3.5.6 Placing Reinforcing Steel - for Continuously Reinforced Concrete

Use the type and amount of steel reinforcement shown on the drawings.

3.5.6.1 Reinforcement Support - for Continuously Reinforced Concrete

Position the reinforcement on approved continuous mesh support devices or numerous chairs securely fastened to the subgrade prior to concrete placement. Support and anchor reinforcement to maintain proper position in final concrete pavement on a maximum 1.2 m by 1.2 m grid, including at edges if steel does not penetrate forms. Vibrate concrete after the steel has been placed. Regardless of placement procedure, use reinforcing steel free from coatings which could impair bond between the steel and concrete, and laps in the reinforcement must be as indicated. Regardless of the equipment or procedures used for installing reinforcement, ensure that the entire depth of concrete is adequately consolidated.

3.6 PAVING - FOR NON-CONTINUOUSLY REINFORCED CONCRETE

**************************************************************************
NOTE: Designer must correlate these paragraphs with paragraph EQUIPMENT.
**************************************************************************

3.6.1 General Requirements - for Non-Continuously Reinforced Concrete

Construct pavement with paving and finishing equipment utilizing rigid fixed forms or by use of slipform paving equipment. Provide paving and finishing equipment and procedures capable of constructing paving lanes of the required width at a rate of at least 0.8 m 2.5 feet of paving lane per minute on a routine basis. Control paving equipment and its operation, and coordinated with all other operations, such that the paver-finisher has a continuous forward movement at a reasonably uniform speed from beginning to end of each paving lane, except for inadvertent equipment breakdown. Backing the paver and refinishing a lane is not permitted. Remove and replace concrete refinished in this manner. Failure to achieve a continuous forward motion requires halting operations, regrouping, and modifying operations to achieve this requirement. Personnel are not permitted to walk or operate in the plastic concrete at any time. Where an open-graded granular base is required under the concrete, select paving
equipment and procedures which operate properly on the base course without causing displacement or other damage.

3.6.2 Consolidation - for Non-Continuously Reinforced Concrete

Consolidate concrete with the specified type of lane-spanning, gang-mounted, mechanical, immersion type vibrating equipment mounted in front of the paver, supplemented, in rare instances as specified, by hand-operated vibrators. Insert vibrators into the concrete to a depth that provides the best full-depth consolidation but not closer to the underlying material than 50 mm 2 inches. Excessive vibration is not permitted. Discontinue paving operations if vibrators cause visible tracking in the paving lane, until equipment and operations have been modified to prevent it. Vibrate concrete in small, odd-shaped slabs or in isolated locations inaccessible to the gang-mounted vibration equipment with an approved hand-operated immersion vibrator operated from a bridge spanning the area. Do not use vibrators to transport or spread the concrete. Do not operate hand-operated vibrators in the concrete at one location for more than 20 seconds. Insert hand-operated vibrators between 150 to 400 mm 6 to 15 inches on centers. For each paving train, provide at least one additional vibrator spud, or sufficient parts for rapid replacement and repair of vibrators at the paving site at all times. Any evidence of inadequate consolidation (honeycomb along the edges, large air pockets, or any other evidence) requires the immediate stopping of the paving operation and approved adjustment of the equipment or procedures.

3.6.3 Operation - for Non-Continuously Reinforced Concrete

When the paver approaches a header at the end of a paving lane, maintain a sufficient amount of concrete ahead of the paver to provide a roll of concrete which spills over the header. Provide a sufficient amount of extra concrete to prevent any slurry that is formed and carried along ahead of the paver from being deposited adjacent to the header. Maintain the spud vibrators in front of the paver at the desired depth as close to the header as possible before they are lifted. Provide additional consolidation adjacent to the headers by hand-manipulated vibrators. When the paver is operated between or adjacent to previously constructed pavement (fill-in lanes), provide provisions to prevent damage to the previously constructed pavement. Electronically control screeds or extrusion plates from the previously placed pavement so as to prevent them from applying pressure to the existing pavement and to prevent abrasion of the pavement surface. Maintain the overlapping area of existing pavement surface completely free of any loose or bonded foreign material as the paver-finisher operates across it. When the paver travels on existing pavement, maintain approved provisions to prevent damage to the existing pavement. Pavers using transversely oscillating screeds are not allowed to form fill-in lanes that have widths less than a full width for which the paver was designed or adjusted.

3.6.4 Required Results - for Non-Continuously Reinforced Concrete

Adjust and operate the paver-finisher, its gang-mounted vibrators and operating procedures coordinated with the concrete mixture being used, to produce a thoroughly consolidated slab throughout that is true to line and grade within specified tolerances. Provide a paver-finishing operation that produces a surface finish free of irregularities, tears, voids of any kind, and any other discontinuities in a single pass across the pavement; multiple passes are not permitted. Provide equipment and its operation that produce a finished surface requiring no hand finishing other than the
use of cutting straightedges, except in very infrequent instances. Stop paving if any equipment or operation fails to produce the above results. Prior to recommencing paving, properly adjust or replace the equipment, modify the operation, or modify the mixture proportions, in order to produce the required results. No water, other than fog sprays (mist) as specified in paragraph PREVENTION OF PLASTIC SHRINKAGE CRACKING above, is allowed to be applied to the concrete or the concrete surface during paving and finishing.

3.6.5 Fixed Form Paving - for Non-Continuously Reinforced Concrete

**************************************************************************
NOTE: Fixed-form paving should always be included as an option or mandatory item as appropriate. Edit bracketed items in subparagraph a. Keys are only permitted for roads and streets with a thickness of 230 mm 9 inches or greater. Do not permit keys for airfield pavements.
**************************************************************************

Provide paving equipment for fixed-form paving and the operation that conforms to the requirements of paragraph EQUIPMENT, and all requirements specified herein.

3.6.5.1 Forms for Fixed-Form Paving - for Non-Continuously Reinforced Concrete

**************************************************************************
NOTE: Delete subparagraph e. when overlay pavements are not required.
**************************************************************************

a. Provide straight forms made of steel and in sections not less than 3 m 10 feet in length that are clean and free of rust or other contaminants. Seal any holes or perforations in forms prior to paving unless otherwise permitted. Maintain forms in place and passable by all equipment necessary to complete the entire paving operation without need to remove horizontal form supports. Provide flexible or curved forms of proper radius for curves of 31 m 100-foot radius or less. Provide wood forms for curves and fillets made of well-seasoned, surfaced plank or plywood, straight, and free from warp or bend that have adequate strength and are rigidly braced. Provide forms with a depth equal to the pavement thickness at the edge. Where the project requires several different slab thicknesses, forms may be built up by bolting or welding a tubular metal section or by bolting wood planks to the bottom of the form to completely cover the underside of the base of the form and provide an increase in depth of not more than 25 percent. Provide forms with the base width of the one-piece or built-up form not less than eight-tenths of the vertical height of the form, except provide forms 200 mm 8 inches or less in vertical height with a base width not less than the vertical height of the form. Provide forms with maximum vertical deviation of top of any side form, including joints, not varying from a true plane more than 3 mm 1/8 inch in 3 m 10 feet, and the upstanding leg not varying more than 6 mm 1/4 inch. Where keyway forms are required, rigidly attach the keyway form to the main form so no displacement can take place. Tack-weld metal keyway forms to steel forms. Align keyway forms so that there is no variation over 6 mm 1/4 inch either vertically or horizontally, when tested with a 4 m 12 foot template after forms are set, including tests across form
joints.]

b. Provide form sections that are tightly locked and free from play or movement in any direction. Provide forms with adequate devices for secure settings so that when in place they withstand, without visible spring or settlement, the impact and vibration of the consolidating and finishing equipment.

c. Set forms for full bearing on foundation for entire length and width and in alignment with edge of finished pavement. Support forms during entire operation of placing, compaction, and finishing so that forms do not deviate vertically more than 3 mm 0.01 foot from required grade and elevations indicated. Check conformity to the alignment and grade elevations shown on the drawings and make necessary corrections immediately prior to placing the concrete. Clean and oil the forms each time before concrete is placed. Concrete placement is not allowed until setting of forms has been checked and approved by the CQC team.

d. Do not anchor guide rails for fixed form pavers into new concrete or existing concrete to remain.

e. Securely hold forms for overlay pavements and for other locations where forms set on existing pavements in place with stakes or by other approved methods. Carefully drill holes in existing pavements for form stakes by methods which do not crack or spall the existing pavement. After use, fill the holes flush with the surrounding surface using approved material, prior to overlying materials being placed. Immediately discontinue any method which does not hold the form securely or which damages the existing pavement. Prior to setting forms for paving operations, demonstrate the proposed form setting procedures at an approved location without proceeding further until the proposed method is approved.

3.6.5.2 Form Removal - for Non-Continuously Reinforced Concrete

Keep forms in place at least 12 hours after the concrete has been placed. When conditions are such that the early strength gain of the concrete is delayed, leave the forms in place for a longer time, as directed. Remove forms by procedures that do not damage the concrete. Do not use bars or heavy metal tools directly against the concrete in removing the forms. Promptly repair any concrete found to be defective after form removal, using procedures specified or as directed.

3.6.6 Slipform Paving - for Non-Continuously Reinforced Concrete

**************************************************************************
NOTE: Retain slipform paving as an option unless there are specific, valid reasons for deleting it. Be sure all other paragraphs correlate with choice made here.
**************************************************************************

3.6.6.1 General - for Non-Continuously Reinforced Concrete

Provide paving equipment for slipform paving and the operation thereof that conforms to the requirement of paragraph EQUIPMENT, and all requirements specified herein. Provide a slipform paver capable of shaping the concrete to the specified and indicated cross section, meeting all tolerances, with a surface finish and edges that require only a very minimum isolated amount
of hand finishing, in one pass. If the paving operation does not meet the above requirements and the specified tolerances, immediately stop the operation, and regroup and replace or modify any equipment as necessary, modify paving procedures or modify the concrete mix, in order to resolve the problem. Provide a slipform paver that is automatically electronically controlled from a taut wire guideline for horizontal alignment and on both sides from a taut wire guideline for vertical alignment, except that electronic control from a ski operating on a previously constructed adjoining lane is required where applicable for either or both sides. Automatic, electronic controls are required for vertical alignment on both sides of the lane. Control from a slope-adjustment control or control operating from the underlying material is not allowed. Properly adjust side forms on slipform pavers so that the finished edge of the paving lane meets all specified tolerances. Install dowels in longitudinal construction joints as specified below. The installation of these dowels by dowel inserters attached to the paver or by any other means of inserting the dowels into the plastic concrete is not permitted.[ If a keyway is required, install a 0.45 to 0.55 mm 26 gauge thick metal keyway liner as the keyway is extruded. Provide keyway forms that do not vary more than plus or minus 3 mm 1/8 inch from the dimensions indicated and do not deviate more than plus or minus 6 mm 1/4 inch from the mid-depth of the pavement. An abrupt offset either horizontally or vertically in the completed keyway is not allowed. Maintain the keyway liner to remain in place and become part of the joint.]

3.6.6.2 Guideline for Slipform Paving - for Non-Continuously Reinforced Concrete

Accurately and securely install guidelines well in advance of concrete placement. Provide supports at necessary intervals to eliminate all sag in the guideline when properly tightened. Provide guideline consisting of high strength wire set with sufficient tension to remove all sag between supports. Provide supports that are securely staked to the underlying material or other provisions made to ensure that the supports are not displaced when the guideline is tightened or when the guideline or supports are accidentally touched by workmen or equipment during construction. Provide appliances for attaching the guideline to the supports that are capable of easy adjustment in both the horizontal and vertical directions. When it is necessary to leave gaps in the guideline to permit equipment to use or cross underlying material, provide provisions for quickly and accurately replacing the guideline without any delay to the forward progress of the paver. Provide supports on either side of the gap that are secured in such a manner as to avoid disturbing the remainder of the guideline when the portion across the gap is positioned and tightened. Check the guideline across the gap and adjacent to the gap for a distance of 60 m 200 feet for horizontal and vertical alignment after the guideline across the gap is tightened. Provide vertical and horizontal positioning of the guideline such that the finished pavement conforms to the alignment and grade elevations shown on the drawings within the specified tolerances for grade and smoothness. The specified tolerances are intended to cover only the normal deviations in the finished pavement that may occur under good supervision and do not apply to setting of the guideline. Set the guideline true to line and grade.

3.6.6.3 Stringless Technology - for Non-Continuously Reinforced Concrete

If the use of any type of stringless technology is proposed, submit a detailed description of the system and perform a trial field demonstration at least one week prior to start of paving. Approval of the control system
will be based on the results of the demonstration and on continuing satisfactory operation during paving.

3.6.7 Placing Reinforcing Steel - for Non-Continuously Reinforced Concrete

Provide the type and amount of steel reinforcement indicated.

3.6.7.1 Pavement Thickness Greater Than 300 mm 12 inches - for Non-Continuously Reinforced Concrete

For pavement thickness of 300 mm 12 inches or more, install the reinforcement steel by the strike-off method wherein a layer of concrete is deposited on the underlying material, consolidated, and struck to the indicated elevation of the steel reinforcement. Place the reinforcement upon the pre-struck surface, followed by placement of the remaining concrete and finishing in the required manner. When placement of the second lift causes the steel to be displaced horizontally from its original position, provide provisions for increasing the thickness of the first lift and depressing the reinforcement into the unhardened concrete to the required elevation. Limit the increase in thickness only as necessary to permit correct horizontal alignment to be maintained. Remove and replace any portions of the bottom layer of concrete that have been placed more than 30 minutes without being covered with the top layer with newly mixed concrete without additional cost to the Government.

3.6.7.2 Pavement Thickness Less Than 300 mm 12 Inches - for Non-Continuously Reinforced Concrete

**************************************************************************
NOTE: Delete bracketed item if CRCP is not being constructed.
**************************************************************************

For pavements less than 300 mm 12 inches thick, position the reinforcement on suitable chairs or continuous mesh support devices securely fastened to the subgrade prior to concrete placement. Consolidate concrete after the steel has been placed. Regardless of placement procedure, provide reinforcing steel free from coatings which could impair bond between the steel and concrete, with reinforcement laps as indicated. Regardless of the equipment or procedures used for installing reinforcement, ensure that the entire depth of concrete is adequately consolidated. [If reinforcing for Continuously Reinforced Concrete Pavement (CRCP) is required, submit the entire operating procedure and equipment proposed for approval at least 30 days prior to proposed start of paving.]

3.6.8 Placing Dowels - for Non-Continuously Reinforced Concrete

**************************************************************************
NOTE: Delete references to slipform paving installation of dowels if slipform paving is not allowed. Delete references to installation in contraction joints if not required.
**************************************************************************

Ensure the method used to install and hold dowels in position result in dowel alignment within the maximum allowed horizontal and vertical tolerance of 3 mm per 300 mm 1/8 inch per foot after the pavement has been completed. Except as otherwise specified below, maintain the horizontal spacing of dowels within a tolerance of plus or minus 15 mm 5/8 inch.
Locate the dowel vertically on the face of the slab within a tolerance of plus or minus 13 mm 1/2 inch. Measure the vertical alignment of the dowels parallel to the designated top surface of the pavement, except for those across the crown or other grade change joints. Measure dowels across crowns and other joints at grade changes to a level surface. Check horizontal alignment perpendicular to the joint edge with a framing square. Do not place longitudinal dowels closer than 0.6 times the dowel bar length to the planned joint line. If the last regularly spaced longitudinal dowel is closer than that dimension, move it away from the joint to a location 0.6 times the dowel bar length, but not closer than 150 mm 6 inches to its nearest neighbor. Resolve dowel interference at a transverse joint-longitudinal joint intersection by deleting the closest transverse dowel. Do not position the end of a transverse dowel closer than 300 mm 12 inches from the end of the nearest longitudinal dowel. Install dowels as specified in the following subparagraphs.

3.6.8.1 Contraction Joints - for Non-Continuously Reinforced Concrete

Securely hold dowels in longitudinal and transverse contraction joints within the paving lane in place, as indicated, by means of rigid metal frames or basket assemblies of an approved type. Securely hold the basket assemblies in the proper location by means of suitable pins or anchors. Do not cut or crimp the dowel basket tie wires.

3.6.8.2 Construction Joints-Fixed Form Paving - for Non-Continuously Reinforced Concrete

Install dowels by the bonded-in-place method or the drill-and-dowel method. Installation by removing and replacing in preformed holes is not permitted. Prepare and place dowels across joints where indicated, correctly aligned, and securely held in the proper horizontal and vertical position during placing and finishing operations, by means of devices fastened to the forms. Provide the spacing of dowels in construction joints as indicated, except that, where the planned spacing cannot be maintained because of form length or interference with form braces, provide closer spacing with additional dowels.

3.6.8.3 Dowels Installed in Hardened Concrete - for Non-Continuously Reinforced Concrete

**************************************************************************
NOTE: The first Tailoring Option is for "Cylinders/Beams" and the second option is for "Beams".
**************************************************************************

Install dowels in hardened concrete by bonding the dowels into holes drilled into the hardened concrete. Before drilling commences, cure the concrete for 7 days or until it has reached a minimum [compressive strength of 17 MPa 2500 psi][ flexural strength of 3.1 MPa 450 psi]. Drill holes 3 mm 1/8 inch greater in diameter than the dowels into the hardened concrete using rotary-core drills. Rotary-percussion drills are permitted, provided that excessive spalling does not occur to the concrete joint face. Excessive spalling is defined as spalling deeper than 6 mm 1/4 inch from the joint face or 12 mm 1/2 inch radially from the outside of the drilled hole. Continuing damage requires modification of the equipment and operation. Drill depth of dowel hole within a tolerance of plus or minus 13 mm 1/2 inch of the dimension shown on the drawings. Upon completion of the drilling operation, blow out the dowel hole with oil-free, compressed
air. Bond dowels in the drilled holes using epoxy resin. Inject epoxy resin at the back of the hole before installing the dowel and extruded to the collar during insertion of the dowel so as to completely fill the void around the dowel. Application by buttering the dowel is not permitted. Hold the dowels in alignment at the collar of the hole, after insertion and before the grout hardens, by means of a suitable metal or plastic grout retention ring fitted around the dowel. Provide dowels required between new and existing concrete in holes drilled in the existing concrete, all as specified above.

3.6.8.4 Lubricating Dowel Bars - for Non-Continuously Reinforced Concrete

Wipe the portion of each dowel intended to move within the concrete clean and coat with a thin, even film of lubricating oil or light grease before the concrete is placed.

3.7 FINISHING

**************************************************************************
NOTE: Edit bracketed items as appropriate. Retain slipform paving subparagraph except when it is prohibited elsewhere. Delete Other Types of Finishing Equipment here and in PART 2, if not wanted. Hand finishing is to be allowed only for isolated, small, odd-shaped slabs or places inaccessible to the paver.
**************************************************************************

Provide finishing operations as a continuing part of placing operations starting immediately behind the strike-off of the paver. Provide initial finishing by the transverse screed or extrusion plate. Provide the sequence of operations consisting of transverse finishing, longitudinal machine floating if used, straightedge finishing, texturing, and then edging of joints. Provide finishing by the machine method. Provide a work bridge as necessary for consolidation and hand finishing operations. Use the hand method only on isolated areas of odd slab widths or shapes and in the event of a breakdown of the mechanical finishing equipment. Keep supplemental hand finishing for machine finished pavement to an absolute minimum. Immediately stop any machine finishing operation which requires appreciable hand finishing, other than a moderate amount of straightedge finishing. Prior to recommencing machine finishing, properly adjust or replace the equipment. Immediately halt any operations which produce more than 3 mm 1/8 inch of mortar-rich surface (defined as deficient in plus 4.75 mm U.S. No. 4 sieve size aggregate) and the equipment, mixture, or procedures modified as necessary. Compensate for surging behind the screeds or extrusion plate and settlement during hardening and take care to ensure that paving and finishing machines are properly adjusted so that the finished surface of the concrete (not just the cutting edges of the screeds) is at the required line and grade. Maintain finishing equipment and tools clean and in an approved condition. Water is not allowed to be added to the surface of the slab with the finishing equipment or tools, or in any other way, except for fog (mist) sprays specified to prevent plastic shrinkage cracking.

3.7.1 Machine Finishing With Fixed Forms

Replace machines that cause displacement of the forms. Only one pass of the finishing machine is allowed over each area of pavement. If the equipment and procedures do not produce a surface of uniform texture, true
3.7.2 Machine Finishing with Slipform Pavers

Operate the slipform paver so that only a very minimum of additional finishing work is required to produce pavement surfaces and edges meeting the specified tolerances. Immediately modify or replace any equipment or procedure that fails to meet these specified requirements as necessary. A self-propelled non-rotating pipe float may be used while the concrete is still plastic, to remove minor irregularities and score marks. Only one pass of the pipe float is allowed. If there is concrete slurry or fluid paste on the surface that runs over the edge of the pavement, immediately stop the paving operation and the equipment, mixture, or operation modified to prevent formation of such slurry. Immediately remove any slurry which does run down the vertical edges by hand, using stiff brushes or scrapers. Slurry, concrete or concrete mortar is not allowed to build up along the edges of the pavement to compensate for excessive edge slump, either while the concrete is plastic or after it hardens.

3.7.3 Surface Correction and Testing

After all other finishing is completed but while the concrete is still plastic, eliminate minor irregularities and score marks in the pavement surface by means of cutting straightedges. Provide cutting straightedges with a minimum length of 4 m 12 feet that are operated from the sides of the pavement or from bridges. Provide cutting straightedges operated from the side of the pavement equipped with a handle 1 m 3 feet longer than one-half the width of the pavement. Test the surface for trueness with a straightedge held in successive positions parallel and at right angles to the center line of the pavement, and the whole area covered as necessary to detect variations. Advance the straightedge along the pavement in successive stages of not more than one-half the length of the straightedge. Immediately fill depressions with freshly mixed concrete, strike off, consolidate with an internal vibrator, and refinish. Strike off projections above the required elevation and refinish. Continue the straightedge testing and finishing until the entire surface of the concrete is free from observable departure from the straightedge and conforms to the surface requirements specified in paragraph SURFACE SMOOTHNESS. This straight edging is not allowed to be used as a replacement for the straightedge testing of paragraph SURFACE SMOOTHNESS. Use long-handled, flat bull floats very sparingly and only as necessary to correct minor, scattered surface defects. If frequent use of bull floats is necessary, stop the paving operation and the equipment, mixture or procedures adjusted to eliminate the surface defects. Keep finishing with hand floats and trowels to the absolute minimum necessary. Take extreme care to prevent over finishing joints and edges. Produce the surface finish of the pavement essentially by the finishing machine and not by subsequent hand finishing operations. All hand finishing operations are subject to approval.

3.7.4 Hand Finishing

Use hand finishing operations only as specified below. Provide a work bridge to be used as necessary for consolidation and placement operations to avoid standing in concrete.
3.7.4.1 Equipment and Template

In addition to approved mechanical internal vibrators for consolidating the concrete, provide a strike-off and tamping template and a longitudinal float for hand finishing. Provide a template at least 300 mm 1 foot longer than the width of pavement being finished, of an approved design, and sufficiently rigid to retain its shape, that is constructed of metal or other suitable material shod with metal. Provide a longitudinal float at least 3 m 10 feet long, of approved design, is rigid and substantially braced, and maintain a plane surface on the bottom. Grate tampers (jitterbugs) are not allowed.

3.7.4.2 Finishing and Floating

As soon as placed and vibrated, strike off the concrete and screeded to the crown and cross section and to such elevation above grade that when consolidated and finished, the surface of the pavement is at the required elevation. In addition to previously specified complete coverage with handheld immersion vibrators, tamp the entire surface with the strike-off and tamping template, and the tamping operation continued until the required compaction and reduction of internal and surface voids are accomplished. Immediately following the final tamping of the surface, float the pavement longitudinally from bridges resting on the side forms and spanning but not touching the concrete. If necessary, place additional concrete, consolidated and screeded, and the float operated until a satisfactory surface has been produced. Do not advance the floating operation more than half the length of the float and then continued over the new and previously floated surfaces.

3.7.5 Texturing

**********************************************************************************************************************************************
NOTE: Designer must select type of texturing desired, retain that subparagraph, and delete the others. A genuine effort must be made to determine the type of texturing, if any, desired by the using service. If no guidance is given, the usual default method must be burlap drag. If other than a burlap drag textured finish is required, edit the appropriate paragraph(s) as shown below.

For Air Force airfield paving projects, do not specify artificial turf, wire comb, or surface grooving textures. For Navy airfield paving projects, do not specify wire comb or surface grooving textures. Use Section 32 01 18.71 GROOVING OF AIRFIELD PAVING to specify saw-cut grooves.

Spring tine grooving is limited to use on roads and streets only.
**********************************************************************************************************************************************

Before the surface sheen has disappeared and before the concrete hardens or curing compound is applied, texture the surface of the pavement as described herein. After curing is complete, thoroughly power broom all textured surfaces to remove all debris.
3.7.5.1  Burlap Drag Surface

Apply surface texture by dragging the surface of the pavement, in the direction of the concrete placement, with an approved burlap drag. Operate the drag with the fabric moist, and the fabric maintained clean or changed as required to keep clean. Perform the dragging so as to produce a uniform finished surface having a fine sandy texture without disfiguring marks.

3.7.5.2  Broom Texturing

Complete brooming before the concrete has hardened to the point where the surface is unduly torn or roughened, but after hardening has progressed enough so that the mortar does not flow and reduce the sharpness of the scores. Overlap successive passes of the broom the minimum necessary to obtain a uniformly textured surface. Wash brooms thoroughly at frequent intervals during use. Remove worn or damaged brooms from the job site. Hand brooming is permitted only on isolated odd shaped slabs or slabs where hand finishing is permitted. For hand brooming, provide brooms with handles longer than half the width of slab to be finished. Transversely draw the hand brooms across the surface from the center line to each edge with slight overlapping strokes.

3.7.5.3  Artificial Turf Drag Surface

Apply artificial turf texture by dragging the surface of the pavement in the direction of concrete placement with an approved full-width drag made with artificial turf.

3.7.6  Edging

Before texturing has been completed, carefully finish the edge of the slabs along the forms, along the edges of slipformed lanes, and at the joints with an edging tool to form a smooth rounded surface of 3 mm 1/8 inch radius. Eliminate tool marks, and provide edges that are smooth and true to line. Water is not allowed to be added to the surface during edging. Take extreme care to prevent overworking the concrete.

3.7.7  Outlets in Pavement

Construct recesses for the tie-down anchors, lighting fixtures, and other outlets in the pavement to conform to the details and dimensions shown. Carefully finish the concrete in these areas to provide a surface of the same texture as the surrounding area that is within the requirements for plan grade and surface smoothness.

3.8  CURING

3.8.1  Protection of Concrete

Continuously protect concrete against loss of moisture and rapid temperature changes for at least 7 days from the completion of finishing operations. Have all equipment needed for adequate curing and protection of the concrete on hand and ready for use before actual concrete placement begins. If any selected method of curing does not afford the proper curing and protection against concrete cracking, remove or replace the damaged pavement, and provide another method of curing as directed.
3.8.2 Wet Curing

Wet-cure concrete and continuously maintain wet for the entire curing period, commencing immediately after finishing. If forms are removed before the end of the curing period, carry out curing as on unformed surfaces, using suitable materials. Apply burlap to concrete surface and cover with polyethylene; lap sheets to ensure full coverage. When forms are removed, cover pavement sides with burlap and polyethylene and keep wet. Anchor burlap and polyethylene to prevent blowing or dislodging by wind or jet blast. Provide an approved work system to ensure that concrete surface is continuously wet 24 hours per day. Wet cure for 14 days. Adjacent lanes of High Temperature Concrete may be placed after 72 hours of wet curing and minimizing the disturbance of the burlap and polyethylene. Curing may be interrupted for no more than 12 hours (includes time for preparation, paving and initial hardening before wet curing). Reinstall wet curing until 14 days of wet curing are completed (add time for lack of curing while paving adjacent lanes).

3.9 JOINTS FOR NON-CONTINUOUSLY REINFORCED CONCRETE

**************************************************************************
NOTE: Edit bracketed items in following subparagraphs to conform to design requirements.
Even if not required, dowels must be permitted for construction joints. Remove joint types not required in the project.
**************************************************************************

3.9.1 General Requirements for Joints

Construct joints that conform to the locations and details indicated and are perpendicular to the finished grade of the pavement. Provide joints that are straight and continuous from edge to edge or end to end of the pavement with no abrupt offset and no gradual deviation greater than 13 mm 1/2 inch. Where any joint fails to meet these tolerances, remove and replace the slabs adjacent to the joint at no additional cost to the Government. Change from the jointing pattern shown on the drawings is not allowed without written approval. Seal joints immediately following curing of the concrete or as soon thereafter as weather conditions permit as specified in Section [32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT][32 13 73.19 COMPRESSION CONCRETE PAVING JOINT SEALANT].

3.9.2 Longitudinal Construction Joints

Install dowels in the longitudinal construction joints, or thicken the edges as indicated. Install dowels as specified above. If any length of completed keyway of 1.5 m 5 feet or more fails to meet the previously specified tolerances, install dowels in that part of the joint by drilling holes in the hardened concrete and grouting the dowels in place with epoxy resin. After the end of the curing period, saw longitudinal construction joints to provide a groove at the top for sealant conforming to the details and dimensions indicated.

3.9.3 Transverse Construction Joints

Install transverse construction joints at the end of each day’s placing operations and at any other points within a paving lane when concrete placement is interrupted for 30 minutes or longer. Install the transverse construction joint at a planned transverse joint. Provide transverse
construction joints by utilizing headers or by paving through the joint, then full-depth saw cutting the excess concrete. Construct pavement with the paver as close to the header as possible, with the paver run out completely past the header. Provide transverse construction joints at a planned transverse joint constructed as shown or, if not shown otherwise, dowelled in accordance with paragraph DOWELS INSTALLED IN HARDENED CONCRETE, or paragraph FIXED FORM PAVING above.

3.9.4 Expansion Joints

Provide expansion joints where indicated, and about any structures and features that project through or into the pavement, using joint filler of the type, thickness, and width indicated, and installed to form a complete, uniform separation between the structure and the pavement or between two pavements. Attach the filler to the original concrete placement with adhesive and mechanical fasteners and extend the full slab depth. After placement and curing of the adjacent slab, sawcut the sealant reservoir depth from the filler. Tightly fit adjacent sections of filler together, with the filler extending across the full width of the paving lane or other complete distance in order to prevent entrance of concrete into the expansion space. Finish edges of the concrete at the joint face with an edger with a radius of 3 mm 1/8 inch.

3.9.5 Slip Joints

Install slip joints where indicated using the specified materials. Attach preformed joint filler material to the face of the original concrete placement with adhesive and mechanical fasteners. Construct a 19 mm 3/4 inch deep reservoir for joint sealant at the top of the joint. Finish edges of the joint face with an edger with a radius of 3 mm 1/8 inch.

3.9.6 Contraction Joints

Construct transverse and longitudinal contraction joints by sawing an initial groove in the concrete with a 3 mm 1/8 inch blade to the indicated depth. During sawing of joints, and again 24 hours later, the CQC team is required to inspect all exposed lane edges for development of cracks below the saw cut, and immediately report results. If there are more than six consecutive uncracked joints after 48 hours, saw succeeding joints 25 percent deeper than originally indicated at no additional cost to the Government. The time of initial sawing varies depending on existing and anticipated weather conditions and be such as to prevent uncontrolled cracking of the pavement. Commence sawing of the joints as soon as the concrete has hardened sufficiently to permit cutting the concrete without chipping, spalling, or tearing. The sawed faces of joints will be inspected for undercutting or washing of the concrete due to the early sawing, and sawing delayed if undercutting is sufficiently deep to cause structural weakness or excessive roughness in the joint. Continue the sawing operation as required during both day and night regardless of weather conditions. Saw the joints at the required spacing consecutively in the sequence of the concrete placement. Provide adequate lighting for night work. Illumination using vehicle headlights is not permitted. Provide a chalk line or other suitable guide to mark the alignment of the joint. Before sawing a joint, examine the concrete closely for cracks, and do not saw the joint if a crack has occurred near the planned joint location. Discontinue sawing when a crack develops ahead of the saw cut. Immediately after the joint is sawed, thoroughly flush the saw cut and adjacent concrete surface with water and vacuumed until all waste from sawing is removed from the joint and adjacent concrete surface. Respray
the surface with curing compound as soon as free water disappears. Take
necessary precautions to insure that the concrete is properly protected
from damage and cured at sawed joints. Tightly seal the top of the joint
opening and the joint groove at exposed edges with cord backer rod before
the concrete in the region of the joint is resprayed with curing compound,
and be maintained until removed immediately before sawing the joint sealant
reservoir. Seal the exposed saw cuts on the faces of pilot lanes with
bituminous mastic or masking tape. After expiration of the curing period,
widens the upper portion of the groove by sawing with ganged diamond saw
blades to the width and depth indicated for the joint sealer. Center the
reservoir over the initial sawcut.

3.9.7 Thickened Edge Joints

Construct thickened edge joints as indicated on the drawings. Grade the
underlying material in the transition area as shown and meet the
requirements for smoothness and compaction specified for all other areas of
the underlying material.

3.10 SURFACE PREPARATION FOR SEALING

**************************************************************************
NOTE: In order to prepare the surface of existing
concrete or new concrete which has POL spillage, POL
stains must be removed to ensure penetration of
surface sealer solution. This paragraph is optional
for new construction and may be deleted.
**************************************************************************

Utilize one of the following agents and methodologies for removing POL
stains prior to sodium silicate sealing:

a. Dishwashing detergent and hot water: Apply to stained concrete and
scrub to develop a thick lather. Let set for five minutes then rinse
with warm/hot water. Use of steam to pre-treat the area and rinse may
aid removal.

b. Trisodium phosphate (TSP): Note that some states have banned this
product because phosphate can cause problems with nearby waterways. DO
NOT MIX TSP WITH ANY ACID! A violent reaction can occur and release
noxious gas. You can use both products but they must be used
separately, with a thorough rinsing with water between applications.

Application method 1: Mix one measure of TSP with six measures of
water. Apply over the stain with a paintbrush and allow it to dry
completely before scraping off the dried paste. Rinse the concrete
surface and scrub with a stiff brush and clean water.

Application method 2: Dissolve 1 pound, 6 ounces of TSP in a gallon of
water. Add enough finely ground calcium carbonate (also called whiting
or agricultural lime) to make a thick paste. (Agricultural lime is
available at garden supply stores.) Spread the paste over the stain
and allow it to dry for a day, if possible. Brush off the dry paste
with a stiff brush and scrub the concrete with water. The paste has a
high pH so personal protective equipment (PPE) must be used and the
paste should be kept away from aircraft. If it is windy, protect the
treated area until the area is cleaned and rinsed to keep the caustic
material from blowing around the apron.
c. Sodium hydroxide: Make a solution of 5 percent sodium hydroxide (caustic soda: NaOH). Apply it over the stain with a paintbrush and allow it to dry for at least 24 hours. Rinse and scrub with clean water then repeat as required. This has a high pH so PPE must be used and the solution should be kept away from aircraft. If it is windy, protect the treated area until the area is cleaned and rinsed to keep the caustic material from blowing around the apron.

d. Sodium carbonate: Apply as directed. Rinse well with water. This is an organic salt. If it is windy, protect the treated area until the area is cleaned and rinsed to keep the salt from blowing around the apron.

e. Phosphoric acid cleaner: Apply as directed. Rinse well with water and sodium carbonate (washing soda or soda ash) to neutralize the pH then rinse with clear water. This product will etch the concrete so do not leave it on too long and ensure the area is rinsed well to ensure no acid is left on the concrete.

f. Bio-remediation: Apply as directed.

3.11 SODIUM SILICATE SEALING

Seal the High Temperature Concrete surfaces with a sodium silicate solution, after paint marking application, using the following procedures:

a. After last continuously reinforced High Temperature Concrete pour is 90 days of age, and non-continuously reinforced High Temperature Concrete is 70 days of age (if used), dry broom and air blow concrete surfaces and apply sodium silicate sealant. Concrete surface must be dry for 24 hours prior to applying sealer. Air temperature must be 5 degrees C 40 degrees F or more and relative humidity must be 80 percent or less, both during application and the 48 hours after application.

b. Apply three coats of sodium silicate solution, using low pressure airless spraying equipment that ensures uniform application. Start applying the solution at the highest point in the pavement and continue downgrade. Each coat must cover not more than 5 square meters per liter 200 square feet per gallon. Excessive application is to be avoided to prevent efflorescence. Allow sodium silicate to penetrate for 2 hours then wash off any visible excess (ponded) solution. Allow the area to dry for 24 hours between each coat.

c. After allowing the last coat to dry for 24 hours, evaluate the surface for any excess silica or dusting. Wash off any excess silica or dusting as needed. Protect application from any pedestrian or vehicular traffic until the last coat has dried.

3.11.1 Pavement Marking Installation

Apply pavement markings and glass beads before sodium silicate application. Apply sodium silicate over markings and glass beads.

3.12 REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED CONCRETE FOR CONTINUOUSLY REINFORCED CONCRETE

3.12.1 High Temperature Concrete

Remove and replace new High Temperature Concrete determined to not meet
acceptance requirements using materials, methods and equipment, and to the limits as directed by Contracting Officer at no additional cost to Government. Removal of partial slabs, or partial lanes of continuously reinforced lanes, is not permitted; remove and replace the entire continuously reinforced lane.

3.12.1.1 Removal and Replacement Of Continuously Reinforced High Temperature Concrete

Removal of partial slabs, or partial lanes of continuously reinforced lanes, is not permitted; remove and replace the entire continuously reinforced lane. Removal of a lane of continuously reinforced High Temperature Concrete pavement requires saw cutting the concrete full depth on all sides 380 mm 15 inches inside from each edge of the lane to be removed using a diamond saw. Remove the concrete within this initial sawcut. Remove the remaining 380 mm 15 inch concrete buffer only with hand held 14 kg 30 pound or less pneumatic hammers to remove the concrete above and below the remaining continuous reinforcement. Remove any loose longitudinal rebar exposed. Regrade and recompact surface of base course. Use manufacturer approved mechanical connector clamp, weld or use threaded connector to attach new transverse reinforcement to existing; lap splicing is not adequate. Replace continuous reinforcement in both directions per plans. Replace concrete following this specification. Submit complete removal and repair plan to Contracting Officer for review prior to work.

3.12.2 Removal and Replacement of Plane Jointed Concrete Pavement

Where it is necessary to remove concrete pavement, remove in accordance with paragraph EXISTING CONCRETE PAVEMENT REMOVAL AND REPAIR. Remove and replace full depth, by full width of the lane, and the limit of removal must be normal to the paving lane and extend to each original joint. Remove and replace any damaged reinforcing bars. Place concrete as specified for original construction. Prior to placement of new concrete, recompact and shape the underlying material as specified in the appropriate section of these specifications, and clean the surfaces of all four joint faces of all loose material and contaminants. Prepare the resulting joints around the new slab as specified for original construction.

3.13 REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS FOR NON-CONTINUOUSLY REINFORCED CONCRETE

3.13.1 General Criteria

Repair or remove and replace new pavement slabs as specified at no cost to the Government. Removal of partial slabs is not permitted. Prior to any repairs, submit a Repair Recommendations Plan detailing areas exceeding the specified limits as well as repair recommendations required to bring these areas within specified tolerances.

3.13.2 Slabs with Cracks

No cores can be taken within continuously reinforced concrete. Before repairing cracks that have developed within continuously reinforced concrete consultation with Corps of Engineers Transportation Systems Center (TSMCX) Air Force Civil Engineer Center (AFCEC) Naval Facilities Engineering Command (NAVFAC, Echelon III) pavement Subject Matter Expert (SME).

The Government may require cores to be taken over cracks to determine depth
of cracking. Such cores are to be drilled with a minimum diameter of 150 mm 6 inches, and be backfilled with an approved non-shrink concrete. Perform drilling of cores and filling of holes at no expense to the Government. Clean cracks that do not exceed 50 mm 2 inches in depth; then pressure injected full depth with epoxy resin, Type IV, Grade 1. Remove and replace slabs containing cracks deeper than 50 mm 2 inches.

3.13.3 Removal and Replacement of Full Slabs

Remove and replace slabs containing more than 15.0 percent of any longitudinal or transverse joint edge spalled. Where it is necessary to remove full slabs, remove in accordance with paragraph REMOVAL OF EXISTING PAVEMENT SLAB below. Remove and replace full depth, by full width of the slab, and the limit of removal normal to the paving lane and extend to each original joint. Compact and shape the underlying material as specified in the appropriate section of these specifications, and clean the surfaces of all four joint faces of all loose material and contaminants and coated with a double application of membrane forming curing compound as bond breaker. Install dowels of the size and spacing as specified for other joints in similar pavement by epoxy grouting them into holes drilled into the existing concrete using procedures as specified in paragraph PLACING DOWELS, above. Provide dowels for all four edges of the new slab. Cut off original damaged dowels flush with the joint face. Lightly oil or grease protruding portions of new dowels. Place concrete as specified for original construction. Take care to prevent any curing compound from contacting dowels. Prepare and seal the resulting joints around the new slab as specified for original construction.

3.13.4 Repairing Spalls Along Joints

Conventional spall repairs are prohibited of all Vertical Landing Zones, Short Take-Off Lanes, and associated safety zones, blast zones, and rotation areas. In these areas, only full depth repairs are acceptable. In areas which have continuously reinforced steel, repair must not damage reinforcing steel in any way.

Repair spalls along joints to be sealed to a depth to restore the full joint-face support prior to placing adjacent pavement. Where directed, repair spalls along joints of new slabs, along edges of adjacent existing concrete, and along parallel cracks by first making a vertical saw cut at least 75 mm 3 inches outside the spalled area and to a depth of at least 50 mm 2 inches. Provide saw cuts consisting of straight lines forming rectangular areas without sawing beyond the intersecting saw cut. Chip out the concrete between the saw cut and the joint, or crack, to remove all unsound concrete and into at least 13 mm 1/2 inch of visually sound concrete. Thoroughly clean the cavity thus formed with high pressure water jets supplemented with oil-free compressed air to remove all loose material. Immediately before filling the cavity, apply a prime coat to the dry cleaned surface of all sides and bottom of the cavity, except any joint face. Apply the prime coat in a thin coating and scrubbed into the surface with a stiff-bristle brush. Provide prime coat for portland cement repairs consisting of a neat cement grout and for epoxy resin repairs consisting of epoxy resin, Type III, Grade 1. Fill the prepared cavity with material identified in the following table based on the cavity volume.
Spall Repairs

<table>
<thead>
<tr>
<th>Volume of Prepared Cavity After Removal Operations</th>
<th>Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>less than 0.00085 cubic meter 0.03 cubic foot</td>
<td>epoxy resin mortar or epoxy resin or latex modified mortar</td>
</tr>
<tr>
<td>0.00085 cubic meter 0.03 cubic foot and 0.009 cubic meter 1/3 cubic foot</td>
<td>Portland cement mortar</td>
</tr>
<tr>
<td>more than 0.009 cubic meter 1/3 cubic foot</td>
<td>Portland cement concrete or latex modified mortar</td>
</tr>
</tbody>
</table>

Provide portland cement concretes and mortars that consist of very low slump mixtures, 13 mm 1/2 inch slump or less, proportioned, mixed, placed, consolidated by tamping, and cured, all as directed. Provide epoxy resin mortars made with Type III, Grade 1, epoxy resin, using proportions and mixing and placing procedures as recommended by the manufacturer and approved. Proprietary patching materials may be used, subject to Government approval. Place the epoxy resin materials in the cavity in layers with a maximum thickness of 50 mm 2 inches. Provide adequate time between placement of additional layers such that the temperature of the epoxy resin material does not exceed 60 degrees C 140 degrees F at any time during hardening. Provide mechanical vibrators and hand tampers to consolidate the concrete or mortar. Remove any repair material on the surrounding surfaces of the existing concrete before it hardens. Where the spalled area abuts a joint, provide an insert or other bond-breaking medium to prevent bond at the joint face. Saw a reservoir for the joint sealant to the dimensions required for other joints. Thoroughly clean the reservoir and then sealed with the sealer specified for the joints. In lieu of sawing, spalls not adjacent to joints and popouts, both less than 150 mm 6 inches in maximum dimension, may be prepared by drilling a core 50 mm 2 inches in diameter greater than the size of the defect, centered over the defect, and 50 mm 2 inches deep or 13 mm 1/2 inch into sound concrete, whichever is greater. Repair the core hole as specified above for other spalls.

3.13.5 Repair of Weak Surfaces

Weak surfaces are defined as mortar-rich, rain-damaged, uncured, or containing exposed voids or deleterious materials. Diamond grind slabs containing weak surfaces less than 6 mm 1/4 inch thick to remove the weak surface. Diamond grind in accordance with paragraph DIAMOND GRINDING OF PCC SURFACES. All diamond ground areas are required to meet the thickness, smoothness and grade criteria specified in PART 1 GENERAL. Remove and replace slabs containing weak surfaces greater than 6 mm 1/4 inch thick.

3.13.6 Repair of Pilot Lane Vertical Faces

Repair excessive edge slump and joint face deformation in accordance with paragraph EDGE SLUMP AND JOINT FACE DEFORMATION in PART 1. Repair inadequate consolidation (honeycombing or air voids) by saw cutting the face full depth along the entire lane length with a diamond blade. Obtain cores, as directed, to determine the depth of removal.

3.14 EXISTING CONCRETE PAVEMENT REMOVAL AND REPAIR

**************************************************************************

NOTE: It is imperative that sufficient exploration
be made (not just reference to as-built drawings) for the designer to know exactly what the in-place existing pavement thickness and load-transfer are at the jointing area--dowels, keys, tie bars, etc--and its condition. Normally, the joint between the new pavement and existing pavement should be made at an existing joint in the old pavement. Coordinate with Section 02 41 00 [DEMOLITION] [AND] [DECONSTRUCTION].

Remove existing concrete pavement at locations indicated on the drawings. Prior to commencing pavement removal operations, inventory the pavement distresses (cracks, spalls, and corner breaks) along the pavement edge to remain. After pavement removal, survey the remaining edge again to quantify any damage caused by removal operations. Perform both surveys in the presence of the Government. Perform repairs as indicated and as specified herein. Carefully control all operations to prevent damage to the concrete pavement and to the underlying material to remain in place. Perform all saw cuts perpendicular to the slab surface, forming rectangular areas. Perform all existing concrete pavement repairs prior to paving adjacent lanes.

3.14.1 Removal of Existing Pavement Slab

NOTE: The saw cut at a distance from the joint should be sawed with a wheel saw which produces a 38 mm 1-1/2 inches or wider kerf and better prevents stress from propagating across the saw cut. Specify wheel saw for Army and Air Force projects. Specify diamond saw for Navy projects.

When existing concrete pavement is to be removed and adjacent concrete is to be left in place, perform the first full depth saw cut on the joint between the removal area and adjoining pavement to stay in place with a standard diamond-type concrete saw. Next, perform a full depth saw cut parallel to the joint that is at least 600 mm 24 inches from the joint and at least 150 mm 6 inches from the end of any dowels with a [wheel saw] [diamond saw] as specified in paragraph SAWING EQUIPMENT. Remove all pavement beyond this last saw cut in accordance with the approved demolition work plan. Remove all pavement between this last saw cut and the joint line by carefully pulling pieces and blocks away from the joint face with suitable equipment and then picking them up for removal. In lieu of this method, this strip of concrete may be carefully broken up and removed using hand-held jackhammers, 14 kg 30 lb or less, or other approved light-duty equipment which does not cause stress to propagate across the joint saw cut and cause distress in the pavement which is to remain in place. In lieu of the above specified removal method, the slab may be sawcut full depth to divide it into several pieces and each piece lifted out and removed. Use suitable equipment to provide a truly vertical lift, and safe lifting devices used for attachment to the slab.

3.14.2 Edge Repair

Protect the edge of existing concrete pavement against which new pavement abuts from damage at all times. Remove and replace slabs which are damaged during construction as directed at no cost to the Government. Repair of previously existing damage areas is considered a subsidiary part of
concrete pavement construction. Saw off all exposed keys and keyways full depth.

3.14.2.1 Spall Repair

Conventional spall repairs are prohibited of all Vertical Landing Zones, Short Take-Off Lanes, and associated safety zones, blast zones, and rotation areas. In these areas, only full depth repairs are acceptable. In areas which have continuously reinforced steel, repair must not damage reinforcing steel in any way.

Not more than 15.0 percent of each slab's edge is allowed to be spalled. Provide a full depth saw cut on the exposed face to remove the spalled face of damaged slabs with spalls exceeding this quantity, regardless of spall size. Provide repair materials and procedures as previously specified in paragraph REPAIRING SPALLS ALONG JOINTS.

3.14.2.2 Underbreak and Underlying Material

Repair all underbreak by removal and replacement of the damaged slabs in accordance with paragraph REMOVAL AND REPLACEMENT OF FULL SLABS above. Protect the underlying material adjacent to the edge of and under the existing pavement which is to remain in place from damage or disturbance during removal operations and until placement of new concrete, and be shaped as shown on the drawings or as directed. Maintain sufficient underlying material in place outside the joint line to completely prevent disturbance of material under the pavement which is to remain in place. Remove and replace any slab with underlying material that is disturbed or loses its compaction.

3.15 PAVEMENT PROTECTION

Protect the pavement against all damage prior to final acceptance of the work by the Government. Placement of aggregates, rubble, or other similar construction materials on airfield pavements is not allowed. Exclude traffic from the new pavement by erecting and maintaining barricades and signs until the concrete is at least 14 days old, or for a longer period if so directed. As a construction expedient in paving intermediate lanes between newly paved pilot lanes, operation of the hauling and paving equipment is permitted on the new pavement after the pavement has been cured for 7 days and the joints have been sealed or otherwise protected, the concrete has attained a minimum field cured flexural strength of 3.8 MPa (550 psi) and approved means are provided to prevent damage to the slab edge. Continuously maintain all new and existing pavement carrying construction traffic or equipment completely clean, and spillage of concrete or other materials cleaned up immediately upon occurrence. Take special care in areas where traffic uses or crosses active airfield pavement. Power broom other existing pavements at least daily when traffic operates. For fill-in lanes, provide equipment that does not damage or spall the edges or joints of the previously constructed pavement.

3.16 TESTING AND INSPECTION FOR CONTRACTOR QUALITY CONTROL

3.16.1 Testing and Inspection by Contractor

During construction, perform sampling and testing of aggregates, cementitious materials (cement, slag cement, and pozzolan), and concrete to determine compliance with the specifications. Provide facilities and labor as may be necessary for procurement of representative test samples.
Furnish sampling platforms and belt templates to obtain representative samples of aggregates from charging belts at the concrete plant. Obtain samples of concrete at the point of delivery to the paver. Testing by the Government in no way relieves the specified testing requirements. Perform the inspection and tests described below, and based upon the results of these inspections and tests, take the action required and submit reports as required. Perform this testing regardless of any other testing performed by the Government, either for pay adjustment purposes or for any other reason.

3.16.2 Testing and Inspection Requirements

Perform CQC sampling, testing, inspection and reporting in accordance with the following Table.

<table>
<thead>

### 3.16.3 Concrete Strength Testing for CQC

NOTE: If paragraph FLEXURAL STRENGTH AND THICKNESS is based on 28-day flexural strength for acceptance, modify this subparagraph to match it. The first option "Cylinders/Beams" includes items a through g; the second option "Beams" includes listing a through f.

Perform Contractor Quality Control operations for concrete strength consisting of the following steps:

a. Take samples for strength tests at the paving site. Fabricate and cure test cylinders in accordance with ASTM C31/C31M; test them in accordance with ASTM C39/C39M.

b. Fabricate and cure 2 test cylinders per sublot from the same batch or truckload and at the same time acceptance cylinders are fabricated and test them for compressive strength at 7-day age.

c. Average all 8 compressive tests per lot. Convert this average 7-day compressive strength per lot to equivalent [28] [90]-day flexural strength using the Correlation Ratio determined during mixture proportioning studies.

d. Compare the equivalent [28] [90]-day flexural strength from the conversion to the Average Flexural Strength Required for Mixtures from paragraph of same title.

e. If the equivalent average [28][90]-day strength for the lot is below the Average Flexural Strength Required for Mixtures by 138 kPa 20 psi flexural strength or more, at any time, adjust the mixture to increase the strength, as approved.

f. Fabricate and cure two beams for every 1500 cubic meters 2000 cubic yards of concrete placed. Fabricate and cure in accordance with ASTM C31/C31M; test at 14-days of age in accordance with ASTM C78/C78M. Use the flexural strength results to verify the cylinder-beam acceptance correlation ratio.

g. Maintain up-to-date control charts for strength, showing the 7-day CQC.
compressive strength, the 14-day compressive strength (from acceptance tests) and the [28] [90]-day equivalent flexural strength of each of these for each lot.

[a. Take samples for strength tests at the paving site. Fabricate and cure test beams in accordance with ASTM C31/C31M; test them in accordance with ASTM C78/C78M.

b. Fabricate and cure 2 test beams per sublot from the same batch or truckload and at the same time acceptance beams are fabricated and test them for flexural strength at 7-day age.

c. Average all 8 flexural tests per lot. Convert this average 7-day flexural strength per lot to equivalent [28] [90]-day flexural strength using the Correlation Ratio determined during mixture proportioning studies.

d. Compare the equivalent [28] [90]-day flexural strength from the conversion to the Average Flexural Strength Required for Mixtures from paragraph of same title.

e. If the equivalent average [28] [90]-day strength for the lot is below the Average Flexural Strength Required for Mixtures by 490 kPa 69 psi flexural strength or more, at any time, adjust the mixture to increase the strength, as approved.

f. Maintain up-to-date control charts for strength, showing the 7-day CQC flexural strength and the [28] [90]-day flexural strength (from acceptance tests) of each of these for each lot.

3.16.4 Reports

Report all results of tests or inspections conducted informally as they are completed and in writing daily. Prepare a weekly report for the updating of control charts covering the entire period from the start of the construction season through the current week. During periods of cold-weather protection, make daily reports of pertinent temperatures. These requirements do not relieve the obligation to report certain failures immediately as required in preceding paragraphs. Confirm such reports of failures and the action taken in writing in the routine reports. The Government has the right to examine all Contractor quality control records.

3.12.2 Testing and Inspection Requirements
3.12.3 Concrete Strength Testing for CQC
3.12.4 Reports

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for construction of concrete pavement for Army, Navy and Air Force airfields and heavy-duty roads, parking areas, hardstands, and vehicular pavement.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. For bracketed items, choose applicable item(s) or insert appropriate information.

Comments, suggestions and recommended changes for this guide specification are welcome and must be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: In preparing contract specifications for concrete pavement, the designer will use UFC 3-250-04 STANDARD PRACTICE FOR CONCRETE PAVEMENTS for guidance. State highway specifications may only be used for non organizational parking, roads, streets, and driveways where the equivalent passes of an 18-kip EASL are less than 5.7 million. All organizational vehicle parking, roads and airfield concrete pavements will use the UFGS without exception.

Specifications developed for Corps of Engineers managed projects must be edited in accordance with ER 1110-34-1 Engineering and Design Transportation Systems Mandatory Center of Expertise (Section 11, 12, App A, B, C).

Contact the Corps of Engineers Transportation
Systems Center (TSMCX), the Air Force Civil Engineer Center (AFEC) pavement Subject Matter Expert (SME), or Naval Facilities Engineering Command (NAVFAC) for guidance on interpreting and editing this specification section.

This specification section is structured for Contractor sampling and testing of materials and mixture proportioning. If Government sampling, testing and mixture proportioning is required, contact the TSMCX, AFEC pavement SME, or NAVFAC for specification language.

1.1 UNIT PRICES

**NOTE: For Lump Sum payment, include concrete unit price from Government estimate in paragraph PAYMENTS to provide cost basis for calculating payment reduction.**

1.1.1 Measurements

The quantity of concrete to be paid for will be the volume of concrete in cubic meters yards including thickened edges [monolithic curb], where required, placed in the completed and accepted pavement. Concrete will be measured in place in the completed and accepted pavement only within the neat line dimensions shown in the plan and cross section. No deductions will be made for rounded or beveled edges or the space occupied by pavement reinforcement, dowel bars, [tie bars, ]or electrical conduits, nor for any void, or other structure extending into or through the pavement slab, measuring 0.1 cubic meter 3 cubic feet or less in volume. No other allowance for concrete will be made unless placed in specified locations in accordance with the approved contract modification. The quantity of other materials specified herein, and used in the construction of the work covered by this section, will not be measured for payment, but will be considered a subsidiary obligation, covered under the price per cubic meter yard for concrete. Joint sealing materials are covered in Section 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT or Section 32 13 73.19 COMPRESSION CONCRETE PAVING JOINT SEALANT.

1.1.2 Payments

**NOTE: Use the applicable paragraph from the two choices below and delete the other.**

1.1.2.1 Unit Price

The quantity of concrete measured as specified above will be paid for at the contract unit price when placed in completed and accepted pavements. Payment will be made at the contract price for cubic meter yard for the scheduled item, with necessary adjustments as specified below. Payment will constitute full compensation for providing all materials, equipment, plant and tools, and for all labor and other incidentals necessary to complete the concrete pavement, except for other items specified herein for
separate payment.

1.1.2.2 Lump Sum

The quantity of concrete will be paid for and included in the lump-sum contract price. If less than 100 percent payment is due based on the pay factors stipulated below, a unit price of [_____] per cubic meter yard will be used for purposes of calculating the payment reduction. Payment will constitute full compensation for all materials, equipment, plant and tools, and for all labor and other incidentals necessary to complete the concrete pavement, except for other items specified herein for separate payment.

1.1.3 Payment of Lots

When a lot of material fails to meet the specification requirements, that lot will be accepted at a reduced price or be removed and replaced. The lowest computed percent payment determined for any pavement characteristic discussed below (for example, thickness, grade, and surface smoothness) becomes the actual percent payment for that lot. The actual percent payment will be applied to the unit price and the measured quantity of concrete in the lot to determine actual payment. Use results of strength tests to control concreting operations. Strength will be evaluated, but will not be considered for payment adjustment. Remove and replace any pavement not meeting the required 'Concrete Strength for Final Acceptance' at no additional cost to the Government.

1.1.4 Payment Adjustment for Smoothness

1.1.4.1 Straightedge Testing

Record location and deviation from straightedge for all measurements. When more than 5.0 and less than or equal to 10.0 percent of all measurements made within a lot exceed the tolerance specified in paragraph SURFACE SMOOTHNESS, after any reduction of high spots or removal and replacement, the computed percent payment based on surface smoothness will be 95 percent. When more than 10.0 percent and less than or equal to 15.0 percent of all measurements exceed the tolerance, the computed percent payment will be 90 percent. When more than 15.0 and less than or equal to 20.0 percent of all measurements exceed the tolerance, the computed percent payment will be 75 percent. Remove and replace the lot when more than 20.0 percent of the measurements exceed the tolerance, at no additional cost to the Government.

1.1.4.2 Profilograph Testing

Record location and data from all profilograph measurements. When the Profile Index of a 0.1 km 0.1 mile segment of a lot exceeds the tolerance specified in paragraph SURFACE SMOOTHNESS by 16 mm per km 1.0 inch per mile but less than 32 mm per km 2.0 inches per mile, after any reduction of high spots or removal and replacement, the computed percent payment based on surface smoothness will be 95 percent. When the Profile Index exceeds the tolerance by 32 mm per km 2.0 inches per mile but less than 47 mm per km 3.0 inches per mile, the computed percent payment will be 90 percent. When the Profile Index exceeds the tolerance by 47 mm per km 3.0 inches per mile but less than 63 mm per km 4.0 inches per mile, the computed percent payment will be 75 percent. Remove and replace the lot when the Profile Index exceeds the tolerance by 63 mm per km 4.0 inches per mile or more, at no additional cost to the Government.
1.1.4.3 Aircraft Arresting Systems

**************************************************************************
NOTE: Delete this paragraph, AIRCRAFT ARRESTING SYSTEMS, if not present or impacted by paving operations.
**************************************************************************

The 60 m 200 feet of airfield pavement on both the approach and departure sides of the arresting system pendant is a critical area. Consider this area as a separate lot for payment adjustment for smoothness. Protruding objects and undulating surfaces are detrimental to successful tailhook engagements and are not allowable. No exceedance of the tolerances specified in paragraph SURFACE SMOOTHNESS is acceptable. Remove and replace pavements exceeding the tolerances.

1.1.5 Payment Adjustment for Plan Grade

When more than 5.0 and less than or equal to 10.0 percent of all measurements made within a lot are outside the specified tolerance, the computed percent payment for that lot will be 95 percent. When more than 10.0 percent but less than 50 percent are outside the specified tolerances, the computed percent payment for the lot will be 75 percent. Remove and replace the deficient area where the deviation from grade exceeds the specified tolerances by 50 percent or more, at no additional cost to the Government.

1.1.6 Payment Adjustment for Thickness

Using the Average Thickness of the lot, determine the computed percent payment for thickness by entering the following table:

<table>
<thead>
<tr>
<th>Deficiency in Thickness Determined by cores</th>
<th>Pavements Equal To or Greater Than 200 mm 8 inches Thick</th>
<th>Pavements Less Than 200 mm 8 inches Thick</th>
</tr>
</thead>
<tbody>
<tr>
<td>millimeters</td>
<td>0.00 to 6.2</td>
<td>0.00 to 0.24</td>
</tr>

Where 0 percent payment is indicated, remove the entire lot and replace at no additional cost to the Government. Where either of the two cores from a sublot show a thickness deficiency of 19 mm 0.75 inch or greater, [13 mm 0.50 inch for pavements 200 mm 8 inches or less in thickness] drill two more cores in the sublot and compute the average thickness of the four cores. If this average shows a thickness deficiency of 19 mm 0.75 inch or more [13 mm 0.50 inch for pavements 200 mm 8 inches or less in thickness] remove the entire sublot.

1.3 SUBMITTALS

******************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a “G.” Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets
following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY CONTROL

**************************************************************************
NOTE: For Air Force and Army airfield projects, select first bracketed item for CQC System Manager. Edit second bracketed item for all other projects.
**************************************************************************

1.4.1 Contractor Quality Control Staff

Reference Section 01 45 00.00 10 QUALITY CONTROL for Contractor personnel qualification requirements. Submit American Concrete Institute certification for Contractor Quality Control staff. Qualifications and resumes for petrographer, surveyor, concrete batch plant operator, and profilograph operator. All Contractor Quality Control personnel assigned to concrete construction are required to be American Concrete Institute (ACI) certified in the following grade:

a. The minimum requirements for the CQC System Manager consist of [being a graduate engineer or a graduate of construction management, with a minimum of 5 years airfield construction experience and a minimum of 1 year experience as a CQC System Manager on an airfield construction project.][___]

b. CQC personnel responsible for inspection of concrete paving operations: ACI Concrete Transportation Inspector. The ACI Concrete Transportation Inspector is required to be present at the paving site during all paving operations, with the exception of the initial saw cutting operation. The QC manager is required to be present during initial saw cutting operations.

c. CQC staff is required to oversee all aspects of sawing operations (sawing, flushing, vacuuming, checking for random cracking, lighting).

d. Lead Foreman or Journeyman of the Concrete Placing, Finishing, and Curing Crews: ACI Concrete Flatwork Technician/Finisher.

e. Batch Plant Manufacturer's Representative: A representative from the batch plant manufacturer is required to be on-site to inspect and make necessary adjustments to all components of the batch plant including but not limited to aggregate bin weighing operations, water metering, cement and fly ash weighing devices. All necessary inspections and adjustments by the manufacturer representative is required to be performed prior to uniformity testing. Submit a written Batch Plant Manufacturer's Inspection Report signed by the representative noting all inspection items and corrections and stating the batch plant is capable of producing the volume of concrete as required herein.
f. Field Testing Technicians: ACI Concrete Field Testing Technician, Grade I.

g. Slipform Paving Equipment Manufacturer's Representative: A representative of the slipform paving equipment manufacturer is required to be on-site to inspect and make corrections to the paving equipment to ensure proper operations. Perform a complete and full hydraulic flow test of the vibrator system prior to the test section being placed. Submit a written Slipform Paver Manufacturer's Inspection Report signed by the manufacturer's representative noting all inspections, corrections, and flow tests have been performed and the paver is in a condition to perform the required work.

h. Laboratory Testing Technicians: ACI Concrete Strength Testing Technician and Laboratory Testing Technician, Grade I or II.

1.4.2 Other Staff

Submit for approval, the qualifications and resumes for the following staff:

a. Petrographer: Bachelor of Science degree in geology or petrography, trained in petrographic examination of concrete aggregate according to ASTM C294 and ASTM C295/C295M and trained in identification of the specific deleterious materials and tests identified in this specification. Detail the education, training and experience related to the project-specific test methods and deleterious materials in the Resume and submit at least 20 days before petrographic and deleterious materials examination is to commence.

b. Licensed Surveyor: Perform all survey work under the supervision of a Licensed Surveyor.

c. Concrete Batch Plant Operator: National Ready Mix Concrete Association (NRMCA) Plant Manager certification.

d. Profilograph Operator: Certification by equipment manufacturer or a state Department of Transportation.

1.4.3 Laboratory Accreditation and Validation

**************************************************************************
NOTE: The USACE validation letter requirement does not apply to the Navy.
**************************************************************************

Provide laboratory and testing facilities. Submit accreditation of the commercial laboratory by an independent evaluation authority, indicating conformance to ASTM C1077, including all applicable test procedures. The laboratories performing the tests are required to be accredited in accordance with ASTM C1077, including ASTM C78/C78M and ASTM C1260. Provide current accreditation and include the required and optional test methods, as specified. In addition, all contractor quality control testing laboratories performing acceptance testing require USACE validation by the Material Testing Center (MTC) for both parent laboratory and on-site laboratory. Validation on all laboratories is required to remain current throughout the duration of the paving project. Contact the MTC manager listed at

http://www.erdc.usace.army.mil/Media/FactSheets/FactSheetArticleView/tabid/9254/Article/
for costs and scheduling. Provide on-site temperature-controlled concrete curing facilities.

1.4.3.1 Aggregate Testing and Mix Proportioning

Aggregate testing and mixture proportioning studies are required to be performed by a commercial laboratory.

1.4.3.2 Acceptance Testing

**************************************************************************
NOTE: While ASTM C31 and ASTM C192 allow use of other materials for beam molds, require steel molds for flexural beam specimens (ASTM C78).
**************************************************************************

Provide all materials, labor, and facilities required for molding, curing, testing, and protecting test specimens at the paving site and in the laboratory. Provide steel molds for molding the beam specimens. Provide and maintain boxes or other facilities suitable for storing and curing the specimens at the paving site while in the mold within the temperature range stipulated by ASTM C31/C31M. Provide flexural loading equipment in accordance with ASTM C78/C78M.

1.4.3.3 Contractor Quality Control

All sampling and testing is required to be performed by an approved, on-site, independent, commercial laboratory, or for cementitious materials and admixtures, the manufacturer's laboratory.

1.4.3.4 Laboratory Inspection

The Government will inspect all laboratories requiring validation for equipment and test procedures prior to the start of any concreting operations for conformance to ASTM C1077. Schedule and provide payment for laboratory inspections. Additional payment or a time extension due to failure to acquire the required laboratory validation is not allowed. The laboratory is to maintain this certification for the duration of the project.

1.4.4 Preconstruction Testing of Materials

**************************************************************************
NOTE: Designer must edit this paragraph and following subparagraphs as appropriate. For Design Build Contracts the testing must be performed by the Contractor utilizing an approved petrographer and commercial testing laboratory. Delete any subparagraphs which are not applicable. Fill in blanks as appropriate.
**************************************************************************

All sampling and testing is required to be performed. Use an approved commercial laboratory or, for cementitious materials and chemical admixtures, a laboratory maintained by the manufacturer of the material. Materials are not allowed to be used until notice of acceptance has been given. Additional payment or extension of time due to failure of any material to meet project requirements, or for any additional sampling or testing required is not allowed. Additional tests may be performed by the
1.4.4.1 Aggregates

************
NOTE: Delete 'test section' for Design-Bid-Build projects. Delete 'contract award' for Design-Build projects.

Sample aggregates in the presence of a Government Representative. Obtain samples in accordance with ASTM D75/D75M and be representative of the materials to be used for the project. Perform all aggregate tests no earlier than 120 days prior to [contract award][test section].

1.4.4.2 Chemical Admixtures, Curing Compounds and Epoxies

At least 30 days before the material is used, submit certified copies of test results for the specific lots or batches to be used on the project. Provide test results less than 6 months old prior to use in the work. Retest chemical admixtures that have been in storage at the project site for longer than 6 months or that have been subjected to freezing, and rejected if test results do not meet manufacturer requirements.

1.4.4.3 Cementitious Materials

Cement, slag cement, [and pozzolan ]will be accepted on the basis of manufacturer's certification of compliance, accompanied by mill test reports showing that the material in each shipment meets the requirements of the specification under which it is provided. Provide mill test reports no more than 1 month old, prior to use in the work. Do not use cementitious materials until notice of acceptance has been given. Cementitious materials may be subjected to testing by the Government from samples obtained at the mill, at transfer points, or at the project site. If tests prove that a cementitious material that has been delivered is unsatisfactory, promptly remove it from the project site. Retest cementitious material that has not been used within 6 months after testing, and reject if test results do not meet manufacturer requirements.

1.4.5 Testing During Construction

During construction, sample and test aggregates, cementitious materials, and concrete as specified herein. The Government will sample and test concrete and ingredient materials as considered appropriate. Provide facilities and labor as may be necessary for procurement of representative test samples. Testing by the Government does not relieve the specified testing requirements.

1.4.6 Test Section

************
NOTE: If test section is not to be part of the production pavement area, delete the bracketed sentence referring to test sections constructed as part of production pavement and production lot payment.

************
Operate and calibrate the mixing plant prior to start of placing the test sections. Do not construct the test sections prior to receiving approval for uniformity testing. Construct the pilot lane and fill-in lane test sections on two separate days using the projects approved mixture proportions. Construct test sections with the same pavement section and placement width proposed for production paving. The underlying grade or pavement structure upon which the test sections are to be constructed is required to be the same as the remainder of the course represented by the test sections. Perform variations in mixture proportions, other than water, if directed. Use the same equipment, materials, and construction techniques on the test sections proposed for use in all subsequent work. Perform base course preparation, concrete production, placing, consolidating, texturing, curing, construction of joints, and all testing in accordance with applicable provisions of this specification. Three days after completion of the test sections, provide and evaluate eight cores with a minimum diameter of 150 mm 6 inches by full depth cut from points selected in the test sections by the Government. Construct the test sections meeting all specification requirements and being acceptable in all aspects, including plastic and hardened concrete properties, surface texture, thickness, grade, and longitudinal and transverse joint alignment. Failure to construct an acceptable test section necessitates construction of additional test sections at no additional cost to the Government. Do not commence production paving until the results on aggregates and concrete, including evaluation of cores, and all pavement measurements for edge slump, joint face deformation, actual plan grade, surface smoothness and thickness have been submitted and approved. Remove test sections which do not meet specification requirements at no expense to the Government. If slipform paving is performed and is unable to construct an acceptable test section, repair or replace the slipform paving equipment, or paving completed using fixed-forms and equipment compatible with them and allowed by the specification. [Pavement accepted as a production lot will be evaluated and paid as specified in PART 1 GENERAL.] Use the test sections to develop and demonstrate the proposed techniques of mixing, hauling, placing, consolidating, finishing, texturing, curing, initial saw cutting, start-up procedures, sampling, testing methods, plant operations, and the preparation of the construction joints for production paving.

1.4.6.1 Pilot Lane

Up to 10 days, but not more than 60 days, prior to construction of the concrete pavement, construct a test section [near the job site, but not as part of the production pavement area. ] [as part of the production paving area at an outer edge as indicated on the drawings. ] Construct the test section consisting of one paving lane at least 130 m 400 feet long and to the same thickness as the thickest portion of pavement shown on the Drawings. Construct at the same lane width as that required for use in the project. If keyed or doweled longitudinal construction joints are required in any of the production pavements, install them full length along one side of the test lane throughout the test section. [If both keys and dowels are required, install each in half of the test section. ]

1.4.6.2 Fill-In Lane

A fill-in lane is defined as full width concrete placement using two adjacent existing lanes as forms. Consider the first 130 m 400 feet of the initial production fill-in lane as a fill-in lane test section for purposes of testing and evaluation. All requirements for the test section are applicable. Obtain cores from the fill-in lane side of the longitudinal
1.4.7 Acceptability of Work

The materials and the pavement itself will be accepted on the basis of production testing. The Government may make check tests to validate the results of the production testing. If the results of the production testing vary by less than 2.0 percent of the Government's test results, the results of the production testing will be used. If the results of the Government and production tests vary by 2.0 percent, but less than 4.0 percent, the average of the two will be considered the value to be used. If these vary by 4.0 percent or more, carefully evaluate each sampling and testing procedure and obtain another series of Government and production tests on duplicate samples of material. If these vary by 4.0 percent or more, use the results of the tests made by the Government and the Government will continue check testing of this item on a continuous basis until the two sets of tests agree within less than 4.0 percent on a regular basis. Testing performed by the Government does not relieve the specified testing requirements.

1.4.8 Acceptance Requirements

1.4.8.1 Pavement Lots

**************************************************************************

NOTE: The lot size can be specified on the basis of time or volume of production. Normally, it is most practical for construction oversight if a lot is made equal to one shift, but not over 10 hours. If the lot size is based on the amount of production, it is to be selected to be approximately equal to the amount of concrete pavement produced in one shift (one day) of operation. The lot size must never exceed 750 cubic meters 1000 cubic yards of concrete pavement. When the total job does not exceed 750 cubic meters 1000 cubic yards, the lot size becomes the total job. Edit the following paragraphs accordingly. Do not change terminology (for instance computed percent payment, actual percent payment).

**************************************************************************

A lot is that quantity of construction to be evaluated for acceptance with specification requirements. A lot is equal to one shift of production not to exceed 750 cubic meters 1000 cubic yards. In order to evaluate thickness, divide each lot into four equal sublots. A subplot is equal to one shift of production not to exceed 190 cubic meters 250 cubic yards. Grade determinations will be made on the lot as a whole. Surface smoothness determinations will be made on every 0.1 km 0.1 mile segment in each lot. Select sample locations on a random basis in accordance with ASTM D3665. When operational conditions cause a lot to be terminated before the specified four sublots have been completed, use the following procedure to adjust the lot size and number of tests for the lot. Where three sublots have been completed, they constitute a lot. Where one or two sublots have been completed, incorporate them into the next lot (except for the last lot), and the total number of sublots used and acceptance criteria adjusted accordingly.
1.4.8.2 Evaluation

Provide all sampling and testing required for acceptance and payment adjustment, including batch tickets with all required acceptance testing. Individuals performing sampling, testing and inspection duties are required to meet the Qualifications. The Government reserves the right to direct additional samples and tests for any area which appears to deviate from the specification requirements. Testing in these areas are in addition to the sublot or lot testing, and the requirements for these areas are the same as those for a sublot or lot. Provide facilities for and, where directed, personnel to assist in obtaining samples for any Government testing.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Bulk Cementitious Materials

Provide all cementitious materials in bulk at a temperature, as delivered to storage at the site, not exceeding 65 degrees C 150 degrees F. Provide sufficient cementitious materials in storage to sustain continuous operation of the concrete mixing plant while the pavement is being placed. Provide separate facilities to prevent any intermixing during unloading, transporting, storing, and handling of each type of cementitious material.

1.5.2 Aggregate Materials

Store aggregate at the site of the batching and mixing plant avoiding breakage, segregation, intermixing or contamination by foreign materials. Store each size of aggregate from each source separately in free-draining stockpiles. Provide a minimum 0.6 m 24 inch thick sacrificial layer left undisturbed for each aggregate stored on ground. Provide free-draining storage for fine aggregate and the smallest size coarse aggregate for at least 24 hours immediately prior to use. Maintain sufficient aggregate at the site at all times to permit continuous uninterrupted operation of the mixing plant at the time concrete pavement is being placed. Do not allow tracked equipment on coarse aggregate stockpiles.

1.5.3 Other Materials

Store reinforcing bars and accessories above the ground on supports. Store all materials to avoid contamination and deterioration.

PART 2 PRODUCTS

******************************************************************************
NOTE: Delete any reference to any products which are not to be used on the project. Coordinate all product requirements with the appropriate agency's Pavements or Materials Engineer.
******************************************************************************

2.1 SYSTEM DESCRIPTION

This section is intended to stand alone for construction of concrete pavement. However, where the construction covered herein interfaces with other sections, construct each interface to conform to the requirements of both this section and the other section, including tolerances for both.
2.1.1 Surface Smoothness

*******************************
NOTE: Edit these paragraphs as appropriate to the project. If it is desired to restrict surface smoothness testing and evaluation to either straightedge method or profilograph method, retain the one and delete the other; otherwise, retain both as a Contractor's option. Require use of the profilograph method for airfield taxiways and runways. When the profilograph method is allowed, and there are areas with dimensions less than 60 m (200 feet) in any direction, retain the straightedge method for these short runs. Profilograph is typically used to measure longitudinal smoothness and straightedge for transverse smoothness. Aircraft arresting systems require straightedge for longitudinal and transverse smoothness.
*******************************

Use the profilograph method for all longitudinal testing, except for paving lanes less than 60 m 200 feet in length. Use the straightedge method for transverse testing, for longitudinal testing where the length of each pavement lane is less than 60 m 200 feet, within 60 m 200 feet on both the approach and departure sides of an aircraft arresting gear, and at the ends of the paving limits for the project. Smoothness requirements do not apply over crowns, drainage structures, or similar penetration. Maintain detailed notes of the testing results and provide a copy to the Government after each day's testing.

2.1.1.1 Straightedge Testing

*******************************
NOTE: Retain first and third bracketed statements for airfield projects and delete the fourth bracketed statement. Retain second bracketed statement for projects with an aircraft arresting systems. Retain fourth bracketed statement for roads and streets projects and delete first and third bracketed statements.
*******************************

Provide the finished surfaces of the pavements with no abrupt change of 6 mm 1/4 inch or more, and all pavements within the limits specified when checked with an approved 4 m 12 foot straightedge. Provide runways and taxiways with a variation from the specified straight edge not greater than 3 mm 1/8 inch in the longitudinal direction and not greater than 6 mm 1/4 inch in the transverse direction. Provide runway pavement within 60 m 200 feet on both the approach and departure sides of an aircraft arresting gear with a variation in the longitudinal direction from the specified straightedge not more than plus or minus 3 mm 1/8 inch. Provide all other airfield areas with a variation from a straight edge not greater than 6 mm 1/4 inch in either the longitudinal or transverse direction. [Provide roads, streets, tank hardstands, vehicular parking areas, and open storage areas with a variation from the specified straight edge not greater than 6 mm 1/4 inch in either the longitudinal or transverse direction.]
2.1.1.2 Profilograph Testing

Provide the finished surfaces of the pavements with no abrupt change of 6 mm 1/4 inch or more, and each 0.1 km 0.1 mile segment of each pavement lot with a Profile Index not greater than specified when tested with an approved California-type profilograph. [Provide runways and taxiways with a Profile index not greater than 110 mm per km 7 inches per mile in the longitudinal direction. Provide runway and taxiway transverse smoothness measured with the straightedge method and the straightedge requirements apply. Provide all other airfield areas with a Profile Index not greater than 140 mm per km 9 inches per mile in the longitudinal direction.] [Provide roads, streets, tank hardstands, vehicular parking areas and open storage areas with a Profile index not greater than 140 mm per km 9 inches per mile in the longitudinal direction.]

2.1.1.3 Bumps ("Must Grind" Areas)

Reduce any bumps ("must grind" areas) shown on the profilograph trace which exceed 10 mm 0.4 inch in height by diamond grinding in accordance with subparagraph DIAMOND GRINDING OF PCC SURFACES below until they do not exceed 7.5 mm 0.3 inch when retested. Taper such diamond grinding in all directions to provide smooth transitions to areas not requiring diamond grinding.

2.1.1.4 Testing Method

After the concrete has hardened sufficiently to permit walking thereon, but not later than 48 hours after placement, test the entire surface of the pavement in each lot in such a manner as to reveal all surface irregularities exceeding the tolerances specified above. If any pavement areas are diamond ground, retest these areas immediately after diamond grinding. Test the entire area of the pavement in both a longitudinal and a transverse direction on parallel lines. Perform the transverse lines 4.5 m 15 feet or less apart, as directed. Perform the longitudinal lines at the centerline of each paving lane shown on the drawings, regardless of whether multiple lanes are allowed to be paved at the same time, and at the 1/8th point in from each side of the lane. Also test other areas having obvious deviations. Perform longitudinal testing lines continuous across all joints. Perform transverse testing lines for pilot lanes carried to construction joint lines and for fill-in lanes carried 600 mm 24 inches across construction joints, and the readings in this area applied to the fill-in lane. Perform straightedge testing of the longitudinal edges of slipformed pilot lanes before paving fill-in lanes as specified below.

2.1.1.4.1 Straightedge Testing

Hold the straightedge in contact with the surface and moved ahead one-half the length of the straightedge for each successive measurement. Determine the amount of surface irregularity by placing the freestanding (unleveled) straightedge on the pavement surface and measuring the maximum gap between the straightedge and the pavement surface. Determine measurements along the entire length of the straight edge.

2.1.1.4.2 Profilograph Testing

Perform profilograph testing using approved California profilograph and procedures described in ASTM E1274. Utilize electronic recording and automatic computerized reduction of data equipment to indicate "must-grind" bumps and the Profile Index for each 0.1 km 0.1 mile segment of the
pavement lot. Accommodate grade breaks on aprons [parking lots] by breaking the profile segment into short sections and repositioning the blanking band on each section. Provide the "blanking band" of 5 mm 0.2 inch wide and the "bump template" span 25 mm 1 inch with an offset of 10 mm 0.4 inch. Count the profilograph testing of the last 9.1 m 30 feet of a paving lane in the longitudinal direction from each day's paving operation on the following day's continuation lane. Compute the profile index for each pass of the profilograph (3 per lane) in each 0.1 km 0.1 mile segment. The profile index for each segment is the average of the profile indices for each pass in each segment. Scale and proportion profilographs of unequal lengths to an equivalent 0.1 km 0.1 mile as outlined in the ASTM E1274. Provide a copy of the reduced tapes to the Government at the end of each day's testing.

2.1.2 Edge Slump and Joint Face Deformation

2.1.2.1 Edge Slump

When slip-form paving is used, provide a maximum of 15.0 percent of the total free edge of each pavement panel with a maximum edge slump of 6 mm 1/4 inch and none of the free edge of the pavement lot with an edge slump exceeding 9 mm 3/8 inch. (A pavement panel is defined as a lane width by the length between two adjacent transverse contraction joints. The total free edge of the pavement is the cumulative total linear measurement of pavement panel edge originally constructed as non-adjacent to any existing pavement; for example, 30 m 100 feet of pilot lane originally constructed as a separate lane, would have 60 m 200 feet of free edge; 30 m 100 feet of fill-in lane would have no free edge.) The area affected by the downward movement of the concrete along the pavement edge is a maximum of 450 mm 18 inches back from the edge.

2.1.2.2 Joint Face Deformation

In addition to the edge slump limits specified above, provide a vertical joint face with a surface within the maximum limits shown below:

<table>
<thead>
<tr>
<th>Offset from Straightedge Applied Longitudinally to Pavement Surface (a)</th>
<th>Offset from Straightedge Applied Longitudinally to Vertical Face (b)</th>
<th>Offset from Straightedge Applied Top to Bottom Against the Joint Face (c)</th>
<th>Abrupt Offset in Any Direction (d)</th>
<th>Offset of Joint Face from True Vertical (e)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Airfield Pavement</td>
<td>3 mm 1/8 inch</td>
<td>6 mm 1/4 inch</td>
<td>9 mm 3/8 inch</td>
<td>3 mm 1/8 inch</td>
</tr>
<tr>
<td>All Other Pavement</td>
<td>6 mm 1/4 inch</td>
<td>All other items same as airfield pavement</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(a) Measurement is taken by placing the straightedge longitudinally on the pavement surface 25 mm 1 inch from the free edge.

(b) Measurement is taken by applying the straightedge longitudinally along the vertical joint face.
2.1.2.3 Slump Determination

Test the pavement surface to determine edge slump immediately after the concrete has hardened sufficiently to permit walking thereon. Perform testing with a minimum 4 m 12 foot straightedge to reveal irregularities exceeding the edge slump tolerance specified above. Determine the vertical edge slump at each free edge of each slipformed paving lane constructed. Place the straightedge transverse to the direction of paving and the end of the straightedge located at the edge of the paving lane. Record measurements at 1.5 to 3.0 m 5 to 10 foot spacings, as directed, commencing at the header where paving was started. Initially record measurements at 1.5 m 5 foot intervals in each lane. When no deficiencies are present after 5 measurements, the interval may be increased. The maximum interval is 3.0 m 10 feet. When any deficiencies exist, return the interval to 1.5 m 5 feet. In addition to the transverse edge slump determination above, at the same time, record the longitudinal surface smoothness of the joint on a continuous line 25 mm 1 inch back from the joint line using the minimum 4 m 12 foot straightedge advanced one-half its length for each reading. Perform other tests of the exposed joint face to ensure that a uniform, true vertical joint face is attained. Properly reference all recorded measurements in accordance with paving lane identification and stationing, and a report submitted within 24 hours after measurement is made. Identify areas requiring replacement within the report.

2.1.2.4 Excessive Edge Slump

When edge slump exceeding the limits specified above is encountered on either side of the paving lane, record additional straightedge measurements to define the linear limits of the excessive slump. Remove and replace concrete slabs having excessive edge slump or joint deformation to the next transverse joint in conformance with paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS. Discontinue use of slip-form paving equipment and procedures that fail to consistently provide edges within the specified tolerances on edge slump and joint face deformation construct by means of standard paving procedures using fixed forms.
2.1.3 Plan Grade

Within 5 days after paving of each lot, test the finished surface of the pavement area by running lines of levels at intervals corresponding with every longitudinal and transverse joint to determine the elevation at each joint intersection. Record the results of this survey and provide a copy to the Government at the completion of the survey of each lot. [Provide finished surfaces of all airfield pavements that vary less than 13 mm 1/2 inch above or below the plan grade line or elevation indicated.] [Provide surfaces of [___] that vary less than 19 mm 3/4 inch.] The above deviations from the approved grade line and elevation are not permitted in areas where closer conformance with the planned grade and elevation is required for the proper functioning of appurtenant structures. Provide finished surfaces of new abutting pavements that coincide at their juncture. Provide horizontal control of the finished surfaces of all airfield pavements that vary not more than 13 mm 1/2 inch from the plan alignment indicated.

2.1.4 Flexural Strength

******************************************************************************
NOTE: Normally, concrete for airfield pavement is to be proportioned and accepted on the basis of 90-day flexural strength. If it is desired to use 28-day strength for design of airfield pavement, approval must be obtained through the TSMCX, AFCEC pavement SME, or NAVFAC. Make the same changes if this is concrete for road pavement proportioned for 28-day strength (no approval needed).

The designer may choose the first Option "Cylinders/Beam" or the second Option "Beams" for strength testing.
******************************************************************************

Submit certified copies of laboratory test reports and sources for cement, supplementary cementitious materials (SCM), aggregates, admixtures, curing compound, epoxy, and proprietary patching materials proposed for use on this project. Each lot of pavement will be evaluated for acceptance in accordance with the following procedures.

2.1.4.1 Sampling and Testing

For acceptance, obtain one composite sample of concrete from each sublot in accordance with ASTM C172/C172M from one batch or truckload. [Fabricate and cure test cylinders 152 x 305 mm 6 x 12 inches in accordance with ASTM C31/C31M, and tested in accordance with ASTM C39/C39M. Test two test cylinders per sublot (8 per lot) at 14 days.][ Fabricate and cure test beams 152 x 152 mm 6 x 6 inches in accordance with ASTM C31/C31M; and tested at 14 days in accordance with ASTM C78/C78M.]

2.1.4.2 Computations

Average the eight 14-day strength tests for the lot. Use the average strength in accordance with paragraph CONCRETE STRENGTH FOR FINAL ACCEPTANCE in PART 2.
2.1.5 Thickness

Each lot of pavement will be evaluated for acceptance and payment adjustment in accordance with the following procedure. Drill two cores, between 100 and 150 mm 4 and 6 inches in diameter, from the pavement, per sublot (8 per lot). Drill the cores within 3 days after lot placement, filling the core holes with an approved non-shrink concrete, respraying the cored areas with curing compound, and for measuring the cores. Provide the results with the thickness measurement data. Record eight measurements of thickness around the circumference of each core and one in the center, in accordance with ASTM C174/C174M. Average the pavement thickness from the 8 cores for the lot and evaluate as described in paragraph PAYMENT ADJUSTMENT FOR THICKNESS above.

2.1.6 Evaluation of Cores

Record and submit testing, inspection, and evaluation of each core for mortar-rich surface, uniformity of aggregate distribution, segregation, voids, cracks, and depth of reinforcement or dowel (if present). Moisten the core with water to visibly expose the aggregate and take a minimum of three photographs of the sides of the cores entire length, rotating the core approximately 120 degrees between photographs. Include a ruler for scale in the photographs that does not obscure the core. Provide plan view of location for each core.

2.1.7 Diamond Grinding of PCC Surfaces

Those performing diamond grinding are required to have a minimum of three years experience in diamond grinding of airfield pavements. In areas not meeting the specified limits for surface smoothness and plan grade, reduce high areas to attain the required smoothness and grade, except as depth is limited below. Reduce high areas by diamond grinding the hardened concrete with an approved equipment after the concrete is at a minimum age of 14 days. Perform diamond grinding by sawing with an industrial diamond abrasive which is impregnated in the saw blades. Assemble the saw blades in a cutting head mounted on a machine designed specifically for diamond grinding that produces the required texture and smoothness level without damage to the concrete pavement or joint faces. Provide diamond grinding equipment with saw blades that are 3 mm 1/8-inch wide, a minimum of 55 to 60 blades per 300 mm 12 inches of cutting head width, and capable of cutting a path a minimum of 0.9 m 3 ft wide. Diamond grinding equipment that causes ravel, aggregate fractures, spalls or disturbance to the joints is not permitted. The maximum area corrected by diamond grinding the surface of the hardened concrete is 10 percent of the total area of any sublot. The maximum depth of diamond grinding is 6 mm 1/4 inch. Provide diamond grinding machine equipped to flush and vacuum the pavement surface. Dispose of all debris from diamond grinding operations off Government property. Prior to diamond grinding, submit a Diamond Grinding Plan for review and approval. At a minimum, include the daily reports for the deficient areas, the location and extent of deficiencies, corrective actions, and equipment. Remove and replace all pavement areas requiring plan grade or surface smoothness corrections in excess of the limits specified above in conformance with paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS. [Retexture pavement areas given a wire comb or tined texture, areas exceeding 2 square meters 25 square feet that have been corrected by diamond grinding by transverse grooving using an approved grooving machine of standard manufacture. Provide grooves that are 6 mm 1/4 inch deep by 6 mm 1/4 inch wide on 37 mm 1-1/2 inch centers and carried into, and tapered to zero depth within the...
non-corrected surface, or match any existing grooves in the adjacent pavement. All areas in which diamond grinding has been performed are subject to the thickness tolerances specified in paragraph THICKNESS, above.

Prior to production diamond grinding operations, perform a test section at the approved location. Perform a test section that consists of a minimum of two adjacent passes with a minimum length of 12 m 40 feet to allow evaluation of the finish, transition between adjacent passes, and the results of crossing a transverse joint. Production diamond grinding operations are not to be performed prior to approval.

2.2 CEMENTITIOUS MATERIALS

******************************************************************************
NOTE: Edit these paragraphs as appropriate for the particular project. Guidance for use of cementitious materials must be sought from the Pavement Materials engineer or from the TSMCX, AFCEC pavement SME, or NAVFAC, especially for areas subject to alkali-aggregate reactivity, or sulfate attack.

When sulfate bearing soil or water is encountered, specify Type II cement for moderate sulfate concentration and Type V cement for high concentration and consider requiring use of fly ash or slag cement for partial replacement. Do not specify Type I or III cement. See UFC 3-250-04 for guidance. Specify limit on false set if it is a problem in the area.

Type III cement must not be specified unless accelerated paving is involved and then only after laboratory mixture proportioning studies and tests during the design stage of the project.
******************************************************************************

Provide cementitious materials consisting of portland cement, [blended cement] or portland cement in combination with supplementary cementitious materials (SCM), that conform to appropriate specifications listed below. New submittals are required when the cementitious materials sources or types change.

2.2.1 Portland Cement

Provide portland cement conforming to ASTM C150/C150M, Type [I] [II] [V], low alkali [including false set requirements]. [Provide Type III cement only in the following locations [______].]

2.2.2 Blended Cements

Provide blended cement conforms to ASTM C595/C595M, Type IP or IS, including the optional requirement for mortar expansion [and sulfate soundness]. Provide pozzolan added to the Type IP blend consisting of ASTM C618 Class F or Class N and that is interground with the cement clinker. Include in written statement from the manufacturer that the amount of pozzolan in the finished cement does not vary more than plus or minus 5 mass percent of the finished cement from lot to lot or within a lot. The percentage and type of mineral admixture used in the blend are
not allowed to change from that submitted for the aggregate evaluation and mixture proportioning. The requirements of Table 2 in paragraph SUPPLEMENTARY CEMENTITIOUS MATERIALS (SCM) CONTENT do not apply to the SCM content of blended cement.

2.2.3 Pozzolan

2.2.3.1 Fly Ash

******************************************************************************

NOTE: Class C fly ash is not permitted for paving concrete.

Use loss on ignition not exceeding 3 percent for frost areas to reduce carbon interference with air entraining admixture.

******************************************************************************

Provide fly ash that conforms to ASTM C618, Class F, including the optional requirements for uniformity and effectiveness in controlling Alkali-Silica reaction with a loss on ignition not exceeding [3] [6] percent. Provide Class F fly ash for use in mitigating Alkali-Silica Reactivity with a total equivalent alkali content less than 3 percent.

2.2.3.2 Raw or Calcined Natural Pozzolan

Provide natural pozzolan that is raw or calcined and conforms to ASTM C618, Class N, including the optional requirements for uniformity and effectiveness in controlling Alkali-Silica reaction with a loss on ignition not exceeding [3] [6] percent. Provide Class N pozzolan for use in mitigating Alkali-Silica Reactivity with a total equivalent alkali content less than 3 percent.

2.2.3.3 Ultra Fine Fly Ash and Ultra Fine Pozzolan

Provide Ultra Fine Fly Ash (UFFA) and Ultra Fine Pozzolan (UFP) that conforms to ASTM C618, Class F or N, and the following additional requirements:

a. The strength activity index at 28 days of age of at least 95 percent of the control specimens.

b. The average particle size not exceeding 6 microns.

2.2.3.4 Silica Fume

******************************************************************************

NOTE: Silica Fume must only be used for OCONUS projects where Class F fly ash and slag cement are not available, and when approved by the TSMCX, AFCEC pavement SME, or NAVFAC. Delete this paragraph here and where encountered throughout the remainder of this section.

******************************************************************************

Provide silica fume that conforms to ASTM C1240, including the optional limits on reactivity with cement alkalis. Provide silica fume as a dry, densified material or as a slurry. Provide the services of a manufacturer's technical representative, experienced in mixing,
proportioning, placement procedures, and curing of concrete containing silica fume, at no expense to the Government. This representative is required to be present on the project prior to and during at least the first 4 days of concrete production and placement using silica fume.

2.2.4 Slag Cement

Provide slag cement (ground-granulated blast-furnace slag) that conforms to ASTM C989/C989M, [Grade 100 or ]Grade 120.

2.2.5 Supplementary Cementitious Materials (SCM) Content

******************************************************************************
NOTE: Use first tailoring option for Navy projects. Use second tailoring option for Army/Air Force projects.
******************************************************************************

[Provide a concrete mix that contain one of the SCMs listed in Table 2 within the range specified therein, whether or not the aggregates are found to be reactive in accordance with paragraph ALKALI SILICA REACTIVITY.][Use of one of the SCMs listed below is optional, unless the SCM is required to mitigate ASR. The use of SCMs is encouraged in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.]

2.3 AGGREGATES

******************************************************************************
NOTE: During the design stage, the designer must research availability of aggregate materials in the project area to determine conformance with the project specifications.
******************************************************************************

Provide aggregates meeting the requirements of this specification. If aggregate sources in the project area do not meet the requirements of this specification, provide aggregates from sources outside the project area.
2.3.1 Aggregate Sources

2.3.1.1 Durability of Coarse Aggregate

NOTE: Use first Tailoring Option for Army and Air Force; second option is for Navy projects only.

Provide aggregate with a satisfactory service record in freezing and thawing of at least 5 years successful service in three concrete paving projects. Include a condition survey of the existing concrete and a review of the concrete-making materials, including coarse aggregates, cement, and mineral admixtures in the service record. Consider the previous aggregate source and test results, cement mill certificate data, mineral admixture chemical and physical composition, and the mix design (cement factor and water-cementitious material ratio) in the review. Provide service record performed by an independent third party professional engineer, petrographer, or concrete materials engineer along with their resume. Include photographs and a written report addressing D-cracks and popouts in accordance with ACI 201.1R in the service record. Provide coarse aggregate with a durability factor of 80 or more when subjected to freezing and thawing of specimens prepared in accordance with ASTM C1646/C1646M and tested in accordance with ASTM C666/C666M, Procedure A, when a coarse aggregate size group or source proposed for use does not have a satisfactory demonstrable service record. Test all coarse aggregate size groups and sources proposed for use individually.

Evaluate and test all fine and coarse aggregates to be used in all concrete for durability in accordance with ASTM C88. Provide fine and coarse aggregates with a maximum of 18 percent loss when subjected to 5 cycles using Magnesium Sulfate or a maximum of 12 percent loss when subjected to 5 cycles if Sodium Sulfate is used.

2.3.1.2 Alkali-Silica Reactivity

Evaluate and test fine and coarse aggregates to be used in all concrete for alkali-aggregate reactivity. Test all size groups and sources proposed for use.

a. Evaluate the fine and coarse aggregates separately, using ASTM C1260. Reject individual aggregates with test results that indicate an expansion of greater than 0.08 percent after 28 days of immersion in 1N NaOH solution, or perform additional testing as follows: utilize the proposed low alkali portland cement, blended cement, and SCM, or Lithium Nitrate in combination with each individual aggregate. If only SCMs are being evaluated, test in accordance with ASTM C1567. If Lithium Nitrate is being evaluated, with or without SCMs, test in accordance with COE CRD-C 662. Determine the quantity that meets all the requirements of these specifications and that lowers the expansion equal to or less than 0.08 percent after 28 days of immersion in a 1N NaOH solution. Base the mixture proportioning on the highest percentage of SCM required to mitigate ASR-reactivity.

b. If any of the above options does not lower the expansion to less than 0.08 percent after 28 days of immersion in a 1N NaOH solution, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing for evaluation and acceptance.
2.3.1.3 Combined Aggregate Gradation

In addition to the grading requirements specified for coarse aggregate and for fine aggregate, provide the combined aggregate grading meeting the following requirements:

a. Provide materials selected and the proportions used such that when the Coarseness Factor (CF) and the Workability Factor (WF) are plotted on a diagram as described in d. below, the point and its associated production tolerance thus determined falls within the parallelogram described therein. Refer to AF ETL 97-5 for combined aggregate plot area recommendations for the intended placement technique(s).

b. Determine the Coarseness Factor (CF) from the following equation:

\[
CF = \frac{(\text{cumulative percent retained on the 9.5 mm sieve})(100)}{(\text{cumulative percent retained on the 2.36 mm sieve})} \times \frac{(\text{cumulative percent retained on the 3/8 inch sieve})(100)}{(\text{cumulative percent retained on the No. 8 sieve})}
\]

c. The Workability Factor (WF) is defined as the percent passing the 2.36 mm No. 8 sieve based on the combined aggregate gradation. Adjust the WF, prorated upwards only, by 2.5 percentage points for each 56 kg per cubic meter 94 pounds per cubic yard of cementitious material greater than 335 kg per cubic meter 564 pounds per cubic yard.

d. Plot a diagram using a rectangular scale with WF on the Y-axis with units from 20 (bottom) to 45 (top), and with CF on the X-axis with units from 80 (left side) to 30 (right side). On this diagram, plot a parallelogram with corners at the following coordinates (CF-75, WF-28), (CF-75, WF-40), (CF-45, WF-32.5), and (CF-45, WF-44.5). If the point determined by the intersection of the computed CF and WF does not fall within the above parallelogram, revise the grading of each size of aggregate used and the proportions selected as necessary.

e. Plot the associated production tolerance limits, identified in Table 6, around the CF and adjusted WF point.

2.3.2 Coarse Aggregate

2.3.2.1 Material Composition

**************************************************************************
** NOTE: Crushing gravel tends to improve quality and bond characteristics and generally results in higher flexural strength of concrete. When mixture proportioning studies or local experience indicates that low flexural strength concrete will be produced with an uncrushed gravel, the possibility of producing higher strength concrete by crushing the gravel must be investigated. When desirable to limit coarse aggregate to crushed materials, modify this paragraph appropriately. **

Do not, under any conditions, permit use of steel furnace slag for any aggregate. (It is markedly different from iron blast furnace slag.)

In power check pads, the high temperatures from jet
blast can cause distress in aggregates in the concrete. Include bracketed item if power check pads are to be constructed. If no service record is available, lab study of available aggregates must be made. Only basalt is permitted on Navy projects.

Special attention must be given to aggregates to be used for compass calibration pads. Aggregates with magnetic properties, such as, but not limited to, magnetite in granites, high-iron minerals in traprock, pyrite in limestone, and free iron or iron oxide in slag aggregate must not be used. When the paving of compass calibration pads is required, add the bracketed item concerning compass pads as additional requirements for coarse and fine aggregates.

Retain the bracketed requirement for washing coarse aggregate if aggregates in the area require it. Add the requirement to use a log washer or other specific equipment if experience in the area shows the need. Delete if not needed. It is permissible to list certain aggregate sources that do not require washing, if that is appropriate. The designer must make the decision during preparation of specifications; do not make the Resident Engineer decide after award if aggregates need to be washed.

Provide coarse aggregate consisting of crushed or uncrushed gravel, crushed stone, [crushed adequately seasoned air-cooled iron blast-furnace slag; steel furnace slag is not permitted,] or a combination thereof. [Provide aggregate used for paving compass calibration hardstands free of materials having undesirable magnetic properties, including magnetite in granite, high-iron minerals in traprock, and pyrite in limestone. ] [Provide coarse aggregate for paving power check pads consisting of limestone, dolomite, basalt or other approved low-silica content aggregate which do not cause thermal distress from jet blast.] Provide aggregates, as delivered to the mixers, consisting of clean, hard, uncoated particles meeting the requirements of ASTM C33/C33M except as specified herein. [Provide coarse aggregate that has been washed sufficient to remove dust and other coatings.] [Provide coarse aggregate that has been cleaned by processing with an approved log washer.] [Provide iron blast-furnace slag conforming to the grading to be used in the concrete with a compact density of not less than 1125 kg per cubic meter 70 lb per cubic foot determined in accordance with ASTM C29/C29M]. Provide coarse aggregate with no more than 40 percent loss when subjected to the Los Angeles abrasion test in accordance with ASTM C131/C131M. Provide coarse aggregates with a maximum sodium sulfate soundness loss of 12 percent, or with a magnesium sulfate soundness loss of 18 percent after five cycles when tested in accordance with ASTM C88.

2.3.2.2 Particle Shape Characteristics

Provide particles of the coarse aggregate that are generally spherical or cubical in shape. The quantity of flat particles and elongated particles in any size group coarser than the 9.5 mm 3/8 inch sieve are not allowed to exceed 20 percent by weight as determined by the Flat Particle Test and the Elongated Particle Test of ASTM D4791, Method A. A flat particle is
defined as one having a ratio of width to thickness greater than 3; an elongated particle is one having a ratio of length to width greater than 3.

2.3.2.3 Size and Grading

**************************************************************************

NOTE: Aggregate quality requirements are not allowed to be reduced or eliminated for airfield projects. Use nominal maximum aggregate size of 37.5 mm 1-1/2 inch (ASTM C33 size number 4) for airfield pavements. Subject to approval of the TSMCX, AFCEC pavement SME, or NAVFAC, a 25 mm 1-inch nominal maximum aggregate size may be used to avoid durability problems associated with some larger size aggregate. For thin bonded overlays, limit the nominal maximum aggregate size to less than one-third of the uniform overlay thickness (not including leveling portion).

**************************************************************************

Provide coarse aggregate with a nominal maximum size of [37.5] [_____] mm [1.5] [_____] inches with a minimum of 10 percent retained on the [25] mm [1.0] inch sieve of the proposed combined aggregate gradation. Grade and provide the coarse aggregates in a minimum of two size groups meeting the individual grading requirements of ASTM C33/C33M, Size No. 4 (37 mm to 19 mm 1.5 to 0.75 inch) and Size No. 67 (19 mm to No. 4 0.75 inch to No. 4) to meet the criteria of paragraph COMBINED AGGREGATE GRADATION. A third coarse aggregate size group may be required to meet the criteria of paragraph COMBINED AGGREGATE GRADATION.

2.3.2.4 Deleterious Materials - Airfield Pavements

**************************************************************************

NOTE: Include these deleterious material requirements for airfield paving projects only, otherwise, delete. In Table 5 select columns showing appropriate percentage by weight in accordance with the following. Delete the inapplicable column in the table and the heading of the column used.

<table>
<thead>
<tr>
<th>Weather Severity</th>
<th>Air Freezing Index Coldest Year in 30 (a)</th>

</tbody>
</table>

(a) Calculated as described in UFC 3-130-01. See ASTM C33/C33M for simplified map of CONUS weather severity.
Weather Severity | Air Freezing Index Coldest Year in 30 (a) | Average Precipitation for any Single Month During the Freezing Period
--- | --- | ---

(b) In poorly drained areas, the weather must be considered severe even though the other criteria indicate a rating of moderate.

(c) For Navy projects, select "Severe Weather" column of Table 5. Delete "Moderate Weather" and associated limits.

**************************************************************************

The amount of deleterious material in each size group of coarse aggregate is not allowed to exceed the limits shown in Table 5 below, determined in accordance with the test methods shown.

| TABLE 5 | LIMITS OF DELETERIOUS MATERIALS IN COARSE AGGREGATE FOR AIRFIELD PAVEMENTS |
| --- | --- | --- |
| Percentage by Mass | Severe Weather | Moderate Weather |
| Clay lumps and friable particles (ASTM C142/C142M) | 0.2 | 0.2 |
| Shale (a) (ASTM C295/C295M) | 0.1 | 0.2 |
| Material finer than 0.075 mm No. 200 sieve (b) (ASTM C117) | 0.5 | 0.5 |
| Lightweight particles (c) (ASTM C123/C123M) | 0.2 | 0.2 |
| Clay ironstone (d) (ASTM C295/C295M) | 0.1 | 0.5 |
| Chert, cherty stone, and other aggregates (less than 2.40 Sp. Gr.) (e) (ASTM C123/C123M and ASTM C295/C295M) | 0.1 | 0.5 |
| Claystone, mudstone, and siltstone (f) (ASTM C295/C295M) | 0.1 | 0.1 |
| Shaly and argillaceous limestone (g) (ASTM C295/C295M) | 0.2 | 0.2 |
| Other soft particles (COE CRD-C 130) | 1.0 | 1.0 |
| Total of all deleterious substances exclusive of material finer than 0.075 mm No. 200 sieve | 1.0 | 2.0 |

<tr>
<td>(a) Shale is defined as a fine-grained, thinly laminated or fissile sedimentary rock. It is commonly composed of clay or silt or both. It has been indurated by compaction or by cementation, but not so much as to have become slate.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(b) Limit for material finer than 0.075 mm No. 200 sieve is allowed to be increased to 1.5 percent for crushed aggregates if the fine material consists of crusher dust that is essentially free from clay or shale. Use XRD or other appropriate techniques as determined by petrographer to quantify amount and justify increase.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(c) Test with a separation medium with a density of Sp. Gr. of 2.0. This limit does not apply to coarse aggregate manufactured from blast-furnace slag unless contamination is evident.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(d) Clay ironstone is defined as an impure variety of iron carbonate, iron oxide, hydrous iron oxide, or combinations thereof, commonly mixed with clay, silt, or sand. It commonly occurs as dull, earthy particles, homogeneous concretionary masses, or hard-shell particles with soft interiors. Other names commonly used for clay ironstone are &quot;chocolate bars&quot; and limonite</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(e) Chert is defined as a rock composed of quartz, chalcedony or opal, or any mixture of these forms of silica. It is variable in color. The texture is so fine that the individual mineral grains are too small to be distinguished by the unaided eye. Its hardness is such that it scratches glass but is not scratched by a knife blade. It may contain impurities such as clay, carbonates, iron oxides, and other minerals. Cherty stone is defined as any type of rock (generally limestone) that contains chert as lenses and nodules, or irregular masses partially or completely replacing the original stone. Other aggregates consist of obsidian, ash tuff, and palygorskite.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(f) Claystone, mudstone, or siltstone, is defined as a massive fine-grained sedimentary rock that consists predominantly of indurated clay or silt without laminations or fissility. It may be indurated either by compaction or by cementation.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(g) Shaly limestone is defined as limestone in which shale occurs as one or more thin beds or laminae. These laminae may be regular or very irregular and may be spaced from a few inches down to minute fractions of an inch. Argillaceous limestone is defined as a limestone in which clay minerals occur disseminated in the stone in the amount of 10 to 50 percent by weight of the rock; when these make up from 50 to 90 percent, the rock is known as calcareous (or dolomitic) shale (or claystone, mudstone, or siltstone).</td>

(h) Perform testing in accordance with the referenced test methods, except use the minimum sample size specified below.

2.3.2.5 Testing Sequence for Deleterious Materials in Coarse Aggregate - Airfields Only

No extension of time or additional payment due to any delays caused by the testing, evaluation, or personnel requirements is allowed. The minimum test sample size of the coarse aggregate is 90 kg (200 pounds) for the 19 mm 3/4 inch and larger maximum size and 12 kg (25 pounds) for the 4.75 to 19 mm No. 4 to 3/4 inch coarse aggregate. Provide facilities for the ready procurement of representative test samples. The testing procedure on each sample of coarse aggregate for compliance with limits on deleterious materials is as follows:

Step 1: Wash each full sample of coarse aggregate for material finer than the 0.075 mm No. 200 sieve. Discard material finer than the 0.075 mm No. 200 sieve.

Step 2: Test remaining full sample for clay lumps and friable particles and remove.

Step 3. Test remaining full sample for chert and cherty stone with SSD density of less than 2.40 specific gravity. Remove lightweight chert and cherty stone. Retain other materials less than 2.40 specific gravity for Step 4.

Step 4: Test the materials less than 2.40 specific gravity from Step 3 for lightweight particles (Sp. GR. 2.0) and remove. Restore other materials less than 2.40 specific gravity to the sample.

Step 5: Test remaining sample for clay-ironstone, shale, claystone, mudstone, siltstone, shaly and argillaceous limestone, and remove.

Step 6: Test a minimum of one-fifth of remaining full sample for other soft particles.

2.3.2.6 Deleterious Material - Road Pavements

**************************************************************************
NOTE: Use this paragraph only for heavy-duty pavements, roads, streets, and parking lots for vehicular and tracked traffic. Otherwise, delete.
**************************************************************************

SECTION 32 13 14.13 Page 38
The amount of deleterious material in each size group of coarse aggregate is not to exceed the limits in the following table when tested as indicated.

<table>
<thead>
<tr>
<th>LIMITS OF DELETERIOUS MATERIALS IN COARSE AGGREGATE FOR ROAD PAVEMENTS</th>

</tbody>
</table>

The limit for material finer than the 0.075 mm No. 200 sieve is allowed to be increased to 1.5 percent for crushed aggregates consisting of crusher dust that is essentially free from clay or shale. Use a separation medium for lightweight particles with a density of 2.0 specific gravity. This limit does not apply to coarse aggregate manufactured from blast-furnace slag unless contamination is evident.

2.3.3 Fine Aggregate

2.3.3.1 Composition

Provide fine aggregate consisting of natural sand, manufactured sand, or a combination of the two, and composed of clean, hard, durable particles meeting the requirements of ASTM C33/C33M. [Provide aggregate used for paving compass calibration hardstands free of materials having undesirable magnetic properties, including magnetite in granite, high-iron minerals in traprock, and pyrite in limestone. ]Stockpile and batch each type of fine aggregate separately. Provide fine aggregate with particles that are generally spherical or cubical in shape.

2.3.3.2 Grading

Provide fine aggregate, as delivered to the mixer, with a grading that conforms to the requirements of ASTM C33/C33M and having a fineness modulus of not less than 2.50 nor more than 3.40.

2.3.3.3 Deleterious Material

******************************************************************************
| NOTE: Retain sample size for airfield pavements. |
******************************************************************************

[The minimum test sample size for fine aggregate proposed for use in airfield paving is 5 kg 10 pounds. ]The amount of deleterious material in the fine aggregate is not to exceed the following limits by mass when performed on the full sample:

<table>

2.4 CHEMICAL ADMIXTURES

2.4.1 General Requirements

Chemical admixtures may only be used when the specific admixture type and manufacturer is the same material used in the mixture proportioning studies. Provide air-entraining admixture conforming to ASTM C260/C260M. An accelerating admixture conforming to ASTM C494/C494M, Type C, may be used only when specified in paragraph MIXTURE PROPORTIONS below provided it is not used to reduce the amount of cementitious material. Calcium chloride and admixtures containing calcium chloride are not allowed. Provide retarding or water-reducing admixture that meet the requirements of ASTM C494/C494M, Type A, B, or D, except that the 6-month and 1-year compressive strength tests are waived. ASTM C494/C494M, Type F and G high range water reducing admixtures and Type S specific performance admixtures are not allowed. ASTM C1017/C1017M flowable admixtures are not allowed.

2.4.2 Lithium Nitrate

Provide lithium admixture that consists of a nominal 30 percent aqueous solution of Lithium Nitrate, with a density of 1.2 kg per L 10 pounds per gallon, with the approximate chemical form as shown below:

<table>
<thead>
<tr>
<th>Constituent</th>
<th>Limit (Percent by Mass)</th>

</tr>
<tr>
<td>Na⁺ (Sodium Ion)</td>
<td>0.1 (max)</td>
</tr>
<tr>
<td>K⁺ (Potassium Ion)</td>
<td>0.1 (max)</td>
</tr>
</tbody>
</table>

Provide the services of a manufacturer's technical representative experienced in dispensing, mixing, proportioning, placement procedures and curing of concrete containing lithium nitrate, at no expense to the Government. This representative is required to be present on the project prior to and during at least the first two days of placement using lithium nitrate.
2.4.3 High Range Water Reducing Admixture (HRWRA)

**************************************************************************
NOTE: High Range Water Reducing Admixtures are permitted only when using Silica Fume. Delete for all other projects
**************************************************************************

Provide a high-range water-reducing admixture that meets the requirements of ASTM C494/C494M, Type F or G, that is free from chlorides, alkalis, and is of the synthesized, sulfonated complex polymer type. Add the HRWRA to the concrete as a single component at the batch plant. Add the admixture to the concrete mixture only when its use is approved or directed, and only when it has been used in mixture proportioning studies to arrive at approved mixture proportions. Submit certified copies of the independent laboratory test results required for compliance with ASTM C494/C494M.

2.5 MEMBRANE FORMING CURING COMPOUND

**************************************************************************
NOTE: Use CRD-C 300 for Army, Air Force, and Navy/Marine Corps airfield pavement projects. ASTM C309 may be used for roads and streets.
**************************************************************************

Provide membrane forming curing compound that [conforms to COE CRD-C 300 and is white pigmented.] [conforms to ASTM C309, white-pigmented Type 2, Class B.]

2.6 WATER

Provide water for mixing and curing that is fresh, clean, potable, and free of injurious amounts of oil, acid, salt, or alkali, except that non-potable water, or water from concrete production operations, may be used if it meets the requirements of ASTM C1602/C1602M.

2.7 JOINT MATERIALS

**************************************************************************
NOTE: Edit as appropriate for project requirements. Coordinate with Section 32 01 19.61 for Army projects and 32 13 73.19 for all other projects.
**************************************************************************

2.7.1 Expansion Joint Material

Provide preformed expansion joint filler material conforming to [ASTM D1751] [or] [ASTM D1752 Type [II] [III].] Provide expansion joint filler that is 19 mm 3/4 inch thick, unless otherwise indicated, and provided in a single full depth piece.

2.7.2 Slip Joint Material

Provide slip joint material that is 6 mm 1/4 inch thick expansion joint filler, unless otherwise indicated, conforming to paragraph EXPANSION JOINT MATERIAL.
2.8 REINFORCING

Provide reinforcement that is free from loose, flaky rust, loose scale, oil, grease, mud, or other coatings that might reduce the bond with concrete. Removal of thin powdery rust and tight rust is not required. However, reinforcing steel which is rusted to the extent that it does not conform to the required dimensions or mechanical properties is not allowed to be used.

2.8.1 Reinforcing Bars and Bar Mats

Provide reinforcing bars conforming to [ASTM A615/A615M, billet-steel] [ASTM A996/A996M, rail and axle steel], Grade 60 [____]. Provide bar mats conforming to ASTM A184/A184M. The bar members may be billet rail or axle steel.

2.8.2 Welded Wire Reinforcement

Provide welded wire reinforcement that is deformed or smooth, conforming to ASTM A1064/A1064M, and is provided in flat sheets.

2.9 DOWELS[ AND TIE BARS]

2.9.1 Dowels

Provide dowels in single piece bars fabricated or cut to length at the shop or mill before delivery to the site. Dowels are to be free of loose, flaky rust and loose scale and be clean and straight. Dowels may be sheared to length provided that the deformation from true shape caused by shearing does not exceed 1 mm 0.04 inch on the diameter of the dowel and does not extend more than 1 mm 0.04 inch from the end of the dowel. Dowels are required to be plain (non-deformed) steel bars conforming to ASTM A615/A615M, Grade 40 or 60; ASTM A996/A996M, Grade 50 or 60. Dowels are to be epoxy coated in conformance with Type 1 coating requirements of ASTM A1078/A1078M, to include the ends. Provide grout retention rings that are fully circular metal or plastic devices capable of supporting the dowel until the epoxy hardens. Dowel sleeves or inserts are not permitted.

2.9.2 Dowel Bar Assemblies

Provide dowel bar assemblies that consist of a framework of metal bars or wires arranged to provide rigid support for the dowels throughout the paving operation, with a minimum of four continuous bars or wires extending along the joint line. Provide dowels that are welded to the assembly or held firmly by mechanical locking arrangements that prevent them from rising, sliding out, or becoming distorted during paving operations.
2.9.3 Tie Bars

Provide tie bars that are deformed steel bars conforming to ASTM A615/A615M, or ASTM A996/A996M, Grade 60 [_____]1, and of the sizes and dimensions indicated. Deformed rail steel bars and high-strength billet or axle steel bars, Grade 50 or higher, are not allowed to be used for bars that are bent and straightened during construction.

2.10 EPOXY RESIN

Provide epoxy-resin materials that consist of two-component materials conforming to the requirements of ASTM C881/C881M, Class as appropriate for each application temperature to be encountered, except that in addition, the materials meet the following requirements:

a. Material for use for embedding dowels and anchor bolts be Type IV, Grade 3.

b. Material for use as patching materials for complete filling of spalls and other voids and for use in preparing epoxy resin mortar be Type III, Grade as approved.

c. Material for use for injecting cracks be Type IV, Grade 1.

d. Material for bonding freshly mixed portland cement concrete or mortar or freshly mixed epoxy resin concrete or mortar to hardened concrete be Type V, Grade as approved.

2.11 EQUIPMENT

All plant, equipment, tools, and machines used in the work are required to be maintained in satisfactory working conditions at all times. Submit the following:

a. Details and data on the batching and mixing plant prior to plant assembly including manufacturer's literature showing that the equipment meets all requirements specified herein.

b. Obtain National Ready Mixed Concrete Association (NRMCA) certification of the concrete plant, at no expense to the Government. Provide inspection report of the concrete plant by an engineer approved by the NRMCA. A list of NRMCA approved engineers is available on the NRMCA website at http://www.nrmca.org. Submit a copy of the NRMCA QC Manual Section 3 Concrete Plant Certification Checklist, NRMCA Certificate of Conformance, and Calibration documentation on all measuring and weighing devices prior to uniformity testing.

c. A description of the equipment proposed for transporting concrete mixture from the central mixing plant to the paving equipment.

d. A description of the equipment proposed for the machine and hand placing, consolidating and curing of the concrete mixture.

**************************************************************************
NOTE: For OCONUS projects, contact NRMCA (http://www.nrmca.org) concerning approved engineers available in the geographic area.
**************************************************************************
Manufacturer's literature on the paver and finisher, together with the manufacturer's written instructions on adjustments and operating procedures necessary to assure a tight, smooth surface on the concrete pavement. The literature is required to show that the equipment meets all details of these specifications. [Include detailed information on automatic laser controlled systems if proposed for use.]

2.11.1 Batching and Mixing Plant

******************************************************************************
NOTE: The batching and mixing plant must be on the construction site or as close as possible, but must be no farther than 15 minutes haul time from the placing site during all periods of the work day. Verify the availability of water and electrical power for sites on Government land. On Navy projects, specify an off-site batch plant. Edit bracketed items as appropriate.

Plant capacity must be governed by the laydown pattern or the size of the job to prevent delay of paving operations.
******************************************************************************

2.11.1.1 Location

Locate the batching and mixing plant [on project site as indicated on the drawings][off Government premises no more than 15 minutes haul time from the placing site]. [Water and electrical power [are] [are not] available on the project site.] Provide operable telephonic or radio communication between the plant and the placing site at all times concreting is taking place.

2.11.1.2 Type and Capacity

Provide a batching and mixing plant consisting of a stationary-type central mix plant, including permanent installations and portable or relocatable plants installed on stable foundations. Provide a plant designed and operated to produce concrete within the specified tolerances, with a minimum capacity of 200 cubic meters 250 cubic yards [_____] per hour, that conforms to the requirements of NRMCA QC 3 including provisions addressing:

1. Material Storage and Handling
2. Batching Equipment
3. Central Mixer
4. Ticketing System
5. Delivery System

2.11.1.3 Tolerances

<table>
<thead>
<tr>
<th>Materials</th>
<th>Percentage of Required Mass</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cementitious Materials</td>
<td>plus or minus 1</td>
</tr>
<tr>
<td>Aggregate</td>
<td>plus or minus 2</td>
</tr>
<tr>
<td>Water</td>
<td>plus or minus 1</td>
</tr>
</tbody>
</table>
For volumetric batching equipment for water and admixtures, the above numeric tolerances apply to the required volume of material being batched. Dilute concentrated admixtures uniformly, if necessary, to provide sufficient volume per batch to ensure that the batchers consistently operate within the above tolerance.

### 2.11.1.4 Moisture Control

Provide a plant capable of ready adjustment to compensate for the varying moisture contents of the aggregates and to change the quantities of the materials being batched. [Provide an electric moisture meter complying with the provisions of COE CRD-C 143 for measuring of moisture in the fine aggregate. Provide a sensing element arranged so that measurement is made near the batcher charging gate of the fine aggregate bin or in the fine aggregate batcher.]

### 2.11.2 Concrete Mixers

Provide stationary or truck mixers that are capable of combining the materials into a uniform mixture and of discharging this mixture without segregation. Do not charge the mixers in excess of the capacity recommended by the manufacturer. Operate the mixers at the drum or mixing blade speed designated by the manufacturer. Maintain the mixers in satisfactory operating condition, with the mixer drums kept free of hardened concrete. Replace mixer blades or paddles when worn down more than 10 percent of their depth when compared with the manufacturer's dimension for new blades or paddles.

#### 2.11.2.1 Stationary

Stationary mixers are required to be drum or pan mixers. Provide mixers with an acceptable device to lock the discharge mechanism until the required mixing time has elapsed.

#### 2.11.2.2 Mixing Time and Uniformity for Stationary Mixers

Use the projects approved mixture proportions for uniformity testing. For stationary mixers, before uniformity data are available, the minimum mixing time for each batch after all solid materials are in the mixer, provided that all of the mixing water is introduced before one-fourth of the mixing time has elapsed, is 1 minute for mixers having a capacity of 0.75 cubic meter 1 cubic yard. For mixers of greater capacity, increase this minimum time by 20 seconds for each additional cubic meter 1.33 cubic yard or fraction thereof. After results of uniformity tests are available, the mixing time may be reduced to the minimum time required to meet uniformity requirements; but if uniformity requirements are not being met, increase the mixing time as directed. Perform mixer performance tests at new mixing times immediately after any change in mixing time or volume. For regular testing perform all six tests on three batches of concrete. The range for regular testing is the average of the ranges of the three batches. Conduct the Regular Test sequence for initial determination of the mixing time or as directed. When regular testing is performed, the concrete is required to meet the limits of any five of the six uniformity requirements listed in...
Table 1 below.

2.11.2.3 Abbreviated Test

Use the projects approved mixture proportions for uniformity testing. Conduct the Abbreviated Test sequence for production concrete verification at the frequency specified in Table 6. When abbreviated testing is performed, the concrete is required to meet only those requirements listed for abbreviated testing. Abbreviated testing consists of performing the three required tests on a single batch of concrete. The range for abbreviated testing is the range for one batch. If more than one mixer is used and all are identical in terms of make, type, capacity, condition, speed of rotation, the results of tests on one of the mixers apply to the others, subject to the approval. Perform all mixer performance (uniformity) testing in accordance with COE CRD-C 55 and with paragraph TESTING AND INSPECTION FOR CONTRACTOR QUALITY CONTROL DURING CONSTRUCTION in PART 3.

<table>

2.11.2.4 Truck

Truck mixers are not allowed for mixing or transporting slipformed paving concrete. Provide only truck mixers designed for mixing or transporting paving concrete with extra large blading and rear opening specifically for low-slump paving concrete. Provide truck mixers, the mixing of concrete therein, and concrete uniformity and testing thereof that conform to the requirements of ASTM C94/C94M. Determine the number of revolutions between 70 to 100 for truck-mixed concrete and the number of revolutions for shrink-mixed concrete by uniformity tests as specified in ASTM C94/C94M and in requirements for mixer performance stated in paragraph TESTING AND INSPECTION FOR CONTRACTOR QUALITY CONTROL DURING CONSTRUCTION in PART 3. If requirements for the uniformity of concrete are not met with 100 revolutions of mixing after all ingredients including water are in the truck mixer drum, discontinue use of the mixer until the condition is corrected. Water is not allowed to be added after the initial introduction of mixing water except, when on arrival at the job site, the slump is less than specified and the water-cement ratio is less than that given as a maximum in the approved mixture. Additional water may be added to bring the slump within the specified range provided the approved water-cement
ratio is not exceeded. Inject water into the head of the mixer (end opposite the discharge opening) drum under pressure, and turn the drum or blades a minimum of 30 additional revolutions at mixing speed. The addition of water to the batch at any later time is not allowed. Perform mixer performance (uniformity) tests for truck mixers in accordance with ASTM C94/C94M.

2.11.3 Transporting Equipment

Transport slipform concrete to the paving site in non-agitating equipment conforming to ASTM C94/C94M or in approved agitators. Transport fixed form concrete in approved truck mixers designed with extra large blading and rear opening specifically for low slump concrete. Provide transporting equipment designed and operated to deliver and discharge the required concrete mixture completely without segregation.

2.11.4 Transfer and Spreading Equipment

******************************************************************************
NOTE: A transfer spreader is required for all Army and Air Force airfield paving projects. This paragraph is required for Navy projects if soft subgrade conditions are anticipated or the design incorporates a drainage layer. Coordinate with Part 3 requirements in sub-paragraph TRAFFIC ON UNDERLYING MATERIAL.
******************************************************************************

Provide equipment for transferring concrete from the transporting equipment to the paving lane in front of the paver that is specially manufactured, self-propelled transfer equipment which accepts the concrete outside the paving lane, transfers, and spreads it evenly across the paving lane in front of the paver and strike off the surface evenly to a depth which permits the paver to operate efficiently.

2.11.5 Paver-Finisher

******************************************************************************
NOTE: The following subparagraphs apply to both fixed-form and slip-form paver-finishers. FIXED FORMS is applicable to fixed-form paver-finishers and SLIPFORM is applicable to slip-form paver-finishers.
******************************************************************************

Provide paver-finisher consisting of a heavy-duty, self-propelled machine designed specifically for paving and finishing high quality pavement, with a minimum weight of 3280 kg per m² 2200 pounds per foot of lane width, and powered by an engine having a minimum 15,000 W per m 6.0 horsepower per foot of lane width. The paver-finisher is required to spread, consolidate, and shape the plastic concrete to the desired cross section in one pass. The mechanisms for forming the pavement are required to be easily adjustable in width and thickness. In addition to other spreaders required by paragraph above, the paver-finisher equipped with a full width knock-down auger or paddle mechanism, capable of operating in both directions, which evenly spreads the fresh concrete in front of the screed or extrusion plate.
2.11.5.1 Vibrators

NOTE: Retain bracketed electronic vibrator monitoring equipment statement for airfield paving.

Provide gang mounted immersion vibrators at the front of the paver on a frame equipped with suitable controls so that all vibrators can be operated at any desired depth within the slab or completely withdrawn from the concrete, as required. Provide vibrators that are automatically controlled to immediately stop as forward motion of the paver ceases. [Equipped the paver-finisher with an electronic vibrator monitoring device displaying the operating frequency of each individual internal vibrator with a readout display visible to the paver operator that operates continuously while paving, and displays all vibrator frequencies with manual or automatic sequencing among all individual vibrators. Discontinue paving if the vibrator monitoring system fails to operate properly during the paving operation.] Provide the spacing of the immersion vibrators across the paving lane as necessary to properly consolidate the concrete, with a maximum clear distance between vibrators of 750 mm 30 inches and outside vibrators a maximum of 300 mm 12 inches from the lane edge. Determine vibrator frequency and amplitude per COE CRD-C 521.

2.11.5.2 Screed or Extrusion Plate

Equipped the paver-finisher with a transversely oscillating screed or an extrusion plate to shape, compact, and smooth the surface and finish the surface that no significant amount of hand finishing, except use of cutting straightedges, is required. Provide adjustment for variation in lane width or thickness and to prevent more than 200 mm 8 inches of the screed or extrusion plate extending over previously placed concrete on either end when paving fill-in lanes. Repair or replace machines that cause displacement of properly installed forms or cause ruts or indentations in the prepared underlying materials and machines that cause frequent delays due to mechanical failures as directed.

2.11.5.3 Longitudinal Mechanical Float

A longitudinal mechanical float may be used. If used, provide a float that is specially designed and manufactured to smooth and finish the pavement surface without working excess paste to the surface that is rigidly attached to the rear of the paver-finisher or to a separate self-propelled frame spanning the paving lane. Provide float plate at least 1.5 m 5 feet long by 200 mm 8 inches wide and automatically be oscillated in the longitudinal direction while slowly moving from edge to edge of the paving lane, with the float plate in contact with the surface at all times.

2.11.5.4 Other Types of Finishing Equipment

Clary screeds, other rotating tube floats, or bridge deck finishers are not allowed on mainline paving, but may be allowed on irregular or odd-shaped slabs, and near buildings or trench drains, subject to approval. Provide bridge deck finishers with a minimum operating weight of 3400 kg 7500 pounds that have a transversely operating carriage containing a knock-down auger and a minimum of two immersion vibrators. Only use vibrating screeds or pans for isolated slabs where hand finishing is permitted as specified, and only where specifically approved.
2.11.5.5  Fixed Forms

Provide paver-finisher equipped with wheels designed to ride the forms, keep it aligned with the forms, and spread the load so as to prevent deformation of the forms. Provide paver-finishers traveling on guide rails located outside the paving lane that are equipped with wheels when traveling on new or existing concrete to remain. Alternatively, a modified slipform paver that straddles the forms may be used. Provide a modified slipform paver which has the side conforming plates removed or rendered ineffective and travels over or along pre-placed fixed forms.

2.11.5.6  Slipform

The slipform paver-finisher is required to be automatically controlled and crawler mounted with padded tracks so as to be completely stable under all operating conditions and provide a finish to the surface and edges so that no edge slump beyond allowable tolerance occurs. Provide suitable moving side forms that are adjustable and produce smooth, even edges, perpendicular to the top surface and meeting specification requirements for alignment and freedom from edge slump.

2.11.6  Curing Equipment

Provide equipment for applying membrane-forming curing compound mounted on a self-propelled frame that spans the paving lane. Constantly agitate the curing compound reservoir mechanically (not air) during operation and provide a means for completely draining the reservoir. Provide a spraying system that consists of a mechanically powered pump which maintains constant pressure during operation, an operable pressure gauge, and either a series of spray nozzles evenly spaced across the lane to provide uniformly overlapping coverage or a single spray nozzle which is mounted on a carriage which automatically traverses the lane width at a speed correlated with the forward movement of the overall frame. Protect all spray nozzles with wind screens. Calibrate the spraying system in accordance with ASTM D2995, Method A, for the rate of application required in paragraph MEMBRANE CURING. Provide hand-operated sprayers allowed by that paragraph with compressed air supplied by a mechanical air compressor. Immediately replace curing equipment if it fails to apply an even coating of compound at the specified rate.

2.11.7  Texturing Equipment

**************************************************************************
NOTE: Designer must select type of texturing desired, retain that subparagraph, and delete the others. A genuine effort must be made to determine the type of texturing, if any, desired by the using service. If no guidance is given, the usual default method must be burlap drag. If other than a burlap drag textured finish is required, edit the appropriate paragraph(s) as shown below.

For Air Force airfield paving projects, do not specify artificial turf, wire comb, or surface grooving textures. For Navy airfield paving projects, do not specify wire comb or surface grooving textures. Use Section 32 01 18.71 GROOVING FOR AIRFIELD PAVEMENTS, to specify saw-cut grooves.

SECTION 32 13 14.13  Page 49
Spring tine grooving is limited to use on roads and streets only.

Provide texturing equipment as specified below. Before use, demonstrate the texturing equipment on a test section, and modify the equipment as necessary to produce the texture directed.

2.11.7.1 Burlap Drag

Securely attach a burlap drag to a separate wheel mounted frame spanning the paving lane or to one of the other similar pieces of equipment. Provide length of the material between 600 to 900 mm 24 to 36 inches dragging flat on the pavement surface. Provide burlap drag with a width at least equal to the width of the slab. Provide clean, reasonably new burlap material, completely saturated with water before attachment to the frame, always resaturated before start of use, and kept clean and saturated during use. Provide burlap conforming to AASHTO M 182, Class 3 or 4.

2.11.7.2 Broom

Apply surface texture using an approved mechanical stiff bristle broom drag of a type that provides a uniformly scored surface transverse to the pavement center line. Provide broom capable of traversing the full width of the pavement in a single pass at a uniform speed and with a uniform pressure that results in scores uniform in appearance and approximately 1.5 mm 1/16 inch in depth but not more than 3 mm 1/8 inch in depth.

2.11.7.3 Artificial Turf

Provide full-width artificial turf drag with the leading transverse edge securely fastened to a lightweight pole on a traveling bridge. Provide a minimum of 600 mm 2 feet of the artificial turf in contact with the concrete surface during texturing operations that results in corrugations uniform in appearance and approximately 2 mm 1/16 inch in depth. A variety of different types of artificial turf are available and approval of any one type will be done only after it has been demonstrated to provide a satisfactory texture. One type that has provided satisfactory texture consists of 7,200 approximately 0.85-inch-long polyethylene turf blades per square foot.

2.11.7.4 Deep Texturing Equipment

Provide texturing equipment that consists of [a stiff bristled broom] [a comb with spring wire tines] [spring strips which produce true, even grooves] forming a drag at least 1.2 m 4 feet long. Mount this drag in a wheeled frame spanning the paving lane and so constructed that the drag is mechanically pulled in a straight line across the paving lane perpendicular to the centerline.

2.11.8 Sawing Equipment

------------------------------------------------------------------
NOTE: Retain bracketed sentence as necessary to correlate with paragraph REMOVAL OF EXISTING
PAVEMENT SLAB in PART 3. Otherwise delete. Also delete wheel saw option on Navy projects.
------------------------------------------------------------------
Provide equipment for sawing joints and for other similar sawing of concrete consisting of standard diamond-type concrete saws mounted on a wheeled chassis which can be easily guided to follow the required alignment. Provide diamond tipped blades. If demonstrated to operate properly, abrasive blades may be used. Provide spares as required to maintain the required sawing rate. Provide wheel saws used in the removal of concrete with large diameter tungsten carbide tipped blades mounted on a heavy-duty chassis which produce a saw kerf at least 40 mm 1-1/2 inches wide. Provide saws capable of sawing to the full depth required. Early-entry saws may be used, subject to demonstration and approval. No change to the initial sawcut depth is permitted.

2.11.9 Straightedge

Provide and maintain at the job site, in good condition, a minimum 4 m 12 foot straightedge for each paving train for testing the hardened portland cement concrete surfaces. Provide straightedges constructed of aluminum or magnesium alloy and blades of box or box-girder cross section with flat bottom, adequately reinforced to insure rigidity and accuracy. Provide straightedges with handles for operation on the pavement.

2.11.10 Work Bridge

Provide a self-propelled working bridge capable of spanning the required paving lane width where workmen can efficiently and adequately reach the pavement surface.

2.12 SPECIFIED CONCRETE STRENGTH AND OTHER PROPERTIES

**************************************************************************

NOTE: Fill in blanks as appropriate. Specified strength must be the flexural strength used in the structural design of the pavement and must not exceed 650 psi 4.5 MPa at 90 days of age. Designer must also ensure that this strength is attainable with the available aggregates. For the standard coarse aggregate with the nominal maximum size of 37 mm 1.5 inches, the total air content must be specified as 6.0 percent where freezing and thawing is a concern. For a coarse aggregate with the nominal maximum size of 25 mm 1.0 inch, the total air content must be specified as 6.5 percent where freezing and thawing is a concern. Specify 4.0 percent where freezing and thawing is not a concern. Specify strength at 90 days. However, modify to 28-days in line 2 if 28-day strength is approved by TSMCX, AFCEC pavement SME, or NAVFAC as stated in paragraph FLEXURAL STRENGTH. Be sure this and succeeding paragraphs correlate.

**************************************************************************

2.12.1 Specified Flexural Strength

**************************************************************************

NOTE: Use the Tailoring Option "Beams" or "Cylinders/Beams" to specify flexural strength for concrete.

**************************************************************************
Specified flexural strength, R, for concrete is [_____] MPa psi at [28] [90] days, as determined by [tests made in accordance with ASTM C78/C78M of beams fabricated and cured in accordance with ASTM C192/C192M] [equivalent flexural strength, as specified in paragraph MIXTURE PROPORTIONING FOR FLEXURAL STRENGTH below].

2.12.2 Water-Cementitious Materials Ratio

Maximum allowable water-cementitious material ratio is 0.45. The water-cementitious material ratio is the equivalent water-cement ratio as determined by conversion from the weight ratio of water to cement plus SCM by the mass equivalency method described in ACI 211.1.

2.12.3 Air Content

Provide concrete that is air-entrained with a total air content of [4.0] [6.0] [6.5] plus or minus 1.5 percentage points, at the point of placement. Determine air content in accordance with ASTM C231/C231M.

2.12.4 Slump

The maximum allowable slump of the concrete at the point of placement is 50 mm 2 inches for pavement constructed with fixed forms. For slipformed pavement, at the start of the project, select a slump which produces in-place pavement meeting the specified tolerances for control of edge slump. The selected slump is applicable to both pilot and fill-in lanes.

2.12.5 Concrete Temperature

The temperature of the concrete as delivered is required to conform to the requirements of paragraphs PAVING IN HOT WEATHER and PAVING IN COLD WEATHER, in PART 3. Determine the temperature of concrete in accordance with ASTM C1064/C1064M.

2.12.6 Concrete Strength for Final Acceptance

**************************************************************************
NOTE: Use the Tailoring Option to specify concrete strength by using "Cylinders/Beams" or "Beams".
**************************************************************************

[The strength of the concrete will be considered acceptable when the average equivalent [90-day] [28-day] flexural strengths for each lot are above the 'Specified Flexural Strength' as determined by correlation with 14-day compressive strength tests specified in paragraph MIXTURE PROPORTIONING FOR FLEXURAL STRENGTH below,] [The strength of the concrete will be considered acceptable when the equivalent [90-day] [28-day] flexural strengths for each lot are above the 'Specified Flexural Strength' as determined by correlation with 14-day flexural strength tests specified in paragraph MIXTURE PROPORTIONING FOR FLEXURAL STRENGTH below,] and no individual set (2 specimens per sublot) in the lot are 170 kPa 25 psi or more below the equivalent 'Specified Flexural Strength'. If any lot or sublot, respectively, fails to meet the above criteria, remove and replace the lot or sublot at no additional cost to the Government. This is in addition to and does not replace the average strength required for day-to-day CQC operations as specified in paragraph AVERAGE CQC FLEXURAL STRENGTH REQUIRED FOR MIXTURES, below.
2.13 MIXTURE PROPORTIONS

**************************************************************************
NOTE: Edit bracketed items as appropriate. Normally, permit accelerating admixtures only with fast-track paving. If approval has been obtained and airfield pavement has been designed and specified for 28-day flexural strength in paragraph SPECIFIED FLEXURAL STRENGTH, modify the following subparagraphs accordingly. Do the same if this is road pavement designed for 28-day strength. Use the higher bracketed total cementitious content if a supplementary cementitious material is used.
**************************************************************************

2.13.1 Composition

Provide concrete composed of cementitious material, water, fine and coarse aggregates, and admixtures. Include supplementary Cementitious Materials (SCM) choice and usage in accordance with paragraph SUPPLEMENTARY CEMENTITIOUS MATERIALS (SCM) CONTENT. Provide a minimum total cementitious materials content of [280 kg per cubic meter 470 pounds per cubic yard] [310 kg per cubic meter 517 pounds per cubic yard]. Acceptable admixtures consist of air entraining admixture and may also include, as approved, [water-reducing admixture, ] [retarding admixture, ] [accelerating admixture, ] [water-reducing and retarding admixtures, ] [water reducing and accelerating admixtures].

2.13.2 Proportioning Studies

Perform trial design batches, mixture proportioning studies, and testing, at no expense to the Government. Submit for approval the Preliminary Proposed Proportioning to include items a., b., and i. below a minimum of 7 days prior to beginning a mixture proportioning study. Submit the results of the mixture proportioning studies signed and stamped by the registered professional engineer having technical responsibility for the mix design study, and submitted at least 30 days prior to commencing concrete placing operations. Include a statement summarizing the maximum nominal coarse aggregate size and the weights and volumes of each ingredient proportioned on a one cubic meter yard basis. Base aggregate quantities on the mass in a saturated surface dry condition. Provide test results demonstrating that the proposed mixture proportions produce concrete of the qualities indicated. Base methodology for trial mixtures having proportions, slumps, and air content suitable for the work as described in ACI 211.1, modified as necessary to accommodate flexural strength. ACI 211.1 can be supplemented with ACI 325.14R. Submit test results including:

a. Coarse and fine aggregate gradations and plots. Include historic gradation averages and standard deviations on individual sieves for each aggregate size group.
b. Combined aggregate gradation and coarseness vs. workability plots.
c. Coarse aggregate quality test results.
d. Fine aggregate quality test results.
e. Mill certificates for cement and supplemental cementitious materials.
f. Certified test results for air entraining, water reducing, retarding, non-chloride accelerating[, and Lithium Nitrate] admixtures.
g. Specified flexural strength, slump, and air content.
h. Documentation of required average CQC flexural strength, Ra.
i. Recommended proportions and volumes for proposed mixture and each of
three trial water-cementitious materials ratios.
k. Flexural [and compressive] strength summaries and plots.
l. Correlation ratios for acceptance testing and CQC testing.
m. Historical record of ACI 214R strength test results, documenting production standard deviation (if available).
n. Narrative discussing methodology on how the mix design was developed.
o. Alternative aggregate blending to be used during the test section if necessary to meet the required surface and consolidation requirements.

2.13.2.1 Water-Cementitious Materials Ratio

Perform at least three different water-cementitious materials ratios, which produce a range of strength encompassing that required on the project. The maximum allowable water-cementitious material ratio required in paragraph SPECIFIED FLEXURAL STRENGTH, above is the equivalent water-cementitious materials ratio. The maximum water-cementitious materials ratio of the approved mix design becomes the maximum water-cementitious materials ratio for the project, and in no case exceeds 0.45.

2.13.2.2 Trial Mixture Studies

Perform separate sets of trial mixture studies made for each combination of cementitious materials and each combination of admixtures proposed for use. No combination of either are to be used until proven by such studies, except that, if approved in writing and otherwise permitted by these specifications, an accelerating or retarding admixture may be used without separate trial mixture study. Perform separate trial mixture studies for each placing method (slip form, fixed form, or hand placement) proposed. Report the temperature of concrete in each trial batch. Design each mixture to promote easy and suitable concrete placement, consolidation and finishing, and to prevent segregation and excessive bleeding. Proportion laboratory trial mixtures for maximum permitted slump and air content.

2.13.2.3 Mixture Proportioning for Flexural Strength

******************************************************************************
NOTE: The first Tailoring Option, "Beams", includes items a through j; the second option "Cylinders/Beams" includes the second listing of items 1 through 10.
******************************************************************************

Follow the step by step procedure below:

[ a. Fabricate all beams for each mixture from the same batch or blend of batches. Fabricate and cure all beams in accordance with ASTM C192/C192M, using 152 x 152 mm 6 x 6 inches steel beam molds.

b. Cure test beams from each mixture for 3, 7, 14, and [28] [90]-day flexural tests; 6 beams to be tested per age.

c. Test beams in accordance with ASTM C78/C78M.

d. Using the average strength for each w/c at each age, plot all results from each of the three mixtures on separate graphs for w/c versus: 3-day flexural strength 7-day flexural strength 14-day flexural strength
e. From these graphs select a w/c that produces a mixture giving a [28] [90]-day flexural strength equal to the required strength determined in accordance with the next paragraph.

f. Using the above selected w/c, select from the graphs the expected 3, 7 and 14-day flexural strengths.

g. From the above expected strengths for the selected mixture, determine the Ratio of the 7-day flexural strength of the selected mixture to the [28] [90]-day flexural strength of the mixture (for CQC control).

h. From the above expected strengths for the selected mixture, determine the Ratio of the 14-day flexural strength of the selected mixture to the [28] [90]-day flexural strength of the mixture (for acceptance).

i. If there is a change in materials, perform additional mixture design studies using the new materials and new Correlation Ratios determined.

j. No concrete pavement placement is allowed until the mixture proportions are approved. The approved water-cementitious materials ratio is restricted to the maximum value specified in paragraph SPECIFIED FLEXURAL STRENGTH, above and not be increased without written approval.

[ a. Fabricate all beams and cylinders for each mixture from the same batch or blend of batches. Fabricate and cure all beams and cylinders in accordance with ASTM C192/C192M, using 152 x 152 mm 6 x 6 inches steel beam molds and 152 x 305 mm 6 x 12 inches single-use cylinder molds.

b. Cure test beams from each mixture for 3, 7, 14, [28] and [90]-day flexural tests; 6 beams to be tested per age.

c. Cure test cylinders from each mixture for 3, 7, 14, [28] and [90]-day compressive strength tests; 6 cylinders to be tested per age.

d. Test beams in accordance with ASTM C78/C78M, cylinders in accordance with ASTM C39/C39M.

e. Using the average strength for each w/c at each age, plot all results from each of the three mixtures on separate graphs for w/c versus:
   3-day flexural strength
   7-day flexural strength
   14-day flexural strength
   [28-day flexural strength]
   [90-day flexural strength]
   3-day compressive strength
   7-day compressive strength
   14-day compressive strength
   [28-day compressive strength]
   [90-day compressive strength]

f. From these graphs select a w/c that produces a mixture giving a [28] [90]-day flexural strength equal to the required strength determined in accordance with the next paragraph.

g. Using the above selected w/c, select from the graphs the expected 3, 7,
14, [28] [90]-day flexural strengths and the expected 3, 7, 14, [28] [90]-day compressive strengths for the mixture.

h. From the above expected strengths for the selected mixture determine the following Correlation Ratios:

(1) Ratio of the 14-day compressive strength of the selected mixture to the [28] [90]-day flexural strength of the mixture (for acceptance).

(2) Ratio of the 7-day compressive strength of the selected mixture to the [28] [90]-day flexural strength of the mixture (for CQC control).

i. If there is a change in materials, perform additional mixture design studies using the new materials and new Correlation Ratios determined.

j. No concrete pavement placement is allowed until the mixture proportions are approved. The approved water-cementitious materials ratio is restricted to the maximum value specified in the next paragraph and not be increased without written approval.

2.13.3 Average CQC Flexural Strength Required for Mixtures

In order to ensure meeting the strength requirements specified in paragraph SPECIFIED CONCRETE STRENGTH AND OTHER PROPERTIES above, during production, the mixture proportions selected during mixture proportioning studies and used during construction requires an average CQC flexural strength exceeding the specified strength, R, by the amount indicated below. This required average CQC flexural strength, Ra, is used only for CQC operations as specified in paragraph TESTING AND INSPECTION FOR CONTRACTOR QUALITY CONTROL DURING CONSTRUCTION in PART 3 and as specified in the previous paragraph. During production, adjust the required Ra, as appropriate and as approved, based on the standard deviation of [equivalent [28] [90]] average [28] [90]-day strengths being attained during paving.

2.13.3.1 From Previous Test Records

Where a concrete production facility has previous test records current to within 18 months, establish a standard deviation in accordance with the applicable provisions of ACI 214R. Include test records from which a standard deviation is calculated that represent materials, quality control procedures, and conditions similar to those expected, that represent concrete produced to meet a specified flexural strength or strengths within 1 MPa 150 psi of the [28] [90]-day flexural strength specified for the proposed work, and that consist of at least 30 consecutive tests. Perform verification testing to document the current strength. A strength test is the average of the strengths of two specimens made from the same sample of concrete and tested at [28] [90] days. Required average CQC flexural strength, Ra, used as the basis for selection of concrete proportions is the value from the equation that follows, using the standard deviation as determined above:

\[
Ra = R + 1.34S 
\]

Where:  
\( S \) = standard deviation  
\( R \) = specified flexural strength  
\( Ra \) = required average flexural strength
Where a concrete production facility does not have test records meeting the requirements above but does have a record based on 15 to 29 consecutive tests, establish a standard deviation as the product of the calculated standard deviation and a modification factor from the following table:

<table>
<thead>
<tr>
<th>NUMBER OF TESTS</th>
<th>MODIFICATION FACTOR FOR STANDARD DEVIATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>1.16</td>
</tr>
<tr>
<td>20</td>
<td>1.08</td>
</tr>
<tr>
<td>25</td>
<td>1.03</td>
</tr>
<tr>
<td>30 or more</td>
<td>1.00</td>
</tr>
</tbody>
</table>

2.13.3.2 Without Previous Test Records

When a concrete production facility does not have sufficient field strength test records for calculation of the standard deviation, determine the required average strength, \( Ra \), by adding 15 percent to the specified flexural strength, \( R \).

PART 3 EXECUTION

3.1 PREPARATION FOR PAVING

Before commencing paving, perform the following. If used, place cleaned, coated, and adequately supported forms. Have any reinforcing steel needed at the paving site; all transporting and transfer equipment ready for use, clean, and free of hardened concrete and foreign material; equipment for spreading, consolidating, screeding, finishing, and texturing concrete at the paving site, clean and in proper working order; and all equipment and material for curing and for protecting concrete from weather or mechanical damage at the paving site, in proper working condition, and in sufficient amount for the entire placement.

3.1.1 Weather Precaution

When windy conditions during paving appear probable, have equipment and material at the paving site to provide windbreaks, shading, fogging, or other action to prevent plastic shrinkage cracking or other damaging drying of the concrete.

3.1.2 Proposed Techniques

**************************************************************************
NOTE: Include joint layout and typical detail of joint/dowel bar spacing in drawings and coordinate with paragraph PLACING DOWELS AND TIE BARS. Insert office title for approval of joint plan changes.
**************************************************************************

Submit placing and protection methods; paving sequence; jointing pattern; data on curing equipment and profilographs; demolition of existing pavements, as specified; pavement diamond grinding equipment and procedures. Submit for approval the following items:
a. A description of the placing and protection methods proposed when concrete is to be placed in or exposed to hot, cold, or rainy weather conditions.

b. A detailed paving sequence plan and proposed paving pattern showing all planned construction joints; transverse and longitudinal dowel bar spacing; and identifying pilot lanes and hand placement areas. Deviations from the jointing pattern shown on the drawings are not allowed without written approval of the [design engineer] [______].

c. Plan and equipment proposed to control alignment of sawn joints within the specified tolerances.

d. Data on the curing equipment, media and methods to be used.

e. Data on profilograph and methods to measure pavement smoothness.

f. Pavement demolition work plan, presenting the proposed methods and equipment to remove existing pavement and protect pavement to remain in place.

3.2 CONDITIONING OF UNDERLYING MATERIAL

3.2.1 General Procedures

Verify the underlying material, upon which concrete is to be placed is clean, damp, and free from debris, waste concrete or cement, frost, ice, and standing or running water. Prior to setting forms or placement of concrete, verify the underlying material is well drained and have been satisfactorily graded by string-line controlled, automated, trimming machine and uniformly compacted in accordance with the applicable Section of these specifications. Test the surface of the underlying material to crown, elevation, and density in advance of setting forms or of concrete placement using slip-form techniques. Trim high areas to proper elevation. Fill and compact low areas to a condition similar to that of surrounding grade, or filled with concrete monolithically with the pavement. Low areas filled with concrete are not to be cored for thickness to avoid biasing the average thickness used for evaluation and payment adjustment. Rework and compact any underlying material disturbed by construction operations to specified density immediately in front of the paver. If a slipform paver is used, continue the same underlying material under the paving lane beyond the edge of the lane a sufficient distance that is thoroughly compacted and true to grade to provide a suitable trackline for the slipform paver and firm support for the edge of the paving lane.

3.2.2 Traffic on Underlying Material

**************************************************************************
NOTE: Transporting equipment must not be allowed to operate on the prepared underlying material for airfield paving. Operating hauling equipment in the paving lane will cause the paver to stop frequently, producing a discontinuity in the pavement surface. Edit bracketed items as appropriate and coordinate with Part 2, subparagraph TRANSFER AND SPREADING EQUIPMENT.
**************************************************************************
After the underlying material has been prepared for concrete placement, equipment is not permitted thereon with exception of the paver. Subject to specific approval, crossing of the prepared underlying material at specified intervals for construction purposes may be permitted, provided rutting or indentations do not occur. Rework and repair the surface before concrete is placed. [Transporting equipment is not to be allowed to operate on the prepared and compacted underlying material in front of the paver-finisher.] [Equipment may be allowed to operate on the underlying material only if approved and only if no damage is done to the underlying material and its degree of compaction. Correct any disturbance to the underlying material that occurs, as approved, before the paver-finisher or the deposited concrete reaches the location of the disturbance and replace the equipment or change procedures to prevent any future damage.]

3.3 WEATHER LIMITATIONS

3.3.1 Placement and Protection During Inclement Weather

Do not commence placing operations when heavy rain or other damaging weather conditions appear imminent. At all times when placing concrete, maintain on-site sufficient waterproof cover and means to rapidly place it over all unhardened concrete or concrete that might be damaged by rain. Suspend placement of concrete whenever rain, high winds, or other damaging weather commences to damage the surface or texture of the placed unhardened concrete, washes cement out of the concrete, or changes the water content of the surface concrete. Immediately cover and protect all unhardened concrete from the rain or other damaging weather.

Remove and replace any slab damaged by rain or other weather full depth, by full slab width, to the nearest original joint as specified in paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS below, at no expense to the Government. Rain damaged pavement is pavement with coarse aggregate exposed at the surface. Cores evaluated by a qualified petrographer to contain carbonation to a depth greater than 3 mm 1/8 inch or Mohs hardness of less than 2 are also considered rain damaged.

3.3.2 Paving in Hot Weather

**************************************************************************
NOTE: Additional information concerning hot weather concreting may be obtained from ACI 305R. Do not delete this paragraph or the next paragraphs dealing with weather.
**************************************************************************

When the ambient temperature during paving is expected to exceed 32 degrees C 90 degrees F, properly place and finish the concrete in accordance with procedures previously submitted, approved, and as specified herein. Provide concrete that does not exceed the temperature shown in the table below when measured in accordance with ASTM C1064/C1064M at the time of delivery. Cooling of the mixing water or aggregates or placing in the cooler part of the day may be required to obtain an adequate placing temperature. Cool steel forms and reinforcing as needed to maintain steel temperatures below 49 degrees C 120 degrees F. Cool or protect transporting and placing equipment if necessary to maintain proper concrete placing temperature. Keep the finished surfaces of the newly laid pavement damp by applying a fog spray (mist) with approved spraying equipment until the pavement is covered by the curing medium.
### Maximum Allowable Concrete Placing Temperature

<table>
<thead>
<tr>
<th>Relative Humidity, Percent, During Time of Concrete Placement</th>
<th>Maximum Allowable Concrete Temperature in Degrees C F</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than 60</td>
<td>3290</td>
</tr>
<tr>
<td>40-60</td>
<td>3085</td>
</tr>
<tr>
<td>Less than 40</td>
<td>2780</td>
</tr>
</tbody>
</table>

### 3.3.3 Prevention of Plastic Shrinkage Cracking

During weather with low humidity, and particularly with high temperature and appreciable wind, develop and institute measures to prevent plastic shrinkage cracks from developing. If plastic shrinkage cracking occurs, halt further placement of concrete until protective measures are in place to prevent further cracking. Periods of high potential for plastic shrinkage cracking can be anticipated by use of ACI 305R. In addition to the protective measures specified in the previous paragraph, the concrete placement may be further protected by erecting shades and windbreaks and by applying fog sprays of water, the addition of monomolecular films, or wet covering. Apply monomolecular films after finishing is complete, do not use in the finishing process. Immediately commence curing procedures when such water treatment is stopped. Repair plastic shrinkage cracks in accordance with paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS. Never trowel over or fill plastic shrinkage cracks with slurry.

### 3.3.4 Paving in Cold Weather

Cold weather paving is required to conform to ACI 306R. Use special protection measures, as specified herein, if freezing temperatures are anticipated or occur before the expiration of the specified curing period. Do not begin placement of concrete unless the ambient temperature is at least 2 degrees C 35 degrees F and rising. Thereafter, halt placement of concrete whenever the ambient temperature drops below 5 degrees C 40 degrees F. When the ambient temperature is less than 10 degrees C 50 degrees F, the temperature of the concrete when placed is required to be not less than 10 degrees C 50 degrees F nor more than 25 degrees C 75 degrees F. Provide heating of the mixing water or aggregates as required to regulate the concrete placing temperature. Materials entering the mixer are required to be free from ice, snow, or frozen lumps. Do not incorporate salt, chemicals or other materials in the concrete to prevent freezing. [If allowed under paragraph MIXTURE PROPORTIONS in PART 2, an accelerating admixture may be used when the ambient temperature is below 10 degrees C 50 degrees F.] Provide covering and other means for maintaining the concrete at a temperature of at least 10 degrees C 50 degrees F for not less than 72 hours after placing, and at a temperature above freezing for the remainder of the curing period. Remove pavement slabs, full depth by full width, damaged by freezing or falling below freezing temperature to the nearest planned joint, and replace as specified in paragraph REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS, at no expense to the Government.
3.4  CONCRETE PRODUCTION

Provide batching, mixing, and transporting equipment with a capacity sufficient to maintain a continuous, uniform forward movement of the paver of not less than 0.8 m (2.5 feet) per minute. Deposit concrete transported in non-agitating equipment in front of the paver within 45 minutes from the time cement has been charged into the mixing drum, except that if the ambient temperature is above 32 degrees C (90 degrees F), the time is reduced to 30 minutes. Deposit concrete transported in truck mixers in front of the paver within 90 minutes from the time cement has been charged into the mixer drum of the plant or truck mixer. If the ambient temperature is above 32 degrees C (90 degrees F), the time is reduced to 60 minutes. Accompany every load of concrete delivered to the paving site with a batch ticket from the operator of the batching plant. Provide batch ticket information required by ASTM C94/C94M on approved forms. In addition provide design quantities in mass or volume for all materials, batching tolerances of all materials, and design and actual water cementitious materials ratio on each batch delivered, [the water meter and revolution meter reading on truck mixers] and the time of day. Provide batch tickets for each truck delivered as part of the lot acceptance package to the placing foreman to maintain on file and deliver them to the Government weekly.

3.4.1  Batching and Mixing Concrete

Maintain scale pivots and bearings clean and free of rust. Remove any equipment which fails to perform as specified immediately from use until properly repaired and adjusted, or replaced.

3.4.2  Transporting and Transfer - Spreading Operations

Operate non-agitating equipment only on smooth roads and for haul time less than 15 minutes. Deposit concrete as close as possible to its final position in the paving lane. Operate all equipment to discharge and transfer concrete without segregation. Dumping of concrete in discrete piles is not permitted. No transfer or spreading operation which requires the use of front-end loaders, dozers, or similar equipment to distribute the concrete are permitted.

3.5  PAVING

Construct pavement with paving and finishing equipment utilizing rigid fixed forms or by use of slipform paving equipment. Provide paving and finishing equipment and procedures capable of constructing paving lanes of the required width at a rate of at least 0.8 m (2.5 feet) of paving lane per minute on a routine basis. Control paving equipment and its operation, and coordinated with all other operations, such that the paver-finisher has a
continuous forward movement at a reasonably uniform speed from beginning to end of each paving lane, except for inadvertent equipment breakdown. Backing the paver and refinishing a lane is not permitted. Remove and replace concrete refinished in this manner. Failure to achieve a continuous forward motion requires halting operations, regrouping, and modifying operations to achieve this requirement. Personnel are not permitted to walk or operate in the plastic concrete at any time. Where an open-graded granular base is required under the concrete, select paving equipment and procedures which operate properly on the base course without causing displacement or other damage.

3.5.2 Consolidation

Consolidate concrete with the specified type of lane-spanning, gang-mounted, mechanical, immersion type vibrating equipment mounted in front of the paver, supplemented, in rare instances as specified, by hand-operated vibrators. Insert vibrators into the concrete to a depth that provides the best full-depth consolidation but not closer to the underlying material than 50 mm 2 inches. Excessive vibration is not permitted. Discontinue paving operations if vibrators cause visible tracking in the paving lane, until equipment and operations have been modified to prevent it. Vibrate concrete in small, odd-shaped slabs or in isolated locations inaccessible to the gang-mounted vibration equipment with an approved hand-operated immersion vibrator operated from a bridge spanning the area. Do not use vibrators to transport or spread the concrete. Do not operate hand-operated vibrators in the concrete at one location for more than 20 seconds. Insert hand-operated vibrators between 150 to 400 mm 6 to 15 inches on centers. For each paving train, provide at least one additional vibrator spud, or sufficient parts for rapid replacement and repair of vibrators at the paving site at all times. Any evidence of inadequate consolidation (honeycomb along the edges, large air pockets, or any other evidence) requires the immediate stopping of the paving operation and approved adjustment of the equipment or procedures.

3.5.3 Operation

When the paver approaches a header at the end of a paving lane, maintain a sufficient amount of concrete ahead of the paver to provide a roll of concrete which spills over the header. Provide a sufficient amount of extra concrete to prevent any slurry that is formed and carried along ahead of the paver from being deposited adjacent to the header. Maintain the spud vibrators in front of the paver at the desired depth as close to the header as possible before they are lifted. Provide additional consolidation adjacent to the headers by hand-manipulated vibrators. When the paver is operated between or adjacent to previously constructed pavement (fill-in lanes), provide provisions to prevent damage to the previously constructed pavement. Electronically control screeds or extrusion plates from the previously placed pavement so as to prevent them from applying pressure to the existing pavement and to prevent abrasion of the pavement surface. Maintain the overlapping area of existing pavement surface completely free of any loose or bonded foreign material as the paver-finisher operates across it. When the paver travels on existing pavement, maintain approved provisions to prevent damage to the existing pavement. Pavers using transversely oscillating screeds are not allowed to form fill-in lanes that have widths less than a full width for which the paver was designed or adjusted.
3.5.4 Required Results

Adjust and operate the paver-finisher, its gang-mounted vibrators and operating procedures coordinated with the concrete mixture being used, to produce a thoroughly consolidated slab throughout that is true to line and grade within specified tolerances. Provide a paver-finishing operation that produces a surface finish free of irregularities, tears, voids of any kind, and any other discontinuities in a single pass across the pavement; multiple passes are not permitted. Provide equipment and its operation that produce a finished surface requiring no hand finishing other than the use of cutting straightedges, except in very infrequent instances. Stop paving if any equipment or operation fails to produce the above results. Prior to recommencing paving, properly adjust or replace the equipment, modify the operation, or modify the mixture proportions, in order to produce the required results. No water, other than fog sprays (mist) as specified in paragraph PREVENTION OF PLASTIC SHRINKAGE CRACKING above, is allowed to be applied to the concrete or the concrete surface during paving and finishing.

3.5.5 Fixed Form Paving

**************************************************************************
NOTE: Fixed-form paving should always be included as an option or mandatory item as appropriate. Edit bracketed items in subparagraph a. Keys are only permitted for roads and streets with a thickness of 230 mm 9 inches or greater. Do not permit keys for airfield pavements.
**************************************************************************

Provide paving equipment for fixed-form paving and the operation that conforms to the requirements of paragraph EQUIPMENT, and all requirements specified herein.

3.5.5.1 Forms for Fixed-Form Paving

**************************************************************************
NOTE: Delete subparagraph e. when overlay pavements are not required.
**************************************************************************

a. Provide straight forms made of steel and in sections not less than 3 m 10 feet in length that are clean and free of rust or other contaminants. Seal any holes or perforations in forms prior to paving unless otherwise permitted. Maintain forms in place and passable by all equipment necessary to complete the entire paving operation without need to remove horizontal form supports. Provide flexible or curved forms of proper radius for curves of 31 m 100-foot radius or less. Provide wood forms for curves and fillets made of well-seasoned, surfaced plank or plywood, straight, and free from warp or bend that have adequate strength and are rigidly braced. Provide forms with a depth equal to the pavement thickness at the edge. Where the project requires several different slab thicknesses, forms may be built up by bolting or welding a tubular metal section or by bolting wood planks to the bottom of the form to completely cover the underside of the base of the form and provide an increase in depth of not more than 25 percent. Provide forms with the base width of the one-piece or built-up form not less than eight-tenths of the vertical height of the form, except provide forms 200 mm 8 inches or less in vertical height with a base
width not less than the vertical height of the form. Provide forms with maximum vertical deviation of top of any side form, including joints, not varying from a true plane more than 3 mm 1/8 inch in 3 m 10 feet, and the upstanding leg not varying more than 6 mm 1/4 inch.

[Where keyway forms are required, rigidly attach the keyway form to the main form so no displacement can take place. Tack-weld metal keyway forms to steel forms. Align keyway forms so that there is no variation over 6 mm 1/4 inch either vertically or horizontally, when tested with a 4 m 12 foot template after forms are set, including tests across form joints.]

b. Provide form sections that are tightly locked and free from play or movement in any direction. Provide forms with adequate devices for secure settings so that when in place they withstand, without visible spring or settlement, the impact and vibration of the consolidating and finishing equipment.

c. Set forms for full bearing on foundation for entire length and width and in alignment with edge of finished pavement. Support forms during entire operation of placing, compaction, and finishing so that forms do not deviate vertically more than 3 mm 0.01 foot from required grade and elevations indicated. Check conformity to the alignment and grade elevations shown on the drawings and make necessary corrections immediately prior to placing the concrete. Clean and oil the forms each time before concrete is placed. Concrete placement is not allowed until setting of forms has been checked and approved by the CQC team.

d. Do not anchor guide rails for fixed form pavers into new concrete or existing concrete to remain.

[ e. Securely hold forms for overlay pavements and for other locations where forms set on existing pavements in place with stakes or by other approved methods. Carefully drill holes in existing pavements for form stakes by methods which do not crack or spall the existing pavement. After use, fill the holes flush with the surrounding surface using approved material, prior to overlying materials being placed. Immediately discontinue any method which does not hold the form securely or which damages the existing pavement. Prior to setting forms for paving operations, demonstrate the proposed form setting procedures at an approved location without proceeding further until the proposed method is approved.]

3.5.5.2 Form Removal

Keep forms in place at least 12 hours after the concrete has been placed. When conditions are such that the early strength gain of the concrete is delayed, leave the forms in place for a longer time, as directed. Remove forms by procedures that do not damage the concrete. Do not use bars or heavy metal tools directly against the concrete in removing the forms. Promptly repair any concrete found to be defective after form removal, using procedures specified or as directed.

3.5.6 Slipform Paving

**************************************************************************

NOTE: Retain slipform paving as an option unless there are specific, valid reasons for deleting it. Be sure all other paragraphs correlate with choice made here.

SECTION 32 13 14.13  Page 64
3.5.6.1 General

Provide paving equipment for slipform paving and the operation thereof that conforms to the requirement of paragraph EQUIPMENT, and all requirements specified herein. Provide a slipform paver capable of shaping the concrete to the specified and indicated cross section, meeting all tolerances, with a surface finish and edges that require only a very minimum isolated amount of hand finishing, in one pass. If the paving operation does not meet the above requirements and the specified tolerances, immediately stop the operation, and regroup and replace or modify any equipment as necessary, modify paving procedures or modify the concrete mix, in order to resolve the problem. Provide a slipform paver that is automatically electronically controlled from a taut wire guideline for horizontal alignment and on both sides from a taut wire guideline for vertical alignment, except that electronic control from a ski operating on a previously constructed adjoining lane is required where applicable for either or both sides. Automatic, electronic controls are required for vertical alignment on both sides of the lane. Control from a slope-adjustment control or control operating from the underlying material is not allowed. Properly adjust side forms on slipform pavers so that the finished edge of the paving lane meets all specified tolerances. Install dowels in longitudinal construction joints as specified below. The installation of these dowels by dowel inserters attached to the paver or by any other means of inserting the dowels into the plastic concrete is not permitted. [If a keyway is required, install a 0.45 to 0.55 mm 26 gauge thick metal keyway liner as the keyway is extruded. Provide keyway forms that do not vary more than plus or minus 3 mm 1/8 inch from the dimensions indicated and do not deviate more than plus or minus 6 mm 1/4 inch from the mid-depth of the pavement. An abrupt offset either horizontally or vertically in the completed keyway is not allowed. Maintain the keyway liner to remain in place and become part of the joint.]

3.5.6.2 Guideline for Slipform Paving

Accurately and securely install guidelines well in advance of concrete placement. Provide supports at necessary intervals to eliminate all sag in the guideline when properly tightened. Provide guideline consisting of high strength wire set with sufficient tension to remove all sag between supports. Provide supports that are securely staked to the underlying material or other provisions made to ensure that the supports are not displaced when the guideline is tightened or when the guideline or supports are accidentally touched by workmen or equipment during construction. Provide appliances for attaching the guideline to the supports that are capable of easy adjustment in both the horizontal and vertical directions. When it is necessary to leave gaps in the guideline to permit equipment to use or cross underlying material, provide provisions for quickly and accurately replacing the guideline without any delay to the forward progress of the paver. Provide supports on either side of the gap that are secured in such a manner as to avoid disturbing the remainder of the guideline when the portion across the gap is positioned and tightened. Check the guideline across the gap and adjacent to the gap for a distance of 60 m 200 feet for horizontal and vertical alignment after the guideline across the gap is tightened. Provide vertical and horizontal positioning of the guideline such that the finished pavement conforms to the alignment and grade elevations shown on the drawings within the specified tolerances for grade and smoothness. The specified tolerances are intended to cover only the normal deviations in the finished pavement that may occur under
good supervision and do not apply to setting of the guideline. Set the guideline true to line and grade.

3.5.6.3 Stringless Technology

If the use of any type of stringless technology is proposed, submit a detailed description of the system and perform a trial field demonstration at least one week prior to start of paving. Approval of the control system will be based on the results of the demonstration and on continuing satisfactory operation during paving.

3.5.7 Placing Reinforcing Steel

**************************************************************************
NOTE: Delete bracketed item if CRCP is not being constructed.
**************************************************************************

Provide the type and amount of steel reinforcement indicated.

3.5.7.1 Pavement Thickness Greater Than 300 mm 12 inches

For pavement thickness of 300 mm 12 inches or more, install the reinforcement steel by the strike-off method wherein a layer of concrete is deposited on the underlying material, consolidated, and struck to the indicated elevation of the steel reinforcement. Place the reinforcement upon the pre-struck surface, followed by placement of the remaining concrete and finishing in the required manner. When placement of the second lift causes the steel to be displaced horizontally from its original position, provide provisions for increasing the thickness of the first lift and depressing the reinforcement into the unhardened concrete to the required elevation. Limit the increase in thickness only as necessary to permit correct horizontal alignment to be maintained. Remove and replace any portions of the bottom layer of concrete that have been placed more than 30 minutes without being covered with the top layer with newly mixed concrete without additional cost to the Government.

3.5.7.2 Pavement Thickness Less Than 300 mm 12 Inches

For pavements less than 300 mm 12 inches thick, position the reinforcement on suitable chairs or continuous mesh support devices securely fastened to the subgrade prior to concrete placement. Consolidate concrete after the steel has been placed. Regardless of placement procedure, provide reinforcing steel free from coatings which could impair bond between the steel and concrete, with reinforcement laps as indicated. Regardless of the equipment or procedures used for installing reinforcement, ensure that the entire depth of concrete is adequately consolidated. [If reinforcing for Continuously Reinforced Concrete Pavement (CRCP) is required, submit the entire operating procedure and equipment proposed for approval at least 30 days prior to proposed start of paving.]

3.5.8 Placing Dowels[ and Tie Bars]

**************************************************************************
NOTE: Delete references to slipform paving
installation of dowels and tie bars if slipform paving is not allowed. Delete references to installation in contraction joints if not required.
Delete bracketed references to tie bars, if tie bars
**************************************************************************
UFGS

are not used. Tie bars are not permitted in airfield pavements. Use tie bars only for roads and streets projects.

**************************************************************************

Ensure the method used to install and hold dowels in position result in dowel alignment within the maximum allowed horizontal and vertical tolerance of 3 mm per 300 mm 1/8 inch per foot after the pavement has been completed. Except as otherwise specified below, maintain the horizontal spacing of dowels within a tolerance of plus or minus 15 mm 5/8 inch. Locate the dowel vertically on the face of the slab within a tolerance of plus or minus 13 mm 1/2 inch. Measure the vertical alignment of the dowels parallel to the designated top surface of the pavement, except for those across the crown or other grade change joints. Measure dowels across crowns and other joints at grade changes to a level surface. Check horizontal alignment perpendicular to the joint edge with a framing square. Do not place longitudinal dowels [and tie bars ] closer than 0.6 times the dowel bar [tie bar ] length to the planned joint line. If the last regularly spaced longitudinal dowel [tie bar ] is closer than that dimension, move it away from the joint to a location 0.6 times the dowel bar [tie bar ] length, but not closer than 150 mm 6 inches to its nearest neighbor. Resolve dowel (tie bar) interference at a transverse joint-longitudinal joint intersection by deleting the closest transverse dowel (tie bar). Do not position the end of a transverse dowel closer than 300 mm 12 inches from the end of the nearest longitudinal dowel. Install dowels as specified in the following subparagraphs.

3.5.8.1 Contraction Joints

Securely hold dowels [and tie bars ] in longitudinal and transverse contraction joints within the paving lane in place, as indicated, by means of rigid metal frames or basket assemblies of an approved type. Securely hold the basket assemblies in the proper location by means of suitable pins or anchors. Do not cut or crimp the dowel basket tie wires.

3.5.8.2 Construction Joints-Fixed Form Paving

Install dowels [and tie bars ] by the bonded-in-place method or the drill-and-dowel method. Installation by removing and replacing in preformed holes is not permitted. Prepare and place dowels [and tie bars] across joints where indicated, correctly aligned, and securely held in the proper horizontal and vertical position during placing and finishing operations, by means of devices fastened to the forms. Provide the spacing of dowels [and tie bars] in construction joints as indicated, except that, where the planned spacing cannot be maintained because of form length or interference with form braces, provide closer spacing with additional dowels [or tie bars].

3.5.8.3 Dowels Installed in Hardened Concrete

**************************************************************************

NOTE: The first Tailoring Option is for "Cylinders/Beams" and the second option is for "Beams".

**************************************************************************

Install dowels in hardened concrete by bonding the dowels into holes drilled into the hardened concrete. Before drilling commences, cure the concrete for 7 days or until it has reached a minimum [compressive strength
of 17 MPa 2500 psi][ flexural strength of 3.1 MPa 450 psi]. Drill holes 3
mm 1/8 inch greater in diameter than the dowels into the hardened concrete
using rotary-core drills. Rotary-percussion drills are permitted, provided
that excessive spalling does not occur to the concrete joint face.
Excessive spalling is defined as spalling deeper than 6 mm 1/4 inch from
the joint face or 12 mm 1/2 inch radially from the outside of the drilled
hole. Continuing damage requires modification of the equipment and
operation. Drill depth of dowel hole within a tolerance of plus or minus
13 mm 1/2 inch of the dimension shown on the drawings. Upon completion of
the drilling operation, blow out the dowel hole with oil-free, compressed
air. Bond dowels in the drilled holes using epoxy resin. Inject epoxy
resin at the back of the hole before installing the dowel and extruded to
the collar during insertion of the dowel so as to completely fill the void
around the dowel. Application by buttering the dowel is not permitted.
Hold the dowels in alignment at the collar of the hole, after insertion and
before the grout hardens, by means of a suitable metal or plastic grout
retention ring fitted around the dowel. Provide dowels required between
new and existing concrete in holes drilled in the existing concrete, all as
specified above. [Where tie bars are required in longitudinal construction
joints of slipform pavement, install bent tie bars at the paver, in front
of the transverse screed or extrusion plate. Do not install tie bars in
preformed holes. Construct a standard keyway, with the bent tie bars
inserted into the plastic concrete through a 0.45 to 0.55 mm 26 gauge thick
metal keyway liner. Protect and maintain the keyway liner to remain in
place and become part of the joint. When bending tie bars, provide the
radius of bend not be less than the minimum recommended for the particular
grade of steel in the appropriate material standard. Before placement of
the adjoining paving lane, straighten the tie bars using procedures which
do not spall the concrete around the bar.]

3.5.8.4 Lubricating Dowel Bars

Wipe the portion of each dowel intended to move within the concrete clean
and coat with a thin, even film of lubricating oil or light grease before
the concrete is placed.

3.6 FINISHING

******************************************************************************
NOTE: Edit bracketed items as appropriate. Retain
slipform paving subparagraph except when it is
prohibited elsewhere. Delete Other Types of
Finishing Equipment here and in PART 2, if not
wanted. Hand finishing is to be allowed only for
isolated, small, odd-shaped slabs or places
inaccessible to the paver.
******************************************************************************

Provide finishing operations as a continuing part of placing operations
starting immediately behind the strike-off of the paver. Provide initial
finishing by the transverse screed or extrusion plate. Provide the
sequence of operations consisting of transverse finishing, longitudinal
machine floating if used, straightedge finishing, texturing, and then
edging of joints. Provide finishing by the machine method. Provide a work
bridge as necessary for consolidation and hand finishing operations. Use
the hand method only on isolated areas of odd slab widths or shapes and in
the event of a breakdown of the mechanical finishing equipment. Keep
supplemental hand finishing for machine finished pavement to an absolute
minimum. Immediately stop any machine finishing operation which requires
appreciable hand finishing, other than a moderate amount of straightedge finishing. Prior to recommencing machine finishing, properly adjust or replace the equipment. Immediately halt any operations which produce more than 3 mm 1/8 inch of mortar-rich surface (defined as deficient in plus 4.75 mm U.S. No. 4 sieve size aggregate) and the equipment, mixture, or procedures modified as necessary. Compensate for surging behind the screeds or extrusion plate and settlement during hardening and take care to ensure that paving and finishing machines are properly adjusted so that the finished surface of the concrete (not just the cutting edges of the screeds) is at the required line and grade. Maintain finishing equipment and tools clean and in an approved condition. Water is not allowed to be added to the surface of the slab with the finishing equipment or tools, or in any other way, except for fog (mist) sprays specified to prevent plastic shrinkage cracking.

3.6.1 Machine Finishing With Fixed Forms

Replace machines that cause displacement of the forms. Only one pass of the finishing machine is allowed over each area of pavement. If the equipment and procedures do not produce a surface of uniform texture, true to grade, in one pass, immediately stop the operation and the equipment, mixture, and procedures adjusted as necessary.

3.6.2 Machine Finishing with Slipform Pavers

Operate the slipform paver so that only a very minimum of additional finishing work is required to produce pavement surfaces and edges meeting the specified tolerances. Immediately modify or replace any equipment or procedure that fails to meet these specified requirements as necessary. A self-propelled non-rotating pipe float may be used while the concrete is still plastic, to remove minor irregularities and score marks. Only one pass of the pipe float is allowed. If there is concrete slurry or fluid paste on the surface that runs over the edge of the pavement, immediately stop the paving operation and the equipment, mixture, or operation modified to prevent formation of such slurry. Immediately remove any slurry which does run down the vertical edges by hand, using stiff brushes or scrapers. Slurry, concrete or concrete mortar is not allowed to build up along the edges of the pavement to compensate for excessive edge slump, either while the concrete is plastic or after it hardens.

3.6.3 Surface Correction and Testing

After all other finishing is completed but while the concrete is still plastic, eliminate minor irregularities and score marks in the pavement surface by means of cutting straightedges. Provide cutting straightedges with a minimum length of 4 m 12 feet that are operated from the sides of the pavement or from bridges. Provide cutting straightedges operated from the side of the pavement equipped with a handle 1 m 3 feet longer than one-half the width of the pavement. Test the surface for trueness with a straightedge held in successive positions parallel and at right angles to the center line of the pavement, and the whole area covered as necessary to detect variations. Advance the straightedge along the pavement in successive stages of not more than one-half the length of the straightedge. Immediately fill depressions with freshly mixed concrete, strike off, consolidate with an internal vibrator, and refinish. Strike off projections above the required elevation and refinish. Continue the straightedge testing and finishing until the entire surface of the concrete is free from observable departure from the straightedge and conforms to the surface requirements specified in paragraph SURFACE SMOOTHNESS. This
straightedging is not allowed to be used as a replacement for the straightedge testing of paragraph SURFACE SMOOTHNESS in PART 1. Use long-handled, flat bull floats very sparingly and only as necessary to correct minor, scattered surface defects. If frequent use of bull floats is necessary, stop the paving operation and the equipment, mixture or procedures adjusted to eliminate the surface defects. Keep finishing with hand floats and trowels to the absolute minimum necessary. Take extreme care to prevent over finishing joints and edges. Produce the surface finish of the pavement essentially by the finishing machine and not by subsequent hand finishing operations. All hand finishing operations are subject to approval.

3.6.4 Hand Finishing

Use hand finishing operations only as specified below. Provide a work bridge to be used as necessary for consolidation and placement operations to avoid standing in concrete.

3.6.4.1 Equipment and Template

In addition to approved mechanical internal vibrators for consolidating the concrete, provide a strike-off and tamping template and a longitudinal float for hand finishing. Provide a template at least 300 mm 1 foot longer than the width of pavement being finished, of an approved design, and sufficiently rigid to retain its shape, that is constructed of metal or other suitable material shod with metal. Provide a longitudinal float at least 3 m 10 feet long, of approved design, is rigid and substantially braced, and maintain a plane surface on the bottom. Grate tampers (jitterbugs) are not allowed.

3.6.4.2 Finishing and Floating

As soon as placed and vibrated, strike off the concrete and screeded to the cross section and to such elevation above grade that when consolidated and finished, the surface of the pavement is at the required elevation. In addition to previously specified complete coverage with handheld immersion vibrators, tamp the entire surface with the strike-off and tamping template, and the tamping operation continued until the required compaction and reduction of internal and surface voids are accomplished. Immediately following the final tamping of the surface, float the pavement longitudinally from bridges resting on the side forms and spanning but not touching the concrete. If necessary, place additional concrete, consolidated and screeded, and the float operated until a satisfactory surface has been produced. Do not advance the floating operation more than half the length of the float and then continued over the new and previously floated surfaces.

3.6.5 Texturing

**************************************************************************
NOTE: Designer must select type of texturing desired, retain that subparagraph, and delete the others. A genuine effort must be made to determine the type of texturing, if any, desired by the using service. If no guidance is given, the usual default method must be burlap drag. If other than a burlap drag textured finish is required, edit the appropriate paragraph(s) as shown below.
For Air Force airfield paving projects, do not specify artificial turf, wire comb, or surface grooving textures. For Navy airfield paving projects, do not specify wire comb or surface grooving textures. Use Section 32 01 18.71 GROOVING FOR AIRFIELD PAVEMENTS, to specify saw-cut grooves.

Spring tine grooving is limited to use on roads and streets only.

**************************************************************************

Before the surface sheen has disappeared and before the concrete hardens or curing compound is applied, texture the surface of the pavement as described herein. After curing is complete, thoroughly power broom all textured surfaces to remove all debris.

[3.6.5.1 Burlap Drag Surface]

Apply surface texture by dragging the surface of the pavement, in the direction of the concrete placement, with an approved burlap drag. Operate the drag with the fabric moist, and the fabric maintained clean or changed as required to keep clean. Perform the dragging so as to produce a uniform finished surface having a fine sandy texture without disfiguring marks.

[3.6.5.2 Broom Texturing]

Complete brooming before the concrete has hardened to the point where the surface is unduly torn or roughened, but after hardening has progressed enough so that the mortar does not flow and reduce the sharpness of the scores. Overlap successive passes of the broom the minimum necessary to obtain a uniformly textured surface. Wash brooms thoroughly at frequent intervals during use. Remove worn or damaged brooms from the job site. Hand brooming is permitted only on isolated odd shaped slabs or slabs where hand finishing is permitted. For hand brooming, provide brooms with handles longer than half the width of slab to be finished. Transversely draw the hand brooms across the surface from the center line to each edge with slight overlapping strokes.

[3.6.5.3 Artificial Turf Drag Surface]

Apply artificial turf texture by dragging the surface of the pavement in the direction of concrete placement with an approved full-width drag made with artificial turf.

[3.6.5.4 Wire-Comb Texturing]

Apply surface texture using an approved mechanical wire comb drag operated to comb the surface transverse to the pavement centerline. Provide a comb capable of traversing the full width of the pavement in a single pass at a uniform speed and with a uniform pressure. Overlap successive passes of the comb the minimum necessary to obtain a continuous and uniformly textured surface. Complete texturing before the concrete has hardened to the point where the surface and edges are unduly torn, but after hardening has progressed to the point where the serrations do not close up. Provide serrations 2 to 5 mm 1/16 to 3/16 inch deep, 1.5 to 3 mm 1/16 to 1/8 inch wide, and spaced 9.5 mm 3/8 inch apart. Produce transverse texturing grooves in straight lines across each lane within a tolerance of plus or minus 13 mm 1/2 inch of a true line.
3.6.5.5 Surface Grooving

[Groove the areas indicated on the drawings as required in 32 01 18.71 GROOVING FOR AIRFIELD PAVEMENTS. ][Groove the areas indicated on the drawings with a spring tine drag producing individual grooves 6 mm 1/4 inch deep and 6 mm 1/4 inch wide at a spacing between groove centerlines of 37 mm 1-1/2 inches. Cut grooves perpendicular to the centerline. Before grooving begins, allow the concrete to attain sufficient strength to prevent aggregate spalling. Do not cut grooves within 150 mm 6 inches of a runway centerline, transverse joint, or crack; or through neoprene compression seals. Produce transverse texturing grooves in straight lines across each lane within a tolerance of plus or minus 13 mm 1/2 inch of a true line.]

3.6.6 Edging

Before texturing has been completed, carefully finish the edge of the slabs along the forms, along the edges of slipformed lanes, and at the joints with an edging tool to form a smooth rounded surface of 3 mm 1/8 inch radius. Eliminate tool marks, and provide edges that are smooth and true to line. Water is not allowed to be added to the surface during edging. Take extreme care to prevent overworking the concrete.

3.6.7 Outlets in Pavement

Construct recesses for the tie-down anchors, lighting fixtures, and other outlets in the pavement to conform to the details and dimensions shown. Carefully finish the concrete in these areas to provide a surface of the same texture as the surrounding area that is within the requirements for plan grade and surface smoothness.

3.7 CURING

******************************************************************************
NOTE: Retain bracketed item at end of first paragraph mandating 24 hour moist cure only where locally required and only where approved by the using service. Membrane curing should be the first choice of curing methods.
******************************************************************************

3.7.1 Protection of Concrete

Continuously protect concrete against loss of moisture and rapid temperature changes for at least 7 days from the completion of finishing operations. Have all equipment needed for adequate curing and protection of the concrete on hand and ready for use before actual concrete placement begins. If any selected method of curing does not afford the proper curing and protection against concrete cracking, remove or replace the damaged pavement, and provide another method of curing as directed. Accomplish curing by one of the following methods [except use only moist curing for the first 24 hours].

3.7.2 Membrane Curing

******************************************************************************
NOTE: The first Tailoring Option is for Army and Air Force jobs; the second option is for Navy projects only.
******************************************************************************
Apply a uniform coating of white-pigmented, membrane-forming, curing compound to the entire exposed surface of the concrete as soon as the free water has disappeared from the surface after [finishing] [moist curing ceases]. Apply immediately along the formed edge faces after the forms are removed. Do not allow the concrete to dry before the application of the membrane. If any drying has occurred, moisten the surface of the concrete with a fine spray of water, and the curing compound applied as soon as the free water disappears. Apply the curing compound to the finished surfaces by means of an approved automatic spraying machine. [Apply the curing compound with an overlapping coverage that provides a two-coat application at a coverage of 10 square meters per L 400 square feet per gallon, plus or minus 5.0 percent for each coat. A one-coat application is allowed provided it is applied in a uniform application and coverage of 5 square meters per L 200 square feet per gallon, plus or minus 5.0 percent is obtained.][Apply the curing compound with a single overlapping application that provides a uniform coverage of 3.7 square meters per L 150 square feet per gallon.] The application of curing compound by hand-operated, mechanical powered pressure sprayers is permitted only on odd widths or shapes of slabs and on concrete surfaces exposed by the removal of forms. When the application is made by hand-operated sprayers, apply a second coat in a direction approximately at right angles to the direction of the first coat. If pinholes, abrasions, or other discontinuities exist, apply an additional coat to the affected areas within 30 minutes. Respray curing compound to concrete surfaces that are subjected to heavy rainfall within 3 hours after the curing compound has been applied by the method and at the coverage specified above. Respray curing compound to areas where the curing compound is damaged by subsequent construction operations within the curing period immediately. Adequately protect concrete surfaces to which membrane-curing compounds have been applied during the entire curing period from pedestrian and vehicular traffic, except as required for joint-sawing operations and surface tests, and from any other possible damage to the continuity of the membrane.

3.7.3 Moist Curing

**NOTE:** For OCONUS projects using Silica Fume, specify a minimum 24-hour moist cure before applying membrane curing compound.

**NOTE:** Edit bracketed items in following

Maintain concrete to be moist-cured continuously wet for the entire curing period, or until curing compound is applied, commencing immediately after finishing. If forms are removed before the end of the curing period, provide curing on unformed surfaces, using suitable materials. Cure surfaces by ponding, by continuous sprinkling, by continuously saturated burlap or cotton mats, or by continuously saturated plastic coated burlap. Provide burlap and mats that are clean and free from any contamination and completely saturated before being placed on the concrete. Lap sheets to provide full coverage. Provide an approved work system to ensure that moist curing is continuous 24 hours per day and that the entire surface is wet.

3.8 JOINTS

**NOTE:** Edit bracketed items in following
subparagraphs to conform to design requirements. Even if not required, dowels must be permitted for construction joints. The effect of tie bars on the pavement action and potential cracking must be analyzed before requiring or permitting their use. Remove joint types not required in the project.

**************************************************************************

3.8.1 General Requirements for Joints

Construct joints that conform to the locations and details indicated and are perpendicular to the finished grade of the pavement. Provide joints that are straight and continuous from edge to edge or end to end of the pavement with no abrupt offset and no gradual deviation greater than 13 mm 1/2 inch. Where any joint fails to meet these tolerances, remove and replace the slabs adjacent to the joint at no additional cost to the Government. Change from the jointing pattern shown on the drawings is not allowed without written approval. Seal joints immediately following curing of the concrete or as soon thereafter as weather conditions permit as specified in Section [32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT] [32 13 73.19 COMPRESSION CONCRETE PAVING JOINT SEALANT].

3.8.2 Longitudinal Construction Joints

Install dowels [or keys] [or tie bars] in the longitudinal construction joints, or thicken the edges as indicated. Install [dowels] [tie bars] as specified above. [If any length of completed keyway of 1.5 m 5 feet or more fails to meet the previously specified tolerances, install dowels in that part of the joint by drilling holes in the hardened concrete and grouting the dowels in place with epoxy resin.] After the end of the curing period, saw longitudinal construction joints to provide a groove at the top for sealant conforming to the details and dimensions indicated.

3.8.3 Transverse Construction Joints

Install transverse construction joints at the end of each day's placing operations and at any other points within a paving lane when concrete placement is interrupted for 30 minutes or longer. Install the transverse construction joint at a planned transverse joint. Provide transverse construction joints by utilizing headers or by paving through the joint, then full-depth sawcutting the excess concrete. Construct pavement with the paver as close to the header as possible, with the paver run out completely past the header. Provide transverse construction joints at a planned transverse joint constructed as shown or, if not shown otherwise, dowelled in accordance with paragraph DOWELS INSTALLED IN HARDENED CONCRETE, or paragraph FIXED FORM PAVING above.

3.8.4 Expansion Joints

Provide expansion joints where indicated, and about any structures and features that project through or into the pavement, using joint filler of the type, thickness, and width indicated, and installed to form a complete, uniform separation between the structure and the pavement or between two pavements. Attach the filler to the original concrete placement with adhesive and mechanical fasteners and extend the full slab depth. After placement and curing of the adjacent slab, sawcut the sealant reservoir depth from the filler. Tightly fit adjacent sections of filler together, with the filler extending across the full width of the paving lane or other complete distance in order to prevent entrance of concrete into the
expansion space. Finish edges of the concrete at the joint face with an edger with a radius of 3 mm 1/8 inch.

3.8.5 Slip Joints

Install slip joints where indicated using the specified materials. Attach preformed joint filler material to the face of the original concrete placement with adhesive and mechanical fasteners. Construct a 19 mm 3/4 inch deep reservoir for joint sealant at the top of the joint. Finish edges of the joint face with an edger with a radius of 3 mm 1/8 inch.

3.8.6 Contraction Joints

Construct transverse and longitudinal contraction joints by sawing an initial groove in the concrete with a 3 mm 1/8 inch blade to the indicated depth. During sawing of joints, and again 24 hours later, the CQC team is required to inspect all exposed lane edges for development of cracks below the saw cut, and immediately report results. If there are more than six consecutive uncracked joints after 48 hours, saw succeeding joints 25 percent deeper than originally indicated at no additional cost to the Government. The time of initial sawing varies depending on existing and anticipated weather conditions and be such as to prevent uncontrolled cracking of the pavement. Commence sawing of the joints as soon as the concrete has hardened sufficiently to permit cutting the concrete without chipping, spalling, or tearing. The sawed faces of joints will be inspected for undercutting or washing of the concrete due to the early sawing, and sawing delayed if undercutting is sufficiently deep to cause structural weakness or excessive roughness in the joint. Continue the sawing operation as required during both day and night regardless of weather conditions. Saw the joints at the required spacing consecutively in the sequence of the concrete placement. Provide adequate lighting for night work. Illumination using vehicle headlights is not permitted. Provide a chalk line or other suitable guide to mark the alignment of the joint. Before sawing a joint, examine the concrete closely for cracks, and do not saw the joint if a crack has occurred near the planned joint location. Discontinue sawing if a crack develops ahead of the saw cut. Immediately after the joint is sawed, thoroughly flush the saw cut and adjacent concrete surface with water and vacuumed until all waste from sawing is removed from the joint and adjacent concrete surface. Take necessary precautions to insure that the concrete is properly protected from damage and cured at sawed joints. Tightly seal the top of the joint opening and the joint groove at exposed edges with cord backer rod before the concrete in the region of the joint is resprayed with curing compound, and be maintained until removed immediately before sawing the joint sealant reservoir. Respray the surface with curing compound as soon as free water disappears. Seal the exposed saw cuts on the faces of pilot lanes with bituminous mastic or masking tape. After expiration of the curing period, widen the upper portion of the groove by sawing with ganged diamond saw blades to the width and depth indicated for the joint sealer. Center the reservoir over the initial sawcut.

3.8.7 Thickened Edge Joints

Construct thickened edge joints as indicated on the drawings. Grade the underlying material in the transition area as shown and meet the requirements for smoothness and compaction specified for all other areas of the underlying material.
3.9 REPAIR, REMOVAL AND REPLACEMENT OF NEWLY CONSTRUCTED SLABS

3.9.1 General Criteria

Repair or remove and replace new pavement slabs as specified at no cost to the Government. Removal of partial slabs is not permitted. Prior to any repairs, submit a Repair Recommendations Plan detailing areas exceeding the specified limits as well as repair recommendations required to bring these areas within specified tolerances.

3.9.2 Slabs with Cracks

The Government may require cores to be taken over cracks to determine depth of cracking. Such cores are to be drilled with a minimum diameter of 150 mm 6 inches, and be backfilled with an approved non-shrink concrete. Perform drilling of cores and filling of holes at no expense to the Government.

Clean cracks that do not exceed 50 mm 2 inches in depth; then pressure injected full depth with epoxy resin, Type IV, Grade 1. Remove and replace slabs containing cracks deeper than 50 mm 2 inches.

3.9.3 Removal and Replacement of Full Slabs

Remove and replace slabs containing more than 15.0 percent of any longitudinal or transverse joint edge spalled. Where it is necessary to remove full slabs, remove in accordance with paragraph REMOVAL OF EXISTING PAVEMENT SLAB below. Remove and replace full depth, by full width of the slab, and the limit of removal normal to the paving lane and extend to each original joint. Compact and shape the underlying material as specified in the appropriate section of these specifications, and clean the surfaces of all four joint faces of all loose material and contaminants and coated with a double application of membrane forming curing compound as bond breaker.

Install dowels of the size and spacing as specified for other joints in similar pavement by epoxy grouting them into holes drilled into the existing concrete using procedures as specified in paragraph PLACING DOWELS[ AND TIE BARS], above. Provide dowels for all four edges of the new slab. Cut off original damaged dowels[ or tie bars] flush with the joint face. Lightly oil or grease protruding portions of new dowels. Place concrete as specified for original construction. Take care to prevent any curing compound from contacting dowels[ or tie bars]. Prepare and seal the resulting joints around the new slab as specified for original construction.

3.9.4 Repairing Spalls Along Joints

Repair spalls along joints to be sealed to a depth to restore the full joint-face support prior to placing adjacent pavement. Where directed, repair spalls along joints of new slabs, along edges of adjacent existing concrete, and along parallel cracks by first making a vertical saw cut at least 75 mm 3 inches outside the spalled area and to a depth of at least 50 mm 2 inches. Provide saw cuts consisting of straight lines forming rectangular areas without sawing beyond the intersecting saw cut. Chip out the concrete between the saw cut and the joint, or crack, to remove all unsound concrete and into at least 13 mm 1/2 inch of visually sound concrete. Thoroughly clean the cavity thus formed with high pressure water jets supplemented with oil-free compressed air to remove all loose material. Immediately before filling the cavity, apply a prime coat to the dry cleaned surface of all sides and bottom of the cavity, except any joint face. Apply the prime coat in a thin coating and scrubbed into the surface with a stiff-bristle brush. Provide prime coat for portland cement repairs consisting of a neat cement grout and for epoxy resin repairs consisting of...
epoxy resin, Type III, Grade 1. Fill the prepared cavity with material identified in the following table based on the cavity volume.

<table>
<thead>
<tr>
<th>Volume of Prepared Cavity After Removal Operations</th>
<th>Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>less than 0.00085 cubic meter 0.03 cubic foot</td>
<td>epoxy resin mortar or epoxy resin or latex modified mortar</td>
</tr>
<tr>
<td>0.00085 cubic meter 0.03 cubic foot and 0.009 cubic meter 1/3 cubic foot</td>
<td>Portland cement mortar</td>
</tr>
<tr>
<td>more than 0.009 cubic meter 1/3 cubic foot</td>
<td>Portland cement concrete or latex modified mortar</td>
</tr>
</tbody>
</table>

Provide portland cement concretes and mortars that consist of very low slump mixtures, 13 mm 1/2 inch slump or less, proportioned, mixed, placed, consolidated by tamping, and cured, all as directed. Provide epoxy resin mortars made with Type III, Grade 1, epoxy resin, using proportions and mixing and placing procedures as recommended by the manufacturer and approved. Proprietary patching materials may be used, subject to Government approval. Place the epoxy resin materials in the cavity in layers with a maximum thickness of 50 mm 2 inches. Provide adequate time between placement of additional layers such that the temperature of the epoxy resin material does not exceed 60 degrees C 140 degrees F at any time during hardening. Provide mechanical vibrators and hand tampers to consolidate the concrete or mortar. Remove any repair material on the surrounding surfaces of the existing concrete before it hardens. Where the spalled area abuts a joint, provide an insert or other bond-breaking medium to prevent bond at the joint face. Saw a reservoir for the joint sealant to the dimensions required for other joints. Thoroughly clean the reservoir and then sealed with the sealer specified for the joints. [In lieu of sawing, spalls not adjacent to joints and popouts, both less than 150 mm 6 inches in maximum dimension, may be prepared by drilling a core 50 mm 2 inches in diameter greater than the size of the defect, centered over the defect, and 50 mm 2 inches deep or 13 mm 1/2 inch into sound concrete, whichever is greater. Repair the core hole as specified above for other spalls.]

3.9.5 Repair of Weak Surfaces

Weak surfaces are defined as mortar-rich, rain-damaged, uncured, or containing exposed voids or deleterious materials. Diamond grind slabs containing weak surfaces less than 6 mm 1/4 inch thick to remove the weak surface. Diamond grind in accordance with paragraph DIAMOND GRINDING OF PCC SURFACES in PART 1. All diamond ground areas are required to meet the thickness, smoothness and grade criteria specified in PART 1 GENERAL. Remove and replace slabs containing weak surfaces greater than 6 mm 1/4 inch thick.

3.9.6 Repair of Pilot Lane Vertical Faces

Repair excessive edge slump and joint face deformation while concrete is in a plastic state by approved methods.

3.10 EXISTING CONCRETE PAVEMENT REMOVAL AND REPAIR

**************************************************************************
SECTION 32 13 14.13 Page 77
NOTE: It is imperative that sufficient exploration be made (not just reference to as-built drawings) for the designer to know exactly what the in-place existing pavement thickness and load-transfer are at the jointing area—such as dowels, keys, tie bars—and its condition. Normally, the joint between the new pavement and existing pavement is made at an existing joint in the old pavement. Coordinate with Section 02 41 00 DEMOLITION.

Removal of existing pavement is not allowed prior to approval of the Proportioning Studies. Remove existing concrete pavement at locations indicated on the drawings. Prior to commencing pavement removal operations, inventory the pavement distresses (cracks, spalls, and corner breaks) along the pavement edge to remain. After pavement removal, survey the remaining edge again to quantify any damage caused by removal operations. Perform both surveys in the presence of the Government. Perform repairs as indicated and as specified herein. Carefully control all operations to prevent damage to the concrete pavement and to the underlying material to remain in place. Perform all saw cuts perpendicular to the slab surface, forming rectangular areas. Perform all existing concrete pavement repairs prior to paving adjacent lanes.

3.10.1 Removal of Existing Pavement Slab

NOTE: The saw cut at a distance from the joint should be sawed with a wheel saw which produces a 38 mm 1-1/2 inches or wider kerf and better prevents stress from propagating across the saw cut. Specify wheel saw for Army and Air Force projects. Specify diamond saw for Navy projects.

When existing concrete pavement is to be removed and adjacent concrete is to be left in place, perform the first full depth saw cut on the joint between the removal area and adjoining pavement to stay in place with a standard diamond-type concrete saw. Next, perform a full depth saw cut parallel to the joint that is at least 600 mm 24 inches from the joint and at least 150 mm 6 inches from the end of any dowels with a [wheel saw] [diamond saw] as specified in paragraph SAWING EQUIPMENT. Remove all pavement beyond this last saw cut in accordance with the approved demolition work plan. Remove all pavement between this last saw cut and the joint line by carefully pulling pieces and blocks away from the joint face with suitable equipment and then picking them up for removal. In lieu of this method, this strip of concrete may be carefully broken up and removed using hand-held jackhammers, 14 kg 30 lb or less, or other approved light-duty equipment which does not cause stress to propagate across the joint saw cut and cause distress in the pavement which is to remain in place. In lieu of the above specified removal method, the slab may be sawcut full depth to divide it into several pieces and each piece lifted out and removed. Use suitable equipment to provide a truly vertical lift, and safe lifting devices used for attachment to the slab.

3.10.2 Edge Repair

Protect the edge of existing concrete pavement against which new pavement abuts from damage at all times. Remove and replace slabs which are damaged.
during construction as directed at no cost to the Government. Repair of previously existing damage areas is considered a subsidiary part of concrete pavement construction. Saw off all exposed keys and keyways full depth.

3.10.2.1 Spall Repair

Repair spalls caused by construction activities if less than 15.0 percent of any slab's edge. Provide repair materials and procedures as previously specified in paragraph, REPAIRING SPALLS ALONG JOINTS. Remove and replace full slabs if spalls exceed 15.0 percent of any slab's edge as specified in paragraph, Removal and Replacement of Full Slabs.

3.10.2.2 Underbreak and Underlying Material

Repair all underbreak by removal and replacement of the damaged slabs in accordance with paragraph REMOVAL AND REPLACEMENT OF FULL SLABS above. Protect the underlying material adjacent to the edge of and under the existing pavement which is to remain in place from damage or disturbance during removal operations and until placement of new concrete, and be shaped as shown on the drawings or as directed. Maintain sufficient underlying material in place outside the joint line to completely prevent disturbance of material under the pavement which is to remain in place. Remove and replace any slab with underlying material that is disturbed or loses its compaction.

3.11 PAVEMENT PROTECTION

Protect the pavement against all damage prior to final acceptance of the work by the Government. Placement of aggregates, rubble, or other similar construction materials on airfield pavements is not allowed. Exclude traffic from the new pavement by erecting and maintaining barricades and signs until the concrete is at least 14 days old, or for a longer period if so directed. As a construction expedient in paving intermediate lanes between newly paved pilot lanes, operation of the hauling and paving equipment is permitted on the new pavement after the pavement has been cured for 7 days and the joints have been sealed or otherwise protected, the concrete has attained a minimum field cured flexural strength of 3.8 MPa and approved means are provided to prevent damage to the slab edge. Continuously maintain all new and existing pavement carrying construction traffic or equipment completely clean, and spillage of concrete or other materials cleaned up immediately upon occurrence. Take special care in areas where traffic uses or crosses active airfield pavement. Power broom other existing pavements at least daily when traffic operates. For fill-in lanes, provide equipment that does not damage or spall the edges or joints of the previously constructed pavement.

3.12 TESTING AND INSPECTION FOR CONTRACTOR QUALITY CONTROL DURING CONSTRUCTION

3.12.1 Testing and Inspection by Contractor

During construction, perform sampling and testing of aggregates, cementitious materials (cement, slag cement, and pozzolan), and concrete to determine compliance with the specifications. Provide facilities and labor as may be necessary for procurement of representative test samples. Furnish sampling platforms and belt templates to obtain representative samples of aggregates from charging belts at the concrete plant. Obtain samples of concrete at the point of delivery to the paver. Testing by the
Government in no way relieves the specified testing requirements. Perform the inspection and tests described below, and based upon the results of these inspections and tests, take the action required and submit reports as required. Perform this testing regardless of any other testing performed by the Government, either for pay adjustment purposes or for any other reason.

3.12.2 Testing and Inspection Requirements

Perform CQC sampling, testing, inspection and reporting in accordance with the following Table.

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Test Method</th>
<th>Control Limit</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>

#### 3.12.3 Concrete Strength Testing for CQC

**NOTE:** If paragraph FLEXURAL STRENGTH AND THICKNESS is based on 28-day flexural strength for acceptance, modify this subparagraph to match it. The first option "Cylinders/Beams" includes items a through g; the second option "Beams" includes listing a through f.

Perform Contractor Quality Control operations for concrete strength consisting of the following steps:

a. Take samples for strength tests at the paving site. Fabricate and cure test cylinders in accordance with ASTM C31/C31M; test them in accordance with ASTM C39/C39M.

b. Fabricate and cure 2 test cylinders per sublot from the same batch or truckload and at the same time acceptance cylinders are fabricated and test them for compressive strength at 7-day age.
c. Average all 8 compressive tests per lot. Convert this average 7-day compressive strength per lot to equivalent [28] [90]-day flexural strength using the Correlation Ratio determined during mixture proportioning studies.

d. Compare the equivalent [28] [90]-day flexural strength from the conversion to the Average Flexural Strength Required for Mixtures from paragraph of same title.

e. If the equivalent average [28][90]-day strength for the lot is below the Average Flexural Strength Required for Mixtures by 138 kPa 20 psi flexural strength or more, at any time, adjust the mixture to increase the strength, as approved.

f. Fabricate and cure two beams for every 1500 cubic meters 2000 cubic yards of concrete placed. Fabricate and cure in accordance with ASTM C31/C31M; test at 14-days of age in accordance with ASTM C78/C78M. Use the flexural strength results to verify the cylinder-beam acceptance correlation ratio.

g. Maintain up-to-date control charts for strength, showing the 7-day CQC compressive strength, the 14-day compressive strength (from acceptance tests) and the [28] [90]-day equivalent flexural strength of each of these for each lot.

( a. Take samples for strength tests at the paving site. Fabricate and cure test beams in accordance with ASTM C31/C31M; test them in accordance with ASTM C78/C78M.

b. Fabricate and cure 2 test beams per subplot from the same batch or truckload and at the same time acceptance beams are fabricated and test them for flexural strength at 7-day age.

c. Average all 8 flexural tests per lot. Convert this average 7-day flexural strength per lot to equivalent [28] [90]-day flexural strength using the Correlation Ratio determined during mixture proportioning studies.

d. Compare the equivalent [28] [90]-day flexural strength from the conversion to the Average Flexural Strength Required for Mixtures from paragraph of same title.

e. If the equivalent average [28] [90]-day strength for the lot is below the Average Flexural Strength Required for Mixtures by 490 kPa 69 psi flexural strength or more, at any time, adjust the mixture to increase the strength, as approved.

f. Maintain up-to-date control charts for strength, showing the 7-day CQC flexural strength and the [28] [90]-day flexural strength (from acceptance tests) of each of these for each lot.

3.12.4 Reports

Report all results of tests or inspections conducted informally as they are completed and in writing daily. Prepare a weekly report for the updating of control charts covering the entire period from the start of the construction season through the current week. During periods of cold-weather protection, make daily reports of pertinent temperatures.
These requirements do not relieve the obligation to report certain failures immediately as required in preceding paragraphs. Confirm such reports of failures and the action taken in writing in the routine reports. The Government has the right to examine all Contractor quality control records.

NOTE: This guide specification covers the requirements for concrete containment dikes and basins. See DEPARTMENT OF DEFENSE (DOD) definitive design "AW 78-24-27 Aboveground Vertical Steel Fuel Tanks with Fixed Roofs" for standard details and design guidance when using this specification for a fuel storage tank containment system. A fuel impermeable containment system is required for fuel storage tank containment areas per UFC 3-460-01. This dike and basin concrete provides cover and protection for a geomembrane liner covered by Section 33 56 19 FUEL IMPERMEABLE LINER SYSTEM. The dike and basin concrete in of itself is not a substitute for a geomembrane liner and is never to be considered an impermeable containment system on its own accord.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
   Aggregate Sources

SD-06 Test Reports
   Independent Laboratory Test Results
   Placing, Spreading And Vibrating; G[, [_____]].

SD-07 Certificates
   Concrete Sampling and Testing; G[, [_____]].
   Certified Test Results
1.3 CONCRETE SAMPLING AND TESTING

1.3.1 General

Provide certification of sampling and testing of all concrete and concrete materials, including design of concrete mixes, conforming to the requirements specified in ASTM C94/C94M Option A and submit to the Contracting Officer for approval. During actual concrete operations, no substitutions are allowed in the materials or proportions that were used in the mix design without additional testing unless specifically approved or directed by the Contracting Officer. In lieu of performing new concrete mix design studies, a concrete mix design from a current project at the military base may be used provided the required concrete strength is obtained and the materials proposed for use in this project are identical to those used in the concrete mix design. Perform quality control sampling and testing in accordance with Section [01 45 00.00 10 QUALITY CONTROL][01 45 00.00 20 QUALITY CONTROL][01 45 00.00 40 QUALITY CONTROL] and as specified herein. The Government may perform verification tests as considered necessary.

1.3.2 Certification for Additional Pavement Materials

Prior to the use of materials not listed in ASTM C94/C94M, but listed in this section, submit Certified Test Results for each lot as directed by the Contracting Officer.

PART 2 PRODUCTS

2.1 SYSTEM REQUIREMENTS

2.1.1 General Requirements

Provide concrete and the equipment, workmanship, materials and quality control conforming to the applicable requirements of ASTM C94/C94M, except as otherwise specified herein. Use concrete composed of cement, supplementary cementitious materials (SCM), fine aggregate, coarse aggregate, water, and an air entraining mixture. State final mix proportions by weight and batch; cementitious materials by weight. Do not exceed a water-cementitious materials ratio (WCR) of 0.45. Maintain the air content of the concrete by volume at 6.0 percent plus or minus 1.0 percent. Do not exceed a concrete slump of 75 mm 3 inches for fixed form paving. Do not increase the slump of transit-mixed concrete because of the inadequacy of mixing, discharge, or placing equipment.

2.1.2 Strength Requirements

Provide concrete with the following average compressive strength: Containment Dikes and Basin 30 MPa 4000 psi at 28 days

2.2 MATERIALS

2.2.1 Aggregate

2.2.1.1 Gradation

Provide coarse and fine aggregate conforming to ASTM C33/C33M with a maximum nominal size of 25 mm 1 inch.
2.2.1.2 Quality

Provide coarse and fine aggregate conforming to ASTM C33/C33M, Class 4.

2.2.1.3 Alkali-Silica Reactivity (ASR)

a. Evaluate and test fine and coarse aggregates to be used for alkali-aggregate reactivity. Evaluate fine and coarse aggregates separately, using ASTM C1260. Test results of the individual aggregates must show a measured expansion equal to or less than 0.08 percent after 28 days of immersion in a 1N NaOH solution. Should the test data indicate an expansion of greater than 0.08 percent, reject the aggregate(s) or perform additional testing as follows: utilize the Contractor's proposed low alkali portland cement, blended cement, and/or SCM in combination with each individual aggregate and test in accordance with ASTM C1567. Determine the quantity that will meet all the requirements of these specifications and that will lower the expansion equal to or less than 0.08 percent after 28 days of immersion in a 1N NaOH solution. Base the mixture proportioning on the highest percentage of SCM required to mitigate ASR.

b. If any of the above options does not lower the expansion to less than 0.08 percent after 28 days of immersion in a 1N NaOH solution, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing to the Contracting Officer for evaluation and acceptance.

2.2.2 Admixtures

******************************************************************************
NOTE: High Range Water Reducing Admixtures are permitted only when using Silica Fume in OCONUS projects. Delete for all other projects
******************************************************************************

a. Provide air-entraining admixture conforming to ASTM C260/C260M.

b. Use accelerating admixture conforming to ASTM C494/C494M, Type C, only when cold weather protection is required and only when approved in writing. Do not use admixtures containing the chlorine ion.

c. Provide water-reducing or retarding admixtures conforming to ASTM C494/C494M, Type A, B, or D.

d. When using Silica Fume, provide a high-range water-reducing admixture (HRWRA) meeting the requirements of ASTM C494/C494M, Type F or G. Provide the HRWRA that is a synthesized, sulfonated complex polymer type and free from chlorides and alkalies. Add the HRWRA to the concrete as a single component at the batch plant. Add the admixture to the concrete mixture only when its use is approved or directed, and only when it has been used in mixture proportioning studies to arrive at approved mixture proportions. Submit certified copies of the independent laboratory test results required for compliance with ASTM C494/C494M.

2.2.3 Cementitious Materials

******************************************************************************
NOTE: Edit these paragraphs as appropriate for the particular project. Since the containment dike
Concrete is underlain by an impervious geomembrane, adverse reactions between the cement and subgrade soils are not anticipated. Only Type I or II cements are required.

Provide cementitious materials of portland cement, blended cement, or only portland cement in combination with supplementary cementitious materials (SCM), and conforming to appropriate specifications listed below. New submittals are required when the cementitious materials sources or types change.

2.2.3.1 Portland Cement

Provide portland cement conforming to ASTM C150/C150M, Type I or II, low alkali [including false set requirements]. Low alkali cement is required if the proposed aggregates are found to have greater than 0.04 percent expansion when tested in accordance with paragraph: Alkali-Silica Reactivity above.

2.2.3.2 Blended Cement

Provide blended cement conforming to ASTM C595/C595M, Type IP or IS, including the optional requirement for mortar expansion [and sulfate soundness]. Provide statement in writing from the manufacturer that the amount of pozzolan in the finished cement will not vary more than plus or minus 5 mass percent of the finished cement from lot to lot or within a lot. No change is allowed in the percentage and type of mineral admixture used in the blend from that submitted for the aggregate evaluation and mixture proportioning.

2.2.4 Supplementary Cementitious Materials (SCM)

2.2.4.1 Fly Ash

Provide fly ash conforming to ASTM C618, Class F, including the optional requirements for uniformity and effectiveness in controlling Alkali-Silica reaction and not have a loss on ignition exceeding 3 percent for frost areas to reduce carbon interference with air entraining admixture.

Provide fly ash conforming to ASTM C618, Class F, including the optional requirements for uniformity and effectiveness in controlling Alkali-Silica reaction and not have a loss on ignition exceeding 3 percent for use in mitigating Alkali-Silica Reactivity, provide a Calcium Oxide (CaO) content of less than 13 percent and a total equivalent alkali content less than 3 percent.

2.2.4.2 Raw or Calcined Natural Pozzolan

Provide raw or calcined natural pozzolan conforming to ASTM C618, Class N, including the optional requirements for uniformity and effectiveness in controlling Alkali-Silica reaction and not have a loss on ignition exceeding 3 percent for use in mitigating Alkali-Silica reactivity.
2.2.4.3 Ground Granulated Blast Furnace Slag (GGBFS)

Provide Ground Granulated Blast-Furnace Slag conforming to ASTM C989/C989M, Grade 100 or Grade 120.

2.2.4.4 Silica Fume

**************************************************************************
NOTE: Silica Fume shall only be used for OCONUS projects where Class F fly ash and GGBF slag are not available. Delete this paragraph here and where encountered throughout the remainder of this section.
**************************************************************************

Provide silica fume conforming to ASTM C1240, including the optional limits on reactivity with cement alkalis. Silica fume may be furnished as a dry, densified material or as a slurry. Provide at the Contractor's expense the services of a manufacturer's technical representative, experienced in mixing, proportioning, placement procedures, and curing of concrete containing silica fume. This representative must be present on the project prior to and during at least the first 4 days of concrete production and placement using silica fume.

2.2.4.5 Supplementary Cementitious Materials (SCM) Content

The Contractor may elect to use one of the SCMs listed below, unless the SCM is required to mitigate ASR. The use of SCMs is encouraged in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.

2.2.5 Reinforcement Steel and Dowels

Provide reinforcement bars conforming to ASTM A615/A615M Grade 40 or 60. Provide welded steel wire fabric conforming to ASTM A1064/A1064M. Provide dowels that are plain (non-deformed) steel bars conforming to ASTM A615/A615M, Grade 40 or 60; ASTM A996/A996M, Grade 50 or 60. Provide epoxy coated dowel bars in conformance with ASTM A775/A775M. Use grout retention rings of fully circular metal or plastic devices capable of supporting the dowel until the epoxy hardens. Dowel sleeves or inserts are not permitted.
2.2.6 CURING MATERIALS

Only approved white pigmented membrane-forming curing compound materials conforming to the requirements specified in ASTM C309, Type 2, Class A or B may be used.

2.2.7 Joint Filler

For expansion joints use a preformed joint filler material conforming to ASTM D1751 or ASTM D1752.

2.2.8 SYNTHETIC FIBER REINFORCEMENT

**************************************************************************
NOTE: Synthetic fibers may only be used in addition to conventional steel reinforcement to mitigate plastic shrinkage cracking. Do not use synthetic fibers as a replacement for reinforcing steel or mesh.
**************************************************************************

ASTM C1116/C1116M. Use 100 percent virgin nylon or polypropylene fibers, 23 micron diameter, 19 mm 3/4 inch length with a minimum tensile strength of 482 MPa 70 ksi. Add fibers to the concrete mix at the batch plant at the rate of 0.89 kg/cubic meter 1.5 lbs/cubic yard.

PART 3 EXECUTION

3.1 GRADE CONTROL

Using bench-mark elevations furnished by the Contracting Officer, establish and maintain the lines and grades shown for the pavement by means of line and grade stakes placed at the jobsite. Construct pavements to the thicknesses and elevations indicated.

3.2 SUBGRADE, FORMS AND STRINGLINE

3.2.1 Underlying Material

3.2.1.1 General

Test the surface of the subgrade as to elevation and density in advance of setting forms. Keep the prepared surface free of foreign matter, waste concrete and/or cement, and debris at all times and thoroughly wet down sufficiently in advance to insure a firm, moist condition when the concrete is placed. In cold weather, prepare and protect the underlying material so that it will be entirely free from frost when the concrete is placed. The use of chemicals to eliminate frost in the underlying material will not be permitted.

3.2.1.2 Liner System

Where an impermeable liner system is placed directly under the concrete, take precautions to protect the underlying liner system from damage. See Section 33 56 19 FUEL IMPERMEABLE LINER SYSTEM for additional requirements.

3.2.2 Forms for Fixed-Form Paving

Use either steel or wood forms and forms subject to approval. Provide
one-piece forms that are equal in depth to the edge thickness of the slab as shown on the drawings. Under no conditions are forms other than the depth of the pavement to be used and adjusted by filling or excavating under the forms to an elevation other than the bottom of the pavement slab. Do not vary the top surface of a form by more than 3 mm 1/8 inch in 3 m 10 feet from a true line and the face by more than 6 mm 1/4 inch in 3 m 10 feet from a true plane.

3.2.2.1 Steel Forms

Furnish steel forms in sections not less than 3 m 10 feet in length, except that on curves the sections are required to be flexible or curved to the proper radius. Provide each form section with form braces, pin sockets, and rigid joint locking devices.

3.2.2.2 Wood Forms

Furnish wood forms made of not less than 50 mm 2 inches nominal thickness, well-seasoned, surfaced plank or plywood, straight, and free from warp or bend. Use wood forms that have the strength and rigidity to resist the impact and vibrations of concrete placing, spreading and finishing without springing, weaving or settling.

3.2.2.3 Form Setting

Set the forms on firm material cut true to grade so that each form section when placed will be firmly in contact with the underlying layer for its entire length and base width. Setting forms on blocks or on built-up spots of subgrade and then attempting to fill and compact under forms after they are in place will not be permitted under any condition. Lock the form sections tightly together. When tested by a 3 m 10-foot straightedge, provide the top of the form conforming to the requirements specified for the finished surface of the concrete, and do not vary the longitudinal axis of the upstanding leg by more than 6 mm 1/4 inch from the straightedge. Clean and oil the forms each time before concrete is placed. Do not place concrete until setting of forms has been approved. Do not drive form stakes in areas underlain by a geomembrane. Anchoring of the forms in these areas is required to be approved by the Contracting Officer prior to installation.

3.3 PLACING, SPREADING AND VIBRATING

Submit a document detailing proposed concrete placement procedures. At a minimum, address form setting, protection of geomembrane, conveyance/pumping, construction joints, expansion joints, placement of reinforcement, curing and joint sealing procedures.

3.3.1 General

Place concrete between stationary forms. Deposit concrete between the forms within 90 minutes from the time all ingredients are charged into the mixing drum. Deposit concrete as close as possible to its final position in the pavement cross section. Place concrete at a continuous and uniform rate. Spread and vibrate concrete immediately after placement.

3.3.2 Paver Fixed-Form Method

Use a paver that is self-propelled and capable of spreading, consolidating and shaping the plastic concrete. Hand spreading will be permitted only
when approved for odd widths or shapes of slabs. Equip pavers with a full-width mechanical spreader at the front which is capable of ready adjustment to provide a uniform cross section of concrete in front of the screed as necessary for proper operation. Use an auger, paddle or other approved type spreader. Hand spreading, where permitted, is to be done with shovels; rakes are not to be used. Where the concrete is delivered to the form in truck mixers, suitable chutes may be used, provided windrows cover essentially the entire area with-in the form. In no case is dumping of concrete in piles permitted.

3.3.3 Vibration

Consolidate concrete by properly designed vibrating screeds, internal vibrators, or other approved techniques immediately after spreading. Cease forward motion of the paver as soon as a vibrator becomes inoperable. Maintain additional vibrators at the site at all times.

3.3.3.1 Slabs 200 mm 8 Inches Thick

Consolidate concrete, greater than 200 mm 8 inches in thickness, with mechanical vibrating equipment immediately after spreading. Provide internal type mechanical vibrating equipment and the number of units and adequate power of each unit to properly consolidate all of the concrete. Automatically control the vibrators and/or tamping elements so that they will be stopped as forward motion ceases. Do not exceed vibrator unit spacing of 750 mm 30 inches, and provide a space from the outside unit and the edge of the slab of approximately 300 mm 1 foot. Insert vibrators into the concrete to a depth that will provide the best consolidation, but not closer to the underlying material than 50 mm 2 inches. Change the depth and angle of vibrators whenever directed by the Contracting Officer.

3.3.3.2 Slabs Less Than 200 mm 8 Inches Thick

Consolidate concrete 200 mm 8 inches or less in thickness with properly designed and operating vibratory screeds immediately after spreading.

3.3.3.3 Hand Placement

Vibrate concrete in odd shaped slabs, or lanes 15 m 50 feet or less in length or in locations inaccessible to the above vibrating equipment with a hand-manipulated vibrator operated from a bridge spanning the concrete placement. Do not have workmen walk in the fresh concrete. Do not use vibrators to transport or spread the concrete in the forms. Do not operate vibrators in the concrete at one location for more than 20 seconds.

3.3.4 Placing Reinforcing Steel

Position reinforcement steel on suitable chairs prior to concrete placement or it may be installed by the strike-off method wherein the concrete is deposited on the underlying material, consolidated and struck to the indicated elevation of the steel reinforcement. When using the strike-off method, lay the reinforcement upon the prestruck surface, and place and finish the remaining concrete in the required manner. Remove and replace any portions of the bottom layer of concrete, that was placed more than 30 minutes without being covered with the top layer, with newly mixed concrete at no additional cost to the Government. Regardless of placement procedure, keep the reinforcing steel free from coatings which could impair bond between the steel and concrete and provide laps in the reinforcement as indicated.
3.3.5 Placing During Cold Weather

Place concrete in cold weather in accordance with ACI 306R. Do not place concrete on base course or subgrade containing frost or frozen material. Include provision to protect the concrete from freezing during the specified curing period. Remove and replace concrete damaged by freezing at no cost to the Government.

3.3.6 Placing During Warm Weather

Place concrete during warm weather in accordance with ACI 305R. During warm weather, produce concrete at the lowest temperature practicable under the existing conditions. Cool the mixing water and/or aggregates, if necessary, to maintain a satisfactory placing temperature. Place concrete continuously and rapidly at a rate of not less than 30 m 100 feet of paving lane per hour. Keep the finished surfaces of newly placed pavement damp by applying a waterfog or mist with approved spraying equipment until the pavement is covered by the curing medium.

3.4 FINISHING

Start finishing operations immediately after placing, spreading and vibrating of the concrete. Finish by the machine method except that, as specifically approved, the hand method may be used for lanes 15 m 50 feet or less in length, minor amounts of narrow slabs, irregular slab widths or shapes and separate, isolated slabs during removal and replacement type repair operations. Maintain finishing equipment and tools clean and in an approved condition.

3.4.1 Machine Finishing - Fixed Forms

3.4.1.1 Equipment

Conform to applicable requirements specified in subparagraph: PAVER FIXED-FORM METHOD of paragraph: PLACING, SPREADING AND VIBRATING above. Check screed and float adjustments of these machines at the start of each day's paving operations and more often as required. When finishing machines ride the edge of a previously constructed slab, include provision to protect the surface of these slabs.

3.4.1.2 Transverse Finishing

As soon as placed, the concrete shall be accurately struck off and screeded to the crown and cross section shown and to such elevation that when consolidated and finished, the surface of the pavement will be free from porous places and will be at the required grade. Excessive manipulation that brings to the surface an excess of mortar and water will not be permitted. Keep the top of the form or pavement edge upon which the finishing machine travels clean.

3.4.1.3 Mechanical Floating

Operate the mechanical float to smooth and finish the pavement to grade and maintain surface contact at all times. Do not use rotating pipe or tube floats or finishers, such as: Clary screeds, rotating "bridge deck finishers" and similar equipment.
3.4.1.4 Other Types of Finishing Equipment

Except for rotating pipe or tube floats or finishers, concrete finishing equipment of types other than specified above may be used on a trial basis, when specifically approved. Replace equipment that fails to produce finished concrete of the required quality with the approved equipment before specified herein.

3.4.2 HAND FINISHING

3.4.2.1 Finishing and Floating

As soon as placed and vibrated, the concrete shall be struck off and screeded to the crown and cross section and to such elevation above grade that, when consolidated and finished, the surface of the pavement will be at the required elevation. Tamp the entire surface. Continue the tamping operation until the required compaction and reduction of internal and surface voids are accomplished. Immediately following the final tamping of the surface, float the pavement longitudinally from bridges resting on the side forms and spanning but not touching the concrete. If necessary, place and screed additional concrete, and the float operated until a satisfactory surface has been produced. Advance the floating operation to not more than half the length of the float, and the floating continued over the new and previously floated surfaces.

3.4.3 Surface Correction and Testing

After all other finishing is completed but while the concrete is still plastic, eliminate minor irregularities and score marks in the pavement surface by means of straight-edges. Use straightedges 3 m 10 feet in length rigidly constructed to prevent deflection in any direction during use, and operate from the sides of the pavement and from bridges. After straight-edge finishing appears complete, test the entire surface for trueness with a 3 m 10 foot straightedge held in successive positions parallel and at right angles to the centerline of the pavement, and the whole area covered as necessary to detect variations. Advance the straightedge along the pavement in successive stages of not more than one-half the length of the straightedge. Continue the straightedge testing and finishing until the entire surface of the concrete is free from observable departure from the straightedge and conforms to the surface requirements specified under subparagraph: SURFACE TESTS AND CORRECTIONS below.

3.4.4 Texturing

Before the surface sheen has disappeared and before the concrete becomes nonplastic, give the surface of the pavement a stiff broom finish.

3.4.5 Edging

After texturing has been completed, the edge of slabs along the forms, and at the joints, where indicated or directed, carefully finish with an edging tool to form a smooth rounded surface of the required radius. Eliminate tool marks, and the provide edges that are smooth and true to line.

3.5 FORM REMOVAL

Keep forms in place at least 12 hours after the concrete has been placed or for a longer period, if directed by the Contracting Officer. Remove forms
without injuring the concrete. Repair any concrete found defective after form removal promptly, using approved procedures.

3.6 CURING

3.6.1 General

Protect concrete against loss of moisture and rapid temperature changes for at least 7 days commencing immediately after finishing is complete. Protect unhardened concrete from rain and flowing water. Keep all equipment needed for adequate curing and protection of the concrete on hand and ready to use before actual concrete placement begins. If the curing materials and procedures used do not provide proper curing and protection against concrete cracking caused by temperature changes during the curing period, remove and replace the damaged pavement and employ another method of curing as directed.

3.6.2 Membrane Curing

Apply a uniform coating of white pigmented membrane curing compound to the entire exposed surface of the concrete as soon after finishing as free water has disappeared from the finished surface. Coat formed surfaces immediately after the forms are removed and in no case longer than 1 hour after removal of forms. Do not allow the concrete to dry before the application of the membrane. Apply the curing compound to the finished surfaces by means of an approved automatic spraying machine as soon as the free water has disappeared. Thoroughly and continuously agitate the curing compound in the drum used for the spraying operation mechanically throughout the full depth of the drum during the application. Air agitation may be used only to supplement mechanical agitation. Apply the curing compound with an overlapping coverage that will give a two-coat application at a coverage of not more than $10 \text{ square meters/Liter}$ or $400 \text{ square feet/gallon}$ for each coat. The application of curing compound by hand-operated pressure sprayers will be permitted only on odd widths or shapes of slabs where specifically approved, and on concrete surfaces exposed by the removal of forms. When application is made by hand-operated sprayers, apply the second coat in a direction approximately at right angles to the direction of the first coat. Respray curing compound that has pinholes, abrasions, or other discontinuities, that was subjected to heavy rainfall within 3 hours of application, or was damaged by subsequent construction operations by the method and at the coverage specified above. Take necessary precautions to insure that the concrete is properly cured at sawed joints, but that no curing compound enters the joints. Tightly seal the top of the joint opening and the joint groove at exposed edges by approved procedures using a temporary sealer or filler before the concrete in the region of the joint is resprayed with curing compound. Use the method for sealing the joint groove that prevents loss of moisture from the joint during the entire specified curing period. Provide approved standby facilities for curing concrete pavement at an accessible location at the jobsite for use in the event of mechanical failure of the spraying equipment or other conditions that might prevent correct application of the membrane curing compound at the proper time. Protect concrete surfaces to which membrane curing compounds have been applied adequately during the entire curing period from pedestrian and vehicular traffic, except as required for joint-sawing operations and surface tests, and from any other possible damage to the continuity of the membrane.
3.7 GRADE AND SURFACE-SMOOTHNESS REQUIREMENTS AND TESTS

3.7.1 General

Provide pavements that are smooth and true to grade and cross section. When tested with a 3 m 10 foot straightedge on lines 1.5 m 5 feet apart parallel with and at right angles to the centerline of the pavement, the surface shall not vary more than 6 mm 1/4 inch from the testing edge of the straightedge.

3.7.2 Surface Tests And Corrections

Not later than 24 hours after concrete has been placed, test the surface of the pavement in the presence of the Contracting Officer using an approved straightedge or other approved device that will reveal all surface irregularities varying from the testing edge exceeding tolerances specified above for concrete pavements. Plainly mark high spots indicated by the testing edge in excess of applicable tolerances. Reduce high areas by approved methods or remove and replace the pavement at no cost to the Government.

3.8 TOLERANCES IN PAVEMENT THICKNESS

Provide pavements of the thicknesses indicated on the plans. Treat deficiencies in the thickness as described below.

3.8.1 Thickness Determination

Determine the anticipated thickness of the concrete prior to placement by passing a template through the formed section. When measurements indicate that the completed concrete section is deficient in thickness by more than 6 mm 1/4 inch, the deficient section will be removed, between regularly scheduled joints, and replaced at no cost to the Government.

3.9 FIELD TEST SPECIMENS

3.9.1 General

Except as modified hereinafter, perform tests to determine the slump, air content, and strength of the concrete in accordance with the requirements of ASTM C94/C94M. Complete tests for slump and air content each time cylinders are fabricated and at such other times as directed by the Contracting Officer.

3.9.2 Specimens for Strength Tests

Take compressive test cylinders not less than once a day nor less than once for each 190 cubic meters 250 cubic yards of concrete or fraction thereof. Take the samples of strength tests in accordance with ASTM C172/C172M. Mold and cure cylinders for acceptance tests in accordance with ASTM C31/C31M. Test cylinders in accordance with ASTM C39/C39M by an approved testing laboratory at no cost to the Government. Mold sufficient cylinders each time to provide two compressive-strength tests at each test age. Test ages are 7, 14, and 28 days.

3.10 JOINTS

**************************************************************************
NOTE: A joint layout plan should be provided with a
maximum just spacing of 3 m 10 feet. Panels should be as closed to square as possible.

3.10.1 General

Provide joints conforming to the details indicated and that are perpendicular to the finished grade of the pavement. Provide transverse expansion and contraction joints that are straight and continuous from edge to edge of the pavement.

3.10.2 Construction Joints

Install transverse construction joints at the end of each day's placing operations and at any other points within a paving lane when concrete placement is interrupted for 30 minutes or longer. Install transverse construction joints in the location of a planned joint.

3.10.3 Expansion Joints

Form expansion joints by means of a preformed filler material.

3.10.4 Contraction Joints

Provide transverse and longitudinal contraction joints of the weakened-plane, and constructed as indicated hereinafter in subparagraph: SAWED JOINTS. Construct longitudinal contraction joints by sawing a groove in the hardened concrete with a power-driven saw in conformance with subparagraph: SAWED JOINTS below, unless otherwise approved.

3.10.4.1 Sawed Joints

Construct sawed joints by sawing a groove in the concrete with a 3 mm 1/8 inch blade to full depth as indicated, without chipping, spalling, or tearing the concrete adjacent to the joint. After expiration of the curing period, widen the upper portion of the groove by sawing to the width and depth indicated. Vary the time of sawing depending on existing and anticipated weather conditions, and such as to prevent uncontrolled cracking of the pavement. Saw the joints at the required spacing consecutively in the sequence of the concrete placement. Do not vary the saw cut by more than 13 mm 1/2 inch from the true joint alignment. Do not saw joints if a crack has occurred near the joint location and discontinue sawing when a crack develops ahead of the saw cut. Immediately after joint is sawed, thoroughly flush the saw cut and adjacent concrete surface with water until all waste from sawing is removed from the joint. Seal the top of the joint opening immediately as specified in subparagraph: MEMBRANE CURING. Provide an ample supply of saw blades and at least one standby sawing unit in good working order at the jobsite at all times during concrete paving operations.

3.10.4.2 Sealing Joints

**************************************************************************
NOTE: In Section 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT, ASTM D5893/D5893M (Silicone) should be specified for all dikes and basins. Surfaces sloping 6h:1v or greater should be type NS (non-sag).
**************************************************************************
Seal joints immediately following curing of the concrete, or as soon as weather conditions permit, as directed. Accomplish sawing of the reservoir or space for seals, immediately before sealing of the joints. Perform sawing by a multi-blade concrete saw. Perform sawing to the width specified and to the depth indicated in one pass. Readily adjust the cutting unit for width by the addition and removal of spacers or by other suitable means. Equip the machine with a mechanical guide which will keep the cutting unit aligned so as to cut equal widths from each side of the joint groove.

a. Sealing Dike Berms: Seal the joints in the concrete dike berms with a non-sag type fuel resistant sealant as specified in SECTION 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT.

b. Sealing Dike Basins: Seal joints in the concrete surface within the diked areas with fuel resistant sealant as specified in SECTION 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT.

3.11 PAVEMENT PROTECTION

Protect the pavement against all damage, prior to final acceptance of the work by the Government. No vehicular traffic will be allowed on the 100 mm 4 inch concrete pavement at any time.

3.12 REPAIR OF DAMAGED SLABS

Repair new pavement slabs that are broken, have spalled edges, or contain cracks as specified hereinafter at no cost to the Government.

3.12.1 Cracked Slabs

Rout and seal cracks in reinforced slabs in accordance with Section 32 01 19.61 SEALING OF JOINTS IN RIGID PAVEMENT. Do not epoxy inject these cracks.

3.12.2 Spalled Slabs

Where directed, repair spalls along joints of new slabs, along edges of adjacent existing concrete, and along parallel cracks by first making a vertical saw cut at least 25 mm 1 inch outside the spalled area and to a depth of at least 50 mm 2 inches. Provide straight line saw cuts forming rectangular areas. Chip out the concrete between the saw cut and the joint, or crack, to remove all unsound concrete and into at least 13 mm 1/2 inch of visually sound concrete. For patching materials and construction requirements, see Section 32 01 29.61 PARTIAL DEPTH PATCHING OF RIGID PAVING.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for Pervious Portland cement concrete paving such as roads, streets, sidewalks, and parking lots.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Pervious concrete is a near-zero-slump, open-graded material consisting of portland cement, coarse aggregate, little or no fine aggregate, admixtures, and water. The combination of these ingredients produces a hardened material with connected pores that allow water to pass through easily. Pervious concrete is recognized as a sustainable building material, as it reduces storm water runoff, improves storm water quality, may recharge groundwater supplies, and can reduce the impact of the urban heat island (albedo) effect.

NOTE: The extent and location of the work to be accomplished should be indicated on the project drawings, or included in the project.
Pervious Portland cement pavements for airfields are not included in this specification.

Pervious concrete paving may be used on site pavements, provided there is documented evidence of successful past performance for similar applications. Parking lots are generally good pervious pavement applications. Typical thicknesses range from 150 to 250 mm (6 to 10 inches).

Permeable pavements may not be used in areas where there is potential to contaminate existing soils, such as fuel areas, industrial storage, marina, vehicle maintenance or service areas. Do not install pervious pavement systems in areas subject to high wheel loads (such as aircraft, ground support equipment, forklifts, and heavy truck traffic) or the special military vehicles listed in UFC 3-201-01, paragraph 4-1.

Consult industry practice for cold regions, arid regions, and regions with high wind erosion. Pervious concrete in freezing areas should be designed with adequate base thickness to ensure that water does not remain in the pavement layer during freezing conditions.

PART 1   GENERAL

1.1   UNIT PRICES

NOTE: Delete this paragraph when the work is covered by a lump-sum contract price.

1.1.1   Measurement

Measure the quantity of pervious concrete paving, completed and accepted, in [square][cubic] meters [square][cubic] yards. Determine the volume of pervious concrete paving, in place and accepted, by the average job thickness obtained in accordance with paragraph FIELD QUALITY CONTROL and the dimensions indicated.

1.1.2   Payment

The quantity of completed and accepted pervious concrete paving will be paid for at the contract unit price, which will constitute full compensation for the construction and completion of the pervious concrete paving, including the test section, and the furnishing of all other necessary labor and incidentals.

1.2   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in
the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
Curing Materials
SD-04 Samples
Test Section
SD-05 Design Data
Mix Design Report; G[, [_____]]
SD-06 Test Reports
Concrete Density Tests
Field Infiltration Tests
Surface Smoothness
Core Thickness
Plan Grade

SD-07 Certificates

NRMCA Certificate Of Conformance

1.4 QUALITY CONTROL

1.4.1 NRMCA Certificate of Conformance

Provide a batching and mixing plant consisting of a stationary-type central mix plant, including permanent installations and portable or relocatable plants installed on stable foundations. Provide a plant designed and operated to produce concrete within the specified tolerances, with a minimum capacity of 200 cubic meters 250 cubic yards [_____] per hour. Submit NRMCA Certificate of Conformance that conforms to the requirements of NRMCA QC 3 including provisions addressing:

1. Material Storage and Handling
2. Batching Equipment
3. Central Mixer
4. Ticketing System
5. Delivery System

1.4.2 Qualifications

1.4.2.1 Laboratory Accreditation

Perform sampling and testing using an approved commercial testing laboratory or on-site facility that is accredited in accordance with ASTM C1077. Maintain this certification for the duration of the project.

1.4.2.2 Field Technicians

Provide field technicians meeting one of the following criteria:

a. Provide at least one National Ready Mixed Concrete Association (NRMCA) certified pervious concrete craftsman on site, overseeing each placement crew during all concrete placement.

b. Provide no less than three NRMCA certified pervious concrete installers on site working as members of each placement crew during all concrete placement.
1.5 DELIVERY AND STORAGE

In accordance with ACI 522.1

1.6 ACCEPTANCE

1.6.1 Tolerances

Acceptance of pervious concrete paving is based on compliance with the tolerances presented in Table 1. Remove and replace pervious concrete paving represented by the failing tests or submit repair plan for approval.

1.6.2 Test Section

Construct a minimum 37 square meters 400 square feet test section to demonstrate typical joints, surface finish, texture, color, infiltration rate, thickness, density, and standard of workmanship. Place test section using the mixture proportions, materials, and equipment as proposed for the project. Test in accordance with requirements in subpart FIELD QUALITY CONTROL.

When a test section does not meet one or more of the tolerances in Table 1, remove and replace the test section. If the test section is acceptable, it may be incorporated into the project.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Cementitious Materials

**************************************************************************
NOTE: Coal fly ash and slag are EPA designated recovered products to be ingredients in concrete and cement. Use materials with recycled content where appropriate for use. The following section allows a
percentage range of supplementary cementitious materials (SCM). Consult agency Subject Matter Expert (SME) for guidance on choice.

Select first sentence in brackets to require the use of SCMs. Select the second option in brackets to permit the use of SCMs.

[Provide cementitious materials in concrete mix with 20 to 50 percent non-portland cement pozzolanic materials by weight.] [Provide cementitious materials consisting of portland cement, [blended cement] or only portland cement in combination with supplementary cementitious materials (SCM), that conform to appropriate specifications listed below. New submittals are required when the cementitious materials sources or types change.]

2.1.1.1 Portland Cement

ASTM C150/C150M, Type I or II [or V] [low alkali].

2.1.1.2 Blended Cement

Provide blended cement conforming to ASTM C595/C595M, Type IP or IS, including the optional requirement for mortar expansion [and sulfate soundness]. Provide pozzolan added to the Type IP blend consisting of ASTM C618 Class F or Class N and that is interground with the cement clinker. Include in written statement from the manufacturer that the amount of pozzolan in the finished cement does not vary more than plus or minus 5 percent by mass of the finished cement from lot to lot or within a lot. Do not permit the percentage and type of mineral admixture used in the blend to change from that submitted for the aggregate evaluation and mixture proportioning. The requirements of paragraph SUPPLEMENTARY CEMENTITIOUS MATERIALS (SCM) CONTENT do not apply to the SCM content of blended cement.

2.1.1.3 Fly Ash and Pozzolan

******************************************************************************
NOTE: Class C fly ash is not permitted for paving concrete. Use loss on ignition not exceeding 3 percent for frost areas to reduce carbon interference with air entraining admixture.
******************************************************************************

ASTM C618, Type F or N, including the optional requirement for uniformity, with a loss on ignition not exceeding [3] [6] percent. Provide Class F fly ash for use in mitigating Alkali-Silica Reactivity with a total equivalent alkali content less than 3 percent.

2.1.1.4 Ultra Fine Fly Ash and Ultra Fine Pozzolan

Provide Ultra Fine Fly Ash (UFFA) and Ultra Fine Pozzolan (UFP) that conforms to ASTM C618, Class F or N, and the following additional requirements:

a. The strength activity index at 28 days of age of at least 95 percent of the control specimens.

b. The average particle size not exceeding 6 microns.
2.1.1.5 Slag

ASTM C989/C989M, Slag Cement (formerly Ground Granulated Blast Furnace Slag) Grade 100 or 120.

2.1.1.6 Supplementary Cementitious Material (SCM) Content

******************************************************************************
NOTE: Select first sentence in brackets for mandatory use of SCMs. Select second sentence in brackets of optional use of SCMs. Consult agency SME for guidance on choice.
******************************************************************************

[Provide a concrete mix that contains one of the SCMs listed in Table 2 within the range specified therein, whether or not the aggregates are found to be reactive in accordance with paragraph ALKALI REACTIVITY TEST.] [Use of one of the SCMs listed below is optional, unless the SCM is required to mitigate ASR.]

<table>

</tbody>
</table>

2.1.2 Water

Water conforming to ASTM C1602/C1602M.

2.1.3 Aggregates

2.1.3.1 Durability

Evaluate and test all aggregates to be used in all concrete for durability in accordance with ASTM C98. Provide fine and coarse aggregates with a maximum of 18 percent loss when subjected to 5 cycles using Magnesium Sulfate or a maximum of 12 percent loss when subjected to 5 cycles using Sodium Sulfate.
2.1.3.2 Alkali Reactivity Test

**************************************************************************
NOTE: Documentation of alkali reactivity testing is required for all aggregate sources.
**************************************************************************

Evaluate the fine and coarse aggregates separately, using ASTM C1260. Reject individual aggregates with test results that indicate an expansion of greater than 0.10 percent at 16 days after casting, or perform additional testing as follows: utilize the proposed low alkali portland cement, blended cement, and SCM in combination with each individual aggregate in accordance with ASTM C1567. Determine the quantity that meets all the requirements of these specifications and that lowers the expansion equal to or less than 0.10 percent at 16 days after casting. Base the mixture proportioning on the highest percentage of SCM required to mitigate ASR-reactivity. If any of the above options does not lower the expansion to less than 0.10 percent at 16 days after casting, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing for evaluation and acceptance.

2.1.3.3 Fine Aggregates

Provide fine aggregate conforming to the quality and grading requirements of ASTM C33/C33M.

2.1.3.4 Coarse Aggregates

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.
**************************************************************************

Provide coarse aggregate consisting of crushed or uncrushed gravel, crushed stone, or a combination thereof meeting the requirements of ASTM C33/C33M and containing a minimum of 25 percent recycled porcelain, concrete, stone, or other recycled material complying with ASTM D6155. Deliver aggregates to the mixers consisting of clean, hard, uncoated particles. Wash aggregate sufficient to remove dust and other coatings.

**************************************************************************
NOTE: For pervious concrete, use No.67 (19 mm to 4.75 mm) (3/4 inch to No.4), No. 7 (12.5 mm to 4.75 mm) (1/2 inch to No. 4), No.8 (9.5 mm to 1.2 mm) (3/8 inch to No.16) or No.89 (9.5 mm to 0.30 mm) (3/8 inch to No. 50) to provide 15 percent to 20 percent optimum void factor in hardened concrete.

Gradations No. 8 and No. 89 are commonly used for parking lot and pedestrian walkway applications. The larger aggregate (No. 67) provides a more
pervious pavement structure, but with a rougher surface finish and is less suited for pedestrian areas. Gradation No 67 is recommended for vehicle pavements.

NOTE: Select class 4M for exterior concrete exposed to frequent wetting in moderate weathering regions. Select class 4S for exterior concrete exposed to frequent wetting in severe weathering regions.

b. Quality: ASTM C33/C33M, Class [4M] [4S].

2.1.4 Chemical Admixtures

2.1.4.1 Water Reducing and Retarding Admixtures

ASTM C494/C494M: Type A, water reducing; Type B, retarding; Type C, accelerating; Type D, water-reducing and retarding; and Type E, water reducing and accelerating. Acceptance is based on 28 day physical properties. Do not use calcium chloride admixtures.

2.1.4.2 Air Entraining Admixture

Air entraining admixture conforming to ASTM C260/C260M.

2.1.4.3 Hydration Retarding Admixture

Hydration retarding admixture conforming to ASTM C494/C494M, Type B, retarding, or Type D, water-reducing and retarding.

2.1.5 Curing Materials

2.1.5.1 Polyethylene Sheet

Provide curing materials conforming to ASTM C171, 0.15 mm 0.006 inch clear or white opaque polyethylene cut to a minimum of 600 mm 24 inches wider than full placement width, for curing of pervious concrete.

2.1.6 Edge Restraints

Provide edge restraints consisting of concrete curb sections [____].

2.1.7 Riser Strips

Provide wood strips of thickness to accommodate the initial strike off and consolidation of the pervious concrete.

2.2 MIX DESIGN

NOTE: Pervious concrete is air-entrained per manufacturer's recommendations for freeze thaw durability. However, due to the open void structure of the material, air content cannot be measured by
standard ASTM test procedures.

The urban heat island effect forms as vegetation is replaced by low reflectivity materials such as dark colored paving. These surfaces absorb, rather than reflect, the sun’s heat, causing surface temperatures and urban ambient temperatures to be one to 6 degrees C 2 to 10 degrees F hotter than surrounding rural areas.

Mitigation of heat island effect is not required by UFC 1-200-02 but may be desired for sustainability reasons. The albedo requirements below for roads and parking lot paving are most beneficial in ASHRAE climate zones 1 through 5. Retain the bracketed sentence when needed to include solar reflectance criteria.

Design pervious concrete mix in accordance with ACI 522.1 to meet the following criteria: the water/cementitious materials ratio within the range of 0.26-0.40 and the air voids of freshly mixed pervious concrete within the range of 18 to 22 percent, as measured in accordance with ASTM C1688/C1688M. Provide air entrainment in freeze-thaw environments.[ Provide system with a minimum initial Solar Reflectance of at least 0.33 as tested in accordance with ASTM C1549.]

2.2.1 Mix Design Report

Perform trial design batches, mixture proportioning studies, testing, and include test results demonstrating that the proposed mixture proportions produce pervious concrete of the qualities indicated. Submit test results in a mix design report to include:

a. Aggregate gradations and plots.

b. Aggregate quality test results, including deleterious materials and ASR tests.

c. Mill certificates for cement and supplemental cementitious materials.

d. Certified test results for all admixtures.

e. Recommended proportions and volumes for proposed mixture.

f. Water/cementitious materials ratio and air voids.

g. Narrative discussing methodology on how the mix design was developed.

2.2.2 Mix Verification

Mix verification tests may be performed by the Government. Provide quantities of cementitious materials, aggregates and admixtures as requested. Verification tests may be conducted on the proposed mix design proportions to confirm the fresh concrete air voids content. An existing mix design may be submitted if developed within the previous 12 months.
2.3  EQUIPMENT

All plant, equipment, and tools used in the performance of the work will be subject to approval before the work is started. Maintain all plant, equipment, and tools in satisfactory working condition at all times.

2.3.1  Compaction Equipment

2.3.1.1  Pipe Roller

A steel pipe roller or a motorized or hydraulically actuated rotating tube screed spanning the width of the section placed.

2.3.1.2  Plate Compactor

Compact small areas using a standard soil plate compactor that has a base area of at least \(0.2\) square meters \(\text{two square feet}\) and exerts a minimum of \(69\) kPa \(10\) psi vertical pressure on the pavement surface (through a temporary cover of \(19\) mm \(3/8\) inch thick plywood).

2.3.2  Vibratory Screed

Truss mounted vibratory screed, adjustable in length to span the paving lane. Provide capability to adjust the vibration along the screed length and compact the full depth of the pervious concrete thickness.

2.3.3  Jointing Tool

Provide a jointing tool consisting of a "pizza cutter roller" to which a beveled fin with a minimum depth of \(1/4\) the thickness of the slab has been welded around the circumference of a steel roller.

2.3.4  Concrete Saw

Provide equipment for sawing joints and for other sawing of concrete consisting of standard diamond-type concrete saws mounted on a wheeled chassis which can be easily guided to follow the required alignment. Provide diamond tipped blades. Provide spares as required to maintain the required sawing rate.

2.3.5  Straightedge

Furnish one \(4\) m \(12\) foot straightedge constructed of aluminum or magnesium alloy, having blades of box or box-girder cross section with flat bottom, adequately reinforced to insure rigidity and accuracy. Provide handles for operation on the pavement.

PART 3  EXECUTION

3.1  PREPARATION FOR PERVIOUS PAVING

Verify the underlying material, upon which pervious concrete is to be placed is clean, damp, and free from debris, waste concrete or cement, frost, ice, and standing or running water. Correct soft, yielding areas and ruts or other irregularities in the surface. Loosen material in the affected areas and remove unsatisfactory material. Add approved select material where directed. Shape the area to line, grade, and cross section, and compact to the specified density. [ Conform Subgrade to Section 31 00 00 EARTHWORK.][ Conform Base course to Section 32 11 20 [BASE COURSE FOR
3.2 WEATHER LIMITATIONS

3.2.1 Inclement Weather

Do not commence placing operations when heavy rain or other damaging weather conditions appear imminent. At all times when placing pervious concrete, maintain on-site sufficient waterproof cover and means to rapidly place it over all unhardened concrete or concrete that might be damaged by rain. Suspend placement of concrete whenever rain, high winds, or other damaging weather commences to damage the surface or texture of the placed unhardened concrete, washes cement out of the concrete, or changes the water content of the surface concrete. Immediately cover and protect all unhardened concrete from the rain or other damaging weather. Completely remove and replace any area damaged by rain or other weather full depth.

3.2.2 Cold Weather

Do not place concrete when ambient temperature is below 5 degrees C or when concrete is likely to be subjected to freezing temperatures within 24 hours without approval. If approval is granted, heat concrete materials so that the temperature of the concrete at placement is between 18 and 29 degrees C. Methods of heating materials are subject to approval. Do not use heated mixing water. Follow practices found in ACI 306.1.

3.2.3 Hot Weather

Maintain required concrete temperature in accordance with ACI 305.1 to prevent evaporation rate from exceeding 0.98 kg of water per square meter or 0.2 pound of water per square foot of exposed concrete per hour. Cool ingredients before mixing or use other suitable means to control concrete temperature and prevent rapid drying of newly placed concrete. After placement, use fog spray or other suitable means to reduce the evaporation rate. Start curing within 20 minutes of concrete discharge. Cool underlying material by sprinkling lightly with water before placing concrete.

3.3 CONCRETE PRODUCTION

Batch, mix, and deliver pervious concrete in accordance with ACI 522.1.

3.4 PAVING

3.4.1 Paving Plan

Submit for approval a paving plan identifying the following items:

a. A description of the placing and protection methods proposed when concrete is to be placed in or exposed to hot, cold, or rainy weather conditions.

b. A detailed paving sequence plan and proposed paving pattern showing all planned construction joints.

c. Plan and equipment proposed to control alignment of formed or sawn
joints within the specified tolerances.

3.4.2 Placing

Comply with guidelines set in ACI 522.1 for placement of pervious concrete, except as modified herein. Do not exceed a free vertical drop of 1.5 m (5 feet). Deposit concrete either directly from the transporting equipment or by conveyor onto the pre-wetted subgrade or subbase, unless otherwise specified. Do not place concrete on frozen subgrade or subbase. Deposit the concrete between the forms to an approximately uniform height. Do not allow foot traffic on the fresh concrete. Place concrete continuously at a uniform rate, without damage to the grade and without unscheduled stops except for equipment failure or other emergencies. If this occurs within 3 m (10 feet) of a previously placed expansion joint, remove concrete back to joint, repair any damage to grade, install a construction joint and continue placing concrete only after cause of the stop has been corrected. Spread the concrete using a come-along, square ended shovel, or rake. Strike off the concrete between forms using a vibrating screed. Other strike off devices may be submitted for Government approval. Remove riser strips immediately after strike off operations are complete.

3.4.3 Fixed Form Paving

Use steel forms, except that wood forms may be used for curves having a radius of 45 m (150 feet) or less, and for fillets. Forms may be built up with metal or wood, added only to the base, to provide an increase in depth of not more than 25 percent. Provide forms with the base width of the form not less than eight-tenths of the vertical height of the form, except that for forms 200 mm (8 inches) or less in vertical height, provide forms with a base width not less than the vertical height of the form. Provide wood forms for curves and fillets that are adequate in strength and rigidly braced. Provide forms and anchors suitable to resist lateral pressures from compaction. Set forms on firm material cut true to grade so that each form section when placed will be firmly in contact with the underlying layer for its entire base. Do not set forms on blocks or on built-up spots of underlying material. Prior to setting forms for paving operations, demonstrate the proposed form setting procedures at an approved location and do not proceed further until the proposed method is approved. Maintain forms in place at least 12 hours after the concrete has been placed. Remove forms without damaging the concrete.

3.4.4 Operation

When paving between or adjacent to previously constructed pavement, make provisions to prevent damage to the previously constructed pavement, including keeping the existing pavement surface free of any debris.

3.4.5 Compaction

Automatically control surface vibration so that it stops immediately as forward motion ceases. Do not permit excessive vibration. Tamp concrete in small, odd-shaped slabs or in locations inaccessible to the paver mounted vibration equipment. Do not use vibrators to transport or spread the concrete. After initial compaction, further smooth and compact concrete by means of hand-operated longitudinal rollers. Use rollers that are not less than 1.82 m (6 feet) long and 200 mm (8 inches) in diameter and stiffened to prevent flexing and warping. Operate the paving equipment to produce a thoroughly compacted concrete layer throughout, requiring no hand finishing, other than the use of jointing tools, except in very infrequent
3.5 FINISHING CONCRETE

Start finishing operations immediately after placement of concrete. Use finishing machine, except hand finishing may be used in emergencies and for concrete slabs in inaccessible locations or of such shapes or sizes that machine finishing is impracticable. Finish pavement surface on both sides of a joint to the same grade. Provide hand finishing equipment for use at all times.

3.5.1 Fixed Form Finishing

Strike off and screed concrete to the required [crown] [slope] and cross-section. When using a static roller for consolidation, stiffen the roller to prevent flexing and warping. Do not permit excessive operation over an area, which will result in an excess of mortar and water being brought to the surface.

3.5.1.1 Joint Finish

Before concrete is hardened, correct edge slump of pavement, exclusive of edge rounding, in excess of 6 mm 0.25 in. Finish concrete surface on each side of construction joints to the same plane, and correct deviations before newly placed concrete has hardened.

3.5.2 Edging

Immediately after consolidation and jointing, carefully finish slab edges, including edges at formed joints, with an edge having a radius of not less than 6 mm 0.25 inch. Clean by removing loose fragments and soupy mortar from corners or edges of slabs which have crumbled. Install edge restraints of pervious systems per the drawings and manufacturer's recommendations.

3.5.3 Jointing

Construct joints at the locations, depths, and width dimensions indicated on the project drawings or the approved shop drawings. Saw cut or use the jointing tool to form contraction joints in fresh concrete immediately after the concrete has been compacted to the specified depth and width. Extend expansion joints through the full depth of the pavement. Cut expansion material flush to grade after concrete has fully hardened and provide joint filler material as indicated or as approved on the shop drawings.

3.6 CURING

Cure pervious concrete for a minimum of 7 days. Protect concrete adequately from injurious action by sun, rain, flowing water, [frost,] mechanical injury, tire marks and oil stains, and do not allow it to dry out from the time it is placed until the expiration of the minimum curing periods specified herein. Maintain temperature of air next to concrete above 5 degrees C 40 degrees F for the full curing periods.

3.6.1 White-Polyethylene Sheet

Begin curing within 20 minutes of concrete discharge unless longer working time is approved. Lay sheets directly on concrete surface and overlap 300
mm 12 inches. Make sheeting not less than 600 mm 24 inches wider than concrete surface to be cured, and weight down on the edges, without using soil or debris, and over the transverse laps to form closed joints. Repair or replace sheets when damaged during curing. Check daily to assure sheets are soundly in place. If moisture evaporates, re-saturate concrete and replace polyethylene on pavement (limit re-saturation and re-placing no longer than 10 minutes per sheet).

3.7 FIELD QUALITY CONTROL

3.7.1 Sampling

Collect samples of fresh concrete in accordance with ASTM C172/C172M during each working day as required to perform tests specified herein.

3.7.2 Consistency Tests

Conduct concrete density tests on the fresh concrete in accordance with ASTM C1688/C1688M. Take samples for density determination from concrete during placement. Perform tests at the beginning of a concrete placement operation and for each batch (minimum) or every 40 cubic meters 50 cubic yards (maximum) of concrete to ensure that specification requirements are met.

3.7.3 Sample Cores

After a minimum of seven days following each placement, take three cores at random locations. Core hardened concrete panels in accordance with ASTM C42/C42M. Test thickness and density of the cores in accordance with ASTM C1542/C1542M and ASTM C1754/C1754M Drying Method B, respectively. Compute the tolerance for core thickness and density reported as the average of three cores of each test panel. Fill core holes with regular concrete or pre-mixed grout.

3.7.4 Field Infiltration Tests

After the curing period is complete, determine the infiltration rate of the pervious concrete in accordance with ASTM C1701/C1701M. Locate field infiltration tests at three random locations for each 930 square meters 10000 square feet of pervious concrete surface area. Determine the location of each test using GPS or other methods suitable to repeat testing during the life of the pavement. Submit the test results For Information Only.

3.7.5 Surface Testing

**************************************************************************
NOTE: Drawings should clearly show all pavement joint intersection elevations, and specific required deviations from a plane surface for such special features as crowns, drainage inlets, etc.
**************************************************************************

Perform surface testing for surface smoothness and plan grade as indicated below. Reference the measurements in accordance with paving lane identification and stationing, and submit a report within 24 hours after measurement is made. Upon conclusion of surface testing, submit a final report of surface testing, signed by a Registered Engineer, containing all surface measurements and a description of all actions taken to correct
3.7.5.1 Surface Smoothness Requirements

Provide the finished surfaces of the pavements with no abrupt change of 3 mm (1/8 inch) or more, and within the tolerances specified in Table 1 when checked with a 4 meter (12 foot) straightedge.

3.7.5.2 Surface Smoothness Testing Method

Test the surface of the pavement with the straightedge to identify all surface irregularities exceeding the tolerances specified above. Test the entire area of the pavement in both a longitudinal and a transverse direction on parallel lines approximately 4.5 m (15 feet) apart. Hold the straightedge in contact with the surface and move ahead one-half the length of the straightedge for each successive measurement. Determine the amount of surface irregularity by placing the straightedge on the pavement surface and allowing it to rest upon the two highest spots covered by its length and measuring the maximum gap between the straightedge and the pavement surface in the area between these two high points. Make the measurement of the gap with a steel spacer bar of rectangular section the same thickness as the allowable gap, and width of four times the nominal maximum aggregate size.

3.7.6 Plan Grade Testing and Conformance

Check each pavement category for conformance with plan grade requirements by running lines of levels to determine the elevation at locations on the pavement surface 4.5 meters (15 feet) on center.

3.8 Pavement Protection

Protect the pavement against all damage prior to final acceptance of the work. Do not stockpile aggregates, landscaping materials, or other construction materials on pervious concrete pavements. Keep all new and existing pervious pavement carrying construction traffic or equipment completely clean, and clean up spillage of concrete or other materials immediately upon occurrence. Remove dust, leaves and debris with a leaf blower or dry vacuum.

3.9 Open To Traffic

Do not open the pavement to vehicular traffic until the concrete has cured at least 7 uninterrupted days during which the ambient temperature has exceeded 13 deg C (55 deg F) or until the pavement is accepted.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for polychloroprene compression seals used for sealing joints of rigid pavements for airfields, roads, streets, hardstands, and other areas.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: For U.S. Air Force pavements, specify the uncompressed width of the seals to be used, and the width of the saw cut reservoir including tolerances. The minimum sawed joint seal reservoir width is 13 mm 1/2 in. The specified uncompressed seal width is twice the specified nominal saw cut reservoir width, i.e., for a 13 mm 1/2 in wide joint seal reservoir saw cut, specify a 25 mm 1 in uncompressed width joint seal.

Consider total joint opening and movement when
specifying the size of the joint and seal. Consider factors affecting the proper sizing of the joint seal to assure the seal remains within the allowable compression range and that the working range of the proposed seal is greater than the total movement of the joints. Follow the computational procedures in UFC 3-250-08FA Chapter 7, Appendix C. Factors to be considered are saw cut reservoir width including tolerances, maximum pavement thermal expansion and contraction, pavement shrinkage during curing and pavement temperature limitations during joint seal reservoir sawing.

Show on the drawings or specify in this section the compression joint seal size, general shape and dimensional tolerances, especially uncompressed seal width. Manufacturer's literature is helpful in determining the seal size with the anticipated joint movement.

1.1 UNIT PRICES

**NOTE: Delete paragraphs MEASUREMENT and PAYMENT for lump sum bidding.**

1.1.1 Measurement

Determine the quantity of each sealing item to be paid by measuring the length of in-place material that has been approved.

1.1.2 Payment

Make Payment at the Contract unit bid prices per unit length for the sealing items scheduled, including approved trail joint installation. Include in the unit bid prices the cost of labor, materials, the use of equipment, and tools required to complete the work.

1.2 REFERENCES

**NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.**

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project.
specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

U.S. ARMY CORPS OF ENGINEERS (USACE)

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding
Principles Validation or Third Party Certification
and as described in Section 01 33 00 SUBMITTAL
PROCEDURES.

Choose the first bracketed item for Navy, Air Force
and NASA projects, or choose the second bracketed
item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S"
classification. Submittals not having a "G" or "S" classification are [for
Contractor Quality Control approval.] [for information only. When used, a
code following the "G" classification identifies the office that will
review the submittal for the Government.] Submit the following in
accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
   Equipment
   Manufacturer's Instructions
SD-04, Samples
   Compression Seals; G[, [______]]
SD-06 Test Reports
   Test Requirements; G[, [______]]

1.4 QUALITY ASSURANCE

1.4.1 Trial Joint Seal and Lubricant/Adhesive Installation

Prior to the cleaning and sealing of the joints for the entire project,
preserve a test section at least 61 m 200 ft long at a designated location
in the project pavement, using the specified materials and the approved
equipment to demonstrate the proposed joint preparation and sealing of the
joints in the project. Following the completion of the trial length and
before another joint is sealed, the Government will inspect the trial
joints to determine that the materials and installation meet the
requirements specified. If materials or installation do not meet
requirements, remove the materials, and reclean and reseal the joints at no
cost to the Government. Do not seal other joints until the test
installation has been approved. If the trial section is approved, permit
the section to be incorporated into the permanent work. Seal other joints
in the manner approved for sealing the trial joint.

1.5 SAFETY

**************************************************************************
NOTE: Delete this paragraph if liquid oxygen (LOX)
equipment, storage, or piping is not within the
project area and renumber subsequent paragraphs. If
LOX equipment, storage, or piping is within the
project area, use continuously reinforced concrete
slabs within the 7.5 m 25 ft clear area of LOX to
reduce the number of joints. If joints cannot be
eliminated within the clear area, then clean the joints in the area and seal with a LOX compatible sealant that has been approved by Headquarters, U.S. Army Corps of Engineers (CEMP-ET) or the appropriate Air Force Major Command. The Major Command or CEMP-ET will be contacted to obtain a list of approved materials.

A MIXTURE OF LOX AND ORGANIC MATERIAL IS EXTREMELY FLAMMABLE, AND MAY SELF-IGNITE OR EXPLODE.

**************************************************************************

Do not place compression joint seals within 7.5 m 25 ft of liquid oxygen (LOX) equipment, LOX storage, or LOX piping.

1.6 DELIVERY, STORAGE, AND HANDLING

Inspect materials delivered to the jobsite for defects. Unload and store materials with a minimum of handling to avoid damage. Provide storage facilities that protect materials from weather and maintain materials within temperatures recommended by the manufacturer.

1.7 ENVIRONMENTAL REQUIREMENTS

Install materials only when the ambient temperature and the pavement temperature within the joint wall is at least 2 degrees C 35 degrees F and rising. Do not permit sealant installation if moisture or foreign material is observed in the joint.

PART 2 PRODUCTS

2.1 SYSTEM EQUIPMENT

Provide machines, tools, and equipment, for use in the performance of the work required by this section, approved before the work is started, and maintained in satisfactory condition. Submit list of proposed machines, tools, and equipment to be used in the performance of joint sealing, including descriptive data, [_____] days prior to use on the project.

2.1.1 Joint Cleaning Equipment

2.1.1.1 Concrete Saw

Provide a self-propelled power saw with water-cooled diamond saw blades for cutting joints to the depths and widths specified and for removing filler, existing old joint seal, or other material embedded in the joints or adhered to the joint faces.

2.1.1.2 Sandblasting Equipment

**************************************************************************

NOTE: Sandblasting equipment with a 6 mm 1/4 in nozzle requires at least 3880 L 137 cubic ft per minute of air to function efficiently. A larger nozzle would not serve a useful purpose in cleaning a joint.

**************************************************************************
Include with the sandblasting equipment an air compressor, hose, and a long-wearing venturi-type nozzle of proper size, shape, and opening. Do not permit the maximum nozzle opening to exceed 6 mm 1/4 in. Provide a portable air compressor capable of providing not less than 4200 L 150 cubic ft per minute and maintaining a line pressure of not less than 620 kPa 90 psi at the nozzle while in use. Use a compressor equipped with traps that maintains the compressed air free of oil and water. Use a nozzle with an adjustable guide that holds the nozzle aligned with the joint approximately 25 mm 1 in above the pavement surface and directs the blast to clean the joint walls. Adjust the height, angle of inclination, and the size of the nozzle to ensure satisfactory results.

2.1.1.3 Waterblasting Equipment

Include with the waterblasting equipment a trailer-mounted water tank, pumps, high-pressure hose, a wand with safety release cutoff controls, nozzle, and auxiliary water resupply equipment. Use a water tank and auxiliary water resupply equipment of sufficient capacity to permit continuous operations. Use pumps, hoses, wand, and nozzle of sufficient capacity to permit the cleaning of both walls of the joint and the pavement surface for a width of at least 13 mm 1/2 in on either side of the joint. Use a pressure gauge mounted at the pump that shows the pressure in kPa psi at which the equipment is operating.

2.1.2 Sealing Equipment

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

NOTE: Do not permit single-axle seal application equipment; this tool tends to cause excessive stretching and may cut or distort the seal. The following subparagraph may be added only for road, parking lot, and street pavements less than 1800 square m 2,000 square yds, and for airfield and tracked pavements less than 450 square m 500 square yds in area:

"Use a hand operated joint seal application equipment that is a two-axle, four-wheel machine that includes means for compressing and inserting the compression seal into the joint and a reel capable of holding one full spool of compression seal. Provide auxiliary equipment to coat both sides of the joint or the seal with lubricant/adhesive just prior to the installation of the compression seal."

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Install the compression seal by placing the compression seal to the prescribed depths and within the specified tolerances without cutting, nicking, twisting, or otherwise damaging the seal. Use equipment capable of placing the seal with not more than two percent longitudinal stretch or compression of the seal during installation. Use a machine that is an automatic self-propelled joint seal application equipment and engine powered. Use a machine that includes a reservoir for the lubricant/adhesive, a device for conveying the lubricant/adhesive in the proper quantities to the sides of the compression seal or the sidewalls of the joints, a reel capable of holding one full spool of compression seal, and a power-driven apparatus for feeding the joint seal through a compression device and inserting the seal into the joint. Include a guide
with the equipment to maintain the proper course along the joint being sealed. Operate the machine by an experienced operator.

2.1.3 Test Requirements

Submit certified copies of test results, [_____] days prior to use of material on the project. Sample, identify and test each lot of compression joint seal and lubricant/adhesive for conformance with the material specification.

a. A lot of compression seal consists of 1 day's production or 6,000 m
   20,000 linear ft for each cross section, whichever is less. A lot of
   lubricant/adhesive consists of 1 day's production. [Submit samples of
   the compression joint seal and lubricant/adhesive material to be tested
   by the Government. Do not permit use of material at the project prior
   to receipt of written notice that the materials meet the laboratory
   requirements.

b. The cost of testing the samples from each original lot supplied will be
   borne by the Government. If the samples fail to meet specification
   requirements, replace the materials represented by the sample and the
   new materials tested. Charge a cost of [_____] for Government testing
   of each lot of replacement material to the Contractor] [Testing of the
   compression joint seal and lubricant/adhesive material is the
   responsibility of the Contractor. Perform testing in an approved,
   independent laboratory, and submit certified copies of the test reports
   for approval [_____] days prior to the use of the materials at the
   jobsite.

c. Submit samples of each lot of material to be retained by the Government
   for possible future testing if the materials appear defective during or
   after application]. Provide additional samples of materials, in
   sufficient quantity to be tested, upon request. Base final acceptance
   on conformance to the specified test requirements and the performance
   of the in-place materials with respect to slipping down the joint or
   material coming out of the joint..

2.2 COMPRESSION SEALS

**************************************************************************
NOTE: The first statement will be selected for projects except where the project is less than 1200 m
4000 linear ft of compression joint seal material. When the project requires less than this amount of
seal material, the first statement can be deleted and the second statement used. The cost of testing
can be obtained from U.S. Army Engineer Waterways Experiment Station.

Allow the Contractor the option of the actual width of the joint seal. However, for guidance on unusual
circumstances, or for resealing joints in existing pavement that have to be sawed out to an extra
width, see UFC 3-250-08FA Chapter 7, "Standard
Practice for Sealing Joints and Cracks in Rigid and
Flexible Pavements."
**************************************************************************

Regardless of testing responsibility, submit 2.7 m 9 ft long samples of the
materials, [60] [_____] days prior to use on the project. Provide printed directions from the manufacturer on recommended installation criteria with the samples plus the manufacturer’s certification that the selected seal is recommended for the installation on this project. Use compression joint seal materials that are vulcanized elastomeric compound using polychloroprene as the only base polymer. Use material and manufactured seal in accordance with [ASTM D2628] [ASTM D2628 and COE CRD-C 548 where jet fuel and/or heat blast resistance is required] as tested by ASTM D412. Use a labyrinth seal for the joint seal. The uncompressed depth of the face of the compression seal (that is to be bonded to the joint wall) is greater than the uncompressed width of the seal, except that for seals 25 mm 1 in or greater in width, the depth need be only 25 mm 1 in or greater.

The actual width of the uncompressed seal for construction and contraction joints is [21 or 25] [_____] mm [0.75 or 1] [_____] in and for expansion joints is [32][_____] mm 1.25 [_____] in. The tolerance on the seal is plus 3 mm or minus 1.5 mm plus 1/8 in or minus 1/16 in.

2.3 LUBRICANT/ADHESIVE

Use a lubricant/adhesive for the compression elastomeric joint seal that is a one-component compound conforming to ASTM D2835.

PART 3 EXECUTION

**************************************************************************
NOTE: Joint openings of uniform cross section are essential to satisfactory installation of the compression joint seal. Saw openings to provide smooth vertical faces of consistent width, within specified tolerances. Nonuniformity in width or roughness causes variations in resistance of the joint seal to insertion and results in irregular depth of insertion, stretching, and a tendency of the joint seal to twist so that the top of the seal is not at the surface.

The proper preparation of joints with respect to the size of joint opening, required cleanliness of vertical and parallel joint faces, and uniform contact between the seal and the joint face can not be overemphasized. The neglect of these operations can result and has resulted in poor performance of joint seals. For the repair of concrete pavements adjacent to the joints, refer to UFC 3-270-01, and Section 32 01 29.61 PARTIAL DEPTH PATCHING OF RIGID PAVING.
**************************************************************************

3.1 PREPARATION OF JOINTS

Immediately before installation of the compression joint seal, clean the joints to remove laitance, filler, existing sealer, foreign material and protrusions of hardened concrete from the sides and upper edges of the joint space to be sealed. Clean by sandblasting or waterblasting and extend along pavement surfaces at least 13 mm 1/2 in on either side of the joint. After final cleaning and immediately prior to sealing, blow out the joints with compressed air and leave free of debris and water. Demonstrate that the selected cleaning operation meets the cleanliness requirements resulting in joint sidewalls that are clean and dry and exhibit newly
exposed concrete. Correct irregularities in the joint face which would prevent uniform contact between the joint seal and the joint face prior to the installation of the joint seal.

3.1.1 Sawing

**************************************************************************
NOTE: Requirements are based on giving the Contractor the option of using either nominal 21 mm 13/16 in or 25 mm 1 in wide compression seal. Select the required values from columns (3) and (4) of the following tables, based on the geographical area and the nominal sealant width to be used for this project.

The first table is metricated, followed by a similar tabulation in I-P units.

* Note in the project specifications to not install this seal in a saw cut less than 71/6 IN nor in an area if sawing at temperatures less than 50 degrees F.

The above tables are based on the following:

a. Tolerance from nominal specified width of uncompressed seal plus 3 mm 1/8 in and minus 1.5 mm 1/16 in.

b. Tolerance from nominal saw cut width plus or minus 1.5 mm 1/16 in.

c. Compress the compression seal at least 20 percent of its uncompressed width.

d. Do not permit compression seal to be compressed more than 60 percent of its uncompressed width (narrowest opening in hot weather is at least 40 percent of uncompressed seal width).

For unusual conditions and for resealing joints in existing pavements where the prepared joint is extra wide, compute values to insert in the blanks using the procedures given in UFC 3-250-08FA, Chapter 7, and the parameters given above. (Before the compression seal is used for resealing joints in existing pavements, it is common practice to resaw the joints, which provides a wider cavity. Hold the width of sawing to the same tolerance as specified for new pavements).
Clean and open joints to the specified width and depth by sawing. Immediately following the sawing operation, clean the joint faces and opening using a water jet to remove saw cuttings or debris remaining on the faces or in the joint opening. Install compression seal within 3 calendar days of the time the joint cavity is sawed. Provide a depth of the joint cavity in accordance with manufacturer's instructions. Where installation procedures are required in accordance with the manufacturer's recommendations, submit printed copies of manufacturers' instructions, [_____] days prior to use on the project. Center the saw cut for the joint seal cavity over the joint line. Provide the nominal width of the sawed joint seal cavity as follows:

a. If a nominal 20 mm 13/16 in wide compression seal is provided, the nominal width of the saw cut is [_____] mm in when the pavement temperature at the time of sawing is between [_____] and [_____] degrees C F. If the pavement temperature at the time of sawing is above this range, decrease the nominal width of the saw cut 1.5 mm 1/16 in. If the pavement temperature at the time of sawing is below this range, increase the nominal width of the saw cut 1.5 mm 1/16 in.

b. If a nominal 25 mm 1 in wide compression seal is provided, the nominal width of the saw cut is [_____] mm ins when the pavement temperature at the time of sawing is between [_____] and [_____] degrees C F. If the pavement temperature at the time of sawing is above this range, decrease the nominal width of the saw cut 1.5 mm 1/16 in. If the pavement temperature at the time of sawing is below this range, increase the nominal width of the saw cut 1.5 mm 1/16 in.

c. Measure the pavement temperature in the presence of the Contracting Officer. Make measurement each day before commencing sawing and when the temperature appears to be varying from the allowable sawing range.

Use a tolerance of plus or minus 1.5 mm 1/16 in for the actual width.

3.1.2 Sandblast Cleaning

**************************************************************************
NOTE: Delete this paragraph and paragraph entitled "SANDBLASTING EQUIPMENT" when sandblasting is prohibited.
**************************************************************************

Use a multiple pass sandblasting technique until the joint surfaces are free of dust, dirt, curing compound, or residue that might prevent ready insertion or uniform contact of the seal and bonding of the lubricant/adhesive to the concrete.

3.1.3 Waterblast Cleaning

**************************************************************************
NOTE: Waterblasting equipment varies considerably with respect to design of wand, nozzle, water pressure, and water volume depending upon the manufacturer. Consequently, the effectiveness of a particular set of equipment cannot be predicted. The joints may be waterblasted the previous day and cleaned with compressed air immediately prior to sealing. Inspect the joints to insure no foreign debris remains in the joint before sealing.
**************************************************************************
Use a multiple pass waterblast technique until the surfaces are free of dust, dirt, curing compound, or residue that might prevent ready insertion or uniform contact of the seal and bonding of the lubricant/adhesive to the concrete. After final cleaning and immediately prior to sealing, blow out the joints with compressed air and leave completely free of debris and water.

3.1.4 Rate of Progress

Limit sandblasting or waterblasting of joint faces to the length of joint that can be sealed during the same workday.

3.2 INSTALLATION OF THE COMPRESSION SEAL

**NOTE: Temperatures of the pavement and the atmosphere are not as critical for the installation of compression joint seals as they are for poured sealants. Therefore, lower temperatures are acceptable, and under some conditions sealing can proceed satisfactorily at temperatures lower than 2 degrees C 35 degrees F. However, joints should be dry to obtain maximum cementing of the lubricant/adhesive to the concrete and contact manufacturers for special instructions under cold conditions.**

Include the bracketed text in this paragraph on projects that the Contractor may not be familiar with this practice, predominantly OCONUS projects.

3.2.1 Time of Installation

Seal joints immediately within 3 calendar days of sawing the joint seal cavity and following concrete cure and the final cleaning of the joint walls. Provide open joints, ready for sealing that cannot be sealed under the specified conditions, with an approved temporary seal to prevent infiltration of foreign material. When rain interrupts the sealing operations, wash, clean with air pressure, and allow joints to dry prior to installing the lubricant/adhesive and compression seal.

3.2.2 Sequence of Installation

Seal longitudinal joints first, followed by transverse joints. Install seals in longitudinal joints so that transverse joint seals are intact from edge to edge of the pavement. Make intersections monolithic by use of joint seal adhesive and care in fitting the intersection parts together. Do not permit extender pieces of seal at intersections. Remove and replace seals falling short at the intersection with new seals at no additional cost to the Government. Require a poured sealant at the intersection where seals are required to change direction by more than 20 degrees. Provide poured sealant in accordance with compression seal manufacturer's
3.3 SEALING OF JOINTS

NOTE: Do not permit stretching of the compression joint seal beyond the specified maximum, as breaks in the seal could occur later.

It is also possible that if the maximum is exceeded, when the longitudinal joints are cut to install the transverse joints that the joint seal material returns to its natural length leaving openings in the final product. Conversely, placing the seal so that the compression seal is compressed longitudinally is also undesirable, as this practice tends to cause unsightly undulations and may exceed depth of installation tolerances.

Use the minimum depth of the seal 6 mm 1/4 in below the surface of the pavement to prevent treads of tracked vehicles from damaging the compression seal if tracked vehicles are to use the pavement. Revise depth of installation to read "10 mm, plus or minus 3 mm" "3/8 in, plus or minus 1/8 in." On airfield pavements a shallower depth of installation may be desired by the using agency, to reduce the accumulation of dust and debris on top of the compression seal, which could be ingested by aircraft engines. In such cases, revise the depth of installation to read "5 mm, plus or minus 3 mm" "3/16 in, plus or minus 1/8 in", if requested in writing by the using service major command. It is also recommended when the compression seal in the longitudinal intersections are being cut that a knife blade be used to reduce the possibility of damage to the compression seal on either side of the intersection.

Cover the sides of the joint seal or the sides of the joint with a coating of lubricant/adhesive and the seal installed as specified. Coat butt joints and seal intersections with liberal applications of lubricant/adhesive. Immediately removed lubricant/adhesive spilled on the pavement to prevent setting on the pavement.

Provide the in-place joint seal will be in an upright position and free from twisting, distortion, and cuts. Adjustments will be made to the installation equipment and procedure, if the stretch exceeds 1 percent. Remove and replace seals exceeding 2 percent stretch. Place the joint seal at a uniform depth within the tolerances specified. Remove and replace in-place joint seals which fail to meet the specified requirements with new joint seal at no cost to the Government.

Place the compression joint seal to a depth of 6 mm 1/4 in, plus or minus 3 mm 1/8 in, below the pavement surface except when the joint is beveled or has a radius at the surface, or unless otherwise directed. For beveled joints or joints with a radius at the surface, install the compression joint seal at a depth of 3 mm 1/8 in, plus or minus 3 mm 1/8 in, below the
bottom of the edge of the bevel or radius. Do not permit the seal to project above the surface of the pavement or above the edge of the bevel or radius.

Install the seal in the longest practicable lengths in longitudinal joints and cut at the joint intersections to provide continuous installation of the seal in the transverse joints. Permit the lubricant/adhesive in the longitudinal joints to set for 1 hour prior to cutting at the joint intersections to reduce the possibility of shrinkage. For transverse joints, the minimum length of the compression joint seal is the pavement width from edge to edge.

3.4 CLEAN-UP

Upon completion of the project, remove unused materials from the site, remove lubricant/adhesive on the pavement surface, and leave the pavement in clean condition.

3.5 QUALITY CONTROL PROVISIONS

3.5.1 Application Equipment

Inspect the application equipment to assure uniform application of lubricant/adhesive to the sides of the compression joint seal or the walls of the joint. If equipment causes cutting, twisting, nicking, excessive stretching or compressing of the seal, or improper application of the lubricant/adhesive, suspend the operation until causes of the deficiencies are determined and corrected.

3.5.2 Procedures

3.5.2.1 Quality Control Inspection

Provide quality control provisions during the joint cleaning process to prevent or correct improper equipment and cleaning techniques that damage the concrete. Cleaned joints will be approved by the Government prior to installation of the lubricant/adhesive and compression joint seal.

3.5.2.2 Conformance to Stretching and Compression Limitations

Determine conformance to stretching and compression limitations. Mark the top surface of the compression seal at 300 mm 1 ft intervals in a manner clear and durable to enable length determinations of the seal. After installation, measure the distance between the marks on the seal. If the stretching or compression exceeds 2 percent, remove the seal and replace it with new joint at no additional cost to the Government. Remove the seal up to the last correct measurement. Inspect the seal a minimum of once per [30] [120] m [100] [400] ft of seal for compliance to the shrinkage or compression requirements. Make measurements at the same interval to determine conformance with depth and width of installation requirements. Remove and replace compression seal that is not in conformance with specification requirements with new joint seal at no additional cost to the Government.

3.5.2.3 Pavement Temperature

Determine the pavement temperature by placing a thermometer in the initial saw cut for the joint and record the reading. Permit the thermometer to remain in the joint for an adequate time to provide a stable control
3.5.3 Acceptance

Inspect the joint sealing system (compression seal and lubricant/adhesive) for proper rate of cure and bonding to the concrete, cuts, twists, nicks and other deficiencies. Remove, waste and replace seals exhibiting defects prior to final acceptance of the project from the joint.

NOTE: This guide specification covers the requirements for constructing a concrete block pavement.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 PAYMENT PROCEDURES

NOTE: Delete this paragraph in fixed price Contracts.

1.1.1 Pavements

Pay per square m square ft of satisfactorily installed unit pavement surface including the units, cut units, bedding sand, and jointing sand.
1.1.2 Edge Restraint

Pay per lineal m ft of satisfactorily installed edge restraint.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN CONCRETE INSTITUTE (ACI)

ACI 301 (2016) Specifications for Structural Concrete
ACI 301M (2016) Metric Specifications for Structural Concrete

ASTM INTERNATIONAL (ASTM)

ASTM C140/C140M  (2020a) Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units
ASTM C936/C936M  (2020) Standard Specification for Solid Concrete Interlocking Paving Units

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the list provided, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor’s Quality Control System. Only add a “G” to an item if the submittal is sufficiently important or complex in...
context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-04 Samples

Field-Constructed Mock-Up; G

Concrete Paving Unit; G[, [_____]]

SD-06 Test Reports

Tests, Inspections and Verifications

SD-07 Certificates

Paving Unit Installer Field Supervisor; G

Provide a copy of an ICPI Concrete Paver Installer School Certification, including a record of completion from a PICP or Permeable Interlocking Concrete Pavement Installer Technician Course.

1.4 DELIVERY, STORAGE AND HANDLING

Deliver materials in manufacturer's original, unopened, undamaged container packaging with identification tags intact on each paver bundle. Coordinate delivery and paving schedule to minimize interference with normal use of buildings adjacent to paving. Deliver concrete pavers to the site in steel banded, plastic banded, or plastic wrapped bundles capable of transfer by forklift or clamp lift. Unload pavers at job site in such a manner that no
damage occurs to the product or to existing construction.

Stockpile jointing, bedding, base and subbase aggregates such that they do not segregate within each pile. Keep piles (1) free from standing water, (2) free of organic material, sediment, or debris, and (3) ready for placement. Store aggregates on paved surfaces. Do not store aggregates on exposed soil or grassed areas unless first covered with geotextile to keep the aggregates clean.

1.5 QUALITY ASSURANCE

1.5.1 Concrete Paver Installer Certification

A paving unit installer field supervisor with a certificate of completion from the Interlocking Concrete Pavement Institute (ICPI) Concrete Paver Installer School Certification is required.

1.5.2 Pre-Construction Meeting

Prior to starting work, hold a pre-construction meeting with the project engineer or other Government representative responsible for the project. Determine the following:

a. Delivery and storage locations for aggregates and concrete paving unit bundles;

b. Anticipated start date;

c. Starting point(s) and direction(s) of paving;

d. Methods for checking slopes and surface tolerances for smoothness and elevations;

e. Estimated daily production for installation of aggregates, edge restraints and paving units; and

f. Recording and reporting actual daily paving production, including identifying the site location and recording the number of bundles installed each day.

For machine assisted installation of paving units, review:

a. Concrete unit manufacturer's written method that explains processes for controlling paver dimensional tolerances, and

b. Diagram(s) of the concrete paver laying pattern and how the paver layers or clusters join together to provide a continuous pattern across the pavement surface.

1.5.3 Weather Requirements

Do not install paver units during rain or snow events or when jointing sand, bedding sand, base or subbase aggregates are frozen. Do not place base or subbase aggregates on frozen soil subgrades.
NOTE: Mechanized installations may require a larger field-constructed mock-up area.

1.5.4 Field-Constructed Mock-Up

Install paver units on a minimum 3 x 3 m 10 x 10 ft area to determine surcharge of the bedding layer, joint sizes, and lines, laying pattern, color and texture of the job. Use this area as the standard by which the work is judged. Subject to acceptance by Contracting Officer or project engineer, allow the mock-up to be retained as part of finished work. If mock-up is not retained, remove mock-up from the installation boundary and properly dispose of material.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Bedding and Jointing Sand

Use two separate sand gradations for the bedding layer and for the paver unit joints.

Prepare bedding sand and gradation in accordance with:

a. ASTM C33/C33M with a maximum amount passing the 0.075 mm No. 200 sieve of 1 percent.

b. A maximum loss of 8 percent in accordance with ASTM D7428 and a maximum loss of 7 percent in accordance with ASTM C88.

c. A minimum of 60 percent combined sub-angular and sub-rounded particle shapes in accordance with ASTM D2488

Prepare jointing sand gradation in accordance with:

a. ASTM C144 with a maximum of 100 percent passing the 1.18 mm No. 16 sieve and no more than 5 percent passing the 0.075 mm No. 200 sieve.

Prepare bedding and jointing sand in accordance with:

a. Material consisting of crushed sand, natural sand, or a combination of crushed and natural sand.

b. A minimum L.A. Abrasion of 40 percent when tested in accordance with ASTM C131/C131M and ASTM C535.

c. A minimum of 90 percent fractured faces in accordance with ASTM D5821.

d. Nonplastic when tested in accordance with ASTM D4318 and free of lumps, clay, vegetation, soft particles, sulphates, and other contaminants.

e. The following gradations, determined in accordance with ASTM C136/C136M and ASTM C117, using ASTM E11 sieve.

2.1.2 Concrete Paving Unit

**************************************************************************
NOTE: Allow color of unit to be specified. Check local availability of specific colors before specifying. Do not permit organic pigments to be used since they are unstable in the alkaline concrete environment and subject to weathering.
**************************************************************************

Submit a sample of five paving units prior to the start of the work. Also, a representative sample of not less than 15 units as directed by the Contracting Officer, from each lot of 20,000 concrete paving units or fraction thereof. Use concrete paving units that are in accordance with ASTM C936/C936M and [_____] thick, [_____] in color, and [_____] in shape. Use units with a pigmentation in accordance with ASTM C979/C979M.

2.1.3 Edge Restraints

2.1.3.1 Precast Concrete

**************************************************************************
NOTE: Minimum compressive strength of precast concrete at 28 days is 21 MPa 3,000 psi unless analysis requires some other value. Entrained air content of the fresh concrete is 6 percent plus or minus 1.5 percent in areas where freezing and thawing coverage is a design consideration. Delete this paragraph when this option is not retained.
**************************************************************************

Use the edge restraints made of precast Portland cement concrete elements with the dimensions shown on the plans. Use precast concrete having a compressive strength of not less than [_____] at 28 days and an entrained air content of not less than [_____].
2.1.3.2 Cast-in-Place Concrete

NOTE: Minimum compressive strength of cast-in-place concrete at 28 days is 21 MPa (3,000 psi) unless analysis requires some other value. Entrained air content of the fresh concrete is 6 percent plus or minus 1.5 percent in areas where freezing and thawing coverage is a design consideration. Delete this paragraph when this option is not retained.

Place edge restraints using Portland cement concrete with the dimensions shown in the plans. Use concrete in conformance with the requirements of ACI 301M, except that it has a compressive strength of not less than [_____] at 28 days and an entrained air content of not less than [_____].

2.2 TESTS, INSPECTIONS AND VERIFICATIONS

Submit a written report within seven (7) calendar days after completion of the work, covering the following testing which is required for each lot.

2.2.1 Paving Unit

NOTE: Require sampling of paving units prior to the start of the work for the purposes of verifying the color and shape of the units only when these considerations are critical to the project aesthetics. For jobs of less than 1000 square m (10,000 square ft) or for pavements not to be exposed to vehicular traffic, allow a manufacturer's certificate which certifies that the paving units meet the requirements of ASTM C936/C936M to be accepted in lieu of sampling and testing the units of each lot.

Conduct the tests prescribed by ASTM C936/C936M and the following tests on the remaining units of each sample from each lot.

2.2.1.1 Freezing and Thawing

NOTE: Allow the freezing and thawing test to be waived for climates not subject to freezing and thawing. For jobs of less than 1000 square m (10,000 square ft), allow a manufacturer's certificate which certifies that the paving units meet the requirements of this paragraph to be accepted in lieu of sampling and testing the units of each lot.

Determine the resistance to freezing and thawing in accordance with ASTM C1645/C1645M and check that the results meet the freeze-thaw requirements stated in ASTM C936/C936M.
2.2.1.2 Dimensional Tolerance

Sample and measure three paving units from each lot in accordance with ASTM C140/C140M. Do not permit the length and width of each unit in the sample to vary from other units in this or other lot samples by more than 1.6 mm 1/16 in. Do not permit the thickness of the unit in the sample to vary by more than 3.2 mm 1/8 in from the specified unit thickness.

2.2.1.3 Compressive Strength

Test three paving units in accordance with ASTM C140/C140M. Do not permit the average minimum compressive strength to be less than 55 MPa 8,000 psi with no individual unit less than 50 MPa 7,200 psi.

2.2.1.4 Retest

Notify the Contracting Officer if units fail to meet the specified requirements. In case the shipment fails the specified requirements, take another sample and new specimens selected from the retained lot for retesting, as directed by the Contracting Officer. Concrete paving unit retests are to be performed at the expense of the Contractor. In case the second set of specimens fails to meet the test requirements, reject the entire lot.

2.2.2 Bedding and Jointing Sand

Obtain representative samples of bedding and jointing sand in accordance with ASTM D75/D75M from each 75 cubic m 100 cubic yds of sand to be used in the project. If the sand fails to meet the gradation requirements take another sample and retest it at no cost to the Government. If this retest fails or if no second test is taken, reject the sand and remove from the job site.

PART 3 EXECUTION

**************************************************************************
NOTE: Use a base course for the block pavement that is a dense graded or bound material to avoid loss of the sands from the bedding layer. Properly grade and level the base course. A smoothness of no more than 10 mm 3/8 in deviation from a 3 m 10 ft straight edge is needed. Check the project specification for the pavement base course to ensure these requirements are met.
**************************************************************************

3.1 PREPARATION

3.1.1 Edge Restraint Location

Install the edge restraint as shown in the drawings prior to placement of the units.

3.1.2 Bedding Sand Layer

Spread the bedding sand evenly over the area to be paved and screed to an uncompacted average thickness of 25 mm 1 in with a tolerance for grade and surface smoothness of plus or minus 6 mm 1/4 in. Do not use this bedding sand to fill low areas that exceed the specified tolerance for the base.
Lease the sand uncompacted and do not disturb by pedestrian or vehicle construction traffic.

3.2 UNIT PLACEMENT

NOTE: Place paving unit subject to vehicular traffic in herringbone pattern, and this pattern can be specified here.

Place the paving units by hand or machine in the indicated pattern. Start the placement of paving units from a corner or straight edge and proceed forward over the undisturbed sand bedding layer. Do not permit the joints, excluding chamfer between paving units, to be less than 2 mm 1/16 in or more than 5 mm 3/16 in in width. After seating, check that the unit surface is flush or up to 6 mm 1/4 in above the edge restraint.

3.2.1 Unfilled Gaps

Fill gaps between paving units and the edge restraint, drainage structure, or other member that cannot be filled with a whole unit with a paving unit cut to fit the gap, except do not allow slivers and the minimum size of cut unit is be [____]. Use a hydraulic splitter, a masonry saw, or other device that accurately leaves a clean, vertical face without spalling for cutting. Do not accept a remaining gap between the unit and adjoining edge restraint, drainage structures, or other member that is greater than 6 mm 1/4 in. Cut or rearrange adjacent units to prevent this.

3.2.2 Seating Units

Seat the units in the bedding sand by compacting them with a minimum of three passes of a vibratory plate compactor, sized as follows: [____].

3.2.3 Jointing Sand

Sweep the jointing sand into joints and vibrate with a vibratory plate or vibratory roller compactor. Continue this process until sweeping and vibrating have filled joints with sand and further vibration cannot force additional sand into the joints. Sweep the coarser sand particles that did not enter the joint and remain on the surface and excess sand on the surface off the pavement.

3.2.4 Timing of Operations

Seating of units and placement of jointing sand can be done concurrently with unit placement. However, do not allow seating of units and placement of jointing sand within 1.5 m 5 ft of an unfinished edge of the pavement that is not supported by the edge restraint.

3.2.5 Final Rolling

NOTE: This paragraph can be deleted for light load pavements such as driveways or pedestrian walkways.

Roll the final finished paving unit surface with four passes of a vibratory or pneumatic roller with a static weight of not less than 4.5 metric tons.
10,000 lbs.

3.2.6 Construction Traffic

Do not allow construction traffic on the paving unit surface until the jointing sand has been placed and vibrated into the joints and debris and excess sand have been swept off.

3.3 SMOOTHNESS AND GRADE TOLERANCES

3.3.1 Smoothness

Do not allow a portion of the finished pavement surface to deviate by more than 10 mm 3/8 in from a 3 m 10 ft long metal straightedge placed on the pavement surface.

3.3.2 Unit Height

Check that the finished unit surface is either flush or up to 6 mm 1/4 in higher than edge restraints or drainage structures.

3.3.3 Grade

Check that the finished pavement is within 12 mm 1/2 in of the planned grade shown on the plans.

3.3.4 Remedial Action

Remove paver units and sand in those area not meeting the smoothness, unit height, or grade tolerance, adjust aggregate base grade, and relay the units and sand.

3.4 CLEANUP

Sweep the entire pavement surface and remove excess sand, units and debris from the project area.

3.5 MAINTENANCE

**************************************************************************
NOTE: Include this paragraph only if the project has aesthetic considerations where future maintenance has to exactly match the color of the block.
**************************************************************************

At the completion of work provide [_____] paving units matching those used in the project. Deliver these paving units stacked on pallets to a Base location provided by the Project Engineer.

NOTE: This guide specification covers the requirements for aggregate surfacing for roads, parking areas and Army airfields.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 UNIT PRICES

NOTE: Delete this paragraph for lump sum construction projects.

1.1.1 Measurement

Measure the quantity of aggregate surface course completed and accepted, as determined by the Contracting Officer, in [square] [cubic] meters yards. The [volume] [area] of aggregate surface course in-place and accepted will be determined by the [average job thickness obtained in accordance with paragraph LAYER THICKNESS and the] dimensions shown on the drawings.
1.1.2 Payment

Quantities of aggregate surface course, determined as specified above, will be paid for at the respective contract unit prices, which will constitute full compensation for the construction and completion of the aggregate surface course.

1.1.3 Waybills and Delivery Tickets

Submit copies of waybills and delivery tickets during progress of the work. Before the final payment is allowed, file certified waybills and certified delivery tickets for all aggregates actually used.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

AASHTO T 180 (2017) Standard Method of Test for Moisture-Density Relations of Soils Using a 4.54-kg (10-lb) Rammer and a 457-mm (18-in.) Drop

AASHTO T 224 (2010) Standard Method of Test for Correction for Coarse Particles in the Soil Compaction Test

ASTM INTERNATIONAL (ASTM)

1.3 DEGREE OF COMPACTION

Degree of compaction required, except as noted in the second sentence, is expressed as a percentage of the maximum laboratory dry density obtained by the test procedure presented in ASTM D1557 abbreviated as a percent of laboratory maximum dry density. Since ASTM D1557 applies only to soils that have 30 percent or less by weight of their particles retained on the 9.0 mm 3/4 inch sieve, the degree of compaction for material having more than 30 percent by weight of their particles retained on the 9.0 mm 3/4 inch sieve will be expressed as a percentage of the laboratory maximum dry density in accordance with AASHTO T 180 Method D and corrected with AASHTO T 224.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-03 Product Data**

- Plant, Equipment, and Tools; G[, [____]]
- Waybills And Delivery Tickets

**SD-06 Test Reports**

- Initial Tests; G[, [____]]
- In-Place Tests; G[, [____]]

### 1.5 EQUIPMENT, TOOLS, AND MACHINES

**NOTE:** If desirable, requirements for types of equipment applicable to methods of construction based on local conditions will be included.

All plant, equipment, and tools used in the performance of the work will be subject to approval by the Contracting Officer before the work is started. Maintain all plant, equipment, and tools in satisfactory working condition at all times. Submit a list of proposed equipment, including descriptive data. Provide adequate equipment having the capability of minimizing segregation, producing the required compaction, meeting grade controls,
thickness control, and smoothness requirements as set forth herein.

1.6 QUALITY ASSURANCE
Sampling and testing are the responsibility of the Contractor. Perform sampling and testing using a laboratory approved in accordance with Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL. Work requiring testing will not be permitted until the testing laboratory has been inspected and approved. Test the materials to establish compliance with the specified requirements and perform testing at the specified frequency. The Contracting Officer may specify the time and location of the tests. Furnish copies of test results to the Contracting Officer within 24 hours of completion of the tests.

1.6.1 Sampling
Take samples for laboratory testing in conformance with ASTM D75/D75M. When deemed necessary, the sampling will be observed by the Contracting Officer.

1.6.2 Testing
1.6.2.1 Sieve Analysis

1.6.2.2 Liquid Limit and Plasticity Index
Determine liquid limit and plasticity index in accordance with ASTM D4318.

1.6.2.3 Moisture-Density Determinations
Determine the laboratory maximum dry density and optimum moisture content in accordance with paragraph DEGREE OF COMPACTION.

1.6.2.4 Field Density Tests
Measure field density in accordance with ASTM D1556/D1556M, ASTM D2167 or ASTM D6938. For the method presented in ASTM D1556/D1556M use the base plate as shown in the drawing. For the method presented in ASTM D6938 check the calibration curves and adjust them, if necessary, using only the sand cone method as described in paragraph Calibration, of the ASTM publication. Tests performed in accordance with ASTM D6938 result in a wet unit weight of soil and ASTM D6938 will be used to determine the moisture content of the soil. Also check the calibration curves furnished with the moisture gauges along with density calibration checks as described in ASTM D6938. Make the calibration checks of both the density and moisture gauges using the prepared containers of material method, as described in paragraph Calibration of ASTM D6938, on each different type of material being tested at the beginning of a job and at intervals as directed. Submit calibration curves and related test results prior to using the device or equipment being calibrated.

1.6.2.5 Wear Test
Perform wear tests on aggregate surface course material in conformance with ASTM C131/C131M.
1.7 ENVIRONMENTAL REQUIREMENTS

**************************************************************************
NOTE: This paragraph may be deleted in localities where freezing temperatures do not occur, and elsewhere when it is definitely known that the work will not be carried on during periods when such temperatures are to be expected. Otherwise, this requirement will be retained, but the protective measures specified may be modified to suit local conditions and individual project requirements.
**************************************************************************

Perform construction when the atmospheric temperature is above 2 degrees C (35 degrees F). It is the responsibility of the Contractor to protect, by approved method or methods, all areas of surfacing that have not been accepted by the Contracting Officer. Bring surfaces damaged by freeze, rainfall, or other weather conditions to a satisfactory condition.

PART 2 PRODUCTS

2.1 AGGREGATES

**************************************************************************
NOTE: As written, this paragraph applies to general conditions. Other materials such as disintegrated granite, volcanic ash or cinders, limerock, and caliche will be specified when supported by adequate performance data. The requirement for soundness and percentage of wear will be deleted when local experience indicates the material is satisfactory.
**************************************************************************

Provide aggregates consisting of clean, sound, durable particles of natural gravel, crushed gravel, crushed stone, sand, slag, soil, or other approved materials processed and blended or naturally combined. Provide aggregates free from lumps and balls of clay, organic matter, objectionable coatings, and other foreign materials. The Contractor is responsible for obtaining materials that meet the specification and can be used to meet the grade and smoothness requirements specified herein after all compaction and proof
rolling operations have been completed.

2.1.1 Coarse Aggregates

**************************************************************************
NOTE: A percentage of wear other than 50 may be specified where experience indicates that the material is satisfactory.
**************************************************************************

The material retained on the 5 mm No. 4 sieve is known as coarse aggregate. Use only coarse aggregates that are reasonably uniform in density and quality. Use only coarse aggregate having a percentage of wear not exceeding 50 percent after 500 revolutions as determined by ASTM C131/C131M. The amount of flat and/or elongated particles must not exceed 20 percent. A flat particle is one having a ratio of width to thickness greater than three; an elongated particle is one having a ratio of length to width greater than three. When the coarse aggregate is supplied from more than one source, aggregate from each source must meet the requirements set forth herein.

2.1.2 Fine Aggregates

The material passing the 5 mm No. 4 sieve is known as fine aggregate. Fine aggregate consists of screenings, sand, soil, or other finely divided mineral matter that is processed or naturally combined with the coarse aggregate.

2.1.3 Gradation Requirements

Gradation requirements specified in TABLE I apply to the completed aggregate surface. It is the responsibility of the Contractor to obtain materials that will meet the gradation requirements after mixing, placing, compacting, and other operations. TABLE I shows permissible gradings for granular material used in aggregate surface roads and airfields. Use sieves conforming to ASTM E11.

</table>
2.2 LIQUID LIMIT AND PLASTICITY INDEX

The portion of the completed aggregate surface course passing the 0.425 mm No. 40 sieve must have a maximum liquid limit of 35 and a plasticity index of 4 to 9.

2.3 TESTS, INSPECTIONS, AND VERIFICATIONS

2.3.1 Initial Tests

Perform one of each of the following tests, on the proposed material prior to commencing construction, to demonstrate that the proposed material meets all specified requirements when furnished. Complete this testing for each source if materials from more than one source are proposed.

a. Sieve Analysis.

b. Liquid limit and plasticity index.

c. Moisture-density relationship.

d. Wear.

Submit certified copies of test results for approval not less than [30] [_____] days before material is required for the work.

2.3.2 Approval of Material

Tentative approval of material will be based on initial test results.

PART 3 EXECUTION

3.1 OPERATION OF AGGREGATE SOURCES

[Perform clearing, stripping, and excavating. Operate the aggregate sources to produce the quantity and quality of materials meeting these specification requirements in the specified time limit. Upon completion of the work, leave aggregate sources on Government property in a satisfactory condition so that they readily drain.] [Finalize aggregate sources on private lands in agreement with local laws or authorities.]

3.2 STOCKPILING MATERIAL

******************************************************************************

NOTE: In cases where material previously stockpiled under a separate contract is utilized in the construction of the aggregate surface course, this requirement will be included in the SPECIAL CONTRACT REQUIREMENTS of the specifications, and this paragraph will be modified as required.

******************************************************************************

Prior to stockpiling the material, clear and level the storage sites. Stockpile all materials, including approved material available from excavation and grading, in the manner and at the locations designated. Stockpile aggregates in such a manner that will prevent segregation. Stockpile aggregates and binders obtained from different sources separately.
3.3 PREPARATION OF UNDERLYING [COURSE] [SUBGRADE]

NOTE: The reference to the specification section that covers the preparation of the subgrade surface for the particular project will be included in this paragraph.

Clean the [underlying course] [subgrade] and shoulders of all foreign substances. Do not construct the surface course on [underlying course] [subgrade] that is frozen material. Correct ruts or soft yielding spots in the [underlying course] [subgrade], areas having inadequate compaction and deviations of the surface from the requirements set forth herein by loosening and removing soft or unsatisfactory material and by adding approved material, reshaping to line and grade and recompacting to density requirements specified in [Section 31 00 00 EARTHWORK] [Section 32 11 20 [BASE COURSE FOR RIGID] [AND ] [SUBBASES FOR FLEXIBLE] PAVING]. Do not allow traffic or other operations to disturb the completed [underlying course] [subgrade] and maintain in a satisfactory condition until the surface course is placed.

3.4 GRADE CONTROL

During construction, maintain the lines and grades including crown and cross slope indicated for the aggregate surface course by means of line and grade stakes placed by the Contractor in accordance with the SPECIAL CONTRACT REQUIREMENTS.

3.5 MIXING AND PLACING MATERIALS

NOTE: More details of applicable methods of placing, mixing, and spreading will be included when appropriate.

Mix and place the materials to obtain uniformity of the material and a uniform optimum water content for compaction. Make adjustments in mixing, placing procedures, or in equipment to obtain the true grades, to minimize segregation and degradation, to obtain the desired water content, and to ensure a satisfactory surface course.

3.6 LAYER THICKNESS

NOTE: When gravel surfaces are constructed less than 150 mm (6 inches) in total thickness, a deficiency of 13 mm (1/2 inch) in the thickness of any area of such paving is considered excessive. Applicable to job conditions, the thickness tolerance provisions may be modified as required, restricting all deficiencies to not more than 6 mm (1/4 inch).

Place the aggregate material on the [underlying course] [subgrade] in layers of uniform thickness. Compact the completed aggregate surface course to the thickness indicated. No individual layer may be thicker than
150 mm 6 inches nor be thinner than 75 mm 3 inches in compacted thickness. Compact the aggregate surface course to a total thickness that is within 13 mm 1/2 inch of the thickness indicated. Where the measured thickness is more than 13 mm 1/2 inch deficient, correct such areas by scarifying, adding new material of proper gradation, reblading, and recompacting as directed. Where the measured thickness is more than 13 mm 1/2 inch thicker than indicated, the course will be considered as conforming to the specified thickness requirements. The average job thickness will be the average of all thickness measurements taken for the job and must be within 6 mm 1/4 inch of the thickness indicated. Measure the total thickness of the aggregate surface course at intervals of one measurement for each [500] [_____] square meters yards of surface course. Measure total thickness using 75 mm 3 inch diameter test holes penetrating the aggregate surface course.

3.7 COMPACTION

Degree of compaction is a percentage of the maximum density obtained by the test procedure presented in ASTM D1557 abbreviated herein as percent laboratory maximum density. Compact each layer of the aggregate surface course with approved compaction equipment, as required in the following paragraphs. Maintain the water content during the compaction procedure at optimum or at the percentage specified by the Contracting Officer. Compact the mixture with mechanical tampers in locations not accessible to rollers. Continue compaction until each layer through the full depth is compacted to at least 100 percent of laboratory maximum density. Remove any materials that are found to be unsatisfactory and replace them with satisfactory material or rework them to produce a satisfactory material.

3.8 PROOF ROLLING

**************************************************************************
NOTE: When an aggregate surfacing is used in construction of Army Class IV airfields, this paragraph will be retained, and the extent of proof rolling will be shown on the drawings. When using the specifications for an aggregate surface course subjected to highway vehicular traffic such as roads, streets, and parking areas or for Army Class I, II, and III airfields, references to proof rolling will be deleted in paragraph AGGREGATES, and this paragraph will be deleted.
**************************************************************************

In addition to the compaction specified above, proof roll the designated areas by application of 30 coverages of a heavy rubber-tired roller having four tires abreast with each tire loaded to 13,600 kg 30,000 pounds and tires inflated to 1000 kPa 150 psi. In the areas designated, proof roll the top lift of layer on which surface course is laid and to each layer of the surface course. Maintain the water content of the lift of the layer on which the surface course is placed and each layer of the aggregate surface course at optimum or at the percentage directed from the start of compaction to the completion of a proof rolling. Remove and replace materials in the aggregate surface course or underlying materials indicated to be unacceptable by the proof rolling with acceptable materials as directed.
3.9 EDGES OF AGGREGATE SURFACE COURSE

Place approved material along the edges of the aggregate surface course in such quantity as to compact to the thickness of the course being constructed. Simultaneously roll and compact at least 300 mm 1 foot of shoulder width with the rolling and compacting of each layer of the surface course when the course is being constructed in two or more layers.

3.10 SMOOTHNESS TEST

Construct each layer so that the surface shows no deviations in excess of 10 mm 3/8 inch when tested with a 3 m 10 foot straightedge applied both parallel with and at right angles to the centerline of the area to be paved. Correct deviations exceeding this amount by removing material, replacing with new material, or reworking existing material and compacting, as directed.

3.11 FIELD QUALITY CONTROL

3.11.1 In-Place Tests

Perform each of the following tests on samples taken from the placed and compacted aggregate surface course. Take samples and test at the rates indicated.

a. Perform density tests on every lift of material placed and at a frequency of one set of tests for every 250 square meters square yards, or portion thereof, of completed area.

b. Perform sieve analysis on every lift of material placed and at a frequency of one sieve analysis for every 500 square meters square yards, or portion thereof, of material placed.

c. Perform liquid limit and plasticity index tests at the same frequency as the sieve analysis.

d. Measure the thickness of the aggregate surface course at intervals providing at least one measurement for each 500 square meters square yards of base course or part thereof. Measure the thickness using test holes, at least 75 mm 3 inch in diameter through the aggregate surface course.

3.11.2 Approval of Material

Final approval of the materials will be based on tests for gradation, liquid limit, and plasticity index performed on samples taken from the completed and full compacted aggregate surface course.

3.12 MAINTENANCE

Maintain the aggregate surface course in a condition that will meet all specification requirements until accepted.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for concrete sidewalks and curbs and gutters.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification may be adjusted to cover separate curbs and gutters or combination curbs and gutters. This guide specification will not be used for integral or monolithic curbs of concrete pavement or for curbs and gutters for bridges.

1.1 UNIT PRICES

NOTE: Delete unit price paragraphs when the work is covered by a lump-sum contract price.
1.1.1 Measurement

1.1.1.1 Sidewalks

The quantities of sidewalks to be paid for will be the number of square meters yards of each depth of sidewalk constructed as indicated.

1.1.1.2 Curbs and Gutters

The quantities of curbs and gutters to be paid for will be the number of linear meters feet of each cross section constructed as indicated, measured along the face of the curb at the gutter line.

1.1.2 Payment

1.1.2.1 Sidewalks

Payment of the quantities of sidewalks measured as specified will be at the Contract unit price per square meter yard of the thickness specified.

1.1.2.2 Curbs and Gutters

Payment of the quantities of curbs and gutters measured as specified will be at the Contract unit price per linear meter foot of each cross section.

1.2 REFERENCES

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Concrete

[ Biodegradable Form Release Agent]

SD-06 Test Reports
Field Quality Control

1.4 EQUIPMENT, TOOLS, AND MACHINES

1.4.1 General Requirements

Plant, equipment, machines, and tools used in the work will be subject to approval and must be maintained in a satisfactory working condition at all times. Use equipment capable of producing the required product, meeting grade controls, thickness control and smoothness requirements as specified. Discontinue using equipment that produces unsatisfactory results. Allow the Contracting Officer access at all times to the plant and equipment to ensure proper operation and compliance with specifications.

1.4.2 Slip Form Equipment

Slip form paver or curb forming machines, will be approved based on trial use on the job and must be self-propelled, automatically controlled, crawler mounted, and capable of spreading, consolidating, and shaping the plastic concrete to the desired cross section in one pass.

1.5 ENVIRONMENTAL REQUIREMENTS

1.5.1 Placing During Cold Weather

Do not place concrete when the air temperature reaches 5 degrees C 40 degrees F and is falling, or is already below that point. Placement may begin when the air temperature reaches 2 degrees C 35 degrees F and is rising, or is already above 5 degrees C 40 degrees F. Make provisions to protect the concrete from freezing during the specified curing period. If necessary to place concrete when the temperature of the air, aggregates, or water is below 2 degrees C 35 degrees F, placement and protection must be approved in writing. Approval will be contingent upon full conformance with the following provisions. Prepare and protect the underlying material so that it is entirely free of frost when the concrete is deposited. Heat [mixing water and aggregates] [mixing water] [aggregates] as necessary to result in the temperature of the in-place concrete being between 10 and 30 degrees C 50 and 85 degrees F. Methods and equipment for heating must be approved. Use only aggregates that are free of ice, snow, and frozen lumps before entering the mixer. Provide covering or other means as needed to maintain the concrete at a temperature of at least 10 degrees C 50 degrees F for not less than 72 hours after placing, and at a temperature above freezing for the remainder of the curing period.

1.5.2 Placing During Warm Weather

The temperature of the concrete as placed must not exceed 30 degrees C 85 degrees F except where an approved retarder is used. Cool the mixing water and aggregates as necessary to maintain a satisfactory placing temperature. The placing temperature must not exceed 35 degrees C 95 degrees F at any time.

PART 2 PRODUCTS

2.1 CONCRETE

Provide concrete conforming to the applicable requirements of [Section 03 30 00 CAST-IN-PLACE CONCRETE] [ASTM C94/C94M] except as otherwise specified. Concrete must have a minimum compressive strength of 24 MPa.
3500 psi at 28 days. Size of aggregate must not exceed 37.5 mm 1-1/2 inches. Submit copies of certified delivery tickets for all concrete used in the construction.

2.1.1 Air Content

**************************************************************************
NOTE: The air content specified is for concrete that will be subjected to freezing weather and the possible action of deicing chemicals. In climates where freezing is not a factor but where air entrainment is used in local commercial practice to improve the workability and placeability of concrete, concrete having air content percent of 4.5 plus or minus 1.5 percent may be specified as Contractor's option to non air-entrained concrete.
**************************************************************************

Use concrete mixtures that have an air content by volume of concrete of 5 to 7 percent, based on measurements made immediately after discharge from the mixer.

2.1.2 Slump

Use concrete with a slump of 75 mm 3 inches plus or minus 25 mm 1 inch for hand placed concrete or 25 mm 1 inch plus or minus 10 mm 1/2 inch for slipformed concrete as determined in accordance with ASTM C143/C143M.

2.1.3 Reinforcement Steel

**************************************************************************
NOTE: Reinforcement steel normally will not be required for curb and gutter construction. Where conditions exist that make it advantageous to use reinforcement steel, include the reinforcing steel details in the drawings, and include the following paragraphs in the Contract specification.
**************************************************************************

Use reinforcement bars conforming to ASTM A615/A615M. Use wire mesh reinforcement conforming to ASTM A1064/A1064M.

2.2 CONCRETE CURING MATERIALS

2.2.1 Impervious Sheet Materials

Use impervious sheet materials conforming to ASTM C171, type optional, except that polyethylene film, if used, must be white opaque.

2.2.2 Burlap

Use burlap conforming to AASHTO M 182.

2.2.3 White Pigmented Membrane-Forming Curing Compound

Use white pigmented membrane-forming curing compound conforming to ASTM C309, Type 2.
2.3 CONCRETE PROTECTION MATERIALS

Use concrete protection materials consisting of a linseed oil mixture of equal parts, by volume, of linseed oil and either mineral spirits, naphtha, or turpentine. At the option of the Contractor, commercially prepared linseed oil mixtures, formulated specifically for application to concrete to provide protection against the action of deicing chemicals may be used, except that emulsified mixtures are not acceptable.

2.4 JOINT FILLER STRIPS

2.4.1 Contraction Joint Filler for Curb and Gutter

Use hard-pressed fiberboard contraction joint filler for curb and gutter.

2.4.2 Expansion Joint Filler, Premolded

**************************************************************************
NOTE: Either type of joint sealer may be specified if determined necessary by the Contracting Officer and the inapplicable publication removed. Joint sealing material may be omitted where sealing of expansion joints is not deemed essential or advisable.
**************************************************************************

Onless otherwise indicated, use 13 mm 1/2 inch thick premolded expansion joint filler conforming to ASTM D1751 or ASTM D1752.

2.5 JOINT SEALANTS

Use cold-applied joint sealant conforming to ASTM C920 or ASTM D5893/D5893M.

2.6 FORM WORK

Design and construct form work to ensure that the finished concrete will conform accurately to the indicated dimensions, lines, and elevations, and within the tolerances specified. Use wood or steel forms that are straight and of sufficient strength to resist springing during depositing and consolidating concrete.

2.6.1 Wood Forms

Use forms that are surfaced plank, 50 mm 2 inches nominal thickness, straight and free from warp, twist, loose knots, splits or other defects. Use forms with a nominal length of 3 m 10 feet. Radius bends may be formed with 19 mm 3/4 inch boards, laminated to the required thickness.

2.6.2 Steel Forms

Use channel-formed sections with a flat top surface and welded braces at each end and at not less than two intermediate points. Use forms with interlocking and self-aligning ends. Provide flexible forms for radius forming, corner forms, form spreaders, and fillers as needed. Use forms with a nominal length of 3 m 10 feet and that have a minimum of 3 welded stake pockets per form. Use stake pins consisting of solid steel rods with chamfered heads and pointed tips designed for use with steel forms.
2.6.3 Sidewalk Forms

Use sidewalk forms that are of a height equal to the full depth of the finished sidewalk.

2.6.4 Curb and Gutter Forms

Use curb and gutter outside forms that have a height equal to the full depth of the curb or gutter. Use rigid forms for curb returns, except that benders or thin plank forms may be used for curb or curb returns with a radius of 3 m 10 feet or more, where grade changes occur in the return, or where the central angle is such that a rigid form with a central angle of 90 degrees cannot be used. Back forms for curb returns may be made of 38 mm 1-1/2 inch benders, for the full height of the curb, cleated together. In lieu of inside forms for curbs, a curb "mule" may be used for forming and finishing this surface, provided the results are approved.

[2.6.5 Biodegradable Form Release Agent

**************************************************************************************************************

NOTE: Concrete release fluids are recognized as a biobased material. Use materials with biobased content where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying product biobased content requirements. A resource that can be used to identify products with bio-based content is the "Catalog" tab within the USDA's "Biopreferred" website at https://www.biopreferred.gov/BioPreferred/. Other products with biobased content are also acceptable when meeting all requirements of this specification.

**************************************************************************************************************

Use form release agent that is colorless and biodegradable and that is composed of at least 87 percent biobased material. Provide product that does not bond with, stain, or adversely affect concrete surfaces and does not impair subsequent treatments of concrete surfaces. Provide form release agent that does not contain diesel fuel, petroleum-based lubricating oils, waxes, or kerosene.

]2.7 Detectable Warning Systems

Detectable Warning Systems shown on the Contract plans are to meet requirements of ICC A117.1 COMM - Section 705.

PART 3 EXECUTION

3.1 SUBGRADE PREPARATION

**************************************************************************************************************

NOTE: On most projects, major grading operations involving excavation and construction of embankments will be performed and paid for under other sections of the specifications and, therefore, are not included in this guide specification. Where such work, including the construction of any required subbase, must be done under this section, paragraphs

SECTION 32 16 19 Page 11
FORM SETTING, SIDEWALK CONCRETE PLACEMENT AND FINISHING, and CURB AND GUTTER CONCRETE PLACEMENT AND FINISHING will be revised to cover necessary additional requirements. The subgrade will be indicated as extending at least 600 mm 2 feet in width back of curb, gutter, entrance, and combination curb and gutters.

Construct subgrade to the specified grade and cross section prior to concrete placement.

3.1.1 Sidewalk Subgrade

Place and compact the subgrade in accordance with [Section 31 00 00 EARTHWORK] [Section [____]]. Test the subgrade for grade and cross section with a template extending the full width of the sidewalk and supported between side forms.

3.1.2 Curb and Gutter Subgrade

Place and compact the subgrade in accordance with [Section 31 00 00 EARTHWORK] [Section 32 11 23 AGGREGATE BASE COURSES] [Section [____]]. Test the subgrade for grade and cross section by means of a template extending the full width of the curb and gutter. Use subgrade materials equal in bearing quality to the subgrade under the adjacent pavement.

3.1.3 Maintenance of Subgrade

Maintain subgrade in a smooth, compacted condition in conformity with the required section and established grade until the concrete is placed. The subgrade must be in a moist condition when concrete is placed. Prepare and protect subgrade so that it is free from frost when the concrete is deposited.

3.2 FORM SETTING

Set forms to the indicated alignment, grade and dimensions. Hold forms rigidly in place by a minimum of 3 stakes per form placed at intervals not to exceed 1.2 m 4 feet. Use additional stakes and braces at corners, deep sections, and radius bends, as required. Use clamps, spreaders, and braces where required to ensure rigidity in the forms. Remove forms in a manner that will not injure the concrete. Do not use bars or heavy tools against the concrete when removing the forms. Promptly and satisfactorily repair concrete found to be defective after form removal. Clean forms and coat with form oil or biodegradable form release agent each time before concrete is placed. Wood forms may, instead, be thoroughly wetted with water before concrete is placed, except that with probable freezing temperatures, oiling is mandatory.

3.2.1 Sidewalks

Set forms for sidewalks with the upper edge true to line and grade with an allowable tolerance of 3 mm 1/8 inch in any 3 m 10 foot long section. After forms are set, grade and alignment must be checked with a 3 m 10 foot straightedge. Sidewalks must have a transverse slope [as indicated] [of 20 mm per meter 1/4 inch per foot] [Unless otherwise indicated, construct sidewalks that are located adjacent to curbs with the low side adjacent to the curb.] Do not remove side forms less than 12 hours after finishing has
been completed.

3.2.2 Curbs and Gutters

Remove forms used along the front of the curb not less than 2 hours nor more than 6 hours after the concrete has been placed. Do not remove forms used along the back of curb until the face and top of the curb have been finished, as specified for concrete finishing. Do not remove gutter forms while the concrete is sufficiently plastic to slump in any direction.

3.3 SIDEWALK CONCRETE PLACEMENT AND FINISHING

3.3.1 Formed Sidewalks

Place concrete in the forms in one layer. When consolidated and finished, the sidewalks must be of the thickness indicated. Use a strike-off guided by side forms after concrete has been placed in the forms to bring the surface to proper section to be compacted. Consolidate concrete by tamping and spading or with an approved vibrator. Finish the surface to grade with a strike off.

3.3.2 Concrete Finishing

After straightedging, when most of the water sheen has disappeared, and just before the concrete hardens, finish the surface with a wood or magnesium float or darby to a smooth and uniformly fine granular or sandy texture free of waves, irregularities, or tool marks. Produce a scored surface by brooming with a fiber-bristle brush in a direction transverse to that of the traffic, followed by edging.

3.3.3 Edge and Joint Finishing

Finish all slab edges, including those at formed joints, with an edger having a radius of 3 mm 1/8 inch. Edge transverse joints before brooming. Eliminate the flat surface left by the surface face of the edger with brooming. Clean and solidly fill corners and edges which have crumbled and areas which lack sufficient mortar for proper finishing with a properly proportioned mortar mixture and then finish.

3.3.4 Surface and Thickness Tolerances

Finished surfaces must not vary more than 8 mm 5/16 inch from the testing edge of a 3 m 10-foot straightedge. Permissible deficiency in section thickness will be up to 6 mm 1/4 inch.

3.4 CURB AND GUTTER CONCRETE PLACEMENT AND FINISHING

3.4.1 Formed Curb and Gutter

Place concrete to the required section in a single lift. Consolidate concrete using approved mechanical vibrators. Curve shaped gutters must be finished with a standard curb "mule".

3.4.2 Curb and Gutter Finishing

Approved slipformed curb and gutter machines may be used in lieu of hand placement.
3.4.3 Concrete Finishing

Float and finish exposed surfaces with a smooth wood float until true to grade and section and uniform in texture. Brush floated surfaces with a fine-hair brush using longitudinal strokes. Round the edges of the gutter and top of the curb with an edging tool to a radius of \(13 \text{ mm} \frac{1}{2} \text{ inch}\). Immediately after removing the front curb form, rub the face of the curb with a wood or concrete rubbing block and water until blemishes, form marks, and tool marks have been removed. Brush the front curb surface, while still wet, in the same manner as the gutter and curb top. Finish the top surface of gutter [and entrance] to grade with a wood float.

3.4.4 Joint Finishing

Finish curb edges at formed joints as indicated.

3.4.5 Surface and Thickness Tolerances

Finished surfaces must not vary more than \(6 \text{ mm} \frac{1}{4} \text{ inch}\) from the testing edge of a \(3 \text{ m} 10\)-foot straightedge. Permissible deficiency in section thickness will be up to \(6 \text{ mm} \frac{1}{4} \text{ inch}\).

3.5 SIDEWALK JOINTS

Construct sidewalk joints to divide the surface into rectangular areas. Space transverse contraction joints at a distance equal to the sidewalk width or \(1.5 \text{ m} 5\) feet on centers, whichever is less, and continuous across the slab. Construct longitudinal contraction joints along the centerline of all sidewalks \(3 \text{ m} 10\) feet or more in width. Construct transverse expansion joints at sidewalk returns and opposite expansion joints in adjoining curbs. Where the sidewalk is not in contact with the curb, install transverse expansion joints as indicated. Form expansion joints around structures and features which project through or into the sidewalk pavement, using joint filler of the type, thickness, and width indicated. Expansion joints are not required between sidewalks and curb that abut the sidewalk longitudinally.

3.5.1 Sidewalk Contraction Joints

Form contraction joints in the fresh concrete by cutting a groove in the top portion of the slab to a depth of at least one-fourth of the sidewalk slab thickness. Unless otherwise approved or indicated, either use a jointer to cut the groove or saw a groove in the hardened concrete with a power-driven saw. Construct sawed joints by sawing a groove in the concrete with a \(3 \text{ mm} \frac{1}{8} \text{ inch}\) blade. Provide an ample supply of saw blades on the jobsite before concrete placement is started. Provide at least one standby sawing unit in good working order at the jobsite at all times during the sawing operations.

3.5.2 Sidewalk Expansion Joints

Form expansion joints using \(13 \text{ mm} \frac{1}{2} \text{ inch}\) joint filler strips. Joint filler in expansion joints surrounding structures and features within the sidewalk may consist of preformed filler material conforming to ASTM D1752 or building paper. Hold joint filler in place with steel pins or other devices to prevent warping of the filler during floating and finishing. Immediately after finishing operations are completed, round joint edges using an edging tool having a radius of \(3 \text{ mm} \frac{1}{8} \text{ inch}\). Remove any concrete over the joint filler. At the end of the curing period, clean the top of
expansion joints and fill with cold-applied joint sealant. Use joint sealant that is gray or stone in color. Thoroughly clean the joint opening before the sealing material is placed. Do not spill sealing material on exposed surfaces of the concrete. Apply joint sealing material only when the concrete at the joint is surface dry and atmospheric and concrete temperatures are above 10 degrees C or 50 degrees F. Immediately remove any excess material on exposed surfaces of the concrete and clean the concrete surfaces.

3.5.3 Reinforcement Steel Placement

**************************************************************************

NOTE: Reinforcement steel normally will not be required for curb and gutter construction. Where conditions exist that make it advantageous to use reinforcement steel, the reinforcing steel details will be indicated, and the following paragraphs will be included in the Contract specification.

**************************************************************************

Accurately and securely fasten reinforcement steel in place with suitable supports and ties before the concrete is placed.

3.6 CURB AND GUTTER JOINTS

Construct curb and gutter joints at right angles to the line of curb and gutter.

3.6.1 Contraction Joints

Construct contraction joints directly opposite contraction joints in abutting portland cement concrete pavements and spaced so that monolithic sections between curb returns will not be less than 1.5 m or 5 feet nor greater than 4.5 m or 15 feet in length.

a. Construct contraction joints (except for slip forming) by means of 3 mm or 1/8 inch thick separators and of a section conforming to the cross section of the curb and gutter. Remove separators as soon as practicable after concrete has set sufficiently to preserve the width and shape of the joint and prior to finishing.

b. When slip forming is used, cut the contraction joints in the top portion of the gutter/curb hardened concrete in a continuous cut across the curb and gutter, using a power-driven saw. Cut the contraction joint to a depth of at least one-fourth of the gutter/curb depth using a 3 mm or 1/8 inch saw blade.

3.6.2 Expansion Joints

Form expansion joints by means of preformed expansion joint filler material cut and shaped to the cross section of curb and gutter. Construct expansion joints in curb and gutter directly opposite expansion joints of abutting portland cement concrete pavement using the same type and thickness of joints as joints in the pavement. Where curb and gutter do not abut portland cement concrete pavement, provide expansion joints at least 13 mm or 1/2 inch in width at intervals not less than 10 meters or 30 feet nor greater than 36 meters or 120 feet. Seal expansion joints immediately following curing of the concrete or as soon thereafter as weather conditions permit. Seal expansion joints and the top 25 mm or 1 inch depth of
curb and gutter contraction-joints with joint sealant. Thoroughly clean the joint opening before the sealing material is placed. Do not spill sealing material on exposed surfaces of the concrete. Concrete at the joint must be surface dry and atmospheric and concrete temperatures must be above 10 degrees C 50 degrees F at the time of application of joint sealing material. Immediately remove excess material on exposed surfaces of the concrete and clean concrete surfaces.

3.7 CURING AND PROTECTION

**************************************************************************
NOTE: Only the methods of curing appropriate to local weather conditions and construction practices will be retained, but Contractor's option of at least two curing methods will be retained to promote competition in bidding.
**************************************************************************

3.7.1 General Requirements

Protect concrete against loss of moisture and rapid temperature changes for at least 7 days from the beginning of the curing operation. Protect unhardened concrete from rain and flowing water. All equipment needed for adequate curing and protection of the concrete must be on hand and ready for use before actual concrete placement begins. Protect concrete as necessary to prevent cracking of the pavement due to temperature changes during the curing period.

3.7.1.1 Mat Method

Cover the entire exposed surface with two or more layers of burlap. Overlap mats at least 150 mm 6 inches. Thoroughly wet the mat with water prior to placing on concrete surface and keep the mat continuously in a saturated condition and in intimate contact with concrete for not less than 7 days.

3.7.1.2 Impervious Sheeting Method

Wet the entire exposed surface with a fine spray of water and then cover with impervious sheeting material. Lay sheets directly on the concrete surface with the light-colored side up and overlapped 300 mm 12 inches when a continuous sheet is not used. Use sheeting that is not less than 450 mm 18-inches wider than the concrete surface to be cured. Secure sheeting using heavy wood planks or a bank of moist earth placed along edges and laps in the sheets. Satisfactorily repair or replace sheets that are torn or otherwise damaged during curing. Sheeting must remain on the concrete surface to be cured for not less than 7 days.

3.7.1.3 Membrane Curing Method

Apply a uniform coating of white-pigmented membrane-curing compound to the entire exposed surface of the concrete as soon after finishing as the free water has disappeared from the finished surface. Coat formed surfaces immediately after the forms are removed and in no case longer than 1 hour after the removal of forms. Do not allow concrete surface to dry before application of the membrane. If drying has occurred, moisten the surface of the concrete with a fine spray of water and apply the curing compound as soon as the free water disappears. Apply curing compound in two coats by hand-operated pressure sprayers at a coverage of approximately 5 square
meters/L 200 square feet/gallon for the total of both coats. Apply the second coat in a direction approximately at right angles to the direction of application of the first coat. The compound must form a uniform, continuous, coherent film that will not check, crack, or peel and must be free from pinholes or other imperfections. If pinholes, abrasion, or other discontinuities exist, apply an additional coat to the affected areas within 30 minutes. Respray concrete surfaces that are subjected to heavy rainfall within 3 hours after the curing compound has been applied by the method and at the coverage specified above. Respray areas where the curing compound is damaged by subsequent construction operations within the curing period. Take precautions necessary to ensure that the concrete is properly cured at sawed joints, and that no curing compound enters the joints. Tightly seal the top of the joint opening and the joint groove at exposed edges before the concrete in the region of the joint is resprayed with curing compound. Use a method used for sealing the joint groove that prevents loss of moisture from the joint during the entire specified curing period. Provide approved standby facilities for curing concrete pavement at a location accessible to the jobsite for use in the event of mechanical failure of the spraying equipment or other conditions that might prevent correct application of the membrane-curing compound at the proper time. Adequately protect concrete surfaces to which membrane-curing compounds have been applied during the entire curing period from pedestrian and vehicular traffic, except as required for joint-sawing operations and surface tests, and from other possible damage to the continuity of the membrane.

3.7.2 Backfilling

After curing, remove debris and backfill, grade, and compact the area adjoining the concrete to conform to the surrounding area in accordance with lines and grades indicated.

3.7.3 Protection

Protect completed concrete from damage until accepted. Repair damaged concrete and clean concrete discolored during construction. Remove and reconstruct concrete that is damaged for the entire length between regularly scheduled joints. Refinishing the damaged portion will not be acceptable. Dispose of removed material as directed.

3.7.4 Protective Coating

**************************************************************************

NOTE: Concrete may require protection against the action of urea, sodium chloride, and calcium chloride used for de-icing purposes. Protection against these chemicals is not required for concrete of the specified air content that will be in place for a cumulative time of 6 weeks at a continuous minimum temperature of 5 degrees C 40 degrees F, excluding the curing time. Concrete which is to receive protective coating should be moist cured to eliminate the need for removing a curing membrane prior to application of the protective coating. ACI Committee Report 515 provides a detailed discussion of protective coating for concrete. The following paragraphs will be inserted if protective coating is required.

**************************************************************************
Apply a protective coating of linseed oil mixture to the exposed-to-view concrete surface after the curing period, if concrete will be exposed to de-icing chemicals within 6 weeks after placement. Moist cure concrete to receive a protective coating.

3.7.4.1 Application

Complete curing and backfilling operation prior to applying two coats of protective coating. Concrete must be surface dry and clean before each application. Spray apply at a rate of not more than 11 square meters/L 50 square yards/gallon for first application and not more than 15.5 square meters/L 70 square yards/gallon for second application, except that the number of applications and coverage for each application for commercially prepared mixture must be in accordance with the manufacturer's instructions. Protect coated surfaces from vehicular and pedestrian traffic until dry.

3.7.4.2 Precautions

Do not heat protective coating by direct application of flame or electrical heaters and protect the coating from exposure to open flame, sparks, and fire adjacent to open containers or applicators. Do not apply material at ambient or material temperatures lower than 10 degrees C 50 degrees F.

3.8 FIELD QUALITY CONTROL

Submit copies of all test reports within 24 hours of completion of the test.

3.8.1 General Requirements

Perform the inspection and tests described and meet the specified requirements for inspection details and frequency of testing. Based upon the results of these inspections and tests, take the action and submit reports as required below, and additional tests to ensure that the requirements of these specifications are met.

3.8.2 Concrete Testing

3.8.2.1 Strength Testing

Take concrete samples in accordance with ASTM C172/C172M not less than once a day nor less than once for every 190 cubic meters 250 cubic yards of concrete placed. Mold cylinders in accordance with ASTM C31/C31M for strength testing by an approved laboratory. Each strength test result must be the average of 2 test cylinders from the same concrete sample tested at 28 days, unless otherwise specified or approved. Concrete specified on the basis of compressive strength will be considered satisfactory if the averages of all sets of three consecutive strength test results equal or exceed the specified strength, and no individual strength test result falls below the specified strength by more than 4 MPa 500 psi.

3.8.2.2 Air Content

Determine air content in accordance with ASTM C173/C173M or ASTM C231/C231M. Use ASTM C231/C231M with concretes and mortars made with relatively dense natural aggregates. Make two tests for air content on randomly selected batches of each class of concrete placed during each shift. Make additional tests when excessive variation in concrete workability is
reported by the placing foreman or the Government inspector. Notify the placing foreman if results are out of tolerance. The placing foreman must take appropriate action to have the air content corrected at the plant. Additional tests for air content will be performed on each truckload of material until such time as the air content is within the tolerance specified.

3.8.2.3 Slump Test

Perform two slump tests on randomly selected batches of each class of concrete for every 190 cubic meters 250 cubic yards, or fraction thereof, of concrete placed during each shift. Perform additional tests when excessive variation in the workability of the concrete is noted or when excessive crumbling or slumping is noted along the edges of slip-formed concrete.

3.8.3 Thickness Evaluation

Determine the anticipated thickness of the concrete prior to placement by passing a template through the formed section or by measuring the depth of opening of the extrusion template of the curb forming machine. If a slip form paver is used for sidewalk placement, construct the subgrade true to grade prior to concrete placement. The thickness will be determined by measuring each edge of the completed slab.

3.8.4 Surface Evaluation

Provide finished surfaces for each category of the completed work that are uniform in color and free of blemishes and form or tool marks.

3.9 SURFACE DEFICIENCIES AND CORRECTIONS

3.9.1 Thickness Deficiency

When measurements indicate that the completed concrete section is deficient in thickness by more than 6 mm 1/4 inch the deficient section will be removed, between regularly scheduled joints, and replaced.

3.9.2 High Areas

In areas not meeting surface smoothness and plan grade requirements, reduce high areas either by rubbing the freshly finished concrete with carborundum brick and water when the concrete is less than 36 hours old or by grinding the hardened concrete with an approved surface grinding machine after the concrete is 36 hours old or more. The area corrected by grinding the surface of the hardened concrete must not exceed 5 percent of the area of any integral slab, and the depth of grinding must not exceed 6 mm 1/4 inch. Remove and replace pavement areas requiring grade or surface smoothness corrections in excess of the limits specified.

3.9.3 Appearance

Exposed surfaces of the finished work will be inspected by the Contracting Officer and deficiencies in appearance will be identified. Remove and replace areas which exhibit excessive cracking, discoloration, form marks, or tool marks or which are otherwise inconsistent with the overall appearances of the work.
3.10 DETECTABLE WARNING SYSTEM

Install Detectable Warning Systems required by Contract plans in accordance with ICC A117.1 COMM, Section 705, and by manufacturers' installation instructions.

3.4.5 Reflective Media and Coating Application Verification
3.4.6 Retroreflective Markings
3.4.7 Material Bond Verification and Operations Area Cleanup for Airfields

-- End of Section Table of Contents --
NOTE: This guide specification covers pavement marking requirements for airfields, heliports, in hangars, roads and Automotive Parking areas by means of paint, raised pavement markers (RPM), preformed tapes or plastics. If curbs, obstructions, and other appurtenant structures are included in the work area, the same general requirements apply, but hand application with spray guns and manual bead dispensers may be required. This guide specification also covers removal of existing pavement markings on roads and Automotive Parking areas. UFGS 32 01 11.51 covers removal of rubber and pavement markings on airfield pavements. Removal of raised pavement markers or reflectors is not covered in this section.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

This guide specification includes tailoring options for AIR FORCE, NASA, NAVY and ARMY. Selection or deselection of a tailoring option will include or exclude that option in the section, but editing the
resulting section to fit the project is still required.

**************************************************************************

NOTE: On the project drawings, show location, width, type, and color of the paint, epoxy, thermoplastic, or preformed tape to be applied, and raised pavement markers (RPM) to be used. Indicate whether pavement marking must be reflectorized or non-reflectorized.

On the project drawings, show the pavement markings to be removed and the minimum percentage of removal required.

**************************************************************************

NOTE: Pavement markings are usually removed by hydro-blasting. Few chemical methods are effective, except those specifically formulated for some specialty paints.

For Army and Air Force, sand or shot blasting may be prohibited by higher headquarters due to the potential for residual foreign object damage (FOD) material being left behind, or due to local air pollution regulations. Show on the drawings the extent of pavement to have markings removed.

**************************************************************************

NOTE: For Air Force applications, coordinate other deviations from this guide specification with the AFIMSC prior to advertising a request for bids.

**************************************************************************

PART 1  GENERAL

1.1  UNIT PRICES

**************************************************************************

NOTE: Delete this paragraph when pavement marking is included in a lump sum project.

**************************************************************************

1.1.1  Measurement

1.1.1.1  Surface Preparation

The unit of measurement for surface preparation (cleaning) is the number of square meters feet of pavement surface prepared for marking and accepted by the Contracting Officer.

1.1.1.2  Pavement Striping and Markings

The unit of measurement for pavement markings is the number of square meters feet of reflective and/or nonreflective striping or markings actually completed and accepted by the Contracting Officer.
1.1.1.3 Raised Pavement Markers

The unit of measurement for raised pavement markers is the number actually placed as specified and approved by the Contracting Officer.

1.1.1.4 Removal of Pavement Markings on Roads and Automotive Parking Areas

The unit of measurement for removal of pavement markings is the number of square meters feet of pavement markings removed as specified and accepted by the Contracting Officer.

1.1.2 Payment

The quantities of surface preparation, pavement striping or markings, raised pavement markers, and removal of pavement markings determined as specified in paragraph Measurement, will be paid for at the contract unit price. The payment constitutes full compensation for furnishing all labor, materials, tools, equipment, appliances, and doing all work involved in preparing and marking the pavements as shown on the drawings. Remove and replace any striping or markings which required reflective media, but are placed without it, do not meet the stated minimum retro-reflective requirements, or with other defects, at no cost to the Government. Remove and replace striping or markings which do not conform to the required physical characteristics, alignment or location required at no cost to the Government.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Regulatory Requirements

Submit certificate stating that the proposed pavement marking paint meets the Volatile Organic Compound, (VOC) regulations of the local Air Pollution Control District having jurisdiction over the geographical area in which the project is located. Submit Safety Data Sheets for each product.

1.4.2 Qualifications

Submit documentation certifying that pertinent personnel are qualified for equipment operation and handling of applicable chemicals. The documentation should include experience on five projects of similar size and scope with references for all personnel.

1.4.3 Qualifications For Airfield Marking Personnel

Submit documentation of qualifications in resume format a minimum of [14] [_____] days before pavement marking work is to be performed showing personnel who will be performing the work have experience working on airfields, operating mobile self-powered marking, cleaning, and paint removal equipment and performing these tasks. Include with resume a list of references complete with points of contact and telephone numbers. Provide certification for pavement marking machine operator and Foreman demonstrating experience successfully completing a minimum of two airfield pavement marking projects of similar size and scope. Provide documentation demonstrating personnel have a minimum of [two] [three] [four] years of experience operating similar equipment and performing the same or similar work in similar environments, similar in size and scope of the planned
project. The Contracting Officer reserves the right to require additional proof of competency or to reject proposed personnel.

1.5 DELIVERY AND STORAGE

Deliver paint materials, thermoplastic compound materials, and reflective media in original sealed containers that plainly show the designated name, specification number, batch number, color, date of manufacture, manufacturer's directions, and name of manufacturer.

Provide storage facilities at the job site, only in areas approved by the Contracting Officer, for maintaining materials at temperatures recommended by the manufacturer. [Make available paint stored at the project site or segregated at the source for sampling not less than 30 days prior to date of required approval for use to allow sufficient time for testing. Notify the Contracting Officer when paint is available for sampling.]

1.6 PROJECT/SITE CONDITIONS

1.6.1 Environmental Requirements

1.6.1.1 Weather Limitations for Application

**************************************************************************

NOTE: If emergency marking at temperatures from minus 1 degrees C 30 degrees F to 5 degrees C 40 degrees F is required, follow the requirements of Air Force Engineering Technical Letter (ETL) 97-16 "Pavement Marking System for Low Temperature Applications."

Allowable air and pavement temperature for application varies with type of pavement marking material and manufacturer.

**************************************************************************

Apply pavement markings to clean, dry surfaces, and unless otherwise approved, only when the air and pavement surface temperature is at least 3 degrees C 5 degrees F above the dew point and the air and pavement temperatures are within the limits recommended by the pavement marking manufacturer. Allow pavement surfaces to dry after water has been used for cleaning or rainfall has occurred prior to striping or marking. Test the pavement surface for moisture before beginning work each day and after cleaning. Do not commence marking until the pavement is sufficiently dry and the pavement condition has been approved by the Contracting Officer. Employ the "plastic wrap method" to test the pavement for moisture as specified in paragraph TESTING FOR MOISTURE.

1.6.1.2 Weather Limitations for Removal of Pavement Markings on Roads and Automotive Parking Areas

Pavement surface must be free of snow, ice, or slush; with a surface temperature of at least 4 degrees C 40 degrees F and rising at the beginning of operations, except those involving shot or sand blasting or grinding. Cease operation during thunderstorms, or during rainfall, except for waterblasting and removal of previously applied chemicals. Cease waterblasting where surface water accumulation alters the effectiveness of material removal.
1.6.2 Traffic Controls

NOTE: Guidance for traffic control procedures can be obtained from the Manual on Uniform Traffic Control Devices (MUTCD) for Streets and Highways.

Place warning signs conforming to MUTCD near the beginning of the worksite and well ahead of the worksite for alerting approaching traffic from both directions. Place small markers along newly painted lines or freshly placed raised markers to control traffic and prevent damage to newly painted surfaces or displacement of raised pavement markers. Mark painting equipment with large warning signs indicating slow-moving painting equipment in operation.

When traffic must be rerouted or controlled to accomplish the work, provide necessary warning signs, flag persons, and related equipment for the safe passage of vehicles.

1.6.3 Airfield Traffic Control

Coordinate performance of all work in the controlled zones of the airfield with the Contracting Officer and with the [Flight Operations Officer or Airfield Manager] [control tower]. Neither equipment nor personnel can use any portion of the airfield without permission of these officers unless the runway is closed. Runways will be closed during the following times:

<table>
<thead>
<tr>
<th>Day or Date</th>
<th>Runway Closing Time</th>
<th>Runway Opening Time</th>
<th>Important Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1.6.4 Airfield Radio Communication

No personnel or equipment will be allowed in the controlled zones of the airfield until radio contact has been made with the control tower and permission is granted by the control tower. A radio for this purpose [will be provided by the Government. The Contractor is responsible for the radio and must reimburse the Government for repair or replacement of the radio if it is lost, damaged, or destroyed] [is to be provided by the Contractor as approved by the Contracting Officer]. Maintain contact with the control tower at all times during work in vicinity of the airfield. Notify the control tower when work is completed and all personnel, equipment and materials have been removed from all aircraft operating surfaces.

1.6.5 Airfield Emergency Landing and Takeoff

Emergencies take precedence over all operations. Upon notification from the control tower of an emergency landing or imminent takeoff, stop all operations immediately and evacuate all personnel and equipment to an area not utilized for aircraft traffic which is at least 75 m 250 feet measured perpendicular to and away from the near edge of the runway unless otherwise authorized by the Contracting Officer. Equipment and chemicals or detergents as well as excess water must be able to be removed from the work area within 3 minutes.
1.6.6 Lighting

When night operations are necessary, provide all necessary lighting and equipment. [Direct or shade lighting to prevent interference with aircraft, the air traffic control tower, and other base operations. Provide lighting and related equipment capable of being removed from the runway within 15 minutes of notification of an emergency. Night work must be coordinated with the Flight Operations Manager or Airfield Manager and approved in advance by the Contracting Officer.] The Government reserves the right to accept or reject night work on the day following night activities by the Contractor.

PART 2 PRODUCTS

2.1 EQUIPMENT

2.1.1 Surface Preparation and Paint Removal

2.1.1.1 Surface Preparation and Paint Removal Equipment for Airfield Pavements

Prepare all airfield surfaces and remove paint from airfield surfaces in accordance with UFGS 32 01 11.51 Rubber and Paint Removal From Airfield Pavements. Provide submittals in accordance with UFGS 32 01 11.51 Rubber and Paint Removal From Airfield Pavements.

2.1.1.2 Surface Preparation Equipment for Roads and Automotive Parking Areas

Submit a surface preparation equipment list by serial number, type, model, and manufacturer. Include descriptive data indicating area of coverage per pass, pressure adjustment range, tank and flow capacities, and safety precautions required for the equipment operation. Mobile equipment must allow for removal of markings without damaging the pavement surface or joint sealant. Maintain machines, tools, and equipment used in the performance of the work in satisfactory operating condition.

2.1.1.1.1 Sandblasting Equipment

**************************************************************************
NOTE: Delete paragraph for Navy projects.
**************************************************************************

Use mobile sandblasting equipment capable of producing a pressurized stream of sand and air that effectively removes paint from the surface without filling voids with debris in asphalt or tar pavements or removing joint sealants in Portland cement concrete pavements. Include with the equipment and air compressor, hoses, and nozzles of adequate size and capacity for removing paint. Equip the compressor with traps and coalescing filters that maintain the compressed air free of oil and water.

2.1.1.2.2 Waterblasting Equipment

Use mobile waterblasting equipment capable of producing a pressurized stream of water that effectively removes paint from the pavement surface without significantly damaging the pavement. Provide equipment, tools, and machinery which are safe and in good working order at all times.
2.1.1.2.3 Shotblasting Equipment

NOTE: Delete paragraph for Air Force, Army, and Navy airfield projects.

Use mobile self propelled shotblasting equipment capable of producing an adjustable depth of paint removal and of propelling abrasive particles at high velocities on the paint for effective removal. Ensure each unit is self cleaning and self contained. Use equipment able to confine the abrasive, any dust that is produced, and removed paint and is capable of recycling the abrasive for reuse.

2.1.1.2.4 Grinding or Scarifying Equipment

Use equipment capable of removing surface contaminates, paint build-up, or extraneous markings from the pavement surface without leaving any residue. Clean the surface by hydro blast to remove surface contaminates and ash after a weed torch is used to remove paint.

2.1.1.2.5 Chemical Removal Equipment

Use chemical equipment capable of applying and removing chemicals and paint from the pavement surface, leaving only non-toxic biodegradable residue without scarring or other damage to the pavement or joints and joint seals.

2.1.2 Application Equipment

Submit application equipment list appropriate for the material(s) to be used. Include manufacturer's descriptive data and certification for the planned use that indicates area of coverage per pass, pressure adjustment range, tank and flow capacities, and all safety precautions required for operating and maintaining the equipment. Provide and maintain machines, tools, and equipment used in the performance of the work in satisfactory operating condition, or remove them from the work site. Provide mobile and maneuverable application equipment to the extent that straight lines can be followed and normal curves can be made in a true arc.

2.1.2.1 Paint Application Equipment

2.1.2.1.1 Hand-Operated, Push-Type Machines

NOTE: Where pavement marking is limited to small street legends and/or Automotive Parking areas, use the paragraph entitled "Hand-Operated, Push-Type Machines."

Provide hand-operated push-type applicator machine of a type commonly used for application of water based paint or two-component, chemically curing paint, thermoplastic, or preformed tape, to pavement surfaces for small marking projects, such as legends and cross-walks, automotive parking areas, or surface painted signs. Provide applicator machine equipped with the necessary tanks and spraying nozzles capable of applying paint uniformly at coverage specified. Hand operated spray guns may be used in areas where push-type machines cannot be used.
2.1.2.1.2 Self-Propelled or Mobile-Drawn Spraying Machines

Provide self-propelled or mobile-drawn spraying machine with suitable arrangements of atomizing nozzles and controls to obtain the specified results. Provide machine having a speed during application capable of applying the stripe widths indicated at the paint coverage rate specified herein and of even uniform thickness with clear-cut edges.

2.1.2.1.2.1 Road Marking

Provide equipment used for marking roads capable of placing the prescribed number of lines at a single pass as solid lines, intermittent lines, or a combination of solid and intermittent lines using a maximum of three different colors of paint as specified.

2.1.2.1.2.2 Airfield Marking

Provide self-propelled or mobile-drawn spraying machine for applying the paint for airfield pavements with an arrangement of atomizing nozzles capable of applying the specified line width in a single pass. Provide paint applicator with paint reservoirs or tanks of sufficient capacity and suitable gages to apply paint in accordance with requirements specified. Equip tanks with suitable mechanical agitators. Equip spray mechanism with quick-action valves conveniently located, and include necessary pressure regulators and gages in full view and reach of the operator. Install paint strainers in paint supply lines to ensure freedom from residue and foreign matter that may cause malfunction of the spray guns. The paint applicator must be readily adaptable for attachment of a dispenser for the reflective media approved for use.

2.1.2.1.2.3 Hand Application

Provide spray guns for hand application of paint in areas where the mobile paint applicator cannot be used.

2.1.2.2 Thermoplastic Application Equipment

2.1.2.2.1 Thermoplastic Material

Apply thermoplastic material with equipment that is capable of providing continuous uniformity in the dimensions and reflectorization of the marking.

2.1.2.2.2 Application Equipment

a. Provide application equipment capable of continuous mixing and agitation of the material, with conveying parts which prevent accumulation and clogging between the main material reservoir and the extrusion shoe or spray gun. All parts of the equipment which come into contact with the material must be easily accessible and exposed for cleaning and maintenance. All mixing and conveying parts up to and including the extrusion shoes and spray guns must maintain the material at the required temperature with heat-transfer oil or electrical-element-controlled heat.

b. Provide application equipment constructed to ensure continuous uniformity in the dimensions of the stripe. Provide an applicator with a means for cleanly cutting off stripe ends squarely and providing a method of applying "skiplines." Provide equipment capable of applying varying widths of traffic markings.
c. Provide mobile and maneuverable application equipment allowing straight lines to be followed and normal curves to be made in a true arc. Provide equipment used for the placement of thermoplastic pavement markings of two general types: mobile applicator and portable applicator.

d. Equip the applicator with a pressurized or drop-on type bead dispenser capable of uniformly dispensing reflective glass spheres at controlled rates of flow. The bead dispenser must operate automatically to begin flow prior to the flow of binder to assure that the strip is fully reflectorized.

2.1.2.2.3 Mobile Application Equipment

Provide a truck-mounted, self-contained pavement marking machine that is capable of hot applying thermoplastic by either the extrusion or spray method.

a. Equip the unit to apply the thermoplastic marking material at temperatures according to the manufacturer's instructions, at widths varying from 75 to 300 mm 3 to 12 inches, with an automatic pressurized or drop-on bead dispensing system, capable of operating continuously, and of installing a minimum of 6 lineal km 20,000 lineal feet of longitudinal markings in an 8-hour day.

b. Equip the mobile unit with a melting kettle which holds a minimum of 2.7 metric tons 6000 pounds of molten thermoplastic material; capable of heating the thermoplastic composition to temperatures as recommended by the manufacturer. Use a thermostatically controlled heat transfer liquid. Heating of the composition by direct flame is not allowed. Oil and material temperature gauges must be visible at both ends of the kettle.

c. Equip mobile units for application of extruded markings with a minimum of two extrusion shoes; located one on each side of the truck, capable of marking simultaneous edge line and centerline stripes; each being a closed, oil-jacketed unit; holding the molten thermoplastic at a temperature as recommended by the manufacturer; and capable of extruding a line of 75 to 200 mm 3 to 8 inches in width; and at a thickness of not less than 3 mm 0.120 inch nor more than 5.0 mm 0.190 inch, of generally uniform cross section.

d. Equip mobile units for application of spray markings with a spray gun system capable of marking simultaneous edgeline and centerline stripes. Surround (jacket) the spray system with heating oil to maintain the molten thermoplastic at a temperature of 191 to 218 degrees C 375 to 425 degrees F, capable of spraying a stripe of 75 to 305 mm 3 to 12 inches in width, and in thicknesses varying from 1.52 mm 0.060 inch to 2.49 mm 0.098 inch, of generally uniform cross section.

e. Equip the mobile unit with an electronic programmable line pattern control system, capable of applying skip or solid lines in any sequence, through any and all of the extrusion shoes, or the spray guns, and in programmable cycle lengths. In addition, equip the mobile unit with an automatic counting mechanism capable of recording the number of lineal meters feet of thermoplastic markings applied to the pavement surface with an accuracy of 0.5 percent.
2.1.2.2.4 Portable Application Equipment

Provide portable hand-operated equipment, specifically designed for placing special markings such as crosswalks, stop bars, legends, arrows, and short lengths of lane, edge and centerlines; and capable of applying thermoplastic pavement markings by the extrusion method. Equip the portable applicator with all the necessary components, including a materials storage reservoir, bead dispenser, extrusion shoe, and heating accessories, capable of holding the molten thermoplastic at the temperature recommended by the manufacturer, and of extruding a line of 75 to 305 mm (3 to 12 inches) in width, and in thickness of not less than 3 mm nor more than 5 mm, 0.120 inch nor more than 0.190 inch and of generally uniform cross section.

2.1.2.3 Reflective Media Dispenser

Attach the dispenser for applying the reflective media to the [paint] [thermoplastic] dispenser and designed to operate automatically and simultaneously with the applicator through the same control mechanism. The bead applicator must be capable of adjustment and designed to provide uniform flow of reflective media over the full length and width of the stripe at the rate of coverage specified in paragraph APPLICATION.

2.1.2.4 Preformed Tape Application Equipment

Provide and use mechanical application equipment for the placement of preformed marking tape which is a mobile pavement marking machine specifically designed for use in applying pressure-sensitive pavement marking tape of varying widths. Equip the applicator with rollers, or other suitable compaction device to provide initial adhesion of the material with the pavement surface. Use additional tools and devices as needed to properly seat the applied material as recommended by the manufacturer.

2.2 MATERIALS

**************************************************************************
NOTE: For Navy and NASA projects, refer to the MPI Manual for recommendations on uses and application rates of paints and select paint systems for the project in accordance with the MPI Architectural Painting Decision Tree available on the Whole Building Design Guide. Use this interactive paint system for the project. The MPI Decision Tree identifies paint systems for each interior and exterior coated surface in "Normal" or "Aggressive environmental conditions and lists the applicable paint systems in descending order of performance. The paint system at the top of each substrate list indicates the highest performing acceptable coating system.

NOTE: Volatile Organic Content (VOC) of pavement markings used must conform to state and local regulations. The EPA's national volatile organic compound emission standards defines pavement markings as either "Traffic Marking Coating" or "Zone Marking Coating". VOC content of traffic marking coatings may not exceed 150 grams per

VOC content of zone marking coatings may not exceed 450 grams per liter. Zone marking coatings can only be sold in containers with a volume of five gallons or less. Most states follow the EPA requirements. Some states and localities have more stringent requirements.

[Use waterborne or methacrylate paint for airfield markings.] [Use waterborne paint] [epoxy paint] [thermoplastic] [high build acrylic] [raised pavement markers] [preformed tape] for roads.] [Use non-reflectorized waterborne [or solventborne] paint for automotive parking areas.] The maximum allowable VOC content of pavement markings is [150] [_____] grams per liter. Color of markings are indicated on the drawings and must conform to ASTM D6628 for roads and automotive parking areas and SAE AMS-STD-595A for airfields. Provide materials conforming to the requirements specified herein.

NOTE: For NAVFAC LANT projects only. When the use of pavement marking materials (epoxy, thermoplastic, and preformed) which perform better than paint is desired for new pavement in Virginia and North Carolina, contact NAVFAC LANT for sample section.

When applied to pavements with high daily vehicular traffic, High Build Acrylic Coating (HBAC) performs similar to epoxy, thermoplastic, and preformed.

2.2.1 Waterborne Paint

NOTE: Airfields, roads, and Automotive Parking areas should typically be marked using waterborne paint. On low volume roads, waterborne paints have been known to provide service lives of up to 2 years. On higher volume roads the service life may be reduced to 6 to 12 months. Waterborne paint can be used to restripe over existing waterborne, solventborne, methacrylate, epoxy paints, thermoplastic compounds, and high-build acrylic.

TT-P-1952 covers three types of low VOC, ready-mixed, one-component, 100 percent acrylic waterborne airfield and traffic marking paints.

Type I - For normal weather conditions

Type II - For use under adverse conditions (faster drying for high humidity environments). Not for use at the greater thickness required for Type IV beads.

Type III - For use under normal weather conditions where higher durability and greater adhesion to glass beads is desired. Applied at a thicker wet
film thickness than Type I or II.

A list of approved products conforming to MPI 97 is located on the Master Painters Institute website.

Most waterborne paints can be applied at temperatures down to 10 degrees C 50 degrees F. However, waterborne paints formulated to be applied at temperatures down to approximately 2 degrees C 35 degrees F are available.

**************************************************************************

[FS TT-P-1952, Type [I or II] [III][MPI 97].

2.2.2 Solventborne Paint

**************************************************************************

NOTE: The use of solventborne paint may be warranted in cool, humid environments, because in such environments, application restrictions are not as critical as with waterborne paints. Solventborne paint is sold in small containers and should only be used for marking areas where hand-operated, push-type application equipment is used, such as Automotive Parking lots. Solventborne paint cannot be used to restripe over existing waterborne paint. Solventborne paint can be used to restripe over existing solventborne, methacrylate, epoxy paints, thermoplastic compounds, and high-build acrylic. Do not specify solventborne paint for Air Force projects.

This paint typically contains VOCs exceeding 150 grams/liter. However, low VOC solventborne paints are also available.

Solventborne paints can be applied at temperatures down to 3 degrees C 35 degrees F, but the solvents they contain will cause asphaltic pavements to bleed through the paint, especially in cases where the asphalt is less than 30 days old, or is otherwise not completely cured.

AASHTO M 248 covers three types of solventborne (alkyd resin) type traffic marking paint.

Type S - Slow drying paint (1 hr or more)

Type N - Intermediate drying paint (15 to 30 min)

Type F - Fast drying paint (3 to 6 min)

**************************************************************************

[AASHTO M 248] [MPI 32].
2.2.3 Methacrylate Paint

NOTE: Methacrylate paint may potentially be used to mark airfields where cold weather may not allow the use of waterborne paint. Methacrylate paint cannot be placed over markings made from other materials.

FAA AC 150-5370-10, Item P-620.2, Methacrylate marking paint is a two-component, low volatile organic compound (VOC) airfield and roadway marking paint suitable for use on Portland Cement concrete, bituminous pavements, and plain or vitrified brick traffic-bearing surfaces at temperatures down to -1 degrees C 30 degrees F.

Formulate methacrylate paint to meet the requirements of FAA AC 150/5370-10, Item P-620.2, Methacrylate.

2.2.4 Epoxy Paint

NOTE: Epoxy pavement markings are a durable, two-component system with exceptional durability on asphalt and concrete surfaces alike. On low to medium volume highways, epoxies have been known to provide service lives in excess of four years. Epoxies often take much longer to dry than other materials. Epoxies also cannot be placed over markings made from other materials. Epoxy can be applied over existing epoxy markings once. After a second application, the old material must be removed.

2.2.4.1 Formulation

Epoxy pavement marking material will be a two component, 100 percent solids, material formulated to provide simple volumetric mixing ratio of two volumes of component A and one volume of component B unless otherwise recommended by the manufacturer.

2.2.4.2 Composition

The component A of both white and yellow must be within the following limits:

<table>
<thead>
<tr>
<th>TABLE I</th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pigments</td>
<td>Minimum 18 percent by weight</td>
<td>21-27 percent by weight</td>
</tr>
<tr>
<td></td>
<td>Titanium Dioxide (ASTM D476,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type II)</td>
<td></td>
</tr>
<tr>
<td>Epoxy Resin</td>
<td>75-82 percent</td>
<td>73-79 percent</td>
</tr>
</tbody>
</table>
The epoxy resin must be free of lead, cadmium, mercury, hexavalent chromium and other toxic heavy metals as defined by the Environmental Protection Agency. Submit a manufacturer's certification of compliance with this requirement.

2.2.4.3 Epoxide Value

Determine epoxide epoxy number of the epoxy resin in accordance with ASTM D1652 for white and yellow component A on pigment free basis. The epoxide number must be within plus or minus 50 of the published manufacturer's standard.

2.2.4.4 Total Amine Value

Determine the amine number on the curing agent (component B) in accordance with ASTM D2074. The amine number must be within plus or minus 50 of the published manufacturer's standard.

2.2.4.5 Toxicity

Upon heating to application temperature, the material must not produce fumes which are toxic or injurious to persons or property.

2.2.4.6 Daylight Directional Reflectance

Directional reflectance of white and yellow paint (without glass beads) in accordance with ASTM E1347: White 84 percent Yellow 55 percent.

2.2.4.7 Laboratory Drying Time

The epoxy pavement marking material must have a maximum no-pick-up time of 30 minutes when tested in accordance with ASTM D711.

2.2.4.8 Curing

The epoxy material must be capable of fully curing under a constant surface temperature of 7 Degrees C 45 Degrees F or above.

2.2.4.9 Adhesion to Concrete

The catalyzed epoxy pavement marking material must have a high degree of adhesion to the specified concrete surface (100 percent concrete failure) when tested according to ASTM D7234. The concrete substrate must have a minimum compressive strength of 27.5 MPa 4,000 psi. Condition prepared specimens at a temperature of 23.9 plus or minus 1.1 Degrees C 75 plus or minus 2 Degrees F for a minimum of 24 hours and a maximum of 72 hours prior to performance of the test.

2.2.4.10 Hardness

Epoxy pavement marking materials must have a Shore D Hardness between 75 and 100 when tested in accordance with ASTM D2240. Cure the samples at 23.9 plus or minus 1.1 Degrees C 75 plus or minus 2 Degrees F for a minimum of 72 hours and a maximum of 96 hours prior to performing the tests.

2.2.4.11 Abrasion Resistance

The wear index for a catalyzed sample must not exceed 82 when tested in
accordance with ASTM D4060 using a 1000 gram load, CS-17 wheels and a test
duration of 1000 cycles. Run the test on cured samples of material which
have been applied at a film thickness of 15 plus or minus 0.5 mils to code
S-16 stainless steel plates. Cure the samples at 23.9 plus or minus 1.1
Degrees C 75 plus or minus 2 Degrees F for a minimum of 48 hours prior to
performing the tests.

2.2.4.12 Tensile Strength

Epoxy pavement marking materials must have a tensile strength of at least
41,370 kPA 6,000 psi when tested in accordance with ASTM D638. Cast the
Type IV specimens in a suitable mold and pull at the rate of 6 mm 1/4 inch
per minute using a suitable dynamic testing machine. Cure the samples at
23.9 plus or minus 1.1 Degrees C 75 plus or minus 2 Degrees F for a minimum
of 12 hours and a maximum of 48 hours prior to performing the tests.

2.2.4.13 Compressive Strength

Catalyzed epoxy pavement marking materials must have a compressive strength
of at least 82,700 kPA 12,000 psi when tested in accordance with ASTM D695.
Condition the cast sample at 23.9 plus or minus 1.1 Degrees C 75 plus or
minus 2 Degrees F for a minimum of 12 hours and a maximum of 48 hours prior
to performing the tests. The rate of compression of these samples must not
exceed 6 mm 1/4 inch per minute.

2.2.5 Thermoplastic Compound

**************************************************************************
NOTE: Thermoplastic pavement markings are durable
markings used for marking roadways. Thermoplastic
pavement markings should not be used on airfield
runways. Thermoplastic markings have intermixed
beads in the material and a top dressing of beads is
applied during placement.
**************************************************************************

2.2.5.1 Composition Requirements

Thermoplastic compound must conform to AASHTO M 249. Formulate the binder
component as an alkyd resin.

2.2.5.2 Primer

**************************************************************************
NOTE: A primer is not required for thermoplastic
placed on new asphalt pavement. A primer should be
specified when thermoplastic will be applied to
existing asphalt pavements or concrete pavements.
**************************************************************************

a. Asphalt concrete primer: Provide thermosetting adhesive primer with a
solids content of pigment reinforced synthetic rubber and synthetic
plastic resin dissolved or dispersed in a volatile organic solvent for
asphaltic concrete pavements. The solids content must not be less than
10 percent by weight at 21 degrees C 70 degrees F and 60 percent
relative humidity. A wet film thickness of 0.13 mm 0.005 inch, plus or
minus 0.03 mm 0.001 inch, must dry to a tack-free condition in less
than 5 minutes.
b. Portland cement concrete primer: Provide an epoxy resin primer for Portland cement concrete pavements, of the type recommended by the manufacturer of the thermoplastic composition.

2.2.6 High Build Acrylic Coating (HBAC)

******************************************************************************
NOTE: High Build Acrylic Coating (HBAC): When applied to pavements with high daily vehicular traffic counts, HBAC performs similar to epoxy, thermoplastic, and preformed materials.

HBAC is suitable for reflective and nonreflective use and can be applied at approximately twice the thickness of conventional marking paints. The paint produces upraised markings and is appropriate for use in marking crosswalks, stop legends, railroad crossings, lettering, centerlines, skip lines, and edge lines. HBAC at a thickness beyond that of conventional marking paints is not intended for use on pavements with snowplow use. However, application at standard thickness, per MPI, is acceptable on surfaces employing snowplows.

Consider either HBAC or thermoplastic markings to reduce maintenance costs in desert areas, where painted markings are susceptible to a "sandblasting" effect during high winds.
******************************************************************************

Formulate High Build Acrylic Coating (HBAC) to meet the requirements of Table II.

Notes:

(1) Properly mix and apply yellow paint at 250 microns plus or minus 50 microns 10 mils plus or minus 2 mils DFT over a suitably sized, clean aluminum substrate (ASTM D823), and cure for a minimum of 48 hours: prepare four individual yellow samples. Expose three samples to continuous Ultraviolet (UV) light for 2500 hours, without cycles condensation, in accordance to ASTM G154: use UVA-340 lamps in the testing apparatus. Following exposure, compare the three exposed samples to the "one" non-exposed sample using SAE AMS-STD-595A colors 33538 and 33655 as visual references: evaluate exposed samples for degree of visual color loss. Yellow paint is rated as passing if each exposed sample appears equivalent to the non-exposed sample, and in addition, displays color loss no greater than SAE AMS-STD-595A color 33655.

<table>
<thead>
<tr>
<th>TEST</th>
<th>MINIMUM REQUIREMENT (AND MAXIMUM WHERE INDICATED)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2)</td>
<td>Using double-stick, foam mounting tape (or equal) with a nominal thickness of 1625 microns 65 mils, apply a rectangular mold with inner dimensions of 7.6 cm by 25.5 cm 3 in by 10 in to a clean aluminum sample approximately sized at 15 cm by 30 cm by 0.30 cm 6 in by 12 in by 1/8 in. Do not remove the tape's plastic backing. Mix and apply excess paint into mold. Remove excess paint, by squeegee or other appropriate draw down technique, to a uniform thickness equal to the tape's height. Perform paint application and draw down within a period of no more than 60 seconds. Approximately one to two minutes following the draw down, remove tape from sample and allow coating to cure for a minimum period of one week ASTM D3924. Using a micrometer or other appropriate device, measure cured coating thickness (less sample thickness) to confirm resulting coating application was at or above 950 microns 38 mils DFT. Inspect coating for visual signs of cracking and curling. Following a one week cure, the coating is rated as passing if applied greater than 950 microns 38 mils DFT and visually free of both cracking and curling.</td>
</tr>
</tbody>
</table>

2.2.7 Preformed Tape

Provide adherent reflectorized strip preformed tape in accordance with ASTM D4505 Retroreflectivity Level II, Class 1, 2 or 3, Skid Resistance Level B.

2.2.8 Raised Pavement Markers Primers and Adhesives

**************************************************************************
NOTE: Line marker segments having a 1 to 3 ratio of stripe to gap are standard. Line segments of 3 m 10 feet with gaps of 9 m 30 feet are recommended. When raised pavement markers are used in lieu of striping, make the line marker segments a 3 to 5 ratio of stripe to gap with line segments of 5 m 15 feet with gaps of 8 m 25 feet recommended.

Nonplowable, raised retroreflective pavement markers are specified in ASTM D4280. Plowable, raised retroreflective pavement markers are specified in ASTM D4383.
**************************************************************************

Use either metallic or nonmetallic markers of the button or prismatic reflector type. Provide permanent color markers as specified for pavement marking, which retain the color and brightness under the action of traffic. Provide button markers with a diameter of not less than 100 mm 4 inches, spaced not more than 12 m 40 feet apart on solid longitudinal lines. Make broken centerline marker spacing in segments [of []] [indicated] with gaps [of []] [indicated] between segments. Provide button markers with rounded surfaces presenting a smooth contour to traffic and not projecting more than 19 mm 3/4 inch above level of pavement. Provide [nonplowable] [plowable] pavement markers and adhesive epoxy conforming to [ASTM D4280] [ASTM D4383].
2.2.9 Reflective Media

**************************************************************************
For Airfields Only: In accordance with Section 2872 (b) of the 2018 National Defense Authorization Act, the Secretary of the Air Force has submitted a certification to the congressional defense committees that states whenever a proposed contract for airfield pavement markings includes the use of Type I and Type III glass beads, the assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight; therefore Type I glass beads or any glass beads with a 1.6 refractive index or less may be used on the airfield provided the life cycle costs are assessed as stated above.

NOTE: When selecting retro-reflective media using TT-B-1325, refer to the following for the intended uses.

TT-B-1325, Beads (Glass Spheres) Retroreflective:

Type I, Gradation A, coarse - low-index recycled glass beads for drop-on applications are intended for marking highways and any airfield markings.

In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, this type of bead can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.

Type I, Gradation B, fine - low-index glass beads for premixed paint are intended for marking highways, or for use in applying temporary airport of airfield markings.

In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, this type of bead can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.

Type II - NOT USED.

Type III - High index glass beads for drop-on applications are intended for applications where increased retroreflectivity is needed or where
life-cycle costs are less than other bead types.

Type IV Gradation A - Large coarse, direct-melt, low-index glass beads for drop-on applications are intended for highways and all airfield markings (the wet film thickness of paint must be increased to properly bind these beads to the pavement). In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, this type of bead can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.

Type IV Gradation B - Medium coarse, direct-melt, low index glass beads for drop-on applications are intended for highways and all airfield markings (the wet film thickness of paint must be increased to properly bind these beads to the pavement). In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, this type of bead can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.

NOTE: Type I or III glass beads can be used with Type I, Type II, or Type III paint. Type IV glass beads can only be used with Type III paint.

2.2.9.1 Reflective Media for Airfields

NOTE: The installation facility management group (i.e. Director of Public Works, Base Civil Engineer, etc.) determines the type of beads used on DOD airfields taking into consideration local conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight in the life cycle cost analysis of the pavement markings.

FS TT-B-1325, [Type I, [Gradation A,] Type III,] [or] [Type IV, Gradation A or B].

2.2.9.2 Reflective Media for Roads

NOTE: Reflective media for Air Force and Army
projects must conform to TT-B-1325. Reflective media for Navy and NASA projects must conform to AASHTO M 247.

Coordinate type of beads with pavement markings being used.

Type I or III glass beads can be used with Type I, Type II, or Type III paint. Type IV glass beads can only be used with Type III paint.

**************************************************************************

[FS TT-B-1325, [Type I, Gradation A] [or] [Type IV, Gradation A or B]] [AASHTO M 247, Type 1].

PART 3   EXECUTION

3.1  EXAMINATION

3.1.1  Testing for Moisture

Test the pavement surface for moisture before beginning pavement marking after each period of rainfall, fog, high humidity, or cleaning, or when the ambient temperature has fallen below the dew point. Do not commence marking until the pavement is sufficiently dry and the pavement condition has been approved by the Contracting Officer or authorized representative.

Employ the "plastic wrap method" to test the pavement for moisture as follows: Cover the pavement with a 300 mm by 300 mm 12 inch by 12 inch section of clear plastic wrap and seal the edges with tape. After 15 minutes, examine the plastic wrap for any visible moisture accumulation inside the plastic. Do not begin marking operations until the test can be performed with no visible moisture accumulation inside the plastic wrap. Re-test surfaces when work has been stopped due to rain.

3.1.2  Surface Preparation Demonstration

Prior to surface preparation, demonstrate the proposed procedures and equipment. Prepare areas large enough to determine [cleanliness][, adhesion of remaining coating] and rate of cleaning. [Perform a demonstration removal of pavement marking in an area designated by the Contracting Officer.] [Approved demonstration area establishes the standard for the remainder of the work.]

3.1.3  Test Stripe Demonstration

Prior to paint application, demonstrate test stripe application within the work area using the proposed materials and equipment. Apply separate test stripes in each of the line widths and configurations required herein using the proposed equipment. Make the test stripes long enough to determine the proper speed and operating pressures for the vehicle(s) and machinery, but not less than 15 m 50 feet long.

3.1.4  Application Rate Demonstration

During the Test Stripe Demonstration, demonstrate compliance with the application rates specified herein. Document the equipment speed and operating pressures required to meet the specified rates in each configuration of the equipment and provide a copy of the documentation to
the Contracting Officer prior to proceeding with the work.

3.1.5 Retroreflective Value Demonstration

**************************************************************************
NOTE: Delete paragraph if reflective markings are not specified.
**************************************************************************

After the test stripes have cured to a "no-track" condition, demonstrate compliance with the average retroreflective values specified herein. Take a minimum of ten readings on each test stripe with a Retroreflectometer with a direct readout in millicandelas per square meter per lux (mcd/m²/lx). Perform testing in accordance with ASTM D4061, ASTM E1710, ASTM E2177, and ASTM E2302.

3.1.6 Level of Performance Demonstration

The Contracting Officer will be present at the application demonstrations to observe the results obtained and to validate the operating parameters of the vehicle(s) and equipment. If accepted by the Contracting Officer, the test stripe is the measure of performance required for this project. Do not proceed with the work until the demonstration results are satisfactory to the Contracting Officer.

3.2 EXTERIOR SURFACE PREPARATION

**************************************************************************
NOTE: Newly placed flexible and rigid pavements require aging prior to painting in order to obtain satisfactory paint performance. If practicable, all new pavement surfaces should be at least 30 days old. All curing materials should be completely removed before application of marking materials. When earlier application of paint is necessary because of operations requirements, the maximum period practicable should be specified, and the initial application should be applied at half the normal rate, with a follow-up application after the pavements has completed curing.

Rubber and paint removal from airfield pavements should be specified in Section 32 01 11.51 RUBBER AND PAINT REMOVAL FROM AIRFIELD PAVEMENTS.

When tested for adhesion (ASTM D4541), a sound marking paint must exhibit greater than 0.97 MPa 140 psi adhesion and/or produce 100 percent cohesive failures within the pavement.

**************************************************************************

Allow new pavement surfaces to cure for a period of not less than [30] [_____] days before application of marking materials. Thoroughly clean surfaces to be marked before application of the paint. Remove dust, dirt, and other granular surface deposits by sweeping, blowing with compressed air, rinsing with water, or a combination of these methods as required. Remove [rubber deposits,] [existing paint markings,] [residual curing compounds,] and other coatings adhering to the pavement by [water blasting][approved chemical removal method][ according to the removal
requirements and procedures outlined in Section 32 01 11.51].

a. For Portland Cement Concrete pavement, grinding, light shot blasting, or light scarification, to a resulting profile equal to ICRI 03732 CSP 2, CSP 3, and CSP 4, respectively, can be used in addition to water blasting on most pavements, to either remove existing coatings, or for surface preparation.

b. Do not use shot blasting on airfield pavements due to the potential of Foreign Object Damage (FOD) to aircraft. Scrub affected areas, where oil or grease is present on old pavements to be marked, with several applications of trisodium phosphate solution or other approved detergent or degreaser and rinse thoroughly after each application. After cleaning oil-soaked areas, seal with shellac or primer recommended by the manufacturer to prevent bleeding through the new paint. Do not commence painting in any area until pavement surfaces are dry and clean.

3.2.1 Early Painting of Rigid Pavements

Pretreat rigid pavements that require early painting with an aqueous solution containing 3 percent phosphoric acid and 2 percent zinc chloride. Apply the solution to the areas to be marked.

3.2.2 Early Painting of Asphalt Pavements

For asphalt pavement systems requiring painting application at less than 30 days, apply the paint and beads at half the normal application rate, followed by a second application at the normal rate after 30 days.

3.3 APPLICATION

Apply pavement markings to dry pavements only.

3.3.1 Paint

Apply paint with approved equipment at rate of coverage specified herein. Provide guidelines and templates as necessary to control paint application. Take special precautions in marking numbers, letters, and symbols. Manually paint numbers, letters, and symbols. Sharply outline all edges of markings. The maximum drying time requirements of the paint specifications will be strictly enforced, to prevent undue softening of bitumen, and pickup, displacement, or discoloration by tires of traffic. If there is a deficiency in drying of the markings, painting operations must cease until the cause of the slow drying is determined and corrected.

3.3.1.1 Waterborne Paint

3.3.1.1.1 Airfields

**************************************************************************

NOTE: For Army and Air Force projects, specify paint conforming to TT-P-1952 and glass beads conforming to TT-B-1325. Edit and retain Table IV for reflectorized markings. Delete reference to MPI 97.

TT-P-1952 Type I or II paint should be applied at a rate of 3.0 plus or minus 0.15 square meter per liter
121 plus or minus 6 square feet per gallon for reflectorized and non-reflectorized markings. For reflectorized markings, the application rate for Type I (Gradation A) beads should be 960 plus or minus 120 grams of glass spheres per liter 8 plus or minus 1 pounds of glass spheres per gallon. In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, Type I beads can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed. The application rate for Type III beads should be 1,200 plus or minus 120 grams of glass spheres per liter 10 plus or minus 1 pounds of glass spheres per gallon.

TT-P-1952 Type III paint should be applied at a rate of 2.7 plus or minus 0.20 square meter per liter 108 plus or minus 8 square feet per gallon for non-reflectorized markings. For reflectorized markings, Type III paint should be applied at a rate of 3 plus or minus 0.15 square meter per liter 121 plus or minus 6 square feet per gallon for Type I (Gradation A) or Type III beads, 1.9 plus or minus 0.30 square meter per liter 76 plus or minus 12 square feet per gallon for Type IV (Gradation A) beads and 2.4 plus or minus 0.23 square meter per liter 98 plus or minus 9 square feet per gallon for Type IV (Gradation B) beads. In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, Type I or IV beads can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.

Type I or III glass beads can be used with Type I, Type II, or Type III paint. Type IV glass beads can only be used with Type III paint.

**************************************************************************

NOTE: For Navy and NASA projects, specify paint conforming to MPI 97 and glass beads conforming to TT-B-1325 and delete Table III.

MPI 97 paint should be applied at a rate of 2.5 plus or minus 0.10 square meter per liter 105 plus or minus 5 square feet per gallon for reflectorized and non-reflectorized markings.

**************************************************************************
For non-reflectorized [and reflectorized] markings, apply paint conforming to [FS TT-P-1952 [Type I or II at a rate of 3.0 plus or minus 0.15 square meter per liter 121 plus or minus 6 square feet per gallon] [Type III at a rate of 2.7 plus or minus 0.20 square meter per liter 108 plus or minus 8 square feet per gallon] [MPI 97 at a rate of 2.5 plus or minus 0.10 square meter per liter 105 plus or minus 5 square feet per gallon].

**************************************************************************
NOTE: Delete first sentence in brackets for Air Force and Army projects. Delete second sentence in brackets and Table III for Navy and NASA projects.
**************************************************************************

[For reflectorized markings, apply FS TT-B-1325 beads at a rate of 834 plus or minus 60 grams of glass spheres per liter 7 plus or minus 0.5 pounds of glass spheres per gallon.] [For reflectorized markings, apply paint and glass spheres at the following rates:]

3.3.1.1.2 Roads

**************************************************************************
NOTE: Use TT-B-1325 Type I (Gradation A) beads for Air Force and Army projects. Use AASHTO M 247 Type 1 beads for Navy and NASA projects.
**************************************************************************
**Apply paint at a rate of 2.6 plus or minus 0.1 square meter per liter 105 plus or minus 5 square feet per gallon. Apply [FS TT-B-1325 Type I (Gradation A)] [AASHTO M 247 Type 1] beads at a rate of 834 plus or minus 60 grams of glass spheres per liter 7 plus or minus 0.5 pounds of glass spheres per gallon.**

**3.3.1.2 Solventborne Paint**

**NOTE: Use TT-B-1325 Type I (Gradation A) beads for Air Force and Army projects road or automotive parking areas. Use AASHTO M 247 Type 1 beads for Navy and NASA projects on road or automotive parking areas. In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, Type I beads can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.**

**Apply paint at a minimum wet film thickness of 0.381 mm 15 mils. Apply [FS TT-B-1325 Type I (Gradation A)] [AASHTO M 247 Type 1] beads at a minimum rate of 715 grams of glass spheres per liter 6 pounds of glass spheres per gallon.**

**3.3.1.3 Methacrylate Paint**

**NOTE: In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, Type I or Type IV beads can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.**

**Apply paint evenly to the pavement surface at a maximum rate of 1.1 square meters per liter 45 square feet per gallon. Apply glass spheres conforming to FS TT-B-1325 uniformly to the wet paint on airfield pavement. Use either Type I (Gradation A), Type III, or Type IV (Gradation A or B) beads. Apply Type I (Gradation A) beads at a minimum rate of 1.8 kilograms of glass spheres per liter 15 pounds of glass spheres per gallon. Apply Type III beads at a minimum rate of 2.4 kilograms of glass spheres per liter 20 pounds of glass spheres per gallon. Apply Type IV (Gradation A or B) beads at a minimum rate of 1.8 kilograms of glass spheres per liter 16 pounds of glass spheres per gallon.**
3.3.1.4 Epoxy Paint

**************************************************************************
NOTE: In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, Type I or Type IV beads can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.
**************************************************************************

Apply paint evenly to the pavement surface at a wet film thickness of 0.508 mm plus or minus 0.025 mm 20 mils plus or minus 1 mil to cover 2.0 plus or minus 0.1 square meters per liter 80 plus or minus 4 square feet per gallon.

Apply glass spheres uniformly to the wet paint on road and street pavement at a rate of 834 plus or minus 60 grams of glass spheres per liter 7 plus or minus 0.5 pounds of glass spheres per gallon.

3.3.1.5 High Build Acrylic Coating

**************************************************************************
NOTE: TT-B-1325 Type IV beads must be used with HBAC paint due to the increased thickness to provide initial retroreflectivity.

NOTE: The High Build Acrylic Coating (HBAC) can require two or more consecutive coats to meet the specified rate of application when using an airless spray gun. In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, Type I or Type IV beads can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance, environmental impact, operational requirements, and the safety of flight has been performed.
**************************************************************************

Apply High Build Acrylic Coating (HBAC) at a rate of 1.3 square meters per liter 50 square feet per gallon. Apply Type IV (Gradation A) beads at a minimum rate of 1.8 kilograms of glass spheres per liter 16 pounds of glass spheres per gallon.

3.3.2 Thermoplastic Compound

Place thermoplastic pavement markings, free from dirt or tint, upon dry pavement. The temperature must be a minimum of 4.4 degrees C 40 degrees F and rising at the time of installation. Apply all centerline, skipline, edgeline, and other longitudinal type markings with a mobile applicator. Place all special markings, crosswalks, stop bars, legends, arrows, and similar patterns with a portable applicator, using the extrusion method.
3.3.2.1 Primer

**NOTE:** Use the first two paragraphs (tailored Air Force, Navy, Army) for Air Force, Navy, and Army projects, and delete (deselect tailoring for NASA) the third paragraph. Use the third paragraph for NASA projects.

A primer is not required for thermoplastic placed on new asphalt pavement. A primer should be specified when thermoplastic will be applied to existing asphalt pavements or concrete pavements.

After surface preparation has been completed, prime the asphalt or concrete pavement surface with spray equipment. Allow primer materials to "set-up" prior to applying the thermoplastic composition. [Allow the asphalt concrete primer to dry to a tack-free condition, usually occurring in less than 10 minutes.] [Allow the Portland cement concrete primer to dry in accordance with the thermoplastic manufacturer recommendations. To shorten the curing time of the epoxy resins, an infrared heating device may be used on the concrete primer.] [Apply asphalt concrete primer to all asphalt concrete pavements at a wet film thickness of 0.13 mm 0.005 inch, plus or minus 0.03 mm 0.001 inch (6.5 to 9.82 square meters per liter) (265 to 400 square feet per gallon).] [Apply Portland cement concrete primer to all concrete pavements (including concrete bridge decks) at a wet film thickness of between 1.0 to 1.3 mm 0.04 to 0.05 inch 7.85 to 9.82 square meters per liter 320 to 400 square feet per gallon.]

After the primer has "set-up", apply the thermoplastic at temperatures no lower than 191 degrees C 375 degrees F nor higher than 218 degrees C 425 degrees F at the point of deposition. Apply all extruded thermoplastic markings at the specified width and at a thickness of not less than 3 mm 0.125 inch nor more than 5 mm 0.190 inch. Apply all sprayed thermoplastic markings at the specified width and the thickness designated in the contract plans. If the plans do not specify a thickness, apply centerline markings at a wet thickness of 2.3 mm 0.090 inch, plus or minus 0.13 mm 0.005 inch, and edgeline markings at a wet thickness of 1.5 mm 0.060 inch, plus or minus 0.13 mm 0.005 inch.

[Extrude or spray thermoplastic reflectorized pavement marking compound in a molten state onto a primed pavement surface. Following a surface application of glass beads and upon cooling to normal pavement temperatures, the marking must be an adherent reflectorized strip of the specified thickness and width that is capable of resisting deformation by traffic.]

3.3.2.2 Reflective Media

**NOTE:** In accordance with Section 2872 of the 2018 National Defense Authorization Act and the Secretary of the Air Force certification to the congressional defense committees, Type I or Type IV beads can be utilized on airfield markings provided assessment of the life-cycle costs associated with the use of such beads appropriately considers the local site conditions, life-cycle cost maintenance,
Immediately after installation of the thermoplastic material, mechanically apply drop-on reflective glass spheres conforming to [FS TT-B-1325 Type I (Gradation A)] [AASHTO M 247 Type 1] at the rate of 0.24 kg per square meter one pound per 20 square feet such that the spheres are held by and imbedded in the surface of the molten material. Accomplish drop-on application of the glass spheres to ensure even distribution at the specified rate of coverage. If there is a malfunction of either thermoplastic applicator or reflective media dispenser, discontinue operations until deficiency is corrected.

3.3.3 Raised Pavement Markers

Align prefabricated markers carefully at the spacing indicated on the drawings and permanently fix in place by means of epoxy adhesives. To ensure good bond prior to applying adhesive, thoroughly clean all areas where markers are to be set by water blasting and use of compressed air.

3.3.4 Preformed Tape

The pavement surface and ambient air temperature must be a minimum of 15 degrees C 60 degrees F and rising. Place the preformed markings in accordance with the manufacturer's written instructions.

3.3.5 Cleanup and Waste Disposal

Keep the worksite clean and free of debris and waste from the removal and application operations. Immediately cleanup following removal operations in areas subject to aircraft traffic. Dispose of debris at approved sites.

3.4 FIELD QUALITY CONTROL

3.4.1 Sampling and Testing

NOTE: The material specifications do not provide for obtaining certified production data, and the importance of verification testing for each batch where appreciable quantities are involved is emphasized. Only when the factors of time, value of material, and its application versus cost of testing and end use of the material justify a waiver of testing will certification be acceptable.

For projects more than 3345 square meters 4,000 square yards in painted surface area, use the requirements for Contractor's testing as stated in the next to last bracketed sentence. Four quart samples will be taken. For projects less than 3345 square meters 4,000 square yards, delete the next to last sentence and include the last bracketed sentence. Two quart samples will be taken.

As soon as the paint [and thermoplastic] materials [and reflective media] are available for sampling, obtain by random selection from the sealed
containers, [two] [four] quart samples of each batch in the presence of the Contracting Officer. [Two quarts will be for sampling and testing by the Contractor and two quarts will be for retention by the Government.] Accomplish adequate mixing prior to sampling to ensure a uniform, representative sample. A batch is defined as that quantity of material processed by the manufacturer at one time and identified by number on the label. Clearly identify samples by designated name, specification number, batch number, project contract number, intended use, and quantity involved.

[Test samples by an approved laboratory. If a sample fails to meet specification, replace the material in the area represented by the samples and retest the replacement material as specified above. Submit certified copies of the test reports, prior to the use of the materials at the jobsite. Include in the report of test results a listing of any specification requirements not verified by the test laboratory.] [At the discretion of the Contracting Officer, samples provided may be tested by the Government for verification.]

3.4.2 Material Inspection

Examine material at the job site to determine that it is the material referenced in the report of test results or certificate of compliance. Provide test results substantiating conformance to the specified requirements with each certificate of compliance.

3.4.3 Dimensional Tolerances

Apply all markings in the standard dimensions provide in the drawings. New markings may deviate a maximum of 10 percent larger than the standard dimension. The maximum deviation allowed when painting over an old marking is up to 20 percent larger than the standard dimensions.

3.4.4 Bond Failure Verification

Inspect newly applied markings for signs of bond failure based on visual inspection and comparison to results from Test Stripe Demonstration paragraph.

3.4.5 Reflective Media and Coating Application Verification

Use a wet film thickness gauge to measure the application of wet paint. Use a microscope or magnifying glass to evaluate the embedment of glass beads in the paint. Verify the glass bead embedment with approximately 50 percent of the individual bead spheres embedded and 50 percent of the individual bead spheres exposed.

3.4.6 Retroreflective Markings

**************************************************************************
NOTE: Delete paragraph if reflective markings are not specified. Delete paragraph for small road and street projects.
**************************************************************************

Collect and record readings for white and yellow retroreflective markings at the rate of one reading per 305 linear m 1000 linear feet. The minimum acceptable average for white markings is 200 millicandelas per square meter per lux (mcd/m²/lx) (measured with Retroreflectometer). The minimum acceptable average for yellow markings is 175 millicandelas per square
meter per lux (mcd/m2/lx). Compute readings by averaging a minimum of 10 readings taken within the area at random locations. Re-mark areas not meeting the retroreflective requirements stated above.

3.4.7 Material Bond Verification and Operations Area Cleanup for Airfields

**************************************************************************

NOTE: Delete paragraph for non-airfield projects.
**************************************************************************

Vacuum sweep the aircraft operating area before it is opened for aircraft operations to preclude potential foreign object damaged to aircraft engines. Visually inspect the pavement markings and the material captured by the vacuum. Verify that no significant loss of reflective media has occurred to the pavement marking due to the vacuum cleaning.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing and installing protective surfacing in children's outdoor play areas.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).

### PART 1 GENERAL

NOTE: Designer should require materials, products, and innovative construction methods and techniques which are environmentally sensitive, take advantage of recycling and conserve natural resources.

### 1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in
this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D1557 (2012; E 2015) Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³) (2700 kN-m/m³)

SECTION 32 18 16.13 Page 5
CONSUMER PRODUCT SAFETY COMMISSION (CPSC)

1.2 DEFINITIONS

1.2.1 Critical Height

The fall height at which the protective surfacing meets the requirements of ASTM F1292.

1.2.2 Designated Play Surface

Any elevated surface for standing, walking, sitting, or climbing; or a flat surface a minimum 50 mm 2 inches wide having up to a maximum 30 degree angle from horizontal. In some play events the platform surface will be the same as the designated play surface. However, the terms should not be interchanged as they do not define the same point of measurement according to ASTM F1487.

1.2.3 Head Injury Criteria (HIC)

A measure of impact severity that considers the duration over which the most critical section of the deceleration pulse persists as well as the peak level of that deceleration. Head impact injuries are not believed to be life threatening if the HIC does not exceed a value of 1,000.

1.2.4 Impact Attenuation

The ability of protective surfacing to reduce and dissipate the energy of an impacting body.

1.2.5 Loose Fill

Consisting of small independent movable components such as sand, gravel, or wood chip. The percent of fine material in the loose fill affects its compression properties from rainfall.

1.2.6 Maximum Equipment Height

The highest point on the equipment (i.e.: roof ridge, top of support pole).

1.2.7 Play Event

A piece of manufactured playground equipment that supports one or more play activities.

1.3 SYSTEM DESCRIPTION

**************************************************************************

NOTE: Drawings will indicate the perimeters of the play event use zone defining fall height, platform height, and maximum equipment height; spot elevations; and details as required to install
protective surfacing to meet child safety requirements.

Accessibility: Drawings will indicate spot elevations; dimensions; ramp slope and rise; transfer platform height and transfer space; transfer step and height; and maneuvering space as required to install protective surfacing to meet child accessibility requirements.

**************************************************************************

Measure the perimeters of the play event use zone in accordance with the requirements of Section 11 68 13 PLAYGROUND EQUIPMENT.

1.3.1 Child Safety

Meet or exceed the impact attenuating performance requirements of synthetic surfacing and loose-fill surfacing systems, installed in the use zones, as follows. The surfacing critical height value must yield up to both a maximum 200 G's peak deceleration, and a maximum 1,000 Head Injury Criteria (HIC) value for a head-first fall from the play event in accordance with CPSC Pub No 325 and ASTM F1292. The protective surfacing should have a minimum critical height value equal to the height of the highest designated play surface. Measuring fall heights for play events is defined in paragraph FALL HEIGHT. Do not install sand, gravel, and wood products over a concrete or bituminous subsurface in accordance with CPSC Pub No 325.

1.3.2 Child Accessibility

**************************************************************************

NOTE: Facilities will be accessible in accordance with TI 800-01 and 36 CFR 1191, Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities.

Ensure one access and egress point for a furnished play event meets accessibility. Ensure all children are accommodated on the playground in a 'play for all' socialization skill development environment. When children with disabilities are allowed to choose play events, they are more eager to learn the skills necessary to participate.

**************************************************************************

The accessibility requirement in accordance with ASTM F1487 includes the following: When the play event use zone consists of a protective surfacing rated as inaccessible, at least one accessible route must be provided from the use zone perimeter to the play event. When there is more than one of the same play activity provided, only one must meet accessibility requirements (i.e.: one swing seat or one spring rocking play event). When the access and egress points are not the same for a play event, an accessible route must be provided to both. The accessible route must access all accessible play events and elements. The protective surfacing materials that meet accessibility are synthetic surfacing and engineered wood fiber in accordance with ASTM F1951. When the accessible surface is within the use zone, it must meet the requirements of paragraph CHILD SAFETY.
1.3.3 Play Areas at CDC

The technical representative for outdoor play areas at CDC must be the installation Child Development Services (CDS) Coordinator. The design of the CDC outdoor play area must be based on the developmental play program for the age groups accommodated at the CDC. The play area is designed to support the CDC program and to provide a stage set for creative play. Developmental activities are selected which promote the intellectual, social, emotional and physical growth of the children. The developmental play program is developed by the MACOM CDS Director, installation CDS Coordinator and CDC Director. They are responsible for the developmental play program, child safety and accessibility to meet that program.

1.3.4 Sites Other than CDC

The technical representative for outdoor play areas on sites other than CDCs is the Director of Public Works or designated representative. The design of these outdoor play areas must be based on the play program and the age groups to be accommodated as determined by the play area committee.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-07 Certificates
- Manufacturer's Qualification
- Manufacturer's Representative
- Installer's Qualification
1.5 QUALITY ASSURANCE

1.5.1 Manufacturer's Qualification

Submit name of the owner or user; service or preventive maintenance provider; date of the installation; point of contact and telephone number; and address for 10 sites. Protective surfacing should have been installed in a minimum 10 sites and been in successful service for a minimum 5 year calendar period. The manufacturer must provide a Certificate of Insurance AA rated for a minimum one million dollars covering both product and general liability.

1.5.2 Manufacturer's Representative

Submit the individual's name, company name and address, and playground safety training certificate. The manufacturer's certified playground safety inspector or the manufacturer's designated certified playground safety representative must supervise the installation and adjustment of the protective surfacing to verify the installation meets the requirements of the manufacturer, this specification, and paragraphs CHILD SAFETY and CHILD ACCESSIBILITY.

1.5.3 Installer's Qualification

Submit the installer's company name and address, training and experience certification. The installer must be certified by the manufacturer for training and experience installing the protective surfacing.

1.5.4 Shop Drawings

When the use zone perimeter and play event configuration conflict with the requirements and paragraphs CHILD SAFETY and CHILD ACCESSIBILITY, submit scale drawings defining corrective measures to include the following: Adjustment to the play event with the use zone perimeter; use zone perimeter overlaps; fall height and critical height value.

1.6 DELIVERY, STORAGE, AND HANDLING

Provide a delivery schedule at least 10 calendar days prior to the first day of delivery. Deliver, handle, and store protective surfacing material in accordance with the manufacturer's recommendations. The storage area must be as designated. Store the materials in a dry, covered area until installed. Inspect protective surfacing material, upon arrival at the job...
site, for meeting specified quality. Unacceptable materials must be removed from the job site.

1.7 WARRANTY

Furnish protective surfacing with a minimum 1 year calendar period warranty.

1.8 MAINTENANCE INSTRUCTIONS

Submit [2] [_____] bound copies of the manufacturer's operation and maintenance manual describing the recommended preventive maintenance, inspection frequency and techniques, periodic adjustments, lubricants, and cleaning requirements. Furnish protective surfacing spare parts provided by the manufacturer.

PART 2 PRODUCTS

2.1 MATERIALS

**************************************************************************

NOTE: Before selecting a protective surfacing system, evaluate the different types of protective surfacing systems to determine the most appropriate surfacing for the climate, accessibility, play value, and cost. Consider life cycle maintenance cost.

Synthetic Surfacing System: Synthetic surfacing systems, either unified or combined, meet accessibility requirements and have less daily maintenance requirements than loose-fill surfacing systems. Synthetic surfacing systems have limited play value. These systems may be used to add color patterns to the playground to be used for play activities.

Loose Fill Surfacing System: The only loose fill surfacing that meets accessibility is engineered wood fiber. To maintain accessibility there needs to be a commitment to replenishing the material every month with the same engineered material. Some loose-fill materials such as sand, not only provide a good impact attenuation surface, but have excellent play value. Loose fill surfacing systems require daily maintenance to maintain impact attenuation performance due to material displacement, decomposition, and compression.

Depth of Material: Depth of the protective surfacing is determined by both the fall height and the type of protective surfacing system selected.

**************************************************************************

Prior to the delivery of materials, submit certificates of compliance attesting that materials meet the specified requirements. Certified copies of the material certificates must include composition and tests to which the material has been subjected. Submit manufacturer's descriptive data; catalogue cuts; and the latest edition of ASTM F1487 and CPSC Pub No 325. Provide materials which are the standard products of a manufacturer.

SECTION 32 18 16.13 Page 11
regularly engaged in the manufacture of protective surfacing and that are similar to surfacing in satisfactory use a minimum 5 year calendar period. Protective surfacing consists of two systems; synthetic surfacing and loose fill surfacing.

2.2 SYNTHETIC SURFACING

Submit a minimum 50 by 50 mm 2 by 2 inch sample. Submit impact attenuation and critical height performance for each thickness of synthetic surfacing and loose fill surfacing provided. Submit delivery schedule and manufacturer's name for synthetic surfacing and loose fill surfacing plus delivery, storage and handling information. Furnish a list to include part numbers of furnished protective surfacing materials and components for synthetic surfacing and loose fill surfacing and manufacturer's specifications, handling and storage requirements, installation procedures, and safety data sheets to include warnings and critical height performance standards for synthetic surfacing and loose fill surfacing. Synthetic surfacing includes the following: poured-in-place system; tile system; and combination system. The synthetic surfacing consists of either impact attenuating substrate covered by a wear surface bonded to produce a unified system; a shredded rubber or aggregate substrate covered by a polyethylene plastic woven sheet wear surface; or a uniform material manufactured in such a way that the top portion meets the requirements specified for wear surface. Submit chemical composition, color granule percentage, and test results to which material has been subjected, identifying each material and component containing recycled materials and showing the estimated percentage of recovered material content. Furnish freezing temperature life-cycle durability.

2.2.1 Subbase

The subbase for synthetic surfacing may be either concrete, aggregate, or bituminous material.

2.2.1.1 Concrete Subbase

Provide concrete material conforming to Section 32 13 14.13 CONCRETE PAVING FOR AIRFIELDS AND OTHER HEAVY DUTY PAVEMENTS.

2.2.1.2 Bituminous Subbase

Provide bituminous material conforming to Section 32 01 13.62 ASPHALT SURFACE TREATMENT.

2.2.1.3 Aggregate Subbase

Provide aggregate material conforming to Section 32 11 20 [BASE COURSE FOR RIGID][ AND ][SUBBASES FOR FLEXIBLE] PAVING.

2.2.2 Impact Attenuating Substrate

Provide a substrate compatible with the wear surface, and consisting of modular units; poured-in-place; or loose fill.

**************************************************************************

NOTE: layground surface products are EPA designated recycled content products. Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before
specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research has shown that products are available among US national manufacturers meeting the recycled content percentage in the following substrate sections.

**************************************************************************

2.2.2.1 Poured-In-Place Substrate

Poured-in-place substrate must consist of a 100 percent recycled, shredded, styrene butadiene rubber (SBR) adhered with a 100 percent solid polyurethane binder to form a resilient, porous material or shredded rubber. Strands of SBR may vary from a minimum 0.5 mm 1/50 inch to a maximum 2 mm 2/25 inch thickness; by a minimum 3 mm 1/8 inch to a maximum 20 mm 4/5 inch length. Binder must be between a minimum 12 percent and a maximum 16 percent of the total weight of the mixture of rubber and urethane; and must provide 100 percent coating of the particles. Foam rubber will not be accepted in the substrate.

2.2.2.2 Loose Fill Substrate

The loose fill substrate must consist of 100 percent recycled shredded rubber produced from recycled vehicle tires without non-steel belts. Loose-fill strands may vary from a minimum 3 mm 1/8 inch to a maximum 6 mm 1/4 inch thickness; a minimum 3 mm 1/8 inch to a maximum 13 mm 1/2 inch width; and a minimum 13 mm 1/2 inch to a maximum 50 mm 2 inch length.

2.2.3 Wear Surface

Wear surfaces consist of the following: a poured-in-place durable, weather-resistant, ultraviolet stable, water permeable material top-coat; an integral component of a tile system; synthetic turf wear surface; rubber sheet wear surface; or a polyethylene woven plastic sheet wear surface. The wear surface must meet requirements of ASTM D2047 for a minimum 0.8 coefficient of friction.

2.2.3.1 Poured-in-Place Wear Surface

Poured-in-place wear surface consists of ethylene propylene diene monomer (EPDM) particles adhered with a polyurethane binder formulated to produce an even, uniform surface. Particles of EPDM must meet ASTM D412 for tensile strength and elongation, and contain a minimum 25 percent of rubber hydrocarbons. Particles of EPDM must be peroxide or sulfur cured in accordance with the manufacturer. Size of rubber particles must be between a minimum 1 mm 1/32 inch, and a maximum 3 mm 1/8 inch diameter. Binder must be between a minimum 16 percent and a maximum 21 percent total weight of rubber used in the wear surface, and must provide 100 percent coating of the particles. Wear surface must be a minimum 10 mm 3/8 inch thick. The wear surface must be porous.
2.2.3.2 Synthetic Turf Wear Surface

Synthetic turf wear surface must consist of nylon fibers a minimum 500 denier, or heavy face weight polypropylene fiber a minimum 5,000 denier; and tufted construction conforming to ASTM F1015. Fibers in each roll must be from the same dye lot.

2.2.3.3 Rubber Sheet Wear Surface

Rubber sheet wear surface must consist of a smooth, uniform formulation of EPDM rubber granules bonded under pressure in the factory with polyurethane to form a continuous sheet, and must be a minimum 10 mm 3/8 inch thick. Up to a maximum 80 percent of the rubber may consist of SBR particles. Particle size must vary from a minimum 1 mm 1/32 inch to a maximum 5 mm 3/16 inch diameter.

2.2.3.4 Polyethylene Plastic Woven Sheet Wear Surface

Polyethylene plastic woven sheet wear surface must be lockstitched and meet the tear resistance test, ASTM D2261 and must have an accelerated ultra-violet degradation protection feature.

2.2.4 Synthetic Tile

Synthetic tile must be sized [as indicated] [____]. Synthetic tile must be a factory-molded unit consisting of the following: combining impact attenuating substrate and wear surface meeting requirements specified for substrate and wear surface; or a dual-density, uniform material, the top portion of which must conform to wear surface requirements specified.

2.2.5 Color

************************************************************************************
NOTE: Specify the percentage of each color granule for a unified poured-in-place system. Recommend the overall color of the surfacing be light colors to reduce contact burn risk from solar heat buildup. An EPDM wear surface is preferred for color retention.
************************************************************************************

Submit [2] [____] color charts displaying surfacing colors, color granule percentages and finishes. The color must be [as shown in Section 09 06 00 SCHEDULES FOR FINISHES] [as indicated] [____]. An EPDM wear surface is preferred for color retention. Black or the following dark colored SBR wear surfaces retain heat and are not acceptable: color combinations containing more than 10 percent black; or color combinations averaging more than 10 percent dark colors.

2.2.6 Sealant

Sealant for tile or combined protective surface systems must be compatible with the protective surfacing, and must match the color of the wear surface.

2.2.7 Hardware

Hardware, anchors or fasteners must be corrosion resistant stainless steel or galvanized steel to anchor the surfacing system securely, in accordance with manufacturer's instructions. Hardware must provide or be recessed to
provide a flat surface and must be covered by the required depth of protective surfacing.

2.2.8 Binder

Binder for synthetic surfacing must be nontoxic, weather-resistant, ultraviolet stable, non-hardening, and retaining impact-attenuating performance. It must be 100 percent solids containing polyurethane, methylene diphenyl isocyanate (MDI), or as recommended by the manufacturer. The use of toluene diphenyl isocyanate (TDI) must not exceed 2 percent. Weight of polyurethane must be between a minimum 1.02 kg/L 8.5 lbs/gal and a maximum 1.14 kg/L 9.5 lbs/gal. Coloring pigments must be inorganic oxides.

2.2.9 Adhesive

Provide a two component polyurethane adhesive as recommended by the manufacturer.

2.2.10 Containment Curbs

Containment curbs include the following: treated wood, concrete, recycled plastic, or recycled plastic molded as lumber. Containment curbs must provide a smooth and hazard-free transition from the protective surfacing to the adjacent surface. Curbs must be free of sharp vertical edges, protruding elements and trip hazards. Curbs must be as recommended by the manufacturer. Provide all edges with a minimum \(13\text{ mm} 1/2\text{ inch}\) radius.

2.2.11 Transition Edge

The transition edge must be designed to maintain the protective surfacing performance, support the surfacing between changes of material, and must be concrete in accordance with paragraph CONCRETE CURB. The face of the edge to the subgrade must be covered with the impact attenuating surface and meet the requirements of paragraph CHILD SAFETY.

2.2.12 Combination System

Combination systems must consist of combined protective surfacing materials specified. Each component is a part of a manufactured surfacing system. Wear surface must be of the materials specified.

2.3 LOOSE-FILL SURFACING

Loose-fill surfacing installed in the use zone must consist of sand, gravel or wood by-products.

2.3.1 Sand

**************************************************************************

NOTE: Sand provides both a protective surface when installed to the recommended depth and play value as in deep digging. When selecting sand, the composition of fine to coarse particles becomes a factor as sand compresses from rainfall. Compressed sand no longer meets impact attenuation for the fall height specified. Also, sand is displaced from running, digging or dragging activities, requiring replenishment on a daily basis to maintain impact
attenuation performance. "Uniformly graded" sand is to be specified as it has less tendency to compact than "well graded" sand. The specified sieve sizes provide a range of passing percentages that meet paragraph CHILD SAFETY requirements. The range of sieve sizes provided give a sand composition that is locally available and reduce custom mixing.

In accordance with the US Army Community and Family Support Center (CFSC-FSCY) requirements for the Army developmental play program, sand is a required play element and must not be eliminated from the play area.

Submit sieve test results. Sand must be uniformly graded, washed, free of dust, clay, dirt, hazardous substances, or foreign objects. Sand particles must be rounded naturally or by mechanical means and sieved in accordance with ASTM C136/C136M to be in the following gradation range.

<table>
<thead>
<tr>
<th>SIEVE SIZE, mm</th>

<td>0-25</td>
</tr>
<tr>
<td>0.15 No. 100</td>
<td>less than 2</td>
</tr>
</tbody>
</table>

2.3.2 Gravel

Gravel must be washed, free of dust, clay, dirt, hazardous substances or foreign objects. Gravel particles must be rounded naturally or by mechanical means and sieved in accordance with ASTM C136/C136M to be in the following gradation range.

<table>
<thead>
<tr>

2.3.3 Wood By-Products

Wood by-products include wood mulch and engineered wood fiber. Wood by-products must be free of sharp or foreign objects or toxic chemicals; poisonous plant material; protrusions; or hazardous material; provide information regarding composition, source, and particle size. Wood by-products manufactured from recycled pallets or lumber containing nails or metal fasteners must be rejected.
2.3.3.1 Wood Mulch

Wood mulch must be untreated chipped bark or untreated chipped tree prunings a maximum 40 mm 1-1/2 inches long and must be free of twigs, leaves, branches, thorns, dirt, grass, yard clippings, soil, or poisonous plants.

2.3.3.2 Engineered Wood Fiber

Engineered wood fiber manufactured for the purpose of protective surfacing must consist of particles varying from a minimum 3 mm 1/8 inch wide to a maximum 13 mm 1/2 inch thick; and a minimum 25 mm 1 inch wide to a maximum 75 mm 3 inches long.

2.4 GEOTEXTILE FABRIC

Geotextile fabric consists of the following: nonwoven polypropylene sheet; nonwoven 100 percent polyester sheet; or nonwoven needle punched polyester sheet composed of recycled polyester resins.

2.5 RECYCLED PLASTIC

**************************************************************************
NOTE: Plastic lumber used for landscaping timbers and posts is an EPA designated product for recycled content. Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research shows products are available among US national manufacturers meeting the minimum recycled content of the percentage listed.
**************************************************************************

Provide the estimated percentage of recovered material content in the material and components; and life-cycle durability. Submit individual component and assembled unit structural integrity test; creep tolerance; deflection tolerance; and vertical load test results; and life-cycle durability. Recycled plastic must contain a minimum 85 percent of recycled content.

2.5.1 High Density Polyethylene

The material must be molded of ultraviolet (UV) and color stabilized polyethylene; and consist of a minimum 75 percent plastic profile of high-density polyethylene, low-density polyethylene, and polypropylene raw material. The material must be non-toxic and have no discernible contaminants such as paper, foil, or wood. The material must contain no more than 3 percent air voids. The material must be free of splinters, chips, peels, buckling, and cracks. Material must be resistant to deformation from solar heat gain. Material must have factory-drilled
holes. Components with extra holes not filled by hardware or covered by other components must be rejected. The material must not be painted.

2.5.2 Structural Component

Recycled plastic materials will not be used as load bearing structural members.

2.5.3 Recycled Plastic Molded As Lumber

**************************************************************************
NOTE: Recycled plastic molded as lumber and wood-polymer lumber are susceptible to both creep and deflection; therefore, it cannot be used for a load bearing structural member of protective surfacing systems. To overcome creep and deflection, the product is increased in volume of material and dimension.
**************************************************************************

The component deflection must not exceed 1/360 of the span of the frame when exposed to a uniform live load of 585 N/m 40 lbs/ft. The product must meet the structural integrity test requirements set forth in ASTM F1487 and ASTM D6112.

2.6 CURBS

2.6.1 Concrete Curb

Concrete curbs must conform to Section 32 16 19 CONCRETE CURBS, GUTTERS AND SIDEWALKS.

2.6.2 Wood

2.6.2.1 Wood Components

Wood components must be exterior premium grade and free of knots. Wood components must have factory-drilled holes. Components with extra holes not filled by hardware or covered by other components must be rejected.

2.6.2.2 Wood Treatment

Wood components that are not naturally rot and insect resistant must be treated to resist rot and insect attack by using standard treatment procedures. Provide wood treatment chemical content, toxicity level, and life-cycle durability. Any wood placed up to a maximum 150 mm 6 inches above, or any portion below the top elevation of the protective surfacing, must be treated after fabrication. Creosote, pentachlorophenol, and tributyl tin oxide are prohibited according to ASTM F1487.

PART 3 EXECUTION

3.1 SITE PREPARATION

**************************************************************************
NOTE: Provide positive drainage for the proper functioning of protective surfacing. Ensure a minimum 2 percent slope is provided for the protective surfacing subgrade. Ensure ponding at
the perimeter does not occur. To ensure proper drainage, provide a percolation test to establish the requirement for a subdrainage system.

Prior to installing the protective surfacing, verify the playground equipment and site furnishings are installed in accordance with Section 11 68 13 PLAYGROUND EQUIPMENT, and Section 12 93 00 SITE FURNISHINGS.

3.1.1 Finished Grade and Underground Utilities

Submit finished grade, underground utilities, storm-drainage system and irrigation system status; and location of underground utilities and facilities. Verify that finished grades are as indicated; the smooth grading has been completed in accordance with Section 31 00 00 EARTHWORK; installation of the underground utilities through the area has been completed in accordance with Section 31 00 00 EARTHWORK; installation of the storm-drainage system through the area has been completed in accordance with Section 33 40 00 STORM DRAINAGE; and the installation of underground sprinklers through the area has been completed in accordance with Section 32 84 24 UNDERGROUND SPRINKLER SYSTEMS. The location of underground utilities and facilities in the area of the operation must be verified. Damage to underground utilities and facilities must be repaired at the Contractor's expense.

3.1.2 Layout

The layout of the entire use zone perimeter must be staked before excavation begins. The location of all elements must be staked to include the following: All play event configuration access and egress points; and use zone perimeters. The use zone is defined as the area beneath and immediately adjacent to a play structure or equipment that is designated for unrestricted circulation around equipment; and on whose surface it is predicted that a user would land when falling from or exiting the equipment. Also, the use zone is associated with the following terms; "Clear Area," and "Fall Zone". The use zone must be free of hard surfaces, objects or obstacles that a child could run into or fall on top of and be injured. Use zone perimeters must not overlap hard surfaces. The use zone perimeter must meet or exceed the requirements of paragraphs CHILD SAFETY and CHILD ACCESSIBILITY. Use zone perimeters must not overlap except for certain play events as defined in ASTM F1487.

3.1.3 Obstructions Below Ground

When obstructions below ground affect the work, shop drawings showing proposed adjustments must be provided.

3.1.4 Percolation Test

Submit a certified report of inspection, test method used and compliance with recognized test standard must be described. A test for percolation must be done to determine positive drainage, to include the lowest elevation of the subgrade in the areas containing the following: sand; gravel; wood by-products; or synthetic surfacing installed over a pervious base. A positive percolation must consist of a minimum 25 mm 1 inch per 3 hour period. When a negative percolation test occurs, a shop drawing must be provided to indicate the corrective measures.
3.1.5  **Substitution**

Under no circumstances are substitutions to be allowed or protective surfacing to be selected without written approval from the technical representative. Evaluate manufacturer substitutions for the critical height value with meeting the site conditions and paragraph FALL HEIGHT.

3.1.6  **Subgrade**

Correct subgrade irregularities to ensure the required depth of protective surfacing is provided. The subgrade elevation must be as required by the manufacturer.

3.1.7  **Subsurface**

Install the subsurface in a true, even plane, and sloped to provide positive drainage as indicated.

3.1.8  **Subbase**

Tolerance of the concrete or bituminous subbase must be within a maximum 6 mm in 3 m 1/4 inch in 10 feet. Tolerance of aggregate subbase must be within a maximum similar to 6 mm in 3 m 1/4 inch in 10 feet. Compact aggregate subbase to a maximum 95 percent, ASTM D1557. The compaction must be completed in accordance with Section 31 00 00 EARTHWORK. Sand, gravel, and wood products must not be installed over a concrete, aggregate, or bituminous subbase, in accordance with paragraph CHILD SAFETY.

3.1.9  **Concrete or Bituminous Curing**

Bituminous or concrete subbase must be cured [a minimum of 7 days] [in accordance with the manufacturer's requirements]. Curing compounds and other deleterious substances that adversely affect adhesion must be removed. Surface must be clean and dry.

3.1.10  **Fall Height**

**************************************************************************

NOTE: To determine the required depth of protective surfacing, the fall height; maximum equipment height dimensions; and spot elevations for each play event must be shown on the drawings.

**************************************************************************

3.1.10.1  **General Requirements**

The fall height is defined as the vertical distance between the finished elevation of the designated play surface and the finished elevation of the protective surfacing beneath it. For some play events the fall height and platform height are the same, while for other play events the fall height and maximum equipment height are the same, Section 11 68 13 PLAYGROUND EQUIPMENT. When the furnished play event fall height varies from the play event shown, shop drawings must be provided defining the revised depth or type of protective surfacing to meet or exceed the requirements of paragraphs CHILD SAFETY and CHILD ACCESSIBILITY.
### 3.1.10.2 Measuring Fall Height

<table>
<thead>
<tr>
<th>EQUIPMENT</th>
<th>MEASURING FALL HEIGHT</th>

</tr>
<tr>
<td>Stationary Equipment, Nonclimbable</td>
<td>Measure from the designated play surface finished elevation.</td>
</tr>
<tr>
<td>Swing</td>
<td>Measure from the bottom of the pivot point.</td>
</tr>
</tbody>
</table>

### 3.2 INSTALLING SYNTHETIC SURFACING SYSTEM

Surfacing edges must fully adhere to the subsurface. Fully cover the subsurface to ensure no hard surfaces are exposed through displacement of loose fill. Rolled or beveled containment curb or transition edges must maintain the full thickness required to meet paragraphs CHILD SAFETY and CHILD ACCESSIBILITY. Material must cover foundation and cutouts around elements penetrating the surface. Seams must be the minimum necessary and must be tight.

#### 3.2.1 Temperature Limitation

Provide temperature limitations for applying adhesive.

#### 3.2.2 Poured-in-Place System

Components of the poured-in-place system must be mixed mechanically on site in accordance with manufacturer's recommendations. Hand-mixing is prohibited. Installation of poured-in-place surfacing must be seamless and completely bonded to subsurface. Material must cover foundations and must be tight around elements penetrating the surface. Add a minimum 2 mm 1/16 inch depth to the required surfacing depth to ensure the full depth of material is installed to meet paragraph CHILD SAFETY.

#### 3.2.2.1 Geotextile Fabric for Poured-In-Place

Install geotextile fabric over a compacted aggregate base as indicated. Fabric must cover the entire area and must be lapped a minimum 100 mm 4 inch width at the seams. Seams must be adhered in accordance with manufacturer's recommendations. The aggregate base must be free of ruts or protruding objects. The fabric must be installed smooth; and free of tensile stresses, folds, and wrinkles. The fabric must be protected from clogging, tears, or other damage. Damaged fabric must be repaired or
3.2.2.2 Poured-in-Place Substrate

The substrate layer of the poured-in-place system must be installed in one continuous pour on the same day. When a second pour is required, the edge of the previous work must be fully coated with polyurethane binder to ensure 100 percent bond with new work. Adhesive must be applied in small quantities so that new substrate can be placed before the adhesive dries.

3.2.2.3 Poured-in-Place Wear Surface

Wear surface must be bonded to substrate. Adhesive must be applied to substrate in small quantities so that wear surface can be applied before adhesive dries. Surface must be hand troweled to a smooth, even finish. When wear surface is composed of different color patterns, pour must be continuous and seamless. When seams are required due to color change or field conditions, the adjacent wear surface must be placed as soon as possible, before initial pour has cured. The edge of initial pour must be coated with adhesive and wear surface mixture must be immediately applied.

3.2.3 Tile System

Tile must be laid out to ensure that end cuts are equal. Tile must be installed in accordance with manufacturer's instructions. Hardware must be as recommended by the manufacturer. Tile must be bonded to the subsurface with an adhesive approved by the manufacturer. Cutouts must be filled with sealant according to manufacturer's instructions to eliminate voids at equipment. Sealant must be the minimum amount necessary, must not exceed a maximum \(10 \text{ mm} \) \(3/8 \text{ inch}\) width. Where excessive voids occur at cutouts, tile must be removed and refitted. The tile system must be installed throughout the play equipment use zone with the proper thickness.

3.2.4 Combination System

The combination system must consist of \{modular impact attenuating substrate units, adhered to form a unified system\}, \{shredded rubber tires over a gravel substrate\} \{____\}. The substrate must be covered with a wear surface as specified. Cutouts around equipment must be properly filled and sealed according to manufacturer's instructions to eliminate voids. Sealant must be the minimum amount necessary, must not exceed a maximum \(10 \text{ mm} 3/8 \text{ inch}\) width. Where excessive voids occur at cutouts, the modular substrate must be removed and refitted. Construction methods must be employed to ensure full depth installation of specified surfacing material and the finished wear surface.

3.2.4.1 Geotextile Fabric

Geotextile fabric must be installed where a modular or shredded rubber substrate is installed over an aggregate base. It should be installed with poured-in-place wear surface or polyethylene plastic woven sheet wear surface installed over substrate. Fabric must cover the entire area to receive the tile system and must be lapped a minimum \(100 \text{ mm} 4 \text{ inch}\) width at the seams. Seams must be adhered in accordance with manufacturer's recommendations.

3.2.4.2 Modular Substrate

Modular substrate must be laid out to minimize small end pieces. The
substrate must be installed in accordance with manufacturer's instructions.

3.2.4.3 Poured-in-Place Substrate

Same as paragraph Poured-in-Place System.

3.2.4.4 Synthetic Turf Wear Surface

Wear surface must be bonded to substrate with 100 percent solids polyurethane adhesive. Surface irregularities and wrinkles must be corrected. Seams must be secured in accordance with manufacturer's recommendations. Wear surface roll width must be as wide as practical for the installation.

3.2.4.5 Rubber Sheet Wear Surface

Wear surface must be bonded to substrate with 100 percent solids polyurethane adhesive. Surface irregularities and wrinkles must be corrected. Seams must be secured in accordance with manufacturer's recommendations. Wear surface roll width must be as wide as practical for the installation.

3.2.4.6 Poured-in-Place Wear Surface

Same as paragraph Poured-in-Place System.

3.2.4.7 Polyethylene Plastic Woven Sheet Wear Surface

Wear surface must be securely anchored to a perimeter containment material with hardware in accordance with the manufacturer's instructions. Hardware must be appropriate for the type of system and secured to eliminate protrusions.

3.3 LOOSE FILL SURFACING SYSTEM

Submit a minimum 0.003 cubic m 0.125 cubic foot sample.

3.3.1 Sand Surfacing System

Sand must be installed over a compacted subgrade at a minimum 450 mm 18 inches depth throughout the use zone. The finished elevation of sand must be determined after sand has been settled by saturating with water and percolating. The sand depth in high play activity areas must be as indicated. Sand must meet the requirements of paragraph CHILD SAFETY.

3.3.2 Gravel Surfacing System

Gravel must be installed over a compacted subgrade at a minimum 300 mm 12 inch depth throughout the use zone. The depth of gravel in high play activity areas must be as indicated. Gravel must meet the requirements of paragraph CHILD SAFETY.

3.3.3 Wood By-Product Surfacing System

Engineered wood fiber protective surfacing must be installed according to manufacturer's instructions. Wood products must meet the requirements of paragraph CHILD SAFETY.
3.3.3.1 Wood Mulch Surfacing System

Wood mulch must be installed over a compacted subgrade covered with geotextile fabric. Wood mulch must meet the requirements of paragraph CHILD SAFETY.

3.3.3.2 Engineered Wood Fiber Surfacing System

Engineered wood fiber protective surfacing must be installed according to manufacturer's instructions. The surfacing must meet the requirements of paragraphs CHILD SAFETY and CHILD ACCESSIBILITY.

3.3.3.3 Geotextile Fabric for Wood By-Product

Geotextile fabric must cover the entire area and must be lapped a minimum 100 mm (4 inch) width at the seams. Seams must be adhered in accordance with manufacturer's recommendations. Folds, wrinkles, or loose fabric must be smoothed. Fabric must be protected from damage during wood product placement.

3.3.3.4 Minimum Depth for Wood By-Product

Wood by-product must be installed at a minimum 300 mm (12 inch) depth throughout the use zone. The depth of wood products in high play activity areas must be as indicated.

3.4 RESTORATION AND CLEAN UP

When the operation has been completed, clean up and protect the site. Existing areas that have been damaged from the operation must be restored to original condition at the Contractor's expense.

3.4.1 Clean Up

The site and play events must be cleaned of all materials associated with the operation. Play events and surfaces must be cleaned of dirt, stains, filings, and other blemishes occurring from shipment and installation. Cleaning methods and agents must be as recommended by the manufacturer.

3.4.2 Protection

The area must be protected as required or directed by providing barricades and signage. Signage must be in accordance with Section 10 14 00.10 EXTERIOR SIGNAGE.

3.4.3 Disposal of Materials

Excess and waste material must be removed and disposed of off Government property.

3.5 PROTECTIVE SURFACING ACCEPTANCE

Submit record of measurements and findings by the certified playground safety inspector. When the protective surfacing is installed, the play events and protective surfacing must be thoroughly inspected and measured to verify the playground meets manufacturer's recommendations, paragraphs CHILD SAFETY and CHILD ACCESSIBILITY, and paragraph FALL HEIGHT as follows: 1) secure anchoring; 2) all hardware and connectors are tight and below the wear surface; 3) sharp points, edges, and protrusions; 4) entanglement; and
5) pinch, crush, and shear points.

a. Measure use zone distances to determine the area is free of hard surfaces, objects or obstacles. Determine exceptions to use zone overlaps occur in accordance with ASTM F1487. Measure play event fall height and compare to critical height value for the thickness of installed synthetic surfacing. Measure play event fall height and depth of loose fill protective surfacing.

b. Ensure installed chopped tire material is free from steel belts. Ensure the slide exit region has the required clear zone. Swing seat clearances are measured while occupied by a maximum user for the age group using the equipment.

c. The finished installation must have the appearance of a single covering. Protective surfacing that does not comply must be reinstalled. Hardware that does not comply must be replaced. Ensure positive drainage for the area and the lowest elevation of protective surfacing subgrade has been provided.

d. A written report describing the results of the evaluation must be provided.

3.6 RE-INSTALLATION

When re-installation is required, the following must be accomplished at no additional cost to the Government re-install the product as specified; provide new replacement materials supplied by the manufacturer; repair any damage caused by the failed installation.

-- End of Section --
SECTION TABLE OF CONTENTS

DIVISION 32 - EXTERIOR IMPROVEMENTS

SECTION 32 31 13

CHAIN LINK FENCES AND GATES

11/16, CHG 1: 05/17

PART 1   GENERAL

1.1   REFERENCES
1.2   SUBMITTALS
1.3   QUALITY CONTROL
1.3.1   Certificates of Compliance
1.4   DELIVERY, STORAGE, AND HANDLING

PART 2   PRODUCTS

2.1   SYSTEM DESCRIPTION
2.2   COMPONENTS
  2.2.1   Fabric
    2.2.1.1   Top and Bottom Selvages
  2.2.2   Posts [, Rails] and Braces
    2.2.2.1   Composite Posts
  2.2.3   Line Posts
  2.2.4   End, Corner, and Pull Posts
  2.2.5   Sleeves
  2.2.6   Top Rail
  2.2.7   Center Rails Between Line Posts
  2.2.8   Bottom Rail
  2.2.9   Post-Brace Assembly
  2.2.10  Stretcher Bars
  2.2.11  Stretcher Bar Bands
  2.2.12  Post Tops
  2.2.13  Gate Posts
  2.2.14  Gates
  2.2.15  Gate Hardware and Accessories
  2.2.16  Miscellaneous Hardware
  2.2.17  Wire Ties
  2.2.18  Padlocks
2.3   MATERIALS
  2.3.1   Zinc Coating
  2.3.2   Tension Wire
2.3.3 Concrete
2.3.4 Grout

PART 3 EXECUTION

3.1 PREPARATION
  3.1.1 Clearing and Grading

3.2 INSTALLATION
  3.2.1 Security
  3.2.2 Fence Installation
    3.2.2.1 Post Spacing
    3.2.2.2 Top and Bottom Tension Wire
  3.2.3 Excavation
  3.2.4 Setting Posts
    3.2.4.1 Earth and Bedrock
    3.2.4.2 Concrete Slabs and Walls
    3.2.4.3 Bracing
  3.2.5 Concrete Strength
  3.2.6 Top Rails
  3.2.7 Center Rails
  3.2.8 Brace Assembly
  3.2.9 Tension Wire Installation
  3.2.10 Fabric Installation
  3.2.11 Stretcher Bar Installation
  3.2.12 Gate Installation
  3.2.13 Tie Wires
  3.2.14 Fasteners
  3.2.15 Zinc-Coating Repair
  3.2.16 Accessories Installation
    3.2.16.1 Post Caps
    3.2.16.2 Padlocks
  3.2.17 Grounding

3.3 CLOSEOUT ACTIVITIES

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steel fencing, including posts, fabric, gates, and miscellaneous accessories. Colored fabric and accessories may be used if required. Edit specifications to suit the project scope.

Use Section 32 31 13.53 HIGH-SECURITY CHAIN LINK FENCES AND GATES when covering the requirements for chain link fence for high security applications.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM F567 (2014a) Standard Practice for Installation of Chain Link Fence

ASTM F883 (2013) Padlocks

Welded, for Fence Structures

U.S. GENERAL SERVICES ADMINISTRATION (GSA)

FS RR-F-191  (Rev K) Fencing, Wire and Post Metal (and Gates, Chain-Link Fence Fabric, and Accessories)

FS RR-F-191/1  (Rev F) Fencing, Wire and Post, Metal (Chain-Link Fence Fabric)

FS RR-F-191/2  (Rev E) Fencing, Wire and Post, Metal (Chain-Link Fence Gates)

FS RR-F-191/3  (Rev E; Am 1) Fencing, Wire and Post, Metal (Chain-Link Fence Posts, Top Rails and Braces)

FS RR-F-191/4  (Rev F) Fencing, Wire and Post, Metal (Chain-Link Fence Accessories)

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**********************************************************************************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Fence Assembly; G[, [____]]
Location of Gate, Corner, End, and Pull Posts; G[, [____]]
Gate Assembly; G[, [____]]
Gate Hardware and Accessories; G[, [____]]
Erection/Installation Drawings; G[, [____]]

SD-03 Product Data

Gate Assembly; G[, [____]]
Gate Hardware and Accessories; G[, [____]]
Zinc Coating; G[, [____]]
PVC Coating; G[, [____]]
Aluminum Alloy Coating; G[, [____]]
Fabric; G[, [____]]
Stretcher Bars; G[, [____]]
Concrete; G[, [____]]

SD-04 Samples

Fabric; G[, [____]]
1.3 QUALITY CONTROL

1.3.1 Certificates of Compliance

Submit certificates of compliance in accordance with the applicable reference standards and descriptions of this section for the following:

a. Zinc coating
b. PVC coating
c. Aluminum alloy coating
d. Fabric
e. Stretcher bars
f. Gate hardware and accessories

g. Concrete

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to site in an undamaged condition. Store materials off the ground to provide protection against oxidation caused by ground contact.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide fencing materials conforming to the requirements of ASTM A116, ASTM A702, ASTM F626.

Submit reports of listing chain-link fencing and accessories regarding weight in grams ounces for zinc coating[, thickness of PVC coating][, and chemical composition and thickness of aluminum alloy coating].

Submit manufacturer's catalog data for complete fence assembly, gate assembly, hardware assembly and accessories.

2.2 COMPONENTS

2.2.1 Fabric

**************************************************************************
NOTE: Coordinate type of fabric with project requirements. The four types of fabric are not necessarily equivalent. Certain security applications may require use of steel fabric only. Standard selvage treatment for fabric 1.52 m 60 inches and less is knuckled at both selvages. Fabric with heavier zinc or aluminum coating or polyvinyl chloride (PVC) coatings may be useful in highly corrosive environments.
**************************************************************************

**************************************************************************
NOTE: Choose core wire gage appropriate for the design. Gages are not the same for all materials. Polyvinyl chloride (PVC) coating may be specified for other than security purposes when aesthetics are of prime importance and the additional cost is justified. There are different PVC-coated fabrics on the market. Variations may include: The methods of applying PVC coating, wall thickness of PVC coating, adhesion of PVC coating to wire, and cost. Take these factors into consideration when selecting a fence fabric for different environmental applications. PVC coating of fencing for certain security applications and grounded fencing requires detailed design and specifying.
**************************************************************************

FS RR-F-191 and detailed specifications as referenced and other requirements as specified.
FS RR-F-191/1; Type [I, zinc-coated steel, [_____] gage] [II, aluminum-coated steel, [_____] gage] [III, aluminum alloy, [_____] gage] [or] [IV, polyvinyl chloride (PVC) coated over zinc- or aluminum-coated steel, [_____]-gage core wire size]. Mesh size, 51 mm 2 inches. Provide selvage [knuckled at one selvage and twisted and barbed at the other] [twisted and barbed at both selvages] [knuckled at both selvages]. Height of fabric, as indicated.

Provide fabric consisting of 3.8 millimeter No. 9-gage wires woven into a [25] [45] [50] millimeter [1 inch] [1-3/4 inch] [2 inch] diamond mesh, with dimensions of fabric and wire conforming to ASTM A116, with [370] [610] gram per square meter [1.20] [2.0] ounces per square foot zinc galvanizing.

Provide one-piece fabric widths for fence heights up to [3658 millimeter 12 feet][_____] .

2.2.1.1 Top and Bottom Selvages

Provide knuckled selvages at top and bottom for fabric with 51 millimeter 2 inch mesh and up to 1524 millimeter 60 inches high, and if over 1524 millimeter 60 inches high, provide twisted and barbed top selvage and knuckled bottom selvage.

Knuckle top and bottom selvages for 45 millimeter and 25 millimeter 1-3/4 inch and 1 inch mesh fabric.

2.2.2 Posts [, Rails] and Braces

**************************************************************************
NOTE: Use as many of the options as possible consistent with functional requirements. Allow Class 3, formed steel sections as an alternative if no other requirements prohibit their use on a particular job. Certain security applications using intrusion detection sensors use steel pipe framework only. For rails and braces, use minimum sizes specified in FS RR-F-191/3 for each class and grade unless members are to be oversized.
**************************************************************************

**************************************************************************
NOTE: Steel pipe is available in two grades: A or B. Grade A is zinc-coated with 0.54 kg per square meter 1.8 ounces per square foot of zinc. Grade B consists of a zinc-coating with 0.27 kg per square meter 0.9 ounce per square foot, a chromate conversion coating, followed by a clear acrylic or polyester coating. The acrylic or polyester coatings used on Grade B pipe should not be confused with optional polyvinyl chloride (PVC) coatings available for framework. Grade A pipe which has the heavier zinc-coated interior may be desired in some coastal regions located in highly corrosive salt-laden environments to prevent rust caused by condensation inside the pipe. Grade A or Grade B pipe may be used in inland and desert areas, provided Grade B pipe meets the salt spray test.
**************************************************************************
FS RR-F-191/3 line posts; Class [1, steel pipe, Grade [A] [or] [B]] [2, aluminum pipe] [3, formed steel sections] [4, steel H sections] or [5, aluminum H sections]. End, corner, and pull posts; Class [1, steel pipe, Grade [A] [or] [B]], [2, aluminum pipe], [6, steel square sections] [or 7, aluminum square sections]. Braces [and rails]; Class [1, steel pipe, Grade [A] [or] [B]] [2, aluminum pipe] or [3, formed steel sections], in [minimum sizes listed in FS RR-F-191/3 for each class and grade] [size [_____]]. [Provide PVC color coating, minimum thickness, 0.25 mm 0.01 inch.] [Steel pipe, Class 1, Grade B meeting the following performance criteria when subjected to salt spray testing in accordance with ASTM B117:

a. Exterior [_____] 1,000 hours with maximum 5 percent red rust.
b. Interior [_____] 650 hours with maximum 5 percent red rust.]

2.2.2.1 Composite Posts

**************************************************************************
NOTE: Provide as alternative to PVC coated fence posts, and use where corrosion is a problem. Since posts are non-conductive, fence grounding procedures need to be detailed where grounding of the fence is required.
**************************************************************************

Produce resin reinforced posts from polyester or epoxy resin, reinforced with E-glass and filler material. Provide post that meet the ASTM F1043 bending strength for heavy industrial fencing, and filled with 20 MPa 3,000 psi concrete. Protect posts from UV degradation by a veil of polyester cloth impregnated with resin and an acrylic based 1.46 mm 1.5 mil DFT coating system. The post can exhibit no structural failure (less than 10 percent loss of strength) as a result of exposure to moisture and UV lamps per ASTM G152, ASTM G153, ASTM G155, and ASTM G154, (3600 hours). Provide posts [green], [black], [brown] in color to match fabric. [Provide outside diameter as specified in FS RR-F-191/3 for round steel pipe.]

2.2.3 Line Posts

Minimum acceptable line posts are as follows:

Up to 1829 millimeter 6 feet high:

Grade A: DN50 1.900 inch O.D. pipe weighing 4.05 kilogram per linear meter 2.72 pounds per linear foot.

Grade B: DN60 2.375 inch O.D. pipe weighing 4.65 kilogram per linear meter 3.12 pounds per linear foot.

Over 1829 millimeter 6 feet high:

DN50 2.0 inch O.D. pipe weighing 5.44 kilogram per linear meter 3.65 pounds per linear foot.

2.2.4 End, Corner, and Pull Posts

Provide minimally acceptable end, corner, and pull posts as follows:

Up to 1829 millimeter 6 feet high:
Grade A: DN50 2.375 inch O.D. pipe weighing 5.44 kilogram per linear meter 3.65 pounds per linear foot.

Grade B: DN60 2.375 inch O.D. pipe weighing 4.65 kilogram per linear meter 3.12 pounds per linear foot.

Over 1829 millimeter 6 feet high:

Grade A: DN70 2.875 inch O.D. pipe weighing 8.62 kilogram per linear meter 5.79 pounds per linear foot.

Grade B: DN70 2.875 inch O.D. pipe weighing 6.91 kilogram per linear meter 4.64 pounds per linear foot.

2.2.5 Sleeves

Provide sleeves for setting into concrete construction of the same material as post sections, sized 25 millimeter 1 inch greater than the diameter or dimension of the post. Weld flat plates to each sleeve base to provide anchorage and prevent intrusion of concrete.

2.2.6 Top Rail

Provide top rails with [a minimum of DN40 1.660 inches O.D. pipe rails.] [Grade A weighing 3.38 kilogram per linear meter 2.27 pounds per linear foot.] [Grade B weighing 2.71 kilogram per linear meter 1.82 pounds per linear foot.] Provide expansion couplings 150 millimeter 6 inches long at each joint in top rails.

[2.2.7 Center Rails Between Line Posts

**************************************************************************
NOTE: Center rails are not normally required for fencing less than 1829 millimeter 6 feet high. Edit as required.
**************************************************************************

For fencing over 1829 millimeter 6-feet high, provide DN40 1.660 inches O.D. pipe center rails, [Grade A weighing 3.38 kilogram per linear meter 2.27 pounds per linear foot] [Grade B weighing 2.71 kilogram per linear meter 1.82 pounds per linear foot.]

[2.2.8 Bottom Rail

Provide bottom rail conforming to minimum sizes specified in FS RR-P-191/3 for each class and grade unless members are to be oversized.

2.2.9 Post-Brace Assembly

Provide bracing consisting of DN40 1.660 inches O.D. pipe [Grade A weighing 3.38 kilogram per linear meter 2.27 pounds per linear foot] [Grade B weighing 2.71 kilogram per linear meter 1.82 pounds per linear foot] and 10 millimeter 3/8 inch adjustable truss rods and turnbuckles.

2.2.10 Stretcher Bars

Provide bars that have one-piece lengths equal to the full height of the fabric with a minimum cross section of 5 by 20 millimeter 3/16 by 3/4 inch,
in accordance with ASTM F626.

2.2.11 Stretcher Bar Bands

Provide bar bands for securing stretcher bars to posts that are steel, wrought iron, or malleable iron spaced not over 381 millimeter 15 inches on center. Bands may also be used in conjunction with special fittings for securing rails to posts. Provide bands with projecting edges chamfered or eased.

2.2.12 Post Tops

Provide tops that are steel, wrought iron, or malleable iron designed as a weathertight closure cap. Provide one cap for each post, unless equal protection is provided by a combination post-cap and wire supporting arm. Provide caps with an opening to permit through passage of the top rail.

2.2.13 Gate Posts

Provide a gate post for supporting each gate leaf as follows:

[ Up to 1829 millimeter 6-feet wide:

DN75 2.875 inch O.D. pipe [Grade A weighing 8.62 kilogram per linear meter 5.79 pounds per linear foot.] [Grade B weighing 6.91 kilogram per linear meter 4.64 pounds per linear foot.]

][Over 1829 millimeter 6 feet wide and up to 3962 millimeter 13 feet wide:

DN75 2.875 inch O.D. pipe [Grade A weighing 8.62 kilogram per linear meter 5.79 pounds per linear foot.] [Grade B weighing 6.91 kilogram per linear meter 4.64 pounds per linear foot.]

][Over 3962 millimeter 13-feet and up to 5486 millimeter 18-feet wide:

Provide DN150 6.625 inch O.D. pipe weighing 28.26 kilogram per linear meter 18.97 pounds per linear foot.

][Over 5486 millimeter 18-feet wide:

Provide DN220 8.625 inch O.D. pipe weighing 36.79 kilogram per linear meter 24.70 pounds per linear foot.

]2.2.14 Gates

**************************************************************************
NOTE: The gate frames and intermediate braces indicated are adequate for gate sizes less than or equal to 2.4 m 8 feet high and 4.3 m 14 feet wide. Gate configurations larger than 2.4 m 8 feet high and 4.3 m 14 feet wide require special design consideration.
**************************************************************************

FS RR-F-191/2; Type [I, single swing] [II, double swing] [III, single cantilever sliding, wheel sliding gate] [IV, double cantilever sliding] [V, single overhead sliding] [VI, double overhead sliding] [VII, vertical lift] [VII, special]. Shape and size of gate frame, [as indicated] [____]. Framing and bracing members, [round][square] of [steel][aluminum] alloy.
[Steel member finish, [zinc-coated] [or] [PVC-coated over zinc- or aluminum-coated steel].] Provide gate frames and braces of minimum sizes listed in FS RR-F-191/3 for each Class and Grade, except that steel pipe frames are a minimum of 48 mm 1.90 inches o.d., 3 mm 0.120 inches minimum wall thickness and aluminum pipe frames and intermediate braces are 47.5 mm 1.869 inches o.d. minimum, 1.4 kg per meter 0.940 lb/ft of length. Gate fabric, is as specified for fencing fabric. Coating for steel latches, stops, hinges, keepers, and accessories, is [galvanized] [PVC, minimum thickness of 0.25 mm 0.01 inch]. Provide [fork] [plunger bar] type gate latches. [Special gate frames, [as indicated] [_____]_] [Provide intermediate members as necessary for gate leaves more than 2.4 m 8 feet wide, to provide rigid construction, free from sag or twist.] [Provide truss rods or intermediate braces for gate leaves less than 2.4 m 8 feet wide.] Attach gate fabric to gate frame in accordance with manufacturer's standards, except that welding is not permitted. Arrange padlocking latches to be accessible from both sides of gate, regardless of latching arrangement.

For gate leaves up to 1829 millimeter 6 feet high or 1829 millimeter 6 feet wide, provide perimeter gate frames of DN32 1.66 inch O.D. pipe [Grade A weighing 3.38 kilogram per linear meter 2.27 pounds per linear foot.] [Grade B weighing 2.71 kilogram per linear meter 1.82 pounds per linear foot.]

For gate leaves over 1829 millimeter 6 feet high or 1829 millimeter 6 feet wide, provide perimeter gate frames of DN40 1.90 inch O.D. pipe [Grade A weighing 4.05 kilogram per linear meter 2.72 pounds per linear foot.] [Grade B weighing 3.40 kilogram per linear meter 2.28 pounds per linear foot.]

Provide gate frame assembly that is welded or assembled with special malleable or pressed-steel fittings and rivets to provide rigid connections. Install fabric with stretcher bars at vertical edges; stretcher bars may also be used at top and bottom edges. Attach stretcher bars and fabric to gate frames on all sides at intervals not exceeding 381 millimeter 15 inches. Attach hardware with rivets or by other means which provides equal security against breakage or removal.

Provide diagonal cross-bracing, consisting of 10 millimeter 3/8 inch diameter adjustable-length truss rods on welded gate frames, where necessary to obtain frame rigidity without sag or twist. Provide nonwelded gate frames with diagonal bracing.

2.2.15 Gate Hardware and Accessories

Provide gate hardware and accessories that conforms to ASTM A116 and ASTM F626, and be as specified:

Provide [malleable iron] [forged steel] [pressed steel] hinges to suit gate size, non-lift-off type, offset to permit 180-degree opening.

Provide latch that permits operation from either side of the gate, with a padlock eye provided as an integral part of the latch.

Provide stops and holders of malleable iron for vehicular gates. Provide stops that automatically engage the gate and hold it in the open position until manually released.

**************************************************************************
NOTE: Delete the following paragraph when double gates are not required.
**************************************************************************
Provide double gates with a cane bolt and ground-set keeper, with latch or locking device and padlock eye designed as an integral part.

NOTE: Delete the following paragraph if manual sliding gates are not required.

Provide manufacturer's standard heavy-duty track ball bearing hanger sheaves, overhead framing and supports, guides, stays, bracing, and accessories as required for easy operation of manual sliding gates.

2.2.16 Miscellaneous Hardware

Provide miscellaneous hot-dip galvanized hardware as required.

2.2.17 Wire Ties

Provide [2.3 millimeter 11-gage] [2.9 millimeter 9-gage] [_____] galvanized steel wire for tying fabric to line posts, spaced 300 millimeter 12 inches on center. For tying fabric to rails and braces, space wire ties 600 millimeter 24 inches on center. For tying fabric to tension wire, space 2.7 millimeter 0.105-inch hog rings 600 millimeter 24 inches on center.

Manufacturer's standard procedure will be accepted if of equal strength and durability.

NOTE: Specify polyvinyl chloride (PVC) coated ties when PVC-coated fence fabric is required.

FS RR-F-191/4. Provide wire ties constructed of the same material as the fencing fabric. [Provide accessories with polyvinyl (PVC) coatings similar to that specified for chain-link fabric or framework.]

2.2.18 Padlocks

NOTE: Consult station regarding padlocks. Most stations will provide padlocks. If Contractor furnished padlocks are required for certain security applications, a padlock conforming to an appropriate Military or Agency Specification may need to be specified. See referenced specification for types, grades, and options available.

Provide padlocks conforming to ASTM F883, with chain.

2.3 MATERIALS

2.3.1 Zinc Coating

Provide hot-dip galvanized (after fabrication) ferrous-metal components and accessories, except as otherwise specified.
Provide zinc coating of weight not less than 550 gram per square meter 1.94 ounces per square foot, as determined from the average result of two specimens, when tested in accordance with ASTM A90/A90M.

Provide zinc coating conforming to the requirements of the following:

a. Pipe: FS RR-F-191/3 Class 1 [Grade A in accordance with ASTM F1083] [Grade B in accordance with ASTM F1043].

b. Hardware and accessories: ASTM A153/A153M, Table 1

c. Surface: ASTM F1043

d. External: Type B-B surface zinc with organic coating, 275 gram per square meter 0.97 ounce per square foot minimum thickness of acrylated polymer.

e. Internal: Surface zinc coating of 275 gram per square meter 0.97 ounce per square foot minimum.

Provide galvanizing repair material that is cold-applied zinc-rich coating conforming to ASTM A780/A780M.

2.3.2 Tension Wire

Provide galvanized, coiled spring wire, No. 7-gage. Provide zinc coating that weighs not less than [370] [610] gram per square meter [1.2] [2.0] ounces per square foot.

2.3.3 Concrete

Provide concrete conforming to ASTM C94/C94M, and obtaining a minimum 28-day compressive strength of 20685 kilopascal 3,000 psi.

2.3.4 Grout

Provide grout of proportions one part portland cement to three parts clean, well-graded sand and a minimum amount of water to produce a workable mix.

PART 3 EXECUTION

Submit manufacturer's erection/installation drawings and instructions that detail proper assembly and materials in the design for fence, gate, hardware and accessories.

Provide complete installation conforming to ASTM F567.

3.1 PREPARATION

Ensure final grading and established elevations are complete prior to commencing fence installation.

3.1.1 Clearing and Grading

Clear fence line of trees, brush, and other obstacles to install fencing for a distance of [_____] meters feet inside; and [_____] meters feet outside the fence. Establish a graded, compacted fence line prior to fencing installation.
3.2 INSTALLATION

[3.2.1 Security]

**************************************************************************
NOTE: Delete this paragraph if new fencing does not involve relocation or replacement of existing fencing. Depending on nature of fence work, paragraph may need further elaboration regarding necessary construction to maintain perimeter.
**************************************************************************

Install new chain link fencing, remove existing fencing, and perform related work to provide continuous security for facility. Schedule and fully coordinate work with Contracting Officer and cognizant Security Officer.

]3.2.2 Fence Installation

**************************************************************************
NOTE: Certain security applications require conformance to an applicable OPNAVINST. Use bracketed sentences as required by the applicable OPNAVINST.
**************************************************************************

Install fence on prepared surfaces to line and grade indicated. [Secure fastening and hinge hardware in place to fence framework by peening or welding. Allow for proper operation of components. Coat peened or welded areas with a repair coating matching original coating.] Install fence in accordance with fence manufacturer's written installation instructions except as modified herein.

3.2.2.1 Post Spacing

Provide line posts spaced equidistantly apart, not exceeding 3.048 m 10 feet on center. Provide gate posts spaced as necessary for size of gate openings. Do not exceed 152.4 m 500 feet on straight runs between braced posts. Provide corner or pull posts, with bracing in both directions, for changes in direction of 0.26 rad 15 degrees or more, or for abrupt changes in grade. Submit drawings showing location of gate, corner, end, and pull posts.

3.2.2.2 Top and Bottom Tension Wire

**************************************************************************
NOTE: Coordinate with requirements for top and bottom rails. Specify bottom tension wire to maintain fence alignment, except for designs requiring bottom rail.
**************************************************************************

Install [top] [and] [bottom] tension wires before installing chain-link fabric, and pull wires taut. Place top and bottom tension wires within 203 mm 8 inches of respective fabric line.

3.2.3 Excavation

Provide excavations for post footings which are [drilled holes] in virgin
or compacted soil, of minimum sizes as indicated.

Space footings for line posts 3048 millimeter 10 feet on center maximum and at closer intervals when indicated, with bottoms of the holes approximately 75 millimeter 3 inches below the bottoms of the posts. Set bottom of each post not less than 915 millimeter 36 inches below finished grade when in firm, undisturbed soil. Set posts deeper, as required, in soft and problem soils and for heavy, lateral loads.

[ Uniformly spread soil from excavations adjacent to the fence line or on areas of Government property, as directed.] [Remove excavated soil from Government property.]

] When solid rock is encountered near the surface, drill into the rock at least 305 millimeter 12 inches for line posts and at least 457 millimeter 18 inches for end, pull, corner, and gate posts. Drill holes at least 25.4 millimeter 1 inch greater in diameter than the largest dimension of the placed post.

If solid rock is below the soil overburden, drill to the full depth required except that penetration into rock need not exceed the minimum depths specified above.

3.2.4 Setting Posts

Remove loose and foreign materials from holes and moisten the soil prior to placing concrete.

Provide tops of footings that are trowel finished and sloped or domed to shed water away from posts. Set hold-open devices, sleeves, and other accessories in concrete.

Keep exposed concrete moist for at least 7 calendar days after placement or cured with a membrane curing material, as approved.

[ Grout all posts set into sleeved holes in concrete with an approved grouting material.]

[ Maintain vertical alignment of posts in concrete construction until concrete has set.]

3.2.4.1 Earth and Bedrock

**************************************************************************
NOTE: Alternate drive anchor method may be specified as an option where evidence indicates that optional method under similar ground conditions has satisfactory and proven performance record.
**************************************************************************

Provide concrete bases of dimensions indicated on the manufactures installation drawings[, except in bedrock]. Compact concrete to eliminate voids, and finish to a dome shape. [In bedrock, set posts with a minimum of 25.4 mm 1 inch of grout around each post. Work grout into hole to eliminate voids, and finish to a dome shape.]

[3.2.4.2 Concrete Slabs and Walls

**************************************************************************
NOTE: Use the following paragraph where required by the design, otherwise delete. Sleeve joints for non-removable fence sections are usually filled with lead or nonshrink grout. Removable fence sections may be useful as an economical means for providing access to equipment. Sleeve joints in removable fence sections may be a tight sliding type, or where moisture entry could be a problem, filled with pipe sulphur jointing compound.

Set posts into zinc-coated sleeves, set in concrete slab or wall, to a minimum depth of 305 mm 12 inches. Fill sleeve joint with lead, nonshrink grout, or other approved material. Set posts for support of removable fence sections into sleeves that provide a tight sliding joint and hold posts aligned and plumb without use of lead or setting material.

3.2.4.3 Bracing

NOTE: Use a single diagonal truss rod for fences less than 3.7 m 12 feet high. Use two diagonal truss rods on fences 3.7 m 12 feet and higher.

Brace gate, corner, end, and pull posts to nearest post with a horizontal brace used as a compression member, placed at least 305 mm 12 inches below top of fence, and [a diagonal tension rod] [two diagonal tension rods].

a. Tolerances

Provide posts that are straight and plumb within a vertical tolerance of 6.35 millimeter 1/4 inch after the fabric has been stretched. Provide fencing and gates that are true to line with no more than 12.7 millimeter 1/2 inch deviation from the established centerline between line posts. Repair defects as directed.

3.2.5 Concrete Strength

Provide concrete that has attained at least 75 percent of its minimum 28-day compressive strength, but in no case sooner than 7 calendar days after placement, before rails, tension wire, or fabric are installed. Do not stretch fabric and wires or hang gates until the concrete has attained its full design strength.

NOTE: Delete the following paragraph if the referenced section is not included.

Take samples and test concrete to determine strength as specified.

3.2.6 Top Rails

Provide top rails that run continuously through post caps or extension arms, bending to radius for curved runs. Provide expansion couplings as recommended by the fencing manufacturer.
3.2.7 Center Rails

Provide single piece center rails between posts set flush with posts on the fabric side, using special offset fittings where necessary.

3.2.8 Brace Assembly

Provide bracing assemblies at end and gate posts and at both sides of corner and pull posts, with the horizontal brace located at midheight of the fabric.

Install brace assemblies so posts are plumb when the diagonal rod is under proper tension.

Provide two complete brace assemblies at corner and pull posts where required for stiffness and as indicated.

3.2.9 Tension Wire Installation

Install tension wire by weaving them through the fabric and tying them to each post with not less than 3.9 millimeter 7-gage galvanized wire or by securing the wire to the fabric with 3.5 millimeter 10-gage ties or clips spaced 610 millimeter 24 inches on center.

3.2.10 Fabric Installation

Provide fabric in single lengths between stretch bars with bottom barbs placed approximately 38 millimeter 1-1/2 inches above the ground line. Pull fabric taut and tied to posts, rails, and tension wire with wire ties and bands.

Install fabric on the security side of fence, unless otherwise directed.

Ensure fabric remains under tension after the pulling force is released.

3.2.11 Stretcher Bar Installation

Thread stretcher bars through or clamped to fabric 102 millimeter 4 inches on center and secured to posts with metal bands spaced 381 millimeter 15 inches on center.

3.2.12 Gate Installation

Install gates plumb, level, and secure, with full opening without interference. Install ground set items in concrete for anchorage as recommended by the fence manufacturer. Adjust hardware for smooth operation and lubricated where necessary.

3.2.13 Tie Wires

Provide tie wires that are U-shaped to the pipe diameters to which attached. Twist ends of tie wires not less than two full turns and bent so as not to present a hazard.

3.2.14 Fasteners

Install nuts for tension bands and hardware on the side of the fence opposite the fabric side. Peen ends of bolts to prevent removal of nuts.
3.2.15 Zinc-Coating Repair

Clean and repair galvanized surfaces damaged by welding or abrasion, and cut ends of fabric, or other cut sections with specified galvanizing repair material applied in strict conformance with the manufacturer's printed instructions.

3.2.16 Accessories Installation

3.2.16.1 Post Caps

**************************************************************************
NOTE: Coordinate with requirements for top rails or supporting arms.
**************************************************************************

[Design post caps to accommodate top rail.] Install post caps as recommended by the manufacturer.

3.2.16.2 Padlocks

Provide padlocks for gate openings and provide chains that are securely attached to gate or gate posts. Provide padlocks keyed alike, and provide two keys for each padlock.

[3.2.17 Grounding

**************************************************************************
NOTE: Delete this paragraph if grounding is not required. If grounding is required and lightning protection is not part of project design, the requirements in the second set of brackets will be used in lieu of those in the first set of brackets.
**************************************************************************

Provide fence grounding details when composite type posts are specified where grounding of the fence is required. Grounding requirements may be indicated on the drawings or included in this section.

Specify polyvinyl chloride coated fencing with care when grounding is a project requirement.

**************************************************************************

Ground fencing as [indicated on drawings][and specified].

[Ground all fences crossed by overhead power lines in excess of 600 volts, and all electrical equipment attached to the fence.][Ground fences on each side of all gates, at each corner, at the closest approach to each building located within 15 m 50 feet of the fence, and where the fence alignment changes more than 15 degrees. Grounding locations can not exceed 198 m 650 feet. Bond each gate panel with a flexible bond strap to its gate post. Ground fences crossed by power lines of 600 volts or more at or near the point of crossing and at distances not exceeding 45 m 150 feet on each side of crossing. Provide ground conductor consisting of No. 6 AWG solid copper wire. Provide copper-clad steel rod grounding electrodes 19 mm 3/4 inch by 3.05 m 10 foot long. Drive electrodes into the earth so that the top of the electrode is at least 152 mm 6 inches below the grade. Where driving is impracticable, bury electrodes a minimum of 305 mm 12 inches deep and radially from the fence, with top of the electrode not less]
than 610 mm 2 feet or more than 2.4 m 8 feet from the fence. Clamp ground conductor to the fence and electrodes with bronze grounding clamps to create electrical continuity between fence posts, fence fabric, and ground rods. Total resistance of the fence to ground cannot exceed 25 ohms.

3.3 CLOSEOUT ACTIVITIES

Remove waste fencing materials and other debris from the work site.

Submit manufacturer's data indicating percentage of recycled material content in protective fence materials, including chain link fence, fabric, and gates to verify affirmative procurement compliance.

NOTE: This guide specification covers the requirements for chain link and ornamental fencing for high security applications. Please review the UFC 4-022-03 "New Document Summary Sheet" that discusses Purpose, Application and Use, and Need. Document provides guidance and in some cases minimum requirements with the appropriate references.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)

PART 1 GENERAL

NOTE: Where special fencing requirements exist, such as wolf-proofing, antiburrowing provisions, crossing drainage ditches, provisions for electrical installations, or special security installations, modify specifications and appropriate details included on the drawings. Modifications and details must afford security equal to that of the fence.

Where special entrance security requirements exist
such as electronic locks, motor operated gates, closed circuit video; add details and modify the specification accordingly.

NOTE: Certain types of security fence must meet the requirements of an applicable OPNAVINST. Edit this specification as needed for the type of fencing required.

Standard drawings are incorporated into UFC 4-022-03 Security Fences and Gates, Appendix C Fence and Gate Design Details. The details in this appendix illustrate general layouts for each type of fence or gate. These illustrations are not intended to depict the importance or size of each element. Provide details and drawings meeting the minimum mandatory requirements and modify for the specific application, environmental conditions, and local/project constraints. See paragraph titled "Integration With Other Requirements" for additional directional direction. Sizes and dimensions indicated are the minimum requirement that must be modified perservice policy and for the specific application, environmental conditions, and local constraints.

Show layout of fence including types and locations of gates, and gate sizes. Indicate on drawings the extent of clearing required.

Require test reports where closer product control is essential or where difficulty might be encountered determining quality of supplied materials.

**************************************************************************

1.2 SUBMITTALS

********************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

********************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver materials to site in an undamaged condition. Store materials elevated off of the ground to protect against oxidation caused by ground contact.

PART 2 PRODUCTS

2.1 COMPONENTS

2.1.1 Chain Link Fence Fabric

**************************************************************************
NOTE: In salt-laden or corrosive industrial atmosphere, either Class 2 fabric with 610 grams 2.0 ounces of zinc coating per square meter foot or Type I, aluminum-coated fabric, will be specified. In other areas, Class 1 with 370 grams 1.2 ounces of zinc coating per square meter foot or Type I will be specified. Class 2b polyvinyl chloride-coated steel fabric may be specified for other than security purposes when esthetics is of prime importance and the additional cost is justified. Fabric height must be as shown on the contract drawings. Minimum fabric height must be 1.9 m 6 feet for controlled areas and 2.13 m 7 feet for restricted areas. Minimum fabric height requirement for security fences and gates is 2.13 m 7 feet per UFC 4-022-03, Paragraph 2-8 Fence Fabric Height - Unless otherwise directed all security and perimeter fencing must have a minimum fence fabric height of 2.13 m 7 feet, excluding the top guard. Fence height including outriggers must be a minimum of 2.44 m 8 feet. Modifications to existing fences are not required to meet this new UFC. Consult with current Service policies on specific requirements regarding fence height and assets that may require a higher level of protection. Certain security applications require fabric to be embedded into the ground or into a concrete curb.
**************************************************************************

2.1.1.1 General

Provide [ASTM A392, [Class 1] [Class 2], zinc-coated steel wire with minimum coating weight of [370][610] grams [1.2][2.0] ounces of zinc per square meter foot of coated surface.] [ASTM A491, Type I, aluminum-coated steel wire.] [Class 2b polyvinyl chloride-coated steel fabric with 92 grams 0.3 ounces of zinc coating per square meter foot in accordance with ASTM F668.] Fabricate fence fabric of 9 gauge wire woven in 50 mm 2 inch mesh conforming to ASTM A116. [Provide manufacturer's standard [_____] in color for polyvinyl chloride coating for fabric and all other fence components.] [Provide twisted and barbed fabric on the top selvage and knuckled on the bottom selvage.]
2.1.1.2 Approval Of Polyvinyl Chloride-Coated Fence Materials

**************************************************************************
NOTE: Delete this paragraph if PVC Coated fencing is not within the project scope.
**************************************************************************
Inspect polyvinyl chloride-coated fence materials for cracking, peeling, and conformance with the specifications prior to installation. Replace any fence materials rejected by the Contracting Officer with approved materials at no additional cost to the Government.

2.1.2 Ornamental Fence Systems

Submit manufacturer's catalog data. Provide ASTM F2814 structural components consisting of tubular steel ornamental pickets and rails.

Provide [ASTM F2408] [ASTM F2589] industrial class pickets with a minimum cross-sectional area of 2.5 sq cm 1 sq in and a minimum wall thickness of 6 mm 14 ga. Provide pickets with spear-pointed tips extending a minimum of 15 cm 6 in above the top rail of the fence. Mount pickets to a top and bottom rail spaced a maximum of 2 m 80 in apart. Space pickets along rails with a maximum gap not to exceed 5.5 cm 2.25 in. Secure pickets to rails by [welding] [inaccessible, tamper-proof fasteners]. Provide all items and accessories finished by [painting] [powder-coating] [_______] in [black][dark bronze][white][_______].

[Add the following accessories to further harden the Ornamental Fence System: [barbed wire on top of fence] [barbed wire along bottom of fence] [barbed wire along side of fence] [spiked railing along the top rail] [chain-link security mesh welded to the pickets and rails]. Accessories are specified separately in this section.

2.1.3 Posts

2.1.3.1 Metal Posts for Chain Link Fence

**************************************************************************
NOTE: For high security fences that are to be sensored, posts will be limited to Group IA or Group IC steel pipe only. Certain security applications using intrusion detection sensors, must use steel pipe framework only.
**************************************************************************
Provide posts conforming to ASTM F1083, zinc-coated. Group IA, with external coating Type A steel pipe. Group IC steel pipe, zinc-coated with external coating Type A or Type B and Group II, roll-formed steel sections, meeting the strength and coating requirements of ASTM F1043 and ASTM A702. Group III, ASTM F1043 steel H-section may be used for line posts in lieu of line post shapes specified for the other classes. [Provide either Group IA steel pipe posts, Group IC, Group II, roll-formed steel sections, or Group III steel H-sections and be zinc coated (Type A) and polyvinyl chloride coated conforming to the requirements of ASTM F1043.] Provide sizes as shown on the drawings. Use line posts and terminal (corner, gate, and pull) posts of the same designation throughout the fence. Provide gate post for the gate type specified subject to the limitation specified in ASTM F900 and/or ASTM F1184.
2.1.3.2 Accessories

a. Provide accessories conforming to ASTM F626. Coat ferrous accessories with [zinc or aluminum coating.] [polyvinyl chloride-coated, minimum thickness of 0.152 mm 0.006 inch, maximum thickness of 0.381 mm 0.015 inch. Match color coating of fittings to color coating of the fabric.]

b. Provide truss rods (with turnbuckles or other means of adjustment) for each terminal post.

c. Provide barbed wire supporting arms of the [single] [45 degree outward angle 3-strand] [V 6 strand] arm type and of the design required for the post furnished. Secure arms by [top tension wire] [top rail] [bolting] [riveting].

d. Furnish post caps in accordance with manufacturer's standard accessories.

e. Provide 9 gauge steel tie wire for attaching fabric to rails, braces, and posts and match the coating of the fence fabric. [Use tie wires for attaching fabric to tension wire on high security fences made from 1.6 mm 16 gage stainless steel. Provide double loop tie wires 165 mm 6.5 inches in length.] Provide miscellaneous hardware coatings which conform to ASTM A153/A153M unless modified.

2.1.4 Chain Link Braces and Rails

**************************************************************************
NOTE: Normally rails will not be specified except where appearance is important and the added cost is justified. When top rails are not specified, top tension wire will be used. Bottom tension wire will be specified unless a bottom rail is required for high security fence.

NOTE: Use a single diagonal truss rod for fences less than 3.7 m 12 feet high. Use two diagonal truss rods on fences 3.7 m 12 feet and higher.
**************************************************************************

ASTM F1083, zinc-coated, Group IA, steel pipe, size NPS 1-1/4. Provide Group IC steel pipe, zinc-coated, that meets the strength and coating requirements of ASTM F1043. [Use braces and rails that are [Group IA] [Group IC], steel pipe, size NPS 1-1/4 or Group II, formed steel sections, size 42 mm 1-21/32 inch and be zinc coated (Type A) and polyvinyl chloride-coated conforming to the requirements of ASTM F1043.] Group II, formed steel sections, size 42 mm 1-21/32 inch, conforming to ASTM F1043, may be used as braces and rails if Group II line posts are furnished.

Braces [, top rail] [and bottom rail]; Class [1, steel pipe, Grade [A] [or] [B]] [2, aluminum pipe] or [3, formed steel sections], in [size [_____]]. [Provide PVC color coating, minimum thickness, 2.5 mm 0.10 inch.] [Provide steel pipe, Class 1, Grade B conforming to the following performance criteria when subjected to salt spray testing in accordance with ASTM B117: Exterior [_____] 1,000 hours with maximum 5 percent red rust; Interior [_____] 650 hours with maximum 5 percent red rust.]
2.1.5 Chain Link Gates

NOTE: Show type of gates on the drawings, including degree of swing required. In heavy use conditions overhead slide gates should be considered if clearances permit, because these gates require less maintenance and repair than cantilever gates. Ground level track and roller systems should be avoided in climates where snow and ice may accumulate. Recessed tracks should never be used in climates where the recess may fill with ice and snow. Where gates are to receive electric locks, the gate post foundations should be lowered to frost depth to help prevent misalignment of the lock components.

2.1.5.1 Gate Assembly

Provide gate assembly conforming to ASTM F900 and/or ASTM F1184 of the type and swing shown. Provide gate frames conforming to strength and coating requirements of ASTM F1083 for Group IA, steel pipe, with external coating Type A, nominal pipe size (NPS) 1-1/2. Provide gate frames conforming to strength and coating requirements of ASTM F1043, for Group IC, steel pipe with external coating Type A or Type B, nominal pipe size (NPS) 1-1/2. [Provide gate frames made of polyvinyl chloride-coated steel pipe (Group IA) (Group IC) with external coating Type A, a nominal pipe size (NPS) 1-1/2, conforming to ASTM F1043.] Use gate fabric that matches the specified chain link fabric.

2.1.5.2 Gate Leaves

For gate leaves, more than 2.44 m 8 feet wide, provide either intermediate members and diagonal truss rods or tubular members as necessary to provide rigid construction, free from sag or twist. For gate leaves less than 2.44 m 8 feet wide, provide truss rods or intermediate braces. Provide intermediate braces on all gate frames with an electro-mechanical lock. Attach fabric to the gate frame by method standard with the manufacturer. Welding is not an acceptable method for attaching fabric to gate frames.

2.1.5.3 Gate Hardware and Accessories

Submit manufacturer's catalog data. Furnish and install latches, hinges, stops, keepers, rollers, and other hardware items as required for the operation of the gate. All items are required to match the material characteristics of the fence system being installed. Arrange latches for padlocking so that the padlock will be accessible from both sides of the gate. Provide stops for holding the gates in the open position. For high security applications, extend each end member of gate frames sufficiently above the top member to carry three strands of barbed wire in horizontal alignment with barbed wire strands on the fence.

2.1.6 Ornamental Fence Gates

2.1.6.1 Swing Gates

Submit manufacturer's catalog data. Fabricate swing gates by welding 5 sq cm 2 sq in tubular steel ends and rails. Use pickets that match the
adjacent fence construction. Reinforce gates to ensure assembly sags no more than 1% of the gate leaf width or 5 cm 2 in, whichever is less. Size gate posts to accommodate the weight and width of each gate leaf. Mount gates to posts with weldable steel plates or blocks, pressed steel, or malleable iron hinges. Hot-dip galvanize all hinges with a minimum zinc weight of 66 g/sq m 1.20 oz/sq ft. Secure all tamper points by welding or peening the threads. Use swing gate latches and drop bar guides manufactured of pressed steel, hot-dipped galvanized with a minimum zinc weight of 366 g/sq m 1.20 oz/sq ft. Finish all gate hardware in the same color/coating as the fence system.

2.1.6.2 Slide Gates

Submit manufacturer's catalog data. Fabricate slide gates by welding 5 sq cm 2 sq in tubular steel ends and rails. Use pickets that match the adjacent fence construction. Select the type and class of slide gate to comply with ASTM F1184. Size gate posts to accommodate the weight and width of each gate leaf in accordance with ASTM F1184, or per manufacturer's recommendations. [Specify Type II, Class 2, interior roller design for cantilever slide gates.]

2.1.7 Turnstiles

Provide [galvanized steel] [metal], three wing turnstile consisting of a rotor, cage, ceiling plate, and bottom bearing plate. [Provide electronic opening and closing [by card key] [_____].] Provide [continuous turn] [one way continuous turn] [one-third turn and stop] motion.

2.1.8 Padlocks

******************************************************************************
NOTE: Type P01 is key operated. Grade 6 is the top grade commercial lock; in Option A the key is captive in cylinder when padlock is unlocked; in Option B the cylinder is removable; Option 6 is environmentally resistant. For combination locks or other options and grades see ASTM F883.
******************************************************************************

Provide padlocks conforming to ASTM F883, Type [P01] [_____], Option[s] [A, B, and G] [_____] [and] [_____], Grade [6][_____. Size 44 mm 1-3/4 inch. [Key all padlocks alike]. [Key all padlocks into master key system as specified in Section 08 71 00 DOOR HARDWARE].

2.1.9 Gate Operator

Provide electric gate operators for sliding gates as follows: Provide electric gate operators with a right angle gearhead instantly reversing motor with magnetic drum-type brake, friction disc clutch, reversing starter with thermal overload protection, and a chain-driven geared rotary-type automatic limit switch. Use only hardened steel machine cut worm and mating bronze gears that operate in a bath of oil. Gate operators with V-belt pulleys are not allowed. Equip gate operators with an emergency release to allow the gate to be operated manually that is also capable of being locked in the engaged or disengaged position. Provide positive stops on the gate tracks as a backup to the limit switches.
2.1.10 **Electro-Mechanical Locks**

Provide electro-mechanical locking devices for sliding gates and personnel gates that are solenoid actuated such that the deadbolt retracts when the solenoid is energized and remains electrically retracted until the gate is closed. Provide continuous duty type solenoid, rated for 120V ac, 60Hz operation. Ensure the locking device is unlockable by key and keyed on both sides. Monitor status of the electro-mechanical lock by two limit switches (integral to the locking device) wired in series. Ensure one switch monitors the deadlock lever and the other monitors the locking tongue.

### 2.2 MATERIALS

#### 2.2.1 Wire

##### 2.2.1.1 Wire Ties

Submit samples as specified. Provide wire ties constructed of the same material as the fencing fabric. [Provide accessories with polyvinyl (PVC) coatings similar to that specified for chain-link fabric or framework.]

##### 2.2.1.2 Barbed Wire

Provide barbed wire conforming to ASTM A121 zinc-coated, Type Z, Class 3, or aluminum-coated, Type A, with 12.5 gauge wire with 14 gauge, round, 4-point barbs spaced no more than 125 mm 5 inches apart.

##### 2.2.1.3 Tension Wire

Provide Type I or Type II tension wire, Class 4 coating, in accordance with ASTM A824. [Provide 7 gauge coil spring wire for top wire.]

#### 2.2.2 Barbed Tape

Provide reinforced barbed tape, [double coil] [single coil], for fence toppings fabricated from 430 series stainless steel with a hardness range of Rockwell (30N) 37-45 conforming to the requirements of ASTM A240/A240M. Provide stainless steel strip 0.6 mm thick by 25 mm 0.025 inch thick by 1 inch wide before fabrication. Provide barbs that are a minimum of 30.5 mm 1.2 inch in length, in groups of 4, spaced on 102 mm 4 inch centers. Use stainless steel core wire with a 2.5 mm 0.098 inch diameter and a minimum tensile strength of 9.68 MPa 140 psi and conforming to ASTM A478. [The above requirements also apply to reinforced barbed tape, single coil, for ground application.] [Fabricate non-reinforced barbed tape, single coil, for ground applications from 301 series stainless steel, with a hardness range of Rockwell (30N) 50-55, in accordance with ASTM A666. Provide stainless steel strips 0.6 mm thick by 31 mm 0.025 inch thick by 1.21 inches wide before fabrication. Use barbs with a minimum of 30.5 mm 1.2 inch in length, in groups of 4, spaced on 102 mm 4 inch centers.] Use 1.3 mm No. 16 AWG stainless steel twistable wire ties for attaching the barbed tape to the barbed wire [and to the fence for ground application].

Ensure long barbed tape obstacles conform to ASTM F1910.

#### 2.2.3 Concrete

ASTM C94/C94M, using 19 mm 3/4 inch maximum size aggregate, and having minimum compressive strength of 21 MPa 3000 psi at 28 days. Use grout
consisting of one part portland cement to three parts clean, well-graded sand and the minimum amount of water to produce a workable mix.

[2.3 FENCE FABRIC REINFORCEMENT]

**************************************************************************
NOTE: Reinforcement for chain link and ornamental fencing is typically constructed with wire rope and concrete deadman anchor. Refer to UFC 4-022-02, Security Engineering: Design and Selection of Vehicle Barriers and UFC 4-022-03 Security Fences and Gates for guidance and details.
**************************************************************************

Provide galvanized structural wire rope as indicated and in accordance with ASTM A1023/A1023M, 20mm3/4 inch nominal diameter of strand, 19 wire strand, regular lay, extra improved plow steel (EIPS), independent wire rope core (IWRC) and with a minimum breaking strength of 9,175 Newtons 40,800 pound-force. Galvanize cable, Class A, in accordance with ASTM A1023/A1023M.

2.3.1 Wire Rope Accessories

All structural steel members used in cable anchoring system shall be hot-dipped galvanized. Clamps, U-bolts, and associated hardware shall be hot-dipped galvanized in accordance with ASTM A153/A153M.

2.3.2 Turnbuckles

Turnbuckles shall be 30mm x 300mm x 300mm1-1/4 inches x 12 inches x inches Type I, Grade 1 galvanized, in accordance with ASTM F1145.

2.3.3 Rope Clamps

Rope clamps shall be hot-dipped galvanized in accordance with ASTM A153/A153M.

2.3.4 Threaded Rods, U-Bolts, and Bolts

All threaded rods, U-bolts shall conform to ASTM A307 and installed with ASTM F844 and ASTM A563 nuts. The entire bolt assembly shall be galvanized.

]PART 3 EXECUTION

3.1 PREPARATION

Perform complete installation conforming to ASTM F567.

3.1.1 Line and Grade

Install fence to the lines and grades indicated. Clear the area on either side of the fence line to the extent indicated. Space line posts equidistant at intervals not exceeding 3 m 10 feet. Set terminal (corner, gate, and pull) posts whenever abrupt changes in vertical and horizontal alignment are encountered. Provide continuous fabric between terminal posts; however, ensure runs between terminal posts do not exceed 152.4 m 500 feet. Repair any damage to galvanized surfaces, including welding, with paint containing zinc dust in accordance with ASTM A780/A780M.
3.1.2 Excavation

Excavate holes to depths indicated. Clear all post holes of loose material and spread waste material where directed. Eliminate ground surface irregularities along the fence line to the extent necessary to maintain a [25][50] mm [1][2] inch clearance between the bottom of the fabric and finish grade.

3.2 INSTALLATION

3.2.1 Installation Drawings

Submit complete Fence Installation Drawings for review and approval by the Contracting Officer prior to shipment. Submit drawing details that include, but are not limited to the following information: Fence Installation Drawings, Location of gate, corner, end, and pull posts, Gate Assembly, Turnstiles, and Gate Hardware and Accessories. Install fence system per approved drawings.

3.2.2 Security Fencing

Install new security fencing, remove existing security fencing, and perform related work to provide continuous security for facility. Schedule and fully coordinate work with Contracting Officer.

3.2.3 Posts

******************************************************************************
NOTE: For fences over 1.83 m 6 feet tall in areas of frequent high winds (113 kph (70 mph) or greater), specify hole diameters of 406 mm 16 inches for terminal posts and 305 mm 12 inches for line posts.
******************************************************************************

3.2.3.1 Earth and Bedrock

a. Set posts plumb and in alignment. Except where solid rock is encountered, set posts in concrete to the depth indicated on the drawings. Where solid rock is encountered with no overburden, set posts to a minimum depth of 457 mm 18 inches in rock. Where solid rock is covered with an overburden of soil or loose rock, set posts to the minimum depth indicated on the drawing unless a penetration of 457 mm 18 inches in solid rock is achieved before reaching the indicated depth, in which case terminate depth of penetration. Grout all portions of posts set in rock.

b. Set portions of posts not set in rock in concrete from the rock to ground level. Set posts in holes not less than the diameter shown on the drawings. Make diameters of holes in solid rock at least 25 mm 1 inch greater than the largest cross section of the post. Thoroughly consolidate concrete and grout around each post, free of voids and finished to form a dome. Allow concrete and grout to cure for 72 hours prior to attachment of any item to the posts. Group II line posts may be mechanically driven, for temporary fence construction only, if rock is not encountered. Set driven posts to a minimum depth of 914 mm 3 feet and protect with drive caps when setting.

c. Test fence post rigidity by applying a 222.4 newtons 50 pound force on
the post, perpendicular to the fabric, at 1.52 m 5 feet above ground. Ensure post movement measured at the point where the force is applied is less than or equal to 19 mm 3/4 inch from the relaxed position. Test every tenth post for rigidity. When a post fails this test, make further tests on the next four posts on either side of the failed post. Remove, replace, and retest all failed parts at the Contractor's expense.

[3.2.3.2 Concrete Slabs and Walls]

**************************************************************************
NOTE: Use the following paragraph where required by the design, otherwise delete. Sleeve joints for nonremovable fence sections are usually filled with lead or nonshrink grout. Removable fence sections may be useful as an economical means for providing access to equipment. Sleeve joints in removable fence sections may be a tight sliding type, or where moisture entry could be a problem, filled with pipe sulphur jointing compound.
**************************************************************************

When installed in concrete slabs or walls, set posts in zinc-coated sleeves, to a minimum depth of 300 mm 12 inches. Fill sleeve joint with lead, nonshrink grout, or other approved material. Set posts for support of removable fence sections in sleeves that provide a tight sliding joint and hold posts aligned and plumb without use of lead or setting material.

[3.2.4 Rails]

**************************************************************************
NOTE: Top Rails are normally not applicable to High Security Installations
**************************************************************************

Bolt bottom rail to double rail ends and securely fasten double rail ends to the posts. Peen bolts to prevent easy removal. Install bottom rail before chain link fabric. [Provide 3/8" diameter eye hook anchored into concrete footing at midpoint.]

[3.2.5 Fabric]

**************************************************************************
NOTE: Normally the bottom of fence fabric will be installed no higher than 50 mm 2 inches from the ground. For Air Force projects, high security fence fabric will be installed no higher than 25 mm 1 inch from the ground. The height requirement for fence fabric will be verified with the user.

In areas where the soil along the fence line is prone to erosion, measures should be taken to maintain the level of security for which the fence is designed.

Tension requirements are for high security fence applications. Fabric fastening requirement of 300 mm 12 inch spacing to top tension wire and bottom rail is a high security fence requirement.

b. Install chain link fabric on the side of the post indicated. Attach fabric to terminal posts with stretcher bars and tension bands. Space bands at approximately 381 mm 15 inch intervals. Install fabric and pull taut to provide a smooth and uniform appearance free from sag, without permanently distorting the fabric diamond or reducing the fabric height. Fasten fabric to line posts at approximately 381 mm 15 inch intervals and fastened to all rails and tension wires at approximately [610][305] mm [24][12] inch intervals.

c. Cut fabric by untwisting and removing pickets. Accomplish splicing by weaving a single picket into the ends of the rolls to be joined. Install the bottom of the fabric [50][25] mm plus or minus 13 mm [2][1] plus or minus 1/2 inch above the ground.

d. After the fabric installation is complete, exercise the fabric by applying a 222 newtons 50 pound push-pull force at the center of the fabric between posts; use a 133 newtons 30 pound pull at the center of the panel to ensure fabric deflection of not more than 63.5 mm 2.5 inches when pulling fabric from the post side of the fence. Every second fence panel is required to meet this requirement. Resecure and retest all failed panels at the Contractor's expense.

3.2.6 Supporting Arms

Install barbed wire supporting arms and barbed wire as indicated on the drawings and as recommended by the manufacturer. Anchor supporting arms [to the posts in a manner to prevent easy removal with hand tools] [with 9.5 mm 3/8 inch diameter plain pin rivets or, at the Contractor's option, with studs driven by low-velocity explosive-actuated tools for steel, wrought iron, ductile iron, or malleable iron. Do not use explosive-actuated tool to drive studs into gray iron or other material that can be fractured. Use a minimum of two studs per support arm.] Pull barbed wire taut and attach to the arms with clips or other means that will prevent easy removal.

3.2.7 Barbed Tape Installation

NOTE: Barbed tape is a high security fence option when required.

Install stainless steel reinforced barbed tape per ASTM F1911 and as detailed on the drawings. Stretch out barbed tape to its manufacturer's recommended length, set on top of the barbed wire and "V" shaped support arms, then secure it to the barbed wire. Secure the barbed tape to the barbed wire at the two points and at every spiral turn of both coils as shown on the drawings. Install stainless steel [reinforced][non-reinforced] barbed tape for ground applications [in accordance with manufacturer's recommendations][as shown on the drawings].

3.2.8 Gate Installation

a. Install gates at the locations shown. Mount gates to swing as indicated. Install latches, stops, and keepers as required. Install
[Slide] [Lift] gates as recommended by the manufacturer.

b. Attach padlocks to gates or gate posts with chains. Weld or otherwise secure hinge pins, and hardware assembly to prevent removal.

c. Submit [6][_____] copies of operating and maintenance instructions. Outline the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Include in the maintenance instructions routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. Also include the general gate layout, equipment layout and simplified wiring and control diagrams of the system as installed.

3.2.9 Grounding

**************************************************************************
NOTE: Delete this paragraph if grounding is not required. If grounding is required and lightning protection is not part of project design, the requirements in the second set of brackets will be used in lieu of those in the first set of brackets. Provide fence grounding details when composite type posts are specified where grounding of the fence is required.
**************************************************************************

a. Ground fencing as [indicated on drawings][and][specified].

b. [Ground fences crossed by overhead powerlines in excess of 600 volts and ground all electrical equipment attached to the fence.]

c. [Ground fences on each side of all gates, at each corner, at the closest approach to each building located within 15 m 50 feet of the fence, and where the fence alignment changes more than 15 degrees. Ensure grounding locations are located no more than 198 m 650 feet apart. Bond each gate panel with a flexible bond strap to its gate post. Ground fences crossed by powerlines of 600 volts or more at or near the point of crossing and at distances not exceeding 45 m 150 feet on each side of crossing.]

d. [Provide ground conductor consisting of 3.3 mmNo. 8 AWG solid copper wire. Use grounding electrodes that measures 19 mm 3/4 inch by 3.05 m 10 foot long and are a copper-clad steel rod. Drive electrodes into the earth so that the top of the electrode is at least 152 mm 6 inches below the grade. Where driving is impracticable, bury electrodes a minimum of 305 mm 12 inches deep and radially from the fence. Install the top of the electrode to be less than 610 mm 2 feet or more than 2.4 m 8 feet from the fence. Clamp ground conductor to the fence and electrodes with bronze grounding clamps to create electrical continuity between fence posts, fence fabric, and ground rods. Measure total resistance of the fence to ground and ensure it is not greater than 25 ohms.]

[3.2.10 Cable Reinforcement Installation

Comply with the contract drawings. Install [1][2][___] strands of [1.9][2.5] cm [3/4][1] in steel aircraft cables mounted to the [chain link
fence] [ornamental fence system] posts utilizing u-bolts and nuts. Peen the ends of the U-bolts to prevent removal. Tighten cables with galvanized steel turnbuckles with swaged fittings to the point there is no visible sag. Install [1 m x 1 m x .5 m][1.3 m x 1.3 m x 0.66 m][_________] [3 ft x 3 ft x 1.5 ft][4 ft x 4 ft x 2 ft][_________] concrete deadman anchors which are a minimum of [1][1.3][___] m [3][4][___] ft underground and installed in undisturbed surrounding soils. Space dead man anchors no more than 61 m 200 ft apart and on each side of gate openings. Connect steel aircraft cables to dead man anchors using swaged end fittings and turnbuckles attached to 3.2 cm 1.25 in galvanized threaded rod which is embedded into concrete anchor and held in place with two 10 cm x 10 cm x 0.66 cm 4 in x 4 in x ¼ in thick steel plates welded to the threaded rod. Place deadman anchors within 3 m 10 feet of last post and on each side of gate openings.

]3.3 CLOSEOUT ACTIVITIES

3.3.1 Cleanup

Remove waste fencing materials and other debris from the work site each workday.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for Wire Fences and Gates.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This section covers non security applications for farm style fences. Edit this section throughout for the applicable project.

Standard drawings STD 872-90-02 through 872-90-13 of fence and gate types required will be included as part of the contract drawings; the standard drawings are available at https://pdc.usace.army.mil/library/drawings/fence. Layout of fence will be shown including types and locations of gates, and gate sizes. Drawings will also indicate the extent of clearing required.
1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WOOD PROTECTION ASSOCIATION (AWPA)

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

*************************************************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

*************************************************************************************************************

Government approval is required for submittals with a "G" or "S"
classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

]

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver materials to site in an undamaged condition. Store materials off the ground to provide protection against oxidation caused by ground contact.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a fencing system as described herein.

Submit Installation Drawings clearly indicating fence installation, location of gates, corners, ends, and pull posts; gate assembly, gate hardware, catalog data and accessories.

2.2 COMPONENTS

2.2.1 Fence Fabric

Provide fence fabric conforming to the following requirements.

2.2.1.1 Woven Wire

ASTM A116 [No. 9 farm] [No. 12-1/2 close mesh] [No. 14-1/2 wolf-proof] [No. 13 poultry and garden] [No. 14-1/2 chick] fence; grade, size as indicated. [ Provide fittings that conform to ASTM F626.]

2.2.1.2 Barbed Wire

ASTM A121 [zinc-coated, Type Z, Class 3][aluminum-coated, Type A, with 12.5 gauge wire with 14 gauge, round, 4-point barbs spaced no more than 125 mm 5 inches apart.]

2.2.2 Gates

**************************************************************************
NOTE: Show type of gates on the drawings, including degree of swing required. In heavy use conditions
overhead slide gates should be considered if clearances permit, because these gates require less maintenance and repair than cantilever gates. Ground level track and roller systems should be avoided in climates where snow and ice may accumulate. Recessed tracks should never be used in climates where the recess may fill with ice and snow. Where gates are to receive electric locks, the gate post foundations should be lowered to frost depth to help prevent misalignment of the lock components.

Provide gate type and swing shown conforming to ASTM F900 and/or ASTM F1184, ASTM A153/A153M. Provide gate frames conforming to strength and coating requirements of ASTM F1083 for Group IA, steel pipe, with external coating Type A, nominal pipe size (NPS) 1-1/2. [Ensure polyvinyl chloride-coated steel pipe gate frames (Group IA) (Group IC) with external coating Type A, a nominal pipe size (NPS) 1-1/2, conform to ASTM F1043.] Provide gate leaves more than 2.44 m 8 feet wide with either intermediate members and diagonal truss rods or tubular members as necessary to provide rigid construction, free from sag or twist. Gate leaves less than 2.44 m 8 feet wide with truss rods or intermediate braces. Provide intermediate braces on all gate frames with an electro-mechanical lock. Attach gate fabric to the gate frame by method standard with the manufacturer. Welding is not permitted. Furnish latches, hinges, stops, keepers, rollers, and other hardware items as required for the operation of the gate. Arrange latches for padlocking so the padlock is accessible from both sides of the gate. Provide stops for holding the gates in the open position.

2.2.3 Posts

2.2.3.1 Metal Posts for Farm Style Fence

Provide metal posts conforming to ASTM A702 [zinc-coated], [T-section] [U-Section], length as indicated, and accessories conforming to ASTM A702.

2.2.3.2 Composite Polyester Resin Reinforced Line Posts

NOTE: Composite posts may be used as an alternative to PVC coated steel line posts in salt- laden or corrosive industrial atmospheres. Since composite posts are non-conductive, fence grounding procedures need to be detailed where grounding of the fence is required.

Provide polyester resin reinforced line posts produced from unsaturated polyester resin reinforced with E-glass. Fill posts with an appropriate filler material to form a rigid structural support member. Provide posts that meet the strength requirements of ASTM F1043 for heavy industrial fencing. Protect posts from UV and moisture degradation by a protective veil impregnated with resin (0.2 to 0.3 mm 8 to 12 mil minimum) and an acrylic based (0.05 mm 2 mil minimum) coating system. Provide corrosion and ultraviolet resistant posts as demonstrated when exposed to accelerated environmental test chamber for not less than 3,600 hours. Ensure posts show no structural failure (i.e., less than 10 percent loss of strength) as a result of exposure to moisture. Test post coating system strength in
accordance with ASTM D4541 for 90 percent adhesion strength. Supply posts that are [green] [black] [brown] in color. Provide outside diameter as specified in ASTM F1043 for round steel pipe.

2.2.3.3 Wood Posts

Provide wood posts cut from sound and solid trees free from short or reverse bends in more than one plane. Make tops convex rounded or inclined. Provide posts free of ring shake, season cracks more than 6 mm 1/4 inch wide, splits in the end, and unsound knots. Provide posts of size and shape indicated. Treat posts in accordance with AWPA U1 as applicable.

2.2.4 Braces and Rails

**************************************************************************
NOTE: Normally, rails will not be specified except where appearance is important and the added cost is justified. When top rails are not specified, top tension wire will be used. Bottom tension wire will be specified unless a bottom rail is required for fence.
**************************************************************************

ASTM F1083, zinc-coated, Group IA, steel pipe, size NPS 1-1/4. Group IC steel pipe, zinc-coated, meeting the strength and coating requirements of ASTM F1043. [Provide braces and rails of [Group IA] [Group IC], steel pipe, size NPS 1-1/4 or Group II, formed steel sections, size 42 mm 1-21/32 inch and be zinc coated (Type A) and polyvinyl chloride-coated conforming to the requirements of ASTM F1043.] Provide Group II, formed steel sections, size 42 mm 1-21/32 inch, that conform to ASTM F1043, if used as braces and rails when Group II line posts are furnished.

2.2.5 Padlocks

**************************************************************************
NOTE: Type P01 is key operated. Grade 6 is the top grade commercial lock; in Option A the key is captive in cylinder when padlock is unlocked; in Option B the cylinder is removable; Option 6 is environmentally resistant. For combination locks or other options and grades see ASTM F883.
**************************************************************************

Provide padlocks conforming to ASTM F883, TYPE [EPB][____], size [44 mm 1-3/4 inch][____]. [Key all padlocks alike]. [Key all padlocks into master key system as specified in Section 08 71 00 DOOR HARDWARE].

2.3 MATERIALS

2.3.1 Concrete

ASTM C94/C94M, using 19 mm 3/4 inch maximum size aggregate, and having minimum compressive strength of 21 MPa 3000 psi at 28 days. Provide grout consisting of one part portland cement to three parts clean, well-graded sand and the minimum amount of water to produce a workable mix.
PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Clearing

Clear the area on each side of the fence as indicated in the plans.

3.1.2 Line and Grade

Install fence to the lines and grades indicated. Space line posts equidistant at intervals not exceeding 3 m 10 feet. Set terminal (corner, gate, and pull) posts at abrupt changes in vertical and horizontal alignment. Provide continuous fabric between terminal posts; however, ensure runs between terminal posts do not exceed 152.4 m 500 feet. Repair any damage to galvanized surfaces, including welding, with paint containing zinc dust in accordance with ASTM A780/A780M.

3.1.3 Excavation

Clear loose material from all post holes. Spread waste material where directed. Eliminate ground surface irregularities along the fence line to the extent necessary to maintain a [25] [50] mm [1] [2] inch clearance between the bottom of the fabric and finish grade.

3.2 INSTALLATION

3.2.1 Installation

Install fence system per approved installation drawings.

3.2.2 Post

For wood posts (Farm Style Fence), excavate to depth indicated and brace post until backfill is completed. Place backfill in layers of 229 mm 9 inches or less, moistened to optimum condition, and compacted with hand tampers or other approved method. Set posts plumb and in proper alignment. Drive metal posts or set in concrete as indicated.

3.2.3 Barbed Wire

Install wire on the side of the post indicated. Pull wire taut to provide a smooth uniform appearance, free from sag. Fasten wire to line posts at approximately 381 mm 15 inch intervals unless indicated otherwise.

3.2.4 Gate Assembly

For farm style fencing, provide standard metal gate assemblies with frame and fittings necessary for complete installation or wood gates as shown.

[3.2.5 Grounding

**************************************************************************
NOTE: Delete this paragraph if grounding is not required. If grounding is required and lightning protection is not part of project design, the requirements in the second set of brackets will be used in lieu of those in the first set of brackets. Provide fence grounding details when composite type
posts are specified where grounding of the fence is required.

[Ground fences crossed by overhead powerlines in excess of 600 volts as specified in Section 26 41 00 LIGHTNING PROTECTION SYSTEM. Ground electrical equipment attached to the fence as specified in [Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION] [Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION].] [Ground fences on each side of all gates, at each corner, at the closest approach to each building located within 15 m 50 feet of the fence, and where the fence alignment changes more than 15 degrees. Space grounding locations so as not to exceed 198 m 650 feet. Bond each gate panel with a flexible bond strap to its gate post. Ground fences crossed by powerlines of 600 volts or more at or near the point of crossing and at distances not exceeding 45 m 150 feet on each side of crossing. Use a ground conductor consisting of No. 8 AWG solid copper wire. Use grounding electrodes 19 mm 3/4 inch by 3.05 m 10 foot long copper-clad steel rod. Drive electrodes into the earth so that the top of the electrode is at least 152 mm 6 inches below the grade. Where driving is impracticable, bury electrodes a minimum of 305 mm 12 inches deep and radially from the fence. Ensure the top of the electrode is not less than 610 mm 2 feet or more than 2.4 m 8 feet from the fence. Clamp ground conductor to the fence and electrodes with bronze grounding clamps to create electrical continuity between fence posts, fence fabric, and ground rods. Test to ensure the maximum total resistance of fence to ground is no greater than 25 ohms.]

3.3 CLEAN UP

Remove waste fencing materials and other debris from work site daily.

3.5 PROTECTION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for segmental concrete block retaining walls. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The following is guidance in selecting the proposed tailoring options:

(1) Contractor Design. Many suppliers have designers that specialize in design of SRW's. Allowing the Contractor to design the system provides the most competitive bidding process. The Contractor has the capacity to select materials for the most efficient design. This is the most favorable design method for typical applications.
(2) Government Design. Non-typical applications may be best designed before solicitation. Such projects would include applications where the design conditions are beyond the capabilities of commercial software available from SRW suppliers, or applications where the Contractor could not be expected to bid without performing stability calculations during the bidding process. Examples may include bin walls, or structures with unusual loading applications, such as coastal structures, blast resistant structures, or structures in high seismic regions.

(3) Hybrid Design. Much of the civil works Corps of Engineers projects involve conditions where the global stability requires analysis, but the internal, external and compound stability are routine. Such conditions are common on waterfront structures. Contractor analysis of global stability is not biddable since the analysis may indicate structure definition that could not be assumed during bid. While this could be handled though a modification to the contract, there is a risk that it will be overlooked. Also, experience has shown that it is difficult to specify the degree of work involved in the design analysis (the reason architect-engineer services are negotiated in accordance with the Federal Acquisition Regulation, Part 36). The hybrid design incorporates the advantages of the Contractor designed wall for internal, external and compound stability, while eliminating the conflict of interest in requiring Contractor design of global stability. Changes made to the wall during preparation of shop drawings, such as free standing height, footing embedment, or location could affect the global stability. If the hybrid design method is used, the submittal process should assure that the wall designer reviews the shop drawing submittals, regardless of a Contractor design check for global stability.

NOTE: This section does not address requirements for dewatering, shoring, or earthwork below foundation level.

Geometric requirements such as wall height, length, and construction limits should be shown on the drawings.

******************************************************************************

NOTE: For Navy: Use this guide specification for gravity segmental block retaining walls with a height not greater than 4 feet.

******************************************************************************
1.1 UNIT PRICES

1.1.1 Measurement

Measurement of segmental retaining wall for payment will be made on the basis of the face area in the vertical plane of segmental concrete units. The pay lines of the structure will be neat lines taken off the approved shop drawings; and will extend from the block-leveling pad interface to the top of wall, excluding any fencing or barrier. Payment will be made at the respective unit price per square meter (SM) foot (SF) listed on the Bidding Schedule.

1.1.2 Payment

Payment will be full compensation for engineering services, excavation and preparatory work, and furnishing all material, labor and equipment to complete the work.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

ASTM INTERNATIONAL (ASTM)

ASTM C140/C140M (2020a) Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units

1.3 DEFINITIONS

**************************************************************************
NOTE: This guide specification only applies to geosynthetic (extensible) reinforcement. There are differences in design and construction applicable to steel soil (inextensible) reinforcement.
**************************************************************************

1.3.1 Blocks

Blocks, for the purpose of this specification, refers to segmental concrete retaining wall units.
1.3.2 Drainage Aggregate

Granular soil or aggregate placed within, between, and/or immediately behind segmental concrete units.

1.3.3 Fill

Soil or aggregate placed in, behind, or below the wall.

1.3.4 Reinforced Fill

Soil placed and compacted within the neat line volume of reinforcement as outlined on the plans.

1.3.5 Retained Fill

Soil placed and compacted behind the reinforced fill.

1.3.6 Reinforcement

Geogrid or a geotextile product manufactured for use as reinforcing in segmental block retaining walls. Steel products are not allowed.

1.3.7 Long Term Design Strength

The long term design strength (LTDS) is:

\[ LTDS = \frac{T_{ult}}{RF_D \times RF_{ID} \times RF_{CR}} \]

where:

- \( T_{ult} \) is the ultimate strength
- \( RF_D \) is the reduction factor for chemical and biological durability
- \( RF_{ID} \) is the reduction factor for installation damage
- \( RF_{CR} \) is the reduction factor for creep

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor’s Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the
District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Shop Drawings; G[, [_____]]

1.5 QUALITY CONTROL

1.5.1 Contractor Qualifications

**************************************************************************

NOTE: Modify the qualifications for the project's degree of difficulty. Enforceable project requirements are limited to the number of completed projects, or years experience.
**************************************************************************

Furnish components and equipment from a manufacturer regularly engaged in the manufacturing of products that are of similar material, design and workmanship. Submit descriptive technical data on the blocks, wall caps, masonry adhesive, reinforcement, geotextile filter materials and equipment to be used. Include all material properties specified under PART 2 PRODUCTS. Include a copy of any standard manufacturer's warranties for the products. Provide standard products with satisfactory commercial or industrial use for 2 years before award of this contract. Submit documentation to demonstrate the job foreman or the company directly responsible for the wall installation has completed a minimum of 10 segmental concrete retaining wall projects at least 2 years experience.

1.5.2 Supplier Qualifications

**************************************************************************

NOTE: The suggested text is recognized to be somewhat vague. It limits situations were a never-before-used product is proposed, or where a product is proposed for use outside the limitations (such as batter) listed in the manufacturer's literature. The qualifications should be modified for the project's degree of difficulty (e.g. walls over 10 m 30 feet height). Caution to avoid unreasonable qualifications should be exercised if modifying.
**************************************************************************

[Submit documentation showing that the installer and supplier meet the qualifications listed. To be considered acceptable, demonstrate experience in the supply of similar size and types of segmental retaining walls on previous projects.]

1.5.3 Manufacturer's Representative

**************************************************************************

NOTE: The geosynthetic manufacturers representatives generally have assumed involvement in construction; but that is not necessarily true in all localities. The number of site visits expected by the manufacturer's representative should be quantified if known.
**************************************************************************

Provide a qualified and experienced representative from the block or reinforcement manufacturer who is available to consult and conduct site visits on an as-needed basis during the wall construction [at least once during construction] [as requested by the Contracting Officer].
1.6 DELIVERY, STORAGE, AND HANDLING

Check products upon delivery to ensure that the proper material has been received and is undamaged. For geosynthetics, follow the guidelines presented in ASTM D4873/D4873M.

1.6.1 Segmental Concrete Units and Wall Caps

Protect blocks from damage and exposure to cement, paint, excessive mud, and like materials. Check materials upon delivery to assure that the block dimensions are within the tolerances specified.

1.6.2 Geosynthetic Labeling

Label each roll with the manufacturer's name, product identification, roll dimensions, lot number, and date manufactured.

1.6.3 Geosynthetic Handling

Handle and unload geosynthetic rolls by hand, or with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Do not drag, lift by one end, lift by cables or chains, or drop to the ground any geosynthetic rolls.

1.6.4 Geosynthetic Storage

Protect geosynthetics from cement, paint, excessive mud, chemicals, sparks and flames, temperatures in excess of 70 degrees C 160 degrees F, and any other environmental condition that may degrade the physical properties. If stored outdoors, elevate rolls from the ground surface. Protect geosynthetics, except for extruded grids, with an opaque waterproof cover. Deliver to the site in a dry and undamaged condition. Do not expose geotextiles to direct sunlight for more than 7 days.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

This work element includes engineering services in addition to the construction requirements. Provide engineering services that include design of the wall in accordance with the National Concrete Masonry Association design method, and providing shop drawings indicating all features of the complete design.

The NCMA design method for segmental retaining walls considers potential failure modes categorized by external, internal, local, compound, and global stability. The Government has considered the global stability and has provided the minimum design requirements on the drawings. Provide engineering services that include analysis of the wall for all modes of stability and shop drawings indicating all features of the complete design.

2.1.1 Design Requirements

**************************************************************************
NOTE: The NCMA and FHWA design methods are nearly identical. They differ primarily in the treatment of the vertical component of active earth pressure and the connection strength. The current FHWA design results in a conservative connection strength.
that only a small number of products meet. The FHWA
design method is less commonly used, except in
transportation related projects. The FHWA design
method may be required for works within highway
right-of-way.

Complete all stability analyses in accordance with either the NCMA TR127B,
or the Federal Highway Administration/AASHTO method detailed in
FHWA NHI-00-043. Follow only one method for the complete design, including
reinforcement design strength, layout, stability calculations, and seismic
effects. Design the segmental retaining wall system under the direction of
a professional engineer. Affix engineer's stamp to all drawings.[ At
least one site visit by the engineer is required during the construction
phase.] The design engineer must stamp all drawings and calculations.

2.1.2 Design Parameters

NOTE: It is recommended that the designer insert
the soil properties below for the purpose of
establishing a common basis for bidding. Verify
that the contract documents provide sufficient
information for interpretation of soil conditions
below the wall, behind the wall, and at Government
furnished borrow locations. Listing soil properties
in the specification is optional. An alternative is
to provide testing results.

The soil properties listed commonly have a
significant influence on the reinforcement design,
but are not all inclusive. A soil test is
recommended prior to entering data for these
parameters. Limiting the parameters to the ones
shown in the table is suggested as they are
generally representative of a Contractors analysis
during bidding. More control over the product can
be obtained by specifying soil properties for
retained fill, soil properties for foundation soils,
and changes in water levels through the retained
fill, reinforced fill, and drains. Indicate
surcharge loads (live or dead) and location on
drawings.

Government selected soil properties will give more
control in procuring a prudent design for
competitively bid projects. The Government usually
has access to all the geologic information that will
be available to the Contractor during construction,
and often has invested more time in consideration of
the data than the Contractor can afford during the
bidding process. However, there is a disadvantage
to listing the soil properties if the Contractor has
the option to change conditions and void the
assumptions. The soil properties should not be
listed if the borrow source is uncertain.

Include in all calculations the determination of long term design strength
of reinforcement specific to this project in accordance with the NCMA TR127B or FHWA NH1-00-043. Base the ultimate strength or index strength on the minimum average roll value tensile strength of the product using the wide width strength test in ASTM D4595. Submit design calculations, including computer output data, program documentation, and all items described under PARAGRAPH: SEGMENTAL RETAINING WALL DESIGN. Itemize list of each reduction factor and include backup data to justify each reduction factor included in the calculations. Include analysis of all failure modes listed in the NCMA TR127B. Include a clear outline of material properties and assumptions.

Use the following soil parameters and water elevation for stability analysis, and select additional soil parameters as required to complete the analysis.

<table>

</tr>
<tr>
<td>Water Elevation in reinforced fill</td>
<td>[_____] meters feet</td>
</tr>
</tbody>
</table>

2.1.2.1 External Stability Design Requirements

NOTE: The minimum base width is an empirical constraint. The minimum base width of 0.7H is the same as FHWA requirements, but slightly exceeding the NCMA requirement of 0.6H.

As a minimum requirement, ensure the length of the reinforcing at the base of the wall is no less than 0.7 times the total height of the blocks.

2.1.2.2 Seismic Design Requirements

NOTE: The pseudo static analysis method is only applicable up to A < 0.4 in the NCMA manual, and up to A < 0.29 in the FHWA method. The wall should be Government designed if A exceeds the recommendations of the design method, or if a dynamic analysis is considered necessary. The NCMA Seismic Design Manual references AASHTO and the Canadian Foundation Engineering Manual for sources of the A value. ER 1110-2-1806 (31 July 1995) also contains similar data obtained from the National Earthquake Hazard Reduction Program (NEHRP).

Complete the seismic stability analysis in accordance with NCMA TR127B or FHWA NH1-00-043. Assume the pseudo-acceleration value with a 10 percent probability of exceedance in 50 years (referred to as the A value by NCMA and FHWA) is [_____].
2.1.2.3 Global Stability Design Requirements

Use the requirements listed in Table 1 to determine the minimum long term design strength of the lowest [_____] reinforcement layer[s]. Use reinforcement lengths at least as long as the lengths shown on the drawings.

2.1.3 Layout

Show on the shop drawings (fabrication and installation drawings) all information needed to fabricate and erect the walls including the leveling pad elevations; the shape and dimensions of wall elements; the number, size, type, and details of the soil reinforcing system and anchorage; and identification of areas requiring coping. Include with the shop drawings all items described under paragraph SEGMENTAL RETAINING WALL DESIGN. If approved by the Contracting Officer, shop drawings may consist of marked up contract drawings showing exact dimensions for the blocks supplied, required coping, and other minor revisions. The design and layout of the internal reinforcement are subject to the following:

a. Incorporate all features indicated in the contract documents in the final design and construction.

b. The leveling pad elevations may vary, as long as they are no higher than the embedment depth profile.

c. Run each reinforcement level as continuous as practical throughout the profile. If a geotextile filter is present, layout the reinforcement so that interference with the geotextile is minimized.

d. Identify any reinforcement not placed with the machine direction as the design reinforcement direction on the shop drawings.

e. Do not combine geogrid and geotextile, nor products from different manufacturers, within one wall. Limit the number of reinforcement products to avoid confusion in placement. For walls under 3.5 meters 12 feet high, use reinforcement of the same grade and strength (i.e. design with one reinforcement strength).

2.2 COMPONENTS

2.2.1 Segmental Concrete Units

Submit two samples of each proposed block which is typical of the size, texture, color, and finish.

2.2.1.1 Face color

**************************************************************************
NOTES: The block color or tint can sometimes change noticeably between production runs. If the block color is inconsistent, the wall may show an irregular visible line or pattern where blocks from different production runs merge. If this is important to the architect, it can be specified that all blocks within a wall must come from the same production run. Normally, this is an unnecessary restriction.
**************************************************************************
2.2.1.2 Face Texture

[Split face typical of broken mortar/brick face]

2.2.1.3 Face Appearance

**************************************************************************
NOTE: Use of blocks with a sculptured face (uneven, beveled, or rounded) usually requires maintaining a half-bond (stacking the vertical joint at the midpoint of the underlying block) for architectural reasons.
**************************************************************************

[Straight, single-surface face/sculptured with 3-surface beveled face/rounded, smooth-curved face]

2.2.1.4 Block Size

A minimum of 0.06 square meters 2/3 square feet of face area, and minimum 150 mm 6 inch height

2.2.1.5 Bond Configuration

No bond configuration is required for straight face blocks. Design beveled or sculptured face blocks to stack with a half-bond (joints located at midpoint of vertically adjacent blocks). Finish the block edges so that vertical joints are flush.

2.2.1.6 Structural requirements

**************************************************************************
NOTES: Durability - AASHTO has proposed specifications for blocks that include compressive strength and absorption (Ref. 1997 Interim Revisions to the Standard Specifications for Highway Bridges). Additional options to increase resistance to chloride attack along roads includes a sloped cap block, surface sealing the completed wall, and higher compressive strength.

Freeze-thaw Testing - The first choice is the default requirement in ASTM C1372, but is not required by the ASTM test (1997) unless testing is required by the specifier. The second choice for 3 percent saline solution is used by the Minnesota Department of Transportation. The specifier should edit this based on the project's location since other states may have different requirements.

The block weight per unit face area is listed as an index statistic to limit pore area and face thickness. Blocks with thin faces and large pore spaces can be damaged by traffic or debris hitting the wall and are less durable. The face thickness and/or pore area can be specified, but the weight per face area is more readily available.

SECTION 32 32 23.13 Page 15
Use segmental concrete blocks meeting the requirements of ASTM C1372. or ASTM C94/C94M, except for the following modifications:

a. Minimum 28-day compressive strength of \[31 \text{ MPa} 4000 \text{ psi}\], based on net area in accordance with ASTM C140/C140M.

b. A maximum moisture absorption rate of \[145 \text{ kg/m}^3 9 \text{ pcf}\], in accordance with ASTM C140/C140M.

c. Provide concrete with a minimum oven dry density of \[2000 \text{ kg/m}^3 125 \text{ pcf}\].

d. Provide blocks with a minimum of \[400 \text{ kg/square meter} 80 \text{ psf}\] of wall face area (determined without void filling).

e. For freeze-thaw durability tested in accordance with ASTM C1262/C1262M, comply with either of the following: (1) eight loss of each of 5 specimens after 100 cycles is 1 percent or less; or (2) weight loss of each of 5 specimens after 150 cycles is 1.5 percent or less. [when tested in a 3 percent saline solution: (1) weight loss of each of 5 specimens after 40 cycles is 1 percent or less; or (2) weight loss of 4 out of 5 specimens after 50 cycles is 1.5 percent or less.]

2.2.2 Wall Caps

Place segmental concrete block units as caps on top of all segmental concrete retaining walls. Provide cap blocks with a color and texture on exposed faces to match that of the other blocks and meet the requirements for the other blocks except that the minimum height \[75 \text{ mm} 3 \text{ inches}\]. Provide cap blocks with abutting edges saw cut or formed to provide tight, flush abutting joints with no gaps in the joints when placed end to end in the alignment shown on the drawings.

2.2.3 Geogrid Reinforcement

Provide a geosynthetic manufactured for reinforcement applications consisting of a regular network of integrally connected polymer tensile elements with aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil, aggregate, or other fill materials. Ensure the geogrid structure is dimensionally stable and able to retain its

SECTION 32 32 23.13 Page 16
geometry under manufacture, transport and installation. Ensure the geogrid is manufactured with 100 percent virgin resin consisting of polyethylene, polypropylene, or polyester, and with a maximum of 5 percent in-plant regrind material. Provide polyester resin with a minimum molecular weight of 25,000 and a carboxyl end group number less than 30. Stabilize polyethylene and polypropylene with long term antioxidants.

2.2.4 Geotextile Reinforcement

******************************************************************************

NOTE: Survivability - The AASHTO M 288 requirements are minimum requirements and will not normally control in the product selection. The AASHTO reference can be avoided by listing the grab, tear, burst, and puncture strengths. These properties are listed in AASHTO M 288. The puncture strength (ASTM D4833/D4833M), the trapezoidal tear strength (ASTM D4533/D4533M) and the mullen burst strength (ASTM D3786) are recognized as important geotextile properties. For the intended application, the commonly specified values for puncture, burst and tear seldom control the product selection.

******************************************************************************

Provide geotextile consisting of a pervious sheet of polymeric material with long-chain synthetic polymers composed of at least 95 percent by weight polyethylene, polypropylene, or polyesters. Manufacture the geotextile with 100 percent virgin resin, and with a maximum of 5 percent in-plant regrind material. Form geotextile into a network such that the filaments or yarns retain dimensional stability relative to each other, including the selvages. Provide polyester resin with a minimum molecular weight of 20,000 and a carboxyl end group number less than 50. Stabilize polyethylene and polypropylene with long term antioxidants. For survivability during installation, and in addition to installation damage used in calculating the long term design strength, ensure the geotextile meets the minimum requirements in AASHTO M 288 Class 1, and has a minimum mass per unit area of 270 g/m² 8 oz/sy.

2.2.5 Reinforcement Properties

******************************************************************************

NOTES: Permittivity - Reinforcement geotextiles should not puddle or impede infiltration or seepage. AASHTO M 288 provides some default guidance.

Geosynthetic Selection - The Federal Acquisition Regulations require full and open competition. Usually justification is not necessary if 3 products meet the specifications. In combining various material requirements, it is easy to specify a geosynthetic product that does not exist. Design utilizing geosynthetics should include a listing with the calculations that verify the specified products are commercially available. The Geosynthetics Fabrics Report magazine publishes an annual specifiers guide that is ideal for this purpose.

******************************************************************************
Provide the reinforcement as shown in the approved shop drawing submittal that meets the long term design strength requirements used in the design, and meets the properties listed in Table 1. Reinforcement strength requirements represent minimum average roll values in the machine direction.

The reinforcement indicated must meet the property requirements listed in Table 1. Reinforcement strength requirements represent minimum average roll values in the machine direction.

The reinforcement indicated must meet the property requirements listed in Table 1. Additional reinforcement shown in the approved shop drawing submittal must meet the long term design strength requirements used in the design as well as other properties listed in Table 1. Submit affidavit certifying that the reinforcement meets the project specifications. Ensure the affidavit is signed by an official authorized to certify on behalf of the manufacturer and is accompanied by a mill certificate that verifies physical properties were tested during manufacturing and lists the manufacturer's quality control testing. [If the affidavit is dated after award of the contract and/or is not specific to the project, attach a statement certifying that the affidavit addressed to the wholesale company is representative of the material supplied.] Include in the documents a statement confirming that all purchased resin used to produce reinforcement is virgin resin. Include in the mill certificate the tensile strength tested in accordance with ASTM D4595. Reinforcement strength requirements represent minimum average roll values in the machine direction.

2.2.5.1 Long Term Design Strength

Base the long term design strength on reduction factors for installation damage and durability that are applicable to the fill that will be used. Minimum reduction factors for durability include: 1.1 for polyethylene and polypropylene geosynthetics, 1.15 for coated polyester geogrids, and 1.6 for polyester geotextiles. Use a creep reduction factor consistent with the test procedure used for determining the ultimate strength.

2.2.6 Geotextile Filter

Provide geotextiles used as filters that meet the requirements specified in Table 2. The property values (except for AOS) represent minimum average
roll values (MARV) in the weakest principal direction. For survivability during installation, provide geotextile meeting the minimum requirements in AASHTO M 288 Class 2, and has a minimum mass per unit area of 270 g/m² 8 oz/sy.

2.3 MATERIALS

2.3.1 Soils and Aggregates

********************************************************************
NOTE: Drainage Aggregate and Aggregate Base - The designer may substitute a gradation readily available in the locality, such as state standard specifications for road construction.
********************************************************************

For all material placed as fill, classify material by ASTM D2487 as GW, GP, GC, GM, SP, SM, SC, CL, ML, or SW. Ensure all material used is free of ice; snow; frozen earth; trash; debris; sod; roots; organic matter; contamination from hazardous, toxic or radiological substances; or stones larger than 3 inches in any dimension. Obtain material entirely from one borrow source, unless the Contracting Officer determines that quality control is adequate and the alternate source produces material that is similar in gradation, texture, and interaction with the reinforced and retained fill. Supply any testing required by the Contracting Officer to evaluate alternate sources. Provide materials of a character and quality satisfactory for the purpose intended.

2.3.1.1 Drainage Aggregate

Meet the requirements of ASTM D448, size No.7.

2.3.1.2 Aggregate Base Material

For the wall leveling pads, meet the requirements of ASTM D1241, gradation C.

2.3.1.3 Reinforced Fill

Provide soil placed in the reinforced fill zone consisting of granular material with less than [5][15] percent passing the 75 µm No. 200 sieve.

2.3.1.4 Retained Fill

Provide soil placed in the retained fill zone consisting of granular material with less than [5][15] percent passing the 75 µm No. 200 sieve.
2.3.2 Masonry Adhesive

Provide masonry adhesive meeting the following requirements:

a. ASTM C920, Type S, Grade NS, Class 25
b. Recommendations of the block manufacturer

2.3.3 Drainage Pipe

Provide corrugated polyethylene pipe drainage pipe meeting requirements of AASHTO M 252.

PART 3 EXECUTION

3.1 EXAMINATION

Examine site prior to installation. Perform classification of soil materials in accordance with ASTM D2488. The Contracting Officer reserves the right to revise the Contractor classifications. In the case of disagreement, the Contracting Officer's classification governs unless the soils are classified in accordance with ASTM D2487. All testing completed by the Contractor in conjunction with soil material classification is incidental to the contract work.

3.2 PREPARATION

Prepare the leveling pad and reinforced fill zone to bear on undisturbed native soils, or acceptably placed and compacted fill. In the event that it is necessary to remove material to a depth greater than specified or to place fill below the leveling pad not otherwise provided for in the contract, notify the Contracting Officer prior to work and an adjustment in the contract price will be considered in accordance with the contract.

3.2.1 Excavation

Excavate foundation soil as required for leveling pad dimensions and reinforcement placement shown on the construction drawings. Stockpile material for backfilling in a neat and orderly manner at a sufficient distance from the banks of the excavation to avoid overloading and to prevent slides or caving. Perform excavation and fill in a manner and sequence that will provide proper drainage at all times. Dispose of surplus material, waste material, and material that does not meet specifications, including any soil which is disturbed by the Contractor's operations or softened due to exposure to the elements and water.

3.2.2 Stockpiles

Keep stockpiles of all material to be incorporated into the work in a neat and well drained condition, giving due consideration to drainage at all times. Clear, grade and seal the ground surface at stockpile locations. Stockpile topsoil separately from suitable backfill material. Protect stockpiles of aggregates and granular soils from contamination which may destroy the quality and fitness of the stockpiled material. If the Contractor fails to protect the stockpiles, and any material becomes frozen, saturated, intermixed with other materials, or otherwise out of specification or unsatisfactory for the use intended, then remove and replace affected materials with new material from approved sources at no additional cost to the Government.
3.2.3  Leveling Pad

3.2.3.1  Aggregate Base Leveling Pad

**************************************************************************
NOTE: Notification of the Contracting Officer - It is beyond the scope of a specification to provide remedies to all possible problems. If the specification indicates the Contracting Officer shall be notified, it is assumed qualified assistance will be utilized to assess the situation when necessary.
**************************************************************************

Compact the subgrade below the leveling pad [90%][95%][100%] laboratory maximum density. Place the aggregate base material in lifts not exceeding 150 mm 6 inches. If the subgrade or aggregate base pumps, bleeds water, or cracks during compaction, notify the Contracting Officer and, if no other changes are directed, replace the aggregate with a concrete leveling pad.

3.2.3.2  Concrete Leveling Pad

Ensure tolerances in screeding are sufficient to place the blocks directly on the leveling pad without mortar, pointing, or leveling course between the blocks and leveling pad.

3.3  INSTALLATION

3.3.1  Block Installation

Construct the wall system components in accordance with the approved shop drawings. Do not incorporate damaged blocks into the retaining wall.

a. Begin block placement at the lowest leveling pad elevation. Place the blocks in full contact with the leveling pad. Place each course of block sequentially for the entire wall alignment to maintain a level working platform for layout of reinforcement and placement of fill.

b. Survey the grade and alignment of the first course and furnish the Survey and Grade Results to the Contracting Officer prior to placing the second course. Include a string line, offset from a base line, or suitable provisions that can be reproduced for quality assurance.

c. Place the blocks with the edges in tight contact. [No gaps are allowed for wall batter and curvature.] Maintain the vertical joints with a minimum 100 mm 4 inch overlap on the underlying block. Adjust coping as required to keep block alignment with a full depth saw cut. No splitting is allowed.

d. Stacking of blocks prior to filling any lower course of block with drainage aggregate is not allowed.

**************************************************************************
NOTE: Wall batter on curves changes the wall (arc) length between courses. Straight face blocks may be laid without maintaining half-bond and are better suited for curved walls. Steep wall batter reduces interference due to unconstant arc length on curves.
The NCMA design manual is only applicable to wall batter between 0 and 15 degrees (about 1H:4V).

e. Engage blocks to the block below by use of keys, lips, pins, clips, or other reliable mechanism to provide a consistent wall batter [between 1H:6V and 1H:16V][_____]..

f. Join cap units [and the top two course of blocks] using masonry adhesive. Take care to keep adhesive from coming into contact with the face of wall units.

3.3.2 Reinforcement Installation

a. Before placing reinforcement, compact the subgrade or subsequent lift of fill and grade level with the top of the blocks. Ensure the surface is smooth and free of windrows, sheepsfoot impressions, and rocks.

b. Place reinforcement at the elevations and to the extent shown on the construction drawings and the approved shop drawing submittal. Orient reinforcement with the design strength axis perpendicular to the wall face. Spliced connections between shorter pieces of reinforcement are not allowed. Place reinforcement strips immediately next to adjacent strips to provide 100 percent coverage.

c. Install the reinforcement in tension. Pull the reinforcement taut and anchor with staples or stakes prior to placing the overlying lift of fill. Pull the reinforcement to ensure tension is uniform along the length of the wall and consistent between layers.

d. Cover all reinforcement completely with soil so that reinforcement panels do not contact in overlaps. Where the wall bends, place a veneer of fill to a nominal thickness of \(75 \text{ mm} \) \(3 \text{ inches}\) to separate overlapping reinforcement.

3.3.3 Fill Placement

NOTE: Subparagraph "c." below - Studies have documented rubber tired heavy equipment traveling on geogrids with minimal or no damage. However, it is regarded as poor practice and usually unnecessary. Problematic conditions include coarse crushed gravel and coated geogrids. The intent of the specification is to minimize equipment on the geogrid so that it occurs only when necessary.

a. Complete fill placement, including drainage aggregate, to the top of each course of facing blocks prior to stacking the subsequent course of blocks.

b. Place reinforced fill from the wall back toward the fill area to ensure that the reinforcement remains taut. Place, spread, and compact fill in such manner that minimizes the development of wrinkles in or movement of the reinforcement.

c. A minimum fill thickness of \(150 \text{ mm} \) \(6 \text{ inches}\) is required prior to
operation of vehicles over the reinforcement. Avoid sudden braking and sharp turning. Do not turn tracked equipment within the reinforced fill zone to prevent tracks from displacing the fill and damaging the reinforcement. Do not operate construction equipment directly upon the reinforcement as part of the planned construction sequence. Rubber tired equipment may operate directly on the reinforcement if the Contractor submits information documenting testing of equipment operating on a similar geogrid product on similar soils, the travel is infrequent, equipment travels slow, turning is minimized, and no damage or displacement to the reinforcement is observed.

d. Place and tamp drainage aggregate directly behind, between, and within the cells of the facing units. Achieve compaction of the drainage aggregate by at least two passes on each lift with a vibratory plate compactor. Take care not to contact or chip the blocks with the compactor. Compact aggregate placed within the block cores and recesses by hand tamping and rodding.

e. At the end of each day, slope the last lift of fill away from the wall in a manner that will allow drainage and direct runoff away from the wall face.

3.3.4 Compaction

Do not place fill on surfaces that contain mud, frost, organic soils, fill soils that have not met compaction requirements, or where the Contracting Officer determines that unsatisfactory material remains in or under the fill. Spread fill and compact in lifts not exceeding the height of one course of blocks.

Compact reinforced and retained fill to 95 percent of the Standard Proctor Density. Exercise care in the compaction process to avoid misalignment of the facing blocks. Do not use heavy compaction equipment (including vibratory drum rollers) within 900 mm (3 feet) from the wall face.

3.3.4.1 Degree of Compaction

Degree of compaction required is expressed as a percentage of the maximum density obtained by the test procedure presented in ASTM D698. The maximum density is hereafter abbreviated as the "Standard Proctor" value.

3.3.4.2 Moisture Control

**************************************************************************
NOTE: Moisture content limits for compaction should be included in these paragraphs when necessary for obtaining strength and stability in embankments and fill, for controlling movement of expansive soils and when, in the opinion of the project geotechnical engineer, moisture control is required for the soils being used. Specify an acceptable variation from the optimum moisture if justified from experience with similar soils or where demonstrated from moisture-density tests for the borrow material during planning. Block alignment is sometimes difficult to maintain if cohesive soils are placed wet of optimum in the reinforced fill zone.
**************************************************************************
Maintain control of moisture in the fill to provide acceptable compaction. Do not disk and plow in the **reinforced** fill zone. Adjust moisture content of cohesive soils at the borrow source before placement. Add water directly to the **reinforced** fill zone only under conditions where the soil has sufficient porosity and capillarity to provide uniform moisture throughout the fill during compaction.

### 3.4 FIELD QUALITY CONTROL

#### 3.4.1 Soil Testing

All testing expenses are the Contractor's responsibility. Inspect and approve testing laboratories in accordance with Section 01 45 00.00 10 01 45 00.00 2001 45 00.00 40 QUALITY CONTROL prior to commencement of testing. The Contracting Officer reserves the right to direct the location and select the material for samples to be tested and to direct where and when moisture-density tests are performed. Use nuclear density testing equipment in general accordance with **ASTM D6938**.

##### 3.4.1.1 Transmittal

Submit test results to the Contracting Officer daily. **Include test results as a part of contractor's daily report, taking care to note any deficiencies and ask for direction on corrective action required.** Furnish of field testing results to the Contracting Officer on a frequent and regular basis, as directed.

##### 3.4.1.2 Corrective Action.

Tests of materials which do not meet the contract requirements (failing test) do not count as part of the required testing. Retest each failure at the same location the failing test was taken. If testing indicates material does not meet the contract requirements, do not place the material represented by the failing test in the contract work or recompact the failing material. **It is the responsibility of the Contracting Officer to determine quantity of material represented by the failing test up to the quantity represented by the testing frequency.** The Contractor may increase testing frequency in the vicinity of a failing test in order to reduce removal requirements, as approved by the Contracting Officer. Such increases in testing frequency are at the Contractor's expense and at no additional cost to the Government.

##### 3.4.1.3 Testing Schedule

#### 3.4.1.3.1 Moisture-Density Relations

**ASTM D698.** One test for each material variation[, not less than [_____] tests total].

#### 3.4.1.3.2 In-Place Densities

**ASTM D1556/D1556M or ASTM D6938.** Not less than 1 test for each 0.67 vertical meters per 100 linear meters 2 vertical feet per 300 linear feet along wall face.

#### 3.4.1.3.3 Sieve Analysis

**ASTM C136/C136M.** Drainage Aggregate, 1 test for each source.
3.4.2 Reinforcement Testing

**************************************************************************

NOTES: Primary reasons for testing geosynthetics include verification of quality control by the manufacturer, detecting degradation during shipping and storage, and verifying the correct product is supplied. Verification of quality control by the manufacturer and detecting degradation during shipping and storage is not economically justified for small jobs. Unlike reinforcing steel for concrete, geosynthetics are difficult to identify in the field, and even experience personnel can sometimes mistake the product identity of unlabeled material. Testing after delivery to verify the correct product was supplied may be advisable for critical structures. The strength is usually the most critical property to verify an acceptable product is furnished.

For cohesive fill, testing the interaction coefficient in accordance with ASTM D6706 or ASTM D6706 may be justified. The interaction coefficient effects the length required to develop stress in the reinforcement, and thus the embedment length. For granular retained fill, there is very little difference between products so testing is not justified. For cohesive soil, the interaction coefficient is only significant for the upper courses (usually the top 1 m 3 feet). The test is expensive, and is not normally justified (the usual alternative is to make a conservative assumption).

**************************************************************************

All testing expenses are the Contractor's responsibility. Use a commercial testing laboratory selected by the Contractor and approved by the Contracting Officer for all testing. The Contracting Officer reserves the right to direct the location and select the material for samples. Testing data specific to the blocks and reinforcement to be supplied as follows:

a. The shear strength between blocks as established in accordance with NCMA TR127B.

b. The connection strength between the blocks and the reinforcement as established in accordance with ASTM D6638. If the FHWA design method is used, implement the modifications in FHWA NHI-00-043.

c. The coefficient for direct shear of the reinforcement on a soil similar in gradation and texture to the material that will be used for fill in the reinforced zone as established in accordance with ASTM D5321/D5321M.

d. The coefficient of interaction for pull-out resistance of the reinforcement in a soil similar in gradation and texture to the material that will be used for fill in the reinforced zone as established in accordance with ASTM D6706.
TABLE 3. REINFORCEMENT TESTING

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>TEST DESIGNATION</th>
<th>FREQUENCY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wide Width Strip Tensile Strength</td>
<td>ASTM D4595</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Modify ASTM D4595 for geogrids considering recommendations in GSI GRI GG6; and express the tensile strength on a unit length basis by substituting \( n \cdot a \) for \( W_s \), where:

\[
\begin{align*}
W_s &= \text{specimen width, (mm inches)} \\
n &= \text{number of ribs in the sample (must be a whole number)} \\
a &= \text{nominal rib spacing for the product tested, (mm inches)}
\end{align*}
\]

3.4.3 Drainage Pipe

Place drain pipe as indicated on the drawings. Lay drain lines to true grades and alignment with a continuous fall in the direction of flow. Keep the interior of the pipe clean from soil and debris; and cap open ends as necessary.

3.4.4 Construction Tolerances

**************************************************************************

NOTE: The suggested tolerances represent the standard of practice. Tighter tolerances should be specified with caution. Loosen horizontal and vertical tolerance if acceptable. Plumbness and alignment will limit bulging.

**************************************************************************

3.4.4.1 Horizontal

Ensure the top of wall is within \([75][___] \text{ mm} [3][___] \text{ inches}\) of the plan location.

3.4.4.2 Vertical

Ensure the top of wall elevations is within \([30][___] \text{ mm} [0.1][___] \text{ feet}\) above to \([30][___] \text{ mm} [0.1][___] \text{ feet}\) below the prescribed top of wall elevations indicated.

3.4.4.3 Plumbness and Alignment

Ensure the wall batter and alignment offset measured as deviation from a straight edge is within plus or minus \([30 \text{ mm per 3 meter}][___] [1.25 \text{ inches per 10 feet}][_____]\) section. Ensure the batter measured from vertical is within \([2][_____]\) degrees of the plan dimension.

3.4.4.4 Block Defects

The blocks will be accepted on the basis of tolerances specified in ASTM C1372.

3.4.4.5 Block Gaps

Ensure gaps between adjacent blocks do not exceed \(3 \text{ mm 1/8 inches}\).
3.5 PROTECTION

Protect work against damage from subsequent operations. Remove disturbed or displaced blocks and replace to conform to all requirements of this section. Do not incorporate damaged material into the wall. Upon completion of wall erection, clean the wall face to remove any loose soil deposits or stains.

NOTE: This guide specification covers the requirements for underground sprinkler irrigation systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Irrigation system requirements depend upon rainfall factors for the project area, plant selections, the quality of growth desired, and budgetary constraints. The area factors will be determined by a registered landscape professional. Reference is made to UFC 3-201-02 Landscape Architecture. While the design of a system with pop-up heads may be justified in some geographic areas, bubbler type systems may be required in areas where water conservation methods are being practiced. If source of water supply is from base water main through a service line and water meter,
determine amount of water available for irrigation system from static pressure at point of connection to water main. In many cases, water supply is adequate for short durations only. The amount of water required is determined from the type of turf to be irrigated, climate, terrain, and soil conditions. System piping layout, pipe sizes, and selection and spacing of heads and emitters must provide the required amount of water and complete coverage of the irrigated areas. Provide valves to allow irrigation of each area separately.

1.2 SYSTEM DESCRIPTION

**************************************************************************
NOTE: In the design of the sprinkler system reference will be made to UFC 3-230-01 Water Storage, Distribution, and Transmission. For a site where specific pipe or material is required or where certain material will not be acceptable, the requirements will be specified and any restricting locations will be shown on the drawings. The following information will be shown on the drawings:

a. An irrigation legend.

b. The extent, size, type, and location of underground sprinkler irrigation system and all appurtenances including all piping, sprinkler heads, emitters, control valves, and controllers. Indicate obstacles that might interfere with the layout or operation of the system. Indicate where pipe under walks and drives must be bored.

c. All required slopes and elevations.

d. Detail of drain pockets.

e. Flow rates and diameter of coverage for individual sprinkler heads and emitters.

f. Minimum irrigation rates.

g. Size, variety, and assembly of backflow prevention units.

h. Number and extent of electrical or hydraulic controller circuits, if required.

i. Automatic valve schedule and timing, along with valve identification key or legend.
**************************************************************************
Provide a system that operates with a minimum water pressure of [___] kPa psi at connection to [main] [meter] [building] [backflow prevention device]
and \[____\] kPa psi at the last head in each zone. Submit Design Analysis and Calculations verifying that system will provide the irrigation requirements.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.
**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Sprinkler System

SD-03 Product Data
Framed Instructions
Field Training
Sprinkler System
1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, excessive humidity, and temperature variation; direct sunlight (in the case of plastic or rubber materials); and dirt, dust, or other contaminants.

1.5 EXTRA MATERIALS

Submit spare parts data for each different item of material and equipment specified, after approval of the related submittals and not later than the start of the field tests. Include with the data a complete list of parts and supplies, with current unit prices and source of supply.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer who has produced similar systems that have performed well for a minimum period of 2 years prior to bid opening. Equipment shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.2 Nameplates

Each item of equipment shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.1.3 Additional Stock

Provide the following extra stock: Two sprinkler heads of each size and type, two valve keys for operating manual valves, two wrenches for removing and installing each type of head, two quick coupler keys and hose swivels, and four irrigation controller housing keys.

2.2 PIPING MATERIALS

**********************************************************************************************************************************************
NOTE: Select piping materials according to project requirements. Verify soil and water conditions onsite, use proper materials where corrosion

SECTION 32 84 23 Page 10
problems exist.

**************************************************************************

2.2.1 Copper Tubing and Associated Fittings

Tubing shall conform to requirements of ASTM B88M ASTM B88, Type K. Fittings shall conform to ASME B16.22 and ASME B16.18, solder joint. Solder shall conform to ASTM B32 95-5 tin-antimony. Flux shall conform to CID A-A-51145, Type I. Grooved mechanical joints and fittings shall be designed for not less than 862 kPa 125 psig service and shall be the product of the same manufacturer. Grooved fitting and mechanical coupling housing shall be ductile iron conforming to ASTM A536. Gaskets for use in grooved joints shall be molded synthetic polymer of pressure responsive design and shall conform to ASTM D2000 for circulating medium up to 110 degrees C 230 degrees F. Grooved joints shall conform to AWWA C606. Coupling nuts and bolts for use in grooved joints shall be steel and shall conform to ASTM A183.

2.2.2 Red Brass Pipe and Associated Fittings

Pipe shall conform to requirements of ASTM B43, regular. Fittings shall be Class 250, cast bronze threaded conforming to the requirements of ASME B16.15.

2.2.3 Galvanized Steel Pipe and Associated Fittings

**************************************************************************

NOTE: Use of pipe is limited to fixed shrub head risers and reduced pressure type backflow preventers.
**************************************************************************

Pipe shall conform to requirements of ASTM A53/A53M, Schedule 40. Fittings shall be Class 150 conforming to requirements of ASME B16.3.

2.2.4 Polyvinyl Chloride (PVC) Pipe, Fittings and Solvent Cement

**************************************************************************

NOTE: PVC pipe may be used where frost line is less than 300 mm 12 inches deep or in areas where piping system can be winterized. Use Schedule 40 PVC fittings with solvent weld; do not use threaded Schedule 40 pipe. For risers use brass pipe or Schedule 80 PVC pipe with Schedule 80 PVC threaded fittings. Locate all risers away from walks. Use solvent cement for unthreaded PVC pipe and fittings. ASTM D1785, PVC 1120, Schedule 40 is Type I, Grade 1 and wall thickness of Schedule 40. ASTM D1785, PVC 1120, Schedule 80 is Type I, Grade 2 and wall thickness of Schedule 80. ASTM D2241, PVC 1120, SDR 21 is Type I, Grade 1 and standard dimension ratio of 21.

**************************************************************************

2.2.4.1 PVC Pipe

Pipe shall conform to the requirements of ASTM D1785, PVC 1120 Schedule [40] [80]; or ASTM D2241, PVC 1120 SDR 21, Class 200.
2.2.4.2 PVC Fittings

Solvent welded socket type fittings shall conform to requirements of ASTM D2466, Schedule 40. Threaded type fittings shall conform to requirements of ASTM D2464, Schedule 80.

2.2.4.3 Solvent Cement

Solvent cement shall conform to the requirements of ASTM D2564.

2.2.5 Polyethylene (PE) Plastic Piping

Pipe shall conform to AWWA C901, outside diameter base with dimension ratio (DR) of 9.3 to provide 1034 kPa 150 psi minimum pressure rating. Fittings shall conform to ASTM D3261, DR of 9.3.

2.2.6 Dielectric Fittings

**************************************************************************
NOTE: Provide dielectric fittings between copper and ferrous metal piping materials.
**************************************************************************

Dielectric fittings shall conform to ASTM F441/F441M, Schedule 80, CPVC threaded pipe nipples, 100 mm 4 inch minimum length.

2.2.7 Emitter Hose and Distribution Tubing

Emitter hose and distribution tubing shall conform to ASTM D2287, maximum inside diameter of 13 mm 1/2 inch, minimum wall thickness of 2.286 mm 90 mils, vinyl plastic extruded from non-rigid chloride, integrally algae-resistant, homogeneous throughout, smooth inside and outside, free from foreign materials, cracks, serrations, blisters and other effects. Slip fittings shall be provided.

2.3 SPRINKLER AND Emitter HEADS

2.3.1 Pop-Up Spray Heads

2.3.1.1 General Requirements

Pop-up spray heads lay flush with housing, then pop up when water pressure 138 kPa 20 psi is activated in system. The rising member supporting the nozzle shall be identical on full, half, third or quarter pattern sprinklers so that nozzles will be interchangeable. The sprinkler head shall be designed to be adjustable for coverage and flow. The nozzle shall be removable so head does not have to be removed for flushing or cleaning. Nozzle rises a minimum of 100 mm 4 inches above the body. The body shall be constructed with a 13 mm 1/2 inch female thread for installation in a fixed underground pipe system.

2.3.1.2 Shrubbery Sprinkler Heads

**************************************************************************
NOTE: Shrubbery sprinkler heads are recommended for flower beds, shrubs, and ground covers.
**************************************************************************

Sprinkler heads shall be conical spray with adjustable or non-adjustable
coverage and designed for permanent aboveground mounting on riser or pop-ups at a height compatible with ground covers. Provide brass nozzles.

2.3.2 Rotary Pop-Up Sprinklers

**************************************************************************
NOTE: Rotary pop-up sprinklers lay flush with housing, then pop up when water pressure is activated in system. Head rotates to direct water spray over a pattern of 360 degrees or a prescribed arc. Primarily used for watering large turf area.
**************************************************************************
Sprinklers shall be capable of covering [_____] m feet diameter at [_____] kPa psi with a distribution rate of [_____] L/second gpm, [_____] pop-up, trajectory of [______], and maximum height of spray of [______].
Construction shall be high impact molded plastic with filter screen, reducible watering radius, and choice of [_____] nozzles and have adjustable radius capabilities.

2.3.3 Bubbler Sprinkler Heads

**************************************************************************
NOTE: A water outlet that does not spray water but permits water to bubble and flow to surrounding plants.
**************************************************************************
Heads shall be multiple-spray bubbler with adjustable flow and designed for permanent aboveground mounting on risers.

2.3.4 Surface Connected Lawn Sprinkler Heads

Heads shall be an impulse type with or without sled, ring, or wheel base; multiple T Type; a rotary type with sled, spike or wheel base; or oscillating type with wheel or sled base.

2.3.5 Emitter Heads

**************************************************************************
NOTE: Emitter head is an outlet device that permits water to drip or trickle from small tubings. Drip irrigation is frequent, slow application of water to specific root zone area of plants. The goal is to provide a constant level of subsurface moisture to the root ball of plant for most favorable growth.
**************************************************************************
Emitter heads shall be self-cleaning, pressure compensating diaphragm with one or six self-piercing barbed outlets; each capable of emitting from 1 to 8 L/hour 1/4 to 2 gallons/hour flow. Emitter body shall be ultraviolet stabilized, algae, and heat resistant plastic construction.

2.4 VALVES

2.4.1 Gate Valves, Less than 80 mm 3 Inches

Gate valves shall conform to the requirements of MSS SP-80, Type 1, Class 150, [threaded] [soldered] ends.
2.4.2 Gate Valves, 80 mm 3 Inches and Larger

Gate valves shall conform to the requirements of AWWA C509 and have encapsulated resilient wedge, parallel seats, non-rising stems, and open by counterclockwise turning. End connections shall be flanged. Interior construction of valves shall be bronze including stem containing a maximum 2 percent aluminum and maximum 16 percent zinc.

2.4.3 Angle Valves, Less Than 65 mm 2-1/2 Inches

Angle valves shall conform to the requirements of MSS SP-80, Type 3, Class 150 [threaded] [soldered] ends.

2.4.4 Angle Valves, 65 mm 2-1/2 Inches and Larger

Angle valves shall conform to the requirements of MSS SP-85, Type II, Class 250 [threaded] [flanged] ends.

2.4.5 Quick Coupling Valves

**************************************************************************

NOTE: A quick coupling device is an effective method of keeping sprinkler out of the way when not in use, eliminating the possibility of damage, injury or theft.

**************************************************************************

Quick coupling valves shall have brass parts and shall be two-piece unit consisting of a coupler water seal valve assembly and a removable upper body to allow spring and key track to be serviced without shutdown of main. Lids shall be lockable vinyl with spring for positive closure on key removal.

2.4.6 Remote Control Valves, Electrical

**************************************************************************

NOTE: An activated open and shut-off device for controlling water flow to sprinkler branch line.

**************************************************************************

Remote control valves shall be solenoid actuated globe valves of 19 to 80 mm 3/4 to 3 inch size, suitable for [24] [_____] volts, [60] [50] cycle, and designed to provide for shut-off in event of power failure. Valve shall be cast bronze or brass or plastic housing suitable for service at 1034 kPa 150 psi operating pressure with external flow control adjustment for shut-off capability, external plug at diaphragm chamber to enable manual operation, filter in control chamber to prevent valve body clogging with debris, durable diaphragm, and accessibility to internal parts without removing valve from system.

2.4.7 Drain Valves

2.4.7.1 Manual Valves

Manual valves shall conform to requirements of MSS SP-80, Type 3, Class 150 [threaded] [soldered] ends for sizes less than 65 mm 2-1/2 inches and MSS SP-85, Type II, Class 250 [threaded] [flanged] ends for sizes 65 mm 2-1/2 inches and larger.
2.4.7.2 Automatic Valves

**************************************************************************
NOTE: This saves water to prevent draining 50 to 100 mm 2 to 4 inch diameter lines during irrigation cycles and avoid continuously saturated soil at drain joints. Automatic drains are necessary for cold climate areas to prevent freeze damage to sprinklers and pipes. PVC or ABS drain valves may be used with PVC systems.
Delete automatic drains for warm climate areas.
**************************************************************************

Automatic valves shall be brass or plastic, spring loaded ball drip type, Class 150 150 pounds and threaded ends, designed to close at 18 kPa 6 foot pressure head with positive seal at 21 kPa 3 psi pressure or greater and be open to drain at less than 21 kPa 3 psi pressure.

2.4.8 Pressure Regulating Master Valve

**************************************************************************
NOTE: Master valve automatically reduces a higher inlet pressure to a constant lower pressure regardless of supply fluctuations.
**************************************************************************

Pressure regulating master valve shall be automatic mechanical self-cleaning, self-purging control system having an adjustable pressure setting operated by a solenoid on alternating current with [0.70] [_____] amperes at [18] [24] volts. Valve shall close slowly and be free of chatter in each diaphragm position, have manual flow stem to adjust closing speed and internal flushing, and [one] [two] inlet tappings capable of being installed as a straight pattern valve. Body shall be cast bronze or brass with removable brass seat serviceable from top without removing valve body from system. Valve shall operate at 1034 kPa 150 psi working pressure and pilot range from 70 to 875 kPa 10 to 125 psi.

2.4.9 Backflow Preventers

**************************************************************************
NOTE: Backflow preventer is designed to keep contaminated water from flowing back into potable water distribution system when some temporary abnormality in system causes higher pressure in contaminated part of system than in potable water piping.
**************************************************************************

Reduced pressure principle assemblies, double check valve assemblies, atmospheric (nonpressure) type vacuum breakers, and pressure type vacuum breakers shall be tested, approved, and listed in accordance with FCCCHR Manual. Backflow preventers with intermediate atmospheric vent shall be in accordance with ASSE 1012. Reduced pressure principle backflow preventers shall be in accordance with ASSE 1013.
2.4.9.1 Pressure Type Vacuum Breaker

**************************************************************************
NOTE: Vacuum breaker is designed to prevent back siphonage only, and is not effective against backflow due to back pressure. A vacuum breaker located above flood elevation is adequate when located aboveground and higher than highest sprinkler head.
**************************************************************************

Vacuum breaker shall conform to the requirements of ASSE 1020 and shall be [bronze] [brass] construction, with one or two check valves, vacuum relief, inlet and discharge shut-offs valves, field test cocks, and vacuum relief opening of greater diameter than unit.

2.4.9.2 Reduced Pressure Type Backflow Preventers

**************************************************************************
NOTE: Reduced pressure type backflow preventer is designed to prevent either back siphonage or back pressure from causing a reverse flow and subsequent contamination of potable water piping. Delete this requirement when system is connected to non-potable water supply system, or when sewage is injected into sprinkler system. When effluent pumps are down, add a fresh water connection with a reduced pressure backflow preventer.
**************************************************************************

Backflow preventers shall be Class [150] [_____] [150] [_____] pound flanged [cast iron], [bronze] [brass] mounted gate valve [and strainer], [304] [_____] stainless steel or bronze, internal parts. Total pressure drop through complete assembly shall be a maximum of 70 kPa 10 psi at rated flow. Piping shall be [red brass] [galvanized steel] pipe and fittings. Strainers shall be bronze or brass construction with gasket caps. Units shall have 200-mesh stainless steel screen elements.

2.5 ACCESSORIES AND APPURTENANCES

2.5.1 Valve Keys for Manually Operated Valves

Valve keys shall be 13 mm 1/2 inch diameter by 1 m 3 feet long, tee handles and keyed to fit valves.

2.5.2 Valve Boxes and Concrete Pads

2.5.2.1 Valve Vaults

Valve boxes shall be cast iron, plastic lockable, or precast concrete[ manufactured in accordance with Section 03 42 13.00 10 PLANT-PRECAST CONCRETE PRODUCTS FOR BELOW GRADE CONSTRUCTION] for each gate valve, manual control valve and remote control valve. Vault sizes shall be adjustable for valve used. Cast the word "IRRIGATION" on the cover. Shaft diameter of vault shall be minimum 130 mm5-1/4 inches. Cast iron vault shall have bituminous coating.
2.5.2.2 Concrete Pads

Concrete pads shall be precast manufactured in accordance with Section 03 42 13.00 10 PLANT-PRECAST CONCRETE PRODUCTS FOR BELOW GRADE CONSTRUCTION or cast-in-place reinforced concrete construction for reduced pressure type backflow preventers.

2.5.3 Pressure Gauges

Pressure gauges shall conform to requirements of ASME B40.100, single style pressure gauge for water with 115 mm 4-1/2 inch dial brass or aluminum case, bronze tube, gauge cock, pressure snubber, and siphon. Scale range shall be suitable for irrigation sprinkler systems.

2.5.4 Service Clamps

Service clamps shall be bronze flat, double strap, with neoprene gasket or "O"-ring seal.

2.5.5 Water Hammer Arresters

Water hammer arrester shall conform to the requirements of PDI WH 201; stainless steel construction with an encased and sealed bellows compression chamber.

2.5.6 Emitter Head Accessories

2.5.6.1 Strainer

Strainer shall be provided at inlet to each drip line. Strainer shall have stainless steel screen having equivalent of 140-mesh filtration capacity and incorporate flush valves within strainer to clean screen without disassembling unit.

2.5.6.2 Pressure Regulator

Pressure regulator shall be provided at each drip system if supply pressure exceeds 350 kPa 50 psi.

2.5.6.3 Riser Adapters

Riser adapters shall be provided with a rigid piping system.

2.5.6.4 Tubing Stakes

Tubing stakes shall be plastic coated steel, or other non-corrosive strong material to secure tubing.

2.5.6.5 Emitter Outlet Check Valve (Bug Cap)

Check valves shall be provided at end of each emitter outlet distribution line. Valves shall permit free flow of water with minimum restriction; prevent back siphoning, entry of insects, and contamination into outlet ports.

2.5.6.6 Access Sleeve

Access sleeve shall be provided at buried emitters placed in covered boxes. Lids of access sleeve shall be secured with removable lugs. Drip
hose in both vertical and horizontal axis shall be secured.

2.5.6.7 Closure Caps

Closure caps shall be in accordance with manufacturer's recommendations.

2.6 AUTOMATIC CONTROLLERS, ELECTRICAL

**************************************************************************
NOTE: Automatic electrical controller is used to control timing and quantity of water to sprinkler or emitter heads. Use 3 to 60 minutes for sprinkler heads and 0 to 3 hours for emitter heads.
**************************************************************************

Controller shall conform to the requirements of NEMA ICS 2 with [120] [220]-volt single phase service, operating with indicated stations, and grounded chassis. Enclosure shall conform to NEMA ICS 6 Type 3R, with locking hinged cover, [pedestal-mounted] [wall-mounted]. Controller shall be programmed for various schedules by setting switches and dials equipped with the following features: A switch for each day of week for [one] [two] [three] schedules, allowing each station to be scheduled individually as to days of watering; a minute switch for each station with a positive increment range of [3 to 60 minutes] [0 to 3 hours], set time within one percent; a switch allowing selected schedules to be repeated after each completion of initial watering schedule and allowing each operation to be scheduled throughout a 24-hour day; a circuit breaker for surge protection; and circuit for a 9-volt rechargeable NiCad battery.

2.7 ELECTRICAL WORK

Wiring and rigid conduit for electrical power shall be in accordance with NFPA 70, and Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

2.8 CONCRETE MATERIALS

Concrete shall have a compressive strength of [17] [_____] MPa [2500] [_____] psi at 28 days as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.9 WATER SUPPLY MAIN MATERIALS

Tapping sleeves, service cut off valves, and connections to water supply mains shall be in accordance with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

2.10 INSULATING JOINTS

Insulating joints and dielectric fittings shall be in accordance with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.
3.2 INSTALLATION

Install Sprinkler System after site grading has been completed. Perform excavation, trenching, and backfilling for sprinkler system in accordance with the applicable provisions of Section 31 00 00 EARTHWORK, except as modified herein.

a. Submit detail drawings for valves, sprinkler heads, backflow preventers, automatic controllers, emitter heads, and water hammer arresters. Include on the drawings a complete list of equipment and materials, and manufacturer's descriptive and technical literature, performance charts and curves, catalog cuts, and installation instructions. Also show on the drawings complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will function as a unit. Show on the drawings proposed system layout, type and number of heads and emitters, zone valves, drain pockets, backflow devices, controllers, and mounting details of controllers.

b. Submit detailed procedures defining the Contractor's provisions for accident prevention, health protection, and other safety precautions for the work to be done. Submit the material supplier's or equipment manufacturer's statement that the supplied material or equipment meets specified requirements. Each certificate shall be signed by an official authorized to certify in behalf of material supplier or product manufacturer and shall identify quantity and date or dates of shipment or delivery to which the certificates apply. Include As-built Drawings which provide current factual information showing locations of mains, heads, valves, and controllers including deviations from and amendments to the drawings and changes in the work.

c. Submit [6] [_____] copies of operation and [6] [_____] copies of maintenance manuals for the equipment furnished. One complete set prior to field testing and the remainder upon acceptance. Manuals shall be approved prior to the field training course. Operating manuals shall detail the step-by-step procedures required for system startup, operation, and shutdown. Operating manuals shall include the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features.

d. Maintenance manuals shall list routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Maintenance manuals shall include piping and equipment layout, simplified wiring and control diagrams of the system as installed, and system programming schedule.

3.2.1 Trenching

Hand excavate trench around roots to pipe grade when roots of 50 mm 2 inches diameter or greater are encountered. Trench width shall be 100 mm 4 inches minimum or 1.5 times diameter of pipe, whichever is wider. Backfill shall be hand tamped over excavation. When rock is encountered, trench shall be excavated 100 mm 4 inches deeper and backfilled with silty sand (SM) or well-graded sand (SW) to pipe grade. Trenches shall be kept free of obstructions and debris that would damage pipe. Subsoil shall not be mixed with topsoil. Existing concrete walks, drives and other obstacles shall be bored at a depth conforming to bottom of adjacent trenches. Pipe sleeves for bored pipe shall be two pipe diameters larger than sprinkler pipe.
3.2.2 Piping System

3.2.2.1 Cover

Underground piping shall be installed to meet the minimum depth of backfill cover specified.

3.2.2.2 Clearances

Minimum horizontal clearances between lines shall be \(100 \text{ mm} \) for pipe \(50 \text{ mm} \) and less; \(300 \text{ mm} \) for \(65 \text{ mm} \) and larger. Minimum vertical clearances between lines shall be \(25 \text{ mm} \).

3.2.2.3 Minimum Slope

Minimum slope shall be \(50 \text{ mm per 10 m} \) in direction of drain valves.

3.2.3 Piping Installation

3.2.3.1 Polyvinyl Chloride (PVC) Pipe

a. Solvent-cemented joints shall conform to the requirements of ASTM D2855.

b. Threaded joints shall be full cut with a maximum of three threads remaining exposed on pipe and nipples. Threaded joints shall be made tight without recourse to wicks or fillers, other than polytetrafluoroethylene thread tape.

c. Piping shall be joined to conform with requirements of ASTM D2774 or ASTM D2855, and pipe manufacturer's instructions. Pipe shall be installed in a serpentine (snaked) manner to allow for expansion and contraction in trench before backfilling. Pipes shall be installed at temperatures over \(5 \text{ degrees C} \) and \(40 \text{ degrees F} \).

3.2.3.2 Soldered Copper Tubing

Pipe shall be reamed and burrs removed. Contact surfaces of joint shall be cleaned and polished. Flux shall be applied to male and female ends. End of tube shall be inserted into fittings full depth of socket. After soldering, a solder bead shall show continuously around entire joint circumference. Excess acid flux shall be removed from tubings and fittings.

3.2.3.3 Threaded Brass or Galvanized Steel Pipe

Prior to installation, pipe shall be reamed. Threads shall be cut in conformance with ASME B1.2. Pipe joint compound shall be applied to male end only.

3.2.3.4 Insulating Joints

Insulating and dielectric fittings shall be provided where pipes of dissimilar metal are joined and at connections to water supply mains as shown. Installation shall be in accordance with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.
3.2.3.5 Grooved Mechanical Joints

Grooves shall be prepared according to the coupling manufacturer's instructions. Grooved fittings, couplings, and grooving tools shall be products of the same manufacturer. Pipe and groove dimensions shall comply with the tolerances specified by the coupling manufacturer. The diameter of grooves made in the field shall be measured using a "go/no-go" gauge, vernier or dial caliper, narrow-land micrometer, or other method specifically approved by the coupling manufacturer for the intended application. Grove width and dimension of groove from end of pipe shall be measured and recorded for each change in grooving tool setup to verify compliance with the coupling manufacturer's tolerances. Grooved joints shall not be used in concealed locations.

3.2.4 Installation of Valves

3.2.4.1 Manual Valves

Valves shall be installed in a valve box extending from grade to below valve body, with a minimum of 100 mm 4 inches cover measured from finish grade to top of valve stem.

3.2.4.2 Automatic Valves

Valve shall be set plumb in a valve box extending from grade to below valve body, with minimum of 100 mm 4 inch cover measured from grade to top of valve. Automatic valves shall be installed beside sprinkler heads with a valve box.

3.2.4.3 Drain Valves

Entire system shall be manually or automatically drainable. Low points of system shall be equipped with drain valve draining into an excavation containing 0.03 cubic meter 1 cubic foot gravel. Gravel shall be covered with building paper then backfilled with excavated material and 150 mm 6 inches of topsoil.

3.2.5 Sprinklers and Quick Coupling Valves

Sprinklers and valves shall be installed plumb and level with terrain.

3.2.6 Installation of Drip Irrigation System

3.2.6.1 Emitter Hose

Emitter laterals shall be buried [150] [_____] mm [6] [_____] inches deep. Connections shall be solvent welded in accordance with manufacturer's recommendation to standard weight Schedule 40 PVC fittings and bushings. Hose shall be installed in a serpentine manner. When cutting hose, shearing tool such as a pipe cutter, knife, or shears shall be used. Manufacturer's recommended tool and procedures when punching hose for emitters shall be followed.

3.2.6.2 Emitter Heads

************************************************************************************************************

NOTE: Installation of water emission points of drip irrigation system above soil surface aids visual checking of system for proper operation and reduces

SECTION 32 84 23 Page 21
system clogging caused by root intrusion.

Emitters shall be installed in a plastic emitter box. Emitter on a rigid PVC nipple shall be connected to PVC drip lateral with a tee or elbow. Tubing shall be attached to barbed fitting and daylight distribution tubing at root ball secured with stake, with bug cap at end of secured distribution tubing. After installing emitters and before operating system, end of drip lateral shall be opened and flushed clean. The number of emitters on a line shall not exceed manufacturer's recommendations for that hose or distribution tubing size and length.

3.2.6.3 Tubing Stakes

Main irrigation line shall be secured with stakes where line is aboveground. Stakes shall be spaced to ensure that hose does not shift location in presence of foot traffic, operations, gravity on slope installations, or environmental effects. Discharge of the emitter distribution tubing shall be staked to ensure that discharge point of emitter will be maintained at specified position in relation to plant material to be irrigated.

3.2.7 Backflow Preventers

Backflow preventer shall be installed in new connection to existing water distribution system, between connection and control valves. Backflow preventer shall be installed with concrete pads.

3.2.7.1 Pressure Type Vacuum Breaker

NOTE: Install device in an accessible location to facilitate inspection and servicing. Device can be installed on main line to irrigation system upstream of shut-off valves (valves may be located downstream from device).

Pressure type vacuum breaker shall be installed 300 mm 12 inches above highest head.

3.2.7.2 Reduced Pressure Type

NOTE: Install device in an accessible location to facilitate inspection and servicing. To prevent freezing locate device inside a building and pipe the relief valve port through an air gap to a drain. Install the device 300 mm 12 inches, minimum, above grade.

Pipe lines shall be flushed prior to installing reduced pressure device; device shall be protected by a strainer located upstream. Device shall not be installed in pits or where any part of device could become submerged in standing water.
3.2.8 Control Wire and Conduit

3.2.8.1 Wires

Low voltage wires may be buried beside pipe in same trench. Rigid conduit shall be provided where wires run under paving. Wires shall be number tagged at key locations along main to facilitate service. One control circuit shall be provided for each zone and a circuit to control sprinkler system.

3.2.8.2 Loops

A 300 mm 12 inch loop of wire shall be provided at each valve where controls are connected.

3.2.8.3 Expansion and Contraction

Multiple tubes or wires shall be bundled and taped together at [3] [6] m [10] [20] foot intervals with 300 mm 12 inch loop for expansion and contraction.

3.2.8.4 Splices

Electrical splices shall be waterproof.

3.2.9 Automatic Controller

Exact field location of controllers shall be determined before installation. Coordinate the electrical service to these locations. Install in accordance with manufacturer's recommendations and NFPA 70.

3.2.10 Thrust Blocks

******************************************************************************
NOTE: Install thrust blocks at bends, tee plugs, and valves of 80 mm 3 inch minimum pipe size.
******************************************************************************

Concrete shall be placed so that sides subject to thrust or load are against undisturbed earth, and valves and fittings are serviceable after concrete has set. Thrust blocks shall be as specified in Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

3.2.11 Backfill

3.2.11.1 Minimum Cover

******************************************************************************
NOTE: Depths of cover are 300 mm 12 inches for laterals and 450 mm 18 inches for mains in warm climate areas. Use 600 mm 24 inches for mains and laterals where piping can be drained in cold climate areas to protect pipe from frost. Consult local conditions in cold climates to protect against freezing of supply mains.
******************************************************************************

Depth of cover shall be [300] [600] [_____] mm [12] [24] [_____] inches for 32 mm 1-1/4 inch pipe or smaller; [300] [450] [600] [_____] mm [12] [18]
3.2.11.2 Restoration

NOTE: Insert the section number and title for the restoration of pavements.

Top 80 mm 3 inches shall be filled with topsoil and compacted with same density as surrounding soil. Lawns and plants shall be restored in accordance with Sections 32 92 19 SEEDING, 32 92 23 SODDING, 32 92 26 SPRIGGING, and Section 32 93 00 EXTERIOR PLANTS. Pavements shall be restored in accordance with Section [____].

3.2.12 Adjustment

After grading, seeding, and rolling of planted areas, sprinkler heads shall be adjusted flush with finished grade. Adjustments shall be made by providing new nipples of proper length or by use of heads having an approved device, integral with head, which will permit adjustment in height of head without changing piping.

3.2.13 Disinfection

Sprinkler system fed from a potable water system shall be disinfected upstream of backflow preventer in accordance with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

3.2.14 Cleaning of Piping

Prior to the hydrostatic and operation tests, the interior of the pipe shall be flushed with clean water until pipe is free of all foreign materials. Flushing and cleaning out of system pipe, valves, and components shall not be considered completed until witnessed and accepted by Contracting Officer.

3.3 FRAMED INSTRUCTIONS

Post framed instructions, containing wiring and control diagrams under glass or in laminated plastic, where directed. Condensed operating instructions, prepared in typed form, shall be framed as specified above and posted beside the diagrams. Post the framed instructions before acceptance testing of the system. Submit labels, signs, and templates of operating instructions that are required to be mounted or installed on or near the product for normal, safe operation. After as-built drawings are approved by Contracting Officer, prepare controller charts and programming schedule. One chart for each controller shall be supplied. Chart shall be a reduced drawing of actual as-built system that will fit the maximum dimensions inside controller housing. Black line print for chart and a different pastel or transparent color shall indicate each station area of coverage. After chart is completed and approved for final acceptance, chart shall be sealed between two 0.505 mm 20 mil pieces of clear plastic.
3.4 **FIELD TRAINING**

Provide a field training course for designated operating and maintenance staff members for a total period of [_____] hours of normal working time and starting after the system is functionally complete but prior to final acceptance tests. Submit information describing training to be provided, training aids to be used, samples of training materials to be provided, and schedules and notification of training. Field training shall cover all of the items contained in the operating and maintenance manuals.

3.5 **FIELD TESTS**

**************************************************************************
NOTE: Delete leakage tests if water supply service main is not part of contract.
**************************************************************************

Provide all instruments, equipment, facilities, and labor required to conduct the tests. Submit performance test reports, in booklet form, showing all field tests performed to adjust each component; and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate in each test report the final position of control valves.

3.5.1 **Hydrostatic Pressure Test**

Piping shall be tested hydrostatically before backfilling and proved tight at a hydrostatic pressure of 1034 kPa 150 psi without pumping for a period of one hour with an allowable pressure drop of 35 kPa 5 psi. If hydrostatic pressure cannot be held for a minimum of 4 hours, make adjustments or replacements and repeat the tests until satisfactory results are achieved and accepted by the Contracting Officer.

3.5.2 **Leakage Tests**

Leakage tests for service main shall be in accordance with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

3.5.3 **Operation Test**

At conclusion of pressure test, sprinkler heads or emitter heads, quick coupling assemblies, and hose valves shall be installed and entire system tested for operation under normal operating pressure. Operation test consists of the system operating through at least one complete programmed cycle for all areas to be sprinkled.

3.6 **CLEANUP**

Upon completion of installation of system, all debris and surplus materials resulting from the work shall be removed.

NOTE: This guide specification covers the requirements for irrigation sprinkler systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Some paragraphs may need to be supplemented to meet project requirements.

PART 1  GENERAL

1.1  REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature
when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: Use only when using water pumps.
**************************************************************************

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section, with additions and modifications specified herein.

1.3 SYSTEM DESCRIPTION

This system is designed with a water pressure minimum of [_____] kPa pounds per square inch (psi) maximum of [_____] kPa psi at connection to main [meter] [building] [backflow prevention device] and [_____] kPa psi at the last head in each zone. [ Provide a system pressure calculations and irrigation requirements of the area.] If pressure falls above or below indicated values, Contractor shall notify Contracting Officer. For Irrigation Sprinkler System, indicate the following:

a. Head, piping, valve, [controller], [sensor] layout. Provide separate hydrozones for plant materials with different water requirements.

b. Pipe, valve, backflow preventer, and controller.

**************************************************************************
NOTE: Use the following in freeze-thaw climates only.
**************************************************************************

c. Invert elevations. Indicate obstructions interfering with operation.

**************************************************************************
NOTE: At the text below, if source of water supply is from station water system through a service line and water meter, determine amount of water required for station irrigation system from static pressure at point of connection of station main. These factors are essential in designing for system pressure. In many cases, water supply is adequate for short durations only. Provide adequate valves for each zone to irrigate an area effectively.
**************************************************************************

d. Water source equipment, including existing mains, piping, valves and meters.

**************************************************************************
NOTE: At the text below, the system pressure and irrigation requirements of the area are determined from water supply, static pressure, soil, plants, freezing conditions, elevation changes, and wind direction and velocity.
**************************************************************************
e. System and supply pressures.

f. Indicate wiring diagram between existing power source and controller/water pump.

g. Number and extent of control valve circuits.

h. Provide details of all irrigation components and accessories.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery

Deliver materials in original rolls, packages, cartons, and containers with the name of manufacturer, brand, and model. Inspect materials delivered to the site for damage.

1.5.2 Storage

Store materials on site in enclosures or under protective covering. Store [plastic piping and] rubber gaskets under cover out of direct sunlight. Do not store materials directly on ground. Keep inside of pipes and fittings free from dirt and debris.

1.5.3 Handling

Handle and carry pipe, fittings, valves, and accessories in such a manner
as to ensure delivery to trench in sound undamaged condition. Do not drag pipe.

1.6 EXTRA STOCK

a. [2] [_____] additional sprinkler heads (nozzles, bodies, screens, pressure compensating devices) of each size and type;

b. [2] [_____] valve keys for operating manual valves;

c. [2] [_____] wrenches for removing and installing each type of head;

d. [2] [_____] quick coupler keys and hose swivels;

f. [4] [_____] irrigation controller enclosure keys; and

g. [2] [_____] hand-held remotes compatible with controller system.

1.7 QUALITY ASSURANCE

1.7.1 Required Test

Submit tests signed by an authorized official of a testing laboratory of sprinkler head, valve, automatic controller, emitter heads, vacuum breaker, backflow preventer, and water hammer arrester.

PART 2 PRODUCTS

2.1 PIPING MATERIALS

**************************************************************************
NOTE: Select material with copper, brass, steel, PVC, and PE, according to project requirements. Verify soil and water conditions on site, use copper or plastic pipe where corrosion problems exist.
**************************************************************************

2.1.1 Copper Tubing and Associated Fittings

2.1.1.1 Tubing

ASTM B88MASTM B88, Type K.

2.1.1.2 Fittings

**************************************************************************
NOTE: Sn 95 and Sn 94 are alloy grades with 95 and 94 percent tin base alloy. Both grades composed of 0.10 percent lead intended for potable water systems. A maximum of 0.20 percent lead in alloy is suitable for drinking. Type I flux is used for tin-lead solders for joining metal except aluminum.
**************************************************************************

ASME B16.22 and ASME B16.18, solder joint. Solder, ASTM B32 alloy Grade Sn95 or Sn94. Flux, CID A-A-51145, Type I.
2.1.2 Red Brass Pipe and Associated Fittings

2.1.2.1 Pipe

ASTM B43, regular.

2.1.2.2 Fittings

ASME B16.15, Class 250, cast bronze threaded.

2.1.3 Galvanized Steel Pipe and Associated Fittings

2.1.3.1 Pipe

******************************************************************************
NOTE: Schedule 40 is standard weight pipe. Use of pipe is limited to fixed shrub head risers and reduced pressure type backflow preventers.
******************************************************************************

ASTM A53/A53M, Schedule 40.

2.1.3.2 Fittings

******************************************************************************
NOTE: Class 150 is pressure temperature rating of 1034 kPa at 177 degrees C 150 psi at 350 degrees F.
******************************************************************************

ASME B16.3, Class 150.

2.1.4 Polyvinyl Chloride (PVC) Pipe, Fittings and Solvent Cement

******************************************************************************
NOTE: PVC pipe may be used where frost line is less than 300 mm 12 inches deep.
******************************************************************************

NSF/ANSI 14, seal of approval for potable water.

2.1.4.1 Pipe

******************************************************************************
NOTE: ASTM D1785, PVC 1120, Schedule 40 is Type I, Grade 1 with 13.8 MPa 2.000 psi hydrostatic design stress, and wall thickness of Schedule 40. ASTM D1785, PVC 1120, Schedule 80 is Type I, Grade 2 with 13.8 MPa 2.000 psi hydrostatic design stress, and wall thickness of Schedule 80. ASTM D2241, PVC 1120, SDR 21 is Type I, Grade 1 with 13.8 MPa 2,000 psi hydrostatic design stress, and standard dimension ratio of 21.
******************************************************************************

ASTM D1785, PVC 1120 Schedule [40] [80]; or ASTM D2241, PVC 1120 SDR 21, [Class 315][Class 200].[ Provide integral lavender-color pipe for non-potable use.][ Provide ultra-violet resistant piping for on-grade use.]
2.1.4.2  Fittings

**************************************************************************
NOTE:  At the text below, use Schedule 40 PVC fittings when solvent welded. Do not use threaded Schedule 40 pipe.
**************************************************************************

a.  Solvent Welded Socket Type:  ASTM D2466, Schedule 40.[  Provide lavender-colored fittings.][  Provide ultra-violet resistant fittings.]

b.  Threaded Type:  ASTM D2464, Schedule 80.[  Provide lavender-colored fittings.][  Provide ultra-violet resistant fittings.]

2.1.4.3  Solvent Cement

**************************************************************************
NOTE:  Use for unthreaded PVC pipe and fittings.
**************************************************************************

ASTM D2564.

2.1.5  Polyethylene (PE) Plastic Piping

2.1.5.1  Pipe

AWWA C901, outside diameter (od) base with dimension ratio (DR) of 9.3 to provide 1034 kPa 150 psi minimum pressure rating.

2.1.5.2  Fittings

ASTM D3261, DR of 9.3.

2.1.6  Dielectric Fittings

**************************************************************************
NOTE:  Provide dielectric fittings between copper and ferrous metal piping materials.
**************************************************************************

ASTM F441/F441M, Schedule 80, CPVC threaded pipe nipples, 100 mm 4 inch length.

2.1.7  Drip Irrigation Tubing

ASTM D2287, maximum inside diameter (id) of [3] [6] [10] [13] [19] [25.40] mm [1/8] [1/4] [3/8] [1/2] [3/4] [one] inch, vinyl plastic extruded from non-rigid chloride, integrally algae-resistant, homogeneous throughout, smooth inside and outside, free from foreign materials, cracks, serrations, blisters and other effects.  Provide [slip] [barbed] [compression] fittings.

2.1.8  Pipe Sleeving

a.  Provide [PVC] [cast iron] [_____] piping two times the diameter of main or lateral piping.

b.  Provide gray PVC electrical conduit sized according to number of control wires.  Minimum 50 mm 2 inch size.
2.2  IRRIGATION AND DRIP SPRINKLER HEADS

[ Provide lavender-colored body, nozzle, and/or cap indicator for non-potable use. ]

2.2.1  Fixed Riser Irrigation Heads

2.2.1.1  Stream Rotors, Full or Part Circle

Sprinkler body, nozzle, and screen constructed of heavy-duty, ultra-violet resistant plastic. Heavy duty, stainless steel internal construction with plastic body.[ Provide check valve below each sprinkler body on riser.]

2.2.1.2  Gear Rotor Irrigation Head, Full or Part Circle

Single-stream, water lubricated, gear drive type capable of covering [_____] mm feet radius [_____] kPa psi with distribution rate of [_____] L/s gpm. Part circle sprinkler with an adjustable arc coverage of 0.52 to 6.28 rad 30 to 360 degrees. Stainless steel internal construction with plastic body, with matched precipitation rate nozzles in standard /low/ flat angle trajectories, filter screen, reducible watering radius, and choice of [_____] nozzles.

2.2.1.3  Impact Irrigation Head

Capable of covering [_____] mm feet radius at [_____] kPa psi with a distribution rate of [_____] L/s gpm, and [_____] V pop-up. Provide one or two nozzles to distribute water, an inlet strainer to prevent debris from clogging nozzles, and non-corrosive [brass] [plastic] head and stainless steel assemblies. Seal bearing assembly from abrasives. Provide entire assembly including strainer removable from top of case without disturbing case installation. Provide plastic housing.

2.2.1.4  Spray Irrigation Heads, Full or Part Circle

Capable of covering [_____] mm feet radius at [_____] kPa psi with a discharge rate of [_____] L/s gpm. Sprinkler body, nozzle, and screen constructed of heavy-duty, ultra-violet resistant plastic. Matched precipitation rate [plastic] [brass] nozzle with an adjustable screw capable of regulating the radius and the flow. Capable of housing under the nozzle; protective, non-clogging filter screen and/or pressure compensating devices. Screen used in conjunction with the adjusting screw from regulating.[ Provide check valve below each sprinkler body on riser.]

2.2.1.5  Adjustable Flood Bubbler Head

**************************************************************************
NOTE: A water outlet that does not spray water but permits water to bubble and flow to the surrounding plants.
**************************************************************************

Capable of providing a discharge rate of [_____] L/s at kPa [_____] gpm at psi, operating over a pressure range of 69 to 414 kPa 10 to 60 psi. Constructed of durable ultra-violet resistant plastic with a plastic inlet filter screen to protect the nozzle against clogging, and a stainless steel adjustable screw, capable of shutting off the bubbler and regulating the flow.
2.2.1.6 Pressure Compensating Flood Bubbler Head

Capable of providing a consistent discharge rate of [_____] L/s at kPa [_____] gpm at [_____] psi. Plastic inlet filter screen bubbler assembly to protect the nozzle against clogging. Permanently assembled design constructed of durable, ultra-violet resistant plastic with a integral rubber flow washer for regulating the discharge rate at an operating pressure range of 138 to 621 kPa 20 to 90 psi.

2.2.2 Pop-Up Irrigation Head

******************************************************************************
NOTE: Pop-up heads lay flush with the housing, then pop up when the water pressure is activated in system.
******************************************************************************

2.2.2.1 Stream Rotor Irrigation Head, Full or Part Circle

Sprinkler body, nozzle, and screen constructed of heavy-duty, ultra-violet resistant plastic. Heavy duty, stainless steel internal construction with plastic body. Pop-up height of [75] [100] [150] [300] mm [3] [4] [6] [12] inches as measured from top of cap at normal installation to middle of nozzle orifice.[  Provide check valve in head.]

2.2.2.2 Gear Rotor Irrigation Head, Full or Part Circle

Sprinkler body, nozzle, and screen constructed of heavy-duty, ultra-violet resistant plastic. Heavy duty, stainless steel internal construction with plastic body and match precipitation rates for standard low or flat angle trajectories. Single-stream, water lubricated, gear drive type capable of covering [_____] mm feet radius [_____] kPa psi with distribution rate of [_____] L/s gpm. Part circle sprinkler with an adjustable arc coverage of 0.52 to 6.28 rad 30 to 360 degrees. Pop-up height of [75] [100] [150] [300] mm [3] [4] [6] [12] inches as measured from top of cap at normal installation to middle of nozzle orifice. Provide wiper seal that positively seals against nozzle flange to keep debris out of rotor and cleans debris from pop-up steam as it retracts.[  Provide check valve in head.]

2.2.2.3 Impact Irrigation Head

Capable of covering [_____] mm feet radius at [_____] kPa psi with a distribution rate of [_____] L/s gpm. Provide one or two nozzles to distribute water, an inlet strainer to prevent debris from clogging nozzles, and non-corrosive [brass] [plastic] head and stainless steel assemblies. Seal bearing assembly from abrasives. Provide entire assembly including strainer removable from top of case without disturbing case installation. Provide plastic housing. Pop-up height of [75] [100] [150] [300] mm [3] [4] [6] [12] inches as measured from top of cap at normal installation to middle of nozzle orifice.

2.2.2.4 Spray Irrigation Head, Full or Part Circle

Capable of covering [_____] mm feet radius at [_____] kPa psi with a discharge rate of [_____] L/s gpm. Sprinkler body, nozzle, and screen constructed of heavy-duty, ultra-violet resistant plastic with wiper seal. [Brass] [Plastic] nozzle with matched precipitation rate and an adjustable screw capable of regulating the radius and flow. Capable of housing under
the nozzle; protective, non-clogging filter screen and/or pressure compensating devices. Screen used in conjunction with the adjusting screw from regulating. Pop-up height of [75] [100] [150] [300] mm [3] [4] [6] [12] inches as measured from the top of cap at normal installation to middle of nozzle orifice. [Provide check valve below each sprinkler body on riser.]

2.2.3 Bubbler Irrigation Head

2.2.3.1 Adjustable Flood Bubbler

Capable of providing a discharge rate of [_____] L/s at kPa [_____] gpm psi operating over a pressure range of 69 to 414 kPa 10 to 60 psi. Construct of durable ultra-violet resistant plastic with a plastic inlet filter screen to protect the nozzle against clogging, and a stainless steel adjusting screw, capable of shutting off the bubbler and regulating the flow. Pop-up height of [75] [100] [150] [300] mm [3] [4] [6] [12] inches as measured from top of cap at normal installation to middle of nozzle orifice.

2.2.3.2 Pressure Compensating Flood Bubbler

Capable of providing a consistent discharge rate of [_____] L/s at kPa [_____] gpm at psi. Plastic inlet filter screen bubbler assembly to protect the nozzle against clogging. Permanently assembled design constructed of durable, ultra-violet resistant plastic with an integral rubber flow washer for regulating the discharge rate at an operating pressure range of 138 to 621 kPa 20 to 90 psi. Pop-up height of [75] [100] [150] [300] mm [3] [4] [6] [12] inches as measured from top of cap at normal installation to middle of nozzle orifice.

2.2.4 Fixed Drip Head

**************************************************************************

NOTE: Drip head is an outlet device that permits water to drip or trickle from small tubings. Drip irrigation is frequent, slow application of water to specific root zone area of plants. The goal is to provide a constant level of subsurface moisture to the root ball for most favorable growth.

**************************************************************************

2.2.4.1 Multi-Port Outlet Device

**************************************************************************

NOTE: Choose one of the following options

**************************************************************************

[Multi-outlet, pressure compensating emitter manifold that is ultra-violet resistant, algae, and heat resistant, non-corrosive PVC material for above or below grade installation. Integral 75 micrometers 200 mesh fabric screen that can be serviced from the top of the unit by unscrewing the top cap. [Six] [eight] [twelve] [_____] top mounted outlet ports that will accept [3] [6] mm [1/8] [1/4] inch vinyl tubing. The [six] [eight] [twelve] [_____] outlets can be accessed through the top of the unit by unscrewing the lid from the base. Each outlet port accepts a pressure compensating emitter controlling the flow from 1.89 to 90.84 0.5 to 24.0 gph per outlet. Operating range of unit is 103 to 345 kPa with 13 mm 15 to 50 psi with 1/2 inch female national pipe thread (FNPT) inlet.]
Multi-outlet, pressure-compensating emitter constructed of a ultra-violet resistant algae and heat resistant, non-corrosive PVC material. Diaphragm/flap constructed of a silicone elastomer material. Pressure-compensated emitter with each outlet delivers a nominal flow of 1.89 [3.79] [7.57] L/h [0.5] [1.0] [2.0] gph at 103 to 345 kPa 15 to 50 psi. [Three] [four] [six] [_____] barbed outlet unit that will accept 3 [6] mm [1/8] [3/4] inch vinyl tubing with continuous "self flushing" emitter feature.

2.2.4.2 Single Outlet Pressure Compensating Emission Device

[Pressure compensated] emitter body constructed of ultra-violet, algae, heat resistant and chemical resistant, non-corrosive PVC material. Diaphragm constructed of a silicone elastomer material. Capable of delivering a nominal flow rate of 1.89 [3.79] [7.57] [_____] L/h [0.5] [1.0] [2.0] [_____] gph at a pressure range of 103 to 345 kPa 15 to 50 psi. [A self piercing inlet barb type 13 mm 1/2 inch female national pipe thread (FNPT) inlet mounted onto a 13 mm 1/2 inch male national pipe thread (MNPT) riser.] Barbed emitter outlet configuration that will accept 3 [6] mm [1/8] [1/4] inch vinyl tubing.

2.2.4.3 Microspray Device

Capable of covering 0 to 4500 mm [0 to 15] [_____] feet radius at [_____] kPa psi with a discharge rate of [_____] L/h gph with overall pop-up height of 100 [150] [300] [_____] mm [4] [6] [12] [_____] inches. Sprinkler body, nozzle, and screen constructed of heavy-duty, ultra-violet resistant plastic with wiper seal on sprinkler. Matched precipitation rate [brass] [plastic] nozzle with an adjustable screw capable of regulating the radius and flow and capable of housing under the nozzle; protective, non-clogging filter screens and/or pressure compensating devices. Screen used in conjunction with the adjusting screw for regulating. Mount with 13 mm 1/2 inch female national pipe thread (FNPT) adapter [poly flex riser stake].

2.2.4.4 In-Line Tubing Device

Factory installed, heavy-walled flexible polyethylene (PE) tubing, pressure compensating, self-cleaning emitters at spacings of 300 [450] [600] [_____] mm [12] [18] [24] [36] [_____] inches. Emitter flow of 1.89 [3.79] [7.57] [_____] L/h [0.5] [1.0] [2.0] [_____] gph with inlet pressure of [_____] kPa psi. Tubing diameter of 13 [19] mm [1/2] [3/4] inch.

2.2.5 Pop-Up Drip Head

**************************************************************************
NOTE: Drip head is an outlet device that permits water to drip or trickle from small tubings. Drip irrigation is frequent, slow application of water to specific root zone area of plants. The goal is to provide a constant level of subsurface moisture to the root ball of plant for most favorable growth.
**************************************************************************

Capable of covering 0 to 4500 mm 0 to 15 feet radius at [_____] kPa psi with a discharge rate of [_____] L/h gph with overall pop-up height of 100 [150] [300] mm [4] [6] [12] inches. Sprinkler body, stem, nozzle, and screen constructed of heavy-duty, ultra-violet resistant plastic with
wiper seal on sprinkler. Provide a heavy-duty, stainless steel retract spring for positive pop-down and a ratcheting system for easy alignment of the pattern. Matched precipitation rate [brass] [plastic] nozzle with an adjusting screw capable of regulating the radius and flow and capable housing under the nozzle; protective, non-clogging filter screens and/or pressure compensating devices. Screen used in conjunction with the adjusting screw for regulating. A side and bottom 12.70 mm 1/2 inch female national pipe thread (FNPT) inlet for the [150] [300] mm [6] [12] inch model. Mount with 12.70 mm 1/2 inch female national pipe thread (FNPT) adapter [poly flex riser stake].

2.3 VALVES

2.3.1 Isolation Valve

2.3.1.1 Ball Valves, Less than 75 mm 3 inches

API Std 598, [brass] [plastic] body, [threaded] [soldered] ends.

2.3.1.2 Gate Valves, 75 mm 3 inches and Larger

AWWA C500, bottom wedging double discs, parallel seats, non-rising stems, open by counterclockwise turning. Provide flanged end connections. Provide bronze interior construction of valves including stem containing a maximum 2 percent aluminum and maximum 16 percent zinc.

2.3.2 Control Valves

2.3.2.1 Pressure Regulating Master Control Valve

**************************************************************************
NOTE: Master valve automatically reduces a higher inlet pressure to a constant lower pressure regardless of supply fluctuations
**************************************************************************

Automatic mechanical self-cleaning, self-purging control system having an adjustable pressure setting operated by a solenoid on alternating current (ac) with [0.70] [_____] amperes at [18] [24] volts. [Direct current (dc) latching with [_____] amperes at [_____] volts.] Valve shall close slowly and be free of chatter in each diaphragm position. Provide a manual flow stem to adjust closing speed and internal flushing. Provide an adjusting screw for setting pressure and schrader valve for monitoring pressure. Provide [one] [two] inlet tappings capable of being installed as a straight pattern valve. Provide heavy duty [cast iron] [brass] [plastic] valve body with brass seat that is removable and serviceable from top without removing valve body from system. Maximum working pressure of valve is 1034 kPa 150 psi and pilot range from 69 to 862 kPa 10 to 125 psi.

2.3.2.2 Remote Control Valve, Electrical

**************************************************************************
NOTE: An activated open and shut-off device for controlling water flow to sprinkler branch line.
**************************************************************************

Solenoid actuated [globe] [angle] valves of 20 to 75 mm 3/4 to 3 inch size,
[alternating current (ac), 60/50 cycle [_____] amps in rush current and [_____] amps holding current.] [Direct current (dc) latching with [_____] amperes at [_____] volts.] Provide [brass] [plastic] valve housing suitable for service at 1034 kPa 150 psi operating pressure. [Provide pressure regulating module capable of regulating outlet pressure between 103 to 172 kPa 15 to 25 psi (plus or minus) 34 kPa 5 psi and adjustable screw for setting pressure schrader valve connection for monitoring pressure.]

2.3.2.3 Manual Angle Control Valve, Manual Globe Control Valve

Less than 65 mm 2 1/2 inch MSS SP-80, type 3, Class 150 [threaded] [soldered] ends. [Angle] [globe] valve 65 mm 2 1/2 inch and larger MSS SP-85, Type II, Class 250 [threaded] [flanged] ends.

2.3.3 Quick Coupling Valves

**************************************************************************
NOTE: A device that permits quick coupling and uncoupling of valves. It is an effective method of keeping sprinkler out of the way when not in use, eliminating the possibility of damage, injury or theft.
**************************************************************************

Two piece unit consisting of a coupler water seal valve assembly and a removable upper body to allow spring and key track to be serviced without shutout of main. Provide brass parts. Provide [yellow] [lavender] [vinyl] rubber lockable lids with springs for positive closure on key removal.

2.3.4 Hose Bib

One piece consisting of all brass construction with full flow [13] [19] [25.40] mm [1/2] [3/4] [one] inch hose connection outlet and [with attached handle] [removable key handle] with gaskets and washers.

2.3.5 Drain Valves

[2.3.5.1 Manual

MSS SP-80, Type 3, Class 150 [threaded] [soldered] ends for sizes less than 65 mm 2 1/2 inches. MSS SP-85, Type II, Class 250 [threaded] [flanged] ends for sizes 65 mm 2 1/2 inches and larger.

][2.3.5.2 Automatic

**************************************************************************
NOTE: Delete automatic drains for warm climate areas. This saves water to prevent draining 50 to 100 mm 2 to 4 inch diameter lines during irrigation cycles and avoid continuously saturated soil at drain joints. Automatic drains are necessary for cold climate areas to prevent freeze damage to sprinklers and pipes.
**************************************************************************

Brass, spring loaded ball drip type, 1034 kPa 150 pounds and threaded ends, designed to close at 1.83 m 6 foot pressure head with positive seal at 21 kPa 3 psi pressure or greater and be open to drain at less than 21 kPa 3 psi
pressure.

2.3.6 Backflow Preventers

**************************************************************************
NOTE: The purpose of a backflow preventer is to keep contaminated water from flowing back into a potable water distribution system when some abnormality in system causes pressure to be temporarily higher in contaminated part of system than in potable water piping.
**************************************************************************

[2.3.6.1 Reduced Pressure Type Backflow Preventers

**************************************************************************
NOTE: The purpose of reduced pressure type backflow preventer is to prevent either back siphonage or back pressure from causing a reverse flow and subsequent contamination of potable water supply.
**************************************************************************

**************************************************************************
NOTE: Delete this requirement when system is connected to non-potable water supply system, or when sewage is injected into sprinkler system. When effluent pumps are down, add a fresh water connection with a reduced pressure backflow preventer.
**************************************************************************

AWWA C511. Provide backflow preventers complete with 1034 kPa 150 psi rated flanged [cast iron], [bronze] [brass] mounted [gate] [ball] valve [and strainer], [304] [_____] stainless steel or bronze, internal parts. Total pressure drop through complete assembly shall be a maximum of 69 kPa 10 psi at rated flow. Listing of particular make, model/design, and size in FCCCHR List will be acceptable as required proof for testing and certification.

a. Piping Assembly: [Red brass pipe and fittings] [Galvanized steel pipe and fittings].

b. Strainers: Bronze or brass construction with gasket caps. Equip units with 75 micrometers No. 200 mesh stainless steel screen elements.

[2.3.6.2 Pressure Type Vacuum Breaker

**************************************************************************
NOTE: Vacuum breakers are designed to prevent back siphonage only, and are not effective against backflow due to back pressure. A vacuum breaker is adequate when it is located aboveground higher than highest irrigation head and its elevation is above areas which may be flooded.
**************************************************************************

ASSE 1020 [bronze] [brass] construction, with one or two check valves, vacuum relief, inlet and discharge shut-offs valves, and field test cocks, and with vacuum relief opening of greater diameter than unit.
2.3.6.3 Atmospheric Vacuum Breaker

**************************************************************************
NOTE: Atmospheric Vacuum breakers are designed to prevent back siphonage only, and are not effective against backflow due to back pressure. A atmospheric vacuum breaker is adequate when it is located aboveground higher than highest irrigation head and its elevation is above areas which may be flooded. Locate atmospheric vacuum breaker downstream of the control valve.
**************************************************************************

AWWA M14, vacuum relief, inlet and discharge openings, and with vacuum relief opening of greater diameter than unit.

2.4 ACCESSORIES AND APPURTEANCES

2.4.1 Tapping Tee

Bronze flat, double strap, with neoprene gasket or "O"-ring seal.

2.4.2 Water Meter

**************************************************************************
NOTE: ASHRAE 189.1 - 2014 requires a water meter with remote communication capabilities. Select the first bracketed option if total irrigated landscape area with controllers exceeds 2322.5 square meters 25,000 square feet.
**************************************************************************

[Provide a submeter in accordance with ASHRAE 189.1. ]Meter to include roll sealed register, magnetic drive, straight reading (odometer shall indicate in liters gallons, large numerals, glass lens for legibility,) low flow indicator to detect leaks, tamper proof seal pin to detect theft; sturdy durable, corrosion resistant main case, electrical grounding continuity; nutating disc measuring chamber with minimum head loss.

2.4.3 Drip Head Accessories

2.4.3.1 Strainer

Provide strainer at inlet to each drip control valve assembly. Provide polyester fabric screen attached to a PVC frame having the equivalent of \( [56] \) \( [75] \) \( [\text{-}] \) micrometers \( [150] \) \( [200] \) \( [\text{-}] \) mesh filtration capacity. Compact "Y" body and cap configuration. Incorporate flush valves within strainer to clean screen without disassembling unit.

2.4.3.2 Riser Adapters

PVC material, [threaded] [barbed] [soldered] to attached drip heads to tubing, pop-up irrigation body, or rigid piping and tubing to rigid piping.

2.4.3.3 Tubing Stakes

Plastic, plastic coated steel, or other non-corrosive strong material to secure tubing.
2.4.3.4 Bug Cap

Provide check valves at end of each emitter outlet distribution line. Valves shall permit free flow of water with minimum restriction; prevent siphoning, entry of insects, and contamination into outlet ports.

2.4.3.5 Subterranean Drip Box and Cover

Construct of ultra-violet resistant PVC. Two slots in bottom of box to allow for installation of distribution tubing onto the emission device.

2.4.3.6 Line Flushing Valve

Construct of PVC with maximum flow rate of \(0.95 \text{ L/s} \) \(15 \text{ gpm}\) with minimum flushing water volume of \(3.79 \text{ liters one gallon}\) at a minimum \(28 \text{ kPa} \) \(4 \text{ psi}\) to a maximum \(172 \text{ kPa} \) \(25 \text{ psi}\) at a point of discharge.

2.4.3.7 Valve Boxes

[Cast-iron] [precast concrete [manufactured in accordance with Section 03 42 13.00 10 PLANT-PRECAST CONCRETE PRODUCTS FOR BELOW GRADE CONSTRUCTION]] [plastic] valve box for each isolation valve, control valve, [quick coupling valve] [and] [drain valve]. Provide box sizes that are suitable and adjustable for valve used.

   a. Cast the word "IRRIGATION" on cover.

   b. Stencil, engrave, or brand controller and valve sequence on remote control valve cover. Letters minimum \(10 \text{ mm} \) \(4 \text{ inches}\) height.

2.4.4 Backflow Preventer Accessories

2.4.4.1 Pressure Gages

ASME B40.100, single style pressure gage for water with \(113 \text{ mm} \) \(4 1/2 \text{ inch}\) dial, brass or aluminum case, bronze tube, gage cock, pressure snubber, and siphon. Provide scale range suitable for irrigation systems.

2.4.4.2 Water Hammer Arresters

ASSE 1010; stainless steel construction with an encased and sealed bellows compression chamber.

2.4.4.3 Backflow Preventer Enclosure

Frame to be constructed of \(4.76 \text{ mm} \) \(3/16 \text{ inch}\) [stainless steel] [steel] angle iron with \(38.10 \text{ mm} \) \(1 1/2 \text{ inch}\) No. 9 expanded metal covering. Construct in a [one piece single swing] [two piece double] hinge configuration. Provisions for pad locking and lighting handles. Size to fit backflow assembly to installed. [Color to be [green] [_____] .] Lock for enclosure provided by others.

2.4.4.4 Concrete Pads

Cast-in-place reinforced concrete construction for reduced pressure type backflow preventers.
2.4.5 Moisture Sensing Device

2.4.5.1 Automatic Rain Shut-Off Device

One piece, maintenance and adjustment free, reacts to a minimum 3.18 mm 1/8 inch of rain water, unaffected by humidity levels, commercial grade materials, no exposed mechanical switch or electrodes, solid state construction with internal relay operating voltage of 24 to 30 VAC, static charge pretested, maximum switch current of one amp.

2.4.5.2 Automatic Freeze Shut-Off Device

Construct of a PVC cylinder with a sensing element mounted at top of cylinder capable of interrupting the control valve common wire as temperatures approach 0 degrees C 32 degrees F. Operating voltage 24 VAC, maximum current one amp. Static charge protection with snubber network.

2.4.5.3 Soil Moisture Sensor Device

24 VAC, field adjustable and capable of interrupting irrigation cycles for pre-determined moisture level at moisture probe location. Waterproof field adjustment module with bypass switch.

2.4.6 Air/Vacuum Relief

Construct of PVC with a maximum operating pressure of 965 kPa 140 psi.

2.4.7 Water Booster Package

Booster pump package to be a prefabricated system, pre-piped, pre-wired and mounted on a steel skid base minimum 75 mm 3 inch welded angle iron or channel brackets, hot dipped galvanized, with a minimum 14 mm 9/16 inch holes at each corner for bolting to concrete with anchors. Field assembled pump systems are not acceptable.

2.4.7.1 Pump

Pump to be end suction close coupled or in-line type, bronze impeller and wear rings, bronze shaft sleeve, mechanical seal with high-resist seat, integral flanged suction and discharge connections, keyed motor shaft, back pull-out type, with centerline discharge for automatic venting and Type 304 stainless steel internal parts and fittings.

2.4.7.2 Motor

Motor to be [_____] rpm, [_____] hp, [_____] phase, ball bearing design, stainless steel shaft, non-over loading on full range of the impeller curve without use of the service factor and including rodent and insect screens over the openings. Single phase motors to be totally enclosed fan cooled and open drip-proof with a minimum 1.15 service factor. Three phase motors to be totally enclosed fan cooled, open drip-proof with a minimum 1.15 service factor.

2.4.7.3 Piping and Fittings

Piping and fittings to be flanged spools of Schedule 40 steel and Class 150 weld flanges, hot dipped galvanized after fabrication. Spacer spools to be welded and galvanized. Companion flanges at suction and discharge header connections to be Schedule 40 steel and galvanized.
2.4.7.4 Gages

Gages shall be 65 mm 2 1/2 inch diameter, liquid filled for vibration dampening, 0-200 pounds, stainless steel casing, with brass needle valve shut-off cocks.

2.4.7.5 Butterfly Valve

Butterfly valves and adjustable handles to be sandblasted and epoxy coated, nuts and bolts to be cad plated, shut off valves to be centerline butterfly lug type, wafer style, drilled and tapped, with bronze disc, capable of remaining installed in the piping.

2.4.7.6 Check Valves

A combination pressure reducing and non-slam check valve to be installed with booster pump package to reduce effect of varying suction pressure.

2.4.7.7 Pump Control Panels

Pump control panels to be 14 gage type UF, type 304 stainless steel with continuous welded seams, door with continuous hinge, all welds passivated to eliminate corrosion, UL listed, NEMA 3R enclosure with holes in bottom to allow for all inlet wiring for main power control accessories and louvers with insect screens on opposite sides for cross ventilation, deadfront, keylockable and padlockable, with main disconnect switch, circuit breaker with adjustable overloads on all legs and adjustable inrush current trip setting on units exceeding 41 amps, heavy duty contactor, 115 volt control circuit transformer with circuit breaker disconnect. A plug-in module type pump start relay shall be mounted and hard wired in the pump panel. A electronic flow switch with 0-60 seconds adjustable time delay relay, mounted and hard wired in the pump panel, to operate as a no-flow safety shut down. NEMA 3R non-fused main disconnect switch, mounted on exterior of pump panel, hard wired to panel circuit breaker.

2.4.8 Flow Meter

25.40 [31] [38] [50] [75] mm [one] [1.25] [1.5] [2] [3] inch flow meter with a minimum [_____] L/s gpm, female national pipe threaded ends and replaceable metering insert. 9 volt direct current output with a pulse rate which is proportional to the L/s gpm, a 0.067 amperes fuse link to protect metering insert and 14 gage output feeder wire to be powered by the controller. Provide [brass] [plastic] meter housing suitable for service at 1034 kPa 150 psi operating pressure.

2.5 AUTOMATIC CONTROLLER [ELECTRICAL] [SOLAR] [BATTERY]

*****************************************************************

NOTE: ASHRAE 189.1 requires that PERMANENT irrigation systems be controlled by smart controllers that use evapotranspiration (ET) and weather data to adjust irrigation schedules or utilize an on-site rain or moisture sensor that automatically shuts off the system after a predetermined amount of rainfall or moisture is sensed in the soil ultimately meeting the 80 percent minimum ETc for Irrigation Adequacy and not to exceed 10 percent for Irrigation Excess.

*****************************************************************
EXCEPTION: A temporary irrigation system used exclusively for the establishment of new landscape shall be exempt from this requirement. Temporary irrigation systems shall be removed or permanently disabled at such time that the plant materials are established.

**************************************************************************

Controller must be [as indicated on the Drawings] commercially/industrially rated, [hybrid type] [solid state type], for [indoor location] [outdoor location] with [120-volt single phase service with surge protection] [24 VAC solar] [24 VDC solar] [24 VDC battery], operating with indicated stations, and grounded chassis. Provide in an enclosure with locking hinge cover.

2.5.1 Controller Features

a. [____]-station controller with [____] independent programs that can run concurrently.

b. Allows an [infinite] [4 to 8] [____] number of cycles per day by placing the program in a looping mode.

c. Ability to be programmed in one second increments, from [one second to 12 hours] [____].

d. A water budgeting capability in all stations within a program in one percent increments from [one percent to 255 percent] [____].

e. A programmable watering calendar ranging from [one to 16] [365 day calendar] [____] to [____] days.

f. A single-station timed manual feature that allows a station to be turned on manually for its programmed watering time.

g. A semi-automatic manual cycle feature.

h. A true manual operation with safety shut-off at midnight and indicate which station is on by means of L.E.D.S. UL listed, having a re-settable circuit breaker, cadmium plated, weatherproof steel case, and keyed lock.

[j. A qualifying smart controller utilizing [Evapotranspiration (ET) [with no service fees] and weather data to adjust watering schedules] [moisture sensors in the soil].

[k. Provide control for master valve or irrigation pump start up]

[l. Have central computer control capability with [the existing central control system on the Base] [the Region's central control system] [____].]

2.5.2 Controller Enclosure

Controller Enclosure must be [NEMA ICS 2] [NEMA ICS 6 Type 3R] [____] mounted [as indicated on the Drawings] [on a concrete pad] [____]. Enclosure must be [indoor wall mounted plastic cabinet] [outdoor pedestal mounted [plastic] [powder-coated metal, color to be [beige] [____]]]
2.6 Electrical Circuits

2.6.1 Control Wiring for Electrically Operated Valves

NFPA 70, copper conductor [1.8] [____] mm [14] [____] gage wire, Type UF.

2.6.2 Conduit

UL 651, rigid polyvinyl chloride conduit, Schedule 40.

2.7 Concrete Materials

[20] [____] MPa [2500] [____] psi compressive concrete strength at 28 days as specified under Section 03 30 00 CAST-IN-PLACE CONCRETE.

Part 3 Execution

3.1 Installation

Install sprinkler system after site grading has been completed.

3.1.1 Trenching

Hand trench around roots to pipe grade when roots of 50 mm 2 inches diameter or greater are encountered. Make width of trench 100 mm 4 inches minimum or 1 1/2 times diameter of pipe, whichever is wider. Backfill and hand tamp over excavation. When rock is encountered, excavate 100 mm 4 inches deeper and backfill with silty sand (SM) or well-graded sand (SW) to pipe grade. Keep trenches free of obstructions and debris that would damage pipe. Do not mix subsoil with topsoil. Bore under existing concrete walks, drives and other obstacles at a depth conforming to bottom of adjacent trenches. Install pipe sleeve, two pipe diameters larger than sprinkler pipe, to fill bore. [Rock will be encountered. Excavate 100 mm 4 inches deeper and backfill with silty sand (SM) or well-graded sand (SW) to pipe grade.] Prior to backfilling of trench, Contracting Officer shall verify and approve location of all irrigation heads.

3.1.2 Piping System

3.1.2.1 Clearances

a. Minimum horizontal clearances between lines: 100 mm for 50 mm 4 inches for 2 inch pipe and less; 300 mm for 50 mm 12 inches for 2 inch pipe and more.

b. Minimum vertical clearances between lines: 25 mm one inch.

3.1.2.2 Minimum Pitch

Down 150 mm per 30 m 6 inches per 100 feet in direction of drain valves.

3.1.2.3 Thrust Blocks

Install thrust blocks at bends, tees, plugs and valves or [63] [____] mm [2 1/2] [____] inches and larger mainline piping. Place concrete so that sides subject to thrust or load are against undisturbed earth, and valves and fittings are serviceable after concrete has set.
### 3.1.2.4 Minimum Backfill Cover

a. **[450] mm [18] inches** for pressure mainline pipe and valve control wire.

b. **[300] mm [12] inches** for non-pressure lateral pipe.

c. **[600] mm [24] inches** for all piping under paved or non-paved pedestrian paths.

d. **[900] mm [36] inches** for all piping under traffic loads, [farm operations], [freezing temperatures].

e. Install pipe sleeves at depths indicated in "c" and "d".

[Rock will be encountered. Provide minimum 100 mm 4 inches of silty sand (SM) or well graded sand (SW) cover on top of all piping.] Fill remainder of trench or pipe cover to within 75 mm 3 inches of top with excavated soil, and compact soil with plate hand-held compactors to same density as undisturbed adjacent soil.

### 3.1.2.5 Restoration

**************************************************************************

**NOTE:** Fill the section number and title for the restoration of pavements in the blank below using proper format per UFC 1-300-02, "Unified Facilities Guide Specifications (UFGS) Format Standard".

**************************************************************************

Fill top 75 mm 3 inches with topsoil and compact with same density as surrounding soil. Restore [turf] and [plants] according to [Section 32 92 19 SEEDING,][Section 32 92 23 SODDING,][Section 32 92 26 SPRIGGING,][and] [Section 32 93 00 EXTERIOR PLANTS]. [Restore pavements according to [____]].

### 3.1.2.6 Sterilization

Sprinkler system fed from a potable water system sterilized upstream of backflow preventer in accordance with AWWA C651. Sterilize new water lines for a minimum of 24 hours to meet [local] [state] [federal] health test requirements before placing in service. Minimum retention period shall be 3 hours.

### 3.1.3 Piping Installation

#### 3.1.3.1 Polyvinyl Chloride (PVC) Pipe

a. **Solvent-Cemented Joints:** ASTM D2855.

b. **Threaded Joints:** full cut with a maximum of three threads remain exposed on pipe and nipples. Make threaded joints tight without recourse to wicks or fillers, other than polytetrafluoroethylene thread tape.

c. **Piping:** ASTM D2774 or ASTM D2855, and pipe manufacturer's instructions. Install pipe in a serpentine (snaked) manner to allow for expansion and contraction in trench before backfilling. Install
pipes at temperatures over 4.5 degrees C 40 degrees F.

3.1.3.2 Soldered Copper Tubing

Ream pipe and remove burrs. Clean and polish contact surfaces of joint. Flux both male and female ends. Insert end of tube into fittings full depth of socket. After soldering, a solder bead shall show continuously around entire joint circumference. Remove excess acid flux from tubings and fittings.

3.1.3.3 Threaded Brass or Galvanized Steel Pipe

Prior to installation ream pipe. Cut threads as specified in ASME B1.2. Make joints with pipe joint compound applied to male end only.

3.1.3.4 Polyethylene (PE) Pipe and Drip Tubing

Bury [drip tubing] [and] [PE pipe] 300 mm 12 inches deep. [Solvent weld] [compression connection] [barbed connection] in accordance with manufacturers recommendation. Install hose in serpentine manner. When cutting hose, use a shearing tool such as a pipe cutter, knife or shears. Use only manufacturer's recommended tool and procedure when installing drip heads.

3.1.3.5 Dielectric Protection

Where pipes of dissimilar metal are joined, make connection with dielectric fitting.

3.1.4 Irrigation Heads

Install plumb and level with terrain. Irrigation heads must not spray directly on or within 1 meter 3-feet of building.

3.1.4.1 Fixed Riser Irrigation Heads

**************************************************************************
NOTE: Fixed risers allowed in planter beds only.
**************************************************************************
Nozzle mounted on fixed riser minimum 150 mm 6 inches above grade in mulched planter beds, 300 mm 12 inches above grade in planter beds with groundcover. Provide swing joint assembly attachment between lateral lines and fixed risers.

3.1.4.2 Pop-Up Irrigation Head

**************************************************************************
NOTE: Pop-ups required along all pedestrian and vehicular and turf edges. Pop-ups required in all turf areas.
**************************************************************************
Install plumb and level with terrain. Provide swing joint assembly attachment between lateral line and pop-up body. Top of irrigation head shall be flush with surrounding finish grade. [ In recreational fields, install all pop-up rotors with stainless steel risers 125 mm 5 inches below finish grade per manufacturer's recommendations.]
3.1.4.3 Drip Heads

**************************************************************************
NOTE: Actual water emission points of drip irrigation system installed above soil surface accomplishes two objectives. It aids visual checking of system for proper operation and it reduces system clogging that can be caused by root intrusion.
**************************************************************************

Install drip heads [in plastic drip box]. Connect drip head to a [rigid PVC nipple] [drip head stake] [directly to tubing]. Attach tubing to barbed fitting and daylight distribution tubing at rootball secured with stake. Add bug cap at end of secured distribution tubing. After installing drip heads and before operating system, open end of drop lateral and flush lines clean. The number of drip heads on a line shall not exceed manufacturer's recommendations for that hose or distribution tubing size and length.

3.1.5 Valves

3.1.5.1 Isolation Valves

Install in a valve box extending from grade to below valve body, with a minimum of 100 mm 4 inches cover measured from finish grade to top of valve stem.

3.1.5.2 Control Valves

Plumb valve in a valve box extending from grade to below valve body, with minimum of 100 mm 4 inch cover measured from grade to top of valve. Install automatic valves beside sprinkler heads with a valve box.

3.1.5.3 Quick Coupling Valves

[Install in a valve box extending from grade to below valve body, with a minimum of 100 mm 4 inches cover measured from finish grade to top of valve stem.][Install 50 mm 2 inches above finish grade in planter bed, level with finish grade in turf areas.]

3.1.5.4 Hose Bibb

Install [above grade] [below grade in valve box] with support.

3.1.5.5 Drain Valves

Entire system shall be manually or automatically drainable. Equip low point of each underground line with drain valve draining into an excavation containing gravel. Cover gravel with building paper. Backfill with excavated material and 150 mm 6 inches of topsoil.

3.1.6 Backflow Preventers

a. Install backflow preventer in new connection to existing water distribution system, between connection and control valves. Install with concrete pads. [Install with concrete pads in turf only.]

b. Flush pipe lines prior to installing device.
c. Device shall not be installed in pits or where any part of the device could become submerged in standing water.

d. Install device a minimum of 300 mm 12 inches from trees, walls, fences, structures and other obstructions.

3.1.6.1 Reduced Pressure Backflow Preventer

a. Protect device by a strainer located upstream.

b. Install device a minimum of 300 mm 12 inches between finish grade and bottom of relief port.

[c. Where freezing conditions occur, locate device inside a building and pipe the relief valve port through an air gap to a drain.

]d. Install water meter above grade, upstream of unit of unit as a part of assembly. Provide galvanized steel support with concrete footing.

3.1.6.2 Pressure Vacuum Breaker

**********************************************************************************************************************************************
NOTE: Install device in an accessible location to facilitate inspection and servicing. The device can be installed on a main line to irrigation system upstream of shut-off valves (valves may be located downstream from device).
**********************************************************************************************************************************************
a. Install device a minimum of 300 mm 12 inches between highest irrigation head and bottom of air relief valve.

[ b. Where freezing conditions occur, locate device inside a building and pipe the relief valve port through an air gap to a drain.

]3.1.6.3 Atmospheric Vacuum Breaker

Install device minimum of 300 mm 12 inches between highest irrigation head and bottom of relief valve located downstream of irrigation control valve.

3.1.7 Accessories

3.1.7.1 Connection To Existing Water Supply Systems (Tapping Tee)

Use tapping or drilling machine valve and mechanical joint type sleeves for connections to be made under pressure. Bolt sleeves around mains; bolt valve conforming to AWWA C500 to the branch. Open valve, attach drilling machine, make tap, close valve, and remove drilling machine, without interruption of service. Notify Contracting Officer in writing at least 15 days prior to the date the connections are required; receive approval before any service is interrupted. Provide materials required to make connections into the existing water supply systems and perform excavating, backfilling, and other incidental labor as required. Furnish the labor and the tapping or drilling machine for making the actual connections to the existing systems.
3.1.7.2 Water Meter

Install meter upstream of backflow preventer per manufacturer's recommendations and local PWC Utility Department Instructions. [Plumb meter in a valve box extending from grade to below meter body, with a minimum of 100 mm 4 inch cover measured from top of grade to top of meter.]

3.1.7.3 Valve Boxes and Lids

a. Install with [0.0283] [_____] cubic meters [one] [_____] cu ft pea gravel sump below valve.

b. Support valve box with [brick] [concrete block] [______].

c. Provide wire screen between gravel sump and bottom of valve body for rodent protection.

d. For turf areas, install flush with finish grade.

e. For planter beds, install 50 mm 2 inches above finish grade.

f. For sloped conditions, install valve box level with terrain.

3.1.7.4 Backflow Preventer Enclosure

a. Install with concrete pad.

b. Place hinges so direction of swing will not conflict with other site features.

3.1.7.5 Rain [and] [Freeze] Shut-Off Device[s]

a. Install as per manufacturer's recommendations.

b. For wall mounted controllers, attach device[s] to side of building or eave, minimum 2400 mm 8 feet above finish grade and a minimum of 300 mm 12 inches from building wall or eave.

c. For pedestal mounted controllers, mount [to side of controller housing] [on top of minimum [1050] [_____] mm [42] [_____] inches high pole outside of irrigation coverage in vandal-resistant enclosure].

3.1.7.6 Soil Moisture Sensing Device

a. Bury the device at depth per manufacturer's recommendation in the effective root zone of hydrozone to be monitored.

b. Place a sensor-protection [plate] [indicator] [valve box with cover] above the device.

c. Provide waterproof connection to all field splices in valve boxes.

3.1.7.7 Air/Vacuum Relief Valve

**************************************************************************
NOTE: Provide air relief/vacuum valve at highest point of all pressurized mainline systems. For drip systems, locate at highest point on drip lateral.
**************************************************************************
Locate at highest point in piping system.

3.1.8 Electrical Circuits

Bury wires beside mainline pipe in same trench. Provide gray electrical conduit where wires run under paved or non-paved pedestrian paths and vehicular roads. Tag wires at controller and control valve location with plastic tie wrapped tags. Provide one control wire to each control valve location and one common wire looped from controller to each control valve. Provide one separate control valve wire of a different color from controller to each control valve cluster.

3.1.8.1 Loops

Provide a 300 mm 12 inch loop of wire at each valve where controls are connected.

3.1.8.2 Expansion and Contraction

Bundle multiple tubes or wires and tape together at [3] [6] m [10] [20] foot intervals with 300 mm 12 inch loop for expansion and contraction.

3.1.8.3 Splices

Make electrical splices waterproof. Locate all field electrical splices in valve boxes.

3.1.9 Automatic Controller

Determine exact location of controllers in field before installation. Coordinate the electrical service to these locations. Install in accordance with manufacturer's recommendations and NFPA 70.

3.1.10 Flushing

After piping, risers, and valves are in place and connected, but prior to installation of sprinkler heads and valves, flush piping system under a full head of water. Maintain flushing for 3 minutes.

3.1.11 Adjustment

After grading, plant installation, and rolling of planted areas, adjust sprinkler heads flush with finished grade. Make adjustments by providing new nipples of proper length or by use of heads having an approved device, integral with head, which will permit adjustment in height of head without changing piping.

3.1.12 Sterilization

Sprinkler system fed from a potable water system shall be sterilized upstream of backflow preventer in accordance with AWWA C651. Sterilize new waterlines for a minimum of 24-hours, to meet [local], [state], [federal], health test requirements before placing in service. Minimum retention period shall be 3 hours.

3.2 FIELD QUALITY CONTROL

The Contractor will conduct and the Contracting Officer and the QC
representative will witness field inspections and field tests specified in this section. Perform field tests, and provide labor, equipment, and incidentals required for testing.

3.2.1 Pressure Test

3.2.1.1 Duration

During pressure test, maintain a hydrostatic pressure of 1034 kPa 150 psi without pumping for a period of one hour with an allowable pressure drop of 35 kPa 5 psi before backfilling system.

3.2.1.2 Leaks

Correct leaks. Make necessary corrections to stop leakage.

3.2.1.3 Retest

Retest system twice until pressure can be maintained for duration of test.

3.2.2 Operation Test

3.2.2.1 Accessories

At conclusion of pressure test, install irrigation heads or drip heads, quick coupling assemblies, and hose bib, and test entire system for operation under normal operating pressure. Make necessary corrections or adjustments to raise or lower pressure for each system if tests results do not match pressure requirements.

3.2.2.2 Acceptance

Operation test is acceptable if system operates through at least one complete cycle for areas to be irrigated.

3.2.3 Controller Charts

Provide one chart for each controller supplied. Indicate in chart area controlled by automatic controller. The chart is a reduction of the actual plan[s] that will fit the maximum dimensions inside controller housing. Use black line print for chart and a different pastel or transparent color to indicate each station area of coverage. After chart is completed and approved for final acceptance, seal chart between two 0.5 mm 20 mil pieces of clear plastic.

NOTE: This guide specification covers the requirements for seeding.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The following information must be shown on the project drawings:

1. Clearly indicate all areas to be turfed and if more than one type of turf is specified, delineate areas for each type.

2. All draft turf specifications must be submitted to the cognizant Landscape Architect/Natural Resources Specialist for review to ensure that the specifications are in accordance with environmental conditions peculiar to the project areas.
PART 1 GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM C602 (2020) Agricultural Liming Materials

U.S. DEPARTMENT OF AGRICULTURE (USDA)

AMS Seed Act (1940; R 1988; R 1998) Federal Seed Act

1.2 DEFINITIONS

1.2.1 Stand of [Turf][_____

95 percent ground cover of the established species.

1.3 RELATED REQUIREMENTS

[Section 31 00 00 EARTHWORK,] [Section 32 84 24 IRRIGATION SPRINKLER SYSTEMS,] [Section 32 96 00 TRANSPLANTING EXTERIOR PLANTS,] [Section 32 92 23 SODDING,] [Section 32 92 26 SPRIGGING,] [Section 32 93 00 EXTERIOR PLANTS,] and Section 32 05 33 LANDSCAPE ESTABLISHMENT applies to this

SECTION 32 92 19 Page 4
section for pesticide use and plant establishment requirements, with additions and modifications herein.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Wood Cellulose Fiber Mulch

Fertilizer

Include physical characteristics, and recommendations.

SD-06 Test Reports
NOTE: In states that require certification, adjust testing requirements to suit local conditions.

Topsoil Composition Tests (reports and recommendations).

SD-07 Certificates

State Certification and Approval for Seed

[ SD-08 Manufacturer's Instructions

Erosion Control Materials

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery

1.5.1.1 Seed Protection

Protect from drying out and from contamination during delivery, on-site storage, and handling.

1.5.1.2 [Fertilizer] [Gypsum] [Sulfur] [Iron] [and] [Lime] Delivery

Deliver to the site in original, unopened containers bearing manufacturer's chemical analysis, name, trade name, trademark, and indication of conformance to state and federal laws. Instead of containers, [fertilizer] [gypsum] [sulfur] [iron] [and] [lime] may be furnished in bulk with certificate indicating the above information.

1.5.2 Storage

1.5.2.1 Seed, [Fertilizer] [Gypsum] [Sulfur] [Iron] [and] [Lime] Storage

Store in cool, dry locations away from contaminants.

1.5.2.2 Topsoil

Prior to stockpiling topsoil, treat growing vegetation with application of appropriate specified non-selective herbicide. Clear and grub existing vegetation three to four weeks prior to stockpiling topsoil.

1.5.2.3 Handling

Do not drop or dump materials from vehicles.

1.6 TIME RESTRICTIONS AND PLANTING CONDITIONS

NOTE: Check with the local Agriculture County Extension Service to determine proper planting seasons for specie specified, for the optimum cover depth, and for the proper rate of application for sowing and drilling seed as this rate varies with the specie of seed used and local conditions. Allow for planting period in the construction completion time. Delete time restrictions for continuous
1.6.1  Restrictions

Do not plant when the ground is [frozen,] [snow covered,] muddy, or when air temperature exceeds [32] [_____] degrees Celsius [90] [_____] degrees Fahrenheit.

1.7  TIME LIMITATIONS

1.7.1  Seed

Apply seed within twenty four hours after seed bed preparation.

PART 2   PRODUCTS

2.1  SEED

******************************************************************************
NOTE: The specific species and varieties used should be based on recommendations of the local Agriculture County Extension Service Office.
******************************************************************************

2.1.1  Classification

Provide [State-certified] [State-approved] [Endophyte-enhanced] seed of the latest season's crop delivered in original sealed packages, bearing producer's guaranteed analysis for percentages of mixtures, purity, germination, weedseed content, and inert material. Label in conformance with AMS Seed Act and applicable state seed laws. Wet, moldy, or otherwise damaged seed will be rejected. Field mixes will be acceptable when field mix is performed on site in the presence of the [Contracting Officer] [______].

2.1.2  Planting Dates

<table>
<thead>
<tr>

</table>

Proportion seed mixtures by weight. Temporary seeding must later be replaced by [Season 1][Season 2] plantings for a permanent stand of grass. The same requirements of turf establishment for [Season 1][Season 2] apply for temporary seeding.

2.2 TOPSOIL

****************************************************************************

NOTE: If topsoil properties are included in another section of Division 31, delete this paragraph and include a cross-reference to the appropriate section. Otherwise, select appropriate paragraphs on topsoil. Check with the local Agriculture County Extension Service Office for soil properties appropriate for the plant materials to be planted. Where suitable topsoil is available within limits of the work area, stripping and stockpiling of topsoil should be included in the applicable section of Division 31 of the specification. If suitable topsoil is not available within the limits of the work area, it should generally be the Contractor's option to either treat the soil of the graded areas with fertilizer and supplements so as to be conducive to turf establishment and maintenance, or to transport topsoil to the project site. Modify pH range for specified turf and geographical requirements.

**************************************************************************

2.2.1 On-Site Topsoil

Surface soil stripped and stockpiled on site and modified as necessary to meet the requirements specified for topsoil in paragraph COMPOSITION. When available topsoil must be existing surface soil stripped and stockpiled on-site in accordance with Section [31 00 00 EARTHWORK][31 23 00.00 20 EXCAVATION AND FILL].
2.2.2 Off-Site Topsoil

Conform to requirements specified in paragraph COMPOSITION. Additional topsoil must be [furnished by the Contractor] [obtained from topsoil borrow areas indicated].

2.2.3 Composition

Containing from 5 to 10 percent organic matter as determined by the topsoil composition tests of the Organic Carbon, 6A, Chemical Analysis Method described in DOA SSIR 42. Maximum particle size, 19 mm 3/4 inch, with maximum 3 percent retained on 6 mm 1/4 inch screen. The pH must be tested in accordance with ASTM D4972. Topsoil must be free of sticks, stones, roots, and other debris and objectionable materials. Other components must conform to the following limits:

<table>
<thead>
<tr>
<th>Component</th>
<th>Limit</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silt</td>

</tr>
</tbody>
</table>

2.3 SOIL CONDITIONERS

******************************************************************************
NOTE: Prior to including these provisions in project specifications, perform tests of on-site topsoil to determine its suitability and the possible need of pH adjusters or soil conditioners. Delete these requirements in developed areas and on small projects where planting is minimal.
******************************************************************************

Add conditioners to topsoil as required to bring into compliance with "composition" standard for topsoil as specified herein.

2.3.1 Lime

******************************************************************************
NOTE: Use ASTM C602 calcium carbonate equivalent (C.C.E.) as specified in Table 1: for burnt lime, C.C.E. must not be less than 140 percent; for hydrated lime, C.C.E. must not be less than 110 percent; and for limestone, C.C.E. must not be less than 80 percent.
******************************************************************************

Commercial grade [hydrate] [or] [burnt] limestone containing a calcium carbonate equivalent (C.C.E.) as specified in ASTM C602 of not less than [_____] percent.

2.3.2 Aluminum Sulfate

Commercial grade.
2.3.3 Sulfur

100 percent elemental

2.3.4 Iron

100 percent elemental

2.3.5 Peat

Natural product of [peat moss] derived from a freshwater site and conforming to [ASTM D4427] [as modified herein]. Shred and granulate peat to pass a 12.5 mm 1/2 inch mesh screen and condition in storage pile for minimum 6 months after excavation.

2.3.6 Sand

Clean and free of materials harmful to plants.

2.3.7 Perlite

Horticultural grade.

2.3.8 Composted Derivatives

Ground bark, nitrolized sawdust, humus or other green wood waste material free of stones, sticks, and soil stabilized with nitrogen and having the following properties:

2.3.8.1 Particle Size

Minimum percent by weight passing:

<table>
<thead>
<tr>
<th>Particle Size</th>
<th>Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.75 mm No. 4 mesh screen</td>
<td>95</td>
</tr>
<tr>
<td>2.36 mm No. 8 mesh screen</td>
<td>80</td>
</tr>
</tbody>
</table>

2.3.8.2 Nitrogen Content

Minimum percent based on dry weight:

<table>
<thead>
<tr>
<th>Material</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fir Sawdust</td>
<td>0.7</td>
</tr>
<tr>
<td>Fir or Pine Bark</td>
<td>1.0</td>
</tr>
</tbody>
</table>

2.3.9 Gypsum

Coarsely ground gypsum comprised of calcium sulfate dihydrate 80 percent, calcium 18 percent, sulfur 14 percent; minimum 96 percent passing through 850 micrometers 20 mesh screen, 100 percent passing thru 970 micrometers 16 mesh screen.

2.3.10 Calcined Clay

Calcined clay must be granular particles produced from montmorillonite clay calcined to a minimum temperature of 650 degrees C 1200 degrees F. Gradation: A minimum 90 percent must pass a 2.36 mm No. 8 sieve; a minimum 99 percent must be retained on a 0.250 mm No. 60 sieve; and material passing a 0.150 mm No. 100 sieve must not exceed 2 percent. Bulk density: A maximum 640 kilogram per cubic meter 40 pounds per cubic foot.
2.4  **FERTILIZER**

**************************************************************************
NOTE: Check with the local Agriculture County Extension Service Office for recommended fertilizer mixture for local conditions.
**************************************************************************

2.4.1  Granular Fertilizer

[Organic][synthetic], granular controlled release fertilizer containing the following minimum percentages, by weight, of plant food nutrients:

[_____] percent available nitrogen
[_____] percent available phosphorus
[_____] percent available potassium
[_____] percent sulfur
[  [_____] percent iron

]2.4.2  Hydroseeding Fertilizer

Controlled release fertilizer, to use with hydroseeding and composed of pills coated with plastic resin to provide a continuous release of nutrients for at least 6 months and containing the following minimum percentages, by weight, of plant food nutrients.

[_____] percent available nitrogen
[_____] percent available phosphorus
[_____] percent available potassium
[  [_____] percent sulfur
][  [_____] percent iron

]2.5  **MULCH**

**************************************************************************
NOTE: Check with the local Agriculture County Extension Service Office to determine choice of mulch most suitable for the project area. Specify only one type of mulch.
**************************************************************************

Mulch must be free from noxious weeds, mold, and other deleterious materials.

2.5.1  Straw

Stalks from oats, wheat, rye, barley, or rice. Furnish in air-dry condition and of proper consistency for placing with commercial mulch blowing equipment. Straw must contain no fertile seed.

2.5.2  Hay

Air-dry condition and of proper consistency for placing with commercial mulch blowing equipment. Hay must be sterile, containing no fertile seed.

2.5.3  Wood Cellulose Fiber Mulch
NOTE: Wood cellulose fiber mulches have been successful on level areas or on slopes with slight grades where sufficient moisture is present to obtain a quick germination of grass seed. The material should be hydraulically applied at the following rates: Areas up to and including 3 to 1 slopes, at the rate of 1,120 kg per 10,000 sq. m; areas steeper than 3 to 1 at the rate of 1,568 kg per 10,000 sq. m. It should not be specified for slopes 2 to 1 or greater in areas where drought may prevent germination of the seed or where runoff from heavy rains may cut gullies through the fiber mulch. In these areas use erosion control materials such as specified in paragraph EROSION CONTROL MATERIAL.

**************************************************************************

NOTE: Hydraulic mulch is an EPA designated product for recycled content. Recycled content percentages listed are recommended by EPA; additional information can be found on the EPA's "Comprehensive Procurement Guidelines (CPG)" page within EPA's website at http://www.epa.gov.

**************************************************************************

Use recovered materials of either paper-based (100 percent post-consumer content) or wood-based (100 percent total recovered content) hydraulic mulch. Processed to contain no growth or germination-inhibiting factors and dyed an appropriate color to facilitate visual metering of materials application. Composition on air-dry weight basis: 9 to 15 percent moisture, pH range from 5.5 to 8.2. Use with hydraulic application of grass seed and fertilizer.

2.6 WATER

**************************************************************************

NOTE: When water is Government furnished, locate the source. Recycled or reclaimed irrigation water may be available through a tertiary treatment plant on or off site. It is preferred that this type of water be used for irrigation whenever possible. Check project specific conditions.

Unless otherwise directed, water is the responsibility of the Contractor. Water source must be potable or non-potable. If non-potable edit specification accordingly. Source of water must be approved by the Contracting Officer and must be of suitable quality for irrigation, containing no elements toxic to plant life.

Coordinate information presented here with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.

**************************************************************************

Source of water must be approved by Contracting Officer and of suitable quality for irrigation, containing no elements toxic to plant life.
2.7 EROSION CONTROL MATERIALS

================================================================================
NOTE: The Contractor may propose other types of erosion control material, based on site conditions.================================================================================

Erosion control material must conform to the following:

2.7.1 Erosion Control Blanket

[100 percent agricultural straw][70 percent agricultural straw/30 percent coconut fiber matrix] stitched with a degradable nettings, designed to degrade within [12 months][18 months].

2.7.2 Erosion Control Fabric

Fabric must be knitted construction of polypropylene yarn with uniform mesh openings 19 to 25 mm 3/4 to 1 inch square with strips of biodegradable paper. Filler paper strips must have a minimum life of 6 months.

2.7.3 Erosion Control Net

Net must be heavy, twisted jute mesh, weighing approximately 605 grams per meter 1.22 pounds per linear yard and 1200 mm 4 feet wide with mesh openings of approximately 25 mm one inch square.

2.7.4 Hydrophilic Colloids

Hydrophilic colloids must be physiologically harmless to plant and animal life without phytotoxic agents. Colloids must be naturally occurring, silicate powder based, and must form a water insoluble membrane after curing. Colloids must resist mold growth.

2.7.5 Erosion Control Material Anchors

Erosion control anchors must be as recommended by the manufacturer.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 EXTENT OF WORK

Provide soil preparation prior to planting (including soil conditioners as required), fertilizing, seeding, and surface topdressing of all newly graded finished earth surfaces, unless indicated otherwise, and at all areas inside or outside the limits of construction that are disturbed by the Contractor's operations.

3.1.1.1 Topsoil

Provide 102 mm 4 inches of [off-site topsoil][on-site topsoil][existing soil] to meet indicated finish grade. After areas have been brought to indicated finish grade, incorporate [fertilizer] [pH adjusters] [soil conditioners] into soil a minimum depth of [100] [_____] mm [4] [_____] inches by diskng, harrowing, tilling or other method approved by the Contracting Officer. Remove debris and stones larger than 19 mm 3/4 inch.
in any dimension remaining on the surface after finish grading. Correct irregularities in finish surfaces to eliminate depressions. Protect finished topsoil areas from damage by vehicular or pedestrian traffic.

[3.1.1.2 Soil Conditioner Application Rates

**************************************************************************

NOTE: Check with the local Agriculture County Extension Service and specify amounts applicable for the project area.
**************************************************************************

Apply soil conditioners at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

[ Lime [ [_____] kg per square meter [_____] pounds per acre] [ [_____] kg per 100 square meters [_____] pounds per 1000 square feet.]

][ Sulfur [ [_____] kg per square meter [_____] pounds per acre] [ [_____] kg per 100 square meters [_____] pounds per 1000 square feet.]

][ Iron [ [_____] kg per square meter [_____] pounds per acre] [ [_____] kg per 100 square meters [_____] pounds per 1000 square feet.]

][ Aluminum Sulfate [ [_____] kg per square meter [_____] pounds per acre] [ [_____] kg per 100 square meters [_____] pounds per 1000 square feet.]

][ Peat [ [_____] cubic meters per square meter [_____] cubic yard per acre] [ [_____] cubic meters per 100 square meters [_____] cubic yards per 1000 square feet.]

][ Sand [ [_____] cubic meters per square meter [_____] cubic yard per acre] [ [_____] cubic meters per 100 square meters [_____] cubic yards per 1000 square feet.]

][ Perlite [ [_____] cubic meters per square meter [_____] cubic yard per acre] [ [_____] cubic meters per 100 square meters [_____] cubic yards per 1000 square feet.]

][ Compost Derivatives [ [_____] cubic meters per square meter [_____] cubic yard per acre] [ [_____] cubic meters per 100 square meters [_____] cubic yards per 1000 square feet.]

][ Calcined Clay [ [_____] cubic meters per square meter [_____] cubic yard per acre] [ [_____] cubic meters per 100 square meters [_____] cubic yards per 1000 square feet.]

][ Gypsum [ [_____] cubic meters per square meter [_____] cubic yard per acre] [ [_____] cubic meters per 100 square meters [_____] cubic yards per 1000 square feet.]

][3.1.1.3 Fertilizer Application Rates

**************************************************************************

NOTE: Check with the local Agriculture County Extension Service and specify amounts applicable for the project area. Two fertilizer applications may be required when hydrosedding with wood fiber mulch.
Apply fertilizer at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

- **Organic Granular Fertilizer**
  - [_____] kg per square meter [_____] pounds per acre
  - [_____] kg per 100 square meters [_____] pounds per 1000 square feet.

- **Synthetic Fertilizer**
  - [_____] kg per square meter [_____] pounds per acre
  - [_____] kg per 100 square meters [_____] pounds per 1000 square feet.

- **Hydroseeding Fertilizer**
  - [_____] kg per square meter [_____] pounds per acre
  - [_____] kg per 100 square meters [_____] pounds per 1000 square feet.

### 3.2 SEEDING

#### 3.2.1 Seed Application Seasons and Conditions

**NOTE:** Check with the local Agriculture County Extension Service to determine proper planting seasons for species specified, for the optimum cover depth, and for the proper rate of application for sowing and drilling seed as this rate varies with the species of seed used and local conditions. Allow for planting period in the construction completion time. Delete time restrictions for continuous growing conditions.

**NOTE:** Delete the last two lines of this paragraph when hydroseeding is selected as the only seed application method.

Immediately before seeding, restore soil to proper grade. Do not seed when ground is muddy [frozen] [snow covered] or in an unsatisfactory condition for seeding. If special conditions exist that may warrant a variance in the above seeding dates or conditions, submit a written request to the Contracting Officer stating the special conditions and proposed variance. Apply seed within twenty four hours after seedbed preparation. Sow seed by approved sowing equipment. Sow one-half the seed in one direction, and sow remainder at right angles to the first sowing.

#### 3.2.2 Seed Application Method

Seeding method must be [broadcasted and drop seeding][drill seeding][hydroseeding].

##### 3.2.2.1 Broadcast and Drop Seeding

Seed must be uniformly broadcast at the rate of [_____] kilograms per hectare pounds per 1000 square feet. Use broadcast or drop seeders. Sow one-half the seed in one direction, and sow remainder at right angles to
the first sowing. Cover seed uniformly to a maximum depth of [6] mm 1/4 inch in clay soils and [13] mm 1/2 inch in sandy soils by means of spike-tooth harrow, cultipacker, raking or other approved devices.

][3.2.2.2 Drill Seeding

**************************************************************************
NOTE: Check with the local Agriculture County Extension Service to determine proper planting seasons for specie specified, for the optimum cover depth, and for the proper rate of application for sowing and drilling seed as this rate varies with the specie of seed used and local conditions. Allow for planting period in the construction completion time. Delete time restrictions for continuous growing conditions.
**************************************************************************

Seed must be drilled at the rate of [_____] kilograms per hectare pounds per 1000 square feet. Use [cultipacker seeders] [grass seed drills]. Drill seed uniformly to average depth of [13] mm 1/2 inch.

][3.2.2.3 Hydroseeding

**************************************************************************
NOTE: Check with the local Agriculture County Extension Service to determine rate of application. This rate will vary due to site requirements for fertilizer, mulch material, and rates of seeding.
**************************************************************************

First, mix water and fiber. Wood cellulose fiber, paper fiber, or recycled paper must be applied as part of the hydrotech seeding operation. Fiber must be added at 11.2 kg per 100 square meter 1,000 pounds, dry weight, per acre. Then add and mix seed and fertilizer to produce a homogeneous slurry. Seed must be mixed to ensure broadcasting at the rate of [_____] kilograms per hectare pounds per 1000 square feet. When hydraulically sprayed on the ground, material must form a blotter like cover impregnated uniformly with grass seed. Spread with one application with no second application of mulch.

][3.2.3 Mulching

[3.2.3.1 Hay or Straw Mulch

Hay or straw mulch must be spread uniformly at the rate of 0.75 metric tons per hectare 2 tons per acre. Mulch must be spread by hand, blower-type mulch spreader, or other approved method. Mulching must be started on the windward side of relatively flat areas or on the upper part of steep slopes, and continued uniformly until the area is covered. The mulch must not be bunched or clumped. Sunlight must not be completely excluded from penetrating to the ground surface. All areas installed with seed must be mulched on the same day as the seeding. Mulch must be anchored immediately following spreading.
3.2.3.2 Mechanical Anchor

Mechanical anchor must be a V-type-wheel land packer; a scalloped-disk land packer designed to force mulch into the soil surface; or other suitable equipment.

3.2.3.3 Asphalt Adhesive Tackifier

Asphalt adhesive tackifier must be sprayed at a rate between 666 to 866 liters per hectare 10 to 13 gallons per 1000 square feet. Sunlight must not be completely excluded from penetrating to the ground surface.

3.2.3.4 Non-Asphaltic Tackifier

Hydrophilic colloid must be applied at the rate recommended by the manufacturer, using hydraulic equipment suitable for thoroughly mixing with water. A uniform mixture must be applied over the area.

3.2.3.5 Asphalt Adhesive Coated Mulch

Hay or straw mulch may be spread simultaneously with asphalt adhesive applied at a rate between 666 to 866 liters per hectare 10 to 13 gallons per 1000 square feet, using power mulch equipment which must be equipped with suitable asphalt pump and nozzle. The adhesive-coated mulch must be applied evenly over the surface. Sunlight must not be completely excluded from penetrating to the ground surface.

3.2.4 Rolling

************************************************************************************************************************
NOTE: Normally the roller weight should not exceed 134 kg per m 90 pounds per foot of roller width.
Light rolling is needed on newly seeded and sprigged areas to firm the seed or sprigs into contact with the soil for optimum germination and growth. However, excessive soil compaction beyond this firming action will reduce the desirable percentages of air and water spaces in good growing topsoil.
************************************************************************************************************************

Immediately after seeding, firm entire area except for slopes in excess of 3 to 1 with a roller not exceeding [134] [_____] kg per m [90] [_____] pounds for each foot of roller width.[ If seeding is performed with cultipacker-type seeder or by hydoseeding, rolling may be eliminated.]

3.2.5 Erosion Control Material

************************************************************************************************************************
NOTE: Specify erosion control where water concentrates and flows across areas at velocities which create an erosion hazard. Allow Contractor option for type of erosion control material, unless project specific requirements dictate otherwise.
************************************************************************************************************************

Install in accordance with manufacturer's instructions, where indicated or as directed by the Contracting Officer.
3.2.6 Watering

Start watering areas seeded as required by temperature and wind conditions. Apply water at a rate sufficient to insure thorough wetting of soil to a depth of [50] [_____] mm [2] [_____] inches without run off. During the germination process, seed is to be kept actively growing and not allowed to dry out.

3.3 PROTECTION OF TURF AREAS

Immediately after turfing, protect area against traffic and other use.

3.4 RENOVATION OF EXISTING TURF AREA

3.4.1 Aeration

Upon completion of weed eradication operations and Contracting Officer's approval to proceed, aerate turf areas indicated, by approved device. Core, by pulling soil plugs, to a minimum depth of [_____] mm [_____] inches. Leave all soil plugs, that are produced, in the turf area. Remove all debris generated during this operation off site. After aeration operations are complete, topdress entire area [6.35 mm/1/4 inch] [12.70 mm 1/2 inch] depth with the following mixture:

[ [_____] percent sand ]
[ [_____] percent humus ]
[ [_____] percent gypsum ]
[ [_____] percent organic fertilizer ]
[ [_____] percent synthetic fertilizer ]

Blend all parts of topdressing mixture to a uniform consistency throughout. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean all soil plugs off of other paving when work is complete.

3.4.2 Vertical Mowing

Upon completion of aerating operation and Contracting Officer's approval to proceed, vertical mow turf areas indicated, by approved device, to a depth of [6 mm/1/4 inch] [13 mm/1/2 inch] above existing soil level, to reduce thatch build-up, grain, and surface compaction. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean other paving when work is complete. Remove all debris generated during this operation off site.

3.4.3 Dethatching

Upon completion of aerating operation and Contracting Officer's approval to proceed, dethatch turf areas indicated, by approved device, to a depth of [6 mm/1/4 inch] [13 mm/1/2 inch] below existing soil level, to reduce thatch build-up, grain, and surface compaction. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean other paving when work is complete. Remove all debris generated during this operation off site.
3.4.4 Overseeding

**************************************************************************
NOTE: Drill seeding is the most viable method of overseeding when significant vegetation remains. Existing vegetative cover (live or dead) may prevent desired soil contact when seeded by other methods.
**************************************************************************

Apply seed in accordance with and at rates indicated in applicable portions of paragraph SEED APPLICATION METHOD.

3.5 RESTORATION

Restore to original condition existing turf areas which have been damaged during turf installation operations at the Contractor's expense. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean other paving when work in adjacent areas is complete.

NOTE: This guide specification covers the requirements for sod.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The following information shall be shown on the project drawings:

1. Clearly indicate all areas to be sodded and if more than one type of sod is specified, delineate areas for each type.

2. All draft sod specifications shall be submitted to the cognizant Landscape Architect/Natural Resources Specialist for review to ensure that the specifications are in accordance with environmental conditions peculiar to the project areas.
PART 1   GENERAL

1.1   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM C602 (2020) Agricultural Liming Materials

TURFGRASS PRODUCERS INTERNATIONAL (TPI)

TPI GSS (1995) Guideline Specifications to Turfgrass Sodding

U.S. DEPARTMENT OF AGRICULTURE (USDA)

1.2   DEFINITIONS

1.2.1   Stand of Turf

100 percent ground cover of the established species.

1.3   RELATED REQUIREMENTS

[Section 31 00 00 EARTHWORK], [Section 32 84 24 IRRIGATION SPRINKLER]
SYSTEMS], [Section 32 96 00 TRANSPLANTING EXTERIOR PLANTS], [Section 32 92 19 SEEDING], [Section 32 92 26 SPRIGGING], [Section 32 93 00 EXTERIOR PLANTS], and Section 32 05 33 LANDSCAPE ESTABLISHMENT applies to this section for pesticide use and plant establishment requirements, with additions and modifications herein.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Fertilizer

Include physical characteristics, and recommendations.

SD-06 Test Reports

SECTION 32 92 23 Page 5
Topsoil composition tests (reports and recommendations).

SD-07 Certificates

[Nursery] [Sod farm] certification for sods. Indicate type of sod in accordance with TPI GSS.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery

1.5.1.1 Sod Protection

NOTE: If sod is to be delivered in quantity over considerable distance, specify trucking in vans equipped with temperature control.

Protect from drying out and from contamination during delivery, on-site storage, and handling.

1.5.1.2 [Fertilizer] [Gypsum] [Sulfur] [Iron] [and] [Lime] Delivery

Deliver to the site in original, unopened containers bearing manufacturer's chemical analysis, name, trade name, trademark, and indication of conformance to state and federal laws. Instead of containers, [fertilizer] [gypsum] [sulfur] [iron] [and] [lime] may be furnished in bulk with certificate indicating the above information.

1.5.2 Storage

1.5.2.1 Sod Storage

Lightly sprinkle with water, cover with moist burlap, straw, or other approved covering; and protect from exposure to wind and direct sunlight until planted. Provide covering that will allow air to circulate so that internal heat will not develop. Do not store sod longer than 24 hours. Do not store directly on concrete or bituminous surfaces.

1.5.2.2 Topsoil

Prior to stockpiling topsoil, treat growing vegetation with application of appropriate specified non-selective herbicide. Clear and grub existing vegetation three to four weeks prior to stockpiling topsoil.

1.5.2.3 Handling

Do not drop or dump materials from vehicles.

1.6 TIME RESTRICTIONS AND PLANTING CONDITIONS
NOTE: Check with the local Agriculture County Extension Service to determine proper planting seasons for species specified.

1.6.1 Restrictions

Do not plant when the ground is [frozen,] [snow covered,] muddy, or when air temperature exceeds [32] [_____] degrees Celsius [90] [_____] degrees Fahrenheit.

1.7 TIME LIMITATIONS

1.7.1 Sod

Place sod a maximum of thirty six hours after initial harvesting, in accordance with TPI GSS as modified herein.

PART 2 PRODUCTS

2.1 SODS

NOTE: The specific species and varieties used should be based on recommendations of the local Agriculture County Extension Service Office. Modify sod thickness as required for species specified. State certified is usually more stringently monitored than State approved, and therefore more expensive.

2.1.1 Classification

Nursery grown, certified as classified in the TPI GSS. Machine cut sod at a uniform thickness of 19 mm 3/4 inch within a tolerance of 6 mm 1/4 inch, excluding top growth and thatch. Each individual sod piece shall be strong enough to support its own weight when lifted by the ends. Broken pads, irregularly shaped pieces, and torn or uneven ends will be rejected. [Wood pegs and wire staples for anchorage shall be as recommended by sod supplier.]

2.1.2 Purity

Sod species shall be genetically pure, free of weeds, pests, and disease.

2.1.3 Planting Dates

Lay sod from [_____] to [_____] for warm season spring planting and from [_____] to [_____] for cool season fall planting.

2.1.4 Composition

2.1.4.1 Proportion

Proportion grass species as follows.
[2.1.4.2] Sod Farm Overseeding

At the sod farm provide sod with overseeding of [annual rye grass seed] [_____][type recommended by seed producer].

[2.2] WILDFLOWER SOD

**************************************************************************
NOTE: The specified species and varieties used should be based on recommendations of the local Agriculture County Extension Service Office. State certified is usually more stringently monitored than State approved, and therefore more expensive.
**************************************************************************

2.2.1 Classification

[Certified,] [Field grown] wildflower sod, machine cut at a uniform thickness of [25] [_____] mm [one] [_____] inch within a tolerance of 6 mm 1/4 inch, excluding top growth. Top growth shall be a maximum height of [75] [_____] mm [3] [_____] inches. Each individual wildflower sod piece shall be strong enough to support its own weight when lifted by the ends. Broken pads, irregular shaped pieces, and torn or uneven ends will be rejected. [Wood pegs and wire staples for anchorage on slope conditions, three to one or greater, shall be used as recommended by wildflower sod supplier.]

2.2.2 Composition

Proportion wildflower species as follows:

<table>
<thead>
<tr>
<th>Botanical Name</th>
<th>Common Name</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>[____]</td>
<td>[____]</td>
<td>[____]</td>
</tr>
<tr>
<td>[____]</td>
<td>[____]</td>
<td>[____]</td>
</tr>
</tbody>
</table>

2.3 TOPSOIL

**************************************************************************
NOTE: If topsoil properties are included in another section of Division 31, delete this paragraph and include a cross-reference to the appropriate section. Otherwise, select appropriate paragraphs on topsoil. Check with the local Agriculture County Extension Service Office for soil properties appropriate for the plant materials to be planted. Where suitable topsoil is available within limits of the work area, stripping and stockpiling of topsoil should be included in the applicable section of Division 31 of the specification. If suitable
topsoil is not available within the limits of the work area, it should generally be the Contractor's option to either treat the soil of the graded areas with fertilizer and supplements so as to be conducive to turf establishment and maintenance, or to transport topsoil to the project site. Modify pH range for specified turf and geographical requirements.

******************************************************************************
2.3.1 On-Site Topsoil

Surface soil stripped and stockpiled on site and modified as necessary to meet the requirements specified for topsoil in paragraph entitled "Composition." When available topsoil shall be existing surface soil stripped and stockpiled on-site in accordance with Section [31 00 00 EARTHWORK][31 23 00.00 20 EXCAVATION AND FILL].

2.3.2 Off-Site Topsoil

Conform to requirements specified in paragraph entitled "Composition." Additional topsoil shall be [furnished by the Contractor] [obtained from topsoil borrow areas indicated].

2.3.3 Composition

Containing from 5 to 10 percent organic matter as determined by the topsoil composition tests of the Organic Carbon, 6A, Chemical Analysis Method described in DOA SSIR 42. Maximum particle size, 19 mm 3/4 inch, with maximum 3 percent retained on 6 mm 1/4 inch screen. The pH shall be tested in accordance with ASTM D4972. Topsoil shall be free of sticks, stones, roots, and other debris and objectionable materials. Other components shall conform to the following limits:

<table>
<thead>
<tr>
<th>Component</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silt</td>
<td>[25-50][7 to 17][_____] percent</td>
</tr>
<tr>
<td>Clay</td>
<td>[10-30][4 to 12][_____] percent</td>
</tr>
<tr>
<td>Sand</td>
<td>[20-35][70 to 82][_____] percent</td>
</tr>
<tr>
<td>pH</td>
<td>[5.5 to 7.0][_____]</td>
</tr>
<tr>
<td>Soluble Salts</td>
<td>[600] [_____] ppm maximum</td>
</tr>
</tbody>
</table>

2.4 SOIL CONDITIONERS

******************************************************************************
NOTE: Prior to including these provisions in project specifications, perform tests of on-site topsoil to determine its suitability and the possible need of pH adjusters or soil conditioners.

******************************************************************************

Add conditioners to topsoil as required to bring into compliance with "composition" standard for topsoil as specified herein.
2.4.1 Lime

**************************************************************************

NOTE: Use ASTM C602 calcium carbonate equivalent (C.C.E.) as specified in Table 1: for burnt lime, C.C.E. shall not be less than 140 percent; for hydrated lime, C.C.E. shall not be less than 110 percent; and for limestone, C.C.E. shall not be less than 80 percent.

**************************************************************************

Commercial grade [hydrate] [or] [burnt] limestone containing a calcium carbonate equivalent (C.C.E.) as specified in ASTM C602 of not less than [_____] percent.

2.4.2 Aluminum Sulfate

Commercial grade.

2.4.3 Sulfur

100 percent elemental

2.4.4 Iron

100 percent elemental

2.4.5 Peat

Natural product of [peat moss] derived from a freshwater site and conforming to [ASTM D4427] [as modified herein]. Shred and granulate peat to pass a 12.5 mm 1/2 inch mesh screen and condition in storage pile for minimum 6 months after excavation.

2.4.6 Sand

Clean and free of materials harmful to plants.

2.4.7 Perlite

Horticultural grade.

2.4.8 Composted Derivatives

Ground bark, nitrolized sawdust, humus or other green wood waste material free of stones, sticks, and soil stabilized with nitrogen and having the following properties:

2.4.8.1 Particle Size

Minimum percent by weight passing:

- 4.75 mm No. 4 mesh screen 95
- 2.36 mm No. 8 mesh screen 80

2.4.8.2 Nitrogen Content

Minimum percent based on dry weight:
2.4.9 Gypsum

Coarsely ground gypsum comprised of calcium sulfate dihydrate 91 percent, calcium 22 percent, sulfur 17 percent; minimum 96 percent passing through 850 micrometers 20 mesh screen, 100 percent passing thru 970 micrometers 16 mesh screen.

2.4.10 Calcined Clay

Calcined clay shall be granular particles produced from montmorillonite clay calcined to a minimum temperature of 650 degrees C 1200 degrees F.

Gradation: A minimum 90 percent shall pass a 2.36 mm No. 8 sieve; a minimum 99 percent shall be retained on a 0.250 mm No. 60 sieve; and a maximum 2 percent shall pass a 0.150 mm No. 100 sieve. Bulk density: A maximum 640 kilogram per cubic meter 40 pounds per cubic foot.

2.5 FERTILIZER

**************************************************************************
NOTE: Check with the local Agriculture County Extension Service Office for recommended fertilizer mixture for local conditions.
**************************************************************************

2.5.1 Granular Fertilizer

[Organic][synthetic], granular controlled release fertilizer containing the following minimum percentages, by weight, of plant food nutrients:

[_____] percent available nitrogen
[_____] percent available phosphorus
[_____] percent available potassium
[_____] percent sulfur
[(_____] percent iron)

2.6 WATER

**************************************************************************
NOTE: When water is Government furnished, locate the source. Recycled or reclaimed irrigation water may be available through a tertiary treatment plant on or off site. It is preferred that this type of water be used for irrigation whenever possible. Check project specific conditions.

Unless otherwise directed, water shall be the responsibility of the Contractor. Water source shall be potable or non-potable. If non-potable edit specification accordingly. Source of water shall be approved by the Contracting Officer and shall be of suitable quality for irrigation, containing no elements toxic to plant life.

Coordinate information presented here with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.
Source of water shall be approved by Contracting Officer and of suitable quality for irrigation containing no element toxic to plant life.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Extent Of Work

Provide soil preparation (including soil conditioners), fertilizing, and sodding of all newly graded finished earth surfaces, unless indicated otherwise, and at all areas inside or outside the limits of construction that are disturbed by the Contractor's operations.

3.1.2 Soil Preparation

Provide 102 mm 4 inches of [off-site topsoil][on-site topsoil] to meet indicated finish grade. After areas have been brought to indicated finish grade, incorporate [fertilizer] [pH adjusters] [soil conditioners] into soil a minimum depth of [100] [_____] mm [4] [_____] inches by disk, harrowing, tilling or other method approved by the Contracting Officer. Remove debris and stones larger than 19 mm 3/4 inch in any dimension remaining on the surface after finish grading. Correct irregularities in finish surfaces to eliminate depressions. Protect finished topsoil areas from damage by vehicular or pedestrian traffic.

3.1.2.1 Soil Conditioner Application Rates

Apply soil conditioners at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

[ Lime [[_____] kg per square meter pounds per acre] [[_____] kg per 100 square meters pounds per 1000 square feet.] ]

[[ Sulfur [[_____] kg per square meter pounds per acre ] [[_____] kg per 100 square meters pounds per 1000 square feet.] ]

[[ Iron [[_____] kg per square meter pounds per acre] [[_____] kg per 100 square meters pounds per 1000 square feet.] ]

[[ Aluminum Sulfate [[_____] kg per square meter pounds per acre] [[_____] kg per 100 square meters pounds per 1000 square feet.] ]

[[ Peat [[_____] cubic meters per square meter cubic yard per acre] ]
3.1.2.2 Fertilizer Application Rates

*******************************************************************************
NOTE: Check with the local Agriculture County Extension Service and specify amounts applicable for the project area.
*******************************************************************************

Apply fertilizer at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

][ Organic Granular Fertilizer [[_____] kg per square meter pounds per acre] [[_____] kg per 100 square meters pounds per 1000 square feet.]
][ Synthetic Granular Fertilizer [[_____] kg per square meter pounds per acre] [[_____] kg per 100 square meters pounds per 1000 square feet.]

3.2 SODDING

3.2.1 Finished Grade and Topsoil

*******************************************************************************
NOTE: Coordinate the placement of topsoil with Section 31 00 00 EARTHWORK. Coordinate the topsoil requirements with Sections 32 92 19 SEEDING; 32 92 26 SPRIGGING; and 32 93 00 EXTERIOR PLANTS.
*******************************************************************************

Prior to the commencement of the sodding operation, the Contractor shall verify that finished grades are as indicated on drawings; the placing of topsoil, smooth grading, and compaction requirements have been completed in accordance with Section [31 00 00 EARTHWORK][31 23 00.00 20 EXCAVATION AND FILL].
The prepared surface shall be a maximum 25 mm 1 inch below the adjoining
grade of any surfaced area. New surfaces shall be blended to existing
areas. The prepared surface shall be completed with a light raking to
remove from the surface debris and stones over a minimum 16 mm 5/8 inch in
any dimension.

3.2.2 Placing

Place sod a maximum of 36 hours after initial harvesting, in accordance
with TPI GSS as modified herein.

3.2.3 Sodding Slopes and Ditches

For slopes 2:1 and greater, lay sod with long edge perpendicular to the
contour. For V-ditches and flat bottomed ditches, lay sod with long edge
perpendicular to flow of water. [Anchor each piece of sod with wood pegs or
wire staples maximum 600 mm 2 feet on center.] [On slope areas, start
sodding at bottom of the slope.]

3.2.4 Finishing

After completing sodding, blend edges of sodded area smoothly into
surrounding area. Air pockets shall be eliminated and a true and even
surface shall be provided. Frayed edges shall be trimmed and holes and
missing corners shall be patched with sod.

3.2.5 Rolling

Immediately after sodding, firm entire area except for slopes in excess of
3 to 1 with a roller not exceeding [134] [_____] kg per m [90] [_____] pounds
for each foot of roller width.

3.2.6 Watering

Start watering areas sodded as required by daily temperature and wind
conditions. Apply water at a rate sufficient to ensure thorough wetting of
soil to minimum depth of [150] [_____] mm [6] [_____] inches. Run-off,
puddling, and wilting shall be prevented. Unless otherwise directed,
watering trucks shall not be driven over turf areas. Watering of other
adjacent areas or plant material shall be prevented.

3.3 PROTECTION OF TURF AREAS

Immediately after turfing, protect area against traffic and other use.

3.4 RENOVATION OF EXISTING TURF AREA

3.4.1 Aeration

Upon completion of weed eradication operations and Contracting Officer's
approval to proceed, aerate turf areas indicated , by approved device.
Core, by pulling soil plugs, to a minimum depth of [_____] mm inches.[
Leave all soil plugs, that are produced, in the turf area.] [ Remove all
debris generated during this operation off site.][ After aeration
operations are complete, topdress entire area [ 6.35 mm 1/4 inch] [ 12.70 mm
1/2 inch] depth with the following mixture:

[ [_____] percent sand
Blend all parts of topdressing mixture to a uniform consistency throughout. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean all soil plugs off of other paving when work is complete.

**3.4.2 Vertical Mowing**

Upon completion of aerating operation and Contracting Officer's approval to proceed, vertical mow turf areas indicated, by approved device, to a depth of \( 6 \text{ mm} \) \( 1/4 \text{ inch} \) \( 13 \text{ mm} \) \( 1/2 \text{ inch} \) above existing soil level, to reduce thatch build-up, grain, and surface compaction. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean other paving when work is complete. Remove all debris generated during this operation off site.

**3.4.3 Dethatching**

Upon completion of aerating operation and Contracting Officer's approval to proceed, dethatch turf areas indicated, by approved device, to a depth of \( 6 \text{ mm} \) \( 1/4 \text{ inch} \) \( 13 \text{ mm} \) \( 1/2 \text{ inch} \) below existing soil level, to reduce thatch build-up, grain, and surface compaction. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean other paving when work is complete. Remove all debris generated during this operation off site.

**3.5 RESTORATION**

Restore to original condition existing turf areas which have been damaged during turf installation operations. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean other paving when work in adjacent areas is complete.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for sprigging.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The following information must be shown on the project drawings:

1. Clearly indicate all areas to be turfed and if more than one type of turf is specified, delineate areas for each type.

2. All draft turf specifications must be submitted to the cognizant Landscape Architect/Natural Resources Specialist for review to ensure that the specifications are in accordance with environmental conditions peculiar to the project areas.
PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM C602 (2020) Agricultural Liming Materials

TURFGRASS PRODUCERS INTERNATIONAL (TPI)

TPI GSS (1995) Guideline Specifications to Turfgrass Sodding

U.S. DEPARTMENT OF AGRICULTURE (USDA)

AMS Seed Act (1940; R 1988; R 1998) Federal Seed Act

1.2 DEFINITIONS

1.2.1 Stand of Turf

95 percent ground cover of the established species.
1.3 RELATED REQUIREMENTS

[Section 31 00 00 EARTHWORK,] [Section 32 84 24 IRRIGATION AND SPRINKLER SYSTEMS,] [Section 32 96 00 TRANSPLANTING EXTERIOR PLANTS,] [Section 32 92 19 SEEDING,] [Section 32 92 23 SODDING,] [Section 32 93 00 EXTERIOR PLANTS,] and Section 32 05 33 LANDSCAPE ESTABLISHMENT applies to this section for pesticide use and plant establishment requirements, with additions and modifications herein.

1.4 SUBMITTALS

******************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Wood Cellulose Fiber Mulch
Fertilizer

Include physical characteristics, and recommendations.

SD-06 Test Reports

***********************************************************************************************************************************************
NOTE: In states that require certification, adjust testing requirements to suit local conditions.
***********************************************************************************************************************************************

Topsoil Composition Tests (Reports and Recommendations).

SD-07 Certificates

State Certification and Approval for Seed

[Nursery] [Sod Farm] Certification for Sprigs. Indicate type of sprig in accordance with TPI GSS.

SD-08 Manufacturer’s Instructions

Erosion Control Materials

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery

1.5.1.1 Sprig Protection

***********************************************************************************************************************************************
NOTE: If sprigs are to be delivered in quantity over considerable distance, specify trucking in vans equipped with temperature control.
***********************************************************************************************************************************************

Protect from drying out and from contamination during delivery, on-site storage, and handling.

1.5.1.2 [Fertilizer] [Gypsum] [Sulfur] [Iron] [and] [Lime] Delivery

Deliver to the site in original, unopened containers bearing manufacturer's chemical analysis, name, trade name, trademark, and indication of conformance to state and federal laws. Instead of containers, [fertilizer] [gypsum] [sulphur] [iron] [and] [lime] may be furnished in bulk with certificate indicating the above information.

1.5.2 Storage

1.5.2.1 Sprig Storage

***********************************************************************************************************************************************
NOTE: Check with the local Agriculture County Extension Service Office to determine if specie used requires more water than is average for the geographical area.
***********************************************************************************************************************************************

Lightly sprinkle with water, cover with moist burlap, straw, or other
approved covering; and protect from exposure to wind and direct sunlight until planted. Provide covering that will allow air to circulate so that internal heat will not develop. Do not store longer than 24 hours. Do not store directly on concrete or bituminous surfaces.

1.5.2.2 Seed, [Fertilizer] [Gypsum] [Sulfur] [Iron] [and] [Lime] Storage

Store in cool, dry locations away from contaminants.

1.5.2.3 Topsoil

Prior to stockpiling topsoil, treat growing vegetation with application of appropriate specified non-selective herbicide. Clear and grub existing vegetation three to four weeks prior to stockpiling topsoil.

1.5.2.4 Handling

Do not drop or dump materials from vehicles.

1.6 TIME RESTRICTIONS AND PLANTING CONDITIONS

1.6.1 Restrictions

Do not plant when the ground is [frozen,] [snow covered,] muddy, or when air temperature exceeds [32] [_____] degrees Celsius [90] [_____] degrees Fahrenheit.

1.7 TIME LIMITATIONS

1.7.1 Sprigging

Perform sprigging a maximum of twenty four hours after initial harvesting.

PART 2 PRODUCTS

2.1 SPRIGS

**************************************************************************
NOTE: The specific species and varieties used should be based on recommendations of the local Agriculture County Extension Service Office.
**************************************************************************

2.1.1 Classification

Healthy living stems, stolons, or rhizomes and attached roots of locally adapted grass without adhering soil, including two to three nodes and from 100 to 150 mm 4 to 6 inches long. Obtain from heavy, dense certified sod as classified in the TPI GSS. [Obtain sprigs from designated areas on the project site.] Provide sprigs which have been grown under climatic conditions similar to those in the locality of the project. Coordinate harvesting and planting operations to prevent exposure of sprigs to the sun for more than 30 minutes before covering and moistening. Sprigs containing weeds or other detrimental material or that are heat damaged will be rejected.
2.1.2 Composition

<table>
<thead>
<tr>
<th>Botanical and Common Name</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

2.1.3 Planting Dates

Sow sprigs from [_____] to [_____] for warm season planting and from [_____] to [_____] for cool season planting.

2.2 SEED

**************************************************************************
NOTE: When applying seed over sprigs as a specified method of establishing sprigs, select the annual seed species to be installed. State-certified seed is more stringently monitored than State-approved seed; and therefore, more expensive.
**************************************************************************

2.2.1 Seed Classification

[State-certified] [State-approved] seed of the latest season's crop must be provided in original sealed packages bearing the producer's guaranteed analysis for percentages of mixture, purity, germination, hard seed, weed seed content, and inert material. Labels must be in conformance with AMS Seed Act and applicable state seed laws.

2.2.2 Temporary Seed Species Composition

<table>

<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

2.3 TOPSOIL

**************************************************************************
NOTE: If topsoil properties are included in another section of Division 31, delete this paragraph and include a cross-reference to the appropriate section. Otherwise, select appropriate paragraphs on topsoil. Check with the local Agriculture County Extension Service Office for soil properties appropriate for the plant materials to be planted. Where suitable topsoil is available within limits of the work area, stripping and stockpiling of topsoil should be included in the applicable section of Division 31 of the specification. If suitable topsoil is not available within the limits of the work area, it should generally be the Contractor's option to either treat the soil of the graded areas with fertilizer and supplements so as to be conducive to turf establishment and maintenance, or to transport topsoil to the project site. Modify pH
range for specified turf and geographical requirements.

2.3.1 On-Site Topsoil

Surface soil stripped and stockpiled on site and modified as necessary to meet the requirements specified for topsoil in paragraph COMPOSITION. When available topsoil must be existing surface soil stripped and stockpiled on-site in accordance with Section [31 00 00 EARTHWORK][31 23 00.00 20 EXCAVATION AND FILL].

2.3.2 Off-Site Topsoil

Conform to requirements specified in paragraph COMPOSITION. Additional topsoil must be [furnished by the Contractor][obtained from topsoil borrow areas indicated].

2.3.3 Composition

Containing from 5 to 10 percent organic matter as determined by the topsoil composition tests of the Organic Carbon, 6A, Chemical Analysis Method described in DOA SSIR 42. Maximum particle size, 19 mm 3/4 inch, with maximum 3 percent retained on 6 mm 1/4 inch screen. The pH must be tested in accordance with ASTM D4972. Topsoil must be free of sticks, stones, roots, and other debris and objectionable materials. Other components must conform to the following limits:

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silt</td>
<td>[25-50][7 to 17][_____] percent</td>
</tr>
<tr>
<td>Clay</td>
<td>[10-30][4 to 12][_____] percent</td>
</tr>
<tr>
<td>Sand</td>
<td>[20-35][70 to 82][_____] percent</td>
</tr>
<tr>
<td>pH</td>
<td>[5.5 to 7.0][_____]</td>
</tr>
<tr>
<td>Soluble Salts</td>
<td>[600] [_____] ppm maximum</td>
</tr>
</tbody>
</table>

2.4 pH ADJUSTERS AND SOIL CONDITIONERS

NOTE: Prior to including these provisions in project specifications, perform tests of on-site topsoil to determine its suitability and the possible need of pH adjusters or soil conditioners.

Add conditioners to topsoil as required to bring into compliance with "composition" standard for topsoil as specified herein.

2.4.1 Lime

NOTE: Use ASTM C602 calcium carbonate equivalent (C.C.E.) as specified in Table 1: for burnt lime, C.C.E. must not be less than 140 percent; for hydrated lime, C.C.E. must not be less than 110 percent; and for limestone, C.C.E. must not be less
than 80 percent.

Commercial grade [hydrate] [or] [burnt] limestone containing a calcium carbonate equivalent (C.C.E.) as specified in ASTM C602 of not less than [_____] percent.

2.4.2 Aluminum Sulfate
Commercial grade.

2.4.3 Sulfur
100 percent elemental

2.4.4 Iron
100 percent elemental

2.4.5 Peat
Natural product of [peat moss] derived from a freshwater site and conforming to [ASTM D4427] [as modified herein]. Shred and granulate peat to pass a 12.5 mm 1/2 inch mesh screen and condition in storage pile for minimum 6 months after excavation.

2.4.6 Sand
Clean and free of materials harmful to plants.

2.4.7 Perlite
Horticultural grade.

2.4.8 Composted Derivatives
Ground bark, nitrolized sawdust, humus or other green wood waste material free of stones, sticks, and soil stabilized with nitrogen and having the following properties:

2.4.8.1 Particle Size
Minimum percent by weight passing:

<table>
<thead>
<tr>
<th>Screen Size</th>
<th>Minimum Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.75 mm No. 4 mesh screen</td>
<td>95</td>
</tr>
<tr>
<td>2.36 mm No. 8 mesh screen</td>
<td>80</td>
</tr>
</tbody>
</table>

2.4.8.2 Nitrogen Content
Minimum percent based on dry weight:

<table>
<thead>
<tr>
<th>Material</th>
<th>Minimum Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fir Sawdust</td>
<td>0.7</td>
</tr>
<tr>
<td>Fir or Pine Bark</td>
<td>1.0</td>
</tr>
</tbody>
</table>

2.4.9 Gypsum
Coarsely ground gypsum comprised of calcium sulfate dihydrate 80 percent, calcium 18 percent, sulfur 14 percent; minimum 96 percent passing through 850 micrometers 20 mesh screen, 100 percent passing thru 970 micrometers 16
mesh screen.

2.4.10 Calcined Clay

Calcined clay must be granular particles produced from montmorillonite clay calcined to a minimum temperature of 650 degrees C (1200 degrees F). Gradation: A minimum 90 percent must pass a 2.36 mm No. 8 sieve; a minimum 99 percent must be retained on a 0.250 mm No. 60 sieve; and material passing a 0.150 mm No. 100 sieve must not exceed 2 percent. Bulk density: A maximum 640 kilogram per cubic meter (40 pounds per cubic foot).

2.5 FERTILIZER

******************************************************************************
NOTE: Check with the local Agriculture County Extension Service Office for recommended fertilizer mixture for local conditions.
******************************************************************************

2.5.1 Granular Fertilizer

[Organic][synthetic], granular controlled release fertilizer containing the following minimum percentages, by weight, of plant food nutrients:

[ ] percent available nitrogen
[ ] percent available phosphorus
[ ] percent available potassium
[ ] percent sulfur
[ ] percent iron

2.5.2 Hydrosprigging Fertilizer

Controlled release fertilizer, to use with hydrosprigging and composed of pills coated with plastic resin to provide a continuous release of nutrients for at least 6 months and containing the following minimum percentages, by weight, of plant food nutrients:

[ ] percent available nitrogen
[ ] percent available phosphorus
[ ] percent available potassium
[ ] percent sulfur
[ ] percent iron

2.6 MULCH

******************************************************************************
NOTE: Check with the local Agriculture County Extension Service Office to determine choice of mulch most suitable for the project area. Specify only one type of mulch.
******************************************************************************

Mulch must be free from noxious weeds, mold, and other deleterious materials.

2.6.1 Straw

Stalks from oats, wheat, rye, barley, or rice. Furnish in air-dry condition and of proper consistency for placing with commercial mulch.
blowing equipment. Straw must contain no fertile seed.

2.6.2 Hay

Air-dry condition and of proper consistency for placing with commercial mulch blowing equipment. Hay must be sterile, containing no fertile seed.

2.6.3 Wood Cellulose Fiber Mulch

******************************************************************************
NOTE: Wood cellulose fiber mulches have been successful on level areas or on slopes with slight grades where sufficient moisture is present to obtain a quick germination of grass seed. The material should be hydraulically applied at the following rates: Areas up to and including 3 to 1 slopes, at the rate of 1,120 kg per 10,000 sq. m (1,000 pounds per acre); areas steeper than 3 to 1 at the rate of 1,568 kg per 10,000 sq. m (1,400 pounds per acre). It should not be specified for slopes 2 to 1 or greater in areas where drought may prevent germination of the seed or where runoff from heavy rains may cut gullies through the fiber mulch. In these areas use erosion control materials such as specified in paragraph EROSION CONTROL MATERIAL.
******************************************************************************

******************************************************************************
NOTE: Hydraulic mulch is an EPA designated product for recycled content. Recycled content percentages listed are recommended by EPA; additional information can be found on the EPA's "Comprehensive Procurement Guidelines (CPG)" page within EPA's website at http://www.epa.gov.
******************************************************************************

Use recovered materials of either paper-based (100 percent post-consumer content) or wood-based (100 percent total recovered content) hydraulic mulch. Processed to contain no growth or germination-inhibiting factors and dyed an appropriate color to facilitate visual metering of materials application. Composition on air-dry weight basis: 9 to 15 percent moisture, pH range from 5.5 to 8.2 [_____]. Use with hydraulic application of grass [seed] and fertilizer.

2.7 WATER

******************************************************************************
NOTE: When water is Government furnished, locate the source. Recycled or reclaimed irrigation water may be available through a tertiary treatment plant on or off site. It is preferred that this type of water be used for irrigation whenever possible. Check project specific conditions.

Unless otherwise directed, water must be the responsibility of the Contractor. Water source must be potable or non-potable. If non-potable edit specification accordingly. Source of water must be approved by the Contracting Officer and must be of
suitable quality for irrigation, containing no elements toxic to plant life.

Coordinate information presented here with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS

Source of water must be approved by Contracting Officer and of suitable quality for irrigation containing no element toxic to plant life.

2.8 EROSION CONTROL MATERIALS

NOTE: Provide all erosion and sediment control measures in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS for Navy instead of here if used for project. The Contractor may propose other types of erosion control material, based on site conditions.

Erosion control material must conform to the following:

[2.8.1 Erosion Control Blanket

Blanket must be machine produced mat of wood excelsior formed from a web of interlocking wood fibers; covered on one side with either knitted straw blanket-like mat construction; covered with biodegradable plastic mesh; or interwoven biodegradable thread, plastic netting, or twisted kraft paper cord netting.

[2.8.2 Erosion Control Fabric

Fabric must be knitted construction of polypropylene yarn with uniform mesh openings 19 to 25 mm 3/4 to 1 inch square with strips of biodegradable paper. Filler paper strips must have a minimum life of 6 months.

[2.8.3 Erosion Control Net

Net must be heavy, twisted jute mesh, weighing approximately 605 grams per meter 1.22 pounds per linear yard and 1200 mm 4 feet wide with mesh openings of approximately 25 mm one inch square.

[2.8.4 Hydrophilic Colloids

Hydrophilic colloids must be physiologically harmless to plant and animal life without phytotoxic agents. Colloids must be naturally occurring, silicate powder based, and must form a water insoluble membrane after curing. Colloids must resist mold growth.

[2.8.5 Erosion Control Material Anchors

Erosion control anchors must be as recommended by the manufacturer.
PART 3 EXECUTION

3.1 PREPARATION

3.1.1 EXTENT OF WORK

Provide soil preparation prior to planting (including soil conditioners), fertilizing, and sprigging, [temporary seeding] of all newly graded finished earth surfaces, unless indicated otherwise, and at all areas inside or outside the limits of construction that are disturbed by the Contractor's operations.

3.1.2 Soil Preparation

**NOTE: Choose one of the following options**

**NOTE: Elevation of subgrade will vary depending upon the needs for additional topsoil, sod, or other treatment.**

Provide 102 mm 4 inches of [off-site topsoil][on-site topsoil][existing soil] to meet indicated finish grade. After areas have been brought to indicated finish grade, incorporate [fertilizer] [pH adjusters] [soil conditioners] into soil a minimum depth of [100] [_____] mm [4] [_____] inches by disk ing, harrowing, tilling or other method approved by the Contracting Officer. Remove debris and stones larger than 19 mm 3/4 inch in any dimension remaining on the surface after finish grading. Correct irregularities in finish surfaces to eliminate depressions. Protect finished topsoil areas from damage by vehicular or pedestrian traffic.

3.1.2.1 Soil Conditioner Application Rates

Apply soil conditioners at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

- **Lime**
  - [_____] kg per square meter pounds per acre
  - [_____] kg per 100 square meters pounds per 1000 square feet.

- **Sulfur**
  - [_____] kg per square meter pounds per acre
  - [_____] kg per 100 square meters pounds per 1000 square feet.

- **Iron**
  - [_____] kg per square meter pounds per acre
  - [_____] kg per 100 square meters pounds per 1000 square feet.

- **Aluminum Sulfate**
  - [_____] kg per square meter pounds per acre
  - [_____] kg per 100 square meters pounds per 1000 square feet.

- **Peat**
  - [_____] cubic meters per square meter cubic yard per acre
  - [_____] cubic meters per 100 square meters cubic yards per 1000 square feet.

- **Sand**
  - [_____] cubic meters per square meter cubic yard per acre
  - [_____] cubic meters per 100 square meters cubic yards per 1000 square feet.
3.1.2.2 Fertilizer Application Rates

Apply fertilizer at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

- **Organic Granular Fertilizer** ([---] kg per square meter pounds per acre) ([---] kg per 100 square meters pounds per 1000 square feet.)
- **Hydrosprigging Fertilizer** ([---] kg per square meter pounds per acre) ([---] kg per 100 square meters pounds per 1000 square feet.)

### 3.2 SPRIGGING INSTALLATION

**NOTE:** Allow the Contractor sprig installation options when installing areas larger than one acre. Define lawn areas and field areas on the drawings.

Prior to installing sprigs, any previously prepared surface compacted or damaged must be reworked to meet the requirements of paragraph SOIL PREPARATION. Areas must be sprigged as indicated.

#### 3.2.1 Installing Sprigs

The sprigging method must be [Broadcast Sprigging] [Hydroplanting] [Row Sprigging] [applying seed-over-sprigs]. Sprigging procedure must ensure even coverage.

##### 3.2.1.1 Broadcast Sprigging

Sprigs must be broadcast uniformly by hand, with mechanical equipment, or other approved method. Sprigs must be planted to provide a minimum number of **30 viable sprigs per square meter 25 viable sprigs per square yard.** The
distance between individual sprigs must be a maximum 300 mm 12 inch space. Sprigs must be forced into the soil to a minimum 25 mm one inch depth by disk-rolling, pressing with steel matting, or other approved method.

3.2.1.2 Hydroplanting

Sprigs must be mixed with water and uniformly applied under pressure over the entire area. Sprigs must be covered by distributing a topdressing uniformly and evenly to a minimum 25 mm one inch depth. Topdressing must conform to the paragraph TOPSOIL.

3.2.1.3 Row Sprigging

Sprigs must be planted in rows spaced a maximum of 300 mm 12 inches apart and to a minimum 25 mm one inch depth, with mechanical sprig planter or other methods. Sprigs must be placed in the rows a maximum 150 mm 6 inch distance apart.

3.2.2 Mulching

3.2.2.1 Hay or Straw Mulch

Hay or straw mulch must be spread uniformly at the rate of 0.75 metric tons per hectare 2 tons per acre. Mulch must be spread by hand, blower-type mulch spreader, or other approved method. Mulching must be started on the windward side of relatively flat areas or on the upper part of steep slopes, and continued uniformly until the area is covered. The mulch must not be bunched or clumped. Sunlight must not be completely excluded from penetrating to the ground surface. All areas installed with seed must be mulched on the same day as the seeding. Mulch must be anchored immediately following spreading.

3.2.2.2 Mechanical Anchor

Mechanical anchor must be a V-type-wheel land packer; a scalloped-disk land packer designed to force mulch into the soil surface; or other suitable equipment.

3.2.2.3 Wood Cellulose Fiber, Paper Fiber and Recycled Paper

Wood cellulose fiber, paper fiber, or recycled paper must be applied as part of the hydroteedging operation. The mulch must be mixed and applied in accordance with the manufacturer's recommendations.

3.2.3 Applying Seed Over Sprigs

Seed must be applied using either [broadcast] [or] [hydroteedging] equipment and methods. Seeding procedure must ensure even coverage. Gravity feed applicators, which drop seed directly from a hopper onto the prepared soil, must not be used.

3.2.3.1 Broadcast Seeding

Seed must be uniformly broadcast at the rate of [_____] kilograms per hectare pounds per 1000 square feet using broadcast seeders. Half the total rate of seed application must be broadcast in 1 direction, with the remainder of the seed rate broadcast at 90 degrees from the first direction. Seed must be covered to a minimum 6 mm 1/4 inch depth by disk harrow, steel mat drag, cultipacker, or other approved device. Seed must
be broadcast and covered prior to sprigging operation.

][3.2.3.2 Hydroseeding

Seed must be mixed to ensure broadcast at the rate of [_____] kilograms per hectare pounds per 1000 square feet. Seed and fertilizer must be added to water and thoroughly mixed at the rates specified. The time period for the seed to be held in the slurry must not exceed 24 hours. [Wood cellulose fiber mulch and tackifier must be added at the rates recommended by the manufacturer after the seed, fertilizer, and water have been thoroughly mixed to produce a homogeneous slurry.] Slurry must be uniformly applied under pressure over the entire area. The hydroseeded area must not be rolled.

][3.2.4 Rolling

The entire area must be firmed with a roller not exceeding 130 kilograms per meter 90 pounds per foot roller width. Slopes over a maximum 3-horizontal-to-1 vertical must not be rolled.

3.2.5 Finishing

A minimum 25 percent of the installed sprigs must extend above the ground surface upon completion of the sprigging operation.

3.2.6 Erosion Control Material

Install in accordance with manufacturer's instructions, where indicated or as directed by the Contracting Officer.

3.2.7 Watering Sprigs

Watering must be started immediately after completing each day of sprigging. Water must be applied at a rate sufficient to ensure moist soil conditions to a minimum 25 mm one inch depth. Run-off, puddling, and wilting must be prevented. Unless otherwise directed, watering trucks must not be driven over turf areas. Watering of other adjacent areas or plant material must be prevented.

3.3 PROTECTION OF TURF AREAS

Immediately after turfing, protect area against traffic and other use.

3.4 RESTORATION

Restore to original condition existing turf areas which have been damaged during turf installation operations. Keep clean at all times at least one paved pedestrian access route and one paved vehicular access route to each building. Clean other paving when work in adjacent areas is complete.

NOTE: This guide specification covers the requirements for exterior planting.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

NOTE: The following information must be shown on the project drawings:

1. All areas to be planted, with plant layout provided.
2. Plant list.
3. Subsurface drainage.
4. Planting accessories.
1.1 REFERENCES

1.2 RELATED REQUIREMENTS

[Section 31 00 00 EARTHWORK,] [Section 32 84 24 IRRIGATION SPRINKLER SYSTEMS,] [Section 32 96 00 TRANSPLANTING EXTERIOR PLANTS,] [Section 32 92 19 SEEDING,] [Section 32 92 23 SODDING,] [Section 32 92 26 SPRIGGING,] and Section 32 05 33 LANDSCAPE ESTABLISHMENT applies to this section for pesticide use and plant establishment requirements, with additions and modifications herein.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Topsoil Composition Tests

Commercial test from an independent testing laboratory including basic soil groups (moisture and saturation percentages, Nitrogen-Phosphorus-Potassium (N-P-K) ratio, pH (ASTM D4972), soil salinity), secondary nutrient groups (calcium, magnesium, sodium, Sodium Absorption Ratio (SAR)), micronutrients (zinc, manganese, iron, copper), toxic soil elements (boron, chloride, sulfate), cation exchange and base saturation percentages, and soil amendment and fertilizer recommendations with quantities for plant material being transplanted. Soil required for each test must include a maximum depth of 450 mm 18 inches of approximately one liter one quart volume for each test. Areas sampled should not be larger than 0.4 hectare one acre and should contain at least 6-8 cores for each sample area and be thoroughly mixed. Problem areas should be sampled separately and compared with samples taken from adjacent non-problem areas. The location of the sample areas should be noted and marked on a parcel or planting map for future reference.

1.4.2 Nursery Certifications

[a. Indicate on nursery letterhead the name of plants in accordance with the LHBH, including botanical common names, quality, and size.

[b. Inspection certificate.

[c. Mycorrhizal fungi inoculum for plant material treated

1.4.3 State Landscape Contractor's License

Construction company must hold a landscape contractors license in the state where the work is performed and have a minimum of five years landscape construction experience. Submit copy of license and three references for similar work completed in the last five years.

1.4.4 Plant Material Photographs

Contractor must submit nursery photographs, for government approval prior to ordering, for each tree larger than 600 mm 24-inch box/ 50 mm 2-inch caliper size.

1.4.5 Percolation Test

Immediately following rough grading operation, identify a typical location for one of the largest trees and or shrubs and excavate a pit per the project details. Fill the pit with water to a depth of 300 mm 12 inches. The length of time required for the water to percolate into the soil, leaving the pit empty, must be measured by the project Landscape Architect and verified by the Contracting Officer. Within six hours of the time the
water has drained from the pit, the Contractor, with the Contracting Officer and project Landscape Architect present, must again fill the pit with water to a depth of 300 mm 12 inches. If the water does not completely percolate into the soil within 9 hours, a determination must be made whether a drainage system or a soil penetrant will be required for each tree and or shrub being transplanted.

1.4.6 Erosion Assessment

************************************************************************************************************
NOTE: The erosion potential of a soil is of concern in vegetated channels, road embankments, dams, levees, spillways, construction sites, [____].
************************************************************************************************************

Assess potential effects of soil management practices on soil loss in accordance with ASTM D6629. Assess erodibility of soil with dominant soil structure less than 70 to 80 mm 2.8 to 3.1 inches in accordance with ASTM D5852.

1.4.7 Pre-Installation Meeting

Convene a pre-installation meeting a minimum of one week prior to commencing work of this section. Require attendance of parties directly affecting work of this section. Review conditions of operations, procedures and coordination with related work. Agenda must include the following:

a. Tour, inspect, and discuss conditions of planting materials.

b. Review planting schedule and maintenance.

c. Review required inspections.

d. Review environmental procedures.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery

1.5.1.1 Branched Plant Delivery

Deliver with branches tied and exposed branches covered with material which allows air circulation. Prevent damage to branches, trunks, root systems, and root balls and desiccation of leaves.

1.5.1.2 Soil Amendment Delivery

Deliver to the site in original, unopened containers bearing manufacturer's chemical analysis, name, trade name, or trademark, and indication of conformance to state and federal laws. Instead of containers, [fertilizer,] [gypsum,] [sulfur,] [iron,] [and] [lime] may be furnished in bulk with a certificate indicating the above information. Store in dry locations away from contaminates.

1.5.1.3 Plant Labels

Deliver plants with durable waterproof labels in weather-resistant ink. Provide labels stating the correct botanical and common plant name and
variety as applicable and size as specified in the list of required plants. Attach to plants, bundles, and containers of plants. Groups of plants may be labeled by tagging one plant. Labels must be legible for a minimum of 60 days after delivery to the planting site.

1.5.2 Storage

1.5.2.1 Plant Storage and Protection

Store and protect plants not planted on the day of arrival at the site as follows:

a. Shade and protect plants in outside storage areas from the wind and direct sunlight until planted.

b. Heel-in bare root plants.

c. Protect balled and burlapped plants from freezing or drying out by covering the balls or roots with moist burlap, sawdust, wood chips, shredded bark, peat moss, or other approved material. Provide covering which allows air circulation.

d. Keep plants in a moist condition until planted by watering with a fine mist spray.

e. Do not store plant material directly on concrete or bituminous surfaces.

1.5.2.2 [Fertilizer,] [Gypsum,] [pH Adjusters] and [Mulch] Storage

Store in dry locations away from contaminants.

1.5.2.3 Topsoil

Prior to stockpiling topsoil, eradicate on site undesirable growing vegetation. Clear and grub existing vegetation three to four weeks prior to stockpiling existing topsoil.

1.5.2.4 [Root Control Barrier] [and] [Weed Control Fabric]

Store materials on site in enclosures or under protective covering in dry location. Store under cover out of direct sunlight. Do not store materials directly on ground.

1.5.3 Handling

Do not drop or dump plants from vehicles. Avoid damaging plants being moved from nursery or storage area to planting site. Handle [boxed][balled and burlapped] [bare root] [balled and potted][processed balled][in-ground fabric bag grown] [container] plants carefully to avoid damaging or breaking the earth ball or root structure. Do not handle plants by the trunk or stem.[ Puddle bare-root plants after removal from the heeling-in bed to protect roots from drying out.] Remove damaged plants from the site.

1.5.4 TIME LIMITATION

Except for container-grown plant material, the time limitation from digging to installing plant material must be a maximum of 90 days. The time limitation between installing the plant material and placing the mulch must be a maximum of 24 hours.
1.6  TIME RESTRICTIONS AND PLANTING CONDITIONS

**************************************************************************
NOTE: Check with the local Agriculture County Extension Service Office for recommended planting dates for the project area. Allow for planting period in the construction completion time provided in the Additional General Paragraphs. Delete time restrictions for continuous growing conditions.
**************************************************************************

Coordinate installation of planting materials during optimal planting seasons for each type of plant material required.

1.6.1  Planting Dates

[Plant all plants from [_____] to [______].]

[1.6.1.1  Deciduous Material

Deciduous material from [_____] to [______] for spring [/summer] planting and from [_____] to [_____] for fall [/winter] planting.

[1.6.1.2  Evergreen Material

Evergreen material from [_____] to [_____] for spring [/summer] planting and from [_____] to [_____] for fall [/winter] planting.

1.6.2  Restrictions

Do not plant when ground is [frozen,] [snow covered,] muddy, or when air temperature exceeds [32] [_____] degrees Celsius [90] [_____] degrees Fahrenheit.

1.7  GUARANTEE

**************************************************************************
NOTE: This guarantee is premised on a fall planting season from approximately October 1 to December 15 and a spring planting season from the time ground can be worked to May 15.
**************************************************************************

**************************************************************************
NOTE: Choose one of the following options.
**************************************************************************

[All plants must be guaranteed for [one year] [_____] beginning on the date of inspection by the Contracting Officer to commence the plant establishment period, against defects including death and unsatisfactory growth, except for defects resulting from lack of adequate maintenance, neglect, or abuse by the Government or by weather conditions unusual for the warranty period.][ Transplanted plants require no guarantee.]

[Guarantee plants [except palms] installed during fall planting season until the following [August 1] [_____]; guarantee plants installed during spring planting season until the following [October 1] [____].][ Transplanted plants require no guarantee.][ The minimum guarantee must be 90 days from
the time of planting.] [Replace palms which are not alive at the end of a one-year period.]

] [Remove and replace dead planting materials immediately unless required to plant in the succeeding planting season. ] At end of warranty period, replace planting materials that die or have 25 percent or more of their branches that die during the construction operations or the guarantee period.

1.8 PLASTIC IDENTIFICATION

**************************************************************************
NOTE: The marking system indicated below is intended to provide assistance in identification of products for making subsequent decisions as to handling, recycling, or disposal.
**************************************************************************

Provide product data indicating polymeric information in Operation and Maintenance Manual.

Type 1: Polyethylene Terephthalate (PET, PETE).
Type 2: High Density Polyethylene (HDPE).
Type 3: Vinyl (Polyvinyl Chloride or PVC).
Type 4: Low Density Polyethylene (LDPE).
Type 5: Polypropylene (PP).
Type 6: Polystyrene (PS).
Type 7: Other. Use of this code indicates that the package in question is made with a resin other than the six listed above, or is made of more than one resin listed above, and used in a multi-layer combination.

PART 2 PRODUCTS

2.1 PLANTS

**************************************************************************
NOTE: Check with local Agriculture County Extension Service Office for the species and varieties of plants recommended for the project area. Specify plants based on a xeriscaping approach, which utilizes indigenous plants and low maintenance plants tolerant of the site's existing soils and climate without supplemental irrigation or fertilization, once established. Indigenous plants typically will perform better than imported species and require less maintenance. It is advisable to sufficiently monitor imported species to determine the relative invasiveness. They can blend into the local ecosystem, but they can also overrun it, suffocating indigenous plants and crippling habitats.

Specify appropriate companion planting, seasonal mixes, and habitat vegetation. Companion planting
takes advantage of complementary relationships between some plants such as parsley and roses. Seasonal mixes utilize plants that thrive at various times of the year. Seasonal mixes are closely related to providing habitat vegetation. Many birds, animals, and insects - especially migratory creatures - depend upon certain plants flowering or seeding at specific times of the year and in certain regions.

Existing vegetation must be evaluated for appropriateness to remain. Existing vegetation may be native and require little maintenance. Utilizing existing site features minimizes site disturbance, which reduces erosion and habitat destruction. Items on site such as excavated rocks may also be considered for use as landscaping features.

2.1.1 Regulations and Varieties

Existing trees and shrubs to remain must be protected and a planting plan be arranged around them. Furnish nursery stock in accordance with ANSI/ANLA Z60.1, except as otherwise specified or indicated. Each plant or group of planting must have a "key" number indicated on the nursery certifications of the plant schedule. Furnish plants, including turf grass, grown under climatic conditions similar to those in the locality of the project. Plants specified must be [indigenous,] low maintenance varieties, tolerant of site's existing soils and climate [without supplemental irrigation or fertilization once established]. [Spray plants budding into leaf or having soft growth with an antidesiccant before digging]. Plants of the same specified size must be of uniform size and character of growth. Plants must be chosen with their mature size and growth habit in mind to avoid over-planting and conflict with other plants, structures or underground utility lines. All plants must comply with all Federal and State Laws requiring inspection for plant diseases and infestation.

2.1.2 Shape and Condition

Well-branched, well-formed, sound, vigorous, healthy planting stock free from disease, sunscald, windburn, abrasion, and harmful insects or insect eggs and having a healthy, normal, and undamaged root system.

2.1.2.1 Deciduous Trees and Shrubs

Symmetrically developed and of uniform habit of growth, with straight boles or stems, and free from objectionable disfigurements.

2.1.2.2 Evergreen Trees and Shrubs

Well developed symmetrical tops with typical spread of branches for each particular species or variety.

2.1.2.3 Ground Covers and Vines

Number and length of runners and clump sizes indicated, and of the proper age for the grade of plants indicated, furnished in removable containers, integral containers, or formed homogeneous soil section.
2.1.3 Plant Size

Minimum sizes measured after pruning and with branches in normal position, must conform to measurements indicated, based on the average width or height of the plant for the species as specified in ANSI/ANLA Z60.1. Plants larger in size than specified may be provided with approval of the [Contracting Officer] [______]. When larger plants are provided, increase the ball of earth or spread of roots in accordance with ANSI/ANLA Z60.1.

2.1.4 Root Ball Size

All box-grown, field potted, field boxed, collected, plantation grown, bare root, balled and burlapped, container grown, processed-balled, and in-ground fabric bag-grown root balls must conform to ANSI/ANLA Z60.1. All wrappings and ties must be biodegradable. Root growth in container grown plants must be sufficient to hold earth intact when removed from containers. Root bound plants will not be accepted.

[2.1.4.1 Mycorrhizal fungi inoculum

Before shipment, root systems must contain mycorrhizal fungi inoculum.

2.1.5 Growth of Trunk and Crown

**************************************************************************

NOTE: The form of growth desired for specimen or special purpose plant material must be described.
**************************************************************************

2.1.5.1 Deciduous Trees

A height to caliper relationship must be provided in accordance with ANSI/ANLA Z60.1. Height of branching must bear a relationship to the size and species of tree specified and with the crown in good balance with the trunk. The trees must not be "poled" or the leader removed.

a. Single stem: The trunk must be reasonably straight and symmetrical with crown and have a persistent main leader.

b. Multi-stem: All countable stems, in aggregate, must average the size specified. To be considered a stem, there must be no division of the trunk which branches more than 150 mm (6 inches) from ground level.

2.1.5.2 Palms

Palms must have the specified height as measured from the base of the trunk to the base of the fronds or foliage in accordance with ANSI/ANLA Z60.1. The palm must have straight trunk and healthy fronds or foliage as typical for the variety grown in the region of the project. Palms trimmed or pruned for delivery must retain a minimum of 150 mm (6 inches) of foliage at the crown as a means of determining plant health.

2.1.5.3 Deciduous Shrubs

Deciduous shrubs must have the height and number of primary stems recommended by ANSI/ANLA Z60.1. Acceptable plant material must be well shaped, with sufficient well-spaced side branches, and recognized by the trade as typical for the species grown in the region of the project.
2.1.5.4 Coniferous Evergreen Plant Material

Coniferous Evergreen plant material must have the height-to-spread ratio recommended by ANSI/ANLA Z60.1. The coniferous evergreen trees must not be "poled" or the leader removed. Acceptable plant material must be exceptionally heavy, well shaped and trimmed to form a symmetrical and tightly knit plant. The form of growth desired must be as indicated.

2.1.5.5 Broadleaf Evergreen Plant Material

Broadleaf evergreen plant material must have the height-to-spread ratio recommended by ANSI/ANLA Z60.1. Acceptable plant material must be well shaped and recognized by the trade as typical for the variety grown in the region of the project.

2.1.5.6 Ground Cover and Vine Plant Material

Ground cover and vine plant material must have the minimum number of runners and length of runner recommended by ANSI/ANLA Z60.1. Plant material must have heavy, well developed and balanced crown with vigorous, well developed root system and must be furnished in containers.

2.2 TOPSOIL

**************************************************************************
NOTE: If topsoil properties are included in another section of Division 31, delete this paragraph and include a cross-reference to the appropriate section. Otherwise, select appropriate paragraphs on topsoil. Check with the local Agriculture County Extension Service Office for soil properties appropriate for the plant materials to be planted. If existing topsoil is used, insert materials, if required, to properly condition for pH and friability. Where suitable topsoil is available within limits of the work area, include stripping and stockpiling of topsoil in the applicable section of Division 31 of the specification. If suitable topsoil is not available within the limits of the work area, consider whether it is more economical to treat the soil of the graded areas with fertilizer and supplements so as to be conducive for plant establishment and maintenance, to transport topsoil to the project site, or to use regionally native plants suited to the on-site soil. If treatment of the soil is more economical, include requirements for fertilizer and supplements. Prior to stockpiling topsoil, remove all weed-grasses. This should occur when the foliage is 150 to 250 mm 6 to 10 inches high and approximately 4 to 6 weeks prior to stockpiling.
**************************************************************************

[2.2.1 Existing Soil

Modify to conform to requirements specified in paragraph COMPOSITION.
2.2.2 On-Site Topsoil

Surface soil stripped and stockpiled on site and modified as necessary to meet the requirements specified for topsoil in paragraph COMPOSITION. When available topsoil must be existing surface soil stripped and stockpiled on-site in accordance with Section 31 00 00 EARTHWORK 31 23 00.00 20 EXCAVATION AND FILL.

2.2.3 Off-Site Topsoil

Conform to requirements specified in paragraph COMPOSITION. Additional topsoil must be furnished by the Contractor obtained from topsoil borrow areas indicated.

2.2.4 Composition

Evaluate soil for use as topsoil in accordance with ASTM D5268. From 5 to 10 percent organic matter as determined by the topsoil composition tests of the Organic Carbon, 6A, Chemical Analysis Method described in DOA SSIR 42. Maximum particle size, 19 mm 3/4 inch, with maximum 3 percent retained on 6 mm 1/4 inch screen. The pH must be tested in accordance with ASTM D4972. Topsoil must be free of sticks, stones, roots, plants, and other debris and objectionable materials. Other components must conform to the following limits:

<table>
<thead>
<tr>
<th>Component</th>
<th>Percentage Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silt</td>
<td>[25-50][7 to 17] %</td>
</tr>
<tr>
<td>Clay</td>
<td>[10-30][4 to 12] %</td>
</tr>
<tr>
<td>Sand</td>
<td>[20-35][70 to 82] %</td>
</tr>
<tr>
<td>pH</td>
<td>[5.5 to 7.0]</td>
</tr>
<tr>
<td>Soluble Salts</td>
<td>[600] ppm max</td>
</tr>
</tbody>
</table>

2.3 SOIL CONDITIONERS

**************************************************************************
NOTE: Prior to including these provisions in project specifications, perform tests of on-site topsoil to determine its suitability and the possible need of pH adjusters or soil conditioners.
**************************************************************************

Provide singly or in combination as required to meet specified requirements for topsoil. Soil conditioners must be nontoxic to plants.

2.3.1 Lime

**************************************************************************
NOTE: Use ASTM C602 calcium carbonate equivalent (C.C.E.) as specified in Table 1: for burnt lime, C.C.E. must not be less than 140 percent; for hydrated lime, C.C.E. must not be less than 110 percent; and for limestone, C.C.E. must not be less than 80 percent.
**************************************************************************
2.3.2 Aluminum Sulfate

Commercial grade.

2.3.3 Sulfur

100 percent elemental

2.3.4 Iron

100 percent elemental

2.3.5 Peat

Natural product of [peat moss] derived from a freshwater site and conforming to [ASTM D4427] [ASTM D5539] as modified herein. Shred and granulate peat to pass a 12.5 mm 1/2 inch mesh screen and condition in storage pile for minimum 6 months after excavation. Peat must not contain invasive species, including seeds.

2.3.6 Sand

Clean and free of materials harmful to plants.

2.3.7 Perlite

Horticultural grade.

2.3.8 Composted Derivatives

Ground bark, nitrolized sawdust, humus or other green wood waste material free of stones, sticks, invasive species, including seeds, and soil stabilized with nitrogen and having the following properties:

2.3.8.1 Particle Size

Minimum percent by weight passing:

- 4.75 mm No. 4 mesh screen 95
- 2.36 mm No. 8 mesh screen 80

2.3.8.2 Nitrogen Content

Minimum percent based on dry weight:

- Fir Sawdust 0.7
- Fir or Pine Bark 1.0

2.3.9 Gypsum

Coarsely ground gypsum comprised of calcium sulfate dihydrate 80 percent, calcium 18 percent, sulfur 14 percent; minimum 96 percent passing through 850 micrometers 20 mesh screen, 100 percent passing thru 970 micrometers 16 mesh screen.
2.3.10  Vermiculite

Horticultural grade for planters.

2.3.11  Rotted Manure

Well rotted horse or cattle manure containing maximum 25 percent by volume of straw, sawdust, or other bedding materials; free of seeds, stones, sticks, soil, and other invasive species.

2.4  PLANTING SOIL MIXTURES

**************************************************************************

NOTE:  Choose one of the following options.
**************************************************************************

[ 100 percent topsoil as specified herein.

][100 percent on-site topsoil.

][[_____] parts topsoil, [_____] parts [_____], and [_____] parts [_____]. Thoroughly mix all parts of planting soil mixture to a uniform blend throughout.

][Sandy topsoil: one part topsoil to one part peat; clay topsoil: two parts topsoil to one part peat. Thoroughly mix all parts of planting soil mixture to a uniform blend throughout.

]2.5  FERTILIZER

**************************************************************************

NOTE:  Check with the local Agriculture County Extension Service Office for recommended fertilizer mixture for local conditions.
**************************************************************************

Fertilizer for groundcover, wildflowers and grasses is not permitted. Fertilizer for trees, plants, and shrubs must be as recommended by plant supplier, except synthetic chemical fertilizers are not permitted. Fertilizers containing petrochemical additives or that have been treated with pesticides or herbicides are not permitted.

2.5.1  Granular Fertilizer

Organic, granular controlled release fertilizer containing the following minimum percentages, by weight, of plant food nutrients:

[_____] percent available nitrogen
[_____] percent available phosphorus
[_____] percent available potassium
[_____] percent sulfur
[_____] percent iron

]2.5.2  Fertilizer Tablets

Organic, plant tablets composed of tightly compressed fertilizer chips forming a tablet that is insoluble in water, is designed to provide a continuous release of nutrients for at least 24 months and contains the following minimum percentages, by weight, of plant food nutrients:
[20] [_____] percent available nitrogen  
[20] [_____] percent available phosphorus  
[5] [_____] percent available potassium

### 2.6 WEED CONTROL FABRIC

***********************************************************************************************
NOTE:  Check with the local Agriculture County  
Extension Service Office for recommended type of  
membrane for the project area.  Specify only one  
type of membrane for the project.
***********************************************************************************************

***********************************************************************************************
NOTE:  Choose one of the following options.
***********************************************************************************************

#### 2.6.1 Roll Type Polypropylene or Polyester Mats

Fabric must be woven, needle punched or non-woven and treated for  
protection against deterioration due to ultraviolet radiation. Fabric must  
be minimum 99 percent opaque to prevent photosynthesis and seed germination  
from occurring, yet allowing air, water and nutrients to pass thru to the  
roots. Minimum weight must be 0.11 kg per square meter 5 ounces per square  
yard with a minimum thickness of 0.50 mm 20 mils with a 20 year (minimum)  
guarantee.

#### 2.7 DRAINAGE PIPE FOR PLANT PITS AND BEDS

***********************************************************************************************
NOTE:  Check with the local Agriculture County  
Extension Service Office for recommended type of  
drainage pipe.  Specify only one type of drainage  
pipe for the project.
***********************************************************************************************

***********************************************************************************************
NOTE: If Section 33 40 00 STORM DRAINAGE UTILITIES  
is utilized, delete requirements for "DRAINAGE PIPE  
FOR PLANT PITS AND BEDS."
***********************************************************************************************

[ Plastic polyvinyl chloride pipe, [_____] mm inches in diameter,  
[unperforated] conforming to ASTM D3034 SDR 35 [perforated] conforming to  
ASTM D2729.][ Plastic HDPE pipe, [_____] mm inches in diameter,  
[unperforated] [perforated].][ Plastic ABS pipe, [_____] mm inches in  
diameter, [unperforated] [perforated].][ Corrugated plastic drainage  
tubing, [_____] mm inches in diameter, [unperforated] [perforated]  
conforming to ASTM F667/F667M.][ Clay drain tile, [_____] mm inches in  
diameter, [unperforated conforming to ASTM C4] [perforated conforming to  
ASTM C4] [[extra strength] [standard strength] conforming to ASTM C700].

### 2.8 MULCH

***********************************************************************************************
NOTE:  Check with the local Agriculture County  
Extension Service Office for recommended and locally  
available mulch material.  Examine installations

SECTION 32 93 00 Page 21
design guides if available for approve mulch list.

Free from noxious weeds, mold, pesticides, or other deleterious materials.

NOTE: Use inert mulch materials only when organic mulch is not available, or when site is located in a dry climate.

[2.8.1 Inert Mulch Materials]

NOTE: Select desired mulch materials. Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying products with recycled content.

[ Provide [recycled] [stone,] [riverbank stone,] [crushed pit-run rock,] [granite chips,] [____,] [or other recycled material] complying with ASTM D6155, ranging in size from [___(____)] to [____(____)] mm (inches).[ Provide materials from site and construction waste to the greatest extent possible.]

[2.8.2 Organic Mulch Materials]

NOTE: Hydraulic mulch is an EPA designated product for recycled content. Recycled content percentages listed are recommended by EPA; additional information can be found on the EPA's "Comprehensive Procurement Guidelines (CPG)" page within EPA's website at http://www.epa.gov.

Provide [wood cellulose fiber,] [wood chips,] [shredded hardwood,] [shredded redwood bark,] [pine straw mulch,] [pine needles,] or [recycled] [____] from site when available. Wood cellulose fiber must be processed to contain no growth or germination-inhibiting factors, dyed with non-toxic, biodegradable dye to an appropriate color to facilitate visual metering of materials application. Paper-based hydraulic mulch must contain 100 percent post-consumer recycled content. Wood-based hydraulic mulch must contain 100 percent total recovered materials content.

[2.8.3 Recycled Organic Mulch]

Recycled mulch may include compost, tree trimmings, or pine needles with a gradation that passes through a 65 by 65 mm 2-1/2 by 2-1/2 inch screen. It must be cleaned of all sticks a minimum 25 mm one inch in diameter and plastic materials a minimum 75 mm 3 inches length. The material must be treated to retard the growth of mold and fungi.
2.9 STAKING AND GUYING MATERIAL

2.9.1 Staking Material

2.9.1.1 Tree Support Stakes

Rough sawn hard wood free of knots, rot, cross grain, bark, long slivers, or other defects that impair strength. Stakes must be minimum 50 mm 2 inches square or 64 mm 2-1/2 inch diameter by 2.4 m 8 feet long, pointed at one end. [Paint or stain wood stakes dark brown.]

2.9.1.2 Ground Stakes

Rough sawn hard wood or plastic, 50 mm 2 inches square are by 0.91 m 3 feet long, pointed at one end.

2.9.2 Guying Material

2.9.2.1 Guying Wire

12 gauge annealed galvanized steel, ASTM A580/A580M.

2.9.2.2 Guying Cable

Minimum five-strand, 5 mm 3/16 inch diameter galvanized steel cable [plastic coated].

2.9.3 Hose Chafing Guards

New or used 2 ply 19 mm 3/4 inch diameter reinforced rubber or plastic hose, black or dark green, all of same color.

2.9.4 Flags

White [surveyor's plastic tape,] [12.70 mm1/2 inch diameter PVC pipe], [150 mm6 inches] [300 mm12 inches] long, fastened to guying wires or cables.

2.9.5 Turnbuckles

Galvanized or cadmium-plated steel with minimum 75 mm 3 inch long openings fitted with screw eyes. Eye bolts must be galvanized or cadmium-plated steel with 25 mm one inch diameter eyes and screw length 38 mm 1-1/2 inches, minimum.

2.9.6 Deadmen

**************************************************************************
NOTE: Avoid the use of concrete or brick materials.
**************************************************************************

100 by 200 mm4 by 8 inch rectangular or 200 mm 8 inch diameter by 900 mm 36 inch long, [pine] [fir] [_____] wood material.

2.9.7 Metal Anchors

2.9.7.1 Driven Anchors

Malleable iron, arrow shaped, galvanized, sized as follows:
### Tree Caliper

<table>
<thead>
<tr>
<th>Tree Caliper</th>
<th>Anchor Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 mm</td>
<td>75 mm</td>

</tr>
</tbody>
</table>

#### 2.9.7.2 Screw Anchors

Steel, screw type with welded-on 75 mm 3 inch round helical steel plate, minimum 10 mm 3/8 inch diameter, 375 mm 15 inches long.

#### 2.10 EDGING MATERIAL

##### 2.10.1 Wood Edging

- **NOTE:** Indicate type of wood, e.g., Redwood, Cypress, Western Red Cedar, [______]. If a decay resistant species is specified, preservative treatment will not be required. Specify decay-resistant species when feasible.

As specified in Section 06 10 00 ROUGH CARPENTRY. [Redwood] [Cypress] [Western Red Cedar] [______] wood edging must be free of solvent at time of delivery. Minimum 200 by 13 mm 8 by 1/2 inch [treated in accordance with AWPA U1 and AWPA T1 with preservatives conforming to AWPA P5 before installation]. Anchoring stakes must be the same material as wood edging, [13 by 50] [______] mm [1/2 by 2] [______] inches, 300 mm 12 inches long.

- **NOTE:** Plastic or rubber garden edging, and plastic lumber, are EPA designated products for recycled content. Recycled content percentages listed are recommended by EPA; additional information can be found on the EPA's "Comprehensive Procurement Guidelines (CPG)" page within EPA's website at [EPA's website](https://www.epa.gov).
http://www.epa.gov. Research shows that the product is commonly available via US national manufacturers meeting the percentage of recycled content listed below.

2.10.2 Recycled Plastic Edging

Plastic lumber as specified in Section 06 10 00 ROUGH CARPENTRY. 100 percent recycled [polyethylene][_____] edging, resistant to insects, termites, boring worms, splintering and rotting, and must not absorb moisture or promote bacterial growth. Minimum [1 by 4][1 by 6][2 by 4][2 by 6][_____] inch, capable of bending a minimum [24][36][_____] radius, integrally colored [brown][_____] with [slip joint][_____] connections. Anchors and stakes must be of the same manufacturer and color as the edging.

2.10.3 Concrete Edging

2.11 ANTIDESICCANTS

Sprayable, water insoluble vinyl-vinledine complex which produce a moisture retarding barrier not removable by rain or snow. Film must form at temperatures commonly encountered out of doors during planting season and have a moisture vapor transmission rate (MVT) of the resultant film of maximum 10 grams per 24 hours at 70 percent humidity.

2.12 EROSION CONTROL MATERIALS

Erosion control material must conform to the following:

2.12.1 Erosion Control Blanket

[100 percent agricultural straw][70 percent agricultural straw/30 percent coconut fiber matrix] stitched with a degradable nettings, designed to degrade within [12 months][18 months].

2.12.2 Erosion Control Fabric

Fabric must be knitted construction of polypropylene yarn with uniform mesh openings 19 to 25 mm 3/4 to 1 inch square with strips of biodegradable paper. Filler paper strips must have a minimum life of 6 months.

2.12.3 Erosion Control Net

Net must be heavy, twisted jute mesh, weighing approximately 605 grams per meter 1.22 pounds per linear yard and 1200 mm 4 feet wide with mesh openings of approximately 25 mm one inch square.
2.12.4 Hydrophilic Colloids

Hydrophilic colloids must be physiologically harmless to plant and animal life without phytotoxic agents. Colloids must be naturally occurring, silicate powder based, and must form a water insoluble membrane after curing. Colloids must resist mold growth.

2.12.5 Erosion Control Material Anchors

Erosion control anchors must be as recommended by the manufacturer.

2.13 ROOT CONTROL BARRIER

Flexible and permeable geotextile fabric with permanently attached time-released nodules. Color to be [black] [gray] [______]. [Pre-formed, round, tapered cylinder] [linear] barrier with integral vertical root deflecting ribs constructed of ultraviolet resistant polypropylene material. Color to be [black] [______].

2.14 WATER

**************************************************************************

NOTE: When water is Government furnished, locate the source. Recycled or reclaimed irrigation water may be available through a tertiary treatment plant on or off site. It is preferred that this type of water be used for irrigation whenever possible. Check project specific conditions.

Unless otherwise directed, water must be the responsibility of the Contractor. Water source must be potable or non-potable. Non-potable is preferred. If non-potable edit specification accordingly. Source of water must be approved by the Contracting Officer and must be of suitable quality for irrigation, containing no elements toxic to plant life.

Coordinate information presented here with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.

**************************************************************************

Source of water to be approved by Contracting Officer and suitable quality for irrigation and must not contain elements toxic to plant life, including acids, alkalis, salts, chemical pollutants, and organic matter. Use collected storm water or graywater when available.

2.15 MYCORRHIZAL FUNGI INOCULUM

Mycorrhizal fungi inoculum must be composed of multiple-fungus inoculum as recommended by the manufacturer for the plant material specified.

2.16 SOURCE QUALITY CONTROL

The [Contracting Officer] [and Landscape Architect of Record] [_____] will inspect plant materials at the [project] site and approve them. Tag plant materials for size and quality.
PART 3 EXECUTION

3.1 EXTENT OF WORK

Provide soil preparation, including [soil conditioners] [and] [soil amendments] prior to planting. Provide [tree,] [shrub,] [vine,] [groundcover,] [seed,] [and] [sod] planting, [post-planting fertilizer,] [edging,] [staking,] [guying,] [weed control fabric,] [erosion control material,] [root control barrier] installation,[____,] [and] [mulch topdressing] of all newly graded finished earth surfaces, unless indicated otherwise, and at all areas inside or outside the limits of construction that are disturbed by the Contractor's operations.

3.2 ALTERNATIVE HERBICIDE TREATMENT (SOLARIZING SOIL)

Within 48 hours of subsoil preparation, saturate soil with water to a depth of 914 mm 3 feet. Immediately stake polyethylene sheeting over area to be planted. Stake tightly to surface of soil. Maintain sheeting in place for a minimum of 6 weeks. Immediately after removing sheeting, cover area to be planted with topsoil. Do not till soil prior to applying topsoil.

3.3 PREPARATION

3.3.1 Protection

Protect existing and proposed landscape features, elements, and sites from damage or contamination. Protect trees, vegetation, and other designated features by erecting high-visibility, reusable construction fencing. Locate fence no closer to trees than the drip line. Plan equipment and vehicle access to minimize and confine soil disturbance and compaction to areas indicated on Drawings.

3.3.2 Layout

Stake out approved plant material locations and planter bed outlines on the project site before digging plant pits or beds. The Contracting Officer reserves the right to adjust plant material locations to meet field conditions. Do not plant closer than [300] [600] [900] [_____] mm [12] [24] [36] [_____] inches to a [building wall,] [pavement edge,] [fence or wall edge] [and] [other similar structures]. Provide on-site locations for excavated rock, soil, and vegetation.

3.3.3 Erosion Control

Provide erosion control and seeding with native plant species to protect slopes.

3.3.4 Soil Preparation

**************************************************************************
NOTE: Elevation of subgrade will vary depending upon the needs for additional topsoil, mulch topdressing, or other treatment.
**************************************************************************

[3.3.4.1 pH Adjuster Application Rates

**************************************************************************
NOTE: Check with the local Agriculture County Extension Service and specify amounts applicable for the project area.

Apply pH adjuster at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

- **Lime** 
  - kg per square meter [_____] 
  - pounds per 100 square meters [_____] 
  - pounds per 1000 square feet

- **Sulfur** 
  - kg per square meter [_____] 
  - pounds per acre [_____] 
  - kg per 100 square meters [_____] 
  - pounds per 1000 square feet

- **Iron** 
  - kg per square meter [_____] 
  - pounds per acre [_____] 
  - kg per 100 square meters [_____] 
  - pounds per 1000 square feet

- **Aluminum Sulfate** 
  - kg per square meter [_____] 
  - pounds per acre [_____] 
  - kg per 100 square meters [_____] 
  - pounds per 1000 square feet

3.3.4.2 Soil Conditioner Application Rates

NOTE: Check with the local Agriculture County Extension Service and specify amounts applicable for the project area.

Apply soil conditioners at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

- **Peat** 
  - cubic meters per square meter [_____] 
  - cubic yards per acre [_____] 
  - cubic meters per 100 square meters [_____] 
  - cubic yards per 1000 square feet

- **Sand** 
  - cubic meters per square meter [_____] 
  - cubic yards per acre [_____] 
  - cubic meters per 100 square meters [_____] 
  - cubic yards per 1000 square feet

- **Compost Derivatives** 
  - cubic meters per square meter [_____] 
  - cubic yards per acre [_____] 
  - cubic meters per 100 square meters [_____] 
  - cubic yards per 1000 square feet

- **Gypsum** 
  - cubic meters per square meter [_____] 
  - cubic yards per acre [_____] 
  - cubic meters per 100 square meters [_____] 
  - cubic yards per 1000 square feet
per acre [_____] cubic meters per 100 square meters [_____] cubic yards per 1000 square feet

Rotted Manure [_____] cubic meters per square meter[_____] cubic yard per acre[_____] cubic meters per 100 square meters [_____] cubic yards per 1000 square feet

3.3.4.3 Fertilizer Application Rates

**************************************************************************
NOTE: Check with the local Agriculture County Extension Service and specify amounts applicable for the project area.
**************************************************************************

Apply fertilizer at rates as determined by laboratory soil analysis of the soils at the job site. For bidding purposes only apply at rates for the following:

Organic granular fertilizer [ [_____] kg per square meter[_____] pounds per acre] [ [_____] kg per 100 square meters[_____] pounds per 1000 square feet ].

3.3.5 Root Control Barrier

**************************************************************************
NOTE: Contact a local arborist or plant nursery person for projects involving root pruning of existing plant material to determine required amount of root structure to be removed.
**************************************************************************

Install geotextile fabric in the soil in a [vertical] [horizontal] [and] [surrounding] application. Use appropriate holding device to assure fabric position. For vertical or horizontal application, a minimum [50] [_____] mm [2] [_____] inch soil cover is required over the top [surface] [edge]. A minimum [450] [_____] mm [18] [_____] inch extension of fabric beyond the structure area to be protected is required to prevent root growth from growing around fabric edges.[Install cylindrical] [linear] polypropylene barrier a minimum [12.70] [25] [_____] mm [1/2] [one] [_____] inch above finish grade to prevent root growth over the barrier. Backfill the outside of the barrier with 19 to 25 mm 3/4 to one gravel a minimum width of [50] [_____] [2] [_____] inches. For linear barrier application use appropriate device to connect two pieces.

3.3.6 Subsoil Drainage for Plant Pits and Beds

**************************************************************************
NOTE: Drawings must indicate areas where subsoil drainage will be required to provide for adequate drainage of areas to be planted.

**************************************************************************
NOTE: If Section 33-40-00 STORM DRAINAGE UTILITIES is utilized, delete requirements for Subsoil Drainage for Plant Pits and Beds.
**************************************************************************

Provide as indicated.[ Lay perforated drain pipe with perforations down.]
Backfill trenches as specified in Section [31-00-00 EARTHWORK][31-23-00.00 20 EXCAVATION AND FILL].

3.4 PLANT BED PREPARATION

Verify location of underground utilities prior to excavation. Protect existing adjacent turf before excavations are made. Do not disturb topsoil and vegetation in areas outside those indicated on Drawings. Where planting beds occur in existing turf areas, remove turf to a depth that will ensure removal of entire root system. Measure depth of plant pits from finished grade. Depth of plant pit excavation must be as indicated and provide proper relation between top of root ball and finished grade. Install plant material as specified in paragraph PLANT INSTALLATION. Do not install trees within 10 feet of any utility lines or building walls.

3.5 PLANT INSTALLATION

3.5.1 Individual Plant Pit Excavation

Excavate pits at least [twice as large] [400] [_____] mm [16] [_____] inches larger in diameter as the size of ball or container to depth shown.

3.5.2 Plant Beds with Multiple Plants

Excavate plant beds continuously throughout entire bed as outlined to depth shown.

3.5.3 Handling and Setting

Move plant materials only by supporting the [root ball] [container]. [Set plants on hand compacted layer of prepared backfill soil mixture [150] [_____] mm [6] [_____] inches thick][Set plants on native soil] and hold plumb in the center of the pit until soil has been tamped firmly around root ball. Set plant materials, in relation to surrounding finish grade, [25 to 50] [_____] to [_____] mm [one to 2] [_____] to [_____] inches above [_____] mm [inches] below] depth at which they were grown in the nursery, collecting field or container. Replace plant material whose root balls are cracked or damaged either before or during the planting process.

Plant material must be set in plant beds according to the drawings. Backfill soil mixture must be placed on previously scarified subsoil to completely surround the root balls, and must be brought to a smooth and even surface, blending to existing areas.

3.5.3.1 Balled and Burlapped Stock

Backfill with [prepared soil mixture] [topsoil] to approximately half the
depth of ball and then tamp and water. Carefully remove or fold back excess burlap and tying materials from the top a minimum 1/3 depth from the top of the rootball. Tamp and complete backfill, place mulch topdressing, and water. Remove wires and non-biodegradable materials from plant pit prior to backfill operations.

3.5.3.2 Bare-Root Stock

Plant so roots are arranged in a natural position. Place roots in water a minimum of 30 minutes prior to planting. Carefully work [prepared soil mixture] [topsoil] among roots. Tamp remainder of backfill, place mulch topdressing and water.

3.5.3.3 Container Grown Stock

Remove from container and prevent damage to plant or root system.

3.5.3.4 Ground Covers and Vines

**************************************************************************

NOTE: Choose one of the following options. Choose the second option for NAVFAC SE projects.
**************************************************************************

[Plant after placing mulch topdressing. Do not remove plant materials from flats or containers until immediately before planting. Space at intervals indicated. Plant at a depth to sufficiently cover all roots. Start watering areas planted as required by temperature and wind conditions. Apply water at a rate sufficient to ensure thorough wetting of soil to a depth of [150] [_____] mm [6] [_____] inches without run off or puddling. Smooth planting areas after planting to provide even, smooth finish.

[Smooth planting areas before planting to provide even, smooth finish.

Plant after placing weed control fabric and mulch topdressing. Do not remove plant material from flats or containers until immediately before planting. Space at the intervals indicated. Plant at a depth to sufficiently cover all roots. Start watering areas planted as required by temperature and wind conditions. Apply water at a rate sufficient to ensure thorough wetting of soil to a depth of [150] [_____] mm [6] [_____] inches without run off or puddling. Add mulch topdressing as needed.

3.5.4 Earth Mounded Watering Basin for Individual Plant Pits

[Form with topsoil around each plant by replacing a mound of topsoil around the edge of each plant pit. Watering basins must be 150 mm 6 inches deep for trees and 100 mm 4 inches deep for shrubs. Eliminate basins around plants in plant beds containing multiple plants.

[Form with topsoil around each plant by placing a mound of topsoil around the edge of each plant pit. Watering basins must be 150 mm 6 inches deep for trees and 100 mm 4 inches deep for shrubs. Construct watering basin in a 1.4 m 4-1/2 foot diameter circle around specimen (not planted in a close group) trees and shrubs.

3.5.5 Weed Control Fabric Installation

Remove grass and weed vegetation, including roots, from within the area enclosed by edging. Completely cover areas enclosed by edging with

3.5.6 Erosion Control Material

Install in accordance with manufacturer's instructions.

3.5.7 Placement of Mulch Topdressing

Place specified mulch topdressing on top of weed control fabric covering total area enclosed by edging. Place mulch topdressing to a depth of [75] mm [3] inches.

3.5.8 Mulch Topdressing

Provide mulch topdressing over entire planter bed surfaces and individual plant surfaces including earth mound watering basin around plants to a depth of [75] mm [3] inches after completion of plant installation and before watering. Keep mulch out of the crowns of shrubs. Place mulch a minimum 50 to 75 mm 2 to 3 inches away from trunk of shrub or tree. Place on top of any weed control fabric.

3.5.9 Installation of Edging

Uniformly edge beds of plants to provide a clear cut division line between planted area and adjacent lawn. Construct bed shapes as indicated. Install edging material in a perfect 1.22 m 4 foot diameter circle inside the 1.37 m 4-1/2 foot watering basin, around individual specimen trees and shrubs not planted in a close group. Install edging with minimum [25 mm] inch left above ground level.

3.5.10 Fertilization

NOTE: Fertilizer planting tablets are the most commonly used and convenient method of pre-planting fertilization. Other types of fertilizer including bone meal or other organic fertilizers or granular fertilizers may be specified when appropriate. Number of tablets or quantity of other fertilizers should be inserted in blanks and should be based on agronomist's recommendations.

3.5.10.1 Fertilizer Tablets

Place fertilizer planting tablets evenly spaced around the plant pits to the manufacturer's recommended depth.

3.5.10.2 Granular Fertilizer

Apply granular fertilizer as a top coat prior to placing mulch layer and water thoroughly.

3.5.11 Watering

Start watering areas planted as required by temperature and wind conditions. Slow deep watering must be used. Apply water at a rate.
sufficient to ensure thorough wetting of soil to a depth of [300] [_____] mm [12] [_____] inches without run off or puddling. Watering of other plant material or adjacent areas must be prevented.

3.5.12  Staking and Guying

3.5.12.1  Staking

**********************************************************************
NOTE:  Select methods of staking each tree based on
the size and species of the tree and local wind
conditions.
**********************************************************************

Stake plants with the number of stakes indicated complete with [double strand of 12 gage guy wire] [_____] as detailed. Attach [guy wire] [_____] half the tree height but not more than 1.5 m 5 feet high. Drive stakes to a depth of [0.80 to 0.91] [_____] m [2-1/2 to 3] [_____] feet into the ground outside the plant pit. Do not injure the root ball. [ Use hose chafer guards where guy wire comes in contact with tree trunk.]

3.5.12.2  Guying

**********************************************************************
NOTE:  Select methods of guying each tree based on
the size and species of the tree and local wind
conditions.
**********************************************************************

Guy plants as indicated. Attach [two strands of guying wire] [guying cable] around the tree trunk at an angle of 0.785 rad 45 degrees at approximately 1/2 of the trunk height [______]. Protect tree trunks with chafer guards where guying [wire] [cable] contacts the tree trunk. Anchor guys to [deadmen wood blocks] [wood ground stakes] [malleable iron anchors] [steel screw anchors]. Fasten flags to each guying [wire] [cable] approximately 2/3 of the distance up from ground level. [ Provide turnbuckles as indicated.]

3.5.12.3  Chafer Guards

Use hose chafer guards, as specified where guy [wire] [cable] will contact the plant.

3.5.12.4  Deadmen

Place deadmen minimum 450 mm 18 inches below ground surface. Place equal distance from tree trunk and around the plant pit.

3.5.12.5  Wood Ground Stakes

Drive wood ground stakes into firm ground outside of plant pit with top of stake flush with ground. Place equal distance from tree trunk and around the plant pit.

3.5.12.6  Iron Anchors

Drive malleable iron anchors into firm ground outside of plant pit a minimum 750 mm 30 inches below finish grade. Place equal distance from tree trunk and around the plant pit.

SECTION 32 93 00  Page 33
3.5.12.7 Steel Screw Anchors

Insert steel screw anchors as recommended in manufacturer's data. Place equal distance from tree trunk and around the plant pit.

3.5.12.8 Flags

Securely fasten flags on each guy [wire] [and] [cable] [approximately two-thirds of the distance up from ground level].

3.5.13 Pruning

**************************************************************************
NOTE: Check with the local Agriculture county Extension Service Office for recommended pruning season for the project area. Insert the dates in the subject paragraph.
**************************************************************************

Prune in accordance with safety requirement of TCIA Z133.

3.5.13.1 Trees and Shrubs

Remove dead and broken branches. Prune to correct structural defects only. Retain typical growth shape of individual plants with as much height and spread as practical. Do not cut central leader on trees. Make cuts with sharp instruments. Do not flush cut with trunk or adjacent branches. Collars must remain in place. Pruning must be accomplished by trained and experienced personnel and must be accordance with TCIA A300P1.

3.5.13.2 Wound Dressing

Do not apply tree wound dressing to cuts.

3.6 RESTORATION AND CLEAN UP

3.6.1 Restoration

Turf areas, pavements and facilities that have been damaged from the planting operation must be restored to original condition at the Contractor's expense.

3.6.2 Clean Up

Excess and waste material must be removed from the installed area and must be [disposed offsite at an approved landfill, recycling center, or composting center] [composted on site]. Separate and recycle or reuse the following landscape waste materials: [nylon straps,] [wire,] [ball wrap,] [burlap,] [wood stakes,] [_____]. Adjacent paved areas must be cleared.

NOTE: This guide specification covers the requirements for transplanting exterior plant material.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The contract drawings will delineate original and new transplanting locations for individual plant material.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICANHORT (AH)

ASTM INTERNATIONAL (ASTM)

ASTM C602 (2020) Agricultural Liming Materials

ASTM D5539 (2013) Seed Starter Mix

ASTM D6155 (2019) Nontraditional Coarse Aggregate for Bituminous Paving Mixtures

TREE CARE INDUSTRY ASSOCIATION (TCIA)

U.S. DEPARTMENT OF AGRICULTURE (USDA)

1.2 RELATED REQUIREMENTS

Section 02 41 00 [DEMOLITION] [AND] [DECONSTRUCTION], [Section 31 00 00 EARTHWORK,] [Section 32 84 24 IRRIGATION SPRINKLER SYSTEMS,] [Section 32 92 19 SEEDING,] [Section 32 92 23 SODDING,] [Section 32 92 26 SPRIGGING,] [Section 32 93 00 EXTERIOR PLANTS,] and Section 32 05 33 LANDSCAPE ESTABLISHMENT applies to this section for requirements, with additions and modifications herein.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

State Landscape Contractor's License & Tree Relocation References
Permits

Photographs

SD-02 Shop Drawings

Transplanting Plan

SD-03 Product Data

Equipment

A listing of equipment to be used for the transplanting operation, including size model, year and type of mechanical tree transplanting equipment.

Soil Test; [Soil Test of current growing area]; [Soil Test of proposed area]; [Soil Test location map]

Percolation Test; [Percolation Test of current growing area]; [Percolation Test of proposed area]

1.4 QUALITY ASSURANCE

1.4.1 State Landscape Contractor's License & Tree Relocation References

Contractor must be a professional tree moving company holding a landscape contractor's license in the state where the work is to be performed and have a minimum of 10 years tree relocation experience. Submit a copy of license and 3 references of tree relocation work in the past five years.

1.4.2 Permits

The Contractor must obtain and pay for permits and fees for the alteration of overhead lines or any other related moving permit or fee that requires compliance with Federal, State and local regulatory requirements.

1.4.3 Photographs

The contractor must provide a clear 100 mm by 150 mm 4 inch by 6 inch minimum size color photograph of the plant material to be relocated. Trees
must be documented by an individual photograph of each. Photographs must indicate the date and species of each plant on the back or front of each photo.

1.4.4 Transplanting Plan

A transplanting plan must be submitted showing existing and proposed locations of transplanted material. The plan must also delineate methods, dates, and times for root pruning, digging, balling, removing, storing, transporting, planting, watering, and maintenance to ensure survivability. The plan must also include equipment and anti-desiccant to be used. A listing of the plant material to be transplanted must be provided by common name and botanical name as listed under "Nomenclature" in ANSI/ANLA Z60.1; classification; caliper; and height.

1.4.5 Pre-Installation Meeting

Convene a pre-installation meeting a minimum of one week prior to commencing work of this section. Require attendance of parties directly affecting work of this section. Review conditions of operations, procedures and coordination with related work. Agenda must include the following:

a. Tour, inspect, and discuss conditions of planting materials.

b. Review planting schedule and maintenance.

c. Review required inspections.

d. Review environmental procedures.

1.4.6 Soil Test

Commercial test from an independent testing laboratory according to the Organic Carbon, 6A, Chemical Analysis Method described in DOA SSIR 42 including basic soil groups (sand, silt, clay, pH (ASTM D4972), soluble salts), secondary nutrient groups (calcium, magnesium, sodium, Sodium Absorption Ratio (SAR)), micronutrients (zinc, manganese, iron, copper). Soil required for each test must include a maximum depth of 450 mm 18 inches of approximately one liter one quart volume for each test. Areas sampled should not be larger than 0.4 hectare one acre and should contain at least 6-8 cores for each sample area and be thoroughly mixed. Problem areas should be sampled separately and compared with samples taken from adjacent non-problem areas. The location of the sample areas should be noted and marked on a parcel or planting map for future reference.

1.4.7 Percolation Test

Immediately following rough grading operation, identify a typical location for one of the largest trees and or shrubs and excavate a pit per the project details. Fill the pit with water to a depth of 300 mm 12 inches. The length of time required for the water to percolate into the soil, leaving the pit empty, must be measured by the project Landscape Architect and verified by the Contracting Officer. Within six hours of the time the water has drained from the pit, the Contractor, with the Contracting Officer and project Landscape Architect present, must again fill the pit with water to a depth of 300 mm 12 inches. If the water does not completely percolate into the soil within 9 hours, a determination must be made and submitted by the Contractor and verified and approved by the
Contracting Officer, whether a drainage system or a soil penetrant will be required for each tree and or shrub being transplanted.

1.5 DELIVERY OF MATERIALS

1.5.1 Soil Conditioners Delivery and Storage

Soil conditioners must be delivered to the site in the original, unopened containers bearing the manufacturer’s chemical analysis. In lieu of containers, soil conditioners may be furnished in bulk. A chemical analysis must be provided for bulk deliveries. Store in dry locations and away from contaminants.

1.6 PLANT MATERIAL IDENTIFICATION

Plant material to be transplanted must be tagged and/or shown on drawings. Transplanted plant material must be delivered with attached, durable, waterproof labels and weather-resistant ink or imprinted tags, stating the correct botanical and common plant name and size.

1.7 INSPECTION OF MATERIALS

Materials must be inspected for compliance with paragraph PRODUCTS and paragraph PLANT MATERIAL IDENTIFICATION. Open soil amendment containers or wet soil amendments must be rejected. Topsoil that contains slag, cinders, stones, lumps of soil, sticks, roots, trash or other material larger than 40 mm 1-1/2 inch diameter must be rejected. Topsoil that contains viable plant material and plant parts must be rejected. Unacceptable material must be removed from the job site. The Contracting Officer reserves the right to refuse any unacceptable plant material. All rejected plant material must be removed from the job site on the day of rejection.

1.8 HANDLING OF PLANT MATERIALS

Materials must not be dropped from vehicles. Plant material must be transported without scarring trunks or deforming crown branching. Materials found to be in unacceptable condition must be replaced at no additional cost to the Government.

1.9 TIME LIMITATION

The time limitation from digging, removing, transporting, to installing transplanted plant material must be the same day. The time limitation between installing the plant material and placing the mulch must be a maximum 48 hours. If project conditions prevent the Contractor from transplanting and installing plant material on the same day, plant materials must be boxed or heeled in as required. Plant material must be maintained and protected by the Contractor.

1.10 GUARANTEE

Transplanted plant material must have a guarantee period of [365 days][______]. All plants that die or have 25 percent or more of their branches that die during the construction operations or the guarantee period, must be replaced in kind in relation to size and species during the planting season from [______] to [______].
1.11 TRANSPLANTED PLANT MATERIAL TIME AND CONDITIONS

******************************************************************************
NOTE: Project specific climate and conditions, nationally or internationally, will dictate the optimal times for transplanting. Contact the local agricultural office for this information.

Root pruning times should be planned a minimum of one year in advance for specimen trees and as recommended by the design professional for other plant materials and conditions.
******************************************************************************

Coordinate installation of planting materials during optimal planting seasons for each type of plant material required.

1.11.1 Deciduous Plant Material Time

Deciduous plant material must be transplanted from [_____] to [______].

1.11.2 Evergreen Plant Material Time

Evergreen plant material must be transplanted from [_____] to [______].

1.11.3 Transplanting Conditions

All transplanting operations must be performed only during periods when beneficial results can be obtained. When drought, excessive moisture, frozen ground or other unsatisfactory conditions prevail, the work must be stopped when directed. When special conditions warrant a variance to all transplanting operations, proposed transplanting times must be submitted for approval. The installing site for the plant material must be prepared and excavated in accordance with paragraph SITE EXCAVATION, prior to removing the plant material. If project conditions prevent the Contractor from transplanting and installing plant material on the same day, plant material must be boxed or heeled in as required. Plant material must be maintained by the Contractor until a suitable planting time.

1.11.4 Underground Utilities

The location of underground utilities and facilities at both the removal and installing sites must be verified and marked. Damage to underground utilities and facilities must be repaired at the Contractor's expense.

1.11.5 Protecting Existing Vegetation

When there are established lawns at either the removal or installing sites, the turf must be protected during the operation. Existing trees, shrubs, and plant beds at the [removal] [and][or] [installing site[s]] that are to be preserved must be barricaded and protected from damage by a tree barricade or other measure. Damage to existing plant material must be mitigated by the Contractor at no additional cost to the Government. Damage must be assessed by a state certified arborist or other approved professional using the National Arborist Association's tree valuation guideline.
1.11.6 Protection of Plant Material to be Transplanted

Protect plant material slated for transplanting that is not transplanted at the beginning of construction operations. Prior to construction operations, tag plants to be transplanted with plastic or vinyl tape tied to the plant caliper. Plants to be transplanted must be protected from root compaction and any other damage (with barrier of metal poles a maximum of 2.5 meters 8 feet on center with plastic fluorescent netting) at a minimum of 6 meter 20 foot diameter from outside of the plant's trunk prior to the start of any construction operations. Where tree drip lines are greater than 3 meter 10 feet from the tree's trunk, locate barrier fencing at the drip line of the tree. Plastic tape and barrier fencing must not be removed until transplanting operations are ready to begin and or instructed by the Contracting Officer. Water and prune plant material as necessary to keep healthy and vigorous, particularly when water is shut off. Water existing plant material to be transplanted from the start of construction operations until the maintenance period is over or until regular [irrigation] [water] service is in working order. Outside storage locations must be continually shaded and protected from the wind. Bare root plants must be heeled in. Plants stored on the project must be protected from any drying at all times covering the balls or roots with moist sawdust, wood chips, shredded bark, peat moss, or other similar mulching material.

1.11.7 Protection of Plant Material During Transplanting

Plant material must be protected during transplanting to prevent desiccation and damage to the branches, trunk, and root system. Branches of shrubs, palms, vines must be protected by tying-in. Exposed branches must be covered during transport. [The root area must be treated with mycorrhizal fungi inoculum.] Plant material must be undamaged, vigorous and healthy with a well-branched root system, free from disease, harmful insects and insect eggs, sun-scald injury, disfigurement or abrasion after transplanting. Plant material showing desiccation, abrasion, sun scald injury or structural branching damage must be replaced at no cost to the government.

PART 2 PRODUCTS

2.1 TOPSOIL

**************************************************************************
NOTE: If topsoil properties are included in another section of Division 31, delete this paragraph and include a cross-reference to the appropriate section. Otherwise, select appropriate sources of topsoil. Check with the local Agriculture County Extension Service Office for soil properties appropriate for the plant materials to be planted. If existing topsoil is used, insert materials, if required, to properly condition for pH and friability. Where suitable topsoil is available within limits of the work area, include stripping and stockpiling of topsoil in the applicable section of Division 31. If suitable topsoil is not available within the limits of the work area, consider whether it is more economical to treat the soil of the graded areas with fertilizer and supplements so as to be conducive for plant growth.
establishment and maintenance, to transport topsoil to the project site, or to use regionally native plants suited to the on-site soil. If treatment of the soil is more economical, include requirements for fertilizer and supplements. Prior to stockpiling topsoil, remove all weed-grasses. This should occur when the foliage is 150 to 250 mm (6 to 10 inches) high and approximately 4 to 6 weeks prior to stockpiling.

Topsoil to be placed around root balls of transplanted material at new planting site must match topsoil of existing site where material is transplanted from, based on soil tests taken at both the current growing area and the proposed growing site. Minimum matching characteristics must include: pH, organic matter, soluble salts, percentages of silt, clay and sand. [Existing soil must be used as topsoil.][Stockpiled on-site surface soil must be used as topsoil.][Additional topsoil must be [furnished by the Contractor] [obtained from topsoil borrow areas indicated]]. Soil conditioners may be added to topsoil to bring into compliance.

2.2 SOIL CONDITIONERS

NOTE: Prior to including these provisions in project specifications, perform tests of on-site topsoil to determine its suitability and the possible need of pH adjusters or soil conditioners.

Provide singly or in combination as required to meet specified requirements for topsoil. Soil conditioners must be nontoxic to plants.

2.2.1 Lime

NOTE: Use ASTM C602 calcium carbonate equivalent (C.C.E.) as specified in Table 1: for burnt lime, C.C.E. must not be less than 140 percent; for hydrated lime, C.C.E. must not be less than 110 percent; and for limestone, C.C.E. must not be less than 80 percent.

Commercial grade [hydrated] [or] [burnt] limestone containing a calcium carbonate equivalent (C.C.E.) as specified in ASTM C602 of not less than [80][_____] percent.

2.2.2 Aluminum Sulfate

Commercial grade.

2.2.3 Sulfur

100 percent elemental
2.2.4 Iron

100 percent elemental

2.2.5 Peat

Natural product of [peat moss] derived from a freshwater site and conforming to [ASTM D4427] [ASTM D5539] as modified herein. Shred and granulate peat to pass a 12.5 mm 1/2 inch mesh screen and condition in storage pile for minimum 6 months after excavation. Peat must not contain invasive species, including seeds.

2.2.6 Sand

Clean and free of materials harmful to plants.

2.2.7 Perlite

Horticultural grade.

2.2.8 Composted Derivatives

Ground bark, nitrolized sawdust, humus or other green wood waste material free of stones, sticks, invasive species, including seeds, and soil stabilized with nitrogen and having the following properties:

2.2.8.1 Particle Size

Minimum percent by weight passing:

- 4.75 mm No. 4 mesh screen 95
- 2.36 mm No. 8 mesh screen 80

2.2.8.2 Nitrogen Content

Minimum percent based on dry weight:

- Fir Sawdust 0.7
- Fir or Pine Bark 1.0

2.2.9 Gypsum

*NOTE: Gypsum must be spread evenly over the entire site area. Do not deposit gypsum in areas that lack adequate drainage. Verify appropriate application rates with a landscaping consultant. Application rates may be as high as 22 tons per acre; however, in some areas there may be regulatory restrictions on the disposal of construction waste on site and a variance may be required.*

Coarsely ground gypsum comprised of calcium sulfate dihydrate 80 percent, calcium 18 percent, sulfur 14 percent; minimum 96 percent passing through 850 micrometers 20 mesh screen, 100 percent passing thru 970 micrometers 16 mesh screen.
2.2.10 Vermiculite

Horticultural grade for planters.

2.2.11 Rotted Manure

Well rotted horse or cattle manure containing maximum 25 percent by volume of straw, sawdust, or other bedding materials; free of seeds, stones, sticks, soil, and other invasive species.

2.3 MULCHES TOPDRESSING

******************************************************************************
NOTE: Check with the local Agriculture County Extension Service Office for recommended and locally available mulch material. Specify only one type of mulch for the project.
******************************************************************************
Free from noxious weeds, mold, pesticides, or other deleterious materials.

******************************************************************************
NOTE: Use inert mulch materials only when organic mulch is not available, or when site is located in a dry climate.
******************************************************************************

[2.3.1 Inert Mulch Materials

******************************************************************************
NOTE: Select desired mulch materials. Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.
******************************************************************************
Provide [recycled] [stone,] [riverbank stone,] [crushed pit-run rock,] [granite chips,] [____,] [or other recycled material] complying with ASTM D6155, ranging in size from [___(____)] to [____(____)] mm inches.[Provide materials from site and construction waste to the greatest extent possible.]

]2.3.2 Organic Mulch Materials

******************************************************************************
NOTE: For projects at Camp Lejeune and New River, use pine straw mulch only. Delete all other options.
******************************************************************************

******************************************************************************
NOTE: Hydraulic mulch is an EPA designated product for recycled content. Recycled content percentages listed are recommended by EPA; additional information can be found on the EPA's "Comprehensive Procurement Guidelines (CPG)" page within EPA's website at http://www.epa.gov.
******************************************************************************
Provide [wood cellulose fiber,] [wood chips,] [shredded hardwood,] [shredded redwood bark,] [pine straw mulch,] [pine needles,] or [recycled] [_____] from site when available. Wood cellulose fiber must be processed to contain no growth or germination-inhibiting factors, dyed with non-toxic, biodegradable dye to an appropriate color to facilitate visual metering of materials application. Paper-based hydraulic mulch must contain 100 percent post-consumer recycled content. Wood-based hydraulic mulch must contain 100 percent total recovered materials content.

2.3.3 Recycled Organic Mulch

Recycled mulch may include compost, tree trimmings, or pine needles with a gradation that passes through a 65 mm by 65 mm 2-1/2 inch by 2-1/2 inch screen. It must be cleaned of all sticks a minimum 25 mm one inch in diameter and plastic materials a minimum 75 mm 3 inch length. The material must be pretreated to retard the growth of mold and fungi.

2.4 STAKING AND GUYING MATERIAL

2.4.1 Staking Material

2.4.1.1 Tree Support Stakes

Rough sawn hard wood free of knots, rot, cross grain, bark, long slivers, or other defects that impair strength. Stakes must be minimum 50 mm 2 inches square or 64 mm 2-1/2 inch diameter by 2.4 m 8 feet long, pointed at one end. Paint or stain wood stakes dark brown.

2.4.1.2 Ground Stakes

Rough sawn hard wood or plastic, 0.91 m 3 feet long.

2.4.2 Guying Material

2.4.2.1 Guying Wire

12 gauge annealed galvanized steel, ASTM A580/A580M.

2.4.2.2 Guying Cable

Minimum five-strand, 5 mm 3/16 inch diameter galvanized steel cable [plastic coated].

2.4.2.3 Hose Chafing Guards

New or used 2 ply 19 mm 3/4 inch diameter reinforced rubber or plastic hose, black or dark green, all of same color.

2.4.2.4 Flags

White [surveyor's plastic tape,] [12.70 mm 1/2 inch diameter PVC pipe,] [150 mm6 inches] [300 mm12 inches] long, fastened to guying wires or cables.

2.4.2.5 Turnbuckles

Galvanized or cadmium-plated steel with minimum 75 mm 3 inch long openings fitted with screw eyes. Eye bolts must be galvanized or cadmium-plated steel with 25 mm one inch diameter eyes and screw length 38 mm 1-1/2 inches,
minimum.

2.4.2.6 Deadmen

**************************************************************************
NOTE: Avoid the use of concrete or brick materials.
**************************************************************************

100 by 200 mm by 8 inch rectangular or 200 mm 8 inch diameter by 900 mm 36 inch long, [pine] [fir] [_____] wood material.

2.4.2.7 Metal Anchors

a. Driven Anchors

Malleable iron, arrow shaped, galvanized, sized as follows:

<table>
<thead>
<tr>
<th>Tree Caliper</th>
<th>Anchor Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 mm</td>
<td>75 mm</td>
</tr>
<tr>
<td>75 to 150 mm</td>
<td>100 mm</td>
</tr>
<tr>
<td>150 to 200 mm</td>
<td>150 mm</td>
</tr>
<tr>
<td>200 to 250 mm</td>
<td>200 mm</td>
</tr>
<tr>
<td>250 to 300 mm</td>
<td>250 mm</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Tree Caliper</th>
<th>Anchor Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 inches and under</td>
<td>3 inches</td>
</tr>
<tr>
<td>3 to 6 inches</td>
<td>4 inches</td>
</tr>
<tr>
<td>6 to 8 inches</td>
<td>6 inches</td>
</tr>
<tr>
<td>8 to 10 inches</td>
<td>8 inches</td>
</tr>
<tr>
<td>10 to 12 inches</td>
<td>10 inches</td>
</tr>
</tbody>
</table>

b. Screw Anchors

Steel, screw type with welded-on 75 mm 3 inch round helical steel plate, minimum 10 mm 3/8 inch diameter, 375 mm 15 inches long.

[2.5 MYCORRHIZAL FUNGI INOCULUM]

Mycorrhizal fungi inoculum must be composed of multiple-fungus inoculum as recommended by the manufacturer for the plant material specified.

]2.6 WATER

**************************************************************************
NOTE: When water is Government furnished, locate the source. Recycled or reclaimed irrigation water may be available through a tertiary treatment plant

SECTION 32 96 00 Page 16
on or off site. It is preferred that this type of water be used for irrigation whenever possible. Check project specific conditions.

Unless otherwise directed, water must be the responsibility of the Contractor. Water source must be potable or non-potable. Non-potable is preferred. If non-potable edit specification accordingly. Source of water must be approved by the Contracting Officer and must be of suitable quality for irrigation, containing no elements toxic to plant life.

Coordinate information presented here with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.

******************************************************************************

Unless otherwise directed, water is the responsibility of the Contractor. Water must be [potable][non-potable], and may be supplied by an existing irrigation system or by collected storm water or a graywater system.

PART 3 EXECUTION

3.1 PLANT MATERIAL PREPARATION AND HANDLING

3.1.1 Pruning

******************************************************************************

NOTE: Root pruning should be scheduled well in advance of transplanting. Tree size, location and condition will determine specific requirements. Early root pruning will allow time for the plant to grow new roots inside the root ball to improve recovery.

******************************************************************************

3.1.1.1 Root Pruning

Large canopy and specimen plant material must be root pruned a minimum of 6 months before transplanting[____]. Minimum root ball sizes must be in accordance with ANSI/ANLA Z60.1.

3.1.1.2 Canopy Pruning

Canopy pruning must conform to TCIA A300P1.

3.1.2 Plant Material Preparation

Plant material designated for transplanting must be watered thoroughly several days before root pruning, digging or moving. Broken or interfering growth must be pruned. Large canopy and specimen plant material must be [wire balled and burlapped] [boxed] [bare rooted] [spaded]. Mark north side of plants prior to excavation. Relocate in new location with north facing same direction.

3.1.3 Palms

In preparation for relocation, remove all dead and green fronds below a
horizontal position with clean, sterilized equipment and tools. All fronds above horizontal must be lifted and tied together in two locations around the crown in an upright position with a light weight cotton rope. Removal of fronds and tying must be completed prior to digging the root ball. Palms trimmed or pruned must retain a minimum 150 mm 6 inches of foliage at the crown as a means of determining plant health.

3.2 SITE PREPARATION

3.2.1 Protection

Protect existing and proposed landscape features, elements, and sites from damage or contamination. Protect trees, vegetation, and other designated features by erecting high-visibility, reusable construction fencing. Locate fence no closer to trees than the drip line. Plan equipment and vehicle access to minimize and confine soil disturbance and compaction to areas indicated on Drawings.

3.2.2 Finish Grade and Topsoil

**************************************************************************
NOTE: Coordinate the placement of topsoil with Section 31 00 00 EARTHWORK. When stockpiled topsoil is limited, define the areas that will use this soil.
**************************************************************************

Verify that finish grades are as indicated on drawings, and that the placing of topsoil, the smooth grading, and the compaction requirements have been completed in accordance with Section [31 00 00 EARTHWORK][31 23 00.00 20 EXCAVATION AND FILL], prior to the commencement of the transplanting operation.

3.2.3 Layout

Relocate plant material as shown on drawings. Plant material locations may be adjusted to meet field conditions, only with Contracting Officer approval. Provide on-site locations for excavated rock, soil, and vegetation.

3.2.4 Erosion Control

**************************************************************************
NOTE: The erosion potential of a soil is of concern in vegetated channels, road embankments, dams, levees, spillways, construction sites, etc.
**************************************************************************

Provide erosion control in accordance with Section 32 93 00 EXTERIOR PLANTS, and by seeding with native plant species to protect slopes.

3.3 SITE EXCAVATION

3.3.1 Obstructions Above or Below Ground

When obstructions above or below ground affect the work, shop drawings showing proposed adjustments to plant material location, and planting method must be submitted for Government approval.
3.3.2 Turf Removal and Replacement

Do not disturb topsoil and vegetation in areas outside those indicated on Drawings. Where the installation operation occurs in an existing lawn area, the turf must be removed from the excavation area to a depth that will ensure the removal of the entire root system.

3.3.3 Plant Pits

Plant pits must be dug to a depth equal to the height of the root ball as measured from the base of the ball to the base of the plant trunk. Plant pits must be dug a minimum of 2 times the diameter of the root system to allow for root expansion. The pit must be constructed with sides sloping towards the base as a cone, to encourage well-aerated soil to be available to the root system for favorable root growth. Cylindrical pits with vertical sides must not be used. Pits must be dug immediately before plants are placed in the pit.

3.4 INSTALLATION

3.4.1 Setting Plant Material

Plant material must be set plumb and held in position until sufficient top soil has been firmly placed around root system or ball. In relation to the surrounding grade, the plant material must be set even with the grade at which it was grown. The root system must be spread out and arranged in its natural position. Damaged or girdled roots must be removed with a clean cut. The beginning of the root flare must be visible at soil level when the tree is planted, since it is critical not to plant the tree too deep. The following must be performed:

a. Plumb plant materials and backfill half of the hole with topsoil.

b. Prior to backfilling, all metal, wood, and synthetic products must be removed from the ball or root system avoiding damage to the root system. Biodegradable burlap and tying material must be carefully opened and folded back from the top a minimum 1/3 depth from the top of the root ball.

c. Water the hole to collapse air pockets.

d. Backfill and gently firm topsoil.

e. Clear soil mounded against trunk.

f. An earth berm, consisting of backfill soil mixture, must be formed with a minimum 100 mm 4 inch height around the edge of the plant pit to aid in water retention and to provide soil for settling adjustments.

3.4.2 Adding Mycorrhizal Fungi Inoculum

Mycorrhizal fungi inoculum must be added as recommended by the manufacturer for the plant material specified.

3.4.3 Watering

A regular watering schedule must be established. Slow deep watering must be used. Plant pits and plant beds must be watered immediately after backfilling, until completely saturated. Run-off and puddling must be
prevented. Watering of other plant material or adjacent areas must be prevented.

3.4.4 Staking and Guying

**************************************************************************

NOTE: The current trend in the horticultural trade has established that staking and guying trees should not be provided unless there is high wind velocity at the project site. However, on military projects staking and guying serve an additional function of protecting the tree during establishment. The current trend in the horticultural trade has established that tree wrap should not be provided unless wind conditions require protection to the trunk.

**************************************************************************

Staking will be required when trees are unstable or will not remain set due to their size, shape, or exposure to high wind velocity. When required the following staking and guying procedures must apply:

3.4.4.1 One Bracing Stake

Trees 1200 to 1800 mm 4 to 6 feet high must be firmly anchored in place with one bracing stake. The bracing stake must be placed on the side of the tree facing the prevailing wind. The bracing stake must be driven vertically into firm ground and must not injure the ball or root system. The tree must be held firmly to the stake with a double strand of guying material. The guying material must be firmly anchored at a minimum 1/2 tree height and must prevent girdling. A chafing guard must be used when metal is the guying material.

3.4.4.2 Two Bracing Stakes

Trees from 1800 to 2400 mm 6 to 8 feet height must be firmly anchored in place with 2 bracing stakes placed on opposite sides. Bracing stakes must be driven vertically into firm ground and must not injure the ball or root system. The tree must be held firmly between the stakes with a double strand of guying material. The guying material must be firmly anchored at a minimum 1/2 tree height and must prevent girdling. Chafing guards must be used when metal is the guying material.

3.4.4.3 Three Bracing or Ground Stakes

Trees over a minimum 2400 mm 8 feet height and less than a maximum 150 mm 6 inch caliper must be held firmly in place with 3 bracing or ground stakes spaced at equal intervals around the tree. Ground stakes must be avoided in areas to be mowed. Stakes must be driven into firm ground outside the earth berm. The guying material must be firmly anchored at a minimum 1/2 tree height and must prevent girdling. For trees over a minimum 75 mm 3 inch diameter at breast height, turnbuckles must be used on the guying material for tree straightening purposes. One turnbuckle must be centered on each guy line. Chafing guards must be used when metal is the guying material.

3.4.5 Deadmen or Earth Anchors

Trees over a minimum 150 mm 6 inch caliper must be held firmly in place
with wood deadmen buried a minimum 900 mm 3 feet in the ground or metal earth anchors. Multi-strand cable guying material must be firmly anchored at a minimum 1/2 tree height and must prevent girdling. Turnbuckles must be used on the guying material for tree straightening purposes. One turnbuckle must be centered on each guy line. Chafing guards must be used.

3.4.6 Flags

A flag must be securely fastened to each guy line between the tree, stake, deadmen, or earth anchor. The flag must be visible to pedestrians.

3.5 FINISHING

All planting operations must conform to TCIA Z133.

3.5.1 Plant Material

Prior to placing mulch, the installed area must be uniformly edged to provide a clear division line between the planted area and the adjacent turf area, shaped as indicated. The installed area must be raked and smoothed while maintaining the earth berms.

3.5.2 Placing Mulch

The placement of mulch must occur a maximum of 48 hours after planting. Mulch, used to reduce soil water loss, regulate soil temperature and prevent weed growth, must be spread to cover the installed area with a minimum 75 mm 3 inch uniform thickness. Mulch must be kept out of the crowns of shrubs, ground cover, and vines and must be kept off buildings, sidewalks and other facilities.

3.5.3 Pruning

**************************************************************************
NOTE: The current trend in the horticultural trade has established that wound dressing or pruning paint should not be provided. These procedures do not contribute to wound closure or the compartmentalization process.
**************************************************************************

Pruning must be accomplished by a certified arborist. The pruning of trees and palms must be in accordance with TCIA A300P1. Only dead or broken material must be pruned from installed plants. The typical growth habit of individual plant material must be retained. Broken branches must be removed.

3.6 MAINTENANCE

Plant maintenance must be in accordance with Section 32 05 33 LANDSCAPE ESTABLISHMENT.

3.7 RESTORATION AND CLEAN UP

3.7.1 Restoration

Turf areas containing ruts or dead turf, as a result of work under this contract, must be graded smooth and sodded with the same species. All pavements and facilities that have been damaged from the transplanting
operation must be restored to original condition at the Contractor's expense.

3.7.2 Backfill Removal Site Plant Pits

Ensure that all remaining holes from the removal site have been backfilled with [on-site soil] [____], tamped to [90 percent] [____] compaction, leveled and finished to meet existing grade after settling. Adjacent trees, shrubs, vines and groundcover destroyed by transplanting or construction operations must be replaced in kind in relation to size and species and must be installed in accordance with Section 32 93 00 EXTERIOR PLANTS. Turf must be replaced with sod, and must be installed in accordance with Section 32 92 23 SODDING.

3.7.3 Clean Up

**************************************************************************
NOTE: While recycling programs are optional for government contractors the specifier should encourage the practice if the cost to the Government is reasonable. Information regarding location of recycling facilities is available from the local city or county waste management division.
**************************************************************************

Excess and waste material must be removed from both removal site and the installed site and must be [disposed offsite at an approved landfill, recycling center, or composting center][composted on site]. Separate and recycle or reuse the following landscape waste materials: [nylon straps,] [wire,] [ball wrap,] [burlap,] [wood stakes,] [____]. Adjacent paved areas must be cleared.

3.8 PLANT ESTABLISHMENT PERIOD

The establishment period for transplanted materials must be the same as for newly planted exterior plants and must conform to the same requirements thereof as found in Section 32 05 33 LANDSCAPE ESTABLISHMENT, paragraph EXTERIOR PLANT ESTABLISHMENT PERIOD.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for pipeline cleaning and TV inspection of sanitary or storm sewer pipelines. Use tailoring options to select the appropriate system for the project.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

TV inspection of sewer pipelines is commonly referred to as closed circuit television inspection (CCTV). CCTV inspection is used to determine the condition of existing pipelines and to identify lateral connections prior to slip lining. It is also used to verify slip lining of existing piping conforms to project specifications, warranty requirements and to confirm lateral re-connections post-construction. CCTV inspections indicate the location of service connections along the main, the location of pipe conditions warranting further action or confirmation.

Cleaning or heavy cleaning is always performed prior to CCTV inspection.
Point repairs may also be required prior to Pre-TV inspection; requirements for point repairs are not addressed in this section. Point repairs are typically less than 3.0 meters 10 feet in length.

Prior to conducting a Pre-TV inspection the engineer should conduct a field investigation to determine pipelines or sections of pipes requiring heavy cleaning and the potential for point repairs. Pre-TV inspections of mains and laterals are needed to assess existing conditions, confirm point repairs and assist in preparing project specifications for 33 01 30.72 RELINING SEWERS and may be done during field investigation. Once the contract is awarded the contractor, the contractor will need to do a second PRE-TV inspection before beginning slip lining work.

Post-TV and Warranty TV inspection portions of these specifications are needed to confirm work performed for slip lining sanitary sewer and storm drainage systems conforms to the project specifications.

PART 1   GENERAL

[1.1 UNIT PRICES

NOTE: Depending on the size of the job, consider establishing unit prices for Cleaning, CCTV inspection, heavy cleaning and other items like root removal may be advantageous to the Government in the event significant amounts of work are added or deleted from the contract.

Measure heavy cleaning distance from the downstream manhole or structure prior to any upstream cleaning.

]1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. DEPARTMENT OF DEFENSE (DOD)

DODI 4150.07 (2019) DOD Pest Management Program

1.3 DEFINITIONS

1.3.1 CCTV Video

CD or DVD storage media containing the recorded video.

1.3.2 Cleaning

To remove soil or solid deposited materials from a pipe segment when the pipe is less than half full of deposited materials.

1.3.3 Defects

Defects in the pipe, manholes, structures, and services include cracks, separation of joints, collapsed pipe, grade irregularities, leaks, roots, grease buildup, offset joints, reverse grades, obstructions, delamination, missing pipe, restrictions, fractures and similar structural irregularities.

1.3.4 Entry Point

The leading edge of the access point or the manhole or structure wall where the pipe segment begins. Only the pipe is video inspected from manhole or structure wall to manhole or structure wall and does not include any portion of the manhole or structure.

1.3.5 Exit Point

The point where the downstream access manhole or structure wall is encountered. Only the pipe is video inspected from manhole or structure wall to manhole or structure wall and does not include any portion of the manhole or structure.

1.3.6 Heavy Cleaning

To remove soil or solid deposited materials from a pipe segment when the materials in the pipe are between half full to full.

1.3.7 Hydraulically Propelled Cleaning Tools

Tools that depend upon water pressure to provide their cleaning force.

1.3.8 National Association of Sewer Service Companies (NASSCO)

National Association of Sewer Service Companies (NASSCO) identifies the generally accepted industry standards for CCTV inspection, observation coding, and certification.
1.3.9 Pipe Segment
The length of pipe from entry point to exit point along the main or service.

1.3.10 Pipeline Assessment and Certification Program (PACP)
A CCTV Inspection standardization certification and observation coding system sponsored by NASSCO.

1.3.11 Point Repair
The location of a failure where a repair is has occurred.

1.3.12 Post-Installation CCTV (Post-TV)
Post-TV inspection is used to determine the slip lining of sanitary or storm sewers has been completed in accordance with the contract documents.

1.3.13 Pre-Installation CCTV (Pre-TV)
Pre-TV inspection is a video inspection of existing sewer lines to confirm cleaning activities, locations of service connections, and identify defects in the existing sewer system infrastructure prior to any work being performed.

1.3.14 Re-TV Inspection
Upon the completion of repairs made after performing a Post-TV Inspection or Warranty TV inspection, the mains or services are re-inspected by performing a Re-TV inspection. Also, refers to rework for a TV-Inspection that has video interruptions, gaps, or is not continuous.

1.3.15 TV Inspection Log
Information collected and recorded by the CCTV operator for each CCTV inspection effort and includes pertinent information for the respective inspection section; such as, date of inspection, location of site, CCTV technician, direction of CCTV inspection with manhole or structure identifiers, weather conditions, pipe size(s), pipe materials, conditions found, locations where the conditions were found.

1.3.16 Warranty CCTV (Warranty-TV)
Warranty-TV inspection is used to determine the slip lining of sanitary or storm sewers does not have any defects present, remains in compliance with project specifications and Post-TV inspection.

1.4 ADMINISTRATIVE REQUIREMENTS

1.4.1 Disposal Plan
Submit a disposal plan prior to performing any work that might generate waste materials. Include a complete description of the materials that are expected to be encountered and their proposed disposal sites. No changes to the disposal plan will be made without prior written acceptance by the Contracting Officer.
1.4.2 Sewage Handling Permit

Prior to commencing application of herbicide, obtain and maintain a valid State sewage handling permit and permits required by local jurisdictions. Submit a copy of this permit to the Contracting Officer prior to beginning any cleaning or pump and haul operations.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Herbicide Application Plan; G[, [______]]

Sewage Handling Permit; G[, [______]]
SD-03 Product Data
Herbicide; G[, [______]]
Cleaning Products; G[, [______]]
SD-05 Design Data
Herbicide Records
SD-06 Test Reports
Calibration Test
SD-07 Certificates
List of Equipment
Disposal Plan; G[, [______]]
Qualifications; G[, [______]]
CCTV Technician's Qualifications; G[, [______]]
Pre-TV Inspection; G[, [______]]
Post-TV Inspection; G[, [______]]
Warranty-TV Inspection; G[, [______]]
SD-11 Closeout Submittals
Pest Management Report
Records of Disposals
Verification of Measurement

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

**************************************************************************
NOTE: Herbicides are a type of pesticide. Contact regional pest management consultant to obtain service specific reporting requirements for the use of herbicides.

For Navy projects, contact the cognizant NAVFAC Applied Biologist. Contact information can be found at https://hub.navfac.navy.mil/webcenter/faces/oracle/webcenter/page/scopedMD/sa0
For Army projects, contact the cognizant Army Applied Biologist. Contact information can be found at http://www.aec.army.mil/services/conserve/pestmanagement.aspx
**************************************************************************

Comply with DODI 4150.07 for requirements on Contractor's licensing,
certification, and record keeping. Maintain daily records using the Pest Management Maintenance Record, DD Form 1532-1, or a computer generated equivalent, and submit copies of records when requested by the Contracting Officer. These forms may be obtained from the main web site: http://www.dtic.mil/whs/directives/forms/eforms/dd1532-1.pdf

1.6.2 Qualifications

For the application of herbicides, use the services of an applicator who is commercially certified in the state where the work is to be performed as required by DODI 4150.07. Herbicide applicators must also be certified in the U.S. Environmental Protection Agency (EPA) pesticide applicator category which includes sewer root pest control. Submit a copy of the pesticide applicator certificates.

1.6.3 CCTV Technician's Qualifications

Provide a CCTV technician with three years of total experience with the CCTV technology. Submit a current PACP Operator certification for personnel performing closed circuit television inspection and pipeline assessments.

1.7 DELIVERY, STORAGE, AND HANDLING

1.7.1 Delivery

Deliver herbicide material to the site in the original unopened containers bearing legible labels indicating the EPA registration number, manufacturer's registered uses and in new or otherwise good condition as supplied by the manufacturer or formulator.

1.7.2 Inspection

Inspect herbicides upon arrival at the job site for conformity to type and quality in accordance with paragraph HERBICIDE. Each label must bear evidence of registration under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), as amended or under appropriate regulations of the host county. Inspect other materials for conformance with specified requirements. Remove unacceptable materials from the job site.

1.7.3 Storage

Storage of herbicides on the installation will not be permitted unless it is written into the contract.

1.7.4 Handling

Handle and mix herbicides in accordance with the manufacturer's label and Safety Data Sheet (SDS), preventing contamination by dirt, water, and organic material. Protect herbicides from weather elements as recommended by the manufacturer's label and SDS. Spill kits must be maintained on herbicide control vehicles and must be available at the mixing site. Conduct herbicide mixing in an area with adequate spill containment.

1.8 SITE CONDITIONS

Application of herbicide will not be permitted during or immediately following heavy rains, when conditions may allow runoff, or create an environmental hazard. Herbicide is not permitted to enter stormwater.
systems, aquifers, or endanger humans or animals.

PART 2   PRODUCTS

2.1  SYSTEM DESCRIPTION

TV inspection of sewer pipelines encompasses cleaning, heavy cleaning, CCTV inspection and video recording of the existing sanitary or storm sewer mains included in the contract documents. This work includes by-pass pumping or diversion of sanitary sewer, sound reduction enclosure of by-pass pump, inspection logs, video requirements, permits, traffic control and the legal disposal of materials removed from the mains. It is typically used in coordination with slip lining existing piping.

It includes the mechanical equipment used to clean and dispose of the materials found in sewer pipes and structures, CCTV cameras and recording devices used to record the internal conditions of non-pressurized sewer piping.

2.2  EQUIPMENT

2.2.1  Cleaning Equipment

Utilize mechanically powered equipment necessary for the proper rodding, bucketing, brushing, root cutting, and flushing of the sewers, including a heavy duty power rodding machine that is compatible with the cleaning to be performed.

2.2.1.1  Rodding

Provide rodding equipment capable of rodding distances of up to 305 meters 1000 feet in one set-up and having the following capabilities:

a. The ability to spin the rod either clockwise or counter-clockwise, and be able to be pushed straight out or pulled back without rotating the machine.

b. The capability of pulling pipe-size swabs or brushes back through the pipeline for cleaning and flushing purposes.

2.2.1.2  Bucket Machine

Provide heavy-duty bucket machines for use on dragline work to clean the pipeline with buckets, brushes, scrapers, swabs or other similar devices in order to effectively remove debris and provide a clean sewer for the CCTV inspection, repair, or lining activities.

2.2.1.3  Hydraulic Flusher

Provide hydraulic high-pressure sewer cleaners used for sewer cleaning, specifically designed and constructed for such cleaning, that have a minimum usable water capacity of 2270 Liters 600 gallons and a pump capable of delivering at least 1.9 Liters per second (L/s) 30 gallons per minute (gpm) at 690 kPa 100 psi and having the following capabilities:

a. Pressure regulator nozzle capable of adjustment from 7 kPa 1 psi to 10 MPa 1500 psi.

b. Constructed for ease of use and safety of operation with two or more
high-velocity nozzles capable of producing a scouring action from 15 to 45 degrees in lines designated to be cleaned.

c. A high-velocity gun for washing and scouring the manhole or structure walls and floor capable of producing flows from a fine spray to a solid stream.

d. Carry its own water tank, auxiliary engines, pumps, and hydraulically driven hose reel.

2.2.1.4 Sanitary Sewer Cleaning Equipment

Provide movable dam type hydraulically propelled equipment constructed in such a way that a portion of the dam may be collapsed at any time during the cleaning operation to protect against flooding of the sanitary sewer and having the following capabilities:

a. A movable dam equal in diameter to the pipe being cleaned.

b. A flexible scraper around the periphery to ensure the removal of grease.

Sewer cleaning balls or other equipment, which cannot be collapsed, are not allowed when cleaning sanitary sewer.

2.2.2 CCTV Equipment

Provide a video system capable of producing a sharply focused, well-lit and color balanced picture in accordance with the following requirements:

2.2.2.1 Pipe Inspection Camera and Associated Equipment

a. Provide a pipe inspection camera system that produces a video using a pan and tilt, radial viewing, that pans a minimum of 275 degrees and rotates 360 degrees. Illumination sensitivity of 3 Lux or less and a minimum of 460 lines of resolution is required.

b. Utilize video cameras specifically designed and constructed for CCTV inspection.

c. Provide a camera that is operative in 100 percent humidity conditions.

d. Provide a camera with an accurate footage counter that displays on the monitor the exact distance of the camera to the nearest 3.0 centimeter 1/10 of a foot.

e. Provide a camera with a height adjustment so that the camera lens is typically centered in the pipe, or higher depending on water levels in the pipe.

f. Provide equipment that will produce digital color images and allows the CCTV technician to remotely balance the iris and color to produce a clear and true video of the pipeline.

g. Provide lighting for the camera that is suitable to provide a clear color picture of the entire periphery of the pipe.

h. Provide a reflector in front of the camera as necessary to enhance the lighting on dark or large diameter pipes.
i. Provide an accompanying computer and recording device capable of projecting and recording the facility location, project name, Contractor's name, date, line size, material type, line identification, manhole or structure ID numbers and ongoing footage counter onto the video screen.

2.3 MATERIALS

2.3.1 Herbicide

**************************************************************************
NOTE: The herbicide must be pre-approved by regional pest management consultant and the wastewater treatment plant operator.

Herbicide may be applied to roots prior to mechanical removal or after mechanical removal to prohibit future root growth.
**************************************************************************

Provide herbicides currently registered by the EPA or approved for such use by the appropriate agency of the host county and approved by the Contracting Officer. Select a herbicide that will eliminate root growth, [inhibit future root growth,] is suitable for the wastewater treatment plant, climatic conditions at the project site and apply at the highest labeled rate. Submit manufacturer's label and SDS for herbicides proposed for use.

2.3.2 Cleaning Products

Select cleaning products that do not present a health and safety concern, are allowed for use in the sewer system according to Federal and State regulations, will not adversely affect the water quality of the water being conveyed in the sewer system, are suitable for the wastewater treatment plant and the climatic conditions at the project site. Submit manufacturer's label and SDS for the cleaning products proposed for use.

PART 3 EXECUTION

3.1 PREPARATION

**************************************************************************
NOTE: Sewer line cleaning removes foreign materials from the pipes to prepare for CCTV inspection, repair operations, or installation of lining materials. The success of the CCTV, pipe repairs, or lining operations depends on the cleanliness of the lines and cannot be over emphasized.
**************************************************************************

3.1.1 Herbicide Application Plan

Prior to commencing application of herbicide, submit an herbicide application plan with proposed sequence of treatment work including dates and times of application. Include the herbicide trade name, EPA registration number, chemical composition, formulation, application rate of active ingredients, method of application, area or volume treated, and amount applied. Include a copy of the pesticide applicator certificates.
3.1.2 Sewer Line Cleaning

***NOTE: Indicate on the drawings the pipe segments requiring heavy cleaning. Heavy cleaning may not be required if the field investigation cleaning and Pre-TV inspection were recently completed. Heavy cleaning may be needed for small diameter pipes in areas known to have frequent maintenance cleaning due to heavy grease or root intrusion. Larger diameter pipes (equal to or greater than 18 inches) will typically not require heavy cleaning unless previous problems have been observed or are known. This should be easily discernible when conducting field investigations.***

Immediately prior to conducting CCTV activities, thoroughly clean the segment of sewer pipe to be video inspected. Clean the segments using hydraulically propelled, high-velocity jet, or mechanically powered equipment.

a. During cleaning and preparation operations, undertake precautions to protect the sewer system and property from damage. Restore property damaged as a result of such cleaning and preparation operations to pre-existing conditions.

b. During the course of normal cleaning operations immediately report pre-existing damage such as broken or missing pipe to the Contracting Officer.

c. When hydraulically propelled cleaning tools or tools which retard the flow in the sewer line are utilized, take precautions to ensure that the water pressure created does not damage or cause flooding on the adjacent site.

d. Maintain access to fire hydrants for the purpose of fire protection at all times.

e. If cleaning of an entire sewer section cannot be successfully performed from one manhole or structure, set up the equipment on the other entry or exit point and attempt cleaning again.

f. If successful cleaning cannot be performed from the opposite end or the equipment fails to traverse the entire pipeline section, cease cleaning those specific sewer sections, notify the Contracting Officer and CCTV inspect both sides of the pipeline section to determine the cause of the blockage.

3.1.2.1 Sanitary Sewer Cleaning

Minimize the interruptions to the existing flows to perform the cleaning of the sewers. Prevent sewage backups and immediately clear back-ups resulting from the cleaning operations. When possible, utilize the flow in the sewer system to provide the necessary pressure for the hydraulic cleaning devices. Return sewage diverted during cleaning operations to the sanitary system and do not discharge onto any surface, or into any water body or storm drain system.
3.1.3 Manhole or Structure Cleaning

NOTE: Indicate on drawings manholes or structures to be cleaned.

Clean concrete and masonry surfaces prior to CCTV inspection. Completely remove grease, laitance, loose bricks, mortar, unsound concrete, loose or damaged wall mounted steps (cut flush with wall), and other materials.

Utilize water blasting (minimum 8.3 MPa 1200 psi) with compatible nozzles as the primary method of cleaning. It is acceptable to use other methods of cleaning such as concrete cleaners, degreasers or mechanical means to clean the surfaces. When other cleaning methods are utilized submit cleaning product data or process for approval. Thoroughly rinse, scrub, and neutralize the surfaces in order to remove cleaning agents and their reactant products. Do not allow material to pass to pipeline sections, which could adversely affect water quality, cause stoppages, accumulations of sand in wet wells, or damage to pumping equipment.

3.1.4 Flow Control

Reduce the flow depth to allow a minimum of 80 percent of the pipe wall to be displayed at all times during inspection so that defects, features, and other notable information can be collected.

3.1.4.1 Flow Reduction

Flow depth reduction can be accomplished by:

a. Providing bypass pumping.

b. High-pressure jet nozzle.

c. Plugging or by pulling the camera with a swab.

d. Performing the CCTV inspection during periods of minimal flow.

3.1.4.2 Floating the Camera

Video inspection performed while floating the camera is not acceptable. Lower water levels as indicated in paragraph FLOW CONTROL.

3.1.5 Root Removal

NOTE: The existence of roots indicate pipe fractures, joint openings or other failures. Typical root removal is performed by use of cutting heads. Extreme conditions require the use of chemical root treatment in order to obtain clear, unobstructed video images.

Use the CCTV field investigation report to determine sections of pipe containing roots. Indicate on drawings sections of pipe, manholes or structures requiring root removal.
Remove roots in the designated sewer sections (and manholes or structures). Ensure complete removal of roots to the joints. Use mechanical equipment that can be operated remotely, such as rodding machines, bucket machines, winches using root cutters and porcupines, and equipment such as high-velocity jet cleaners. Capture and remove roots from the sewerline at the downstream manhole or structure.

3.1.6 Material Removal and Disposal

Remove sludge, dirt, roots, grease, and other solid or semi-solid material resulting from cleaning operations at the downstream manhole or structure of the section being cleaned.

3.1.6.1 Dams or Weirs

When hydraulic cleaning equipment is used, place dam or weir in the downstream manhole or structure to trap such materials. Do not allow material to pass from pipeline section to pipeline section, which could cause stoppages, accumulations of sand in wet wells, or damage to pumping equipment.

3.1.6.2 Sludge and Debris Storage

Under no circumstances is sludge or other debris removed during these operations to be stored, dumped or spilled into streets, ditches, storm drains, or other sanitary sewer systems.

a. Dispose of solids and semi-solids resulting from the cleaning operations no less often than the end of each work day in accordance with the approved Disposal Plan.

b. Under no circumstances will debris be allowed to accumulate on the work site beyond the end of each work day, except in totally enclosed containers and as acceptable by the Contracting Officer.

c. Continuously maintain the haul route and work areas neat, clean, and reasonably free of odor. Cleanup any spill which occurs during the transport of cleaning or surface preparation by-products. Perform the cleanup of any such material pursuant to this Contract and in accordance with applicable law and environmental regulations.

d. Immediately notify the Contracting Officer of any spill and begin clean up any such spill or waste.

e. The Government will charge to the Contractor for any costs incurred or penalties imposed upon the Government as a result of the spill, dump or discard.

f. Under no circumstances is this material to be discharged into the waterways or any place other than where authorized to do so in accordance with the approved Disposal Plan.

3.1.6.3 Hauling of Waste Material

Provide vehicles hauling such waste material that meet the following requirements:

a. Provide transport vehicles of the type(s) approved for this application
b. Provide transport vehicles with watertight bodies equipped and fitted with seals and covers to prohibit material spillage or drainage.

c. Clean vehicles to prevent deposits of material on roadways.

d. Load vehicles within legal weight limits and operate safely within traffic speed regulations.

e. The routes used for the conveyance of this material on a regular basis is subject to approval by the local governing bodies having jurisdiction over such routes.

3.2 APPLICATION

3.2.1 Chemical Root Treatment

Where permitted by the Contracting officer, State sewer regulations and the utility provider's requirements use a herbicide to aid in the removal of roots, treat pipeline sections that have root intrusion with an acceptable herbicide and in accordance with the following conditions:

a. There can be no adverse effects on the performance of the wastewater treatment plant caused by the active ingredients of the herbicide. If adverse effects are identified in the wastewater treatment system, the Contractor must immediately suspend the application of the herbicide as directed by the Contracting Officer. Application of herbicides will be terminated, as directed by the Contracting Officer, if the adverse effects cannot be corrected to the satisfaction of the wastewater treatment plant operator.

b. Adhere to safety precautions as recommended by the manufacturer concerning handling and application of the herbicide.

c. Apply the herbicide to the roots in accordance with the manufacturer's recommendations and specifications.

3.2.1.1 Equipment Calibration and Tank Measurement

Submit a list of equipment to be used. Conduct calibration test on the application equipment to be used immediately prior to commencement of herbicide application. Measure the volume and contents of the application tank. Testing must confirm that the application equipment is operating within the manufacturer's specifications and meets the specified requirements. Submit written certification of the equipment calibration test results within 1 week of testing. Where results from the equipment calibration and tank measurements tests are unsatisfactory, re-treatment will be required.

3.2.1.2 Mixing and Application

Perform all work related to formulating, mixing, and application in the presence of a DOD certified pesticide applicator, Pest Management QAE/PAR, or Integrated Pest Management Coordinator. Submit herbicide records. Records will include the following information: date of application, location and site, type of operation, area treated, name of applicator, pesticide information (trade name, active ingredient, and formulation),
amount of pesticide applied, and calculated pounds of active ingredient applied.

A closed system is recommended as it prevents the herbicide from coming into contact with the applicator or other persons. Only use water from designated locations. Fit filling hoses with a backflow preventer meeting local plumbing codes or standards. Prevent overflow during the filling operation. Spill kits must be maintained on the root control vehicles and must be available at the mixing site. Herbicide mixing must be conducted in an area that has been designated by the Contracting Officer and that has adequate spill containment. Inspect the application equipment for applying herbicides prior to each day of use for leaks, clogging, wear, or damage. Immediately perform repairs on the application equipment to prevent or eliminate leaks and clogging.

3.2.1.3 Clean Up, Disposal, And Protection

Once application has been completed, proceed with clean up and protection of the site without delay. Clean the site of all material associated with the treatment measures, according to label instructions, and as indicated. Remove and dispose of excess and waste material off Government property.

3.2.1.3.1 Disposal of Herbicide

Dispose of residual herbicides and containers off Government property, and in accordance with the approved disposal plan, label instructions and EPA requirements.

3.2.2 Inspection of Sewer Lines

Inspection of sewer lines applies to Pre-TV inspection, Post-TV inspection, RE-TV inspection and Warranty-TV inspection. Perform inspections of sewer lines in the presence of the Contracting Officer.

3.2.2.1 Communication

**************************************************************************
NOTE: Ensure hand operated radios and cell phones are allowed in the project area.
**************************************************************************

Set up hand operated radios, telephones, or other means of communication between the entry and exit points being inspected to ensure uninterrupted communication between members of the CCTV crew when manually operated winches are used to pull the television camera through the line.

3.2.2.2 Flush Main

Introduce a minimum of **3785 Liters 1000 gallons** of clear, potable water into the upstream manhole or structure or access structure of the mains to be CCTV inspected just prior to inserting the camera. The Contractor is responsible for collecting and disposing of the water in accordance with the approved disposal plan.

3.2.2.3 Camera Operation

Set counter to **0.00 meters 0.00 feet** at the entry point, which is the beginning manhole or structure wall. Move the camera through the line in either direction at a moderate speed, stopping to permit proper
documentation of the sewer's condition or service connection locations. In no case will the camera be operated at a speed greater than 9.1 meters per minute 30 feet per minute. Slowly pan and tilt the camera at the beginning and ending manhole, structure connections, service connections, joints, visible defects, and pipe arterial transitions. Provide a full 360 degree view of the pipe, joints, and service connections.

Utilize manual winches, power winches, cable, powered rewinds or other devices that do not obstruct the camera view or interfere with camera operation or CCTV inspection of the pipe conditions as the camera is moved through the sewer line.

3.2.2.3.1 Recording Defects

During CCTV inspection, temporarily stop the camera at each defect or feature along the line.

3.2.2.4 Documentation of CCTV Inspection

Documentation of CCTV inspection applies to Pre-TV inspection, Post-TV inspection, RE-TV inspection and Warranty-TV inspection.

Utilize a data logger and reporting system that is PACP compliant to make a video and audio recording of the CCTV inspections. Submit video recordings, inspection logs and digital photographs as indicated below.

3.2.2.4.1 Video Recordings

**************************************************************************
NOTE: Video recordings supply a video and audio record of pipe segment inspections that may be replayed.
**************************************************************************

Provide a color video showing the completed work and document the inspection on a digital recorder. Capture inspection video in either MPEG4 or Windows Media Video (WMV) format with a minimum resolution of 352 x 240 pixels and an interlaced frame rate at a minimum of 24 frames per second. Save video on CD or DVD. However, the CCTV inspection video of a segment must be wholly contained on a single CD or DVD. The video recording must meet the following requirements:

a. Provide a continuous and uninterrupted recorded video for the pipe segment being examined. Include the official project title, Contracting party, Contractor's name, street name, manhole or structure ID numbers, direction of video and flow, date and time video was recorded, continuous counter text, pipe size and material, material changes in the pipe segment, audio and text call outs of laterals, fixtures and problem areas in the recorded video.

b. Include an audio track recorded by the CCTV technician during the actual inspection work with a description of the parameters of the line being inspected on the video recordings. [The audio may be from the voice of the CCTV technician or it may be computer generated.]

c. Include the location, pipe diameter, pipe material, defects, service lateral locations and any unusual conditions found in PACP format.

d. Submit labeled CDs or DVDs of the video inspections.
e. Without exception, CCTV inspections must be continuous without video interruption or gaps for pipe segments.

f. Clean, flush, and RE-TV pipe segments with video interruptions or gaps.

3.2.2.4.2 TV Inspection Logs

Submit computer generated records that clearly show the location and orientation in relation to an adjacent manhole or structure of each infiltration point observed during the inspection.

Record other points of significance such as locations and orientations of service connections, missing or broken pipe, roots, the presence of grease, scale or corrosion, bellies, fractures, cracks, and other discernible features using PACP designations.

3.2.2.4.3 Digital Photographs

Submit JPEG images at a minimum resolution of 640 x 480 pixels. Save digital photographs in JPEG file format on CD or DVD. Document noted defects and lateral connections as color digital files and hard copy print-outs. Photo logs are to accompany each photo submitted.

3.2.3 Pre-TV Inspection

Immediately after cleaning has been performed, complete a Pre-TV inspection, in accordance with paragraph INSPECTION OF SEWER LINES. Submit Pre-TV inspection documentation in accordance with paragraph DOCUMENTATION OF CCTV INSPECTION.

3.2.4 Post-TV Inspection

**************************************************************************
NOTE: Post-TV inspection is performed to verify slip lining does not have any defects and to verify all lateral connections are open.
**************************************************************************

Immediately after visual, deflection, pressure and leak testing and service reconnections are complete on a pipe segment, complete Post-TV inspection accordance with paragraph INSPECTION OF SEWER LINES. Submit Post-TV inspection documentation in accordance with paragraph DOCUMENTATION OF CCTV INSPECTION.

3.2.4.1 Post-TV Defects

If defects are found in the mains or services during the Post-TV inspection make repairs according to the specifications. RE-TV all repairs accordance with paragraph INSPECTION OF SEWER LINES. Provide additional RE-TV inspections of complete pipe segments as follows:

a. Perform a RE-TV inspection of the complete pipe segment. If no additional defects are found in the Re-TV inspections, then the Post-TV inspection is complete.

b. If defects are found in these additional inspections make repairs according to the specifications and provide Re-TV inspection for the complete pipe segment.
c. If defects are found in these additional inspections make repairs according to the specifications and Re-TV the repaired pipe segments until no Post-TV defects are found.

3.2.5 Warranty-TV Inspection

Complete a Warranty-TV inspection starting no earlier than [60][_____] days prior to expiration of the warranty and submit no later than [30][_____] days prior to the expiration of the warranty. Comply with paragraphs TV INSPECTION OF SEWER LINES and DOCUMENTATION OF CCTV INSPECTION. Complete Warranty-TV inspections in the presence of the Contracting Officer. The Contracting Officer has the option to select the pipe segments for the Warranty-TV inspection. Comply with the following requirements:

a. Provide a complete pipe segment Warranty-TV inspection of pipe segments where a liner repair was performed during Post-TV Inspection.

b. Provide a complete pipe segment Warranty-TV inspection of pipe segments where a point repair was performed.

c. Provide a Warranty-TV inspection of at least one full pipe segment of each size and type of slip lining installed.

d. Provide a Warranty-TV inspection of at least [10][_____] percent of the total length of all pipe segments.

All of Warranty-TV inspections above may be included to satisfy the percentage of total length requirement. If no defects are found in the mains and services in the above minimum pipe segments inspected, then the Warranty-TV inspection is complete.

3.2.5.1 Warranty-TV Defects

If defects are found in the mains or services during the Post-TV inspection make repairs according to the specifications. Re-TV all repairs. Provide additional Warranty-TV inspections of complete pipe segments as follows:

a. Warranty-TV inspect an additional 15 percent of the footage based on the length of the total project. If no additional defects are found in the additional Warranty-TV inspections, then the Warranty-TV inspection is complete.

b. If defects are found in these additional inspections make repairs according to the specifications, Re-TV all repairs and provide Warranty-TV inspections for the remaining pipe segments in the project.

c. If defects are found in these additional inspections make repairs according to the specifications and Re-TV the repaired pipe segments.

3.2.6 RE-TV Inspection

After repairs are made to a main or service, complete RE-TV inspection accordance with paragraph INSPECTION OF SEWER LINES and DOCUMENTATION OF CCTV INSPECTION.
3.3 FIELD QUALITY CONTROL

3.3.1 Verification of Measurement

Once herbicide application has been completed, measure tank contents to determine the remaining volume. The total volume measurement of used contents for the application must equal the established application rate for the project site conditions. Submit written verification that the volume of herbicide used meets the application rate.

3.3.2 Inspection

3.3.2.1 Technical Representative

Provide a technical representative who is a DOD certified pesticide applicator or Pest Management Quality Assurance Evaluator (QAE)/Performance Assessment Representative (PAR). The technical representative must be present at all meetings concerning root removal and during treatment application. Contact the Integrated Pest Management Coordinator prior to starting work.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Sewer Cleaning

Submit copies of Records of Disposals indicating the disposal site, date, amount, and a brief description of the materials disposed.

3.4.2 Herbicides

Upon completion of this work, submit the Pest Management Report DD Form 1532, or an equivalent computer product, to the Integrated Pest Management Coordinator. This form identifies the target pest, type of operation, brand name and manufacturer of pesticide, formulation, concentration or rate of application used.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for storm sewer and sanitary sewer main rehabilitation utilizing pipe within a pipe methods, Fold-and-Form Pipeliner (FFP) and Cured-In-Place Pipe (CIPP).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

Pipe rehabilitation by FFP and CIPP are effective means to rehabilitate existing storm water and sanitary sewer mains that are appropriately sized for their intended use. When this section is utilized, also include Section 33 01 30.16 TV INSPECTION OF SEWER PIPELINES.

PART 1 GENERAL

1.1 BASIS OF PAYMENT

Include all costs to perform the work in this section in the Lump Sum bid.

Provide unit price costs of permits, materials, labor, equipment, and services necessary for traffic control, bypass pumping and diversion of
sewage flows, cleaning and Pre-television (Pre-TV) inspection of sewers to be lined, liner installation, reconnection of service connections, quality controls, Post-TV inspection. Provide samples for performance of required material tests, testing of the lined pipe system, and warranty work, as specified herein.

Include the cost of removal of obstructions that appeared on pre-bid video documentation and made available prior to the bid opening in the bid price.

Final payment for the project will be withheld pending receipt and approval of test results, Post-TV inspection videos, Warranty-TV inspection, and repairs found in the Post-TV and Warranty-TV video inspection. If properties tested do not meet the minimum physical and thickness requirements as required in the Contract, repair the Fold-and-Form Pipeliner (FFP) Cured-In-Place Pipe (CIPP) according to manufacturer's recommendations or remove and replace the lining material.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE)

ASCE MOP 120 (2009) Trenchless Renewal of Culverts and Storm Sewers

AMERICAN WATER WORKS ASSOCIATION (AWWA)

AWWA M45 (2013; 3rd Ed) Fiberglass Pipe Design

ASTM INTERNATIONAL (ASTM)

ASTM D2412 (2011) Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading

ASTM F1216 (2016) Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube

ASTM F1743 (2016) Standard Practice for Rehabilitation of Existing Pipeline and Conduits by Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

1.3 DEFINITIONS

1.3.1 Storm Sewers

Unless otherwise specified or indicated, see ASCE MOP 120 for definitions.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**************************************************************************

NOTE: It is recommended that Contractor Quality Control (CQC) Plan, and SD-03, SD-04, SD-05, SD-06, and SD-11 items be submitted for Government approval.

1.5 QUALITY CONTROL

1.5.1 Quality Control Plan (QCP)

Submit a detailed Contractor Quality Control (CQC) Plan that fully represents and conforms to the requirements of these specifications. At a minimum the CQC is to include the following:

a. Defined responsibilities, of the personnel, for assuring that quality requirements, for this Contract are met. Assign these responsibilities to specific personnel.

b. Submit clearly defined proposed procedures for quality control, product sampling and testing as part of the plan.

c. Proposed methods for product performance controls, including method of and frequency of product sampling and testing both in raw material form and cured product form.

d. A scheduled performance and product test result review with the Contracting Officer at a regularly scheduled progress meeting.

e. Prepare Inspection Forms and guidelines for quality control inspections in accordance with the standards specified in this Contract and submitted with the QCP.

f. Outline specific repair or replacement procedures for potential defects that occur in the installed liner system, following repair or replacement procedures that are compatible with the system being used. Submit Repair or Replacement Procedures must adhere to the product manufacturer's written specifications for repair or replacement.

**************************************************************************

NOTE: Product and installation improvements are rapidly changing the pipe lining industry. Up to date training is recommended for all sizes of projects. Select training options based upon the anticipated duration of the lining portion of the project.

If other than two people are to receive training insert the number of personnel in the brackets.
g. [Provide two days of training for [two] [_____] people, conducted by the FPPCIPP system manufacturer, for Government personnel. Provide this training prior to liner installation, include both technical and field training and include key aspects of visual inspection and sampling procedures for testing requirements.] [On smaller projects, having an estimated duration of less than 10 working days of lining work, furnish a checklist containing key elements of the FPPCIPP installation criteria that is important for the Government personnel to ensure that quality control and testing requirements are performed in accordance with the Contract documents.]

1.5.2 Liner Manufacturer's Inspection

a. During the process of manufacture and impregnation, provide the Contracting Officer with a reasonable opportunity to examine operations where the manufacture and impregnation (if applicable) of the liner is being carried out. Provide a minimum of fourteen days written notice to the Contracting Officer to observe the various processes. If the CIPP is manufactured without providing the required notice to the Contracting Officer the CIPP will be marked as rejected prior to installation and will not be approved for installation.

b. Provide full access to witness the CIPP wet-out process and provide information related to the manufacturing as requested by the Contracting Officer, without delay and without claims of confidentiality or product privacy.

1.5.3 Liner Manufacturer's Qualifications

Use felt material manufactured by companies specializing in felt production for CIPP. The manufacturer is to have manufactured felt material for CIPP for at least two years as documented by references. Submit felt manufacturer, references and location of the manufacturing facility. The felt material manufacturer and facility cannot change during construction unless specifically approved by the Contracting Officer in writing and in advance of its use.

1.5.4 Contractor's Qualifications

The Contractor is to have a minimum of three years of continuous experience installing CIPP liners in pipe of a similar size, length and configuration as contained in this Contract. A minimum of 45,720 meters 150,000 linear feet of shop wet-out liner installation is required and a minimum of six onsite wet-out installations are required as specifically applicable to this Contract.

A minimum of three years experience using the proposed FPP rehabilitation of sewers' product is required as well as the installation of at least 15,240 meters 50,000 linear feet of the proposed FPP product(s). Employees and subcontractors performing work on the FPP rehabilitation are to be certified by the FPP rehabilitation system supplier as qualified to perform work with the proposed product. The firm performing the work is to be licensed by the liner process manufacturer.

1.5.5 CIPP Installer's Qualifications

The lead personnel including the superintendent, the foreman and the lead
crew personnel for the resin wet-out, the CIPP liner installation, liner curing and the robotic service reconnections each are to have a minimum of three years of total experience with the CIPP technology utilized.

1.5.6 Superintendent's Qualifications

The superintendent for the Contract is to have supervised projects in which at least 7620 meters 25,000 linear feet of pipe has been rehabilitated using the product. The superintendent must be on-site during all phases of the work involving the insertion and processing of the liner pipe.

1.5.7 QC Specialist

The Quality Control (QC) Specialist is responsible for monitoring and documenting activities related to QC of the liner system from manufacturing through installation. The QC Specialist is to have a minimum of three years of continuous experience installing FFP CIPP liners of similar size, length and configuration as contained in this contract. The QC Specialist is to be certified by the liner system supplier as qualified to perform work with the proposed liner system.

1.5.8 QC Laboratory

Select a QC Laboratory that has provided QC testing for at least three completed projects with the proposed liner system; and is independent from, and not associated with, the Contractor. QC Laboratory certification in accordance with the following standards is required: ASTM D790, ASTM D2412, ASTM D2990, ASTM D5813, and ASTM F1216. Submit the Certificate of QC Laboratory Accreditation.

1.6 DELIVERY, STORAGE, AND HANDLING

Include test reports certifying that the materials conform to the applicable ASTM standards listed herein with materials shipped to the project site. Ship, store, and handle materials in a manner consistent with the written specifications of the liner system manufacturer to avoid damage. Damage may include, but is not limited to, gouging, abrasion, flattening, cutting, puncturing, or ultra-violet (UV) degradation. Select on site storage locations for approval by the Contracting Officer. Promptly remove and dispose of damaged materials.

As a minimum the FFP delivered to the job site is to contain the manufacturers name or trademark, the nominal outside diameter, the cell classification, the DR designation, and the ASTM designation of the pipe.

1.7 PROJECT/SITE CONDITIONS

The use of the product is not to result in the formation or production of any detrimental compounds or by-products including cuttings and pipe coupons, at the wastewater treatment plant or environment. Cool superheated water to below 38 degrees C 100 degrees F before discharge. Notify the Contracting Officer and identify any by-products produced as a result of the installation operations. Comply with local waste discharge requirements.
1.8 WARRANTY

1.8.1 Warranty-TV Inspection

**************************************************************************
NOTE: This inspection is generally performed at 10 months after completion of a lining section and reveals flaws in material and workmanship not otherwise seen, such as settlement, leaks and delamination.

NOTE: Consider adding Warranty-TV inspection to the commissioning requirements of the project. The benefits include a final internal examination of selected portions of the newly installed culverts and storm drain piping system.
**************************************************************************

a. After a pipe section has been lined and for a period of time up to one year following completion of the project, complete a Warranty-TV Inspection as specified in Section 33 01 30.16 TV INSPECTION OF SEWER PIPELINES and at a time directed by the Contracting Officer. The specific locations will be selected by the Contracting Officer.

b. Repair any defects or abnormalities in lining, laterals or manhole connections which may materially affect the integrity, strength, function or operation of the pipe in accordance with Repair or Replacement Procedures.

PART 2 PRODUCT

2.1 SYSTEM DESCRIPTION

Rehabilitate sewer pipelines by the installation of Fold-and-Form Pipeliners (FFP) a Cured-in-Place Pipe (CIPP) liner. Provide a continuous and tight-fitting liner throughout the entire length of the original pipe. Extend the FFP the full length of the original pipe, from entry point to exit point, and provide a structurally sound and water-tight new pipe within a pipe. Cleanup, restore existing surface conditions and structures, and repair portions of the FFP system determined to be defective. Conduct installation operations and schedule cleanup in a manner to minimize obstruction and inconvenience to traffic, pedestrians, and tenants.

2.1.1 Structural Requirements

a. The physical properties, wall thickness and characteristics of the finished FFP will vary according to the material installed. Provide a FFP system which meets or exceeds the minimum properties specified herein:

(1) Design the FFP in accordance with the applicable ASTM Standard, depending on the material being installed. The FFP design is not to assume bonding to the original pipe wall.

(2) The FFP design engineer is to set the long term (50 year extrapolated) Modulus Retention Factor as a percentage of the flexural modulus as determined by ASTM D790 test method. Base the Modulus Retention Factor on long term test data (ASTM D2990 or
equal) submitted by the manufacturer of the product selected to substantiate the long term creep retention factor.

(3) The installed FFP material is to meet or exceed the structural properties, as listed below.

(a) As a minimum, base the required structural FFP wall thickness on the physical properties of the manufactured FFP and according to the design of the Professional Engineer and in accordance with ASTM F1504 and ASTM F1533.

</tbody>
</table>

2.1.2 Structural Requirements

a. Provide calculations supporting the liner thickness. The data is to include both the calculated thicknesses and the thicknesses proposed to be installed. Design the CIPP in accordance with the applicable provisions of ASTM F1216 and ASTM D2412 for fully deteriorated gravity pipe conditions.
b. The installed, cured liner thickness is the largest thickness as determined by calculations for deflection, bending, buckling and minimum stiffness. The minimum installed, cured liner thickness is as follows, regardless of what the calculations indicate as the required minimum thickness:

*NOTE: Thickness values are stated in SI or metric units since they are regarded as the standard; therefore, English units are not provided for thickness values below. Refer to ASTM D790, paragraph 1.3.*

- **150 mm6 inch sewer**: 4.5 mm
- **200 mm8 inch sewer**: 6 mm up to 5.2 meters 17 feet deep
- **200 mm8 inch sewer**: 7.5 mm up to 7.6 meters 25 feet deep
- **250 mm10 inch sewer**: 6 mm up to 3.4 meters 11 feet deep
- **250 mm10 inch sewer**: 7.5 mm up to 5.5 meters 18 feet deep
- **250 mm10 inch sewer**: 9 mm up to 7.6 meters 25 feet deep
- **300 mm12 inch sewer**: 7.5 mm up to 3.7 meters 12 feet deep
- **300 mm12 inch sewer**: 9 mm up to 5.5 meters 18 feet deep
- **300 mm12 inch sewer**: 10.5 mm up to 7.6 meters 25 feet deep
- **375 mm15 inch sewer**: 7.5 mm up to 3.0 meters 10 feet deep
- **375 mm15 inch sewer**: 9 mm up to 4.3 meters 14 feet deep
- **375 mm15 inch sewer**: 10.5 mm up to 6.1 meters 20 feet deep

c. The physical properties and characteristics of the finished liner will vary considerably, depending on the types and mixing proportions of the materials used, and the degree of cure executed. Control these variables and provide a CIPP system which meets or exceeds the minimum properties specified herein:

1. Design the CIPP to meet or exceed ASTM F1216 Appendixes. The CIPP design is to assume no bonding to the original pipe wall.

2. The CIPP design engineer is to set the long term (50 year extrapolated) Creep Retention Factor at 50 percent of the initial design flexural modulus as determined by ASTM D790 test method. Use this value unless long term test data (ASTM D2990) substantiates a higher retention factor is required.

3. At a minimum, the CIPP is to meet or exceed the structural properties, as listed below:
### Minimum Physical Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Test Method</th>
<th>Cured Composite (ASTM F1216)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flexural Modulus of Elasticity (Short Term)</td>
<td>ASTM D790</td>

(5) Prior to installation of the lining materials, submit certification of compliance with these specifications or the requirements of the pre-approved CIPP system. Include certified material test results that confirm materials conform to these specifications. Materials not complying with these requirements will be rejected.
2.1.3  Engineering Design Calculations

**************************************************************************
NOTE: Use ASCE MOP 120 as applicable.
**************************************************************************

Provide engineering design calculations, performed and sealed by a qualified registered Professional Engineer in accordance with the Appendix of ASTM F1216, for each length of liner to be installed including the thickness of each proposed FFP/CIPP. It is acceptable to submit a design for the most severe line condition and apply that design to all of the line sections. Calculations are to include data that conforms to the requirements of these specifications.

2.1.4  Performance Requirements

a. Provide continuous and jointless FFP from manhole to manhole, free of defects that will affect the long term life and operation of the pipe.

   (1) The FFP is to fit sufficiently tight within the existing pipe so as to not leak at the manholes, at the service connections, or through the wall of the installed pipe.

   (2) Seal these areas to stop leakage using a material compatible with the FFP. Repair or replace the liner if leakage occurs through the wall of the pipe. Final approval of the liner installation will be based on a leak tight pipe.

b. The installed FFP is to have a 50 year corrosion resistance to the typical chemicals found in domestic sewage.

c. Provide a continuous and jointless CIPP from manhole to manhole or access point to access point, free of defects that will affect the long term life and operation of the pipe.

d. Fit the CIPP sufficiently tight within the existing pipe so as to not leak at the manholes, at the service connections or through the wall of the installed pipe. Seal leaks at the manholes or the service connections using a material compatible with the CIPP. If leakage occurs through the wall of the pipe, repair or replace the liner.

e. Design the CIPP for a life expectancy of 50 years or greater and to have a 50 year corrosion resistance to the typical chemicals found in domestic sewage.

f. Robotically re-open existing and confirmed active service connections and any other service laterals to be reinstated as directed by the Contracting Officer to their original shape and to a minimum of 90 percent of their original capacity. Repair over-cut service connections to meet the requirements of these specifications. Re-establish the service openings utilizing a remotely controlled brushing device to smoothly cut and remove jagged edges, material and shavings resulting in the cutting operation.

2.1.5  Hydrophilic Seals

Submit Hydrophilic Seal information that specifically indicates that the seal material is compatible with the liner material being utilized and the hydrophilic seal will produce a tight fitting, waterproof seal between the
liner and the host pipe at the manhole location.

2.2 ASSEMBLY

2.2.1 Tolerances

a. Maintain the hydraulic capacity as large as possible. At a minimum, the rehabilitated pipe is to equal the full flow capacity of the original pipe before rehabilitation. In those cases where full capacity cannot be achieved after liner installation, submit a request to waive this requirement, together with the reasons for the waiver request. Derive calculated capacities using a commonly accepted roughness coefficient for the existing pipe material taking into consideration its age and condition.

b. Measure the installed CIPP thickness for each line section installed. The installed CIPP liner thickness tolerance is minus 5 percent to plus 10 percent as compared to the approved liner design. Submit a minimum of one CIPP liner sample for every line section of installed CIPP liner to be used to check the liner thickness. Replace sections where the liner thickness does not fall within the approved design thickness.

2.2.2 Equipment

Provide sufficient equipment to stop or by-pass sewer flow, clean and CCTV mains, install and cure liners, and re-instate service connections as indicated in the Contract documents.

2.2.3 Manhole Connections

Form a tight seal between the rehabilitation (lining) material and the host pipe at the pipe penetration of the manhole wall. Apply the seal consisting of a resin mixture or hydrophilic seal compatible with the installed liner at the manhole-wall interface in accordance with the liner system manufacturer's specifications. Seal annular spaces greater than 13 mm 1/2 inch with manhole wall repair material. Finish off the seal with non-shrink grout or cementitious liner material placed around the pipe opening from the inside of the manhole in a band at least 100 mm 4 inches wide. Provide an epoxy coating over the repair on the manhole walls.

Provide a continuous and smooth invert through manholes. If a liner is installed through a manhole, the bottom portion of the liner is to remain. Grout and shape the bench of the manhole as necessary to support the liner. If the liner terminates on either side of the manhole, build up the invert to remove flow restrictions and to form a continuous invert through the manhole.

2.2.4 Assembly of Fabric Tube

a. Provide a fabric tube manufactured of one or more layers of absorbent non-woven felt fabric, felt fiberglass composite or fiberglass and meet the requirements of ASTM F1216, ASTM F1743, ASTM D5813, and ASTM F2019 that is capable of absorbing and carrying resins, constructed to withstand installation pressures and curing temperatures and have sufficient strength to bridge missing pipe segments, and stretch to fit irregular pipe sections. Submit certified information from the felt manufacturer of the nominal void volume in the fabric tube that will be filled with resin.
b. The wet-out fabric tube is to have a uniform thickness and excess resin distribution that, when compressed at installation pressures, will meet or exceed the design thickness after cure.

c. Manufacture the fabric tube to a size and length that when installed will tightly fit the internal circumference of the host pipe. Allowance for circumferential stretching during installation. Size the tube to the diameter of the existing pipe and the length to be rehabilitated, and be able to stretch to fit irregular pipe sections and negotiate bends. Prior to ordering, measure in the field the minimum tube length necessary to effectively span the designated run between manholes to ensure that the tube will have sufficient length to extend the entire length of the run. Measure the inside diameter of the existing pipelines in the field prior to ordering liner so that the liner can be installed in a tight-fitted condition.

d. Coat the outside or inside layer of the fabric tube (before inversion or pull-in, as applicable) with an impermeable, flexible membrane that contains the resin and facilitates, if applicable, vacuum impregnation and monitoring of the resin saturation during the resin impregnation (wet out) procedure.

e. Do not include material in the fabric tube that may cause delamination in the cured CIPP. Dry or unsaturated layers are not acceptable upon visual inspection as evident by color contrast between the tube fabric and the active resin containing a colorant.

f. Use a light reflective interior pipe surface color so that a clear detailed examination of the CIPP can be made with closed circuit television inspection equipment. Provide a hue of the color dark enough to distinguish a contrast between the fully resin saturated felt fabric and dry or resin lean areas.

g. When seams in the fabric are required, sew them so that the seams are stronger than unseamed felt.

h. Spirally form and sew where the length requires joining.

i. Mark the outside of the fabric tube every 1.5 meters 5 feet with the name of the manufacturer or CIPP system, manufacturing lot and production footage.

j. The installer will determine the minimum length of the fabric tube to effectively span the distance from the starting manhole to the terminating manhole or access point, plus that amount required to run-in and run-out for the installation process.

**************************************************************************
NOTE: Thickness values are stated in SI or metric units since they are regarded as the standard; therefore, English units are not provided for thickness values below. Refer to ASTM D790, paragraph 1.3.
**************************************************************************

k. As a minimum, provide the fabric tube wall thickness manufactured to the nearest 0.5 mm 0.02 in increment, rounded up from the design thickness for that section of installed CIPP. Wall thickness transitions, in 0.5 mm 0.02 in increments or greater as appropriate,
may be fabricated into the fabric tube between installation entrance and exit access points. Provide a sufficient quantity of resin used in the impregnation to entirely fill the felt voids for the nominal felt thickness.

2.2.5 Resin

a. Provide a corrosion resistant polyester or vinyl ester resin and catalyst system or epoxy and hardener system that, when cured within the tube composite, meets the requirements of ASTM F1216, ASTM F1743, or ASTM F2019, the physical properties herein, and those, indicated in the design of the CIPP for this project. The resin is to produce CIPP which will comply with or exceed the structural and chemical resistance requirements of this specification.

b. Submit the resin to tube ratio, by volume, as determined by the Design Calculations.

c. Provide the polyester or vinyl ester resin that is PREMIUM, NON-RECYCLED resin only. Do not use Polyethylene Terephthalate (PET) resins, or those containing fillers, additives or enhancement agents. Old resin or reworked resin is not permitted.

d. Do not use Quick-cure or accelerated resin systems that cure in half the specified time or substantially quicker than the minimum three hours.

e. Do not change resins, catalysts, resin/catalysts, or mixing ratios during this Contract unless specifically approved by the Contracting Officer in writing in advance.

f. Ship the resin directly from the resin manufacturer's facility to the CIPP wet-out facility. Submit copies of the shipping documents from the resin manufacturer to the Contracting Officer showing dates of shipment, the originating location and the receiving location.

g. Use the resin to manufacture the CIPP as shipped. Do not add fillers or additives at the wet-out facility except for the required catalyst.

h. Apply the resin to the felt tubing (wet-out) under factory conditions. Protect the materials against ultraviolet (UV) light, excessive heat and contamination at all times.

2.2.6 Materials

2.2.6.1 Manufacturer's Technology Data

a. Submit manufacturer's technology data for FPPCIPP products and associated technologies.

   (1) Include infrared spectrum (IR) analysis for proposed resin and confirmation that the resins meet ASTM D5813. The IR analyses will be used to verify that the resin and the resin catalyst composition and mixture being used is the approved resin and resin catalyst system.

   (2) Submit results of IR analyses of the proposed resin and resin catalyst mixture, performed and certified by the resin manufacturer, prior to manufacturing CIPP.
(3) The results of these analyses (the resin's chemical fingerprint) will be used as the standard for verifying the resin and resin catalyst mixture being used throughout construction.

2.2.7 Manufacturing Certifications

a. Submit manufacturing certifications that the CIPP was manufactured in accordance with these specifications and ASTM D5813 with each shipment. The certifications are to include:

(1) A signed statement by the wet-out manager/supervisor that no fillers were added to the resin system during manufacture of the CIPP.

(2) Wet-out forms documenting the wet-out for each section of CIPP manufactured without delay or claim to any confidentiality.

(a) The wet-out forms are to document the date and time of wet-out, the wet-out supervisor, the wet-out facility address, the location where the CIPP will be installed (by work order and manhole numbers), the CIPP diameter, the length of wet-tube and dry-tube, the thickness of the CIPP, the roller gap setting for establishing the liner thickness, the felt manufacturer, the resin used (by product name and batch or shipment number) and quantity, the catalyst(s) used (by product name) and quantity, quality control samples taken, and other information pertinent to the wet-out process.

2.2.8 Catalyst

Catalyst product data and quantity. Include a Certificate of Authenticity from the resin manufacturer for each shipment to the wet-out facility as part of the Catalyst product data submittal. Include the date of manufacture and the Heat Distortion Temperature.

2.2.9 Raw Resin Data

Submit Raw Resin Data, including the manufacturer and description of product components.

2.2.10 Flexible Membrane

Submit product data for the Flexible Membrane (coating) material including the manufacturer's recommended repair (patching) procedure.

2.2.11 Lubricant

Submit detailed description of the lubricant proposed for the insertion or inversion process. Ensure that the lubricant is compatible with the wastewater treatment plant operations and pre-treatment program.

2.2.12 Resin Dye

Submit certification that the Resin Dye quantity and type is compatible with the components of the lining system.
PART 3   EXECUTION

3.1  PREPARATION

3.1.1  Set-Up and Sequence

Submit a Sequence of Liner Installation plan. Include proposed set-up locations in the plan that are coordinated with the Traffic Control Plan.

3.1.2  Traffic Control

a. Utilize manholes in the project area as installation access points, at the direction of the Contracting Officer.

b. When a street must be closed to traffic because of the location of the sewer access point, submit a detailed Traffic Control Plan to the Contracting Officer at least 10 days in advance. Meet the requirements of the local agency having jurisdiction over traffic control.

c. Provide labor, signs, barricades, cones, arrow boards, flaggers and any additional equipment necessary to complete the work.

3.2  CLEANING OF PIPE LINES

Clean mains and services as indicated in SECTION 33 01 30.16 TV INSPECTION OF SEWER PIPELINES.

Remove internal debris from the existing pipe line that will interfere with the installation of the liner as required in these specifications.

Legally dispose of solid debris and deposits removed from the system. Moving solid material from manhole section to manhole section is not permitted.

As applicable, either plug the pipe to be cleaned, or install a flow bypass pumping system to facilitate the proper cleaning the pipe lines. Immediately clean up raw sewage spills caused by the Contractor's operations and disinfect the spill area using methods and materials approved by the Contracting Officer. In the event of a spill, notify the Contracting Officer immediately and take appropriate actions to stop and contain the spill.

Exercise care and caution in the use of cleaning equipment in order to avoid damage to the existing pipe.

Provide backflow prevention on fire hydrants used to obtain water as required in Division 01 sections for temporary utilities.

3.3  BYPASSING EXISTING SEWAGE FLOWS

Provide for the flow of existing mainline and service connection effluent around the section or sections of pipe designated for liner installation.

Plug service connections only after proper notification to the Contracting Officer. Service connections are not to remain plugged overnight.

Begin work after plugs or a sewage bypass system and pumping facilities have been installed and tested under full operating conditions, including the bypass of mainline and side sewer flows.
Once the lining process has begun, maintain existing sewage flows until the resin/felt tube composite is fully cured, cooled down, fully televised and the CIPP ends finished.

Coordinate sewer bypass and flow interruptions with the Contracting Officer at least 14 days in advance.

Provide pump(s) and bypass line(s) of adequate capacity and size to handle peak flows.

Submit a detail of the sewer Bypass plan and design to the Contracting Officer before proceeding with liner installation.

3.4 ODOR CONTROL PLAN

Submit an odor control plan that will ensure that project specific odors will be minimized at the project site and surrounding area.

3.5 PRE-TV INSPECTION

Perform post-cleaning Pre-TV video inspections of the pipelines.

PACP certified personnel are to perform the TV inspection.

Submit the Pre-TV videos on CD or DVD and corresponding written logs prior to installation of the liner and for later reference by the Contracting Officer.

3.6 LINE OBSTRUCTIONS

**************************************************************************
NOTE: The vast majority of point repairs are made by the open cut method. No dig sectional point repairs are typically suited for high volume traffic areas and deeper mains.
**************************************************************************

Remove obstructions, correct misalignments, repair broken or collapsed sections and sags that will prohibit the installation or will interfere with the long-term performance of the lining materials by performing a point repair. Point repairs may be by [open cut repair methods] [or] [by sectional point repair methods in accordance with ASTM F1216].

3.7 LATERAL LOCATIONS

Confirm the locations of branch service connections prior to installing and curing the liner material. In the event the status of a service connection cannot be adequately defined, the Contracting Officer will make the final decision, prior to installation and curing of the liner, as to the status.

Unless directed otherwise, only re-open service connections deemed active.

3.8 INSTALLATION OF CIPP LINER

Prior to the installation of the liner, place temperature sensors in the host pipe in order to monitor the temperature of the liner wall and to verify correct curing. Place temperature sensors between the host pipe and the liner in the bottom of the host pipe (invert) throughout its length and
monitor the temperature on the outside of the liner during the curing process.

Place the temperature sensors at intervals as indicated in the sensor manufacturer's written specifications. Place additional sensors where significant heat sinks are likely or anticipated.

Monitor the sensors by a computer using a tamper proof data base that is capable of recording temperatures at the interface of the liner and the host pipe.

Install the liner in accordance with ASTM F1216 and ASTM F1743 with the following modification: Position the wet-out tube in the pipeline using the method indicated in the manufacturer's instructions. Do not damage the tube as a result of installation. Pull-in or invert through an existing manhole or access point and fully extend to the next manhole or termination point.

Install and cure the CIPP Liner in the host pipe as indicated in the manufacturer's specifications and as described in the approved submittals.

Accomplish curing by utilizing the medium in accordance with the cure schedule. Continuously monitor the curing source, or input and output temperatures and log the temperatures during the cure cycles. Use the manufacturer's recommended cure method and schedule for each line segment installed. Take the liner wall thickness and the existing ground conditions with regard to temperature, moisture level, and thermal conductivity of soil into account during the curing process.

For heat cured liners, if one or more temperature sensor(s) do not reach the temperature as specified by the manufacturer to achieve proper curing or cooling, the installer is to make necessary adjustments to comply with the manufacturer's specifications.

Compile and submit Curing Logs from the system computer that specifically identifies each installed sensor station in the length of pipe, indicates the maximum temperature achieved and the sustained temperature time. Each sensor is to record both the maximum temperature and the minimum cool down temperature and comply with the manufacturer's written product data.

For UV Cured Liners, record all light train sensor readings along the entire length of the installed liner into a tamper proof computer. Follow the cure procedure in accordance with the manufacturer's written product data.

3.9 INSTALLATION OF FFP LINER

Install and process the FFP in the host pipe according to these specifications, ASTM F1867 and the manufacturer's specifications.

Prior to installation of the FFP liner, place temperature sensors in the host pipe to monitor the temperatures during the processing of the FFP. Monitor and log temperatures during processing and cool down. Submit temperature logs.

Position the FFP in the pipeline using the method specified by the manufacturer. Pull-in the FFP through an existing manhole or access point and fully extend the FFP liner to the next designated manhole or termination point.
Complete the processing of the FFP by utilizing the appropriate medium in accordance with the manufacturer's instructions. Use ASTM F1867 and the manufacturer's recommended processing procedure for each line segment installed. Consider the FFP wall thickness and the existing ground conditions with regard to temperature, moisture level, and thermal conductivity of the host pipe and soil, during the installation of the FFP. Adjust pressures according to site conditions to ensure a tight expansion out against the host pipe.

3.10 DISPOSAL OF SUPERHEATED WATER

Submit a procedure for the disposal of superheated water for approval by the Contracting Officer.

3.11 COOL DOWN

Cool the FFP in accordance with the approved FFP product specifications.

Monitor and record temperatures and curing data throughout the installation process to ensure that each phase of the process is achieved in accordance with the FFP system product specifications.

3.12 CURING LOGS

Submit completed curing logs for each pipe segment.

3.13 FINISH (CIPP)

Provide CIPP that is continuous over the entire length of a sewer line section, is free from visual defects such as foreign inclusions, dry spots, pinholes, major wrinkles and de-lamination, and is impervious and free of leakage from the pipe to the surrounding ground or from the ground to inside the lined pipe.

Repair defects in accordance with the Repair or Replacement Procedures which may affect the structural integrity or strength of the linings.

Seal the beginning and end of the CIPP to the existing host pipe utilizing a hydrophilic end sealing material compatible with the existing (HOST) pipe and the liner.

Provide water tight service connections.

3.14 FINISH (FFP)

Provide FFP that is fully expanded and continuous over the entire length of a sewer line section, is free from visual defects such as foreign inclusions, dry spots, pinholes, major wrinkles, is impervious and free of any leakage from the pipe to the surrounding ground or from the ground to inside the lined pipe.

Repair any defect, in accordance with the Repair or Replacement Procedures which may affect the structural integrity or strength of the linings.

Seal the beginning and end of the FFP to the existing host pipe using a hydrophilic end sealing material compatible with the existing (host) pipe.
and the FFP.

Provide watertight service connections.

If the wall of the FFP leaks, remove and replace the section of FFP with a watertight pipe.

3.15 FIELD QUALITY CONTROL

All costs for the collection, transportation and testing of samples are the responsibility of the Contractor.

3.15.1 Testing of Installed FFP

a. Verify the physical properties of the installed FFP through field sampling and laboratory testing. Submit FFP Samples for testing to the Contracting Officer for testing, by a qualified, independent laboratory that specializes in material testing; testing will be at the Contractor's expense. Test in accordance with ASTM F1871 and ASTM F1504 test methods to confirm compliance with the requirements specified in these Contract documents.

b. Provide samples for testing to the Contracting Officer from the actual installed FFP. At a minimum, provide samples from one location per 762 meters 2500 linear feet of installed pipe. Cut the sample from a section of processed FFP that has been installed through a like diameter pipe which has been held in place by a suitable heat sink, such as sandbags. Process, cut, and label test samples in the presence of the Contracting Officer. Immediately package the samples in a pre-addressed, postage paid, pre-labeled, unsealed packing, addressed for delivery to the testing laboratory. Seal packages in the presence of the Contracting Officer; and ship or transport to the testing lab.

c. On pipelines greater in diameter than is practical to produce restrained samples, the Contracting Officer may, at his or her discretion, designate a location in the newly installed FFP where the Contractor is to take a sample. Repair the opening produced from the sample, in accordance with manufacturer's specifications.

d. Identify on the sample and as built drawings the test sample location as referenced to the nearest manhole and station. One re-testing of failed samples will be permitted for proper protocol compliance verification. If properties tested do not meet minimum requirements, repair or replace the FFP pipe section. Sample and test sections of the replaced FFP section.

e. Submit FFP liner sample test results.

f. Chemical resistance - The FFP system installed is to meet the chemical resistance requirements for a typical domestic sewage environment. Use materials proposed for actual construction for FFP testing.

g. Maintain the hydraulic capacity as large as possible. At a minimum the installed FFP is to equal the full flow capacity of the original pipe before rehabilitation. In those cases where full capacity cannot be achieved after FFP installation, submit a Flow Capacity Waiver request together with the reasons for the waiver request. Calculated capacities may be derived using a commonly accepted roughness coefficient for the existing pipe material taking into consideration its age and condition.
(1) Measure the installed FFP thickness for each line section installed.

(2) Use non-destructive methods for confirming the thickness of the installed FFP.

(3) Remove the FFP if the FFP thickness does not meet the specified Contract requirements. The FFP thickness has a tolerance of minus 5 percent and plus 10 percent.

h. Where leakage is observed through the wall of the pipe, institute localized testing (weirs or similar) that will verify that the leakage rate of the installed liner does not exceed acceptable tolerances for new sanitary sewer installations for the local jurisdictions.

3.15.2 Testing of Installed CIPP

a. Verify the physical properties of the installed CIPP through field sampling and laboratory testing. Submit CIPP Liner Samples for testing by an independent third party laboratory. Test in accordance with ASTM F1216, ASTM F1743, and ASTM D5813 for chemical resistance. Test methods to confirm compliance with the requirements specified in these Contract documents.

b. Collect samples from the actual installed CIPP liner. At a minimum, one sample for each 305 meters 1000 linear feet of CIPP Liner installed; one sample for each size of CIPP Liner installed; and one plate sample cured with CIPP on pipelines greater than 450 mm 18 inches in diameter. Cut the samples from a section of cured CIPP that has been inverted or pulled through a like diameter pipe which has been held in place by a heat sink, such as sandbags.

c. Process, cut, and label test samples in the presence of the Contracting Officer. Immediately package the samples in a pre-addressed, postage paid, pre-labeled, unsealed packing, addressed for delivery to the testing laboratory. Seal packages in the presence of the Contracting Officer; and ship or transport to the testing lab.

d. Submit CIPP liner sample test results.

3.16 RECONNECTIONS OF EXISTING SERVICES

Make reconnections of existing services after the liner has been installed, fully cured, and cooled down.

Make external reconnections with a tee fitting in accordance with the lining system manufacturer's written specifications. Seat and seal saddle connections to the new CIPP using grout or resin compatible with the CIPP. FFP following manufacturer's specifications.

Utilize a CCTV camera and remote cutting tool for internal reconnections. The machined opening must be at least 90 percent of the service connection opening and the bottom of both openings are required to match. The opening cannot be more than 100 percent of the service connection opening. Smooth the edges of the opening and remove pipe or liner fragments, which may obstruct flow or snag debris. Cut the invert of the sewer connection flush with the invert entering the mainline.
In the event that service reinstatements result in openings that are greater than 100 percent of the service connection opening, install a repair, sufficient in size to completely cover the over-cut service connection according to the manufacturer's specifications.

Collect coupons of pipe material resulting from service tap cutting at the next manhole downstream of the pipe rehabilitation operation prior to leaving the site. Account for all pipe coupons and do not allow them to pass through the system.

3.17 POST-TV INSPECTION

Perform a detailed closed-circuit Post-TV inspection in the presence of the Contracting Officer after installation of the liner and reconnection of the side sewers in accordance with Section 33 01 30.16 TV INSPECTION OF SEWER PIPELINES. Utilize a radial view (pan and tilt) TV camera. A post-TV video inspection is to confirm that the finished liner is continuous over the entire length of the installation, free of significant visual defects, damage, deflection, holes, leaks and other defects. Submit unedited digital video documentation of the inspection (Post-TV video inspection) to the Contracting Officer within 10 working days of the liner installation.

Include the following data on the Post-TV video: Inspection date, manhole identification numbers, size of pipe, direction of flow, location of reconnected side sewers, debris, as well as defects in the liner, such as gouges, cracks, bumps, or bulges.

Clean the newly installed liner removing accumulated debris and build-up immediately prior to conducting the Post-TV inspection.

3.18 REPAIR OF CIPP DEFECTS

Locate and succinctly define defects in the installed CIPP that will not affect the operation and long term life of the product. The warranty CCTV inspection will include pipe segments with noted defects that were not repaired.

Locate and succinctly define repairable defects that occur in the installed CIPP based on approved product specifications, including a detailed step-by-step repair procedure.

Clearly locate and define un-repairable defects in the CIPP based on the approved product specifications, including a recommended procedure for the removal and replacement of the CIPP.

3.19 REPAIR OF FPP DEFECTS

Repair or replace any defects which, in the judgment of the Contracting Officer, will affect the integrity or strength of the lining. Prior to the repair of defective work, submit a Shop Drawing indicating the FPP Repair Method. Provide field or workshop demonstration of the method of repair if requested by the Contracting Officer. Make the repairs in full compliance with the FPP manufacturer's specifications. Re-TV repairs to FPP in accordance in accordance with Section 33 01 30.16 TV INSPECTION OF SEWER PIPELINES.

3.20 SITE CLEANUP

Cleanup and restore existing surface conditions and structures. Repair any
of the FFP system determined to be defective.

Schedule cleanup in a manner to cause the least possible obstruction and inconvenience to traffic, pedestrians, and property occupants.

3.21 CLOSEOUT ACTIVITIES

3.21.1 Demonstration

Complete Post-TV inspections and repairs to the installed liner before acceptance. Complete Pre-TV, Post-TV, Re-TV and Warranty-TV inspections in accordance with Section 33 01 30.16 TV INSPECTION OF SEWER PIPELINES.

Submit post installation inspection documentation within 10 working days of the liner installation. The Contracting Officer may, at his or her discretion, suspend any further installation of lining materials if post-installation documentation is not submitted within 10 working days. As a result of this suspension, no additional working days will be added to the Contract, nor will any adjustment be made for increase in cost.

Submit as-built drawings for the portions of the sanitary sewer system that were rehabilitated showing complete detail with dimensions, both above and below grade, including invert elevations at the manholes.

Include the identification of the work completed on one set of Contract Drawings. Keep legible as-built drawings on the project site at times and maintain them as the work progresses. Continuously update the as-built drawings with accurate dimensions and notations concerning locations, sizes, pipe lengths and specific material types. Include dimensional location, size and type of point repairs on the as-built drawings.

Within 10 working days of final acceptance of said work, submit As-built drawings; Pre-TV and Post-TV CDs/DVDs; and Inspection forms.

NOTE: This guide specification outlines many of the requirements for leak detection systems for fueling applications.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification does not address the monitoring of tank bottoms for field-fabricated, vertical storage tanks.

Use this UFGS in conjunction with UFC 3-460-01 "Design: Petroleum Fuel Facilities". Include in this specification any additional equipment/devices necessary to meet state and local regulations.

UFC 3-460-01 requires underground storage tanks and underground piping to be monitored for leaks in accordance with 40 CFR 280, 40 CFR 281, 49 CFR 195,
In order to meet SPCC (40 CFR 112) program requirements and/or as a best management practice, all underground pipes associated with Aboveground Storage Tanks (ASTs) shall meet the secondary containment and/or leak detection provisions of 40 CFR 280, 40 CFR 281, and any applicable state and local requirements - see spec writer notes under UNDERGROUND PIPING section.

Various methods can be used to conform to the leak detection and monitoring requirements of the CFRs. This specification covers the preferred methods related to tanks and piping. Variations from this specification must be coordinated with and approved by the Using Agency.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN PETROLEUM INSTITUTE (API)

API RP 540 (1999; R 2004) Electrical Installations in Petroleum Processing Plants

API RP 1130 (2007; R 2017) Computational Pipeline Monitoring for Liquids

API RP 2003 (2015; 8th Ed) Protection Against Ignitions Arising out of Static, Lightning, and Stray Currents
1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes
following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect equipment and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer. Replace damaged or defective items.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

Provide materials and equipment that are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship, and that have been in satisfactory commercial or industrial use for a minimum 2 years prior to bid opening. The 2 year period shall include applications of the equipment and materials under similar circumstances and of similar size. Materials and equipment must have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2 year period. Products having less than a 2 year field service record will be acceptable if a certified record of satisfactory field operation, for not less than 6000 hours, exclusive of the manufacturer's factory tests, can be shown.

2.1.1 Nameplates

**************************************************************************

NOTE: In a salt water environment, substitute acceptable non-corroding metal such as, but not limited to, nickel-copper, 304 stainless steel, or monel. Aluminum is unacceptable. Nomenclature (or system identification) should be established by the designer.

Require melamine plastic nameplates for all NAVFAC projects. Also for NAVFAC projects, require nameplates to be associated or keyed to system charts and schedules.

**************************************************************************

Attach nameplates to all specified equipment defined herein. List on each nameplate the manufacturer's name, address, [contract number,] [acceptance date,] component type or style, model or serial number, catalog number, capacity or size, and the system which is controlled. Construct plates of [anodized aluminum] [stainless steel] [melamine plastic, 3 mm 0.125 inch thick, UV resistance, black with white center core, matte finish surface and square corners] [____]. Install nameplates in prominent locations with nonferrous screws, nonferrous bolts, or permanent adhesive. Minimum size of nameplates shall be 25 by 65 mm one by 2.5 inches. Lettering shall be the normal block style with a minimum 6 mm 0.25 inch height. Accurately align all lettering on nameplates. [For plastic nameplates, engrave lettering into the white core.] [Key the nameplates to a chart and schedule for each system. Frame charts and schedule under glass, and locate where directed near each system. Furnish two copies of each chart and schedule. Each nameplate description shall identify its function.]

2.1.2 Metallic Requirements

**************************************************************************
NOTE: Include the bracketed information if aviation fuel will be handled.

Internal parts and components of equipment, piping, piping components, and valves that could be exposed to fuel during system operation shall not be constructed of zinc coated (galvanized) metal[, brass, bronze, or other copper bearing alloys]. Do not install cast iron bodied valves in piping systems that could be exposed to fuel during system operation.

2.2 ELECTRICAL WORK

NOTE: Coordinate the ignition temperature of the fuel(s) to be handled with the electrical design. Ignition temperatures will be as defined in NFPA 497M. Fuel ignition temperatures will dictate the maximum allowable temperature rating of the electrical equipment.

Provide controllers, integral disconnects, contactors, controls, and control wiring with their respective pieces of equipment. Provide electrical equipment, including motors and wiring, as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide switches and devices necessary for controlling and protecting electrical equipment. Controllers and contactors shall have a maximum of 120-volt control circuits and shall have auxiliary contacts for use with the controls provided.

2.2.1 Underground Wiring

Enclose underground electrical wiring in PVC coated conduit. Dielectrically isolate conduit at any steel storage tank connection.

2.2.2 Grounding and Bonding

Grounding and bonding shall be in accordance with NFPA 70, NFPA 77, NFPA 407, NFPA 780, API RP 540, API RP 2003, IEEE 142, and IEEE 1100. Provide jumpers to overcome the insulating effects of gaskets, paints, or nonmetallic components.

2.3 LEAK DETECTION SYSTEM

NOTE: This paragraph and subsequent sub-paragraphs address primarily leak detection systems that conform to 40 CFR 280 and 40 CFR 281. For leak detection systems applicable to large fuel distribution systems (49 CFR 195), refer to paragraph COMPUTATIONAL PIPELINE MONITORING SYSTEM.

Provide a system, including sensors and detectors, that is intrinsically safe for use in a Class 1, Division 1, Group D environment as defined by NFPA 70. System shall be compatible with the fuel to be handled. Sensors shall distinguish and report the difference between hydrocarbons and water. Output and transmission from sensors and detectors shall be electronic. Sensors shall have a minimum probability of detection of 95 percent and a maximum probability of false alarm of 5 percent. Sensors and
detectors shall be compatible with the electronic monitoring/alarm panel. Sensors shall be reusable after an alarm condition is sensed. Submit shop drawings for the leak detection system that include the following.

a. Wiring schematics for all parts of the system showing each operating device and listing their normal ranges of operating values (including pressures, temperatures, voltages, currents, speeds, etc.).

b. Single line diagrams of the entire system, including any required alterations to the existing piping and tank(s).

c. Diagrams for posting that include distance markings such that alarm indications can be correlated to leak location in plan view. The diagrams shall include a piping and wiring display map with schematic diagrams from the leak detection system manufacturer. The diagrams shall be framed under glass or laminated plastic and be posted where indicated by the Contracting Officer.

2.3.1 Underground Storage Tanks

NOTE: 40 CFR 280 and 40 CFR 281 define and regulate underground storage tank (UST) systems. According to these CFRs, UST systems are defined as one or more combination of underground tanks (including underground pipes connected thereto) that are used to contain an accumulation of regulated substances, and the volume of which (including the volume of underground pipes connected thereto) is 10 percent or more beneath the surface of the ground.

Per the CFRs, UST systems do not cover underground tanks less than or equal to 416 L 110 gallons, and tanks used for storing heating oil for consumptive use on the premises where stored. NOTE: Heating oil tanks must meet secondary containment and leak detection requirements of 40 CFR 280 / 281 to meet provisions of Spill Prevention Countermeasure and Control (SPCC) Program.

UFGS 33 56 10 requires all new underground storage tanks be the double-walled type. The required leak detection method for these type tanks is to continuously and automatically monitor the tank's interstitial space. The system used must be capable of detecting both fuel released through a tank's interior wall as well as the influx of ground water through a tank's exterior wall.

System shall continuously and automatically monitor the interstitial space of an underground tank for breaches in the integrity of the inner and/or outer tank shells. Monitor the interstitial space by using either an electronic capacitance type liquid sensor or a positive pressure system. Monitoring the interstitial space of a fiberglass reinforced plastic (FRP) tank may be performed using a liquid-filled interstitial space monitoring system. The liquid solution used in a liquid-filled interstitial shall be
freeze protected (brine) and shall contain appropriate corrosion inhibitors. The monitoring system shall detect and discriminate between high and low brine level conditions.

2.3.2 Aboveground Vaulted Storage Tanks

All aboveground storage tanks require leak detection. This leak detection can be:

Visual - such as a dedicated indicator on a vaulted tank.

Manual - such as a manual access port used to stick the interstice.

Electronic - such as an electronic capacitance type, or similar.

NOTE: Provide electronic and/or visual interstitial monitoring if required by the Using Agency. Interstitial monitoring for aboveground tanks is not required.

As mentioned previously, this specification does not address the monitoring of tank bottoms for field-fabricated, vertical storage tanks. For these type applications refer to Standard Design AW 78-24-27 ABOVEGROUND VERTICAL STEEL TANKS W/FLOATING PANS AND FIXED ROOFS.

System shall continuously and automatically monitor the interstitial space of a vaulted tank for breaches in the integrity of the primary tank and the exterior vaulted shell. Provide a manual access port that can be used to stick the interstice. In addition, provide either (1) a visual method that can automatically monitor the interstitial space such as a Pop-Up gauge, or (2) an electronic method such as an electronic capacitance type liquid sensor.

2.3.3 Underground Piping associated with tanks less than or equal to 50,000 gallons

NOTE: This section addresses the leak detection requirements associated with underground fuel pipes (both pressurized and suction) that are regulated by 40 CFR 280 and 40 CFR 281.

For pipes associated with tanks less than or equal to 50,000 gallons in capacity that are not part of an airport hydrant system, the following is required per 40 CFR 280 Subpart D:

Pressurized and suction piping must be double walled with interstitial monitoring - include CONTAINMENT SUMPS paragraph.
Pressurized piping must be equipped with an automatic line leak detection system - include paragraph from this UNDERGROUND PIPING section.

The use of integrally installed liquid and/or vapor sensors installed within the interstitial space of double-walled piping is discouraged and is not covered in this specification.

For UST systems with field-constructed tanks and airport hydrant fuel distribution systems, 40 CFR 280 Subpart K allows for alternative leak detection strategies. The specification writer must delineate leak detection system requirements for such systems under the COMPUTATIONAL PIPELINE MONITORING SYSTEM paragraph, and design a system that meets the Subpart K regulatory required leak rate. In order to do so the specification writer must consider pipe segment volumes, in conjunction with the specified achievable leak detection rate of the equipment.

Leak Detection System associated with tanks less than or equal to 50,000 gallons shall continuously and automatically monitor for piping leaks using an automatic line leak detector. Detector shall detect a minimum leak rate of 0.003 L/s 3 gallons per hour at 69 kPa 10 psig line pressure within 1 hour. Detector shall detect leaks against a minimum 1.8 m 6 feet of head pressure. Detector shall detect leaks from any portion of the underground product piping.

2.3.4 Containment Sumps

NOTE: Provide leak detection system on sumps if required by the approved SPCC plan and/or local regulatory requirements. Sumps may used in various locations (e.g., low drain points, high vent points, aboveground to belowground piping transitions, underneath fuel dispensers, above UST manways, etc.).

Within each sump, require liquid sensors to be installed to monitor for the influx of liquids (fuel or water). Where double-wall piping is used for the fuel distribution, slope the piping appropriately from sump to sump in order to assure immediate notification of any piping failure.

Leak Detection System on sumps shall continuously and automatically monitor each containment sump [and dispenser sump] with an electronic capacitance type liquid sensor. Sensor shall detect liquids within a minimum of 25 mm 1 inch above a sump's bottom. The leak detection system must be capable of triggering shutdown of the submersible turbine pump or the dispenser pump.
2.3.5 Monitoring Wells

**************************************************************************
NOTE: For wells where groundwater could possibly come in contact with the sensor being used, specify a hydrocarbon/groundwater type sensor. For locations where groundwater is not a concern, specify a vapor type sensor.
**************************************************************************

System shall continuously and automatically monitor each monitoring well with a [hydrocarbon/groundwater] [vapor] sensor. [Hydrocarbon/groundwater sensor shall distinguish the difference between hydrocarbons and water while totally immersed in groundwater. Sensor shall sense when the groundwater level has reached a minimum definable setpoint.] [Vapor sensor shall detect vapors of the fuel to be handled as well as sense the presence of liquid.]

2.4 ELECTRONIC MONITORING/ALARM PANEL FOR PIPELINES ASSOCIATED WITH TANKS GREATER THAN 50,000 GALLONS

**************************************************************************
NOTE: Use a single panel to monitor all applicable sensors and detectors if possible. Delete any of the items of this paragraph that are not applicable.
**************************************************************************

Panel shall perform continuous integrity checks on the status of each sensor's connections and wiring. Panel shall include a battery backup (rechargeable) that can operate the complete leak detection system during a power failure for a minimum period of 48 hours. Submit shop drawings of the panel layout along with panel mounting and support details. Panel shall be compatible with and connected to the following:

a. Tank interstitial sensors and detectors.

b. Sump sensors and detectors.

c. Automatic line leak detectors.

d. Monitoring well sensors and detectors.

e. Digital tank gauge system as defined in Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.4.1 Panel Housing

**************************************************************************
NOTE: Panels located outdoors require NEMA 4 enclosures. Panels located indoors only require a standard industrial enclosure. Explosion-proof enclosures are currently unavailable.
**************************************************************************

Panel housing shall be a [NEMA 4 rated enclosure in accordance with NEMA 250] [standard industrial enclosure]. Panel housing shall have a hinged door to swing left or right (doors shall not swing up or down).
2.4.2 Panel Alarms

Panel shall account for the effects of thermal expansion or contraction of the fuel product, vapor pockets, tank or piping deformation, evaporation or condensation, as well as groundwater levels (if applicable) prior to initiating an alarm condition. Panel shall produce an audible and visual alarm in the event any of the following occur.

a. Sensing of a hydrocarbon liquid from a sensor or detector.

b. Sensing of a hydrocarbon vapor from a sensor or detector.

c. Sensing of water from a sensor or detector.

d. Failure of an automatic line leak test.

e. Loss of pressure in positively pressurized tank interstitial.

f. Sensing a high or low liquid level in liquid-filled tank interstitial.

g. Sensing minimum groundwater setpoint.

h. Failure of any integrity check.

i. Sensing tank high, high-high, or low level alarm conditions.

2.4.2.1 Audible Alarm

Panel shall have [internal] [external] speakers that produce a buzzer sound of 70 [_____] decibels or greater in the event of a detected alarm condition. The audible alarm must be located in an area easily heard [in the control room] [near the dispensers] [near the pumps] in the event of an alarm condition.

2.4.2.2 Visual Alarm

Panel shall have a visual alarm that illuminates in the event of a detected alarm condition. Visual alarm shall include either individual lights for each alarm condition or shall include a single light and a liquid crystal display (LCD) panel that displaces information regarding each alarm condition. The visual alarm must be located in an area where it can be seen [in the control room] [near the dispensers] [near the pumps] when illuminated in the event of an alarm condition.

2.4.3 Acknowledge Switch

Panel shall have a manual acknowledge switch that will deactivate the audible alarm. Acknowledge switch shall not deactivate subsequent audible
alarms unless depressed manually again for each occurrence. Under no circumstance shall this acknowledgement switch extinguish the visual alarms until the alarm condition has been corrected. Switches shall be an integral component located on the front panel and be either a key switch or push button.

2.5 COMPUTATIONAL PIPELINE MONITORING SYSTEM

**************************************************************************
NOTE: EPA established minimum detectable leak rates for UST systems with field-constructed tanks and airport hydrant systems in 40 CFR 280 Subpart K. Specification writer must consider pipe segment volumes, in conjunction with the specified achievable leak detection rate of the equipment, in order to design a system that meets the regulatory required leak rate. Additional applicable requirements for large fuel distribution applications are in 49 CFR 195.

Pipeline systems must be designed so that they can meet the regulatory required minimum detectable leak rates in 40 CFR 280 Subpart K. This means the designer must consider pipe segment volumes in coordination with available leak detection equipment, and must install proper isolation valves, high point vents / low point drains, and pressure relief valves. The install of a permanent leak detection system versus the use of portable vendor equipment to conduct leak detection tests is at the discretion of the Using Agency. The designer should consider the life cycle cost of a permanent installed leak detection system versus the cost of testing systems using portable vendor provided equipment, in order to determine if the installation of a permanent system makes sense. The use of portable vendor provided equipment is often cheaper.

CPM system can be permanently mounted or can be configured to be portable. For permanently mounted systems, indicated the location of the system on the drawings. For portable systems, indicate the piping connection point(s) on the drawings.

**************************************************************************
CPM system shall conform to API RP 1130. System shall detect leaks as small as 0.004 percent of the pipeline volume within 1 hour. System shall account for thermal effects on the piping and fuel. System shall be compatible with the fuel to be handled. System shall be [permanently mounted where indicated][provided as a complete, portable system].

2.6 FINISHES

2.6.1 Factory Coating

**************************************************************************
NOTE: For all Navy projects (regardless of location), the 500 hour salt spray test is required and must be specified.
For Army projects, a salt spray test is optional. The 125 hour test is suggested for mild or noncorrosive environments. The 500 hour test is suggested for extremely corrosive environments.

Unless otherwise specified, provide equipment and components fabricated from ferrous metal with the manufacturer's standard factory finish. Each factory finish shall be capable of withstanding 125 or 500 hours exposure to the salt spray test specified in ASTM B117. For test acceptance, the test specimen shall show no signs of blistering, wrinkling, cracking, or loss of adhesion and no sign of rust creepage beyond 3 mm 1/8 inch on either side of the scratch mark immediately after completion of the test.

For equipment and component surfaces subject to temperatures above 50 degrees C 120 degrees F, the factory coating shall be appropriately designed for the temperature service.

2.6.2 Field Painting

Painting required for surfaces not otherwise specified shall be field painted as specified in [Section 09 97 13.27 HIGH PERFORMANCE COATING FOR STEEL STRUCTURES][Section 09 90 00 PAINTING, GENERAL]. Do not paint stainless steel and aluminum surfaces. Do not coat equipment or components provided with a complete factory coating. Prior to any field painting, clean surfaces to remove dust, dirt, rust, oil, and grease.

PART 3 EXECUTION

3.1 INSTALLATION

NOTE: During design, layout equipment and components to allow adequate access for routine maintenance. Do not rely solely on the Contractor to make these judgments. Show access doors where applicable for maintenance.

Install parts requiring periodic inspection, operation, maintenance, and repair in locations that allow ready access. Install leak detection system and components in accordance with manufacturer's installation instructions.

3.1.1 Storage Tank Sensors/Detectors

Install interstitial tank sensors and detectors at the tank's low end. Sensor installation shall be in accordance with the tank manufacturer's recommendations and shall not compromise the tank's secondary containment in any manner. Sensors shall be easily removed from a tank. Connection of metal conduit to steel tanks shall be with dielectric fittings.

3.1.2 Automatic Line Leak Detector

Install detector on discharge side of each submersible pump in accordance with the pump and detector manufacturer's recommendations.

3.1.3 Sensors in Sumps

Install sensors in the low point of a sump in accordance with sump and
sensor manufacturer’s recommendations.

3.2 FIELD QUALITY CONTROL

3.2.1 Leak Detection System Test

Activate and test the entire leak detection system in accordance with manufacturer’s testing procedures. Use the electronic monitoring/alarm panel to record and present the results.

3.2.2 Storage Tank Tightness Tests

For tanks less than or equal to 50,000 gallons, storage tank tightness tests must be performed in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS. Use the electronic monitoring/alarm panel to record and present the results.

For tanks greater than 50,000 gallons, storage tank tightness test must be performed with a system that is certified to be able to detect leaks at no more than 0.5 gallons per hour.

3.2.3 Tank Fill Tests

High liquid level alarm tests on storage tanks shall be performed in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS. Use the electronic monitoring/alarm panel to record and present the results.

3.3 DEMONSTRATIONS

Conduct a training session for designated Government personnel in the operation and maintenance procedures related to the equipment/systems specified herein. Include pertinent safety operational procedures in the session as well as physical demonstrations of the routine maintenance operations. Furnish instructors who are familiar with the installation/equipment/systems, both operational and practical theories, and associated routine maintenance procedures. The training session shall consist of a total of [_____] hours of normal working time and shall start after the system is functionally completed, but prior to final system acceptance. Submit a letter, at least 14 working days prior to the proposed training date, scheduling a proposed date for conducting the onsite training.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
   Cleaning Agents
   Abrasive for Blasting
   Gasoline-Oil-Resisting Rubber Gloves and Boots
   Cotton Coveralls and Hard Hat
   Respiratory Protective Equipment
   Disinfectant

SD-06 Test Reports
   Blasting Abrasive Test
   Tank Contents Tests
   Cleaning Test Panel Results

**************************************************************************
NOTE: Delete if hazardous waste is to be disposed of by the Government. Designer must verify that Government disposal is practical and make all arrangements for Government disposal.
**************************************************************************

Safety Permits

1.3 DEFINITIONS

1.3.1 Certified Industrial Hygienist (CIH)

As used in this section, refers to an Industrial Hygienist employed by the Contractor and is certified by the American Board of Industrial Hygiene in comprehensive practice.

1.3.2 Marine Chemist

The holder of a valid Certificate issued by the National Fire Protection Association in accordance with the "Rules for Certification of Marine Chemists," establishing him as a person qualified to determine whether construction, alteration, repair, or shipbreaking of vessels, which may involve hazards covered by NFPA 306 can be undertaken with safety.

1.3.3 Hazardous Areas

Hazardous areas must be defined as any area within 30 meters 100 feet of active aboveground storage tanks, areas within 30 meters 100 feet of leaking sections of fuel pipelines or other vapor sources, areas within 60 meters 200 feet of the downwind side of potential vapor emission sources (i.e., pressure-vacuum vents or open vents on active tanks, leaking
sections of pipelines), areas within existing tanks, and areas within a
dike.

1.3.4 Hot Work Operations

Hot work, for work covered by this section, includes: flame heating,
welding, torch cutting, brazing, carbon arc gouging, or any work which
produces heat, by any means, of 200 degrees C 400 degrees F or more; or in
the presence of flammables or flammable atmospheres, other ignition sources
such as spark or arc producing tools (except steel hand tools) or
equipment, static discharges, friction, impact, open flames or embers,
nonexplosion-proof lights, fixtures, motors or equipment. Prepare tank
bottoms for hot work in accordance with API RP 2207.

1.3.5 Personal Monitoring

**************************************************************************
NOTE: Consult with cognizant industrial hygienist
regarding deletion if no lead hazard is present in
tanks.
**************************************************************************

Sampling of lead concentrations within the breathing zone of an employee to
determine the 8-hour time weighted average concentration in accordance with
29 CFR 1910.1025. Samples must be representative of the employee's work
tasks. Breathing zone must be considered an area within a hemisphere,
forward of the shoulders, with a radius of 150 to 225 mm 6 to 9 inches and
the center at the nose or mouth of an employee.

1.3.6 Reproductive Hazard

A reproductive hazard is defined as any occupational stressor (biological,
chemical, or physical) that has the potential to adversely affect the human
reproductive process. For example, it is well known that central nervous
system problems often occur in the offspring of mothers exposed to organic
mercury during pregnancy. Therefore, based on the example cited, organic
mercury can be classified as a reproductive stressor. Many reproductive
hazards also cause other adverse health effects; for example, ethylene
oxide is also known to be a carcinogen (i.e., produces cancer). Certain
reproductive stressors can also have adverse effects on the male
reproductive system. (If requested by the Contractor, the Contracting
Officer will make available the Navy's standard on reproductive hazards.)

1.3.7 Flammable Liquid

Any liquid having a flash point below 38 degrees C 100 degrees F and a
vapor pressure not exceeding 275 kPa 40 psia at 38 degrees C 100 degrees F.

1.3.8 Combustible Liquid

Any liquid having a flash point at or above 38 degrees C 100 degrees F.

1.4 QUALIFICATIONS

a. To Be Considered Qualified: Show proof of having completed work on
three previous projects.

b. See certificate requirements for personnel as specified in paragraph
CERTIFICATES.
1.5 QUALITY ASSURANCE

1.5.1 Modification of References

******************************************************************************
NOTE: Delete brackets and words within brackets if there is no leaded fuel in any tank.
******************************************************************************

Except as modified herein, the work must conform with the recommendations of NFPA 326, API RP 500, API RP 2003, and API Std 2015. Where the word "should" appears in these publications, substitute "must."

1.5.2 Copies of Standards

******************************************************************************
NOTE: Delete brackets and words within brackets if there is no leaded fuel in any tank.
******************************************************************************

Furnish four copies of NFPA 326, API RP 500, API RP 2003, and API Std 2015.

1.5.3 Safety Permits and Equipment

Acquire safety permits (specified by the facility safety authorities) and necessary safety equipment.

1.5.4 Regulatory Requirements

a. Obtain permits required to comply with local, State, and Federal regulations.

b. Submit copies of permits required to comply with local, State, and Federal regulations.

c. Hazardous wastes, such as water, sediment, and sludge, must be packaged, labeled, stored, transported, treated and disposed of in accordance with 40 CFR 260 through 40 CFR 266 and State and local regulations. Transporters, sorters, treaters and disposers must be certified and have EPA ID numbers. Payment for disposal of hazardous waste will not be made until a completed hazardous waste manifest from the treatment or disposal facility is returned, and a copy furnished to the Government.[ Deliver hazardous waste to the Government for disposal[ as directed by the Contracting Officer].]

1.5.5 Medical Examinations

******************************************************************************
NOTE: Delete if there is no lead hazard.
******************************************************************************

Before exposure to lead-contaminated fuel tank and at the completion of the work, provide workers with a comprehensive medical examination as required by 29 CFR 1910.1025 and 29 CFR 1910.1200. The initial examination will not be required if adequate records show that employees have been examined as required by 29 CFR 1910.1025 within the last year and the blood lead levels did not exceed 30 micrograms per 100 grams of whole blood.
1.5.6 Medical Records

NOTE: Delete if there is no lead hazard.

Maintain complete and accurate medical records of employees for a period of at least 40-years or for the duration of employment plus 20-years, whichever is longer.

1.5.7 CIH Responsibilities

a. Certify training.

b. Review and approve safety plans and work plan for conformance to the applicable referenced standards.

c. Inspect tank cleaning work for conformance with the approved safety and work plans.

d. Direct monitoring.

e. Ensure work is performed in strict accordance with specifications at all times.

f. Ensure hazardous exposure to personnel and to the environment are adequately controlled at all times.

1.5.8 Training

NOTE: Delete 29 CFR 1910.1025 if there is no lead hazard.

Train each employee performing tank cleaning, waste disposal, and air sampling operations prior to the time of initial job assignment, in accordance with API Std 2015, 29 CFR 1910.120, 29 CFR 1910.134, [29 CFR 1910.1025], and 29 CFR 1910.1200. The training must also include counseling of each employee on reproductive hazards involved in the work.

1.5.9 Respiratory Protection Program

NOTE: Delete if there is no lead hazard.

a. Furnish each employee required to wear a negative pressure respirator or other appropriate type with a respirator fit test at the time of initial fitting and at least every 6 months thereafter as required by 29 CFR 1910.1025 where lead exposure is involved. Fit testing is not required for positive pressure respirators.

1.5.10 Pre-Construction Conference

Along with the CIH, marine chemist, or gas-free engineer, meet with the Contracting Officer to discuss in detail the tank cleaning work plan, including work procedures and precautions for the work plan.

1.5.11 Certificates

Submit certificates for the items listed. Where equipment or materials are specified to conform with the standards of organizations, such as National Institute for Occupational Safety and Health (NIOSH), Underwriters Laboratories (UL), and American Petroleum Institute (API), include a label or listing indicating compliance. In lieu of the label or listing, the Contractor may submit a test report from an approved testing organization stating that the item has been tested in accordance with the specified organization's test methods and that the item conforms with the organization's standard or code.

1.5.11.1 Qualifications of Marine Chemist

Submit name, address, and telephone number of the marine chemist selected to perform the required duties. Submit documentation that the marine chemist is certified by the National Fire Protection Association, including the certificate number and date of certification or recertification. The NFPA certification will be acceptable for non-ship work on this contract. Refer to NFPA 306 to determine when a marine chemist is required, how a marine certificate is issued and maintained, and what to expect during an inspection.

1.5.11.2 Qualifications of Certified Industrial Hygienist (CIH)

Submit name, address, and telephone number of the CIH selected to perform responsibilities in paragraph CIH RESPONSIBILITIES. Provide previous experience of the CIH. Submit proper documentation that the Industrial Hygienist is certified by the American Board of Industrial Hygiene in comprehensive practice, including certification number and date of certification/recertification. The CIH must be familiar with the hazards involved in fuel systems work.

1.5.11.3 Testing Laboratory

Submit the name, address, and telephone number of the testing laboratory selected to perform the monitoring, testing, and reporting of airborne concentrations of lead and other contaminants. Provide proper documentation that persons performing the analysis have been judged proficient by successful participation within the last year in the National Institute for Occupational Safety and Health (NIOSH) Proficiency Analytical Testing (PAT) Program. The laboratory must be accredited by the American Industrial Hygiene Association (AIHA). Provide AIHA documentation along with date of accreditation/reaccreditation.

1.5.11.4 Safety Plan

Submit a safety plan within 45 calendar days after contract award and 30-days prior to commencing work. [The safety program must be reviewed and approved by the safety/health officer of the facility.] The safety plan must meet requirements of EM 385-1-1, OSHA, and address the following:

a. Identification and evaluation of the hazards and risks associated with
each site being studied, including reproductive hazards and precautionary measures to be followed by workers for all hazards.

b. Names and qualifications of each Contractor's representative in charge of the work and present at the job site when tank cleaning and repair work will be performed.

c. Identification of supervisory personnel and alternates responsible for site safety/response operations.

d. Determination of levels of personal protection to be worn for various site operations.

e. List of equipment with adequate nomenclature by item, that will be used at the job site and the date and location where this equipment can be inspected by the Contracting Officer.

f. Establishment of work zones (exclusion area, contamination area, and support area).

g. Establishment of a tank entry and work permit program in accordance with 29 CFR 1910.146, EM 385-1-1, and NFPA 326.

h. Establishment of decontamination methods and procedures.

i. Determination of the number of people required to enter the contamination zones during the initial entries and subsequent operations.

j. Establishment of emergency procedures, such as: escape routes, fire protection, signals for withdrawing work parties from site, emergency communications, wind indicators, including Navy notification.

k. Identification and arrangements with nearest medical facility for emergency medical care for both routine-type injuries and toxicological problems. Submit name, location, and telephone number of this medical facility.

l. Establishment of continual air and personnel monitoring procedures.

m. Establishment of procedures for obtaining and handling potentially contaminated samples.

n. Identification of medical monitoring program, including respirator medical qualification examination for each individual at the work site.

o. Identification of training plan to be instituted, including contents of 29 CFR 1910.1200 and 29 CFR 1910.134; its training contents; and instructor with appropriate training certification. Training plan must also include counseling to each employee on reproductive hazards.

1.5.11.5 Work Plan

**************************************************************************
NOTE: Data for these paragraphs should be obtained from the Commanding Officer of the individual Naval facility having tanks for cleaning.

The shut down or interruption to normal operations or traffic must be listed on the progress schedule and submitted to the Contracting Officer.

NOTE: Delete if there is no hazardous waste in the project. Edit if hazardous waste is to be disposed of by the Government. Designer must verify that Government disposal is practical and make all arrangements for Government disposal.

1.5.11.6 Hazardous Waste Disposal Plan

Prepare a Hazardous Waste Disposal Plan and submit within [45] [_____] calendar days after contract award for approval by the Contracting Officer, or if there are no hazardous wastes indicated by Government tests, submit the plan [21] [_____] days after the Contractor's tests indicate hazardous wastes. The Hazardous Waste Disposal Plan must comply with applicable requirements of Federal, State, and local hazardous waste regulations and must address the following:

a. Identification of hazardous wastes associated with the work, including a sampling and testing plan for each waste stream, the purpose of each test, and the rationale for evaluating the test results. Indicate the representative sampling and specific testing methods, number of samples, and the name and qualifications of the testing laboratory.

b. Estimated quantities of wastes to be disposed in the cleaning of each tank and a description of arrangements made for storage and disposal.

c. Names and qualifications of each Contractor that will be transporting, storing, treating, and disposing of the wastes. Include the facility location and a 24-hour point of contact. Furnish two copies of [EPA] [State] [and] [local] hazardous waste [permit applications] [permits] [and] [EPA Identification numbers].

d. Names and qualifications (experience and training) of personnel who will be working on-site with hazardous wastes.

e. List of waste handling equipment to be used in performing the work, to include cleaning, treatment, volume reduction, and transport equipment.

f. Spill prevention, containment, and cleanup contingency measures to be implemented.

g. Work plan and schedule for waste removal and disposal.

h. Cost for hazardous waste disposal according to this plan.

1.5.11.7 Tank Certification of Safety

NOTE: Designer must select either Marine Chemist or CIH.
Submit certification, in accordance with NFPA 326, from [an NFPA certified "Marine Chemist"] [a CIH] stating that tank is safe for hot work and that special precautionary measures have been taken for workers to enter the tank to perform the work.

1.5.11.8 Training Certification

NOTE: Delete words in bracket if there is no leaded gasoline hazard.

Submit certifications signed and dated by the CIH specified in the testing plan and by each employee stating that the employee has received training on work practices and received counseling on and fully understands the reproductive hazards involved with lead and toluene exposure and the work.

1.5.11.9 Hazardous Waste Permits

Submit copies of [EPA] [State] [and] [local] hazardous waste [permit applications] [permits] [and] [EPA Identification numbers] of the transporter, treatment, storage and disposal facility that will be accepting hazardous waste. Include the facility location and a 24-hour point of contact.

1.5.11.10 Non-Hazardous Waste Permits

Submit [EPA] [State] [local] permits for disposal site for non-hazardous residues and wastes.

1.5.12 Test Results

1.5.12.1 Required Test Reports

Submit test results required by MIL-A-22262, for blasting abrasive. Submit contractor's independent tests of tank contents (water, sediment, and sludge). Submit tank cleaning test panel results, including water pressure and temperature and nozzle distances used during tank washing procedure.

1.5.12.2 Air Monitoring

Submit monitoring results to the Contracting Officer within 2 working days after the samples are taken, signed by the testing laboratory employee performing the air monitoring, the employee that analyzed the sample, and the CIH.

1.6 DELIVERY AND STORAGE

Deliver equipment and materials to the site in an undamaged condition bearing the manufacturer's name and brand designation. Store equipment and materials off the ground to provide proper ventilation, drainage, and protection against dampness. Replace defective and damaged equipment and materials.
1.7 JOB CONDITIONS

1.7.1 Ventilation

Maintain a vapor-free condition throughout the course of the work inside the tank. The air movers must be non-sparking, explosion-proof, electrically operated or air-driven exhaust type. A rate of one air change per hour must be the lowest acceptable rate, for tanks under 3600 kL 30,000 BBL. For tanks greater than 3600 kL 30,000 BBL, use 4700 L/s 10,000 cfm. Air movers must be kept in operation whenever workers are in the tanks; except the air movers must be shut down 15 minutes before taking tests.

1.8 SCHEDULING AND SEQUENCING

1.8.1 Sequence of Primary Phases of the Cleaning Procedure

a. Planning the operations
b. Preparation for cleaning
c. Vapor-freeing of the tank
d. Cleaning the tank
e. Clean-up, residue disposal, inspection, and acceptance.

1.8.2 General Scheduling

Complete the work specified in this section before any other work in the tank is started. The work includes the complete interior cleaning of the storage tanks.

PART 2 PRODUCTS

2.1 MATERIALS

Submit identification for the items by designated name, specification number, project contracting number, and intended use. Submit Safety Data Sheets for materials to be used at the job site, in accordance with 29 CFR 1910.1200.

2.1.1 Cleaning Agents

**************************************************************************
NOTE: Coordinate listing of cleaning agents with paragraph WASHING on cleaning method.
**************************************************************************

b. Solvent: MIL-PRF-680, Type II, minimum flashpoint of 60 degrees C 140 degrees F.
c. Approved commercial cleaning agent.
2.1.2 Abrasive

2.1.2.1 Abrasive for Blasting

Provide sharp, washed, salt-free [, angular] abrasive material, free from feldspar and other constituents that tend to break down and remain on the surface. Abrasive must not contain magnetic materials and must conform to MIL-A-22262, [except that Mohs' hardness must be 7 to 9] [and [_____]].

2.1.2.2 Recycled Abrasive

Screen and air wash abrasive that is recycled at the job site, to remove dirt and fines. Add new abrasive so that the combined new and recycled abrasive mixture meets specified abrasive requirements for chemical composition, moisture, friability, silica, anchor pattern and oil content. Do not recycle abrasive which has picked up toxic or hazardous material. Do not recycle nickel slag.

2.2 EQUIPMENT

Furnish necessary clothing and equipment for the work and protection of people entering the tank. Electrical equipment and wiring must be in accordance with NFPA 70, Class I, Group D, Division 1. Provide any item or items for the protection of these people including but not limited to the following:

a. **Gasoline-Oil-Resisting Rubber Gloves and Boots**: Gauntlet type and conductive type respectively (acid-proof rubber is an acceptable material); furnished for each person entering or working inside the tank or handling sludge materials on the exterior of the tank, plus one extra pair each for emergency use.

b. **Cotton Coveralls and Hard Hat**: Light colored; one change per person per day, and an adequate supply of chemical-resistant disposable coveralls to be worn over cotton coveralls.

c. **Respiratory Protection**: Provide one of the following types of NIOSH-approved respiratory protective equipment for each person working inside the tank, plus one extra for emergency use. NIOSH 99-109 listing constitutes NIOSH approval.

   (1) Self-contained breathing apparatus with a full facepiece operated in a positive pressure mode.

   (2) A combination respirator which includes a Type C supplied-air respirator with a full facepiece operated in a positive pressure mode and an auxiliary positive pressure self-contained breathing apparatus. [ Provide and use two-way communication equipment when cleaning underground tanks [larger than 190 kL 50,000 gallons capacity] [or] [where manhole accesses are deeper than 3 meters 10 feet from the working level].]

   (3) The CIH may specify airline (Type C) respirator in place of those specified above; however, the decision must be based on the results of personal monitoring.

   (4) Use Type CE respirator for abrasive blasting inside the tank.

   (5) CIH must specify respiratory protection if required for personnel
handling sludge material outside of the tank.

d. Safety Harness: For each person working inside tank, plus one extra for outside the tank.

e. **13 mm 1/2-inch Diameter Life Rope of Required Length:** For each person working inside the tank.

g. **Combustible Gas Indicator**, [Lead-in-Air Analyzer], [Hydrogen-Sulfide (H2S) Indicator], [Benzene Indicator] and Oxygen Meter. [Recommend a portable gas chromatograph or other more accurate instrument for the benzene indicator.]

h. Shovels, Buckets, Brooms, Wrenches, Scrapers, Squeegees, Wire Brushes, Scrub-Brushes, Ladders, Staging, and Other Tools: Do not use brooms or brushes that have plastic or synthetic bristles.

i. **Lighting:** UL 844, explosion-proof, minimum 540 lx 50 footcandle, floodlight type, or Mining Enforcement and Safety Administration (MESA) approved, explosion-proof, portable battery-powered light.

j. **Air Movers for Tank Ventilation:** Explosion proof electrically operated or air driven. Nonferrous fan blades. Use **velometers** for measuring velocity.

l. **Soap for Personnel Washing:** Non-phosphate type.

m. **A.B.C. Fire Extinguishers:** UL listed 2A: 40B: C, 2A: 20B: C, or 4A: 30B: C; minimum 7 kg 15 pound capacity.

n. **First Aid Kit:** One 16-unit kit for each 25 persons.

**PART 3 EXECUTION**

3.1 **PREPARATION FOR ENTRY**

Prepare the tank for entry in accordance with NFPA 326. Isolate from sources of energy. Ensure vapors have been controlled or removed. Identify potential hazards and apply control measures to mitigate the hazards. Test and monitor atmospheric conditions to ensure conditions of the Marine Chemist Certificate safety designations have been met.

3.1.1 **Isolation From Piping**

For tank cleaning prior to out-of-service inspection and minor cold repairs, close the double block and bleed isolation valves and remove the body cavity plugs from the valves. Monitor the body cavity for fuel and maintain the valves in this condition for the duration of the cleaning, inspection, or minor cold repairs, not to exceed one month. Secure the valves in the closed position with mechanical means. Perform lockout tagout procedures on the valves.

For ordinary cleaning prior to out-of-service inspection and hot work or...
when nozzles are not equipped with double block and bleed valves, or for outages lasting longer than one month, disconnect piping connected to the tank. Provide a solid-plate line blank between two flanges near the tank in accordance with ASME B16.48, or remove a valve or piece of pipe and provide a blind flange compliant with ASME B16.5 to isolate tank.[ For underground tanks where connected pipelines are buried, blind off the pipelines at the nearest valve box.] Isolation means must be of sufficient strength to withstand pressure which might be exerted by the product being blanked off, and must be gasketed on both sides if blind flange is inserted between two flanges. Do not disconnect piping or valves until it is certain the line has been defueled.

Isolate all piping connected to the tank. Perform lockout tagout procedures on any valve remaining connected to the tank.

3.1.1.1 Thermal Relief

Evaluate thermal relief capability on active facility piping isolated from the tank. Should isolation means result in a segment of active piping unprotected from thermal overpressure, provide temporary means consistent with API Std 521 to relieve the overpressure. Consult with operators to determine existing relief pressures and set temporary relief means to ensure overpressure does not occur.

3.1.2 Lockout Tagout

Perform lockout tagout on all electrical circuits and sources of energy to the tank in accordance with EM 385-1-1 and NFPA 326.

3.1.3 Removal of Ignition Sources

Remove sources of ignition from the cleaning area. Do not permit ignition producing devices, including matches, lighters or cigarettes, within 30 m 100 feet upwind and 60 m 200 feet downwind of a tank, or inside the tank farm, or within the tank firewall, whichever is farther.

3.1.4 Survey of Hazardous Areas

Carefully survey the entire area around the tank to be cleaned to ensure that there are no vapors present in the pit, low places, or hazardous areas and that all unauthorized personnel are cleared from the area. Ensure that there is no possibility of anyone smoking in the immediate vicinity. Hazardous areas are defined as follows:

a. Interior of tanks.

b. Areas within 30 meters 100 feet from points having flammable vapor emissions which, for example, are from the exhaust manholes of tanks under repair, open vents or pressure vacuum vents (breather valves) of active tanks in the vicinity of tanks under repairs or cleaning. CAUTION: Allowance must be made for 4 or more miles per hour winds by increasing the size of the hazardous area to a minimum of 60 meters 200 feet on the downward side.

[c. For aboveground tanks, all areas within a common impoundment dike up to the height of the dike walls and within 3 meters 10 feet in all directions of the exterior surfaces of tank shell and roof.
3.2 PROJECT CONDITIONS

3.2.1 Cutting Tank Access Holes

**************************************************************************
NOTE: Use for tanks without manholes that are going to be demolished. For tanks that are going to remain in service contact the Contracting Officer if the tanks do not have a manhole. It may be more cost effective to install a new tank than cut a manhole in the shell.
**************************************************************************

Tanks in this project may not have manholes.

3.2.2 Permission for Each Entry Into a Tank

Obtain written permission from the Contracting Officer prior to each entry into a tank. Permission will be granted only under the following conditions:

a. The Contractor's qualified supervisor is present.

b. The Contractor's personnel have been briefed by the supervisor on the procedure and role of each employee in the event of an emergency.

c. Required equipment is approved and properly located.

d. Personnel are properly equipped with properly fitted protective equipment and have received adequate training from a qualified instructor.

e. The entire area adjacent to the tank is secured.

f. A minimum of two persons outside and two or more persons inside of each tank are provided at all times during cleaning operations.

**************************************************************************
NOTE: Lead limit of 50 micrograms per cubic meter is consistent with 29 CFR 1910.1025.
**************************************************************************

g. Tank air is monitored and corrective action is taken to ensure that the vapor concentration is less than 10 percent of the lower flammable limit (LFL) [, lead-in-air is less than 50 micrograms per cubic meter] [, hydrogen sulfide is less than 10 ppm permissible exposure level (PEL)] [, benzene is less than one ppm PEL] and oxygen content is a minimum of 19.5 percent.

h. An NFPA certified "Marine Chemist" or CIH has certified that the tank is safe for hot work, and that the required special precautionary measures have been taken due to the potential health hazard to the worker that still exists, even when the vapor concentration is well below the LFL. The Contractor must be responsible for reviewing the record drawing(s) of the tank to be cleaned.

i. People entering the area leave smoking materials such as cigarettes and flame-producing devices at a previously determined location.
j. When work involves handling and disposal of hazardous waste, the Contractor has a copy of 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, 40 CFR 265, and 40 CFR 266 in his possession.

k. Permit only personnel authorized in the safety plan within 100 feet of the tank perimeter.

3.2.3 Traffic Control

Direct traffic minimum 60 meters 200 feet away from the tank cleaning area. Set up road blocks and warning signs. Do not operate vehicles in hazardous areas.

3.2.4 Lavatory Facilities

**************************************************************************
NOTE: Obtain data for these paragraphs from the Commanding Officer of the individual Naval facility having tanks for cleaning.
**************************************************************************
**************************************************************************
NOTE: Delete brackets and words within brackets if there is no leaded fuel in any tank.
**************************************************************************

Arrange for lavatory and toilet facilities [and, in the case of tanks for leaded fuel, provide showers for bathing].

3.2.5 Miscellaneous

Ensure that the manufacturers have labeled containers holding products involving hazards in use or storage, in accordance with 29 CFR 1910.1200. Label containers used to store, transport, or dispose of hazardous waste in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, 40 CFR 265, and 40 CFR 266 [and State Regulations]. Remove small objects of ferrous metal within the working areas to prevent the accidental striking of a spark. Place equipment upwind of tank openings at highest elevation possible; do not place in a spot lower than the surrounding terrain. Review drawings of the tank to be cleaned and brief workers on the location of pits, sumps, piping, or other tank appurtenances which could be hazardous to personnel. Provide floodlights to illuminate the work area without the need for battery operated handlights. Provide scaffolding, platforms, and ladders for secure, safe accessibility to tank surfaces. Install electrical equipment in accordance with API RP 500. Provide floodlights to illuminate the work area without the need for battery operated handlights. Do not use artificial lights inside tank until the tank is vapor-free.[ Unless otherwise approved by the Contracting Officer, do not heat tanks during winter to provide personnel comfort or melt ice.]

3.2.5.1 Grounding and Bonding for Equipment

Provide grounding and bonding for equipment which may generate static electricity [, including air hose to sandblast nozzle]. Do not pass the air hose through an area where flammable vapors may exist.
3.2.5.2 Fire Extinguishers

**************************************************************************
NOTE: Coordinate with the local fire department to
determine the minimum quantities of fire
extinguishers for each specific job.
**************************************************************************

Furnish [two] [_____] carbon-dioxide fire extinguishers of minimum 7 kg 15 pounds capacity each, in the immediate vicinity of the work. Provide a continuous fire watch. CAUTION: Do not discharge high pressure carbon dioxide extinguishers where explosive vapors exist since the discharge can cause a spark which will ignite the vapors.

3.2.5.3 Disconnection of Pipelines

For normal tank cleaning prior to out-of-service (internal) inspection and minor cold repairs, close the double block and bleed valves on the tank nozzles connected to piping and remove the body cavity plugs from the bottoms of the valves and bleed the valves for the duration of the cleaning, inspection or minor cold repairs. Perform lock-out/tag-out procedures on the valves.

For cleaning prior to hot work or when nozzles are not equipped with double block and bleed valves, or for extended outages lasting longer than one month, disconnect pipelines connected to the tank. Provide a solid-plate blind flange between two flanges near the tank, or remove a valve or piece of pipe and provide a blind flange to prevent flammable material from entering the tank.[ For underground tanks where connected pipelines are buried, blind off the pipelines at the nearest valve box.] Blind flanges must be of sufficient strength to withstand pressure which might be exerted by the material being blanked off, and must be gasketed on both sides if blind flange is inserted between two flanges. CAUTION: Do not disconnect piping or valves until it is certain the line has been emptied of fuel.

3.2.5.4 Removal of Ignition Sources

Remove sources of ignition from the cleaning area. Do not permit ignition producing devices, including matches, lighters or cigarettes, within 30 meters 100 feet upwind and 60 meters 200 feet downwind of a tank, or inside the tank farm, or within the tank firewall, whichever is farther.

3.2.5.5 Survey of Hazardous Areas

Carefully survey the entire area around the tank to be cleaned to ensure that there are no vapors present in the pit, low places, or hazardous areas and that all unauthorized personnel are cleared from the area. Ensure that there is no possibility of anyone smoking in the immediate vicinity. Hazardous areas are defined as follows:

a. Interior of tanks.

b. Areas within 30 meters 100 feet from points having flammable vapor emissions which, for example, are from the exhaust manholes of tanks under repair, open vents or pressure vacuum vents (breather valves) of active tanks in the vicinity of tanks under repairs or cleaning. CAUTION: Allowance must be made for 6 or more km/h 4 or more miles per hour winds by increasing the size of the hazardous area to a minimum of 60 meters 200 feet on the downwind side.
[ c. For aboveground tanks, all areas within a common impoundment dike up to the height of the dike walls and within 3 meters 10 feet in all directions of the exterior surfaces of tank shell and roof.

3.2.5.6 Exit from a Tank During Emergencies

To permit quick, free exit from a tank during emergencies, keep the area around the tank openings and emergency routes clear of obstructions.

3.3 INSPECTION

3.3.1 Inspection of Equipment

3.3.1.1 Respirators

Respirator users must inspect their respirators in strict accordance with the instructions provided by the manufacturer.

3.3.1.2 Air Hose from Breathing-Air Supply

If air line respirators are used, ensure that:

a. There are no breaks in outside covering;

b. Condition of gaskets is good;

c. Connections are tight; and

d. There are no restrictions in the hose.

3.3.1.3 Safety Harness and Life Line

Ensure that:

a. There is no frayed or weak material; and

b. Condition of harness is good.

3.3.1.4 Breathing-Air Supply Source

Ensure:

a. Good working condition;

b. Location in vapor-free area;

c. Compliance with 29 CFR 1910.134 for breathing air quality, frequency of air analysis, and presence of safety devices; and

d. Backup air supply source.

3.3.1.5 Monitoring Equipment

Calibrate each day before use:

a. Combustible gas indicator

b. Oxygen meter
c. H2S Indicator
]d. Lead-in-Air Analyzer
]3.3.1.6 Other Equipment

Ensure:

a. Proper grounding and bonding;

b. Explosion-proof motors; and

c. Explosion-proof lighting.

3.3.2 Personnel Inspection

3.3.2.1 Clothing

Personnel for Proper Attire Commensurate with Hazards Involved: Check for:

a. Clean clothing in good condition (wear freshly laundered clothing at the beginning of the job and at the start of each workday thereafter).

b. Boots and gloves of approved type and in good condition.

3.3.2.2 Breathing-Air Supply

If air line respirators are used, ensure that air is supplied to the facepiece at a rate of 2 to 7 L/s 4 to 15 cfm. If self-contained breathing apparatus are used, ensure sufficient number of full replacement cylinders are available to last the duration of the job.

3.3.2.3 Harness and Lifeline

Harness and lifeline must be in good condition and properly attached.

3.3.2.4 Gum or Tobacco Chewing

Ensure that gum or tobacco chewing is prohibited.

3.3.2.5 Physical Defects or Injuries

Ensure that people have no physical defects or injuries which may prevent their wearing respirators or which may cause rescue to be difficult. No beards, sideburns, or large mustaches will be allowed on people who must wear respirators.

3.3.2.6 Alcoholic Beverages and Drugs

Ensure that people entering the tank are not under the influence of alcoholic beverages and drugs.

3.3.2.7 Counseling on Reproductive Hazards

Ensure that all employees have been counseled on and fully understand the reproductive hazards related to work in contaminated areas or in leaded gasoline or chemically contaminated tanks since they may be seriously affected by organic lead compounds or other chemical contaminants.
3.3.2.8 Hazardous Areas

Check hazardous areas as defined in paragraph SURVEY OF HAZARDOUS AREAS.

3.4 TABLE OF TANK HISTORY

**************************************************************************
NOTE: Data for these paragraphs should be obtained from the Commanding Officer of the individual facility having tanks for cleaning.
**************************************************************************

<table>
<thead>
<tr>
<th>Tank Number</th>
<th>Tank Location</th>
<th>Tank Capacity</th>
<th>Date Constructed</th>
<th>Type of Lining (If Applicable)</th>
<th>Type of Fuel</th>
<th>Remarks from the Last Inspection</th>
</tr>
</thead>
</table>

3.5 FUEL REMOVAL

**************************************************************************
NOTE: Contact the fuel department of the nearest Naval Supply Center or Depot to determine if dirty residual fuel can be accepted by the Government for reclamation. If not reclaimed by the Government, consider the following. Depending on the amount of residual fuel remaining in the tank after pump down by the Government and the degree of fuel emulsification, the designer, in consultation with the activity, should decide on whether to require fuel/water separation under the scope of this Contract, dispose of the mixture as hazardous wastes if tests show presence of hazardous constituents, or use other options available to the Government.
**************************************************************************

All possible fuel will be pumped or otherwise removed from the tank by the Government. Consider remaining fuel contaminated or waste fuel; [pump into 55 gallon drums or other suitable containers for disposal in accordance with approved procedures meeting [host nation,] local, State, and Federal regulations] [provide oil/water separators for further recovery of fuels and turn over to the Government for use]. Dispose of remaining fuel emulsions in accordance with applicable [host nation,] local, State, and Federal regulations. Drums or tanks used for containerizing waste fuel will be furnished by the [Contractor] [Government]. Oil/water separator for fuel separation will be furnished by the [Contractor] [Government].

3.6 IDENTIFICATION OF TANKS WITH HAZARDOUS WASTE SLUGGES AND RESIDUES

**************************************************************************
NOTE: Information on the hazardous waste characteristics of the sludge in the tanks should be provided by the activity. If not, sampling and analysis must be conducted during the 0-35 percent design stage to properly define scope and costs.
**************************************************************************

The following [tank is] [tanks are] known or suspected to contain hazardous
### 3.7 TANK CLEANING

For the interior of tanks [with floating roofs, the bottom and up the shell to the height of the floating roof] [without floating roofs, the shell, bottom, columns, roof, rafters, and interior accessory system components such as pumps, piping, and ladders] must be cleaned [to bare metal] [not to bare metal but only to the surface of sound lining or coating], free of rust, dirt, scale, loose material, fuel, oil, grease, sludge, and other deleterious substances. [Do not damage sound existing lining material. Remove unsound or loose lining or coating, and clean surfaces which became exposed to bare substrate.] Immediately notify the Contracting Officer if lining or coating is deteriorated or loose. [For tanks with floating roofs, provide general cleaning of the top of the roof by means such as sweeping or vacuuming.]

### 3.7.1 Monitoring

**************************************************************************
NOTE: Use for tanks with leaded gasoline hazard.
Consult cognizant industrial hygienist regarding deletion if there is not leaded gasoline hazard.
**************************************************************************

Monitoring of airborne concentrations of lead must be in accordance with 29 CFR 1910.1025 of benzene in accordance with 29 CFR 1910.1028, and as specified herein. Air monitoring, testing, and reporting must be performed by a CIH or an Industrial Hygiene (IH) Technician who is under the direction of the CIH.

a. The CIH or the IH Technician under the direction of the CIH must be on the jobsite directing the monitoring, and inspecting the work to ensure that the requirements of the Contract have been satisfied during the entire operation. [The CIH must be located [_____] during the entire tank cleaning operation.]

b. Take personal air monitoring samples on employees who are anticipated to have the greatest risk of exposure as determined by the CIH. In addition, take air monitoring samples on at least 25 percent of the work crew or a minimum of two employees, whichever is greater, during each work shift.

c. Submit results of air monitoring samples, signed by the CIH, within 2 working days after the air samples are taken. Notify the Contracting Officer immediately of exposure to lead at or in excess of the action level of 30 micrograms per cubic meter of air outside of the lead control area, and 0.5 ppm for benzene.

### 3.7.1.1 Monitoring During Tank Cleaning Work

Perform personal and area monitoring during the entire tank cleaning operation. Sufficient area monitoring must be conducted at the physical boundary to ensure unprotected personnel are not exposed above 30
micrograms per cubic meter of air for lead and 0.5 ppm for benzene at all times. If the outside boundary lead levels are at or exceed 30 micrograms per cubic meter of air or the benzene levels are at or exceed 0.5 ppm, work must be stopped and the CIH must immediately correct the condition(s) causing the increased levels and notify the Contracting Officer immediately. The CIH must review the sampling data collected on that day to determine if condition(s) requires any further change in work methods. Tank cleaning work must resume when approval is given by the CIH. The Contractor must control the lead level outside of the work boundary to less than 30 micrograms per cubic meter of air and the benzene levels to less than 0.5 ppm at all times. As a minimum, conduct area monitoring daily on each shift in which tank cleaning operations are performed in areas immediately adjacent to the control area. For outdoor operations, at least one sample on each shift must be taken on the downwind side of the control area. If adjacent areas are contaminated, clean and visually inspect contaminated areas. The CIH must certify that the area has been cleaned of contamination.

[3.7.2 Lead Hazard Personnel Safety]

**************************************************************************
NOTE: Delete brackets and words within brackets if there is no leaded fuel in any tank.
**************************************************************************

Due to the lead hazard (inorganic and organic (TEL)) associated with this tank, comply with API Std 2015, and the applicable rules and regulations of the State of [Hawaii] [_____] and Federal Occupational Safety and Health Standards. If there is conflict among the API Publications, State, and Federal regulations; the most stringent criteria must apply. Ensure that the requirements for protective clothing and equipment, monitoring to determine exposure levels, and all other relevant controls are complied with. Ensure that employees are counseled on the reproductive hazards associated with lead.

[3.7.3 Precautions for Airborne Lead]

**************************************************************************
NOTE: Delete brackets and words within brackets if there is no leaded fuel in any tank.
**************************************************************************

**************************************************************************
NOTE: The following paragraphs can be inserted into the appropriate section (demolition, tank coating, or repair/modifications) for follow on work to the tank.
**************************************************************************

Since the tank is a known lead hazard, the Contractor must, in accordance with API Std 2015, ensure that the workers inside the tank wear the appropriate protective clothing and respiratory equipment as prescribed by API Std 2015 for the duration of the tank cleaning. Use only the types of respirators specified for "Respiratory Protection" under paragraph EQUIPMENT. After completion of the cleaning operation, the Contractor has the option of allowing people to enter the tank without respiratory protective equipment, only after lead-in-air analysis has been obtained in accordance with API Std 2015.
3.7.4 Water, Sediment, and Sludge Analysis

**************************************************************************
NOTE: All wastes must be tested prior to tank cleaning, by the Government and by the Contractor, regardless of the tank's past history as to the storage of leaded fuel.

Use this paragraph if the Government has already tested the water, sediment, and sludge. If at all possible, the Government must perform the necessary tests to determine if the wastes are hazardous or nonhazardous prior to bid. The Government test results should be presented in the Specification and used as a basis for bidding. This does not preclude independent testing required of the Contractor to verify the Government analysis. For Air Force projects, check latest Air Force requirements for handling of hazardous waste materials.

40 CFR Part 261 is the EPA criteria for hazardous waste. The concern with leaded fuel or any other lead product is the characteristic of toxicity. If the sample contains 5 mg/liter or more of lead, then the sample is considered a hazardous waste. The test method to determine the lead concentration is specifically defined in 40 CFR Part 261 and does not distinguish between inorganic and organic (TEL) lead. The dangers associated with organic lead (TEL) is related to personnel safety (its absorption into the human body through the skin or respiratory system) and is of no concern to EPA with regards to the handling and disposal of hazardous wastes. The EPA test measures the concentration of total lead which leaches out into solution. Lead in its pure or stable forms, such as lead weights, that does not leach out into the test solution, is not a hazardous waste.

The EPA has a test procedure called Toxicity Characteristic Leaching Procedure (TCLP). Changes may be required to specifications and cost estimates because of expanded testing requirements.

**************************************************************************
NOTE: When Government disposal of hazardous waste has been determined to be the most practical method of disposal, include the option for delivery of waste to the Government. Add details if necessary.

**************************************************************************
The water, sediment, and sludge remaining in the tank contain the following quantities of leachable metals as analyzed by the Government in accordance with 40 CFR 261.

a. Water: [_____]
b. Sediment: [_____]

SECTION 33 01 50.55 Page 29
c. Sludge:  [____]

The Government analysis indicates that the water, sediment, and sludge are [nonhazardous] [hazardous]. The Contractor will be responsible for independently testing the water, sediment, and sludge in accordance with 40 CFR 261 to verify the above. Submit laboratory reports to the Contracting Officer describing sampling and testing procedures used, test results, and findings. If the results differ such that the Contractor must handle the waste differently from the method specified, notify the Contracting Officer, and the Contractor will be subject to an equitable adjustment to the Contract under the Changes clause of the Contract Clauses. If the Contractor's tests determine that the water, sediment, and sludge are hazardous, then the hazardous wastes must be packaged, labeled, stored, transported, treated and disposed of in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, 40 CFR 265, and 40 CFR 266. Transporters, storers, treaters and disposers must be certified and have EPA ID numbers. Payment for disposal of hazardous waste will not be made until a completed hazardous waste manifest from the treatment or disposal facility is returned, and a copy furnished to the Government.[ Deliver hazardous waste to the Government for disposal [as directed by the Contracting Officer.] [_____] ] Nonhazardous or hazardous wastes must be handled and disposed of as described below.

3.7.5 Water Removal and Disposal

**************************************************************************
*NOTE: The Government should estimate and indicate the quantity of water, sludge, sediment, and fuel, if any, remaining in the tank so that the Contractor can be more responsive in his bidding. Verify availability of Government disposal facilities.*
**************************************************************************

**************************************************************************
*NOTE: When Government disposal of hazardous waste has been determined to be the most practical method of disposal, include the option for delivery of waste to the Government. Add details if necessary.*
**************************************************************************

**************************************************************************
*NOTE: Land application of non-hazardous wastes such as onto surrounding grounds or inside the berm may be subject to local, State, and Federal groundwater protection regulations. Designer must check for site-specific regulatory restrictions. Based on tests to determine the character of the wastewater, an assessment should be made for any need to pretreat the nonhazardous wastes through oil-water separators or filters prior to land application, when such disposal is allowed.*
**************************************************************************

Pump or otherwise remove water from the tank. Ensure that the sludge and sediment are not pumped out or mixed with the water. There are [_____] gallons of [nonhazardous] [hazardous] water that [can be disposed of into the berm area.] [must be packaged, labeled, stored, transported, treated, and disposed of in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262,
3.7.6  Sludge and Sediment Removal and Disposal

Squeegee or brush any sludge, sediment, or other loose material into piles, shovel into buckets or other suitable containers, and remove from the tank.

3.7.6.1  Sludge Disposal Using [Landfill] [Berm]

NOTE: Select the applicable paragraph(s) from the following:

NOTE: The Government should estimate and indicate the quantity of water, sludge, sediment, and fuel, if any, remaining in the tank so that the Contractor can be more responsive in his bidding. Verify availability of Government disposal facilities.

NOTE: Disposal of sludge and sediment in the berm area may interfere with the Contractor's operations if storage or lay down of materials within the berm is planned. State permit may be required for disposal in the berm area and should be obtained by the Government prior to advertising for bids.

There are [_____] barrels of nonhazardous sediment and sludge in the tank that can be disposed of in [the berm area] [sanitary landfill]. Spread nonhazardous sludge as uniformly as possible over the area in a maximum 3-inch thick layer for weathering in the berm area. Fence the area temporarily and mark with a wood or metal sign. When the ambient temperatures are above zero degrees C 32 degrees F, the weathering period must be a minimum of 4 weeks. For colder temperatures, the weathering period must be extended by the number of days the temperature falls below zero degrees C 32 degrees F. After the required time elapses, remove the signs and fences.

[ Sludge Disposal Using Reclamation Plant

NOTE: The Government should estimate and indicate the quantity of water, sludge, sediment, and fuel, if any, remaining in the tank so that the Contractor can be more responsive in his bidding. Verify availability of Government disposal facilities.

There are [_____] barrels of nonhazardous sediment and sludge in the tank that must be delivered to the Government for disposal in the Government operated oily waste reclamation plant.

][Removal of Sludge
NOTE: The Government should estimate and indicate the quantity of water, sludge, sediment, and fuel, if any, remaining in the tank so that the Contractor can be more responsive in his bidding. Verify availability of Government disposal facilities.

There are [_____] barrels of hazardous sediment and sludge in the tank that must be disposed of by the Contractor. Package, label, store, transport, treat, and dispose of hazardous sludge and sediment in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, 40 CFR 265, and 40 CFR 266.

][Delivery of Sludge to the Government

NOTE: When Government disposal of hazardous waste has been determined to be the most practical method of disposal, include the option for delivery of waste to the Government. Add details if necessary.

NOTE: The Government should estimate and indicate the quantity of water, sludge, sediment, and fuel, if any, remaining in the tank so that the Contractor can be more responsive in his bidding. Verify availability of Government disposal facilities.

There are [_____] barrels of hazardous sediment and sludge in the tank that must be delivered to the Government for disposal. Package, label, accumulate, transport, treat, and dispose of hazardous sludge and sediment in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, 40 CFR 265, and 40 CFR 266.

]3.7.7 Washing

NOTE: This paragraph is applicable to concrete or steel tanks. Only water must be used as the first preference. Steel tanks which have contained light products can normally be cleaned by washing down with fresh water under pressure. Detergent must be considered, if water by itself will be inadequate to remove all fuel residue. Use detergent, if the tank service will be changed from leaded fuel to unleaded fuel. The detergent and solvent solution should be specified only if the tank is expected to be heavily coated with fuel residue. The choice of cleaning agent must be based on the type of fuel stored in the tank and the conditions expected. Consider brush blasting to minimize the use of water.

After water, fuel, and sludge have been removed, thoroughly wash the tank interior. Contractor must limit the water pressure during washing so that
it does not cause damage to the existing coating. Contractor must clean a representative test panel with their planned washing procedure. Test panel access must be provided to and examined by the Contracting Officer to determine whether coating damage is occurring as a result of the Contractor’s washing procedure. Contractor must modify water temperature and pressures based on cleaning test panel results. Maximum allowable pressure on coated surfaces must be \[1380 \text{ Kpa}\] \[200 \text{ psig}\] and maximum allowable temperature of wash water must be \[57 \text{ degree C}\] \[135 \text{ degrees F}\]. Prior to cleaning the tank, tests must be conducted to determine the minimum distance of the nozzle to the steel to prevent damage to the tank coating. Perform Quality Control to inspect the cleaning during the process to ensure the coating is not being removed. Minimize the use of water; substitute brush blasting when practical. Start washing at the top of the walls and columns and work down to the floor. Wash the floor last starting from the sides and working towards the sump. Wash to remove oil, sludge, wax, tar, and other fuel residue adhering to the surface. Wash by any one or a combination of the following methods:

*N.B.* Select the applicable paragraph(s) from the following:

- Use only fresh water under pressure.
- Apply a detergent conforming to FS O-D-1276 by spray or brush and soak approximately 30 minutes.
- Apply a detergent cleaning solution by spray or brush and allow to soak approximately 30 minutes. The cleaning solution must be either a one-to-one ratio of detergent conforming to FS O-D-1276 and solvent conforming to MIL-PRF-680 or an equivalent commercial cleaning agent as approved by the Contracting Officer.
- Hand-scrub the surfaces vigorously with long-handled stiff-bristle brushes. Wet the brushes intermittently with fresh [cleaning agent] during scrubbing process. For heavily oil-soaked areas which still appear to retain some residue after first scrubbing, [give a second application of cleaning agent and repeat the scrub process a second time.] [scrub until clean.]
- Rinse the surfaces thoroughly with fresh water.
- Brush-off blast clean.

3.7.8 Wash Water, [Detergent Solution,] and Sediment Removal

During the washing process, operate a portable pump continuously with suction hose extended to the tank bottom to remove water, [detergent,] dirt, oil, or other loose materials washed off. Following the final rinse, pump, squeegee, and mop the tank dry.

- Prior to discharge or disposal, test the wash water, sediment, and sludge in accordance with paragraph WATER, SEDIMENT, AND SLUDGE ANALYSIS. The Contractor must furnish temporary tanks to hold water and detergent solution until testing is completed.

*N.B.* Select the applicable paragraph(s) from the
following:

**************************************************************************
**************************************************************************
NOTE: Use the first paragraph if only fresh water is used for washing.
**************************************************************************

[ b. The wash water is [nonhazardous and can be disposed of in the berm area.] [hazardous and must be handled in accordance with paragraph WATER, SEDIMENT, AND SLUDGE ANALYSIS.]
]

**************************************************************************
**************************************************************************
NOTE: Use the second paragraph if detergent or solvent is used for washing or if wash water only is to be discharged to a sanitary sewer. Verify existence of industrial waste treatment and oil reclamation plants; if not available, revise wording and include list of pollutants and discharge limits for which discharge into local sanitary sewerage system is permissible.
**************************************************************************

**************************************************************************
**************************************************************************
NOTE: Designer should check with owner/operator of Navy or municipal sewer system if dumping waste water into sewers will be allowed and describe special conditions which Contractor must follow. Obtain necessary permits and permission to discharge to sanitary sewers prior to advertising for bids.
**************************************************************************

[ b. The water and detergent solution is nonhazardous and can be disposed of into the [Navy] [municipal] sewer system. The Contractor must ensure that the wash water does not exceed the discharge limitations listed below. Notify the Contracting Officer and the [Navy] [municipal] sewage treatment plant operator at least 24-hours prior to discharge into the sanitary sewer at Phone No. [______].

**************************************************************************
**************************************************************************
NOTE: Items and limits are given as an example only. The project designer must develop a list of items and limits which are specific for the project site.
**************************************************************************

<table>
<thead>
<tr>
<th>TABLE 2. WASTE WATER DISCHARGE LIMITS TO SEWERS</th>

<td>[_____] mg/l Max.</td>
</tr>
</tbody>
</table>

If the discharge limits are exceeded for any of the above items, dispose of the water and detergent solution as directed by the Contracting Officer, at either the Navy’s [Industrial Waste Treatment Plant] [or] [the Oil Reclamation Plant]. The Contractor may pretreat the wash water to make it suitable for discharge to the sanitary sewer system if approved by the Contracting Officer. Submit the plan for pretreatment to the Contracting Officer for approval [21] [_____] days prior to scheduled pretreated discharges.

c. For bidding purposes, assume that the sediment is [nonhazardous and can be disposed of [in the berm area] [in a sanitary landfill]] [hazardous and must be handled in accordance with paragraph SLUDGE AND SEDIMENT REMOVAL AND DISPOSAL].

#### 3.7.9 Removal of Scale and Other Tenaciously Adhering Materials

Perform [sandblast cleaning][ or ] [power wire brushing]. [The brush must be made of spark resistant bronze wire.] After [sandblasting][ or ] [power wire brushing], clean the entire tank interior surfaces by brushing, blowing with dry compressed air, and vacuuming. Remove loose materials from the tank interior. [Perform abrasive blasting in accordance with API RP 2027.]

#### 3.7.10 Disposal of Used Blasting Abrasive

**************************************************************************
NOTE: When Government disposal of hazardous waste has been determined to be the most practical method of disposal, include the option for delivery of waste to the Government. Add details if necessary.
**************************************************************************

Test used abrasive in accordance with 40 CFR 261 to determine if it is a hazardous waste using the EP toxicity test for metals. Handle and dispose of abrasive determined to be hazardous waste in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, 40 CFR 265, and 40 CFR 266. Dispose of abrasive which is not hazardous waste at a landfill off Government property in accordance with applicable regulations. The contract price will be adjusted if the used abrasive is determined to be hazardous waste.[ However, payment for disposal of hazardous waste will not be made until a completed manifest from the treatment or disposal facility is returned, and a copy furnished to the Government.][ Deliver hazardous waste to the Government for disposal [as directed by the]
3.7.11 Special Instructions for Cleaning Tank Storage JP-5 Fuel

a. Comply with the precautions and procedures outlined above for cleaning petroleum storage tanks.

**************************************************************************
NOTE: JP-5 has a relatively low Reid vapor pressure, and the combustible gas indicator will not ordinarily indicate any vapors present in the tank, at any time during the entire tank cleaning work. This does not mean that hazardous flammable fuel vapors are not present.
**************************************************************************

b. Use respiratory equipment specified for "Respiratory Protection" under paragraph EQUIPMENT, in this section, at all times, regardless whether or not combustible gas indicator indicates any vapors present in the tank. Wear the respiratory protective equipment continuously until the tank side and bottom has been thoroughly cleaned, washed and dried.

**************************************************************************
NOTE: Delete the paragraph, if there is no floating-roof tank.
**************************************************************************

[ c. Thoroughly clean of fuel, rust and debris in the interior of each pontoon of the floating tanks.

]3.7.12 Special Precautions

**************************************************************************
NOTE: Delete, if not applicable.
**************************************************************************

Special Precautions for Tanks with Pipe Columns and Braces, Pontoons, and Leaking Bottoms:

a. Pipes used for columns and braces, pontoons and leaking bottoms are a potential source of explosive vapors even after the tank is cleaned. The tank may be determined to be vapor free below 4 percent of lower explosive limit; but after one or two hours, explosive readings must again be obtained from these sources. The Contractor must take readings at least every half hour when working in tanks after they have been cleaned and each floating roof or pan pontoon must be checked individually with a combustible gas indicator.

b. If the repair work is to be performed on floating roof tanks, the interior of each pontoon on the roof must be thoroughly cleaned of fuel, rust, water, and debris.

[3.7.13 Lead-Hazard-Free Tests

**************************************************************************
NOTE: Delete brackets and words within brackets if there is no leaded fuel in any tank.
**************************************************************************
In accordance with API Std 2015, perform lead-in-air tests to make sure that the tank is lead-hazard-free (CAUTION: Never perform lead-hazard-free tests before or during cleaning, only after).

3.8 FINAL CLEAN-UP

After the Contracting Officer has inspected and accepted the tank cleaning and before final inspection, accomplish the following work:

3.8.1 Stenciling Tank

Stencil on the tank in 20 mm 3/4-inch letters adjacent to the manhole openings the following data:

Date Cleaned - [____]
Contractor Name - [____]
Address - [____]

3.8.2 Restoration of Site to Original Condition

[Do not reconnect pipelines until application of interior and exterior coatings specified in other sections of this specification, have been completed. ]Replace valves, piping, manhole covers, and similar items which were removed at the start of the job with new gasket material resistant to fuel not less than the thickness of the gasket removed. Pressure check valves and piping. Remove, from the site, debris, equipment and materials used for the cleaning operations. Restore the site to its original condition.

NOTE: This guide specification covers the requirements for an out of service Inspection of a Field Fabricated Fuel Storage Tank.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

For cases when inspection is followed by repair, use this Section with 33 01 50.75 REPAIR OF FIELD FABRICATED FUEL STORAGE TANK. Insert applicable requirements from 33 01 50.75 should this Section be used stand alone.

Make use of this Section in consultation with SMEs listed below. The Section requires considerable judgment and specialized professional engineering competence. There are substantial consequences to a fuel storage tank inspection. Do not use this Section unless professionally competent and proficient in the assessment of fuel storage tank integrity.

Knowledge and competence in topics covered in this
Section are maintained by each Service center of excellence. Subject Matter Expert (SME) is defined as Service Headquarters Subject Matter Experts:

Air Force - The Air Force Fuels Facilities Subject Matter Expert (AFCEC/COS)

Army - Headquarters, U.S. Army Corps of Engineers, POL-MCX Facilities Proponent (CECW-EC) through the Army Petroleum Center (APC)

Navy/Marine Corps - NAVFAC POL Facility Subject Matter Expert (NAVFAC EXWC, CI11)

PART 1   GENERAL

1.1 REFERENCES

********************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

**************************************************************************
NOTE: Requirements in this Section must be checked against requirements in the project Statement of Work or Project Program to ensure that there is not a conflict.
**************************************************************************
1.2.1 DoD Tank Features List

As used in this Section, documentation of functional and physical attributes in the form of a spreadsheet which the Contracting Officer will provide after award. This document is in addition to the API Std 653 Annex C inspection checklist.

1.2.2 Hazardous Area

As used in this Section, any area within 30 meters 100 feet of active storage tanks, areas within 30 meters 100 feet of leaking sections of fuel pipelines or other vapor sources, areas within 60 meters 200 feet of the downwind side of potential vapor emission sources (i.e., pressure-vacuum vents, sample ports, or open vents on active tanks; leaking sections of pipelines), areas within existing tanks, and areas within a tunnel or adit.

1.2.3 Hot Work

For work covered by this section: drilling, boring, flame heating, welding, torch cutting, brazing, carbon arc gouging, grinding, abrasive blasting, or any work which produces heat, by any means, of 200 degrees C 400 degrees F or more; or in the presence of flammables or flammable atmospheres, other ignition sources such as spark or arc producing tools or equipment, static discharges, friction, impact, open flames or embers, nonexplosion-proof lights, fixtures, motors or equipment.

1.2.4 Independent

Impartial third party not a part or affiliated with Contractor or subcontractor principal or subsidiary businesses.

1.2.5 Inspector of Record

The individual, certified as a fuel storage tank inspector, in responsible charge of the storage tank inspection who will attest to the suitability for service. The recognized certification is API Std 653.

1.2.6 Mandatory Repair

Action necessary to preserve or restore the structural and hydraulic integrity of the tank or piping, or to mitigate a safety hazard. Includes any condition which has or may breach the hydraulic or structural integrity of the tank prior to the next integrity inspection.

1.2.7 Marine Chemist

The holder of a valid Certificate issued by the National Fire Protection Association in accordance with the "Rules for Certification of Marine Chemists" establishing the individual as a Qualified Person pursuant to NFPA 326.

1.2.8 MAWP

Maximum allowable working pressure: As used in this Section, maximum internal pressure in the piping system for continued operation at the most severe condition of coincident internal or external pressure and temperature expected during service.
1.2.9 Mil
A unit of length equal to 0.001 of an inch.

1.2.10 Progressive Indication
A response from a nondestructive examination interpreted to be relevant and evaluated to be time-dependent deterioration such as active corrosion.

1.2.11 Recommended Repair
Action intended to extend the service life of the tank or piping and to address conditions that currently, or within the next service interval, will not have an adverse affect on tank operability or integrity. Applicability is limited to exclude soft or elastomeric parts for any pressure containing system.

1.2.12 Tank Engineer
One or more licensed professional engineers, or an engineering firm acceptable to the Contracting Officer, knowledgeable and experienced in the engineering disciplines associated with the evaluation of mechanical and material characteristics that affect the integrity and reliability of storage tanks. The storage tank engineer is the tank inspection subject matter expert.

1.2.13 Tank Inspection
As used in this Section, a tank inspection is a multi-disciplinary engineering assessment of all petroleum, oil, and lubricant storage tank systems within or connected to the tank hydraulic boundary. Systems include nozzles, appurtenances and conveyance systems such as piping, stilling well, valve, flow control, cathodic protection, overfill protection, spill prevention, containment, leak detection, fire suppression, gauging, ventilation, lighting, and other electrical systems. Inspection includes a review of cathodic protection reports and relevant as-built records when available. Unless stated otherwise in the [Project Program] [Statement of Work], the limits are the boundary of secondary containment.

1.2.14 Tank Inspector
An individual certified as a fuel storage tank inspector. The recognized certification is API Std 653.

1.3 ADMINISTRATIVE REQUIREMENTS

******************************************************************************
NOTE: Piping hydrostatic test for use on cut and cover tank piping within the hydraulic boundary or on drain-dry AST piping.
******************************************************************************

1.3.1 Sequencing
[ Schedule hydrostatic test of nozzle piping to occur early during the inspection phase. Report results in the preliminary inspection report.

] Schedule tank inspection(s) to occur in accordance with Section 01 14 00
WORK RESTRICTIONS.

1.3.2 Safety Permits and Equipment

Acquire safety permits and necessary safety equipment in compliance with Installation Requirements, Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS, Section 33 01 50.55 CLEANING OF PETROLEUM STORAGE TANKS, and EM 385-1-1. A permit is required for all hot work. The storage tank is a confined space and entry must be made in accordance with requirements of EM 385-1-1 Section 34.

1.3.3 Regulatory Requirements

Obtain permits required to comply with local, State, and Federal regulations.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a
Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

- Tank Inspector Credentials; G[, [_____]]
- Piping Inspector Credentials; G[, [_____]]
- Tank Engineer Credentials; G[, [_____]]
- NDE Examiner Credentials; G[, [_____]]
- NDE Firm Credentials; G[, [_____]]
- Hydrostatic Test Plan; G[, [_____]]
- Inspection Plan; G[, [_____]]
- Preliminary Inspection Report; G[, [_____]]
- Inspection Report; G[, [_____]]

SD-06 Test Reports

- Hydrostatic Test Report; G[, [_____]]

SD-07 Certificates

- Instrument Calibration Certificate

SD-10 Operation and Maintenance Data

- Electronic Tank Calibration Table; G[, [_____]]

1.5 QUALITY ASSURANCE

1.5.1 Modification of References

Perform work in accordance with UFC 3-460-03. Except as modified herein, work must conform to [API 570, API RP 574, ]API Std 653, and API RP 575.

1.5.2 Qualification and Certification

1.5.2.1 Tank Engineer

Qualification: Minimum [four][seven] years verifiable experience in evaluation, design, repair, and integrity assessment of [field fabricated][cut and cover] fuel storage tanks. Provide evidence of having completed tank inspections, inspections of repairs, or integrity assessments on at least five similar size and type tanks within the previous four years.

Certification: Licensed Professional Civil or Mechanical Engineer. [Certification as an API Std 653 tank inspector. ]Provide Tank Engineer Credentials and qualification.
1.5.2.2 Tank Inspector

Qualification: Minimum [four][seven] years verifiable experience performing inspections of bulk fuel storage tanks or of cut and cover fuel storage tanks. Provide evidence of having completed inspections on at least five similar size and type storage tanks within the previous four years.

Certification: API Std 653 tank inspector. Provide Tank Inspector Credentials to include API Std 653 certification and qualification.

[1.5.2.3 Piping Inspector

**************************************************************************

NOTE: Piping inspector for use if piping and nozzle inspection and piping hydrostatic test on cut and cover tank piping that is part of the tank hydraulic boundary or on drain-dry AST piping is within the purview of the inspection scope.

**************************************************************************

Qualification: Minimum four years verifiable experience performing fuel piping inspections of the same size and type as required. Provide evidence of having completed at least five similar inspections within the previous four years.

Certification: API 570 piping inspector. Provide Piping Inspector Credentials to include API 570 certification and qualification.

1.5.2.4 Non-Destructive Examination (NDE) Company

Qualification: Independent third party company with minimum four years verifiable experience conducting:

a. Tank plate scanning for surface, subsurface, and backside indications

b. Weld examination for surface and subsurface indications

Certification: NDE Firm Credentials to include contact information, industry qualification, and experience.

1.5.2.5 Non-Destructive Examiner

Qualification: Examiners must be qualified to perform non-destructive examination in accordance with API Std 653 and API Std 650. Examiners must meet minimum requirements for qualification in ANSI/ASNT CP-189. Qualified examiners must have minimum five years verifiable experience performing non-destructive examination of fuel storage tanks. Experience is defined as work activity performing a specific NDE method under the direction of qualified supervision but does not include time spent in training programs.

Certification: Examiners certified to at least Level II requirements compliant with ANSI/ASNT CP-189 for the applicable method. Level II Limited certification does not meet this requirement. Provide NDE Examiner Credentials to include qualification and certification.

1.6 INSPECTION PLAN

Submit Inspection Plan pursuant to Section [01 33 00.05 20 CONSTRUCTION]
1.6.1 Desired Service Interval

**************************************************************************

NOTE: Use judgment regarding Desired Service Interval. OOS repair durations can be lengthy. Goal is 20-year interval but must account for repair duration. If 24 years is infeasible or unnecessary, use 12 years. Ensure interval is consistent with requirements in work statement.

**************************************************************************

Unless otherwise stated in the [Project Program][Statement of Work], use [12][24] years as the interval to the next inspection.

1.6.2 Environmental Conditions

Plan ventilation and tank entry means which will provide a gas-free environment suitable for safe entry. Comply with Section 33 01 50.55 CLEANING OF PETROLEUM STORAGE TANKS and API Std 2015. Prepare for tank bottom work consistent with API RP 2207.

1.6.2.1 Gas Test Holes

Liquid or hydrocarbon vapor might exist [in the tank shell to substrate interstice][below the bottom plates]. Should the space be required to be sampled or inerted, provide an engineered detail to install and repair test holes. Purge the interstice with inert gas if required to establish gas-free conditions and in accordance with API RP 2207. Provide test holes pursuant to paragraph GAS TEST HOLE INSTALLATION. Repair gas test holes in accordance with paragraph GAS TEST HOLE REPAIR.

1.6.3 Tank Geometric Data

**************************************************************************

NOTE: Use this paragraph in the event a qualitative data from a LIDAR survey of the tank interior is desired.

**************************************************************************

Plan a survey regime which will result in a thorough, electronic dataset of tank interior surfaces and internal piping. Data must be non-proprietary and conform to ASTM E2807. Point density must be adequate to provide surface resolution of 0.20 inch each axis. Data are intended for use as a permanent set of baseline geometric information and to be registered with inspection data. Ensure point cloud is supported directly within AUTOCAD software.

1.6.4 Destructive Testing

**************************************************************************

NOTE: Use this paragraph should it be expected that confirmation of inspection NDE will be useful or required, if there are questions about weldability, or if metallurgical properties of the material need to be established. Do not use destructive testing unless warranted and repairs are programmed. Require in the Project Program or SOW the quantity,
Provide destructive testing which will obtain test coupons, submit them to a laboratory for analysis, and report [metal loss, ]chemical, mechanical, macrographic, and metallographic properties of the material. Use the services of an accredited test laboratory. Design the testing to inform the repair design and weld procedure qualification as required in Section 33 01 50.75 REPAIR OF FIELD FABRICATED FUEL STORAGE TANKS. [Compare and report the metal loss data with results of the NDE performed during inspection. ]Coupon location, size, and quantity are pursuant to requirements in the [Project Program][Statement of Work].

1.6.5 Actionable Indication Determination

Retroactive compliance with criteria such as UFC, DoD Standard Design, and API Std 650 is not required. Many vintage tank welds fully perform despite noncompliance with current weld profile or spacing criteria. Evaluate past performance of welds and assess the expectation for continued performance in structural and hydraulic integrity. Do not find a weld actionable solely for the purpose of current criteria compliance, unless the finding informs a recommendation that affects integrity or operability.

1.6.6 Aboveground Storage Tank

**NOTE: Use this paragraph only for aboveground tanks.**

Plan the storage tank inspection and other specialized engineering services. Use the API Std 653 Annex C inspection checklist. In addition, incorporate inspection of components which fall outside the scope of API Std 653[ and API 570], but which fall within the scope of this Section. Plan the inspection to validate storage tank conditions in order to fully inform a repair design.

Specify complementary examination methods capable of detecting and sizing surface and subsurface defects, as well as product and backside corrosion. Qualitative methods are acceptable for screening purposes as long as requirements of this Section are met and quantitative data are obtained by follow-on means.

Plan an inspection approach which will examine 100 percent, as interior appurtenances allow, of the tank bottom. Tailor plan to specific facility conditions. Address relevant damage mechanisms pursuant to engineering best practice and API RP 571. Do not use a risk-based approach.

1.6.6.1 Corrosion Rate

Screen inspection data to distinguish progressive versus non-progressive indications but use only progressive indications in rate calculations. Calculate corrosion rates per region per API Std 653 and include in preliminary report.

1.6.6.2 Remaining Thickness Analysis

Calculate minimum plate thickness for all regions. Assume product side
corrosion rate for coated regions is zero if the expected life of the coating system equals or exceeds the service interval. Report the thickness required to achieve, at the end of the service interval, 100 mils of plate thickness.

1.6.6.3 Remaining Service Life

Classify relevant indications into mandatory and recommended categories. Apply requirements in paragraph SUITABILITY FOR SERVICE.

1.6.6.4 Atmospheric Vent Capability

Calculate the normal and emergency atmospheric vent requirements at maximum rates of fill and issue. Assess capability of vents and their conformance to NFPA 30.

1.6.7 Cut and Cover Tank

**************************************************************************

NOTE: Use this paragraph only for cut and cover tanks.
**************************************************************************

Plan the storage tank inspection and other specialized engineering services. Incorporate inspection of components which fall outside the scope of API Std 653[ and API 570], but which fall within the scope of this Section. Plan the inspection to validate storage tank conditions in order to fully inform a repair design.

Specify complementary examination methods capable of detecting and sizing surface and subsurface defects, as well as product and backside corrosion. Qualitative methods are acceptable for screening purposes as long as requirements of this Section are met and quantitative data are obtained by follow-on means.

Plan an inspection approach which will examine 100 percent, as interior appurtenances allow, of the tank shell and bottom. Tailor plan to specific facility conditions. Address relevant damage mechanisms pursuant to engineering best practice and API RP 571. Do not use a risk-based approach.

1.6.7.1 Modified Inspection Approach Analysis

Use a modified approach in order to apply principles of API Std 653 to the extent practicable, and also assess unique characteristics of cut and cover storage tanks. Evaluate tank conditions through a systematic approach led by the Tank Engineer. Many original construction welds are noncompliant with current standards and practices for geometry and spacing. Use engineering judgment when recommending repair of existing fully-performing but noncompliant welds.

Provide a Modified Inspection Approach Analysis (MIAA) which describes the engineering basis for the inspection. Adhere to principles of API Std 653. Take into account the tank design and construction methods. Incorporate best engineering practice. Analyze and submit the MIAA in accordance with Section [01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES][01 33 00 SUBMITTAL PROCEDURES].
1.6.7.2 Modified API Inspection

Use an inspection regime which implements this Section and principles of API Std 653, API RP 575[, API 570, and API RP 574].

1.6.7.3 Corrosion Rate

**************************************************************************
NOTE: Calculate corrosion rate using two methods. Evaluate results to determine which is more conservative.
**************************************************************************

Organize thickness data into bottom and shell regions. Screen inspection data to distinguish progressive versus non-progressive indications but use only progressive indications in rate calculations. Calculate long term corrosion rates per region as the quotient of metal loss and time. Calculate corrosion rates in accordance with API Std 653. Use assumptions in Table 1. Report thickness in mils and rates in mils per year.

Table 1 Corrosion and Remaining Thickness Assumptions

| Minimum thickness, (mils) end of service interval | 100 |
| Original service start year | [__] |
| Nominal thickness (mils, bottom) | [__] |
| Nominal thickness (mils, other regions) | [__] |
| Desired Service Interval (years) | See paragraph DESIRED SERVICE INTERVAL |

1.6.7.4 Remaining Thickness Analysis

**************************************************************************
NOTE: Use a factor of safety in the corrosion rate if needed to mitigate inspection uncertainty risk on tanks without RPB and/or leak detection, or if needed as a best practice.
**************************************************************************

Use the corrosion rate calculated from values in Table 1 and the method in API Std 653. Report the required thickness to achieve 100 mils of plate thickness at the end of a service interval, using both the long term corrosion rate and with the API corrosion rate method.

1.6.8 Non-Destructive Examination

Plan an examination to provide complementary non-destructive techniques. Do not rely on a single technology. Ensure techniques, in the aggregate, have the capability to detect backside corrosion at the minimum volume as well as through holes. Procedures must be compliant with ASME BPVC SEC V.

Qualitative methods are acceptable for screening as long as requirements of this Section are met and quantitative data are obtained by follow-on means.
Record associated geometric data for relevant indications. Identify examiner(s) used at each indication.

Specify VT, UT, and VBT techniques fully compliant with this Section, ASME BPVC SEC V, and API Std 650. Adhere to NDE terminology in ASTM E1316. Provide an NDE Plan which includes requirements of ASME BPVC SEC V.

1.6.8.1 Plate Scan

Provide bottom [and shell ]plate scanning to screen surfaces for backside corrosion. Provide UT at regions where tank scanning cannot be conducted. Prove up backside indications with an ultrasonic method.

1.6.8.2 Weld Examination

Provide bottom [and shell ]weld examination independent of plate scanning. Characterize indications as actionable based on hydraulic or structural integrity and not on criteria compliance. Identify conditions which are symptomatic of poor weld performance.

1.6.8.3 Vacuum Box Testing

Provide a procedure to test in two pressure increments. Start the test with a 3 psig differential. Maintain vacuum pressure for at least 10 seconds. Slowly increase to 8 psig differential and maintain for at least 10 seconds. Record examiner(s) and register test data with the geometric dataset.

1.6.8.4 NDE Reliability

If MFL is used, comply with API Std 653 Annex G requirements for qualification of tank bottom examiners. Only third-party companies, having no conflict of interest in tank bottom examination applications, may facilitate qualification tests. For any other technique, provide a qualified procedure and documentation that examiners are capable of reliably detecting backside metal loss with the procedure.

1.6.9 Tank Piping

**************************************************************************
NOTE: Piping inspection and piping hydrostatic test are for use on cut and cover tank piping that is part of the tank hydraulic boundary or on drain-dry AST piping.

Use judgment on which type of test to specify. Identify test boundaries and whether there are means for isolation. Hot work during the inspection phase may be required. Identify local test water disposition requirements.
**************************************************************************

Plan an inspection of tank process piping, drain and water draw lines, nozzle necks, flanges, and valves. Inspect to provide condition information, identify deterioration, and establish geometric data. Incorporate into the inspection plan principles of API 570 and API RP 574.
1.6.9.1 Tank Piping Hydrostatic Test

Plan a temperature compensated, volume and pressure reconciled hydrostatic test. Segments are drain-dry piping and any piping exposed to tank head. Test to the isolation valve flange. Plan the test consistent with API RP 1110. Isolate test segments with suitable means. Use water as the test medium. Test pressure must be meaningful and not less than 150 psig unless an alternative is authorized by the Contracting Officer. Do not exceed the rating of an ASME B16.5, carbon steel, ANSI Class 150 flange. Minimum test duration is four hours.

Test must analyze consistent and inconsistent error, the magnitude of lost volume, and data trends. Inconsistent error able to be reconciled to less than 0.25 degree F is an acceptable result unless an alternate threshold is authorized by the Contracting Officer.

Prepare Hydrostatic Test Plan consistent with API RP 1110 and this Section. Submit in accordance with Section [01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES][01 33 00 SUBMITTAL PROCEDURES]. Include:

a. Site specific test procedure and pressure
b. Description of equipment, piping, and valves to be used, including one line diagram(s)
c. Method to secure test segment
d. Test record form
e. Current instrument calibration certificates
f. List of test segments and intended test pressure for each
g. Acceptance criterion
h. Method to characterize test water to screen for contaminants
i. Method to transport, store, and dispose test water
j. Post-test engineering analysis

Plan a combined strength and leak test consistent with principles of UFC 3-460-03 Appendix G. Strength test pressure component must be meaningful and not less than 150 psig unless an alternative is authorized by the Contracting Officer. Leak test component must use a method which has been third party certified by the National Work Group on Leak Detection Evaluations. Segments are drain-dry piping and any piping exposed to tank head. Test to the isolation valve flange. Provide tests early in the inspection evolution.

1.7 SUITABILITY FOR SERVICE

**************************************************************************
NOTE: Program mechanical repairs to provide 24 years of service even if a State or local jurisdiction requires a shorter compliance inspection interval. Revisit this approach and apply judgment once condition data are received.
**************************************************************************
Evaluate inspection data to determine suitability for continued use. Identify conditions which pose a risk to integrity. Determine a metal loss threshold for mandatory repairs.

In the determination of mandatory repairs:

a. Use a "first, do no harm" approach to classifying tank repairs.

b. Use Desired Service Interval as the time to next inspection unless notified otherwise by the Contracting Officer.

c. Use minimum remaining thickness (MRT) no less than 100 mils at the next inspection.

d. Do not classify as mandatory repair of conditions which are noncompliant with current standards but are unrelated to structural or hydraulic integrity (e.g., gouge, improper weld spacing, weld profile).

e. Apply repair determination to individual indications. Do not average across an entire plate or course.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Preparation for Inspection

Develop written procedures in accordance with API Std 653 and API RP 575 for entry and re-entry into a storage tank. Ensure gas-generating, pyrophoric, or toxic residues have been removed. Review requirements in this Section and the inspection plan to test the interstice for hydrocarbons and purge as necessary. Do not start inspection until storage tank has been certified by the Marine Chemist to be safe for entry, and requirements of this Section, Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS, and EM 385-1-1 have been met.

PART 2 PRODUCTS

2.1 Gaskets

Composition ring, one piece factory cut, compliant with ASME B16.21, Buna-N. Gaskets must be composed of either graphite or synthetic fibers in a nitrile binder and must be resistant to the effects of aviation hydrocarbon fuels and manufactured of fire-resistant materials. Use full-faced gaskets for flat-face flanged joints. Use ring gaskets on raised-face flanged joints. Buna-N material must conform to SAE AMS3275. Select a gasket suitable for the work and test pressure of the fluid.

2.2 Fasteners

2.2.1 Flange Bolts, Nuts, and Washers

Bolts for pipe flanges, flanged fittings, manway covers, valves, and accessories must conform to ASME B18.2.1. Bolts must be of sufficient length to obtain full bearing on the nuts and must project no more than three full threads beyond the nuts with the bolts tightened to the required torque. Bolts must be regular hexagonal bolts conforming to ASME B18.2.1 with material conforming to ASTM A193/A193M, Class 2, Grade B8, stainless steel, when connections between steel and aluminum are made, and Grade B7 when only carbon steel components are involved. Bolts must be threaded in...
accordance with ASME B1.1, Class 2A fit, Coarse Thread Series, for sizes one inch and smaller and Eight-Pitch Thread Series for sizes larger than one inch. Where aluminum is bolted to steel, use stainless steel fasteners.

Nuts for pipe flanges, flanged fittings, valves and accessories must conform to ASME B18.2.2, hexagonal, heavy series with material conforming to ASTM A194/A194M, Grade 8, stainless steel for stainless steel bolts, and Grade 7 for carbon steel bolts. Nuts must be threaded in accordance with ASME B1.1, Class 2B fit, Coarse Thread Series for sizes one inch and smaller and Eight-Pitch Thread Series for sizes larger than one inch.

Use chromium molybdenum alloy washers dimensioned to ASTM F436 flat circular for chromium molybdenum bolts. Use stainless steel washers dimensioned in accordance with ASTM F436 flat circular and fabricated from the same grade of stainless steel as the bolt. Use torque wrenches to tighten flange bolts to the torque recommended by the gasket manufacturer or to eliminate drips. Tighten in the pattern recommended by the gasket manufacturer. Use anti-seize compound on stainless steel bolts.

2.2.2 Structural Bolts, Nuts, and Washers

a. Bolts: ASTM F3125/F3125M (ASTM A325), Type 1, heavy hex style, plain finish. Ensure bolt heads are distinctively marked with the manufacturer unique identifier and grade. Bearing type connections are Type N unless determined otherwise.

b. Nuts: ASTM A563, Grade C, heavy hex style, plain finish. Ensure nuts are distinctively marked with the manufacturer's unique identifier and grade.

c. Washers: ASTM F436, Type 1, circular. When the outer face of the joint has a slope greater than 1:20 with respect to a plane normal to the bolt axis, use ASTM F436, Type 1, beveled to compensate for the lack of parallelism.

2.2.3 Thread Lubricant

Provide thread lubricant on fastener to minimize galling compliant with MIL-PRF-907 Anti-Seize Compound on fasteners external to the tank. On tank interior fasteners use SAE 30 oil.

PART 3 EXECUTION

**************************************************************************
NOTE: This Section is not ordinarily intended to be used without Section 33 01 50.75 REPAIR OF FIELD FABRICATED FUEL STORAGE TANK. If used stand-alone, incorporate appropriate requirements from that section.
**************************************************************************

3.1 CONTROL OF HAZARDOUS ENERGY

Prior to entry, provide proper lockout and tagout of the storage tank and appurtenances to completely isolate from sources of energy. Items to be isolated include nozzles, valves, pumps, and motor starters. Isolate tank and piping with physical means such as blind flanges compliant with ASME B16.5 or solid-plate line blanks compliant with ASME B16.48 to prevent fuel or vapor transfer into the tank or piping. Isolation means must be of
sufficient strength to withstand pressure which might be exerted by the product being blanked off, and must be gasketed on both sides if line blank is inserted between two flanges. Do not use a valve as means of isolation. Execute in accordance with accepted Accident Prevention Plan, Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS and EM 385-1-1. Coordinate lockout / tagout with site fuels operator.

3.1.1 Thermal Relief

Evaluate thermal relief capability on active facility piping isolated from the tank. Should isolation means result in a segment of active piping unprotected from thermal overpressure, provide temporary means consistent with API Std 521 to relieve the overpressure. Consult with operators to determine existing relief pressures and adjust temporary relief settings to ensure overpressure does not occur.

3.2 TANK PLATE ACCESS

Provide means of access to all areas of the tank envelope for personnel, materials, and equipment. Provide lighting, ventilation, and access to the work for the Contracting Officer representative while inspection is being performed.

3.3 GAS-FREE ENVIRONMENT

Degas tank until requirements of Section 33 01 50.55 CLEANING OF PETROLEUM STORAGE TANKS, the accepted Accident Prevention Plan, API Std 2015, 29 CFR 1910.146, and the certified Marine Chemist are met. Obtain gas-free certification from the Marine Chemist. Maintain the gas-free environment. Purge the interstice with inert gas as-needed to remove hydrocarbon vapors consistent with API RP 2207.

3.4 TANK CLEANING

Clean tank in accordance with this Section and Section 33 01 50.55 CLEANING OF PETROLEUM STORAGE TANKS. The interior surfaces must be cleaned not to bare metal but only to the surface of sound coating, free of rust, dirt, scale, loose material, fuel, oil, grease, sludge, and other deleterious material. Do not damage sound coating material. If coating is loose or disbonded and interferes with the tank inspection, remove it and clean the surfaces to bare [metal][concrete]. If tank coating repair or replacement is required in the [Project Program][Statement of Work], clean surfaces to the level of cleanliness necessary for coating removal and recoating work to proceed. Cleanliness requirements of this paragraph are not intended to meet coating surface preparation requirements.

3.5 DATA MANAGEMENT

Organize data in a non-proprietary management system such as a database or spreadsheet. Serialize all NDE and API inspection indications with a unique identifier. The system must have the capability to easily be searched to track the provenance of each inspection indication to repair. Cloud-based systems are not acceptable.

Categorize indications pursuant to definitions in ASTM E1316.

3.6 GAS TEST HOLE INSTALLATION

In the event verification of conditions in the interstice is required and
pursuant to Marine Chemist requirements, install gas test holes in accordance with the inspection design and hot work permit. Drill with a pneumatic tool using cooling lubricant. Test hole diameter must not exceed 3/16 in. Record all gas test hole locations in the indications database with a serialized identifier. Mark all test hole locations adjacent to the hole in a neat and professional manner which will remain evident following the repair. Repair gas test holes in accordance with paragraph GAS TEST HOLE REPAIR.

3.7 PHOTOGRAPHIC DOCUMENTATION

Document conditions with well-illuminated photographic means and minimum capture resolution of 2560 x 1920. Only downsample images for reporting purposes. Provide full resolution images in electronic format on portable media. USB flash drives are not allowed. Include photographs which document the condition of the tank, general overall layout, and discrepancies.

3.8 STORAGE TANK INSPECTION

Arrive at site with all necessary equipment and material. Perform a thorough storage tank inspection in accordance with API Std 653, API RP 575, [API 570], this Section, and pursuant to the engineered inspection plan. Scan 100 percent of tank [bottom][hydraulic surfaces] as interior appurtenances allow, to screen for discontinuities, flaws, anomalies, corrosion, cracks, gouges, laminations, and other conditions. Collect data to be used in the assessment of corrosion growth, structural integrity, brittle fracture, and hydraulic integrity. Complete the DoD Tank Features List and the API Std 653 checklist and provide them with the preliminary report.

Populate a database with inspection results. Distinguish between product-side and back-side indications. Categorize indications into corrosion-based and non corrosion-based indications.

3.8.1 Protect in Place

Protect in place motors, pumps, impellers, risers, floating roof, and ATG probe and conductors. Mark indications and inspection information on tank plates in a neat and professional manner. Do not use fluorescent paint in the tank.

3.8.2 Inspection Before and During Cleaning

Pressure washing can remove trace indications in areas requiring further examination. Perform a visual screening of the tank by the API Std 653 inspector prior to cleaning. Make a record of areas of disbonded or deteriorated coating. Provide oversight during cleaning to ensure excessive pressure is not applied to the coating system.

3.8.3 Appurtenances

Measure roof support columns and gauge tubes to determine whether they are plumb. Verify whether gauge tubes are slotted and centered over the datum plate. Verify operability of alarms, hatches, manway cover, davit arm, and tape gauge. Assess condition of miscellaneous conduit, tubing, product recovery system, hydraulic control valve and piloting, thermal relief, water drawoff system, floating roof seals, handrail, stairway, and landing. Pneumatically test repad telltale holes pursuant to requirements
3.8.4 Structure

Examine the tank structure, joints, and columns. Assess whether there are signs of strain[ or water intrusion]. Determine whether columns have thinned areas or metal loss, and whether tube columns have relief weepholes.

3.8.5 Atmospheric, Circulation, Emergency Vents

Assess condition of vent screen suitability. Verify emergency vent freely operates.

[3.8.6 Coating Condition Survey (CCS)]

**************************************************************************
NOTE: Use this paragraph if coating is not planned to be removed and CCS is warranted.
**************************************************************************

Pursuant to [Project Program][Statement of Work] requirements, provide an [internal][external][internal and external] coating condition survey (CCS) by an independent NACE Certified Protective Coating Specialist (PCS). PCS minimum qualifications are provided in Section [01 45 00.05 20 DESIGN AND CONSTRUCTION QUALITY CONTROL][01 45 00.00 10 QUALITY CONTROL][01 45 00.00 20 QUALITY CONTROL]. PCS who is providing the CCS must have verifiable experienced in the field of epoxy and (poly)urethane coating analysis, coating failure forensics, and coating system design. PCS must not be affiliated with, employed by, or have an ownership interest in a materials manufacturer or vendor, or with any subcontractor performing coating services in fulfillment of this [Project Program][Statement of Work]. Submit qualifications and experience of the proposed PCS, and the CCS report per Section [01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES][01 33 00 SUBMITTAL PROCEDURES].

Use visual observations and non-destructive testing in the survey. Provide objective ratings of coating system conditions at various tank regions. Evaluate the degree of rusting in accordance with ASTM D610. Assess coating adhesion, hardness, and measure dry film thickness (DFT) in accordance SSPC PA 2. Determine whether entire coating system or regions thereof are candidates to receive overcoating, spot repair, or a combination of both in order to extend the system service life. The intent of the CCS is for the Government to receive objective third-party information about the most cost-effective method of corrosion control. The Government will use that information to base decisions to extend the life of the facility. The CCS must contain detailed observations and analytical data about the coating, its condition, and the substrate. Cite industry criteria applied in the survey. Minimum CCS report contents are listed below.

a. Condition of existing coating system and film

b. Toxicity Characteristic Leaching Procedure test results that identify the existence of potentially hazardous substances which may impact coating management (e.g., lead, cadmium, chromium, arsenic, barium, mercury, selenium, silver).

c. Analysis of remaining life, suitability for overcoating, and basic technical requirements for overcoating
d. Basis information for cost-effective management of the coating system such as film thickness, and percentage areas of rust, checking, blistering, and chalking

e. Recommendations to achieve cost effective management of coating systems, including overcoating and spot repair quantities, dimensions, and limits

[3.8.7 Coating Assessment

******************************************************************************
NOTE: Use this paragraph if CCS is not warranted and ordinary inspection is desired.
******************************************************************************

Provide an assessment of the tank coating systems. Identify type and extent of existing systems. Identify extent of coating failure, disbondment, and blisters. Perform dry film thickness (DFT) measurements in accordance with SSPC PA 2. Measure DFT on the external shell and roof, and internal bottom regions. Organize and report the DFT data in tabular form. Identify the minimum, maximum, and average thickness obtained from the regions.

[3.8.8 Engineering Assessment

Use the data obtained during the inspections to perform an engineering assessment of the hydraulic and structural conditions of the storage tank and its appurtenances. Determine and report backside corrosion rates for regions of the tank. Calculate the remaining service life.

3.9 NDE TECHNIQUES

Mark relevant indications on tank surfaces in a neat and professional manner adjacent to the indication. Repair areas of removed coating in accordance with [Project Program][Statement of Work] requirements.

3.9.1 Visual Examination

Visually inspect the overall condition of the tank. Include manway cover, atmospheric vent system, sump, and floating roof. Assess corrosion, coating condition, welds, appurtenances, gauging tubes, nozzles. Apply API RP 575 recommended practices for performing a tank inspection. Enhance visual acuity with a magnifying lens of 5X to 10X power wherever required to discern indications otherwise not clear. Measure size and contour of welds with suitable gages. Minimum light intensity at the examination surface must be 100 foot-candles. The VT procedure must be compliant with ASME BPVC SEC V.

[3.9.2 Shell Examination

******************************************************************************
NOTE: Shell scan for use on cut and cover tanks
******************************************************************************

Scan tank shell hydraulic surfaces for indications such as metal loss, pits, cracks, gouges, and general corrosion. Distinguish between product and backside indications.
Quantify indications with an ultrasonic method. Be vigilant to detect large areas of uniformly-corroded metal and laminations. In areas inaccessible by scanning, use UT to characterize condition. Mark relevant indications on tank surfaces in a neat and professional manner adjacent to the indication.

3.9.3 Bottom Examination

Scan 100 percent of the tank bottom, as interior appurtenances allow, for indications such as metal loss, pits, cracks, gouges, and general corrosion. Distinguish between product and backside indications.

Measure metal thickness with an ultrasonic method. Procedures must be compliant with ASME BPVC SEC V. Record measurements, exclusive of coating, for all tank bottom plates. Provide UT thickness measurement on no less than five locations per plate and at indications from the screening technologies determined to be relevant.

Mark relevant indications on tank surfaces in a neat and professional manner adjacent to the indication. Register UT data locations with geometric dataset.

3.9.4 Vacuum Box Testing

Perform VBT on locations in the tank where a breach in the hydraulic boundary is suspected. Use a procedure compliant with this Section and ASME BPVC SEC V. Evacuate the vacuum box slowly. Do not increase vacuum during active bubble formation. The VBT standard for acceptance is the no leak condition and API Std 650.

3.10 PIPING AND NOZZLE INSPECTION

**************************************************************************
NOTE: Piping and nozzle inspection and piping hydrostatic test for use on cut and cover tank piping that is part of the tank hydraulic boundary or on drain-dry AST piping.
**************************************************************************

Pursuant to [Project Program][Statement of Work] requirements, perform an inspection of tank piping using the principles of API 570 and API RP 574. For areas determined to require further investigation, provide Fitness for Service evaluation pursuant to API RP 579-1 assessment methodology.

Examine nozzle necks, fittings, flanges, low points, thermal relief, expansion joints, slide pads, and vibration isolators. Assess suitability and serviceability.

3.10.1 Tank Piping Hydrostatic Test

Notify the Contracting Officer 14 days prior to hydrostatic test. Hydrotest piping in accordance with API RP 1110 and the Test Plan. Test the segment from inside the tank to the first accessible flange outside the tank. Utilize alternative means to isolate unflanged piping. Remove appurtenances within the test segment and isolate with blind flanges. Deploy components with pressure rating no less than existing flanges. Maintain the pressure within the piping for the test duration with no leakage or reduction in gauge pressure. Do not use an instrument without a calibration certificate.
Provide means to remove entrapped air. For inaccessible piping, account for the volume of any test medium added or removed by measuring with a calibrated meter. Provide means of communication between technicians at each end of the test segment. Ensure test water contains less than 50 ppm chloride content. Generate a test record contemporaneous with each test event.

3.10.1.1 Instruments

a. Instruments must be clean, in good working order, and within the interval of its calibration.

b. Calibrate all test instruments against a standard by an accredited laboratory. Calibration must have taken place no more than six months prior to the test. Calibration certificates must include the Model, Serial Number, date of certification, and must be signed by the calibrating company. Provide current Instrument Calibration Certificate for measurement instruments.

c. Provide indicating pressure test gauge connected directly to the segment and readily visible to the operator controlling pressure for the duration of the test. Analog type gauges must be compliant with ASME B40.100 Grade 3A, accurate to plus or minus 0.25 percent full scale, graduated over a range not less than 1-1/2 times nor more than four times the test pressure, and incremented no greater than 0.5 psi.

d. Digital type pressure gauge must be integral transducer type, compliant with ASME B40.100 Grade 3A, and accurate to plus or minus 0.25 percent full scale.

e. Provide digital contact thermometer incremented to 0.1 degree F or less. Memorialize pressure data with analog chart recorder. Transducers must have a range not less than 1.5 times and not greater than four times the pressure being tested.

f. Use calibrated continuous recorders (dataloggers) with adequate storage capacity to record temperature and pressure data. Synchronize temperature and pressure datalogger intervals.

g. Measure the volume of test medium with a calibrated meter.

3.10.1.2 Test Parameters

Maintain segment at a steady test pressure condition for a minimum of 15 minutes prior to initiation of examination for leakage. Examine piping, joints, and connections of accessible piping for leaks while maintaining test pressure. Leakage of temporary gaskets and seals, installed for the purpose of conducting the hydrostatic test and which will be replaced later, is permitted unless the leakage rate precludes maintenance of system test pressure for the required duration. Personnel performing the examination for leaks must be qualified for visual examination. Extend the test interval as needed to ensure positive reconciliation of test data. Monitor temperature and pressure. Analyze consistent error, inconsistent error, the magnitude of any lost volume, and pressure versus temperature data trends.

Measure test medium temperature independent of the environment. Provide instrument with output resolution of at least 0.1 degree F for water as the
test medium. Ensure instrument accuracy exceeds the uncertainty required to achieve acceptance criteria.

Account for an accurate determination of fluid volume during a test. Provide volume measurements to the nearest fluid ounce.

3.10.1.3 Test Report

Provide test results and engineered analysis. Provide certification from the engineer the piping segments are either pass or fail. Inconclusive results are not acceptable. Submit Hydrostatic Test Report in accordance with Section [01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES][01 33 00 SUBMITTAL PROCEDURES].

3.11 VALVES

Verify isolation and control valves are suitable and serviceable. Verify operation of valve appurtenances including motor and hand-operated equipment, pilot controls, body cavity relief, and position indicators. Pursuant to [Project Program][Statement of Work] requirements, clean, recondition, test, and commission isolation valves and actuators back into service.

3.12 GAS TEST HOLE REPAIR

**************************************************************************
NOTE: If Section 33 01 50.75 REPAIR OF FIELD FABRICATED FUEL STORAGE TANKS is being used in the contract concurrent with this Section, use repair of gas test hole requirements in Section 33 01 50.75.

If Section 33 01 50.75 REPAIR OF FIELD FABRICATED FUEL STORAGE TANKS is not being used in the contract, then repair must be performed pursuant to this Section.

**************************************************************************

Repair all gas test holes pursuant to Section 33 01 50.75 REPAIR OF FIELD FABRICATED FUEL STORAGE TANKS. Fill every gas test hole with weld metal. Temporarily plug the gas test holes between inspection and repair phases.

3.13 DESTRUCTIVE TESTING

**************************************************************************
NOTE: Use this paragraph should it be expected that confirmation of inspection NDE will be useful or required, if there are questions about weldability, or if metallurgical properties of the material need to be established. Do not use destructive testing unless warranted and repairs are programmed.

**************************************************************************

After scanning has been performed and backside corrosion data reviewed, remove [two][five] 6 in diameter coupons of tank material for testing. Coupon locations will be identified by Government. Remove coupons with a straight, neat, distortion-free cutline and in accordance with Section 33 01 50.75 REPAIR OF FIELD FABRICATED FUEL STORAGE TANKS.
Mark coupon product side to identify orientation. Document coupon front and back side conditions with photography in accordance with paragraph PHOTOGRAPHIC DOCUMENTATION. Prepare samples and submit to laboratory for testing. In-situ testing is not acceptable as a substitute for laboratory testing. Use the services of an accredited laboratory to perform testing.

Repair holes from coupons pursuant to Section 33 01 50.75 REPAIR OF FIELD FABRICATED FUEL STORAGE TANKS.

][3.14 TANK CALIBRATION TABLE

******************************************************************************
NOTE: Strapping is not commonly required for inspections. Include this paragraph if existing strapping charts are believed to be inaccurate by the Government or if the tank under inspection is being returned to service. If Section 33 01 50.75 is being used concurrently, defer tank calibration requirements to that Section.
******************************************************************************

Calibrate tank in accordance with paragraph TANK CALIBRATION METHOD. Provide two hard copy laminated capacity tables, one in English units and one in SI units. Tables must show the volume of product at all liquid levels, from the lowest point of the tank bottom to the level of overflow. Include unit conversion notes on each table.

English unit table must show the volume of product in gallons and barrels, and the corresponding level of product in 1/16 inch increments. SI unit table must show the volume of product in liters and in cubic meters, and the corresponding level of product in 2.0 mm increments.

Volume calculations must be made in the smaller units. Larger units may be obtained by rounding. Use the top of the datum plate as level zero. Show levels below the top of the datum plate, including nozzle piping, in negative units. Tables must not include tank volume above the level of overflow.

On the calibration table (strapping chart), identify level points coincident with automatic tank gauge action or alarm settings.

Provide Electronic Tank Calibration Table on electronic media compatible with the Electronic Automatic Tank Gauging System. Also provide tables identical to the master gauge table in format compatible with Microsoft Excel. Contact Contracting Officer for direction on required format.

3.14.1 Tank Calibration Method

Calibrate storage tank in accordance with the API Manual of Petroleum Measurement Standards using the [API MPMS 2.2A][API MPMS 2.2B][API MPMS 2.2C][API MPMS 2.2D] method.

]3.15 DATABASE

Manage the indications database in a secure, auditable, and organized manner. Record visual and API inspection findings and associated geometric data in the system. Limit edit rights to individuals with a specific need.
3.16 INSPECTION REPORT

3.16.1 Preliminary Report

Upon completion of the inspection for each tank, prepare a preliminary report for the Government Technical Team. Identify mandatory and recommended repairs in itemized lists. Use a unique identifier (not bullets) for each item. State the methodology used to determine MRT. Submit Preliminary Inspection Report in accordance with Section [01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES]. Preliminary report contents are:

a. Tank ID, location, product service, and inspection date.

b. Suitability for service analysis pursuant to paragraph SUITABILITY FOR SERVICE, suitability for service statement identifying whether the tank is suitable for continued operation, reduce capacity, or complete removal from service. If tank is unsuitable for service or operating at a reduced capacity, provide a concise description of the reason(s).

c. Inspector of Record name, certification number, and date.

d. Summary of tank, nozzle, and appurtenance conditions.

e. Analysis of bottom examination and corrosion growth.

f. API Std 653 and DoD Tank Features List.

[g. Storage Tank Engineer name, profession engineer's license number, [API Std 653 certification number ]and date.]

3.16.2 Full Inspection Report

Deliver a full report of inspection findings to the Contracting Officer. The report must include a record of NDE findings with drawings depicting plate layout and thickness measurement locations. Incorporate engineering analysis, suitability for service analysis pursuant to paragraph SUITABILITY FOR SERVICE, corrosion rate determinations, and remaining service life calculations. Include electronic appendices with inspection and geometric data. Provide separate report for each tank inspected. Provide Tank Inspection Summary Sheet for each tank inspected. Define all terms including adjectival descriptions. In addition, provide the NDE data as an electronic file as required in the paragraph DATA MANAGEMENT. Submit Inspection Report in accordance with Section [01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES].

3.16.2.1 Executive Summary

Provide a one page summary of the condition of the tank and concise recommendations for repairs.

3.16.2.2 Suitability for Service Statement

Statement must be a one page document. Specify the due date for the next inspection. Include the API Std 653 inspector of record certificate number and signature[ as well as the tank engineer's seal and signature]. Provide a statement for each tank inspected. In the event the statement cannot be made, document the reason(s) and recommend corrective measures.
3.16.2.3 Wind or Rising Water Load Analysis

Pursuant to [Project Program][Statement of Work] requirements, perform a wind load calculation to determine the minimum ballast fill height required to withstand a severe wind event (i.e., to prevent overturning, sliding, buckling, or uplift) consistent with UFC 3-301-01 and ASCE 7-16. Review historical weather records applicable to the location.

3.16.2.4 Seismic Load Analysis

Pursuant to [Project Program][Statement of Work] requirements, perform a seismic load calculation to determine the maximum fill height and freeboard required to prevent overflow during a seismic event. Calculate loads consistent with UFC 3-301-01 using Risk Category III, unless notified otherwise by the Contracting Officer.

3.16.2.5 Tank History

Establish the known historical record of the tank. The record must include as much information as possible and include:

a. Nameplate information
b. Products previously and currently stored in the tank
c. List of previous inspections
d. List and describe significant environmental (earthquake, hurricane, flooding) or operational (over-pressure, vacuum, mechanical damage, fire, settlement) events
e. List and describe repairs or alterations performed (include significant drawings and executive summaries from other repair reports in the report appendices)
f. Other pertinent facts and data

3.16.2.6 Inspection Methodology

Provide a detailed description of the inspection methodology for each tank component inspected. Identify type of inspection, equipment, and methods. Discuss corrosion rates, MRT, remaining service life[, and hydrostatic testing methodology]. Explain how statistical significance was addressed and meaningful data were obtained.

3.16.2.7 Findings

Describe inspection and NDE findings for each region. Present corrosion rates, minimum thickness, and remaining service life calculations. Discuss all findings. Summarize NDE data in the report body and provide complete NDE data in appendices.

3.16.2.8 Recommendations

Report recommendations based on policy, criteria, standards, and regulations separately from those related to hydraulic and structural integrity.
3.16.2.9  Data
Include all data collected during the inspection. Data must be electronic, in tabular form, and be registered with tank geometric data.

3.16.2.10  Checklist/Features List
Prepare API Std 653 Appendix C and DoD Tank Features List. Annotate items which are not applicable. Provide checklist, features list, field notes, and measurements taken by the tank inspector. Provide the DoD Tank Features List in both portable document and spreadsheet formats.

3.16.2.11  Sketches
Include tank bottom, shell, and roof plate sketches depicting orientation, indications, appurtenances, nozzles and their purpose, manways, and other significant tank features. Include the sizes, dimensions, and lengths of significant tank features.

[ For ASTs, include sketches of the dike, piping in the dike, locations of supports, stairs, ladders, cathodic protection stations, and monitoring wells. Include the sizes, dimensions, and lengths of significant dike features.

][For USTs, include sketches of the pumphouse and pits associated with the UST, piping in the pumphouse, information of piping and equipment in the pumphouse and pits, locations of supports, stairs, ladders, etc. Include the sizes, dimensions, and lengths of significant UST pumphouse and pit features.

]3.16.2.12  Photographs
Provide full resolution well-lit electronic color photographs which depict the area of interest. Provide a photoguide which contains descriptive caption for the photographs.

3.16.2.13  Calculations
Provide calculations consistent with API Std 653. Provide calculations for corrosion rates, MRT, next inspection date, settlement, seismic and wind load analysis, and estimated remaining service life. Provide a sample calculation for each determination along with assumptions and references used.

3.17  TANK RETURN TO SERVICE
**********************************************************************************************************************
NOTE: If Section 33 01 50.75 is being used concurrently, use return to service requirements in that Section.

Use first bracketed option for NAVFAC if tank is being returned to service after inspection.

Use second bracketed option for Army or Air Force.
**********************************************************************************************************************
[ In order to return a storage tank to the operator fit for service, comply with NAVFAC Red Zone requirements in Section 01 45 00.05 20 DESIGN AND
CONSTRUCTION QUALITY CONTROL, and requirements of UFC 3-460-03. Minimum return to service requirements are:

a. Inspection Report
b. Tank Suitability for Service Statement
c. List of Identified Repairs
d. List of Recommended Repairs
e. List of Pending (Actual) Repairs
f. Calibration (Strapping) Charts
g. Signed statement which declares custody of the tank is returned to the Activity and items a through f above have been provided to the Contracting Officer

In order to return a storage tank to the operator fit for service, comply with requirements of UFC 3-460-03 and Section 01 45 00.00 10 QUALITY CONTROL.

Provide adequate time for curing of coating. Use new gaskets on manway and flanged connections which were opened during the work. Replace fasteners which were removed during the work and are unsuitable for re-use. Verify the vents are not covered and are operating properly. Verify any temporary gas test hole plugs have been removed and all gas test holes have been repaired pursuant to paragraph GAS TEST HOLE REPAIR. Test valves to ensure they operate and cavities do not contain liquid. Tank cannot be returned to the operator until the suitability for service statement has been provided.

3.17.1 Cleanliness

3.17.1.1 Tank

After completion of the work, clean interior surfaces of the tank to remove all foreign matter such as blast material, dirt, debris, grease, and oils. Provide interior surfaces free from sources of product contamination, fit for service in [F-76] [JP-5 / JP-8 turbine] [_____] fuel storage, and to the satisfaction of the Contracting Officer. After removal of protective coverings, inspect motors, pumps, impellers, risers, floating roof, and gauges to ensure contamination or damage has not taken place. Should damage or contamination be found, remedy the finding to the satisfaction of the Contracting Officer.

3.17.1.2 Piping

Clean the interior of piping to ensure surfaces are free of contamination or foreign matter, and fit for [F-76] [JP-5 / JP-8 turbine] [_____] fuel service.

NOTE: This guide specification covers the requirements for the procurement, installation, and testing of slip lining for existing exterior piping.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 SUMMARY

This section of the specifications consists of the requirements and work needed to rehabilitate [an] existing pipe[s] in a levee system using the slip lining method by providing pipe liner[s], bulkheads, annular space grouting between the host and slip liner, performance testing as stated herein and providing all labor, materials and equipment necessary to accomplish the work as stated herein. In all instances, rehabilitation shall include installation of [a] liner pipe within an existing host pipe with a continuously grouted annular space. The size[s], type[s], and dimensions of the pipe liner[s] shall be selected by the Contractor and submitted for approval and shall include all connections, joints, and other appurtenances as required to complete the work.
1.2 MEASUREMENT AND PAYMENT

Payment will be made for work performed under this item in accordance with [the][each] pipe slip lined as shown in the bid schedule. Payment includes all costs associated with labor, equipment, material, supervision, cleaning, inspection, sheeting, installation, safety, dust/erosion control, testing, site restoration and all other work specified or not which is reasonably required to provide a completed installation. Any item not specified shall be considered incidental to the work. Include all incidental cost in the bid price for the slip liner.

1.3 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.4 ADMINISTRATIVE REQUIREMENTS

1.4.1 Pre-Installation Conference

Within [_____] calendar days of notice to proceed, conduct a scope-validation meeting, including potential Sub-Contractors, and Contracting Officer to facilitate common agreement and understanding of the work to be performed. At this time, the resumes of Sub-Contractors, project superintendent or project manager shall be supplied to the Contracting Officer or be eliminated from consideration.

1.4.2 Detailed Work Plan

Submit a Detailed Work Plan not less than 30 days prior to commencement of work. The plan shall include but is not limited to the following:

a. Proposed construction sequencing and scheduling

b. Plan for removal of any obstructions encountered

c. Detail Drawings in an approved form, for [each] slip lining system including pipe manufacturer's instructions for installation

d. List of proposed products showing new diameter[s] of slip lining pipe[s] to be installed along with existing pipe diameter[s]

e. Specify all mandrel dimensions, including length[s], for each pipe to be slip lined

f. Provide maximum depth of cover over pipe[s]

g. Areas requiring special construction techniques

h. Proposed methods for flow control or by-pass to divert excessive flow away from a section of pipe if the need arises during the slip lining process

i. Proposed access and staging area[s]

j. Proposed method of re-establishment of connection[s] (if applicable)
k. Joints, gaskets, proposed Resins, Coatings, [____], and other pertinent information as applicable

l. Dates of excavation and pipe placement, along with proposed work hours

m. Method for preventing damage to the host and liner pipe[s] using guide rails, pipe invert paving, or other applicable methods when the invert of the host pipe has deteriorated significantly

n. Method for waste grout recovery

o. Detailed plan for dealing with buoyant uplift of the liner pipe during grouting

q. Manufacturer's recommendation regarding methods for repair of damage to liner pipe following installation

r. List of proposed subcontractors

s. Written confirmation that the grouting procedures has been coordinated with the grout installer and the liner pipe manufacturer.

1.4.3 Sequencing and Scheduling

Submit plan for final approval of Construction Progress Schedule prior to commencing construction. Provide 72 hour notice to Contracting Officer prior to placing liner pipe[s]. Do not proceed with slip lining operations for pipe[s] that are likely to reach gauge operation elevation within 5 days as forecast by the National Weather Service. Lay out the sequencing of work to minimize work stoppages as a result of high water. Additionally after liner pipe has been placed, make all reasonable attempts to grout the annulus prior to partial or total submergence of the pipe. In the event in which high water submerges a portion of a lined pipe prior to annular grouting, clean out the annular space using high pressure water jetting prior to grouting.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-01 Preconstruction Submittals**

Contractor Qualifications; G, DO
Grout Contractor Qualifications; G, DO
Pipe Inspection Procedures; G, DO
Construction Progress Schedule; G, DO

**SD-06 Test Reports**

Grout Trial Mix Tests

**SD-10 Operation and Maintenance Data**

Maintenance; G[, [____]]
1.6 QUALITY ASSURANCE

1.6.1 Qualifications and Supervision

Submit Contractor Qualifications for slip lining piping, documenting their engagement in the successful installation of similar slip lining systems for at least [_____] years. Provide an experienced superintendent with experience in installation of similar slip lining systems. The superintendent shall be on site at all times and shall have full authority to direct the means, methods, equipment and personnel and performance of the work.

1.6.2 Grout Contractor Qualifications

Submit Grout Contractor Qualifications in letter form from the foam manufacturer stating that they are an approved applicator for that product, as well as the grout mix design, and test break results for that particular design. Reference paragraph GROUT MATERIALS AND MIXES for grout mix design requirements.

1.7 DELIVERY, STORAGE, AND HANDLING

Prevent injury or abrasion to liner pipe during loading, transportation, and unloading. Do not drop pipe from cars or trucks, nor allow pipe to roll down skids without proper restraining ropes. Use suitable pads, strips, skids, or blocks for each pipe during transportation and while awaiting installation in the field. Liner pipe shall be moved by machinery in a controlled manner. Do not allow liner pipe to roll down the levee embankment at any time. Handle and store in accordance with the manufacturer's published recommendations.

Remove slip liner pipe with cuts, gashes, nicks, abrasions, or any such physical damage which is deeper than 10 percent of the wall thickness from the site and replace with undamaged pipe at no additional cost to the Government.

1.8 WARRANTY

Submit [_____] copies of the signed Manufacturer's Warranty for all products within [_____] [days] [weeks] of final completion of the work.

PART 2 MATERIALS

2.1 DESIGN REQUIREMENTS

2.1.1 Conveyance Capacity

Provide slip lining pipe[s] designed to allow the maximum conveyance capacity possible, but in no case provide less capacity than currently exists while maintaining a 25 mm 1-inch minimum average annular space between the host pipe and liner pipe for grouting. In some cases capacity can be increased by improvement of entrance conditions and any such
improvements must be submitted. Submit calculations that demonstrate how capacity is determined for the liner pipe. If there are circumstances which prohibit supplying a slip lining system that provides at least the current conveyance capacity for [each] [the] pipe to be slip lined, notify the Contracting Officer to determine an appropriate course of action.

2.1.2 Downstream Scour Protection

Consider the velocity of outlet flow and take appropriate action, if needed, to ensure that downstream scour protection is adequate. This may be addressed with rip rap, baffle blocks, energy dissipaters, or other means.

2.1.3 Design Criteria

The slip liner pipe system shall be designed by a licensed professional engineer to meet the standards outlined in the following sub-paragraphs. Submit calculations of the system's structural properties prior to construction. Support all assumptions utilized in calculations with product data, test reports, or referenced publications.

a. Design the new slip liner pipe system using the fully flood-loaded levee elevation to establish external hydrostatic pressure.

b. Design the new slip liner pipe system for maximum 5 percent ovality and a maximum allowable long term deflection of 5 percent.

c. Design the new slip liner pipe system using a safety factor of 2.5 for buckling and 2.0 for bending, wall crushing and buoyancy. Analysis for buckling shall be two-fold: to check for buckling from the grouting pressure of the liner pipe; and to check for buckling from external pressure of the underground water table. Ignore the cross-sectional shape distortion of the host pipe in the buckling analysis.

2.1.4 Analysis and Calculations

Submit detailed analysis and calculations, stamped by a licensed P.E., not less than 30 days prior to commencement of work. Demonstrate suitable application of products based on the following parameters:

a. Deflection

b. Confined buckling (for both Grouting case and the Flood Load case)

c. Long-term (50-year) hydrostatic buckling

d. Calculations verifying conveyance capacity and velocity of outlet flow meet the requirements as stated herein

e. Design Calculations showing that the proposed pipe satisfies the current design criteria neglecting any contribution of the host pipe[s]

f. Bulkhead designs and locations including vent and injection port location and proposed materials to be used in bulkhead construction

g. Buoyant force calculations during grouting

h. Grout mix designs per the requirements stated herein
i. Initial set time of grout

j. Estimated grout volume for each pipe

k. The maximum grout injection pressures proposed as well as maximum allowable grout injection pressures as provided by the pipe manufacturer

l. Proposed grout stage volumes

2.2 LINER PIPE

Provide pipe[s] constructed of corrosion resistant, thermoplastic, or thermosetting resin. Suitable pipe lining materials include solid wall High Density Polyethylene Pipe (HDPE), Machine Spiral Wound Poly Vinyl Chloride (PVC) Pipe, and Glass Fiber-Reinforced Plastic Pipe. Secure written product approval from the Contracting Officer before commencing any work.

a. Select liner pipe material to ensure that thermal expansion or contraction does not exceed a total of 13 mm 0.5 inches for the length of the pipe throughout the range of ambient air temperatures anticipated during the service life of the liner pipe[s]. Assume ambient air temperatures for this item to range from [___] degrees C to [___] degrees F.

b. Submit manufacturer's detailed product data with complete information on liner pipe materials (pipes, joints, gaskets, fittings, entrance bells), physical properties, dimensions, installation minimum/maximum allowable parameters such as maximum recommended external grout pressure, axial compressive stress, minimum bending radius or maximum joint angular deflection, etc. Include a manufacturer's certificate of compliance with specifications for proposed materials.

c. Pipe liner materials other than those stated below may be submitted for consideration and approval by the Contracting Officer based on meeting the design requirements as stated herein.

2.2.1 PVC Pipe (Machine Spiral Wound)

2.2.1.1 Profile Strip

Provide extruded PVC profile strip in accordance with the requirements of ASTM F1697 except as noted below.

a. Contrary to ASTM F1697, composite profile strip comprised of extruded PVC and a ferrous element necessary to provide long-term structural strength of the pipe is prohibited.

b. All profile strips shall be specifically applicable for installation and use in the project environment.

2.2.1.2 Joints

Joints shall meet the requirements of ASTM D3212, and gaskets meeting the requirements of ASTM F477.

a. The joint shall consist of a single, mechanical interlock between profile strips supplemented with sealant and is created continuously as the profile is wound into the pipe.
b. Once wound into place within the host pipe, joints shall be considered completed and the pipe shall not be intentionally or otherwise expanded or permitted to translate in any direction at the joint.

c. The completed liner pipe shall be provided such that neither the outside diameter of the pipe is increased nor the internal diameter of the pipe is decreased at the joint.

d. Joints shall be water-tight over the range of head pressure expected for the pipe.

2.2.2 Solid-Wall High Density Polyethylene Pipe (HDPE)

2.2.2.1 Pipe

a. Pipe and pipe fittings shall be manufactured from high density compounds in accordance with ASTM D3350, cell classification 345464C with a designation of PE 3408 and a minimum Standard Dimension Ratio (SDR) of 32.5.

b. Pipe shall be solid wall with a smooth interior and exterior with no corrugations or ferrous elements.

c. Each pipe segment shall be marked on the inside and outside with a coded number which identifies the manufacturer, SDR, size, materials, machine, date and shift on which the pipe was extruded.

d. Pipe[s] shall be specifically applicable for installation and use in the project environment.

2.2.2.2 Joints

a. Joints shall be water-tight over the range of head pressure expected for the pipe.

b. Joints shall be butt-fused in accordance with ASTM F2620 and the manufacturer's recommendations or shall be capable of being joined into a continuous length by an interlocking method such that joints meet the requirements of ASTM D3212. Screw-type or threaded joints will not be allowed unless a positive lock is included in the joint system or the perimeter of the joint is extrusion welded at the bearing assembly, prior to insertion.

c. Internal beads resulting from butt fusion shall be limited to a 6 mm 0.25 inch projection perpendicular to the inside wall of the pipe. Trim beads larger than 6 mm 0.25 inch 360 degrees around the interior of the pipe. External beads resulting from butt fusion need not be trimmed unless the bead projection will negatively impact pipe installation or migration of annulus grout.

2.2.3 Glass Fiber-Reinforced Plastic Pipe

2.2.3.1 Pipe

Provide centrifugally cast fiberglass reinforcement plastic mortar pipe (CCFRMP) in accordance with ASTM D3262, cell classification Type 1, Liner 2, Grade 3. All pipes shall be specifically applicable for installation and use in the project environment.
a. Minimum pipe stiffness shall be [_____] kPa psi when tested in accordance with ASTM D2412.

b. The glass shall be a commercial grade of E-type glass fibers with the amount, location and orientation of the chopped glass-fiber reinforcement specifically designed for each application.

c. Sand shall be minimum 98 percent silica kiln-dried and graded.

d. The polyester wall resin shall be an isophthalic, orthophthalic or other approved resin with a minimum tensile elongation of 2 percent.

e. Fiberglass liner shall be shown by tests to be resistant to long-term corrosion. Testing shall be performed in accordance with ASTM D3681 using 1.0N sulfuric acid for sanitary sewage, and ASTM C581 for industrial sewage.

f. Each pipe segment shall be marked on the inside and outside to identify the manufacturer's number, diameter, stiffness, ASTM designation and lot number.

2.2.3.2 Joints

a. Provide pipe with joints designed so that neither the outside diameter of the pipe is increased nor the internal diameter of the pipe is decreased at the joint.

b. Joints shall be water-tight over the range of head pressure expected for the pipe.

c. Joints shall meet the performance requirements of ASTM D4161. Field connect pipe[s] with low-profile, fiberglass bell-spigot joints or flush fiberglass bell-spigot joints, when the fit requires. Utilize elastomeric sealing gaskets as the sole means to maintain joint watertightness. Gaskets shall meet the requirements of ASTM F477. Joints at tie-ins, when needed, may utilize gasket-sealed closure couplings.

2.2.4 UV Protective End Treatment

All slip liner pipes constructed of materials that are not UV stabilized (i.e. fiberglass pipe) that terminate at an open end or headwall shall receive a factory-applied coating on the interior surface of the pipe to resist deterioration from ultraviolet radiation. The UV protective coating shall be applied for a distance inside the pipe equal to two times the inside diameter of the liner pipe. In the event that field cutting is necessary, no additional coating will be required for the cut end.

a. Coating color shall be light gray or similar shade subject to approval by the Contracting Officer.

b. Nicks, scratches and minor abrasions to the coating shall be touched up in the field following final installation.

2.3 GROUT MATERIALS AND MIXES

2.3.1 Grout For Annular Space

Provide grout for the annular space in accordance with this Specification.
and with the manufacturer's published recommendations. The grout shall be nonstructural or structural based upon the type of slip liner system provided. If the pipe liner provided cannot meet the stated requirements for factor of safety against buckling or crushing, then a structural grout must be used regardless of the pipe liner system used in order to fulfill the factor of safety requirements as stated herein.

2.3.2 Grout Mix for Annulus Grouting

2.3.2.1 Cement

Comply with ASTM C150/C150M.

2.3.2.2 Water

Use only potable water to prepare grout.

2.3.2.3 Admixtures

Select admixtures to meet performance requirements, improve pumpability, control set time and reduce segregation. Admixtures shall not be biodegradable.

2.3.2.4 Compressive Strength

2.3.2.4.1 Structural Grout

The grout 28-day compressive strength shall be that determined during the design and submitted for approval. Test 28-day compressive strength in accordance with ASTM C942/C942M.

2.3.2.4.2 Nonstructural Grout

The grout shall have a minimum penetration resistance of [690][_____] kPa [100][_____] psi in 24 hours when tested in accordance with ASTM C403/C403M and a minimum compressive strength of [2415][_____] kPa [350][_____] psi in 28 days when tested in accordance with ASTM C495/C495M.

2.3.2.5 Mix Design

Design a grout mix and installation procedure to completely fill the annular space based upon, but not restricted to the list below (a. - g.), such that the slip liner pipe will not float (either by external restraint or internal weighting). The grout shall maintain an appropriate viscosity as tested in accordance with ASTM C939/C939M. Verify the density in conformance with ASTM C138/C138M or by other methods as approved by the Contracting Officer.

a. Size of annular void

b. Absence or presence of water

c. Sufficient strength and durability to achieve the design requirements as stated herein

d. Provide adequate retardation for placement

e. Provide less than 1 percent shrinkage by volume
f. Distance between grout injection ports  
g. Heat of hydration compatible with pipe material in accordance with pipe manufacturer's recommendation

2.3.2.6 Mixers and Pumps

Mix the materials in equipment of sufficient size and capacity to provide the desired amount of grout material for each stage of the grouting operation. The system shall mix the grout to a homogeneous consistency and deliver grout to the injection point [under a normal range of operating conditions] [at a steady pressure with a non-pulsating pump at the mix tank]. The equipment shall be capable of mixing the grout at densities required for the approved procedures and shall also be capable of changing mixing parameters as dictated by field conditions at any time during the grouting operation.

2.3.2.7 Pressure Gauges

a. Pressure gauges shall be suitable for use in the grouting environment and have a working range between 1.5 to 2.0 times the design grout pressures, and have accuracy within 0.5 percent of full range.

b. Provide, at a minimum, one pressure gauge at the point of injection and one pressure gauge at the grout pump.

2.3.3 Grout Trial Mix Tests

a. Structural Grout: Provide Grout Trial Mix Test Results with viscosity, density, and 28-day minimum compressive strength. Also provide the grout working time before a 15 percent change in viscosity occurs.

b. Non-structural Grout: Provide Grout Trial Mix Test Results with viscosity, density, 24-hour penetration resistance set time, and 28-day minimum compressive strength. Also provide the grout working time before a 15 percent change in density or viscosity occurs.

2.3.4 Bulkhead Concrete

Design a low slump concrete mix to form a bulkhead at each end of the pipe to retain the annular grout. Low slump concrete shall consist of cement, fine and coarse aggregate, water, and an air-entraining admixture. Concrete shall be thoroughly compacted into the prepared void by tamping, rodding, ramming, etc. Forms may be used to confine the concrete. The temperature of the in situ concrete (i.e., headwall or gatewell structure), adjacent air, and bulkhead concrete shall be above 4 degrees C (40 degrees F) during placement.

PART 3 EXECUTION

3.1 PREPARATION AND INSPECTION

The Contracting Officer makes no guarantee regarding the information, data, and physical condition of underground facilities or existing pipe[s]. Before commencing with any work, or ordering any materials, physically measure the length and diameter and inspect the existing pipe[s] designated to receive a pipe liner to verify that the rehabilitation plan is appropriate and meets the requirements of EM 385-1-1. For pipes large enough and safe to enter, a walk-through inspection with digital
photography is preferred when confined space entry procedures are followed. Inspect small or unsafe pipes using CCTV. Submit pipe inspection procedures to locate breaks, obstacles and connections in pre-construction submittals for approval. Note all connections and any conditions which may prevent proper installation of the liner. Correct these conditions prior to liner installation. Coordinate slip lining efforts with the Contracting Officer and the owner of the affected pipe. Submit the CCTV Recordings and Report Logs and/or Digital Photographs and Report Logs prior to pipe liner installation. Base the work plan on a thorough review of the inspection video and/or digital photographs and report logs.

3.1.1 Safety

Note any areas that may involve entry and/or work in confined spaces and address in the project Health and Safety Plan provided under Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS prior to performing work in these areas.

3.1.2 Control of Flow

Provide for maintenance and control of flow as necessary for effective inspection and satisfactory installation of the slip liner and grout. Such work shall include by-pass pumping or berming and dewatering for submerged pipes. Submit proposed means and methods for control of flow with the pipe inspection procedures.

3.1.3 Bypass Pumping

If required, provide for continuous bypass flow around the section or sections of pipe designated for the liner process. Provide pump and bypass lines of adequate capacity to handle the necessary flow.

3.1.4 Pre-Lining Cleaning

Prior to the man-entry or CCTV inspection and installation of the slip liner pipe, thoroughly clean the host pipe[s] designated to receive the liner. Cleaning shall constitute removal of all debris, solids, roots, deposits, and other matter which would preclude proper installation of the slip liner pipe and annulus grout. Perform cleaning such that no damage occurs to the host pipe. Handle water used for flushing and cleaning [the] pipe[s] prior to slip liner system installation to comply with regulatory agencies having jurisdiction regarding erosion prevention and sediment control procedures for storm water discharge.

3.1.5 Insertion and Pulling of Mandrel

Prior to commencing any work, pull a mandrel through all host pipes too small or unsafe to enter in order to check for deformation, joint deflection or obstructions prior to ordering any pipe liner materials. Host pipes large enough and safe to enter may be verified through man-entry, mandrel or both at the Contractor's discretion.

a. The mandrel length of liner pipe shall be equal to the liner pipe joint length.

b. The mandrel shall have an outside diameter not less than that of the proposed slip liner pipe plus 2-inches, shall be equal to the pipe joint length of the liner pipe to be installed and shall have a
stiffness equal to or greater than that of the slip liner pipe. When a segment of slip liner pipe is used as a mandrel, it shall not be used as a permanent slip liner pipe.

3.2 EXCAVATION

Perform work utilizing existing points of entry including headwalls, manholes, etc. Excavation along the length of the host pipe (between headwalls/manholes) is strictly prohibited. In the event that it becomes necessary to perform an excavation, obtain written confirmation that an excavation is warranted from the Contracting Officer. If an excavation is required, excavations shall be minimal and comply with local, State, and Federal regulations. Repair any excavation of levee material according to [USACE regulations][Section 31 00 00 EARTHWORK] regarding acceptable fill material, benching and compaction requirements.

3.3 INSTALLATION

3.3.1 General

a. Restore project site to original condition prior to final payment. Include the cost to repair all damages resulting from the work in the base bid.

b. Point repairs, deemed necessary at any point on the existing pipeline prior to slip lining shall be approved by the Contracting Officer prior to start of work, require locating the insertion pit at the point repair location.

c. Locate and identify all connections, excavate, and disconnect prior to the slip line pipe insertion. Upon completion of insertion of the slip line pipe and a 24-hour pipe relaxation period, expedite the reconnection of cross connections as quickly as possible. Provide for temporary pumping and/or control of flow from each connection until final reconnection has been performed. Connections are to be reopened and trimmed to a neat, clean opening concentric with the connection pipe in a manner that provides a water tight seal between the liner pipe and the connection pipe.

d. In all instances, the liner pipe shall be a fixed diameter and shall not be expanded intentionally or otherwise.

e. Maximum and minimum lay lengths shall be in accordance with manufacturer's requirements and any constraints based on work limits [as prescribed by the Contracting Officer].

f. Insertion may proceed from either upstream or downstream as suitable access is available.

g. Use sub-aqueous pipe lubricant meeting the specifications of ASTM C497M ASTM C497 Section 12 in accordance with pipe manufacturer's installation instructions. Use only lubricants approved by the pipe manufacturer.

h. Use caution to prevent jagged edges from damaging the slip liner pipe during insertion when the invert of host pipe has deteriorated significantly. In such cases, describe in the work plan how damage to the host and liner pipe[s] will be prevented using guide rails, pipe invert paving, or other applicable methods.
i. Consider thermal expansion/contraction effects such that the ends of the slip liner pipe are flush with the existing headwall/manhole to within 12 mm 0.5 inch. Where a slip liner pipe meets a gatewell or flapgate, the slip liner pipe cannot project beyond the end of the host pipe. Reasonable attempts shall be made to achieve a flush surface between the slip liner pipe and the host pipe. Delay trimming of the liner pipe[s] for 28 days after completion of grouting.

j. Take necessary precautions to maintain line and grade of the host pipe and avoid flotation of the liner pipe. Construct all blocking, if used, of inert, non-ferrous material, and install in accordance with manufacturer's recommendations.

k. Drilling holes in the slip liner pipe for any reason is prohibited.

l. Prior to grouting, visually inspect all slip liner pipe joints to check the integrity of joints and verify that the liner has not been damaged during installation. Repair if needed using liner manufacturer's recommended procedure.

m. Sealing at manholes, if applicable: A tight seal is required at manholes, openings, or abutments with no annular gaps. Rebuild manholes between linear ends resulting in a smooth, continuous flow line through the manhole.

n. At the completion of construction the exposed ends of [the][all] slip lined pipe[s] shall have a clean, finished look with no visible signs of grout vents, injection tubes, etc.

3.3.2 Machine Spiral Wound PVC Pipe

a. Install machine Spiral Wound PVC Liner Pipe in accordance with ASTM F1741, manufacturer's recommendations and the provisions of this Section. In the event of a conflict, the most restrictive of the three shall govern.

b. No mechanical pulling or pushing force (such as backhoe bucket or winch cable) shall be exerted on the ends of the pipe during installation.

c. In all instances, the liner pipe shall be a fixed diameter and shall not be expanded intentionally or otherwise.

3.3.3 Solid-Wall High Density Polyethylene Pipe (HDPE)

a. Install Solid-Wall High Density Polyethylene (HDPE) Liner Pipe in accordance with ASTM F585, manufacturer's recommendations and the provisions of this Section. In the event of a conflict, the most restrictive of the three shall govern.

b. Allow the installed pipe to relax and cool following installation in accordance with manufacturer's recommended time, but not less than 24 hours, prior to any reconnection of lines, grouting of the annulus, or backfilling of the insertion pit. Staged grouting is essential, especially for larger diameter pipes, in order to keep thermal expansion low and to prevent a reduction in the pipe diameter.

c. The slip liner pipe shall be free of foreign inclusions and visible defects such as cracks, creases, unpigmented or nonuniformly pigmented
pipe. Cut the ends of the pipe squarely and cleanly so as not to adversely affect joining or connecting. Field cuts shall be de-burred and free of defects.

d. Sections of slip liner pipe shall be joined and inserted into the host pipe until a continuous liner pipe is created along the entire length of the host pipe, in accordance with pipe manufacturer's recommendations.

3.3.4 Glass Fiber-Reinforced Plastic Pipe

Install Glass Fiber-Reinforced Plastic Liner Pipe in accordance with ASTM D3839, manufacturer's recommendations and the provisions of this Section. In the event of a conflict, the most restrictive of the three shall govern.

3.3.5 Bulkheads for Annulus Grouting

a. Once the slip liner pipe has been installed; construct bulkheads in sequence from upstream to downstream at the end of each pipe segment; including gatewells and manholes located intermediately along the pipe length to be slip lined. The bulkhead shall have a minimum length measured along the long axis of the pipe of 300 mm 1 foot, or the thickness of the headwall, whichever is greater. The lengths of grouting ports shall be staggered such that the entire run of the pipe can be completely grouted.

b. Shop drawings shall include all locations of the grout/air ports and sketches of the proposed bulkheads, as well as the lengths of each grouting port. Shop drawings shall include manufacturer's literature for accessories and form coating materials. Submit the proposed materials, dimensions, location of grout injection ports, vent tubes, etc.

c. Construct bulkheads a minimum of 24 hours after the completion of the slip liner insertion process to allow for thermal equilibrium between the slip liner pipe and the host pipe conditions and at most 72 hours after completion of the slip liner insertion process to minimize the exposure of the annulus to debris from a rainfall event. The annulus shall be cleaned if a local rainfall event or a river flooding event partially or wholly submerges the pipe prior to bulkhead construction.

d. Place vent holes at the crown and the invert in the downstream bulkhead. An access hole, sized to facilitate the method of grout input and an air vent shall be placed at the crown in the upstream bulkhead. The vent holes in the downstream bulkhead are plugged as soon as grout begins to flow out each hole. The air vent in the upstream bulkhead is kept clear until grout begins to flow out of the vent.

e. The bulkheads shall be hand-finished to a professional quality appearance. After a curing period and pressure washing of the headwalls, a Soluble Reactive Silicate Concrete Treatment Product shall be applied over the entire headwall surface, including the bulkheads.

3.3.6 Annulus Grouting

Following construction of the bulkheads, fill annular space with grout between the ID of the host pipe and the OD on the liner pipe.
a. Notify the Contracting Officer at least 24 hours in advance of grouting operations.

b. Grout the pipe from downstream to upstream, unless prohibited by access, along its entire length with cementitious grout. Place the grout by either gravity flow or by low pressure pumping to completely fill all voids within the annular space without causing deformation of the liner. The grout extends the full length of the pipe.

c. Ensure the liner pipe maintains the designed line and grade while the annulus grout is placed in uniform lifts. Place annulus grout in lifts of [_____] to avoid floating of the liner and to ensure a uniform grout thickness.

d. The gauged grout pressure at the pipe shall not exceed that of the pipe manufacturer's recommendation or 35 kPa (5 psi), whichever is smaller. Regardless of the pressure, the Contractor is solely responsible for any damage or distortion to the slip liner pipe due to grouting.

e. Remove water in annular space immediately prior to grout pumping to maintain the correct water-cement ratio of the grout mixture.

f. Drilling of additional injection holes from the surface or through the liner pipe to facilitate grouting is prohibited.

g. Continue injection of grout until all of the following conditions have been achieved unless otherwise approved by the Contracting Officer:

   (1) The estimated volume of grout has been injected, as measured at the pump.

   (2) The exhausted grout recovered at each vent is between 85 and 115 percent of the density of the freshly injected grout.

h. No hardened grout is permitted in the liner pipe invert after completion of grouting operations.

i. When cold weather grouting is performed (temperature is between 0-5 degrees C (32-40 degrees F) during and after grouting) the following conditions shall be met:

   (1) Temperature of the grout mix must be 15 degrees C (60 degrees F) or higher at the time of pumping.

   (2) The use of insulation/concrete blankets over areas of the levee behind the headwalls where the minimum cover above the frost line is not met for a period of seven days.

j. Cold weather grouting when the temperature is below 0 degrees C (32 degrees F) during and after grouting the following conditions shall be met:

   (1) Temperature of the grout mix must be 15 degrees C (60 degrees F) or higher at the time of pumping.

   (2) The use of insulation/concrete blankets over areas of the levee behind the headwalls where the minimum cover above the frost line
is not met for a period of seven days.

(3) The use of an internal heater in the pipe that does not exceed the pipe's maximum localized temperature for the first 24 hours after grouting.

3.4 TESTING AND ACCEPTANCE

3.4.1 Rework

Remove any material that has not received prior approval from the Contracting Officer or is not accepted as suitable work by the Contracting Officer and replaced or repaired to the satisfaction of the Contracting Officer with an approved method/material at the Contractor's sole expense. Materials left in place, but not meeting these Specifications, will be paid for at a reduced price.

3.4.2 Grout Testing

3.4.2.1 Density

Conduct field grout density testing on non-structural grout only. Measure density in accordance with ASTM C138/C138M not less than two times per hour in the field during grouting operations. Grout that exceeds ±48 kg/cubic meter ±3 lb/cubic foot of the design density shall be rejected.

3.4.2.2 Compressive Strength

Engage the services of an independent, ASTM/AASHTO accredited testing laboratory to collect and test specimens associated with the strength requirements of this Section.

3.4.2.2.1 Structural Grout

a. Collect, transport, cure, test and report samples in accordance with ASTM C942/C942M, except as stated below.

b. Contrary to ASTM C942/C942M, collect and test specimens based on the more restrictive of the following criteria:

   (1) One specimen (consisting of one, 3-gang mold) for each grouting event for each pipe collected at approximately the mid-point of the grouting operations.

   (2) One specimen (consisting of one, 3-gang mold) for each 14 cubic m 500 cubic feet of grout placed for each pipe.

c. Test all specimens for compressive strength at 28 days. Additional specimens and tests may be performed at the Contractor's discretion.

3.4.2.2.2 Nonstructural Grout

a. Collect, transport, cure, test and report samples in accordance with ASTM C495/C495M.

b. Collect four specimens (75 mm x 150 mm 3 inch x 6 inch cylinders) for each pipe at approximately the mid-point of the grouting operation.

c. Test all specimens for compressive strength at 28 days. Additional
specimens and tests may be performed at the Contractor's discretion.

d. Tests and companion specimens associated with oven-dry unit weight (ASTM C495/C495M Item 9) are not required.

3.4.3 Acceptance Inspection

After all work is completed, perform an inspection of [the] [each] pipe that received a pipe liner, documenting the post-installation conditions. For pipes large enough and safe to enter, a walk-through inspection with digital photography is preferred when confined space entry procedures are followed. Small or unsafe pipes shall be inspected using CCTV. Submit the Post-Installation CCTV Recordings and Report Logs and/or Post-Installation Digital Photographs and Report Logs.

a. Infiltration of ground water or annular grout through the liner pipe will be a basis for non-acceptance.

b. All connections shall be accounted for and be unobstructed.

3.4.3.1 Defects

All defects discovered during the post-installation inspection shall be corrected before the work under the Contract will be considered for Substantial Completion. After the defects, if any, are corrected in accordance with manufacturer's recommendations, the affected pipe segments shall be inspected a second time as a follow-up inspection. All follow-up inspections will be performed by the Contractor, and all costs associated with such follow-up inspections associated with the correction of work shall be borne by the Contractor.

3.4.3.2 Final Acceptance

Provide final digital photographs and/or video and report logs to the Contracting Officer for review and approval of finished work for [the] [each] pipe slip lined prior to receiving final payment.

3.5 MAINTENANCE

Submit manufacturer's recommendations for care and maintenance upon completion of installation.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for work related to the installation of utility pipelines (i.e., electrical power, communications, water, gas, oil, petroleum products, steam, sewage, drainage, irrigation, and similar facilities) utilizing microtunneling or boring and jacking trenchless construction methods.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS and Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, apply to this section with additions and modifications specified herein.

NOTE: Boring and jacking is a term applied to a horizontal auger boring process characterized as mechanically boring and casing a hole through the soil with a cutting head on a continuous flight of augers mounted inside the casing pipe. The casing is advanced simultaneously with the boring operation via a hydraulic jacking system. Line and grade
accuracy may not be achieved to the degree of microtunneling, but this method is often used to economically install 100 mm to 1.8 m 4 inch to 72 inch diameter casing pipe under roads and railroads through a wide variety of soil types (including weathered rock and small cobbles/gravels) up to distances of 122 m 400 feet.

Microtunneling is a process characterized as a highly sophisticated, laser guided, remote controlled system using a microtunnel boring machine (MBTM) and providing the capability of continuous accurate monitoring and control of alignment and grade. MBTMs are categorized as being either slurry-type or auger-type, referring to the method in which spoil material is carried from the cutter head to the jacking pit area.

There are a limited number of manufacturers of equipment that can perform the work described in this specification; a few of those manufacturers are located in the United States.

Use ASCE Standard 36-15, Standard Construction Guidelines for Microtunneling for the planning, design, and construction of microtunneling projects.

Microtunneling can be used to install larger diameter gravity pipelines. Pipes used in microtunneling can range in diameter from a minimum of 300 mm 12 inches to a maximum of 3454 mm 136 inches. Microtunneling is ideally suited for placing 600 mm 24 inch to 2438 mm 96 inch diameter gravity carrier pipes and 600 to 2438 mm 24 to 96 inch casing pipe for containing utility lines. Distances can exceed 300 m 1000 linear feet. Large diameter, straight gravity pipelines under highly congested roadways, railroad crossings and wetlands are typical microtunneling projects. Section 33 05 23.13 UTILITY HORIZONTAL DIRECTIONAL DRILLING should be considered for use for smaller diameter pipelines.

Microtunneling is typically not suited for installations with soil cover less than 1.8 m 6 feet or twice the diameter of the pipe being installed due to concerns of heave or settlement of the ground surface or installations with numerous service laterals located between manholes.

Microtunneling is generally well suited for use in sands, clays, and gravel soils. In soils containing rock, cobbles, boulders, or in mixed-face soils (softer overlying harder material) in-depth consideration given to ground conditions, proper cutter head and guidance equipment selection is recommended in order to achieve desired results. When microtunneling is utilized, also include Section 33 01 30.16 TV INSPECTION OF SEWER PIPELINES.
In microtunneling boring and jacking permanent pipe casing can be used as the carrier pipe or a separate pipe may be placed inside the casing. The Designer of Record specifies the pipe materials to be used. The Contractor is responsible for proper selection of equipment and methods for installation.

In microtunneling boring and jacking the Contractor typically uses a lubricating fluid to reduce friction on the pipe/soil interface. The possible damage to the exterior of the pipe due to stresses and friction should be accounted for in the design.

In "dry boring and jacking" operations, water or other fluids are not used in the removal of spoils. Dry boring and jacking is often specified for highway and railroad crossings.

Cathodic protection for steel pipes should be considered where the anticipated degree of corrosion is so great that coating systems are not adequate to protect the piping for the desired life of the system.

Jacking and receiving shafts are required to be clear of all obstructions in the shafts and above the shafts - including overhead lines.

Microtunneling boring and jacking through contaminated soils or areas anticipated to have numerous underground obstructions is not recommended unless special provisions for handling, disposal, or treatment of contaminated soil or obstructions encountered are included in the contract documents.

Refer to ASCE Standard 36-15 for guidance on addressing obstructions anticipated during construction.

**************************************************************************
**************************************************************************

NOTE: Project Drawings:

1. The following information should be shown on the project drawings:

   a. Plan and location of all new pipelines, including size of pipe casing and carrier pipe.

   b. Location and profiles of soil sampling and bore holes.

   c. Location, size, and type of service of existing connecting, intersecting, and adjacent pipelines and other utilities.

   d. Paved areas and railroads which pass over new pipelines.
e. New pipeline profiles, to show existing conditions.

f. Monitoring survey test locations to check for heave and settlement before, during and after microtunneling.

g. Manhole and lateral piping bedding conditions.

h. Details for the connection of the pipe casing to manholes and infiltration control.

i. Location of surrounding structures (including foundation type) and any sensitivity to settlement and any subsurface structures that could be affected by the operation.

j. Show traffic plans for work near roadways or railroads. Show possible equipment staging areas and spoil storage areas. Spoil storage and removal requires a relatively large area for dewatering and must be strictly controlled. This should be addressed in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. Refer to applicable sections for specific removal and disposal of hazardous materials. Spoil storage locations and construction operations need to consider possible runoff into wetlands, streams, or storm drains.

k. Class or thickness of pipe used in the work, including material identification, and limits for same where class or thickness will differ along length of pipeline.

l. Designate Shaft Locations. Most microtunneling boring and jacking equipment requires unobstructed overhead clearance, free of overhead lines and trees. Large equipment (excavators, cranes, etc.,) and vehicular access to the shafts as well as adequate surface workspace adjacent to jacking shaft work area, is critical. The microtunnelingboring and jacking system requires adequate shaft construction areas to successfully complete the operations. For pipe diameters of less than 1200 mm 48 inches, a minimum area needed is approximately 650 square meters 7000 sf. For pipe diameters of 1200 mm 48 inches to 2438 mm 96 inches, the minimum jacking shaft work area is approximately 929 square meters 10,000 sf.

m. All construction requirements conforming to the standards of the railroad or highway owner. Indicate limits of right-of-way and any other site requirements or dimensions.

**************************************************************************

PART 1   GENERAL

Provide utility installation using microtunnelingboring and jacking
techniques at locations indicated. The Contractor is responsible for all work related to the provision of utilities installed, including assessing surface, subsurface, and environmental (seasonal) conditions.

1.3 SUBMITTALS

**********************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**********************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Microtunneling Plan; G[, [_____]]

Boring and Jacking Plan; G[, [_____]]
Statement of Contractor Qualifications; G[, [____]]

SD-03 Product Data

***************************************************************************
NOTE: Use other specifications to require submittals for the actual carrier pipe unless the pipe casing is going to act as the carrier pipe.
***************************************************************************

Pipe casing [and couplings]; G[, [____]]

Lubricating Fluid for pipe exterior; G[, [____]]

Submit manufacturer's standard drawings or catalog cuts, except submit both drawings and cuts for push-on [and rubber-gasketed bell-and-spigot] joints. Include information concerning gaskets with submittal for joints and couplings.

SD-05 Design Data

***************************************************************************
NOTE: Suggested Submittals:

1. Submit the following for review by the designer:

a. Manufacturer's literature describing in detail the microtunneling boring and jacking system to be used. Detailed descriptions of projects on which this system has been successfully used, giving total pipe length, soil conditions, accuracy achieved, project duration, and number of restarts.

b. Method of spoil removal (from the boring to final disposition).

c. Anticipated jacking loads.

d. Method(s) of controlling surface and groundwater throughout the work, including at access shafts and adjacent surface workspaces.

e. Shaft dimensions, locations, surfaced construction, profile, depth, method of excavation, shoring bracing, and thrust block design.

f. Verification that the pipe complies with the specification.
***************************************************************************

Design calculations for pipe casing; G[, [____]]

Access Shaft Construction Plan; G[, [____]]

SD-06 Test Reports

Monitoring Survey; G[, [____]]
**SD-08 Manufacturer's Instructions**

**Installation** procedures for pipe casing; **G[, [____]]**

**Safety Data Sheets; G[, [____]]**

**SD-11 Closeout Submittals**

**Record Drawings; G[, [____]]**

**Daily Work Logs of installation operations**, including records of the volume of materials removed, daily progress and grout volumes used, and as-built drawings of location and alignment of casing/pipeline; **G[, [____]]**

1.4 **PRE-CONSTRUCTION**

No later than 45 days prior to commencement of the work, submit the following to the Contracting Officer for review and approval:

- Microtunneling Plan
- Boring and Jacking Plan
- Access Shaft Construction Plan
- **Statement of Contractor Qualifications**

Submit a complete list of all drilling fluids, additives, and mixtures to be used along with Safety Data Sheets.

1.5 **QUALITY CONTROL**

1.5.1 **STATEMENT OF CONTRACTOR QUALIFICATIONS**

Contractors are required to have proven and successful experience in **microtunneling** boring and jacking. The experience is the successful completion of similar projects to the tolerances indicated for the size of pipe and quantities shown on the plans, in the anticipated soil conditions indicated in the geotechnical report included in the contract documents. Submit a description of at least three such projects which include, at a minimum, a listing of the location(s), date of projects, owner with contact information, pipe type, size installed, length of installation, type, and manufacturer of equipment used, and other information relevant to the successful completion of the project.

1.5.2 **RECORDS**

1.5.2.1 **DAILY WORK LOG**

Maintain a work log of construction events and observations. Include the following information for each days work:

a. Hours worked.

b. Location of boring machine face or shield by station and progress made in advancing pipe.

c. Completed field forms, such as steering control logs, for checking line

SECTION 33 05 23  Page 12
and grade of boring operation, showing achieved alignment relative to design alignment.

d. Maximum pipe jacking pressures per drive.

e. Ground water control operations and piezometric levels.

f. Descriptions of soil conditions encountered.

g. Any unusual conditions or events, including observed ground movement.

h. Reasons for operational shutdown in event drive is halted.

1.6 DELIVERY, STORAGE, AND HANDLING

Inspect materials delivered to site for damage. Unload and store with minimum handling. Store materials on site in enclosures or under protective covering. Store [jointing materials and] rubber gaskets under cover out of direct sunlight. Do not store materials directly on the ground. Keep inside of pipes free of dirt and debris.

1.6.1 Handling

Handle pipe in a manner to ensure delivery to the excavation site in sound undamaged condition. Avoid damage to coatings and linings on pipe; make repairs if coatings or linings are damaged. Carry, do not drag pipe to the excavation site. [Store jointing materials and] [rubber gaskets that are not to be installed immediately, under cover out of direct sunlight.] [Handle steel pipe with [coal-tar enamel] [coal-tar epoxy] coating in accordance with the provisions for handling coal-tar enamel coated pipe in AWWA C203. Handling coal-tar epoxy coated steel is not permitted below 4.4 degrees C 40 degrees F.]

1.7 SAFETY

1.7.1 General

Provide procedures for safe conduct of the work in accordance with EM 385-1-1. When and where installations temporarily disrupt pedestrian use of sidewalk areas for periods exceeding two consecutive work days, provide an alternate route that meets current ABA Accessibility Standard for Department of Defense Facilities.

1.7.2 Equipment

Utilize equipment that employs a common grounding system to prevent electrical shock in the event of underground electrical cable strike. Ensure the grounding system connects all pieces of interconnecting machinery; the drill, mud mixing system, drill power unit, drill rod trailer, operators booth, worker grounding mats, and any other interconnected equipment to a common ground. Utilize equipment having an "electrical strike" audible and visual warning system that notifies the system operators of an electrical strike.

1.7.3 Sheeting, Shoring and Dewatering

Provide sheeting, shoring and dewatering as specified in Section 31 23 00.00 20, EXCAVATION AND FILL, and as specified herein.
1.7.4 Tunnel Bore

Unprotected mining of the tunnel bore is not permitted. Fully support the tunnel face and bore at all times.

1.8 QUALITY ASSURANCE

1.8.1 Microtunneling Plan

Provide a plan prepared, signed and sealed by a licensed Professional Engineer and include the following:

1.8.1.1 Operational Layout

1.8.1.1.1 Layout Plan

Provide a plan location of the operation, discussing relationship of equipment, the method of construction and details for the following:

a. Access pits configurations and details, including equipment layout.

b. Location of intermediate jacking stations, if required.

c. Casing pipe with connection details.

1.8.1.2 Pedestrian Access Around Site

When and where installations disrupt pedestrian use of sidewalk areas for periods exceeding two consecutive days, provide an alternate route that meets current ADA requirements.

1.8.1.2 Method and Procedures

Provide an outline of the methods and procedures, including drawings, schedule of operations, specifications, and manufacturer's catalog data for products in lieu of specifications, methods of operation for microtunneling boring and jacking operations, and specifically the following:

a. Jacking Equipment and Methods: Provide drawings of the jacking frame, jacking head, reaction blocks, jacking installation, pipe guides, procedures for lubricating exterior of pipe during jacking (if applicable), maximum force that jacking equipment can deliver.

b. Boring Equipment and Methods: Provide a discussion of the methods of operation, design and specifications for boring operation, steerage control, line and grade control methods, proposed procedures for removing or clearing obstructions, and a description of proposed methods for ground stabilization and minimizing overexcavation and loss of ground. Submit safety data sheets for fluids, grout, or chemical products.

c. Casing Annulus and Interior Space Grouting: Identify casing insulators/spacers/centralizers/tiedowns (type, number, spacing and installation instructions,) grout materials and method of placement, description of equipment used and grout pressure employed.

d. Survey Alignment Control: Identify method and equipment to install pipe within specified tolerances.
e. Ground Stabilization: Discuss dewatering and grouting, identification of measures and methods used to stabilize face at heading (if necessary), narrative of equipment, procedure and grout mix, and identification of subcontractor who will perform any required stabilization grouting.

f. Excavation Support System Plan: Provide a plan and discussion of methods to be employed, including design drawings and calculations, sealed and signed by a licensed Professional Engineer.

g. Monitoring/Survey Plan: Develop and provide a discussion of the monitoring/survey plan to be employed to protect structures and utilities from settlement and/or heave, including the following. Incorporate into the plan any supplemental requirements specified in Part 3, paragraph entitled "Field Quality Control".

(1) Structures Assessment: Provide a discussion of structures and utilities to be protected, and measures to be employed for preconstruction and postconstruction assessment of critical structures, namely those located within the [zone of active excavation][a distance equal to [5] [_____] times the depth of the boring from the ground surface] from proposed pipe centerline. Include photographs or video of existing damage to structures in the vicinity of sewer alignment in assessment reports.

(2) Instrumentation Monitoring Plan: Describe of instrumentation design, layout of instrumentation points, equipment installation details, manufacturer's catalog literature, and monitoring report forms.

(3) Surface Settlement Monitoring Plan: Identify on a plan the location of settlement monitoring points, reference benchmarks, survey frequency and procedures, and reporting formats.

h. Contingency Plan: Provide a plan and discuss protection of pavements, adjacent structures, and utilities affected by adverse movements detected by instrumentation. As a minimum, include the following:

(1) Names, telephone numbers, and locations of persons responsible for implementation of contingency plans.

(2) Materials and equipment required to implement contingency plans. Identify the location of all required materials and equipment.

(3) Step-by-step procedure for performing work involved in implementation of the contingency plans.

(4) Clear identification of the objectives of the contingency plans and methods to measure plan success.

]PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The work includes providing labor, materials, and specialized equipment for the installation of utility pipelines utilizing the boring and jacking microtunneling methods of installation.
2.1.1 Design Requirements

**************************************************************************
NOTE: Use ASCE 36-15, ASCE 27-00, ASCE 28-00 as applicable.
**************************************************************************

2.1.1.1 Excavations

Design excavations, including access shaft walls, considering loadings from reaction blocks, traffic loads and any surcharge loads.

2.1.1.1.1 Highway Crossing Criteria

For loadings under highways use HS20 vehicle loading distribution in accordance with AASHTO.

2.1.1.1.2 Railway Crossing Criteria

For pipe crossings under railways use Cooper E-80 locomotive loading distributions in accordance with AREMA Eng Man specifications for culverts. Account for loading due to any multiple tracks.

2.1.1.2 Design Calculations of Pipe Casing

Submit design calculations for pipe casing demonstrating that the equipment used in installing the pipe will not distort or otherwise damage the pipe. Provide calculations of maximum allowable jacking force to be used based on pipe materials to be used. The calculations are to be sealed by a licensed Professional Engineer using soil properties derived from subsurface investigations performed along the utility route.

2.2 EQUIPMENT

2.2.1 Microtunneling System

2.2.1.1 General Requirements

Utilize a continuously monitored laser guided Microtunneling Boring Machine (MTBM) system matched to the expected subsurface conditions, a hydraulic jacking system to jack the pipeline, a process to remove the slurry from the slurry water, a guidance system to provide installation accuracy to within the indicated tolerances, excavation equipment, material handling equipment, a dewatering system, and sheeting/shoring required to provide the work indicated and meet the following minimum performance requirements:

a. Capable of providing positive face support both during excavation and during shutdown regardless of the MTBM type.

b. Capable of handling and removing materials of high water content from the machine head.

c. All functions are controlled remotely from a surface control unit.

d. Capable of controlling rotation utilizing a bidirectional drive on the cutter head or by using anti-roll fins or grippers.

e. Capable of injecting lubricant around the exterior of the pipe being jacked.
2.2.1.2 Control System

The main control system of the MTBM is to provide the following information to the operator, as the minimum, required for successful operation of the MTBM:

a. Deviation of the MTBM from the required line and grade of the pipeline (normally by reference to a laser beam).

b. Grade and roll of the MTBM.

c. Jacking load.

d. Torque and RPM of the cutter head.

e. Instantaneous jacking rate and total distance jacked.

f. Indication of steering direction.

g. Progress of pipe advancement via CCTV at the pipe head.

2.2.2 Boring and Jacking System

Utilize a continuously monitored boring and jacking system matched to the expected subsurface conditions, a hydraulic jacking system to jack the pipeline, an auger to remove boring spoils, a guidance system to provide installation accuracy within the indicated tolerances, excavation equipment, material handling equipment, a dewatering system, and sheeting/shoring required to provide the work indicated.

2.2.3 Pipe Jacking Equipment

Provide main jacking equipment with a capacity greater than the anticipated jacking load. Provide intermediate jacking stations when the total anticipated jacking force needed to complete the installation may exceed the capacity of the main jacks or the designed maximum jacking force for the pipe. The jacking system is to supply a uniform distribution of jacking forces on the end of the pipe by use of thruster rings and cushioning material.

2.3 MATERIALS

2.3.1 Pipe Casing

Provide straight wall pipe casing [of type and diameter indicated] of [reinforced concrete pipe (RCP)] [steel pipe].
[2.3.1.1] Reinforced Concrete Pipe

****************************************************************************************
NOTE: This section covers tongue and groove, straight wall reinforced concrete pipe intended for use as conveyance systems of sewage and storm water, and for the construction of culverts and industrial casings installed and constructed by microtunneling boring and jacking methods.
****************************************************************************************

2.3.1.1.1 Pipe

Pipe, [[_____] mm inch inside diameter,] class [____:], nominal length [_____] and concrete strength [_____] MPa psi in accordance with ASTM C76M ASTM C76.

2.3.1.1.2 Joints and Jointing Material

Form joints of concrete and as detailed in the Contract drawings. Utilize a rubber gasket or mastic to provide the seal. [Incorporate an assembly of [steel bands] [or] [steel bell ends] and spigot rings and rubber gaskets in accordance with Contract drawings.]

2.3.1.1.3 Internal Diameter

The internal diameter of [ 300 to 600 mm 12 to 24 inch pipe cannot vary by more than plus 6 mm 1/4 inch from the design diameter.] [ 600 mm 24 inch and larger pipe cannot vary from the design diameter by more than plus one percent or plus 10 mm 3/8 inch, whichever is less.]

2.3.1.1.4 Wall Thickness

At any location along the length of the pipe, or at any point around its circumference, the wall thickness cannot vary by more than plus five percent of the design diameter.

2.3.1.1.5 End Squareness

Ensure that each pipe end lies within two planes perpendicular to the longitudinal center line of the pipe, spaced at 10 mm 3/8 inches apart. Square the tongue or spigot end to within 5 mm 3/16 inches and the groove or bell end of the pipe to within 5 mm 3/16 inches.

2.3.1.1.6 Roundness

Ensure that the outside diameter of the pipe does not vary from a true circle by more than one percent. Permissible out-of-round dimensions are one half the difference between the maximum and minimum outer diameter of the pipe at any one location along the barrel.

2.3.1.1.7 Length of Pipe

Do not deviate from the finished pipe design length by more than plus 3 mm per 300 mm 1/8 inch per foot with a maximum variation of plus 13 mm 1/2 inch in any length of pipe.
2.3.1.1.8 Length of Two Opposite Sides

Variations in laying length of two opposite sides of the pipe cannot exceed
[6 mm\(1/4\) inch for all sizes through 600 mm 24 inches internal diameter] [3 mm per 300 mm\(1/8\) inch per foot for all sizes larger than 600 mm 24 inches internal diameter], with a maximum of 10 mm 3/8 inches in any length of pipe.

[2.3.1.2 Steel Pipe]

**************************************************************************
NOTE: This section covers steel pipe used as a casing pipe for other carrier pipes. This section also covers steel as the carrier pipe for stormwater, sanitary sewer or other utility lines.
**************************************************************************

2.3.1.2.1 Pipe

Provide steel pipe in conformance with [ASTM A139/A139M, Grade B with a minimum yield strength of 242 MPa 35,000 psi] [AWWA C200] [API Spec 5L Grade B] [ASTM A53/A53M] [ASTM A716] [ASTM A746]. [Weld steel pipe seamless, square cut with even lengths that complies with Articles 4.2, 4.3, and 4.4 of the API Spec 5L]. Pipe shall have an inside diameter of [_____] mm[_____] inches and a minimum wall thickness of [_____] mm[_____] inches [as indicated].

**************************************************************************
NOTE: Choose the first paragraph for microtunneling and the second for boring and jacking. Modify as needed.
**************************************************************************

2.3.1.2.2 Joints

Accomplish the connection of adjacent pieces of microtunneling steel pipe by [field buttwelding,] [internal weld sleeves,] [integral press fit connectors,] by a certified welder, in compliance with AWS D1.1/D1.1M as long as loading and installation design criteria are met.

Utilize casing pipe having beveled ends with a single V-groove for field welding. Butt weld joints using a full-penetration weld on the outside circumference of the pipe prior to jacking. The welds are to conform to the latest AWS Welding Code by a certified welder. Unless otherwise specified, inspect and test welds using a non-destructive testing method consisting of magnetic particle examination (MT), in compliance with the AWS code. Visually inspect in compliance with AWS D1.1/D1.1M visual inspection criteria by a certified welder and by the QC manager on casing pipe that is sacrificial (fully grouted internally). Non-destructive testing is not required on welds on casing pipe that is sacrificial.

Grouting Plugs: On large pipe, (600-mm24-inch diameter or greater), provide pipe with 51-mm 2-inch diameter tapped holes with threaded plugs for exterior grouting.

2.3.1.2.3 Roundness

The maximum difference between the major and minor outside diameters cannot
exceed one percent of the specified nominal outside diameter or 6 mm 0.25 inch, whichever is less. [For pipe exceeding 1200 mm 48 inches in diameter, a maximum deviation of 13 mm 1/2 inch is permitted provided the circumference tolerance is maintained within 6 mm 1/4 inch.]

2.3.1.2.4 Circumference

Ensure that the outside circumference is within plus one percent of the nominal circumference or within plus 13 mm 0.50 inches, whichever is less.

2.3.1.2.5 Straightness

The maximum allowable straightness deviation in any 3 m 10 foot length cannot exceed 3 mm 1/8 inch. [For lengths over 3 m 10 feet, the maximum allowable deviation of the entire pipe length is computed by the following formula, but not to exceed 10 mm 3/8 inch in any length exceeding 9.1 m 30 foot length: Maximum Allowable Deviation in mm equals (1/8) times (total length in meters) divided by 0.125 Maximum Allowable Deviation in inches equals (1/8) times (total length in feet) divided by 10.]

2.3.1.2.6 Pipe Ends

Ensure that the end of the pipe is perpendicular to the longitudinal axis of the pipe and within 5 mm per meter 1/16 inch per foot of diameter, with a maximum allowable deviation of 6 mm 1/4 inch measured with a square and straightedge across the end of the pipe.

2.3.2 Grout

Provide cement grout for pressure grouting to fill the voids around the casing and for filling the interior annular space between carrier pipe and the casing composed of Portland cement conforming to ASTM C150/C150M, Type II, and sand meeting requirements of ASTM C33/C33M for fine aggregate, sufficiently fluid to inject through the casing and fill voids, with prompt setting to control grout flow. Utilize a grout with a minimum compressive strength of 0.70 MPa 100 psi attained within 24 hours. Admixtures are to be free of chlorides, corrosive or other material detrimental to the materials the grout contacts.

2.3.3 CONCRETE

Provide 25 MPa 3000 psi concrete in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.3.4 Lubricating Fluid (Bentonite or Polymer)

Provide material for lubricating the exterior of pipe. Provide bentonite machine requirements of API Spec 13A and having the capacity of mixing with water to form a stable and homogeneous suspension.

2.3.5 SOIL MATERIALS

Provide soil materials in accordance with the requirements specified in Section [31 00 00 EARTHWORK][31 23 00.00 20 EXCAVATION AND FILL].
2.4 Incidental Materials

2.4.1 Casing Insulators/Bore Spacers

Provide carbon steel with polyvinyl chloride coating or stainless steel casing insulators/bore spacers 200 mm 8 inches in length for pipe 300 mm 12 inches and less in diameter, and 300 mm 12 inches in length for pipe 350 mm 14 inches and greater in diameter, having a 51 mm 2 inch minimum runner width. Orient spacers to allow for grout to flow easily to completely fill the casing pipe with grout throughout its length.

**************************************************************************
NOTE: If casing pipe transitions to carrier pipe/utility duct without a structure, provide an end closure/bulkhead detail for the casing pipe transition and modify the following as to suit the detail.
**************************************************************************

2.4.2 End Closures/Bulkheads

Provide Temporary End Closures to contain grout used for filling the annular space between conduits and the casing. Provide Permanent End Closures of [_____] meters [_____] feet length as indicated consisting of brick and mortar (one part cement/two parts sand/water) to completely encapsulate the conduits transition into the casing. Center the closure on the casing pipe end.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Access Shaft and Pit Construction Plan

No later than 45 days prior to start of construction submit an Access Shaft Construction Plan. Include in the plan a discussion of the method of construction of access shafts used for microtunneling boring and jacking. Address the excavation methods, dewatering system, sheeting/shoring and bracing systems proposed for use, and any ground stabilization to be employed for the shaft work area or thrust block. Acceptable construction methods include the use of interlocked steel sheetpiling or precast circular concrete segments lowered in place during excavation.

3.1.1.1 Design Requirements

a. Construct shafts of a size commensurate with safe working practices [at locations indicated]. [Coordinate shaft locations with the Contracting Officer.] The Contractor may propose to relocate shafts to better suit the capabilities of the equipment/methods proposed, but may not alter either the indicated pipeline alignment or structures associated with the installed pipeline, nor result in additional claims for compensation.

b. To the extent possible, keep shaft locations clear of pavements [and within a single traffic lane,] in order to minimize disruption to the flow of traffic. Locate support equipment, spoil piles, and materials to minimize disruption to traffic.

c. Support all excavations and prevent movement of the soil, pavement,
utilities or structures outside of the excavation. Furnish, place, and maintain sheeting, bracing, and lining required to support the sides of all shafts and to provide adequate protection of the work, personnel, and the general public. Provide a concrete floor in the jacking access shaft. Design loads on the sides of the jacking and receiving pit walls are dependent on the construction method and flexibility of the wall systems.

d. Consider the loading from boring or pipe jacking when preparing the design of the jacking and receiving pit supports as well as special provisions and reinforcement around the breakout location. Design the base of the pits to withstand uplift forces from the full design head of water, unless approved dewatering or other ground modification methods are employed.

e. Construct a thrust block to transfer jacking loads into the soil. Ensure that the backstop and the proposed pipe alignment are square to each other and are designed to withstand the maximum jacking pressure to be used with a factor of safety of at least 2.5. Also, design the thrust block to minimize excessive deflections in such a manner as to avoid disturbance of adjacent structures or utilities or excessive ground movement. Begin jacking operations only after concrete thrust block or treated soil has attained the required strength.

f. If tremie concrete sealing slabs are placed within the earth support system to prevent groundwater inflow when access shafts are dewatered, furnish and install sealing slabs of sufficient thickness to provide a minimum factor of safety of 1.2 against hydrostatic uplift in order to prevent bottom blowout when the excavation is completely dewatered.

3.2 CONSTRUCTION

3.2.1 Access Shafts

3.2.1.1 Construction Requirements

a. Provide ground stabilization in the work area and the thrust block as required to accomplish the work.

b. Construct a jacking access shaft to accommodate the installation of pipe casings, equipment and piping jacking device. Install thrust blocks(s) as required and consolidate the ground (grout) where the casings exit the shaft. Provide a dry jacking work area having a stable concrete floor that drains to a recessed sump pump to handle nuisance inflow. Groundwater inflows into the jacking shaft are not to exceed 0.32 Liter/second 5 gallons/minute; soil inflows are not to exceed a total volume of 57 Liters 2 cubic feet.

c. Construct a receiver shaft to accommodate the installation of pipe casings and the equipment used in the work. Consolidate the ground (grout) where the casings enter the shaft.

d. Furnish, install, and maintain equipment to keep the jacking shaft free of excess water. Provide surface protection during the period of construction to ensure that surface runoff does not enter shafts. Adhere to the dewatering plan and do not affect surrounding soils or structures beyond the tolerances stated in paragraph entitled "Tolerances."
e. Provide security fence around all access shaft areas and provide shaft cover(s) when the shaft area is not in use.

f. Pit Backfill and Compaction: Upon completion of the pipe jacking and all tests or inspections are complete remove all equipment, debris, and unacceptable materials from the pits and commence backfilling operation. Complete backfilling, compaction, and pavement repairs in accordance with [Section 31 00 00 EARTHWORK][31 23 00.00 20 EXCAVATION AND FILL].

3.3 INSTALLATION

3.3.1 Installation of Tracer Wire

Install a continuous length of tracer wire for the full length of each run of nonmetallic pipe in accordance with the American Public Works Association Uniform Color Code. Attach wire to top of pipe in such a manner that will not be displaced during construction operations.

3.3.2 Connections to Existing Lines

Schedule connections to existing lines with the Contracting Officer to cause a minimum interruption of service on the existing line. [Make connections to existing lines under pressure [in accordance with the recommended procedures of the manufacturer of the pipe being tapped] [as indicated].]

3.3.3 Advancing the Pipe

Jack each pipe casing section forward as the excavation progresses in such a way to provide complete and adequate, ground support at all times. Utilize a bentonite slurry applied to the external surface of the pipe to reduce skin friction. Provide a jacking frame for developing a uniform distribution of jacking forces around the periphery of the pipe. Place a plywood spacer on the outer shoulder of the pipe casing joint. Design and construct the thrust reaction backstop to withstand the jacking forces. Continuously maintain a square alignment between the backstop and pipe casing and support the maximum obtainable jacking pressure with a safety factor at least 2.0. Continuously monitor the jacking pressure and rate of cutter head advancement. Exercise special care when setting the pipe guard rails in the jacking pit to ensure correctness of the alignment, grade and stability.

3.3.3.1 Installation Requirements

a. Utilize boring equipment capable of fully supporting the face of the tunnel.

b. Maintain face pressure exerted at the heading by the MTBM as required to prevent loss of ground, groundwater inflows, and settlement or heave of the ground surface by balancing soils and groundwater pressures present.

c. Dewatering for groundwater control is allowed at the jacking and receiving pits only.

d. Do not jack pipe casing until the concrete thrust block and tremie seal (if selected), and grouted soil zone in jacking and receiving shafts have attained the required strength.
e. Jack the pipe into place without causing damage to the coatings, joints or completed pipe section.

f. After completion of the jacking operation between jacking and receiving shafts, displace the lubricate material from between the pipe casing exterior and the surrounding ground with a cement grout. Control pressure and the amount of grout to avoid pipe damage and displacement of the pipe and soil beyond the tolerances specified in paragraph "Tolerances." Grout within 48 hours after pipe installation has been completed to prevent any surface settlement due to movement of soil material into the void space or loosened zone around the pipe casing.

g. Replace pipe casings damaged during installation.

h. Ensure that the welds of steel pipe attain the full strength of the pipe and are watertight before jacking of the pipe section. Ensure that the inner face of the internal weld seam is flush with the pipe to facilitate the installation of the carrier pipe in the pipe casing.

i. Perform all welding in accordance with requirements for shielded metal arc welding of AWS D1.5M/D1.5 for bridges and AWS D1.1/D1.1M for buildings and other structures.

j. Provide a pipeline that has a consistent diameter across assembled joints.

k. Once the tunneling process has begun, continue with that process uninterrupted until the pipe reaches the receiving shaft. Continue to push any damaged pipe until that damaged pipe section is pushed into the receiving shaft and is removed. Notify the [Contracting Officer][Engineer] immediately if any pipe is known to be or believed to be damaged.

### 3.3.4 [Carrier Pipe] [Conduit] Installation

#### 3.3.4.1 Cleaning

Clean the inside of the casing of all foreign matter by using a pipe cleaning plug.

#### 3.3.4.2 [Carrier Pipe] [Conduit Joints]

[Bond all metallic conduit joints within the casing pipe.] Inspect with the Contracting Officer, prior to backfilling trenches, the transition of [carrier pipe] [conduit] within the casing to non-cased trenching.

#### 3.3.4.3 Casing Insulators/Spacers

Install casing insulators/spacers in accordance with approved submittals and the drawings. On center spacing is not to exceed 1.2 meters 4 feet.

#### 3.3.4.4 End Closures/Bulkheads and Grouting of Casing Pipe

a. Closures: Seal ends of casing with [brick and mortar][______].

b. After installing, inspecting and acceptance of the [carrier pipe][conduit] and spacers within the casing pipe, pressure fill the annular space between the [carrier pipe][conduit] and the casing pipe,
UFGS

with cement grout specified herein. Regulate pump pressures to refusal or in accordance with the approved grouting plan. Place grout in a sequence and manner that will preclude voids or pockets of entrapped air or water. Use a refusal pressure equal to 8.0 kg/sm per meter 0.5 psf per foot of overburden.

3.3.5 Ventilation

Provide adequate ventilation for all tunnels and shafts, following confined space entry procedures. Include such factors as the volume required to furnish fresh air in the shafts, and the volume to remove dust that may be caused by the cutting of the face and other operations which may impact the laser guidance system. In the design of the ventilation system, the minimum amount of fresh air to be supplied is [_____] cubic m/s CFM. [Routinely test the air in areas accessed by workers in accordance with the most current OSHA methods and standards. The current OSHA allowable gas concentrations or those presented below, whichever are more stringent, shall be met:

<table>
<thead>
<tr>
<th>Gas</th>
<th>Concentration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon Monoxide</td>
<td>≤0.005 percent</td>

3.3.6 Lighting

Provide adequate lighting for the nature of the activity being conducted by workers. Separate and insulate with ground fault interrupters power and lighting circuits. Comply with requirements with regards to shatter resistance and illumination requirements.

3.3.7 Spoil Transportation

Match the excavation rate with rate of spoil removal. Utilize a system capable of balancing groundwater pressures and adjustment to maintain face stability for the particular soil conditions of the project.

3.4 TOLERANCES

**************************************************************************
NOTE TO DESIGNER - The tolerances for a typical MTBM project are 125 mm 5 inches on line and 38 mm 1 1/2 inches on grade in a 91.4 m 300 foot installation. In order to meet local sewerage regulations regarding slope, it is recommended to design at the desired slope plus tolerances. Also, consider adding between 30 - 75 mm 0.1 - 0.25 foot drop across manholes.
**************************************************************************

3.4.1 Tolerances

Maximum allowable lateral deviation is [125][_____] mm [5][_____] inches; maximum allowable vertical deviation is [_____] mm [_____] inches in the
3.5 FIELD QUALITY CONTROL

Employ the monitoring/survey plan. Maintain daily records in accordance with the paragraph titled RECORDS.

3.5.1 Instrumentation/Survey

**********************************************************************************************

NOTE: The Engineer should specify minimum monitoring requirements using the following, supplemental as required by the project specific conditions.

**********************************************************************************************

3.5.1.1 Mandatory Requirements

[ Include the following, as a minimum, to supplement Contractor Quality Control measures employed to monitor ground surface heave or settlement in the monitoring/survey plan. ]

a. Monitor ground movements associated with the project using established survey points and make changes in the construction methods that control ground movements and prevent damage or detrimental movement to the work and adjacent structures and pavements.

b. Record in the daily work log a summary of monitoring survey results. Clearly identify work not meeting specified requirements, out-of-tolerance results, and impacts on new or existing work from settlement or heave.

c. Install instrumentation and perform monitoring to determine ground settlement surrounding each jacking and receiving pit.

d. Prior to any excavation activities, perform a pre-construction survey of the areas in and surrounding excavations and along the proposed utility alignment to identify any structures, facilities, underground or above ground utilities to be protected within a radius of [five] [_____] times either the depth of any excavation or the depth of trenchless excavation.

3.5.1.2 Supplemental Requirements

[ a. Prior to the start of advancing the pipe or any dewatering operation, install surface settlement markers along the trenchless excavation centerline using the following guidelines:

(1) Locate surface settlement markers in a grid, spaced 3.0 [_____] m by 3.0 [_____] m 10 [_____] feet by 10 [_____] feet extending not less than 9.1 [_____] m 30 [_____] feet on either side of the trenchless excavation centerline. Use wooden hubs in unpaved areas with the hubs driven flush with the surface and a tack driven in the top for level rod placement. Use temporary paint or other approved materials in pavement areas. Minimize the size of temporary markings to the greatest extent practical. Remove all markers and markings prior to completion of work.

]
b. Prior to the start of advancing the pipe or dewatering operations, survey all monitoring points a minimum of three times to establish baseline readings. Perform all surveys to an accuracy of 3.0 mm.

d. If the survey readings indicate settlement or heave is greater than Limit Level 1 in the above table, provide notification to the Contracting Officer immediately and increase the monitoring frequency of the instruments as directed. Proceed with advancing the pipe after providing mitigating measures to limit additional movements.

e. If the survey readings indicate settlement or heave is greater than Limit Level 2 in the above table, cease work and provide notification to the Contracting Officer immediately and implement the Contingency Plan.

f. Perform all repairs and/or rebuilding of the pavement or adjacent structures to their condition existing prior to settlement/lifting.

g. Continue to monitor by the survey at two week intervals for a period of six (6) weeks after tunneling. If settlement/lifting occurs, make repair as directed, if there is no further settlement/lifting.

3.5.2 Field Tests

Perform field tests, and provide labor, equipment, and incidentals required for testing, except that water and electric power needed for field tests, shall be furnished by the Contractor. Submit test results, identifying any results that do not meet specified requirement. Provide corrective action and retest pipe as needed.

**NOTE:** Indicate appropriate Section number and title in blank below.

**SECTION 33 05 23 Page 27**
subject to approval by the Contracting Officer.

3.5.2.1 Pipe Casing

Inspect and verify that pipe material meets the dimensional tolerances specified prior to use. Record each day's inspection results in the daily work log.

3.5.2.1.1 Testing Requirements for Gravity Mains

Perform low pressure air test of all gravity mains (structure to structure) in accordance with ASTM C1091 Standard Test Method for Hydrostatic Infiltration testing of Vitrified Clay Pipe Lines.

3.5.2.1.2 Non-Standard Pipe Lengths

Cut non-standard joint lengths from full length pipe having satisfactorily passed the hydrostatic test.

3.5.2.1.3 Elevations

Prior to removal of MTBM equipment, sheeting, and backfilling of access shafts, collect invert information on pipeline installed. Confirm that the elevations meet stated tolerances.

3.5.3 Inspections

Prior to the removal of MTBM equipment, sheeting, and backfilling of access shafts, conduct CCTV inspection of the mains installed in accordance with Section 33 01 30.16 TV INSPECTION OF SEWER PIPELINES.

3.6 CLEANUP AND FINAL CLOSEOUT

3.6.1 Site Cleanup

Immediately clean "blow holes" or "breakouts" of drilling fluid to the surface and fill depressions with satisfactory fill material. Dispose of all drilling fluids, soils, and separated materials in compliance with Federal, State, and local environmental regulations.

3.6.2 Drilling Fluid

Immediately upon completion of work of this section, remove all rubbish and debris from the job site. Remove all construction equipment and materials leaving the entire area involved in a neat condition equal to existing conditions prior to construction, unless indicated otherwise.

3.6.3 Record Drawings and Daily Work Logs

Submit an electronic copy and three hard copies of the record drawings to the Contracting Officer within five days after completing the work. Include in the record drawings a plan, profile, and all information recorded during the progress of the work. Clearly tie the record drawings to the project's survey control. Maintain and submit upon completion final Daily Work Logs of installation operations, signed by the superintendent.

3.7 DISPOSITION OF MATERIAL

[Dispose of waste in Government disposal area] [as indicated on the
drawings] [which is located within a haul distance of [_____] kilometers miles]. Remove [from Government property] surplus or other soil material not required or suitable for fill or backfilling.

Store or legally dispose of excavated material and fluids used in the boring process and shaft construction [away from the construction site and] in compliance with all permits and applicable Federal, State, and local regulations. [Comply with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.] [Only store or stockpile materials in areas shown on Contract drawings.] [Stockpiling is permitted on the construction site provided material is removed at regular intervals not exceeding 48 hours.]

NOTE: This guide specification covers the requirements for directional drilling systems, equipment, piping (PVC and HDPE), and procedures.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
