a. A simple split (DX) system consisting of a single indoor unit and a single outdoor unit from the same manufacturer.

b. Systems in Table I (previously approved by the designer in accordance with UFC 3-410-02).

c. A system (not already shown Table I) of multiple boilers or multiple chillers communicating with a proprietary network for which an approved request has been obtained and for which: all units are from the same manufacturer, they are all co-located in the same room, the network connecting them is fully contained in that room, and the units are operating using a common "plant" sequence of operation which stages the units in a manner that requires operational parameters be shared between them and which cannot be accomplished with a single lead-lag command from a third-party controller.

1.1.2.2 Implementation of Proprietary Systems

For proprietary systems exempted from open protocol requirements, a proprietary network and DDC hardware communicating via proprietary protocol are permitted. For these systems a building control network meeting the requirements of Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS must also be provided, along with a gateway or interface to connect the proprietary system to the open building control network.

The proprietary system gateway or interface must provide the required functionality as shown on the points schedule. Scheduling, alarming, trending, overrides, network inputs, network outputs and other protocol...
1.1.2.3 Proprietary Multi-Split Engineering Tool Software

**************************************************************************
NOTE: Indicate in Table I for each permitted system whether the engineering tool software is required. Coordinate with the project site to determine if this software is needed.
**************************************************************************

For each permitted proprietary systems in Table 1 shown as requiring Proprietary Multi-Split Engineering Tool Software, provide the software needed to replace a unit and configure the replacement. Submit hard copies of the software user manuals with the software submittal.

Submit Proprietary Multi-Split Engineering Tool Software on CD-ROM as a Technical Data Package. Submit [_____] hard copies of the software user manual for each piece of software.

1.1.3 System Requirements

Provide systems meeting the requirements this Section and other Sections referenced by this Section, and which have the following characteristics:

**************************************************************************
NOTE: Select where sequences of operation are specified. UFGS 23 09 93 SEQUENCES OF OPERATION FOR HVAC CONTROL contains template sequences of operation.
**************************************************************************

a. The system implements the control sequences of operation [shown in the Contract Drawings][____] using DDC hardware to control mechanical and electrical equipment

b. The system meet the requirements of this specification as a stand-alone system and does not require connection to any other system.

**************************************************************************
NOTE: The requirement ", unless otherwise pre-approved by the Contracting Officer" in the following paragraph is required only for Air Force projects and is in AIR FORCE tailoring tags. (Deselect the AIR FORCE tailoring option if not specifying an Air Force owned system.)
**************************************************************************

c. Control sequences reside in DDC hardware in the building. The building control network is not dependent upon connection to a Utility Monitoring and Control System (UMCS) Front End or to any other system for performance of control sequences. To the greatest extent practical, the hardware performs control sequences without reliance on the building network, unless otherwise pre-approved by the Contracting Officer.
d. The hardware is installed such that individual control equipment can be replaced by similar control equipment from other equipment manufacturers with no loss of system functionality.

e. All necessary documentation, configuration information, programming tools, programs, drivers, and other software are licensed to and otherwise remain with the Government such that the Government or their agents are able to perform repair, replacement, upgrades, and expansions of the system without subsequent or future dependence on the Contractor, Vendor or Manufacturer.

f. Sufficient documentation and data, including rights to documentation and data, are provided such that the Government or their agents can execute work to perform repair, replacement, upgrades, and expansions of the system without subsequent or future dependence on the Contractor, Vendor or Manufacturer.

g. Hardware is installed and configured such that the Government or their agents are able to perform repair, replacement, and upgrades of individual hardware without further interaction with the Contractor, Vendor or Manufacturer.

**************************************************************************
NOTE: The following list paragraph is included only when the NIAGARA BACNET or NIAGARA LONWORKS tailoring options are selected.
**************************************************************************

h. All Niagara Framework components have an unrestricted interoperability license with a Niagara Compatibility Statement (NiCS) following the Tridium Open NiCS Specification and have a value of "ALL" for "Station Compatibility In", "Station Compatibility Out", "Tool Compatibility In" and "Tool Compatibility Out". Note that this will result in the following entries in the license file:
   accept.station.in="*"
   accept.station.out="*"
   accept.wb.in="*"
   accept.wb.out="*"

1.1.4 End to End Accuracy

**************************************************************************
NOTE: This paragraph is referenced (by subpart title) elsewhere in the specification. If this paragraph is edited, removed, renamed, etc. make sure to verify that all references to it are updated as needed.
**************************************************************************

Select products, install and configure the system such that the maximum error of a measured value as read from the DDC Hardware over the network is less than the maximum allowable error specified for the sensor or instrumentation.

1.1.5 Verification of Dimensions

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing any work.
1.1.6 Drawings

The Government will not indicate all offsets, fittings, and accessories that may be required on the drawings. Carefully investigate the mechanical, electrical, and finish conditions that could affect the work to be performed, arrange such work accordingly, and provide all work necessary to meet such conditions.

1.2 RELATED SECTIONS

**************************************************************************
NOTE: Select whether Section 01 91 00.15 or , BUILDING COMMISSIONING, is used for commissioning or provide appropriate reference to the Commissioning specification.
**************************************************************************

**************************************************************************
NOTE: This subpart used tailoring options:
1) Text referring to UFGS 23 09 23.01 is included only when the LNS or NIAGARA LONWORKS tailoring option is selected.

2) Text referring to UFGS 23 09 23.02 is included only when the BACNET or NIAGARA BACNET tailoring option is selected.

1.4 DEFINITIONS

The following list of definitions includes terms used in Sections referenced by this Section and are included here for completeness. The definitions contained in this Section may disagree with how terms are defined or used in other documents, including documents referenced by this Section. The definitions included here are the authoritative definitions for this Section and all Sections referenced by this Section.

After each term the protocol related to that term is included in parenthesis.

NOTE: The following subparts use tailoring options to include or exclude terms based on the which tailoring options are selected. Each individual term does not have a designer note associated with it as this makes the list of definitions very difficult to read. The parenthesis after the subpart title will also indicate when the term is in tailoring option tags:

1) Subparts including "(LonWorks)" in the title are included when the LNS or NIAGARA LONWORKS tailoring options are selected.

2) Subparts including "(BACnet)" in the title are
included when the BACNET or NIAGARA BACNET tailoring options are selected.

3) Subparts including "(Niagara Framework)" in the title are included when the NIAGARA BACNET or NIAGARA LONWORKS tailoring options are selected.

4) Subparts including "(All protocols)" are not in any tailoring options and are always included.

1.4.1 Alarm Generation (All protocols)

Alarm Generation is the monitoring of a value, comparison of the value to alarm conditions and the creation of an alarm when the conditions set for the alarm are met. Note that this does NOT include delivery of the alarm to the final destination (such as a user interface) — see paragraph ALARM ROUTING in Section 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION.

1.4.2 Application Generic Controller (AGC) (LonWorks)

A device that is furnished with a (limited) pre-established application that also has the capability of being programmed. Further, the ProgramID and XIF file of the device are fixed. The programming capability of an AGC may be less flexible than that of a General Purpose Programmable Controller (GPPC).

1.4.3 Application Specific Controller (ASC) (LonWorks)

A device that is furnished with a pre-established built in application that is configurable but not re-programmable. An ASC has a fixed factory-installed application program (i.e Program ID) with configurable settings.

1.4.4 Building Automation and Control Network (BACnet) (BACnet)

The term BACnet is used in two ways. First meaning the BACnet Protocol Standard - the communication requirements as defined by ASHRAE 135 including all annexes and addenda. The second to refer to the overall technology related to the ASHRAE 135 protocol.

1.4.5 BACnet Advanced Application Controller (B-AAC) (BACnet)

A hardware device BTL Listed as a B-AAC, which is required to support BACnet Interoperability Building Blocks (BIBBs) for scheduling and alarming, but is not required to support as many BIBBs as a B-BC.

1.4.6 BACnet Application Specific Controller (B-ASC) (BACnet)

A hardware device BTL Listed as a B-ASC, with fewer BIBB requirements than a B-AAC. It is intended for use in a specific application.

1.4.7 BACnet Building Controller (B-BC) (BACnet)

A hardware device BTL Listed as a B-BC. A general-purpose, field-programmable device capable of carrying out a variety of building automation and control tasks including control and monitoring via direct digital control (DDC) of specific systems and data storage for trend
information, time schedules, and alarm data. Like the other BTL Listed controller types (B-AAC, B-ASC etc.) a B-BC device is required to support the server ("B") side of the ReadProperty and WriteProperty services, but unlike the other controller types it is also required to support the client ("A") side of these services. Communication between controllers requires that one of them support the client side and the other support the server side, so a B-BC is often used when communication between controllers is needed.

1.4.8 BACnet Broadcast Management Device (BBMD) (BACnet)

A communications device, typically combined with a BACnet router. A BBMD forwards BACnet broadcast messages to BACnet/IP devices and other BBMDs connected to the same BACnet/IP network. Each IP subnet that is part of a BACnet/IP network must have at least one BBMD. Note there are additional restrictions when multiple BBMDs share an IP subnet.

1.4.9 BACnet/IP (BACnet)

An extension of BACnet, Annex J, defines the use of a reserved UDP socket to transmit BACnet messages over IP networks. A BACnet/IP network is a collection of one or more IP subnets that share the same BACnet network number. See also paragraph BACNET BROADCAST MANAGEMENT DEVICE.

1.4.10 BACnet Internetwork (BACnet)

Two or more BACnet networks, connected with BACnet routers. In a BACnet Internetwork, there exists only one message path between devices.

1.4.11 BACnet Interoperability Building Blocks (BIBBs) (BACnet)

A BIBB is a collection of one or more ASHRAE 135 Services intended to define a higher level of interoperability. BIBBs are combined to build the BACnet functional requirements for a device in a specification. Some BIBBs define additional requirements (beyond requiring support for specific services) in order to achieve a level of interoperability. For example, the BIBB DS-V-A (Data Sharing-View-A), which would typically be used by a front-end, not only requires the client to support the ReadProperty Service, but also provides a list of data types (Object / Properties) which the client must be able to interpret and display for the user.

In the BIBB shorthand notation, -A is the client side and -B is the server side.

1.4.12 BACnet Network (BACnet)

In BACnet, a portion of the control Internetwork consisting of one or more segments connected by repeaters. Networks are separated by routers.

1.4.13 BACnet Operator Display (B-OD) (BACnet)

A basic operator interface with limited capabilities relative to a B-OWS. It is not intended to perform direct digital control. A B-OD profile could be used for LCD devices, displays affixed to BACnet devices, handheld terminals or other very simple user interfaces.

1.4.14 BACnet Segment (BACnet)

One or more physical segments interconnected by repeaters (ASHRAE 135).

1.4.15 BACnet Smart Actuator (B-SA) (BACnet)

A simple actuator device with limited resources intended for specific applications.

1.4.16 BACnet Smart Sensor (B-SS) (BACnet)

A simple sensing device with limited resources.

1.4.17 BACnet Testing Laboratories (BTL) (BACnet)

Established by BACnet International to support compliance testing and interoperability testing activities and consists of BTL Manager and the BTL Working Group (BTL-WG). BTL also publishes Implementation Guidelines.
1.4.18 BACnet Testing Laboratories (BTL) Listed (BACnet)

A device that has been listed by BACnet Testing Laboratory. Devices may be
certified to a specific device profile, in which case the listing indicates
that the device supports the required capabilities for that profile, or may
be listed as "other".

1.4.19 Binary (All protocols)

A two-state system where an "ON" condition is represented by a high signal
level and an "OFF" condition is represented by a low signal level.
'Digital' is sometimes used interchangeably with 'binary'.

1.4.20 Binding (LonWorks)

The act of establishing communications between CEA-709.1-D devices by
associating the output of a device to the input of another so that
information is automatically (and regularly) sent.

1.4.21 Broadcast (BACnet)

Unlike most messages, which are intended for a specific recipient device, a
broadcast message is intended for all devices on the network.

1.4.22 Building Control Network (BCN) (All protocols)

The network connecting all DDC Hardware within a building (or specific
group of buildings).

1.4.23 Building Point of Connection (BPOC) (All protocols)

A FPOC for a Building Control System. (This term is being phased out of
use in preference for FPOC but is still used in some specifications and
criteria. When it was used, it typically referred to a piece of control
hardware. The current FPOC definition typically refers instead to IT
hardware.)

1.4.24 Channel (LonWorks)

A portion of the control network consisting of one or more segments
connected by repeaters. Channels are separated by routers. The device
quantity limitation is dependent on the topology/media and device type.
For example, a TP/FT-10 network with locally powered devices is limited to
128 devices per channel.

1.4.25 Commandable (All protocols)

See Overridable.

1.4.26 Commandable Objects (BACnet)

Commandable Objects have a Commandable Property, Priority_Array, and
Relinquish_Default Property as defined in ASHRAE 135, Clause 19.2, Command
Prioritization.

1.4.27 Configurable (All protocols)

**************************************************************************
SECTION 23 09 00 Page 21
A property, setting, or value is configurable if it can be changed via hardware settings on the device, via the use of engineering software or over the control network from the front end, and is retained through (after) loss of power.

In a non-Niagara Framework BACnet system, a property, setting, or value is configurable if it can be changed via one or more of:
1) via BACnet services (including proprietary BACnet services)
2) via hardware settings on the device

In a Niagara Framework BACnet system, a property, setting, or value is configurable if it can be changed via one or more of:
1) via BACnet services (including proprietary BACnet services)
2) via hardware settings on the device
3) via the Niagara Framework

Note this is more stringent than the ASHRAE 135 definition.

1.4.28 Configuration Property (LonWorks)

Controller parameter used by the application which is usually set during installation/testing and seldom changed. For example, the P and I settings of a P-I control loop. Also see paragraph STANDARD CONFIGURATION PROPERTY TYPE (SCPT).

1.4.29 Control Logic Diagram (All protocols)

A graphical representation of control logic for multiple processes that make up a system.

1.4.30 Device (BACnet)

A Digital Controller that contains a BACnet Device Object and uses BACnet to communicate with other devices.

1.4.31 Device Object (BACnet)

Every BACnet device requires one Device Object, whose properties represent the network visible properties of that device. Every Device Object requires a unique Object Identifier number on the BACnet Internetwork. This number is often referred to as the device instance or device ID.

1.4.32 Device Profile (BACnet)

A collection of BIBBs determining minimum BACnet capabilities of a device, defined in ASHRAE 135. Standard device profiles include BACnet Advanced Workstations (B-AWS), BACnet Building Controllers (B-BC), BACnet Advanced Application Controllers (B-AAC), BACnet Application Specific Controllers.
1.4.33 Digital Controller (All protocols)

An electronic controller, usually with internal programming logic and digital and analog input/output capability, which performs control functions.

1.4.34 Direct Digital Control (DDC) (All protocols)

Digital controllers performing control logic. Usually the controller directly senses physical values, makes control decisions with internal programs, and outputs control signals to directly operate switches, valves, dampers, and motor controllers.

1.4.35 Domain (LonWorks)

A grouping of up to 32,385 nodes that can communicate directly with each other. (Devices in different domains cannot communicate directly with each other.) See also Node Address.

1.4.36 Explicit Messaging (LonWorks)

A non-standard and often vendor (application) specific method of communication between devices where each message contains a message code that identifies the type of message and the devices use these codes to determine the action to take when the message is received.

1.4.37 External Interface File (XIF) (LonWorks)

A file which documents a device's external interface, specifically the number and types of LonMark objects, the number, types, directions, and connection attributes of network variables, and the number of message tags.

1.4.38 Field Point of Connection (FPOC) (All protocols)

The FPOC is the point of connection between the UMCS IP Network and the field control network (either an IP network, a non-IP network, or a combination of both). The hardware at this location which provides the connection is generally an IT device such as a switch, IP router, or firewall.

In general, the term "FPOC Location" means the place where this connection occurs, and "FPOC Hardware" means the device that provides the connection. Sometimes the term "FPOC" is used to mean either and its actual meaning (i.e. location or hardware) is determined by the context in which it is used.

1.4.39 Fox Protocol (Niagara Framework)

The protocol used for communication between components in the Niagara Framework. By default, Fox uses TCP port 1911.

1.4.40 Functional Profile (LonWorks)

A standard description, defined by LonMark, of one or more LonMark Objects used to classify and certify devices.
1.4.41 Gateway (All protocols)

**************************************************************************
NOTE: This subpart uses tailoring options: Text referring to Niagara Framework is included only when the NIAGARA LONWORKS or NIAGARA BACNET tailoring options are selected.
**************************************************************************

A device that translates from one protocol application data format to another. Devices that change only the transport mechanism of the protocol - "translating" from TP/FT-10 to Ethernet/IP or from BACnet MS/TP to BACnet over IP for example - are not gateways as the underlying data format does not change. Gateways are also called Communications Bridges or Protocol Translators.

A Niagara Framework Supervisory Gateway is one type of Gateway.

1.4.42 General Purpose Programmable Controller (GPPC) (LonWorks)

Unlike an ASC or AGC, a GPPC is not furnished with a fixed application program and does not have a fixed ProgramID or XIF file. A GPPC can be (re-)programmed, usually using vendor-supplied software. When a change to the program affects the external interface (and the XIF file) the ProgramID will change.

1.4.43 IEEE 802.3 Ethernet (All protocols)

A family of local-area-network technologies providing high-speed networking features over various media, typically Cat 5, 5e or Cat 6 twisted pair copper or fiber optic cable.

1.4.44 Internet Protocol (IP, TCP/IP, UDP/IP) (All protocols)

A communication method, the most common use is the World Wide Web. At the lowest level, it is based on Internet Protocol (IP), a method for conveying and routing packets of information over various LAN media. Two common protocols using IP are User Datagram Protocol (UDP) and Transmission Control Protocol (TCP). UDP conveys information to well-known "sockets" without confirmation of receipt. TCP establishes connections, also known as "sessions", which have end-to-end confirmation and guaranteed sequence of delivery.

1.4.45 Input/Output (I/O) (All protocols)

Physical inputs and outputs to and from a device, although the term sometimes describes network or "virtual" inputs or outputs. See also "Points".

1.4.46 I/O Expansion Unit (All protocols)

An I/O expansion unit provides additional point capacity to a digital controller

1.4.47 IP subnet (All protocols)

A group of devices which share a defined range IP addresses. Devices on a common IP subnet can share data (including broadcasts) directly without the need for the traffic to traverse an IP router.
1.4.48 JACE (Niagara Framework)

Java Application Control Engine. See paragraph NIAGARA FRAMEWORK SUPERVISORY GATEWAY

1.4.49 Local-Area Network (LAN) (All protocols)

A communication network that spans a limited geographic area and uses the same basic communication technology throughout.

1.4.50 Local Display Panels (LDPs) (All protocols)

A DDC Hardware with a display and navigation buttons, and must provide display and adjustment of points as shown on the Points Schedule and as indicated.

1.4.51 LonMark (LonWorks)

See paragraph LONMARK INTERNATIONAL. Also, a certification issued by LonMark International to CEA-709.1-D devices.

1.4.52 LonMark International (LonWorks)

Standards committee consisting of numerous independent product developers, system integrators and end users dedicated to determining and maintaining the interoperability guidelines for LonWorks. Maintains guidelines for the interoperability of CEA-709.1-D devices and issues the LonMark Certification for CEA-709.1-D devices.

1.4.53 LonMark Interoperability Association (LonWorks)

See paragraph LONMARK INTERNATIONAL.

1.4.54 LonMark Object (LonWorks)

A collection of network variables, configuration properties, and associated behavior defined by LonMark International and described by a Functional Profile. It defines how information is exchanged between devices on a network (inputs from and outputs to the network).

1.4.55 LonWorks (LonWorks)

The term used to refer to the overall technology related to the CEA-709.1-D protocol (sometimes called "LonTalk"), including the protocol itself, network management, interoperability guidelines and products.

1.4.56 LonWorks Network Services (LNS) (LonWorks)

A network management and database standard for CEA-709.1-D devices.

1.4.57 LonWorks Network Services (LNS) Plug-in (LonWorks)

Software which runs in an LNS compatible software tool, typically a network configuration tool. Device configuration plug-ins provide a user friendly method to edit a device's configuration properties.
1.4.58  **MAC Address (All protocols)**

Media Access Control address. The physical device address that identifies a device on a Local Area Network.

1.4.59  **Master-Slave/Token-Passing (MS/TP) (BACnet)**

Data link protocol as defined by the BACnet standard. Multiple speeds (data rates) are permitted by the BACnet MS/TP standard.

1.4.60  **Monitoring and Control (M&C) Software (All protocols)**

The UMCS 'front end' software which performs supervisory functions such as alarm handling, scheduling and data logging and provides a user interface for monitoring the system and configuring these functions.

1.4.61  **Network Number (BACnet)**

A site-specific number assigned to each network. This network number must be unique throughout the BACnet Internetwork.

1.4.62  **Network Variable (LonWorks)**

See paragraph STANDARD NETWORK VARIABLE TYPE (SNVT).

1.4.63  **Network Configuration Tool (LonWorks)**

**************************************************************************
NOTE: This subpart uses tailoring options: The parenthetical referring to LNS is included only when the LNS tailoring option is selected.
**************************************************************************

The software used to configure the control network and set device configuration properties. This software creates and modifies the control network database (LNS Database).

1.4.64  **Niagara Framework (Niagara Framework)**

A set of hardware and software specifications for building and utility control owned by Tridium Inc. and licensed to multiple vendors. The Framework consists of front end (M&C) software, web based clients, field level control hardware, and engineering tools. While the Niagara Framework is not adopted by a recognized standards body and does not use an open licensing model, it is sufficiently well-supported by multiple HVAC vendors to be considered a de-facto Open Standard.

1.4.65  **Niagara Framework Supervisory Gateway (Niagara Framework)**

DDC Hardware component of the Niagara Framework. A typical Niagara architecture has Niagara specific supervisory gateways at the IP level and other (non-Niagara specific) controllers on field networks (TP/FT-10, MS/TP, etc.) beneath the Niagara supervisory gateways. The Niagara specific controllers function as a gateway between the Niagara framework protocol (Fox) and the field network beneath. These supervisory gateways may also be used as general purpose controllers and also have the capability to provide a web-based user interface.

Note that different vendors refer to this component by different names.

SECTION 23 09 00  Page 26
The most common name is "JACE"; other names include (but are not limited to) "EC-BOS", "FX-40", "TMN", "SLX" and "UNC".

1.4.66  Node (LonWorks)

A device that communicates using the CEA-709.1-D protocol and is connected to a CEA-709.1-D network.

1.4.67  Node Address (LonWorks)

The logical address of a node on the network, consisting of a Domain number, Subnet number and Node number. Note that the "Node number" portion of the address is the number assigned to the device during installation and is unique within a subnet. This is not the factory-set unique Node ID (see Node ID).

1.4.68  Node ID (LonWorks)

A unique 48-bit identifier assigned (at the factory) to each CEA-709.1-D device. Sometimes called the Neuron ID.

1.4.69  Object (BACnet)

An ASHRAE 135 Object. The concept of organizing BACnet information into standard components with various associated Properties. Examples include Analog Input objects and Binary Output objects.

1.4.70  Object Identifier (BACnet)

A grouping of two Object properties: Object Type (e.g. Analog Value, Schedule, etc.) and Object Instance (in this case, a number). Object Identifiers must be unique within a device.

1.4.71  Object Instance (BACnet)

See paragraph OBJECT IDENTIFIER

1.4.72  Object Properties (BACnet)

Attributes of an object. Examples include present value and high limit properties of an analog input object. Properties are defined in ASHRAE 135; some are optional and some are required. Objects are controlled by reading from and writing to object properties.

1.4.73  Operator Configurable (All protocols)

******************************************************************************

NOTE: This subpart uses tailoring options:

1) Text referring to Niagara Framework is included only when the NIAGARA LONWORKS or NIAGARA BACNET tailoring options are selected.

2) Text referring to LNS is included only when the LNS tailoring option is included.

3) Text referring to non Niagara-based BACnet is only included when the BACNET tailoring option is selected.
Operator configurable values are values that can be changed from a single common front end user interface across multiple vendor systems.

For Niagara Framework Systems, a property, setting, or value is Operator Configurable when it is configurable from a Niagara Framework Front End.

For LNS LonWorks systems, Operator Configurable is defined the same as Configurable. See paragraph CONFIGURABLE.

For non Niagara-based BACnet systems, a property, setting, or value in a device is Operator Configurable when it is Configurable and is either:

1. a Writable Property of a Standard BACnet Object; or
2. a Property of a Standard BACnet Object that is Writable when Out_of_Service is TRUE and Out_of_Service is Writable.

1.4.74 Override (All protocols)

Changing the value of a point outside of the normal sequence of operation where the change has priority over the sequence and where there is a mechanism for releasing the change such that the point returns to the normal value. Overrides persist until released or overridden at the same or higher priority but are not required to persist through a loss of power. Overrides are often used by operators to change values, and generally originate at a user interface (workstation or local display panel).

1.4.75 Packaged Equipment (All protocols)

Packaged equipment is a single piece of equipment provided by a manufacturer in a substantially complete and operable condition, where the controls (DDC Hardware) are factory installed, and the equipment is sold and shipped from the manufacturer as a single entity. Disassembly and reassembly of a large piece of equipment for shipping does not prevent it from being packaged equipment. Package units may require field installation of remote sensors. Packaged equipment is also called a "packaged unit".

Note industry may use the term "Packaged System" to mean a collection of equipment that is designed to work together where each piece of equipment is packaged equipment and there is a network that connects the equipment together. A "packaged system" of this type is NOT packaged equipment; it is a collection of packaged equipment, and each piece of equipment must individually meet specification requirements.

1.4.76 Packaged Unit (All protocols)

See packaged equipment.

1.4.77 Performance Verification Test (PVT) (All protocols)

The procedure for determining if the installed BAS meets design criteria prior to final acceptance. The PVT is performed after installation, testing, and balancing of mechanical systems. Typically the PVT is performed by the Contractor in the presence of the Government.
1.4.78  **Physical Segment (BACnet)**

A single contiguous medium to which BACnet devices are attached (ASHRAE 135).

1.4.79  **Polling (All protocols)**

A device periodically requesting data from another device.

1.4.80  **Points (All protocols)**

Physical and virtual inputs and outputs. See also paragraph INPUT/OUTPUT (I/O).

1.4.81  **Program ID (LonWorks)**

An identifier (number) stored in the device that identifies the node manufacturer, functionality of device (application & sequence), transceiver used, and the intended device usage.

1.4.82  **Proportional, Integral, and Derivative (PID) Control Loop (All protocols)**

Three parameters used to control modulating equipment to maintain a setpoint. Derivative control is often not required for HVAC systems (leaving "PI" control).

1.4.83  **Proprietary (BACnet)**

Within the context of BACnet, any extension of or addition to object types, properties, PrivateTransfer services, or enumerations specified in ASHRAE 135. Objects with Object_Type values of 128 and above are Proprietary Objects. Properties with Property_Identifier of 512 and above are proprietary Properties.

1.4.84  **Protocol Implementation Conformance Statement (PICS) (BACnet)**

A document, created by the manufacturer of a device, which describes which portions of the BACnet standard may be implemented by a given device. ASHRAE 135 requires that all ASHRAE 135 devices have a PICS, and also defines a minimum set of information that must be in it. A device as installed for a specific project may not implement everything in its PICS.

1.4.85  **Repeater (All protocols)**

A device that connects two control network segments and retransmits all information received on one side onto the other.

1.4.86  **Router (All protocols)**

**************************************************************************

NOTE: This subpart uses tailoring options:

1) Text referring to LonWorks is included if the LNS or NIAGARA LONWORKS tailoring options are selected.

2) Text referring to BACnet is included if the BACNET or NIAGARA BACNET tailoring options are selected.

SECTION 23 09 00  Page 29
A device that connects two CEA-709.1-D channels (in a LonWorks system) or two ASHRAE 135 networks (in a BACnet system) and controls traffic between the two by retransmitting signals received from one side onto the other based on the signal destination. Routers are used to subdivide a LonWorks control network or a BACnet internetwork and to limit network traffic.

1.4.87 Segment (All protocols)

**NOTE:** This subpart uses tailoring options: The TP/FT-10 example is included only if the LNS or NIAGARA LONWORKS tailoring option is selected.

A 'single' section of a control network that contains no repeaters or routers. There is generally a limit on the number of devices on a segment, and this limit is dependent on the topology/media and device type. For example, in a LonWorks system a TP/FT-10 network with locally powered devices is limited to 64 devices per segment.

1.4.88 Service Pin (LonWorks)

A hardware push-button on a device which causes the device to broadcast a message (over the control network) containing its Node ID and Program ID.

1.4.89 Standard BACnet Objects (BACnet)

Objects with Object_Type values below 128 and specifically enumerated in Clause 21 of ASHRAE 135. Objects which are not proprietary. See paragraph PROPRIETARY.

1.4.90 Standard BACnet Properties (BACnet)

Properties with Property_Identifier values below 512 and specifically enumerated in Clause 21 of ASHRAE 135. Properties which are not proprietary. See Proprietary.

1.4.91 Standard BACnet Services (BACnet)

ASHRAE 135 services other than ConfirmedPrivateTransfer or UnconfirmedPrivateTransfer. See paragraph PROPRIETARY.

1.4.92 Standard Configuration Property Type (SCPT) (LonWorks)

Pronounced skip-it. A standard format type (maintained by LonMark International) for Configuration Properties.

1.4.93 Standard Network Variable Type (SNVT) (LonWorks)

Pronounced snivet. A standard format type (maintained by LonMark International) used to define data information transmitted and received by the individual nodes. The term SNVT is used in two ways. Technically it is the acronym for Standard Network Variable Type, and is sometimes used in this manner. However, it is often used to indicate the network variable itself (i.e. it can mean "a network variable of a standard network variable type"). In general, the intended meaning should be clear from the context.
1.4.94 Subnet (LonWorks)

Consists of a logical grouping of up to 127 nodes, where the logical
   grouping is defined by node addressing. Each subnet is assigned a number
   which is unique within the Domain. See also paragraph NODE ADDRESS.

1.4.95 TP/FT-10 (LonWorks)

A Free Topology Twisted Pair network defined by CEA-709.3. This is the
   most common media type for a CEA-709.1-D control network.

1.4.96 TP/XF-1250 (LonWorks)

A high speed (1.25 Mbps) twisted pair, doubly-terminated bus network
   defined by the LonMark Interoperability Guidelines. This media is
   typically used only as a backbone media to connect multiple TP/FT-10
   networks.

1.4.97 User-defined Configuration Property Type (UCPT) (LonWorks)

Pronounced u-keep-it. A Configuration Property format type that is defined
   by the device manufacturer.

1.4.98 User-defined Network Variable Type (UNVT) (LonWorks)

A network variable format defined by the device manufacturer. Note that
   UNVTs create non-standard communications (other vendor's devices may not
   correctly interpret it) and may close the system and therefore are not
   permitted by this specification.

1.4.99 UMCS (All protocols)

UMCS stands for Utility Monitoring and Control System. The term refers to
   all components by which a project site monitors, manages, and controls
   real-time operation of HVAC and other building systems. These components
   include the UMCS "front-end" and all field building control systems
   connected to the front-end. The front-end consists of Monitoring and
   Control Software (user interface software), browser-based user interfaces
   and network infrastructure.

   The network infrastructure (the "UMCS Network"), is an IP network
   connecting multiple building or facility control networks to the Monitoring
   and Control Software.

1.4.100 UMCS Network (All protocols)

The UMCS Network connects multiple building or facility control networks to
   the Monitoring and Control Software.

1.4.101 Writable Property (BACnet)

A Property is Writable when it can be changed through the use of one or
   more of the WriteProperty services defined in ASHRAE 135, Clause 15
   regardless of the value of any other Property. Note that in the ASHRAE 135
   standard, some Properties may be writable when the Out of Service Property
   is TRUE; for purposes of this Section, Properties that are only writable
   when the Out of Service Property is TRUE are not considered to be Writable.

SECTION 23 09 00 Page 31
1.5 PROJECT SEQUENCING

**************************************************************************
NOTE: Table II provides bracketed text in which the number of days between items may be specified. In many cases this information will be specified elsewhere. When project schedule is specified elsewhere remove bracketed text and Table II will provide sequencing but not specific intervals. If time intervals are to be specified here keep the bracketed text and enter the number of days in the space provided.
**************************************************************************

TABLE II: PROJECT SEQUENCING lists the sequencing of submittals as specified in paragraph SUBMITTALS (denoted by an 'S' in the 'TYPE' column) and activities as specified in PART 3 EXECUTION (denoted by an 'E' in the 'TYPE' column). TABLE II does not specify overall project milestone and completion dates[; these dates are specified in the contract documents][____].

a. Sequencing for Submittals: The sequencing specified for submittals is the deadline by which the submittal must be initially submitted to the Government. Following submission there will be a Government review period as specified in Section 01 33 00 SUBMITTAL PROCEDURES. If the submittal is not accepted by the Government, revise the submittal and resubmit it to the Government within [14][____] days of notification that the submittal has been rejected. Upon resubmittal there will be an additional Government review period. If the submittal is not accepted the process repeats until the submittal is accepted by the Government.

b. Sequencing for Activities: The sequencing specified for activities indicates the earliest the activity may begin.

c. Abbreviations: In TABLE II the abbreviation AAO is used for 'after approval of' and 'ACO' is used for 'after completion of'.

**************************************************************************
NOTE: The following table uses tailoring options:
1) Items referring to LNS are included only when the LNS tailoring option is selected.
2) XIF Files is included only when the LNS or NIAGARA FRAMEWORK tailoring option is selected
3) Items referring to Niagara Framework are included only when the NIAGARA LONWORKS or NIAGARA BACNET tailoring option is selected.

1.6 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.
The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

DDC Contractor Design Drawings; G[, [_____]]

Draft As-Built Drawings; G[, [_____]]

Final As-Built Drawings; G[, [_____]]

**SD-03 Product Data**

Programming Software; G[, [_____]]

Controller Application Programs; G[, [_____]]

Configuration Software; G[, [_____]]

**NOTE:** Controller Configuration Settings is only required for BACnet and is included only when BACNET or NIAGARA BACNET tailoring options are selected.

Controller Configuration Settings; G[, [_____]]

Proprietary Multi-Split Engineering Tool Software; G[, [_____]]

Manufacturer's Product Data; G[, [_____]]

**NOTE:** XIF files and the three LNS-related submittals are only required for LNS-based LonWorks systems and are included when the LNS tailoring option is selected.

XIF files; G[, [_____]]

Draft LNS Database; G[, [_____]]

Final LNS Database; G[, [_____]]
NOTE: Niagara Framework Supervisory Gateway Backups, Niagara Framework Engineering Tool and Niagara Framework Wizards are only required for Niagara Framework systems and are included when the NIAGARA LONWORKS or NIAGARA BACNET

Niagara Framework Supervisory Gateway Backups; G[, [_____]]

NOTE: The Niagara Framework Engineering Tool is specified in Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS and Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS, but is a designer option in these Sections. If the Niagara Framework Engineering Tool is not required for the project, remove the submittal requirements in this Section.

Niagara Framework Engineering Tool; G[, [_____]]

Niagara Framework Wizards; G[, [_____]]

SD-05 Design Data

Boiler Or Chiller Plant Gateway Request

SD-06 Test Reports

Existing Conditions Report

Pre-Construction Quality Control (QC) Checklist; G[, [_____]]

Post-Construction Quality Control (QC) Checklist; G[, [_____]]

Start-Up Testing Report; G[, [_____]]

NOTE: The following two submittals do not apply to Navy projects and are included only when the ARMY, AIR FORCE or SERVICE GENERIC tailoring option is selected.

PVT Procedures; G[, [_____]]

PVT Report; G[, [_____]]

NOTE: The following four submittals apply only to
Navy projects and are included only when the NAVY tailoring option is selected.

Control Contractor’s Performance Verification Testing Plan; G
Equipment Supplier’s Performance Verification Testing Plan; G
Endurance Testing Results; G
Performance Verification Test Report; G
SD-10 Operation and Maintenance Data
Operation and Maintenance (O&M) Instructions; G[, [_____]]
Training Documentation; G[, [_____]]

NOTE: The Enclosure Keys are needed by the project site DPW.
Enclosure Keys; G[, [_____]]

NOTE: The Password Summary Report is needed by the project site DPW.
Password Summary Report; G[, [_____]]
Closeout Quality Control (QC) Checklist; G[, [_____]]

1.7 DATA PACKAGE AND SUBMITTAL REQUIREMENTS

NOTE: The acquisition of all technical data, data bases and computer software items that are identified herein will be accomplished strictly in accordance with the Federal Acquisition Regulation (FAR) and the Defense Acquisition Regulation Supplement (DFARS). Those regulations as well as the Services implementation thereof should also be consulted to ensure that a delivery of critical items of technical data is not inadvertently lost. Specifically, DFARS 252.227-7013 Rights in Technical Data - Noncommercial Items, as well as any requisite software licensing agreements will be made a part of the CONTRACT CLAUSES or SPECIAL CONTRACT REQUIREMENTS.

In addition, the appropriate DD Form 1423 Contract Data Requirements List, will be filled out for each distinct deliverable data item and made a part of the contract. Where necessary, a DD Form 1664, Data Item Description, will be used to explain and more
fully identify the data items listed on the DD Form 1423. It is to be noted that all of these clauses and forms are required to ensure the delivery of the data in question and that such data is obtained with the requisite rights to use by the Government.

Include with the request for proposals a completed DD Form 1423, Contract Data Requirements List. This form is essential to obtain delivery of all documentation. Each deliverable will be clearly specified with both description and quantity being required.

Coordinate the review of all submittals with the project site. The site may have a System Integrator or other individual/office that should review all submittals before acceptance of the system.

Most of the submittals included in this Section are critical and require Government review. Any added submittals, normally, should be for information only and reviewed through the Contractor Quality Control system.

Technical data packages consisting of technical data and computer software (meaning technical data which relates to computer software) which are specifically identified in this project and which may be defined/required in other specifications must be delivered strictly in accordance with the CONTRACT CLAUSES and in accordance with the Contract Data Requirements List, DD Form 1423. Data delivered must be identified by reference to the particular specification paragraph against which it is furnished. All submittals not specified as technical data packages are considered 'shop drawings' under the Federal Acquisition Regulation Supplement (FARS) and must contain no proprietary information and be delivered with unrestricted rights.

1.8 SOFTWARE FOR DDC HARDWARE AND GATEWAYS

Provide all software related to the programming and configuration of DDC Hardware and Gateways as indicated. License all Software to the project site. The term "controller" as used in these requirements means both DDC Hardware and Gateways.

1.8.1 Programming Software

NOTE: This subpart only applies to LonWorks systems and is only included when the LNS or NIAGARA LONWORKS tailoring option is selected.

In addition, the sentence referring to Application Generic Controllers and Wizards is included only when the NIAGARA LONWORKS tailoring option is selected.

For each type of General Purpose Programmable Controller (GPPC), provide the programming software in accordance with Section 23 09 23.01 LONWORKS
DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. For each type of Application Generic Controller (AGC) provided as part of without a configuration and programming Wizard, provide the programming and configuration software in accordance with Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. Submit hard copies of user manuals for each software with the software submittal.

Submit Programming Software on CD-ROM as a Technical Data Package. Submit [_____] hard copies of the software user manual for each piece of software.

1.8.2 Controller Application Programs

**************************************************************************
NOTE: This subpart only applies to LonWorks systems and is only included with the LNS and NIAGARA LONWORKS tailoring options.

In addition, "(LNS plug-in)" is only included when the LNS tailoring options is selected.
**************************************************************************

For each General Purpose Programmable Controller (GPPC), provide copies of the application program as source code compatible with the programming software for that GPPC in accordance with Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. For each Application Generic Controller (AGC), provide copies of the application program as source code compatible with the programming and configuration tool (LNS plug-in) for that AGC in accordance with Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS.

Submit Controller Application Programs on CD-ROM as a Technical Data Package. Include on the CD-ROM a list or table of contents clearly indicating which application program is associated with each device. Submit [2][_____] copies of the Controller Application Programs CD-ROM.

1.8.3 Configuration Software

**************************************************************************
NOTE: This subpart only applies to BACnet systems and is only included with the BACNET and NIAGARA BACNET tailoring options.
**************************************************************************

For each type of controller, provide the configuration tool software in accordance with Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. Submit hard copies of the software user manuals for each software with the software submittal.

Submit Configuration Software on CD-ROM as a Technical Data Package. Submit [_____] hard copies of the software user manual for each piece of software.

1.8.4 Controller Configuration Settings

**************************************************************************
NOTE: This subpart only applies to BACnet systems and is only included with the BACNET and NIAGARA BACNET tailoring options.
**************************************************************************

For each controller, provide copies of the installed configuration settings as source code compatible with the configuration tool software for that controller in accordance with Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS.
Submit Controller Configuration Settings on CD-ROM as a Technical Data Package. Include on the CD-ROM a list or table of contents clearly indicating which files are associated with each device. Submit [2][_____] copies of the Controller Configuration Settings CD-ROM.

1.8.5 Programming Software

**************************************************************************
NOTE: This subpart only applies to BACnet systems and is only included with the BACNET and NIAGARA BACNET tailoring options.
**************************************************************************

For each type of programmable controller, provide the programming software in accordance with Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. Submit hard copies of software user manuals for each software with the software submittal.

Submit Programming Software on CD-ROM as a Technical Data Package. Submit [_____] hard copies of the software user manual for each piece of software.

1.8.6 Controller Application Programs

**************************************************************************
NOTE: This subpart only applies to BACnet systems and is only included with the BACNET and NIAGARA BACNET tailoring options.
**************************************************************************

For each programmable controller, provide copies of the application program as source code compatible with the programming software for that controller in accordance with Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS.

Submit Controller Application Programs on CD-ROM as a Technical Data Package. Include on the CD-ROM a list or table of contents clearly indicating which application program is associated with each device. Submit [2][_____] copies of the Controller Application Programs CD-ROM.

1.8.7 LNS Plug-Ins (for LNS-based LonWorks systems)

**************************************************************************
NOTE: This subpart only applies to LNS-based LonWorks systems and is only included with the LNS tailoring option.
**************************************************************************

Provide LNS Plug-ins in accordance with Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS for each Application Specific Controller and each Application Generic Controller. For LNS Plug-ins distributed under a license, license the Plug-In to the project site. Submit hard copy manuals, if available, for each plug-in provided as part of the LNS- Plug-Ins submittal.

Submit LNS Plug-ins on CD-ROM as a Technical Data Package. Include on the CD-ROM a list or table of contents clearly indicating which files are associated with each device.

1.8.8 Niagara Framework Wizards (for Niagara LonWorks systems)

**************************************************************************
NOTE: This subpart only applies to Niagara Framework Based LonWorks systems and is only included with the NIAGARA LONWORKS tailoring option.
**************************************************************************
For each Application Generic Controller with a Niagara Framework Wizard and for each Application Specific Controller provide Niagara Framework Wizards in accordance with Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. Submit hard copy manuals, if available, for each Wizard provided as part of the Niagara Framework Wizards submittal.

Submit Niagara Framework Wizards on CD-ROM as a Technical Data Package. Include on the CD-ROM a list or table of contents clearly indicating which files are associated with each device. Submit [_____] hard copies of the software user manual, if available, for each Wizard.

1.8.9 Niagara Framework Supervisory Gateway Backups

NOTE: This subpart only applies to Niagara Framework systems and is only included with the NIAGARA LONWORKS and NIAGARA BACNET tailoring options.

For each Niagara Framework Supervisory Gateway, provide a backup of all software within the Niagara Framework Supervisory Gateway, including configuration settings. This backup must be sufficient to allow the restoration of the Niagara Framework Supervisory Gateway or the replacement of the Niagara Framework Supervisory Gateway.

Submit backups for each Niagara Framework Supervisory Gateway on CD-ROM as a Technical Data Package. Mark each backup indicating clearly the source Niagara Framework Supervisory Gateway.

1.8.10 Niagara Framework Engineering Tool (for all Niagara Framework system)

NOTE: This subpart only applies to Niagara Framework systems and is only included with the NIAGARA LONWORKS and NIAGARA BACNET tailoring options.

In addition, this subpart uses tailoring options:

1) Text referring to UFGS 23 09 23.01 will be included if the NIAGARA LONWORKS tailoring option is selected.

2) Text referring to UFGS 23 09 23.02 will be included if the NIAGARA BACNET tailoring option is selected.

NOTE: The Niagara Framework Engineering Tool is specified in Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS and Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS, but is a designer option in these Sections. If the Niagara Framework Engineering Tool is not required for the project, remove the submittal requirements in this Section.
Provide a Niagara Framework Engineering Tool in accordance with Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS and Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. Submit software user manuals with the Niagara Framework Engineering Tool submittal.

Submit the Niagara Framework Engineering Tool on CD-ROM as a Technical Data Package. Submit [_____] hard copies of the software user manual for the Niagara Framework Engineering Tool.

1.9 BOILER OR CHILLER PLANT GATEWAY REQUEST

**********************************************************************************************************************************************
NOTE: Before approving the use of a gateway to multiple chillers or boilers ensure that the sequence of operation for the units requires information be shared between them and cannot be readily performed by a third-party controller.
**********************************************************************************************************************************************

**********************************************************************************************************************************************
NOTE: This subpart uses tailoring options:
1) Text referring to UFGS 23 09 23.01 and LonWorks will be included if the LNS or NIAGARA LONWORKS tailoring options are selected.

2) Text referring to UFGS 23 09 23.02 and BACnet will be included if the BACNET or NIAGARA BACNET tailoring options are selected.
**********************************************************************************************************************************************

If requesting the use of a gateway to a boiler or chiller plant as indicated in paragraph Proprietary Systems Exempted From Open Protocol Requirements, submit a Boiler or Chiller Plant Gateway Request describing the configuration of the boilers or chillers including model numbers for equipment and controllers, the sequence of operation for the units, and a justification for the need to operate the units on a shared non-LonWorks non-BACnet network.

1.10 QUALITY CONTROL CHECKLISTS

**********************************************************************************************************************************************
NOTE: This subpart uses tailoring options. Each checklist is included only when appropriate tailoring option is selected.
**********************************************************************************************************************************************

The QC Checklist for LNS-Based LonWorks Systems in APPENDIX A of this Section must be completed by the Contractor's Chief Quality Control (QC) Representative and submitted as indicated.

The QC Checklist for Niagara Framework Based LonWorks Systems in APPENDIX A of this Section must be completed by the Contractor's Chief Quality Control (QC) Representative and submitted as indicated.

The QC Checklist for BACnet Systems in APPENDIX A of this Section must be completed by the Contractor's Chief Quality Control (QC) Representative and submitted as indicated.
The QC Checklist for Niagara Framework Based BACnet Systems in APPENDIX A of this Section must be completed by the Contractor's Chief Quality Control (QC) Representative and submitted as indicated.

The QC Representative must verify each item indicated and initial in the space provided to indicate that the requirement has been met. The QC Representative must sign and date the Checklist prior to submission to the Government.

1.10.1 Pre-Construction Quality Control (QC) Checklist

******************************************************************************
NOTE: Indicate the required number of Pre-Construction QC Checklists.
******************************************************************************

Complete items indicated as Pre-Construction QC Checklist items in the QC Checklist. Submit [four][_____] copies of the Pre-Construction QC Checklist.

1.10.2 Post-Construction Quality Control (QC) Checklist

******************************************************************************
NOTE: Indicate the required number of Post-Construction QC Checklists.
******************************************************************************

Complete items indicated as Post-Construction QC Checklist items in the QC Checklist. Submit [four][_____] copies of the Post-Construction QC Checklist.

1.10.3 Closeout Quality Control (QC) Checklist

******************************************************************************
NOTE: Indicate the required number of Closeout QC Checklists.
******************************************************************************

Complete items indicated as Closeout QC Checklist items in the QC Checklist. Submit [four][_____] copies of the Closeout QC Checklist.

PART 2 PRODUCTS

******************************************************************************
NOTE: This subpart uses tailoring options:

1) Text referring to UFGS 23 09 23.01 will be included if the LNS or NIAGARA LONWORKS tailoring options are selected.

2) Text referring to UFGS 23 09 23.02 will be included if the BACNET or NIAGARA BACNET tailoring options are selected.
******************************************************************************

Provide products meeting the requirements of Section 23 09 13 INSTRUMENTATION AND CONTROL DEVICES FOR HVAC, Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS for LNS
LonWorks systems or Niagara LonWorks systems, Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS for BACnet or Niagara BACnet systems, other referenced Sections, and this Section.

2.1 GENERAL PRODUCT REQUIREMENTS

Units of the same type of equipment must be products of a single manufacturer. Each major component of equipment must have the manufacturer's name and address, and the model and serial number in a conspicuous place. Materials and equipment must be standard products of a manufacturer regularly engaged in the manufacturing of these and similar products. The standard products must have been in a satisfactory commercial or industrial use for two years prior to use on this project. The two year use must include applications of equipment and materials under similar circumstances and of similar size. DDC Hardware not meeting the two-year field service requirement is acceptable provided it has been successfully used by the Contractor in a minimum of two previous projects. The equipment items must be supported by a service organization. Items of the same type and purpose must be identical, including equipment, assemblies, parts and components.

2.2 PRODUCT DATA

******************************************************************************
NOTE: This subpart uses tailoring options:

1) Text referring to UFGS 23 09 23.01 will be included if the LNS or NIAGARA LONWORKS tailoring options are selected.

2) Text referring to UFGS 23 09 23.02 will be included if the BACNET or NIAGARA BACNET tailoring options are selected.
******************************************************************************

Provide manufacturer's product data sheets documenting compliance with product specifications for each product provided under Section 23 09 13 INSTRUMENTATION AND CONTROL DEVICES FOR HVAC, Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS, Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS, or this Section. Provide product data for all products in a single indexed compendium, organized by product type.

For all LonWorks hardware: for each manufacturer, model and version (revision) of DDC Hardware indicate the type or types of DDC Hardware the product is being provided as in accordance with Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS

For all BACnet hardware: for each manufacturer, model and version (revision) of DDC Hardware provide the Protocol Implementation Conformance Statement (PICS) in accordance with Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS.

Submit Manufacturer's Product Data on CD-ROM.

2.2.1 XIF Files

******************************************************************************
NOTE: This subpart only applies to LonWorks systems
******************************************************************************
and is only included when the LNS or NIAGARA LONWORKS tailoring option is selected.

Provide External Interface Files (XIF Files) for DDC Hardware in accordance with Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. Submit external interface files (XIF files) as a technical data package for each model of DDC Hardware provided under this specification. Submit XIF files on CD-ROM.

2.3 OPERATION ENVIRONMENT

Unless otherwise specified, provide products rated for continuous operation under the following conditions:

a. Pressure: Pressure conditions normally encountered in the installed location.

b. Vibration: Vibration conditions normally encountered in the installed location.

c. Temperature:

NOTE: Designer must decide if suggested outside air temperature range is sufficient, and provide a range if it’s not.

(1) Products installed indoors: Ambient temperatures in the range of 0 to 50 degrees C 32 to 112 degrees F and temperature conditions outside this range normally encountered at the installed location.

(2) Products installed outdoors or in unconditioned indoor spaces: Ambient temperatures in the range of [-37 to +66 degrees C -35 to +151 degrees F] and temperature conditions outside this range normally encountered at the installed location.

d. Humidity: 10 to 95 percent relative humidity, noncondensing and humidity conditions outside this range normally encountered at the installed location.

2.4 WIRELESS CAPABILITY

For products incorporating any wireless capability (including but not limited to radio frequency (RF), infrared and optical), provide products for which wireless capability can be permanently disabled at the device. Optical and infrared capabilities may be disabled via a permanently affixed opaque cover plate.

2.5 ENCLOSURES

NOTE: In outdoor applications specify Type 3 unless hosedown of the enclosure is anticipated, in which case specify Type 4.

For retrofit projects in older mechanical rooms or where hosedown of the enclosure is anticipated specify Type 4 enclosures. Type 4 provides a...
greater degree of protection in dirty and wet environments than does Type 2.

Enclosures supplied as an integral (pre-packaged) part of another product are acceptable. Provide two Enclosure Keys for each lockable enclosure on a single ring per enclosure with a tag identifying the enclosure the keys operate. Provide enclosures meeting the following minimum requirements:

2.5.1 Outdoors

For enclosures located outdoors, provide enclosures meeting NEMA 250 [Type 3][Type 4] requirements.

2.5.2 Mechanical and Electrical Rooms

For enclosures located in mechanical or electrical rooms, provide enclosures meeting NEMA 250 [Type 2][Type 4] requirements.

2.5.3 Other Locations

For enclosures in other locations including but not limited to occupied spaces, above ceilings, and in plenum returns, provide enclosures meeting NEMA 250 Type 1 requirements.

2.6 WIRE AND CABLE

Provide wire and cable meeting the requirements of NFPA 70 and NFPA 90A in addition to the requirements of this specification and referenced specifications.

2.6.1 Terminal Blocks

For terminal blocks which are not integral to other equipment, provide terminal blocks which are insulated, modular, feed-through, clamp style with recessed captive screw-type clamping mechanism, suitable for DIN rail mounting, and which have enclosed sides or end plates and partition plates for separation.

2.6.2 Control Wiring for Binary Signals

For Control Wiring for Binary Signals, provide 18 AWG (1.02 mm diameter) 18 AWG copper or thicker wire rated for 300-volt service.

2.6.3 Control Wiring for Analog Signals

For Control Wiring for Analog Signals, provide 18 AWG (1.02 mm diameter) 18 AWG or thicker, copper, single- or multiple-twisted wire meeting the following requirements:

a. minimum 50 mm (2 inch) 2 inch lay of twist

b. 100 percent shielded pairs

c. at least 300-volt insulation

d. each pair has a 20 AWG tinned-copper drain wire and individual overall pair insulation
e. cables have an overall aluminum-polyester or tinned-copper cable-shield tape, overall 20 AWG tinned-copper cable drain wire, and overall cable insulation.

2.6.4 Power Wiring for Control Devices

For 24-volt circuits, provide insulated copper 18 AWG or thicker wire rated for 300 VAC service. For 120-volt circuits, provide 14 AWG or thicker stranded copper wire rated for 600-volt service.

2.6.5 Transformers

Provide UL 5085-3 approved transformers. Select transformers sized so that the connected load is no greater than 80 percent of the transformer rated capacity.

PART 3 EXECUTION

[3.1 EXISTING CONDITIONS

**************************************************************************

NOTE: For renovation or retrofits keep this paragraph dealing with existing conditions. For new constructions existing conditions generally does not apply and this paragraph can be removed.

Indicate the required number of copies of the Existing Conditions Report.

**************************************************************************

3.1.1 Existing Conditions Survey

Perform a field survey, including testing and inspection of the equipment to be controlled and submit an Existing Conditions Report documenting the current status and its impact on the Contractor's ability to meet this specification. For those items considered nonfunctional, document the deficiency in the report including explanation of the deficiencies and estimated costs to correct the deficiencies. As part of the report, define the scheduled need date for connection to existing equipment. Make written requests and obtain Government approval prior to disconnecting any controls and obtaining equipment downtime.

Submit [four][_____] copies of the Existing Conditions Report.

3.1.2 Existing Equipment Downtime

Make written requests and obtain Government approval prior to disconnecting any controls and obtaining equipment downtime.

3.1.3 Existing Control System Devices

Inspect, calibrate, and adjust as necessary to place in proper working order all existing devices which are to be reused.

]3.2 INSTALLATION

**************************************************************************

NOTE: This subpart uses tailoring options:
1) Text referring to UFGS 23 09 23.01 will be included if the LNS or NIAGARA LONWORKS tailoring options are selected.

2) Text referring to UFGS 23 09 23.02 will be included if the BACNET or NIAGARA BACNET tailoring options are selected.

**************************************************************************

Fully install and test the control system in accordance Section 23 09 13 INSTRUMENTATION AND CONTROL DEVICES FOR HVAC, Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS for LNS LonWorks systems or Niagara LonWorks systems, Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS for BACnet or Niagara BACnet systems, and this Section.

3.2.1 Dielectric Isolation

Provide dielectric isolation where dissimilar metals are used for connection and support. Install control system in a matter that provides clearance for control system maintenance by maintaining access space required to calibrate, remove, repair, or replace control system devices. Install control system such that it does not interfere with the clearance requirements for mechanical and electrical system maintenance.

3.2.2 Penetrations in Building Exterior

Make all penetrations through and mounting holes in the building exterior watertight.

3.2.3 Device Mounting Criteria

Install devices in accordance with the manufacturer's recommendations and as indicated and shown. Provide a weathershield for all devices installed outdoors. Provide clearance for control system maintenance by maintaining access space required to calibrate, remove, repair, or replace control system devices. Provide clearance for mechanical and electrical system maintenance; do not interfere with the clearance requirements for mechanical and electrical system maintenance.

3.2.4 Labels and Tags

Key all labels and tags to the unique identifiers shown on the As-Built drawings. For labels exterior to protective enclosures provide engraved plastic labels mechanically attached to the enclosure or DDC Hardware. Labels inside protective enclosures may be attached using adhesive, but must not be hand written. For tags, provide plastic or metal tags mechanically attached directly to each device or attached by a metal chain or wire.

a. Label all Enclosures and DDC Hardware.

b. Tag Airflow measurement arrays (AFMA) with flow rate range for signal output range, duct size, and pitot tube AFMA flow coefficient.

c. Tag duct static pressure taps at the location of the pressure tap.
3.2.5 Surge Protection

3.2.5.1 Power-Line Surge Protection

Protect equipment connected to AC circuits to withstand power-line surges in accordance with IEEE C62.41. Do not use fuses for surge protection.

3.2.5.2 Surge Protection for Transmitter and Control Wiring

*********************************************************
NOTE: Determine if any additional inputs or outputs require surge protection and show the requirement for them on the drawings.
*********************************************************

Protect DDC hardware against or provided DDC hardware capable of withstanding surges induced on control and transmitter wiring installed outdoors and as shown. Protect equipment against the following two waveforms:

a. A waveform with a 10-microsecond rise time, a 1000-microsecond decay time and a peak current of 60 amps.

b. A waveform with an 8-microsecond rise time, a 20-microsecond decay time and a peak current of 500 amperes.

3.2.6 Basic Cybersecurity Requirements

3.2.6.1 Passwords

*********************************************************
NOTE: Provide a POC for password coordination. This will generally be a supervisor or other senior member of the project site maintenance organization.
This report is required to be delivered as hardcopy in a sealed envelope to keep passwords more confidential.
*********************************************************

For all devices with a password, change the password from the default password. Do not use the same password for more than one device. Coordinate selection of passwords with [____]. Provide a Password Summary Report documenting the password for each device and describing the procedure to change the password for each device.

Provide [two][____] hardcopies of the Password Summary Report, each copy in its own sealed envelope.

3.2.6.2 Wireless Capability

Unless otherwise indicated, disable wireless capability (including but not limited to radio frequency (RF), infrared and optical) for all devices with wireless capability. Optical and infrared capabilities may be disabled via a permanently affixed opaque cover plate. Password protecting a wireless connections does not meet this requirement; the wireless capability must be disabled.
3.2.6.3 IP Network Physical Security

Install all IP Network media in conduit. Install all IP devices including but not limited to IP-enabled DDC hardware and IP Network Hardware in lockable enclosures.

3.3 DRAWINGS AND CALCULATIONS

**************************************************************************

NOTE: Most contractor drawings are updated Contract Drawings. Therefore, it is important that the contract drawing package is complete.

Drawing package content is discussed in UFC 3-410-02 and UFC 3-410-07. Template drawings are available online at Whole Building Design Guide page for this section:
http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-

Many requirements in this specification refer to the Points Schedules so it is critical that complete Points Schedules are part of the Contract Drawings.

A Riser Diagram is not a required part of the Contract Drawings but you may wish to include a Riser Diagram in the contract drawings to show project specific requirements such as DDC Hardware locations etc.

Select a drawing size, (approx 279x432 mm 11x17 inch or 557x860 mm 22x34 inch) or to leave it up to the Contractor.

Select an electronic submittal format in coordination with the project site. Be sure to require drawings in a format that is usable by the site maintenance staff. This may require including multiple format requirements here.

**************************************************************************

Provide drawings in the form and arrangement indicated and shown. Use the same abbreviations, symbols, nomenclature and identifiers shown. Assign a unique identifier as shown to each control system element on a drawing. When packaging drawings, group schedules by system. When space allows, it is permissible to include multiple schedules for the same system on a single sheet. Except for drawings covering all systems, do not put information for different systems on the same sheet.

Submit hardcopy drawings on [ISO A1 841 by 594 mm 34 by 22 inches][or][A3 420 by 297 mm 17 by 11 inches] sheets, and electronic drawings in PDF and in [AutoCAD][Microstation][Bentley BIM V8][Autodesk Revit 2013] format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule.

a. Submit DDC Contractor Design Drawings consisting of each drawing
indicated with pre-construction information depicting the intended control system design and plans. Submit DDC Contractor Design Drawings as a single complete package: [_____] hard copies and [_____] copies on CD-ROM.

b. Submit Draft As-Built Drawings consisting of each drawing indicated updated with as-built data for the system prior to PVT. Submit Draft As-Built Drawings as a single complete package: [_____] hard copies and [_____] copies on CD-ROM.

c. Submit Final As-Built Drawings consisting of each drawing indicated updated with all final as-built data. Final As-Built Drawings as a single complete package: [_____] hard copies and [_____] copies on CD-ROM.

3.3.1 Sample Drawings

Sample drawings in electronic format are available at the Whole Building Design Guide page for this section: [http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-23-09-00](http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-23-09-00). These drawings may prove useful in demonstrating expected drawing formatting and example content and are provided for illustrative purposes only. Note that these drawings do not meet the content requirements of this Section and must be completed to meet project requirements.

3.3.2 Drawing Index and Legend

Provide an HVAC Control System Drawing Index showing the name and number of the building, military site, State or other similar designation, and Country. In the Drawing Index, list all Contractor Design Drawings, including the drawing number, sheet number, drawing title, and computer filename when used. In the Design Drawing Legend, show and describe all symbols, abbreviations and acronyms used on the Design Drawings. Provide a single Index and Legend for the entire drawing package.

3.3.3 Thermostat and Occupancy Sensor Schedule

Provide a thermostat and occupancy sensor schedule containing each thermostat's unique identifier, room identifier and control features and functions as shown. Provide a single thermostat and occupancy sensor schedule for the entire project.

3.3.4 Valve Schedule

Provide a valve schedule containing each valve's unique identifier, size, flow coefficient Kv (Cv), pressure drop at specified flow rate, spring range, positive positioner range, actuator size, close-off pressure to torque data, dimensions, and access and clearance requirements data. In the valve schedule include actuator selection data supported by calculations of the force required to move and seal the valve, access and clearance requirements. Provide a single valve schedule for the entire project.

3.3.5 Damper Schedule

Provide a damper schedule containing each damper's unique identifier, type (opposed or parallel blade), nominal and actual sizes, orientation of axis and frame, direction of blade rotation, actuator size and spring ranges, operation rate, positive positioner range, location of actuators and damper
end switches, arrangement of sections in multi-section dampers, and methods of connecting dampers, actuators, and linkages. Include the AMCA 511 maximum leakage rate at the operating static-pressure differential for each damper in the Damper Schedule. Provide a single damper schedule for the entire project.

3.3.6 Project Summary Equipment Schedule

Provide a project summary equipment schedule containing the manufacturer, model number, part number and descriptive name for each control device, hardware and component provided under this specification. Provide a single project equipment schedule for the entire project.

3.3.7 Equipment Schedule

Provide system equipment schedules containing the unique identifier, manufacturer, model number, part number and descriptive name for each control device, hardware and component provided under this specification. Provide a separate equipment schedule for each HVAC system.

3.3.8 Occupancy Schedule

Provide an occupancy schedule drawing containing the same fields as the occupancy schedule Contract Drawing with Contractor updated information. Provide a single occupancy schedule for the entire project.

3.3.9 DDC Hardware Schedule

Provide a single DDC Hardware Schedule for the entire project and including following information for each device.

3.3.9.1 DDC Hardware Identifier

The Unique DDC Hardware Identifier for the device.

3.3.9.2 HVAC System

The system "name" used to identify a specific system (the name used on the system schematic drawing for that system).

3.3.9.3 LonWorks Device Information

**************************************************************************
NOTE: This subpart and its subparts are required only for LonWorks systems and are included only when the LNS or NIAGARA LONWORKS tailoring options are selected.
**************************************************************************

3.3.9.3.1 Network Address

The LonWorks Domain, Subnet and Node address for the device.

3.3.9.3.2 Unique Node ID

The Unique 48-bit Node ID associated with the device. (Also referred to as the Neuron ID for some devices)
3.3.9.4 BACnet Device Information

**************************************************************************

NOTE: This subpart and its subparts are required only for BACnet systems and are included only when the BACNET or NIAGARA BACNET tailoring options are selected.
**************************************************************************

3.3.9.4.1 Device Object Identifier

The Device Object Identifier: The Object_Identifier of the Device Object

3.3.9.4.2 Network Number

The Network Number for the device.

3.3.9.4.3 MAC Address

The MAC Address for the device

3.3.9.4.4 BTL Listing

The BTL Listing of the device. If the device is listed under multiple BTL Profiles, indicate the profile that matches the use and configuration of the device as installed.

3.3.9.4.5 Proprietary Services Information

If the device uses non-standard ASHRAE 135 services as defined and permitted in Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS, indicate that the device uses non-standard services and include a description of all non-standard services used. Describe usage and content such that a device from another vendor can interoperate with the device using the non-standard service. Provide descriptions with sufficient detail to allow a device from a different manufacturer to be programmed to both read and write the non-standard service request:

a. read: interpret the data contained in the non-standard service and;

b. write: given similar data, generate the appropriate non-standard service request.

3.3.9.4.6 Alarming Information

Indicate whether the device is used for alarm generation, and which types of alarm generation the device implements: intrinsic, local algorithmic, remote algorithmic.

3.3.9.4.7 Scheduling Information

Indicate whether the device is used for scheduling.

3.3.9.4.8 Trending Information

Indicate whether the device is used for trending, and indicate if the device is used to trend local values, remote values, or both.
3.3.9.5 Niagara Station ID

NOTE: This subpart is required only for Niagara Framework systems and is included only when the NIAGARA LONWORKS or NIAGARA BACNET tailoring options are selected.

The Niagara Station ID for each Niagara Framework Supervisory Gateway

3.3.10 Points Schedule

Provide a Points Schedule in tabular form for each HVAC system, with the indicated columns and with each row representing a hardware point, network point or configuration point in the system.

a. When a Points Schedule was included in the Contract Drawing package, use the same fields as the Contract Drawing with updated information in addition to the indicated fields.

b. When Point Schedules are included in the contract package, items requiring contractor verification or input have been shown in angle brackets ("<" and ">"), such as <___> for a required entry or <value> for a value requiring confirmation. Complete all items in brackets as well as any blank cells. Do not modify values which are not in brackets without approval.

Points Schedule Columns must include:

3.3.10.1 Point Name

The abbreviated name for the point using the indicated naming convention.

3.3.10.2 Description

A brief functional description of the point such as "Supply Air Temperature".

3.3.10.3 DDC Hardware Identifier

The Unique DDC Hardware Identifier shown on the DDC Hardware Schedule and used across all drawings for the DDC Hardware containing the point.

3.3.10.4 Settings

The value and units of any setpoints, configured setpoints, configuration parameters, and settings related to each point.

3.3.10.5 Range

The range of values, including units, associated with the point, including but not limited to a zone temperature setpoint adjustment range, a sensor measurement range, occupancy values for an occupancy input, or the status of a safety.
3.3.10.6  Input or Output (I/O) Type

The type of input or output signal associated with the point. Use the following abbreviations for entries in this column:

a.  AI:  The value comes from a hardware (physical) Analog Input
b.  AO: The value is output as a hardware (physical) Analog Output
c.  BI:  The value comes from a hardware (physical) Binary Input
d.  BO: The value is output as a hardware (physical) Binary Output
e.  PULSE: The value comes from a hardware (physical) Pulse Accumulator Input
f.  NET-IN:  The value is provided from the network (generally from another device). Use this entry only when the value is received from another device as part of scheduling or as part of a sequence of operation, not when the value is received on the network for supervisory functions such as trending, alarming, override or display at a user interface.
g.  NET-OUT: The value is provided to another controller over the network. Use this entry only when the value is transmitted to another device as part of scheduling or as part of a sequence of operation, not when the value is transmitted on the network for supervisory functions such as trending, alarming, override or display at a user interface.

3.3.10.7  Object and Property Information

**************************************************************************
 NOTE:  This subpart is required only for BACnet systems and is included only when the BACNET or NIAGARA BACNET tailoring options are selected.
**************************************************************************

The Object Type and Instance Number for the Object associated with the point. If the value of the point is not in the Present_Value Property, then also provide the Property ID for the Property containing the value of the point. Any point that is displayed at the front end or on an LDP, is trended, is used by another device on the network, or has an alarm condition must be documented here.

3.3.10.8  Primary Point Information: SNVT Name

**************************************************************************
 NOTE:  This subpart is required only for LonWorks systems and is included only when the LNS or NIAGARA LONWORKS tailoring options are selected.
**************************************************************************

The name of the SNVT used for the point. Any point that is displayed at the front end or on an LDP, is trended, is used by another device on the network, or has an alarm condition must be documented here.

3.3.10.9  Primary Point Information: SNVT Type

**************************************************************************
 NOTE:  This subpart is required only for LonWorks
**************************************************************************
systems and is included only when the LNS or NIAGARA LONWORKS tailoring options are selected.

**************************************************************************

The SNVT type used by the point. Provide this information whenever SNVT Name is required.

3.3.10.10 Niagara Station ID

**************************************************************************

NOTE: This subpart is required only for Niagara Framework systems and is included only when the NIAGARA LONWORKS or NIAGARA BACNET tailoring options are selected.

**************************************************************************

The Niagara Station ID of the Niagara Framework Supervisory Gateway the point is mapped into.

3.3.10.11 Network Data Exchange Information (Gets Data From, Sends Data To)

**************************************************************************

NOTE: This subpart is required only for BACnet systems and is included only when the BACNET or NIAGARA BACNET tailoring options are selected.

**************************************************************************

Provide the DDC Hardware Identifier of other DDC Hardware the point is shared with.

3.3.10.12 Override Information (Object Type and Instance Number)

**************************************************************************

NOTE: This subpart is required only for BACnet systems and is included only when the BACNET or NIAGARA BACNET tailoring options are selected.

In addition this subpart uses tailoring options: The text referring to Niagara Framework is only included when the NIAGARA BACNET tailoring option is selected.

**************************************************************************

For each point requiring an Override and not residing in a Niagara Framework Supervisory Gateway, indicate if the Object for the point is Commandable or, if the use of a separate Object was specifically approved by the Contracting Officer, provide the Object Type and Instance Number of the Object to be used in overriding the point.

3.3.10.13 Override Information (SNVT Name and Type)

**************************************************************************

NOTE: This subpart is required only for LonWorks systems and is included only when the LNS or NIAGARA LONWORKS tailoring options are selected.

In addition this subpart uses tailoring options: The text referring to Niagara Framework is only included when the NIAGARA LONWORKS tailoring option is selected.
For each point requiring an Override and not residing in a Niagara Framework Supervisory Gateway, indicate the SNVT Name and SNVT Type of the network variable used for the override.

3.3.10.14  Trend Object Information

NOTE: This subpart is required only for non Niagara Framework based BACnet systems and is included only when the NIAGARA BACNET tailoring option is selected.

For each point requiring a trend, indicate if the trend is Local or Remote, the trend Object type and the trend Object instance number. For remote trends provide the DDC Hardware Identifier for the device containing the trend Object in the Points Schedule notes.

3.3.10.15  Alarm Information

NOTE: This subpart is required only for BACnet systems and is included only when the BACNET or NIAGARA BACNET tailoring options are selected.

Indicate the Alarm Generation Type, Event Enrollment Object Instance Number, and Notification Class Object Instance Number for each point requiring an alarm. (Note that not all alarms will have Event Enrollment Objects.)

NOTE: The following paragraph is included only when the BACNET tailoring option is selected.

For Niagara BACnet systems: Indicate the Alarm Generation Type and Notification Class Object Instance Number for each point requiring an alarm. (Note that not all alarms will have a Notification Class Object.)

3.3.10.16  Configuration Information

NOTE: The next paragraph uses tailoring options. Text after the first sentence is included only when the NIAGARA BACNET or NIAGARA LONWORKS tailoring option is selected.
Indicate the means of configuration associated with each point. For points in a Niagara Framework Supervisory Gateway, indicate the point within the Niagara Framework Supervisory Gateway used to configure the value. For other points:

**************************************************************************  
NOTE: The following TWO list paragraphs are included only when the BACNET or NIAGARA BACNET tailoring option is selected.  
**************************************************************************  
a. For Operator Configurable Points indicate BACnet Object and Property information (Name, Type, Identifiers) containing the configurable value. Indicate whether the property is writable always, or only when Out_Of_Service is TRUE.

b. For Configurable Points indicate the BACnet Object and Property information as for Operator Configurable points, or identification of the configurable settings from within the engineering software for the device or identification of the hardware settings on the device.

**************************************************************************  
NOTE: The following TWO list paragraphs are included only when the LNS or NIAGARA LONWORKS tailoring option is selected. In addition:
1) References to LNS plug-ins are included only when the LNS tailoring option is selected.
2) References to Niagara Framework Wizards are included only when the NIAGARA LONWORKS tailoring option is selected.  
**************************************************************************  
a. Indicate "Plug-In" if the point is configurable via an LNS plug-in. Indicate "Niagara Framework Wizard" if the point is configurable via a Niagara Framework Wizard.

b. If the point is not configurable through an LNS plug-in or a Niagara Framework Wizard, indicate the network variable or configuration property used to configure the value.

3.3.11 Riser Diagram

The Riser Diagram of the Building Control Network may be in tabular form, and must show all DDC Hardware and all Network Hardware, including network terminators. For each item, provide the unique identifier, common descriptive name, physical sequential order (previous and next device on the network), room identifier and location within room. A single riser diagram must be submitted for the entire system.

3.3.12 Control System Schematics

Provide control system schematics in the same form as the control system schematic Contract Drawing with Contractor updated information. Provide a control system schematic for each HVAC system.

3.3.13 Sequences of Operation[ Including Control Logic Diagrams]
intent is to require the contractor to develop them. If requiring contractor to develop control logic diagrams provide at least one sample to establish format. If not requiring control logic diagrams remove bracketed text.

Provide HVAC control system sequence of operation and [control logic diagrams] in the same format as the Contract Drawings. Within these drawings, refer to devices by their unique identifiers. Submit sequences of operation[ and control logic diagrams] for each HVAC system

3.3.14 Controller, Motor Starter and Relay Wiring Diagram

Provide controller wiring diagrams as functional wiring diagrams which show the interconnection of conductors and cables to each controller and to the identified terminals of input and output devices, starters and package equipment. Show necessary jumpers and ground connections and the labels of all conductors. Identify sources of power required for control systems and for packaged equipment control systems back to the panel board circuit breaker number, controller enclosures, magnetic starter, or packaged equipment control circuit. Show each power supply and transformer not integral to a controller, starter, or packaged equipment. Show the connected volt-ampere load and the power supply volt-ampere rating. Provide wiring diagrams for each HVAC system.

3.4 CONTROLLER TUNING

Tune each controller in a manner consistent with that described in the ASHRAE FUN SI ASHRAE FUN IP and in the manufacturer's instruction manual. Tuning must consist of adjustment of the proportional, integral, and where applicable, the derivative (PID) settings to provide stable closed-loop control. Each loop must be tuned while the system or plant is operating at a high gain (worst case) condition, where high gain can generally be defined as a low-flow or low-load condition. Upon final adjustment of the PID settings, in response to a change in controller setpoint, the controlled variable must settle out at the new setpoint with no more than two (2) oscillations above and below setpoint. Upon settling out at the new setpoint the controller output must be steady. With the exception of naturally slow processes such as zone temperature control, the controller must settle out at the new setpoint within five (5) minutes. Set the controller to its correct setpoint and record and submit the final PID configuration settings with the O&M Instructions and on the associated Points Schedule.

3.5 START-UP

3.5.1 Start-Up Test

Perform the following startup tests for each control system to ensure that the described control system components are installed and functioning per this specification.

Adjust, calibrate, measure, program, configure, set the time schedules, and otherwise perform all necessary actions to ensure that the systems function as indicated and shown in the sequence of operation and other contract documents.
3.5.1.1 Systems Check

An item-by-item check must be performed for each HVAC system

3.5.1.1.1 Step 1 - System Inspection

**************************************************************************

NOTE: If the specification has been edited to include M&C Software (from Section 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION), include the requirement to inspect M&C Clients to make sure they display shutdown conditions. Otherwise, remove the bracketed text referring to M&C Client

**************************************************************************

With the system in unoccupied mode and with fan hand-off-auto switches in the OFF position, verify that power and main air are available where required and that all output devices are in their failsafe and normal positions. Inspect each local display panel [and each M&C Client] to verify that all displays indicate shutdown conditions.

3.5.1.1.2 Step 2 - Calibration Accuracy Check

Perform a two-point accuracy check of the calibration of each HVAC control system sensing element and transmitter by comparing the value from the test instrument to the network value provided by the DDC Hardware. Use digital indicating test instruments, such as digital thermometers, motor-driven psychrometers, and tachometers. Use test instruments with accuracy at least twice as accurate as the specified sensor accuracy and with calibration traceable to National Institute of Standards and Technology standards. Check one the first check point in the bottom one-third of the sensor range, and the second in the top one-third of the sensor range. Verify that the sensing element-to-DDC readout accuracies at two points are within the specified product accuracy tolerances, and if not recalibrate or replace the device and repeat the calibration check.

3.5.1.1.3 Step 3 - Actuator Range Check

With the system running, apply a signal to each actuator through the DDC Hardware controller. Verify proper operation of the actuators and positioners for all actuated devices and record the signal levels for the extreme positions of each device. Vary the signal over its full range, and verify that the actuators travel from zero stroke to full stroke within the signal range. Where applicable, verify that all sequenced actuators move from zero stroke to full stroke in the proper direction, and move the connected device in the proper direction from one extreme position to the other. For valve actuators and damper actuators, perform the actuator range check under normal system pressures.

3.5.1.2 Weather Dependent Test

Perform weather dependent test procedures in the appropriate climatic season.

3.5.2 Start-Up Testing Report

Submit [4] [_____] copies of the Start-Up Testing Report. The report may be submitted as a Technical Data Package documenting the results of the
tests performed and certifying that the system is installed and functioning per this specification, and is ready for the Performance Verification Test (PVT).

3.5.3 Draft LNS Database

**************************************************************************
NOTE: This subpart is required only for LNS-based LonWorks systems and is included only when the LNS tailoring options is selected.
**************************************************************************

Upon completion of the Start-Up Test, submit the Draft LNS Database reflecting the system as installed and configured at the completion of the Start-Up and Start-Up-Testing. The Draft LNS Database must be a complete, fully commissioned LNS database for the complete control network provided under this specification. The Draft LNS database submittal must consist of the entire folder structure of the LNS database (e.g. c:\Lm\DB\{database name}). For versions of LNS which use credits, the provided LNS Database must include all device credits.

Submit two copies of the fully commissioned, valid draft LNS Database (including all LNS credits) as a Technical Data Package. Submit each copy on a CD-ROM and clearly mark the CD-ROM identifying it as the LNS Database for the work covered under this specification and with the date of the most recent database modification.

3.6 PERFORMANCE VERIFICATION TEST (PVT)

**************************************************************************
NOTE: This subpart does not apply to Navy projects, and is included only when the ARMY, AIR FORCE or SERVICE GENERIC tailoring option is selected.
**************************************************************************

3.6.1 PVT Procedures

**************************************************************************
NOTE: The designer must decide whether to require a one-point accuracy check and/or inlet and outlet air temperature measurements. Project specific requirements should be added, particularly for problematic controls based on designer and user experience.
**************************************************************************

Prepare PVT Procedures based on Section 25 08 10 UTILITY MONITORING AND CONTROL SYSTEM TESTING explaining step-by-step, the actions and expected results that will demonstrate that the control system performs in accordance with the sequences of operation, and other contract documents. Submit [4] [_____] copies of the PVT Procedures. The PVT Procedures may be submitted as a Technical Data Package.

3.6.1.1 Sensor Accuracy Checks

Include a one-point accuracy check of each sensor in the PVT procedures.
3.6.1.2 Temporary Trending Hardware

NOTE: This subpart is required only for LNS-based LonWorks systems and is included only when the LNS tailoring options is selected.

NOTE: For LNS-based LonWorks, trending is accomplished at the UMCS Front End, and the building control system will generally not be integrated into the UMCS during PVT. In this case additional hardware to perform trending will be required.

Unless trending capability exists within the building control system or the building control system is connected to a UMCS or other system which can perform trending, temporarily install hardware on the building control network to perform trending during the endurance test as indicated. Remove the temporary hardware at the completion of all commissioning activities.

3.6.1.3 Endurance Test

NOTE: Select the duration of the endurance test.

NOTE: This subpart uses tailoring options:
1) The paragraph requiring the use of BACnet Trend Log Objects is included only when the BACNET tailoring option is selected.

2) The paragraph requiring the use of a Niagara Trend Log Object is included only when the NIAGARA LONWORKS or NIAGARA BACNET tailoring option is selected. The last sentence of the paragraph (which requires measuring TP/FT-10 bandwidth) is only included when the NIAGARA LONWORKS tailoring option is selected.

3) The paragraph referring to existing trend capabilities and temporary trending hardware is included only when the LNS tailoring option is selected.

4) The sentence requiring the measurement of bandwidth on TP/FT-10 is included only when the LNS or NIAGARA LONWORKS tailoring option is selected.

Include a [one-week] [_____] endurance test as part of the PVT during which the system is operated continuously.
Use the building control system BACnet Trend Log or Trend Log Multiple Objects to trend all points shown as requiring a trend on the Point Schedule for the entire endurance test. If insufficient buffer capacity exists to trend the entire endurance test, upload trend logs during the course of the endurance test to ensure that no trend data is lost.

Use the building control system Niagara Trend Log Objects to trend all points shown as requiring a trend on the Point Schedule for the entire endurance test. If insufficient buffer capacity exists to trend the entire endurance test, upload trend logs during the course of the endurance test to ensure that no trend data is lost. The PVT must include a methodology to measure and record the network bandwidth usage on each TP/FT-10 channel during the endurance test.

Use the existing trending capabilities or the Temporary Trending Hardware as indicated to trend all points shown as requiring a trend on the Point Schedule for the entire endurance test. The PVT must include a methodology to measure and record the network bandwidth usage on each TP/FT-10 channel during the endurance test.

3.6.1.4 PVT Equipment List

Include in the PVT procedures a control system performance verification test equipment list that lists the equipment to be used during performance verification testing. For each piece of equipment, include manufacturer name, model number, equipment function, the date of the latest calibration, and the results of the latest calibration.

3.6.2 PVT Execution

Demonstrate compliance of the control system with the contract documents. Using test plans and procedures approved by the Government, software capable of reading and writing COV Notification Subscriptions, Notification Class Recipient List Properties, event enrollments, demonstrate all physical and functional requirements of the project. Show, step-by-step, the actions and results demonstrating that the control systems perform in accordance with the sequences of operation. Do not start the performance verification test until after receipt of written permission by the Government, based on Government approval of the PVT Plan and Draft As-Builts and completion of balancing. UNLESS GOVERNMENT WITNESSING OF A TEST IS SPECIFICALLY WAIVED BY THE GOVERNMENT, PERFORM ALL TESTS WITH A GOVERNMENT WITNESS. Do not conduct tests during scheduled seasonal off periods of base heating and cooling systems. If the system experiences any failures during the endurance test portion of the PVT, repair the system, repeat the endurance test portion of the PVT until the system operates continuously and without failure for the specified endurance test period.

3.6.3 PVT Report

**************************************************************************
NOTE: Indicate the required number of copies for the PVT Report.
**************************************************************************

Prepare and submit a PVT report documenting all tests performed during the PVT and their results. Include all tests in the PVT procedures and any additional tests performed during PVT. Document test failures and repairs conducted with the test results.
Submit [four][_____] copies of the PVT Report. The PVT Report may be submitted as a Technical Data Package.

3.6.4 Final LNS Database

**************************************************************************
NOTE: This subpart is required only for LNS-based LonWorks systems and is included only when the LNS tailoring options is selected.
**************************************************************************

Submit a Final LNS Database consisting of the complete, fully commissioned LNS database for the complete control network provided under this specification. Provide the the entire folder structure of the LNS database (e.g. c:\Lm\DB\{database name}. For versions of LNS which use credits, include all device credits in the provided LNS Database.

Submit two copies of the fully commissioned, valid as-built LNS Database (including all LNS credits) for the complete control network provided under this specification as a Technical Data Package. Submit each copy on CD-ROM and clearly mark the CD-ROM identifying it as the LNS Database for the work covered under this specification and with the date of the most recent database modification.

3.7 PERFORMANCE VERIFICATION TESTING

**************************************************************************
NOTE: This subpart and its subparts are the PVT requirements for Navy projects and are included only when the NAVY tailoring option is selected.
**************************************************************************

3.7.1 General

**************************************************************************
NOTE: Indicate the number of days before installation for the pre-PVT meeting, and the meeting attendees.
**************************************************************************

PVT testing must demonstrate compliance of controls work with contract document requirements and must be performed by the Controls Contractor and Equipment Suppliers. No less than [14][____] calendar days prior to start of controls system installation, meet with the Contracting Office's technical representative (COTR) [and the designing engineer of the HVAC systems], the Contractor's QA representative, the Contractor's Controls Contractor representative, [and the control system Owner] to develop a mutual understanding relate to the details of the PVT work requirements, including required submittals, work schedule, and field quality control.

3.7.2 Performance Verification Testing and Commissioning

PVT testing is a Government quality assurance function that includes systems trending and field tests. Commissioning is a quality control function that is the Commissioning Team’s responsibility to the extent required by this contract.
3.7.3 Performance Verification Testing of Equipment with Packaged Controls

Controls Contractor and Equipment Supplier(s) must share and coordinate PVT testing responsibilities for equipment provided with on-board factory packaged controls such as boiler controllers, dedicated outside air systems (DOAS’s), and packaged pumping systems.

3.7.3.1 Controls Contractor Responsibilities

The Controls Contractor must provide a PVT Plan separate from Equipment Supplier’s performance verification testing plan, perform endurance testing, and perform PVT testing concurrent with Equipment Suppliers’ testing for equipment provided with on-board factory packaged controls to demonstrate the following:

a. Equipment enabling and disabling.

b. Equipment standard and optional control points necessary to accomplish functionality regardless if specified in contract documents or not.

c. Equipment standard and optional alarms critical to safe operation regardless if specified in contract documents or not.

d. All control points added by Controls Contractor in addition to onboard factory packaged controls regardless if specified in contract documents or not.

Refer to paragraphs titled “Performance Verification Test Plan” and “Endurance Testing” for additional information.

3.7.3.2 Equipment Supplier Responsibilities

Each Equipment Supplier must provide PVT Plans separate from Controls Contractor’s plans and perform PVT testing concurrent with Controls Contractor’s testing for their equipment provided with on-board factory packaged controls to demonstrate the following:

a. Equipment standard and optional control features necessary to accomplish functionality regardless if specified in contract documents or not.

b. Equipment standard and optional operation modes necessary to accomplish functionality regardless if specified in contract documents or not.

c. Equipment standard and optional alarm conditions for safe operation regardless if specified in contract documents or not.

Refer to all paragraphs under paragraph titled “Performance Verification Testing” except for section titled “Endurance Testing” for additional information.

3.7.4 Sequencing of Performance Verification Testing Activities

PVT activities must be sequenced with major activities listed below for Test and Balance (TAB) Contractor, Equipment Suppliers, Commissioning Specialists, and others to demonstrate fully functioning systems. Refer to Section 01 32 17.00 20 COST-LOADED NETWORK ANALYSIS SCHEDULES (NAS). Complete the items in TABLE III: SEQUENCING OF PVT TESTING ACTIVITIES as schedule activities or milestones.
TABLE III: SEQUENCING OF PVT TESTING ACTIVITIES

3.7.4.1 PVT Testing for Multi-Phase Construction

For air moving systems except outside air systems serving multiple phases, all major activities listed in TABLE III through Government’s verbal approval of Test and Balance verification field work can be completed by phase if all ductwork construction is completed for that phase.

For primary systems such as chilled water systems, HVAC heating hot water systems, and outside air systems serving multiple phases, all major activities listed listed in TABLE III through Government’s verbal approval of Test and Balance verification field work for all air moving systems served by that primary system for that phase must be completed prior to conducting PVT field work for that primary system.
3.7.5 **Control Contractor's Performance Verification Testing Plan**

Submit a detailed PVT Plan of the proposed control systems testing in this contract for approval prior to its use. Develop and use a single PVT Plan for each system with a unique control sequence. Systems sharing an identical control sequence can be tested using copies of the PVT Plan intended for these systems.

PVT Plans must include system-based, step-by-step test methods demonstrating system performs in accordance with contract document requirements. The Government may provide sample PVT Plans upon request. PVT Plans must include the following:

a. Control sequences from contract documents segmented such that each control algorithm, operation mode, and alarm condition is immediately followed by numbered test methods required to initiate a response, expected response, space for comments, and "pass" or "fail" indication for each expected response.

b. PVT Plans with control sequences from contract documents that are not segmented into parts will not be accepted.

c. Indication where assisting personnel are required such as Mechanical Contractor.

d. Signature and date lines for the Contractor's PVT administrator, Contractor's quality assurance representative, and Contracting Officer's representative acknowledging completion of testing.

3.7.6 **Performance Verification Testing Sample Size**

PVT testing sample sizes will be as follows:

a. 100-Percent of the following systems:
   
   (1) primary systems including, but not limited to, chilled water and HVAC heating hot water systems
   
   (2) air handling unit systems including all associated fans except for remote exhaust air fans
   
   (3) DOAS’s including all associated fans except for remote exhaust air fans

b. 20-Percent of each set of systems with a shared identical control sequence for systems such as:
   
   (1) air terminal units
   
   (2) exhaust air fans
   
   (3) terminal equipment such as fan coil units and unit heaters

3.7.6.1 **Selection of Systems to Test**

For sample sets less than 100-percent, the Government will choose which systems will be tested. The Government may require additional testing if previous testing results are inconsistent or demonstrate improper system control as follows:
a. An additional 25-percent after five-percent failure rate of first sample set.

b. 100-percent after any failures occurring in additional sample set.

3.7.7 Conducting Performance Verification Testing

At least 15 days prior to preferred test date, request the Contracting Officer to allow the beginning of Government-witnessed PVT testing. Provide an estimated time table required to perform testing of each system. Furnish personnel, equipment, instrumentation, and supplies necessary to perform all aspects of testing. Testing personnel must be regularly employed in the testing and calibration of control systems. After receipt of Contracting Officer’s approval to begin testing, perform PVT testing using project's as-built (shop) control system drawings, project's design drawings, and approved PVT Plans.

During testing, identify deficiencies that do not meet contract document requirements. Deficiencies must be investigated, corrected with corrections documented, and re-tested at a later date following procedures for the initial PVT testing. The Government may require re-testing of any control system components affected by the original failed test.

3.7.8 Endurance Testing

3.7.8.1 General

Conduct endurance testing in conjunction with the PVT to demonstrate control loop stability and accuracy. For all control loops tested, record trend data of the control variables over time, demonstrating that the control loop responds to a sudden change of the control variable set point without excessive overshoot or undershoot. Conduct endurance testing for each system subject to PVT testing. Systems must be operating as normally anticipated during occupancy throughout endurance testing.

Endurance testing results must clearly demonstrate control loop stability and accuracy. Controlled loop outputs must be stable and accurately maintain each setpoint.

3.7.8.2 Hardware

**************************************************************************
NOTE: Select "Use hardware provided in this contract for testing." only when a workstation is provided in this scope of work.
**************************************************************************

[Use hardware provided in this contract for testing.] [Use Government furnished hardware for testing if available when endurance testing begins. If unavailable, the Contractor must provide suitable hardware for required testing.]

If insufficient buffer capacity exists to trend the entire endurance test, upload trend data during the course of endurance testing to ensure all trend data is retained. Lost trend data will require retesting of all control points for affected system(s).
3.7.8.3 Endurance Testing Results Format

Submit endurance testing results for each tested system in a graphical format complete with clear indication of value(s) for y-axis, value for x-axis, and legend identifying each trended control point. The number of control points contained on a single graph must be such that all control points can be clearly visible. Control points must be logically grouped such that related points appear on a single graph. In addition, submit a separate comma separated value (CSV) file of raw trend data for each trended system. Each trended control point in CSV file must be clearly identified.

For control points recorded based on change of value, change of value for recording data must be clearly identified for each control point.

3.7.8.4 Endurance Testing Start, Duration, and Frequency

**************************************************************************
NOTE: Select duration and frequency of data collection.
**************************************************************************

Trending of all control points for a given system must start at an identical date and time regardless of the basis of data collection. Duration of all endurance tests must be at least [one-week][______].

Unless specified otherwise for control points recorded based on time, frequency of data collection must be [15-minutes] [______]. Frequency of data collection for specific types of control points is as follows:

3.7.8.4.1 Points Trended at One Minute Intervals

a. Temperature for supply air, return air, mixed air, supply water, and return water
b. Temperature for outside air, supply air, return air and exhaust air entering and leaving energy recovery device
c. Flow for supply air, return air, outside air, chilled water, and HVAC heating hot water
d. Flow for exhaust air associated with energy recovery
e. Relative humidity for outside air and return air
f. Relative humidity for outside air, supply air, return air and exhaust air entering and leaving energy recovery device
g. Command and status for control dampers and control valves
h. Speed for fans and pumps
i. Pressure for fans and pumps

3.7.8.4.2 Points Trended at 15 Minute Intervals

a. Temperature and relative humidity for zones
b. Temperature and relative humidity for outside air not associated with energy recovery

c. Command and status for equipment

d. Pressure relative to the outside for facility

3.7.8.5 Trended Control Points

Trended control points for each system must demonstrate each system performs in accordance with contract document requirements. Trended control points must include, but not be limited to, control points listed in contract document points list.

Minimum control points that are required to be trended for selected systems are listed below. These control points must be trended as applicable to this contract in addition to control points necessary to demonstrate systems perform in accordance with contract document requirements and those listed in contract document’s points list.

**************************************************************************
NOTE: Delete systems below if certain they are not in this project. If uncertain, then keep.
**************************************************************************

[3.7.8.5.1 Air-Cooled Chiller Chilled Water System.

a. Chiller(s) command and status

b. Chiller isolation valve(s) command and status

c. Chilled water pump(s) actual speed

d. Chilled water pump(s) setpoint and actual differential pressure

e. Minimum flow bypass control valve command

f. Minimum system flow setpoint and actual flow

g. Chilled water supply setpoint and actual temperature

h. Chilled water return actual temperature

i. Chilled water actual flow

j. Outside air actual dry-bulb temperature

][3.7.8.5.2 HVAC Heating Hot Water System with Boiler.

a. Boiler(s) command and status

b. Boiler(s) isolation valve command and status

c. HVAC heating hot water pump(s) actual speed

d. HVAC heating hot water pump(s) setpoint and actual differential pressure
e. Minimum flow bypass control valve command
f. Minimum system setpoint and actual flow
g. HVAC heating hot water supply setpoint and actual temperature
h. HVAC heating hot water return actual temperature
i. HVAC heating hot water actual flow
j. Outside air actual dry-bulb temperature

3.7.8.5.3 HVAC Heating Hot Water System with Steam-to-Hot Water Heat Exchanger.

a. Steam control valve(s) command
b. Heat exchanger isolation valve(s) command and status
c. HVAC heating hot water pump(s) actual speed
d. HVAC heating hot water pump(s) setpoint and actual differential pressure
e. Minimum flow bypass control valve command
f. Minimum system setpoint and actual flow
g. HVAC heating hot water supply setpoint and actual temperature
h. HVAC heating hot water return actual temperature
i. HVAC heating hot water actual flow
j. Outside air actual dry-bulb temperature

3.7.8.5.4 Air Handling Unit with Relief Air Fan

a. Outside air actual dry-bulb temperature
b. Outside air actual relative humidity
c. Outside air setpoint and actual airflow
d. Minimum outside air control damper command
e. Economizer outside air control damper command
f. Facility setpoint and actual relative pressure
g. Return air actual dry-bulb temperature
h. Return air actual relative humidity
i. Return air control damper command
j. Relief air control damper command
h. Relief air fan actual speed
i. Mixed air setpoint and setpoint and actual temperature
j. Preheat coil leaving air setpoint and actual temperature
k. Preheat coil control actuator command
l. Cooling coil leaving air setpoint and actual temperature
m. Cooling coil control valve command
n. Supply air fan actual speed
o. Discharge air actual temperature
p. Supply air fan setpoint and actual static pressure

3.7.8.5.5 Dedicated Outside Air System (DOAS)

a. Outside air actual dry-bulb temperature
b. Outside air actual relative humidity
c. Outside air isolation damper command and status
d. Outside air setpoint and actual airflow
e. Energy recovery wheel command, status, and actual speed
f. Energy recovery wheel’s OA bypass control damper command and status
g. Energy recovery wheel’s defrost cycle command and status
h. Energy recovery wheel’s OA discharge air actual dry-bulb temperature
i. Energy recovery wheel’s OA discharge air actual relative humidity
j. Preheat coil leaving air setpoint and actual temperature
h. Preheat coil control actuator command
i. Cooling coil leaving air setpoint and actual temperature
j. Cooling coil control valve command
k. Supply air fan actual speed
l. Reheat coil control valve command
m. Discharge air setpoint and actual temperature
n. Supply air fan setpoint and actual static pressure
o. Facility setpoint and actual relative pressure
p. Return air actual dry-bulb temperature
q. Return air actual relative humidity
r. Energy recovery wheel’s EA bypass control damper command and status
s. Energy recovery wheel’s EA discharge air actual dry-bulb temperature
t. Energy recovery wheel’s EA discharge air actual relative humidity
u. Exhaust air fan actual speed
v. Exhaust air isolation damper command and status

3.7.8.5.6 Series Fan-Powered Supply Air Terminal Units
a. Zone setpoint and actual dry-bulb temperature
b. Zone actual relative humidity
c. Control damper command
d. Fan command and status
e. Heating coil valve command
f. Airflow actual value
g. Leaving air actual temperature

3.7.8.6 Endurance Testing Sample Size

Endurance Testing sample sizes were as follows:

a. 100-Percent of the following systems:
   (1) primary systems including, but not limited to, chilled water and HVAC heating hot water systems
   (2) air handling unit systems including all associated fans except for remote exhaust air fans
   (3) DOAS’s including all associated fans except for remote exhaust air fans

b. 20-Percent of each set of systems with a shared identical control sequence for systems such as:
   (1) air terminal units
   (2) exhaust air fans
   (3) terminal equipment such as fan coil units and unit heaters

3.7.8.6.1 Selection of Systems to Test

For sample sets less than 100-percent, the Government will choose which systems will be tested. The Government may require additional testing if previous testing results are inconsistent or demonstrate improper system control as follows:

a. An additional 25-percent after five-percent failure rate of first sample set.
b. 100-percent after any failures occurring in additional sample set.

3.7.9 Performance Verification Test Report

Submit a PVT Report after receiving Government’s written approval of PVT field work that is intended to document test results and final control system sequences and settings prior to turnover. The PVT Report must contain the following:

a. Executive summary that briefly discusses results of each system’s endurance testing and PVT testing and conclusions for each system.

b. Endurance testing for each system.

c. Completed PVT Plan for each system used during testing that includes hand written field notes and participant signatures.

d. Blank PVT Plan for each system approved prior to testing that is edited to reflect changes occurring during testing. Edits must be typed and must reflect changes to control sequences from contract documents, must reflect changes to numbered test methods required to initiate a response, and must reflect changes to expected response. Only one blank PVT Plan is required for each set of systems sharing an identical control sequence, such as air terminal units, exhaust air fans, fan coil units and unit heaters.

e. Written certification that the installation and testing of all systems are complete and meet all contract document requirements.

3.8 FINAL LNS DATABASE

**************************************************************************
NOTE: This subpart is required only for LNS-based LonWorks systems and is included only when the LNS tailoring option is selected.
**************************************************************************

Submit a Final LNS Database consisting of the complete, fully commissioned LNS database for the complete control network provided under this specification. Provide the the entire folder structure of the LNS database (e.g. c:\Lm\DB\{database name}). For versions of LNS which use credits, include all device credits in the provided LNS Database.

Submit two copies of the fully commissioned, valid as-built LNS Database (including all LNS credits) for the complete control network provided under this specification as a Technical Data Package. Submit each copy on CD-ROM and clearly mark the CD-ROM identifying it as the LNS Database for the work covered under this specification and with the date of the most recent database modification.

3.9 OPERATION AND MAINTENANCE (O&M) INSTRUCTIONS

Provide HVAC control System Operation and Maintenance Instructions which include:

a. "Data Package 3" as indicated in Section 01 78 23 OPERATION AND MAINTENANCE DATA for each piece of control equipment.
b. "Data Package 4" as described in Section 01 78 23 OPERATION AND MAINTENANCE DATA for all air compressors.

c. HVAC control system sequences of operation formatted as indicated.

d. Procedures for the HVAC system start-up, operation and shut-down including the manufacturer's supplied procedures for each piece of equipment, and procedures for the overall HVAC system.

e. As-built HVAC control system detail drawings formatted as indicated.

f. Routine maintenance checklist. Provide the routine maintenance checklist arranged in a columnar format, where the first column lists all installed devices, the second column states the maintenance activity or that no maintenance required, the third column states the frequency of the maintenance activity, and the fourth column is used for additional comments or reference.

g. Qualified service organization list, including at a minimum company name, contact name and phone number.

Submit [2] copies of the Operation and Maintenance Instructions, indexed and in booklet form. The Operation and Maintenance Instructions may be submitted as a Technical Data Package.

[3.10 MAINTENANCE AND SERVICE

**************************************************************************

NOTE: The maintenance and service to be provided by the Contractor for the duration of the maintenance contract is specified in this paragraph. The Maintenance and Service may need to be a separate bid item funded by O&M funds.

Requirements should be coordinated with "WARRANTY MANAGEMENT" in Section 01 78 00 CLOSEOUT SUBMITTALS

If not requiring 1 year maintenance and service, delete this subpart. Most Navy projects will not use this requirement.
**************************************************************************

Provide services, materials and equipment as necessary to maintain the entire system in an operational state as indicated for a period of one year from the date of final acceptance of the project. Minimize impacts on facility operations.

a. The integration of the system specified in this section into a Utility Monitoring and Control System must not, of itself, void the warranty or otherwise alter the requirement for the one year maintenance and service period. Integration into a UMCS includes but is not limited to establishing communication between devices in the control system and the front end or devices in another system.

b. The changing of configuration properties must not, of itself, void the...
warranty or otherwise alter the requirement for the one year maintenance and service period.

3.10.1 Description of Work

Provide adjustment and repair of the system including the manufacturer's required sensor and actuator (including transducer) calibration, span and range adjustment.

3.10.2 Personnel

Use only service personnel qualified to accomplish work promptly and satisfactorily. Advise the Government in writing of the name of the designated service representative, and of any changes in personnel.

3.10.3 Scheduled Inspections

**************************************************************************
NOTE: Indicate when inspections are to be scheduled.
**************************************************************************

Perform two inspections at six-month intervals and provide work required. Perform inspections in [June and December][____]. During each inspection perform the indicated tasks:

a. Perform visual checks and operational tests of equipment.

b. Clean control system equipment including interior and exterior surfaces.

c. Check and calibrate each field device. Check and calibrate 50 percent of the total analog inputs and outputs during the first inspection. Check and calibrate the remaining 50 percent of the analog inputs and outputs during the second major inspection. Certify analog test instrumentation accuracy to be twice the specified accuracy of the device being calibrated. Randomly check at least 25 percent of all binary inputs and outputs for proper operation during the first inspection. Randomly check at least 25 percent of the remaining binary inputs and outputs during the second inspection. If more than 20 percent of checked inputs or outputs failed the calibration check during any inspection, check and recalibrate all inputs and outputs during that inspection.

d. Run system software diagnostics and correct diagnosed problems.

e. Resolve any previous outstanding problems.

3.10.4 Scheduled Work

**************************************************************************
NOTE: Include bracketed text to accept default work times or indicate permissible work times in the space provided.
**************************************************************************

This work must be performed [during regular working hours, Monday through Friday, excluding Federal holidays][____].
3.10.5 Emergency Service

The Government will initiate service calls when the system is not functioning properly. Qualified personnel must be available to provide service to the system. A telephone number where the service supervisor can be reached at all times must be provided. Service personnel must be at the site within 24 hours after receiving a request for service. The control system must be restored to proper operating condition as required per Section 01 78 00 CLOSEOUT SUBMITTALS.

3.10.6 Operation

After performing scheduled adjustments and repairs, verify control system operation as demonstrated by the applicable tests of the performance verification test.

3.10.7 Records and Logs

Keep dated records and logs of each task, with cumulative records for each major component, and for the complete system chronologically. Maintain a continuous log for all devices, including initial analog span and zero calibration values and digital points. Keep complete logs and provide logs for inspection onsite, demonstrating that planned and systematic adjustments and repairs have been accomplished for the control system.

3.10.8 Work Requests

Record each service call request as received and include its location, date and time the call was received, nature of trouble, names of the service personnel assigned to the task, instructions describing what has to be done, the amount and nature of the materials to be used, the time and date work started, and the time and date of completion. Submit a record of the work performed within 5 days after work is accomplished.

3.10.9 System Modifications

Submit recommendations for system modification in writing. Do not make system modifications, including operating parameters and control settings, without prior approval of the Government.

3.11 TRAINING

**************************************************************************

NOTE: Training requirements should be coordinated with the relevant shop organization at the project site. Extent of training should be based on the needs of the installation personnel.

**************************************************************************

Conduct a training course for [_____] operating staff members designated by the Government in the maintenance and operation of the system, including specified hardware and software. Conduct [32] [_____] hours of training at the project site within 30 days after successful completion of the performance verification test. The Government reserves the right to make audio and visual recordings (using Government supplied equipment) of the training sessions for later use. Provide audiovisual equipment and other training materials and supplies required to conduct training. A training day is defined as 8 hours of classroom instruction, including two 15 minute breaks and excluding lunchtime, Monday through Friday, during the daytime.
shift in effect at the training facility.

3.11.1 Training Documentation

********************************************************************************
NOTE: Designer must choose appropriate shop supervisor(s) to coordinate training attendance.
********************************************************************************

Prepare training documentation consisting of:

a. Course Attendee List: Develop the list of course attendees in coordination with and signed by the [Controls][HVAC][Electrical] shop supervisor.

b. Training Manuals: Provide training manuals which include an agenda, defined objectives for each lesson, and a detailed description of the subject matter for each lesson. When presenting portions of the course material by audiovisuals, deliver copies of those audiovisuals as a part of the printed training manuals.

3.11.2 Training Course Content

For guidance in planning the required instruction, assume that attendees will have a high school education, and are familiar with HVAC systems. During the training course, cover all of the material contained in the Operating and Maintenance Instructions, the layout and location of each controller enclosure, the layout of one of each type of equipment and the locations of each, the location of each control device external to the panels, the location of the compressed air station, preventive maintenance, troubleshooting, diagnostics, calibration, adjustment, commissioning, tuning, and repair procedures. Typical systems and similar systems may be treated as a group, with instruction on the physical layout of one such system. Present the results of the performance verification test and the Start-Up Testing Report as benchmarks of HVAC control system performance by which to measure operation and maintenance effectiveness.

3.11.3 Training Documentation Submittal Requirements

********************************************************************************
NOTE: Indicate number of additional copies of training material required.
********************************************************************************

Submit hardcopy training manuals and all training materials on CD-ROM. Provide one hardcopy manual for each trainee on the Course Attendee List and [2][_____] additional copies for archive at the project site. Provide [2][_____] copies of the Course Attendee List with the archival copies. Training Documentation may be submitted as a Technical Data Package.
APPENDIX A

QC CHECKLIST FOR LNS-BASED LONWORKS SYSTEMS

This checklist is not all-inclusive of the requirements of this specification and should not be interpreted as such.

Instructions: Initial each item in the space provided (______) verifying that the requirement has been met.

This checklist is for (circle one):

Pre-Construction QC Checklist Submittal
Post-Construction QC Checklist Submittal
Close-out QC Checklist Submittal

Items verified for Pre-Construction, Post-Construction and Closeout QC Checklist Submittals:

1 All DDC Hardware is numbered on Control System Schematic Drawings. (______)

2 Signal lines on Control System Schematic are labeled with the signal type. (______)

3 Local Display Panel (LDP) Locations are shown on Control System Schematic drawings. (______)

Items verified for Post-Construction and Closeout QC Checklist Submittals:

4 All sequences are performed as specified using DDC Hardware. (______)

5 Training schedule and course attendee list has been developed and coordinated with shops and submitted. (______)

6 All DDC Hardware is installed on a TP/FT-10 Channel. (______)

7 All Application Specific Controllers (ASCs) are LonMark certified. (______)

8 Communication between DDC Hardware is only via CEA-709.1-D using SNVTs. Other protocols have not been used. Network variables other than SNVTs have not been used. (______)

9 Explicit messaging has not been used. (______)

10 Scheduling is performed in DDC Hardware meeting the Simple Schedule Functional Profile. (______)

Items verified for Closeout QC Checklist Submittal:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for instrumentation and control devices for HVAC when combined with a companion DDC Network. Please refer to the respective specification sections for Direct Digital Control Devices and Utility Monitoring and Control Systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This section is for use on all USACE and AFCEC projects and for additions or retrofits to existing NAVFAC systems.

This specification covers installation of local control devices and instrumentation. It is primarily intended for building level control systems which are to be integrated into a Utility Monitoring and Control System (UMCS) Front End as specified in Section 25 10 10 UTILITY MONITORING AND
CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION.

The HVAC Control System design must be in accordance with UFC 3-410-02 Direct Digital Control for HVAC and Other Building Control Systems.

1.1 SUMMARY

NOTE: Designer is to add location and site specific requirements.

This section provides for the instrumentation control system components excluding direct digital controllers, network controllers, gateways etc. that are necessary for a completely functional automatic control system. When combined with a Direct Digital Control (DDC) system, the Instrumentation and Control Devices covered under this section must be a complete system suitable for the control of the heating, ventilating and air conditioning (HVAC) and other building-level systems as specified and indicated.

a. Install hardware to perform the control sequences as specified and indicated and to provide control of the equipment as specified and indicated.

b. Install hardware such that individual control equipment can be replaced by similar control equipment from other equipment manufacturers with no loss of system functionality.

c. Install and configure hardware such that the Government or their agents are able to perform repair, replacement, and upgrades of individual hardware without further interaction with the installing Contractor.

1.1.1 Verification of Dimensions

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing any work.

1.1.2 Drawings

The Government will not indicate all offsets, fittings, and accessories that may be required on the drawings. Carefully investigate the mechanical, electrical, and finish conditions that could affect the work to be performed, arrange such work accordingly, and provide all work necessary to meet such conditions.

1.2 RELATED SECTIONS

Related work specified elsewhere.

1.4 SUBMITTALS

*************************************************************************
NOTE: Submittals related to this section are specified in UFGS 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.
*************************************************************************

Submittal requirements are specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

1.5 DELIVERY AND STORAGE

Store and protect products from the weather, humidity, and temperature variations, dirt and dust, and other contaminants, within the storage condition limits published by the equipment manufacturer.
1.6  INPUT MEASUREMENT ACCURACY

**************************************************************************
NOTE: This paragraph is referenced elsewhere in the specification. If this paragraph is edited, removed, renamed etc make sure to verify that all references to it are updated as needed.
**************************************************************************

Select, install and configure sensors, transmitters and DDC Hardware such that the maximum error of the measured value at the input of the DDC hardware is less than the maximum allowable error specified for the sensor or instrumentation.

1.7  SUBCONTRACTOR SPECIAL REQUIREMENTS

Perform all work in this section in accordance with the paragraph entitled CONTRACTOR SPECIAL REQUIREMENTS in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS.

PART 2   PRODUCTS

2.1  EQUIPMENT

2.1.1  General Requirements

All products used to meet this specification must meet the indicated requirements, but not all products specified here will be required by every project. All products must meet the requirements both Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and this Section.

2.1.2  Operation Environment Requirements

Unless otherwise specified, provide products rated for continuous operation under the following conditions:

2.1.2.1  Pressure

Pressure conditions normally encountered in the installed location.

2.1.2.2  Vibration

Vibration conditions normally encountered in the installed location.

2.1.2.3  Temperature

**************************************************************************
NOTE: Designer must decide if suggested outside air temperature range is sufficient, and provide a range if it's not.
**************************************************************************

a.  Products installed indoors: Ambient temperatures in the range of 0 to 50 degrees C 32 to 112 degrees F and temperature conditions outside this range normally encountered at the installed location.

b.  Products installed outdoors or in unconditioned indoor spaces: Ambient temperatures in the range of [-37 to +66 degrees C-35 to +151 degrees F]
Humidity

10 to 95 percent relative humidity, non-condensing and also humidity conditions outside this range normally encountered at the installed location.

2.2 WEATHERSHIELDS

Provide weathershields constructed of galvanized steel painted white, unpainted aluminum, aluminum painted white, or white PVC.

2.3 TUBING

Provide ASTM B75/B75M or ASTM B88 rated tubing meeting the following requirements:

a. For tubing 9 mm 0.375 inch outside diameter and larger provide tubing with minimum wall thickness equal to ASTM B88, Type M

b. For tubing less than 9 mm 0.375 inch outside diameter provide tubing with minimum wall thickness of 0.6 mm 0.025 inch

c. For exposed tubing and tubing for working pressures greater than 207 kPa 30 psig provide hard copper tubing.

d. Provide fittings which are ASME B16.18 or ASME B16.22 solder type using ASTM B32 95-5 tin-antimony solder, or which are ASME B16.26 compression type.

2.3.2 Stainless Steel

For stainless steel tubing provide tubing conforming to ASTM A269/A269M

2.3.3 Plastic

Provide plastic tubing with the burning characteristics of linear low-density polyethylene tubing which is self-extinguishing when tested in accordance with ASTM D635, has UL 94 V-2 flammability classification or better, and which withstands stress cracking when tested in accordance with
ASTM D1693. Provide plastic-tubing bundles with Mylar barrier and flame-retardant polyethylene jacket.

2.3.4 Polyethylene Tubing

Provide flame-resistant, multiple polyethylene tubing in flame-resistant protective sheath with mylar barrier, or unsheathed polyethylene tubing in rigid metal, intermediate metal, or electrical metallic tubing conduit for areas where tubing is exposed. Single, unsheathed, flame-resistant polyethylene tubing may be used where concealed in walls or above ceilings and within control panels. Do not provide polyethylene tubing for [systems indicated as critical and] smoke removal systems, or for systems with working pressures over 206 kPa 30 psig. Provide compression or brass barbed push-on type fittings. Provide extruded seamless polyethylene tubing conforming to the following:

a. Minimum Burst Pressure Requirements: 690 kPa at 24 degrees C 100 psig at 75 degrees F to 172 kPa at 66 degrees C 25 psig at 150 degrees F.

c. Tensile Strength (Minimum): ASTM D638, 7584 kPa 1100 psi.

d. Flow Rate (Average): ASTM D1238, 0.30 decigram per minute.

e. Density (Average): ASTM D792, 921 kg per cubic meter 57.5 pounds per cubic feet.

f. Burn rate: ASTM D635

g. Flame Propagation: UL 1820, less than 1.5 meters 5 feet ASTM D635

h. Average Optical Density: UL 1820, less than 0.15 ASTM D635

2.4 WIRE AND CABLE

Provide wire and cable meeting the requirements of NFPA 70 and NFPA 90A in addition to the requirements of this specification and referenced specifications.

2.4.1 Terminal Blocks

For terminal blocks which are not integral to other equipment, provide terminal blocks which are insulated, modular, feed-through, clamp style with recessed captive screw-type clamping mechanism, suitable for DIN rail mounting, and which have enclosed sides or end plates and partition plates for separation.

2.4.2 Control Wiring for Binary Signals

For Control Wiring for Binary Signals, provide 18 AWG (1.02 mm diameter) 18 AWG copper or thicker wire rated for 300-volt service.

2.4.3 Control Wiring for Analog Signals

For Control Wiring for Analog Signals, provide 18 AWG (1.02 mm diameter) 18 AWG or thicker, copper, single- or multiple-twisted wire meeting the following requirements:
a. minimum 50 mm (2 inch) 2 inch lay of twist
b. 100 percent shielded pairs
c. at least 300-volt insulation
d. each pair has a 20 AWG tinned-copper drain wire and individual overall pair insulation
e. cables have an overall aluminum-polyester or tinned-copper cable-shield tape, overall 20 AWG tinned-copper cable drain wire, and overall cable insulation.

2.4.4 Power Wiring for Control Devices
For 24-volt circuits, provide insulated copper 18 AWG or thicker wire rated for 300 VAC service. For 120-volt circuits, provide 14 AWG or thicker stranded copper wire rated for 600-volt service.

2.4.5 Transformers
Provide UL 5085-3 approved transformers. Select transformers sized so that the connected load is no greater than 80 percent of the transformer rated capacity.

2.5 AUTOMATIC CONTROL VALVES

**************************************************************************
NOTE: Ball valves are generally less expensive than globe valves, but because of potential cavitation problems should only be used in 2-position and chilled water applications. It is recommended that you coordinate their use with the local maintenance staff because unlike globe valves, maintenance is more likely to require complete removal of the valve.

Show each valve's Kv (m^3/hr) and/or Cv (gal/min) on the Valve Schedule. Kv = 0.857 x Cv. Modulating control valves should be sized for maximum full flow pressure drop between 50 percent and 100 percent (typically between 21 - 34 kPa 3 - 5 psig of the branch circuit it is controlling. Two position valves must be the same size as the connected piping.

Valves having class IV leakage ratings are typically used in process applications rather than HVAC. Class III leakage ratings are typical for HVAC applications unless strict environmental control is required.
**************************************************************************

Provide valves with stainless-steel stems and stuffing boxes with extended necks to clear the piping insulation. Provide valves with bodies meeting ASME B16.34 or ASME B16.15 pressure and temperature class ratings based on the design operating temperature and 150 percent of the system design operating pressure. Unless otherwise specified or indicated, provide valves meeting FCI 70-2 [Class III leakage rating][Class IV leakage rating]. Provide valves rated for modulating or two-position service as indicated, which close against a differential pressure indicated as the
Close-Off pressure and which are Normally-Open, Normally-Closed, or Fail-In-Last-Position as indicated.

2.5.1 Valve Type

**************************************************************************
NOTE: Special attention must be paid to system pressure for hot water applications. Ball valves are more susceptible to cavitation than globe valves having the same pressure drop due to higher internal velocities in the ball valve. To prevent cavitation within the valve, the designer may need to increase the hydronic system pressure. Cavitation can occur when using ball valves for hot water service due to the increased internal velocity through the ball valve. The designer should take into consideration the drop in system pressure through the valve to prevent cavitation at the outlet of the valve.
**************************************************************************

2.5.1.1 Liquid Service 150 Degrees F or Less

Use either globe valves or ball valves except that butterfly valves may be used for sizes 100 mm 4 inch and larger.

2.5.1.2 Liquid Service Above 150 Degrees F

a. Two-position valves: Use either globe valves or ball valves except that butterfly valves may be used for sizes 100 mm 4 inch and larger.

b. Modulating valves: Use globe valves except that butterfly valves may be used for sizes 100 mm 4 inch and larger.

2.5.1.3 Steam Service

Use globe valves except that butterfly valves may be used for sizes 100 mm 4 inch and larger.

2.5.2 Valve Flow Coefficient and Flow Characteristic

2.5.2.1 Two-Way Modulating Valves

Provide the valve coefficient \( (K_v) \) \( (C_v) \) indicated. Provide equal-percentage flow characteristic for liquid service except for butterfly valves. Provide linear flow characteristic for steam service except for butterfly valves.

2.5.2.2 Three-Way Modulating Valves

Provide the valve coefficient \( (K_v) \) \( (C_v) \) indicated. Provide linear flow characteristic with constant total flow throughout full plug travel.

2.5.3 Two-Position Valves

Use full line size full port valves with maximum available \( (K_v) \) \( (C_v) \).
2.5.4  Globe Valves

2.5.4.1  Liquid Service Not Exceeding 66 Degrees C 150 Degrees F

a. Valve body and body connections:

   (1) valves 38 mm 1-1/2 inches and smaller: brass or bronze body, with threaded or union ends

   (2) valves from 51 mm to 76 mm 2 inches to 3 inches inclusive: brass, bronze, or iron bodies. 51 millimeters2 inch valves with threaded connections; 63 to 76 mm 2-1/2 to 3 inches valves with flanged connections

b. Internal valve trim: Brass or bronze.

c. Stems: Stainless steel.

d. Provide valves compatible with a solution of 50 percent ethylene or propylene glycol.

2.5.4.2  Liquid Service Not Exceeding 121 Degrees C 250 Degrees F

a. Valve body and body connections:

   (1) valves 38 mm 1-1/2 inches and smaller: brass or bronze body, with threaded or union ends

   (2) valves from 51 mm to 76 mm 2 inches to 3 inches inclusive: brass, bronze, or iron bodies. 51 millimeters2 inch valves with threaded connections; 63 to 76 mm 2-1/2 to 3 inches valves with flanged connections

b. Internal trim: Type 316 stainless steel including seats, seat rings, modulation plugs, valve stems, and springs.

c. Provide valves with non-metallic parts suitable for a minimum continuous operating temperature of 121 degrees C 250 degrees F or 28 degrees C 50 degrees F above the system design temperature, whichever is higher.

d. Provide valves compatible with a solution of 50 percent ethylene or propylene glycol

2.5.4.3  Hot water service 121 Degrees C 250 Degrees F and above

a. Provide valve bodies conforming to ASME B16.34 Class 300. For valves 25 mm 1 inch and larger provide valves with bodies which are carbon steel, globe type with welded ends. For valves smaller than 25 mm 1 inch provide valves with socket-weld ends. Provide valves with virgin polytetrafluoroethylene (PTFE) packing. Provide valve and actuator combinations which are normally closed.

b. Internal trim: Type 316 stainless steel including seats, seat rings, modulation plugs, valve stems, and springs.

2.5.4.4  Steam Service

**************************************************************************
For modulating valves at 103 kPa 15 psig or less inlet steam pressure, the design pressure drop should be 80 percent of the inlet gauge pressure. Higher than 103 kPa 15 psig inlet steam pressure, the pressure drop must be 42 percent of the inlet absolute pressure.

For steam service, provide valves meeting the following requirements:

a. Valve body and connections:

   (1) valves 38 mm 1-1/2 inches and smaller: complete body of brass or bronze, with threaded or union ends

   (2) valves from 51 mm to 76 mm 2 inches to 3 inches inclusive: body of brass, bronze, or carbon steel

   (3) valves 100 mm 4 inches and larger: body of carbon steel. 50 mm 2 inch valves with threaded connections; valves 63 mm 2-1/2 inches and larger with flanged connections.

b. Internal Trim: Type 316 stainless steel including seats, seat rings, modulation plugs, valve stems, and springs.

c. Valve sizing: sized for [103.4 kPa] [15 psig] [_____] inlet steam pressure with a maximum [83 kPa] [12 psi] [_____] differential through the valve at rated flow, except where indicated otherwise.

2.5.5 Ball Valves

2.5.5.1 Liquid Service Not Exceeding 66 Degrees C 150 Degrees F

a. Valve body and connections:

   (1) valves 38 mm 1-1/2 inches and smaller: bodies of brass or bronze, with threaded or union ends

   (2) valves from 51 mm to 76 mm 2 inches to 3 inches inclusive: bodies of brass, bronze, or iron. 50 mm 2 inch valves with threaded connections; valves from 63 to 76 mm 2-1/2 to 3 inches with flanged connections.

b. Ball: Stainless steel or nickel-plated brass or chrome-plated brass.

c. Seals: Reinforced Teflon seals and EPDM O-rings.

e. Provide valves compatible with a solution of 50 percent ethylene or propylene glycol.

2.5.6 Butterfly Valves

Provide butterfly valves which are threaded lug type suitable for dead-end service and modulation to the fully-closed position, with carbon-steel bodies or with ductile iron bodies in accordance with ASTM A536. Provide butterfly valves with non-corrosive discs, stainless steel shafts supported by bearings, and EPDM seats suitable for temperatures from -28.9 to +121.1
degrees C -20 to +250 degrees F. Provide valves with rated Kv Cv of the Kv Cv at 70 percent (60 degrees) open position. Provide valves meeting FCI 70-2 Class VI leakage rating.

2.5.7 Pressure Independent Control Valves (PICV)

******************************************************************************
NOTE: Pressure independent control valves minimize flow fluctuations due to changes in piping pressure. These valves are more expensive than other control valve options, but can provide more steady process control where fast changes in piping pressure are expected.
******************************************************************************

Provide pressure independent control valves which include a regulator valve which maintains the differential pressure across a flow control valve. Pressure independent control valves must accurately control the flow from 0-100 percent full rated flow regardless of changes in the piping pressure and not vary the flow more than plus or minus 5 percent at any given flow control valve position when the PICV differential pressure lies between the manufacturer's stated minimum and maximum. The rated minimum differential pressure for steady flow must not exceed 34.5 kPa 5 psid across the PICV. Provide either globe or ball type valves meeting the indicated requirements for globe and ball valves. Provide valves with a flow tag listing full rated flow and minimum required pressure drop. Provide valves with factory installed Pressure/Temperature ports ("Pete's Plugs") to measure the pressure drop to determine the valve flow rate.

2.5.8 Duct-Coil and Terminal-Unit-Coil Valves

For duct or terminal-unit coils provide control valves with either [flare-type][screw type] or solder-type ends. Provide flare nuts for each flare-type end valve.

2.6 DAMPERS

2.6.1 Damper Assembly

Provide single damper sections with blades no longer than 1.2 m 48 inches and which are no higher than 1.8 m 72 inches and damper blade width of 203 mm 8 inches or less. When larger sizes are required, combine damper sections. Provide dampers made of steel, or other materials where indicated and with assembly frames constructed of 2.8 mm 0.07 inch minimum thickness [galvanized][stainless] steel channels with mitered and welded corners. Steel channel frames constructed of 1.5 mm 0.06 inch minimum thickness are acceptable provided the corners are reinforced.

a. Flat blades must be made rigid by folding the edges. Blade-operating linkages must be within the frame so that blade-connecting devices within the same damper section must not be located directly in the air stream.

b. Damper axles must be 13 mm 1/2 inch minimum, plated steel rods supported in the damper frame by stainless steel or bronze bearings. Blades mounted vertically must be supported by thrust bearings.

c. Provide dampers which do not exceed a pressure drop through the damper of 10 Pa 0.04 inches water gauge at 5 m/s 1000 ft/min in the wide-open
2.6.2 Operating Linkages

For operating links external to dampers, such as crank arms, connecting rods, and line shafting for transmitting motion from damper actuators to dampers, provide links able to withstand a load equal to at least 300 percent of the maximum required damper-operating force without deforming. Rod lengths must be adjustable. Links must be brass, bronze, zinc-coated steel, or stainless steel. Working parts of joints and clevises must be brass, bronze, or stainless steel. Adjustments of crank arms must control the open and closed positions of dampers.

2.6.3 Damper Types

******************************************************************************

NOTE: As of July 2009, UFC 4-010-01 requires a maximum OA damper leakage of 15 L/s per square meter at 249 Pa 3 cfm per square foot at 1 iwc static, which is a Class 1A damper. If this UFC or a similar requirement for a low-leakage damper is applicable to the project select Class 1A.

Otherwise:
1) If the application is in a very cold climate or where the system runs continuously consider selecting Class 1.

2) In other flow control applications select Class 2

For reference only, AMCA 511 leakage classifications at 1017 Pa 4 iwc static are:
Class 1A: N/A.

Class 1: 41 L/s per square meter 8 cfm per square foot of damper area.

Class 2: 102 L/s per square meter 20 cfm per square foot of damper area.

Class 3: 406 L/s per square meter 80 cfm per square foot of damper area.

AMCA 511 leakage classifications at 256 Pa 1 iwc static are:
Class 1A: 15 L/s per square meter 3 cfm per square foot of damper area.

Class 1: 20 L/s per square meter 4 cfm per square foot of damper area.

******************************************************************************

2.6.3.1 Flow Control Dampers

Provide parallel-blade or opposed blade type dampers for outside air, return air, relief air, exhaust, face and bypass dampers as indicated on the Damper Schedule. Blades must have interlocking edges. The channel
frames of the dampers must be provided with jamb seals to minimize air leakage. Unless otherwise indicated, dampers must meet AMCA 511 [Class 1A][Class 1][Class 2] requirements. Outside air damper seals must be suitable for an operating temperature range of -40 to +75 degrees C -40 to +167 degrees F. Dampers must be rated at not less than 10 m/s 2000 ft/min air velocity.

2.6.3.2 Mechanical Rooms and Other Utility Space Ventilation Dampers

Provide utility space ventilation dampers as indicated. Unless otherwise indicated provide AMCA 511 class 3 dampers. Provide dampers rated at not less than 7.6 m/s 1500 ft/min air velocity.

2.6.3.3 Smoke Dampers

Provide smoke-damper and actuator assemblies which meet the current requirements of NFPA 90A, UL 555, and UL 555S. For combination fire and smoke dampers provide dampers rated for 121 degrees C 250 degrees F Class II leakage per UL 555S.

2.7 SENSORS AND INSTRUMENTATION

Unless otherwise specified, provide sensors and instrumentation which incorporate an integral transmitter. Sensors and instrumentation, including their transmitters, must meet the specified accuracy and drift requirements at the input of the connected DDC Hardware's analog-to-digital conversion.

2.7.1 Analog and Binary Transmitters

Provide transmitters which match the characteristics of the sensor. Transmitters providing analog values must produce a linear 4-20 mA, 0-10 Vdc signal corresponding to the required operating range and must have zero and span adjustment. Transmitters providing binary values must have dry contacts rated at 1A at 24 Volts AC.

2.7.2 Network Transmitters

Sensors and Instrumentation incorporating an integral network connection are considered DDC Hardware and must meet the DDC Hardware requirements of Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS when used in a Lonworks network, or the requirements of 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS when used in a BACnet network.

2.7.3 Temperature Sensors

Provide the same sensor type throughout the project. Temperature sensors may be provided without transmitters. Where transmitters are used, the range must be the smallest available from the manufacturer and suitable for the application such that the range encompasses the expected range of temperatures to be measured. The end to end accuracy includes the combined effect of sensitivity, hysteresis, linearity and repeatability between the measured variable and the end user interface (graphic presentation) including transmitters if used.
2.7.3.1  Sensor Accuracy and Stability of Control

2.7.3.1.1  Conditioned Space Temperature

Plus or minus 0.3 degrees C 0.5 degree F over the operating range.

2.7.3.1.2  Unconditioned Space Temperature

a. Plus or minus 0.6 degrees C 1 degree F over the range of -1 to +55 degrees C 30 to 131 degrees F AND

b. Plus or minus 2 degrees C 4 degrees F over the rest of the operating range.

2.7.3.1.3  Duct Temperature

Plus or minus 0.3 degrees C 0.5 degree F.

2.7.3.1.4  Outside Air Temperature

a. Plus or minus 1 degree C 2 degrees F over the range of -35 to +55 degrees C -30 to +130 degrees F AND

b. Plus or minus 0.6 degrees C 1 degree F over the range of -1 to +40 degrees C 30 to 130 degrees F.

2.7.3.1.5  High Temperature Hot Water

Plus or minus 2 degrees C 3.6 degrees F.

2.7.3.1.6  Chilled Water

Plus or minus 0.4 degrees C 0.8 degrees F over the range of 2 to 18 degrees C 35 to 65 degrees F.

2.7.3.1.7  Dual Temperature Water

Plus or minus 1 degree C 2 degrees F.

2.7.3.1.8  Heating Hot Water

Plus or minus 1 degree C 2 degrees F.

2.7.3.1.9  Condenser Water

Plus or minus 1 degree C 2 degrees F.

2.7.3.2  Transmitter Drift

The maximum allowable transmitter drift: 0.1 degrees C 0.25 degrees F per year.

2.7.3.3  Point Temperature Sensors

Point Sensors must be encapsulated in epoxy, series 300 stainless steel, anodized aluminum, or copper.
2.7.3.4 Temperature Sensor Details

2.7.3.4.1 Room Type

Provide the sensing element components within a decorative protective cover suitable for surrounding decor.

2.7.3.4.2 Duct Probe Type

Ensure the probe is long enough to properly sense the air stream temperature.

2.7.3.4.3 Duct Averaging Type

Continuous averaging sensors must be one foot in length for each 0.1 square m 1 square foot of duct cross-sectional area, and a minimum length of 1.5 m 5 feet.

2.7.3.4.4 Pipe Immersion Type

For pipes with larger than 7.6 cm 3 inch diameter, provide minimum 7.6 cm 3 inch immersion. For pipes with less than 7.6 cm 3 inch diameter, provide immersion at least half the diameter of the pipe. Provide each sensor with a corresponding pipe-mounted sensor well, unless indicated otherwise. Sensor wells must be stainless steel when used in steel piping, and brass when used in copper piping.

2.7.3.4.5 Outside Air Type

Provide the sensing element rated for outdoor use.

2.7.4 Relative Humidity Sensor

**************************************************************************

NOTE: 3 percent RH Accuracy may be sufficient for typical comfort cooling applications. For applications with more stringent requirements, a 2 percent RH accuracy may be desired.

**************************************************************************

Relative humidity sensors must use bulk polymer resistive or thin film capacitive type non-saturating sensing elements capable of withstanding a saturated condition without permanently affecting calibration or sustaining damage. The sensors must include removable protective membrane filters. Where required for exterior installation, sensors must be capable of surviving below freezing temperatures and direct contact with moisture without affecting sensor calibration. When used indoors, the sensor must be capable of being exposed to a condensing air stream (100 percent relative humidity) with no adverse effect to the sensor's calibration or other harm to the instrument. The sensor must be of the wall-mounted or duct-mounted type, as required by the application, and must be provided with any required accessories. Sensors used in duct high-limit applications must have a bulk polymer resistive sensing element. Duct-mounted sensors must be provided with a duct probe designed to protect the sensing element from dust accumulation and mechanical damage. Relative humidity (RH) sensors must measure relative humidity over a range of 0 percent to 100 percent with an accuracy of plus or minus [2][3] percent. RH sensors must function over a temperature range of 4.4 to 57.2 degrees C 40 to 135 degrees F and must not drift more than 1 percent per year.
2.7.5 Carbon Dioxide (CO2) Sensors

Provide photometric type CO2 sensors with integral transducers and linear output. Carbon dioxide (CO2) sensors must measure CO2 concentrations between 0 to 2000 parts per million (ppm) using non-dispersible infrared (NDIR) technology with an accuracy of plus or minus 50 ppm and a maximum response time of 1 minute. The sensor must be rated for operation at ambient air temperatures within the range of 0 to 50 degrees C (32 to 122 degrees F) and relative humidity within the range of 20 to 95 percent (non-condensing). The sensor must have a maximum drift of 2 percent per year. The sensor chamber must be manufactured with a non-corrosive material that does not affect carbon dioxide sample concentration. Duct mounted sensors must be provided with a duct probe designed to protect the sensing element from dust accumulation and mechanical damage. The sensor must have a calibration interval no less than 5 years.

2.7.6 Differential Pressure Instrumentation

2.7.6.1 Differential Pressure Sensors

Provide Differential Pressure Sensors with ranges as indicated or as required for the application. Pressure sensor ranges must not exceed the high end range indicated on the Points Schedule by more than 50 percent. The over pressure rating must be a minimum of 150 percent of the highest design pressure of either input to the sensor. The accuracy must be plus or minus 1 percent of full scale. The sensor must have a maximum drift of 2 percent per year.

2.7.6.2 Differential Pressure Switch

Provide differential pressure switches with a user-adjustable setpoint which are sized for the application such that the setpoint is between 25 percent and 75 percent of the full range. The over pressure rating must be a minimum of 150 percent of the highest design pressure of either input to the sensor. The switch must have two sets of contacts and each contact must have a rating greater than it's connected load. Contacts must open or close upon rise of pressure above the setpoint or drop of pressure below the setpoint as indicated.

2.7.7 Flow Sensors

2.7.7.1 Airflow Measurement Array (AFMA)

Provide airflow measurement arrays with ranges as indicated or as required for the application. The airflow measurement array must be rated for operation at ambient air temperatures within the range of 0 to 50 degrees C (32 to 122 degrees F) and relative humidity within the range of 20 to 95 percent (non-condensing). The airflow measurement array must have a maximum drift of 2 percent per year. The airflow measurement array must have a calibration interval no less than 5 years.
at velocities below 400 fpm, outside influences (building pressure, wind velocities, etc.) have a greater effect on the repeatability. When sizing AFMS for applications where the minimum OA and economizer functions are combined into one AFMS (and associated damper), a review of the conditions at the minimum OA flow is prudent to make sure the desired AFMS can accurately read at this design point.

2.7.7.1.1 Airflow Straightener

Provide AFMAs which contain an airflow straightener if required by the AFMA manufacturer's published installation instructions. The straightener must be contained inside a flanged sheet metal casing, with the AFMA located as specified according to the published recommendation of the AFMA manufacturer. In the absence of published documentation, provide airflow straighteners if there is any duct obstruction within 5 duct diameters upstream of the AFMA. Air-flow straighteners, where required, must be constructed of 3 mm 0.125 inch aluminum honeycomb and the depth of the straightener must not be less than 40 mm 1.5 inches.

2.7.7.1.2 Resistance to Airflow

The resistance to air flow through the AFMA, including the airflow straightener must not exceed 20 Pa 0.085 inch water gauge at an airflow of 10 m/s 2,000 fpm. AFMA construction must be suitable for operation at airflows of up to 25 m/s 5000 fpm over a temperature range of 4 to 49 degrees C 40 to 120 degrees F.

2.7.7.1.3 Outside Air Temperature

NOTE: Ensure that outside air temperature range is appropriate for the environment at the project site, and provide a range if it’s not.

In outside air measurement or in low-temperature air delivery applications, provide an AFMA certified by the manufacturer to be accurate as specified over a temperature range of [-29 to +49 degrees C-20 to +120 degrees F] [____].

2.7.7.1.4 Pitot Tube AFMA

Each Pitot Tube AFMA must contain an array of velocity sensing elements. The velocity sensing elements must be of the multiple pitot tube type with averaging manifolds. The sensing elements must be distributed across the duct cross section in the quantity and pattern specified or recommended by the published installation instructions of the AFMA manufacturer.

a. Pitot Tube AFMAs for use in airflows over 3.0 m/s 600 fpm must have an accuracy of plus or minus 5 percent over a range of 2.5 to 12.5 m/s 500 to 2500 fpm.

b. Pitot Tube AFMAs for use in airflows under 3.0 m/s 600 fpm must have an accuracy of plus or minus 5 percent over a range of 0.6 to 12.5 m/s 125 to 2500 fpm.
2.7.7.1.5 Electronic AFMA

Each electronic AFMA must consist of an array of velocity sensing elements of the resistance temperature detector (RTD) or thermistor type. The sensing elements must be distributed across the duct cross section in the quantity and pattern specified or recommended by the published application data of the AFMA manufacturer. Electronic AFMAs must have an accuracy of plus or minus 5 percent over a range of 0.6 to 12.5 m/s 125 to 5,000 fpm and the output must be temperature compensated over a range of 0 to 100 degrees C 32 to 212 degrees F.

2.7.7.1.6 Fan Inlet Measurement Devices

Fan inlet measurement devices cannot be used unless indicated on the drawings or schedules.

2.7.7.2 Orifice Plate

Orifice plate must be made of an austenitic stainless steel sheet of 3. mm 0.125 inch nominal thickness with an accuracy of plus or minus 1 percent of full flow. The orifice plate must be flat within 0.1 mm 0.002 inches. The orifice surface roughness must not exceed 0.5 µm 20 micro-inches. The thickness of the cylindrical face of the orifice must not exceed 2 percent of the pipe inside diameter or 12.5 percent of the orifice diameter, whichever is smaller. The upstream edge of the orifice must be square and sharp. Where orifice plates are used, concentric orifice plates must be used in all applications except steam flow measurement in horizontal pipelines.

2.7.7.3 Flow Nozzle

Flow nozzle must be made of austenitic stainless steel with an accuracy of plus or minus 1 percent of full flow. The inlet nozzle form must be elliptical and the nozzle throat must be the quadrant of an ellipse. The thickness of the nozzle wall and flange must be such that distortion of the nozzle throat from strains caused by the pipeline temperature and pressure, flange bolting, or other methods of installing the nozzle in the pipeline must not cause the accuracy to degrade beyond the specified limit. The outside diameter of the nozzle flange or the design of the flange facing must be such that the nozzle throat must be centered accurately in the pipe.

2.7.7.4 Venturi Tube

Venturi tube must be made of cast iron or cast steel and must have an accuracy of plus or minus 1 percent of full flow. The throat section must be lined with austenitic stainless steel. Thermal expansion characteristics of the lining must be the same as that of the throat casting material. The surface of the throat lining must be machined to a plus or minus 1.2 µm 50 micro inch finish, including the short curvature leading from the converging entrance section into the throat.

2.7.7.5 Annular Pitot Tube

Annular pitot tube must be made of austenitic stainless steel with an accuracy of plus or minus 2 percent of full flow and a repeatability of plus or minus 0.5 percent of measured value. The unit must have at least one static port and no less than four total head pressure ports with an averaging manifold.
2.7.7.6 Insertion Turbine Flowmeter

Provide dual axial turbine flowmeter with all installation hardware necessary to enable insertion and removal of the meter without system shutdown. All parts must meet or exceed the pressure classification of the pipe system it is installed in. Insertion Turbine Flowmeter accuracy must be plus or minus 0.5 percent of rate at calibrated velocity, within plus or minus of rate over a 10:1 turndown and within plus or minus 2 percent of rate over a 50:1 turndown. Repeatability must be plus or minus 0.25 percent of reading. The meter flow sensing element must operate over a range suitable for the installed location with a pressure loss limited to 1 percent of operating pressure at maximum flow rate. The flowmeter, must include either dry contact pulse outputs, 4-20mA, 0-10Vdc or 0-5Vdc outputs. The turbine rotor assembly must be constructed of Series 300 stainless steel and use Teflon seals.

2.7.7.7 Vortex Shedding Flowmeter

Vortex Shedding Flowmeter accuracy must be within plus or minus 0.8 percent of the actual reading over the range of the meter. Steam meters must contain density compensation by direct measurement of temperature. Mass flow inferred from specified steam pressure are not acceptable. The flowmeter body must be made of austenitic stainless steel and include a weather tight NEMA 4X electronics enclosure. The vortex shedding flowmeter body must not require removal from the piping in order to replace the shedding sensor.

2.7.7.8 Ultrasonic Flow Meter

Provide Ultrasonic Flow Meters complete with matched transducers, self aligning installation hardware and transducer cables. Ultrasonic transducers must be optimized for the specific pipe and process conditions for the application. The flow meter accuracy must plus or minus 1 percent of rate from 0.3 to 12 meters/sec 0 to 40 ft/sec. The flowmeter must include either dry contact pulse outputs, 4-20mA, 0-10Vdc or 0-5Vdc output.

2.7.7.9 Insertion Magnetic Flow Meter

Provide insertion type magnetic flowmeters with all installation hardware necessary to enable insertion and removal of the meter without system shutdown. All parts must meet or exceed the pressure classification of the pipe system it is installed in. Flowmeter accuracy must be no greater than plus or minus 1 percent of rate from 0.6 to 6 meters/sec 2 to 20 feet/sec. Wetted material parts must be 300 series stainless steel. The flowmeter must include either dry contact pulse outputs, 4-20mA, 0-10Vdc or 0-5Vdc outputs.

2.7.7.10 Positive Displacement Flow Meter

The flow meter must be a direct reading, gerotor, nutating disc or vane type displacement device rated for liquid service as indicated. A counter must be mounted on top of the meter, and must consist of a non-resettable mechanical totalizer for local reading, and a pulse transmitter for remote reading. The totalizer must have a six digit register to indicate the volume passed through the meter in [liters] [gallons], and a sweep-hand dial to indicate down to 1 L 0.25 gallons. The pulse transmitter must have a hermetically sealed reed switch which is activated by magnets fixed on gears of the counter. The meter must have a bronze body with threaded or
flanged connections as required for the application. Output accuracy must be plus or minus 2 percent of the flow range. The maximum pressure drop at full flow must be 34 kPa 5 psig.

2.7.7.11 Flow Meters, Paddle Type

Sensor must be non-magnetic, with forward curved impeller blades designed for water containing debris. Sensor accuracy must be plus or minus 1 percent of rate of flow, minimum operating flow velocity must be 0.3 meters/second 1 foot per second. Sensor repeatability and linearity must be plus or minus 1 percent. Materials which will be wetted must be made from non-corrosive materials and must not contaminate water. The sensor must be rated for installation in pipes of 76 mm to 1 m 3 to 40 inch diameters. The transmitter housing must be a NEMA 250 Type 4 enclosure.

2.7.7.12 Flow Switch

Flow switch must have a repetitive accuracy of plus or minus 10 percent of actual flow setting. Switch actuation must be adjustable over the operating flow range, and must be sized for the application such that the setpoint is between 25 percent and 75 percent of the full range.. The switch must have Form C snap-action contacts, rated for the application. The flow switch must have non flexible paddle with magnetically actuated contacts and be rated for service at a pressure greater than the installed conditions. Flow switch for use in sewage system must be rated for use in corrosive environments encountered.

2.7.7.13 Gas Flow Meter

Gas flow meter must be diaphragm or bellows type (gas positive displacement meters) for flows up to 19.7 L/sec 2500 SCFH and axial flow turbine type for flows above 19.7 L/sec 2500 SCFH, designed specifically for natural gas supply metering, and rated for the pressure, temperature, and flow rates of the installation. Meter must have a minimum turndown ratio of 10 to 1 with an accuracy of plus or minus 1 percent of actual flow rate. The meter index must include a direct reading mechanical totalizing register and electrical impulse dry contact output for remote monitoring. The electrical impulse dry contact output must not require field adjustment or calibration. The electrical impulse dry contact output must have a minimum resolution of 3 cubic meters 100 cubic feet of gas per pulse and must not exceed 15 pulses per second at the design flow.

2.7.8 Electrical Instruments

Provide Electrical Instruments with an input range as indicated or sized for the application. Unless otherwise specified, AC instrumentation must be suitable for 60 Hz operation.

2.7.8.1 Current Transducers

**************************************************************************
NOTE: Select the required accuracy for current transducers. Note that higher accuracy transducers will be more expensive and will likely require a more expensive/better quality controller.
**************************************************************************

Current transducers must accept an AC current input and must have an accuracy of plus or minus [0.5] [2] percent of full scale. The device must
have a means for calibration. Current transducers for variable frequency applications must be rated for variable frequency operation.

2.7.8.2 Current Sensing Relays (CSRs)

Current sensing relays (CSRs) must provide a normally-open contact with a voltage and amperage rating greater than its connected load. Current sensing relays must be of split-core design. The CSR must be rated for operation at 200 percent of the connected load. Voltage isolation must be a minimum of 600 volts. The CSR must auto-calibrate to the connected load or be adjustable and field calibrated. Current sensors for variable frequency applications must be rated for variable frequency operation.

2.7.8.3 Voltage Transducers

Voltage transducers must accept an AC voltage input and have an accuracy of plus or minus 0.25 percent of full scale. The device must have a means for calibration. Line side fuses for transducer protection must be provided.

2.7.8.4 Energy Metering

2.7.8.4.1 Watt or Watthour Transducers

Watt transducers must measure voltage and current and must output kW or kWh or both kW and kWh as indicated. kW outputs must have an accuracy of plus or minus 0.5 percent over a power factor range of 0.1 to 1. kWh outputs must have an accuracy of plus or minus 0.5 percent over a power factor range of 0.1 to 1.

2.7.8.4.2 Watthour Revenue Meter (with and without Demand Register)

**************************************************************************
NOTE: The intent of including meters in this Section is for energy monitoring as may be required for interface to a UMCS. Meters are typically only required by this Section for retrofit applications. Coordination of meter installation and meter requirements with other specifications may be required.

Select the revenue meter accuracy as required for the application. For most applications, the 0.5 accuracy class should be suitable/sufficient. (Note the 0.5 accuracy class allows a 0.5 percent error, while the 0.2 class allows 0.2 percent).
**************************************************************************

All Watthour revenue meters must measure voltage and current and must be in accordance with ANSI C12.1 with an ANSI C12.20 Accuracy class of [0.5] [0.2] and must have pulse initiators for remote monitoring of Watthour consumption. Pulse initiators must consist of form C contacts with a current rating not to exceed two amperes and voltage not to exceed 500 V, with combinations of VA not to exceed 100 VA, and a life rating of one billion operations. Meter sockets must be in accordance with NEMA/ANSI C12.10. Watthour revenue meters with demand registers must output instantaneous demand in addition to the pulse initiators.
2.7.8.4.3 Steam Meters

Steam meters must be the vortex type, with pressure compensation, a minimum turndown ratio of 10 to 1, and an output signal compatible with the DDC system.

2.7.8.4.4 Hydronic BTU Meters

The BTU meter is to be supplied with wall mount hardware and be capable of being installed remote from the flow meter. The BTU meter must include an LCD display for local indication of energy rate and for display of parameters and settings during configuration. Each BTU meter must be factory configured for its specific application and be completely field configurable by the user via a front panel keypad (no special interface device or computer required). The unit must output Energy Rate, Energy Total, Flow Rate, Supply Temperature, and Return Temperature. An integral transmitter is to provide a linear analog or configurable pulse output signal representing the energy rate; and the signal must be compatible with building automation system DDC Hardware to which the output is connected.

2.7.9 pH Sensor

The sensor must be suitable for applications and chemicals encountered in water treatment systems of boilers, chillers and condenser water systems. Construction, wiring, fittings and accessories must be corrosion and chemical resistant with fittings for tank or suspension installation. Housing must be polyvinylidene fluoride with O-rings made of chemical resistant materials which do not corrode or deteriorate with extended exposure to chemicals. The sensor must be encapsulated. Periodic replacement must not be required for continued sensor operation. Sensors must use a ceramic junction and pH sensitive glass membrane capable of withstanding a pressure of 689 kPa at 66 degrees C 100 psig at 150 degrees F. The reference cell must be double junction configuration. Sensor range must be 0 to 12 pH, stability 0.05, sensitivity 0.02, and repeatability of plus or minus 0.05 pH value, response of 90 percent of full scale in one second and a linearity of 99 percent of theoretical electrode output measured at 24 degrees C 76 degrees F.

2.7.10 Oxygen Analyzer

Oxygen analyzer must consist of a zirconium oxide sensor for continuous sampling and an air-powered aspirator to draw flue gas samples. The analyzer must be equipped with filters to remove flue air particles. Sensor probe temperature rating must be 435 degrees C 815 degrees F. The sensor assembly must be equipped for flue flange mounting.

2.7.11 Carbon Monoxide Analyzer

**************************************************************************
NOTE: Enter the range for the CO Analyzer
**************************************************************************

Carbon monoxide analyzer must consist of an infrared light source in a weather proof steel enclosure for duct or stack mounting. An optical detector/analyzer in a similar enclosure, suitable for duct or stack mounting must be provided. Both assemblies must include internal blower systems to keep optical windows free of dust and ash at all times. The third component of the analyzer must be the electronics cabinet. Automatic flue gas temperature compensation and manual/automatic zeroing devices must
be provided. Unit must read parts per million (ppm) of carbon monoxide in the range of \([___]\) to \([___]\) ppm and the response time must be less than 3 seconds to 90 percent value. Unit measurement range must not exceed specified range by more than 50 percent. Repeatability must be plus or minus 1 percent of full scale with an accuracy of plus or minus 1 percent of full scale.

2.7.12 Occupancy Sensors

**************************************************************************

NOTE: Avoid using occupancy sensors with instant start fluorescent ballasts for instant start of lamps because they shorten the lamp life. Use only rapid start fluorescent ballasts.

Show which type of occupancy sensor to use drawings: Ultrasonic sensors are best suited for spaces with partitions or dividers; Infrared sensors are best suited in line-of-sight applications. Dual mode sensor are available for situations where only one mode will not adequately identify occupancy.

Show occupancy sensor mounting location on drawings. Office furniture is less likely to interfere with (block) ceiling mounted sensors. In retrofit applications, occupancy sensors can be installed in place of existing light switches.

Dual-technology sensors (one sensor incorporating both types) ordinarily turn lighting ON when both technologies sense occupancy. Then, detection by either technology will hold lighting ON.

**************************************************************************

Occupancy sensors must have occupancy-sensing sensitivity adjustment and an adjustable off-delay timer with a setpoint of 15 minutes. Adjustments accessible from the face of the unit are preferred. Occupancy sensors must be rated for operation in ambient air temperatures ranging from 5 to 35 degrees C 40 to 95 degrees F or temperatures normally encountered in the installed location. Sensors integral to wall mount on-off light switches must have an auto-off switch. Wall switch sensors must be decorator style and must fit behind a standard decorator type wall plate. All occupancy sensors, power packs, and slave packs must be UL listed. In addition to any outputs required for lighting control, the occupancy sensor must provide an output for the HVAC control system.

2.7.12.1 Passive Infrared (PIR) Occupancy Sensors

PIR occupancy sensors must have a multi-level, multi-segmented viewing lens and a conical field of view with a viewing angle of 180 degrees and a detection of at least 6 m 20 feet unless otherwise indicated or specified. PIR Sensors must provide field-adjustable background light-level adjustment with an adjustment range suitable to the light level in the sensed area, room or space. PIR sensors must be immune to false triggering from RFI and EMI.

2.7.12.2 Ultrasonic Occupancy Sensors

Ultrasonic sensors must operate at a minimum frequency 32 kHz and must be
designed to not interfere with hearing aids.

2.7.12.3 Dual-Technology Occupancy Sensor (PIR and Ultrasonic)

Dual-Technology Occupancy Sensors must meet the requirements of both PIR and Ultrasonic Occupancy Sensors.

2.7.13 Vibration Switch

Vibration switch must be solid state, enclosed in a NEMA 250 Type 4 or Type 4X housing with sealed wire entry. Unit must have two independent sets of Form C switch contacts with one set to shutdown equipment upon excessive vibration and a second set for monitoring alarm level vibration. The vibration sensing range must be a true rms reading, suitable for the application. The unit must include either displacement response for low speed or velocity response for high speed application. The frequency range must be at least 3 Hz to 500 Hz. Contact time delay must be 3 seconds. The unit must have independent start-up and running delay on each switch contact. Alarm limits must be adjustable and setpoint accuracy must be plus or minus 10 percent of setting with repeatability of plus or minus 2 percent.

2.7.14 Conductivity Sensor

**************************************************************************
NOTE: Remove the bracketed text for new construction (Contractor cannot meet this requirement). For retrofit projects, coordinate with the project site to determine need for this analysis.
**************************************************************************

Sensor must include local indicating meter and must be suitable for measurement of conductivity of water in boilers, chilled water systems, condenser water systems, distillation systems, or potable water systems as indicated. Sensor must sense from 0 to 10 microSiemens per centimeter (µS/cm) for distillation systems, 0 to 100 µS/cm for boiler, chilled water, and potable water systems and 0 to 1000 µS/cm for condenser water systems. Contractor must field verify the ranges for particular applications and adjust the range as required. The output must be temperature compensated over a range of 0 to 100 degrees C 32 to 212 degrees F. The accuracy must be plus or minus 2 percent of the full scale reading. Sensor must have automatic zeroing and must require no periodic maintenance or recalibration.

2.7.15 Compressed Air Dew Point Sensor

Sensor must be suitable for measurement of dew point from -40 +27 degrees C -40 +80 degrees F over a pressure range of 0 to 1 MPa 0 to 150 psig. The transmitter must provide both dry bulb and dew point temperatures on separate outputs. The end to end accuracy of the dew point must be plus or minus 2.8 degrees C 5 degrees F and the dry bulb must be plus or minus 0.6 degrees C 1 degree F. Sensor must be automatic zeroing and must require no normal maintenance or periodic recalibration.

2.7.16 NOx Monitor

Monitor must continuously monitor and give local indication of boiler stack gas for NOx content. It must be a complete system designed to verify compliance with the Clean Air Act standards for NOx normalized to a 3
percent oxygen basis and must have a range of from 0 to 100 ppm. Sensor must be accurate to plus or minus 5 ppm. Sensor must output NOx and oxygen levels and binary output that changes state when the NOx level is above a locally adjustable NOx setpoint. Sensor must have normal, trouble and alarm lights. Sensor must have heat traced lines if the stack pickup is remote from the sensor. Sensor must be complete with automatic zero and span calibration using a timed calibration gas system, and must not require periodic maintenance or recalibration.

2.7.17 Turbidity Sensor

Sensor must include a local indicating meter and must be suitable for measurement of turbidity of water. Sensor must sense from 0 to 1000 Nephelometric Turbidity Units (NTU). Range must be field-verified for the particular application and adjusted as required. The output must be temperature compensated over a range of 0 to 100 degrees C 32 to 212 degrees F. The accuracy must be plus or minus 5 percent of full scale reading. Sensor must have automatic zeroing and must not require periodic maintenance or recalibration.

2.7.18 Chlorine Detector

The detector must measure concentrations of chlorine in water in the range 0 to 20 ppm with a repeatability of plus or minus 1 percent of full scale and an accuracy of plus or minus 2 percent of full scale. The Chlorine Detector transmitter must be housed in a non-corrosive NEMA 250 Type 4X enclosure. Detector must include a local panel with adjustable alarm trip level, local audio and visual alarm with silence function.

2.7.19 Floor Mounted Leak Detector

Leak detectors must use electrodes mounted at slab level with a minimum built-in-vertical adjustment of 3 mm 0.125 inches. Detector must have a binary output. The indicator must be manual reset type.

2.7.20 Temperature Switch

2.7.20.1 Duct Mount Temperature Low Limit Safety Switch (Freezestat)

Duct mount temperature low limit switches (Freezestats) must be manual reset, low temperature safety switches at least 3 meters 1 foot long per square meter square foot of coverage which must respond to the coldest 450 mm 18 inch segment with an accuracy of plus or minus 2 degrees C 3.6 degrees F. The switch must have a field-adjustable setpoint with a range of at least -1 +10 degrees C 30 to 50 degrees F. The switch must have two sets of contacts, and each contact must have a rating greater than its connected load. Contacts must open or close upon drop of temperature below setpoint as indicated and must remain in this state until reset.

2.7.20.2 Pipe Mount Temperature Limit Switch (Aquastat)

Pipe mount temperature limit switches (aquastats) must have a field adjustable setpoint between 15 and 32 degrees C 60 and 90 degrees F, an accuracy of plus or minus 2 degrees C 3.6 degrees F and a 5 degrees C 10 degrees F fixed deadband. The switch must have two sets of contacts, and each contact must have a rating greater than its connected load. Contacts must open or close upon change of temperature above or below setpoint as indicated.
2.7.21 Damper End Switches

**************************************************************************

NOTE: If the HVAC system design includes smoke dampers in the return air and fan discharge, or other dampers requiring end switches, show the end switches on drawings.

Dampers that have the potential to close off all airflow to/from a fan should have end switches providing an interlock with the fan control circuit. Interlock should be active in all modes (Hand, Automatic and Bypass).

**************************************************************************

Each end switch must be a hermetically sealed switch with a trip lever and over-travel mechanism. The switch enclosure must be suitable for mounting on the duct exterior and must permit setting the position of the trip lever that actuates the switch. The trip lever must be aligned with the damper blade.

End switches integral to an electric damper actuator are allowed as long as at least one is adjustable over the travel of the actuator.

2.7.22 Air Quality Sensors

Provide full spectrum air quality sensors using a hot wire element based on the Taguchi principle. The sensor must monitor a wide range of gaseous volatile organic components common in indoor air contaminants like paint fumes, solvents, cigarette smoke, and vehicle exhaust. The sensor must automatically compensate for temperature and humidity, have span and calibration potentiometers, operate on 24 VDC power with output of 0-10 VDC, and have a service rating of 0 to 60 degrees C 32 to 140 degrees F and 5 to 95 percent relative humidity.

2.8 INDICATING DEVICES

**************************************************************************

NOTE: Indicating devices are typically provided by the Mechanical Contractor and the specifications of ancillary indicating devices is located in Sections 23 30 00 HVAC AIR DISTRIBUTION, 23 05 15 COMMON PIPING FOR HVAC. Both sections are listed in Subpart 1.2

With the re-organization of the indicating devices are specified in other sections are are included here to ensure they are included in the project specification. If the indicating devices are adequately listed on other sections, then remove all or part of the bracketed text.

**************************************************************************

All indicating devices must display readings in [metric (SI)][English (inch-pound)] units.

2.8.1 Thermometers

Provide bi-metal type thermometers at locations indicated. Thermometers
must have either **230 mm 9 inch** long scales or **90 mm 3.5 inch** diameter dials, with insertion, immersion, or averaging elements. Provide matching thermowells for pipe-mounted installations. Select scale ranges suitable for the intended service, with the normal operating temperature near the scale's midpoint. The thermometer's accuracy must be plus or minus 2 percent of the scale range.

### 2.8.1.1 Piping System Thermometers

Piping system thermometers must have brass, malleable iron or aluminum alloy case and frame, clear protective face, permanently stabilized glass tube with indicating-fluid column, white face, black numbers, and a **230 mm 9 inch** scale. Piping system thermometers must have an accuracy of plus or minus 1 percent of scale range. Thermometers for piping systems must have rigid stems with straight, angular, or inclined pattern. Thermometer stems must have expansion heads as required to prevent breakage at extreme temperatures. On rigid-stem thermometers, the space between bulb and stem must be filled with a heat-transfer medium.

### 2.8.1.2 Air-Duct Thermometers

Air-duct thermometers must have perforated stem guards and 45-degree adjustable duct flanges with locking mechanism.

### 2.8.2 Pressure Gauges

Provide pipe-mounted pressure gauges at the locations indicated. Gauges must conform to **ASME B40.100** and have a **100 mm 4 inch** diameter dial and shutoff cock. Select scale ranges suitable for the intended service, with the normal operating pressure near the scale's midpoint. The gauge's accuracy must be plus or minus 2 percent of the scale range.

Gauges must be suitable for field or panel mounting as required, must have black legend on white background, and must have a pointer traveling through a 270-degree arc. Gauge range must be suitable for the application with an upper end of the range not to exceed 150 percent of the design upper limit. Accuracy must be plus or minus 3 percent of scale range. Gauges must meet requirements of **ASME B40.100**.

### 2.8.3 Low Differential Pressure Gauges

Gauges for low differential pressure measurements must be a minimum of **90 mm 3.5 inch** (nominal) size with two sets of pressure taps, and must have a diaphragm-actuated pointer, white dial with black figures, and pointer zero adjustment. Gauge range must be suitable for the application with an upper end of the range not to exceed 150 percent of the design upper limit. Accuracy must be plus or minus two percent of scale range.

### 2.8.4 Pressure Gauges for Pneumatic Controls

**************************************************************************
NOTE: Remove this paragraph if pneumatic devices are not required.
**************************************************************************

Gauges must [have a **0 to 207 kPa 0 to 30 psi** scale][sufficient scale to display the full range of expected pressures] with **5 kPa 1 psi** graduations.
2.9 OUTPUT DEVICES

2.9.1 Actuators

**************************************************************************

NOTE: Include the appropriate bracketed text if pneumatic actuators are used.

Edit the control Schematic drawing to show electric and/or pneumatic actuators along with their failsafe positions (NO, NC, or fail-in-last-position (FILP)). See the UFC for design guidance on choosing actuator fail-to positions.

Include the bracketed text if using electric actuator position feedback. This should be limited to primary equipment, such as built-up air handlers. Show this feedback signal on the control schematic drawings or specifically state where this requirement applies. Add the actuator position to the Points Schedule as a network variable available to be monitored by the UMCS (present or future).

**************************************************************************

Actuators must be electric (electronic) [or pneumatic as indicated]. All actuators must be normally open (NO), normally closed (NC) or fail-in-last-position (FILP) as indicated. Normally open and normally closed actuators must be of mechanical spring return type. Electric actuators must have an electronic cut off or other means to provide burnout protection if stalled. Actuators must have a visible position indicator. [Electric actuators must provide position feedback to the controller as indicated.] Actuators must smoothly and fully open or close the devices to which they are applied. Electric actuators must have a full stroke response time in both directions of 90 seconds or less at rated load. Electric actuators must be of the foot-mounted type with an oil-immersed gear train or the direct-coupled type. Where multiple electric actuators operate from a common signal, the actuators must provide an output signal identical to its input signal to the additional devices. [Pneumatic actuators must be rated for 172 kPa 25 psi operating pressure except for high-pressure cylinder-type actuators.] All actuators must be rated for their operating environment. Actuators used outdoors must be designed and rated for outdoor use. Actuators under continuous exposure to water, such as those used in sumps, must be submersible.

Actuators incorporating an integral network connection are considered DDC Hardware and must meet the DDC Hardware requirements of Section [23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS ] [23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS].

2.9.1.1 Valve Actuators

**************************************************************************

NOTE: Indicate in the Valve Schedule a close-off pressure that is 150 percent of the pump dead head pressure for 2-way valves and 200 percent of the valve differential pressure for 3-way valves, or equivalent torque values.

**************************************************************************
Valve actuators must provide shutoff pressures and torques as indicated on the Valve Schedule.

2.9.1.2 Damper Actuators

Damper actuators must provide the torque necessary per damper manufacturer's instructions to modulate the dampers smoothly over its full range of operation and torque must be at least 7.3 Nm/square m 6 inch-pounds/1 square foot of damper area for opposed blade dampers and 10.9 Nm/square m 9 inch-pounds/1 square foot of damper area for parallel blade dampers.

**************************************************************************
NOTE: Remove the bracketed text if pneumatic devices are not required.
**************************************************************************

[2.9.1.3 Positive Positioners

**************************************************************************
NOTE: Positive positioners may be required for larger valves and actuators or where high-speed actuation is needed. Edit the drawings to show positive positioners when they are required. The typical drawings do not show/require them due to maintenance requirements for these devices. See UFC 3-410-02 for more information.
**************************************************************************

Positive positioners must be a pneumatic relay with a mechanical position feedback mechanism and an adjustable operating range and starting point.

]2.9.1.4 Electric Actuators

Each actuator must have distinct markings indicating the full-open and full-closed position. Each actuator must deliver the torque required for continuous uniform motion and must have internal end switches to limit the travel, or be capable of withstanding continuous stalling without damage. Actuators must function properly within 85 to 110 percent of rated line voltage. Provide actuators with hardened steel running shafts and gears of steel or copper alloy. Fiber or reinforced nylon gears may be used for torques less than 16 inch-pounds.

a. Two-position actuators must be single direction, spring return, or reversing type. Two position actuator signals may either be the control power voltage or line voltage as needed for torque or appropriate interlock circuits.

b. Modulating actuators must be capable of stopping at any point in the cycle, and starting in either direction from any point. Actuators must be equipped with a switch for reversing direction, and a button to disengage the clutch to allow manual adjustments. Provide the actuator with a hand crank for manual adjustments, as applicable. Modulating actuator input signals can either be a 4 to 20 mAdc or a 0-10 VDC signal.

**************************************************************************
NOTE: Non spring return (NSR) or Fail in Last Position Actuators (FILP) are both acceptable alternatives for non safety or equipment protection applications. They are not recommended for applications such as AHU mixing boxes, preheat coils, steam-water heat exchanges, etc..

Provide in the design valve and damper schedule a designation on the need for spring return and desired fail position for each valve and damper.

--------------------------------------------------------------------------------

c. Floating or pulse width modulation actuators are acceptable for non-fail safe applications unless indicated otherwise provided that the floating point control (timed actuation) must have a scheduled re-calibration of span and position no more than once a day and no less than once a week. The schedule for the re-calibration should not affect occupied conditions and be staggered between equipment to prevent falsely loading or unloading central plant equipment.

[2.9.1.5 Pneumatic Actuators]

********************************************************************************

NOTE: Remove this paragraph if pneumatic devices are not required.
********************************************************************************

Provide piston or diaphragm type actuators with replaceable diaphragm/piston.

[2.9.2 Solenoid-Operated Electric to Pneumatic Switch (EPS)]

Solenoid-Operated Electric to Pneumatic Switches (EPS) must accept a voltage input to actuate its air valve. Each valve must have three-port operation: common, normally open, and normally closed. Each valve must have an outer cast aluminum body and internal parts of brass, bronze, or stainless steel. The air connection must be a 10 mm 0.38 inch NPT threaded connection. Valves must be rated for 345 kPa 50 psig.

2.9.3 Electric to Pneumatic Transducers (EP)

********************************************************************************

NOTE: Depending on the application, the designer may choose to select an EP and actuator combination to operate over the full range in less than 90 seconds.
********************************************************************************

Electric to Pneumatic Transducers (EPs) must convert either a 4-20 mA input signal, a 0-10 Vdc input signal to a proportional 0 to 140 kPa 0 to 20 psig pneumative output. The EP must withstand pressures at least 150 percent of the system supply air pressure (main air). EPs must include independent offset and span adjustment. Steady state air consumption must not be greater than 0.23 L/s 0.05 scfm. EPs must have a manual adjustable override for the EP pneumative output. EPs must have sufficient output capacity to provide full range stroke of the actuated device in both directions within [90][_____] seconds.
2.9.4 Relays

NOTE: Panel mounted relays have historically been specified as 'socket type' for UMCS. Recent popularity of encapsulated types of relays under brand names such as 'RIB.' has increased which provides flexibility in mounting relays at the controlled device (i.e. Motor Starters) that allows for low voltage wiring be run to/from the panel to the device rather than medium voltage.

Relays must have contacts rated for the intended application, indicator light, and dust proof enclosure. The indicator light must be lit when the coil is energized and off when coil is not energized.

Control relay contacts must have utilization category and ratings selected for the application. Each set of contacts must incorporate a normally open (NO), normally closed (NC) and common contact. Relays must be rated for a minimum life of one million operations.

2.10 USER INPUT DEVICES

User Input Devices, including potentiometers, switches and momentary contact push-buttons. Potentiometers must be of the thumb wheel or sliding bar type. Momentary Contact Push-Buttons may include an adjustable timer for their output. User input devices must be labeled for their function.

2.11 MULTIFUNCTION DEVICES

Multifunction devices are products which combine the functions of multiple sensor, user input or output devices into a single product. Unless otherwise specified, the multifunction device must meet all requirements of each component device. Where the requirements for the component devices conflict, the multifunction device must meet the most stringent of the requirements.

2.11.1 Current Sensing Relay Command Switch

The Current Sensing Relay portion must meet all requirements of the Current Sensing Relay input device. The Command Switch portion must meet all requirements of the Relay output device except that it must have at least one normally-open (NO) contact.

Current Sensing Relays used for Variable Frequency Drives must be rated for Variable Frequency applications unless installed on the source side of the drive. If used in this situation, the threshold for showing status must be set to allow for the VFD's control power when the drive is not enabled and provide indication of operation when the drive is enabled at minimum speed.

2.11.2 Space Sensor Module

NOTE: Indicate requirements for each space sensor module on the Space Sensor Module and Occupancy Sensor drawing.

Space Sensor Modules may be commonly referred to as
Thermostats but should not be confused with devices that have contact outputs for control of heating/cooling equipment (fans, compressors, etc.).

Note that any device which includes control functionality (including a thermostat) is a DDC Controller and is specified in Sections 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS or 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS.

Space Sensor Modules must be multifunction devices incorporating a temperature sensor and one or more of the following as specified and indicated on the Space Sensor Module Schedule:

a. A temperature indicating device.
b. A User Input Device which must adjust a temperature setpoint output.
c. A User Input Momentary Contact Button and an output to the control system indicating zone occupancy.
d. A three position User Input Switch labeled to indicate heating, cooling and off positions ('HEAT-COOL-OFF' switch) and providing corresponding outputs to the control system.
e. A two position User Input Switch labeled with 'AUTO' and 'ON' positions and providing corresponding output to the control system.
f. A multi-position User Input Switch with 'OFF' and at least two fan speed positions and providing corresponding outputs to the control system.

Space Sensor Modules cannot contain mercury (Hg).

[2.12 COMPRESSED AIR STATIONS

NOTE: Remove this bracketed paragraph if pneumatic devices are not required.

NOTE: The designer will estimate the required control air consumption to calculate the required motor horsepower of the control air compressor and coordinate with the electrical designer.

For hospitals and critical installations, a standby compressor will be provided. For all other applications, the portion covering standby compressor will be deleted. For hospitals, delete the Contractor option permitting the use of polyethylene tubing in lieu of copper.

Indicate on the drawings the locations where
metallic raceway or electric metallic tubing is not required for protection of nonmetallic tubing.

2.12.1 Air Compressor Assembly

Air compressors for pneumatic control systems must be the tank-mounted, electric motor driven, air cooled, reciprocating type with integral [duplex motors and compressors][single motor and compressor], tank, controller, [alternator switch, ]pressure switch, belt guard[s], pressure relief valve, automatic moisture drain valve and must be supported by a steel base mounted on an air storage tank. Compressor piston speeds must not exceed 2.28 meter/second 450 fpm. Provide compressors with a dry-type combination intake air filter and silencer with baked enamel steel housing. The filter must be 99 percent efficient at 10 µm 10 microns. The pressure switch must start the compressor[s] at 482 kPa 70 psig and stop the compressor[s] at 620 kPa 90 psig. The relief valve must be set for 69 to 172 kPa 10 to 25 psig above the control switch cut-off pressure. Provide compressor capacity suitable for not more than a [33] [50] percent run time, at full system control load. Compressors must have a combination type magnetic starter with undervoltage protection and thermal-overload protection for each phase and must automatically restart after a power outage. Motors 0.5 hp and larger must be three-phase.[

A second (duplex arrangement) compressor of capacity equal to the primary compressor must be provided, with interlocked control to provide automatic changeover upon malfunction or failure of either compressor. A manual selector switch must be provided to index the lead compressor including the automatic changeover.

2.12.2 Compressed Air Station Specialties

2.12.2.1 Refrigerated Air Dryers

Provide each air compressor tank with a refrigerant air dryer sized for continuous operation at full delivery capacity of the compressor. The air must be dried at a pressure of not less than 483 kPa 70 psi to a temperature not greater than 2 degrees C 35 degrees F and an ambient air temperature between 13 and 35 degrees C 55 and 95 degrees F. The dryer must be provided with an automatic condensate drain trap with manual override feature with an adjustable cycle and drain time. Locate each dryer in the air piping between the tank and the pressure-reducing station. The refrigerant used in the dryer must be one of the fluorocarbon gases and have an Ozone Depletion Potential of not more than 0.05. A five micron pre-filter and coalescing-type 0.03 µm micron oil removal filter with shut-off valves must be provided in the dryer discharge.

2.12.2.2 Compressed Air Discharge Filters

Provide a disposable type in-line filter in the incoming pneumatic main at each pneumatic control panel. The filter must be capable of eliminating 99.99 percent of all liquid or solid contaminants 0.1 micron or larger. Provide the filter with fittings that allow easy removal/replacement. Each filter bowl must be rated for 1034 kPa 150 psi maximum working pressure. A pressure regulator, with high side and low side pressure gauges, and a safety valve must be provided downstream of the filter.
2.12.2.3  Air Pressure-Reducing Stations

Provide air compressors with a pressure-reducing valve (PRV) with a field adjustable range of 0 to 345 kPa 0 to 50 psig discharge pressure, at an inlet pressure of 482 to 620 kPa 70 to 90 psig. Provide a factory-set pressure relief valve downstream of the PRV to relieve over-pressure. Provide a pressure gage upstream of the PRV with range of 0 to 689 kPa 0 to 100 psig and downstream of the PRV with range of 0 to 207 kPa 0 to 30 psig. For two-pressure control systems, provide an additional PRV and downstream pressure gage. Pressure regulators of the relieving type must not be used.

2.12.2.4  Flexible Pipe Connections

The flexible pipe connections must be designed for 1034 kPa and 150 degrees C 150 psi and 250 degrees F service, and must be constructed of rubber or tetrafluoroethylene resin tubing with a reinforcing protective cover of braided corrosion-resistant steel, bronze, monel, or galvanized steel. The connectors must be suitable for the service intended and must have threaded or soldered ends. The length of the connectors must be as recommended by the manufacturer for the service intended.

2.12.2.5  Vibration Isolation Units

The vibration isolation units must be standard products with published loading ratings, and must be single rubber-in-shear, double rubber-in-shear, or spring type.

2.12.3  Compressed Air Tanks

The air storage tank must be fabricated for a working pressure of not less than 1380 kPa 200 psi and constructed and certified in accordance with ASME BPVC SEC VIII D1. The tank must be of sufficient volume so that no more than six compressor starts per hour are required with the starting pressure switch differential set at 140 kPa 20 psi. The tank must be provided with an automatic condensate drain trap with manual override feature. Provide drain valve and piping routing the drainage to a floor sink or other safe and visible drainage location.

3.1  INSTALLATION

3.1.1  General Installation Requirements

Perform the installation under the supervision of competent technicians regularly employed in the installation of DDC systems.

3.1.1.1  Device Mounting Criteria

All devices must be installed in accordance with manufacturer's recommendations and as specified and indicated. Control devices to be installed in piping and ductwork must be provided with required gaskets, flanges, thermal compounds, insulation, piping, fittings, and manual valves for shutoff, equalization, purging, and calibration. Strap-on temperature sensing elements must not be used except as specified. Spare thermowells must be installed adjacent to each thermowell containing a sensor and as indicated. Devices located outdoors must have a weathershield.
3.1.1.2 Labels and Tags

Match labels and tags to the unique identifiers indicated on the As-Built drawings. Label all enclosures and instrumentation. Tag all sensors and actuators in mechanical rooms. Tag airflow measurement arrays to show flow rate range for signal output range, duct size, and pitot tube AFMA flow coefficient. Tag duct static pressure taps at the location of the pressure tap. Provide plastic or metal tags, mechanically attached directly to each device or attached by a metal chain or wire. Labels exterior to protective enclosures must be engraved plastic and mechanically attached to the enclosure or instrumentation. Labels inside protective enclosures may attached using adhesive, but must not be hand written.

3.1.2 Weathershield

Provide weathershields for sensors located outdoors. Install weathershields such that they prevent the sun from directly striking the sensor and prevent rain from directly striking or dripping onto the sensor. Install weather shields with adequate ventilation so that the sensing element responds to the ambient conditions of the surroundings. When installing weathershields near outside air intake ducts, install them such that normal outside air flow does not cause rainwater to strike the sensor.

3.1.3 Room Instrument Mounting

**************************************************************************

NOTE: All facilities are required to follow ADA standards unless the building is for able-bodied military personnel with no handicapped visitors. Buildings must be constructed to ADA standards. For more information, please refer to the following website.

**************************************************************************

Mount room instruments, including but not limited to wall mounted non-adjustable space sensor modules and sensors located in occupied spaces, 1.5[1.2] meters [60][48] inches above the floor unless otherwise indicated. Install adjustable devices to be ADA compliant unless otherwise indicated on the Room Sensor Schedule:

a. Space Sensor Modules for Fan Coil Units may be either unit or wall mounted but not mounted on an exterior wall.

b. Wall mount all other Space Sensor Modules.

3.1.4 Indication Devices Installed in Piping and Liquid Systems

**************************************************************************

NOTE: Coordinate with the project site for preference on the use of programmable controllers or multiple application specific controllers in cases where a single application specific controller for the application is not available.

**************************************************************************

Provide snubbers for gauges in piping systems subject to pulsation. For gauges for steam service use pigtail fittings with cock. Install
thermometers and temperature sensing elements in liquid systems in thermowells. Provide spare Pressure/Temperature Ports (Pete's Plug) for all temperature and pressure sensing elements installed in liquid systems for calibration/testing.

3.1.5 Occupancy Sensors

**************************************************************************
NOTE: Choose the preferred location and type of
for Occupancy Sensors (coordinate with the project
site to determine preference of O&M Staff).
**************************************************************************

Provide a sufficient quantity of occupancy sensors to provide complete coverage of the area (room or space). Occupancy sensors are to be ceiling mounted. Install occupancy sensors in accordance with NFPA 70 requirements and the manufacturer's instructions. Do not locate occupancy sensors within 2 m 6 feet of HVAC outlets or heating ducts, or where they can "see" beyond any doorway. Installation above doorway(s) is preferred. Do not use ultrasonic sensors in spaces containing ceiling fans. Install sensors to detect motion to within 600 mm 2 feet of all room entrances and to not trigger due to motion outside the room. Set the off-delay timer to [15] minutes unless otherwise indicated. Adjust sensors prior to beneficial occupancy, but after installation of furniture systems, shelving, partitions, etc. For each controlled area, provide one hundred percent coverage capable of detecting small hand-motion movements, accommodating all occupancy habits of single or multiple occupants at any location within the controlled room.

3.1.6 Switches

**************************************************************************
NOTE: Wall mounted thermostats and similar control
system components containing user input devices in
ADA compliant facilities and spaces are required to
be mounted 1200 mm 48 inches above the floor for
forward reach and 1300 mm54 inches for side reach.
Note the mounting height and location for these
system components on the drawings or revise the
following paragraph accordingly.
**************************************************************************

3.1.6.1 Temperature Limit Switch

Provide a temperature limit switch (freezestat) to sense the temperature at the location indicated. Provide a sufficient number of temperature limit switches (freezestats) to provide complete coverage of the duct section but no less than 3 m 1 foot in length per square meter square foot of cross sectional area. Install manual reset limit switches in approved, accessible locations where they can be reset easily. Install temperature limit switch (freezestat) sensing elements in a side-to-side (not top-to-bottom) serpentine pattern with the relay section at the highest point and in accordance with the manufacturer's installation instructions.

3.1.6.2 Hand-Off Auto Switches

Wire safety controls such as smoke detectors and freeze protection thermostats to protect the equipment during both hand and auto operation.
3.1.7 Temperature Sensors

Install temperature sensors in locations that are accessible and provide a good representation of sensed media. Installations in dead spaces are not acceptable. Calibrate and install sensors according to manufacturer’s instructions. Select sensors only for intended application as designated or recommended by manufacturer.

3.1.7.1 Room Temperature Sensors

Mount the sensors on interior walls to sense the average room temperature at the locations indicated. Avoid locations near heat sources such as copy machines or locations by supply air outlet drafts. Mount the center of all user-adjustable sensors [1.5 m 5 feet above the finished floor][1220 mm 48 inches above the floor to meet ADA requirements][at the height[s] indicated]. Non user-adjustable sensors can be mounted as indicated in paragraph ROOM INSTRUMENT MOUNTING.

3.1.7.2 Duct Temperature Sensors

3.1.7.2.1 Probe Type

Place tip of the sensor in the middle of the airstream or in accordance with manufacturer's recommendations or instructions. Provide a gasket between the sensor housing and the duct wall. Seal the duct penetration air tight. When installed in insulated duct, provide enclosure or stand off fitting to accommodate the thickness of duct insulation to allow for maintenance or replacement of the sensor and wiring terminations. Seal the duct insulation penetration vapor tight.

3.1.7.2.2 Averaging Type

Weave the sensing element in a serpentine fashion from side to side perpendicular to the flow, across the duct or air handler cross-section, using durable non-metal supports in accordance with manufacturer's installation instructions. Avoid tight radius bends or kinking of the sensing element. Prevent contact between the sensing element and the duct or air handler internals. Provide a duct access door at the sensor location. The access door must be hinged on the side, factory insulated, have cam type locks, and be as large as the duct will permit, maximum 18 by 18 inches. For sensors inside air handlers, the sensors must be fully accessible through the air handler's access doors without removing any of the air handler's internals.

3.1.7.3 Immersion Temperature Sensors

Provide thermowells for sensors measuring piping, tank, or pressure vessel temperatures. Locate wells to sense continuous flow conditions. Do not install wells using extension couplings. When installed on insulated piping, provide stand enclosure or stand off fitting to accommodate the thickness of the pipe insulation and allow for maintenance or replacement of the sensor or wiring terminations. Where piping diameters are smaller than the length of the wells, provide wells in piping at elbows to sense flow across entire area of well. Wells must not restrict flow area to less than 70 percent of pipe area. Increase piping size as required to avoid restriction. Provide the sensor well with a heat-sensitive transfer agent between the sensor and the well interior ensuring contact between the sensor and the well.
3.1.7.4 Outside Air Temperature Sensors

Provide outside air temperature sensors on the building’s north side with a protective weather shade that does not inhibit free air flow across the sensing element, and protects the sensor from snow, ice, and rain. Location must not be near exhaust hoods and other areas such that it is not influenced by radiation or convection sources which may affect the reading. Provide a shield to shade the sensor from direct sunlight.

3.1.8 Air Flow Measurement Arrays (AFMA)

Locate Outside Air AFMAs downstream from the Outside Air filters.

Install AFMAs with the manufacturer’s recommended minimum distances between upstream and downstream disturbances. Airflow straighteners may be used to reduce minimum distances as recommended by the AFMA manufacturer.

3.1.9 Duct Static Pressure Sensors

**************************************************************************
NOTE: Recommend that the designer of record determine the preferred location. It is desirable to have more than one terminal device downstream of the sensor to prevent a single device from having too much authority over the control loop.
**************************************************************************

Locate the duct static pressure sensing tap at 75 percent of the distance between the first and last air terminal units [as indicated on the design documents]. If the transmitter output is a 0-10Vdc signal, locate the transmitter in the same enclosure as the air handling unit (AHU) controller for the AHU serving the terminal units. If a remote duct static pressure sensor is to be used, run the signal wire back to the controller for the air handling unit.

3.1.10 Relative Humidity Sensors

Install relative humidity sensors in supply air ducts at least 3 m 10 feet downstream of humidity injection elements.

3.1.11 Meters

3.1.11.1 Flowmeters

Install flowmeters to ensure minimum straight unobstructed piping for at least 10 pipe diameters upstream and at least 5 pipe diameters downstream of the flowmeter, and in accordance with the manufacturer's installation instructions.

3.1.11.2 Energy Meters

Locate energy meters as indicated. Connect each meter output to the DDC system, to measure both instantaneous demand/energy and other variables as indicated.
3.1.12 Dampers

3.1.12.1 Damper Actuators

Provide spring return actuators which fail to a position that protects the served equipment and space on all control dampers related to freeze protection or force protection. For all outside, makeup and relief dampers provide dampers which fail closed. Terminal fan coil units, terminal VAV units, convectors, and unit heaters may be non-spring return unless indicated otherwise. Do not mount actuators in the air stream. Do not connect multiple actuators to a common drive shaft. Install actuators so that their action seal the damper to the extent required to maintain leakage at or below the specified rate and so that they move the blades smoothly throughout the full range of motion.

3.1.12.2 Damper Installation

Install dampers straight and true, level in all planes, and square in all dimensions. Dampers must move freely without undue stress due to twisting, racking (parallelogramming), bowing, or other installation error. External linkages must operate smoothly over the entire range of motion, without deformation or slipping of any connecting rods, joints or brackets that will prevent a return to its normal position. Blades must close completely and leakage must not exceed that specified at the rated static pressure. Provide structural support for multi-section dampers. Acceptable methods of structural support include but are not limited to U-channel, angle iron, corner angles and bolts, bent galvanized steel stiffeners, sleeve attachments, braces, and building structure. Where multi-section dampers are installed in ducts or sleeves, they must not sag due to lack of support. Do not use jackshafts to link more than three damper sections. Do not use blade to blade linkages. Install outside and return air dampers such that their blades direct their respective air streams towards each other to provide for maximum mixing of air streams.

3.1.13 Valves

**************************************************************************
NOTE: Three-way valve port markings vary from one manufacturer to another. Before installing a three-way valve, note the inlets and outlets, note which port is normally open, which is normally closed, and which is the common port. On butterfly valves, limit the valve travel to 70 percent (60 degrees) open position to achieve design flow.
**************************************************************************

Install the valves in accordance with the manufacturer's instructions.

3.1.13.1 Valve Actuators

Provide spring return actuators on all control valves where freeze protection is required. Spring return actuators for terminal fan coil units, terminal VAV units, convectors, and unit heaters are not required unless indicated otherwise.

3.1.14 Thermometers and Gauges
3.1.14.1 Local Gauges for Actuators

NOTE: Remove this bracketed paragraph if pneumatic devices are not required.

Provide a pressure gauge at each pneumatic control input and output. Pneumatic actuators must have an accessible and visible pressure gauge installed in the tubing lines at the actuator as indicated.

3.1.14.2 Thermometers

Mount devices to allow reading while standing on the floor or ground, as applicable.

3.1.15 Wire and Cable

NOTE: Coordinate with the project site and indicate whether all wiring needs to be in raceways or whether low-voltage wiring can be run without raceways.

Note that requiring all wiring to be run in raceways will increase the project cost.

Provide complete electrical wiring for the Control System, including wiring to transformer primaries. Wire and Cable must be installed without splices between control devices and in accordance with NFPA 70 and NFPA 90A. Instrumentation grounding must be installed per the device manufacturer's instructions and as necessary to prevent ground loops, noise, and surges from adversely affecting operation of the system. Test installed ground rods as specified in IEEE 142. Cables and conductor wires must be tagged at both ends, with the identifier indicated on the shop drawings. Electrical work must be as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and as indicated. Wiring external to enclosures must be run in raceways, except low-voltage control and low-voltage network wiring may be installed as follows:

a. plenum rated cable in suspended ceilings over occupied spaces may be run without raceways

b. nonmetallic-sheathed cables or metallic-armored cables may be installed as permitted by NFPA 70.

Install control circuit wiring not in raceways in a neat and safe manner. Wiring must not use the suspended ceiling system (including tiles, frames or hangers) for support. Where conduit or raceways are required, control circuit wiring must not run in the same conduit/raceway as power wiring over 50 volts. Run all circuits over 50 volts in conduit, metallic tubing, covered metal raceways, or armored cable.

3.1.16 Copper Tubing

Provide hard-drawn copper tubing in exposed areas and either hard-drawn or annealed copper tubing in concealed areas. Use only tool-made bends. Use only brass or copper solder joint type fittings, except for connections to
apparatus. For connections to apparatus use brass compression type fittings.

3.1.17 Plastic Tubing

Install plastic tubing within covered raceways or conduit except when otherwise specified. Do not use plastic tubing for applications where the tubing could be subjected to a temperature exceeding 55 degrees C 130 degrees F. For fittings, use brass or acetal resin of the compression or barbed push-on type for instrument service. Except in walls and exposed locations, plastic multitube instrument tubing bundle without conduit or raceway protection may be used where a number of air lines run to the same points, provided the multitube bundle is enclosed in a protective sheath, is run parallel to the building lines and is adequately supported as specified.

3.1.18 Pneumatic Lines

**************************************************************************
NOTE: Remove this bracketed paragraph if pneumatic devices are not required.
**************************************************************************

Run tubing concealed in finished areas, run tubing exposed in unfinished areas like mechanical rooms. For tubing enclosed in concrete, provide rigid metal conduit. Run tubing parallel and perpendicular to building walls. Use 1.5 m 5 foot maximum spacing between tubing supports. With the compressor turned off, test each tubing system pneumatically at 1.5 times the working pressure and prove it air tight, locating and correcting leaks as applicable. Caulking joints is not permitted. Do not run tubing and electrical power conductors in the same conduit.

a. Install pneumatic lines must such that they are not exposed to outside air temperatures. Conceal pneumatic lines except in mechanical rooms and other areas where other tubing and piping is exposed.

b. Install all tubes and tube bundles exposed to view in lines parallel to the lines of the building. Route tubing in mechanical/electrical so that the lines are easily traceable.

c. Purge air lines of dirt, impurities and moisture before connecting to the control equipment. Number-code or color-code air lines and key the coding in the As-Built Drawings for future identification and servicing the control system.

3.1.18.1 Pneumatic Lines In Mechanical/Electrical Spaces

In mechanical/electrical spaces, use plastic or copper tubing for pneumatic lines. Install horizontal and vertical runs of plastic tubing or soft copper tubing min raceways or rigid conduit dedicated to tubing. Support dedicated raceways, conduit, and hard copper tubing not installed in raceways every 2 m 6 feet for horizontal runs and every 2.4 m 8 feet for vertical runs.

3.1.18.2 Pneumatic Lines External to Mechanical/Electrical Spaces

External to mechanical/electrical spaces, use plastic tubing in raceways not containing power wiring or copper tubing with sweat fittings. Support raceways and tubing not in raceways every 2.4 m 8 feet. For pneumatic
lines concealed in walls use hard-drawn copper tubing or plastic tubing in rigid conduit. Plastic tubing in a protective sheath, run parallel to the building lines and supported as specified, may be used above accessible ceilings and in other concealed but accessible locations.

3.1.18.3 Terminal Single Lines

For terminal single lines use hard-drawn copper tubing, except when the run is less than 300 mm 12 inches in length, flexible polyethylene may be used.

3.1.18.4 Connection to Liquid and Steam Lines

Use [copper][Series 300 stainless steel] with [brass compression][stainless-steel compression] fittings for connection of sensing elements and transmitters to liquid and steam lines.

3.1.18.5 Connection to Ductwork

Use plastic tubing for connections to sensing elements in ductwork.

3.1.18.6 Tubing in Concrete

Install tubing in concrete in rigid conduit. Install tubing in walls containing insulation, fill, or other packing materials in raceways dedicated to tubing.

3.1.18.7 Tubing Connection to Actuators

For final connections to actuators use plastic tubing no more than 300 mm 12 inches long and unsupported at the actuator.

3.1.19 Compressed Air Stations

**************************************************************************
NOTE: If possible, foundations and housekeeping pads should be specified in Section 23 30 00 HVAC AIR DISTRIBUTION.
**************************************************************************

Mount the air compressor assembly on vibration eliminators, in accordance with ASME BPVC SEC VIII D1 for tank clearance. Connect the air line to the tank with a flexible pipe connector. Provide compressed air station specialties with required tubing, including condensate tubing to a floor drain. Compressed air stations must deliver control air meeting the requirements of ISA 7.0.01. Provide foundations and housekeeping pads for the HVAC control system air compressors [in accordance with the air compressor manufacturer's instructions][as specified in Section 23 30 00 HVAC AIR DISTRIBUTION].

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for LonWorks-based building control systems using the CEA-709.1-D-C communications protocol, including tailoring options for LNS-based and Niagara Framework-based LonWorks systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Comments, suggestions and recommended changes for this guide specification are welcome and should be as a Criteria Change Request (CCR). CCRs for this specification can be submitted through the Whole Building Design Guide page for this section: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-23-09-00-23-09-23-01-02/.
This specification covers installation of local (building-level) controls using LonWorks-based DDC. It is primarily intended for building level control systems which are to be integrated into a Utility Monitoring and Control System (UMCS) as specified in Section 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION (where Section 25 10 10 has also used the matching LonWorks or Niagara Framework tailoring option).

For projects that require the building system to provide UMCS functionality (without connection to a UMCS), the designer must include the necessary requirements from Section 25 10 10 in the project specification.

Template drawings in electronic format for use with this section are available online at the Whole Building Design Guide page for Section 23 09 00: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-

**************************************************************************
**************************************************************************

NOTE: This specification makes use of SpecsIntact Tailoring Options. This note describes these options and how to use them.

"TAILORING OPTION NOTES" Tailoring Option
Each time tailoring options are used there is an accompanying designer note describing the text that is tailored. As this Section makes heavy use of tailoring options there are many of these notes and they can distract from designer notes describing other decisions. The designer notes describing tailoring options are all in a "TAILORING OPTION NOTES" tailoring option which can be hidden (in specsintact select View-Tailoring Options and then deselect "TAILORING OPTION NOTES") once this section is tailored and the tailoring option notes are no longer needed.

"NIAGARA FRAMEWORK" and "LNS" Tailoring Options
This specification includes tailoring options for "NIAGARA FRAMEWORK" and for "LNS". Exactly ONE of these tailoring options must be chosen. You have currently selected the following options:

--------
NIAGARA FRAMEWORK
LNS
--------

If you don't see either the words "NIAGARA FRAMEWORK" or "LNS" between the dashes above, you have not selected a tailoring option and this specification is not valid. Select ONE of the tailoring options.

If you see both "NIAGARA FRAMEWORK" and "LNS" you have selected both tailoring options. Remove one of the tailoring options.
Service Tailoring Option
This specification also includes tailoring options for the Service (Air Force, Army, Navy) the specification is used for. There is a "Service Generic" tailoring option that can also be used. Only ONE of the four tailoring options related to the service should be used. You have currently selected the following options:
--------
  AIR FORCE
  ARMY
  NAVY
  SERVICE GENERIC
--------
If more than one item appears between the dashes above you have selected more than one services tailoring option and need to remove all but one of them.
**************************************************************************
**************************************************************************
WARNING - Both the NIAGARA FRAMEWORK and LNS Tailoring Options have been selected. This will result in a specification that contains conflicts and cannot be met. DESELECT one of these tailoring options. See UFC 3-410-02.
**************************************************************************
**************************************************************************

PART 1   GENERAL
1.1   SUMMARY
**************************************************************************
NOTE: Designer is to add location and site specific requirements.
**************************************************************************

Provide a complete Direct Digital Control (DDC) system, except for the Front End which is specified in Section 25 10 10 UTILITY MONITORING AND CONTROL (UMCS) FRONT END AND INTEGRATION, suitable for the control of the heating, ventilating and air conditioning (HVAC) and other building-level systems as specified and shown and in accordance with Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

1.1.1   System Requirements

Provide a system meeting the requirements of both Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and this Section and with the following characteristics:

**************************************************************************
NOTE: The following list paragraph uses tailoring options:
1) The paragraph NOT referencing Niagara Framework is included only when the LNS tailoring option is selected.
2) The paragraph referencing Niagara Framework is
The control system must be an open implementation of LonWorks technology using CEA-709.1-D as the communications protocol. The system must use LonMark Standard Network Variable Types as defined in LonMark SNVT List exclusively for communication over the network.

The control system must be an open implementation of LonWorks technology using CEA-709.1-D and Fox as the communications protocols. Except for communication between Niagara Framework components (between Niagara Framework Supervisory Gateways or between a Niagara Framework Supervisory Gateway and a Niagara Framework Front End) which must use the Fox Protocol, the system must use LonMark Standard Network Variable Types as defined in LonMark SNVT List exclusively for communication over the network.

NOTE: The following list paragraph uses tailoring options:
1) The paragraph referring to LNS is included only when the LNS tailoring option is selected.
2) The paragraph referring to Niagara Framework is included only when the NIAGARA FRAMEWORK tailoring option is selected.

Use LonWorks Network Services (LNS) for all network management including addressing and binding of network variables. As specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC, submit copies of the complete, fully-commissioned, valid, as-built Final LNS database, including all LNS credits, for the complete control system provided under this specification. All devices must be on-line and commissioned into the LNS database.

Use the Niagara Framework for all network management including addressing and binding of network variables. Each Niagara Framework Supervisory Gateway must contain a database for all controllers connected to its non-IP ports.

NOTE: The following list paragraph uses tailoring options specific to Niagara Framework systems. The requirements specific to Niagara Framework are included only when the NIAGARA FRAMEWORK tailoring option is selected.

Install and configure control hardware, except as specified for Niagara Framework Supervisory Gateways, to provide all input and output Standard Network Variables (SNVTs) as indicated and as needed to meet the requirements of this specification. Points in Niagara Framework Supervisory Gateways which do not communicate with non-Niagara Framework DDC Hardware may be exposed via Fox instead.

NOTE: The following list paragraph uses tailoring options.
options for requirements specific to Niagara Framework systems. The requirements specific to Niagara Framework are included only when the NIAGARA FRAMEWORK tailoring option is selected.

**************************************************************************

d. All DDC hardware installed under this specification must communicate via CEA-709.1-D, and Niagara Framework Supervisory Gateways must also communicate over the IP network via Fox. Install the control system such that a SNVT output from any node on the network can be bound to any other node in the same domain.

**************************************************************************

NOTE: Select Web Pages if a local (in the building) web interface is required.

The following TWO list paragraphs apply only to Niagara Framework systems and are included only when the NIAGARA FRAMEWORK tailoring option is selected.

**************************************************************************

e. Use Niagara Framework hardware and software exclusively for alarming, scheduling, trending, and communication with a front end (UMCS). Use the Fox protocol for all communication between Niagara Framework Supervisory Gateways; use the CEA-709.1-D protocol for all other building communication. [Niagara Framework Supervisory Gateway must serve web pages as specified.]

**************************************************************************

NOTE: Select the required version of the Niagara Framework. This choice must be carefully coordinated with the project site. Niagara Framework is currently (2015) in a transition between two releases: "AX" and "Version 4". A Version 4 UMCS front end (e.g. as specified in Section 25 10 10) will work with either an AX or Version 4 Niagara Framework Supervisory Gateway, but an AX front end will ONLY work with an AX Niagara Framework Supervisory Gateway.

If the site has an AX front end, select "AX".
If the site has a Version 4 front end, or does not have a front end:
  1) if there are multiple vendors servicing the project site that support Version 4, select "Version 4"
  2) otherwise, select "either AX or Version 4"

**************************************************************************

f. Use Niagara Framework [AX][Version 4.0 or later][either AX or Version 4.0 or later].

1.1.2 Verification of Specification Requirements

Review all specifications related to the control system installation and advise the Contracting Officer of any discrepancies before performing any work. If Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC or any other Section referenced in this specification is not included in the
project specifications advise the Contracting Officer and either obtain the missing Section or obtain Contracting Officer approval before performing any work.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section’s Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard’s Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

CONSUMER ELECTRONICS ASSOCIATION (CEA)

CEA-709.3 (1999; R 2015) Free-Topology Twisted-Pair Channel Specification

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE 802.3 (2022) Ethernet

INTERNET ENGINEERING TASK FORCE (IETF)

LONMARK INTERNATIONAL (LonMark)

1.3 DEFINITIONS

For definitions related to this section, see Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

1.4 SUBMITTALS

***************

NOTE: Submittals related to this section are specified in UFGS 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. UFGS 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC MUST be used with this specification to have a complete specification.

***************

Submittals related to this Section are specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

PART 2 PRODUCTS

All products used to meet this specification must meet the specified requirements, but not all products specified here will be required by every project. Provide products which meet the requirements of both Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and this Section.

2.1 NETWORK HARDWARE

2.1.1 CEA-709.1-D Routers

CEA-709.1-D Routers must meet the requirements of CEA-709.1-D and must provide connection between two or more CEA-709.3 TP/FT-10 channels, or between one or more CEA-709.3 TP/FT-10 channels and a LonMark Interoperability Guide TP/XF-1250 channel.
2.1.2 CEA-709.1-D Repeaters

CEA-709.1-D Repeaters must be CEA-709.1-D Routers configured as repeaters. Physical layer repeaters are prohibited.

2.1.3 CEA-709.1-D Gateways

**************************************************************************
NOTE: This subpart uses tailoring options for requirements specific to Niagara Framework systems. The requirements specific to Niagara Framework are included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

In addition to the requirements for DDC Hardware, CEA-709.1-D gateways must be a Niagara Framework Supervisory Gateway or must:

a. Allow bi-directional mapping of data between the non-CEA-709.1-D protocol and SNVTs

b. Incorporate a network connection to a TP/FT-10 network in accordance with CEA-709.3 and a separate connection appropriate for the a non-CEA-709.1-D network

Although Gateways must meet DDC Hardware requirements, except for Niagara Framework Supervisory Gateways, they are not DDC Hardware and must not be used when DDC Hardware is required. (Niagara Framework Supervisory Gateways are both Gateways and DDC Hardware.)

2.1.4 CEA-852-C Router

**************************************************************************
NOTE: This subpart applies only to LNS-based systems and is only included when the LNS tailoring option is selected.
**************************************************************************

CEA-852-C Routers must perform layer 3 routing of CEA-709.1-D packets over an IP network in accordance with CEA-852-C. The router must provide the appropriate connection to the IP network and connections to the CEA-709.3 TP/FT-10 or LonMark Interoperability Guide TP/XF-1250 network. CEA-852-C Routers must support the Dynamic Host Configuration Protocol (DHCP; IETF RFC 4361 for IP configuration and the use of an CEA-852-C Configuration Server (for CEA-852-C configuration), but must not rely on these services for configuration. CEA-852-C Routers must be capable of manual configuration via a console RS-232 or USB port.

2.1.5 Ethernet Switch

**************************************************************************
NOTE: Select whether Ethernet Switches must be managed. In general, do NOT require managed switches unless there is a specific project requirement for managed switches. Managed switches add cost to the system, and require that they be managed by the project site following installation. Some sites are equipped to handle such management, but for some (many) sites this will be an

SECTION 23 09 23.01 Page 10
unacceptable O&M burden.

Ethernet Switches [must be managed switches and ]must autoconfigure between 10,100 and 1000 megabits per second (MBPS).

2.2 CONTROL NETWORK WIRING

a. Provide TP/FT-10 control wiring in accordance with CEA-709.3.

b. Provide TP/XF-1250 control wiring in accordance with the LonMark Interoperability Guide.

NOTE: Although the controls contractor installs the building control system backbone, which is an IP network, this system will later be integrated into the basewide network via the FPOC. To ensure no issues arise during this later integration, obtain additional Ethernet media requirements (if any) from the project site NEC.

c. For the Building Control Network IP Network provide media that is CAT-5e Ethernet media at a minimum and meets all requirements of IEEE 802.3 [and [_____]].

2.3 DIRECT DIGITAL CONTROL (DDC) HARDWARE

All DDC Hardware must meet the following general requirements:

NOTE: The following paragraph uses tailoring options: The phrase "Except for Niagara Framework Supervisory Gateways, it" is included only when the NIAGARA FRAMEWORK tailoring option is selected.

a. Except for Niagara Framework Supervisory Gateways, it must incorporate a "service pin" which, when pressed will cause the DDC Hardware to broadcast its 48-bit NodeID and its ProgramID over the network. The service pin must be distinguishable and accessible.

b. It must incorporate a light to indicate the device is receiving power.

NOTE: The following paragraph uses tailoring options:
1) The phrase "Except for Niagara Framework Supervisory Gateways, it" is included only when the NIAGARA FRAMEWORK tailoring option is selected.

2) Transceiver requirements related to Niagara Framework Supervisory Gateways are included only when the NIAGARA FRAMEWORK tailoring option is selected.

c. Except for Niagara Framework Supervisory Gateways, it must incorporate a TP/FT-10 transceiver in accordance with CEA-709.3 and
connections for TP/FT-10 control network wiring. Niagara Framework Supervisory Gateways must incorporate an IP connection and at least one other transceiver. These other transceivers must be either a TP/FT-10 transceiver in accordance with CEA-709.3 or a TP/XF-1250 transceiver in accordance with LonMark Interoperability Guide. Niagara Framework Supervisory gateways must have connection of the appropriate type for each transceiver.

NOTE: The following paragraph uses tailoring options - "or the Fox protocol" is included only when the NIAGARA FRAMEWORK tailoring option is selected.

** **************************************************************************
** NOTE: The following paragraph uses tailoring options
**
** 1) "LNS" is only included when the LNS tailoring option is selected.
**
** 2) "the Niagara Framework" is included only when the
** NIAGARA FRAMEWORK tailoring option is selected.
** **************************************************************************

** **************************************************************************
** d. It must communicate on the network using only the CEA-709.1-D protocol or the Fox protocol.
** **************************************************************************

** **************************************************************************
** NOTE: The following paragraph uses tailoring options
**
** e. It must be capable of having network communications configured via LNS the Niagara Framework.
** **************************************************************************

** **************************************************************************
** NOTE: FYI, a link powered device gets its power from the communication cable as opposed to from a separate power source.
** **************************************************************************

** **************************************************************************
** f. It must be locally powered; link powered devices are not acceptable.
** **************************************************************************

** **************************************************************************
** NOTE: The following paragraph uses tailoring options for requirements specific to Niagara Framework systems:
**
** g. LonMark external interface files (XIF files), as defined in the LonMark XIF Guide, must be submitted for each type of DDC Hardware except Niagara Framework Supervisory Gateways.
**
** h. Application programs and configuration settings must be stored in a manner such that a loss of power does not result in a loss of the application program or configuration settings:
**
** 1) Loss of power must never result in the loss of application programs, regardless of the length of time power is lost.
**
** 2) Loss of power for less than 2,500 hours must not result in the
loss of configured settings.

i. It must have all functionality specified and required to support the application (Sequence of Operation or portion thereof) in which it is used, including but not limited to:

**************************************************************************
NOTE: The following paragraph uses tailoring options for requirements specific to Niagara Framework systems. The phrases "or Niagara Framework Points", and "and Niagara Framework Points" are included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

(1) It must provide input and output SNVTs or Niagara Framework Points as specified, as indicated on the Points Schedule, and as otherwise required to support the sequence and application in which it is used. All SNVTs and Niagara Framework Points must have meaningful names identifying the value represented by the SNVT or Niagara Framework Points. Unless a standard network variable type of an appropriate engineering type is not available, all network variables must be of a standard network variable type with engineering units appropriate to the value the variable represents.

**************************************************************************
NOTE: The following paragraph uses tailoring options for requirements specific to Niagara Framework systems. The sentence referring to Niagara Framework is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

(2) All settings and parameters used by the application in which the DDC hardware is used must be configurable via one of the following: standard configuration properties (SCPTs) as defined in the LonMark SCPT List, user-defined configuration properties (UCPTs), network configuration inputs (nci s) of a SNVT type as defined in the LonMark SNVT List, network configuration inputs (nci s) of a user defined network variable type, or hardware settings on the controller itself. Niagara Framework Supervisory Gateways may instead be configurable via the Niagara Framework.

j. It must meet FCC Part 15 requirements and have UL 916 or equivalent safety listing.

**************************************************************************
NOTE: FYI - The following requires that contractors with hardware that could be submitted under several categories to choose which requirements they must meet. This ensures that the device is evaluated according to its actual use.
**************************************************************************

**************************************************************************
NOTE: The following paragraph uses tailoring options for requirements specific to Niagara Framework systems. "Niagara Framework Supervisory
k. In addition to these general requirements and the DDC Hardware Input-Output (I/O) Function requirements, all DDC Hardware must also meet the requirements of a Niagara Framework Supervisory Gateway, a Local Display Panel (LDP), Application Specific Controller (ASC), General Purpose Programmable Controller (GPPC), or an Application Generic Controller (AGC). All pieces of DDC Hardware must have their DDC Hardware Type identified as part of the Manufacturer's Product Data submittal as specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. Except for Local Display Panels provided as part of another controller, where a single device meets the requirements of multiple types, select a single type for that specific device based on its use. Where a Local Display Panel is provided as part of another device, indicate both the controller type and local display panel. One model of DDC hardware may be submitted as different DDC Hardware types when used in multiple applications.

l. The user interface on all DDC Hardware with a user interface which allows for modification of a value must be password protected.

m. Clocks in DDC Hardware incorporating a Clock must continue to function for 120 hours upon loss of power to the DDC Hardware.

2.3.1 Hardware Input-Output (I/O) Functions

DDC Hardware incorporating hardware input-output (I/O) functions must meet the following requirements:

2.3.1.1 Analog Inputs

DDC Hardware analog inputs (AIs) must perform analog to digital (A-to-D) conversion with a minimum resolution of 8 bits plus sign or better as needed to meet the accuracy requirements specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. Signal conditioning including transient rejection must be provided for each analog input. Analog inputs must be capable of being individually calibrated for zero and span. Calibration via software scaling performed as part of point configuration is acceptable. The AI must incorporate common mode noise rejection of at least 50 dB from 0 to 100 Hz for differential inputs, and normal mode noise rejection of at least 20 dB at 60 Hz from a source impedance of 10,000 ohms.

2.3.1.2 Analog Outputs

NOTE: PART 3 of this section and the Points Schedules may require that points have an H-O-A switch. For analog outputs these switches may be "full on, full off" overrides or may have a knob allowing for override to any value (0-100 percent). Unless the project site specifically requires that analog outputs be fully adjustable through the range 0-100 percent, keep the bracketed text allowing either option (i.e. keep "to 0 percent and to 100 percent"). Requiring fully adjustable overrides (i.e. "through the range of 0 percent to 100 percent") will likely raise the cost of the system.
DDC Hardware analog outputs (AOs) must perform digital to analog (D-to-A) conversion with a minimum resolution of 8 bits plus sign, and output a signal with a range of 4-20 mA dc or 0-10 Vdc. Analog outputs must be capable of being individually calibrated for zero and span. Calibration via software scaling performed as part of point configuration is acceptable. DDC Hardware with Hand-Off-Auto (H-O-A) switches for analog outputs must provide for overriding the output [to 0 percent and to 100 percent][through the range of 0 percent to 100 percent]

2.3.1.3 Binary Inputs

DDC Hardware binary inputs (BIs) must accept contact closures and must ignore transients of less than 5 milli-second duration. Protection against a transient of 50 Vac must be provided.

2.3.1.4 Binary Outputs

DDC Hardware binary outputs (BOs) must provide relay contact closures or triac outputs for momentary and maintained operation of output devices. DDC Hardware with H-O-A switches for binary outputs must provide for overriding the output open or closed.

2.3.1.4.1 Relay Contact Closures

Closures must have a minimum duration of 0.1 second. Relays must provide at least 180V of isolation. Electromagnetic interference suppression must be provided on all output lines to limit transients to 50 Vac. Minimum contact rating must be 0.5 amperes at 24 Vac.

2.3.1.4.2 Triac Outputs

Triac outputs must provide at least 180 V of isolation. Minimum contact rating must be 0.5 amperes at 24 Vac.

2.3.1.5 Pulse Accumulator

DDC Hardware pulse accumulators must have the same characteristics as the BI. In addition, a buffer must be provided to totalize pulses. The pulse accumulator must accept rates of at least 20 pulses per second. The totalized value must be resettable via a configurable parameter.

2.3.1.6 Integrated H-O-A Switches

NOTE: Even if H-O-A switches are implemented, requiring feedback of H-O-A status may seriously limit competition and raise project costs. Unless there is a specific project requirement for H-O-A feedback, remove the bracketed text.

NOTE: This subpart uses tailoring options for requirements specific to Niagara Framework systems. "Niagara Framework of via" is only included when the NIAGARA FRAMEWORK tailoring option is selected.
Where integrated H-O-A switches are provided on hardware outputs, controller must provide means of monitoring position or status of H-O-A switch. This feedback may be provided via the Niagara Framework or via network variable.

2.3.2 Local Display Panel (LDP)

**************************************************************************
NOTE: This subpart uses tailoring options for requirements specific to Niagara Framework systems. "Niagara Framework points" is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

The Local Display Panels (LDPs) must be DDC Hardware with a display and navigation buttons or a touch screen display, and must provide display and adjustment of Niagara Framework points or network variables as indicated on the Points Schedule and as specified. LDPs must be provided as stand-alone DDC Hardware or as an integral part of another piece of DDC Hardware. LDPs must come factory installed with all applications necessary for the device to function as an LDP.

The adjustment of values using display and navigation buttons must be password protected.

2.3.3 Application Specific Controller (ASC)

Application Specific Controllers (ASCs) have a fixed factory-installed application program (i.e. ProgramID) with configurable settings and do not have the ability to be programmed for custom applications. ASCs must meet the following requirements in addition to the General DDC Hardware and DDC Hardware Input-Output (I/O) Function requirements:

a. ASCs must be LonMark Certified.

**************************************************************************
NOTE: The following list paragraph uses tailoring options:
1) The paragraph referring to Niagara Framework and Niagara Framework Wizards is included only when the NIAGARA FRAMEWORK tailoring option is selected.
2) The paragraph referring to LNS and LNS Plug-ins is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

b. Unless otherwise approved, all necessary Configuration Properties and network configuration inputs (ncis) for the sequence and application in which the ASC is used must be fully configurable through the Niagara Framework. Application Specific Controller configurable via a Niagara Framework Wizard is preferred. Wizards must be submitted for each type (manufacturer and model) of Application Specific Controller which has a Wizard available for configuration. Wizards distributed under a license must be licensed to the project site. (Note: configuration accomplished via hardware settings does not require configuration via Niagara Framework Wizard.)
Unless otherwise approved, all necessary Configuration Properties and network configuration inputs (ncis) for the sequence and application in which the ASC is used must be fully configurable through an LNS plug-in. LNS Plug-ins must be submitted for each type (manufacturer and model) of Application Specific Controller. LNS Plug-ins distributed under a license must be licensed to the project site. (Note: configuration accomplished via hardware settings does not require configuration via plug-in)

c. ASCs may include an integral or tethered Local Display Panel

2.3.4 General Purpose Programmable Controller (GPPC)

A General Purpose Programmable Controller (GPPC) must be programmed for the application. GPPCs must meet the following requirements in addition to the general DDC Hardware requirements and Hardware Input-Output (I/O) Functions:

a. The programmed GPPC must conform to the LonMark Interoperability Guide.

b. All programming software required to program the GPPC must be delivered to and licensed to the project site in accordance with Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. Submit the most recent version of the Programming software for each type (manufacturer and model) of General Purpose Programmable Controller (GPPC).

**************************************************************************
NOTE: The requirement to submit source code is vital to allow the Government to maintain the system and modify or reprogram devices if needed. The intent is that the Government can both:

1) modify the source code and re-download to the controller to change the sequence

2) buy an unprogrammed identical replacement controller and download the program into it in order to replace the controller
**************************************************************************

c. Submit copies of the installed GPPC application programs (all software that is not common to every controller of the same manufacturer and model) as source code compatible with the supplied programming software in accordance with Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. The submitted GPPC application program must be the complete application necessary for the GPPC to function as installed and be sufficient to allow replacement of the installed controller with a GPPC of the same type.

d. GPPCs may be include an integral or tethered Local Display Panel

2.3.5 Application Generic Controller (AGC)

An Application Generic Controller (AGC) has a fixed application program which includes the ability to be programmed for custom applications. AGCs must meet the following requirements in addition to the general DDC Hardware requirements and Hardware Input-Output (I/O) Functions:

a. The programmed AGC must conform to the LonMark Interoperability Guide.
b. The AGC must have a fixed ProgramID and fixed XIF file.

*********************************************************************************************************************************************
NOTE: The following TWO list paragraphs use tailoring options:
1) Requirements for LNS plug-ins are included only when the LNS tailoring option is selected.
2) Requirements for Niagara Framework Wizards are included only when the NIAGARA FRAMEWORK tailoring option is selected.
*********************************************************************************************************************************************

c. Unless otherwise approved, the AGC must be fully configurable and programmable for the application using one or more LNS plug-ins Niagara Framework Wizards, all of which must be submitted as specified for each type of AGC (manufacturer and model).

d. Submit copies of the installed AGC application programs as source code compatible with the supplied LNS plug-in Niagara Framework Wizard used for programming the device in accordance with Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. The submitted AGC application program must be the complete application program necessary for the AGC to function as installed and be sufficient to allow replacement of the installed controller with an AGC of the same type.

*********************************************************************************************************************************************
NOTE: The requirement to submit source code is vital to allow the Government to maintain the system and modify or reprogram devices if needed. The intent is that the Government can both:

1) modify the source code and re-download to the controller to change the sequence

2) buy an unprogrammed identical replacement controller and download the program into it in order to replace the controller
*********************************************************************************************************************************************

e. AGCs may be include an integral or tethered Local Display Panel

2.3.6 Niagara Framework Supervisory Gateway

*********************************************************************************************************************************************
NOTE: This subpart applies only to Niagara Framework systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
*********************************************************************************************************************************************

*********************************************************************************************************************************************
NOTE: FYI - The Niagara Framework Supervisory Gateway is known by many names within industry, and this specification uses the name "Niagara Framework Supervisory Gateway" in order to remain vendor neutral. Probably the most common term used for this device in industry is a "Java Application Control Engine", or JACE.
*********************************************************************************************************************************************
Any device implementing the Niagara Framework is a Niagara Framework Supervisory Gateway and must meet these requirements. In addition to the general requirements for all DDC Hardware, Niagara Framework Supervisory Gateway Hardware must:

a. Be direct digital control hardware.

b. Have an unrestricted interoperability license and its Niagara Comparability Statement (NiCS) must follow the Tridium Open NiCS Specification.

c. Manage communications between a field control network and the Niagara Framework Monitoring and Control Software, and between itself and other Niagara Framework Supervisory Gateways. Niagara Framework Supervisory Gateway Hardware must use Fox protocol for communication with other Niagara Framework Components, regardless of the manufacturer of the other components.

d. Be fully programmable using the Niagara Framework Engineering Tool and must support the following:

(1) Time synchronization, Calendar, and Scheduling using Niagara Scheduling Objects

(2) Alarm generation and routing using the Niagara Alarm Service

(3) Trending using the Niagara History Service and Niagara Trend Log Objects

(4) Integration of field control networks using the Niagara Framework Engineering Tool

(5) Configuration of integrated field control system using the Niagara Framework Engineering Tool when supported by the field control system

e. Meet the following minimum hardware requirements:

(1) [One][Two] 10/100/1000 Mbps Ethernet Port(s)

(3) Central Processing Unit of 600 Mhz or higher.[[4] Embedded operating system.]

f. provide access to field control network data and supervisory functions via web interface and support a minimum of 16 simultaneous users. Note: implementation of this capability may not be required on this project; see requirements in PART 3, EXECUTION of this Section.

g. Submit a backup of each Niagara Framework Supervisory Gateway as specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. The backup must be sufficient to restore a Niagara Framework Supervisory Gateway to the final as-built condition such that a new Niagara Framework Supervisory Gateway loaded with the backup is indistinguishable in functionality from the original.
2.4 NIAGARA FRAMEWORK ENGINEERING TOOL

**************************************************************************
NOTE: This subpart applies only to Niagara Framework systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

The Niagara Framework Engineering Tool must be Niagara Workbench or an equivalent Niagara Framework engineering tool software must:

a. have an unrestricted interoperability license and its Niagara Compatibility Statement (NiCS) must follow the Tridium Open NiCS Specification.

b. be capable of performing network configuration for Niagara Framework Supervisory Gateways and Niagara Framework Monitoring and Control Software.

c. be capable of programming and configuring of Niagara Framework Supervisory Gateways and Niagara Framework Monitoring and Control Software.

d. be capable of discovery of Niagara Framework Supervisory Gateways and all points mapped into each Niagara Framework Supervisory Gateway and making these points accessible to Niagara Framework Monitoring and Control Software.

Monitoring and Control Software is specified in Section 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION.

PART 3 EXECUTION

3.1 CONTROL SYSTEM INSTALLATION

3.1.1 Niagara Framework Engineering Tool

**************************************************************************
NOTE: This subpart applies only to Niagara Framework systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

**************************************************************************
NOTE: If the installation has a Niagara Framework Engineering Tool keep the first bracketed text and provide the software name and version number in the space provided. If the installation does not have a Niagara Framework Engineering Tool keep the second bracketed text.
**************************************************************************

[The project site currently has the [_____] Niagara Framework Engineering Tool. If this software is not adequate for programming the Niagara Framework Supervisory Gateways provided under this project, provide a Niagara Framework Engineering Tool as specified.][Provide a Niagara Framework Engineering Tool as specified.]
3.1.2 Building Control Network (BCN)

**************************************************************************
NOTE: This subpart uses tailoring options:
1) "Niagara Framework Supervisory Gateways" is included only when the NIAGARA FRAMEWORK tailoring option is selected.
2) "CEA-852-C Routers" is included only when the LNS tailoring option is selected.
**************************************************************************

Provide a Building Control Network (BCN) connecting all DDC hardware as specified. The Building Control Network (BCN) must consist of an IP Network, one or more Niagara Framework Supervisory Gateways CEA-852-C Routers, and one or more Non-IP Building Control Network Channels:

3.1.2.1 Building Control Network (BCN) Installation

**************************************************************************
NOTE: This subpart uses tailoring options:
1) "Niagara Framework Supervisory Gateways" is included throughout this subpart only when the NIAGARA FRAMEWORK tailoring option is selected.
2) "CEA-852-C Routers" is included throughout this subpart only when the LNS tailoring option is selected.
**************************************************************************

Provide building control networks meeting the following requirements:

a. Provide a Building Control Network IP Network, Non-IP Building Control Network Channels and Niagara Framework Supervisory Gateways CEA-852-C Routers to create a single building control network connecting all DDC Hardware.

b. In addition to the connection to the Niagara Framework Supervisory Gateway CEA-852-C Router, each Non-IP Building Control Network (BCN) Channel directly connected to a Niagara Framework Supervisory Gateway CEA-852-C Router must be directly connected to either DDC Hardware or to CEA-709.1-D Routers, but not to both. A channel containing only CEA-709.1-D Routers is a backbone channel and a channel containing DDC Hardware is a non-backbone channel.

c. When only a single Niagara Framework Supervisory Gateway CEA-852-C Router is required, the IP network consists of only the Niagara Framework Supervisory Gateway CEA-852-C Router. When multiple Niagara Framework Supervisory Gateways CEA-852-C Routers are required, provide an IP Network connecting all Niagara Framework Supervisory Gateways CEA-852-C Routers.

**************************************************************************
NOTE: The following list paragraph uses tailoring options. The text "other than Niagara Framework Supervisory Gateways" and the text "Connect all Niagara Framework Supervisory Gateways to the Building Control Network (BCN) IP Network." are only included when the NIAGARA FRAMEWORK tailoring option
d. Connect all DDC Hardware other than Niagara Framework Supervisory Gateways to a non-backbone BCN Channel. Connect all Niagara Framework Supervisory Gateways to the Building Control Network (BCN) IP Network.

e. Install components such that there is no more than one CEA-709.1-D Router between any DDC Hardware and a Niagara Framework Supervisory Gateway CEA-852-C Router.

f. Install the network such that the peak expected bandwidth usage for each and every channel is less than 70 percent, including device-to-device traffic and traffic to the Utility Monitoring and Control System (UMCS) as indicated on the Points Schedule.

NOTE: The following list paragraph uses tailoring options. The text "other than a Niagara Framework Supervisory Gateway" is only included when the NIAGARA FRAMEWORK tailoring option is selected.

3.1.2.2 Non-IP Building Control Network (BCN) Channel

Provide Non-IP Building Control Network (BCN) Channels meeting the following requirements:

a. For each non-backbone channel, provide a TP/FT-10 channel in doubly terminated bus topology in accordance with CEA-709.3. For each backbone channel, provide either a TP/FT-10 channel in doubly terminated bus topology in accordance with CEA-709.3 or a TP/XF-1250 channel in accordance with the LonMark Interoperability Guide.

b. Connect no more than 2/3 the maximum number of devices permitted by CEA-709.3 to each TP/FT-10 channel. Connect no more than 2/3 the maximum number of devices permitted by LonMark Interoperability Guide to TP/XF-1250 channel.

c. Connect no more than 2/3 the maximum number of devices permitted by the manufacturer of the device transceivers to each channel. When more than one type of transceiver is used on the same channel, use the transceiver with the lowest maximum number of devices to calculate the 2/3 limit.

3.1.2.3 Building Control Network (BCN) IP Network

Install IP Network Cabling in conduit. Install Ethernet Switches in lockable enclosures. Install the Building Control Network (BCN) IP Network so that it is available at the Facility Point of Connection (FPOC) location [as specified][______]. When the FPOC location is a room number, provide sufficient additional media to ensure that the Building Control Network (BCN) IP Network can be extended to any location in the room.
3.1.3 DDC Hardware

**************************************************************************
NOTE: Select bracketed text for requirements when no Application Specific controller exists for the application. This selection must be made in coordination with the project site, as they may have a specific requirement related to their O&M capabilities or preferences.

One option for systems using the Niagara Framework is to require the use of a Niagara Framework Supervisory Gateway whenever an Application Specific Controller isn't available for the application (essentially allowing only Niagara Framework Supervisory Gateways and Application Specific Controllers and prohibiting Application Generic Controllers and General Purpose Programmable Controllers). Remove the bracketed text (from "or Application Generic" through the end of the paragraph) to require the use of Niagara Framework Supervisory Gateways when Application Specific Controllers aren't available for the application in question. Otherwise, keep this bracketed text and then select the appropriate bracketed text.

Select appropriate bracketed text to indicate requirement for programmable controllers or multiple application specific controllers in cases where a single application specific controller for the application is not available.

The first option ("Application Generic Controllers, General Purpose Programmable Controllers or multiple Application Specific Controllers") is most permissive and should be used when the project site does not have a specific requirement.

If the third option ("multiple Application Specific Controllers") is selected, requirements related only to General Purpose Programmable Controllers and Application Generic Controllers may be removed from this Section. Great caution must be exercised in removing these requirements to ensure that requirements related to Application Specific Controllers are not affected by the removal of text.

**************************************************************************
**************************************************************************
NOTE: This subpart uses tailoring options:
1) "Niagara Framework Supervisory Gateways", "via the Niagara Framework" and "a Niagara Framework Supervisory Gateway [or " are included only when the NIAGARA FRAMEWORK tailoring option is selected.

2) "CEA-852-C Routers" and "via LNS using an LNS-based Network Configuration Tool" are included...
**only when the LNS tailoring option is selected.**

**************************************************************************

Install Niagara Framework Supervisory Gateways CEA-852-C Routers in lockable enclosures. Install other DDC Hardware which is not is suspended ceilings in [lockable] enclosures.

Configure and commission all DDC Hardware on the Building Control Network via the Niagara Framework via LNS using an LNS-based Network Configuration Tool. Use Application Specific Controllers whenever an Application Specific Controller suitable for the application exists. When an Application Specific Controller suitable for the application does not exist use a Niagara Framework Supervisory Gateway [or Application Generic Controllers, General Purpose Programmable Controllers or multiple Application Specific Controllers][Application Generic Controllers or General Purpose Programmable Controllers][multiple Application Specific Controllers].

3.1.3.1 Hand-Off-Auto (H-O-A) Switches

**************************************************************************

NOTE: See also DDC Hardware in PART 2.

The bracketed text is a general requirement for H-O-A switches and should only be included if such a requirement is absolutely necessary. It is best practice to use overrides in lieu of H-O-A switches. If H-O-A switches are specifically required by the project site it is best to remove the bracketed text and indicate which points require H-O-A switches on the Points Schedules.

Note that many sequences already have H-O-A switch requirements for motors independent of any other H-O-A requirements.

Select the desired capability for external switches for analog outputs

**************************************************************************

Provide Hand-Off-Auto (H-O-A) switches [for all DDC Hardware analog outputs and binary outputs used for control of systems other than terminal units,] as specified and as indicated on the Points Schedule. H-O-A switches must be integral to the controller hardware, an external device co-located with (in the same enclosure as) the controller, integral to the controlled equipment, or an external device co-located with (in the same enclosure as) the controlled equipment.

a. For H-O-A switches integral to DDC Hardware, meet the requirements specified in paragraph DIRECT DIGITAL CONTROL (DDC) HARDWARE.

b. For external H-O-A switches for binary outputs, provide switches capable of overriding the output open or closed.

c. For external H-O-A switches for analog outputs, provide switches capable of overriding [to 0 percent or 100 percent][through the range of 0 percent to 100 percent].
3.1.3.2 Local Display Panels

NOTE: This subpart uses tailoring option: The text "points in a Niagara Framework Supervisory Gateway or" is only included when the NIAGARA FRAMEWORK tailoring option is selected.

NOTE: Indicate on each Points Schedule which points, if any, are to be displayed or overridable from an LDP.

Coordinate with the project site to determine number and location of LDPs needed and show on them on the drawings.

Provide LDPs to display and override values of points in a Niagara Framework Supervisory Gateway or Network Variables as indicated on the Points Schedule. Install LDPs displaying points for anything other than a terminal unit in the same room as the equipment. Install LDPs displaying points for only terminal units [in a mechanical room central to the group of terminal units it serves][______].

[3.1.3.3 Graphics and Web Pages

NOTE: This subpart applies only to Niagara Framework systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.

NOTE: Only include this requirement if requiring web pages served from the Niagara Framework Supervisory Gateway. Select options based on project requirements.

Note that serving web pages from the Niagara Framework Supervisory Gateway is normally not necessary as web pages will typically be served from a Niagara Framework front end.

The contractor will require a certificate for the Web Server (in order to use HTTPS as required here). Coordinate with the project site IT organization (NEC) to obtain this certificate.

Configure Niagara Framework Supervisory Gateways to use web pages to provide a graphical user interface including System Displays [using the project site sample displays], including overrides, as indicated on the Points Schedule and as specified. Label all points on displays with [full English language descriptions] [the point name as indicated on the Points Schedule] [the point description as indicated on the Points Schedule].
Configure user permissions for access to and executions of action using graphic pages. Coordinate user permissions with the [Controls] [HVAC] [Electrical] shop supervisor. Configure the web server to use HTTPS based on the Transport Layer Security (TLS) protocol in accordance with IETF RFC 7465 using a Government furnished certificate.

3.1.3.4 Overrides for GPPCs and AGCs

**************************************************************************
NOTE: The following methods of implementing overrides are intended to be used for overriding setpoints and outputs. They will also work to override inputs, but the use of overrides on inputs is strongly discouraged since the operator loses all indication of the actual state of the system (e.g. The operator overrides zone temperature to 65 to force heating, zone heats up to 85 and operator has no indication that it's hot in the zone).
**************************************************************************

Provide the capability to override points for all General Purpose Programmable Controllers and Application Generic Controllers as specified and as indicated on the Points Schedule using one of the following methods:

a. Override SNVT of Same SNVT Type method:

(1) Use this method for all setpoint overrides and for overrides of inputs and outputs whenever practical.

(2) Provide a SNVT input to the DDC hardware containing the point to be overridden of the same SNVT type as the point to be overridden.

(3) Program and configure the DDC hardware such that:

(a) If the value of the SNVT on the override input is the Invalid Value defined for that SNVT by the LonMark SNVT List, then the point is not overridden (its value is determined from the sequence).

(b) If the value of the SNVT on the override input is not the Invalid Value defined for that SNVT by the LonMark SNVT List then set the value of the point to be overridden to the value of the SNVT on the override input.

b. HVAC Override SNVT method:

(1) Use this method for override of inputs and outputs when the "Override SNVT Shares SNVT Type" method is impractical.

(2) Provide a SNVT input to the DDC hardware containing the point to be overridden of SNVT type SNVT_hvac_overid. Show on the Points Schedule how to perform the specified override using this SNVT.

3.1.3.5 Overides for ASCs

Whenever possible use the methods specified for General Purpose Programmable Controllers and Application Generic Controllers to perform overrides for all Application Specific Controllers. If neither the "Override SNVT of Same SNVT Type" method or "HVAC Override SNVT" method are
supported by the Application Specific Controller show this on the Points Schedule and perform overrides as follows:

a. Provide one or more SNVT input(s) to the DDC hardware containing the point to be overridden. Document the number and type of each SNVT provided on the Points Schedule.

b. Configure the Application Specific Controller such that:

   (1) For some specific combination or combinations of values at the SNVT override input(s) the point is not overridden, and its value is determined from the sequence as usual. Show on the Points Schedule the values required at the SNVT override input(s) to not override the point.

   (2) For other specific combinations of SNVT override input(s), the value of the point to be overridden is determined from the value of the override input(s). Show on the Points Schedule the correlation between the SNVT override input(s) and the resulting value of the overridden point.

3.1.4 Scheduling, Alarming, Trending and Overrides

3.1.4.1 Scheduling

******************************************************************************

NOTE: The following paragraph applies only to Niagara Framework systems and is included only when the NIAGARA FRAMEWORK tailoring option is selected.

******************************************************************************

Configure schedules in Niagara Framework Supervisory Gateway using Niagara Schedule Objects as indicated on the Points Schedule and as specified. When the schedule is controlling occupancy modes in DDC Hardware other than a Niagara Framework Supervisory Gateway use a network variable of type SNVT_Occupancy.

******************************************************************************

NOTE: The following paragraph applies only to LNS-based systems and is included only when the LNS tailoring option is selected.

******************************************************************************

Provide DDC Hardware with LonMark Objects meeting the Simple Scheduler Functional Profile and configure schedules as specified on the Points Schedule and as specified.

3.1.4.1.1 Schedule Groupings

******************************************************************************

NOTE: Indicate if a common schedule may be used for multiple Terminal Units (TUs).

If allowing a common schedule for multiple TUs: keep the 'group of' bracketed text, and decide if TU groupings will be included on the drawings (keep the 'as indicated' bracketed text) or if the Contractor should decide on groupings (remove the 'as indicated' bracketed text).

******************************************************************************

SECTION 23 09 23.01  Page 27
Provide a separate schedule for each AHU including its associated Terminal Units and for each stand-alone Terminal Unit (those not dependent upon AHU service) or group of stand-alone Terminal Units acting according to a common schedule as indicated.

3.1.4.1.2 Occupancy Mode Mapping to SNVT Values

Use the following mapping between SNVT_Occupancy enumerations and occupancy modes:

a. OCCUPIED mode: Enumeration value of OC_OCCUPIED
b. UNOCCUPIED mode: Enumeration value of OC_UNOCCUPIED
c. WARM-UP/COOL-DOWN (PRE-OCCUPANCY) mode: Enumeration value of OC_STANDBY

3.1.4.2 Alarming

**************************************************************************
NOTE: The following paragraph applies only to LNS-based systems and is included only when the LNS tailoring option is selected.
**************************************************************************

For each point which is shown on the Points Schedule with an alarm condition, provide a SNVT output for the point to be used for alarm generation by the UMCS Front End.

**************************************************************************
NOTE: The following paragraph applies only to Niagara Framework systems and is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

For each point not in a Niagara Framework Supervisory Gateway which is shown on the Points Schedule with an alarm condition, provide a SNVT output for the point to be used for alarm generation. For each point which is shown on the Points Schedule with an alarm condition, configure alarms in Niagara Framework Supervisory Gateway using Niagara Alarm Extensions and Alarm Services.

3.1.4.3 Trending

**************************************************************************
NOTE: The following paragraph applies only to LNS-based systems and is included only when the LNS tailoring option is selected.
**************************************************************************

For each point which is shown on the Points Schedule as requiring a trend, provide a SNVT output for the point to be used for trending by the UMCS Front End.

**************************************************************************
NOTE: The following paragraph applies only to Niagara Framework systems and is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

For each point not in a Niagara Framework Supervisory Gateway which is...
shown on the Points Schedule as requiring a trend, provide a SNVT output for the point to be used for trending. For each point which is shown on the Points Schedule as requiring a trend, configure a trend in a Niagara Framework Supervisory Gateway using Niagara Framework History Extensions and the Niagara Framework History Service.

3.1.4.4 Overrides

**************************************************************************
NOTE: The following paragraph applies only to LNS-based systems and is included only when the LNS tailoring option is selected.
**************************************************************************

For each point shown on the Points Schedule as requiring an override, provide an override as specified in paragraphs "Overrides for GPPCs and AGCs" and "Overrides for ASCs".

**************************************************************************
NOTE: The following paragraph applies only to Niagara Framework systems and is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

Provide overrides for points as indicated on the Points Schedule. For overrides to points in Niagara Framework Supervisory Gateways, use the Niagara Framework. For overrides to other points, provide an override to a point in a Niagara Framework Supervisory Gateway via the Niagara Framework where the Niagara Framework Supervisory Gateway overrides the other point as specified in paragraphs "Overrides for GPPCs and AGCs" and "Overrides for ASCs".

3.1.5 Gateways

**************************************************************************
NOTE: This subpart uses tailoring options for requirements specific to Niagara Framework systems. The phrases "or to Niagara Framework Points" and "(Note: A Niagara Framework Supervisory Gateway is CEA-709.1-D control hardware.)" are included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

**************************************************************************
NOTE: The intent of this is to allow the use of gateways to packaged equipment controllers not procured under the scope of the project this specification is used for and, to not allow the installation of a non-BACnet network connected to a BACnet network via a gateway.
**************************************************************************

The requirements in this paragraph do not themselves permit the installation of hardware not meeting the other requirements of this section. Except for proprietary systems specifically indicated in Section 23 09 00, all control hardware installed under this project must meet the requirements of this specification, including the control hardware providing the network interface for a package unit or split system.
specify under this Section or another Section. Only use gateways to connect to pre-existing control devices and to proprietary systems specifically permitted by Section 23 09 00.

Provide Gateways to connect non-CEA-709.1-D control hardware in accordance with the following:

a. Configure gateway to map writeable data points in the controlled equipment to Network Variable Inputs of Standard Network Variable Types as defined by the LonMark SNVT List, or to Niagara Framework points, as indicated in the Points Schedule and as specified.

b. Configure gateway to map readable data points in the controlled equipment to Network Variable Outputs of Standard Network Variable Types as defined by the LonMark SNVT List, or to Niagara Framework points, as indicated in the Points Schedule and as specified.

c. Do not use non-CEA-709.1-D control hardware for controlling built-up units or any other equipment that was not furnished with factory-installed controls. (Note: A Niagara Framework Supervisory Gateway is CEA-709.1-D control hardware.)

d. Do not use non-CEA-709.1-D control hardware for system scheduling functions.

e. Each gateway must communicate with and perform protocol translation for non-CEA-709.1-D control hardware controlling one and only one package unit or a single non-CEA-709.1-D system specifically permitted by Section 23 09 00.

f. Connect one network port on the gateway to the Building Control Network and the other port to the single piece of controlled equipment or the non-CEA-709.1-D network specifically permitted by Section 23 09 00.

g. For gateways to existing package units or simple split systems, non-CEA-709.1-D network wiring connecting the gateway to the package unit or split system interface must not exceed 3 m 10 feet in length and must connect to exactly two devices: the controlled equipment or split system interface and the gateway.

3.1.6 Network Interface Jack

**************************************************************************
NOTE: Choose the preferred location for network interface jacks by controllers with thermostats (coordinate with the project site to determine preference of O&M Staff).
**************************************************************************

Provide standard network interface jacks such that each node on the control network is within 3 m 10 ft of an interface jack. For terminal unit controllers with hardwired thermostats this network interface jack may instead be located at the thermostat. Locating the interface jack [at the thermostat] near the controller is preferred. If the network interface jack is other than a 3 mm 1/8 inch phone jack, provide an interface cable with a standard 3 mm 1/8 inch phone jack on one end and a connector.
suitable for mating with installed network interface jack on the other. No more than one type of interface cable must be required to access all network interface jacks. Furnish [one] [_____] interface cable(s).

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for protocol-specific requirements for a Direct Digital Control (DDC) building control system based on the ASHRAE 135 protocol, including a tailoring option to require the Niagara Framework.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Comments, suggestions and recommended changes for this guide specification are welcome and should be as a Criteria Change Request (CCR). CCRs for this specification can be submitted through the Whole Building Design Guide page for this section: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-23-09-23.02-

NOTE: The use of this UFGS, and the design of BACnet Control Systems, must be in accordance with UFC 3-410-02, DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS. This specification MUST be used in conjunction with UFGS 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC in order to specify a complete and functional system.

Edit this guide specification for project specific requirements ONLY by selecting appropriate tailoring options, choosing applicable item(s), or inserting appropriate information in bracketed items. Do not make edits outside of bracketed items without prior approval as specified in UFC 3-410-02.
When used with UFGS 23 09 00, this specification covers installation of local (building-level) controls using BACnet-based DDC. It is primarily intended for building level control systems which are to be integrated into a Utility Monitoring and Control System (UMCS) as specified in Section 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION (where Section 25 10 10 has also used the matching BACnet or Niagara Framework tailoring option).

For projects that require the building system to provide UMCS functionality (without connection to a UMCS), the designer must include the necessary requirements from Section 25 10 10 in the project specification.

Template drawings in electronic format for use with this section are available online at the Whole Building Design Guide page for Section 23 09 00: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-

******************************************************************************
******************************************************************************

NOTE: This specification makes use of SpecsIntact Tailoring Options. This note describes these options and how to use them.

"TAILORING OPTION NOTES" Tailoring Option
Each time tailoring options are used there is an accompanying designer note describing the text that is tailored. As this Section makes heavy use of tailoring options there are many of these notes and they can distract from designer notes describing other decisions. The designer notes describing tailoring options are all in a "TAILORING OPTION NOTES" tailoring option which can be hidden (in SpecsIntact select View-Tailoring Options and then deselect "TAILORING OPTION NOTES") once this section is tailored and the tailoring option notes are no longer needed.

"NIAGARA FRAMEWORK" and "NOT NIAGARA FRAMEWORK" Tailoring Options
This specification includes tailoring options for whether or not the Niagara Framework is required - "NIAGARA FRAMEWORK" and "NOT NIAGARA FRAMEWORK". Exactly ONE of these tailoring options must be chosen. You have currently selected the following options:

--------
NIAGARA FRAMEWORK
NOT NIAGARA FRAMEWORK
--------

If you don't see either the words "NIAGARA FRAMEWORK" or "NOT NIAGARA FRAMEWORK" between the dashes above, you have not selected a tailoring option and this specification is not valid. Select
ONE of the tailoring options.

If you see both "NIAGARA FRAMEWORK" and "NOT NIAGARA FRAMEWORK" you have selected both tailoring options. Remove one of the tailoring options.

Service Tailoring Option
This specification also includes tailoring options for the Service (Air Force, Army, Navy) the specification is used for. There is a "Service Generic" tailoring option that can also be used. Only ONE of the four tailoring options related to the service should be use. You have currently selected the following options:

----------
AIR FORCE
ARMY
NAVY
SERVICE GENERIC
----------

If more than one item appears between the dashes above you have selected more than one services tailoring option and need to remove all but one of them.

**************************************************************************
**************************************************************************
WARNING - Both the NIAGARA FRAMEWORK and NOT NIAGARA FRAMEWORK Tailoring Options have been selected. This will result in a specification that contains conflicts and cannot be met. DESELECT one of these tailoring options. See UFC 3-410-02.
**************************************************************************
**************************************************************************

PART 1 GENERAL

**************************************************************************
**************************************************************************
NOTE: IMPORTANT: You selected the NIAGARA FRAMEWORK Tailoring Option. Ensure that the front end (UMCS) uses the Niagara Framework, otherwise integration will fail.
**************************************************************************

1.1 SUMMARY

Provide a complete Direct Digital Control (DDC) system, except for the front end which is specified in Section 25 10 10 UTILITY MONITORING AND CONTROL (UMCS) FRONT END AND INTEGRATION, suitable for the control of the heating, ventilating and air conditioning (HVAC) and other building-level systems as specified and shown and in accordance with Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

1.1.1 System Requirements

Provide a system meeting the requirements of both Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and this Section and with the following characteristics:
NOTE: The following list paragraph uses tailoring options:
1) The paragraph referencing Niagara Framework is included only when the NIAGARA FRAMEWORK tailoring option is selected.
2) The paragraph NOT referencing Niagara Framework is included only when the NOT NIAGARA FRAMEWORK tailoring option is selected.

a. Except for Gateways, the control system must be an open implementation of BACnet technology using ASHRAE 135 and Fox as the communications protocols. The system must use standard ASHRAE 135 Objects and Properties and the Niagara Framework. The system must use standard ASHRAE 135 Services and the Niagara Framework exclusively for communication over the network. Gateways to packaged units must communicate with other DDC hardware using ASHRAE 135 or the Fox protocol exclusively and may communicate with packaged equipment using other protocols. The control system must be installed such that any two ASHRAE 135 devices on the Internetwork can communicate using standard ASHRAE 135 Services.

b. Install and configure control hardware to provide ASHRAE 135 Objects and Properties or Niagara Framework Objects as indicated and as needed to meet the requirements of this specification.

c. Use Niagara Framework hardware and software exclusively for scheduling, trending, and communication with a front end (UMCS). Use Niagara Framework or standard BACnet Objects and services for alarming. Use the Fox protocol for all communication between Niagara
Framework Supervisory Gateways; use the ASHRAE 135 protocol for all other building communication. [Niagara Framework Supervisory Gateway must serve web pages as specified.]

*********************************************************************

NOTE: Select the required version of the Niagara Framework. This choice must be carefully coordinated with the project site. Niagara Framework is currently (2015) in a transition between two releases: "AX" and "Version 4". A Version 4 UMCS front end (e.g. as specified in Section 25 10 10) UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION will work with either an AX or Version 4 Niagara Framework Supervisory Gateway, but an AX front end will ONLY work with an AX Niagara Framework Supervisory Gateway.

If the site has an AX front end, select "AX".
If the site has a Version 4 front end, or does not have a front end:
1) if there are multiple vendors servicing the project site that support Version 4, select "Version 4"

2) otherwise, select "either AX or Version 4"

*********************************************************************

d. Use Niagara Framework [AX][Version 4.0 or later][either AX or Version 4.0 or later].

1.1.2 Verification of Specification Requirements

Review all specifications related to the control system installation and advise the Contracting Officer of any discrepancies before performing any work. If Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC or any other Section referenced in this specification is not included in the project specifications advise the Contracting Officer and either obtain the missing Section or obtain Contracting Officer approval before performing any work.

1.2 REFERENCES

*********************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically
be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 DEFINITIONS

For definitions related to this section, see Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

1.4 SUBMITTALS

**************************************************************************
NOTE: Submittals related to this section are specified in UFGS 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. UFGS 23 09 00 MUST be used with this specification to have a complete specification.

Submittal requirements related to this Section are specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

PART 2 PRODUCTS

All products used to meet this specification must meet the indicated requirements, but not all products specified here will be required by every project. All products must meet the requirements both Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and this Section.

2.1 NETWORK HARDWARE

2.1.1 BACnet Router

**NOTE: This subpart uses tailoring options: the text "except for Niagara Framework Supervisory Gateways, devices used as BACnet routers" is included only when the NIAGARA FRAMEWORK tailoring option is selected.

All BACnet Routers must be BACnet/IP Routers and must perform layer 3 routing of ASHRAE 135 packets over an IP network in accordance with ASHRAE 135 Annex J and Clause 6. The router must provide the appropriate connection to the IP network and connections to one or more ASHRAE 135 MS/TP networks. Devices used as BACnet Routers must meet the requirements for DDC Hardware, and except for Niagara Framework Supervisory Gateways, devices used as BACnet routers must support the NM-RC-B BIBB.

2.1.2 BACnet Gateways

**Gateways should be used only for the integration of a single piece of equipment. Gateways should not be used to permit the installation of new, non-ASHRAE 135 networks.

**NOTE: This subpart uses tailoring options: the text "be a Niagara Framework Supervisory Gateway or must", "except for Niagara Framework Supervisory Gateways", and "(Niagara Framework Supervisory Gateways are both Gateways and DDC Hardware.)" are included only when the NIAGARA FRAMEWORK tailoring option is selected.

In addition to the requirements for DDC Hardware, the BACnet Gateway must be a Niagara Framework Supervisory Gateway or must meet the following requirements:
a. It must perform bi-directional protocol translation from one non-
ASHRAE 135 protocol to ASHRAE 135. BACnet Gateways must incorporate a
network connection to an ASHRAE 135 network (either BACnet over IP in
accordance with Annex J or MS/TP) and a separate connection appropriate
for the non-ASHRAE 135 protocol and media.

b. It must retain its configuration after a power loss of an indefinite
time, and must automatically return to their pre-power loss state once
power is restored.

c. It must allow bi-directional mapping of data between the non-ASHRAE 135
protocol and Standard Objects as defined in ASHRAE 135. It must
support the DS-RP-B BIBB for Objects requiring read access and the
DS-WP-B BIBB for Objects requiring write access.

d. It must support the DS-COV-B BIBB.

Although Gateways must meet DDC Hardware requirements, except for Niagara
Framework Supervisory Gateways, they are not DDC Hardware and must not be
used when DDC Hardware is required. (Niagara Framework Supervisory
Gateways are both Gateways and DDC Hardware.)

2.1.3 Ethernet Switch

**************************************************************************
NOTE: Select whether Ethernet Switches must be
managed. In general, do NOT require managed
switches unless there is a specific project
requirement for managed switches. Managed switches
add cost to the system, and require that they be
managed by the project site following installation.
Some sites are equipped to handle such management,
but for some (many) sites this will be an
unacceptable O&M burden.
**************************************************************************

Ethernet Switches must be managed switches and must autoconfigure between
10,100 and 1000 megabits per second (MBPS).

2.2 CONTROL NETWORK WIRING

a. BACnet MS/TP communications wiring must be in accordance with ASHRAE 135.
The wiring must use shielded, three wire (twisted-pair with reference)
cable with characteristic impedance between 100 and 120 ohms.
Distributed capacitance between conductors must be less than 100 pF per
meter 30 pF per foot.

**************************************************************************
NOTE: Although the controls contractor installs the
building control system backbone, which is an IP
network, this system will later be integrated into
the basewidth network via the FPOC. To ensure no
issues arise during this later integration, obtain
additional Ethernet media requirements (if any) from
the project site NEC.
**************************************************************************

b. Building Control Network Backbone IP Network must use Ethernet media.
Ethernet cables must be CAT-5e at a minimum and meet all requirements
of IEEE 802.3 [and [____]].

2.3 DIRECT DIGITAL CONTROL (DDC) HARDWARE

2.3.1 General Requirements

All DDC Hardware must meet the following requirements:

a. It must be locally powered and must incorporate a light to indicate the device is receiving power.

b. It must conform to the BTL Guide

c. It must be BACnet Testing Laboratory (BTL) Listed.

d. The Manufacturer's Product Data submittal for each piece of DDC Hardware must include the Protocol Implementation Conformance Statement (PICS) for that hardware as specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

e. It must communicate and be interoperable in accordance with ASHRAE 135 and have connections for BACnet IP or MS/TP control network wiring.

f. Other than devices controlling terminal units or functioning solely as a BACnet Router, it must support DS-COV-B, DS-RPM-A and DS-RPM-B BIBBs.

g. Devices supporting the DS-RP-A BIBB must also support the DS-COV-A BIBB.

h. Application programs, configuration settings and communication information must be stored in a manner such that they persist through loss of power:

   (1) Application programs must persist regardless of the length of time power is lost.

   (2) Configured settings must persist for any loss of power less than 2,500 hours.

   (3) Communication information, including but not limited to COV subscriptions, event reporting destinations, Notification Class Object settings, and internal communication settings, must persist for any loss of power less than 2,500 hours.

i. Internal Clocks:

   (1) Clocks in DDC Hardware incorporating a Clock must continue to function for 120 hours upon loss of power to the DDC Hardware.

   (2) DDC Hardware incorporating a Clock must support the DM-TS-B or DM-UTC-B BIBB.

**************************************************************************
NOTE: The following list paragraph uses tailoring options: the text "or Niagara Framework Points" is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

j. It must have all functionality indicated and required to support the
application (Sequence of Operation or portion thereof) in which it is used, including but not limited to providing Objects or Niagara Framework Points as specified and as indicated on the Points Schedule.

k. In addition to these general requirements and the DDC Hardware Input-Output (I/O) Function requirements, all DDC Hardware must also meet any additional requirements for the application in which it is used (e.g. scheduling, alarming, trending, etc.).

l. It must meet FCC Part 15 requirements and have UL 916 or equivalent safety listing.

m. Except for Niagara Framework Supervisory Gateways, Device must support Commandable Objects to support Override requirements as detailed in PART 3 EXECUTION

n. User interfaces which allow for modification of Properties or settings must be password-protected.

o. Devices communicating BACnet MS/TP must meet the following requirements:

   (1) Must have a configurable Max_Master Property.

   (2) DDC Hardware other than hardware controlling a single terminal unit must have a configurable Max_Info_Frames Property.

   (3) Must respond to any valid request within 50 msec with either the appropriate response or with a response of "Reply Postponed".

   (4) Must use twisted pair with reference and shield (3-wire media) wiring[, or twisted pair with shield (2-wire media) wiring and use half-wave rectification].

p. Devices communicating BACnet/IP must use UDP Port 0xBAC0. Devices with configurable UDP Ports must default to 0xBAC0.
q. All Device IDs, Network Numbers, and BACnet MAC addresses of devices must be fully configurable without limitation, except MS/TP MAC addresses may be limited by ASHRAE 135 requirements.

**************************************************************************
NOTE: The following list paragraph uses tailoring options: the text "Except for Niagara Framework Supervisory Gateways," is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

r. Except for Niagara Framework Supervisory Gateways, DDC Hardware controlling a single terminal unit must have:

(1) Objects (including the Device Object) with an Object Name Property of at least 8 characters in length.

(2) A configurable Device Object Name.

(3) A configurable Device Object Description Property at least 16 characters in length.

**************************************************************************
NOTE: The following list paragraph uses tailoring options: the text "either Niagara Framework Supervisory Gateways or " is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

s. Except for Objects in either Niagara Framework Supervisory Gateways or DDC Hardware controlling a single terminal unit, all Objects (including Device Objects) must:

(1) Have a configurable Object Name Property of at least 12 characters in length.

(2) Have a configurable Object Description Property of at least 24 characters in length.

t. For programmable DDC Hardware, provide and license to the project site all programming software required to program the Hardware in accordance with Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

u. For programmable DDC Hardware, provide copies of the installed application programs (all software that is not common to every controller of the same manufacturer and model) as source code compatible with the supplied programming software in accordance with Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. The submitted application program must be the complete application necessary for controller to function as installed and be sufficient to allow replacement of the installed controller with another controller of the same type.

2.3.2 Hardware Input-Output (I/O) Functions

DDC Hardware incorporating hardware input-output (I/O) functions must meet the following requirements:
2.3.2.1 Analog Inputs

DC Hardware analog inputs (AIs) must be implemented using ASHRAE 135 Analog Input Objects and perform analog to digital (A-to-D) conversion with a minimum resolution of 8 bits plus sign or better as needed to meet the accuracy requirements specified in Section 23 09 00. Signal conditioning including transient rejection must be provided for each analog input. Analog inputs must be capable of being individually calibrated for zero and span. Calibration via software scaling performed as part of point configuration is acceptable. The AI must incorporate common mode noise rejection of at least 50 dB from 0 to 100 Hz for differential inputs, and normal mode noise rejection of at least 20 dB at 60 Hz from a source impedance of 10,000 ohms.

2.3.2.2 Analog Outputs

**************************************************************************
NOTE: PART 3 of this section and the Points Schedules may require that points have an H-O-A switch. For analog outputs these switches may be "full on, full off" overrides or may have a knob allowing for override to any value (0-100 percent). Unless the project site specifically requires that analog outputs be fully adjustable through the range 0-100 percent, keep the bracketed text allowing either option (i.e. keep "to 0 percent and to 100 percent"). Requiring fully adjustable overrides (i.e. "through the range of 0 percent to 100 percent") will likely raise the cost of the system.
**************************************************************************

DDC Hardware analog outputs (AOs) must be implemented using ASHRAE 135 Analog Output Objects and perform digital to analog (D-to-A) conversion with a minimum resolution of 8 bits plus sign, and output a signal with a range of 4-20 mAdc or 0-10 Vdc. Analog outputs must be capable of being individually calibrated for zero and span. Calibration via software scaling performed as part of point configuration is acceptable. DDC Hardware with Hand-Off-Auto (H-O-A) switches for analog outputs must provide for overriding the output [to 0 percent and to 100 percent][through the range of 0 percent to 100 percent]

2.3.2.3 Binary Inputs

DDC Hardware binary inputs (BIs) must be implemented using ASHRAE 135 Binary Input Objects and accept contact closures and must ignore transients of less than 5 milli-second duration. Protection against a transient 50VAC must be provided.

2.3.2.4 Binary Outputs

DDC Hardware binary outputs (BOs) must be implemented using ASHRAE 135 Binary Output Objects and provide relay contact closures or triac outputs for momentary and maintained operation of output devices. DDC Hardware with H-O-A switches for binary outputs must provide for overriding the output open or closed.

2.3.2.4.1 Relay Contact Closures

Closures must have a minimum duration of 0.1 second. Relays must provide
at least 180V of isolation. Electromagnetic interference suppression must be provided on all output lines to limit transients to 50 Vac. Minimum contact rating must be 0.5 amperes at 24 Vac.

2.3.2.4.2 Triac Outputs

Triac outputs must provide at least 180 V of isolation. Minimum contact rating must be 0.5 amperes at 24 Vac.

2.3.2.5 Pulse Accumulator

DDC Hardware pulse accumulators must be implemented using either an ASHRAE 135 Accumulator Object or an ASHRAE 135 Analog Value Object where the Present_Value is the totalized pulse count. Pulse accumulators must accept contact closures, ignore transients less than 5 msec duration, protect against transients of 50 VAC, and accept rates of at least 20 pulses per second.

2.3.2.6 ASHRAE 135 Objects for Hardware Inputs and Outputs

The requirements for use of ASHRAE 135 objects for hardware input and outputs includes devices where the hardware sensor or actuator is integral to the controller (e.g. a VAV box with integral damper actuator, a smart sensor, a VFD, etc.)

[2.3.2.7 Integrated H-O-A Switches

**************************************************************************
NOTE: Even if H-O-A switches are implemented, requiring feedback of H-O-A status may seriously limit competition and raise project costs. Unless there is a specific project requirement for H-O-A feedback, remove the bracketed text.
**************************************************************************

**************************************************************************
NOTE: This subpart uses tailoring options: the text "the Niagara Framework or via" is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

Where integrated H-O-A switches are provided on hardware outputs, controller must provide means of monitoring position or status of H-O-A switch. This feedback may be provided via the Niagara Framework or via any valid BACnet method, including the use of proprietary Objects, Properties, or Services.

]2.3.3 Local Display Panel (LDP)

**************************************************************************
NOTE: This subpart uses tailoring options: the text "Niagara Framework points or" is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

The Local Display Panels (LDPs) must be DDC Hardware with a display and navigation buttons or a touch screen display, and must provide display and adjustment of Niagara Framework points or ASHRAE 135 Properties as
indicated on the Points Schedule and as specified. LDPs must be either BTL Listed as a B-OD, B-OWS, B-AWS, or be an integral part of another piece of DDC Hardware listed as a B-BC. For LDPs listed as B-OWS or B-AWS, the hardware must be BTL listed and the product must come factory installed with all applications necessary for the device to function as an LDP.

The adjustment of values using display and navigation buttons must be password protected.

2.3.4 Expansion Modules and Tethered Hardware

**************************************************************************
NOTE:
a. Covers the case where a base controller has add-on modules to provide I/O capability, where the modules "snap on" to the controller. This generally relies on a proprietary protocol between the base unit and the expansion modules, but as the module is essentially part of the base unit upon installation this is permitted.

b. Covers a remotely tethered device and is primarily needed for remote "thermostats" connected to a controller, where the thermostat is essentially an extension of the controller.
**************************************************************************

A single piece of DDC Hardware may consist of a base unit and also:

a. An unlimited number of hardware expansion modules, where the individual hardware expansion modules are designed to directly connect, both mechanically and electrically, to the base unit hardware. The expansion modules must be commercially available as an optional add-on to the base unit.

b. A single piece of hardware connected (tethered) to a base unit by a single cable where the cable carries a proprietary protocol between the base unit and tethered hardware. The tethered hardware must not contain control logic and be commercially available as an optional add-on to the base unit as a single package.

Note that this restriction on tethered hardware does not apply to sensors or actuators using standard binary or analog signals (not a communications protocol); sensors or actuators using standard binary or analog signals are not considered part of the DDC Hardware.

Hardware capable of being installed stand-alone, or without a separate base unit, is DDC Hardware and must not be used as expansion modules or tethered hardware.

2.3.5 Supervisory Control Requirements

2.3.5.1 Scheduling Hardware

**************************************************************************
NOTE: This subpart is only required for non-Niagara Framework based systems and is only included when the NOT NIAGARA FRAMEWORK tailoring option is selected.
DDC Hardware used for scheduling must meet the following requirements:

a. It must be BTL Listed as a B-BC and support the SCHED-E-B BIBB.

b. It is preferred, but not required, that devices support the DM-OCD-B BIBB on all Calendar and Schedule Objects, such that a front end BTL listed as a B-AWS may create or delete Calendar and Schedule Objects. It is also preferred but not required that devices supporting the DM-OCD-B BIBB accept any valid value for properties of Calendar and Schedule Objects. Note that there are additional requirements in the EXECUTION Part of this Section for Devices which do not support the DM-OCD-B BIBB as specified.

c. The Date_List property of all Calendar Objects must be writable.

d. The Present_Value Property of Schedule must support the following values: 1, 2, 3, 4.

2.3.5.2 Alarm Generation Hardware

Non-Niagara Framework DDC Hardware used for alarm generation must meet the following requirements:

a. Device must support the AE-N-I-B BIBB

b. The Recipient_List Property must be Writable for all Notification Class Objects used for alarm generation.

c. For all Objects implementing Intrinsic Alarming, the following Properties must be Writable:
   (1) Time_Delay
   (2) High_Limit
   (3) Low_Limit
   (4) Deadband
   (5) Event_Enable
   (6) If the issue date of this project specification is after 1 January 2016, Time_Delay_Normal must be writable.
d. For Event Enrollment Objects used for alarm generation, the following Properties must be Writable:

(1) Event_Parameters
(2) Event_Enable
(3) If the issue date of this project specification is after 1 January 2016, Time_Delay_Normal must be writable.

e. It is preferred, but not required, that devices support the DM-OCD-B BIBB on all Notification Class Objects and Event Enrollment Objects, such that a front end BTL listed as a B-AWS may create or delete Notification Class Objects and Event Enrollment Objects. It is also preferred, but not required that devices supporting the DM-OCD-B BIBB accept any valid value as an initial value for properties of Notification Class Objects and Event Enrollment Objects. Note that there are additional requirements in the EXECUTION Part of this Section for devices which do not support the DM-OCD-B BIBB as specified.

f. Devices provided to meet the requirements indicated under "Support for Future Alarm Generation" in the EXECUTION part of this specification must support the AE-N-E-B BIBB.

2.3.5.3 Trending Hardware

DDC Hardware used for collecting trend data must meet the following requirements:

a. Device must support Trend Log or Trend Log Multiple Objects.

b. Device must support the T-VMT-I-B BIBB.

c. Devices provided to meet the EXECUTION requirement for support of Future Trending must support the T-VMT-E-B BIBB.

d. The following properties of all Trend Log or Trend Log Multiple Objects must be present and Writable:
   - Start_Time
   - Stop_Time
   - Log_DeviceObjectProperty
   - Log Interval  Log interval must support an interval of at least 60 minutes duration.

e. Trend Log Objects must support using Intrinsic Reporting to send a BUFFER_FULL event.

f. The device must have a Notification Class Object for the BUFFER_FULL event. The Recipient_List Property must be Writable.
g. Devices must support values of at least 1,000 for Buffer_Size Properties.

h. It is preferred, but not required, that devices support the DM-OCD-B BIBB on all Trend Log Objects, such that a front end BTL listed as a A-AWS may create or delete Trend Log Objects. It is also preferred, but not required that devices supporting the DM-OCD-B BIBB accept any valid value as an initial value for properties of Trend Log Objects. Note that there are additional EXECUTION requirements for devices which do not support the DM-OCD-B BIBB as specified.

2.3.6 Niagara Framework Supervisory Gateway

**************************************************************************
NOTE: This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

**************************************************************************
NOTE: FYI - The Niagara Framework Supervisory Gateway is known by many names within industry, and this specification uses the name "Niagara Framework Supervisory Gateway" in order to remain vendor neutral. Probably the most common term used for this device in industry is a "Java Application Control Engine", or JACE.
**************************************************************************

Any device implementing the Niagara Framework is a Niagara Framework Supervisory Gateway and must meet these requirements. In addition to the general requirements for all DDC Hardware, Niagara Framework Supervisory Gateway Hardware must:

a. Be direct digital control hardware.

b. Have an unrestricted interoperability license and its Niagara Compatibility Statement (NiCS) must follow the Tridium Open NiCS Specification.

c. Manage communications between a field control network and the Niagara Framework Monitoring and Control Software, and between itself and other Niagara Framework Supervisory Gateways. Niagara Framework Supervisory Gateway Hardware must use Fox protocol for communication with other Niagara Framework Components, regardless of the manufacturer of the other components.

d. Be fully programmable using the Niagara Framework Engineering Tool and must support the following:

(1) Time synchronization, Calendar, and Scheduling using Niagara Scheduling Objects

(2) Alarm generation and routing using the Niagara Alarm Service

(3) Trending using the Niagara History Service and Niagara Trend Log Objects
(4) Integration of field control networks using the Niagara Framework Engineering Tool

(5) Configuration of integrated field control system using the Niagara Framework Engineering Tool when supported by the field control system

e. Meet the following minimum hardware requirements:

1. [One][Two] 10/100/1000 Mbps Ethernet Port(s)
2. One or more MS/TP ports.
3. Central Processing Unit of 600 Mhz or higher.
4. Embedded operating system.

f. Provide access to field control network data and supervisory functions via web interface and support a minimum of 16 simultaneous users. Note: implementation of this capability may not be required on all projects.

g. Submit a backup of each Niagara Framework Supervisory Gateway as specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. The backup must be sufficient to restore a Niagara Framework Supervisory Gateway to the final as-built condition such that a new Niagara Framework Supervisory Gateway loaded with the backup is indistinguishable in functionality from the original.

2.4 NIAGARA FRAMEWORK ENGINEERING TOOL

**************************************************************************
NOTE: This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

The Niagara Framework Engineering Tool must be Niagara Workbench or an equivalent Niagara Framework engineering tool software must:

a. Have an unrestricted interoperability license and its Niagara Compatibility Statement (NiCS) must follow the Tridium Open NiCS Specification.

b. Be capable of performing network configuration for Niagara Framework Supervisory Gateways and Niagara Framework Monitoring and Control Software.

c. Be capable of programming and configuring of Niagara Framework Supervisory Gateways and Niagara Framework Monitoring and Control Software.

d. Be capable of discovery of Niagara Framework Supervisory Gateways and all points mapped into each Niagara Framework Supervisory Gateway and making these points accessible to Niagara Framework Monitoring and Control Software.

Monitoring and Control Software is specified in Section 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION.
NOTE: Use the bracketed text for retrofit projects only. For new construction, the existing conditions survey may not be required and may be removed (be sure to remove the report from the submittals as well). Keeping it as a requirement, however, will ensure that the Contractor checks the mechanical equipment prior to beginning controls installation. This should allow problems to be caught and addressed earlier.

3.1 CONTROL SYSTEM INSTALLATION

3.1.1 Niagara Framework Engineering Tool

NOTE: This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.

NOTE: If the installation has a Niagara Framework Engineering Tool keep the first bracketed text and provide the software name and version number in the space provided. If the installation does not have a Niagara Framework Engineering Tool keep the second bracketed text.

[The project site currently has the [_____] Niagara Framework Engineering Tool. If this software is not adequate for programming the Niagara Framework Supervisory Gateways provided under this project, provide a Niagara Framework Engineering Tool.]

3.1.2 Building Control Network (BCN)

NOTE: Note that the term BCN is used across multiple specification including those using different protocols, and "network" is used in the generic sense to refer to the entire system. In BACnet this is called the Internetwork but the term BCN is still used for consistency across specification.

NOTE: This subpart uses tailoring options: the phrase "for the IP network and" is only included when the NIAGARA FRAMEWORK tailoring option is selected.

Install the Building Control Network (BCN) as a single BACnet Internetwork consisting of a single IP network as the BCN Backbone and zero or more
BACnet MS/TP networks. Note that in some cases there may only be a single device on the BCN Backbone.

Except for the IP Network and as permitted for the non-BACnet side of Gateways, use exclusively ASHRAE 135 networks.

3.1.2.1 Building Control Network IP Backbone

Install IP Network Cabling in conduit. Install Ethernet Switches in lockable enclosures. Install the Building Control Network (BCN) IP Backbone such that it is available at the Facility Point of Connection (FPOC) location [as indicated][______]. When the FPOC location is a room number, provide sufficient additional media to ensure that the Building Control Network (BCN) IP Backbone can be extended to any location in the room.

Use UDP port 0xBAC0 for all BACnet traffic on the IP network. (Note that in a Niagara Framework system there may not be BACnet traffic on the IP Network)

3.1.2.2 BACnet MS/TP Networks

When using MS/TP, provide MS/TP networks in accordance with ASHRAE 135 and in accordance with the ASHRAE 135 figure "Mixed Devices on 3-Conductor Cable with Shield" (Figure 9-1.4 in the 2012 version of ASHRAE 135). Ground the shield at the BACnet Router and at no other point. Ground the reference wire at the BACnet Router through a 100 ohm resistor and do not ground it at any other point. In addition:

a. Provide each segment in a doubly terminated bus topology in accordance with TIA-485.

b. Provide each segment with 2 sets of network bias resistors in accordance with ASHRAE 135, with one set of resistors at each end of the MS/TP network.
c. Use 3 wire (twisted pair and reference) with shield media for all MS/TP media installed inside. Use fiber optic isolation in accordance with ASHRAE 135 for all MS/TP media installed outside buildings, or between multiple buildings.

d. For 18 AWG cable, use segments with a maximum length of 1200 m (4000 ft). When using greater distances or different wire gauges comply with the electrical specifications of TIA-485.

e. For each controller that does not use the reference wire provide transient suppression at the network connection of the controller if the controller itself does not incorporate transient suppression.

f. Install no more than 32 devices on each MS/TP segment. Do not use MS/TP to MS/TP routers.

**************************************************************************
NOTE: The following list paragraph uses tailoring options: the text "a Niagara Framework Supervisory Gateway configured as" is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

g. Connect each MS/TP network to the BCN backbone via a Niagara Framework Supervisory Gateway configured as a BACnet Router.

h. For BACnet Routers, configure the MS/TP MAC address to 0. Assign MAC Addresses to other devices consecutively beginning at 1, with no gaps.

i. Configure the Max_Master Property of all devices to be 31.

3.1.2.3 Building Control Network (BCN) Installation

Provide a building control network meeting the following requirements:

a. Install all DDC Hardware connected to the Building Control Network.

b. Where multiple pieces of DDC Hardware are used to execute one sequence, install all DDC Hardware executing that sequence on a single MS/TP network dedicated to that sequence.

c. Traffic between BACnet networks must be exclusively via BACnet routers.

**************************************************************************
NOTE: The following list paragraph is required only for Niagara Framework systems and is included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

d. Use the Fox protocol for all traffic both originating and terminating at Niagara Framework components. Use the Fox protocol for all traffic originating or terminating at a Niagara Framework UMCS (including traffic to or from a future UMCS). All other traffic, including traffic between ASHRAE 135 devices and traffic between Niagara Framework Supervisory Gateways and ASHRAE 135 devices must be in accordance with ASHRAE 135.
3.1.3 DDC Hardware

**************************************************************************
NOTE: Indicate whether enclosures must be lockable.
**************************************************************************

Install all DDC Hardware that connects to an IP network in lockable enclosure. Install other DDC Hardware that is not in suspended ceilings in lockable enclosures. For all DDC hardware with a user interface, coordinate with site to determine proper passwords and configure passwords into device.

a. Except for zone sensors (thermostats), install all Tethered Hardware within 2 m 6 feet of its base unit.

b. Install and configure all BTL-Listed devices in a manner consistent with their BTL Listing such that the device as provided still meets all requirements necessary for its BTL Listing.

c. Install and configure all BTL-Listed devices in a manner consistent with the BTL Device Implementation Guidelines such that the device as provided meets all those Guidelines.

3.1.3.1 Device Identifiers, Network Addresses, and IP addresses

**************************************************************************
NOTE: Each device requires a unique DeviceID and each network requires a unique Network Number; a BACnet system will not operate if there are duplicates. While it is a simple matter to ensure unique IDs for a single project, there is no mechanism in BACnet to avoid duplicates when a project is later integrated into an existing basewide UMCS. The installation must manually track and manage DeviceIDs and Network Numbers among all their BACnet systems, networks, and devices. The UFC has information on suggested strategies. Coordinate with the installation and either instruct the contractor to coordinate with the installation, or provide ranges for DeviceIDs and Network Numbers. BACnet allows DeviceIDs in the range 0 – 4,194,302 and Network Numbers in the range 1 – 65,534. Coordinate IP addresses with the installation NEC or instruct the contractor to do so.
**************************************************************************

a. Do not use any Device Identifier or Network Number already used by another BACnet system at the project site. [Coordinate Device IDs and Network Numbers with the installation. The installation POC is [_____]] [Use Device IDs within the range of [_____] to [_____] and Network Numbers in the range of [_____] to [_____]].

b. [Use IP addresses within the range of [_____] to [_____]] [Coordinate device IP addresses with installation. The installation POC is [_____]].
3.1.3.2 **ASHRAE 135 Object Name Property and Object Description Property**

Configure the Object_Names and Object_Descriptions properties of all ASHRAE 135 Objects (including Device Objects) as indicated on the Points Schedule (Point Name and Point Description) and as specified. At a minimum:

a. Except for DDC Hardware controlling a single terminal unit, configure the Object_Name and Object_Description properties of all Objects (including Device Objects) as indicated on the Points Schedule and as specified.

b. In DDC Hardware controlling a single terminal unit, configure the Device Object_Name and Device Object_Description as indicated on the Points Schedule and as specified.

**************************************************************************

**NOTE:** Indicate who is authorized to approve alternative object (point) names and descriptions.

**************************************************************************

When Points Schedule entries exceed the length limitations in the device, notify [_____] and provide recommended alternatives for approval.

3.1.3.3 **Niagara Framework Point Names and Descriptions**

**************************************************************************

**NOTE:** This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.

**************************************************************************

Configure the names and descriptions of all Points in Niagara Framework Supervisory Gateways as indicated on the Points Schedule and as specified.

3.1.3.4 **Niagara Station IDs**

**************************************************************************

**NOTE:** This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.

**************************************************************************

Ensure that Niagara Station IDs of new Niagara Framework Supervisory Gateways are maintained as unique within UMCS front-end, including ensuring they do not conflict with any existing Niagara Station ID.

3.1.3.5 **Hand-Off-Auto (H-O-A) Switches**

**************************************************************************

**NOTE:** See also DDC Hardware in PART 2.

The bracketed text is a general requirement for H-O-A switches and should only be included if such a requirement is absolutely necessary. It is best practice to use overrides in lieu of H-O-A switches. If H-O-A switches are specifically required by the project site it is best to remove the bracketed text and indicate which points require H-O-A switches on the Points Schedules.
Note that many sequences already have H-O-A switch requirements for motors independent of any other H-O-A requirements.

Select the desired capability for external switches for analog outputs

Provide Hand-Off-Auto (H-O-A) switches [for all DDC Hardware analog outputs and binary outputs used for control of systems other than terminal units, as specified and as indicated on the Points Schedule. Provide H-O-A switches that are integral to the controller hardware, an external device co-located with (in the same enclosure as) the controller, integral to the controlled equipment, or an external device co-located with (in the same enclosure as) the controlled equipment.

a. For H-O-A switches integral to DDC Hardware, meet the requirements specified in paragraph DIRECT DIGITAL CONTROL (DDC) HARDWARE.

b. For external H-O-A switches used for binary outputs, provide for overriding the output open or closed.

c. For external H-O-A switches used for analog outputs, provide for overriding [to 0 percent or 100 percent][through the range of 0 percent to 100 percent].

3.1.3.6 Local Display Panels

NOTE: Designer must indicate on each Points Schedule which points, if any, are to be displayed or adjustable from an LDP.

Designer should coordinate with the project site to determine number and location of LDPs needed and show on them on the drawings.

Provide LDPs to display and override values of points in a Niagara Framework Supervisory Gateway or ASHRAE 135 Object Properties as indicated on the Points Schedule. Install LDPs displaying points for anything other than a terminal unit in the same room as the equipment. Install LDPs displaying points for only terminal units [in a mechanical room central to the group of terminal units it serves][____]. For LDPs using WriteProperty to commandable objects to implement an override, write values with priority 9.

3.1.3.7 MS/TP Slave Devices

Configure all MS/TP devices as Master devices. Do not configure any devices to act as slave devices.
3.1.3.8 Change of Value (COV) and Read Property

a. To the greatest extent possible, configure all devices to support the SubscribeCOV service (the DS-COV-B BIBB). At a minimum, all devices supporting the DS-RP-B BIBB, other than devices controlling only a single terminal unit, must be configured to support the DS-COV-B BIBB.

b. Whenever supported by the server side, configure client devices to use the DS-COV-A BIBB.

3.1.3.9 Engineering Units

**************************************************************************

NOTE: Coordinate with site and select either English or SI units for the building control system devices based on the standard used at the project site. Units must NOT be changed between BACnet projects at a site as units MUST be standardized across the entire UMCS. Also note that this choice affects how values are stored and/communicated in the system, not necessarily how they are displayed at the front end.

Keep the first section of bracketed text for SI (Metric) units, and the second for IP (English) units.

**************************************************************************

[ Configure devices to use SI (Metric) units as follows:

  a. Temperature in degrees C
  b. Air or natural gas flows in Liters per Second (LPS)
  c. Water flow in Liters per Second (LPS)
  d. Steam flow in kilograms per second (kg/s)
  e. Differential Air pressures in Pascals (Pa)
  f. Water, steam and natural gas pressures in kiloPascals (kPa)
  g. Enthalpy in kiloJoules per kilogram (kJ/kg)
  h. Heating and Cooling Energy in kilowatt-hours (kWh)
  i. Heating and Cooling load in kilowatts (kW)
  j. Electrical Power: kilowatts (kW)
  k. Electrical Energy: kilowatt-hours (kWh)]

[Configure devices to use English (Inch-Pound) engineering units as follows:

  a. Temperature in degrees F
  b. Air or natural gas flows in cubic feet per minute (CFM)
c. Water in gallons per minute (GPM)
d. Steam flow in pounds per hour (pph)
e. Differential Air pressures in inches of water column (IWC)
f. Water, steam, and natural gas pressures in PSI
g. Enthalpy in BTU/lb
h. Heating and cooling energy in MBTU (1MBTU = 1,000,000 BTU))
i. Cooling load in tons (1 ton = 12,000 BTU/hour)
j. Heating load in MBTU/hour (1MBTU = 1,000,000 BTU)
k. Electrical Power: kilowatts (kW)
l. Electrical Energy: kilowatt-hours (kWh)

3.1.3.10 Occupancy Modes

********************************************************************************
NOTE: Intent is to standardize mode enumerations for operational modes. Sequences will be defined in Specification Section 23 09 93 SEQUENCES OF OPERATION FOR HVAC CONTROL
********************************************************************************

Use the following correspondence between value and occupancy mode whenever an occupancy state or value is required:

a. OCCUPIED mode: a value of one
b. UNOCCUPIED mode: a value of two
c. WARM-UP/COOL-DOWN (PRE-OCCUPANCY) mode: a value of three

Note that elsewhere in this Section the Schedule Object is required to also support a value of four, which is reserved for future use. Also note that the behavior of a system in each of these occupancy modes is indicated in the sequence of operation for the system.

3.1.3.11 Use of BACnet Objects

********************************************************************************
NOTE: This subpart uses tailoring options: the text "Except as specifically indicated for Niagara Framework Objects," is only included when the NIAGARA FRAMEWORK tailoring option is selected.
********************************************************************************

Except as specifically indicated for Niagara Framework Objects, Use only standard non-proprietary ASHRAE 135 Objects and services to accomplish the project scope of work as follows:

a. Use Analog Input or Analog Output Objects for all analog hardware I/O. Do not use Analog Value Object for analog hardware I/O.

b. Use Binary Input or Binary Output Objects for all binary hardware I/O. Do not use Binary Value Objects for binary hardware I/O.
c. Use Analog Value Objects for analog setpoints.

d. Use Accumulator Objects or Analog Value Objects for pulse inputs.

e. For occupancy modes, use Multistate Value Objects and the correspondence between value and occupancy mode specified in paragraph OCCUPANCY MODES.

**************************************************************************
NOTE: The following list paragraph is required only for NON-Niagara Framework systems, and is included only when the NOT NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

f. Use Schedule Objects and Calendar Objects for all scheduling. Use Trend Log Objects or Trend Log Multiple Objects for all trending and Notification Class Objects for trend log upload. Use a combination of Event Enrollment Objects, Intrinsic Alarming, and Notification Class Objects for alarm generation.

**************************************************************************
NOTE: The following list paragraph is required only for Niagara Framework systems, and is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************
f. Use a combination of Niagara Framework Alarm Extensions and Alarm Services, Intrinsic Alarming, and Notification Class Objects for alarm generation.

g. For all other points shown on the Points Schedule as requiring an ASHRAE 135 Object, use the Object type shown on the Points Schedule or, if no Object Type is shown, use a standard Object appropriate to the point.

3.1.3.11.1 Niagara Framework Objects

**************************************************************************
NOTE: This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

Points in the Niagara Framework Supervisory Gateway, even if used in a sequence or are shown on the Points Schedule, are not required to be exposed as BACnet Objects unless they are required to be available on the network by another device or sequence of operation (i.e. there is some other reason they are needed).

Use a Niagara Framework Supervisory Gateway as specified for all scheduling and trending. Use a Niagara Framework Supervisory Gateway as specified for all alarming except for intrinsic alarming.

3.1.3.12 Use of Standard BACnet Services

**************************************************************************
NOTE: This subpart uses tailoring options: the text
"(including Niagara Frameworks Supervisory Gateways when communicating with non-Niagara Framework DDC Hardware)" is only included when the NIAGARA FRAMEWORK tailoring option is selected.

**************************************************************************
Except as noted in this paragraph, for all DDC Hardware (including Niagara Frameworks Supervisory Gateways when communicating with non-Niagara Framework DDC Hardware) use Standard BACnet Services as defined in this specification (which excludes some ASHRAE 135 services) exclusively for application control functionality and communication.

DDC Hardware that cannot meet this requirement may use non-standard services provided they can provide identical functionality using Standard BACnet Services when communicating with BACnet devices from a different vendor. When implementing non-standard services, document all non-standard services in the DDC Hardware Schedule as specified and as specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

3.1.3.13 Device Application Configuration

a. For every property, setting or value shown on the Points Schedule or otherwise indicated as Configurable, provide a value that is retained through loss of power and can be changed via one or more of:

(1) BACnet services (including proprietary services)

(2) Hardware settings on the device

**************************************************************************
NOTE: The following item paragraph is required only for Niagara Framework systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

(3) The Niagara Framework

**************************************************************************
NOTE: The following list paragraph uses tailoring options: the text "in non-Niagara Framework Hardware" is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

b. For every property, setting or value in non-Niagara Framework Hardware shown on the Points Schedule or otherwise indicated as Operator Configurable, provide a value that is retained through loss of power and can be changed via one or more of:

(1) A Writable Property of a standard BACnet Object

(2) A Property of a standard BACnet Object that is Writable when Out_Of_Service is TRUE and Out_Of_Service is Writable.

**************************************************************************
NOTE: The following item paragraph is required only for Niagara Framework systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************
(3) Using some other method supported by a Niagara Framework Supervisory Gateway

NOTE: The following TWO list paragraphs are required only for Niagara Framework systems and are only included when the NIAGARA FRAMEWORK tailoring option is selected.

c. Configure Niagara Framework Supervisory Gateways such that the property, setting or value is configurable from a Niagara Framework Front End.
d. For every property, setting or value in a Niagara Framework Supervisory Gateway which is shown on the Points Schedule or otherwise indicated as Operator Configurable, configure the value to be configurable from within the Niagara Framework such that it can be configured from a system graphic page at a Niagara Framework Front End.

3.1.3.14 Niagara Framework Engineering Tool

NOTE: This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.

Use the Niagara Framework Engineering Tool to fully discover the field control system and make all field control system information available to the Niagara Framework Supervisory Gateway. Ensure that all points on the points schedule are available to the front end via the Fox protocol.

[3.1.3.15 Graphics and Web Pages

NOTE: This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.

NOTE: Only include this requirement if requiring web pages served from the Niagara Framework Supervisory Gateway. Select options based on project requirements.

Note that serving web pages from the Niagara Framework Supervisory Gateway is normally not necessary as web pages will typically be served from a Niagara Framework front end.

The contractor will require a certificate for the Web Server (in order to use HTTPS as required here). Coordinate with the project site IT organization (NEC) to obtain this certificate.
Configure Niagara Framework Supervisory Gateways to use web pages to provide a graphical user interface including System Displays[using the project site sample displays], including overrides, as indicated on the Points Schedule and as specified. Label all points on displays with [full English language descriptions][the point name as indicated on the Points Schedule][the point description as indicated on the Points Schedule][______]. Configure user permissions for access to and executions of action using graphic pages. Coordinate user permissions with [the [Controls] [HVAC] [Electrical] shop supervisor][______]. Configure the web server to use HTTPS based on the Transport Layer Security (TLS) protocol in accordance with RFC 5246 using a Government furnished certificate.

**3.1.4 Scheduling, Alarming, Trending, and Overrides**

3.1.4.1 Scheduling

-------------------------------------------------------------------
NOTE: The following designer note and paragraph text are only required for NON-Niagara Framework based systems and are only included when the NOT NIAGARA FRAMEWORK tailoring option is selected.
-------------------------------------------------------------------

-------------------------------------------------------------------
NOTE: Indicate the number of blank schedule objects required for later use. In determining this number keep in mind that this is for future support (adding more schedules after the system is completed) and that one schedule can be used for multiple HVAC systems.
-------------------------------------------------------------------

Configure schedules in BACnet Scheduling Objects to schedule systems as indicated on the Points Schedule and as specified using the indicated correspondence between value and occupancy mode. If no devices supports both the SCHED-E-B and DM-OCD-B BIBBS for Schedule Objects, provide [5][_____] blank Schedule Objects in DDC Hardware BTL listed as B-BCs and supporting the SCHED-E-B BIBB for later use by the site.

-------------------------------------------------------------------
NOTE: This following paragraph is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.
-------------------------------------------------------------------

Configure schedules in Niagara Framework Supervisory Gateway using Niagara Schedule Objects as indicated on the Points Schedule and as specified. When the schedule is controlling occupancy modes in DDC Hardware other than a Niagara Framework Supervisory Gateway use the indicated correspondence between value and occupancy mode.

-------------------------------------------------------------------
NOTE: Indicate if a common schedule may be used for multiple Terminal Units (TUs). If allowing a common schedule for multiple TUs: keep the 'group of' bracketed text, and decide if TU groupings will be included on the drawings (keep the 'as indicated'
bracketed text) or if the Contractor should decide on groupings (remove the 'as indicated' bracketed text).

Provide a separate schedule for each AHU including it's associated Terminal Units and for each stand-alone Terminal Unit (those not dependent upon AHU service) or group of stand-alone Terminal Units acting according to a common schedule (as indicated).

3.1.4.2 Alarm Configuration

NOTE: This subpart is only required for Niagara Framework based systems and is only included when the NIAGARA FRAMEWORK tailoring option is selected.

Configure alarm generation and management as indicated on the Points Schedule and as specified. Configure alarm generation in Niagara Framework Supervisory Gateways using Niagara Framework Alarm Extensions and Alarm Services or in other DDC Hardware (not Niagara Framework Supervisory Gateways) using ASHRAE 135 Intrinsic Alarming. Configure alarm management and routing for all alarms, including those generated via intrinsic alarming in other devices, in the Niagara Framework Supervisory Gateway such that the alarms are able to be accessed from the Niagara Framework Front End.

Where Intrinsic Alarming is used, configure intrinsic alarming as specified in paragraph "Configuration of ASHRAE 135 Intrinsic Alarm Generation". Configure a Niagara Framework Supervisory Gateway to provide a means to configure the intrinsic alarm parameters such that the Intrinsic Alarm is configurable from the front end via the Niagara Framework.

3.1.4.3 Configuration of ASHRAE 135 Intrinsic Alarm Generation

NOTE: This subpart uses tailoring options: The text "ASHRAE 135 Intrinsic" in the subpart title is only included when the NIAGARA FRAMEWORK tailoring option is selected.

Intrinsic alarm generation must meet the following requirements:

Configure alarm generation as indicated on the Points Schedule and as specified using Intrinsic Alarming in accordance with ASHRAE 135 or Algorithmic Alarming in accordance with ASHRAE 135. Alarm generation must meet the following requirements:
a. Send alarm events as Alarms (not Events).

b. Use the ConfirmedNotification Service for alarm events.

c. For alarm generation, support two priority levels for alarms: critical and non-critical. Configure the Priority of Notification Class Objects to use Priority 112 for critical and 224 for non-critical alarms.

d. Number of Notification Class Objects for Alarm Generation:

1. If the device implements non-critical alarms, or if any Object in the device supports Intrinsic Alarms, then provide a single Notification Class Object specifically for (shared by) all non-critical alarms.

2. If the device implements critical alarms, provide a single Notification Class Object specifically for (shared by) all critical alarms.

3. If the device implements both critical and non-critical alarms, provide both Notification Class Objects (one for critical, one for non-critical).

4. If the device controls equipment other than a single terminal unit, provide both Notification Class Objects (one for critical, one for non-critical) even if no alarm generation is required at time of installation.

e. For all intrinsic alarms configure the Limit_Enable Property to set both HighLimitEnable and LowLimitEnable to TRUE. If the specified alarm conditions are for a single-sided alarm (only High Limit used or only Low Limit used) assign a value to the unused limit such that the unused alarm condition will not occur.

f. For all objects supporting intrinsic alarming, even if no alarm generation is required during installation, configure the following Properties as follows:

1. Notification_Class to point to the non-Critical Notification Class Object in that device.

2. Limit_Enable to enable both the HighLimitEnable and LowLimitEnable

3. Notify_Type to Alarm

**************************************************************************
NOTE: The following list paragraph (and the two item paragraphs below it) is required only for NON-Niagara Framework systems and are included only when the NOT NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

g. Use of alarm generation types:

1. Only use algorithmic alarm generation when intrinsic alarm generation is not supported by the device or object, or when the specific alarm conditions cannot be implemented using intrinsic
alarm generation.

(2) Only use remote alarm generation when the alarm cannot be generated using intrinsic or local algorithmic alarm generation on the device containing the referenced property. If remote alarm generation is used, use the same DDC Hardware for all remote alarm generation within a single sequence.

**************************************************************************
NOTE: The following list paragraph is required only for Niagara Framework systems and are included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

g. Configure the Recipient_List Property of the Notification Class Object to point to the Niagara Framework Supervisory Gateway managing the alarm.

3.1.4.4 Support for Future Alarm Generation

**************************************************************************
NOTE: This subpart is only required for NON-Niagara Framework systems and is included only when the NOT NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

For every piece of DDC Hardware, support future alarm generation capabilities by supporting either intrinsic or additional algorithmic alarming. Provide one of the following:

a. Support intrinsic alarming for every Object used by the application in that device.

b. Support additional Event_Enrollment Objects. For DDC hardware controlling a single terminal unit, support at least one additional object. Otherwise, support at least [4][_____] additional Objects.
Support additional Event_Enrollment Objects via one of the following:

(1) Provide unused Event_Enrollment Objects on that device.

(2) Support the DM-OCD-B BIBB and the creation of sufficient Event_Enrollment Objects on that device.

(3) Provide one or more devices in the IP network that support the AE-N-E-B BIBB and have unused Event_Enrollment Objects.

(4) Provide one or more devices on the IP network that support the AE-N-E-B BIBB, the DM-OCD-B BIBB, and the creation of sufficient Event_Enrollment Objects.

The total number of Event_Enrollment Objects required by the project is the sum of the individual device requirements, and the distribution of Event_Enrollment Objects among devices is not further restricted. (Note this allows a single device to contain many Event_Enrollment Objects satisfying the requirements for multiple devices.)
3.1.4.5 Trend Log Configuration

**************************************************************************
NOTE: This subpart is only required for NON-Niagara Framework systems and is included only when the NOT NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

a. Configure trends in Trend Log or Trend Log Multiple Objects as indicated on the Points Schedule and as specified.

b. Configure all trend logs (including any provided to support future trends) to save data on regular intervals using the BUFFER_FULL event to request trend upload from the front end.

c. Configure Trend Log Objects with a minimum Buffer_Size property value of 1,000 and Trend Log Multiple Objects with a minimum Buffer_Size property value of 1,000 per point trended (for example, a Trend Log Multiple Object used to trend 3 points must have a Buffer_Size Property value of at least 3,000).

d. Configure a Notification Class Object in devices doing trending (including devices supporting future trends) to handle the BUFFER_FULL event.

e. When possible, trend each point using an Object in the device containing the point. When it is necessary to trend using an Object in another device, all trends not on the same Device as the Object being trended must be on a single device (i.e. all Trend Log and Trend Log Multiple Objects used for remote trending within a sequence must be on the same device).

f. For each trend log, including any trend logs provided to support future trending, configure the following properties as specified:

   (1) Logging_Type: Set to Polling
   (2) Stop_When_Full: Set to Wrap Around
   (3) Buffer_Size: Set to 400 or greater.
   (4) Notification_Threshold: Set to 90 percent of full
   (5) Notification_Class: Set to the Notification Class Object in that device
   (6) Event_Enable: Set to TRUE
   (7) Log_Interval: Set to 15 minutes.

g. Future Trending support. Provide support for future trending:

   (1) Provide one or more devices on the Building Control Network Backbone IP network which support both the T-VMT-E-B and DM-OCD-B BIBBs for Trend Log Objects. Provide sufficient devices to support the creation of at least [[_____] additional Trend Log Objects] one additional Trend Log Object for every terminal unit plus 4 additional Trend Log Objects for every non-terminal unit].

SECTION 23 09 23.02 Page 36
(2) Provide [[_____] additional Trend Log Objects][one additional Trend Log Object for every terminal unit plus 4 additional Trend Log Objects for every non-terminal unit] in one or more devices on the Building Control Network Backbone IP network that support the T-VMT-E-B BIBB for later use by the site.

(3) A combination of these two methods is permitted provided the total required number of Trend Log Objects is met.

3.1.4.6 Trending

**************************************************************************
NOTE: This subpart is only required for Niagara Framework systems and is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

Perform all trending using a Niagara Framework Supervisory Gateway using Niagara Framework History Extensions and Niagara Framework History Service exclusively.

3.1.4.7 Overrides

**************************************************************************
NOTE: The strongly preferred method of Overrides is through Commandable Objects. Consider carefully before approving the other method specified here, and do not approve any other method of Overriding.
**************************************************************************

**************************************************************************
NOTE: This subpart uses tailoring options:
1) In the first paragraph, the requirements to use Niagara Framework for overrides is required only for Niagara Framework systems and is included only when the NIAGARA FRAMEWORK tailoring option is selected.

2) In the second paragraph, the text "in non-Niagara Framework Supervisory Gateway DDC Hardware" is required only for Niagara Framework systems and is included only when the NIAGARA FRAMEWORK tailoring option is selected.
**************************************************************************

Provide an override for each point shown on the Points Schedule as requiring an override. Use the Niagara Framework for all overrides to points in Niagara Framework Supervisory Gateways. For overrides to other points, provide an override to a point in a Niagara Framework Supervisory Gateway via the Niagara Framework where the Niagara Framework Supervisory Gateway overrides the other point as specified.

Unless otherwise approved, provide Commandable Objects to support all Overrides in non-Niagara Framework Supervisory Gateway DDC Hardware. With specific approval from the Contracting Officer, Overrides for points which are not hardware outputs and which are in DDC hardware controlling a single terminal unit may support overrides via an additional Object provided for the override. No other means of implementing Overrides may be used.

a. Where Commandable Objects are used, ensure that WriteProperty service
requests with a Priority of 10 or less take precedence over the 
SEQUENCE VALUE and that WriteProperty service request with a priority 
of 11 or more have a lower precedence than the SEQUENCE VALUE.

b. For devices implementing overrides via additional Objects, provide 
Objects which are NOT Written to as part of the normal Sequence of 
Operations and are Writable when Out_Of_Service is TRUE and 
Out_Of_Service is Writable. Use this point as an Override of the normal 
value when Out_Of_Service is TRUE and the normal value otherwise. Note 
these Objects may be modified as part of the sequence via local 
processes, but must not be modified by local processes when 
Out_Of_Service is TRUE.

3.1.5 BACnet Gateways

******************************************************************************
NOTE: This subpart uses tailoring options for 
requirements specific to Niagara Framework systems. 
The phrases "or to Niagara Framework Points" and 
"(Note: A Niagara Framework Supervisory Gateway is 
BACnet control hardware.)" are included only when 
the NIAGARA FRAMEWORK tailoring option is selected.
******************************************************************************

******************************************************************************
NOTE: The intent of this is to allow the use of 
gateways to packaged equipment controllers not 
procured under the scope of the project this 
specification is used for and not to allow the 
installation of a non-BACnet network connected to a 
BACnet network via a gateway except as noted for 
Boiler and Chiller Plants.
******************************************************************************

The requirements in this paragraph do not themselves permit the 
installation of hardware not meeting the other requirements of this 
section. Except for proprietary systems specifically indicated in Section 
23 09 00, all control hardware installed under this project must meet the 
requirements of this specification, including the control hardware 
providing the network interface for a package unit or split system 
specified under another section. Only use gateways to connect to 
pre-existing control devices, and to proprietary systems specifically 
permitted by Section 23 09 00.

3.1.5.1 General Gateway Requirements

Provide BACnet Gateways to connect non-BACnet control hardware in 
accordance with the following:

a. Configure gateways to map writable data points in the controlled 
equipment to Writable Properties of Standard Objects, or to Niagara 
Framework points, as indicated in the Points Schedule and as specified.

b. Configure gateway to map readable data points in the controlled 
equipment to Readable Properties of Standard Objects, or to Niagara 
Framework points, as indicated in the Points Schedule and as specified.

c. Configure gateway to support the DS-COV-B BIBB for all points mapped to 
BACnet Objects.
d. Do not use non-BACnet control hardware for controlling built-up units or any other equipment that was not furnished with factory-installed controls. (Note: A Niagara Framework Supervisory Gateway is BACnet control hardware.)

e. Do not use non-BACnet control hardware for system scheduling functions.

f. Each gateway must communicate with and perform protocol translation for non-BACnet control hardware controlling one and only one package unit or a single non-BACnet system specifically permitted by Section 23 09 00.

g. Connect one network port on the gateway to the Building Control Backbone IP Network or to a BACnet MS/TP network and the other port to the single piece of controlled equipment or the non-BACnet system specifically permitted by Section 23 09 00.

h. For gateways to existing package units or simple split systems, non-BACnet network wiring connecting the gateway to the package unit must not exceed 3 meters 10 feet in length and must connect to exactly two devices: the controlled equipment (packaged unit) or split system interface and the gateway.

3.6 COMMISSIONING

3.7 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for space temperature control systems of the electric, analog electronic, and pneumatic type for heating, ventilating, and cooling system.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](criteria_change_request).
mounted switches.

2. Complete ATC schematics including flow diagrams, connection diagrams, wiring interlock diagrams, setpoints, and sequences of operation. Indicate control and operating ranges to clarify control sequences. Indicate manual-off-auto local controls on the locally mounted motor starters and in control panel(s) for remote motor starters; wire all safety controls to protect during both local manual and auto operation. Indicate electric elementary diagrams of motor starters, control device actuators, and control sensors.

3. Location and types of automatic dampers, including smoke dampers, e.g., opposed or parallel blade.

4. Control valve nominal sizes, flow capacities, inlet pressures, controlled fluid, maximum and minimum pressure drops at the designed flow, and calculated Cv. Select valves for smallest Cv within available pressure constraints, pipe velocities, economy of design, and noise criteria.

5. Required controller parameters:
   a. Throttling range, setpoint, and controller action, direct or reverse.
   b. Differential for two-position controllers.
   c. Specify the dead-band range for heating and cooling applications and the cascade control range or remote setpoint adjustment.

6. Special controller parameters:
   a. Fixed setpoint and fixed differential controllers.
   b. Adjustable damping and damping rate.
   c. Proportional-integral-derivative mode constant settings.

7. Scale the range of temperature and pressure indicators. Location of temperature wells and pressure taps.

8. Initial time switch settings for each zone.

9. Smoke detection systems and location of key-operated override switches, when required, along with the zoning arrangements for these systems.

10. Define which indicators and gages are mounted on the panel face and which are located inside the
panel. Provide a complete layout of the panel faces where a unique arrangement is necessary for efficient operation.

11. Location of room sensors and outdoor sensors.

12. Location of pneumatic compressors and refrigerated air dryers when required.

13. Write sequence of operation to include conventional control operations (e.g., temperature and pressure control loops), time clock operations, energy management functions (e.g., night setback and reset schedules), pushbutton overrides, safety devices, and emergency conditions.

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBCONTRACTOR SPECIAL REQUIREMENTS

Perform all work in this section in accordance with the paragraph SUBCONTRACTOR SPECIAL REQUIREMENTS in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS. The paragraph specifies that all contract requirements of this section shall be accomplished directly by a first tier subcontractor. No work required shall be accomplished by a second tier subcontractor.
1.3 SYSTEM DESCRIPTION

Provide [new and modify existing] space temperature control systems complete and ready for operation.

1.4 SYSTEM REQUIREMENTS

******************************************************************************
NOTE: Indicate which control systems or control devices must be of a particular type for reasons of safety, control accuracy, or other technical reasons.
******************************************************************************

Provide control systems composed of any combination of electric, analog electronic or pneumatic devices. Indicated control system devices of a particular type do not intend a requirement for the device unless the requirement is specifically indicated. Requirements apply to field installed control systems.

******************************************************************************
NOTE: Regarding the text below, indicate the manufacturer's name when there is an existing control system.
******************************************************************************

[ Existing control system was manufactured by [______]. Provide new equipment compatible with the existing control system to the extent that the direct interface uses the same control signal type and level over the same calibrated range as the existing equipment. ]

******************************************************************************
NOTE: Regarding the text below, indicate portions of existing systems that are to be reused.
******************************************************************************

[ Inspect and test reused portions of existing control systems, and furnish a report to the Government identifying all inoperative components or system deficiencies. The report shall include a cost estimate to correct deficiencies, scheduled need dates for equipment shutdown for repairs and connection to existing controls and systems. Proceed with repairs only after receipt of Government approval. Diagnose and report any malfunctions of existing control system device that occurs after the work commences. The Government is responsible for maintenance and repair of Government equipment. The Contractor shall be held responsible for repair costs due to Contractor negligence or abuse of Government equipment. ]

1.5 CENTRALIZED DIRECT DIGITAL CONTROL (DDC) SYSTEMS

******************************************************************************
NOTE: If DDC is being used, use Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC in lieu of this section.
******************************************************************************

DDC systems are not permitted. Microprocessor-based single-loop controllers, unitary control system, variable-air-volume (VAV) boxes, and room thermostats may be used provided that the devices are manually configurable by the use of device firmware and require no software written by the Contractor for their application and use.
1.6 PERFORMANCE REQUIREMENTS

Provide control systems to maintain the required heating, ventilating, and cooling (HVAC) conditions by performing the functions and sequences of operations indicated. Control systems shall be complete, including all equipment and appurtenances, and ready for operation. Control systems shall be furnished, installed, tested, calibrated, and started up by, or under the supervision of trained technicians certified by the Contractor as qualified and regularly employed in such work. Control system equipment, valves, panels and dampers shall bear the manufacturer's nameplate.

1.7 DESIGN REQUIREMENTS

1.7.1 Control System Diagrams

For each system, indicate HVAC process flow and location of devices relative to flow and to the HVAC control panel, the connections of control devices in control loops, references of control device contacts and device operating coils to line numbers of a ladder diagram and sequencing diagrams showing the operation of valves, dampers, and contacts relative to controller output, and HVAC process variables.

1.7.2 Ladder Diagram

Indicate connections and interlocks to control system devices and other devices such as starters, drives, HVAC control system panels, and HVAC equipment panels. Diagram shall be coordinated by line number and device number with each control system diagram.

1.7.3 Operating Parameters

Indicate operating parameters for devices shown on the control system diagram such as setpoints, ranges, limits, differentials, outside air temperature schedules, contact operating points, and HVAC equipment operating time schedules.

1.7.4 Automatic Control Valve Schedules

Indicate valve size, Cv, flow rate, pressure drop, top size, spring range, positioner range, operating signal characteristics, and power source.

1.7.5 Damper Schedules

Indicate damper sizes, quantities and sizes of actuators, spring ranges, positioner ranges, operating signal characteristics, and power source.

1.7.6 Wiring Diagram

Indicate terminal blocks, wire marker identification, connections to control system devices, external and internal power sources, and connections to external devices, starters, drives, control panels, jumpers, and ground connections.

1.7.7 Compressed Air Station Schematic

Indicate compressors, motors and horsepower rating, voltage, starter, isolators, manual bypasses, tubing sizes, drain piping and drain traps, reducing valves, dryer, manufacturers' names and model numbers, mounting,
access, and clearance requirements. Also include control panel schematics
for pneumatic control.

1.7.8 Sequence of Operation

Sequence of operation for each HVAC control system coordinated with device
identifiers on control system diagram and ladder diagram.

1.7.9 Arrangement Drawing

Arrangement diagram of each HVAC control system panel coordinated with
device identifiers on the control system diagram and the ladder diagram.

1.8 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions
in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list, and corresponding submittal
items in the text, to reflect only the submittals
required for the project. The Guide Specification
technical editors have classified those items that
require Government approval, due to their complexity
or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item
if the submittal is sufficiently important or
complex in context of the project.

For Army projects, fill in the empty brackets
following the "G" classification, with a code of up
to three characters to indicate the approving
authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office
(Engineering Division or other organization in the
District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes
following the "G" typically are not used for Navy
and Air Force projects.

The "S" classification indicates submittals required
as proof of compliance for sustainability Guiding
Principles Validation or Third Party Certification
and as described in Section 01 33 00 SUBMITTAL
PROCEDURES.

Choose the first bracketed item for Navy and Air
Force projects, or choose the second bracketed item
for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S"
classification. Submittals not having a "G" or "S" classification are [for
Contractor Quality Control approval.][for information only. When used, a
code following the "G" classification identifies the office that will
review the submittal for the Government.] Submit the following in
accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.9 QUALITY ASSURANCE

1.9.1 Standard Products

a. Material and equipment shall be standard products of manufacturers regularly engaged in the manufacturing of such products, using similar materials, design and workmanship. The standard products shall have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year use shall include applications of similarly sized equipment and materials used under similar circumstances.

The 2 years experience must be satisfactorily completed by a product which has been sold or is offered for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures. Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation, for not less than 6000 hours exclusive of the manufacturer's factory tests, can be shown.

b. The equipment items shall be supported by a service organization.

1.9.2 Nameplates and Tags

a. Provide nameplates bearing legends as shown and tags bearing device unique identifiers as shown shall have engraved or stamped characters. Nameplates shall be mechanically attached to HVAC control panel doors.
b. A plastic or metal tag shall be mechanically attached directly to each field-mounted device or attached by a metal chain or wire.

c. Each airflow measurement station shall have a tag showing flow rate range for signal output range, duct size, and device identifier where shown.

1.9.3 Verification of Dimensions

Contractor shall become familiar with details of work, shall verify dimensions in the field, and shall advise Contracting Officer of any discrepancy before performing work.

1.9.4 Modification of References

Accomplish work in accordance with ASME B31.1, ASME B31.5, NFPA 70, and NFPA 90A, except as modified herein or indicated otherwise for equipment, materials, installation, examination, inspection, and testing. Consider the advisory or recommended provisions to be mandatory, as though the word "shall" had been substituted for the words "should" or "could" or "may," wherever they appear. Interpret reference to "authority having jurisdiction" and "owner" to mean the Contracting Officer.

1.9.5 Site Testing Procedures

Indicate test equipment to be used including manufacturers' names and model numbers, date of last calibration, and accuracy of calibration.

1.9.6 Commissioning Procedures

Define procedures specific to each control system including instructions on how to set control parameters and setpoints, proportional, integral and derivative mode constants, contact output settings, positioner range adjustments, and calibration checks of transmitters.

1.9.7 Calibration Adjustment and Commissioning Reports

Submit specific to each HVAC control system, including settings adjustments and results of calibration checks.

1.9.8 Space Temperature Control System

In addition to the requirements specified in the paragraph SUBMITTALS, meet the following requirements. Submit Operation and Maintenance Manuals for items of equipment listed under paragraph PRODUCT DATA. Manual shall contain full hardware support documentation, which shall include but not be limited to the following:

a. General description and specifications

b. Installation and initial checkout procedures

c. Detailed electrical and logical description

d. Troubleshooting procedures, diagrams, and guidelines

e. Alignment and calibration procedures for components

f. Preventive maintenance requirements and a maintenance checklist
g. Detailed schematics and assembly drawings

h. Spare parts list data, including required tool kits and suggested method of repairs such as field repair, factory repair, or item replacement

i. Signal identification and timing diagrams

j. Complete as-built control drawings, schedules, and sequence of operation

k. Controller configuration and parameter setting procedures

l. Step-by-step procedures required for each HVAC control systems startup, operation, shutdown, recovery, and fault diagnosis

m. Manufacturer supplied operator manuals for equipment

n. Qualified service organization list

PART 2 PRODUCTS

******************************************************************************
NOTE: In order to comply with UFC 1-200-02, designs must achieve energy consumption levels that are at least 30 percent below the baseline established in the 2010 publication of ASHRAE 90.1. The Designer of Record must design control systems that assist in achieving this requirement.
******************************************************************************

2.1 COMPONENTS

******************************************************************************
NOTE: Indicate control devices that must be in enclosures with more stringent requirements than that covered by NEMA 250 Type 1 and state the requirements.
******************************************************************************

Provide components factory ordered for this project. Rebuilt equipment, warehoused equipment, or earlier generation equipment shall not be acceptable. Electrical, electronic, and electropneumatic devices not located within control panels shall have a NEMA 250 Type 1 enclosure in accordance with NEMA 250 unless otherwise specified. Actuators and positive positioners, and transmitters shall operate within temperature limit ratings of plus 2 to 66 degrees C (35 to 150 degrees F). Panel mounted instruments shall operate within limit ratings of 2 to 49 degrees C (35 to 120 degrees F) and 10 percent to 95 percent relative humidity, noncondensing. Devices installed outdoors shall operate within limit ratings of minus 2 to 66 degrees C (35 to 150 degrees F).

2.2 ACTUATORS

Provide pneumatic, electric, or electronic actuators. Actuators shall function as required within 85 to 110 percent of their power supply rating. Actuators shall fail to their spring return positions on signal or power failure unless indicated as timed, power return actuators. Actuators shall
have visible position indicators. Where actuators do not have positive spring returns for fail-safe operation, provide capacity tanks, restrictors, check valves, and relays, or reserve power as required to achieve proper timed positioning for up to 4 minutes after primary power failure. Actuators shall open or close the devices to which they are applied within 60 seconds after a full scale signal input change. Pneumatic actuators shall be rated for 172 kPa (gage) 25 psig operating pressure except for high pressure cylinder type actuators.

2.2.1 Damper Actuators

Damper actuators shall be rated for at least 125 percent of the motive power necessary to operate the connected damper. The actuator stroke shall be limited by an adjustable stop in the direction of the return stroke. Actuators shall be provided with mounting and connecting hardware.

2.2.2 Valve Actuators

Valve actuators shall be rated for at least 125 percent of the motive power necessary to operate the valves over their full range of operation against the total and differential pressures.

2.2.3 Positive Positioners

Positive positioners shall be pneumatic relays with mechanical feedback mechanisms, adjustable operating ranges, and starting points.

2.3 AUTOMATIC CONTROL VALVES

Provide automatic control valves.

**************************************************************************
NOTE: Avoid selection of oversized control valves. Select valve Cv so that maximum pressure drops are used within constraints of available pressures, pipe velocities, economy of design, and noise criteria. Select steam valves using critical pressure drop (.45 of absolute pressure) where available, and select connected equipment using resultant pressure on downstream side of valve. List calculated Cv and flow rate in schedules (not manufacturer’s listed Cv) to allow bidders to personally select valves.
**************************************************************************

2.3.1 Valve Assembly

Valves shall have stainless steel stems and stuffing boxes with extended necks to clear the piping insulation. Valve bodies shall be designed for not less than 862 kPa (gage) 125 psig working pressure or 150 percent of the system operating pressure, whichever is greater. Maximum rated shutoff pressure of the valve shall exceed the rated deadhead pressure of the pump that supplies it. Valve leakage rating shall be 0.01 percent of rated Cv for soft-seated valves and 0.05 percent for metal-to-metal seated valves. Class 125 copper alloy valve bodies and Class 150 steel or stainless steel valves shall conform to ASME B16.5 as a minimum. Components of cast iron valves shall conform to ASTM A126 Class B or C as a minimum.
2.3.2 Butterfly Valve Assembly

Butterfly valves shall be threaded lug type suitable for dead-end service, and for modulation to the fully closed position, with carbon steel bodies or cast iron Class 125 and noncorrosive discs, stainless steel shafts supported by bearings, and EPDM seats suitable for temperatures from minus 29 degrees to plus 121 degrees C.20 degrees to plus 250 degrees F. Valves shall have a manual means of operation independent of the actuator.

2.3.3 Two-Way Valves

Two-way modulating valves shall have equal percentage characteristics.

2.3.4 Three-Way Valves

Three-way valves shall provide constant total flow throughout full plug travel.

2.3.5 Duct-Coil and Terminal-Unit-Coil Valves

Control valves with either flare-type or solder-type ends shall be provided for duct or terminal-unit coils. Flare nuts shall be provided for each flare-type end valve.

2.3.6 Valves for Chilled Water, Condenser Water, and Glycol Service

ASME B16.1. Bodies for valves 50 mm 2 inches and smaller shall be brass or bronze, with threaded-end or union-end connections. Bodies for valves from 65 mm 2.5 inches and larger shall be cast iron. Bodies for valves 65 mm 2.5 inches and larger shall have flanged-end connections. Internal valve trim shall be brass or bronze except that valve stems may be Type 316 stainless steel. Water valves shall be sized for a [21 kPa] [3 psi] [_____] differential through the valve at rated flow, except as indicated otherwise. Select valve flow coefficient (Cv) for an actual pressure drop not less than 50 percent or greater than 125 percent of the design pressure drop at design flow. Valves 100 mm 4 inches and larger shall be butterfly valves.

2.3.7 Valves for Hot Water Service

Valves for hot water service below 121 degrees C 250 Degrees F shall conform to ASME B16.1. Bodies for valves 50 mm 2 inches and smaller shall be brass or bronze, with threaded-end or union-end connections. Bodies for valves 65 mm 2.5 inches and larger shall be cast iron. Bodies for 65 mm 2.5 inches and larger shall have flanged-end connections. Water valves shall be sized for a [21 kPa] [3 psi] [_____] differential through the valve at rated flow, except as indicated otherwise. Select valve flow coefficient (Cv) for an actual pressure drop not less than 50 percent or greater than 125 percent of the design pressure drop at design flow. Internal trim, including seats, seat rings, modulating plugs, and springs, of valves controlling water hotter than 99 degrees C 210 degrees F shall be Type 316 stainless steel. Internal trim for valves controlling water 99 degrees C 210 degrees F or less shall be brass or bronze. Non-metallic parts of hot water control valves shall be suitable for a minimum continuous operating temperature of 121 degrees C or 10 degrees C 250 degrees F or 50 degrees F above the system design temperature, whichever is higher. Valves 100 mm 4 inches and larger shall be butterfly valves.
2.3.8 Valves for Steam Service

ASME B16.1. Bodies for valves 40 mm 1.5 inches and smaller shall be brass or bronze, with threaded or union ends. Bodies for valves 50 to 80 mm 2 to 3 inches inclusive shall be brass, bronze, or cast iron. Bodies for valves 100 mm 4 inches and larger shall be cast iron. Bodies for 50 mm 2 inch valves shall have threaded ends. Bodies for valves 65 mm 2.5 inches and larger shall be provided with flanged-end connections. Internal valve trim shall be Type 316 stainless steel. Steam valves shall be sized for [103 kPa (gage)] [15 psig] [_____] inlet steam pressure with a maximum [90 kPa] [13 psi] [_____] differential through the valve at rated flow, except as indicated otherwise.

2.3.9 Valves for High Temperature Hot Water Service

Valves for high temperature hot water service above 121 degrees C 250 degrees F. Valve bodies shall conform to ASME B16.34 Class 300. Valve and actuator combination shall be normally closed. Bodies shall be carbon steel, globe type with welded ends on valves 25 mm one inch and larger. Valves smaller than 25 mm one inch shall have socket-weld ends. Packing shall be virgin polytetrafluoroethylene (PTFE). Internal valve trim shall be Type 316 stainless steel. Water valves shall be sized for a [21 kPa] [3 psi] [_____] differential pressure through the valve at rated flow, except as indicated otherwise. Select valve flow coefficient (Cv) for an actual pressure drop not less than 50 percent or greater than 125 percent of the design pressure drop at design flow.

2.3.10 Valves for Compressed Air Service

Valves used for switching compressed air supplied to pneumatic systems shall be brass body, three-way valves which shall conform to ASME B16.15 Class 250.

2.4 DAMPERS

Provide dampers in air ducts.

**************************************************************************

NOTE: Use parallel blade dampers for mixing boxes and where two-position control is required. Use opposed blade dampers for modulating applications for face and bypass control.

**************************************************************************

2.4.1 Damper Assembly

Damper shall conform to SMACNA 1966. A single damper section shall have blades no longer than 1219 mm 48 inches and shall be no higher than 1829 mm 72 inches. Maximum damper blade width shall be 200 mm 8 inches. Larger sizes shall consist of a combination of sections. Dampers shall be steel or other materials where indicated. Flat blades shall be made rigid by folding the edges. Provide blades with compressible seals at points of contact. Provide channel frames of dampers with jamb seals to minimize air leakage. Dampers shall not leak in excess of 51 L/s per square meter 10 cfm per square foot at 996 Pa 4 inches water gage static pressure when closed. Seals shall be suitable for an operating temperature range of minus 40 degrees C to 93 degrees C 40 degrees F to 200 degrees F. Dampers shall be rated at not less than 10 m/s 2000 fpm air velocity. Moving parts of the operating linkage in contact with each other shall consist of
dissimilar materials. Damper axles shall be 13 mm 0.5 inch minimum plated steel rods supported in the damper frame by stainless steel or bronze bearings. Blades mounted vertically shall be supported by a non-ferrous dissimilar thrust bearings. Pressure drop through dampers shall not exceed 12 Pa 0.05 inch water gage at 5 m/s 1,000 fpm in the wide-open position. Frames shall not be less than 51 mm 2 inches wide. Dampers shall be tested in accordance with AMCA 500-D.

2.4.2 Operating Links

Operating links external to dampers, such as crankarms, connecting rods, and line shafting for transmitting motion from damper actuators to dampers, shall withstand a load equal to at least twice the maximum required damper-operating force. Rod lengths shall be adjustable. Links shall be brass, bronze, zinc-coated steel, or stainless steel. Mating parts shall consist of dissimilar materials. Working parts of joints and clevises shall be brass, bronze, or stainless steel. Adjustments of crankarms shall control the open and closed position of dampers.

2.5 FIRE PROTECTION DEVICES

Provide smoke detectors in return and supply air ducts on the downstream side of the filters in accordance with NFPA 90A, except as otherwise indicated. Provide UL listed or FM approved detectors for duct installation.

2.5.1 Smoke Detectors

**************************************************************************
NOTE:  Choose one of the following options.
**************************************************************************
**************************************************************************
NOTE:  Regarding the text below, use this paragraph if project has [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE].
**************************************************************************
[ Provide in each air-handling system with supply air capacity greater than 944 L/s 2000 cfm in accordance with NFPA 90A. Locate downstream of the supply air filters and prior to any branch connection in accordance with NFPA 72. Provide in each air-handling system, serving more than one story, and having a return air capacity greater than 7079 L/s 15000 cfm in accordance with NFPA 90A. Locate at each story prior to connection to common return and at return connection to air handler prior to any fresh air inlet connection and prior to any recirculation connection in accordance with NFPA 72. Smoke control and exhaust systems shall have provision for automatic and manual operation by means of a key-operated switch to override any other shutdown features and shall be located [adjacent to the fire alarm system control panel] [as indicated].
]
**************************************************************************
NOTE:  Regarding the text below:  Use this paragraph if building has an existing fire evacuation alarm

SECTION 23 09 53.00 20  Page 20
system. For connection to existing system, designer must determine if the existing fire alarm control panel is compatible with smoke detectors and has spare zone capacity. Edit accordingly. When in doubt leave choice of connection to fire alarm panel or a separate control unit in paragraph. For some antiquated alarm systems, it may be necessary to replace the control panel in which case [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] must be included in project and the first option should be used.

**************************************************************************

[ Provide in each air-handling system with supply air capacity greater than 944 L/s 2000 cfm in accordance with NFPA 90A. Locate downstream of the supply air filters and prior to any branch connection in accordance with NFPA 72.

Provide in each air-handling system, serving more than one story, and having a return air capacity greater than 7079 L/s 15000 cfm in accordance with NFPA 90A. Locate at each story prior to connection to common return and at return connection to air handler prior to any fresh air inlet connection and prior to any recirculation connection in accordance with NFPA 72. Design for detection of abnormal smoke densities by the [ionization] [or] photoelectric principle, responsive to both invisible and visible particles of combustion, and not susceptible to undesired operation by changes to relative humidity.

Provide UL listed or FM approved detectors for duct installation. Provide duct detectors with an approved duct housing, mounted exterior to the duct, and with perforated sampling tubes extending across the width of the duct. Provide permanent descriptive zone labels indicating in which air-handling units the detectors in alarm are located.

Provide detectors with a test port [, test switch] [and] [or] [, remote keyed test device]. Provide control and power modules required for operation of detectors [in their own control unit] [or] [integral with the main building fire alarm control panel]. A ground fault or single break or open condition in electrical circuitry to any detector or its control or power units shall cause activation of building fire alarm control panel trouble signals.

Electrical supervision of wiring used exclusively for air-handling unit shutdown is not required provided a break in wiring would cause shutdown of the associated unit. Equipment and devices shall be compatible and operable in all respects with, and shall in no way impair reliability or operational functions of, the existing building fire alarm system. The existing fire alarm control panel was manufactured by [______].

Smoke control and exhaust systems shall have provisions for [automatic and] manual operation by means of a key-operated switch to override any other shutdown features and shall be located [adjacent to the fire alarm system control panel] [as indicated].]
NOTE: Use this paragraph only with specific approval of the Engineering Field Division Fire Protection Engineer. Approval will normally be granted only if the building has no fire alarm system and none is required. When in doubt, contact the Fire Protection Engineer.

Provide in each air-handling system with supply air capacity greater than 944 L/s 2000 cfm in accordance with NFPA 90A. Locate downstream of the supply air filters and prior to any branch connection in accordance with NFPA 72. Provide in each air-handling system, serving more than one story, and having a return air capacity greater than 7079 L/s 15000 cfm in accordance with NFPA 90A. Locate at each story prior to connection to common return and at return connection to air handler prior to any fresh air inlet connection and prior to any recirculation connection in accordance with NFPA 72.

Design for detection of abnormal smoke densities by the [ionization] [or] [photoelectric] principle, responsive to both invisible and visible particles of combustion, and not susceptible to undesired operation by changes in relative humidity. Provide UL listed or FM approved detectors for duct installation. Provide duct detectors with an approved duct housing, mounted exterior to the duct, and with perforated sampling tubes extending across the width of the duct.

Provide 115 Vac power supply unit integral with duct housing. Obtain power from [the source to the air-handling unit or air-handling unit controls] [the location indicated]. Detectors shall have test port or test switch. [Provide remote alarm indicator [and keyed test] device at [_____] [the location indicated].] Provide each detector with a visible indicator lamp that lights when the detector is activated.

Activation of duct detector shall cause shutdown of the associated air-handling unit [and closing of dampers] [and shall sound an alarm bell, with minimum 152 mm 6 inch diameter, in a normally occupied area] located [as directed] [as indicated]. [Provide a separate bell with an engraved plastic or metal label indicating which unit each bell annunciates for each air-handling unit.]

2.5.2 Smoke Dampers [and Combination Smoke/Fire Dampers]

Smoke dampers and actuator assemblies as required in accordance with NFPA 90A shall meet the Class II leakage requirements of UL 555S. Dampers shall be factory fabricated, galvanized steel or stainless steel with lubricated bearings, linkages, and seals to withstand temperatures from minus 29 to 121 degrees C 20 to 250 degrees F. Provide replaceable seals. [Combination smoke/fire dampers shall have a UL 1.5 hour rating and shall be equipped with electric/thermal links which close the damper at 74 degrees C 165 degrees F and then automatically reset after normal temperature is restored by cycling damper actuator.] Equip dampers with pneumatic or electric actuators which close smoke dampers tightly when activated. After the smoke has cleared, the dampers shall automatically
reset.

2.6 SENSORS

**************************************************************************
NOTE: Use smallest span sufficient to cover the operating range. Use 0.06 degrees C 0.10 degree F allowable tolerance sensors where small temperature changes will have large impact on energy consumption; e.g., chilled water, where the span is nominally 4.44 to 6.67 degrees C 8 to 12 degrees F. The normal 0.28 degree C 0.5 degree F sensor would have an error of 3 to 6 percent: 0.28 degree C 0.5 degree F divided by 4.44 degree C 8 degrees F equals .06 or 6 percent.
**************************************************************************
**************************************************************************
NOTE: Indicate outside air sensors mounted on a north wall if possible; a fan-type air aspirator if necessary to avoid effects of wind, rain, solar radiation, and building outside air film; and also indicate a power source for the aspirator.
**************************************************************************

2.6.1 Spans and Ranges

Transmitters shall be calibrated to provide an electric or electronic output signal of 4 to 20 mA electric or electronic and 21 to 103 kPa 3 to 15 psi output for pneumatics over the indicated span or range.

[ a. Conditioned space temperature, from 10 to 38 degrees C 50 to 100 degrees F.]

[ b. Duct temperature, from 4 to 60 degrees C 40 to 140 degrees F.]

[ c. High temperature hot-water temperature, from 93 to 260 degrees C 200 to 500 degrees F.]

[ d. Chilled water temperature, from minus one to 27 degrees C 30 to 80 degrees F.]

[ e. Dual temperature water, from minus one to 116 degrees C 30 to 240 degrees F.]

[ f. Heating hot water temperature, from 38 to 121 degrees C 100 to 250 degrees F.]

[ g. Condenser water temperature, from minus one to 54 degrees C 30 to 130 degrees F.]

[ h. Outside air temperature, from minus 34 to 54 degrees C 30 to 130 degrees F.]

[ i. Relative humidity, from 0 to 100 percent for high/low limit applications; from 20 to 80 percent for space applications.]

[ j. Differential pressure for VAV supply duct static pressure from 0 to 498 Pa 0 to 2.0 inches water gage.]
2.6.2 Temperature Sensors

2.6.2.1 Resistance Temperature Detectors (RTD's)

RTD shall be platinum with a tolerance of plus or minus 0.25 percent at 0 degrees C 32 degrees F, and shall be encapsulated in epoxy, Series 300 stainless steel, anodized aluminum, or copper. RTD shall be furnished with RTD transmitter as specified, integrally-mounted unless otherwise indicated.

2.6.2.2 Continuous Averaging RTD's

Continuous averaging RTD's shall have a tolerance of plus or minus 0.55 degrees C 1.0 degrees F at the reference temperature, and shall be of sufficient length to ensure that the resistance represents an average over the cross section in which it is installed. Sensing element shall have a bendable copper sheath. Averaging RTD shall be furnished with RTD transmitter as specified, to match the resistance range of the averaging RTD. Element length shall be a minimum of 3280 mm per square meter one linear foot per square foot of coil face area.

2.6.2.3 RTD Transmitter

RTD transmitter shall be selected to match the resistance range of the RTD. Transmitter shall be a two-wire, loop-powered device. Transmitter shall produce a linear 4 to 20 mA dc output corresponding to required temperature measurement. Output error shall not exceed 0.1 percent of the calibrated measurement. Transmitter shall include offset and span adjustments.

2.6.2.4 Pneumatic Temperature Transmitter

Transmitting sensing elements shall be bi-metal, averaging element and capillary, rod and tube, or bulb and capillary. Transmitters shall operate
within the range of 4 to 116 degrees C 40 to 240 degrees F. Provide the following spans and allowable deviations for applications listed.

a. Room sensors, minus 4 degrees C 25 degrees F, plus or minus 0.28 degrees C 0.5 degrees F

b. Room, chilled water, dew point, return air sensors, 10 degrees C 50 degrees F, plus or minus 0.42 degree C 0.75 degree F

c. Outside air, hot water, coil discharge sensors, 38 degrees C 100 degrees F, plus or minus 0.56 degree C 1.0 degree F

d. High temperature hot water, chilled hot water system sensors, 93 degrees C 200 degrees F, plus or minus 1.11 degrees C 2.0 degrees F.

2.6.3 Relative Humidity Instruments

2.6.3.1 Relative Humidity Sensor

**************************************************************************

NOTE:

1. Measuring dew point temperature and relative humidity with accuracy and repeatability using "commercial" controls is difficult. It is recommended that the designer plan the control system to eliminate the need to control dew point temperature or relative humidity including eliminating enthalpy control. Dry bulb temperatures should be used to control outside, return, and exhaust air dampers in economizer applications. Only use humidity control when the space has specific humidity requirements.

2. Indicate a fan powered type aspirating cabinet, an electronic relative humidity sensing element, a transmitter for outside air relative humidity sensing applications, and a power source for the cabinet.

**************************************************************************

Provide relative humidity sensor. Use nonsaturating sensing elements capable of withstanding a saturated condition without permanently affecting calibration or sustaining damage. Sensing elements shall be bulk polymer or thin film polymer. Sensing elements shall have an accuracy of plus or minus 2 percent of full scale within the range of 20 to 80 percent relative humidity. Provide a two-wire, loop-powered transmitter located at the sensing elements to convert the sensing elements output to a linear 4 to 20 mA dc output corresponding to required humidity measurement. Output error shall not exceed 0.1 percent of calibrated measurement. Transmitter shall include offset and span adjustments. Transmitter shall have ability to be calibrated electronically by using a one-point, in-situ method which allows for error correction with a single potentiometer.

2.6.4 Dew Point Instruments

**************************************************************************

NOTE: Provide 2 degrees C 3 degree F dew point allowable deviation for normal control, as in
commissary refrigerated display case, anti-sweat heater controls; provide a 0.55 degree C one degree F deviation for critical occupied space, as in computer rooms.

**************************************************************************

Provide analog salt-phase transition or dual chilled, mirror type sensor. Sensor shall have an allowable deviation of plus or minus [0.55] degrees C [one] degrees F dew point over the range of minus 12 to plus 27 degrees C 10 to 80 degrees F dew point.

2.6.5 Airflow Sensors

Provide airflow sensors.

**************************************************************************

NOTE: Use only where necessary. Airflow sensors are high maintenance items.

**************************************************************************

2.6.5.1 Electronic Airflow Measurement Stations and Transmitters

a. Stations shall contain an array of velocity sensing elements and straightening vanes inside a flanged sheet metal casing. Velocity sensing elements shall be RTD or thermistor type, with linearizing means. Sensing elements shall be distributed across the duct cross section in the quantity and pattern set forth for measurements and instruments in accordance with ASHRAE FUN SI ASHRAE FUN IP and SMACNA 1780, for traversing of ducted airflows. Resistance to airflow through the airflow measurement station shall not exceed 20 Pa 0.08 inch water gage at airflow of 10 m/s 2000 fpm. Station construction shall be suitable for operation at airflows of up to 25.40 m/s 5000 fpm over a temperature range of 4 to 49 degrees C 40 to 120 degrees F, and accuracy shall be plus or minus 3 percent over a range of 0.64 to 12.70 m/s 125 to 2500 fpm scaled to air volume. Use stations if required velocity measurement is below 2.50 meters per second 500 feet per minute.

b. Transmitters shall produce a linear, temperature compensated 4 to 20 mA dc output corresponding to required velocity pressure measurement. Transmitters shall be a two-wire, loop-powered device. Output error of transmitters shall not exceed 0.5 percent of calibrated measurement. Transmitters shall have offset and span adjustments.

2.6.5.2 Pitot Tube Airflow Measurement Stations and Transmitters

a. Stations shall contain an array of velocity sensing elements and straightening vanes inside a flanged sheet metal casing. Velocity sensing elements shall be multiple pitot tube type with averaging manifolds. Sensing elements shall be distributed across the duct cross section in the quantity and pattern set forth for measurements and instruments in accordance with ASHRAE FUN SI ASHRAE FUN IP or SMACNA 1780, for traversing of ducted airflows. Resistance to airflow through the airflow measurement station shall not exceed 20 Pa 0.08 inch water gage at airflow of 10 m/s 2000 fpm. Station construction shall be suitable for operation at airflows of up to 25.40 m/s 5000 fpm over a temperature range of 4 to 49 degrees C 40 to 120 degrees F, and accuracy shall be plus or
minus 3 percent over a range of 2.5 to 12.7 m/s 500 to 2500 fpm scaled to air volume. Do not use stations if required velocity measurement is below 2.50 meters per second 500 feet per minute.

b. Transmitters shall produce a linear 4 to 20 mA dc output corresponding to the required velocity pressure measurement. Each transmitter shall have a low-range differential pressure sensing element and a square root extractor. The transmitter shall be a two-wire, loop powered device. Sensing element accuracy shall be plus or minus 1 percent of full scale, and overall transmitter accuracy shall be plus or minus 0.25 percent of the calibrated measurement. Each transmitter shall have offset and span adjustments.

2.6.6 Pressure Sensors

**************************************************************************
NOTE: Indicate spare pressure taps where in-piping calibration is required.
**************************************************************************

Provide electronic pressure sensor and transmitter. Sensor shall be a pressure transmitter with an integral sensing element. Sensor over pressure rating shall be 172 kPa (gage) 25 psig above its normal operating range. Sensing element accuracy shall be plus or minus one percent of full scale. Transmitter accuracy shall be plus or minus 0.1 percent of the calibrated measurement. Transmitter shall be a two-wire, loop-powered device. Transmitter shall produce a linear 4 to 20 mA dc output corresponding to required pressure measurement. Transmitter shall have offset and span adjustments.

2.7 THERMOWELLS

Provide brass or Series 300 stainless steel thermowells with threaded brass plug and chain, 50 mm 2 inch lagging neck and extension type well, and inside diameter and insertion length as required for the application. Provide thermowells for immersion sensors with conducting material inside the well.

2.8 THERMOSTATS

Provide thermostats.

**************************************************************************
NOTE:
**************************************************************************

1. Use a recessed aspirating type mounting in public areas where it is necessary to make the thermostat less obvious to minimize vandalism. Do not use aspirating or concealed mountings in family housing. Use adjustable thermostats in family housing.

2. Locate room thermostats on interior walls where they will respond to average conditions in the rooms. Thermostats shall not be mounted on exterior walls if other locations are available. If mounted on exterior walls, thermostats shall be indicated with an insulating subbase. Thermostats for comfort
cooling that are occupant controlled (indicate the limits) shall have fixed factory temperature limits. Indicate centerline of room thermostat at 1.50 meters 5 feet above finished floor.

3. Indicate switch differential for each contact and between each contact on multistage switches; also, indicate whether the differential is adjustable or fixed.

2.8.1 Ranges

Thermostat ranges shall be selected so that the setpoint is adjustable [without tools] between plus or minus 5 degrees C plus or minus 10 degrees F of the setpoint indicated.

2.8.2 Nonmodulating Electric Room Thermostats

Contacts shall be single-pole double-throw (SPDT), hermetically sealed, and wired to identified terminals. Maximum differential shall be one degree C 2 degrees F. Thermostat covers shall consist of locking metal or heavy-duty plastic, and shall be capable of being locked by an Allen wrench or special tool. Thermostats shall have manual switches as required by the application and a minimum range of 13 to 32 degrees C 55 to 90 degrees F.

2.8.3 Microprocessor-Based Room Thermostats

Microprocessor-based room thermostats shall have built-in keypads for scheduling of day and night temperature settings. [Access to the scheduling mode shall be by password control code.] When out of the scheduling mode, thermostats shall have continuous 12-hour time display, with AM and PM indication, continuous display of day of the week, and either continuous display of room temperature with display of temperature setpoint on demand, or continuous display of temperature setpoint with display of room temperature on demand. In the programmable mode, use the display for setting and interrogating time program ON-OFF setpoints for each day of the week. The time program shall allow two separate temperature setback intervals per day. Thermostats shall have a means for temporary and manual override of program schedule, with automatic program restoration on the following day. Thermostats shall have a replaceable battery to maintain timing and to maintain the schedule in memory for one year in the event of a power outage. Maximum differential shall be one degree C 2 degrees F. Where used for heat pump applications, thermostat shall have an emergency heat switch.

2.8.4 Nonmodulating Capillary Thermostats and Aquastats

a. Thermostat shall have a capillary length of at least 1 1/2 meters 5 feet, adjustable direct reading scales for both setpoint and differential, and a differential adjustable from 3 to 9 degrees C 6 to 16 degrees F.

b. Aquastats shall be strap-on type, with 5.50 degrees C 10 degrees F
**fixed differential.**

2.8.5 Low-Temperature Protection Thermostats (Freezestats)

**************************************************************************
**NOTE: Indicate capillary serpentined in a plane**
**perpendicular to airflow to uniformly sense entire**
**airflow.**
**************************************************************************

Low-temperature protection thermostats shall be manually reset
low-temperature safety thermostats, with NO and NC contacts or a
two-position pneumatic output signal and a 6 meters 20 foot element which
shall respond to the coldest 456 mm 18 inch segment.

2.8.6 Modulating Capillary Thermostats

Thermostats shall have either one output signal, two output signals
operating in unison, or two output signals operating in sequence, as
required for the application. Thermostats shall have adjustable throttling
ranges of 2 to 4 degrees C 4 to 8 degrees F for each output.

2.8.7 Modulating Pneumatic Room Thermostats

Two-temperature combination thermostats shall be adjustable proportioning
type with dual setpoints containing two temperature sensing elements: one
for heating control and one for cooling control; two for heating control or
two for cooling control. Changeover for two-temperature combination
thermostats shall be accomplished by a change in control air supply
pressure which selects proper setpoint and proper controller action.
Single-temperature thermostats shall be adjustable proportioning type with
one temperature sensing element: one setpoint and proper controller
action. "Dead-band" thermostats shall have one adjustable proportioning
type controller with two setpoints, adjustable dead-band, and one
controller output or two adjustable proportioning type controllers mounted
on a common backplate with two setpoints, adjustable dead-band, and two
controller outputs. Temperature sensing elements shall be selected for
proper controller action. Individual temperature-sensing elements shall
have a separate adjustable throttling range of one to 5.50 degrees C 2 to
10 degrees F; thermostat shall have a minimum range of 13 to 32 degrees C
55 to 90 degrees F and minimum safe air input pressure of 172 kPa (gage) 25
psig. Dead-band setting shall have a minimum adjustable range of 2 to 8
degrees C 4 to 15 degrees F. Room thermostat shall have concealed setpoint
dial [, covers with Allen screws] [, aspirator type wall box with flush
plate and locking screws] [, built-in concealed thermometers] [, exposed
adjustment covers with visible thermometers for family housing], and
plug-in gage ports.

2.8.8 Modulating, Insertion, Immersion, & Averaging Pneumatic Thermostats

**************************************************************************
**NOTE: Indicate remote bulb return air thermostats**
**in lieu of room thermostats where acceptable.**
**************************************************************************

Thermostats shall be two-pipe, pilot-operated type with pneumatic feedback,
proportional action and shall have an adjustable throttling range of one to
55 degrees C 2 to 100 degrees F with a minimum range of minus 12 to plus
121 degrees C 10 to 250 degrees F. Averaging elements shall be 825 mm 1
Nonmodulating Pneumatic Thermostats

Thermostats shall have integral positive acting relays, zero or maximum output pressure. Remote element thermostats shall have standard or averaging bulbs. Averaging element thermostats shall be 825 mm one foot in length for each square meter 4 square feet of ductwork cross-sectional area and a minimum length of 2.44 meters 8 feet. Differential ranges shall be field adjustable. Remote element thermostat differential range shall be one to 14 degrees C 2 to 25 degrees F with minimum control ranges of minus 23 to plus 121 degrees C minus 10 to plus 250 degrees F. Room thermostat differential range shall be one to 5.50 degrees C 2 to 10 degrees F with minimum control ranges of 13 to 32 degrees C 55 to 90 degrees F.

SUNSHIELDS

Provide sunshields for outside air temperature sensing elements to prevent the sun from directly striking temperature sensing elements. Provide sunshields with adequate ventilation so that the sensing element responds to the ambient temperature of surroundings. The top of each sunshield shall have galvanized metal or aluminum rainshield projecting over the face of the sunshield. Sunshields shall be painted white or shall be unpainted aluminum.

PRESSURE SWITCHES AND SOLENOID VALVES

Provide pressure switches and solenoid valves.

Pressure Switches

Switches shall have an adjustable setpoint with visible setpoint scale. Range shall be as indicated. Differential adjustment shall span 20 to 40 percent of the range of the device.

Differential Pressure Switches

Switches shall be an adjustable diaphragm-operated device with [two SPDT] [one SPDT] contacts, with taps for sensing lines to be connected to duct pressure fittings designed to sense air pressure. Fittings shall be angled-tip type with tips pointing into the airstream. [Range shall be 125 to 1494 Pa 0.5 to 6 inches water gage. Differential shall be a maximum of 37 Pa 0.15 inch water gage at the low end of the range and 87 Pa 0.35 inch water gage at the high end of the range.]

Pneumatic Electric (PE) Switches

Switches shall have an adjustable setpoint range of 21 to 138 kPa (gage) 3 to 20 psig, and differential adjustable from [14 to 41] [7 to 14] [2 to 7] [1 to 2] [0.25 to 1] psi.

Solenoid Operated Pneumatic (EP) Valves

Valves shall have three-port operation: common, normally open, and normally closed. Valves shall have an outer cast aluminum body. The air connection shall be a 6 mm 1/4 inch NPT threaded connection. Valves shall be rated for 345 kPa (gage) 50 psig where used in a control system which operates at 172 kPa (gage) 25 psig or less, or 1034 kpa (gage) 150 psig.
where used in a control system which operates in the range of 172 to 689 kPa (gage) 25 to 100 psig.

2.11 INDICATING DEVICES

Provide indicating devices.

2.11.1 Thermometers

a. Thermometers for insertion in ductwork and piping systems shall have brass, malleable iron, or aluminum alloy case and frame, clear protective face, and permanently stabilized glass tube with an indicating fluid column, white face, black numbers, and a 229 mm 9 inch scale.

b. Thermometers for piping systems shall have rigid stems with straight, angular, or inclined pattern.

c. Thermometer stems shall have expansion heads as required to prevent breakage at extreme temperatures. On rigid stem thermometers, the space between bulb and stem shall be filled with a heat transfer medium.

d. Air duct thermometers shall have perforated stem guards and 45 degree adjustable duct flanges with locking mechanisms.

e. Averaging thermometers shall have 90 mm 3.5 inch (nominal) dial, with black legend on white background, and pointer traveling through a 270 degree arc.

f. Thermometers shall have an accuracy of plus or minus one percent of scale range. Thermometers shall have the following ranges:

(1) Mixed air temperature: minus 18 to plus 38 degrees C in 1/2 degree C 0 to 100 degrees F in 1 degree F graduations.

(2) Return air temperature: minus 18 to plus 38 degrees C in 1/2 degrees C 0 to 100 degrees F in 1 degree F graduations.

(3) Cooling coil discharge temperature: minus 18 to plus 38 degrees C in 1/2 degree C 0 to 100 degrees F in 1 degree F graduations.

(4) Heating coil discharge temperature: minus one to plus 82 degrees C in one degree C 30 to 180 degrees F in 2 degree F graduations.

(5) Hydronic heating systems below 104 degrees C 220 degrees F: 4 to 116 degrees C in one degree 40 to 240 degrees F in 2 degree graduations.

(6) Chilled water temperature: minus 18 to plus 38 degrees C in 1/2 degree C 0 to 100 degrees F in one degree F graduations.

(7) Condenser water temperature: 4 to 60 degrees C in 1/2 degree C 40 to 140 degrees in one degree F graduations.

(8) Glycol temperature: minus 18 to plus 38 degrees C 0 to 100 degrees F
graduations, and 4 to 116 degrees C 40 to 240 degrees F for heating service in one degree C 2 degree F graduations.

(9) High temperature hot water: 38 to 288 degrees C in 3 degree C 100 to 550 degrees F in 5 degree F graduations.

2.11.2 Pressure Gages

Provide pressure gages with gage cock, snubber, and syphon.

a. ASME B40.100. Gages shall be 65 mm 2 1/2 inch (nominal) size, back-connected, suitable for field or panel mounting as required, shall have black legend on white background, and shall have a pointer traveling through a 270 degree arc. Accuracy shall be plus or minus 3 percent of scale range.

b. Gages for indicating signal output to pneumatic actuators and main air gages shall have scale of 0 to 210 kPa (gage) in 10 kPa 0 to 30 psig in 1 psig graduations.

c. Gages for air storage tanks and for use before and after dirt and oil filters or dryers, shall have a scale of [0 to 1100] [_____] kPa (gage) [0 to 160] [_____] psig with 15 kPa (gage) 2 psig graduations.

d. Gages for hydronic and steam system applications shall have ranges and graduations as indicated.

e. Pneumatic transmission receiver gages shall have a range to match the respective transmitters.

2.12 LOW-DIFFERENTIAL PRESSURE GAGES

Gages for low-differential pressure measurements shall be 115 mm 4 1/2 inch (nominal) size with two seats of pressure taps, and shall have a diaphragm-actuated pointer, white dial with black figures, and pointer zero adjustment. Gages shall have ranges and graduations as indicated. Accuracy shall be plus or minus 2 percent of scale range.

2.13 CONTROLLERS

**************************************************************************
NOTE: Indicate which type of controller is required for each application.
**************************************************************************

2.13.1 Single-Loop Controllers

**************************************************************************
NOTE: Indicate single-loop controllers for applications where proportional-integral (PI) modes or proportional-integral-derivative (PID) modes are required or where the need for either mode is anticipated. Indicate single-loop controllers where one or two contact outputs are required to be operated in response to changes in process variable input signals for control application.
**************************************************************************
2.13.1.1 Controller Features

Controller shall be a microprocessor-based, single-loop device that does not require Contractor-generated software. Controller shall conform to FCC Part 15. Controller panel cutout shall be 92 by 92 mm 3.62 by 3.62 inches. Controller shall have field selectable range for process variables, a remote setpoint analog input and analog output with adjustable high and low end limits, and proportional control manual reset adjustment. Analog output shall result from PID control. Analog output shall be configurable as direct acting and reverse acting. Controller shall have keyboard, display, auto/manual selection for control of analog output, and remote setpoint adjustment/local setpoint adjustment selection. Controller shall have adjustable high-end and low-end limits, ratio, and bias adjustments on remote setpoint input; operator initiated self-tune/manual-tune selection, anti-reset wind-up feature, and two configurable independent SPDT with adjustable system contact closure outputs. Controller shall be configurable to power-up in manual with local setpoint control, in automatic with local setpoint control, and in automatic with remote setpoint control. Contact closures shall be activated by a process variable and by a process variable deviation from setpoint as configured. The range of hysteresis adjustment shall not be smaller than 1 percent to 5 percent of process variable input span. Controller shall power the analog output loop to 20 mA where connected to a load of 600 ohms. Controller shall have 5-year battery backup or shall have nonvolatile memory to store operating parameters.

2.13.1.2 Controller Parameter Input and Display

Control parameters shall be entered and displayed directly, in the correct engineering units, through a series of keystrokes on a front panel display with a 3 1/2-digit, seven-segment display, with decimal point and polarity indication. Use of the display shall allow manual interrogation of setpoint, mode constants, and values of process variables and outputs.

2.13.1.3 Controller Electrical Requirements

Controller shall be powered by 120 Vac. Controller shall provide electrical noise isolation, not less than 100 dB at 60 Hz common mode rejection ratio, and not less than 60 dB at 60 Hz normal mode rejection ratio between ac power line and process variable input, remote setpoint input, and output signals.

2.13.1.4 Controller Accuracy

Controller shall have an accuracy of plus or minus 0.30 percent of input span, plus or minus one digit.

2.13.1.5 Controller Self Tuning

Controller self-tuning operation shall apply proportional, integral, and derivative modes of control; mode constants shall be modified as required. Self tuning shall only operate when selected from the front panel.

2.13.1.6 Controller Manual Tuning

Controller manual tuning operation shall provide proportional, integral, and derivative control modes, or any combination thereof, by means of individual mode constant adjustments. Adjustments shall be set for the
appropriate value if a particular control mode action is desired, or to zero for the particular mode not desired. The proportional mode constant shall be adjustable from 0 to 200 percent of input signal range; the integral mode constant shall be adjustable from 0 to 20 repetitions per minute; and the derivative mode constant shall be adjustable from 0 to 5 minutes.

2.13.2 Pneumatic Controllers

**************************************************************************
NOTE: Indicate on drawings in sequence of operation, the following controller characteristics:

1. Type of setpoint adjustment: local or remote. Specify "field selectable" where future provisions for remote setpoint may be foreseen, or where similar units, a portion of which requires remote adjustment, are to be used at remote job sites.

2. Type of input ports: single or dual.

3. Type of inputs: primary with single input ports, or primary and secondary with dual input ports.
**************************************************************************

Controllers shall be two-pipe devices which use main air supplied to controller and pneumatic relay to produce the controller output signal. Controllers shall have field selectable local and remote adjustable setpoints, and an adjustable proportional band for analog (proportional) control or an adjustable differential for binary (two-position or floating) control. Controllers shall have single- or dual-input ports as required for the application and field selectable direct or reverse action for inputs. Dual input controllers shall have adjustable secondary input authority. Controllers shall have integral gage or test connections for testing or indication of input and output signals.

2.13.3 Analog Electronic Controllers

Controllers shall be solid-state electronic devices which sense the difference between input sensor analog values (resistance or voltage) and setpoint adjustment analog values (resistance or voltage), and shall amplify the difference signal to provide the output signal. Controllers shall include the following:

a. Proportional band: 2.5 to 33 percent of input device span.

b. Authority: minimum of 33 to 200 percent.

c. Inputs: thermistor, resistance, transmitter, or output of other electronic controllers.

d. Outputs: within the range of minus 5 to 20 Vdc or a 4 to 20 mA dc current loop.

e. Remote setpoint adjustment (SPA): plus or minus 10 percent of input device span.
2.13.4 Unitary Control Systems

NOTE: Energy-efficient temperature control systems should be used for small systems as well as large systems. Systems that otherwise are not cost effective may use programmable controllers that are commercially available for HVAC applications. These are chiefly staging type controllers but some do incorporate modulating outdoor air damper control. Controllers are available to control cooling in two steps with either two or four heating steps, and in three cooling steps with three heating steps.

Unitary control systems shall be energy-efficient, micro-processor-based temperature controllers and associated devices that do not require Contractor-generated software. Provide control systems with [integral] [or] [remote] sensor as indicated. Controllers shall operate heating, cooling, and ventilating modes with independent occupied and unoccupied settings for each of 7 consecutive days. Cooling shall be controlled in [two] [three] steps and heating shall be controlled in [two] [three] [four] steps with modulating control provided for the ventilation mode. Provide temperature changeover control to limit the ventilation mode when outdoor air temperature is not sufficiently low for "free-cooling." Provision shall be made for [automatic] [manual] changeover between heating and cooling modes, providing a one minute minimum time delay between the start and stop operation of heating and cooling stages upon startup and after power failure to prevent short cycling and power surges. Provide an optimum startup program to minimize warm-up or cool-down periods prior to the occupied mode. Outside air dampers shall be closed during the optimum startup program unless outside air is beneficial for cool-down in lieu of mechanical cooling. Fan shall operate continuously during the occupied mode and shall cycle during the unoccupied mode for heating or cooling. Provide battery backup to retain programs and maintain clock operation for 48 hours minimum during power outages. Controller shall have a self-diagnostic program to indicate errors and locking covers to prevent unauthorized program entries. Provide a convenient means to restore the occupied mode of operation for a minimum 2-hour period without removing covers. An indexing switch shall allow operation in a continuous unoccupied mode during abnormal periods without changing normal programs. [Servicing tool required to place the unitary control system in use shall be a hand-held device used to adjust and monitor setpoints, controlled device positions, input sensor values, and other control system parameters.]

2.13.5 Pneumatic Low-Range Pressure Controllers for Ductwork Applications

Controllers shall provide two-pipe, pilot-operated control with pneumatic feedback and proportional action. Sensing elements shall be differential type with pressure ranges appropriate for intended service. One element shall measure the variable while the other element measures the standard reference. Static pressure controllers shall have slack diaphragms with standard ranges between 0 to 1494 Pa 0 to 6 inches water gage and an adjustable throttling range of 5 to 125 Pa 0.02 to 0.5 inch water gage. Sensing element shall be mountable in ductwork and shall measure static pressure without pulsations.
2.13.6 Pneumatic Differential Pressure Controllers for Liquid Applications

Differential pressure controllers shall have a minimum range of 0 to 345 kPa (gage) or 0 to 1724 kPa (gage) 0 to 50 psig or 0 to 250 psig as specified or required for the application and shall have an adjustable throttling range of 7 to 172 kPa (gage) 1 to 25 psig. Sensing element shall be filled diaphragm type with three-valve manifold for isolation and nulling. Provide syphons and pressure snubbers.

2.14 CONTROL DEVICES AND ACCESSORIES

Provide control devices and accessories.

2.14.1 Function Modules

Function modules shall accept mA dc analog input signals to produce analog output signals or contact output signals. Modules shall have zero and span adjustments for analog outputs, and setpoint adjustments for contact outputs.

2.14.1.1 Minimum Position Switches and Temperature Setpoint Devices

Minimum position switches and temperature setpoint devices shall accept manual input and shall produce steady analog output. Switches and devices shall be suitable for recessed wall mounting or panel mounting and shall have a graduated dial.

2.14.1.2 Signal Inverter Modules

Signal inverter modules shall accept analog input signal and produce analog output signal that linearly reverses the direction of signal change of input versus output.

2.14.1.3 High-Low Signal Selector Modules

High-low signal selector modules shall accept analog input signals and select either the highest or the lowest input signal as the output signal.

2.14.1.4 Sequencer Modules

Sequencer modules shall provide fixed time delayed sequencing of one or more contact transfers from an analog input signal. Sequencers shall return contacts to their zero input signal condition when power is interrupted.

2.14.2 Relays

Relays shall be two-pole, double-throw (DPDT) with a 10-ampere resistive rating at [120] [24] Vac, and shall have an enclosed coil. Provide with a light indicator which is lit when the coil is energized and is not lit when the coil is not energized.

2.14.3 Time-Delay Relays

Time-delay relays shall be DPDT with octal connectors and dust covers. The adjustable timing range shall be [0 to 3 minutes] [______].
2.14.4  Time Clocks

**************************************************************************
NOTE:  Indicate time clock to automatically index to day or night thermostats; control system shall function on Saturday and Sunday as specified for night cooling and heating.  The second clock circuit of the same clock that controls HVAC air delivery system timing shall be used to maintain outside air dampers closed from beginning of night period through the morning warm-up period.
**************************************************************************

Time clocks shall be a 24-hour, 365-day programmable timing device with two independently timed circuits.  Clocks shall have a manual scheduling keypad and alphanumeric display of timing parameters.  Timing parameters shall include Gregorian calendar date for month, day and day-of-month indication; and 24-hour time-of-day display, with one-minute resolution for programming the ON and OFF times for each circuit.  Circuits shall have programmable timed override from 1 to 99 minutes.  Clocks shall have capacity for programming four ON events and four OFF events for each circuit.  Programmed events shall be assignable to a 365-day schedule.  Clocks shall have automatic standard time and daylight saving time adjustments, keyed to input of appropriate dates.  Provide clocks with 4-day battery backup.

2.14.5  Override Timer

**************************************************************************
NOTE:  Mechanical override timer, when activated, shall bypass the time clock and activate the day heating or cooling and ventilation controls for assigned units.  Upon expiration of timer operation, the control system shall return to normal mode.
**************************************************************************

Override timers shall be manually set, mechanically driven timers, or electronic timers, without a "hold" feature.  Time intervals shall be selectable for up to 12 hours of operation and shall expire unless reset.

2.14.6  Current-to-Pneumatic (IP) Transducers

Transducers shall be two-wire transmitters which convert an input signal to 21 to 103 kPa (gage) or 103 to 21 kPa (gage) 3 to 15 psig or 15 to 3 psig pneumatic output, with a conversion accuracy of plus or minus 2 percent of full scale, including linearity and hysteresis.  Air consumption shall not be greater than 0.12 L/s 0.25 scfm.

2.14.7  Regulated Power Supplies

Power supplies shall provide a 24-Vdc linear supply at not less than 2 amperes, with regulation to 0.05 percent of output voltage.  Power supplies shall have a fused input, and shall be protected from voltage surges and power-line transients.  Power supply output shall be protected against overvoltage and short circuits.  Power supply loading shall not be greater than 1.2 amperes.

2.14.8  Transformers
NOTE: Indicate a backup transformer connected to an alternate voltage supply for systems connected to critical areas where continuous operation is necessary.

UL 508 and NEMA ST 1 as applicable. Transformers, other than transformers in bridge circuits, shall have primaries wound for available voltage and secondaries wound for correct control circuit voltage. Transformers shall be sized so that connected loads equal 80 percent of rated capacity. Transformers shall be enclosed in rustproof, galvanized steel cabinets with conduit connections. Disconnect switch shall be provided on the primary side, and a fuse cutout on the secondary side. [For systems serving ] [_____] [or] [as indicated], provide backup power supply including transformers connected to [the emergency power source] [_____]. [Provide for automatic switchover and alarm upon failure of primary control circuit.]

2.14.9 Pilot Lights and Manual Switches

Device illumination shall be by light-emitting diode (LED) or neon lamp. Switches shall have operating levers and index plates showing switch positions and names of apparatus controlled or other appropriate designations.

2.15 HVAC SYSTEM CONTROL PANELS

Provide HVAC system control panels.

2.15.1 Panel Assembly

Panel shall be fabricated for bottom entry connection for control system electric power, control system main air source, control system wiring, pneumatic tubing, interconnection of control systems, interconnection of starters, and external shutdown devices. Panel shall have an operating temperature rise of not greater than 11 degrees C 20 degrees F above an ambient temperature of 38 degrees C 100 degrees F.

2.15.2 Panel Electrical Requirements

Control panel shall be powered by nominal 120 Vac terminating at panel on terminal blocks. Instrument cases shall be grounded. Interior and exterior panel enclosures shall be grounded.

2.15.3 Enclosures

Enclosures for each panel shall be a single door, wall-mounted box conforming to NEMA 250 with a continuous hinged and gasketed exterior door with a print pocket, key lock, and interior back panel. Inside finish shall be white enamel, and outside finish shall be gray primer over phosphatized surfaces.

2.15.4 Mounting and Labeling

Provide pilot lights, switches, panel-mounted control devices, and pressure gages shall be mounted on the door. Power conditioners, fuses, and duplex
outlets shall be mounted on the interior of the cabinet. Other components housed in the panel shall be mounted on the interior back panel surface of the enclosure and shall be identified by plastic or metal nameplates which are mechanically attached to the panel. Lettering shall be cut or stamped into the nameplate to a depth of not less than 0.4 mm (1/64 inch), and shall have contrasting color, produced by filling with enamel or lacquer or by use of laminated material. Painting of lettering directly on the surface of the door or interior back panel is not permitted.

2.15.5 Wiring and Tubing

a. Pneumatic device inputs and outputs shall be piped to bulkhead fittings in the bottom of the panel with a 50 mm (2 inch) loop to facilitate replacement. Electric, electronic, and electropneumatic device signals entering and leaving the panel shall be wired to identified terminal blocks.

b. Wiring shall be installed in wiring ducts so that devices can be added or replaced without disturbing existing wiring that is not affected by the change. Wiring to single-loop controllers shall have a 100 mm (4 inch) wiring loop in the horizontal wiring duct at each wiring connection. There shall be no wiring splices within the control panel. Interconnections required for power or signals shall be made on device terminals, if available, or panel terminal blocks, with not more than two wires connected to each terminal.

c. Instrument signal grounds at the same reference level shall end at a grounding terminal connected to a common ground point for that level. Wiring shield grounds at the same reference level shall end at a grounding terminal connected to a common ground point for that level. Grounding terminal blocks shall be identified by reference level.

d. Wiring connected to controllers shall be identified by function and polarity, e.g., process variable input and remote setpoint input and output.

2.16 COMPRESSED AIR STATIONS

Provide compressed air stations.

2.16.1 Air Compressor Assembly

**************************************************************************
NOTE: In that there are additions to existing control systems, do not add additional loads or reuse existing control compressor unless it is verified by the designer that it has ample capacity and is dependable. If existing compressor is to be reused, so specify and indicate its location on drawings.
**************************************************************************

a. Compressor shall be equipped with an electric motor with a totally enclosed belt guard, operating pressure switch, safety relief valves, gages, intake filter, and intake silencer. Compressor shall have combination type magnetic starter with undervoltage protection and thermal overload protection for each phase. Compressor shall be supported by a steel base mounted on an air storage tank. Air compressor shall be sized to supply compressed
air required by the control system while operating not more than one-third of the time.

NOTE: Regarding the text below, provide duplex air compressors for systems having greater than 50 control air users or greater than 0.71 L/s 1.5 cubic feet per minute of free air.

b. Compressor shall be a duplex machine. Compressor shall be equipped with an electric motor with a totally enclosed belt guard, operating pressure switch, safety relief valve, cylinder unloader or solenoid unloader, intake filter, and intake silencer. Provide an alternator and two magnetic starters with undervoltage protection and thermal overload protection for each phase. Compressors shall be supported on a steel base mounted on an air storage tank. Compressor shall be sized to the control system compressed air requirement while operating not more than one-half of the time.

c. Compressed air storage tank shall be fabricated for working pressure of not less than 1379 kPa (gage) 200 psig, and constructed and certified in accordance with ASME BPVC. Tank shall be of sufficient volume so that no more than six compressor starts per hour are required with the starting pressure switch differential set at 138 kPa 20 psi differential. Tank shall be provided with an automatic condensate drain trap with a manual override feature.

2.16.2 Compressed Air Station Specialties

a. Pressure regulator and refrigerated air dryer shall be provided in the air outlet line of the air storage tank. Dryer shall be sized for full air delivery capacity of compressor. Air shall be dried at a pressure of not less than 483 kPa (gage) 70 psig to a temperature not greater than 2 degrees C 35 degrees F. Dryer shall be provided with an automatic condensate drain trap with a manual override feature.

b. Two parallel combination dirt and coalescing type oil filters with shutoff valves and pressure regulators shall be provided in the dryer discharge. Air filtration system shall be rated for full delivery capacity of compressor. Filter shall be 100 percent efficient for particle diameters down to 0.3 microns. Filter bowl shall be rated for 1034 kPa (gage) 150 psig maximum working pressure. One of the filters shall serve as a standby. Pressure regulator and safety valve shall be provided downstream of the filter.

c. Flexible pipe connectors shall be designed for 1034 kPa (gage) and 121 degrees C 150 psi and 250 degrees F service, and shall be constructed of rubber, tetrafluoroethylene resin, or braided corrosion-resistant steel, bronze, monel, or galvanized steel. Connectors shall be suitable for service intended and may have threaded or soldered ends. Length of connectors shall be as recommended by the manufacturer for service intended.

d. Vibration isolation units shall be standard products with
published loading ratings, and shall be single rubber-in-shear, double rubber-in-shear, or spring type.

2.17 ELECTRONIC VARIABLE AIR VOLUME VAV TERMINAL UNIT CONTROLS

Provide electronic VAV terminal unit controls.

2.17.1 VAV Terminal Units

**************************************************************************
NOTE: For NAVFAC LANT projects that use the regional specifications, refer to NAVFAC LANT regional specification NFPS 23 73 33.00 22 HEATING, VENTILATING AND COOLING SYSTEMS.
**************************************************************************

VAV terminal units shall be as specified in Section 23 30 00 HVAC AIR DISTRIBUTION.

2.17.2 Terminal Unit Controls

a. UL 916 and FCC Part 15. Controls for pressure independent boxes shall consist of a velocity sensing device in the primary air entering box, a room temperature sensing element, a damper actuator, and an adjustable microprocessor-based VAV box controller. Controls shall operate a damper for cooling [and a duct coil for heating]. Actuator shall open or close the device to which it is applied within 6 minutes.

b. Controls for pressure independent boxes with recirculating fans shall consist of a velocity sensing device in the primary air entering the box, a room temperature sensing element, an adjustable microprocessor-based VAV box controller, a damper with actuator, and a duct pressure switch to operate the recirculation fan. Controller shall operate the damper for cooling and the recirculating fan [and duct coil] for heating.

c. One hand-held communication and programming device with an instruction manual, plus one additional hand-held communication device and instruction manual per 100 terminal units, shall be provided. Communication and programming device shall connect directly to the controller or to a jack at the room temperature sensing element location. Communication and programming device shall be used to read and set minimum velocity, maximum velocity, heating setpoint, and cooling setpoint, and to read air velocity and space temperature.

2.18 CONTROL TUBING AND WIRING

Provide HVAC control tubing and wiring.

2.18.1 Tube and Fittings

**************************************************************************
NOTE: Systems that are critical and required for smoke removal operation shall have tubing of noncombustible material only.
**************************************************************************
2.18.1.1 Copper Tubing

ASTM B75/B75M or ASTM B88M ASTM B88. Tubing 10 mm 0.375 inch outside diameter and larger shall have a minimum wall thickness equal to ASTM B88M ASTM B88, Type M. Tubing less than 10 mm 0.375 inch outside diameter shall have a minimum wall thickness of 0.64 mm 0.025 inch. Concealed tubing shall be hard or soft copper; multiple tubing shall be racked or bundled. Exposed tubing shall be hard copper; rack multiple tubing. Tubing for working pressures greater than 206 kPa (gage) 30 psig shall be hard copper. Bundled tubing shall have each tube numbered each 2.0 meters six feet minimum. Racked and individual tubes shall be permanently identified at each end. Fittings shall be solder type ASME B16.18 or ASME B16.22, using ASTM B32, Plumbing Code approved lead-free solder, or compression type ASME B16.26.

2.18.1.2 Polyethylene Tubing

**************************************************************************
NOTE: If the building has crawl spaces or ceilings with openings to the outside, such as vent louver, prohibit use of bare polyethylene tubing in these areas.**************************************************************************

Polyethylene tubing shall be provided only for systems with working pressure of 206 kPa (gage) 30 psig or less. Provide flame-resistant, multiple polyethylene tubing in flame-resistant protective sheath with Mylar barrier, or unsheathed flame-resistant polyethylene tubing in rigid metal, intermediate metal, or electrical metallic tubing conduit for areas where tubing is exposed. Single, unsheathed, flame-resistant polyethylene tubing may be used where concealed in walls or above ceilings and within control panels, except prohibited in crawl spaces, attics, and above-ceiling spaces that are vented to the outdoors. Do not provide polyethylene tubing for [systems indicated as critical and] smoke removal systems. Number each tube in sheathing each two feet minimum. Permanently identify unsheathed tubing at each end. Provide compression or barbed push-on type fittings. Extruded seamless polyethylene tubing shall conform to the following:

a. Minimum burst pressure requirements: 690 kPa (gage) at 24 degrees C to 172 kPa (gage) at 66 degrees C 100 psig at 75 degrees F to 25 psig at 150 degrees F.

d. Flow rate (average): ASTM D1238, 0.30 decigram per minute.

e. Density (average): ASTM D792, 920 kg/m3 57.5 pounds per cubic feet.

f. Burn rate: ASTM D635.

2.18.2 Wiring

a. Terminal blocks shall be insulated, modular, feed-through, clamp style with recessed captive screw-type clamping mechanisms. Terminal blocks shall be rail mounted, and shall have end plates, partition plates or enclosed sides for separation.
b. Control wiring for 24-V circuits shall be 18 AWG minimum and shall be rated for 300-V service.

c. Wiring for circuits operating at more than 100 V shall be 14 AWG minimum and shall be rated for 600-V service.

d. Analog signal wiring circuits within control panels shall not be less than 20 AWG and shall be rated for 300-V service.

e. Instrumentation cable shall be 18 AWG, stranded copper, single or multiple twisted, minimum 2-inch lay of twist, 100 percent shielded pairs, and shall have 300-V insulation. Each pair shall have a 20-AWG tinned copper drain wire, individual pair, and overall insulation. Cables shall have an overall aluminum polyester or tinned overall copper cable shield tape, 20-AWG tinned-copper cable drain wire, and overall cable insulation.

f. Nonconducting wiring ducts in control panels shall have slotted side snap-on covers, fittings for connecting ducts, mounting clips for securing ducts, and wire retaining clips.

PART 3    EXECUTION

3.1    INSTALLATION

******************************************************************************
NOTE: Indicate access doors where required for servicing mounted devices.
******************************************************************************

Perform installation under the supervision of competent technicians regularly employed in the installation of control systems. Provide components for a complete and operational control system. Provide control system complete and ready for operation, as specified and indicated. Provide dielectric isolation where dissimilar metals are used for connection and support. Penetrations through and mounting holes in the building exterior shall be watertight. Control system installation shall provide adequate clearance for control system maintenance by maintaining access spaces between coils, to mixed-air plenums, and as required to calibrate, remove, repair, or replace control system devices. Control system installation shall not interfere with the clearance requirements for mechanical and electrical system maintenance. Install devices mounted in or on piping or ductwork, on building surfaces, in mechanical and electrical spaces, or in occupied space ceilings in accordance with manufacturer's recommendations and as indicated on contract documents. Provide control devices to be installed in piping and ductwork with required gaskets, flanges, thermal compounds, insulation, piping, fittings, and manual valves for shutoff, equalization, purging, and calibration. Certify that installation of control system is complete and technical requirements of this section have been met.

3.1.1    Sensors

Provide sensors in locations to sense the appropriate condition. Install sensor and transmitter where easily accessible and serviceable without special tools. Sensors shall be calibrated to the accuracy specified in the contract, and operate correctly when installed. Do not install sensors designed for one application in the place of another application (e.g.,
replacing a duct sensor with a room sensor).

3.1.1.1 Room Sensors

Provide on interior walls to sense average room conditions. Avoid locations which may be covered by office furniture. Do not mount room sensors on exterior walls if other locations are available. Mount centerline of sensor 1 1/2 meters 5 feet above finished floor.

3.1.1.2 Duct Temperature Sensors

Provide sensors in ductwork in general locations as indicated. Select specific sensor location within duct to accurately sense appropriate air temperatures. Locate sensor connection boxes in position not obstructed by ducts or equipment. Install gaskets between sensor housing and duct wall. Seal duct and insulation penetrations. Install duct averaging sensors between two rigid supports in serpentine position to sense average conditions. Sensor shall have a total minimum length of 825 mm per square meter one linear foot per 4 square feet of duct area. Sensor shall be mounted a minimum of 80 mm 3 inches from outside wall surface. Thermally isolate temperature sensing elements from supports. Provide duct access doors to averaging sensors.

3.1.1.3 Immersion Temperature Sensors

**************************************************************************
NOTE: Indicate pipe size increases for thermowells in small diameter piping.
**************************************************************************

Provide thermowells for sensors measuring temperatures in liquid applications or pressure vessels. Locate wells to sense continuous flow conditions. Do not install wells using extension couplings. Where piping diameters are smaller than the length of the wells, provide wells in piping at elbows to effect proper flow across entire area of the well. Wells shall not restrict flow area to less than 70 percent of pipe area. Increase piping size as required to avoid restriction. Temperature sensors shall be installed in thermowells with thermal transmission material to speed the response of temperature measurement. Provide thermowells with sealing nuts to contain thermal transmission material.

3.1.1.4 Strap-on Temperature Sensors

Strap-on temperature sensors, using helical screw stainless steel clamps, shall be permitted on new hot water piping for on-off operation, and for existing hot water piping sizes not greater than 80 mm 3 inches. Clean the pipe to bright metal. Insulate strap-on bulb and pipe after installation. Provide other liquid temperature sensors with thermowells. Provide NEMA Type 4 enclosures for outdoor installations. Provide brushed aluminum or brushed stainless steel enclosures for sensors located in finished spaces.

3.1.1.5 Outside Air Temperature Sensors

Provide outside air temperature sensor on north side of building, away from exhaust hoods, air intakes, and other areas which may affect temperature readings. Install sunshields to protect outside air temperature sensor from direct sunlight.
3.1.6 Low-Temperature Protection Thermostats (Freezestats)

Provide thermostat for each [7.5 square meter] [80 square feet] of coil-face area to sense the temperature at location indicated. Install thermostat sensing element in serpentine pattern.

3.1.2 Thermometers

Provide thermometers which are installed in liquid systems in thermowells with thermal transmitting materials within the well to speed the response of temperature measurement.

3.1.3 Pressure Sensors

3.1.3.1 Duct Static Pressure

Duct static pressure sensor shall be located where indicated on drawings. If no location is indicated, it should be located approximately two-thirds of distance from supply fan to the end of duct with greatest pressure drop.

3.1.3.2 Steam Pressure

Provide snubbers and isolation valves on steam pressure sensing applications.

3.1.4 Pressure Gages

Provide snubbers for gages in piping systems subject to pulsation. Gages for steam service shall have pigtail fittings with cocks. Install pressure gages at locations indicated. Pneumatic output lines shall have pressure gages mounted near the control panel.

3.1.5 Valves

Provide valve with stems upright where possible but with stems not lower than horizontal. Provide positioners where indicated and where necessary to prevent overlap of heating and cooling where one controller operates more than one pneumatic device and to maintain the proper dead band between heating and cooling.

3.1.6 Damper Actuators

Provide damper actuators so that the damper sealing action is smooth and sufficient to maintain leakage at or below specified leakage rate. Multiple actuators operating a common damper shall be connected to a common drive shaft. Provide positioners where indicated and where necessary to prevent overlap of heating and cooling where one controller operates more than one pneumatic device and to maintain the proper dead band between heating and cooling.

3.1.7 Access Doors

Provide access doors in ductwork to service airflow monitoring devices, devices with averaging elements, and low-temperature protection thermostats (freezestats).

3.1.8 Tubing

a. Provide control system so that pneumatic lines are not exposed to
air temperatures below minus 4 degrees C 25 degrees F. Install tubes and tube bundles exposed to view neatly in lines parallel to lines of the building. Route tubing between panels and actuators in mechanical and electrical spaces so that lines are easily traceable. Tubes shall be permanently tagged on both ends with an identifier indicated on shop drawings. Install concealed tubing in finished areas, and install exposed tubing in unfinished areas such as mechanical equipment rooms.

b. Pneumatic lines in mechanical and electrical spaces shall be plastic tubing or copper tubing. Install horizontal and vertical runs of plastic tubes or soft copper tubing in raceways dedicated to tubing. Dedicated raceways shall be supported every 2 meters 6 feet of horizontal run and every 2.44 meter 8 feet for vertical runs. Tubing not installed in raceways shall be hard-drawn copper tubing with sweat fittings and valves, supported every 2 meter 6 feet of horizontal run and every 2.44 meters 8 feet for vertical runs.

c. Tubing for connecting sensing elements and transmitters to liquid and steam lines shall be [copper] [Series 300 stainless steel] with [brass compression] [stainless steel compression] fittings.

d. Tubing for final connection of sensing elements and transmitters to ductwork shall be plastic with a maximum length of 305 mm 12 inches.

e. Tubing external to mechanical and electrical spaces, where run in plenum ceilings, shall be soft copper with sweat fittings, supported every 2.44 meters 8 feet. Tubing not in plenum spaces shall be soft copper with sweat fittings supported every 2.44 meters 8 feet or shall be plastic tubing in raceways dedicated to tubing.

f. Provide tubing in concrete in rigid conduit. Install tubing in walls containing insulation, fill, or other packing materials in raceways dedicated to tubing.

g. Final connections to actuators shall be plastic tubing, a maximum of 305 mm 12 inches long and unsupported at the actuator.

h. Provide a manual valve at each HVAC control panel to allow shutoff of main air. Pneumatic connections to HVAC control panels shall be made using bulkhead fittings except where bundled tubing is being used.

i. Final connections to HVAC control panel bulkhead fittings shall be exposed tubing approximately 305 mm 12 inches long.

j. Tubing and two insulated copper phone wires for installation checkout may be run in the same conduit. Tubing and electrical power conductors shall not be run in the same conduit. Control circuit conductors, 24 V or less, may be run in the same conduit as polyethylene tubing.

3.1.9 Wiring

a. Provide wiring external to control panels, including low-voltage wiring, in metallic raceways. Install wiring without splices.
between sensors, transmitters, control devices, and HVAC control panels. Install instrumentation grounding as necessary to prevent ground loops, noise, and surges adversely affecting operation of the system. Tag cables, conductors, and wires at both ends, with identifiers indicated on shop drawings.

b. Other electrical work shall be specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide step-down transformers where control equipment operates at lower than line circuit voltages. Transformers serving individual heating, ventilating, and air-conditioning units shall be fed from fan motor leads, or fed from the nearest distribution panelboard or motor control center, using circuits provided for that purpose.

c. Ground control panels and cabinets as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Grounding of the green ac ground wire at the breaker panel alone is not adequate. Install ground wire from each control panel to adequate building ground.

3.1.10 Foundations and Housekeeping Pads

Provide 80 mm 3 inch high concrete foundations and housekeeping pads for the HVAC control system air compressors.

3.1.11 Compressed Air Stations

Mount air compressor assembly on vibration eliminators, in accordance with ASME BPVC for tank clearance. Connect air line to the tank with a flexible pipe connector. Install compressed air station specialties with required tubing, including condensate tubing to a floor drain.

3.1.12 Control Drawings

Post laminated copies of as-built control system drawings in each mechanical room.

3.2 ADJUSTMENTS

Calibrate instrumentation and controls, and verify specified accuracy using test equipment traceable to National Institute for Science and Technology (NIST) standards. Adjust controls and equipment to maintain conditions indicated, to perform the functions indicated, and to operate in the sequence specified.

3.3 FIELD QUALITY CONTROL

**************************************************************************
NOTE: Include Section 23 05 93 TESTING, ADJUSTING AND BALANCING.
**************************************************************************

a. Demonstrate compliance of HVAC control systems. Furnish personnel, equipment, instrumentation, and supplies necessary to perform calibration and site testing. Calibrate test equipment in accordance with NIST standards. Ensure that tests are performed or supervised by competent employees of the control system installer or the control system manufacturer regularly employed in testing and calibration of control systems.
b. Testing shall include field tests and the performance verification test. Field tests shall demonstrate proper calibration of instrumentation, input and output devices, and operation of specific equipment. The performance verification test shall ensure proper execution of sequence of operation and proper tuning of control loops.

c. The plan for each phase of field acceptance testing shall be approved in writing before beginning that phase of testing. Furnish written notification of planned testing to Contracting Officer at least 21 days prior to testing. Include proposed test procedures with notification. The Contractor will not be allowed to start testing without written Government approval of test procedures. Test procedures shall consist of detailed instructions for complete testing to prove the performance of heating, ventilating, and air-conditioning system and control system. Include the following tests in test procedures.

d. Submit original copies of data produced, including results of each test procedure, to the Government at the conclusion of each phase of testing. Tests are subject to supervision and approval by Contracting Officer. Do not perform testing during scheduled seasonal off-periods of heating and cooling systems.

3.3.1 Test Reporting

After completion or termination of field tests and again after the performance verification test, identify, determine causes, replace, repair, or calibrate equipment which fails to meet the specification; and deliver a written report to the Government. The report shall document test results, explain in detail the nature of each failure, and corrective action taken. After delivering the performance verification test report, the Contractor shall convene a test review meeting at the job site to present results and recommendations to the Government. As a part of the test review meeting, the Contractor shall demonstrate by performing appropriate portions of field tests or the performance verification test that failures have been corrected. Based on Contractor's report and test review meeting, the Government will determine either the restart point or successful completion of testing. Do not commence required retesting until after receipt of written notification by the Government. At the conclusion of retesting, repeat the assessment.

3.3.2 Contractor's Field Testing

Calibrate field equipment and verify equipment and system operation before system is placed on-line. Include the following tests in field testing.

3.3.2.1 Tubing and Wiring Integrity Tests

Test tubing system pneumatically at 1.5 times the design working pressure for 24 hours. Allowable leakage rate is that which produces a pressure drop 7 kPa (gage) 1 psig in 24 hours with compressed air supply turned off. Test wiring for continuity, ground faults, and open and short circuits.

3.3.2.2 System Inspection

Observe HVAC control system in shutdown condition. Check dampers and valves for proper normal positions. Document positions for the performance verification test report.
3.3.2.3 Calibration Accuracy and Operation of Input Test

Verify correct calibration and operation of input instrument. For each sensor and transmitter, including for temperature, pressure, relative humidity, and dew point inputs, record the reading at the sensor or transmitter location using calibrated test equipment. Record the output reading provided by that sensor or transmitter. Document each of these location and output readings for the performance verification test report. The test equipment shall have been calibrated within one year of the date of use in the field. Test equipment calibration shall be traceable to the measurement standard of the National Institute of Standards and Technology.

3.3.2.4 Operation of Output Test

Check the operation of output to verify correct operation. Operate analog device to minimum range (e.g., 4 mA) and maximum range (e.g., 20 mA), and measure and record actual output values.

3.3.2.5 Actuator Range Adjustment

With the controller, apply a control signal to each actuator and verify that the actuator operates properly from its normal position through to the full range of stroke position. Record actual spring ranges and normal positions for modulating control valves and dampers.

3.3.3 Coordination With HVAC System Balancing

Tune the control system after air and hydronic systems have been balanced, minimum damper positions have been set, and a report has been issued.

3.3.4 Field Test Documentation

Before scheduling the performance verification test, provide field test documentation and written certification of completion to Contracting Officer and the Naval Energy and Environmental Support Activity (NEESA), that the installed system has been calibrated, tested, and is ready to begin the performance verification test. Do not start the performance verification test prior to receiving written permission from the Government.

3.3.5 Performance Verification Test

Conduct the performance verification tests to demonstrate that the control system maintains setpoints and that the control loops are tuned for the correct sequence of operation. Conduct the performance verification test during one week of continuous HVAC and control systems operation and before final acceptance of work. Specifically, the performance verification test shall demonstrate that the HVAC system operates properly through the complete sequence of operation (e.g., seasonal, occupied and unoccupied, warm up, etc.), for specified control sequences. Demonstrate proper control system response for abnormal conditions for which there is a specified system or controls response by simulating these conditions. Demonstrate that hardware interlocks and safety devices work as designed. Demonstrate that the control system performs the correct sequence of control.
3.3.6 Opposite Season Test

Repeat the performance verification test during an opposite season to the first performance verification test.

3.4 TRAINING

Provide a qualified instructor to conduct training courses for designated personnel in maintenance and operation of HVAC and control systems. Orientate training to the specific system being installed under the contract. Furnish audiovisual equipment and other training materials and supplies. A training day is defined as 8 hours of classroom or lab instruction, including two 15-minute breaks and excluding lunch time, Monday through Friday, during the daytime shift in effect at the training facility. For guidance, assume that the attendees have a high school education and are familiar with HVAC systems. Submit planned training schedule, agenda, and class materials to the Government at least 45 days prior to training.

3.4.1 Training Course Documentation

Training shall be based on the operation and maintenance manuals and control system training manual. Deliver manuals for each trainee with two additional sets for archiving at the project site. Include an agenda, defined objectives, and a detailed description of subject matter for each lesson.

3.4.2 Operator Training I

The first class shall be taught for a period of 5 consecutive training days at least 1 month prior to the scheduled performance verification test. The first course shall be taught in a Government-provided facility on base. Training shall be classroom instruction, but have hands-on operation of similar digital controllers. Maximum of [5] [_____] personnel shall attend the course. Upon completion of course, each student, using appropriate documentation, shall be able to perform elementary operations, with guidance, and describe general hardware and functionality of the system. Course shall include but not be limited to description of hardware and operation of the system.

3.4.3 Operator Training II

The second course shall be taught in the field, using the operating equipment at project sites for a total of 16 hours of instruction per student, in blocks of 4 hours. Maximum of [5] [_____] personnel shall attend the course. Include hands-on training under constant monitoring of instructor. Course content shall duplicate the Operator Training I course as applied to the installed system. Instructor shall determine the level of the password to be issued to each student before each session. Upon completion of the course, students shall be proficient in system operation. Prepare a written report describing the skill level of each student at the end of the course.

3.4.4 Operator Training III

The third course shall be taught in the field, at the project site, for a period of 3 training days no later than 6 months after completion of endurance test. Maximum of [5] [_____] personnel shall attend the course. Course shall be structured to address specific topics that the
students need to discuss and to answer questions concerning operation of the system. Upon completion of the course, students shall be proficient in system operation and shall have no unanswered questions regarding operation of the installed system.

3.4.5 System Maintenance Training

Course shall be taught at the project site within one month after completion of endurance test for a period of 2 training days. Maximum of [_____] personnel shall attend the course. Course shall include but not be limited to the following:

a. Physical layout for each piece of hardware
b. Troubleshooting and diagnostics procedures
c. Repair instructions
d. Preventive maintenance procedures and schedule
e. Calibration procedures

3.5 QUALIFIED SERVICE ORGANIZATION LIST

The qualified service organization list shall include names and telephone numbers of organizations qualified to service HVAC control systems.

3.6 COMMISSIONING

**************************************************************************

NOTE: If commissioning procedures are required beyond the scope of those described in Section 23 05 93 TESTING, ADJUSTING AND BALANCING, include procedures in this paragraph.

**************************************************************************

Commissioning of control systems is specified in the pre-field TAB engineering report described in Section 23 05 93 TESTING, ADJUSTING AND BALANCING.

3.7 SCHEDULE

Some metric measurements in this section are based on mathematical
conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

<table>
<thead>
<tr>
<th>Products</th>
<th>Inch-Pound</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Pneumatic Actuators: Operating Pressure</td>
<td>25 psig</td>
<td>172 kPa (gage)</td>
</tr>
<tr>
<td>b. Transmitters: Output Signal</td>
<td>3 to 15 psi</td>
<td>21 to 103 kPa</td>
</tr>
<tr>

   3.4.4.3.2  Safeties
   3.4.4.3.3  DDC Hardware Reset
3.4.4.4  Pressure Control

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for sequences of operation for HVAC control.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This Section contains only Sequences of Operation and cannot be used stand-alone (without the use of other Sections). This Section is intended to be used with Section 23 09 00.

Template drawings and Points Schedule in electronic format for use with this section are available in online at: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms

NOTE: The Sequences of Operation in this Section are being updated, and this Section will soon be revised to include the updated sequences.
PART 1   GENERAL

1.1   DEFINITIONS

For definitions related to this Section, see Section 23 09 00 INTRUMENTATION AND CONTROL FOR HVAC.

1.2   SUBMITTALS

Submittals related to this Section are specified in Section 23 09 00 INTRUMENTATION AND CONTROL FOR HVAC.

PART 2   PRODUCTS

Products related to this Section are specified in Section 23 09 00 INTRUMENTATION AND CONTROL FOR HVAC and related Sections 23 09 13 INSTRUMENTATION AND CONTROL DEVICES FOR HVAC and 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS or 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS.

PART 3   EXECUTION

**************************************************************************
NOTE: These sequences are 'template' sequences.
When editing this specification, the sequences should be put onto the drawings and these template sequences should be deleted. Note that the Alarm Handling and Scheduling sequences each need to be edited and placed onto their own drawing.

When removing the sequences, keep this subpart number and title intact, but replace the entire contents of the subpart with a note such as "All Sequences of Operation are located on drawings".
**************************************************************************

3.1   SEQUENCES OF OPERATION FOR OCCUPANCY SCHEDULING

**************************************************************************
NOTE: FYI: Scheduling is normally performed by the Monitoring and Control (M&C) software (Section 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION. The UMCS (Section 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION) Contractor will set this up. In the absence of a UMCS or if communication with the UMCS is lost, a default schedule will be active.

The M&C software will have capabilities to perform scheduling according to day of week, holidays, etc and will have the capability to override system occupancy modes based on demand limiting programs or operator overrides.
**************************************************************************
3.1.1 System Mode

Operate air handling units (AHUs) in Occupied, Warm-Up-Cool-Down, or Unoccupied modes as specified. VAV boxes, Fan Coils, and operate other terminal equipment in Occupied or Unoccupied modes as specified. Chillers, boilers, and other sources of heating/cooling for hydronic loads do not require scheduling; these systems receive requests for heating/cooling from their loads.

3.1.2 System Scheduler Requirements

**************************************************************************
NOTE: Indicate if a common schedule may be used for multiple Terminal Units (TUs). If allowing a common schedule for multiple TUs: keep the 'group of' bracketed text, and decide if TU groupings will be included on the drawings (keep the 'as shown' bracketed text) or if the Contractor should decide on groupings (remove the 'as shown' bracketed text).

These sequences include details specific to the LonWorks protocol. When using other protocols, edit sequences accordingly.
**************************************************************************

The System Scheduler functionality must reside in either a piece of DDC Hardware dedicated to this functionality or in the DDC Hardware controlling the system AHU. A single piece of DDC Hardware dedicated to scheduling (performing no other control functionality) may contain multiple SystemSchedulers. Provide a unique System Scheduler for: each AHU including its associated Terminal Units, and each stand-alone Terminal Unit (those not dependent upon AHU service) or group of stand-alone Terminal Units acting according to a common schedule. Each System Scheduler must provide the following functionality:

3.1.2.1 Scheduled Occupancy Input

Accept network variable of type SNVT_occupancy. Support the following possible values: OC_STANDBY, OC_OCCUPIED and OC_UNOCCUPIED.

3.1.2.2 Occupancy Override Input

Accept network variable of type SNVT_occupancy. Support the following possible values: OC_STANDBY, OC_OCCUPIED, OC_UNOCCUPIED, and OC_NUL.

3.1.2.3 Space Occupancy Inputs

For systems with multiple occupancy sensors, accept multiple inputs of network variable type SNVT_Occupancy. Support the following possible values: OC_OCCUPIED, OC_UNOCCUPIED, and OC_NUL. For systems with a single occupancy sensor, accept a network variable input of type SNVT_Occupancy or a hardware binary input (BI) indicating the space occupancy status as Occupied or Unoccupied.

3.1.2.4 Air Handler Occupancy Output

For a System Scheduler for a system containing an air handler, output one or more SNVTs indicating the desired occupancy status as one of the following possible values: Warm-Up-Cool-Down (when required by the AHU...
Sequence of Operation), Occupied and Unoccupied.

3.1.2.5 Terminal Unit Occupancy Output

For a System Scheduler for a stand-alone terminal unit, [a group of stand-alone terminal units acting according to a common schedule,] or a group of terminal units served by a single air handler, output one or more SNVTs indicating the desired occupancy status as one of the following possible values: Occupied and Unoccupied.

3.1.2.6 Default Schedule

**************************************************************************
NOTE: Designer must provide the default (backup) 24-hour 7-day schedule on the Points Schedule (i.e. Occupied from 0600 - 2200 Monday through Friday, Unoccupied Saturday and Sunday).
**************************************************************************

Incorporate a 24-hour 7-day default schedule as shown on the drawings which may be activated and deactivated by the System Scheduler Logic.

3.1.2.7 Communication Determination

Determine the time elapsed between receipts of the scheduled occupancy input SNVT, and use this elapsed time to activate and deactivate the Default Schedule as specified. (This provides the capability for the system scheduler to use its Default Schedule if it loses communication with the UMCS).

3.1.3 System Scheduler Output Determination

For controlling an Air Handler, interpret a SNVT input of OC_STANDBY as Warm-Up-Cool-Down if the sequence of operation supports that mode, otherwise interpret OC_STANDBY as Occupied. For Terminal Units, interpret OC_STANDBY as Occupied.

3.1.3.1 Air Handler Occupancy Output

If more than 95 minutes have passed since the last receipt of the Scheduled Occupancy input, determine the Air Handler Occupancy Output by the default schedule and the Space Occupancy Inputs. Otherwise, determine the output as follows:

a. If the Override Occupancy Input is not OC_NUL, determine the Air Handler Occupancy Output from the Override Occupancy Input.

b. Otherwise, if at least the required number (as shown on the Occupancy Schedule Drawing) of Space Occupancy Inputs are OC_OCCUPIED or the hardware BI is Occupied the Air Handler Occupancy Output must be OC_OCCUPIED.

c. Otherwise, determine the Air Handler Occupancy Output from the Scheduled Occupancy Input SNVT.

3.1.3.2 Terminal Unit Occupancy Output

If more than 95 minutes have passed since the last receipt of the Scheduled Occupancy input, determine the Terminal Unit Occupancy Output by the
default schedule. Otherwise, determine the output as follows:

a. If the Override Occupancy Input is not OC_NUL, determine the Terminal Unit Occupancy Output from the Override Occupancy Input SNVT:

b. Otherwise, determine the Terminal Unit Occupancy Output from the Scheduled Occupancy SNVT.

3.1.4 Air Handler System Scheduling

a. Bind the AHU Occupancy Output SNVT from the System Scheduler to the DDC Hardware that executes the Occupancy Mode Determination part of the Air Handler Sequence of Operation

b. For Air Handlers using occupancy sensors, bind the output SNVT (of type SNVT_Occupancy) of each occupancy sensor to a Space Occupancy Input of the System Scheduler.

c. Bind the Terminal Unit Occupancy Output SNVT from the System Scheduler to each AHU-Dependent Terminal Unit.

d. AHU-Dependent Terminal Units with occupancy sensors must have the Effective Occupancy SNVT (of type SNVT_Occupancy) of each Terminal Unit bound to a Space Occupancy Input of the System Scheduler.

3.1.5 Stand-Alone Terminal Unit Scheduling

Bind the Terminal Unit Occupancy Output from the System Scheduler to the DDC Hardware that executes the Occupancy Mode Determination part of the Terminal Unit Sequence of Operation.

3.2 SEQUENCES OF OPERATION FOR AIR HANDLING UNITS

******************************************************************************

NOTE:

1) The following sequences, with few exceptions, assume the use of a System Scheduler and space occupancy input(s) to switch between occupied and unoccupied mode setpoints.

2) Show occupied and unoccupied mode setpoints on the Points Schedule. A configured setpoint is operator adjustable over the control network, but resides in the local DDC Hardware. In these sequences it serves as the default occupied mode setpoint and (at a separate setting/value) as an unoccupied mode 'setback' setpoint.

3) Space occupancy input(s) may consist of an occupancy sensor and/or a local push-button. Indicate the use of a sensor and/or push-button by placing an 'X' in the 'Thermostat and Occupancy Sensor Schedule'. If a push-button is used, show the override time duration in the Schedule. Note that the occupancy sensor specification requires a delay that is adjustable between 30 seconds and 15 minute. If a delay outside of this range is needed edit the Occupancy Sensor Product specification in PART 2.

SECTION 23 09 93 Page 12
4) Occupancy sensor location is left up to the Contractor. If ceiling mount sensors are preferred, edit the sequences and/or indicate in the Thermostat and Occupancy Sensor Schedule.

5) For each unit, as applicable, indicate if the zone temperature setpoint will be occupant adjustable by placing an 'X' in the 'Thermostat and Occupancy Sensor Schedule'. For non-occupant-adjustable setpoints, show the setpoint in the Points Schedule. The intent is that the Contractor provides one or the other as shown. Non-occupant-adjustable setpoints are adjustable by a system operator using a local display panel (LDP) or an operator workstation (and appropriate software).

3.2.1 All-Air Small Package Unitary System

******************************************************************************************************************************************

NOTE: For heating-only or cooling-only systems, edit the sequence as required. Where applicable, select 'Emerg Heat' for heat pump systems.

******************************************************************************************************************************************

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control must be proportional-integral (PI) control.

3.2.1.1 Fan ON-AUTO Switch

3.2.1.1.1 ON

With the thermostat fan ON-AUTO switch in the ON position, the DDC Hardware must start and continuously run the fan.

3.2.1.1.2 AUTO

With the thermostat fan ON-AUTO switch in the AUTO position, the DDC Hardware operates the fan according to HEAT-OFF-COOL[-EMERG HEAT] switch.

3.2.1.2 HEAT-OFF-COOL[-EMERG HEAT] Switch

3.2.1.2.1 HEAT-COOL[-EMERG HEAT]

With the thermostat switch in the HEAT or COOL [or EMERG HEAT] positions, use the DDC Hardware to operate the package unit according to the Occupancy Mode.

3.2.1.2.2 OFF

With the thermostat switch in the OFF position, de-energize the heating unit and cooling unit [and emergency supplemental heat] with the DDC Hardware.
3.2.1.3 Occupancy Modes

3.2.1.3.1 Occupied

The unit DDC Hardware must be in the Occupied Mode when the local space occupancy input(s) indicate that the space is occupied or when the input from the System Scheduler is occupied.

3.2.1.3.2 Unoccupied

The unit DDC Hardware must be in the Unoccupied Mode when the local space occupancy input(s) indicate that the space is unoccupied and when the input from the System Scheduler is unoccupied.

3.2.1.4 Safeties

Run the unit subject to the unit manufacturer's safeties.

3.2.1.5 Zone Temperature Control

a. In the Occupied Mode the zone temperature setpoint (ZN-T-SP) must be at the configured setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as indicated.

b. In the Unoccupied Mode the zone temperature setpoint (ZN-T-SP-UNOCC) must be at the configured setpoint (ZN-T-SP-UNOCC) as indicated.

c. Cycle the fan, cooling unit, heating unit[, and emergency supplemental heat] with the DDC Hardware, in accordance with the HEAT-COOL[-EMERG HEAT] switch setting, to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP).

3.2.2 Heating and Ventilating Unit (or Unit Ventilator)

**************************************************************************

NOTE:

1) A special interlock control sequence for each fan system will be developed by the designer if required.

2) This system has a single outside air duct. Select either 2-position outside air dampers or modulating dampers.

3) Indicate the System Scheduler and M&C Software Occupancy Schedule on the Occupancy Schedule drawing. The designer needs to coordinate System Scheduler (occupancy mode determination) with space occupancy sensor input and pushbutton override switch input use. As described in the System Scheduler sequence, 'occupied' inputs from two different spaces are required to help avoid needless turning on of the system (due to cleaning staff or security staff passing through after hours).

4) The inclusion of filter pressure switches should be coordinated with the local O&M staff. Pressure switches may not be desired/needed, particularly if filters are replaced on a regular schedule. Edit the Points Schedule as required.
5) Absence of fan proof(s) or activation of any safety will result in system shutdown. The system remains shutdown until manually reset devices are reset and a manual reset button (RST-BUT), local to the DDC controller, is pressed. Reset could also be performed from a workstation (via SNVT) or local display panel (LDP). It is recommended that you coordinate the decision with the local O&M staff. Edit the Control Logic Diagram and Points Schedule to indicate which reset method is to be provided by the Contractor.

6) The hardware (product) specification requires that the low limit (freeze stat) device include a manual reset at the device. In the event of shutdown due to freeze stat trip the system will remain shutdown until the device is reset and a separate DDC reset, as described above, is also used.

7) Smoke control is not addressed in this Section. Smoke control sequence of operation for each fan system, if beyond the requirements described, will be developed by the designer, based on the requirements and parameters of the project. The designer will account for operation of dampers and fans for pressurization and manual override of interlocks to the fire alarm system. All automatic overrides of normal HVAC control sequences will be activated through the fire protection and smoke control interface panel that the designer will design for the project. With the present control sequence, in the event of shutdown due to smoke detector input the system will remain shutdown until the smoke detector is reset and a separate DDC reset, as described above, is also used. The Fire Alarm Panel (FAP) input takes precedence over any DDC input to force the fan(s) to run.

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control must be proportional-integral (PI) control.

3.2.2.1 HAND-OFF-AUTO Switches

Provide supply fan motor starter to accept a Fire Alarm Panel (FAP) signal that takes precedence over all other starter inputs and switches and starts the fan. Provide fan motor starter which accepts an occupant accessible emergency shutoff switch as indicated. Provide supply fan motor starter with an H-O-A switch:

3.2.2.1.1 HAND

With the H-O-A switch in HAND position, the supply fan starts and runs continuously, subject to Safeties.
3.2.2.1.2 OFF

With the H-O-A switch in OFF position, the supply fan stops.

3.2.2.1.3 AUTO

With the H-O-A switch in AUTO position, the supply fan runs subject to the Supply Fan Start/Stop (SF-SS) command and Safeties.

3.2.2.2 Occupancy Modes

Obtain the system's Occupancy Mode input from the System Scheduler as specified and indicated. Operate the system in one of the following modes:

3.2.2.2.1 Occupied

The Unit's DDC Hardware must be in the Occupied Mode when the input from the System Scheduler (SYS-OCC) is occupied [or when the local space occupancy input(s) (ZN-OCC) indicate that the space is occupied].

3.2.2.2.2 Unoccupied

The Unit's DDC Hardware must be in the Unoccupied Mode when the input from the System Scheduler (SYS-OCC) is unoccupied[ and when the local space occupancy input(s) (ZN-OCC) indicate that the space is unoccupied].

3.2.2.3 System Enable and Loop Enable

3.2.2.3.1 Occupied Mode

**************************************************************************
** NOTE: Include bracketed text (Mixed Air Damper Control) for systems with 2-position dampers.  **
**************************************************************************

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Enable the Zone Temperature Control loop [and Mixed Air Damper Control].

3.2.2.3.2 Unoccupied Mode

Disable all control loops. When BLDG-T drops below BLDG-T-LL-SP (with a 3 degrees C 5 degrees F deadband) enable the supply fan (SYS-ENA) and command to run (SF-SS) and enable the Zone Temperature Control loop.

3.2.2.4 Proofs and Safeties

Subject the supply fan and all DDC Hardware control loops to Proofs and Safeties. Direct-hardwire interlock safeties to the fan starter circuit as indicated. DDC Hardware must monitor all proofs and safeties and failure of any proof or activation of any safety must result in all control loops being disabled and the AHU fan being commanded off until reset.

3.2.2.4.1 Proofs

Supply fan status (proof) (SF-S)

3.2.2.4.2 Safeties

a. Heating Coil discharge air temperature low limit (freeze stat)
b. Supply air smoke (SA-SMK)
[ c. Return air smoke (RA-SMK)]

3.2.2.4.3 DDC Hardware

DDC Hardware reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as indicated on the Points Schedule drawing.

3.2.2.5 Zone Temperature Control

***************
NOTE: If the system has modulating dampers, select bracketed damper text in Zone Temperature Control paragraph. Otherwise, select Mixed Air Damper Control.
***************

3.2.2.5.1 Enabled Loop

When this loop is enabled, the DDC Hardware must modulate the heating valve [and outside air, relief, and return air dampers in sequence] to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP). [Provide sequencing as indicated: Upon a rise in zone temperature above zone temperature setpoint (ZN-T-SP), subject to the zone temperature setpoint deadband as indicated, modulate the outside air, relief, and return air dampers to maintain zone temperature at setpoint. During occupied mode, ensure outside air damper minimum position (OA-D-MIN) is as indicated.] Upon a fall in zone temperature below zone temperature setpoint, subject to the deadband as indicated, modulate the heating valve towards open to maintain zone temperature setpoint.

3.2.2.5.2 Disabled Loop

When this loop is disabled, close the heating valve[ and close the outside air damper and relief damper and open the return damper].

3.2.2.6 Mixed Air Damper Control

When this is enabled, open the outside air and relief air dampers and close the return air damper. When this is disabled, close the outside air and relief air dampers and open the return air damper.

3.2.3 Single Zone with Heating and [DX]Cooling Coils

***************
NOTE: 1) Edit the sequence and drawings as necessary for systems with/without a preheat coil, economizer, and other project specific control loop requirements.

2) Minimum outside air flow control can be accomplished several different ways. Refer to the UFC, but don't use flow measurement in a constant
volume system.

3) The inclusion of filter pressure switches should be coordinated with the local O&M staff. Pressure switches may not be desired/needed, particularly if filters are replaced on a regular schedule. Edit the Points Schedule and Control Schematic as required.

4) Indicate the System Scheduler and M&C Software Occupancy Schedule on the Occupancy Schedule drawing. The designer needs to coordinate System Scheduler (occupancy mode determination) with space occupancy sensor input and pushbutton override switch input use. As described in the System Scheduler sequence, 'occupied' inputs from two different spaces are required to help avoid needless turning on of the system (due to cleaning staff or security staff passing through after hours).

5) Absence of fan proof(s) or activation of any safety will result in system shutdown. The system remains shutdown until manually reset devices are reset and a manual reset button (RST-BUT), local to the DDC controller, is pressed. Reset could also be performed from a workstation (via SNVT) or local display panel (LDP). It is recommended that you coordinate the decision with the local O&M staff. Edit the Control Logic Diagram and Points Schedule to indicate which reset method is to be provided by the Contractor.

6) The hardware (product) specification requires that the low limit (freezestat) device include a manual reset at the device. In the event of shutdown due to freeze stat trip the system will remain shutdown until the device is reset and a separate DDC reset, as described above, is also used.

7) Smoke control is not addressed in this Section. Smoke control sequence of operation for each fan system, if beyond the requirements described, will be developed by the designer, based on the requirements and parameters of the project. The designer will account for operation of dampers and fans for pressurization and manual override of interlocks to the fire alarm system. All automatic overrides of normal HVAC control sequences will be activated through the fire protection and smoke control interface panel that the designer will design for the project. With the present control sequence, in the event of shutdown due to smoke detector input the system will remain shutdown until the smoke detector is reset and a separate DDC reset, as described above, is also used. The Fire Alarm Panel (FAP) input takes precedence over any DDC input to force the fan(s) to run.

**************************************************************************

SECTION 23 09 93 Page 18
Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control must be proportional-integral (PI) control.

3.2.3.1 HAND-OFF-AUTO Switch

Provide supply fan motor starter to accept a Fire Alarm Panel (FAP) signal that takes precedence over all other starter inputs and switches and starts the fan. Provide fan motor starter which accepts an occupant accessible emergency shutoff switch as indicated. Provide supply fan motor starter with an H-O-A switch:

3.2.3.1.1 HAND

With the H-O-A switch in HAND position, the supply fan starts and runs continuously, subject to Safeties.

3.2.3.1.2 OFF

With the H-O-A switch in OFF position, the supply fan stops.

3.2.3.1.3 AUTO

With the H-O-A switch in AUTO position, the supply fan runs subject to the Supply Fan Start/Stop (SF-SS) command and Safeties.

3.2.3.2 Occupancy Modes

Obtain the system's Occupancy Mode input from the System Scheduler as specified and indicated. Operate the system in one of the following modes: Occupied, Unoccupied[, or WarmUp/CoolDown].

3.2.3.3 System Enable and Loop Enable

3.2.3.3.1 Occupied Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS) and enable all control loops.

3.2.3.3.2 Unoccupied Mode

While the building temperature (BLDG-T) is above the low limit setpoint (BLDG-T-LL) disable all control loops and the supply fan does not run. When BLDG-T drops below BLDG-T-LL (with a 3 degrees C 5 degrees F deadband) enable the supply fan (SYS-ENA) and command to run (SF-SS) and enable the Heating Coil Temperature Control loop. Disable the Outside Air Flow Control, Economizer Damper Control, and [DX] Cooling Coil Control loops.

3.2.3.3.3 Warm Up / Cool Down Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS) and disable the Minimum Outside Air Flow Control loop. Enable all other control loops.

3.2.3.4 Proofs and Safeties

The supply fan and all DDC Hardware control loops are subject to Proofs and Safeties. Safeties must be direct-hardwire interlocked to the fan starter circuit as indicated. DDC Hardware must monitor all proofs and safeties.
and failure of any proof or activation of any safety result in all control loops being disabled and the AHU fan being commanded off until reset.

3.2.3.4.1 Proofs

Supply fan status (proof) (SF-S)

3.2.3.4.2 Safeties

a. Heating coil discharge air temperature low limit (freeze stat) (HTG-DA-T-LL)
b. Supply air smoke (SA-SMK)
c. Return air smoke (RA-SMK)

3.2.3.4.3 DDC Hardware

Provide DDC Hardware reset of all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.2.3.5 Minimum Outside Air Flow Control

When this loop is enabled, open the 2-position minimum outside air damper to introduce the minimum outside air flow quantity as shown. When this loop is disabled, the minimum outside air damper will be closed.

3.2.3.6 Economizer Damper Control

3.2.3.6.1 Enabled Loop

When this loop is enabled, and the Economizer is ON as determined by the Economizer Enable Logic, the DDC Hardware will modulate the economizer outside air, relief, and return air dampers (Economizer dampers) in sequence with the [DX] cooling coil control and heating coil control valve as shown to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP) as shown.

3.2.3.6.2 Disabled Loop

When this loop is disabled, or the Economizer is OFF as determined by the Economizer Enable Logic, the economizer outside air and relief air dampers will be closed, and the return air damper will be open.

3.2.3.6.3 Economizer Enable Logic

Ensure the economizer is ON when the outside air dry bulb temperature is between the high limit (ECO-HL-SP) and low limit (ECO-LL-SP) setpoints as shown. Otherwise the Economizer is OFF. Ensure ECO-HL-SP and ECO-LL-SP each have a 1 degree C 2 degrees F deadband.

3.2.3.7 Heating Coil Control

When this loop is enabled, modulate the heating coil control valve in sequence with the [DX staging control][cooling coil valve] and economizer dampers as shown to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP) as shown. When this loop is disabled, the heating coil control valve is
3.2.3.8 [DX ]Cooling Coil Control

When this loop is enabled the DDC Hardware must [stage the DX Unit] [modulate the cooling coil control valve] in sequence with the heating coil valve and economizer dampers as shown to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP) as shown. When this loop is disabled, the [DX unit is off] [cooling coil control valve is closed].

3.2.4 Single Zone with Dual-Temperature Coil

**************************************************************************

NOTE:

1) Edit the sequence and drawings as necessary for systems with/without a preheat coil, economizer, and other project specific control loop requirements.

2) Minimum outside air flow control can be accomplished several different ways. Refer to the UFC, but don't use flow measurement in a constant volume system.

3) The inclusion of filter pressure switches should be coordinated with the local O&M staff. Pressure switches may not be desired/needed, particularly if filters are replaced on a regular schedule. Edit the Points Schedule and Control Schematic as required.

4) Indicate the System Scheduler and M&C Software Occupancy Schedule on the Occupancy Schedule drawing. The designer needs to coordinate System Scheduler (occupancy mode determination) with space occupancy sensor input and pushbutton override switch input use. As described in the System Scheduler sequence, 'occupied' inputs from two different spaces are required to help avoid needless turning on of the system (due to cleaning staff or security staff passing through after hours).

5) Absence of fan proof(s) or activation of any safety will result in system shutdown. The system remains shutdown until manually reset devices are reset and a manual reset button (RST-BUT), local to the DDC controller, is pressed. Reset could also be performed from a workstation (via SNVT) or local display panel (LDP). It is recommended that you coordinate the decision with the local O&M staff. Edit the Control Logic Diagram and Points Schedule to indicate which reset method is to be provided by the Contractor.

6) The hardware (product) specification requires that the low limit (freezestat) device include a manual reset at the device. In the event of shutdown due to freeze stat trip the system will remain shutdown until the device is reset and a separate DDC reset, as described above, is also used.
7) Smoke control is not addressed in this Section. Smoke control sequence of operation for each fan system, if beyond the requirements described, will be developed by the designer, based on the requirements and parameters of the project. The designer will account for operation of dampers and fans for pressurization and manual override of interlocks to the fire alarm system. All automatic overrides of normal HVAC control sequences will be activated through the fire protection and smoke control interface panel that the designer will design for the project. With the present control sequence, in the event of shutdown due to smoke detector input the system will remain shutdown until the smoke detector is reset and a separate DDC reset, as described above, is also used. The Fire Alarm Panel (FAP) input takes precedence over any DDC input to force the fan(s) to run.

*** Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control must be proportional-integral (PI) control.

3.2.4.1 HAND-OFF-AUTO Switch

Provide supply fan motor starter to accept a Fire Alarm Panel (FAP) signal that takes precedence over all other starter inputs and switches and starts the fan. Provide fan motor starter which accepts an occupant accessible emergency shutoff switch as indicated. Provide supply fan motor starter with an H-O-A switch:

3.2.4.1.1 HAND

With the H-O-A switch in HAND position, the supply fan starts and runs continuously, subject to Safeties.

3.2.4.1.2 OFF

With the H-O-A switch in OFF position, the supply fan stops.

3.2.4.1.3 AUTO

With the H-O-A switch in AUTO position, the supply fan runs subject to the Supply Fan Start/Stop (SF-SS) command and Safeties.

3.2.4.2 Occupancy Modes

Obtain Occupancy Mode input from the System Scheduler as specified and shown. Operate the system in one of the following modes: Occupied, Unoccupied[, or WarmUp/CoolDown].

3.2.4.3 System Enable and Loop Enable

3.2.4.3.1 Occupied Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS) and enable all
3.2.4.3.2 Unoccupied Mode

While the building temperature (BLDG-T) is above the building low limit setpoint (BLDG-T-LL), disable all control loops and do not run the supply fan. When BLDG-T drops below BLDG-T-LL (with a 3 degrees C 5 degrees F deadband), enable the supply fan (SYS-ENA) and command to run (SF-SS) and enable the Dual Temperature Coil Temperature Control loop. Disable the Minimum Outside Air Flow Control and Economizer Damper Control loops.

3.2.4.3.3 Warm Up / Cool Down Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Disable the Minimum Outside Air Flow Control loop and enable all other control loops.

3.2.4.4 Proofs and Safeties

The supply fan and all DDC Hardware control loops are subject to Proofs and Safeties. Direct-hardwire interlock safeties to the fan starter circuit as shown. Monitor all proofs and safeties, and disable all control loops and command the AHU fan off until reset due to failure of any proof or activation of any safety.

3.2.4.4.1 Proofs

Supply fan status (proof) (SF-S)

3.2.4.4.2 Safeties

a. Dual Temperature coil discharge air temperature low limit (freeze stat) (DT-DA-T-LL)

b. Supply air smoke (SA-SMK)

c. Return air smoke (RA-SMK)

3.2.4.4.3 DDC Hardware

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.2.4.5 Minimum Outside Air Flow Control

When this loop is enabled, open the 2-position minimum outside air damper to introduce the minimum outside air flow quantity as shown. When this loop is disabled, close the minimum outside air damper.

3.2.4.6 Economizer Damper Control

3.2.4.6.1 Enabled Loop

When this loop is enabled, and the Economizer is ON as determined by the Economizer Enable Logic, modulate the economizer outside air, relief, and return air dampers (Economizer dampers) in sequence with the dual temperature coil to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP)
3.2.4.6.2 Disabled Loop

When this loop is disabled, or the Economizer is OFF as determined by the Economizer Enable Logic, close the economizer outside air and relief air dampers, and open the return air damper.

3.2.4.6.3 Economizer Enable Logic

Ensure the economizer is ON when the outside air dry bulb temperature is between the high limit (ECO-HL-SP) and low limit (ECO-LL-SP) setpoints as shown. Otherwise the Economizer is OFF. Ensure ECO-HL-SP and ECO-LL-SP each have a 1 degree C 2 degrees F deadband.

3.2.4.7 Dual Temperature Coil Control

3.2.4.7.1 Enabled Loop

When this loop is enabled, select heating or cooling mode based on a pipe-mounted dual-temperature supply water sensor. A single sensor may be used for multiple instances of this sequence.

3.2.4.7.2 DDC Hardware

Modulate the coil control valve in sequence with the economizer dampers as shown to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP) as shown.

3.2.4.7.3 Disabled Loop

When this loop is disabled, close the control valve.

SECTION 23 09 93 Page 24
5) Indicate the System Scheduler and M&C Software Occupancy Schedule on the Occupancy Schedule drawing. The designer needs to coordinate System Scheduler (occupancy mode determination) with space occupancy sensor input and pushbutton override switch input use. As described in the System Scheduler sequence, 'occupied' inputs from two different spaces are required to help avoid needless turning on of the system (due to cleaning staff or security staff passing through after hours).

6) Absence of fan proof(s) or activation of any safety will result in system shutdown. The system remains shutdown until manually reset devices are reset and a manual reset button (RST-BUT), local to the DDC controller, is pressed. Reset could also be performed from a workstation (via SNVT) or local display panel (LDP). It is recommended that you coordinate the decision with the local O&M staff. Edit the Control Logic Diagram and Points Schedule to indicate which reset method is to be provided by the Contractor.

7) The hardware (product) specification requires that the low limit (freeze stat) device include a manual reset at the device. In the event of shutdown due to freeze stat trip the system will remain shutdown until the device is reset and a separate DDC reset, as described above, is also used.

8) Smoke control is not addressed in this guide specification. Smoke control sequence of operation for each fan system, if beyond the requirements described, will be developed by the designer, based on the requirements and parameters of the project. The designer will account for operation of dampers and fans for pressurization and manual override of interlocks to the fire alarm system. All automatic overrides of normal HVAC control sequences will be activated through the fire protection and smoke control interface panel that the designer will design for the project. With the present control sequence, in the event of shutdown due to smoke detector input the system will remain shutdown until the smoke detector is reset and a separate DDC reset, as described above, is also used. The Fire Alarm Panel (FAP) input takes precedence over any DDC input to force the fan(s) to run.

**************************************************************************
Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control are proportional-integral (PI) control.

3.2.5.1 HAND-OFF-AUTO Switch

Provide supply fan motor starter to accept a Fire Alarm Panel (FAP) signal that takes precedence over all other starter inputs and switches and starts
the fan. Provide fan motor starter which accepts an occupant accessible emergency shutoff switch as indicated. Provide supply fan motor starter with an H-O-A switch:

3.2.5.1.1 HAND

With the H-O-A switch in HAND position, start the supply fan and run continuously, subject to Safeties.

3.2.5.1.2 OFF

With the H-O-A switch in OFF position, stop the supply fan.

3.2.5.1.3 AUTO

With the H-O-A switch in AUTO position, run the supply fan subject to the Supply Fan Start/Stop (SF-SS) command and Safeties.

3.2.5.2 Occupancy Modes

Obtain the Occupancy Mode input from the System Scheduler as specified and shown. Operate the system in one of the following modes: Occupied, Unoccupied[, or WarmUp/CoolDown].

3.2.5.3 System Enable and Loop Enable

3.2.5.3.1 Occupied Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS) and enable all control loops.

3.2.5.3.2 Unoccupied Mode

While the building temperature (BLDG-T) is above the low limit setpoint (BLDG-T-LL) disable all control loops and do not run the supply fan. When BLDG-T drops below BLDG-T-LL (with a 3 degrees C 5 degrees F deadband), enable the supply fan (SYS-ENA) and command to run (SF-SS) and enable the Heating Coil Temperature Control loop. Disable all other control loops.

3.2.5.3.3 Warm Up / Cool Down Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Disable the Minimum Outside Air Flow Control loop and enable all other control loops.

3.2.5.4 Proofs and Safeties

The supply fan and all DDC Hardware control loops are subject to Proofs and Safeties. Direct-hardwire interlock safeties to the fan starter circuit as shown. Monitor all proofs and safeties and disable all control loops and command the AHU fan off until reset due to failure of any proof or activation of any safety.

3.2.5.4.1 Proofs

Supply fan status (proof) (SF-S)

3.2.5.4.2 Safeties

a. Heating coil discharge air temperature low limit (freezestat)
b. Supply air smoke (SA-SMK)
c. Return air smoke (RA-SMK)

3.2.5.4.3 DDC Hardware

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.2.5.5 Minimum Outside Air Flow Control

When this loop is enabled the DDC Hardware, open the 2-position minimum outside air damper to introduce the minimum outside air flow quantity as shown. When this loop is disabled, close the minimum outside air damper.

3.2.5.6 Economizer Damper Control

3.2.5.6.1 Enabled Loop

When this loop is enabled, and the Economizer is ON as determined by the Economizer Enable Logic, modulate the economizer outside air, return air, and relief air dampers (Economizer dampers) in sequence with the bypass and supply dampers and the heating coil control valve as shown to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP) as shown.

3.2.5.6.2 Disabled Loop

When this loop is disabled, or the Economizer is OFF as determined by the Economizer Enable Logic, close the economizer outside air and relief air dampers, and open the return air damper.

3.2.5.6.3 Economizer Enable Logic

Ensure the economizer is ON when the outside air dry bulb temperature is between the high limit (ECO-HL-SP) and low limit (ECO-LL-SP) setpoints as shown. Otherwise the Economizer is OFF. Ensure ECO-HL-SP and ECO-LL-SP each have a 1 degree C 2 degrees F deadband.

3.2.5.7 Temperature Control Loop Heating Coil Control

When this loop is enabled, modulate the heating coil control valve, modulate the economizer dampers if enabled, open and close the 2-position cooling coil valve and modulate the bypass and supply air dampers in sequence to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP) as shown. When this loop is disabled, close both valves and position the bypass and supply air dampers to bypass air.

3.2.6 Single Zone with Humidity Control

**************************************************************************

NOTE:

1) Edit the sequence and drawings as necessary for systems with/without a preheat coil and other project specific control loop requirements.

SECTION 23 09 93 Page 27
2) The inclusion of filter pressure switches should be coordinated with the local O&M staff. Pressure switches may not be desired/needed, particularly if filters are replaced on a regular schedule. Edit the Points Schedule and Control Schematic as required.

3) Indicate the System Scheduler and M&C Software Occupancy Schedule on the Occupancy Schedule drawing. The designer needs to coordinate System Scheduler (occupancy mode determination) with space occupancy sensor input and pushbutton override switch input use. As described in the System Scheduler sequence, 'occupied' inputs from 2 different spaces are required to help avoid needless turning on of the system (due to cleaning staff or security staff passing through after hours).

3) Absence of fan proof(s) or activation of any safety will result in system shutdown. The system remains shutdown until manually reset devices are reset and a manual reset button (RST-BUT), local to the DDC controller, is pressed. Reset could also be performed from a workstation (via SNVT) or local display panel (LDP). It is recommended that you coordinate the decision with the local O&M staff. Edit the Control Logic Diagram and Points Schedule to indicate which reset method is to be provided by the Contractor.

4) The hardware (product) specification requires that the low limit (freezestat) device include a manual reset at the device. In the event of shutdown due to freeze stat trip the system will remain shutdown until the device is reset and a separate DDC reset, as described above, is also used.

5) Smoke control is not addressed in this guide specification. Smoke control sequence of operation for each fan system, if beyond the requirements described, will be developed by the designer, based on the requirements and parameters of the project. The designer will account for operation of dampers and fans for pressurization and manual override of interlocks to the fire alarm system. All automatic overrides of normal HVAC control sequences will be activated through the fire protection and smoke control interface panel that the designer will design for the project. With the present control sequence, in the event of shutdown due to smoke detector input the system will remain shutdown until the smoke detector is reset and a separate DDC reset, as described above, is also used. The Fire Alarm Panel (FAP) input takes precedence over any DDC input to force the fan(s) to run.

**************************************************************************

Install DDC hardware to perform this Sequence of Operation and to provide
SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control are proportional-integral (PI) control.

3.2.6.1 HAND-OFF-AUTO Switch

Provide supply fan motor starter to accept a Fire Alarm Panel (FAP) signal that takes precedence over all other starter inputs and switches and starts the fan. Provide fan motor starter which accepts an occupant accessible emergency shutoff switch as indicated. Provide supply fan motor starter with an H-O-A switch:

3.2.6.1.1 HAND

With the H-O-A switch in HAND position, start the supply fan and run continuously, subject to Safeties.

3.2.6.1.2 OFF

With the H-O-A switch in OFF position, stop the supply fan.

3.2.6.1.3 AUTO

With the H-O-A switch in AUTO position, run the supply fan subject to the Supply Fan Start/Stop (SF-SS) command and Safeties.

3.2.6.2 Occupancy Modes

Obtain Occupancy Mode input from the System Scheduler as specified and shown. Operate the system in one of the following modes: Occupied, Unoccupied[, or WarmUp/CoolDown].

3.2.6.3 System Enable and Loop Enable

3.2.6.3.1 Occupied Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS) and enable all control loops.

3.2.6.3.2 Unoccupied Mode

While the building temperature (BLDG-T) is above the low limit setpoint (BLDG-T-LL), disable all control loops and do not run the supply fan. When BLDG-T drops below BLDG-T-LL (with a 3 degrees C 5 degrees F deadband), enable the supply fan (SYS-ENA) and command to run (SF-SS), enable the Preheat Coil Control loop and Reheat Coil Control loop and disable all other loops.

[3.2.6.3.3 Warm Up / Cool Down Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Disable the Minimum Outside Air Flow Control loop and enable all other control loops.

]3.2.6.4 Proofs and Safeties

The supply fan and all DDC Hardware control loops are subject to Proofs and Safeties. Direct-hardware interlock safeties to the fan starter circuit as shown. Monitor all proofs and safeties and disable all control loops and command the AHU fan off until reset due to failure of any proof or
activation of any safety.

3.2.6.4.1 Proofs

Supply fan status (proof) (SF-S)

3.2.6.4.2 Safeties

a. Preheat coil discharge air temperature low limit (freezestat) (PH-DA-T-LL)
b. Supply air smoke (SA-SMK)
c. Return air smoke (RA-SMK)

3.2.6.4.3 DDC Hardware

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where both reset functions are provided and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.2.6.5 Minimum Outside Air Flow Control

When this loop is enabled, open the 2-position minimum outside air damper to introduce the minimum outside air flow quantity as shown. When this loop is disabled, close the minimum outside air damper.

3.2.6.6 Preheat Coil Control Loop

When this loop is enabled, modulate the preheat coil valve to maintain the preheat coil discharge air temperature (PH-DA-T) at setpoint (PH-DA-T-SP) as shown. When this loop is disabled, close the preheat coil valve.

3.2.6.7 Cooling-and-Dehumidification Coil Control

When this loop is enabled, modulate the cooling and dehumidification valve to maintain either the zone temperature (ZN-T) at setpoint (ZN-T-SP) or zone relative humidity (ZN-RH) at setpoint (ZN-RH-SP), whichever calls for more chilled water flow. Modulate the valve in sequence with the reheat valve and humidification valve as shown to avoid simultaneous cooling and reheating, and simultaneous dehumidification and humidification. When this loop is disabled, close the coil valve.

3.2.6.8 Reheat Coil Control

When this loop is enabled, modulate the reheat coil valve to maintain the zone temperature (ZN-T) at setpoint (ZN-T-SP) as shown. Modulate the valve in sequence with the cooling-and-dehumidification valve as shown to avoid simultaneous cooling and reheating. When this loop is disabled, close the coil valve.

3.2.6.9 Humidification Control

When this loop is enabled, modulate the humidifier valve to maintain zone relative humidity (ZN-RH) at setpoint (ZN-RH-SP). Modulate the valve in sequence with the cooling-and-dehumidification valve as shown to avoid simultaneous dehumidification and humidification. When the supply air duct
humidity (SA-RH) rises above 80 percent relative humidity, begin modulating the humidifier valve towards closed and continue to gradually move towards closed until the supply air duct humidity reaches 90 percent relative humidity, at which point the humidifier valve is fully closed. When this loop is disabled, close the humidifier valve.

3.2.7 Multizone [Dual-Duct] [with][without] Return Fan

**************************************************************************
NOTE:
1) The sequence is identical for a Dual-Duct system. You need only change hot/cold deck to hot/cold duct.

2) Edit the sequence and drawings as necessary for systems with/without a return fan, preheat coil, economizer, and other project specific control loop requirements.

3) Choose whether or not to require setpoint reset of the hot deck temperature setpoint, and whether the reset should be based on Outside Air Temperature or Coldest Zone Temperature. Edit the control schematic drawing to show the reset parameters.

4) Minimum outside air flow control can be accomplished several different ways. Refer to the UFC, but don't use flow measurement in a constant volume system.

5) The inclusion of filter pressure switches should be coordinated with the local O&M staff. Pressure switches may not be desired/needed, particularly if filters are replaced on a regular schedule. Edit the Points Schedule and Control Schematic as required.

6) Indicate the System Scheduler and M&C Software Occupancy Schedule on the Occupancy Schedule drawing. The designer needs to coordinate System Scheduler (occupancy mode determination) with space occupancy sensor input and pushbutton override switch input use. As described in the System Scheduler sequence, 'occupied' inputs from 2 different spaces are required to help avoid needless turning on of the system (due to cleaning staff or security staff passing through after hours).

7) Absence of fan proof(s) or activation of any safety will result in system shutdown. The system remains shutdown until manually reset devices are reset and a manual reset button (RST-BUT), local to the DDC controller, is pressed. Reset could also be performed from a workstation (via SNVT) or local display panel (LDP). It is recommended that you coordinate the decision with the local O&M staff. Edit the Control Logic Diagram and Points Schedule to indicate which reset method is to be provided by the Contractor.
8) The hardware (product) specification requires that the low limit (freeze stat) device include a manual reset at the device. In the event of shutdown due to freeze stat trip the system will remain shutdown until the device is reset and a separate DDC reset, as described above, is also used.

9) Smoke control is not addressed in this guide specification. Smoke control sequence of operation for each fan system, if beyond the requirements described, will be developed by the designer, based on the requirements and parameters of the project. The designer will account for operation of dampers and fans for pressurization and manual override of interlocks to the fire alarm system. All automatic overrides of normal HVAC control sequences will be activated through the fire protection and smoke control interface panel that the designer will design for the project. With the present control sequence, in the event of shutdown due to smoke detector input the system will remain shutdown until the smoke detector is reset and a separate DDC reset, as described above, is also used. The Fire Alarm Panel (FAP) input takes precedence over any DDC input to force the fan(s) to run.

**************************************************************************
Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control are proportional-integral (PI) control.

3.2.7.1 HAND-OFF-AUTO switches and Fire Alarm Panel (FAP) Signal:

Supply Fan VFD. Provide supply fan motor starter to accept a Fire Alarm Panel (FAP) signal that takes precedence over all other starter inputs and switches and starts the fan. Provide fan motor starter which accepts an occupant accessible emergency shutoff switch as shown. Provide supply fan motor starter with an H-O-A switch:

3.2.7.1.1 HAND

With the H-O-A switch in HAND position, the supply fan starts and runs continuously, subject to Safeties.

3.2.7.1.2 OFF

With the H-O-A switch in OFF position, the supply fan stops.

3.2.7.1.3 AUTO

With the H-O-A switch in AUTO position, the supply fan runs subject to the Supply Fan Start/Stop (SF-SS) command and Safeties.

[3.2.7.2 Return Fan VFD]

Incorporate an integral H-O-A switch, manual speed adjustment and also accept a Fire Alarm Panel (FAP) signal. Run the return fan according to
the following inputs (in order of decreasing priority):

a. Use FAP signal to cause the RF to run at 100 percent

b. Connect SF-S (proof) to the RF VFD safety circuit such that if SF is not running, RF is off.

c. Use RF H-O-A switch to select RF mode as follows:
   (1) When switch is in Hand, run fan. Ensure fan speed is under manual control.
   (2) When switch is in Off, fan is off.
   (3) When switch is in Auto, run fan. Ensure fan speed is under control of the DDC Hardware.

3.2.7.3 Occupancy Modes

Obtain Occupancy Mode input from the System Scheduler as specified and shown. Operate the system in one of the following modes: Occupied, Unoccupied[, or WarmUp/CoolDown].

3.2.7.4 System Enable and Loop Enable

3.2.7.4.1 Occupied Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Enable all control loops. Also enable the Zone Temperature Control loops serviced by the AHU.

3.2.7.4.2 Unoccupied Mode

While the building temperature (BLDG-T) is above the low limit setpoint (BLDG-T-LL), disable all control loops and do not run the supply fan. When BLDG-T drops below BLDG-T-LL (with a 3 degrees C 5 degrees F deadband), enable the supply fan (SYS-ENA) and command to run (SF-SS), enable the Hot Deck Coil Control loop and all Zone Temperature Control loops, and disable all other control loops.

3.2.7.4.3 Warm Up / Cool Down Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Disable the Minimum Outside Air Flow Control loop and enable all other control loops. Also enable the Zone Temperature Control loops serviced by the AHU.

3.2.7.5 Proofs and Safeties

The supply fan and all DDC Hardware control loops are subject to Proofs and Safeties. Direct-hardwire interlock safeties to the fan starter circuit as shown. Monitor all proofs and safeties and disable all control loops and command the AHU fan off until reset due to failure of any proof or activation of any safety.

3.2.7.5.1 Proofs

a. Supply fan status (proof) (SF-S)[

b. Return fan status (proof) (RF-S)]
3.2.7.5.2 Safeties

a. Mixed air temperature low limit (freeze stat) (MA-T-LL)

b. Supply air smoke (SA-SMK)

c. Return air smoke (RA-SMK)

3.2.7.5.3 DDC Hardware Reset

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.2.7.6 Minimum Outside Air Flow Control

When this loop is enabled, open the 2-position minimum outside air damper to introduce the minimum outside air follow quantity as shown. When this loop is disabled, close the minimum outside air damper.

3.2.7.7 Mixed Air Temperature Control With Economizer

3.2.7.7.1 Enabled Loop

When this loop is enabled, and the Economizer is ON as determined by the Economizer Enable Logic, modulate the economizer outside air, relief, and return air dampers to maintain the mixed air temperature (MA-T) at setpoint (MA-T-SP) as shown.

3.2.7.7.2 Disabled Loop

When this loop is disabled, or the Economizer is OFF as determined by the Economizer Enable Logic, close the economizer outside air and relief air dampers, and open the return air damper.

3.2.7.7.3 Economizer Enable Logic

Ensure the economizer is ON when the outside air dry bulb temperature is between the high limit (ECO-HL-SP) and low limit (ECO-LL-SP) setpoints as shown. Otherwise the Economizer is OFF. Ensure ECO-HL-SP and ECO-LL-SP each have a 1 degree C 2 degrees F deadband.

3.2.7.8 Hot Deck Coil Control

3.2.7.8.1 Enabled Loop

When this loop is enabled, modulate the hot deck heating coil valve to maintain the hot deck temperature (HD-T) at setpoint (HD-T-SP) as shown. When this loop is disabled, close the hot deck coil valve.

3.2.7.8.2 DDC Hardware Reset

Reset the hot deck temperature setpoint (HD-T-SP) using a linear reset schedule as shown. Base reset of the setpoint (HD-T-SP) on [Outside Air Temperature] [Coldest Zone Temperature].

SECTION 23 09 93 Page 34
3.2.7.9 Cold Deck Coil Control

When this loop is enabled, modulate the cold deck cooling coil valve to maintain the cold deck temperature (CD-T) at setpoint (CD-T-SP) as shown. When this loop is disabled, close the cold deck cooling coil valve.

3.2.7.10 Zone Temperature Control

When this loop is enabled:

3.2.7.10.1 Zone Temperature Setpoint

Ensure zone temperature setpoint (ZN-T-SP) is at the configured setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as shown.

3.2.7.10.2 DDC Hardware Modulation

Modulate the hot deck and cold deck dampers to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP).

3.2.8 Multizone with Hot Deck Bypass [with][without] Return Fan

**************************************************************************

NOTE:

1) NOTE: Edit the sequence and drawings as necessary for systems with/without a return fan, preheat coil, economizer, and other project specific control loop requirements.

2) Minimum outside air flow control can be accomplished several different ways. Refer to the UFC, but don't use flow measurement in a constant volume system.

3) The inclusion of filter pressure switches should be coordinated with the local O&M staff. Pressure switches may not be desired/needed, particularly if filters are replaced on a regular schedule. Edit the Points Schedule and Control Schematic as required.

4) Indicate the System Scheduler and M&C Software Occupancy Schedule on the Occupancy Schedule drawing. The designer needs to coordinate System Scheduler (occupancy mode determination) with space occupancy sensor input and pushbutton override switch input use. As described in the System Scheduler sequence, 'occupied' inputs from 2 different spaces are required to help avoid needless turning on of the system (due to cleaning staff or security staff passing through after hours).

5) Absence of fan proof(s) or activation of any safety will result in system shutdown. The system remains shutdown until manually reset devices are reset and a manual reset button (RST-BUT), local to the DDC controller, is pressed. Reset could also be performed from a workstation (via SNVT) or local...
display panel (LDP). It is recommended that you coordinate the decision with the local O&M staff. Edit the Control Logic Diagram and Points Schedule to indicate which reset method is to be provided by the Contractor.

6) The hardware (product) specification requires that the low limit (freeze stat) device include a manual reset at the device. In the event of shutdown due to freeze stat trip the system will remain shutdown until the device is reset and a separate DDC reset, as described above, is also used.

7) Smoke control is not addressed in this guide specification. Smoke control sequence of operation for each fan system, if beyond the requirements described, will be developed by the designer, based on the requirements and parameters of the project. The designer will account for operation of dampers and fans for pressurization and manual override of interlocks to the fire alarm system. All automatic overrides of normal HVAC control sequences will be activated through the fire protection and smoke control interface panel that the designer will design for the project. With the present control sequence, in the event of shutdown due to smoke detector input the system will remain shutdown until the smoke detector is reset and a separate DDC reset, as described above, is also used. The Fire Alarm Panel (FAP) input takes precedence over any DDC input to force the fan(s) to run.

**************************************************************************
Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and indicated on the Points Schedule. Unless otherwise specified, all modulating control must be proportional-integral (PI) control.

3.2.8.1 HAND-OFF-AUTO Switches

Supply fan motor starter must accept a Fire Alarm Panel (FAP) signal that takes precedence over all other starter inputs and switches and must start the fan. The fan motor starter must accept an occupant accessible emergency shutoff switch as shown. The supply fan motor starter must have an H-O-A switch:

3.2.8.1.1 HAND

With the H-O-A switch in HAND position, start and continuously run the supply fan, subject to Safeties.

3.2.8.1.2 OFF

With the H-O-A switch in OFF position, stop the supply fan.

3.2.8.1.3 AUTO

With the H-O-A switch in AUTO position, run the supply fan subject to the Supply Fan Start/Stop (SF-SS) command and Safeties.
[3.2.8.2 Return Fan Motor Starter

Return fan motor starter must accept a Fire Alarm Panel (FAP) signal that takes precedence over all other starter inputs and switches must start the fan. The return fan motor starter must have an H-O-A switch:

3.2.8.2.1 HAND

With the H-O-A switch in HAND position, run the return fan subject to Safeties.

3.2.8.2.2 OFF

With the H-O-A switch in OFF position, the return fan must be off.

3.2.8.2.3 AUTO

With the H-O-A switch in AUTO position, run the return fan subject to the supply fan running.

]3.2.8.3 Occupancy Modes

Obtain the system’s Occupancy Mode input from the System Scheduler as specified and indicated. Operate the system in one of the following modes: Occupied, Unoccupied[, or WarmUp/CoolDown].

3.2.8.4 System Enable and Loop Enable

3.2.8.4.1 Occupied Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Enable all control loops. Also enable the Zone Temperature Control loops serviced by the AHU.

3.2.8.4.2 Unoccupied Mode

While the building temperature (BLDG-T) is above the low limit setpoint (BLDG-T-LL), disable all control loops and do not run the supply fan. When BLDG-T drops below BLDG-T-LL (with a 3 degrees C 5 degrees F deadband), enable the supply fan (SYS-ENA) and command to run (SF-SS), and enable all Zone Temperature Control loops. Disable the Minimum Outside Air Flow Control, Mixed Air Temperature Control With Economizer, and Cold Deck Coil Control loops.

[3.2.8.4.3 Warm Up / Cool Down Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Disable the Minimum Outside Air Flow Control loop and enable all other control loops. Also enable the Zone Temperature Control loops serviced by the AHU.

]3.2.8.5 Proofs and Safeties

The supply fan[, return fan,] and all DDC Hardware control loops are subject to Proofs and Safeties. Direct-hardwire interlocksafeties to the fan starter circuit as shown. Monitor all proofs and safeties and disable all control loops and command the AHU fan off until reset due to failure of any proof or activation of any safety.
3.2.8.5.1 Proofs
   a. Supply fan status (proof) (SF-S)
   [ b. Return fan status (proof) (RF-S)]

3.2.8.5.2 Safeties
   a. Mixed air temperature low limit (freeze stat) (MA-T-LL)
   b. Supply air smoke (SA-SMK)
   [ c. Return air smoke (RA-SMK)]

3.2.8.5.3 DDC Hardware Reset
   Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.2.8.6 Minimum Outside Air Flow Control
   When this loop is enabled, open the 2-position minimum outside air damper to introduce the minimum outside air follow quantity as shown. When this loop is disabled, close the minimum outside air damper.

3.2.8.7 Mixed Air Temperature Control With Economizer

3.2.8.7.1 Enabled Loop
   When this loop is enabled, and the Economizer is ON as determined by the Economizer Enable Logic, modulate the economizer outside air, relief, and return air dampers to maintain the mixed air temperature (MA-T) at setpoint (MA-T-SP) as shown.

3.2.8.7.2 Disabled Loop
   When this loop is disabled, or the Economizer is OFF as determined by the Economizer Enable Logic, close the economizer outside air and relief air dampers, and open the return air damper.

3.2.8.7.3 Economizer Enable Logic
   Ensure the economizer is ON when the outside air dry bulb temperature is between the high limit (ECO-HL-SP) and low limit (ECO-LL-SP) setpoints as shown. Otherwise the Economizer is OFF. Ensure ECO-HL-SP and ECO-LL-SP each have a 1 degree C 2 degrees F deadband.

3.2.8.8 Cold Deck Coil Control
   When this loop is enabled, modulate the cooling coil valve to maintain the cold deck supply air temperature (SA-T) at setpoint (SA-T-SP) as shown. When this loop is disabled, close the cooling coil valve.

3.2.8.9 Zone Temperature Control
   a. Ensure the zone temperature setpoint (ZN-T-SP) is at the configured
setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as shown.

b. Modulate the zone bypass and cold deck dampers, and the zone heating coil valve to maintain zone temperature (ZN-T) at setpoint (ZN-T-SP). Perform sequencing as shown: Upon a rise in zone temperature above zone temperature setpoint, subject to the zone temperature setpoint deadband as shown, modulate the zone cold deck damper towards open as the bypass deck damper modulates towards closed. Upon a fall in zone temperature below zone temperature setpoint, subject to the deadband as shown, ensure the bypass damper is fully opened and the zone heating valve modulates towards open.

c. For systems with electric resistance heating elements, require proof of air flow before activating the heating elements.

3.2.9 Variable Air Volume System [with][without] Return Fan

**************************************************************************
NOTE:
1) Edit the sequence and drawings as necessary for systems with/without a return fan, preheat coil, economizer, and other project specific control loop requirements.

2) Minimum outside air flow control can be accomplished several different ways. Refer to the UFC.

3) The inclusion of filter pressure switches should be coordinated with the local O&M staff. Pressure switches may not be desired/needed, particularly if filters are replaced on a regular schedule. Edit the Points Schedule and Control Schematic as required.

4) This spec does not include a variable frequency drive (VFD) specification. Specify a VFD that meets the requirements of the control sequence including the integral H-O-A and a safety shutdown input circuit that is separate from the start/stop input circuit and Fire Alarm Panel (FAP) override switch.

5) Indicate the System Scheduler and M&C Software Occupancy Schedule on the Occupancy Schedule drawing. The designer needs to coordinate System Scheduler (occupancy mode determination) with space occupancy sensor input and pushbutton override switch input use. As described in the System Scheduler sequence, 'occupied' inputs from 2 different spaces are required to help avoid needless turning on of the system (due to cleaning staff or security staff passing through after hours).

6) Absence of fan proof(s) or activation of any safety will result in system shutdown. The system remains shutdown until manually reset devices are reset and a manual reset button (RST-BUT), local to the DDC controller, is pressed. Reset could also be
performed from a workstation (via SNVT) or local display panel (LDP). It is recommended that you coordinate the decision with the local O&M staff. Edit the Control Logic Diagram and Points Schedule to indicate which reset method is to be provided by the Contractor.

7) The hardware (product) specification requires that the low limit (freezestat) device include a manual reset at the device. In the event of shutdown due to freeze stat trip the system will remain shutdown until the device is reset and a separate DDC reset, as described above, is also used.

8) Smoke control is not addressed in this guide specification. Smoke control sequence of operation for each fan system, if beyond the requirements described, will be developed by the designer based on the requirements and parameters of the project. The designer will account for operation of dampers and fans for pressurization and manual override of interlocks to the fire alarm system. All automatic overrides of normal HVAC control sequences will be activated through the fire protection and smoke control interface panel that the designer will design for the project. With the present control sequence, in the event of shutdown due to smoke detector input the system will remain shutdown until the smoke detector is reset and a separate DDC reset, as described above, is also used. The Fire Alarm Panel (FAP) input takes precedence over any DDC input to force the fan(s) to run.

**************************************************************************
Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.2.9.1 HAND-OFF-AUTO Switches

Provide supply fan variable frequency drive (VFD) unit to accept a Fire Alarm Panel (FAP) signal that takes precedence over all other VFD inputs and switches and causes the VFD to run at 100 percent speed. Provide VFD that accepts an occupant accessible emergency shutoff switch as shown. Provide supply fan variable frequency drive (VFD) unit with an integral H-O-A switch:

3.2.9.1.1 HAND

With the H-O-A switch in HAND position, start the supply fan and run continuously, subject to Safeties. Ensure fan speed is under manual-operator control.

3.2.9.1.2 OFF

With the H-O-A switch in OFF position, stop the supply fan.
3.2.9.1.3 AUTO

With the H-O-A switch in AUTO position, run the supply fan subject to the Supply Fan Start/Stop Signal (SF-SS) and Safeties. Ensure fan speed is under control of the DDC Hardware.

3.2.9.2 Return Fan Variable Frequency Drive

Provide return fan variable frequency drive (VFD) unit that accepts a Fire Alarm Panel (FAP) signal that takes precedence over all other VFD inputs and switches and causes the VFD to run at 100 percent speed. Provide return fan variable frequency drive (VFD) unit with an integral H-O-A switch:

3.2.9.2.1 HAND

With the H-O-A switch in HAND position, run the return fan subject to Safeties. Ensure fan speed is under manual-operator control.

3.2.9.2.2 OFF

With the H-O-A switch in OFF position, the return fan is off.

3.2.9.2.3 AUTO

With the H-O-A switch in AUTO position, run the return fan subject to the supply fan running. Ensure fan speed is under control of the DDC Hardware.

3.2.9.3 Occupancy Modes

Obtain Occupancy Mode input from the System Scheduler as specified and shown. Operate the system in one of the following modes: Occupied, Unoccupied[, or Warm Up/Cool Down].

3.2.9.4 Proofs and Safeties

The supply fan[, return fan,] and all DDC Hardware control loops are subject to Proofs and Safeties. Direct-hardwire interlock safeties to the VFD as shown. Monitor all proofs and safeties and disable all control loops and command the AHU fan off until reset due to failure of any proof or activation of any safety.

3.2.9.4.1 Proofs

a. Supply fan status (SF-S)

b. Return fan status (RF-S)

3.2.9.4.2 Safeties

a. Preheat coil discharge air temperature low limit (freezestat) (PH-DA-T-LL) for systems with a preheat coil. Cooling coil discharge air temperature low limit (freezestat) (CLG-DA-T-LL) for all other systems

b. Supply air duct pressure high limit (SA-P-HL)

c. Supply air smoke (SA-SMK)
d. Return air smoke (RA-SMK)

3.2.9.4.3 DDC Hardware Reset

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.2.9.5 System Enable and Loop Enable

3.2.9.5.1 Occupied Mode

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Enable all control loops.

3.2.9.5.2 Unoccupied Mode

While the building temperature (BLDG-T) is above the low limit setpoint (BLDG-T-LL) disable all control loops and do not run the supply fan. When BLDG-T drops below BLDG-T-LL (with a 3 degrees C 5 degrees F deadband), enable the supply fan (SYS-ENA) and command to run (SF-SS), enable the Supply Duct Static Pressure Control[, Return Fan Volume Control][, Preheat Control] loops. Disable the Minimum Outside Air Flow Control, Mixed Air Temperature Control, and Cooling Coil Control loops.

3.2.9.5.3 Warm Up/Cool Down

Enable the supply fan (SYS-ENA) and command to run (SF-SS). Disable the Minimum Outside Air Flow Control loop and enable all other control loops.

3.2.9.6 Fan Capacity Control

3.2.9.6.1 Supply Duct Static Pressure Control

When this loop is enabled, modulate the supply fan variable frequency drive unit to maintain the duct static pressure (SA-P) at setpoint (SA-P-SP) as shown, as measured by the duct static pressure tap and sensor as shown. When this loop is disabled, ensure the DDC Hardware capacity modulation output to the VFD is zero percent.

3.2.9.6.2 Return Fan Volume Control

When this loop is enabled, modulate the return fan variable frequency drive unit to maintain a constant volumetric airflow difference at setpoint (F-DIFF-SP) as shown, as measured by the airflow measurement arrays located in the supply and return ducts as shown. When this loop is disabled, ensure the output to the VFD is zero percent.

3.2.9.7 Minimum Outside Air Flow Control

When this loop is enabled, modulate the minimum outside air damper to maintain the minimum OA volumetric flow (MINOA-F) at setpoint (MINOA-F-SP) as shown. When this loop is disabled, close the minimum outside air damper.
3.2.9.8  Mixed Air Temperature Control With Economizer

3.2.9.8.1  Enabled Loop

When this loop is enabled, and the Economizer is ON as determined by the Economizer Enable Logic, modulate the economizer outside air, relief, and return air dampers to maintain the mixed air temperature (MA-T) at setpoint (MA-T-SP) as shown.

3.2.9.8.2  Disabled Loop

When this loop is disabled, or the Economizer is OFF as determined by the Economizer Enable Logic, close the economizer outside air and relief air dampers, and open the return air damper.

3.2.9.8.3  Economizer Enable Logic

Ensure the economizer is ON when the outside air dry bulb temperature is between the high limit (ECO-HL-SP) and low limit (ECO-LL-SP) setpoints as shown. Otherwise the Economizer is OFF. Ensure ECO-HL-SP and ECO-LL-SP each have a 1 degree C 2 degrees F deadband.

3.2.9.9  Cooling Coil Control

When this loop is enabled, modulate the cooling coil valve to maintain the supply air temperature (SA-T) setpoint (SA-T-SP) as shown. When this loop is disabled, close the cooling coil valve.

3.2.9.10  Preheat Coil Control

When this loop is enabled, modulate the preheat coil valve to maintain the preheat coil discharge air temperature (PH-DA-T) at setpoint (PH-DA-T-SP) as shown. When this loop is disabled, close the preheat coil valve.

3.3  SEQUENCES OF OPERATION FOR TERMINAL UNITS

**************************************************************************

NOTE:  For the VAV Box Sequences:
1) Show the occupancy schedule (days/times) on the Occupancy Schedule drawing. For simplicity, it is recommended that all boxes, served by a common air handler, operate on the same schedule.

2) Space occupancy input(s) may consist of an occupancy sensor and/or a local push-button. Indicate the use of a sensor and/or push-button by placing an 'X' in the 'Thermostat and Occupancy Sensor Schedule'. If a push-button is used, show the override time duration in the Schedule. Note that the occupancy sensor specification requires a delay that is adjustable between 30 seconds and 15 minutes. If a delay outside of this range is needed edit the Occupancy Sensor Product specification in PART 2

3) For each VAV box thermostat, indicate if the zone temperature setpoint will be occupant adjustable by placing an 'X' in the 'Thermostat and Occupancy Sensor Schedule'. For non-occupant-adjustable
setpoints, show the setpoint in the Points Schedule. The intent is that the Contractor provides one or the other as shown. Non-occupant-adjustable setpoints are adjustable by a system operator using a local display panel (LDP) or operator workstation (and appropriate software).

3.3.1 Zone Temperature Control - Cooling-Only VAV Box

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.3.1.1 Occupancy Modes

3.3.1.1.1 Occupied

Ensure the VAV box DDC Hardware is in the Occupied Mode when the local space occupancy input(s) (ZN-OCC) indicate that the space is occupied or when the input from the System Scheduler (SYS-OCC) is occupied.

3.3.1.1.2 Unoccupied

The VAV box DDC Hardware must be in the Unoccupied Mode when the local space occupancy input(s) (ZN-OCC) indicate that the space is unoccupied and the input from the System Scheduler (SYS-OCC) is unoccupied.

Safeties

This system has no safeties.

3.3.1.2 Zone Temperature Control

3.3.1.2.1 Occupied Mode

In the Occupied Mode the zone temperature setpoint (ZN-T-SP) must be at the configured setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as shown. The DDC Hardware must modulate the VAV box damper to maintain VAV box supply air flow (VAV-SA-F) at setpoint as measured by a multi-point flow sensing element at the inlet to the VAV box. Sequencen as indicated: Upon a rise in zone temperature (ZN-T) above zone setpoint (ZN-T-SP), subject to the zone temperature setpoint deadband as indicated, adjust the airflow setpoint between minimum and maximum flow based on the difference between zone temperature and zone temperature setpoint as indicated.

3.3.1.2.2 Unoccupied Mode

In the Unoccupied Mode, ensure the VAV box damper is at its minimum position.

3.3.2 Zone Temperature Control - VAV Box with Reheat

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.
3.3.2.1 Occupancy Modes

3.3.2.1.1 Occupied

Ensure the VAV box DDC Hardware is in the Occupied Mode when the local space occupancy input(s) (ZN-OCC) indicate that the space is occupied or when the input from the System Scheduler (SYS-OCC) is occupied.

3.3.2.1.2 Unoccupied

Ensure the VAV box DDC Hardware is in the Unoccupied Mode when the local space occupancy input(s) (ZN-OCC) indicate that the space is unoccupied and the input from the System Scheduler (SYS-OCC) is unoccupied.

3.3.2.2 Safeties

For VAV boxes with electric resistance heating elements, require proof of air flow before activating the heating elements.

3.3.2.3 Zone Temperature Control

a. In the Occupied Mode, ensure the zone temperature setpoint (ZN-T-SP) is at the configured setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as shown.

b. In the Unoccupied Mode, ensure the zone temperature setpoint (ZN-T-SP) is at the configured setpoint as shown.

c. Modulate the VAV box damper to maintain VAV box supply air flow (VAV-SA-F) at setpoint as measured by a multi-point flow sensing element at the inlet to the VAV box. Perform sequencing as shown: Upon a rise in zone temperature above zone temperature setpoint (ZN-T-SP), subject to the zone temperature setpoint deadband as shown, adjust the airflow setpoint between minimum and maximum flow based on the difference between zone temperature and zone temperature setpoint as shown. Upon a fall in zone temperature below zone temperature setpoint, subject to the deadband as shown, maintain the airflow at a fixed air flow setpoint (with a setting independent of the cooling minimum air flow), and modulate the heating valve towards open or cycle the staged electric resistance heating coil(s) on in sequence.

3.3.3 Zone Temperature Control - Fan Powered VAV Box

**************************************************************************
NOTE: This sequence is applicable to both Series and Parallel fan powered VAV boxes.

As specified in Section 23 30 00 HVAC AIR DISTRIBUTION, fans located in series fan-powered VAV boxes must start whenever the AHU fan that serves these boxes is started.

Select appropriate fan control text for series or parallel application. Note that since an unoccupied AHU cannot run except to provide heating, unoccupied zone temperature setpoint deadband should be large enough to prevent an unoccupied VAV from attempting to provide cooling.
Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.3.3.1 Occupancy Modes

3.3.3.1.1 Occupied

Ensure the VAV box DDC Hardware is in the Occupied Mode when the local space occupancy input(s) (ZN-OCC) indicate that the space is occupied or when the input from the System Scheduler (SYS-OCC) is occupied.

3.3.3.1.2 Unoccupied

Ensure the VAV box DDC Hardware is in the Unoccupied Mode when the local space occupancy input(s) (ZN-OCC) indicate that the space is unoccupied and the input from the System Scheduler (SYS-OCC) is unoccupied.

3.3.3.2 Safeties

For VAV boxes with electric resistance heating elements, require proof of air flow before activating the heating elements.

3.3.3.3 Fan Control

[Run series fans whenever the box is occupied or the Zone Temperature Control loop determines that the box is in heating mode. Prior to starting the fan, close the supply damper.Pause the controller after closing the damper before starting the fan to ensure that the fan is not spinning due to supply air delivered by the AHU. After the fan starts, control the supply damper by the Zone Temperature Control loop.][Run parallel fans whenever the Zone Temperature Control loop determines that the box is in heating mode.]

3.3.3.4 Zone Temperature Control

3.3.3.4.1 Occupied Mode

In the Occupied Mode, ensure the zone temperature setpoint (ZN-T-SP) is at the configured setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as shown.

3.3.3.4.2 Unoccupied Mode

In the Unoccupied Mode, ensure the zone temperature setpoint (ZN-T-SP) is at the configured setpoint as shown.

3.3.3.4.3 Sequencing

3.3.3.4.3.1 Cooling Mode

Upon a rise in zone temperature above zone temperature setpoint (ZN-T-SP), subject to the zone temperature setpoint deadband as shown, adjust the airflow setpoint between minimum and maximum based on the difference between zone temperature and zone temperature setpoint as shown. Modulate the VAV box damper to mix supply and plenum return air as it maintains VAV
box supply airflow (VAV-SA-F) at setpoint as measured by a multi-point flow sensing element at the inlet to the VAV box.

3.3.3.4.3.2 Heating Mode

Upon a fall in zone temperature below zone temperature setpoint, subject to the deadband as shown, the DDC Hardware must first turn on the parallel fan and then modulate the VAV box damper to mix supply and plenum return air to maintain a fixed air flow setpoint (with a setting independent of the cooling minimum air flow), and modulate the heating valve towards open or cycle the staged electric resistance heating coil(s) on in sequence.

3.3.4 Perimeter Radiation Control Sequence

**************************************************************************
NOTE:
1) Show the occupancy schedule (days/times) on the Occupancy Schedule drawing. For simplicity, it is recommended that all units operate on the same schedule.

2) Space occupancy input(s) may consist of an occupancy sensor and/or a local push-button. Indicate the use of a sensor and/or push-button by placing an 'X' in the Thermostat Schedule. If a push-button is used, show the override time duration in the Schedule. Note that the occupancy sensor specification requires a delay that is adjustable between 30 seconds and 15 minutes. If a delay outside of this range is needed edit the Occupancy Sensor Product specification in PART 2
**************************************************************************

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.3.4.1 Occupancy Modes

3.3.4.1.1 Occupied

Ensure the radiator DDC Hardware is in the Occupied Mode when the local space occupancy input(s) indicate that the space is occupied or when the input from the System Scheduler is occupied.

3.3.4.1.2 Unoccupied

Ensure the radiator DDC Hardware is in the Unoccupied Mode when the local space occupancy input(s) indicate that the space is unoccupied and when the input from the System Scheduler is unoccupied.

3.3.4.2 Safeties

This system has no safeties.
3.3.4.3  Space Temperature Control

3.3.4.3.1  Occupied Mode

In the Occupied Mode, modulate the heating control valve to maintain space temperature at the configured setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as shown.

3.3.4.3.2  Unoccupied Mode

In the Unoccupied Mode, modulate the heating control valve to maintain space temperature at the configured setpoint as shown.

3.3.5  Unit Heater and Cabinet Unit Heater

******************************************************************************

NOTE:
1) Show the occupancy schedule (days/times) on the Occupancy Schedule drawing. For simplicity, it is recommended that all units operate on the same schedule.

2) Space occupancy input(s) may consist of an occupancy sensor and/or a local push-button. Indicate the use of a sensor and/or push-button by placing an 'X' in the Thermostat Schedule. If a push-button is used, show the override time duration in the Schedule. Note that the occupancy sensor specification requires a delay that is adjustable between 30 seconds and 15 minute. If a delay outside of this range is needed edit the Occupancy Sensor Product specification in PART 2

******************************************************************************

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.3.5.1  Off-Auto Switch

3.3.5.1.1  OFF

With the thermostat OFF-AUTO switch in the OFF position, stop the fan and close the heating control valve.

3.3.5.1.2  AUTO

With the thermostat OFF-AUTO switch in the AUTO position, control the unit in accordance with its Occupancy Mode.

3.3.5.2  Occupancy Modes

3.3.5.2.1  Occupied

Ensure the unit heater DDC Hardware is in the Occupied Mode when the local space occupancy input(s) indicate that the space is occupied or when the input from the System Scheduler is occupied.
3.3.5.2.2 Unoccupied

Ensure the unit heater DDC Hardware is in the Unoccupied Mode when the local space occupancy input(s) indicate that the space is unoccupied and when the input from the System Scheduler is unoccupied.

3.3.5.3 Safeties

Run the unit subject to the unit manufacturer's safeties.

3.3.5.4 Space Temperature Control

3.3.5.4.1 Occupied Mode

In the Occupied Mode, modulate the heating control valve and cycle the multi-speed fan to maintain space temperature at the configured setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as shown.

3.3.5.4.2 Unoccupied Mode

In the Unoccupied Mode, modulate the heating control valve and cycle the multi-speed fan to maintain space temperature at the configured setpoint as shown.

3.3.6 Gas-Fired Infrared Heater

**************************************************************************
NOTE:
1) Use of a System Scheduler is likely not needed in this application. If it is, edit the sequence and the drawings.

2) Space occupancy input(s) may consist of an occupancy sensor and/or a local push-button. Indicate the use of a sensor and/or push-button by placing an 'X' in the Thermostat Schedule. If a push-button is used, show the override time duration in the Schedule. Note that the occupancy sensor specification requires a delay that is adjustable between 30 seconds and 15 minute. If a delay outside of this range is needed edit the Occupancy Sensor Product specification in PART 2
**************************************************************************

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.3.6.1 On-Off-Auto Switch

3.3.6.1.1 ON

With the thermostat ON-OFF-AUTO switch in the ON position, energize the heater and run the heater continuously.
3.3.6.1.2  OFF

With the thermostat ON-OFF-AUTO switch in the OFF position, de-energize the heater.

3.3.6.1.3  AUTO

With the thermostat ON-OFF-AUTO switch in the AUTO position, control the heater in accordance with its Occupancy Mode.

3.3.6.2  Occupancy Modes

3.3.6.2.1  Occupied

Ensure the unit DDC Hardware is in the Occupied Mode when the local space occupancy input(s) indicate that the space is occupied.

3.3.6.2.2  Unoccupied

Ensure the unit DDC Hardware is in the Unoccupied Mode when the local space occupancy input(s) indicate that the space is unoccupied.

3.3.6.3  Safeties

Run the heater subject to the unit manufacturer's safeties.

3.3.6.4  Space Temperature Control

3.3.6.4.1  Occupied Mode

In the Occupied Mode, operate the heater to maintain space temperature at the configured setpoint or at the occupant-adjustable setpoint via the wall-mounted thermostat, as indicated.

3.3.6.4.2  Unoccupied Mode

In the Unoccupied Mode, operate the heater to maintain space setpoint at the configured unoccupied setpoint as indicated.

3.3.7  Dual Temperature Fan-Coil Unit

**************************************************************************
NOTE:
1) Show the occupancy schedule (days/times) on the Occupancy Schedule drawing. For simplicity, it is recommended that all units operate on the same schedule.

2) Space occupancy input(s) may consist of an occupancy sensor and/or a local push-button. Indicate the use of a sensor and/or push-button by placing an 'X' in the Thermostat Schedule. If a push-button is used, show the override time duration in the Schedule. Note that the occupancy sensor specification requires a delay that is adjustable between 30 seconds and 15 minute. If a delay outside of this range is needed edit the Occupancy Sensor Product specification in PART 2

SECTION 23 09 93 Page 50
3) Show 2-way and 3-way valve selections on the Valve Schedule.

4) Fan coil units typically have unit-mounted thermostats. Indicate if wall mounting is desired and/or show in the Thermostat Schedule for the individual fan coil units.

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.3.7.1 Off-Auto Switch

3.3.7.1.1 OFF

With the thermostat OFF-AUTO switch in the OFF position, stop the fan and close the dual-temperature control valve.

3.3.7.1.2 AUTO

With the thermostat OFF-AUTO switch in the AUTO position, control the unit in accordance with its Occupancy Mode.

3.3.7.2 Occupancy Modes

3.3.7.2.1 Occupied

Ensure the unit DDC Hardware is in the Occupied Mode when the local space occupancy input(s) indicate that the space is occupied or when the input from the System Scheduler is occupied.

3.3.7.2.2 Unoccupied

Ensure the unit DDC Hardware is in the Unoccupied Mode when the local space occupancy input(s) indicate that the space is unoccupied and when the input from the System Scheduler is unoccupied.

3.3.7.3 Heat/Cool Modes

Automatically switch the fan coil unit DDC Hardware between the heating and cooling modes and the resultant control action, based on a pipe-mounted dual-temperature supply water temperature sensor.

3.3.7.4 Safeties

Run the unit subject to the unit manufacturer's safeties.

3.3.7.5 Space Temperature Control

3.3.7.5.1 Occupied Mode

In the Occupied Mode, modulate the dual-temperature control valve and modulate the multi-speed fan to maintain space temperature at the configured setpoint or at the occupant-adjustable setpoint via the [wall-mounted] thermostat, as indicated.
3.3.7.5.2 Unoccupied Mode

In the Unoccupied Mode, modulate the dual-temperature control valve and modulate the multi-speed fan to maintain space temperature at the configured setpoint as indicated.

3.4 SEQUENCES OF OPERATION FOR HYDRONIC SYSTEMS

3.4.1 Hydronic Heating Hot Water from Distributed [Steam][HTHW] Converter

**************************************************************************

NOTE:
1) Select Steam or High Temperature Hot Water as required.

2) The designer may want to consider other conditions under which this system is enabled, such as outside air temperature.
**************************************************************************

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control must be proportional-integral (PI) control.

3.4.1.1 System Enable and Loop Enable

a. Monitor the enabled status of all systems served by this system. [If one][two][__] or more systems served by this system are enabled, enable this system (SYS-ENA), otherwise disable this system][__].

b. When this system is enabled (SYS-ENA) command the hot water pump on via the Hot Water Pump Start/Stop (HW-PMP-SS) command.

c. When this system is enabled (SYS-ENA) and the hot water pump is proofed on, enable the Heat Exchanger Control loop.

3.4.1.2 HAND-OFF-AUTO Switch

Provide hot water pump motor starter with an H-O-A switch:

3.4.1.2.1 HAND

With the H-O-A switch in HAND position, the pump starts and runs continuously.

3.4.1.2.2 OFF

With the H-O-A switch in OFF position, the pump stops.

3.4.1.2.3 AUTO

With the H-O-A switch in AUTO position, the pump runs subject to the Hot Water Pump Start/Stop (HW-PMP-SS) command.

3.4.1.3 Proofs and Safeties

DDC Hardware must monitor all proofs and safeties.
3.4.1.3.1 Proofs

Hot water pump status (HW-PMP-S)

3.4.1.3.2 Safeties

None

3.4.1.3.3 DDC Hardware Reset

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as indicated on the Points Schedule drawing.

3.4.1.4 Heat Exchanger Valve Control

**************************************************************************
NOTE: If a reset schedule is not required delete this option ([determined from a linear reset schedule]) from the sequence along with the reset schedule in the drawing. Where reset is used, edit the temperatures shown in the reset schedule on the drawing.
**************************************************************************

When this loop is enabled modulate the [steam][high temperature hot water] valve to maintain the Hot Water Supply Temperature (HWS-T) at setpoint (HWS-T-SP). The Hot Water Supply Temperature Setpoint (HW-T-SP) must be [determined from a linear reset schedule] as shown. When this loop is disabled, close the valve.

3.4.2 Hydronic Heating Hot Water From Single-Building Boiler

**************************************************************************
NOTE: The designer may want to consider other conditions under which this system is enabled, such as outside air temperature.
**************************************************************************

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.4.2.1 System Enable and Loop Enable

a. Monitor the enabled status of all systems served by this system. If one or more systems served by this system are enabled, enable this system (SYS-ENA). If no systems served by this system are enabled, disable this system.

b. When this system is enabled (SYS-ENA) and the hot water pump is proofed on, enable the boiler control and hot water temperature control loops.

3.4.2.2 HAND-OFF-AUTO Switch

Provide hot water pump motor starter with an H-O-A switch:
3.4.2.2.1 HAND

With the H-O-A switch in HAND position, start the pump and run continuously.

3.4.2.2.2 OFF

With the H-O-A switch in OFF position, stop the pump.

3.4.2.2.3 AUTO

With the H-O-A switch in AUTO position, run the pump subject to the Hot Water Pump Start/Stop (HW-PMP-SS) command.

3.4.2.3 Proofs and Safeties

DDC Hardware must monitor all proofs and safeties.

3.4.2.3.1 Proofs

Hot water pump

3.4.2.3.2 Safeties

None

3.4.2.3.3 DDC Hardware Reset

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.4.2.4 Boiler Control

When this loop is enabled, turn the boiler on. When this loop is disabled, the boiler is turned off.

3.4.2.5 Hot Water Temperature Control

When this loop is enabled modulate the 3-way mixing valve to maintain hot water supply temperature (HWS-T) at setpoint (HWS-T-SP). The Hot Water Supply Temperature Setpoint (HWS-T-SP) must be [determined from a linear reset schedule] as shown. When this loop is disabled, the valve is in its normal (failsafe) position.

3.4.3 Hydronic Dual-Temperature System with [Steam][High Temperature Hot Water] Heat Exchanger and Chilled Water

**************************************************************************
NOTE:
1) Select Steam or High Temperature Hot Water as required.

3) The designer may want to consider other conditions under which this system is enabled, such as outside air temperature.
Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral (PI) control.

3.4.3.1 System Enable and Loop Enable

a. Monitor the enabled status of all systems served by this system. If one or more systems served by this system are enabled, enable this system (SYS-ENA). If all systems served by this system are not enabled, do not enable this system.

b. When the system is enabled (SYS-ENA), run the pump.

c. When this system is enabled (SYS-ENA), and the HEATING/COOLING switch is in HEATING the Heat Exchanger Control loop is enabled.

3.4.3.2 Switchover Valve Operation

Monitor the status of the DTWR-T-LL and DTWR-T-HL switches.

3.4.3.2.1 HEATING/COOLING Switch in the HEATING Position

With the HEATING/COOLING switch in the HEATING position, the switchover valve must open the heat-cool system piping to the heat exchanger and close the heat-cool system piping to the [central plant chilled water][single-building chiller].

3.4.3.2.2 HEATING/COOLING Switch in the COOLING Position

With the HEATING/COOLING switch in the COOLING position, the switchover valve must open the heat-cool system piping to the [central plant chilled water][single-building chiller] and close the heat-cool system piping to the heat exchanger whenever the dual-temperature return water temperature (DTWR-T) is below the dual-temperature return water high-limit temperature (DTWR-T-HL).

3.4.3.3 HAND-OFF-AUTO Switch

Provide Dual-Temperature water pump motor starter with an H-O-A switch:

3.4.3.3.1 HAND

With the H-O-A switch in HAND position, the pump starts and runs.
3.4.3.3.2 OFF

With the H-O-A switch in OFF position, the pump stops.

3.4.3.3 AUTO

With the H-O-A switch in AUTO position, the pump runs subject to the Dual-Temperature Water Pump Start/Stop (DTW-PMP-SS) System Enable (SYS-ENA) command.

3.4.3.4 Proofs and Safeties

DDC Hardware must monitor all proofs and safeties.

3.4.3.4.1 Proofs

None

3.4.3.4.2 Safeties

Direct-hardwire interlock heat exchanger differential pressure switch (HX-P-LL) to the [steam][high temperature hot water] valve.

3.4.3.4.3 DDC Hardware Reset

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.4.3.5 [Heat Exchanger][Mixing] Valve Control

When this loop is enabled modulate the [steam][high temperature hot water] valve to maintain the Hot Water Supply Temperature (HWS-T) at setpoint (HWS-T-SP). The Hot Water Supply Temperature Setpoint (HWS-T-SP) must be [determined from a linear reset schedule] as shown. The DDC Hardware must monitor the status of the HX-P-LL safety. When this loop is disabled, close the valve.

3.4.4 Hydronic Secondary with Variable Speed Pump

******************************************************************************
NOTE:
1) This spec does not include a variable frequency drive (VFD) specification. Specify a VFD that meets the requirements of the control sequence including the integral H-O-A.

2) The designer may want to consider other conditions under which this system is enabled, such as outside air temperature.
******************************************************************************

Install DDC hardware to perform this Sequence of Operation and to provide SNVT inputs and outputs as specified and shown on the Points Schedule. Unless otherwise specified, all modulating control is proportional-integral
3.4.4.1 System Enable and Loop Enable:

a. Monitor the enabled status of all systems served by this system. If one or more systems served by this system are enabled, enable this system (SYS-ENA). If all systems served by this system are not enabled, do not enable this system.

b. When this system is enabled (SYS-ENA) the Pressure Control loop must be enabled.

3.4.4.2 HAND-OFF-AUTO Switch

Provide hot water pump variable frequency drive (VFD) unit with an integral H-O-A switch:

3.4.4.2.1 HAND

With the H-O-A switch in HAND position, the pump starts and runs continuously. Ensure pump speed is under manual-operator control.

3.4.4.2.2 OFF

With the H-O-A switch in OFF position, the pump stops.

3.4.4.2.3 AUTO

With the H-O-A switch in AUTO position, run the pump subject to the Hot Water Pump Start/Stop (HW-PMP-SS) command and ensure pump speed is under control of the DDC system.

3.4.4.3 Proofs and Safeties

DDC Hardware must monitor all proofs and safeties.

3.4.4.3.1 Proofs

None

3.4.4.3.2 Safeties

None

3.4.4.3.3 DDC Hardware Reset

Reset all proofs and safeties via a local binary push-button (RST-BUT) input to the DDC Hardware, via a remote command to the DDC Hardware via SNVT or both (where the Contractor provides both reset functions and the operator can use either one to perform the reset), as shown on the Points Schedule drawing.

3.4.4.4 Pressure Control

When this loop is enabled modulate the pump variable frequency drive unit to maintain the pipe system pressure at setpoint as shown, as measured by the differential pressure tap and sensor as shown. When this loop is disabled, ensure the DDC Hardware capacity modulation output to the VFD is zero percent.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for low pressure facility gas piping systems conforming to NFPA 54 NFPA 58 for non-industrial uses.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification is intended for use when specifying the following facility gas distribution systems:

- low pressure natural gas systems, 34 kPa 5 psi maximum, except for gas-air mixtures within the flammable range are limited to 69 kPa 10 psi maximum,

- low pressure undiluted LPG systems, 140 kPa 20psi maximum,

- aboveground steel piping both outside (up to 1.50 meters 5 feet beyond exterior walls) and within
buildings in compliance with [NFPA 54/ANSI Z223.1], "National Fuel Gas Code" and [NFPA 58], "Liquefied Petroleum Gas Code",

thermoplastic gas pressure pipe, tubing, and fittings,

aluminum and aluminum-alloy drawn seamless tubes,

reinforced epoxy resin gas pressure pipe and fittings,

for non-industrial uses.

Use Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES for external utility (beyond 1.50 meters 5 feet from exterior walls) [natural gas distribution] [liquid petroleum gas (LPG)] (includes tailoring for LPG systems).

Use Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES contains tailoring for utility metering systems. (The Energy Independence and Security Act (EISA 2007) requires equivalent metering of natural gas and steam in accordance with the guidelines established under the act prior to October 1, 2016.)

Define the gas meter, service regulator, and service line pipe, fittings, and appurtenances in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES when that specification is included in the project. Otherwise, use the definition of these components in this specification.

The gas meter, service regulator, and service line pipe, fittings, and appurtenances must meet the requirements of 49 CFR 192.

As a minimum, show the following information on the project drawings:

1. Layout and location of piping,
2. Location of appurtenances, valves, etc,
3. Details of method of mounting piping,
4. Capacity of pressure regulators

5. Meter location and emergency shut-offs.

**************************************************************************

1.1 SUMMARY

This specification section applies to gas piping installed within buildings incidental underground piping under building, above ground steel piping and
corrugated stainless steel tubing (CSST) both outside (up to 1.50 meters 5 feet beyond exterior walls) and within buildings in compliance with NFPA 54/AGA Z223.1, "National Fuel Gas Code" NFPA 58, "Fuel Gas Piping".

1.2 REFERENCES

**********************************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SYSTEM DESCRIPTION

The gas piping system includes [natural gas] [and] [liquid petroleum] piping and appurtenances from point of connection with supply system, as indicated, to gas operated equipment within the facility. Submit operation
and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA, in three separate packages. Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section, with additions and modifications specified herein. [Provide cathodically protected insulating joints connecting aboveground piping from the meter to the building, with [lightning arrestors] [zinc grounding cells] conforming to API RP 2003, installed where indicated.]

1.3.1 Gas Facility System and Equipment Operation

Include shop drawings showing piping layout, locations of system valves, gas line markers[ and cathodic protection system]; step-by-step procedures for system start up, operation and shutdown (index system components and equipment to the system drawings); isolation procedures including valve operation to shutdown or isolate each section of the system (index valves to the system maps and provide separate procedures for normal operation and emergency shutdown if required to be different). Submit Data package No. 4.

1.3.2 Gas Facility System Maintenance

Include maintenance procedures and frequency for system and equipment; identification of pipe materials and manufacturer by locations, pipe repair procedures, and jointing procedures at transitions to other piping material or material from a different manufacturer. Submit Data Package No. 4.

1.3.3 Gas Facility Equipment Maintenance

Include identification of valves, shut-offs, disconnects, and other equipment by materials, manufacturer, vendor identification and location; maintenance procedures and recommended tool kits for valves and equipment; recommended repair methods (i.e., field repair, factory repair, or replacement) for each valve and piece of equipment; and preventive maintenance procedures, possible failure modes and troubleshooting guide. Submit Data Package No. 3.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 QUALITY ASSURANCE

Submit manufacturer's descriptive data and installation instructions for approval for compression-type mechanical joints used in joining dissimilar materials and for insulating joints. Mark all valves, flanges and fittings in accordance with MSS SP-25.

1.5.1 Welding Qualifications

******************************************************************************
NOTE: When the need exists for more stringent welding requirements, the designer may develop an alternate paragraph from industry standards using the applicable portions of Section 40 05 13.96 WELDING PROCESS PIPING as a guide.
******************************************************************************

a. Weld piping in accordance with qualified procedures using performance qualified welders and welding operators in accordance with API RP 2009, ASME BPVC SEC IX, and ASME B31.9. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.9. Notify the Contracting Officer at least 24 hours in advance of tests, and perform at the work site if practicable.

b. Submit a certified copy of welders procedures and qualifications metal and PE in conformance with ASME B31.9 for each welder and welding operator. Submit the assigned number, letter, or symbol that will be used in identifying the work of each welder to the Contracting Officer. Weld all structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING, and in conformance with AWS A5.8/A5.8M, and AWS WHB-2.9.]

1.5.2 Jointing Thermoplastic and Fiberglass Piping

Perform all jointing of piping using qualified joiners and qualified procedures in accordance with AGA XR0603. Furnish the Contracting Officer with a copy of qualified procedures and list of and identification symbols of qualified joiners. Submit manufacturer's installation instructions and manufacturer's visual joint appearance chart, including all PE pipe and
1.5.3 Shop Drawings

Submit drawings for complete Gas Piping System, within [30] [_____] days of contract award, showing location, size and all branches of pipeline; location of all required shutoff valves; and instructions necessary for the installation of gas equipment connectors and supports. Include LP storage tank, pad, and mounting details.

1.6 DELIVERY, STORAGE, AND HANDLING

1.6.1 Plastic Pipe

Handle, transport, and store plastic pipe and fittings carefully. Plug or cap pipe and fittings ends during transportation or storage to minimize dirt and moisture entry. Do not subject piping to abrasion or concentrated external loads. Discard PE pipe sections and fittings that have been damaged.

1.6.2 CSST Tubing

Handle, transport and store CSST tubing on the wooden spool or shipping container provided by the manufacturer. Insure tubing ends are capped during transportation and storage to minimize dirt and moisture entry. Discard any tubing segment and fitting that has been damaged.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Asbestos or products containing asbestos are not allowed. Submit catalog data and installation instructions for pipe, valves, all related system components, pipe coating materials and application procedures. Conform to NFPA 54NFPA 58 and with requirements specified herein. Provide supply piping to appliances or equipment at least as large as the inlets thereof.

2.2 GAS PIPING SYSTEM AND FITTINGS

**************************************************************************
NOTE: When acceptable to the serving gas supplier aluminum, thermoplastic or fiberglass pipe; copper, aluminum alloy, or steel tubing may be used with gases not corrosive to such materials. Before selecting aluminum, copper, thermoplastic or fiberglass materials, contact the gas supplier for a gas analysis to determine the types of chemicals which will be in the gas supply, and select suitable materials based on the gas analysis. In general, odorized gas is not suitable for aluminum or copper bearing materials.
**************************************************************************
### 2.2.1 Steel Pipe, Joints, and Fittings

**NOTE:** For steam electric generation stations, industrial and institutional plants, and central heating plants, use Schedule 80 black steel piping in accordance with ANSI B31.1 for threaded joints.

- **a. Pipe:** Black carbon steel in accordance with ASTM A53/A53M, Schedule [40] [80], threaded ends for sizes 50 mm 2 inches and smaller; otherwise, plain end beveled for butt welding.
- **b. Threaded Fittings:** ASME B16.3, black malleable iron.
- **c. Socket-Welding Fittings:** ASME B16.11, forged steel.
- **d. Butt-Welding Fittings:** ASME B16.9, with backing rings of compatible material.
- **e. Unions:** MSS SP-83ASME B16.39, black malleable iron.
- **f. Flanges and Flanged Fittings:** ASME B16.5 steel flanges or convoluted steel flanges conforming to ASME BPVC SEC VIII D1, with flange faces having integral grooves of rectangular cross sections which afford containment for self-energizing gasket material.

**NOTE:** Other materials, such as threaded ductile iron, copper or brass pipe in iron pipe sizes, may be used with gases noncorrosive to such materials. Designer may specify other approved materials and list proper reference publications based on those materials in this paragraph and reference paragraph. Designer also may delete materials or equipment listed if not desirable or applicable.

Provide steel pipe conforming to ASME B36.10M; and malleable-iron threaded fittings conforming to MSS SP-86 ASME B16.1 and ASME B16.3. Provide steel pipe flanges and flanged fittings, including bolts, nuts, and bolt pattern in accordance with ASME B16.5 and ASTM A105/A105M. Provide wrought steel buttwelding fittings conforming to ASME B16.9. Provide socket welding and threaded forged steel fittings conforming to MSS SP-83 ASME B16.11[ and ASTM A181/A181M, Class 60].

### 2.2.2 Aluminum Alloy Pipe and Tubing, Joints, and Fittings

Provide aluminum alloy pipe conforming to ASTM B241/B241M, except that alloy 5456 is not allowed. Mark the ends of each length of pipe indicating it conforms to NFPA 54 NFPA 58. Thread, flange, braze, or weld pipe joints. Provide aluminum alloy tubing conforming to ASTM B210/B210M, Type A or B, or ASTM B241/B241M, Type A or equivalent, with joints made up with gas tubing fittings recommended by the tubing manufacturer.

### 2.2.3 Copper Tubing, Joints and Fittings

Provide copper tubing conforming to ASTM B88M ASTM B88, Type K or L, or...
ASTM B280, with tubing joints made up with tubing fittings recommended by the tubing manufacturer. Provide copper and copper alloy press fittings, with sealing elements of Hydrogenated Nitrile Butadiene Rubber (HNBR), factory installed, or an alternative supplied by the fitting manufacturer. Press fittings are not a permitted connection fitting for natural and LP gas on Army and Navy projects.

][2.2.4 Steel Tubing, Joints and Fittings

Provide steel tubing conforming to ASTM 01.01, and ASTM A513/A513M, with tubing joints made up with gas tubing fittings recommended by the tubing manufacturer.

][2.2.5 Thermoplastic Pipe, Tubing, Joints, and Fittings

*************************************************************************
NOTE: Use of thermoplastic pipe or components is not allowed under buildings. Use only for outdoor, underground installations only.
*************************************************************************

Provide thermoplastic pipe, tubing, casing and joints and fittings conforming to ASTM D2513 and API Spec 5CT.

][2.2.6 Fiberglass Pipe, Joints, and Fittings

Provide fiberglass piping systems conforming to ASTM D2517 and API Spec 15LR.

][2.2.7 Corrugated Stainless Steel Tubing, Fittings and Accessories

Provide corrugated stainless steel tubing conforming to ANSI LC 1/CSA 6.26 (austenitic stainless steel of series 300) with tubing joints made with special mechanical fittings as supplied by the tubing manufacturer.

  2.2.7.1 Tubing

Austenitic stainless alloy of series 300 with polyethylene jacket/coating in accordance with ANSI LC 1/CSA 6.26 for sizes 9.4-mm 3/8-inch through 50-mm 2-inch

  2.2.7.2 Mechanical Fittings

Copper alloy with one end matched to the corrugated tubing and one end with NPT threads in accordance with ASME B1.20.1

  2.2.7.3 Striker Plates

Hardened steel designed to protect tubing from mechanical damage in accordance with ANSI LC 1/CSA 6.26

  2.2.7.4 Manifolds

Malleable iron, steel or copper alloy with threaded connections/ports in accordance with ASME B1.20.1

][2.2.8 Sealants for Steel Pipe Threaded Joints

*************************************************************************
NOTE: Use this paragraph only if steel threaded
*************************************************************************
pipe is specified.

Provide joint sealing compound as listed in UL FLAMMABLE & COMBUSTIBLE, Class 20 or less. For taping, use tetrafluoroethylene tape conforming to UL FLAMMABLE & COMBUSTIBLE.

2.2.9 Warning and Identification

Provide pipe flow markings, warning and identification tape, and metal tags as required.

2.2.10 Flange Gaskets

Provide gaskets of nonasbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16 inch thickness, full face or self-centering flat ring type, containing aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR) suitable for a maximum 316 degrees C 600 degree F service, to be used for hydrocarbon service.

2.2.11 Pipe Threads

Provide pipe threads conforming to ASME B1.20.2M ASME B1.20.1.

2.2.12 Escutcheons

Provide chromium-plated steel or chromium-plated brass escutcheons, either one piece or split pattern, held in place by internal spring tension or set screw.

2.2.13 Gas Transition Fittings

NOTE: Choose the applicable options from the following:

[ a. Provide steel to plastic (PE) designed for steel-to-plastic with tapping tee or sleeve conforming to AGA XR0603 requirements for transitions fittings. Coat or wrap exposed steel pipe with heavy plastic coating.]

[ b. Plastic to Plastic: Manufacturer's standard bolt-on (PVC to PE) plastic tapping saddle tee, UL listed for gas service, rated for 690 kPa (gage) 100 psig, and O-ring seals. Manufacturer's standard slip-on PE mechanical coupling, molded, with stainless-steel ring support conforming to ASTM A666, O-ring seals, and rated for 1035 kPa (gage) 150 psig gas service. Manufacturer's standard fused tapping (PE-to-PE) tee assembly with shut-off feature.]]

[ c. Provide lever operated pressure lubricated plug type gas shut-off valve conforming to CGA 3.11-M88. Provide lever operated non-lubricated gas shut-off valves conforming to CGA 3.16-M88. Provide manually operated shut-off valve conforming to CGA 9.2-M88]]
2.2.14 Insulating Pipe Joints

2.2.14.1 Insulating Joint Material

Provide insulating joint material between flanged or threaded metallic pipe systems where shown to control galvanic or electrical action.

2.2.14.2 Threaded Pipe Joints

Provide threaded pipe joints of steel body nut type dielectric unions with insulating gaskets.

2.2.14.3 Flanged Pipe Joints

Provide joints for flanged pipe consisting of full face sandwich-type flange insulating gasket of the dielectric type, insulating sleeves for flange bolts, and insulating washers for flange nuts. [Provide lap joint flange pipe ends conforming to ASTM F2015.]

2.2.15 Flexible Connectors

b. Do not install the flexible connector through the appliance cabinet face. Provide rigid metallic pipe and fittings to extend the final connection beyond the cabinet, except when appliance is provided with an external connection point.

2.3 VALVES

Provide lockable shutoff or service isolation valves [as indicated in the drawings] conforming to the following:

2.3.1 Valves 50 mm 2 Inches and Smaller

Provide valves 50 mm 2 inches and smaller conforming to ASME B16.33 of materials and manufacture compatible with system materials used.[ Provide manually operated household cooking gas appliance valves conforming to ANSI Z21.1/CSA 1.1 and ANSI Z21.15/CSA 9.1.]

[2.3.2 Valves 65 mm 2-1/2 Inches and Larger

**************************************************************************
NOTE: Use the following for projects requiring larger volumes and pipe sizes over 65 mm 2-1/2 inches.
**************************************************************************

Provide valves 65 mm 2-1/2 inches and larger of carbon steel conforming to API Spec 6D, Class 150.

][2.3.3 Valve Support on PE Piping

Provide valve support assembly in accordance with the PE piping manufacturer's requirements at valve terminations points.
2.4 **RISERS**

Provide manufacturer's standard riser, transition from plastic to steel pipe with 0.18 to 0.30 mm 7 to 12 mil thick epoxy coating. Use swaged gas-tight construction with O-ring seals, metal insert, and protective sleeve. Provide remote bolt-on or bracket or wall-mounted riser supports as indicated.

2.5 **PIPE HANGERS AND SUPPORTS**

Provide pipe hangers and supports conforming to MSS SP-58.

2.6 **LINE AND APPLIANCE REGULATORS AND SHUTOFF VALVES**

**************************************************************************
NOTE: Regulators and shutoff valves specified herein are located downstream of the gas meter / service regulator, within the building gas supply system.

The customer's gas meter, service regulator, service line, and service line shutoff valve for gas fuel systems are specified in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES and must conform to 49 CFR 192 requirements. If that section is not a part of the contract specifications, select the applicable paragraphs included in this specification. Contact and validate with the installation's facility engineering the specific requirements for meters and regulators. Define on the drawings and in the specifications the requirements and division of responsibilities for providing both the meter and regulator.

**************************************************************************

2.7 **NATURAL GAS SERVICE**

**************************************************************************
NOTE: Paragraphs below specify the service regulator and gas meter that supply the building gas piping system. These components are specified in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES and must conform to 49 CFR 192 requirements.

If Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES is a part of the contract specifications, delete the paragraphs below.
If Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES is not a part of the contract specifications, include the paragraphs below.

Contact and validate with the installation’s facility engineering the specific requirements for meters and regulators. Define on the drawings and in the specifications the requirements and division of responsibilities for providing both the meter and regulator.

**************************************************************************

2.7.1 Service Regulators

a. Provide ferrous bodied pressure regulators for individual service lines, capable of reducing distribution line pressure to pressures required for users. Provide service regulators conforming to AGA ANSI B109.4 CGA-6.18-M95 with full capacity internal relief [and overpressure shutoff]. Set pressure relief at a lower pressure than would cause unsafe operation of any connected user.

b. Adjust regulators for liquified petroleum gas to 2.5 to 3 kPa 10 to 12 inches of water column, with pressure relief set at 4 kPa 16 inches of water column.

c. Provide regulator(s) having a single port with orifice diameter no greater than that recommended by the manufacturer for the maximum gas flow rate at the regulator inlet pressure. Provide regulator valve vent of resilient materials designed to withstand flow conditions when pressed against the valve port, capable of regulating downstream pressure within limits of accuracy and limiting the buildup of pressure under no-flow conditions to 50 percent or less of the discharge pressure maintained under flow conditions. Provide a self-contained service regulator, and pipe not exceeding 50 mm 2 inch size.

2.7.2 Gas Meter

[AGA ANSI B109.1][AGA ANSI B109.2][AGA ANSI B109.3] [pipe][pedestal] mounted, [diaphragm] or [bellow][style], [cast-iron][enamel-coated steel][aluminum] case. [Provided with a strainer immediately upstream]. Provide [diaphragm-type meter conforming to AGA ANSI B109.1 for required flow rates less than 500 ccfh, or AGA ANSI B109.2, for flow rates 500 ccfh and above] [rotary-type displacement meter conforming to AGA ANSI B109.3] as required by local gas utility supplier. Provide combined [odometer-type] register totalizer index, UV-resistant index cover, water escape hole in housing, and means for sealing against tampering. Provide temperature-compensated type meters sized for the required volumetric flow rate and suitable for accurately measuring and handling gas at pressures, temperatures, and flow rates indicated. Provide meters with over-pressure protection as specified in 49 CFR 192 and ASME B31.8. Provide meters that are tamper-proof [with] [frost protection] [fungus protection][seismic protection]. Provide meters with a pulse switch initiator capable of operating up to speeds of 500 maximum pulses per minute with no false pulses and requiring no field adjustments. Provide not less than one pulse per 2.83 cubic meters 100 cubic feet of gas. Minimum service life must be 30,000,000 cycles.
2.7.2.1 Utility Monitoring and Control System (UMCS) / Energy Monitoring and Control (EMCS) or Automatic Meter Reading Interfaces

Provide gas meters capable of interfacing the output signal, equivalent to volumetric flow rate, with the existing UMCS / EMCS for data gathering in units of cubic meters cubic feet. Provide meters that do not require power to function and deliver data. Output signal must be either a voltage or amperage signal that can be converted to volumetric flow by using an appropriate scaling factor.

2.7.2.2 Measurement Configuration

For buildings that already have a gas meter with a pulse output, ensure that the pulse output is connected to a data gathering device (i.e. electric meter). For buildings where a natural gas meter already exists but does not have a pulse output, add a pulse kit to the existing meter and tie the output to a data gathering device. If the existing gas meter will not accept a pulse kit or if no meter exists a new natural gas meter must be installed, also requiring a pulse output to a data gathering device. Ensure the pulse frequency and electronic characteristics are compatible with the existing data gathering device, if any.

2.8 SEISMIC PROVISIONS

**************************************************************************
NOTE: Provide this earthquake protective feature primarily for seismic zones 3 and 4.
**************************************************************************

Provide earthquake automatic gas shutoff valve conforming to ASCE 25-16, SMACNA 1981 or excess flow valve (EFV) conforming with ANSI Z21.93/CSA 6.30 and UL listed or AGA listed or International Association of Plumbing and Mechanical Officials (IAPMO) listed. The earthquake valve may be either pendulum or ball construction with [remote [, pneumatic] [electronic] [or] [electric] actuator. The EFV may be either a bypass (automatic reset) or a non-bypass type (manual reset).

2.9 AUTOMATIC GAS SHUT-OFF

**************************************************************************
NOTE: This section has a corresponding graphic for attaching CSA US 3-92 called "IAS_3-92_Rev_020601.pdf"
NOTE: TO DOWNLOAD UFGS GRAPHICS
Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms
**************************************************************************

[Provide low pressure automatic gas shutoff or excess flow valve (EFV) downstream of the point of delivery after the [meter/regulator] [propane tank] conforming to ANSI Z21.93/CSA 6.30 and UL listed or CSA listed or International Association of Plumbing and Mechanical Officials (IAPMO) listed. The EFV may be either a bypass (automatic reset) or a non-bypass type (manual reset).][Provide low pressure automatic gas shutoff or excess flow valve (EFV) at each branch to an appliance.]
2.10 LIQUIFIED PETROLEUM GAS - (LPG), LPG CONTAINERS AND ACCESSORIES

**************************************************************************
NOTE: The maximum size permitted under DOT specifications is 0.50 cubic meter 1000 pounds water capacity. Fuse plugs may be used in addition to the spring-loaded safety relief valves for aboveground ASME containers of 4.5 cubic meters 1200 gallons) water capacity or less.
**************************************************************************

Provide NFPA 58, [DOT] [or] [ASME] compliant containers with appurtenances, system working pressure, minimum design pressure, that is LPG vapor pressure at 38 degrees C 100 degrees F, and water capacity as indicated. Provide containers with piping and fittings, [ fuse plugs,] [ hose and flexible hose connectors,] [ gas-air mixer,] [ strainer,] and marking conforming to NFPA 58, and [ API MPMS 2.2A for upright cylindrical tanks] [ API MPMS 2.2E for horizontal cylindrical tanks] Provide valves conforming to UL 125 and UL 842. Provide pipe unions conforming to UL 860.

2.11 BOLTING (BOLTS AND NUTS)

Stainless steel bolting; ASTM A193/A193M, Grade B8M or B8MA, Type 316, for bolts; and ASTM A194/A194M, Grade 8M, Type 316, for nuts. Dimensions of bolts, studs, and nuts must conform with ASME B18.2.1 and ASME B18.2.2 with coarse threads conforming to ASME B1.1, with Class 2A fit for bolts and studs and Class 2B fit for nuts. Bolts or bolt-studs must extend through the nuts and may have reduced shanks of a diameter not less than the diameter at root of threads. Bolts must have American Standard regular square or heavy hexagon heads; nuts must be American Standard heavy semifinished hexagonal.

2.12 GASKETS

Fluorinated elastomer, compatible with flange faces.

2.13 IDENTIFICATION FOR ABOVEGROUND PIPING

MIL-STD-101 for legends and type and size of characters. For pipes 19 mm 3/4 inch od and larger, provide printed legends to identify contents of pipes and arrows to show direction of flow. Color code label backgrounds to signify levels of hazard. Make labels of plastic sheet with pressure-sensitive adhesive suitable for the intended application. For pipes smaller than 19 mm 3/4 inch od, provide brass identification tags 40 mm 1 1/2 inches in diameter with legends in depressed black-filled characters.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy or areas of conflict before performing the work.

3.2 EXCAVATION AND BACKFILLING

Provide required excavation, backfilling, and compaction as specified in Section 31 00 00 EARTHWORK.
3.3 GAS PIPING SYSTEM

Provide a gas piping system from the point of delivery, defined as the outlet of the [meter set assembly] [service regulator] [shutoff valve], [as specified under "Gas Service" within this specification,][as specified in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES,] to the connections to each gas utilization device that is in compliance with NFPA 54[NFPA 58].

3.3.1 Protection and Cleaning of Materials and Components

Protect equipment, pipe, and tube openings by closing with caps or plugs during installation. At the completion of all work, thoroughly clean the entire system.

3.3.2 Workmanship and Defects

Piping, tubing and fittings must be clear and free of cutting burrs and defects in structure or threading and must be thoroughly brushed and chip-and scale-blown. Repair of defects in piping, tubing or fittings is not allowed; replace defective items when found.

3.4 PROTECTIVE COVERING

3.4.1 Underground Metallic Pipe

Protect buried metallic piping and tubing from corrosion by either: (1) applying protective coatings as specified in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES; (2) encasement in a watertight plastic conduit; or (3) encasement in a protective system designed and listed by the manufacturer for this application. When dissimilar metals are joined underground, use gastight insulating fittings.

3.4.2 Aboveground Metallic Piping Systems

******************************************************************************
NOTE: This paragraph applies to normal interior and exterior conditions from the meter or main shut-off. Where severe corrosion is expected, edit this paragraph to provide for protection against corrosion.
******************************************************************************

3.4.2.1 Ferrous Surfaces

Touch up shop primed surfaces with ferrous metal primer. Solvent clean surfaces that have not been shop primed. Mechanically clean surfaces that contain loose rust, loose mill scale and other foreign substances [by power wire brushing] [or] [commercial sand blasted conforming to SSPC SP 6/NACE No.3] and prime with [ferrous metal primer] [or] [vinyl type wash coat]. Finish primed surfaces with two coats of exterior [oil paint] [or] [vinyl paint].

3.4.2.2 Nonferrous Surfaces

Except for aluminum alloy pipe, do not paint nonferrous surfaces. Paint surfaces of aluminum alloy pipe and fittings to protect against external corrosion where they contact masonry, plaster, insulation, or are subject
to repeated wettings by such liquids as water, detergents or sewage. Solvent-clean the surfaces and treat with vinyl type wash coat. Apply a first coat of aluminum paint and a second coat of alkyd gloss enamel or silicone alkyd copolymer enamel.

3.5 INSTALLATION

**************************************************************************

NOTE: To assist the designer in selecting the proper documents for a specific project, the following scope in accordance with documents is provided:

1. NFPA 54 Scope: "1.1.1 Applicability: Coverage of piping systems extends from the point of delivery to the connections with each gas utilization device. For other than indicated liquified petroleum gas systems, the point of delivery is the outlet of the service meter assembly, or the outlet of the service regulator or service shutoff valve when no gas meter is provided. For undiluted liquified petroleum gas systems, the point of delivery is the outlet of the first stage pressure regulator."

If underground piping is subject to physical damage, specify deeper burial depths to protect piping.

**************************************************************************

Install the gas system in conformance with the manufacturer's recommendations and applicable provisions of NFPA 54, NFPA 58, and AGA XR0603, and as indicated. Perform all pipe cutting without damage to the pipe, with an approved type of mechanical cutter, unless otherwise authorized. Use wheel cutters where practicable. On steel pipe 150 mm 6 inches and larger, an approved gas cutting and beveling machine may be used. Cut thermoplastic and fiberglass pipe in accordance with AGA XR0603.

3.5.1 Metallic Piping Installation

Bury underground piping a minimum of 450 mm 18 inches below grade. Make changes in direction of piping with fittings only; mitering or notching pipe to form elbows and tees or other similar type construction is not permitted. Branch connection may be made with either tees or forged branch outlet fittings. Provide branch outlet fittings which are forged, flared for improvement of flow where attached to the run, and reinforced against external strains. Do not use aluminum alloy pipe in exterior locations or underground.

3.5.2 Metallic Tubing Installation

Install metallic tubing using gas tubing fittings approved by the tubing manufacturer. CSST gas piping systems must be installed by contractors who have completed the manufacturer's training program as indicated on a certification card. Make branch connections with tees. Prepare all tubing ends with tools designed for that purpose. Do not use aluminum alloy tubing in exterior locations or underground. Maintain electrical continuity of gas piping system in accordance with NFPA 54 [NFPA 58], paragraph entitled 'Electrical Bonding and Grounding'.

SECTION 23 11 20 Page 25
3.5.3 Thermoplastic and Fiberglass Piping, Tubing, and Fittings

Installation of thermoplastic and fiberglass piping, tubing, and fittings is permitted only outside and underground. Bury piping a minimum of 450 mm (18 inches) below grade. Install the piping to avoid excessive stresses due to thermal contraction, and use only where indicated. Installations must be made using qualified procedures, by qualified installers, and in compliance with AGA XR0603 and NFPA 54 [NFPA 58], and must be inspected by a qualified inspector.

3.5.4 Connections Between Metallic and Plastic Piping

Connections between metallic and plastic piping are only allowed outside, underground, and with approved transition fittings.

3.5.5 Piping and Tubing Buried Under Buildings

Run underground piping and tubing installed beneath buildings in a steel pipe casing protected from corrosion with protective coatings as specified in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES or installed within a water tight plastic conduit or as part of a listed encasement system. Extend casing or encasement system at least 100 mm (4 inches) outside the building, and provide the pipe with spacers and end bushings to seal at both ends to prevent the entrance of water and/or the escape of gas. Extend a vent line from the annular space above grade outside to a point where gas will not be a hazard, and terminate in a rain/insect-resistant fitting.

3.5.6 Concealed Piping in Buildings

Do not use combinations of fittings (unions, tubing fittings, running threads, right- and left-hand couplings, bushings, and swing joints) to conceal piping within buildings.

3.5.6.1 Piping and Tubing in Partitions

Locate concealed piping and tubing in hollow, rather than solid, partitions. Protect tubing passing through walls or partitions against physical damage both during and after construction, and provide appropriate safety markings and labels. Provide protection of concealed pipe and tubing in accordance with ANSI LC 1/CSA 6.26.

3.5.6.2 Piping in Floors

**************************************************************************
NOTE: When acceptable to the serving gas supplier, gas piping may be embedded in portland cement concrete floor slabs. If acceptable, delete brackets.
**************************************************************************

Lay piping in solid floors [except where embedment in concrete is indicated] in channels suitably covered to permit access to the piping with minimum damage to the building. [Surround piping embedded in concrete by a minimum of 40 mm (1-1/2 inches) of concrete and do not allow physical contact with other metallic items such as reinforcing rods or electrically neutral conductors. Do not embed piping in concrete slabs containing quickset additives or cinder aggregate.]
3.5.7 Aboveground Piping

Run aboveground piping as straight as practicable along the alignment and elevation indicated, with a minimum of joints, and separately supported from other piping system and equipment. Install exposed horizontal piping no farther than 150 mm 6 inches from nearest parallel wall and at an elevation which prevents standing, sitting, or placement of objects on the piping.

3.5.8 Final Gas Connections

**************************************************************************

NOTE: Only allow flexible connectors where they will not be vulnerable to physical abuse or will not be accessible to unqualified personnel. Acceptable locations would include locked equipment rooms, equipment suspended at least 3 m 10 feet above floor, and remote buildings with limited accessibility by unqualified personnel. If flexible connectors are allowed, include bracketed sentence prohibiting connectors from passing through the equipment cabinet.

**************************************************************************

Unless otherwise specified, make final connections with rigid metallic pipe and fittings. [Make final connections to kitchen ranges using flexible connectors not less than 1.02 m 40 inch long[, to afford access to coupling] [and][ to permit movement of equipment for cleaning].][ Flexible connectors may be used for final connections to residential dryers.] [Flexible connectors may be used for final connections to gas utilization equipment.] [In addition to cautions listed in instructions required by ANSI standards for flexible connectors, insure that flexible connectors do not pass through equipment cabinet.] Provide accessible gas shutoff valve and coupling for each gas equipment item.

3.5.9 Seismic Requirements

**************************************************************************

NOTE: Provide seismic details and show on the drawings. Delete bracketed phrase if no seismic details are provided.

**************************************************************************

Support and brace piping and attached valves to resist seismic loads in conformance with ASCE 25-16[ and ][as specified in UFC 3-301-01, and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC][as indicated]. CSST tubing and fittings that are seismically qualified in accordance with the FM APP GUIDE: Flexible Piping Systems for Flammable Gases must meet the seismic requirements in accordance with the manufacturer's installation instructions.

3.6 PIPE JOINTS

Design and install pipe joints to effectively sustain the longitudinal pull-out forces caused by contraction of the piping or superimposed loads.
3.6.1 Threaded Metallic Joints

Provide threaded joints in metallic pipe with tapered threads evenly cut and made with UL approved graphite joint sealing compound for gas service or tetrafluoroethylene tape applied to the male threads only. Threaded joints up to 40 mm 1-1/2 inches in diameter may be made with approved tetrafluoroethylene tape. Threaded joints up to 50 mm 2 inches in diameter may be made with approved joint sealing compound. After cutting and before threading, ream pipe and remove all burrs. Caulking of threaded joints to stop or prevent leaks is not permitted.

3.6.2 Welded Metallic Joints

Conform beveling, alignment, heat treatment, and inspection of welds to NFPA 54. Remove weld defects and make repairs to the weld, or remove the weld joints entirely and reweld. After filler metal has been removed from its original package, protect and store so that its characteristics or welding properties are not affected adversely. Do not use electrodes that have been wetted or have lost any of their coating.

3.6.3 Thermoplastic and Fiberglass Joints

3.6.3.1 Thermoplastic and Fiberglass

******************************************************************************

NOTE: Thermoplastic and fiberglass pipe should not be installed where temperature will be below minus 29 degrees C 20 degrees F or above 38 degrees C 100 degrees F. fiberglass pipe may be used at temperatures up to 66 degrees C 150 degrees F, providing the pipe is marked in accordance with ASTM D2513.

******************************************************************************

Conform jointing procedures to AGA XR0603. Do not make joints with solvent cement or heat of fusion between different kinds of plastics.

3.6.3.2 PE Fusion Welding Inspection

Visually inspect butt joints by comparing with, manufacturer's visual joint appearance chart. Inspect fusion joints for proper fused connection. Replace defective joints by cutting out defective joints or replacing fittings. Inspect, in conformance with API 570, 100 percent of all joints and re-inspect all corrections. Arrange with the pipe manufacturer's representative in the presence of the Contracting Officer to make first time inspection.

3.6.4 Flared Metallic Tubing Joints

Make flared joints in metallic tubing with special tools recommended by the tubing manufacturer. Use flared joints only in systems constructed from nonferrous pipe and tubing, when experience or tests have demonstrated that the joint is suitable for the conditions, and when adequate provisions are made in the design to prevent separation of the joints. Do not use metallic ball sleeve compression-type tubing fittings for tubing joints.

3.6.5 Solder or Brazed Joints

Make all joints in metallic tubing and fittings with materials and
procedures recommended by the tubing supplier. Braze joints with material having a melting point above 538 degrees C 1000 degrees F, containing no phosphorus.

3.6.6 Joining Thermoplastic or Fiberglass to Metallic Piping or Tubing

When compression type mechanical joints are used, provide gasket material in the fittings compatible with the plastic piping and with the gas in the system. Use an internal tubular rigid stiffener in conjunction with the fitting, flush with end of the pipe or tubing, extending at least to the outside end of the compression fitting when installed. Remove all rough or sharp edges from stiffener. Do not force fit stiffener in the plastic. Split tubular stiffeners are not allowed.

3.6.7 Press Connections

Make press connections in accordance with manufacturer's installation instructions using tools approved by the manufacturer. Fully insert the tubing into the fitting and then mark at the shoulder of the fitting. Check the fitting alignment against the mark on the tubing to assure the tubing is fully inserted before the joint is pressed.

3.7 PIPE SLEEVES

Provide pipes passing through concrete or masonry walls or concrete floors or roofs with pipe sleeves fitted into place at the time of construction. Do not install sleeves in structural members except where indicated or approved. Make all rectangular and square openings as detailed. Extend each sleeve through its respective wall, floor or roof, and cut flush with each surface, except in mechanical room floors not located on grade where clamping flanges or riser pipe clamps are used. Extend sleeves in mechanical room floors above grade at least 100 mm 4 inches above finish floor. Unless otherwise indicated, use sleeves large enough to provide a minimum clearance of 6.4 mm 1/4 inch all around the pipe. Provide steel pipe for sleeves in bearing walls, waterproofing membrane floors, and wet areas. Provide sleeves in nonbearing walls, floors, or ceilings of steel pipe, galvanized sheet metal with lock-type longitudinal seam, or moisture-resistant fiber or plastic. For penetrations of fire walls, fire partitions and floors which are not on grade, seal the annular space between the pipe and sleeve with fire-stopping material and sealant that meet the requirement of Section 07 84 00 FIRESTOPPING.

3.8 PIPES PENETRATING WATERPROOFING MEMBRANES

Install pipes penetrating waterproofing membranes as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.

3.9 FIRE SEAL

Fire seal all penetrations of fire rated partitions, walls and floors in accordance with Section 07 84 00 FIRESTOPPING.

3.10 ESCUTCHEONS

Provide escutcheons for all finished surfaces where gas piping passes through floors, walls, or ceilings except in boiler, utility, or equipment rooms.
3.11 SPECIAL REQUIREMENTS

Provide drips, grading of the lines, freeze protection, and branch outlet locations as shown and conforming to the requirements of NFPA 54, NFPA 58.

3.12 BUILDING STRUCTURE

Do not weaken any building structure by the installation of any gas piping. Do not cut or notch beams, joists or columns. Attach piping supports to metal decking. Do not attach supports to the underside of concrete filled floors or concrete roof decks unless approved by the Contracting Officer.

3.13 PIPING SYSTEM SUPPORTS

Support gas piping systems in buildings with pipe hooks, metal pipe straps, bands or hangers suitable for the size of piping or tubing. Do not support any gas piping system by other piping. Conform spacing of supports in gas piping and tubing installations to the requirements of NFPA 54, NFPA 58. Conform the selection and application of supports in gas piping and tubing installations to the requirements of MSS SP-58. In the support of multiple pipe runs on a common base member, use a clip or clamp where each pipe crosses the base support member. Spacing of the base support members is not to exceed the hanger and support spacing required for any of the individual pipes in the multiple pipe run. Rigidly connect the clips or clamps to the common base member. Provide a clearance of 3.2 mm (1/8 inch) between the pipe and clip or clamp for all piping which may be subjected to thermal expansion.

3.14 ELECTRICAL BONDING AND GROUNDING

NOTE: Conventional flange joints allow sufficient current flow to satisfy this requirement.

Provide a gas piping system within the building that is electrically continuous and bonded to a grounding electrode as required by NFPA 54, NFPA 58, and NFPA 70.

3.15 SHUTOFF VALVE

Install the main gas shutoff valve controlling the gas piping system to be easily accessible for operation, as indicated, protected from physical damage, and marked with a metal tag to clearly identify the piping system controlled. Install valves approximately at locations indicated. Orient stems vertically, with operators on top, or horizontally.[ Provide PE piping manufacturer bracket support assembly securely fastened to structure for valve connections to resist operating torque applied to PE pipes.] Provide stop valve on service branch at connection to main and shut-off valve on riser outside of building.

3.16 LINE AND APPLIANCE PRESSURE REGULATORS

Install line pressure regulators and appliance regulators in accordance with the manufacturer's requirements and in accordance with NFPA 54[NFPA 58]. Install each regulator in an accessible location and install shutoff valves ahead of each line and appliance regulator to allow for maintenance. Where vent limiting devices are not included in the
regulators, install a vent pipe to the exterior of the building. Terminate all service regulator vents and relief vents in the outside air in rain and insect resistant fittings. Locate the open end of the vent where gas can escape freely into the atmosphere, away from any openings into the building and above areas subject to flooding.

3.17 GAS SERVICE INSTALLATION

[Gas service line, service regulator and gas company meter must be installed in accordance with Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES.] Installations must be in accordance with 49 CFR 192 and ASME B31.8. Contractor must submit and use only tested and approved work procedures. Contractor must use only welders and jointers who have been recently qualified by training and test for joining and installing the gas pipe material used on this job. The finished product must be inspected by a person qualified to inspect joints made by the particular procedures used to make joints.

**************************************************************************

NOTE: This section specifies service line, service regulator, and gas company meter. These components must be installed in accordance with 49 CFR 192 and ASME B31.8 to allow gas systems to be accepted by Utility Privatization Contractors.

These installations are also specified is Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES. If that section is not included in the contract documents, delete the reference statement above and include the paragraphs below in this specification.

Where project documentation includes Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES, delete the paragraphs below and include the reference statement above.

**************************************************************************

3.17.1 Service Line

Install service line, branch connection to the main, and riser in accordance with 49 CFR 192 and ASME B31.8. Provide a minimum of 450 mm 18 inches cover or encase the service line so that it is protected. Install service line so that no undue stress is applied to the pipe, connection, or riser. Install approved riser and terminate with an approved isolation valve, EFV and automatic shutoff device. After laying of pipe and testing, backfill the trench in accordance with Section 31 00 00 EARTHWORK.

Were steel pipe is used as service line, install corrosion prevention coating and cathodic protect for the steel service line. Where connected to an existing cathodically protected steel pipe, ensure electrical continuity from the riser to the branch connection to the main. Install a dielectric fitting on the riser to prevent electrical continuity to the above ground piping.

Where plastic pipe is used as the service line, make joints in accordance with procedures qualified by test. Personnel joining plastic pipe must be qualified by making a satisfactory specimen joint that passes the required
inspection and test listed in 49 CFR 192.285. Inspection must be made by inspectors qualified in evaluating joints made under the specific joining procedure, as required by 49 CFR 192.287.

3.17.2 Service Regulator

Install service regulator in accordance with 49 CFR 192 and ASME B31.8 and this specification ensuring that the customer's piping is protected from over pressurization should the service regulator fail. A 3/8 inch tapped fitting equipped with a plug must be provided on both sides of the service regulator for installation of pressure gauges for adjusting the regulator. For inside installations, route the regulator vent pipe through the exterior wall to the atmosphere, and seal building penetrations for service line and vent. Terminate the regulator vent so that it is protected from precipitation and insect intrusion, so that it is not submerged during floods, and so that gas escaping will not create a hazard or enter the building through openings.

3.17.3 Gas Meter

Install shutoff valve, meter set assembly, and service regulator on the service line [outside the building] [inside the building, a minimum of 1 meter 3 feet from any potential ignition source], 18 inches above the [ground] [finished floor] on the riser. An insulating joint (dielectric connection) must be installed on the inlet side of the meter set assembly and service regulator and must be constructed to prevent flow of electrical current.

3.18 CATHODIC PROTECTION

**************************************************************************
NOTE: Use this paragraph only for those projects requiring underground, or partially buried gas piping systems

Designs are required to have cathodic protection for underground ferrous gas piping regardless of soil condition. Other guidance is available in TM 5-811-7. Provide cathodic protection on additions to existing systems and stations for testing.
**************************************************************************

Provide cathodic protection for underground ferrous gas piping as specified in [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [and] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM].

3.19 TESTING

Submit test procedures and reports in booklet form tabulating test and measurements performed; dated after award of this contract, and stating the Contractor's name and address, the project name and location, and a list of the specific requirements which are being certified. Test entire gas piping system to ensure that it is gastight prior to putting into service. Prior to testing, purge the system, clean, and clear all foreign material. Test each joint with an approved gas detector, soap and water, or an equivalent nonflammable solution. Inspect and test each valve in conformance with API Std 598 and API Std 607. Complete testing before any work is covered, enclosed, or concealed, and perform with due regard for
the safety of employees and the public during the test. Install bulkheads, anchorage and bracing suitably designed to resist test pressures if necessary, and as directed and or approved by the Contracting Officer. Do not use oxygen as a testing medium.

3.19.1 Pressure Tests

Submit test procedures and reports in booklet form tabulating test and measurements performed; dated after award of this contract, and stating the Contractor's name and address, the project name and location, and a list of the specific requirements which are being certified. Before appliances are connected, test by filling the piping systems with air or an inert gas to withstand a minimum pressure of 21 kPa 3 pounds gauge for a period of not less than 10 minutes as specified in NFPA 54 as specified in NFPA 58 without showing any drop in pressure. Do not use Oxygen for test. Measure pressure with a mercury manometer, slope gauge, or an equivalent device calibrated to be read in increments of not greater than 1 kPa 0.1 pound. Isolate the source of pressure before the pressure tests are made.

3.19.2 Pressure Tests for Liquified Petroleum Gas

Pressure test system as described above. When appliances are connected to the piping system, use fuel gas for testing appliances to withstand a pressure of not less than 2.5 kPa nor more than 3.5 kPa 10.0 inches nor more than 14.0 inches water column (0.36 nor more than 0.51 pounds per square inch) for a period of not less than 10 minutes without showing any drop in pressure. Measure pressure with a water manometer or an equivalent device calibrated to be read in increments of not greater than 20 Pa 0.1 inch water column. Isolate the source of pressure before the pressure tests are made.

3.19.3 Test With Gas

Before turning on gas under pressure into any piping, close all openings from which gas can escape. Immediately after turning on the gas, check the piping system for leakage by using a laboratory-certified gas meter, an appliance orifice, a manometer, or equivalent device. Conform all testing to the requirements of NFPA 54 NFPA 58. If leakage is recorded, shut off the gas supply, repair the leak, and repeat the tests until all leaks have been stopped.

3.19.4 Purging

After testing is completed, and before connecting any appliances, fully purge all gas piping. LPG piping tested using fuel gas with appliances connected does not require purging. Conform testing procedures to API RP 1110. Do not purge piping into the combustion chamber of an appliance. Do not purge the open end of piping systems into confined spaces or areas where there are ignition sources unless the safety precautions recommended in NFPA 54NFPA 58 are followed.

3.19.5 Labor, Materials and Equipment

Furnish all labor, materials and equipment necessary for conducting the testing and purging.

3.20 PIPE COLOR CODE MARKING

**************************************************************************

SECTION 23 11 20 Page 33
NOTE: Coordinate color code marking with Section 09 90 00. Add color code marking for piping not listed in Table I of Section 09 90 00 to the table.

**************************************************************************

Provide color code marking of piping as specified in Section 09 90 00 PAINTS AND COATINGS, conforming to ASME A13.1.

PART 3  EXECUTION

3.1  PREPARATION

3.2  INSTALLATION
  3.2.1  Hangers and Supports
  3.2.2  Grading of Pipe Lines
  3.2.3  Pipe Sleeves
  3.2.4  Flashing for Buildings
  3.2.5  Unions and Flanges
  3.2.6  Connections for Future Equipment
  3.2.7  Changes in Pipe Size
  3.2.8  Cleaning of Pipe
  3.2.9  Valves
    3.2.9.1  Globe Valves
    3.2.9.2  Radiators Valves
    3.2.9.3  Relief Valves
  3.2.10  Pressure Gage
  3.2.11  Thermometers
  3.2.12  Strainers
  3.2.13  Pumps
  3.2.14  Equipment Foundations
  3.2.15  Equipment Installation
  3.2.16  Cleaning of Systems
  3.2.17  Painting of Piping and Equipment
  3.2.18  Identification of Piping

3.3  FIELD QUALITY CONTROL
  3.3.1  Hydrostatic Test of Piping System
  3.3.2  Auxiliary Equipment and Accessory Tests
    3.3.2.1  Backflow Preventers

3.4  TESTING, ADJUSTING, AND BALANCING
  3.4.1  Markings of Settings
  3.4.2  Sound Level Tests

3.5  SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for complete low temperature water heating system including hot water piping (supply and return) and terminal units used for heating.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This section does not include feedwater treatment equipment or process hot water terminal units. Piping as used in this specification includes pipe, tubes, flanges, bolting, gaskets, valves, relief devices, fittings, and pressure containing parts of other piping components, hangers and supports, and other equipment items necessary to prevent overstressing of the pressure containing parts.

NOTE: The following information should be shown on the drawings:

SECTION 23 21 13.00 20 Page 4
1. Layout of heating system.

2. Location, size, and capacity of finned tube radiators, convectors, unit heaters, flow meters, pumps, and expansion tanks.

PART 1  GENERAL

1.1 REFERENCES

******************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section with additions and modifications specified herein.

1.3 SYSTEM DESCRIPTION

Except as specified otherwise, equipment and piping components shall be suitable for use in low temperature water heating system. Except as modified herein, the pressure temperature limitations shall be as specified in the referenced standards and specifications. Pressures in this specification are pressures in kilopascal (kPa) pounds per square inch above atmospheric pressure, and temperatures are in degrees Centigrade (C) Fahrenheit (F).

1.3.1 Hot Water Heating System

Submit plan, elevations, dimensions, capacities, and ratings. Include the following:

a. Unit heaters
b. Convectors
c. Finned tube radiators
d. Pumps
e. Valves
f. Expansion tanks
g. Flow measuring equipment
h. Backflow preventer
1. Air separating tank
[j. Boilers]
k. Hot water heat exchangers
[l. Converters]

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Hot water heating system

SECTION 23 21 13.00 20  Page 10
SD-03 Product Data

Convectors

Finned tube radiators

Pumps

Include pump speed and characteristic curve for performance of impeller selected for each pump. Curves shall indicate capacity vs head, efficiency, and brake power for full range, from shut-off to free delivery.

Expansion tanks

Flow measuring equipment

Backflow preventers

External air separation tanks

Hot water heating pipe

SD-06 Test Reports

Hydrostatic test of piping system

Auxiliary equipment and accessory tests

Submit test reports in accordance with the paragraph entitled "Field Quality Control."

SD-07 Certificates

Backflow preventer certification

Report of prior installations

Welding procedures

Welder's qualifications

SD-10 Operation and Maintenance Data

Convectors, Data Package 3; G[, [____]]

Finned tube radiators, Data Package 3; G[, [____]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Submit a list of qualified service organizations which includes addresses and qualifications.

1.5 QUALITY ASSURANCE

1.5.1 Standard Commercial Product for Terminal Units

Terminal units provided shall comply with features called out in this specification and shall be the manufacturer's standard commercial product. Additional or better features which are not prohibited by this
specification but which are a part of the manufacturer's standard commercial product, shall be included in the terminal units being furnished. A standard commercial product is a product which has been sold or is currently being offered for sale, on the commercial market through advertisements or manufacturer's catalogs, or brochures. Provide Institute of Boiler and Radiator Manufacturer (IBR) or Steel Boiler Institute (SBI) rating for required capacity.

1.5.2 Welding

1.5.2.1 Report of Prior Installations

Submit a Certificate of Full Approval or a current Certificate of Approval for each design, size, and make of backflow preventer being provided for the project. Certificate shall be from the Foundation for Cross-Connection Control and Hydraulic Research, University of Southern California, and shall attest that this design, size, and make of backflow preventer has satisfactorily passed the complete sequence of performance testing and evaluation for the respective level of approval. A Certificate of Provisional Approval is not acceptable in lieu of the above.

1.5.2.2 Welding Procedures

Before performing welding, submit three copies of welding procedure specification for all metals to be used in the work, together with proof of welder's qualification as outlines in ASME B31.9.

1.5.2.3 Welder's Qualifications

Before welder or operator performs welding, submit three copies of Welder's Performance Qualification Record in conformance with ASME B31.9 showing that the welder was tested under the approved procedure specification submitted by the Contractor. In addition, submit each welder's assigned number, letter, or symbol used to identify the work of the welder.

1.5.2.4 Identification of Welder's Work

Ensure that each welder's assigned number, letter or symbol is affixed immediately upon completion of the weld. To welders making defective welds after passing a qualification test, give a requalification test. Upon failing to pass the test, do not permit welder to work in this contract.

1.5.2.5 Previous Qualifications

Welding procedures, welders, and welding operators previously qualified by test may be accepted for this contract without requalification subject to the approval and provided that all the conditions specified in ASME B31.9 are met before a procedure can be used.

1.5.3 Brazing and Soldering

1.5.3.1 Brazing Procedure

ASME B31.9. Brazing procedure for joints shall be as outlined in CDA A4015.

1.5.3.2 Soldering, Soldering Preparation, and Procedures for Joints

ASME B31.9 and as outlined in CDA A4015.
1.5.4 Backflow Preventer Certification

Submit a Certificate of Full Approval or a current Certificate of Approval for backflow preventers.

1.6 SAFETY STANDARDS

1.6.1 Welding

Safety in welding and cutting of pipe shall conform to **AWS Z49.1**.

1.6.2 Guards

Couplings, motor shafts, gears and other moving parts shall be guarded, in accordance with OSHA **29 CFR 1910.219**. Guards shall be cast iron or expanded metal. Guard parts shall be rigid and removable without disassembling the guarded unit.

PART 2 PRODUCTS

2.1 PIPE AND FITTINGS

2.1.1 Hot Water Heating Pipe (Supply and Return)

**************************************************************************

NOTE: Specify Schedule 40, 80, or 120 steel or Type K or L copper as required for temperature and pressure involved. Type M copper should only be specified for drain piping.

**************************************************************************

**ASTM A53/A53M** electric resistance welded or seamless Schedule [_____] steel pipe [or **ASTM B88M** **ASTM B88** Type [_____] hard drawn Copper tubing].

2.1.2 Fittings

Provide fittings compatible with the pipe being provided and shall conform to the following requirements.

2.1.2.1 Steel or Malleable Iron Pipe

Sizes 3 to 50 mm 1/8 to 2 inches. **ASME B16.11** steel socket welding or screwed type or **ASME B16.3** for screwed type malleable iron fittings.

2.1.2.2 Steel, Cast Iron, or Bronze

Sizes 65 mm 2 1/2 inches and above. Steel fitting butt welding type **ASME B16.9** or **ASME B16.5** flanged type. Cast iron fittings flanged type **ASME B16.1**. Bronze fittings up to 200 mm 8 inch size flanged type **ASME B16.24**.

2.1.2.3 Fittings for Copper Tubing

**ASME B16.18** cast bronze solder joint type or **ASME B16.22** wrought copper solder joint type. Fittings may be flared or compression joint type.
2.1.3 Unions

2.1.3.1 Steel Pipe

Provide ASME B16.39, malleable iron unions, threaded connections.

2.1.3.2 Copper Tubing

Provide CID A-A-59617, bronze unions, solder joint end.

2.1.3.3 Dielectric Union

Provide insulated union with galvanized steel female pipe-threaded end and a copper solder joint end conforming with ASME B16.39, Class 1, dimensional, strength and pressure requirements. Union shall have a water-impervious insulation barrier capable of limiting galvanic current to one percent of the short-circuit current in a corresponding bimetallic joint. When dry, insulation barrier shall be able to withstand a 600-volt breakdown test.

2.1.4 Flanges

Remove raised faces when used with flanges having a flat face.

2.1.4.1 Steel Flanges

ASME B16.5 forged steel, welding type.

2.1.4.2 Cast Iron Screwed Flanges

ASME B16.1.

2.1.4.3 Bronze Screwed Flanges

2.1.5 Drains and Overflows

2.1.5.1 Steel Pipe

ASTM A53/A53M, [Electric resistance welded] [Seamless] Schedule 40, malleable iron or forged steel fittings, screwed or welded joints.

2.1.5.2 Copper Tubing

ASTM B88M ASTM B88, Type [K] [L] [M] hard drawn, cast brass or wrought copper fittings, Grade Sb5 solder joints.

2.1.5.3 PVC Pipe

ASTM D1785, Schedule 40, [and Schedule 80 for sizes 200 mm 8 inch and larger,] solvent weld joints.

2.1.6 Valves

Valves shall have rising stems and shall open when turned counterclockwise.
2.1.6.1 Gate Valves

a. Bronze Gate Valves: MSS SP-80, 50 mm 2 inches and smaller, wedge disc, inside screw type not less than Class 150. Use solder joint ends with copper tubing.

b. Steel Gate Valves: ASME B16.34, provide with open stem and yoke type with solid wedge or flexible wedge disc and heat and corrosion-resistant steel trim.

c. Cast Iron Gate Valves: MSS SP-70, 65 mm 2 1/2 inches and larger, open stem and yoke type with bronze trim.

2.1.6.2 Globe and Angle Valves

a. Bronze Globe and Angle Valves: MSS SP-80, 50 mm 2 inches and smaller, Class 200, except use Class 150 with solder ends for copper tubing. Valves shall have renewable seat and discs except solder end valves which shall have integral seats.

b. Steel Globe and Angle Valves: ASME B16.34, provide with heat and corrosion-resistant trim.

c. Cast Iron Globe and Angle Valves: MSS SP-85, 65 mm 2 1/2 inches and larger, with bronze trim, tapped drains and brass plug.

2.1.6.3 Check Valves

a. Bronze Check Valves: MSS SP-80, 50 mm 2 inches and smaller, regrinding swing check type, Class 200.

b. Steel Swing Check Valves: [ASME B16.34], regrinding swing check type, Class 200.

(1) Swing check valves shall have bolted caps.

(2) Steel Lift check valves 50 mm 2 inches and smaller shall have bolted caps. Lift check valves 65 mm 2 1/2 inches and larger shall have pressure seal caps.

c. Cast Iron Check Valves: ASME B16.34, 65 mm 2 1/2 inches and larger, bronze trim, non-slam, eccentric disc type for centrifugal pump discharge service.

2.1.6.4 Temperature Regulating Valves

Provide ASSE 1017 copper alloy body with adjustable range thermostat.

2.1.6.5 Water Pressure-Reducing Valves

ASSE 1003.

2.1.6.6 Plug Valves

MIL-V-12003, except that a replaceable valve seat will not be required. [Type I - lubricated, tapered plug] [Type II - non-lubricated, lift-plug] valves.
2.1.6.7 Ball Valves

Flanged or butt-welding ends ball valve shall conform to MSS SP-72, [bronze] [steel]. Threaded, socket-welding, solder joint, grooved and flared ends shall conform to MSS SP-110.

2.1.6.8 Radiator Valves

Radiator valves shall be angle or straightway pattern, with packed or packless bonnet shutoff globe type, designed especially for hot water heating system. Valve shall be constructed of brass or bronze or copper alloy conforming to ASTM specifications for materials with non-metallic renewable disc and plastic wheel handle for shutoff service.

2.1.6.9 Flow Control Balancing Valves

Copper alloy or cast iron body, copper alloy or stainless internal working parts, and integral pointer that indicates the degree of valve opening. Valves shall be suitable for 862 kPa (gage) 125 psig at 87.8 degrees C 190 degrees F hot water. Valve shall function as a service valve when in fully closed position. Valve body shall have factory-installed tappings for differential pressure meter connections for verification of pressure differential across valve orifice. Meter connections shall have positive check valves or shutoff valves. Each valve shall have metal tag showing the liters per second gallons per minute flow for each differential pressure reading.

2.1.6.10 Butterfly Valves

Conform with MSS SP-67, Type I - Tight shut off valve, and [flanged] [screwed] [single flange] [flangeless] valve ends. Valve body material shall be [cast iron] [steel] [bronze] and shall be bubble tight for shutoff at 1034 kPa (gage) 150 psig. Flanged and flangeless type valves shall have Type 300 series corrosion resistant steel stems and corrosion resistant or bronze discs with molded elastomer disc seals. Flow conditions shall be for the regulation from maximum flow to complete shutoff by way of throttling effect. Valves shall be provided in [closed] [open] system. Valves smaller than 200 mm 8 inches shall have throttling handles. Valves 200 mm 8 inches and larger shall have totally enclosed manual gear operators with adjustable balance return stops and indicators. Valves shall have a minimum of 7 locking positions and shall be suitable for water temperatures up to 93 degrees C 200 degrees F.

2.1.6.11 Butterfly Valves 2 Millimeters 2 Inches and Smaller

Valves shall be one-piece and three-piece design with male or female threaded or soldered end connections and shall be bubble tight for shutoff at 1034 kPa (gage) 150 psig. Stem and disc assembly shall be of 300 series corrosion resistant steel. Disc seal assembly shall be of 300 series corrosion resistant steel. Disc seal shall be suitable for the liquid being used in the system in which the valve is to be installed. Valves shall be suitable for water temperature up to 93 degrees C 200 degrees F and shall be capable of operating at the rated pressure of [_____] kPa (gage) psig. Valves shall be designed for throttling service use by valve lever and indicator adjustment.

2.1.6.12 Relief Valves

Bronze body, teflon seat, stainless steel stem and springs, automatic,
direct pressure actuated, capacities ASME certified and labelled.

2.1.6.13 Valve Operating Mechanisms

**************************************************************************
NOTE: Show location of each floor stand, chainwheel or power operator required in the project. Delete paragraph entitled "Valve Operating Mechanisms" and its subparagraphs if these items are not required in the project.
**************************************************************************

Provide [floor stands] [chainwheels] [power operators] [and extension stems] where indicated and as specified.

**************************************************************************
NOTE: Show floor stand details including distance from centerline of valve to top of floor, floor thickness, and handwheel height.
**************************************************************************

a. Floor Stands: Construct for bolting to the floor and include an extension stem and an operating handwheel. Design an adequately supported and guided extension stems for connection to the valve stem by a sleeve coupling or universal joint. Floor stands shall be cast iron or steel. Handwheel shall identify rotation direction for closing the valve and shall be of such diameter as to permit operation of the valve with a force of not more than 178 N 40 pounds.

b. Chainwheel Operator: Shall be fabricated of cast iron or steel and shall include a wheel, endless chain and a guide to keep the chain on the wheel. Provide galvanized steel endless chain extending to within one meter 3 feet of the floor.

c. Power Operators: Shall be [electric] [pneumatic]. Power operated valves shall open and close at rates no slower than 4 mm per second 10 inches per minute for gate valves and 1.70 mm per second 4 inches per minute for globe and angle valves. Valves shall open fully or close tightly without requiring further attention when the actuating control is moved to the open or close position. A predetermined thrust exerted on the stem during operation resulting from an obstruction in the valve shall cause the motor to automatically stop. Power operators shall be complete with all gearing and controls necessary for the size of valve being provided. Power operators shall be designed to operate on the [electric] [compressed air] power supply indicated.

d. Extension Stem: Corrosion resisting steel designed for rising and non-rising stems. Provide in length required to connect the valve stem and the [handwheel] [operating mechanism] and of sufficient cross section to transfer the torque required to operate the valve.

2.1.6.14 Balancing Valves

Balancing valves shall be calibrated bronze body balancing valves with integral ball valve and venturi or valve orifice and valve body pressure taps for flow measurement based on differential pressure readings. Valve pressure taps and meter connections shall have seals and built-in check valves with threaded connections for a portable meter. Meter shall be provided by the same manufacturer and be capable of reading system
pressures and shall meet the requirements of the paragraph entitled "Flow Measuring Equipment." Valves shall have internal seals to prevent leakage around rotating element and be suitable for full shut-off rated pressure. Valves shall have an operator with integral pointer and memory stop. Balancing valves shall be selected for the required flows as indicated on the plans.

2.1.7 End Connections

2.1.7.1 Flexible Connectors

Provide flexible pipe connectors on piping connected to equipment. Flexible section shall consist of rubber, tetrafluoroethylene resin, corrosion-resistant steel, bronze, monel, or galvanized steel. Material provided and configuration shall be suitable for [pressure,] [vacuum,] [temperature,] and circulating medium. Flexible section shall have [threaded,] [welding,] [soldering,] [flanged] [or] [socket-weld] ends and shall be suitable for service intended. Flexible section may be reinforced with metal retaining rings, with built-in braided wire reinforcement and restriction bolts or with wire braid cover suitable for service intended.

2.1.7.2 Steel Piping

Screwed or socket welded for 50 mm 2 inches and smaller and flanged or butt welded for 65 mm 2 1/2 inches and larger.

b. Flanged Joints: Bolting and gaskets shall be as follows:

(1) Bolting: Bolt and stud material ASTM A307, Grade B, and nut material ASTM A194/A194M, Grade 2. Bolt, stud, and nut dimensions ASME B18.2.2 threads ASME B1.1 coarse type with Class 2A fit for bolts and studs, and Class 2B fit for nuts. Bolts or bolt studs shall extend completely through the nuts and may have reduced shanks of a diameter not less than the diameter at root of threads. Carbon steel bolts shall have American Standard regular square or heavy hexagon heads and shall have American Standard heavy semifinished hexagonal nuts conforming to ASME B18.2.2.

(2) Gaskets: ASME B16.21, Nonasbestos compressed material 1 1/2 mm 1/16 inch thickness full face or self-centering flat ring type and suitable for pressure and temperature of the piping system.

c. Butt Weld Joints: ASME B31.9. Backing rings shall conform to ASME B31.9. Ferrous rings shall not exceed 0.05 percent sulfur; for alloy pipe, backing rings shall be of material compatible with the chemical composition of the parts to be welded and preferably of the same composition. Provide continuous machined or split band backing rings.

2.1.7.3 Joints for Copper Tubing

a. Solder conforming to ASTM B32 alloy grade Sb5 or Sn96. Solder and flux shall be lead free (less than 0.2 percent of lead).

b. Copper Tube Extracted Joint: An extracted mechanical tee joint may be
made in copper tube. Make joint with an appropriate tool by drilling a pilot hole and drawing out the tube surface to form a collar having a minimum height of three times the thickness of the tube wall. To prevent the branch tube from being inserted beyond the depth of the extracted joint, provide dimpled depth stops. Notch the branch tube for proper penetration into fitting to assure a free flow joint. Braze extracted joints using a copper phosphorous classification brazing filler metal. Soldered joints shall not be permitted.

2.1.8 Expansion Joints

2.1.8.1 Packless Type

Provide ASTM F1120, Type III with fabricated corrosion-resistant steel bellows.

2.1.8.2 Guided Slip-Tube Type

Provide ASTM F1007, Type IV internally-externally guided, injected semiplastic type packing.

2.1.9 Instrumentation

2.1.9.1 Pressure and Vacuum Gauges

Provide ASME B40.100 with restrictor.

2.1.9.2 Indicating Thermometers

Thermometers shall be dial type with an adjustable angle suitable for the service. Provide thermowell sized for each thermometer in accordance with the thermowell specification. Fluid-filled thermometers (mercury is not acceptable) shall have a nominal scale diameter of 125 mm 5 inches. Construction shall be stainless-steel case with molded glass cover, stainless-steel stem and bulb. Stem shall be straight, length as required to fit well. Bimetal thermometers shall have a scale diameter of 90 mm 3 1/2 inches. Case shall be hermetic. Case and stem shall be constructed of stainless steel. Bimetal stem shall be straight and of a length as required to fit the well.

2.1.9.3 Pressure/Temperature Test Ports

Pressure/Temperature Test Ports shall have brass body and EPDM and/or Neoprene valve seals. Ports shall be rated for service between 2 and 135 degrees C 35 and 275 degrees F and up to 3447 kPa (gage) 500 psig. Ports shall be provided in lengths appropriate for the insulation thickness specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS and installed to allow a minimum of 305 mm 12 inches of access for probe insertion. Provide with screw-on cap attached with a strap or chain to prevent loss when removed. Ports shall be 8 mm DN 1/4 inch NPT and accept 3 mm 1/8 inch diameter probes.

2.1.10 Miscellaneous Pipeline Components

2.1.10.1 Air Vent

Provide float type air vent in hydronic systems. Vent shall be constructed of brass or semi-steel body, copper float, and stainless steel valve and valve seat. Design air vent to suit system operating temperature and
pressure. Provide isolating valve to permit service without draining the system. Pipe discharge of vent to a drain.

2.1.10.2 Strainers

Strainers for classes 125 and 250 piping in IPS 15 to 200 mm 1/2 to 8 inches, inclusive, FS WW-S-2739 and locate as indicated.

2.1.10.3 Hangers and Supports

Design and fabrication of pipe hangers, supports, and welding attachments shall conform to MSS SP-58 and ASME B31.9. Hanger types and supports for bare and covered pipe shall conform to MSS SP-69 for the temperature range. [If ferrous materials are used, provide hot dipped galvanized hangers, inserts and supports.]

2.1.10.4 Pipe Sleeves

Sleeves in masonry and concrete walls, floors, and roof slabs shall be ASTM A53/A53M, Schedule 40 or Standard Weight, hot-dip galvanized steel [ductile-iron or cast-iron] pipe. Sleeves in partitions shall be zinc-coated sheet steel having a nominal weight of not less than 4.40 kilogram per square meter 0.906 pound per square foot.

2.1.10.5 Escutcheon Plates

Provide one piece or split hinge metal plates for piping passing through floors, walls, and ceilings in exposed spaces. Provide polished stainless steel plates or chromium-plated finish on copper alloy plates in finished spaces and paint finish on metal plates in unfinished spaces.

2.2 CENTRAL MECHANICAL EQUIPMENT

2.2.1 [Boilers]

Provide as specified in [Section 23 52 43.00 20 LOW PRESSURE WATER HEATING BOILERS UNDER 800,000 BTU/HR OUTPUT][Section 23 52 46.00 20 LOW PRESSURE WATER HEATING BOILERS OVER 800,000 BTU/HR OUTPUT].

]2.2.2 [Hot Water Heat Exchangers]

Provide as specified in Section 23 21 13.23 20 [HIGH] [MEDIUM] TEMPERATURE WATER SYSTEM WITHIN BUILDINGS.

]2.2.3 [Converters]

Steam to hot water converters shall conform to FS WW-H-191 and shall have capacity as indicated for the design conditions. The converters shall be
designed for support by separate pipe hangers, and [temperature regulator] [vent valve] shall be provided.

2.3 PIPING SYSTEM EQUIPMENT

2.3.1 Pumps

Provide hot water circulating pumps, CID A-A-50560, Service A. Pump casing and flange shall be made of close-grained cast iron. Shaft shall be carbon or alloy steel with lubricated bearings and impeller shall be bronze. Select pumps so that the operating point on selected impeller-curve will lie at or to the left of shutoff side of, and not more than 5 percent below, point of maximum efficiency for impeller. Provide motors of [open] [splash proof] [totally enclosed] type conforming to NEMA MG 1 and suitable for electrical characteristic as indicated. Motor starters shall conform to NEMA ICS 2 [manual] [across the line] [reduced-voltage-start] [part-wind] [wye-delta] type with NEMA ICS 6[general purpose] [weather-resistant] [watertight] enclosure.

2.3.2 Expansion Tanks

Provide welded steel, constructed and tested hydrostatically in accordance with ASME BPVC SEC VIII D1. Tank shall be equipped with all necessary fittings. The tank and fittings shall be pressure rated at least equal to the test pressure of the total system. Zinc coat the tank inside and out after fabrication by the hot dip process ASTM A123/A123M.

2.3.3 External Air Separation Tanks

Provide tank constructed of steel, designed for not less than 517 kPa (gage) 75 psig, and constructed and tested in accordance with the requirements of ASME BPVC SEC VIII D1. Provide tangential inlet and outlet connections, flanged for sizes 65 mm 2 1/2 inches and larger. Each unit shall have an internal design suitable for creating the required vortex and subsequent air separation. Provide with automatic air release device and galvanized steel strainer. Provide a blow down connection with a gate valve and piped to nearest floor drain.

2.3.4 Backflow Preventers

**************************************************************************
NOTE: If contract specifications includes Section 22 00 00 PLUMBING, GENERAL PURPOSE in which backflow preventers are specified, delete this paragraph entitled "Backflow Preventers."
**************************************************************************

Reduced pressure principle type. Furnish proof that each make, model/design, and size of backflow preventer being furnished for the project is approved by and has a current "Certificate of Approval" from the [FCCCHR List] [or] [local code]. Listing of a particular make, model/design, and size in the current [FCCCHR List] [or] [local code] will be acceptable as the required proof.

2.3.5 Flow Measuring Equipment

Orifice or venturi type. Flow metering equipment including pitot tubes, venturis, orifice plates, flanges, and indicating meters shall be the product of one and the same manufacturer. Provide flowmeters of [permanent
type] [or] [portable type] [type indicated]. Flowmeters shall be suitable for service in which they are to be installed. Primary elements of flowmeters shall conform to ASME recommendations for flowmeters. Provide bronze, monel, or stainless steel materials for wetted parts of flow meters.

a. Orifices: Square-edge type, made of corrosion and erosion resistant metal and mounted between pipe flanges having factory-made pressure taps provided with shutoff valves. Orifice flanges shall conform to ASME B16.36.

b. Tubular Flowmeters: Flow measuring elements consisting of venturi tubes or pitot tubes where indicated. Locations and arrangement of piping, both upstream and downstream of flow measuring elements shall conform to the manufacturer's published literature. Provide each flow measuring element with an integral tab, or a metal tag on a corrosion-resistant steel wire, extending outside pipe covering, and stamped or printed in a visible position with manufacturer's name and address; serial number of meter to which it is to be connected; name, number, or location of equipment served; specified rate of flow; and multiplier to be applied to meter reading. Provide taps with shutoff valves and quick connecting hose fittings for portable meters or double ferrule compression fittings for connection to tubing for permanently located meters or recorders. Tubes shall be calibrated in accordance with ASME recommendations.

(1) Venturi Tubes: Certified by the manufacturer for the actual piping configuration and any necessary piping changes required for certification without additional cost to the Government. Throat diameter for each venturi tube shall be designed so that at specified rate of flow the scale reading will fall between 50 percent and 80 percent of full scale value. Select venturi tube sizes from the manufacturer's latest published tables of flow versus differential pressure. Unrecovered head loss at maximum flow shall not exceed 10 percent. Provide bronze or cast iron tubes with bronze-lined throats, with flanged, threaded, or welded ends to suit piping system. Provide bodies of fabricated steel and fittings of the same class as piping in which installed. Two integral meter taps shall be provided in each venturi tube. Connections for attachment to portable flow meter hoses shall be readily accessible and not over 1830 mm 6 feet above a floor or permanent platform.

(2) Pitot Tube Assemblies: Provide corrosion-resistant materials. Tubes shall be capable of measuring liquid flow through tube elements providing an averaged, interpolated flow measurement from a single, fixed position. Provide self cleaning elements and impact tube designed to rotate when turned by the operator to protect pressure-sensing elements of tube when not in use. Location and total amount of pitot tubes required for system flow measurement shall be as recommended by the manufacturer and as indicated.

c. Meters: Designed for a full scale pressure differential of 12 kPa 50 inches water gage for tubular type or 25 kPa 100 inches water gage for orifice type. Dials shall have square root or linear scales with developed length of not less than 305 mm 12 inches. Provide flush mounted panel meters that read directly in liters per second gallons per minute. Dials of portable meters shall have square root scales reading from 0 to 6 L/s 0 to 100 gpm for use with multiplier stamped on
orifice or tubular type. Provide meters designed for not less than 1378 kPa 200 psi and protected against pressure surges. Meter bodies shall have taps for venting and draining.

(1) Permanently Mounted Meters: Each meter shall be connected completely [as indicated] [and] [as specified] and provided with the following: three valve manifold equalizer lines, two block valves, two vent and drain valves, and an integral pulsation damper. Overall accuracy of meters shall be plus or minus 2 percent of full scale flow over a range from 20 to 100 percent of full scale flow.

(2) Portable Meters: Provide meter with a factory-fabricated carrying case with carrying handle. Provide case fitted to hold meter securely and to accommodate the following accessories:

(a) Two 4.60 meters 15 foot lengths of connecting hose with suitable female connectors for connecting from meter to [venturi tube] [orifice flange] [pitot tube] pressure-tap nipples. Provide hose designed for a minimum service pressure of 861 kPa 125 psi or 150 percent of maximum system service pressure, whichever is greater.

(b) A completely assembled three-valve manifold with two block valves and vent and drain valves, piped and mounted on a base designed for use laying flat on a stationary surface.

(c) A bound set of descriptive bulletins, installation and operating instructions, parts list, and a set of curves showing flow versus pressure differential for each orifice, venturi tube, or pitot tube with which meter is to be used.

(d) A metal instruction plate, secured inside cover, illustrating use of meter.

(e) Provide meters with overall accuracy of plus or minus 5 percent of full scale flow over a range from 20 to 100 percent of full scale flow.

2.4 TERMINAL UNITS

2.4.1 Finned Tube Radiators

[Steel tube and steel fin type FS S-R-2834]. [Copper tube and aluminum fin type CID A-A-50545, [shall have an adjustable damper].]

2.4.2 Conectors

CID A-A-50543 and CID A-A-50544, of design and capacity not less than that indicated.

2.4.3 Unit Heaters

Provide hot water unit heaters as specified in Section 23 82 00.00 20 TERMINAL HEATING UNITS.

2.4.4 Heating and Ventilating Units

Provide fan-coil units, induction units, unit ventilators, and gravity
ventilators as specified in Section 23 30 00 HVAC AIR DISTRIBUTION.

2.5 ELECTRICAL EQUIPMENT

Provide complete with motors, motor starters, thermal overload protection, and controls. Equipment and wiring shall be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.6 CONTROLS

Provide controls as specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.7 INSULATION

Provide shop and field applied insulation as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.8 ASBESTOS PROHIBITION

Asbestos and asbestos containing products are prohibited.

PART 3 EXECUTION

3.1 PREPARATION

Provide storage for equipment and material at the project site. All parts shall be readily accessible for inspection, repair, and renewal. Protect material and equipment from the weather.

3.2 INSTALLATION

Piping fabrication, assembly, welding, soldering, and brazing shall conform to ASME B31.9. Piping shall follow the general arrangement shown. Route piping and equipment within buildings out of the way of lighting fixtures and doors, windows, and other openings. Run overhead piping in buildings in inconspicuous positions. Provide adequate clearances from walls, ceilings, and floors to permit welding of joints and application of insulation. Make provision for expansion and contraction of pipe lines. Make changes in size of water lines with reducing fittings. Do not bury, conceal, or insulate until piping has been inspected, tested, and approved. Do not run piping concealed in walls, partitions, underground, or under the floor except as otherwise indicated. Where pipe passes through building structure, locate pipe joints and expansion joints where they may be inspected. Provide flanged joints where necessary for normal maintenance and where required to match valves and equipment. Furnish gaskets, packing, and thread compounds suitable for the service. Provide long radius ells where possible to reduce pressure drops. Pipe bends in lieu of welding fittings may be used where space permits. Pipe bends shall have a uniform radius of at least five times the pipe diameter and shall be free from appreciable flattening, wrinkling, or thinning of the pipe. Do not use mitering of pipe to form elbows, notching straight runs to form full sized tees, or any similar construction. Make branch connections over 50 mm 2 inches with welding tees except factory made forged welding branch outlets or nozzles having integral reinforcements conforming to ASME B31.9 may be used, provided the nominal diameter of the branch is at least one pipe size less than the nominal diameter of the run. Branch connections 50 mm 2 inches and under can be threaded or welded. Run vertical piping plumb and straight and parallel to walls. Provide sleeves for lines passing...
through building structure. Provide a fire seal where pipes pass through fire wall, fire partitions, fire rated pipe chase walls, or floors above grade. Install piping connected to equipment with flexibility for thermal stresses and for vibration, and support and anchor so that strain from weight and thermal movement of piping is not imposed on the equipment.

3.2.1 Hangers and Supports

Unless otherwise indicated, horizontal and vertical piping attachments shall conform to MSS SP-58. Band and secure insulation protection shields without damaging pipe insulation. Continuous inserts and expansion bolts may be used.

3.2.2 Grading of Pipe Lines

Unless otherwise indicated, install horizontal lines of hot water piping to grade down in the direction of flow with a pitch of not less than 25 mm in 9 meters one inch in 30 feet, except in loop mains and main headers where the flow may be in either direction.

3.2.3 Pipe Sleeves

Provide sleeves where pipes and tubing pass through masonry or concrete walls, floors, roof, and partitions. Annular space between pipe, tubing, or insulation and the sleeve shall not be less than 6 mm 1/4 inch. Hold sleeves securely in proper position and location before and during construction. Sleeves shall be of sufficient length to pass through entire thickness of walls, partitions, or slabs. Sleeves in floor slabs shall extend 50 mm 2 inches above finished floor. Firmly pack space between pipe or tubing and sleeve with oakum and caulk on both ends of the sleeve with plastic waterproof cement which will dry to a firm but pliable mass, or provide a [mechanically adjustable] segmented elastomeric seal. Seal both ends of penetrations through fire walls and fire floors to maintain fire resistive integrity with UL listed fill, void, or cavity material.

3.2.4 Flashing for Buildings

Provide flashing where pipes pass through building roofs, and make outside walls tight and waterproof.

3.2.5 Unions and Flanges

Provide unions and flanges to permit easy disconnection of piping and apparatus. Each connection having a screwed-end valve shall have a union. Place unions and flanges no farther apart than 30 meters 100 feet. Install unions downstream of valves and at equipment or apparatus connections. Provide unions on piping under 50 mm 2 inches in diameter, and provide flanges on piping 50 mm 2 inches and over in diameter. Provide dielectric unions or flanges between ferrous and non-ferrous piping, equipment, and fittings; except that bronze valves and fittings may be used without dielectric couplings for ferrous-to-ferrous or non-ferrous-to-non-ferrous connections.

3.2.6 Connections for Future Equipment

Locate capped or plugged outlets for connections to future equipment as indicated.
3.2.7 Changes in Pipe Size

Provide reducing fittings for changes in pipe size; reducing bushings are not permitted. In horizontal lines, provide eccentric reducing fittings to maintain the top of the lines in the same plane.

3.2.8 Cleaning of Pipe

Thoroughly clean each section of pipe, fittings, and valves free of foreign matter before erection. Prior to erection, hold each piece of pipe in an inclined position and tap along its full length to loosen sand, mill scale and other foreign matter. For pipe 50 mm 2 inches and larger, draw wire brush, of a diameter larger than that of the inside of the pipe, several times through the entire length of pipe. Before making final connections to apparatus, wash out interior of piping thoroughly with water. Plug or cap open ends of mains during shutdown periods. Do not leave lines open where foreign matter might enter the pipe.

3.2.9 Valves

Install valves in conformance with ASME B31.9. Provide gate valves unless otherwise directed. Install valves with stems horizontal or above. Locate or equip stop valves to permit operation from floor level, or provide with safe access in the form of walkways or ladders. Install valves in positions accessible for operation and repair.

3.2.9.1 Globe Valves

Install globe valves so that the pressure is below the disk and the stem horizontal.

3.2.9.2 Radiators Valves

Provide radiator valves on water inlet and balancing valves on water outlet of terminal heating units such as radiation, unit heaters, and fan coil unit.

3.2.9.3 Relief Valves

Provide valves on pressure tanks, low pressure side of reducing valves, heat exchangers, and expansion tanks. Select system relief valve so that capacity is greater than make-up pressure reducing valve capacity. Select equipment relief valve capacity to exceed rating of connected equipment. Pipe relief valve outlet to the nearest floor drain.

3.2.10 Pressure Gage

Provide a shut-off valve or pet cock between pressure gages and the line.

3.2.11 Thermometers

Provide thermometers and thermal sensing elements of control valves with a separable socket. Install separable sockets in pipe lines in such a manner to sense the temperature of flowing the fluid and minimize obstruction to flow.

3.2.12 Strainers

Provide strainers, with meshes suitable for the services, where indicated,
or where dirt might interfere with the proper operation of valve parts, orifices, or moving parts of equipment.

3.2.13 Pumps

Select pumps for specified fluid temperatures, are non-overloading in parallel or individual operation, and operate within 25 percent of midpoint of published maximum efficiency curve. Support piping adjacent to pump such that no weight is carried on pump casings. Install close coupled and base mounted pumps on concrete base, with anchor bolts, set and level, and grout in place and provide supports under elbows on pump suction and discharge line sizes 100 mm 4 inches and over. Lubricate pump before start-up.

3.2.14 Equipment Foundations

Locate equipment foundations as shown on the drawings. Size, weight, and design shall preclude shifting of equipment under operating conditions. Foundations shall meet the requirements of the equipment manufacturer. Concrete shall conform to Section 03 30 00 CAST-IN-PLACE CONCRETE, and grout shall be approved non-shrinking.

3.2.15 Equipment Installation

Install equipment in accordance with installation instructions of the manufacturers. Grout equipment mounted on concrete foundations before installing piping. Install piping in such a manner as not to place a strain on the equipment. Do not bolt flanged joints tight unless they match. Grade, anchor, guide, and support piping without low pockets.

3.2.16 Cleaning of Systems

As installation of the various system components is completed, fill, start, and vent prior to cleaning. Place terminal control valves in open position. Add cleaner to closed system at concentration as recommended by manufacturer. Apply heat while circulating, slowly raising temperature to 71 degrees C 160 degrees F and maintain for 12 hours minimum. Remove heat and circulate to 38 degrees C 100 degrees F or less; drain systems as quickly as possible and refill with clean water. Circulate for 6 hours at design temperatures, then drain. Refill with clean water and repeat until system cleaner is removed. Use neutralizer agents on recommendation of system cleaner supplier and approval of Contracting Officer. Remove, clean, and replace strainer screens. Inspect, remove sludge, and flush low points with clean water after cleaning process is completed. Include disassembly of components as required. Preliminary or final tests are not permitted until cleaning is approved.

3.2.17 Painting of Piping and Equipment

**************************************************************************
NOTE: When the project specification does not have a section on field painting, the requirements in Section 09 90 00 PAINTS AND COATINGS for cleaning and painting of pipe and equipment, and for painting and stenciling of piping shall be included in this section.
**************************************************************************

Provide in accordance with Section 09 90 00 PAINTS AND COATINGS.
3.2.18 Identification of Piping

****************************************************
NOTE: When the project specification does not have
a section on field painting, the requirements in
Section 09 90 00 for cleaning and painting of pipe
and equipment, and for painting and stenciling of
piping shall be included in this section.
****************************************************

Identify piping in accordance with OSHA 29 CFR 1910.144, except that labels
or tapes may be used in lieu of painting or stenciling. Spacing of
identification marking on runs shall not exceed 15 meters 50 feet.
Materials for labels and tapes shall conform to CID A-A-1689, and shall be
general purpose type and color class. Painting and stenciling shall
conform to Section 09 90 00 PAINTS AND COATINGS.

3.3 FIELD QUALITY CONTROL

Perform inspections and tests as specified herein to demonstrate that
piping and equipment, as installed, is in compliance with contract
requirements. Start up and operate the system. During this time,
periodically clean the various strainers until no further accumulation of
foreign material occurs. Exercise care so that minimum loss of water
occurs when strainers are cleaned. Adjust safety and automatic control
instruments to place them in proper operation and sequence.

3.3.1 Hydrostatic Test of Piping System

*****************************************************
NOTE: Test piping systems at one and one-half times
system pressure or 345 kPa (gage) 50 psig whichever
is greater.
*****************************************************

Test piping system hydrostatically using water not exceeding 38 degrees C
100 degrees F. Conduct tests in accordance with the requirements of
ASME B31.9 and as follows. Test piping system after all lines have been
cleaned and before applying insulation covering. Remove or valve off from
the system, gages, and other apparatus which may be damaged by the test
before the tests are made. Install calibrated test pressure gage in the
system to observe any loss in pressure. Maintain test pressure for a
sufficient length of time to enable an inspection of each joint and
connection. Perform tests after installation and prior to acceptance.
Notify the Contracting Officer in writing [_____] days prior to the time
scheduled for the tests.

3.3.2 Auxiliary Equipment and Accessory Tests

Observe and check pumps, accessories, and equipment during operational and
capacity tests for leakage, malfunctions, defects, noncompliance with
referenced standards, or overloading.

3.3.2.1 Backflow Preventers

Backflow preventers shall be tested by locally approved and certified
backflow assembly testers. A copy of the test report shall be provided to
the Contracting Officer prior to placing the domestic water system into
operation, or no later than 5 days after the test.

3.4 TESTING, ADJUSTING, AND BALANCING

**************************************************************************

NOTE: Use the first sentence for simple hydronic systems and where Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC is not included in the specifications. Use the second sentence for all specifications with Section 15996.

**************************************************************************

[Except as specified herein, perform in accordance with SMACNA 1780, Chapter VIII "Hydronic System TAB Procedures," drawings and specifications; prepare complete report of final test results.] [Test, adjust, and balance the hydronic system in accordance with Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC.]

3.4.1 Markings of Settings

Following final acceptance of the balancing report, the settings of all valves, splitters, dampers, and other adjustment devices shall be permanently marked so that adjustment can be restored if disturbed at anytime.

3.4.2 Sound Level Tests

Upon completion of testing and balancing of hydronic systems, conduct sound level tests of conditioned spaces. Use sound level meter required by ASA S1.4, Type 2, calibrated in accordance with NBS standards and guidelines, and accompanied by a certificate of calibration. Record sound levels in dBA with heating systems off and with heating systems operating. Record the following data for each room and system:

a. Background sound level (systems off);

b. Total sound level corrected for background; and

c. Sound power rating by manufacturer of the respective outlet.

Test Locations: Take sound level reading at location 2 meters 6 feet from face of each outlet on a line at 45 degrees with face of outlet. Remedial Action: If sound level at any observation point exceeds [20] [45] [_____] dBA, take remedial action as directed.

3.5 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurement, and not on metric measurement commonly agreed to by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

[HIGH][MEDIUM] TEMPERATURE WATER SYSTEM WITHIN BUILDINGS

07/07, CHG 1: 11/19

**NOTE:** This guide specification covers the requirements for high and medium temperature water piping systems inside of building mechanical rooms, including connections to interior existing piping and system terminal unit.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**NOTE:** Project requirements may require addition of supplemental information to the paragraphs contained herein, however, designer is cautioned to verify additional references to ascertain applicability of materials to system design prior to inclusion.

**NOTE:** The following information shall be shown on the project drawings:

1. Flow diagram of high or medium temperature water piping indicating connections to existing supply and return, pressure and temperature of existing supply.
and return, (maximum and minimum or constant, applicable), valves and critical valve positions (including normally closed for bypass valve), any necessary flow rates, pressure drops not already in equipment schedule or specifications, and location of temperature and/or pressure sensors.

2. System Terminal Unit detail providing location of all piping including valves, strainers, flanges, fittings, connections, and supports (coordinate with Section 23 21 13.00 20 and Section 23 22 26.00 20).

3. Single line plan and any necessary sections indicating location, sizes, and routing of all associated piping.

4. Appropriate schedules for equipment, including any reset schedules.

5. Information necessary when asbestos material is involved (See second note in paragraph entitled "Description").

6. Detail of connections to existing high or medium temperature water piping, including air chambers and vents as required.

PART 1  GENERAL

ASTM INTERNATIONAL (ASTM)

ASTM A193/A193M (2023) Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service and Other Special Purpose Applications

1.2 DEFINITIONS

1.2.1 Medium Temperature Water (MTW)

Heating hot water systems operating at **121 to 177 degrees C 250 to 350 degrees F**.

1.2.2 High Temperature Water (HTW)

Heating hot water systems operating at greater than **177 degrees C but less than 232 degrees C 350 degrees F but less than 450 degrees F**.

1.2.3 Terminal Unit

Heat exchanger or steam producer using [HTW][MTW] as the primary heating medium.

1.2.4 Steam Producer

Unfired steam generator.

1.3 GENERAL REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section with additions and modifications specified herein.

1.3.1 Associated Work

**************************************************************************

NOTE: Edit, specifying all associated sections for

SECTION 23 21 13.23 20 Page 6
Other work associated with this section including insulation, hot water piping, hot water distribution outside the building, steam, and painting is covered in other sections of this specification.

1.3.2 Description

NOTE: Work should be confined to inside of building mechanical rooms. Avoid running high or medium temperature water in occupied spaces or where hidden from access or view.

NOTE: This section requires connections to existing high or medium temperature water piping that may contain asbestos insulation or associated material. Sampling and testing of suspicious material and subsequent inclusion of Section 02 82 00 ASBESTOS REMEDIATION or Section 02 83 00 LEAD REMEDIATION and appropriate plans for asbestos material removal and disposal must be verified by the designer and provided as necessary.

The work shall include the furnishing, installing, and testing of high temperature water piping inside the building, as indicated, together with all fittings and appurtenances necessary for a complete and operable system. [The work also includes modifications and [HTW][MTW] system connection] to the existing [HTW][MTW] piping.

1.3.3 Classes and Maximum Working Pressures

Except as specified otherwise, piping components shall be suitable for use under the maximum working pressures indicated. Except as modified herein, the pressure temperature limitations shall be as specified in the referenced standards and specifications. All pressures in this specification are pressures in kilopascal (kPa) pounds per square inch (psi) above atmospheric pressure, and all temperatures are in degrees Celsius (C) degrees Fahrenheit (F).

1.3.4 Field Verification

The Contractor shall become familiar with all details of the work, verify all dimensions in the field, verify the maximum operating temperature and pressure of the heating distribution system with the heating plant foreman, and advise the Contracting Officer of any discrepancy within 3 days and before performing any work.

1.3.5 Identification

Each major item of equipment shall have the manufacturer's name, address, type or style, and model or serial number on a plate secured to the item of equipment.
1.3.6 Welding Safety

Safety in welding and cutting of pipe shall conform to AWS Z49.1.

1.3.6.1 Procedures and Qualifications

Before any welding is performed, the Contractor shall submit welding procedure specifications for all metals included in the work, together with proof of its qualification as outlined in ASME B31.1.

Before any welder or operator performs any welding, submit Welder's Performance Qualification Record in conformance with ASME B31.1 showing that the welder was rated under the approved procedure specification submitted by the Contractor. In addition, submit each welder's assigned number, letter, or symbol used to identify the work of the welder, and affix immediately upon completion of the weld. To welders making defective welds after passing a qualification test, give a qualification test and upon failing to pass the test, do not permit to work this contract.

Welders and welding operators previous qualifications on welding procedures test may be accepted for the contract without requalification subject to the approval and provided that all the conditions specified in ASME B31.1 are met before a procedure can be used.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air
Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
Valves
Packing
Gaskets

SD-02 Shop Drawings
[HTW][MTW] System connection diagrams (within building)

SD-03 Product Data
Valves
Strainers
Pipe
Pipe fittings
[Heat exchanger]
[Steam producer]
[Expansion joints]

Information shall show details, dimensions, capacities, and ratings.

SD-07 Certificates
Welding procedure specifications
Performance qualification record
Previous qualifications
Valves
Gaskets

PART 2 PRODUCTS

2.1 PIPE AND PIPE SYSTEM
NOTE: When individual branch loops require circulating pumps due to constant volume plant system design or insufficient available differential pressure for terminal unit control valve in a variable volume plant system design, designer must provide appropriate pump specifications herein. Pumps shall be carefully sized for the specific loop only such that operation of the main plant system and other branch loops is not affected.

**************************************************************************

NOTE: If it is necessary to provide for additional thermal expansion of piping, designer may provide design and specification for either expansion loop(s) or mechanical expansion joints for the particular service, however, expansion loop(s) are preferred.

**************************************************************************

2.1.1 High Pressure Piping System

**************************************************************************

NOTE: Specify the maximum pressure and temperature leaving the central heating plant. Note that some operating pressures may be substantially higher than corresponding saturation pressures at the supply temperature, depending upon the method of plant generator pressurization (Booster pumps and compressed gas pressurization methods produce distribution pressures considerably higher than steam buffer type method). Select design pressure equal or greater than one and one half (1-1/2) times the maximum operating pressure.

**************************************************************************

ASME B31.1; Maximum operating pressure of [_____] kPa psi at [_____] degrees C degrees F; design pressure of [2068] [2758] [4136] [_____] kPa [300] [400] [600] [_____] psi.

2.1.2 Pipe

Pipe 50 mm 2 inches in diameter and larger: schedule 80, black steel plain end beveled, ASTM A53/A53M, Grade B, Type E (electric resistance welded) or S (seamless), or ASTM A106/A106M, Grade B. Pipe sizes through 40 mm 1 1/2 inches in diameter: schedule 80, black steel, ASTM A106/A106M, Grade B.

2.1.3 Pipe Fittings

Fittings shall be compatible in thickness with the pipe being used, shall be used in conformance with ASME B31.1, and shall conform to the following requirements. Steel welded fittings: ASTM A234/A234M. Flanges shall be serrated or raised-faced type. In horizontal lines, reducing fittings shall be the eccentric type and installed to ensure that the system can be thoroughly drained. Remove raised faces when used with existing flanges having a flat face.
2.1.3.1 Fittings for Steel Pipe Sizes 3 to 50 mm 1/8 to 2 inches

ASME B16.11, Class 300 steel socket welding type.

2.1.3.2 Fittings for Steel Sizes 65 mm 2 1/2 inches and Above

Steel fitting butt welding type ASME B16.9 or ASME B16.5 flanged type, Class 300.

2.1.4 Gaskets

The Contractor shall submit the manufacturers published temperature and pressure ratings and provide materials recommended by the manufacturer for the maximum operating temperature, system design pressure, and service specified herein.

2.1.5 Bolting

Bolt studs for flanged joints shall be alloy steel studs, threaded on both ends and fitted with two hexagon nuts per stud. Bolt shall be ASME B18.2.1 and material shall conform to ASTM A193/A193M, Grade B-7, threads Class 7 fit. Nuts shall be American Standard Heavy semi-finished hexagonal (ASME B18.2.2) and material shall conform to ASTM A194/A194M, Grade 7.

2.1.6 Vents

**************************************************************************
NOTE: Air chambers may be deleted if branch connections are made to bottom half of existing overhead supply and return mains. See paragraph entitled "Branch Connections" herein.
**************************************************************************

Provide air chambers and manual air vent valves as indicated at all high points in the [HTW][MTW] system. Provide a 15 mm 1/2 inch vent line from each air vent to the nearest drain. Vent lines shall be provided with two 15 mm 1/2 inch bar stock globe valves as indicated.

2.1.7 Valves; Gate, Globe, Ball, Check, Angle, and Control

All valve materials shall conform to ASME B16.34. Valve bodies shall be carbon or stainless steel (Type 304 or 316) with stainless steel trim. All valves shall be Class 300. Ends shall be butt welding or raised face flanged type conforming to ASME B16.34. Valve pressure and temperature design values shall not be exceeded. The Contractor shall submit the manufacturers recommended materials list for valves, packing, and gaskets with certification that all meet the system design pressure at maximum operating temperature and the service as specified herein.

2.1.7.1 Globe Valves

Globe type valves shall have outside screw and yoke with bolt bonnets, and flat seats, but shall not be of the reversed-cup type. The stuffing boxes shall be large and deep. Valves 50 mm 2 inches and larger shall have at least six U or V type [teflon-impregnated braided non-asbestos] packing rings, specifically designated as suitable for high-temperature water. Valves smaller than 50 mm 2 inches shall have four or five rings.
Spiral or continuous packing will not be acceptable. A metal insert shall be provided having proper clearance around the stem at the bottom of the stuffing box and acting as a base for the packing materials. Packing glands shall be furnished with liner of noncorrosive material and shall be of one piece with not less than two bolts. Valves 32 mm 1 1/4 inches and smaller need not have yokes or bolted screws and deep stuffing boxes. Stems shall be provided with bevel above the disk for cutoff and repacking valve under pressure when fully open. On the underside side of the bonnet a pack-under-pressure bushing of stainless steel shall be provided. The bushing shall be screwed into place.

2.1.7.2 Gate Valves

Gate valves, wedge gate type, outside screw and yoke, valve body with straight through ports without recesses except between seats to assure minimum turbulence, erosion, and resistance to flow. The bonnet shall be equipped with a bonnet bushing. The valves shall have a self-centering male and female joint equipped with a gasket.

2.1.7.3 Temperature Control Valves

******************************************************************************

NOTE: Provide valve operating conditions based upon the type of control maintained at the central heating plant for the distribution system, and the arrangement of piping at the system terminal unit. Three-way valves and balancing valves are not recommended, nor any arrangement that may allow a drop in temperature/pressure sufficient to cause flash to steam. The delta P at design load should not be less than one half the available pressure drop across the valve in order for the equal-percentage type valve to function properly.

******************************************************************************

******************************************************************************

Note: Control valve delta P at design load (valve full open) shall not be less than 34 kPa 5 psi. If the control valve available differential pressure drop with valve full open is less than 34 kPa 5 psi, it is necessary to provide a pump sized for the specific branch (loop) only, which does not affect other system branches, to boost the available pressure.

******************************************************************************

Two-way, single seated, equal percentage-flow type, industrial quality flow regulating (control) valve conforming to the materials specified herein, and size selected by the valve manufacturer for the following conditions:

a. Maximum flow rate: [_____] L/s Gpm
b. Minimum flow rate: [_____] L/s Gpm
c. Internal pressure: [_____] (maximum operating) kPa Psi
d. Pressure differential at design load: [_____] (open) delta p, kPa Psi
e. Pressure Differential at minimum load: [_____] (closed) delta p, kPa
Provide automatic operator with manual override (handwheel) and position indicator.

2.1.7.4 Emergency Shutoff Valve

[HTW] [MTW] automatic, quick closing, ball valve located between the manual [HTW] [MTW] supply shutoff valve and the system terminal unit inlet, with pressure/temperature sensor located on the shell side. Emergency valve shall automatically close when the pressure/temperature setting of the shell side safety relief valve is reached. Emergency Valve shall be normally open.

2.1.8 Strainers

Body materials shall conform to ASME B16.34, Fine Mesh type strainer and trim shall be Type 304 or 316 stainless steel, selected for the service specified herein.

2.1.9 Joints

2.1.9.1 Welded Joints

Joints between sections of pipe and between pipe and fittings shall be welded. Joints between pipe and valves shall be welded or flanged. The welding shall conform to requirements of paragraph entitled "Responsibility of Contractor for Fusion Welding." Branch connections may be made with either welding tees or forged branch outlet fittings, either being acceptable without size limitations. Branch outlet fittings where used shall be forged, flared for improved flow where attached to the run, reinforced against external strains, and designed to withstand full pipe-bursting strength.

2.1.9.2 Flanged Joints

Joints for connection to valves in high or medium temperature water system shall be welded or flanged, faced true, provided with gaskets, and made perfectly square and tight. Flanges shall be forged steel, raised face, weld-neck type. Slip-on flanges will not be allowed. Gaskets for [HTW] [MTW] systems shall be [metallic non-asbestos] [______].

2.1.10 Hangers and Supports

***********************************************************************************************
NOTE: In project locations with Environmental Severity Classification (ESC) of C4 or C5 or high humidity areas as identified in ASHRAE 90.1 as climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C, include bracketed sentence below to require hot-dipped galvanized hangers if ferrous materials are used. See UFC 1-200-01 for determination of ESC for project locations.
***********************************************************************************************

ASME B31.1, MSS SP-58, MSS SP-69, and as specified herein.[ If ferrous materials are used, provide hot-dipped galvanized hangers, inserts and supports.]
2.1.11 Pipe Sleeves

Schedule 80 steel pipe, and as specified herein.

2.1.12 Caulking and Sealants

Materials as recommended by the manufacturer for the service specified herein.

2.1.13 Instrumentation

2.1.13.1 Pressure Gages

ASME B40.100, with corrosion resistant steel trim for high temperature water service. Dial range shall be 0 kPa psi to the system design pressure specified herein. Provide stainless steel isolation petcock.

2.1.13.2 Indicating Thermometers

Thermometers shall be dial type with an adjustable angle suitable for the service. Provide thermowell sized for each thermometer in accordance with the thermowell specification. Fluid-filled thermometers (mercury is not acceptable) shall have a nominal scale diameter of 127 mm 5 inches. Construction shall be stainless-steel case with molded glass cover, stainless-steel stem and bulb. Stem shall be straight, length as required to fit well. Bimetal thermometers shall have a scale diameter of 90 mm 3 1/2 inches. Case shall be hermetic. Case and stem shall be constructed of stainless steel. Bimetal stem shall be straight and of a length as required to fit the well.

2.1.14 System Terminal Units

2.1.14.1 Heat Exchanger, [HTW][MTW]

**************************************************************************
NOTE: Since the hot water heat exchanger and associated hot water piping is specified in Section 23 21 13.00 20 LOW TEMPERATURE WATER [LTW] HEATING SYSTEM and high or medium temperature water piping herein, coordination for the heat exchanger details indicating arrangement of piping is necessary. Avoid redundancy between Section 23 21 13.23 20 [HIGH] [MEDIUM] TEMPERATURE WATER SYSTEM WITHIN BUILDINGS, Section 23 21 13.00 20 LOW TEMPERATURE WATER [LTW] HEATING SYSTEM and other related specifications sections. When paragraph entitled "Pressure Gages" is used, provide auxiliary piping and accessories in other sections, including relief valve, thermal measuring element (sensor), and auxiliary piping and wiring, alarms, controllers, and flow switches.
**************************************************************************

Designed for an operating pressure of 2758 kPa 400 psi [_____] and a temperature of 204 degrees C 400 degrees F [_____]; factory tested hydraulically to 4136 kPa 600 psi [_____]; welded steel support brackets or flanges; Class 300 steel primary water flanges; stainless steel or seamless, stress relieved, cupro-nickel (90-10) U-tubes; steel head and
flanged opening for easy tube bundle removal; tube sheets and baffles of same material as tubes] [steel]; steel shell designed for a pressure of 4136 [2758] [2068] kPa 600 [400] [300] psi; openings for ASME pressure relief valve, thermal measuring element (sensor), pressure gage, vent, thermometer, and drain, provided by welded fittings to shell; handholes provided where indicated or recommended by manufacturer. Arrangement of heat exchanger piping shall be as indicated such that [HTW] [MTW] (primary heating medium) is connected to the U-tube side (with offset flanges) and secondary water to the shell side. The heat exchanger shall be designed in accordance with ASME BPVC SEC VIII D1, and carry the code stamp.

2.1.14.2 Steam Producer, [HTW][MTW]

***************************************************
NOTE: When paragraph entitled "Indicating Thermometers" is used, coordination with Section 23 22 26.00 20 STEAM SYSTEM AND TERMINAL UNITS and other related sections is necessary. Designer must provide specifications for the following accessories:

1. Feedwater pump(s).
2. Condensate receiver.
4. Chemical feed.
5. Makeup water.
6. Auxiliary piping & wiring.
7. Magnetrol water column pump controller/low water cutoff.
8. Proportional pressure controller with pressure sensing element for control valve.

***************************************************

Arranged with [HTW] [MTW] on the U-tube side and steam on the shell side, designed for an operating pressure of 2758 kPa 400 psi [], an temperature of 204 degrees C 400 degrees F [], factory tested hydraulically to 4136 kPa 600 psi []; welded steel support brackets or flanges; Class 300 steel water connections (offset); stainless steel or seamless, stress relieved, cupro-nickel (90-10) U-tubes; steel head and flanges opening for easy tube bundle removal; steel shell designed for a minimum pressure of 862 kPa 125 psi; openings for feedwater/makeup water, drain, blowdown, steam outlet, water level gage, water level control mechanism (pneumatic or electric), ASME safety relief valve [one] [two], pressure gage, [manhole] [handholes], chemical feed, and vent; internal water separator welded to shell at steam exit. The steam producer shall be designed in accordance with ASME BPVC SEC VIII D1, and carry the code stamp.

PART 3 EXECUTION

3.1 INSTALLATION

Arrange work in a neat and orderly manner so that minimum storage of equipment and material is required at the project site. All parts shall be
readily accessible for inspection, repair, and renewal. Protect material and equipment from the weather.

3.2 PIPING

Unless specifically stated to the contrary, fabrication, assembly, welding, soldering, and brazing shall conform to ASME B31.1 for all piping of the hot water system. All piping shall follow the general arrangement shown; cut accurately to measurements established for the work by the Contractor, and work into place without springing or forcing, except where cold-springing is specified. Install piping within buildings entirely out of the way of lighting fixtures and doors, windows, and other openings. Run overhead piping in buildings in the most inconspicuous positions. Provide adequate clearances from walls, ceilings, and floors to permit the welding of joints; at least 150 mm 6 inches for pipe sizes 100 mm 4 inches and less, 254 mm 10 inches for pipe sizes over 100 mm 4 inches, and in corners provide sufficient clearance to permit the welder to work between the pipe and one wall. Make provision for expansion and contraction of pipe lines. Make changes in size of water lines with reducing fittings. Do not bury, conceal, or insulate piping until it has been inspected, tested, and approved. Protect materials and equipment from the weather. Do not run piping concealed in walls or partitions or underground or under the floor except as otherwise indicated. Where pipe passes through building structure, do not conceal pipe joints but locate where they may be readily inspected. Run all pipe to be insulated as shown and as required with sufficient clearance to permit application of insulation. Use flanged joints only where necessary for normal maintenance and where required to match valves. Provide gaskets, packing, and thread compounds suitable for the service. Use long radius ells wherever possible to reduce pressure drops. Pipe bends in lieu of welding fittings may be used where space permits. Pipe bends shall have a uniform radius of at least five times the pipe diameter and must be free from any appreciable flattening, wrinkling, or thinning of the pipe. Changes in direction may be made by bending of pipe provided that a hydraulic pipe bender is used. Pipe to be bent shall be steel conforming to ASTM A53/A53M, Class required to match adjoining pipe. Bent pipe showing kinks, wrinkles, or malformations will not be acceptable. Do not use mitering of pipe to form elbows, notching straight runs to form full sized tees, or any similar construction. Make all branch connections with welding tees except factory made forged welding branch outlets or nozzles having integral reinforcements conforming to ASME B31.1. Open ends of pipe lines and equipment shall be properly capped or plugged during installation to keep dirt and other foreign matter out of the system. Pipe not otherwise specified shall be uncoated.

3.2.1 Branch Connections

Branches from supply and return mains shall be taken off as indicated or as approved. Connections shall be carefully made to ensure unrestricted circulation, eliminate air pockets, and permit the complete drainage of the system. Changes in horizontal piping sizes shall be made through eccentric reducing fittings.

3.2.2 Cleaning of Piping (Pre-Erection)

Thoroughly clean each section of pipe, fittings, and valves of all foreign matter before erection as follows: hold each piece of pipe in an inclined position and thoroughly tap along its full length to loosen sand, mill scale and other foreign matter. Pipe 50 mm 2 inches and larger shall have a wire brush of a diameter larger than that of the inside of the pipe drawn
through its entire length several times. Before final connections are made to apparatus, wash out the interior of all piping thoroughly with water. Plug or cap open ends of mains during all shutdown periods. Do not leave lines open at any place where any foreign matter might accidentally enter pipe.

3.2.3 Cleaning of Piping (Post-Erection)

Prior to the hydrostatic, performance and operating tests, the interior of the heat-carrying piping shall be flushed with water until the piping is free of all foreign materials to the satisfaction of the [Contractor Quality Control representative] [Contracting Officer].

3.2.4 Valves

3.2.4.1 General

Install valves in conformance with ASME B31.1 and as required herein at the locations indicated. Install valves with stems horizontal or above. Locate or equip stop valves to permit operation from floor level, or provide with safe access in the form of walkways or ladders. Install valves in positions accessible for operation and repair.

3.2.4.2 System Terminal Unit Piping

**************************************************************************
NOTE: Ascertain that the flow in the hot water side (shell) is continuous to preclude overheating, that the hot water supply side is provided with appropriate safety relief valve piped to drain, and that any necessary alarms and flow switches are provided on the hot water supply of the heat exchanger. Ascertain also that the high or medium temperature water is on the tube side of the heat exchanger and hot water on the shell side.
**************************************************************************

**************************************************************************
NOTE: The following information shall be shown on the project drawings:

1. Flow diagram of high or medium temperature water piping indicating connections to existing supply and return, pressure and temperature of existing supply and return, (maximum and minimum or constant, applicable), valves and critical valve positions (including normally closed for bypass valve), any necessary flow rates, pressure drops not already in equipment schedule or specifications, and location of temperature and/or pressure sensors.

2. System Terminal Unit detail providing location of all piping including valves, strainers, flanges, fittings, connections, and supports (coordinate with Section 23 21 13.00 20 LOW TEMPERATURE WATER [LTW] HEATING SYSTEM and Section 23 22 26.00 20 STEAM SYSTEM AND TERMINAL UNITS).

3. Single line plan and any necessary sections
indicating location, sizes, and routing of all associated piping.

4. Appropriate schedules for equipment, including any reset schedules.

5. This section requires connections to existing high or medium temperature water piping that may contain asbestos insulation or associated material. Provide plans for removal and disposal of such material.

6. Detail of connections to existing high or medium temperature water piping, including air chambers and vents as required.

Since the hot water heat exchanger and associated hot water piping is specified in Section 23 21 13.00 20 LOW TEMPERATURE WATER [LTW] HEATING SYSTEM and high or medium temperature water piping herein, coordination for the heat exchanger details indicating arrangement of piping is necessary. Avoid redundancy between Section 23 21 13.23 20 [HIGH] [MEDIUM] TEMPERATURE WATER SYSTEM WITHIN BUILDINGS, Section 23 21 13.00 20 LOW TEMPERATURE WATER (LTW) HEATING SYSTEM and other related specifications sections. When paragraph entitled "Pressure Gages" is used, provide auxiliary piping and accessories in other sections, including relief valve, thermal measuring element (sensor), and auxiliary piping and wiring, alarms, controllers, and flow switches.

When paragraph entitled "Indicating Thermometers" is used, coordination with Section 23 22 26.00 20 STEAM SYSTEM AND TERMINAL UNITS and other related sections is necessary. Designer must provide specifications for the following accessories:

1. Feedwater pump(s).
2. Condensate receiver.
4. Chemical feed.
5. Makeup water.
6. Auxiliary piping & wiring.
7. Magnetrol water column pump controller/low water cutoff.
8. Proportional pressure controller with pressure sensing element for control valve.

**************************************************************************

All associated [HTW] [MTW] piping shall conform to the requirements

SECTION 23 21 13.23 20  Page 18
specified herein and arrangement be as indicated and specified. Install control valve in the return side providing an upstream strainer, gate isolation valves, and a bypass with a globe or plug valve (Do not install control valve in supply with a check valve in the return). Install automatic emergency shutoff valve to provide quick [HTW] [MTW] shutoff in case of U-tube rupture and to protect the secondary piping. Install gate isolation valve in the supply. Provide a dirt leg with a gate isolation valve and capped end for the supply line drop. All valves shall be installed in horizontal lines. Arrange connections to system terminal units with offset flanges such that adequate clearance is provided for pulling tubes and maintenance without requiring breaking of pipe.

3.2.5 Cleaning and Painting of Piping and Equipment

Clean and paint piping in accordance with Section 09 90 00 PAINTS AND COATINGS.

3.2.6 Identification of Piping and Physical Hazards

Identify all piping & physical hazards in accordance with 29 CFR 1910.144, ASME A13.1, and NEMA Z535.1. Spacing of identification marks on runs shall not exceed 15 meters 50 feet. Painting and stenciling shall conform to Section 09 90 00 PAINTS AND COATINGS. Colors shall conform to NEMA Z535.1.

3.2.7 Hangers and Supports

The design and fabrication of pipe hangers, supports, and welding attachments shall conform to MSS SP-58 and ASME B31.1. Hanger types and supports for bare and covered pipe shall conform to MSS SP-69 for the temperature range. Unless otherwise indicated, horizontal and vertical piping attachments shall conform to MSS SP-58. Continuous inserts and expansion joints may be used.

3.2.8 Pipe Sleeves

Provide sleeves where pipes pass through masonry or concrete walls. Sleeves in outside walls below and above grade, shall be steel pipe, Schedule 80. Space between pipe or insulation and the sleeve shall be not less than 6 mm 1/4 inch. Hold sleeves securely in proper position and location before and during construction. All sleeves shall be of sufficient length to pass through entire thickness of walls, partitions, or slabs. Firmly pack space between the pipe and the sleeve with oakum and caulk on both ends of the sleeve with elastic cement.

3.2.9 Instrumentation

Provide a thermometer and pressure gage, as specified herein, on both the high or medium temperature water supply and return piping located on the system terminal unit side of the isolation valves.

3.3 WELDING

3.3.1 Responsibility of Contractor for Fusion Welding

The Contractor is entirely responsible for the quality of the welding and shall:

   a. Conduct tests not only of the welding procedure used by his organization to determine the suitability of the procedure to insure
welds that will meet the required tests, but also of the welding operators to determine the ability of the operators to make sound welds under standard conditions.

b. Be thoroughly familiar with ASME B31.1 and with AWS B2.1/B2.1M.

c. Be capable of performing all welding operations required for construction and installation of the heating system.

3.3.2 Qualifications of Welders

Rules of procedure for qualification of all welders and general requirements for fusion welding shall conform with the applicable portions of ASME B31.1, or with AWS B2.1/B2.1M, and also as outlined below.

3.3.2.1 Examining Welders

Each welder shall be examined at the jobsite by the Contractor in the presence of a representative of the Contracting Officer to determine the ability of the welder to meet the qualifications required. Welders for piping shall be tested and qualified for all applicable positions. Each welder shall be required to identify his weld with his specific code marking signifying his name and number assigned.

3.3.2.2 Examination Results

The Contracting Officer shall be provided with a listing of names and corresponding code markings. Where a welder fails to meet the prescribed welding qualifications, that welder shall be retested, and if he fails the second test, he shall be disqualified for work on the project.

3.3.3 Beveling, Alignment, and Erection

Fabrication of welded pipe joints shall be in accordance with ASME B31.1.

3.3.4 Weld Inspection

Welds shall be inspected for defects in accordance with the following:

a. Cracks shall not be acceptable regardless of length or location;

b. Undercut shall not be deeper than 5 percent of the base-metal thickness or 0.79 mm (1/32 inch), whichever is less;

c. Overlap shall not be permitted. The Contracting Officer reserves the right to further examine the welds by other means to establish the soundness of any weld. Weld defects shall be removed and repairs made to the weld, or the weld joints shall be entirely removed and repairs made to the weld at no additional cost to the Government. Repairing defective welds by adding weld material over the defect or by peening will not be permitted. Welders responsible for defective welds may be required to requalify under paragraph entitled "Qualifications of Welders."

3.3.5 Electrodes

Electrodes shall be stored and dried in accordance with AWS D1.1/D1.1M or as recommended by the manufacturer. Electrodes that have been wetted or that have lost any of their coating shall not be used.
3.4 QUALITY CONTROL

3.4.1 General Test Requirements

Tests shall be conducted before, during, and after the installation of the system. All instruments, equipment, facilities, and labor required to properly conduct the tests shall be provided by the Contractor. Test pressure gages for a specific test shall be approved by the Contracting Officer and shall have dials indicating not less than 1 1/2 times nor more than 2 times the test pressure. Any deficiencies shall be corrected at the Contractor's expense. Failure to correct any deficiencies will be cause for rejection of the system.

3.4.2 Field Tests

The following field tests shall be conducted when applicable to the system involved. If any failures occur, the Contractor shall make such adjustments or replacements as directed by the Contracting Officer, and the tests shall be repeated at the Contractor's expense until satisfactory installation and operation are achieved.

3.4.2.1 Hydrostatic Tests of Service Piping

All service piping shall be tested hydrostatically before insulation is applied at field joints, and shall be proved tight at a pressure 1 1/2 times the maximum operating pressure or 1379 kPa, 200 psi, whichever is greater, except hot water lines shall not be tested at more than 4136 kPa, 600 psi. Hydrostatic test pressures shall be held for a minimum of 4 hours.

3.4.2.2 Operational Tests

After completion of the system, or testable portions thereof, operational tests shall be conducted as in service to demonstrate satisfactory function and operating effectiveness. The tests on each system, or portion thereof, shall last not less than 6 hours.

3.5 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

<table>
<thead>
<tr>
<th>Products</th>
<th>Inch-Pound</th>
<th>Metric</th>

NOTE: This guide specification covers the requirements for hydronic pumps primarily designed for chilled water, hot water and condenser water service in building HVAC systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

System Coordination; G[, [____]]
1.3 QUALITY ASSURANCE

1.3.1 Manufacturer Services

Provide the services of a manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, testing of the equipment, and conduct training.

Submit the names and qualifications of the manufacturer's representative and training engineers and written certification from the manufacturer that the representative and trainers are technically qualified.

1.3.2 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate equipment that has been in satisfactory HVAC operation at least 2 years prior to issuance of this solicitation. Support equipment with a service organization that is reasonably convenient to the jobsite. Pumps [and] [motors] of the same types must each be the product of one manufacturer.

1.3.3 Conformance with Agency Requirements

Where materials or equipment are specified to be an approved type, attach the seal or label of approval from a nationally recognized testing agency, adequately equipped and competent to perform such services. A written certificate from the testing agency must accompany the materials or equipment and be submitted stating that the items have been tested and that they conform to the applicable requirements of the specifications and to the standards listed herein. The certificate must indicate the methods of testing used by the testing agency. In lieu of a certificate from a testing agency, published catalog specification data, accompanied by the
manufacturer's certified statement to the effect that the items are in accordance with the applicable requirements of the specifications and the referenced standards, will be considered and may be acceptable as evidence that the items conform with agency requirements.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect equipment, delivered and designated for storage, from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Hydronic pumps used for heating and air conditioning applications are defined by the type of impeller, number of impellers, type of casing, method of connection to the driver, and mounting position. Provide centrifugal water pumps of the types indicated and specified. Use an electric motor driving unit for each pump as indicated and specified.

2.1.1 Selection Criteria

Select pumps at a point within the maximum efficiency for a given impeller casing combination. Deviations within 3 percent of maximum efficiency are permissible, provided the lesser efficiency is not less than the scheduled efficiency in the construction design documents. Pumps having impeller diameters larger or smaller than manufacturer's published maximum and minimum impeller diameters for a given impeller casing combination will be rejected. Pump performance data, as shown in performance curves, must be based on factory tests using precision instrumentation and exacting procedures as detailed in HI ANSI/HI 14.6.

2.1.2 System Coordination

Submit drawings containing complete wiring and piping schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show the proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation. Provide a complete listing of equipment, materials and miscellaneous components including mechanical seals, bearings, and couplings.

2.1.3 Safety Requirements

Fully enclose or guard couplings, projecting set-screws, keys, and other rotating parts, that pose an entangling hazards.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Nameplates

Securely affix a standard nameplate to pumps and motors in a conspicuous place showing the manufacturer's name, address, type or style, model, serial number, and catalog number. In addition, for each pump show the capacity in \text{L/second gpm} \text{ at rated speed in rpm and total head in mm feet of water. For each electric motor show at least the minimum information required by NEMA MG 1. Show such other information as the manufacturer may consider necessary to complete identification on the nameplate. Pumps must}
be listed and labeled by UL, and comply with UL 778 for pumps not using universal motors rated more than 250 volts such as circulating pumps.

2.2.2 Framed Instructions

Submit proposed diagrams, instructions, and other sheets, prior to posting. Post approved wiring and control diagrams showing the complete layout of the entire system, including equipment, piping valves, and control sequence, framed under glass or in approved laminated plastic, where directed. Provide condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system, framed as specified above for the wiring and control diagrams, and posted beside the diagrams. Post the framed instructions before acceptance testing of the systems.

2.2.3 Pump Characteristic

**************************************************************************
NOTE: Characteristics of each pump will normally be specified by a minimum of two points on the head-capacity curve. The blanks for liters per second gpm and total head in mm feet will be filled in appropriately. If two or more pumps are to operate in parallel or in series, and a system head curve is shown, the appropriate brackets will be removed indicating pumps will match the system curve.
**************************************************************************

Construct hydronic water pumps in accordance with HI 1.1-1.2 and HI ANSI/HI 2.1-2.2. The pumps must be capable of discharging quantities at total discharge heads measured at the discharge flange, between the following limits:

Operate pumps at optimum efficiencies to produce the most economical pumping system under the conditions encountered [and size to make optimum match with the system head curve as shown].[ Suction lift on Pump No. [_____] must not be more than [_____] mm feet.] Pumps must furnish not less than 150 percent of rated capacity at a total discharge head of not less than 65 percent of total rated head.[ The shutoff total head must not be greater than 120 percent of total rated head.] Operate pumps at specified system fluid temperatures without vapor binding and cavitation. Operate pumps to HI ANSI/HI 9.6.3 standard for Preferred Operationg Region (POR).

2.2.4 Pump Drivers

Provide electric motors as indicated for each pump and in compliance with Section [26 20 00 INTERIOR DISTRIBUTION SYSTEM][______].

2.2.5 Equipment Data

Submit manufacturer's descriptive data and technical literature, performance charts and curves for all impeller sizes for a given casing, catalog cuts, and installation instructions. Provide spare parts data for each different item of material and equipment specified, after approval of the detail drawings and not later than [_____] months prior to the date of beneficial occupancy. Include a complete list of parts and supplies, with current unit prices and local source of supply with contact information.
Submit catalog information, certified pumps curves, rated capacities, final impeller dimensions, and accessories provided for the product indicated. Indicate operating point of each pump on curves. Furnish pump curves for each pump and combination of pumps designed to operate in parallel. The pump curve must show as a minimum; bhp, flow, total dynamic head, efficiency, NPSH, impeller diameter and system curve (individually and in combination for each pump operating in a parallel application). Select pumps operating in parallel operation to cross the system curve when operating individually.

2.3 HYDRONIC PUMPS

**************************************************************************
NOTE: Enter the pump numbers shown on the drawings in the appropriate blanks. Delete inapplicable configurations.
**************************************************************************

Provide centrifugal, [single-stage type,] [or] [multi-stage type,] designed for HVAC service in the following configurations:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Pump No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circulator</td>

<tr>
<td>Automatic Cooling Coil Condensate Pump Units</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

2.3.1 Circulator

**************************************************************************
NOTE: These pumps deliver up to 10 L per second 150 gpm and up to 10 m 35 feet head. They are most often used for low flow rates in small systems and are available in a wet rotor or three piece oil lubricated design. Wet rotor circulators use system fluid for cooling and lubrication. They do not require oiling and are less expensive; however, impeller can stick after a prolonged shutdown. Three piece circulators are oil lubricated with the
potential for longer life if properly lubricated and can overcome a stuck impeller after a prolonged shutdown; however, there is potential maintenance of mechanical seals and coupling assembly.

Provide pumps with capacities as indicated of a horizontal, [in-line, three piece oil lubricated] [wet rotor] circulator type specifically designed for quiet operation. Suitable for 107 degrees C 225 degrees F operation at [860][_____] kPa [125][_____] psig working pressure. The pump must be single stage with [flanged] [union] piping connections. The pump internals must be capable of being serviced without disturbing piping connections.

NOTE: Insert the following paragraph for three piece oil lubricated circulator pumps.

[ a. The three piece pump must be composed of three separable components a motor, bearing assembly, and [cast iron] [lead free bronze certified in accordance with NSF 372 pump end (wet end). The motor shaft must be connected to the pump shaft via a replaceable flexible coupler.]

NOTE: Insert the following paragraph for wet rotor circulators used for potable water service.

[ b. Wet rotor circulator for potable water service must be lead content certified in accordance with NSF 372.]

2.3.1.1 Seal Assembly

NOTE: Retain this paragraph for wet rotor circulators used for potable water service.

Pump must be equipped with an internally flushed mechanical seal assembly. Seal assembly must have a brass housing, Buna bellows and seat gasket, stainless steel spring, and be of a carbon ceramic design with the carbon face rotating against a stationary ceramic face.

2.3.1.2 Motor Mount

NOTE: Include this paragraph for three piece oil lubricated circulators.

To ensure alignment, mount the motor to the bearing assembly via a bolted motor bracket assembly. Use a replaceable resilient rubber motor mount to assist in aligning the motor shaft with the pump shaft.

2.3.1.3 Motors

Motors must meet scheduled horsepower, speed, voltage, and enclosure design. Motors must be drip proof, maintenance free, premium efficiency and meet NEMA MG 1 specifications.
NOTE: Include the following paragraph for variable speed pumps with ECM motors.

[ Pump must be driven by an electrically commutated electrical motor (ECM) with permanent magnet rotor. The rotor magnets must be time stable, non-toxic ceramic magnets. Drive the electrically commutated electrical motor by a frequency converter with an integrated PFC filter. ]

2.3.2 Small In-Line

NOTE: These pumps deliver up to 12.5 L per second 200 gpm and 17 m 55 feet head. Pump motor shaft must stay horizontal, but pump body can be repositioned for horizontal or vertical discharge. These pumps are designed for 1750 rpm and indoor service using open drip proof enclosure electric motors.

Provide pumps with capacities as indicated, suitable for 107 degrees C 225 degrees F operation at [1204][_____] kPa [175][_____] psig working pressure. The pump must be single stage, in-line design, in cast iron bronze fitted construction. The pump internals must be capable of being serviced without disturbing piping connections.

2.3.2.1 Pump Shaft

The pump must have a solid steel shaft with a coupler between the pump and motor shafts. For non-stainless steel shafts, employ a non-ferrous shaft sleeve to completely cover the wetted area under the seal.

2.3.2.2 Bearing

The bearing assembly must house maintenance-free permanently lubricated bearings.

2.3.2.3 Seal Assembly

Equip the pump with an internal self-flushing mechanical seal assembly. Seal assembly must have Buna bellows and seat gasket, stainless steel spring, and be of a carbon ceramic design with the carbon face rotating against a stationary ceramic face.

2.3.2.4 Impeller

Provide impeller of cast bronze or brass material. Impeller must be hydraulically and dynamically balanced to HI 9.6.4 balance grade G6.3, keyed to the shaft and secured by a locking capscrew or nut.

2.3.2.5 Volute

Pump volute must be of cast iron. The connection style on cast iron pumps must be flanged.
2.3.2.6 Motor Mount

To ensure alignment, mount the motor to the bearing assembly via a bolted motor bracket assembly. Use a replaceable resilient rubber motor mount to assist in aligning the motor shaft with the pump shaft.

2.3.2.7 Motors

NEMA MG 1; premium efficiency; non-overloading at any point on the pump curve; maintenance free with permanently lubricated bearings; and resilient mounted for smaller sizes, rigid mounted otherwise.

2.3.3 Large In-Line

******************************************************************************

NOTE: Large In-Line pumps can deliver up to 158 L per second 2500 gpm and 38 m 125 ft head at 1750 rpm. The use of large In-Line pumps is discouraged due to difficulty in providing routine servicing and repair. Large in-line pumps including motor can be more expensive than the preferred base-mounted, flexible coupled end suction pumps. In some cases floor space is limited so large in-line pumps may need to be used. Large In-Line pumps come in two basic configurations – split coupled and close coupled. Split coupled configuration allows mechanical seal maintenance without disturbing the pump or motor. However, split coupled pumps only allow the motor shaft to be oriented vertically with motor shaft down. Close coupled pumps may be mounted with the motor shaft vertical or horizontal but do not allow mechanical seal maintenance without disturbing the pump or motor. When mounted horizontally, it is critical that adequate support be provided to avoid strain on pump parts and piping.

******************************************************************************

Provide pumps with capacities as indicated; [split-coupled] [closed coupled], in-line, single stage, for installation in [vertical] [horizontal (where close coupled)] position, and. suitable for 107 degrees C 225 degrees F operation at [1204][_____] kPa [175][_____] psig working pressure. The pump internals must be capable of being serviced without disturbing piping connections.

2.3.3.1 Casing

Provide pump casing complying with ASTM A48/A48M Class 30 cast iron, suitable for [1204][_____] kPa [175][_____] psig working pressure with integral cast iron flanges drilled for ASME B16.1 [ANSI Class 125] [ANSI Class 250] flanges, with an integrally-cast support ring matching an Class 125 flange for pump support. The pump volute must include gauge tappings at suction and discharge nozzles along with vent and drain tappings at top and bottom.

2.3.3.2 Pump Shaft

Provide carbon or stainless steel pump shaft, guided by a carbon graphite lower throttle bushing. Carbon steel pump shaft must have a bronze shaft sleeve that completely covers the wetted area under the seal.
2.3.3.3 Seal Assembly

Equip the pump with a mechanical seal assembly consisting of a carbon seal rotating ring, stainless steel spring, ceramic seat and flexible bellows and gasket. The liquid cavity must have a tapped flush line with manual valve to remove air from the seal chamber to allow fast initial start-up and insure mechanical seal cooling.

2.3.3.4 Spacer Coupling

**************************************************************************
NOTE: Delete paragraph specifying spacer coupling below when close coupled pumps are used.
**************************************************************************

The axially split spacer coupling must be of high tensile aluminum, split to allow the servicing of the seal without disturbing the pump or motor. Pump coupler must be aligned by the manufacturer before shipment. The motor bracket must contain a carbon steel coupler guard conforming to 29 CFR 1910.219 standards for safety.

2.3.3.5 Impeller

**************************************************************************
NOTE: Bronze impellers should not be used for pumping temperatures in excess of 120 degrees C 250 degrees F. Consult manufacturer for temperatures exceeding 120 degrees C 250 degrees F.
**************************************************************************

Hydraulically and dynamically balance the impeller to HI 9.6.4 balance grade G6.3, closed, single suction, fabricated from cast bronze, keyed to the shaft and secured by a locking capscrew.

2.3.3.6 Motor

**************************************************************************
NOTE: Motor enclosure will usually be open drip proof where motor is located in dry, clean, well ventilated indoor area. Use totally enclosed fan cooled motor enclosure for outdoor service.
**************************************************************************

Electric motors must meet NEMA MG 1 and the horsepower, speed, voltage, indicated. Motor enclosure must be open drip Proof[, totally enclosed fan cooled], with heavy duty grease lubricated ball bearings completely adequate for the maximum load for which the motor is designed. Motor must be non-overloading at any point on the pump curve and premium efficiency. Provide motor efficiencies as shown in the ICC IgCC standard. Totally enclosed fan cooled motor efficiencies must be as shown in NEMA MG 1.

Include one-piece combination motor bracket and volute coverplate in the assembly to ensure concentric alignment of the motor to the pump casing.

2.3.4 Base-Mounted, Flexible Coupled, End suction

Provide pumps with capacities as indicated; base mounted, separately-coupled, end suction designed with volute housing mounted to the
frame to allow for pump service without relocating the motor or disturbing piping connections. Bearings and seals must be serviceable without disturbing piping. Pump must be factory hydrostatically tested in accordance with Hydraulic Institute standards and thoroughly cleaned.

2.3.4.1 Casing

**************************************************************************
NOTE: Cast iron casings should not be used for pumping temperatures in excess of 120 degrees C 250 degrees F. Consult manufacturer for temperatures exceeding 120 degrees C 250 degrees F.
**************************************************************************

Provide radially split pump casing ASTM A48/A48M Class 30 cast iron suitable for [1204][1720][_____] kPa [175][250][_____] psig working pressure with integral cast iron flanges drilled for ASME B16.1 [ANSI Class 125] [ANSI Class 250] flanges, with an integrally-cast pedestal support foot. The pump volute must include gauge tappings at suction and discharge nozzles along with vent and drain tappings at top and bottom.

2.3.4.2 Pump Shaft

**************************************************************************
NOTE: Carbon steel shaft should not be used for pumping temperatures in excess of 120 degrees C 250 degrees F. Consult manufacturer for temperatures exceeding 120 degrees C 250 degrees F.
**************************************************************************

Carbon steel pump shaft with a replaceable [bronze][stainless steel] shaft sleeve completely covering the wetted area of the shaft under the seal.

2.3.4.3 Bearing

**************************************************************************
NOTE: Regreasable ball bearings are discouraged. Studies have indicated that contamination and ineffective lubrication are responsible for approximately half of all bearing replacements. Concerns include the following; excessive grease will cause bearings to overheat, bearings are required to be regreased on a regular interval (2500 operating hours or every six months), impurities can be introduced when regreasing bearings, and grease added must be compatible with grease applied previously.
**************************************************************************

Incorporate maintenance free, permanently lubricated and sealed bearings in the pump bearing frame. [Regreasable ball bearing type with provision for purging or flushing through the bearing surface andgreased while running after start-up.]

2.3.4.4 Seal Assembly

**************************************************************************
NOTE: When fluid used to internally flush seals exceeds 107 degrees C 225 degrees F, provide a heat
exchanger to decrease the temperature of the seal flushing water to 107 degrees C 225 degrees F in order that the seal life does not get shortened.

Equip with an integrally flushed mechanical seal assembly or a positive pressure external seal flushing line. Provide a mechanical seal with ceramic seal seat and carbon seal ring. Seal assembly must be rated up to 107 degrees C 225 degrees F.

2.3.4.5 Baseplate

Baseplate must be of steel construction fully enclosed at sides and ends with welded cross members and fully open grouting area for field grouting. Minimum base plate stiffness must conform to HI 1.3 for horizontal baseplate design standards.

2.3.4.6 Coupler

Provide a flexible-type coupler between the pump and motor, capable of absorbing torsional vibration and variable speed operation between the pump and motor. The coupler must allow replacement with no need to move the hubs. Coupler must have natural rubber or neoprene type element materials with a maximum misalignment capability of 4 degrees angular and 3 mm 0.125 inches parallel. Provide donut shaped elastomer element with preassembled flanges mechanically clamped to reinforced element and preassembled spacer center assembly. Secure flexible donut shaped element of coupler in place with radial clamp ring screws. Couplers must be rated for required maximum rpm, amperage horsepower and torque. The coupler must be shielded by a coupler guard securely fastened to the base. Provide coupler guard in compliance with current national safety standards including 29 CFR 1910.219 and NEMA Z535.4. Guards cannot have gaps greater than 6 mm 0.250 inches, must be safety orange in color, and have an NEMA Z535.4 compliant warning label.

2.3.4.7 Impeller

NOTE: Cast bronze impellers should not be used for pumping temperatures in excess of 120 degrees C 250 degrees F. Consult manufacturer for temperatures exceeding 120 degrees C 250 degrees F.

Hydraulically and dynamically balance to HI 9.6.4 balance grade G6.3, closed, overhung, single suction, fabricate from cast bronze, key to shaft and secured by a locking capscrew.

2.3.4.8 Motor

NOTE: Motor enclosure will usually be open drip proof where motor is located in dry, clean, well ventilated indoor area. Use totally enclosed fan cooled motor enclosure for outdoor service.

Electric Motors must meet NEMA MG 1 and be the wattage horsepower, speed, and voltage indicated. Motor enclosure must be open drip proof [totally enclosed fan cooled]. Motor must have heavy duty grease lubricated ball
bearings completely adequate for the maximum load for which the motor is designed. Motor must be non-overloading at any point on the pump curve and premium efficiency. Provide motor efficiencies as shown in the ICC IgCC standard. [Totally enclosed fan cooled motor efficiencies must comply with NEMA MG 1.]

2.3.5 Base-Mounted, Close Coupled, End Suction

**************************************************************************

NOTE: Use of base-mounted, close coupled, end suction pumps is discouraged. This type of pump takes up less floor space than base-mounted, flexible coupled, end suction pumps and should only be considered when floor space is extremely limited. Close coupled pumps do not have a pump shaft and pump bearing assembly. Motor bearings must be able to handle both motor rotating element and impeller forces. This requires a special motor with bearings designed to handle additional impeller loads and shaft that extends into the volute. This type of pump can be about the same cost as the preferred base-mounted, flexible coupled, end suction pump.

**************************************************************************

Provide pumps with capacities as indicated. Pump must be base mounted, close coupled, single stage, end suction design capable of being serviced without disturbing piping connections.

2.3.5.1 Casing

Provide pump volute of Class 30 cast iron suitable for [1204][_____] kPa [175][_____] psig working pressure. Include vent, drain and gauge tappings.

2.3.5.2 Seal Assembly

Seal off the liquid cavity at the motor shaft by an internally flushed mechanical seal or a positive pressure external seal flushing line with ceramic seal seat and carbon seal ring, suitable for continuous operation at 107 degrees C 225 degrees F. A replaceable shaft sleeve of bronze alloy must completely cover the wetted area under the seal.

2.3.5.3 Impeller

Provide cast bronze or 304 stainless steel impeller, enclosed type, hydraulically and dynamically balanced to HI 9.6.4 balance grade G6.3, keyed to shaft and secured by a locking capscrew.

2.3.5.4 Motor

**************************************************************************

NOTE: Motor enclosure will usually be open drip proof where motor is located in dry, clean, well ventilated indoor area. Use totally enclosed fan cooled motor enclosure for outdoor service.

**************************************************************************

Electric Motors must comply with NEMA MG 1 and be the wattage horsepower, and voltage indicated. Motor enclosure must be [open drip proof] [totally
enclosed fan cooled]. provide with heavy duty grease lubricated ball bearings completely adequate for the maximum load for which the motor and pump impeller is designed. Motor must be non-overloading at any point on the pump curve and premium efficiency. Provide motor efficiencies as shown in the ICC IgCC standard. Totally enclosed fan cooled motor efficiencies must be as shown in NEMA MG 1.

2.3.6 Base-Mounted, Flexible Coupled, Double Suction[,] [Horizontally Split][ and ][Vertically Split]

Provide pumps with capacities as indicated; base mounted, flexible coupled, double-suction, [horizontal] [and] [vertical] split case design, single stage centrifugal pump. Construction must be cast iron - bronze fitted, equipped with mechanical seals. Bearings and seals must be serviceable without disturbing piping or motor. Factory hydrostatically test the pump in accordance with Hydraulic Institute standards and thoroughly clean.

2.3.6.1 Casing

**************************************************************************
NOTE:  Cast iron casings should not be used for pumping temperatures in excess of 120 degrees C 250 degrees F. Consult manufacturer for temperatures exceeding 120 degrees C 250 degrees F.
**************************************************************************

Provide ASTM A48/A48M Class 30 or ASTM A159 cast iron pump casing, suitable for [1204][] kPa [175][_____] psig working pressure, with integral cast iron flanges drilled for ASME B16.1 [ANSI Class 125] [ANSI Class 250] flanges. Supply the pump volute with plugged vent, drain, and gauge tappings.

2.3.6.2 Bearings

**************************************************************************
NOTE:  The use of regreasable ball bearings are discouraged. Studies have indicated that contamination and ineffective lubrication are responsible for approximately half of all bearing replacements. Concerns include the following; excessive grease will cause bearings to overheat, bearings are required to be regreased on a regular interval (2500 operating hours or every six months), impurities can be introduced when regreasing bearings, and grease added must be compatible with grease applied previously.
**************************************************************************

Incorporate maintenance free, permanently lubricated and sealed bearings with an L10 life of 60,000 hours minimum in the pump bearing frame.

Incorporate regreasable ball bearing type pump bearing frame with provision for purging or flushing through the bearing surface and greased while running after start-up.

2.3.6.3 Seal Assembly

**************************************************************************
NOTE: When fluid used to internally flush seals
**************************************************************************
provide a heat exchanger to decrease the temperature of the seal flushing water to 107 degrees C 225 degrees F so that the seal life does not get shortened.

Seal off liquid cavity by an internally-flushed seal assembly. Seal assembly must have a brass housing, Buna bellows and seat gasket, stainless steel spring, and be of a carbon face rotating against a stationary silicon carbide seat. Provide replaceable mechanical seals without disturbing the upper casing half and system piping. Seals must be suitable for continuous operation at 107 degrees C 225 degrees F. Arrange to assure that seal leakage cannot enter the bearing housings.

2.3.6.4 Coupler

Provide a flexible-type coupler between the pump and motor capable of absorbing torsional vibration and variable speed operation. The coupler must allow replacement with no need to move the hubs. Coupler must have natural rubber or neoprene type element materials with a maximum misalignment capability of 4 degrees angular and 3 mm 0.125 inches parallel. Provide donut shaped elastomer element and with preassembled flanges mechanically clamped to reinforced element and preassembled spacer center assembly. Secure flexible donut shaped element of coupler in place with radial clamp ring screws. Couplers must be rated for required maximum rpm, wattage horsepower and torque. Shield the coupler by a coupler guard securely fastened to the base. Coupler guard must comply with current national safety standards including 29 CFR 1910.219, and NEMA Z535.4. Provide guards with gaps no greater than 6 mm 0.250 inches, of safety orange in color, and have an NEMA Z535.4 compliant warning label.

2.3.6.5 Base Plate

Provide baseplate of steel construction fully enclosed at sides and ends with welded cross members and fully open grouting area for field grouting. Minimum base plate stiffness must conform to HI 1.3 for horizontal baseplate design standards.

2.3.6.6 Impeller

NOTE: Cast bronze impellers should not be used for pumping temperatures in excess of 120 degrees C 250 degrees F. Consult manufacturer for temperatures exceeding 120 degrees C 250 degrees F.

Bronze or brass enclosed double suction type, both hydraulically and dynamically balanced to HI 9.6.4 grade G6.3, keyed to shaft and fixed in an axial position. Hub must have sufficient metal thickness to allow machining for installation of impeller rings.

2.3.6.7 Motor

NOTE: Motor enclosure will usually be open drip proof where motor is located in dry, clean, well ventilated indoor area. Use totally enclosed fan cooled motor enclosure for outdoor service.
Provide electric motor conforming to NEMA MG 1 and of the wattage horsepower, and voltage indicated. Motor enclosure must be open drip proof [totally enclosed fan cooled]; with heavy duty grease lubricated ball bearings completely adequate for the maximum load for which the motor is designed. Motor must be non-overloading at any point on the pump curve and premium efficiency. Provide motor efficiencies as shown in the ICC IgCC standard. Totally enclosed fan cooled motor efficiencies must be as shown in NEMA MG 1.

2.3.6.8 Pump Shaft

Provide pump shaft of solid 416 stainless steel shaft or solid carbon steel shaft with replaceable bronze or 304 stainless steel shaft sleeve covering wetted area of shaft.

2.3.7 Vertical Lineshaft Turbine

Provide pumps with capacities as indicated. Pump must be vertical lineshaft turbine manufactured for lubrication of the line-shaft bearings by the water being pumped. Design and manufacture the pumping unit in accordance with HI ANSI/HI 2.1-2.2 standards AWWA E103.

2.3.7.1 Bowl Assembly

Flange type construct the intermediate bowls, discharge cases and suction bowls from ASTM A48/A48M Class 30 close grain cast iron. They must be free of defects and accurately machined and fitted to ASME B4.2 ASME B4.1 close tolerances. Epoxy enamel coat the intermediate bowls waterways for maximum efficiency. Thread all threaded discharge cases for water lubricated column assembly. All assembly bolting must be stainless steel. Provide intermediate bowl bearings.

2.3.7.2 Pump Shaft

Construct the bowl shaft from ASTM A582/A582M type 416 stainless steel, precision ground and polished with surface finish better than 40 RMS.

2.3.7.3 Lineshaft

Vertical pump lineshaft must be open and constructed from ASTM A582/A582M type 416 stainless steel. Straighten lineshaft sections to 0.13 mm per 300 mm 0.0005inch/foot total runout. Lineshaft sections must not exceed 3 m 10 feet in length and must be coupled with threaded stainless steel couplings. Design the diameter of the lineshaft and coupling in accordance with AWWA E103.

2.3.7.4 Impeller

Provide impellers of ASTM B584 silicon bronze or stainless steel, the enclosed type. They must be free from defects, machined, and balanced to HI 9.6.4 balance grade G6.3 for optimum efficiency and performance. Securely fasten to the bowl shaft with stainless steel taper lock collets. The impellers must be adjustable by means of a top shaft adjusting nut or adjustable solid shaft coupling.

2.3.7.5 Discharge Head

Construct the discharge head, sized for pump capacity, of ASTM A48/A48M
Class 30 high grade ductile iron or fabricated steel of the high profile type with an integral motor base which allows the head shaft to be coupled to the top shaft above the stuffing box. A separate motor stand is not acceptable. The discharge head must have an ASME B16.1 (for cast iron) or Class 150 (for steel) discharge flange supplied with dual 6 mm 1/4 inch NPT ports at the top. Thread the head to accept the column pipe.

2.3.7.6 Stuffing Box

**************************************************************************
NOTE: Stuffing box is recommended over mechanical seals for vertical turbine pumps due to the many variables encountered in mechanical seal applications with this type of pump. Abrasives are commonly found in condenser water open loop systems, where this type of pump is used, that cause premature mechanical seal failure.
**************************************************************************

Provide stuffing box of cast or ductile iron, ASTM A536 class 65, and containing a minimum of five rings of packing; with an available fitting for pressure relief. The packing follower gland must be stainless steel and secured in place by stainless steel studs and nuts. The packing box bearing must be bronze. Provide a water slinger to operate on the top shaft, above the packing gland.

2.3.7.7 Mechanical Seal

Provide a mechanical seal.

2.3.7.8 Column Pipe

Provide column pipe of ASTM A53/A53M grade B steel pipe not less than Schedule 30. Machine the column ends with threads and faced parallel to the threads to ensure proper alignment. Connect the pipe with threaded sleeve type ductile iron couplings or flanges that will accept 20 mm 3/4 inch stainless steel or bronze bearing retainers. Lineshaft bearings must be fluted rubber retained in a centering spider retainer.

2.3.7.9 Basket Strainer

Provide and attach a stainless steel basket strainer of a suitable size to the pump suction with stainless steel fasteners. Strainer must have a net inlet area equal to at least three times the impeller inlet area. The maximum opening must not be more than 75 percent of the maximum opening of the water passage through the bowl or impeller.

2.3.7.10 Motor

Electric motor must meet NEMA MG 1 and be the size and voltage indicated. Provide [1800RPM] [_____] motor with NEMA Class B or Class F insulation. The motor must have a vertical hollow (or solid) shaft motor with space heaters and a non-reverse ratchet (or self-release coupling) to prevent reverse rotation. The motor must have an angular contact thrust bearing to meet the designed pump's hydraulic thrust load plus the weight of the rotating parts under operating conditions. Provide high efficiency motor with a weather protected WP-1 enclosure, [230/460] [_____] volt, [3] [1] phase, 60HZ, and a [1.15] [_____] service factor. Motor must be non-overloading at any point on the pump curve and premium efficiency.
Provide motor with efficiencies in compliance with NEMA MG 1.

2.3.8  Cooling Coil Condensate Pump Units

Provide pumps with capacities as indicated. Cooling Coil Condensate Pump Unit must be a packaged unit including a corrosion-resistant pump, plastic tank with cover, and automatic controls. Include [factory] [field] installed check valve and a 1800 mm 72 inch minimum, electrical power cord with plug for 120V/1PH/60HZ electrical service.

2.3.8.1  Motor

Electric motor must comply with NEMA MG 1 and be the size, voltage and enclosure indicated. Provide heavy duty grease lubricated ball bearings completely adequate for the maximum load for which the motor is designed.

2.4  ELECTRICAL WORK

Provide electrical motor driven equipment specified herein complete with motors, motor starters, and controls. Provide electric equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Electrical characteristics must be as indicated. Provide motor starters complete with properly sized thermal overload protection in each phase and other appurtenances necessary for the motor control specified. Each motor must be of sufficient capacity to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor when operating at proper electrical system voltage and frequency. Manual or automatic control and protective or signal devices required for the operation herein specified and any control wiring required for controls and devices but not indicated must be provided under this section of the specifications.

2.5  ELECTRICAL EQUIPMENT

Provide electrical equipment in conformance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical motor driven equipment herein specified complete with motors, motor starters, and controls. Motor controls, equipment, and wiring must be in accordance with NFPA 70.

2.5.1  Electric Motors

Drive each electric motor-driven pump by a continuous-duty electric motor with enclosure type for specific service as defined in paragraph HYDRONIC PUMPS. Motor must have a [1.5] [_____] service factor. Provide [squirrel-cage induction][synchronous] motors having normal-starting-torque and low-starting-current characteristics, and of sufficient size so that the nameplate wattage horsepower rating will not be exceeded throughout the entire published pump characteristic curve. Integral size motors must be the premium efficiency type in accordance with NEMA MG 1. Pump electric motor efficiencies must meet or exceed the requirements of the ICC IgCC standard. Motor bearings must provide smooth operations under the conditions encountered for the life of the motor. Provide adequate thrust bearing in the motor to carry the weight of all rotating parts plus the hydraulic thrust and be capable of withstanding upthrust imposed during pump starting[ and under variable pumping head conditions specified]. Motors must be rated [_____] volts, [_____] phase, 60 Hz and such rating must be stamped on the nameplate. Provide motors in conformance with NEMA MG 1.
2.5.2 Control Equipment

[Manually controlled pumps must have START-STOP pushbutton in cover.][Automatically controlled pumps must have three-position "MANUAL-OFF-AUTOMATIC" selector switch in cover.] Provide additional controls or protective devices as indicated. [Install a pump low-water cutoff [in the well][on the suction pipe] and must shut the pump off when the water level in the well reaches the level shown.]

2.5.3 Variable Speed Control

**************************************************************************
NOTE: If any of the motors have a variable speed control, then include this paragraph.
**************************************************************************

The variable speed motor controllers must meet the requirements of UFGS 26 29 23 ADJUSTABLE SPEED DRIVE SYSTEMS UNDER 600 VOLTS.

2.6 EQUIPMENT APPURTENANCES

2.6.1 Attachments

Furnish all necessary bolts, nuts, washers, bolt sleeves, and other types of attachments with the equipment for the installation of the equipment. Bolts conform to the requirements of ASTM A307 and hexagonal nuts of the same quality as the bolts used. Threads must be clean-cut and conform to ASME B1.1. Bolts, nuts, and washers specified to be galvanized or not otherwise indicated or specified, must be zinc coated after being threaded, by the hot-dip process conforming to [ASTM A123/A123M][ASTM A153/A153M] as appropriate. Bolts, nuts, and washers specified or indicated to be stainless steel must be Type 316.

2.6.2 Equipment Guards

Provide equipment driven by open shafts, belts, chains, or gears with all-metal guards enclosing the drive mechanism. Secure guards in position with steel braces or straps that permit easy removal for servicing the equipment. Coupler guards must comply with current national safety standards including 29 CFR 1910.219 and NEMA Z535.4. Provide guards with gaps no greater than 6 mm 0.250 inches, safety orange in color, and have an NEMA Z535.4 compliant warning label.

2.6.3 Tools

Furnish a complete set of all special tools which may be necessary for the adjustment, operation, maintenance, and disassembly of all equipment. Special tools are considered to be those tools which because of their limited use are not normally available, but which are necessary for the particular equipment. Special tools must be high-grade, smooth, forged, alloy, tool steel. Furnish one pressure grease gun for each type of grease required. Deliver all tools at the same time as the equipment to which they pertain. Properly store and safeguard such tools until completion of the work, at which time deliver them to the Contracting Officer.

2.7 FINISHES

All motors, pump casings, and similar parts of equipment must be thoroughly cleaned, primed, and given two finish coats of paint at the factory in
accordance with the recommendations of the manufacturer. Give ferrous surfaces not to be painted a shop coat of grease or other suitable rust-resistant coating.

[2.8 FACTORY TESTS]

**************************************************************************

NOTE: Factory Tests for specific pumps shipped to construction site are not normally required unless the pumps are used for a critical application where precise performance is required. Manufacturers' performance data is based on factory tests using precision instrumentation and exacting procedures as detailed in Hydraulic Institute Standard ANSI/HI 1.6 Centrifugal Pump Tests for each typical pump model. Delete the following paragraph unless required.

**************************************************************************

Pumps must be tested by the manufacturer or a nationally recognized testing agency in compliance with HI 1.3. Submit certified test results.

]PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

**************************************************************************

NOTE: Pump and driver shaft alignment on base mounted, long-coupled pumps is critical to reduce vibration, increase bearing life, increase coupler life, and increase mechanical seal life. Although shafts are typically aligned at factory, some misalignment will occur during shipping and lifting. Dial indicators or laser devices are called out to accurately perform final alignment of pump and driver shafts. Scales, straight edges and calipers provide less accurate alignment and are only suitable for initial alignment.

**************************************************************************

Install each pump and motor in accordance with the written instructions of the manufacturer[ and under the direct supervision of the manufacturer's representative]. Provide access space around the device for servicing no less than the minimum recommended by the manufacturer.

[3.2.1 Base Mounted, Long-Coupled Pumps]

Set the pump baseplate as follows.

a. Place two sets of shims or wedges for each foundation bolt. Lower baseplate onto foundation bolts and level baseplate both lengthwise and across by adding or removing shims or mount wedges. A maximum difference of 3 mm 0.125 inches lengthwise and 1.5 mm 0.059 inches across is allowable.
b. Mount pump and driver on baseplate if not already mounted at factory. Pump and driver shafts must have initial cold (pump and driver at ambient temperature) alignment check and final hot (pump and driver at operating temperature) alignment check. Perform cold alignment check before baseplate is grouted, after baseplate is grouted, and after piping is connected. Perform final alignment check when pump and driver are at operating temperature. Move or shim only the driver to make adjustments to prevent strain on the piping installations. Initial alignment may be performed with scales, straight edges and calipers. Final alignment must be done with dial gauges or laser alignment devices. Final alignment misalignment may not exceed coupling manufacturer's maximum parallel and angular misalignment values. When using variable frequency drives, reduce the manufacturer's misalignment values by 50 percent. Remove flexible coupling when performing alignment.

c. Support the connecting piping to ensure that there are no piping loads at the pump flange connections and connecting piping is not forced into position. [Use concrete for equipment foundations as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Provide concrete foundations that are integral with and of the same class as that of the building floor unless otherwise indicated. Use concrete having a compressive strength of at least 17 MPa (2,500 psi) in foundations that are entirely separated from the surrounding floor. Install a premolded filler strip between the foundation and floor slab as shown. Furnish foundation bolts, as required, for proper positioning during the placement of the concrete.]

3.3 FIELD QUALITY CONTROL

After installation of the pumping units and appurtenances, including coupling guard, is complete, carry out operating tests to assure that the pumping installation operates properly. [Make arrangements to have the manufacturer's representatives present when field equipment tests are made.] Give each pumping unit a running field test in the presence of the Contracting Officer for a minimum of 2 hours. Operate each pumping unit at its rated capacity or such other point on its head-capacity curve selected by the Contracting Officer. Provide an accurate and acceptable method of measuring the discharge flow. Tests must assure that the units and appurtenances have been installed correctly, that there is no objectionable heating, vibration, or noise from any parts, and that all manual and automatic controls function properly. If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests. Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Each test report must indicate the final position of controls.

3.4 FIELD PAINTING

Do not paint stainless steel, galvanized steel, and nonferrous surfaces.

3.4.1 Touch-up painting

Factory painted items requiring touching up in the field must be thoroughly cleaned of all foreign material, and primed and topcoated with the
manufacturer's standard factory finish.

3.4.2 Exposed Ferrous Surfaces

Paint exposed ferrous surfaces with two coats of enamel paint conforming to SSPC Paint 21. Solvent clean factory primed surfaces before painting. Surfaces that have not been factory primed must be prepared and primed with one coat of SSPC Paint 25 or in accordance with the enamel paint manufacturer's recommendations.

3.5 CLOSEOUT ACTIVITIES

3.5.1 Operation and Maintenance Manuals

Submit one complete set at the time the tests procedure is submitted; remaining sets before the contract is completed. Permanently bind each in a hard cover. Inscribe the following identification on the covers: the words "OPERATING AND MAINTENANCE INSTRUCTIONS," name and location of the building, name of the Contractor, and contract number. Place flysheets before instructions covering each subject. Use 216 by 279 mm 8-1/2 by 11 inches paper for instruction sheets, with large sheets of drawings folded in.

Include, but do not limit to, the following in the Instructions:

a. System layout showing piping, valves, and controls.

b. Approved wiring and control diagrams[ including variable frequency drives].

c. A control sequence describing startup, operation, and shutdown.

d. Operating and maintenance instructions for each piece of equipment, including task list for routine maintenance, routine inspections, intermediate inspections, and annual inspections; lubrication instructions; and troubleshooting guide.

e. Manufacturer's bulletins, cuts, and descriptive data; and parts list and recommended spare parts.

3.5.2 Training

Upon completion of the work, and at a time designated by the Contracting Officer, provide the services of one or more competent engineers for a training period of not less than [_____] hours to instruct a representative of the Government in the contents of the operation and maintenance manuals for the equipment furnished under these specifications. These field instructions must cover all the items contained in the bound instructions. Submit the training course curriculum and training instructions 14 days prior to the start of training.

SECTION 23 22 26.00 20
STEAM SYSTEM AND TERMINAL UNITS
02/10, CHG 1: 05/15

NOTE: This guide specification covers the requirements for provision of a complete steam system within the building including steam, condensate, and terminal units for heating.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification does not include steam boilers, feedwater treatment equipment, or process steam terminal units, boiler feed, and blow-off piping.

NOTE: The following information shall be shown on the project drawings:

1. Extent of work including point of connection of new work to existing

2. General arrangement of the piping
3. Valve locations

4. Safety valve location, setting, pipe size, and method of termination

5. Valve clearances to permit proper valve operation in confined spaces

6. Floor stand, chainwheel operator, and power operator locations, when required

7. Floor stand details, when required

8. Electrical or compressed air power supply for power operators, when required

9. Expansion joints

10. Instrumentation

11. Condensate meters

12. Steam and air traps

13. Unit heaters, when required

14. Convertors, when required

15. Condensate return pumping units including pump capacity and electrical characteristics for the pump motor

16. Radiation units including size and capacity

17. Location where cold-springing is permitted

18. Connections for future equipment, when required.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically
be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 GENERAL REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section, with the additions and modifications specified herein. This section includes steam and condensate piping, [unit heaters,] [convertors,] [condensate return units,] [radiation units,] [and steam coils] used for heating within the building. Steam boilers, feedwater treatment equipment, process steam terminal units, boiler feed piping, and blow-off piping are not covered in this section.

1.2.1 Classes and Maximum Working Pressures

Equipment, piping, and piping components shall be suitable for use under the maximum working pressure indicated. Except as modified herein, the pressure temperature limitations shall be as specified in the referenced standards and specifications.

1.2.2 Standard Commercial Product

The terminal units provided shall, as a minimum, comply with the features specified herein and shall be the manufacturer's standard commercial product. Additional or better features which are not specifically
prohibited herein but which are a part of the manufacturer's standard commercial product, shall be included in the terminal units being furnished. A standard commercial product is a product which has been sold or is currently being offered for sale, on the commercial market through advertisements or manufacturer's catalogs or brochures. Provide Institute of Boiler and Radiator Manufacturer (IBR) or Steel Boiler Institute (SBI) rating for required capacity.

1.2.3 Welding Safety

AWS 249.1.

1.2.4 Definitions

1.2.4.1 High Pressure Piping System

A system whose pressure is greater than 103 kPa (gage) 15 psig and shall conform to ASME B31.1.

1.2.4.2 Low Pressure Piping System

A system whose pressure is 103 kPa (gage) 15 psig or less.

1.2.4.3 Terminal Unit

An enclosed unit that provides heated air from a steam coil and includes natural convection units, radiation, and forced air units.

1.2.4.4 Piping and Piping System

Includes pipe, tubing, flanges, bolting, gaskets, valves, safety valves, fittings, and pressure containing parts of other piping components, hangers, supports, guides, expansion joints, anchors, and other equipment items necessary to prevent overstressing the pressure containing parts.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-03 Product Data**

Unit Heaters

Convertors

Condensate Return Pumping Units

Finned Tube Radiation Units

Cast Iron Baseboard Radiation Units

Conectors

Steam to Air Heating Coils

Valves

Valve Operating Mechanism

Steam Meters

Traps

Strainers

Flash Tanks

Expansion Joints

Instrumentation

**SD-06 Test Reports**

Steam Piping tests

Copper Tubing test
Valves tests
Expansion Joints tests
Instrumentation tests
Pipe and Pipe System
Unit Heaters tests
Convertors tests
Condensate Return Pumping Units tests
Radiation Units tests
Steam to Air Heating Coils tests

Submit reports of tests required by the reference specification and standards.

SD-07 Certificates
Welding Procedure
Welder's Performance Qualification Record
List of Welders and Welder's Symbols

SD-08 Manufacturer's Instructions
Unit Heaters
Convertors
Condensate Return Pumping Units

Include manufacturer's recommendations for equipment foundations.

1.4 QUALITY ASSURANCE

1.4.1 Welding Procedure

Submit welding procedure specification for metals included in the work, together with proof of the procedure's qualifications as outlined in ASME B31.1.

1.4.2 Welder's Performance Qualification Record

Submit [to the Contracting Officer] the Welder's Performance Qualification Record in conformance with ASME B31.1 for each welder, showing that the welder was tested under the approved procedure specification submitted by the Contractor. In addition, the Contractor shall submit list of welders and welder's symbols, assigned number, or letter which shall be used to identify the work of the welder which shall be affixed immediately upon completion of the weld. Welders making defective welds after passing a qualification test shall be required to take a requalification test. Welders failing the requalification tests will not be permitted to work...
1.4.3 Previous Qualifications

Welding procedures, welders, and welding operators previously qualified by test may be accepted for this contract without requalification subject to approval if the conditions specified in ASME B31.1 are met before a procedure can be used.

PART 2 PRODUCTS

2.1 PIPE AND PIPE SYSTEM

2.1.1 High Pressure Steam Piping System (Over 103 kPa (gage) Over 15 psig)

**************************************************************************
NOTE: Specify the operating pressures and temperatures.
**************************************************************************

ASME B31.1 for a steam working pressure of [___] kPa (gage) psig and a temperature of [___] degrees C F, a condensate pressure of [___] kPa (gage) psig, and a temperature of [___] degrees C F.

2.1.1.1 High Pressure Steam Piping

**************************************************************************
NOTE: Specify Schedule 40 pipe for systems operating at 862 kPa 125 pounds or less steam pressure. For systems operating at pressures greater than 862 kPa 125 pounds or where piping will be subjected to high stress, determine pipe thickness required and specify the appropriate pipe schedule.
**************************************************************************

ASTM A106/A106M or ASTM A53/A53M, Grade B, Schedule [___], black steel, [electric-resistance welded] [or] [seamless]. Use ASTM A53/A53M pipe for bending.

2.1.2 Low Pressure Steam Piping System

**************************************************************************
NOTE: Specify the operating pressures and temperatures.
**************************************************************************

ASME B31.1 for a steam working pressure of 103 kPa (gage) 15 psig or less, a condensate pressure of [___] kPa (gage) psig, and a temperature of [___] degrees C F.

2.1.2.1 Low Pressure Steam Piping

a. Steel Piping: ASTM A53/A53M, Schedule 40, black, [electric-resistance welded] [or] [seamless]. Use ASTM A53/A53M pipe for bending.

b. Copper Tubing: ASTM B88M ASTM B88, Type K.
2.1.3 Condensate Return Piping (690 kPa (gage) 100 psig or Less)

2.1.3.1 Steel Piping

ASTM A106/A106M or ASTM A53/A53M, Grade B, Schedule 80, black, [electric-resistance welded] [or] [seamless].

2.1.3.2 Copper Tubing (103 kPa (Gage) 15 psig or Less)

ASTM B88MASTM B88, Type K.

2.1.4 Fittings

Provide fittings compatible in all respects (material, size, pressure, and temperature limitations) with the pipe being used and within any further limitations of ASME B31.1.

2.1.4.1 Fittings for Steel Pipe

a. Sizes 3 to 50 mm 1/8 to 2 inches:

   (1) Steel Fittings: ASME B16.11, socket welding or threaded. Where pressure exceeds 103 kPa (gage) 15 psig, provide socket-welding type only.

b. Sizes 65 mm 2 1/2 inches and larger:

   (1) Steel Fittings: ASME B16.9, buttwelding or ASME B16.5, flanged.

   (2) Bronze Fittings: ASME B16.24, flanged. Sizes larger than 200 mm 8 inches are not permitted.

2.1.4.2 Fittings for Copper Tubing

ASME B16.18, cast copper alloy or ASME B16.22, wrought copper, solder joint type. Flared or compression joint type fittings for tube sizes not exceeding 50 mm 2 inches outside diameter (O.D.) may be provided as permitted in ASME B31.1.

2.1.5 Unions

2.1.5.1 Unions for Steel Pipe

ASME B16.39, threaded.

2.1.5.2 Unions for Copper Tubing

CID A-A-59617, solder joint end type.

2.1.6 Flanges

Remove the raised faces on flanges when used with flanges having a flat face.

2.1.6.1 Steel Flanges

ASME B16.5, forged steel, welding type.
2.1.6.2 Bronze Flanges

ASME B16.24, threaded.

2.1.7 Valves

Shall conform to the following paragraphs. End connections shall conform to paragraph END CONNECTIONS.

2.1.7.1 Gate Valves

a. Bronze Gate Valves: MSS SP-80, [Type 1 (solid wedge, non-rising stem)] [or] [Type 2 (solid wedge, inside screw, rising stem)], 80 mm 3 inches and smaller, threaded or solder joint ends, and not less than Class 150.

**************************************************************************
NOTE: When special trim material is required, revise latter portion of paragraph to identify the special trim material.
**************************************************************************

b. Steel Gate Valves: ASME B16.34. Provide outside screw and yoke type with solid wedge or flexible wedge disc, and with trim suitable for the service temperature and pressure.

2.1.7.2 Globe and Angle Valves

a. Bronze Globe and Angle Valves: MSS SP-80, Type 1 (metal disc, integral seat) or Type 3 (metal disc, renewable seat), 80 mm 3 inches and smaller, threaded or solder joint ends, Class 200 except that Class 150 with solder joint ends may be used for copper tubing. Valves shall have renewable seats and discs, except solder joint end valves which shall have integral seats.

**************************************************************************
NOTE: When special trim material is required, revise latter portion of paragraph to identify the special trim material.
**************************************************************************

b. Steel Globe and Angle Valves: ASME B16.34, with trim suitable for the service temperature and pressure.

2.1.7.3 Check Valves

a. Bronze Check Valves: MSS SP-80, Type 3 (swing check, metal disc to metal seat), 80 mm 3 inches and smaller, threaded or solder joint ends, Class 200, regrinding type.

**************************************************************************
NOTE: When special trim material is required, revise latter portion of paragraph to identify the special trim material.
**************************************************************************

b. Steel Check Valves: MIL-DTL-18436, with trim suitable for the service temperature and pressure.
(1) Swing Check Valves: Shall have bolted caps.

(2) Lift Check Valves: Shall have threaded or bolted caps.

### 2.1.7.4 Steam Pressure Reducing Valves

CID A-A-50558, Type [____], Class [____], Construction [____], Load Characteristics [____], cast iron prohibited.

### 2.1.7.5 Temperature Regulating Valves

CID A-A-50559, Type [____], Style [____], Class [____], cast iron prohibited.

### 2.1.7.6 Air Vent Valves

FS F-V-2906, [with] [without] vacuum holding device, pressure rated for the intended service, and with a [capacity of [____] liter per second cfm] [capacity based on manufacturer's standard for the connection size], cast iron prohibited.

### 2.1.7.7 Radiator Valves

Provide angle or straightway pattern with packed or packless bonnet shutoff globe type designed especially for steam heating system. Valve shall be constructed of copper alloy conforming to ASTM specifications for materials with non-metallic renewable disc and plastic wheel handle for shutoff service.

### 2.1.7.8 Valve Operating Mechanism

-------------
NOTE: Show location of each floor stand, chainwheel, or power operator required in the project. Delete paragraph VALVE OPERATING MECHANISM and its subparagraphs if these items are not required in the project.
-------------

Provide [floor stands] [chainwheels] [power operators] [and extension stems] where indicated and as specified.

-------------
NOTE: Show floor stand details including distance from centerline of valve to top of floor, floor thickness, and handwheel height.
-------------

a. Floor Stands: Shall be cast iron or steel, constructed for bolting to the floor and shall include an extension stem, an operating handwheel, and a position indicator for non-rising stems. Floor stand shall be not less than 762 mm 30 inches high. Handwheel shall identify rotation direction for closing the valve and shall be of such diameter as to permit operation of the valve with a force of not more than 178 Newton 40 pounds.

b. Chainwheel Operator: Shall be fabricated of cast iron or steel and shall include a wheel, an endless chain, and a guide to keep the chain...
on the wheel. Provide galvanized steel endless chain extending to within 914 mm 3 feet of the floor.

**************************************************************************

NOTE: Show electric or compressed air power supply required to operate the power operators.
**************************************************************************

c. Power Operators: Shall be [electric] [pneumatic]. Power operated valves shall open and close at rates no slower than 254 mm 10 inches per minute for gate valves and 100 mm 4 inches per minute for globe and angle valves. Valves shall open fully or close tightly without requiring further attention when the actuating control is moved to the open or close position. A predetermined thrust exerted on the stem during operation resulting from an obstruction in the valve shall cause the motor to automatically stop. Power operators shall be complete with all gearing and controls necessary for the size of valve being provided. Power operators shall be designed to operate on the [electric] [compressed air] power supply indicated.

d. Extension Stem: Shall be corrosion resisting steel designed for rising and non-rising stems, as applicable, and for connection to the valve stem by a sleeve coupling or universal joint. Provide in length required to connect the valve stem and the [handwheel] [operating mechanism] and of sufficient cross section to transfer the torque required to operate the valve.

2.1.7.9 Safety Valves

**************************************************************************

NOTE: The designer shall ensure that safety valves are installed for proper personnel protection. Vent piping shall be sized to minimize back pressure. The pipe sizes and the method of termination shall be shown on the drawings.
**************************************************************************

**************************************************************************

NOTE: Consult reference document to determine Type, Class, and Style as appropriate for the project.
**************************************************************************

MIL-DTL-18436, Type 1, Class [______], Style [______], and sized in accordance with ASME BPVC. Set point shall be as indicated, cast iron prohibited.

2.1.8 End Connections

2.1.8.1 Steel Piping

Sizes 50 mm 2 inches and smaller threaded or socket welded; sizes 65 mm 2 1/2 inches and larger flanged or butt welded.

b. Flanged Joints: Flanges shall conform to paragraph entitled "Flanges." Bolting and gaskets shall be as follows:
NOTE: For temperature limitations on the use of these bolts, consult ASME B31.1.

(1) Bolting: Material used for bolts and studs shall conform to ASTM A307, Grade B; and material for nuts shall conform to ASTM A194/A194M, Grade 2. Dimensions of bolts, studs, and nuts shall conform to ASME B18.2.1 and ASME B18.2.2 with threads conforming to ASME B1.1 coarse type, with Class 2A fit for bolts and studs, and Class 2B fit for nuts. Bolts or bolt-studs shall extend completely through the nuts and may have reduced shanks of a diameter not less than the diameter at root of threads. Carbon steel bolts shall have American Standard regular square or heavy hexagon heads and shall have American Standard heavy semifinished hexagonal nuts, conforming to ASME B18.2.1 and ASME B18.2.2.

(2) Gaskets: Gaskets shall be as follows:

<table>
<thead>
<tr>

Gaskets shall be as thin as the finish of surfaces will permit. Metal or metal-jacketed non-asbestos gaskets shall be used with small male and female or small tongue-and-groove flanges or flanged fittings; they may be used with steel flanges with lapped, large male and female, large tongue-and-groove, or raised faces. Full faced gaskets shall be used with flat-faced bronze flanges. Lapped steel flanges, or raised-face steel flanges shall have ring gaskets with an outside diameter extending to the inside of the bolt holes. Widths of gaskets for small male and female and for tongue-and-groove joints shall be equal to the widths of the male face or tongue. Gaskets shall have an inside diameter equal to or larger than the port openings. Rings for ring joints shall be in accordance with dimensions in ASME B16.20, suitable for the service conditions encountered, and shall be softer than the flanges. Dimensions for non-metallic gaskets shall be in accordance with ASME B16.21.
c. Butt Weld Joints:  ASME B31.1. The use of backing rings shall conform to ASME B31.1. Ferrous rings shall be of good weldable quality and shall not exceed 0.05 percent sulfur; for alloy pipe, backing rings shall be of material compatible with the chemical composition of the parts to be welded and preferably of the same composition. Backing rings shall be continuous machined or split band type.

2.1.8.2 Joints for Copper Tubing

a. Solder Joints:  ASTM B32, alloy grade Sb5 solder for steam pressure 103 kPa (gage) 15 psig or less.

b. Brazed Joints:  FS QQ-B-654 for steam pressure 827 kPa (gage) 120 psig or less.

2.1.9 Expansion Joints

2.1.9.1 Packless Type

**************************************************************************
NOTE: Consult reference document to determine Type, Class, and Style as appropriate for the project.
**************************************************************************

MIL-DTL-17813, Type [____], Class [____], located as indicated. Bellows material shall be [____]. Expansion joint shall be designed for [____] cycles of movement.

2.1.9.2 Guided Slip-Tube Type

**************************************************************************
NOTE: Consult reference document to determine Type, Class, and Style as appropriate for the project.
**************************************************************************

MIL-E-17814, Type [____], Style [____], Class [____], locate as indicated. Expansion joint material shall be [____].

2.1.10 Instrumentation

2.1.10.1 Pressure and Vacuum Gages

ASME B40.100 with restrictor, locate as indicated. Provide scale range for intended service. Scale range not to exceed two times (2X) the indicated pressure of piping.

2.1.10.2 Tank Gages

CID A-A-50568, locate as indicated.

2.1.10.3 Indicating Thermometers

Thermometers shall be dial type with an adjustable angle suitable for the service. Provide thermowell sized for each thermometer in accordance with the thermowell specification. Fluid-filled thermometers (mercury is not acceptable) shall have a nominal scale diameter of 125 mm 5 inches.
Construction shall be stainless-steel case with molded glass cover, stainless-steel stem, and bulb. Stem shall be straight, length as required to fit well. Bimetal thermometers shall have a scale diameter of 90 mm 3 1/2 inches. Case shall be hermetic. Case and stem shall be constructed of stainless steel. Bimetal stem shall be straight and of a length as required to fit the well.

2.1.11 Miscellaneous Pipeline Components

2.1.11.1 Steam Meters

[ a. Rotary Axial-Turbine Steam Meter

(1) Provide rotary axial-turbine totalizing type designed for mounting directly in the steam line (for sizes up to 100 mm 4 inches inclusively) or in a bypass piping arrangement with orifice plate in the main line (for sizes 125 mm 5 inches and up). Bypass meter shall be furnished for horizontal or vertical upward flow or vertical downward flow.

(2) The meter shall be self-contained and self-operating requiring no mercury, pressure piping, compressed air, or electrical connections except for operation of accessory contacts where required or desired. The meter shall include a dampened fan shaft assembly, fixed internal orifice, and magnetically driven counter of [dial and pointer type] [cyclometer type]. Stuffing box shall not be allowed.

(3) Materials of construction shall be [cast iron body with 113 kg 250 pounds flanged ends for pressures up to 1724 kPa 250 psig and temperatures up to 232 degrees C 450 degrees F] [cast steel body with 136 kg 300 pounds flanged ends for pressures up to 2070 kPa 300 psig and temperatures up to 400 degrees C 750 degrees F]. Wear parts shall be of monel or stainless steel with graphite top bearing and jewelled bottom bearing.

(4) Meter shall be direct reading in pounds of steam over a 10 to 1 range, with continuous overload capability up to 150 percent of rated capacity and temporary overload capability up to 200 percent of rated capacity.

(5) Accuracy shall be within plus or minus 2 percent of actual flow over the entire 10 to 1 range at flow rates and pressures within the limits set forth in the capacity tables.

[ (6) Meter shall be equipped with pressure compensating counter for automatically and continuously correcting meter readings to compensate for line pressure variations. The counter shall be self-contained and self-operating and require no connections other than a single tap to the steam main. Pressure compensation range shall be [_____] to [_____] kPa psi.]

[ (7) Meter counter shall be equipped with electric contactor to operate a remote totalizer, or for providing impulses for interfacing with an energy monitoring system. Contacts or impulses to be proportional to pressure compensated steam flow.]}

[ b. Variable Orifice Steam Meters]
(1) Provide spring loaded variable orifice principle type steam meters, density compensated, to ensure accuracy within plus or minus 2 percent of actual flow rate independent of line pressure changes.

(2) Provide a computer to display totalized flow, flow rate, temperature, pressure, time, and date.

(3) The computer shall be capable of providing high and low flow rate and temperature alarm set points, four independent timers to store peak flow rate and total flow, a 4 to 20 mA output and a communication port for energy management interface.

2.1.11.2 Air Traps

**CID A-A-60001** for float-operated steam traps (non-thermostatic), except that the valve mechanism shall be inverted so as to be closed, not opened, by rising water. Arrange float-controlled valves to close promptly when water enters the traps. Locate traps as indicated.

2.1.11.3 Steam Traps

**************************************************************************

NOTE: Consult reference document to determine Type, Class, and Style as appropriate for the project.
**************************************************************************

**CID A-A-60001**, Type [____], Style [____], thermostatic and non-thermostatic steam traps. Provide traps with separate strainers and locate as indicated.

2.1.11.4 Strainers

**FS WW-S-2739**, Style Y (Y pattern) for Class 125 and 250 piping in sizes 15 to 200 mm 1/2 to 8 inches, inclusive, locate as indicated, cast iron prohibited.

2.1.11.5 Exhaust Heads

2.1.11.6 Hangers, Supports, Spacing Requirements, and Attachments

**MSS SP-58** and **ASME B31.1** for materials, design, and manufacture. **MSS SP-69** for selection and application.

2.1.11.7 Flash Tanks

Construct of steel for a minimum working pressure of 862 kPa 125 psig. Provide the tank with a vent and valved drain.

2.2 UNIT HEATERS

**FS S-U-2833**, [propeller] [centrifugal] fan type with [horizontal] [vertical] air delivery and with capacity as indicated for the design conditions. Fans shall be dynamically balanced only.
2.3 CONVERTORS

*UFGS*

**CONVERTORS**

FS WW-H-191, steam to hot water convertors, with capacity as indicated for the design conditions. Design convertor for support by [system piping] [separate pipe hangers], and provide [temperature regulator] [air vent valve] [air and steam trap].

2.4 CONDENSATE RETURN UNITS

**************************************************************************

**NOTE:** The discharge pressure limitations for condensate pumping unit with hexahedral or vertical receiver is 69 to 517 kPa (gage) 10 to 75 psig, for horizontal receiver, it is 69 to 1379 kPa (gage) 10 to 200 psig.

**************************************************************************

2.4.1 Condensate Return Pumping Units

FS F-P-2908, with [hexahedral, floor-mounted receiver,] [horizontal, cylindrical, stand-mounted receiver,] [vertical, cylindrical, underground receiver], and a [single] [duplex] pump unit, with capacity as indicated.

2.4.2 Pump Motors

NEMA MG 1, suitable for the electrical characteristics as indicated. Motors shall be [open] [splash proof] [totally enclosed] type.

2.4.3 Motor Starters

**************************************************************************

**NOTE:** The motor control requirements should be coordinated with Section 26 20 00, INTERIOR DISTRIBUTION SYSTEM and will depend on field conditions. The following types of motor starters should be used as a guide only. When electrical equipment is connected to heavily loaded power circuits, the starting current may cause an excessive voltage drop on the circuit.

NEMA ICS 2, [manual] [across-the-line magnetic,] [reduced voltage-start] [part-winding] [wye-delta] type with NEMA ICS 6 [general purpose]
[weather-resistant] [water tight] enclosure.

2.5 RADIATION UNITS

2.5.1 Finned Tube Radiation Units

[FS S-R-2834, steel tube with steel fins,] [CID A-A-50545, copper tube with aluminum fins,] [with an adjustable damper,] size and capacity not less than indicated.

2.5.2 Cast Iron Baseboard Radiation Units

CID A-A-50545, size and capacity not less than indicated.

2.5.3 Convector

2.6 STEAM TO AIR HEATING COILS

Heating and ventilating units for steam system shall be as specified in [Section 23 30 00 HVAC AIR DISTRIBUTION,] except that steam coils shall be provided in lieu of water coils. Coils for factory fabricated air handlers and reheat coils shall be constructed as follows: Construct steam distribution (nonfreeze type) coils of cast semi-steel, welded-steel, or copper headers, red brass or copper tubes, and copper or aluminum fins mechanically bonded or soldered or helically wound to tubes. Roll and bush, braze, or weld tubes into headers. Condensing tubes shall be not less than 16 mm 5/8 inch outside diameter. Distributing tubes shall be not less than 10 mm 3/8 inch outside diameter, with orifices to discharge steam to condenser tubes and shall be held securely in position. The maximum length of a single coil shall be limited to 120 times the outside diameter of the tube. Coil casings and tube support sheets, with collars of ample width, shall be not lighter than 16 gage 1.6129 mm thick 0.0635 inch thick galvanized steel, formed to provide structural strength. When required, provide multiple tube supports to prevent tube sag. The finned tube and header section shall float within the casing to allow free expansion of tubing for coils subject to high pressure steam service. Factory test coils at 1724 kPa (gage) 250 psig hydrostatic test pressure or under water at 1724 kPa (gage) 250 psig air pressure. Coils shall be suitable for 1379 kPa (gage) 200 psig steam working pressure. Test rate coils in accordance with AHRI 410.

PART 3 EXECUTION

3.1 INSTALLATION

Work material and equipment into a complete, convenient, and economical system or systems; and provide apparatus, parts, materials, and accessories which are necessary to accomplish this result.

3.1.1 Piping

Fabricate, assemble, weld, solder, braze, and install piping and pipe system in accordance with ASME B31.1 and as further qualified herein. Piping shall follow the general arrangement shown. Cut piping accurately to measurements established, for the work shown, by the Contractor, and work into place without springing or forcing, except where cold-springing is indicated. Locate piping and equipment within buildings entirely out of
the way of lighting fixtures, conduit, and doors, windows, and other openings. Run overhead piping in buildings in the most inconspicuous positions. Provide adequate clearances from walls, ceilings, and floors to permit the welding of joints; at least 150 mm 6 inches for pipe sizes 100 mm 4 inches and smaller, 250 mm 10 inches for pipe sizes larger than 100 mm 4 inches, and in corners provide sufficient clearance to permit the welder to work between the pipe and one wall. Make provision for expansion and contraction of pipe lines. Do not bury, conceal, or insulate piping until it has been inspected, tested, and approved. Do not conceal piping in walls, partitions, underground, or under the floor except as indicated. Where pipe passes through building structure, do not conceal pipe joints, but locate where they may be readily inspected and not weaken building structure. Run insulated pipe as shown and as required with sufficient clearance to permit application of insulation. Use flanged joints only where necessary for normal maintenance and where required to match valves and equipment. Gaskets, packing, and thread compounds shall be suitable for the service. Apply joint compound or tape on male thread only. Use long radius ells wherever possible to reduce pressure drops. Pipe bends may be used in lieu of welding fittings where space permits. Pipe bends shall have a uniform radius of at least five times the pipe diameter and shall be free from any appreciable flattening, wrinkling, or thinning of the pipe. Mitering of pipe to form elbows, notching straight runs to form full sized tees, or any similar construction shall not be used. Make branch connections with welding tees except factory made forged welding branch outlets or nozzles having integral reinforcements conforming to ASME B31.1 may be used, provided the nominal diameter of the branch is at least one pipe size less than the nominal diameter of the run. Run piping as indicated, and avoid interference with other piping, conduit, or equipment. Run vertical piping plumb and straight and parallel to walls, except where specifically shown otherwise. Do not trap lines, except where indicated. Use reducing fittings for changes in pipe sizes. The use of bushings is prohibited. In horizontal lines 65 mm 2 1/2 inches and larger, use reducing fittings of the eccentric type to maintain the bottom of the lines in the same plane for steam lines and to maintain the top of the lines in the same plane for condensate lines except where a trap or pocket would result. Provide suitable size sleeves for lines passing through building structure. Install piping connected to equipment to provide flexibility for thermal stresses and for vibration. Support and anchor pipe so that strain from weight and thermal movement of piping is not imposed on the equipment. Thoroughly clean each section of pipe, fittings, and valves of foreign matter before erection. Before placing in position, clean the inside of black steel pipe by rapping along its full length to loosen sand, mill scale, and other foreign matter; pipe 50 mm 2 inches and larger shall have a wire brush of a diameter larger than that of the inside of the pipe drawn through its entire length several times. Before final connections are made to the apparatus, thoroughly wash out the piping interior with water. Blow out steam piping with high-pressure steam, if available, or compressed air, removing rust, oil, chips, sand, and other material. Plug or cap open ends of mains during shutdown periods. Do not leave lines open at any place where any foreign matter might accidentally enter pipe.

3.1.1.1 Welding

a. Welding of Piping: Welding of joints in piping, butt welds, fillet welds, bends, loops, offsets, and preparation and cleaning of pipe shall be in accordance with ASME B31.1. Welds shall be visually examined and meet acceptance standards indicated in Chapter VI of ASME B31.1.
b. Quality of Welds: Quality of welds, correction of defects, stress relieving, and preheating shall be in accordance with ASME B31.1.

c. Arc Welding and Gas Welding: In accordance with ASME BPVC SEC IX.

3.1.1.2 Brazing and Soldering

a. Brazing and soldering procedure qualification shall conform to ASME B31.1. Brazing procedure for joints shall be as outlined in the CDA A4015.

b. Soldering, soldering preparation, and procedures for joints shall be in accordance with ASME B31.1 and as outlined in the CDA A4015.

c. Copper Tube Extracted Joint: An extracted mechanical tee joint may be made in copper tube. Make joint with an appropriate tool by drilling a pilot hole and drawing out the tube surface to form a collar having a minimum height of three times the thickness of the tube wall. To prevent the branch tube from being inserted beyond the depth of the extracted joint, provide dimpled depth stops. Notch the branch tube for proper penetration into fitting to ensure a free flow joint. Braze extracted joints using a copper phosphorous classification brazing filler metal. Soldered joints shall not be permitted.

3.1.1.3 Hangers and Supports

Unless otherwise indicated, horizontal and vertical piping attachments shall conform to MSS SP-58. Continuous inserts and expansion bolts may be used.

3.1.1.4 Grading and Venting of Pipe Lines

Unless otherwise indicated, install horizontal lines of steam and return piping to grade down in the direction of flow with a pitch of not less than 25 mm in 9 meters one inch in 30 feet, except in loop mains and main headers where the flow may be in either direction. When counterflow of condensate within the steam pipe occurs in a portion of a pipeline, pitch up in the direction of steam flow a minimum of 150 mm per 30 meters 6 inches per 100 feet and increase pipe diameters by one standard pipe size. Steam mains pitched away from the boiler shall contain drip connection and air vent valves at the extreme end. Air vents shall be provided at the highest point of any vertical riser. Drip connections shall not be interconnected above the water line of the boiler.

3.1.1.5 Pipe Sleeves

******************************************************************************
NOTE: Specify flanges and clamping rings where waterproofed construction is required.
******************************************************************************

Provide pipe sleeves where pipes and tubing pass through masonry or concrete walls, floors, roofs, and partitions. Use Schedule 40 galvanized steel pipe sleeves in outside walls below and above grade, in floor, and in roof slabs. Sleeves in partitions shall be zinc-coated sheet steel having a weight of not less than 4.43 kg per square meter 0.907 psf. Space between pipe, tubing, or insulation and the sleeve shall be not less than 25 mm 1 inch. Hold sleeves securely in proper position and location before
and during construction. Sleeves shall be of sufficient length to pass through entire thickness of walls, partitions, or slabs. Sleeves in floor slabs shall extend 50 mm \(2\)\ inches above the finished floor. Pack space between the pipe or tubing and the sleeve firmly with oakum and caulk both ends of the sleeve with elastic cement. [Furnish sleeves in waterproofed construction with flanges and clamping rings].

### 3.1.1.6 Floor, Wall, and Ceiling Plates

**NOTE: Provide floor, wall, and ceiling plates for buildings other than power plants and heating plants.**

Secure plates to the pipe with enough clearance for thermal expansion of pipe. Use chromium-plated steel or nickel-plated cast iron plates on pipes passing through floors and partitions of toilet rooms and where indicated; use painted cast iron, malleable iron, or steel for all other plates.

### 3.1.1.7 Flashing for Buildings

Provide tight waterproof flashing where pipes pass through building roofs and outside walls.

### 3.1.1.8 Unions and Flanges

Provide unions and flanges where necessary to permit easy disconnection of piping and apparatus, and as indicated. Provide a union for each threaded end valve. [Place unions or flanges no farther apart than 30 meters \(100\) feet.] Use unions on piping smaller than 50 mm \(2\)\ inches in diameter, and use flanges on piping 50 mm \(2\)\ inches and larger in diameter. Provide dielectric unions or flanges between ferrous and non-ferrous piping, equipment, and fittings; except that bronze valves and fittings may be used without dielectric couplings for ferrous-to-ferrous or non-ferrous to non-ferrous connections. Dielectric fittings shall utilize a non-metallic filler which will prevent current flow. The spacer shall be suitable for the pressure and temperature of the service. The fittings shall otherwise conform to the requirements of paragraph entitled "Fittings."

### 3.1.1.9 Traps and Connections

Traps shall be of the type and capacity for the service and shall be properly supported and connected. Except for thermostatic traps in pipe coils, radiators, and convectors, install traps with a dirt pocket and strainer between it and the piping or apparatus it drains. When necessary to maintain in continuous service apparatus or piping which is to be drained, provide a three-valve bypass so that the trap may be removed and repaired and condensate may drain through the throttled bypass valve. Provide a check valve on the discharge side of the trap whenever the trap is installed for lift or operating against a back pressure, or discharges into a common return line. When a thermodynamic trap is used, a check valve is not required or recommended. Provide test connections on the discharge side of the high and medium pressure traps when they are specifically required. The test connection shall include a 15 mm \(1/2\)\ inch globe valve with uncapped nipple.
3.1.1.10 Connections for Future Equipment

Locate capped or plugged outlets for connections to future equipment as indicated.

3.1.2 Valves

3.1.2.1 General

Install valves in conformance with ASME B31.1, ASME BPVC SEC VIII D1, and as required herein, at the locations indicated and elsewhere as required for the proper functioning of the system. Use gate valves unless otherwise directed. Install stop valves in the supply lines equipped or located so as to permit operation from floor level, or provided with safe access in the form of walkways or ladders. Install valves in positions accessible for operation and repair. Provide gate valves 200 mm 8 inches and larger with globe-valved bypass in accordance with MSS SP-45.

3.1.2.2 Globe Valves

Install globe valves so that the pressure shall be below the disk. Install globe valves with the stems horizontal on steam and exhaust lines.

3.1.2.3 Steam Pressure-Reducing Valves

**************************************************************************
NOTE: The designer shall ensure that safety valves are installed for proper personnel protection. Vent piping shall be sized to minimize back pressure. The pipe sizes and the method of termination shall be shown on the drawings.
**************************************************************************

**************************************************************************
NOTE: The bypass valves shall be located in bypass piping. The valve and piping shall be sized to restrict the capacity to approximately that of the reducing valve and the sizes shall be indicated on the drawings.
**************************************************************************

**************************************************************************
NOTE: Provide a drip trap upstream of the pressure reducing valve to preclude the build-up of condensate and potential water hammer through the valve and downstream piping.
**************************************************************************

Provide the steam line entering each pressure-reducing valve with a strainer. Provide each pressure-reducing valve unit with two cutout valves and with a globe or angle bypass valve and bypass piping. Provide each pressure-reducing valve unit with an indicating steam gage to show the reduced pressure, and a safety valve on the low pressure side with sufficient capacity to relieve the high pressure steam.

3.1.2.4 Valves for Radiators

Install a radiator valve on each radiator.
3.1.2.5 Safety Valves

Provide with drip pan elbows.

3.1.3 Pressure Gages

Install a shutoff valve or petcock between each pressure gage and the line, and gages on steam lines shall have a syphon installed ahead of the gage.

3.1.4 Thermometers

Provide thermometers and thermal sensing elements of control valves with a separable socket. Install separable sockets in pipe lines in such a manner to sense the temperature of the flowing fluid and minimize obstruction to flow.

3.1.5 Steam Meters

Provide steam meters with a suitable three-valve bypass to permit dismantling and inspection without interference with the service.

3.1.6 Strainers

Provide strainers with meshes suitable for the services where indicated, and where dirt might interfere with the proper operation of valve parts, orifices, and moving parts of equipment.

3.1.7 Equipment Foundations

Design equipment foundations of sufficient size and weight to provide isolation and to preclude shifting of equipment under operating conditions. Foundations shall meet the requirements of the equipment manufacturer. When required by the Contracting Officer, the equipment manufacturer's approval of the foundation design and construction for the equipment involved shall be obtained.

3.1.8 Equipment Installation

Install equipment as specified and in accordance with the manufacturer's installation instructions. Grout equipment mounted on concrete foundations before piping is installed. Install piping in such a manner as not to place a strain on any of the equipment. Do not bolt flanged joints tight unless they match. Adequately extend expansion bends before installation. Grade, anchor, guide, and support piping without low pockets.

3.1.9 Cleaning of System

As installations of the various system components are completed, clean before final closing. Remove foreign matter from equipment and surrounding areas. Preliminary or final tests shall not be performed until the cleaning is approved.

3.1.10 Cleaning and Painting of Piping and Equipment

******************************************************************************
NOTE: When the project specification does not have a section on field painting, the requirements for cleaning and painting of pipe and equipment, contained in Section 09 90 00, PAINTS AND COATINGS, shall be included in this section.

SECTION 23 22 26.00 20  Page 28
Clean and paint piping and equipment in accordance with Section [09 90 00 PAINTS AND COATINGS].

### 3.1.11 Identification of Piping

Labels for pipes 20 mm 3/4 inch diameter and larger shall bear printed legends to identify contents of pipes and arrows to show direction of flow. Labels shall have color coded background to signify levels of hazard in accordance with ASME A13.1. Legends and type and size of characters shall also conform as ASME A13.1. Make labels of plastic sheet CID A-A-1689 with pressure sensitivity suitable for the intended applications, or they may be premolded of plastic to fit over pipe. For pipe smaller than 20 mm 3/4 inch diameter, provide brass identification tags 40 mm 1 1/2 inches in diameter with legends in depressed black filled characters.

### 3.2 FIELD TESTS AND INSPECTIONS

************
NOTE: For Contractor Quality Control projects, include field inspections.
************

************
NOTE: Coordinate with Division 1 concerning the availability of water and electric power.
************

Field [inspections, field] tests, and trial operations specified in this section shall be performed by the Contractor. The Contractor shall provide gas, oil, labor, equipment, and incidentals required for testing[, except that in accordance with Division 1 the Government will provide water or electric power required for tests]. The Contractor shall give the Contracting Officer [____] days' advance written notice of the dates and times scheduled for tests and trial operations.

#### 3.2.1 Field Inspections

Inspect piping system prior to initial operation, for conformance to drawings, specifications, and ASME B31.1. Equipment, material, or work rejected because of defects or non-conformance with drawings, specifications, and ASME B31.1 shall be replaced or corrected by the Contractor, as directed by the Contracting Officer.

#### 3.2.2 Field Tests

Conduct the following tests after completion of the piping installation and prior to initial operation.

##### 3.2.2.1 Piping System

Test piping system hydrostatically using water not exceeding 38 degrees C 100 degrees F. Conduct tests in accordance with the requirements of ASME B31.1 and as follows. Test the piping system after the lines have been cleaned as herein specified and before any insulation covering has been applied. Test piping system at 1 1/2 times the system pressure or 345 kPa (gage) 50 psig whichever is greater. Before performing tests, remove or valve off from the system, gages, traps, and other apparatus which may
be damaged by the test pressure. Install a calibrated test pressure gage in the system to observe any loss in pressure. Maintain the required test pressure for a sufficient length of time to enable an inspection to be made of joints and connections. Perform tests after installation and prior to acceptance.

3.2.2.2 Start-Up and Operational Test

Start-up the system and initially operate with components operating. During the test, periodically clean the various strainers until no further accumulation of foreign material occurs. Exercise care so that minimum loss of [water] [steam] occur when strainers are cleaned. Adjust safety and automatic control instruments as necessary to place them in proper operation and sequence.

3.2.2.3 Extent of Field Tests

After installation and before acceptance, subject the work of this section to necessary field tests, including those herein specified, and in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Refrigerant Piping System; G[, [_____]]

SD-03 Product Data
Refrigerant Piping System
Spare Parts
Qualifications
1.3 QUALITY ASSURANCE

1.3.1 Qualifications

**************************************************************************
NOTE: If the need exists for more stringent requirements for weldments, delete the first bracketed statement, otherwise delete the second. Regarding welding Section reference, use first bracketed statement for Army projects and delete the second option of the Navy Section; and vice versa.
**************************************************************************

Submit [_____] copies of qualified procedures, and list of names and identification symbols of qualified welders and welding operators, prior to non-factory welding operations. Weld piping in accordance with the qualified procedures using performance qualified welders and welding operators. Procedures and welders must be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests to be performed at the work site, if practical. The welder or welding operator must apply the personally assigned symbol near each weld made, as a permanent record. Weld structural members in accordance with Section [05 05 23.16 STRUCTURAL WELDING][05 12 00 STRUCTURAL STEEL]. Welding and nondestructive testing procedures are specified in Section [40 05 13.96 WELDING PROCESS PIPING][40 17 26.00 20 WELDING PROCESS PIPING].

1.3.2 Contract Drawings

Because of the small scale of the drawings, it is not possible to indicate all offsets, fittings, and accessories that may be required. Carefully investigate the plumbing, fire protection, electrical, structural and finish conditions that would affect the work to be performed and arrange such work accordingly, furnishing required offsets, fittings, and accessories to meet such conditions.
1.4 DELIVERY, STORAGE, AND HANDLING

Protect stored items from the weather, humidity and temperature variations, dirt and dust, or other contaminants. Proper protection and care of all material both before and during installation is the Contractor's responsibility. Replace any materials found to be damaged at the Contractor's expense. During installation, cap piping and similar openings to keep out dirt and other foreign matter.

1.5 MAINTENANCE

1.5.1 General

Submit Data Package 2 plus operation and maintenance data complying with the requirements of Section 01 78 23 OPERATION AND MAINTENANCE DATA and as specified herein.

1.5.2 Extra Materials

**************************************************************************
NOTE: Remove this paragraph in Navy projects.
**************************************************************************

Submit spare parts data for each different item of equipment specified, after approval of detail drawings and not later than [_____] months prior to the date of beneficial occupancy. Include a complete list of parts and supplies, with current unit prices and source of supply, a recommended spare parts list for 1 year of operation, and a list of the parts recommended by the manufacturer to be replaced on a routine basis in the data.

PART 2 PRODUCTS

2.1 STANDARD COMMERCIAL PRODUCTS

a. Provide materials and equipment which are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship and that have been in satisfactory commercial or industrial use for 2 years prior to bid opening.

b. The 2 year use must include applications of equipment and materials under similar circumstances and of similar size. The 2 years' experience must be satisfactorily completed by a product which has been sold or is offered for sale on the commercial market through advertisements, manufacturer's catalogs, or brochures. Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation, for not less than 6000 hours exclusive of the manufacturer's factory tests, can be shown.

c. Products must be supported by a service organization. System components must be environmentally suitable for the indicated locations. Submit a certified list of qualified permanent service organizations for support of the equipment which includes their addresses and qualifications. The service organizations must be reasonably convenient to the equipment installation and be able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.
d. Exposed equipment moving parts, parts that produce high operating temperature, parts which may be electrically energized, and parts that may be a hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Install safety devices so that proper operation of equipment is not impaired. Welding and cutting safety requirements must be in accordance with AWS Z49.1.

e. Provide the manufacturer's standard catalog data, at least [5 weeks] [_____] prior to the purchase or installation of a particular component. Highlight the data to show information such as, but not limited to, material, size, options, performance charts, and curves in adequate detail to demonstrate compliance with contract requirements. Include the manufacturer's recommended installation instructions and procedures in the data provided. Provide data for the following components as a minimum:

(1) Piping and Fittings
(2) Valves
(3) Piping Accessories
(4) Pipe Hangers, Inserts, and Supports

2.2 ELECTRICAL WORK

**************************************************************************
NOTE: Use the first bracketed statement for Army projects or the second for Navy jobs; delete the non-applicable statement.
**************************************************************************

[Electrical equipment and wiring must be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Field wiring must be in accordance with manufacturer's instructions.] [Manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices specified, but not shown, must be provided.]

2.3 REFRIGERANT PIPING SYSTEM

**************************************************************************
NOTE: This specification is written primarily for Group A1 refrigerants (i.e., R-134a, R-410A, and R-404A). For information on refrigerant classifications refer to ASHRAE 15 & 34. If the piping system is intended for other refrigerants such as R-123 (Group B1) or ammonia (Group B2), then the designer will have to research ASHRAE 15 & 34 and ASME B31.5 and modify the specification appropriately.

It is the responsibility of the engineer to select materials to resist deterioration for conditions of operation.
**************************************************************************

Provide refrigerant piping, valves, fittings, and accessories in accordance with ASHRAE 15 & 34 and ASME B31.5, except as specified herein. Refrigerant piping, valves, fittings, and accessories must be compatible with the fluids used and capable of withstanding the pressures and
temperatures of the service. Refrigerant piping, valves, and accessories used for refrigerant service must be cleaned, dehydrated, and sealed (capped or plugged) prior to shipment from the manufacturer's plant. Submit drawings, at least [5] weeks prior to beginning construction, provided in adequate detail to demonstrate compliance with contract requirements. Drawings must consist of:

a. Piping layouts which identify all valves and fittings.

b. Plans and elevations which identify clearances required for maintenance and operation.

2.4 PIPE, FITTINGS AND END CONNECTIONS (JOINTS)

2.4.1 Steel Pipe

**************************************************************************
NOTE: Due to the possibility of stress fractures resulting from repeated temperature related expansion and contraction, the designer of record is responsible for determining whether to allow the use of 45-degree elbow fittings on each project.
**************************************************************************

Steel pipe for refrigerant service must conform to ASTM A53/A53M, Schedule 40, Type E or S, Grades A or B. Do not use Type F pipe.

2.4.1.1 Welded Fittings and Connections

Butt-welded fittings must conform to ASME B16.9. Socket-welded fittings must conform to ASME B16.11. Identify welded fittings with the appropriate grade and marking symbol. Welded valves and pipe connections (both butt-welds and socket-welds types) must conform to ASME B31.9.

2.4.1.2 Threaded Fittings and Connections

Threaded fitting must conform to ASME B16.3. Threaded valves and pipe connections must conform to ASME B1.20.2M ASME B1.20.1.

2.4.1.3 Flanged Fittings and Connections

Flanges must conform to ASME B16.5, Class 150. Gaskets must be non-asbestos compressed material in accordance with ASME B16.21, 1.59 mm 1/16 inch thickness, full face or self-centering flat ring type. Gaskets must contain aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR). Bolts, nuts, and bolt patterns must conform to ASME B16.5. Bolts must be high or intermediate strength material conforming to ASTM A193/A193M.

2.4.2 Steel Tubing

Tubing must be cold-rolled, electric-forged, welded-steel in accordance with ASTM A334/A334M, Grade 1. Joints and fittings must be socket type provided by the steel tubing manufacturer.

2.4.3 Copper Tubing

Provide copper tubing conforming to ASTM B280 annealed or hard drawn as required. Copper tubing must bear the product identification markings in
accordance with ASTM B280, "ACR" must be present on copper tubing. Copper tubing must be soft annealed where bending is required and hard drawn where no bending is required. Soft annealed copper tubing must not be used in sizes larger than 35 mm 1-3/8 inches. Joints must be brazed except that joints on lines 22 mm 7/8 inch and smaller may be flared. Cast copper alloy fittings for flared copper tube must conform to ASME B16.26 and ASTM B62. Wrought copper and bronze solder-joint pressure fittings must conform to ASME B16.22 and ASTM B75/B75M. Joints and fittings for brazed joint must be wrought-copper or forged-brass sweat fittings. Cast sweat-type joints and fittings are not allowed for brazed joints. Brass or bronze adapters for brazed tubing may be used for connecting tubing to flanges and to threaded ends of valves and equipment.

2.4.4 Solder

Solder must conform to ASTM B32, grade Sb5, tin-antimony alloy for service pressures up to 1034 kPa 150 psig. Solder flux must be liquid or paste form, non-corrosive and conform to ASTM B813.

2.4.5 Brazing Filler Metal

Filler metal must conform to AWS A5.8/A5.8M, Type BAg-5 with AWS Type FB3-A or Type FB3-C flux, except Type BCuP-3, BCuP-4, or BCuP-5 may be used for brazing copper-to-copper joints. BAlSi-4 with AWS Type FB1-A flux may be used when joining copper piping to aluminum components.

2.4.6 Brazing Flux

Brazing flux must conform to AWS A5.31/A5.31M, Type FB3-A or Type FB3-C when using Type BAg-5 filler metal. Type FB1-A is to be used with Type BAlSi-4 filler metal.

2.4.7 Press Fittings

Press fittings are not acceptable for use in refrigerant piping systems.

2.5 VALVES

Valves must be designed, manufactured, and tested specifically for refrigerant service. The valve material and all internal components must be compatible with the specific refrigerant and lubricant used. Valve bodies must be of brass, bronze, steel, or ductile iron construction. Valves 25 mm 1 inch and smaller must have brazed or socket welded connections. Valves larger than 25 mm 1 inch must have [tongue-and-groove flanged] [butt welded] end connections. Do not use threaded end connections, except in pilot pressure or gauge lines where maintenance disassembly is required and welded flanges cannot be used. Internal parts must be removable for inspection or replacement without applying heat or breaking pipe connections. Valve stems exposed to the atmosphere must be stainless steel or corrosion resistant metal plated carbon steel. Direction of flow must be legibly and permanently indicated on the valve body. Control valve inlets must be fitted with integral or adapted strainer or filter where recommended or required by the manufacturer. Purge, charge and receiver valves must be of manufacturer's standard configuration.

2.5.1 Refrigerant Stop Valves

Valve must be the globe or full-port ball type with a back-seating stem
especially packed for refrigerant service. Valve packing must be replaceable under line pressure. Provide valve with a [handwheel] [or] [wrench] operator and a seal cap. Valve must be the straight or angle pattern design as indicated.

2.5.2 Check Valves

Valve must be the swing or lift type as required to provide positive shutoff at the differential pressure indicated. Valve must be provided with resilient seat.

2.5.3 Liquid Solenoid Valves

Provide valves that comply with AHRI 760 I-P and are suitable for continuous duty with applied voltages 15 percent under and 5 percent over nominal rated voltage at maximum and minimum encountered pressure and temperature service conditions. Valves must be direct-acting or pilot-operating type, packless, except that packed stem, seal capped, manual lifting provisions must be furnished. Provide solenoid coils that are moisture-proof, UL approved, totally encapsulated or encapsulated and metal jacketed as required. Valves must have safe working pressure of 4206 kPa 610 psi and a maximum operating pressure differential of at least 1375 kPa 200 psi at 85 percent rated voltage. Valves must have an operating pressure differential suitable for the refrigerant used.

2.5.4 Expansion Valves

Provide valve conforming to AHRI 751 SI AHRI 750 I-P and ASHRAE 17. Valve must be the diaphragm and spring-loaded type with internal or external equalizers, and bulb and capillary tubing. Provide valve with an external superheat adjustment along with a seal cap. Internal equalizers may be utilized where flowing refrigerant pressure drop between outlet of the valve and inlet to the evaporator coil is negligible and pressure drop across the evaporator is less than the pressure difference corresponding to 1 degree C 2 degrees F of saturated suction temperature at evaporator conditions. Bulb charge must be determined by the manufacturer for the application and such that liquid will remain in the bulb at all operating conditions. Do not use gas limited liquid charged valves and other valve devices for limiting evaporator pressure without a distributor or discharge tube or effective means to prevent loss of control when bulb becomes warmer than valve body. Pilot-operated valves must have a characterized plug to provide required modulating control. A de-energized solenoid valve may be used in the pilot line to close the main valve in lieu of a solenoid valve in the main liquid line. Provide an isolatable pressure gauge in the pilot line, at the main valve. Automatic pressure reducing or constant pressure regulating expansion valves may be used only where indicated or for constant evaporator loads.

2.5.5 Electronic Expansion Valves

Valve must conform to AHRI 1371 SIAHRI 1370 I-P and ASHRAE 17. The valve must prevent the return of liquid to the compressor in the event of power loss or low superheat.

2.5.6 Safety Relief Valves

Valve must be the two-way type, unless indicated otherwise. Valve must bear the ASME code symbol. Valve capacity must be certified by the National Board of Boiler and Pressure Vessel Inspectors. Valve must be of
an automatically reseating design after activation.

2.5.7 Evaporator Pressure Regulators, Direct-Acting

Valve must include a diaphragm/spring assembly, external pressure adjustment with seal cap, and pressure gauge port. Valve must maintain a constant inlet pressure by balancing inlet pressure on diaphragm against an adjustable spring load. Pressure drop at system design load must not exceed the pressure difference corresponding to a 1 degree C 2 degrees F change in saturated refrigerant temperature at evaporator operating suction temperature. Spring must be selected for indicated maximum allowable suction pressure range.

2.5.8 Refrigerant Access Valves

Provide refrigerant access valves and hose connections in accordance with AHRI 720.

2.6 PIPING ACCESSORIES

2.6.1 Filter Driers

Driers must conform to AHRI 711AHRI 710 I-P. Sizes 15 mm 5/8 inch and larger must be the full flow, replaceable core type. Sizes 13 mm 1/2 inch and smaller must be the sealed type. Cores must be of suitable desiccant that will not plug, cake, dust, channel, or break down, and must remove water, acid, and foreign material from the refrigerant. Construct filter driers so that none of the desiccant will pass into the refrigerant lines. Minimum bursting pressure must be 10.3 MPa 1,500 psi.

2.6.2 Sight Glass and Liquid Level Indicator

2.6.2.1 Assembly and Components

Assembly must be pressure- and temperature-rated and constructed of materials suitable for the service. Glass must be borosilicate type. Ferrous components subject to condensation must be electro-galvanized.

2.6.2.2 Gauge Glass

Gauge glass must include top and bottom isolation valves fitted with automatic checks, and packing followers; red-line or green-line gauge glass; elastomer or polymer packing to suit the service; and gauge glass guard.

2.6.2.3 Bull's-Eye and Inline Sight Glass Reflex Lens

Provide bull's-eye and inline sight glass reflex lens for dead-end liquid service. For pipe line mounting, provide two plain lenses in one body suitable for backlighted viewing.

2.6.2.4 Moisture Indicator

Indicator must be a self-reversible action, moisture reactive, color changing media. Indicator must be furnished with full-color-printing tag containing color, moisture, and temperature criteria. Unless otherwise indicated, the moisture indicator must be an integral part of each corresponding sight glass.
2.6.3 Vibration Dampeners

Dampeners must be of the all-metallic bellows and woven-wire type.

2.6.4 Flexible Pipe Connectors

Connector must be a composite of interior corrugated phosphor bronze or Type 300 Series stainless steel, as required for fluid service, with exterior reinforcement of bronze, stainless steel or monel wire braid. Assembly must be constructed with a safety factor of not less than 4 at 150 degrees C 300 degrees F. Unless otherwise indicated, the length of a flexible connector must be as recommended by the manufacturer for the service intended.

2.6.5 Strainers

Strainers used in refrigerant service must have brass or cast-iron body, Y-or angle-pattern, cleanable, not less than 60-mesh noncorroding screen of an area to provide net free area not less than ten times the pipe diameter with pressure rating compatible with the refrigerant service. Screens must be stainless steel or monel and reinforced spring-loaded where necessary for bypass-proof construction.

2.6.6 Pressure and Vacuum Gauges

Provide gauges conforming to ASME B40.100 with throttling type needle valve or a pulsation dampener and shut-off valve. Gauge must be a minimum of 85 mm 3-1/2 inches in diameter with a range from 0 kPa 0 psig to approximately 1.5 times the maximum system working pressure. Select each gauge range so that at normal operating pressure, the needle is within the middle-third of the range.

2.6.7 Temperature Gauges

Provide industrial duty type temperature gauges for the required temperature range. Gauges must have Celsius scale in 1 degree Fahrenheit scale in 2 degrees graduations scale (black numbers) on a white face. The pointer must be adjustable. Provide rigid stem type temperature gauges in thermowells located within 1.5 m 5 feet of the finished floor. Provide universal adjustable angle type or remote element type temperature gauges in thermowells located 1.5 to 2.1 m 5 to 7 feet above the finished floor. Provide remote element type temperature gauges in thermowells located 2.1 m 7 feet above the finished floor.

2.6.7.1 Stem Cased-Glass

Provide stem cased-glass case composed of polished stainless steel or cast aluminum, 229 mm 9 inches long, with clear acrylic lens, and non-mercury filled glass tube with indicating-fluid column.

2.6.7.2 Bimetallic Dial

Provide bimetallic dial type case that is greater than 89 mm 3-1/2 inches, stainless steel, and hermetically sealed with clear acrylic lens. Bimetallic element must be silicone dampened and unit fitted with external calibrator adjustment. Accuracy must be one percent of dial range.
2.6.7.3  Liquid-, Solid-, and Vapor-Filled Dial

Provide liquid-, solid-, and vapor-filled dial type cases that are greater than 89 mm 3-1/2 inches, stainless steel or cast aluminum with clear acrylic lens. Fill must be nonmercury, suitable for encountered cross-ambients, and connecting capillary tubing must be double-braided bronze.

2.6.7.4  Thermowell

Thermowell must be identical size, 13 or 19 mm 1/2 or 3/4 inch NPT connection, brass or stainless steel. Where test wells are indicated, provide captive plug-fitted type 13 mm 1/2 inch NPT connection suitable for use with either engraved stem or standard separable socket thermometer or thermostat. Mercury must not be used in thermometers. Extended neck thermowells must be of sufficient length to clear insulation thickness by 25 mm 1 inch.

2.6.8  Pipe Hangers, Inserts, and Supports

Provide pipe hangers, inserts, guides, and supports conforming to MSS SP-58.

2.6.9  Escutcheons

Escutcheons must be chromium-plated iron or chromium-plated brass, either one piece or split pattern, held in place by internal spring tension or set screws.

2.7  FABRICATION

2.7.1  Factory Coating

**************************************************************************
NOTE: For equipment to be installed outdoors, adequate protection will be specified. Manufacturers must submit evidence that unit specimen have passed the specified salt spray fog test. A 125-hour test will be specified in a noncorrosive environment and a 500 hour test will be specified in a corrosive environment.
**************************************************************************

Unless otherwise specified, equipment and component items, when fabricated from ferrous metal, must be factory finished with the manufacturer's standard finish, except that items located outside of buildings must have weather resistant finishes that will withstand [125] [500] hours exposure to the salt spray test specified in ASTM B117 using a 5 percent sodium chloride solution. Immediately after completion of the test, the specimen must show no signs of blistering, wrinkling, cracking, or loss of adhesion and no sign of rust creepage beyond 3 mm 1/8 inch on either side of the scratch mark. Cut edges of galvanized surfaces where hot-dip galvanized sheet steel is used must be coated with a zinc-rich coating conforming to ASTM D520, Type I.

2.7.2  Factory Applied Insulation

Factory installed insulation must be in accordance with ASHRAE 90.1 - SI ASHRAE 90.1 - IP. [Refrigerant suction lines between the cooler and each compressor [and cold gas inlet connections to gas cooled motors]]
PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, perform a verification of dimensions in the field. Submit a letter, at least \[\text{[2]}\] weeks prior to beginning construction, including the date the site was visited, conformation of existing conditions, and any discrepancies found before performing any work.

3.2 INSTALLATION

**************************************************************************

NOTE: Belowground refrigerant piping should be avoided if at all possible. Direct buried refrigerant piping will not be installed under any circumstances. In the event that belowground pipe routing is the only alternative, the piping will be routed through an accessible trench system (i.e. concrete, fiberglass, PVC, etc.) The designer will specifically detail the trench design as well as fully detail the piping techniques necessary to accommodate oil circulation at both full and part load conditions. Oil circulation is extremely critical to the successful operation of any refrigerant system. Designers will avoid creating any oil traps within a refrigerant piping system.

**************************************************************************

Pipe and fitting installation must conform to the requirements of ASME B31.1. Cut pipe accurately to measurements established at the jobsite, and work into place without springing or forcing, completely clearing all windows, doors, and other openings. Cutting or other weakening of the building structure to facilitate piping installation is not permitted without written approval. Cut pipe or tubing square, remove by reaming, and permit free expansion and contraction without causing damage to the building structure, pipe, joints, or hangers.

3.2.1 Directional Changes

Make changes in direction with fittings, except that bending of pipe 100 mm 4 inches and smaller is permitted, provided a pipe bender is used and wide weep bends are formed. Mitering or notching pipe or other similar
construction to form elbows or tees is not permitted. The centerline radius of bends must not be less than 6 diameters of the pipe. Bent pipe showing kinks, wrinkles, flattening, or other malformations will not be accepted.

3.2.2 Functional Requirements

Install piping 4 mm/m 1/2 inch/10 feet of pipe in the direction of flow to ensure adequate oil drainage. Properly cap or plug open ends of refrigerant lines or equipment during installation to keep moisture, dirt, or other foreign material out of the system. Piping must remain capped until installation. Equipment piping must be in accordance with the equipment manufacturer's recommendations and the contract drawings. Equipment and piping arrangements must fit into space allotted and allow adequate acceptable clearances for installation, replacement, entry, servicing, and maintenance.

3.2.3 Fittings and End Connections

3.2.3.1 Threaded Connections

Make threaded connections with tapered threads and make tight with PTFE tape complying with ASTM D3308 or equivalent thread-joint compound applied to the male threads only. Do not show more than three threads after the joint is made.

3.2.3.2 Brazed Connections

Perform brazing in accordance with AWS BRH, except as modified herein. During brazing, fill the pipe and fittings with a pressure regulated inert gas, such as nitrogen, to prevent the formation of scale. Before brazing copper joints, clean both the outside of the tube and the inside of the fitting with a wire fitting brush until the entire joint surface is bright and clean. Do not use brazing flux on copper-to-copper connections. Remove surplus brazing material at all joints. Make steel tubing joints in accordance with the manufacturer's recommendations. Paint joints in steel tubing with the same material as the baked-on coating within 8 hours after joints are made. Protect tubing against oxidation during brazing by continuous purging of the inside of the piping using nitrogen. Support piping prior to brazing and do not spring or force.

3.2.3.3 Welded Connections

Fusion-weld joints in steel refrigerant piping. Make branch connections with welding tees or forged welding branch outlets. Thoroughly clean pipe of all scale and foreign matter before the piping is assembled. During welding, fill the pipe and fittings with an inert gas, such as nitrogen, to prevent the formation of scale. Beveling, alignment, heat treatment, and inspection of weld must conform to ASME B31.1. Remove and reweld weld defects at no additional cost to the Government. Store and dry electrodes in accordance with AWS D1.1/D1.1M or as recommended by the manufacturer. Do not use electrodes that have been wetted or that have lost any of their coating.

3.2.3.4 Flared Connections

When flared connections are used, use a suitable lubricant between the back of the flare and the nut in order to avoid tearing the flare while tightening the nut.
3.2.3.5 Flanged Connections

When steel refrigerant piping is used, provide union or flange joints in each line immediately preceding the connection to each piece of equipment requiring maintenance, such as compressors, coils, chillers, control valves, and other similar items. Flanged joints must be assembled square end tight with matched flanges, gaskets, and bolts. Provide gaskets that are suitable for use with the refrigerants to be handled.

3.2.4 Valves

3.2.4.1 General

Install refrigerant stop valves on each side of each piece of equipment such as compressors condensers, evaporators, receivers, and other similar items in multiple-unit installation, to provide partial system isolation as required for maintenance or repair. Install stop valves with stems horizontal unless otherwise indicated. Install ball valves must be installed with stems positioned to facilitate operation and maintenance. Isolating valves for pressure gauges and switches must be external to thermal insulation. Safety switches must not be fitted with isolation valves. Filter dryers having access ports may be considered a point of isolation. Purge valves must be provided at all points of systems where accumulated non-condensable gases would prevent proper system operation. Valves must be furnished to match line size, unless otherwise indicated or approved.

3.2.4.2 Expansion Valves

Install expansion valves with the thermostatic expansion valve bulb located on top of the suction line when the suction line is less than 54 mm 2-1/8 inches in diameter and at the 4 o'clock or 8 o'clock position on lines larger than 54 mm 2-1/8 inches. Fasten the bulb securely with two clamps. Insulate the bulb. Install the bulb in a horizontal portion of the suction line, if possible, with the pigtail on the bottom. If the bulb must be installed in a vertical line, the bulb tubing must be facing up.

3.2.4.3 Valve Identification

**************************************************************************
NOTE: Delete last two sentences when identification tags are not considered necessary in small projects.
**************************************************************************

Tag each system valve, including those which are part of a factory assembly. Tags must be in alphanumeric sequence, progressing in direction of fluid flow. Tags must be embossed, engraved, or stamped plastic or nonferrous metal of various shapes, sized approximately 34 mm 1-3/8 inch diameter, or equivalent dimension, substantially attached to a component or immediately adjacent thereto. Attach tags with nonferrous, heavy duty, bead or link chain, 14 gauge annealed wire, nylon cable bands or as approved. Reference tag numbers in Operation and Maintenance Manuals and system diagrams.

3.2.5 Vibration Dampers

Provide vibration damper in the suction and discharge lines on spring mounted compressors. Install vibration dampers parallel with the shaft of
the compressor and anchor firmly at the upstream end on the suction line and the downstream end in the discharge line.

3.2.6 Strainers

Provide strainers immediately ahead of solenoid valves and expansion devices. Strainers may be an integral part of an expansion valve.

3.2.7 Filter Dryer

Provide a liquid line filter dryer on each refrigerant circuit located such that all liquid refrigerant passes through a filter dryer. Size dryers in accordance with the manufacturer's recommendations for the system in which it is installed. Install dryers such that it can be isolated from the system, the isolated portion of the system evacuated, and the filter dryer replaced. Install dryers in the horizontal position except replaceable core filter dryers may be installed in the vertical position with the access flange on the bottom.

3.2.8 Sight Glass

Install a moisture indicating sight glass in all refrigerant circuits downstream of all filter dryers and where indicated. Provide full line size sight glasses.

3.2.9 Discharge Line Oil Separator

Provide discharge line oil separator in the discharge line from each compressor. Connect the oil return line to the compressor as recommended by the compressor manufacturer.

3.2.10 Accumulator

**************************************************************************
NOTE: Suction line accumulator should be included under certain split system applications, such as having extended refrigerant lines, 15 m 50 feet or longer. If accumulator is not used, then delete this paragraph.
**************************************************************************

Provide accumulators in the suction line to each compressor.

3.2.11 Flexible Pipe Connectors

Install connectors perpendicular to line of motion being isolated. Fit piping for equipment with bidirectional motion with two flexible connectors, in perpendicular planes. Install reinforced elastomer flexible connectors in accordance with manufacturer's instructions. Provide piping guides and restraints related to flexible connectors as required.

3.2.12 Temperature Gauges

Locate temperature gauges specifically on, but not limited to the following: [the sensing element of each automatic temperature control device where a thermometer is not an integral part thereof] [the liquid line leaving a receiver] [and] [the suction line at each evaporator or liquid cooler]. Thermowells for insertion thermometers and thermostats must extend beyond thermal insulation surface not less than 25 mm 1 inch.
3.2.13 Pipe Hangers, Inserts, and Supports

Pipe hangers, inserts, and supports must conform to MSS SP-58, except as modified herein. Do not use pipe hanger types 5, 12, and 26. Fabricate hangers used to support piping 50 mm 2 inches and larger to permit adequate adjustment after erection while still supporting the load. Support piping subjected to vertical movement, when operating temperatures exceed ambient temperatures, by variable spring hangers and supports or by constant support hangers.

3.2.13.1 Hangers

Do not use Type 3 on insulated piping. Type 24 may be used only on trapeze hanger systems or on fabricated frames.

3.2.13.2 Inserts

Secure Type 18 inserts to concrete forms before concrete is placed. Continuous inserts which allow more adjustments may be used if they otherwise meet the requirements for Type 18 inserts.

3.2.13.3 C-Clamps

Torque Type 19 and 23 C-clamps in accordance with MSS SP-58 and have both locknuts and retaining devices, furnished by the manufacturer. Field-fabricated C-clamp bodies or retaining devices are not acceptable.

3.2.13.4 Angle Attachments

Furnish Type 20 attachments used on angles and channels with an added malleable-iron heel plate or adapter.

3.2.13.5 Saddles and Shields

Where Type 39 saddle or Type 40 shield are permitted for a particular pipe attachment application, the Type 39 saddle, connected to the pipe, must be used on all pipe 100 mm 4 inches and larger when the temperature of the medium is 16 degrees C 60 degrees F or higher. Use Type 40 shields on all piping less than 100 mm 4 inches and all piping 100 mm 4 inches and larger carrying medium less than 16 degrees C 60 degrees F. Use a high-density insulation insert of cellular glass under the Type 40 shield for piping 50 mm 2 inches and larger.

3.2.13.6 Horizontal Pipe Supports

Space horizontal pipe supports as specified in MSS SP-58 and install a support no more than 300 mm 1 foot from the pipe fitting joint at each change in direction of the piping. Space pipe supports no more than 1.5 m 5 feet apart at valves. [Pipe hanger loads suspended from steel joist with hanger loads between panel points in excess of 23 kg 50 pounds must have the excess hanger loads suspended from panel points.]

3.2.13.7 Vertical Pipe Supports

Support vertical pipe at each floor, except at slab-on-grade, and at intervals of not more than 4.5 m 15 feet not more than 2.4 m 8 feet from end of risers, and at vent terminations.
3.2.13.8 Pipe Guides

Provide Type 35 guides using steel, reinforced polytetrafluoroethylene (PTFE) or graphite slides where required to allow longitudinal pipe movement. Provide lateral restraints as required. Provide slide materials that are suitable for the system operating temperatures, atmospheric conditions, and bearing loads encountered.

3.2.13.9 Steel Slides

Where steel slides do not require provisions for restraint of lateral movement, an alternate guide method may be used. On piping 100 mm 4 inches and larger, usea Type 39 saddle. On piping under 100 mm 4 inches, a Type 40 protection shield may be attached to the pipe or insulation and freely rest on a steel slide plate.

3.2.13.10 High Temperature Guides with Cradles

Where there are high system temperatures and welding to piping is not desirable, the Type 35 guide must include a pipe cradle, welded to the guide structure and strapped securely to the pipe. Separate the pipe from the slide material by at least 100 mm 4 inches, or by an amount adequate for the insulation, whichever is greater.

3.2.13.11 Multiple Pipe Runs

In the support of multiple pipe runs on a common base member, use a clip or clamp where each pipe crosses the base support member. Spacing of the base support members must not exceed the hanger and support spacing required for an individual pipe in the multiple pipe run.

3.2.13.12 Seismic Requirements

**************************************************************************
NOTE: Provide seismic details, if a Government designer (either Corps office of A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase "as shown on the drawings" if no seismic details are provided. UFC 3-301-01 SEISMIC DESIGN FOR BUILDINGS and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC or 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL properly edited, must be included in the contract documents.
**************************************************************************

Support and brace piping and attached valves to resist seismic loads as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and [23 05 48.19 [SEISMIC] BRACING FOR HVAC] [22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL] [as shown on the drawings]. Provide structural steel required for reinforcement to properly support piping, headers, and equipment but not shown under this section. Specify material used for support under Section 05 12 00 STRUCTURAL STEEL.

3.2.13.13 Structural Attachments

Attachment to building structure concrete and masonry must be by cast-in
concrete inserts, built-in anchors, or masonry anchor devices. Inserts and anchors must be applied with a safety factor not less than 5. Do not attach supports to metal decking. Construct masonry anchors for overhead applications of ferrous materials only. Provide structural steel brackets required to support piping, headers, and equipment, but not shown, under this section. Specify material used for support under Section 05 12 00 STRUCTURAL STEEL.

3.2.14 Pipe Alignment Guides

 Provide pipe alignment guides where indicated for expansion loops, offsets, and bends and as recommended by the manufacturer for expansion joints, not to exceed 1.5 m 5 feet on each side of each expansion joint, and in lines 100 mm 4 inches or smaller not more than 600 mm 2 feet on each side of the joint.

3.2.15 Pipe Anchors

 Provide anchors wherever necessary or indicated to localize expansion or to prevent undue strain on piping. Provide anchors consisting of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Install anchor braces in the most effective manner to secure the desired results using turnbuckles where required. Do not attach supports, anchors, or stays where they will injure the structure or adjacent construction during installation or by the weight of expansion of the pipeline. Where pipe and conduit penetrations of vapor barrier sealed surfaces occur, immediately anchor these items adjacent to each penetrated surface, to provide essentially zero movement within penetration seal. Submit detailed drawings of pipe anchors for approval before installation.

3.2.16 Building Surface Penetrations

 Do not install sleeves in structural members except where indicated or approved. Provide galvanized sheet metal sleeves in non-load bearing surfaces conforming to ASTM A653/A653M, Coating Class G-90, 1.0 mm (20 gauge) 20 gauge. Provide uncoated carbon steel pipe sleeves in load bearing surfaces conforming to ASTM A53/A53M, [Schedule 30] [Schedule 20] [Standard weight]. Apply sealants to moisture and oil-free surfaces and elastomers to not less than 13 mm 1/2 inch depth. Do not install sleeves in structural members.

3.2.16.1 Refrigerated Space

 Fit refrigerated space building surface penetrations with sleeves fabricated from hand-lay-up or helically wound, fibrous glass reinforced polyester or epoxy resin with a minimum thickness equal to equivalent size Schedule 40 steel pipe. Construct sleeves with integral collar or fit cold side with a bonded slip-on flange or extended collar. In the case of masonry penetrations where sleeve is not cast-in, fill voids with latex mixed mortar cast to shape of sleeve and assemble flange/external collar type sleeve with butyl elastomer vapor barrier sealant through penetration to cold side surface vapor barrier overlap and fastened to surface with masonry anchors. Flash integral cast-in collar type sleeve [as indicated.] [with not less than 100 mm 4 inches of cold side vapor barrier overlap of sleeve surface.] Normally seal uninsulated penetrating round surfaces to sleeve bore with mechanically expandable seals in vapor tight manner and insulate remaining warm and cold side sleeve depth with not less than [100] [_____] mm [4] [_____] inches of foamed-in-place rigid polyurethane or
foamed-in-place silicone elastomer. Apply vapor barrier sealant to finish warm side insulation surface. Insulate warm side of penetrating surface beyond vapor barrier sealed sleeve insulation for a distance which prevents condensation. Seal wires in refrigerated space surface penetrating conduit with vapor barrier plugs or compound to prevent moisture migration through conduit and condensation therein.

3.2.16.2 General Service Areas

Extend each sleeve through its respective wall, floor, or roof, and cut flush with each surface. Provide pipes passing through concrete or masonry wall or concrete floors or roofs with pipe sleeves fitted into place at the time of construction. Provide sleeves that allow a minimum of 6 mm 1/4 inch all-around clearance between bare pipe and sleeves or between jacketed-insulation and sleeves. Except in pipe chases or interior walls, seal the annular space between pipe and sleeve or between jacket over-insulation and sleeve in accordance with Section 07 92 00 JOINT SEALANTS.

3.2.16.3 Waterproof Penetrations

Install pipes passing through roof or floor waterproofing membrane through a 5.17 kg/sq. m 17 ounce copper sleeve, or a 0.81 mm 0.032 inch thick aluminum sleeve, each within an integral skirt or flange. Form flashing sleeve, and extend skirt or flange greater than 200 mm 8 inches from the pipe and set over the roof or floor membrane in a troweled coating of bituminous cement. Extend the flashing sleeve up the pipe a minimum of 50 mm 2 inches above the roof or floor penetration. Seal the annular space between the flashing sleeve and the bare pipe or between the flashing sleeve and the metal-jacket-covered insulation as indicated. Seal penetrations by either one of the following methods.

3.2.16.3.1 Waterproofing Clamping Flange

Pipes up to and including 250 mm 10 inches in diameter passing through roof or floor waterproofing membrane may be installed through a cast iron sleeve with caulking recess, anchor lugs, flashing clamp device, and pressure ring with brass bolts. Clamp waterproofing membrane into place and place sealant in the caulking recess.

3.2.16.3.2 Modular Mechanical Type Sealing Assembly

In lieu of a waterproofing clamping flange and caulking and sealing of annular space between pipe and sleeve or conduit and sleeve, a modular mechanical type sealing assembly may be installed. Provide seals consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe/conduit and sleeve with corrosion protected carbon steel bolts, nuts, and pressure plates. Loosely assemble links with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and each nut. After the seal assembly is properly positioned in the sleeve, tighten the bolt to cause the rubber sealing elements to expand and provide a watertight seal between the pipe/conduit and the sleeve. Size each seal assembly as recommended by the manufacturer to fit the pipe/conduit and sleeve involved. The Contractor electing to use the modular mechanical type seals must provide sleeves of the proper diameters.
3.2.16.4 Fire-Rated Penetrations

Seal penetration of fire-rated walls, partitions, and floors as specified in Section 07 84 00 FIRESTOPPING.

3.2.16.5 Escutcheons

Provide escutcheons for finished surfaces where exposed piping, bare or insulated, pass through floors, walls, or ceilings, except in boiler, utility, or equipment rooms. Where sleeves project slightly from floors, use special deep-type escutcheons. Secure escutcheon to pipe or pipe covering.

3.2.17 Access Panels

Provide access panels for all concealed valves, vents, controls, and items requiring inspection or maintenance. Provide access panels of sufficient size and locate so that the concealed items may be serviced and maintained or completely removed and replaced. Provide access panels as specified in Section 08 31 00 ACCESS DOORS AND PANELS.

3.2.18 Field Applied Insulation

Field installed insulation is specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS, except as defined differently herein.

3.2.19 Field Painting

Painting required for surfaces not otherwise specified, and finish painting of items only primed at the factory are specified in Section 09 90 00 PAINTS AND COATINGS.

3.2.19.1 Color Coding

**************************************************************************

NOTE: Color coding for piping identification required by the using agency will be developed and inserted in the "Color Code Schedule" in Section 09 90 00 PAINTS AND COATINGS. For Air Force Installations, piping will be color-coded in accordance with Attachment 4 of AFM 88-15.

**************************************************************************

Color coding for piping identification is specified in Section 09 90 00 PAINTS AND COATINGS.

3.2.19.2 Color Coding Scheme

**************************************************************************

NOTE: Color Coding Scheme may be deleted if not required in the project. Use Sections with a 10 after the Section number and delete those with 20 for Army projects, and vice versa.

**************************************************************************

Provide a color coding scheme for locating hidden piping in accordance with [Section 22 00 00 PLUMBING, GENERAL PURPOSE][Section 22 00 70 PLUMBING, HEALTHCARE FACILITIES].
3.2.20 Identification Tags

NOTE: Delete this paragraph when identification tags are not considered necessary on small projects.

Provide identification tags made of brass, engraved laminated plastic or engraved anodized aluminum indicating service and item number on all valves and dampers. Tags must be 35 mm 1-3/8 inch minimum diameter and marking must be stamped or engraved. Indentations must be black for reading clarity. Attach tags to valves with No. 12 AWG copper wire, chrome-plated beaded chain or plastic straps designed for that purpose.

3.3 CLEANING AND ADJUSTING

Clean uncontaminated system(s) by evacuation and purging procedures currently recommended by refrigerant and refrigerant equipment manufacturers, and as specified herein, to remove small amounts of air and moisture. Systems containing moderate amounts of air, moisture, contaminated refrigerant, or any foreign matter are considered contaminated systems. Restore contaminated systems to clean condition including disassembly, component replacement, evacuation, flushing, purging, and re-charging, using currently approved refrigerant and refrigeration manufacturer's procedures. Restore contaminated systems at no additional cost to the Government as determined by the Contracting Officer. Do not use water in any procedure or test.

3.4 TRAINING COURSE

a. Submit a schedule, at least [2] [_____] weeks prior to the date of the proposed training course, which identifies the date, time, and location for the training. Conduct a training course for [_____] members of the operating staff as designated by the Contracting Officer. The training period must consist of a total [_____] hours of normal working time and start after the system is functionally completed but prior to final acceptance tests.

b. Cover all of the items contained in the approved operation and maintenance manuals as well as demonstrations of routine maintenance operations in the field posted instructions.

c. Submit [6] [_____] complete copies of an operation manual in bound 216 by 279 8 1/2 by 11 inch booklets listing step-by-step procedures required for system startup, operation, abnormal shutdown, emergency shutdown, and normal shutdown at least [4] [_____] weeks prior to the first training course. Include the manufacturer's name, model number, and parts list in the booklets. Include the manufacturer's name, model number, service manual, and a brief description of all equipment and their basic operating features in the manuals.

d. Submit [6] [_____] complete copies of maintenance manual in bound 216 by 279 8 1/2 x 11 inch booklets listing routine maintenance procedures, possible breakdowns and repairs, and a trouble shooting guide. Include piping layouts and simplified wiring and control diagrams of the system as installed in the manuals.
3.5 REFRIGERANT PIPING TESTS

**************************************************************************
NOTE: The following refrigerant system tests are
for field fabricated refrigerant piping systems.
The tests do not apply to packaged, unitary
equipment which is charged at the factory.

Equipment and piping will be capable of withstanding
leak pressure tests at not less than the design
pressure corresponding to the highest ambient
temperature (refer to ASHRAE 15 & 34).
**************************************************************************

After all components of the refrigerant system have been installed and
connected, subject the entire refrigeration system to pneumatic,
evacuation, and startup tests as described herein. Submit a schedule, at
least [2] [_____] weeks prior to the start of related testing, for each
test. Identify the proposed date, time, and location for each test.
Conduct tests in the presence of the Contracting Officer. Water and
electricity required for the tests will be furnished by the Government.
Provide all material, equipment, instruments, and personnel required for
the test. Provide the services of a qualified technician, as required, to
perform all tests and procedures indicated herein. Coordinate field tests
with Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS.
Submit [6] [_____] copies of the tests report in bound 216 by 279 mm 8 1/2
by 11 inch booklets documenting all phases of the tests performed. Include
initial test summaries, all repairs/adjustments made, and the final test
results in the report.

3.5.1 Preliminary Procedures

Prior to pneumatic testing, isolate equipment which has been factory tested
and refrigerant charged as well as equipment which could be damaged or
cause personnel injury by imposed test pressure, positive or negative, from
the test pressure, or remove from the system. Remove safety relief valves
and rupture discs that are not part of factory sealed systems, and cap or
plug openings.

3.5.2 Pneumatic Test

Provide pressure control and excess pressure protection at the source of
test pressure. Valves must be wide open, except those leading to the
atmosphere. Test gas must be dry nitrogen, with minus 55 degrees C minus
70 degree F dewpoint and less than 5 ppm oil. Apply test pressure in two
stages before any refrigerant pipe is insulated or covered. In accordance
with ASME B31.5, a preliminary test not to exceed 170 kPa 25 psi must be
applied as a means of locating major leaks. Every joint being tested must
be coated with a thick soap or color indicating solution. The second stage
test pressure must be at least 110 percent of the design pressure, but
cannot exceed 130 percent of the design pressure of any component in the
system. For large systems that are not completely visible, the pressure in
the system must be gradually increased to one-half of the test pressure
after which the pressure must be increased in steps of one-tenth of the
test pressure, until the required test pressure has been reached. The test
pressure must be continuously maintained for at least 24 hours, after which
it can be reduced to the leak test pressure. A correction factor of 2 kPa
0.3 psi will be allowed for each degree C F change between test space
initial and final ambient temperature, plus for increase and minus for a
decrease. The leak test pressure must be the design pressure, or a pressure specified in the engineering design. To repair leaks, the joint must be taken apart, thoroughly cleaned, and reconstructed as a new joint. Joints repaired by caulking, re-melting, or back-welding/brazing are not acceptable. Following repair, the entire system must be retested using the pneumatic tests described above. Reassemble the entire system once the pneumatic tests are satisfactorily completed.

3.5.3 Evacuation Test

Following satisfactory completion of the pneumatic tests, relieve the pressure and evacuate the entire system to an absolute pressure of 300 micrometers. During evacuation of the system, the ambient temperature must be higher than 2 degrees C 35 degrees F. Do not evacuate no more than one system at one time by one vacuum pump. Once the desired vacuum has been reached, close the vacuum line and allow the system to stand for 1 hour. If the pressure rises over 500 micrometers after the 1 hour period, evacuate the system again down to 300 micrometers and let set for another 1 hour period. Do not charge the system until a vacuum of at least 500 micrometers is maintained for a period of 1 hour without the assistance of a vacuum line. If during the testing the pressure rises above 500 micrometers, continue to repeat the evacuation procedures until all residual moisture has been removed. During evacuation, record pressures by a thermocouple-type, electronic-type, or a calibrated-micrometer type gauge.

3.5.4 System Charging and Startup Test

Following satisfactory completion of the evacuation tests, charge the system with the required amount of refrigerant by raising pressure to normal operating pressure and in accordance with manufacturer's procedures. Following charging, the system must operate with high-side and low-side pressures and corresponding refrigerant temperatures, at design or improved values. Test the entire system tested for leaks. Test fluorocarbon systems with halide torch or electronic leak detectors.

3.5.5 Refrigerant Leakage

If a refrigerant leak is discovered after the system has been charged, the leaking portion of the system must be immediately isolated from the remainder of the system and the refrigerant pumped into the system receiver or other suitable container. The refrigerant must not be discharged into the atmosphere.

3.5.6 Contractor's Responsibility

At all times during the installation and testing of the refrigeration system, take steps to prevent the release of refrigerants into the atmosphere. The steps must include, but not be limited to, procedures which will minimize the release of refrigerants to the atmosphere and the use of refrigerant recovery devices to remove refrigerant from the system and store the refrigerant for reuse or reclaim. At no time will the allowable leak rate exceed the leak rates allowed in Section 608 of the Clean Air Act: 30 percent of the full charge per year for industrial refrigeration, 20 percent of the full charge per year for commercial refrigeration, and 10 percent of the full charge per year for comfort cooling. Any system leaks within the first year must be repaired in accordance with the requirements herein at no cost to the Government including material, labor, and refrigerant if the leak is the result of defective equipment, material, or installation.

NEMA 250 (2020) Enclosures for Electrical Equipment (1000 Volts Maximum)

NEMA MG 1 (2021) Motors and Generators

U.S. ARMY CORPS OF ENGINEERS (USACE)

EM 200-1-13 (2016) Environmental Quality -- Minimizing the Risk of Legionellosis Associated with Building Water Systems on Army Installation

U.S. DEPARTMENT OF DEFENSE (DOD)

UFC 3-430-08N (2004) Central Heating Plants

1.2 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity.
or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

********************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Water Treatment System; G[, [_____]]

Water Analysis; G[, [_____]]

Spare Parts

Field Instructions

Tests; G[, [_____]]

Training Course; G[, [_____]]

SD-06 Test Reports

Condenser Water QA Tests

Steam Boiler Water QA Tests

SD-10 Operation and Maintenance Data

Water Treatment System
1.3 MAINTENANCE MATERIAL SUBMITTALS

Submit spare parts data for each different item of material and equipment specified, after approval of the detail drawings, not later than [_____] months prior to the date of beneficial occupancy. Include a complete list of parts and supplies, with source of supply, with the data.

1.4 QUALITY CONTROL

1.4.1 Safety

**************************************************************************
NOTE: Catwalk, ladder and guardrail may be required. If so, select the applicable item and delete the others and indicate on drawings the selected item. If not applicable, delete the entire sentence within the brackets.
**************************************************************************

Ensure exposed moving parts, parts that produce high operating temperature, parts which may be electrically energized, and parts that may be a hazard to operating personnel are insulated, fully enclosed, guarded, or fitted with other types of safety devices. Install safety devices so that proper operation of equipment is not impaired. Provide [catwalk,] [ladder,] [and guardrail] where indicated and in accordance with Section [05 50 13 MISCELLANEOUS METAL FABRICATIONS] [05 51 33 METAL LADDERS].

1.4.2 Drawings

Because of the small scale of the drawings, it is not possible to indicate all offsets, fittings, and accessories that may be required. Carefully investigate the plumbing, fire protection, electrical, structural and finish conditions that would affect the work to be performed and arrange such work accordingly, furnishing required offsets, fittings, and accessories to meet such conditions.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Summary

This section covers the provisions and installation procedures necessary for a complete and totally functional water system(s) chemical treatment. Provide and install the system with all necessary System Components, Accessories, Piping Components, and Supplemental Components/Services. Minimize to risk of Legionellosis by following the guidance in EM 200-1-13.

2.1.2 Standard Products

a. Provide materials and equipment which are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship and that have
been in satisfactory commercial or industrial use for two years' prior to bid opening.

b. Include in the two-year use all applications of equipment and materials under similar circumstances and of similar size. Ensure the two years' experience has been satisfactorily completed by a product which has been sold or is offered for sale on the commercial market through advertisements, manufacturer's catalogs, or brochures. Products having less than a two-year field service record are acceptable if a certified record of satisfactory field operation, for not less than 6000 hours exclusive of the manufacturer's factory tests, can be shown.

c. All products are required to be supported by a service organization. Submit a certified list of qualified permanent service organizations for support of the equipment, including their addresses and qualifications. These service organizations are required to be reasonably convenient to the equipment installation and able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

d. The selected service organization provides the chemicals required, the concentrations required, and the water treatment equipment sizes and flow rates required. The company provides all chemicals required for the [condenser] [condenser and chilled] water systems and fills the systems with chemicals to the levels specified. The chemical is required to meet the requirements of this specification as well as the recommendations from the manufacturers of the condenser and cooling tower. Acid treatment chemicals are not allowed to be used.

2.1.3 Water Analysis

**************************************************************************
NOTE: A water analysis may be available from the user. If an analysis is not available, an analysis will be performed during the design, and appropriate data will be entered.

Cooling towers with a capacity greater than 176 kW 50 tons will be provided with automatic chemical feed and blow down systems. Smaller towers will be provided with continuously activated systems. Indicate the location of the entire water treatment system.
**************************************************************************

Conditions of make-up water to be supplied to the boilers, cooling towers and chilled water systems reported in accordance with ASTM D596 are as follows:

<table>
<thead>
<tr>
<th>Date of Sample</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>[_____] degrees C</td>
</tr>

</tbody>
</table>

2.2  EQUIPMENT

2.2.1  Nameplates

Provide a nameplate for each major component of equipment that includes the manufacturer's name, address, type or style, and catalog or serial number securely attached to the item of equipment. Provide nameplates for:

a. Pump(s)

b. Pump Motor(s)

c. Water Treatment Controller(s)

2.2.2  Electrical Work

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor-control centers, the references to motor starters will be deleted. Mechanical designer must ensure that the electrical designer is provided with electrical requirements for chemical feed pumps.
**************************************************************************
Ensure all electrical equipment, motors, motor efficiencies, and wiring complies with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical motor driven equipment specified complete with motors, motor starters, and controls. Provide electrical characteristics and enclosure types as shown, and unless otherwise indicated, provide all motors of 745 W 1 horsepower and above with open, drip-proof, or totally enclosed fan cooled enclosures, high efficiency type. Perform field wiring in accordance with manufacturer's instructions. Each motor is required to conform to NEMA MG 1 and be of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Provide continuous duty motors with the enclosure specified. Provide motor starters complete with thermal overload protection and other appurtenances necessary for the motor control indicated. Furnish motors with a magnetic across-the-line or reduced voltage type starter as required by the manufacturer. Furnish motor starters with [NEMA 1] [NEMA 3R] [NEMA [_____] enclosures. Provide manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices specified, but not shown.

2.2.3 Gauges

Provide gauges that conform to ASME B40.100, Class 1, 2, or 3, Style X, Type I or III as required, 115 mm 4-1/2 inches in diameter with phenolic or metal case.

2.3 COMPONENTS

2.3.1 Condenser Water Treatment Systems

The use of chemical-treatment products containing hexavalent chromium (Cr) is prohibited. Treat the water to be used in the condenser water systems to maintain the conditions recommended by this specification as well as the recommendations from the manufacturers of the condenser and evaporator coils. Chemicals are required to meet all required federal, state, and local environmental regulations for the treatment of condenser-side heat exchangers, cooling towers and direct discharge to the sanitary sewer.

Provisions should be made to effectively dose, monitor and control a water treatment program to include (1) inhibitor and biocide injection (2) water sampling, (3) corrosion coupon sampling, and (4) effective bleed and control points.

2.3.1.1 Condenser Water Limits

Meet the following condenser water limits, unless dictated differently by the cooling tower or chiller manufacturer's recommendations:

<table>
<thead>
<tr>
<th>Treatment type</th>
<th>Phosphonate/Polymer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puckorius Index</td>
<td>4 minimum</td>
</tr>
<tr>
<td>Langelier Index</td>
<td>4 maximum</td>
</tr>
<tr>
<td>Total Dissolved Solids</td>
<td>5000 ppm maximum</td>
</tr>
<tr>
<td>Calcium Hardness</td>
<td>1200 ppm maximum</td>
</tr>
</tbody>
</table>
For treated condenser/cooling tower water, minimize blowdown until the first of one of the top 5 limits is reached. Specific requirements for treatment chemicals and levels are listed below in paragraphs dealing with small and large systems.

2.3.1.2 Glycol Solution

**************************************************************************
NOTE: If freeze protection for condenser water is not required or addressed using a different method, this paragraph should be deleted. When a glycol system is used, the size of the HVAC systems should be corrected due to changes in specific heat and viscosity. ASHRAE's "HVAC systems and Equipment Handbook" should be consulted for the appropriate calculation procedures. Ethylene glycol should be used for HVAC systems. However, if the heat transfer media has the possibility of mixing with a potable water system, propylene glycol should be used. The required concentration should be entered based upon the anticipated ambient or operating temperature.
**************************************************************************

Coordinate minimum glycol concentration with manufacturer to avoid corrosion inhibitor degradation. Test the glycol in accordance with ASTM D1384 with less than 0.013 mm 0.5 mils penetration per year for all system metals. Provide glycol that contains corrosion inhibitors. Silicate based inhibitors are not acceptable. Ensure the solution is compatible with pump seals, other elements of the system, and water treatment chemicals used within the system.

2.3.1.3 Chemical Treatment for Small Systems

For cooling systems with a capacity of 175.8 kW 50 tons or less, provide the following chemical treatment. For corrosion control provide 6.8 to 9.1 kg 15 to 20 pounds polyphosphate in nylon mesh bag in cooling tower sump. If biocide is needed, use either 1-bromo-3-chloro-5.5-dimethylhydantoin or gluteraldehyde as recommended by manufacturer.

2.3.1.4 Chemical Treatment for Large Systems

For cooling systems with capacities greater than 175.8 kW 50 tons provide one of the three following chemical treatments with the limits indicated. The zinc and molybdate in the last two treatments help to meet the maximum corrosion requirements in waters that tend to be more corrosive. Maintain biocides to control bacteria below 10,000 colony forming units per milliliter.

a. Phosphonate Type Treatment
Phosphate | 3-5 ppm  
---|---  
Polymer | 3-4 ppm  
TT | 1-2 ppm  
Biocides | as required

b. Zinc-Phosphonate Type Treatment

| Phosphate | 3-5 ppm  
---|---  
Polymer | 3-4 ppm  
Zinc | 1-2 ppm  
TT | 1-2 ppm  
Biocides | as required

c. Zinc-Molybdate Type Treatment

| Phosphate | 3-5 ppm  
---|---  
Polymer | 3-4 ppm  
Molybdate | 10-15 ppm  
Zinc | 2-3 ppm  
TT | 1-2 ppm  
Biocides | as required

2.3.1.4.1 General Requirements

Provide a water treatment system capable of automatically feeding chemicals and bleeding the system to prevent corrosion, scale, and biological formations. Submit [6] [_____] complete copies, at least 5 weeks prior to the purchase of the water treatment system, of the proposed water treatment plan including a layout; control scheme; a list of existing make-up water chemistry, including the items listed in paragraph Water Analysis; a list of treatment chemicals to be added; the proportion of chemicals to be added; the final treated water control levels; and a description of health, safety and environmental concerns for handling the chemicals plus any special ventilation requirements. Automatic chemical feed systems automatically feed chemicals into the condenser water based on makeup water rate. Use electrical signals from a water meter on the makeup water line to control the output of chemical feed pumps. Set the system initially manually based on the water analysis of the make-up water. Submit [6] [_____] complete copies of operating and maintenance manuals for the step-by-step water treatment procedures. Include in the manuals all
testing procedures used in determining water quality.

2.3.1.4.2 Chemical Feed Pumps and Tanks

**************************************************************************
NOTE: The required maximum pump flow rate will be shown on the drawings. The flow rate will depend upon the makeup water flow rate, the chemical composition of the makeup water and the concentration of the chemical supplied. A water treatment company should be consulted for determining the proper maximum pump flow rate.

A water treatment company will be consulted to determine the number of tanks required and must be shown on plans. The number will depend on the size of the boiler, makeup water flow rate, and makeup water composition. A potable water line will be provided near the tanks for the mixing of chemicals.
**************************************************************************

a. Furnish chemical feed pumps and tanks as a package with the pumps mounted on and piping connected to the tank. Furnish chemical feed pumps of the positive displacement diaphragm type. Furnish all pump cylinders, plungers, ball check valves, and check valve bodies made of corrosion resistant materials suitable for the chemicals being pumped. Ensure the cylinders of the provided pumps are replaceable for increased or reduced pressure or capacity ranges.

b. Provide pumps with a flow rate adjustable from 0 to 100 percent while in operation. The volumetric accuracy of the pumps is required to be within one percent over the range indicated. Ensure pump capacities are adjustable by positioning crank pin with micrometer setscrews. Divide stroke length scale in percentage graduations engraved on scale. Ensure the discharge pressure of pumps is not less than 1.5 times the line pressure at the point of connection. Provide the pumps with a pressure relief valve and a check valve mounted in the pump discharge. Control the pump by an external controller/timer receiving signals from the makeup water meter.

c. Provide drive motors rated at 110 volt, single phase with drip-proof enclosures. Provide two chemical tanks constructed of [materials compatible with the chemicals to be stored in the tank] [high density polyethylene] [stainless steel] [fiber reinforced plastic] with a hinged cover and mounted on legs. Ensure tanks have filling and drain connections and gauge glasses. Furnish each tank with one pump, mounted and piped with pipe materials and fittings suitable for working pressure and compatible with the chemicals in the tank it is in contact with, with suction strainer and stainless steel screen, and with 13 mm 1/2 inch relief valve with steel body and stainless steel trim. Provide a tank bottom that is dished concave to a radius equal to the diameter of the tank. Provide motor-driven agitator. Size the tanks to have sufficient capacity to require recharging only once per [7] [14] [21] [_____] days during normal operation.

2.3.1.4.3 Chemical Injection Assembly

Provide an injection assembly at each chemical feed point. Locate the injection assembly downstream of recirculating pumps and upstream of the
condenser. Construct the injection assemblies of stainless steel. Locate the discharge of the assemblies in the condenser water piping as recommended by the manufacturer. Include with each assembly a shutoff valve and check valve at the point of entrance into the condenser water line.

2.3.1.4.4 Water Meter

Provide water meters with an electric contacting register and remote accumulative counter. Install the meter within the make-up water line, as indicated.

2.3.1.4.5 Timers

Provide timers which are of the automatic reset, adjustable type, and are electrically operated. Ensure the timers are designed to work with the contacting head water meters. Include the water meter cable with the timer. Ensure timers control operation of the chemical feed pumps and are suitable for a 120 volt current. Locate the timers within the water treatment control panel.

2.3.1.4.6 Bleed (Blowdown) Line

Control the flow through the bleed line by a conductivity meter and probe installed to measure the conductivity of the condenser water. Provide a high and low set point on the conductivity meter above which the meter opens a solenoid valve on the bleed line. Locate the bleed line attachment to the condenser water piping downstream of the recirculating pumps and upstream of the chemical injection point. Extend the bleed line to the nearest drain for continuous discharge.

2.3.1.4.7 Control Panel

**************************************************************************
NOTE: The MAN-OFF-AUTO switch should be deleted for continuously fed systems. In areas where a panel could come in contact with the water treatment chemical, choose the stainless steel construction.
**************************************************************************

Provide a NEMA 12 control panel enclosure suitable for surface mounting. Construct the panel of [stainless steel] [coated steel] with a hinged door and lock. Include a laminated plastic nameplate identifying each of the following functions:

(1) Main power switch and indicating light
(2) MAN-OFF-AUTO selector switch
(3) Indicating lamp for bleed-off valve
(4) Indicating lamp for each chemical feed pump
(5) Set point reading for each timer

2.3.1.4.8 Chemical Piping

Construct the piping and fittings of [schedule 80 PVC] [stainless steel] suitable for the water treatment chemicals.

2.3.1.4.9 Sequence of Operation

Add chemicals based upon sensing the make-up water flow rate and activating
appropriate timers. Provide a separate timer for each chemical. Control the blow down based upon the conductivity of the condenser water. Control the injection of the chemical required for biological control manually set for proper chemical feed. The water treatment company is required to determine and set a timer set points, blow down rates, and chemical pump flow rates.

2.3.1.4.10 Test Kits

Provide one test kit of each type required to determine the water quality as outlined within the operation and maintenance manuals.

2.3.2 Chilled Water System

**************************************************************************
NOTE: The services of a company regularly engaged in water treatment for mechanical systems to treat a chilled water system should only be required if the makeup water available is of very poor quality.

For dual temperature systems (chilled and heated water), coordinate the compatibility of the separate water treatment systems.
**************************************************************************

2.3.2.1 Requirements for Glycol Solution

**************************************************************************
NOTE: If freeze protection for chilled water is not required, this paragraph should be deleted. When a glycol system is used, the size of the HVAC systems should be corrected due to changes in specific heat and viscosity. ASHRAE's "HVAC systems and Equipment Handbook" should be consulted for the appropriate calculation procedures. Ethylene glycol should be used for HVAC systems. However, if the heat transfer media has the possibility of mixing with a potable water system, propylene glycol should be used. The required concentration should be entered based upon the anticipated ambient or operating temperature. Consult with a water treatment company to determine the exact treatment levels for chilled water treatment.
**************************************************************************

Coordinate minimum [ethylene][propylene] glycol concentration with manufacturer to avoid corrosion inhibitor degradation. Test the glycol in accordance with ASTM D1384 with less than 0.013 mm 0.5 mils penetration per year for all system metals. Ensure the glycol contains corrosion inhibitors. Silicate based inhibitors are not acceptable. Ensure the solution is compatible with pump seals, other elements of the system, and water treatment chemicals used within the system.
2.3.2.2 Chilled Water Treatment

Treat chilled water with either a borax/nitrite type treatment or a molybdate type treatment. Both types of treatment are acceptable for use with glycol. Maintain borax/nitrite treatment at the limits of [  ] ppm nitrite, [  ] ppm copper corrosion inhibitor (TT or MBT), and pH of 8.5 to 9.5. Maintain molybdate treatment at the limits of [  ] ppm molybdate, [  ] ppm copper corrosion inhibitor (TT or MBT), and pH of 8.0 to 9.0.

2.3.2.3 Dual Temperature Systems

Dual hot/chilled water systems that are treated with borax/nitrite are also to be treated with a biocide.

2.3.2.4 Chilled Water Test Kits

Provide one test kit of each type required to determine the water quality as outlined within the operation and maintenance manuals (e.g. pH and nitrite or molybdate).

2.3.3 Low and Medium Temperature Hot Water Boilers and Heat Exchangers

Low and medium temperature hot water boilers are defined as those operating below 177 degrees C 350 degrees F, (122 degrees C 250 degrees F for Low Temperature).

2.3.3.1 Chemical Feeder

2.3.3.2 Water Softening System

**************************************************************************
NOTE: The makeup water analysis and the boiler manufacturer's recommended feed water conditions will be used to determine the need for a water softener. Softening of makeup water for hot water boilers is required if the makeup water hardness is above 200 ppm or the makeup rate is above 1 percent.
**************************************************************************

Provide a water softening system as specified in Section 22 31 00 WATER SOFTENERS, CATION-EXCHANGE (SODIUM CYCLE).

2.3.3.3 Low and Medium Temperature Hot Water Treatment

Treat hot water with either a borax/nitrite type treatment or a molybdate type treatment. Both types of treatment are acceptable to use with glycol. Maintain borax/nitrite treatment at the limits of 600 to 1000 ppm nitrite, 40 - 50 ppm copper corrosion inhibitor (TT or MBT) and pH of 8.5 to 9.5. Maintain molybdate treatment at the limits of 100 to 125 ppm molybdate, 40 - 50 ppm copper corrosion inhibitor (TT or MBT) and pH of 8.0 to 9.0.
2.3.3.4 Dual Temperature Systems

Dual hot/chilled water systems treated with borax/nitrite are required to also be treated with a biocide.

2.3.3.5 Test Kit Requirements

Provide one test kit of each type required to determine the water quality as outlined within the operation and maintenance manuals (e.g. pH and nitrite or molybdate).

2.3.4 High Temperature Hot Water Boilers

**************************************************************************

High Temperature Hot Water Boilers are defined as those operating above 177 degrees C 350 deg F. The chemical treatment requires more attention (daily), the makeup water requires softening and the chemicals and limits differ from the low and medium temperature hot water boilers.

**************************************************************************

2.3.4.1 Chemical Feeder Unit

**************************************************************************

NOTE: The required maximum pump flow rate will be shown on the drawings. The flow rate will depend upon the makeup water flow rate, the chemical composition of the makeup water and the concentration of the chemical supplied. A water treatment company should be consulted for determining the proper maximum pump flow rate.

A company regularly engaged in water treatment for mechanical systems will be consulted to determine the number of tanks required to be shown on the drawings. The number will depend on the size of the boiler, makeup water flow rate, and makeup water composition. A potable water line will be provided near the tanks for the mixing of chemicals.

**************************************************************************

Provide a feeder unit for each boiler. Ensure chemical feeder provided is automatic proportioning, shot type, or pump type. Provide all appurtenances necessary to ensure the system performs in compliance with the requirements outlined herein. Base the size and capacity of feeder upon local requirements and water analysis.

2.3.4.2 Pumps and Tanks

a. Furnish chemical feed pumps and tanks as a package with the pumps mounted on and piping connected to the tank. The chemical feed pumps are required to be positive displacement diaphragm type. Furnish the pump cylinders, plungers, ball check valves, and check valve bodies fabricated from corrosion resistant materials suitable for the chemicals being pumped. Ensure cylinders used are replaceable for increased or reduced pressure or capacity ranges.

b. Provide for a flow rate of the pumps that is adjustable from 0 to 100
percent while in operation. Ensure volumetric accuracy of the pumps is within one percent over the range indicated. Ensure pump capacities are adjustable by positioning crank pin with micrometer setscrews. Divide stroke length scale in percentage graduations engraved on scale. Ensure the discharge pressure of pumps is not less than 1.5 times the line pressure at the point of connection. Design the pumps to feed the chemical solutions into the HTW return line to the system circulating pumps with a capacity to feed a maximum of \([5.3] \text{ mL/second} \) \([5] \text{ gph}\). Provide the pumps with a pressure relief valve and a check valve mounted in the pump discharge. Control the pumps by an external controller/timer receiving signals from the makeup water meter.

c. Provide drive motors that are 110 volt, single phase and have drip-proof enclosures. Provide the tanks constructed of [materials compatible with the chemicals to be stored in the tank] [high density polyethylene] [stainless steel] [fiber reinforced plastic] with a hinged cover and mounted on legs. Ensure tanks have both filling and drain connections and gauge glass. Furnish each tank with one pump, mounted and piped with black iron pipe and fittings suitable for working pressures and compatible with the chemicals in the tank it is in contact with, with suction strainer and stainless steel screen, and with \(13 \text{ mm} \ 1/2 \text{ inch}\) relief valve with steel body and stainless steel trim. Provide tank with a dished concave bottom to a radius equal to the diameter of the tank. Provide units suitable for phosphate, caustic feed and sulfite feeding. Provide sulfite tank with a floating cover to completely cover the surface of the solution. Include a motor-driven agitator. Size tanks to have sufficient capacity to require recharging only once per \([7] \ [14] \ [21] \ [\text{_____}]\) days during normal operation.

d. For auto proportioning systems, provide controllers designed to be used with selected system specifically for the purpose of injecting chemicals into boiler systems.

e. Mount system components on metal buses or supports instead of mounting directly to the floor.

### 2.3.4.3 Water Softening System

**************************************************************************
NOTE: The makeup water analysis and the boiler manufacturer's recommended feed water conditions will be used to determine the need for a water softener. Hardness must be maintained below 2 ppm.
**************************************************************************

Provide water softening system as specified in Section 22 31 00 WATER SOFTENERS, CATION-EXCHANGE (SODIUM CYCLE).

### 2.3.4.4 Treated Water Limits

Consult with the boiler manufacturer for the determination of the boiler water chemical composition limits. Provide for the following recirculating hot water chemical limits unless dictated differently by the boiler manufacturer's recommendations:

| pH  | 9.3–9.9 |

SECTION 23 25 00 Page 18
2.3.5 Test Kit

Provide one test kit of each type required to determine the water quality as outlined within the operation and maintenance manuals (e.g. pH, hardness and sulfite).

2.3.6 Steam Boiler Water Treatment

<table>
<thead>
<tr>
<th>Substance</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sulfite</td>
<td>30-60 ppm</td>
</tr>
<tr>
<td>Hardness</td>
<td>Less than 2.0 ppm</td>
</tr>
</tbody>
</table>

2.3.6.1 Boiler Water Limits

Provide for boiler water limits as follows unless dictated differently by the boiler manufacturer's recommendations:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Causticity (OH)</td>
<td>20-200 ppm</td>
</tr>
<tr>
<td>Total Alkalinity (CaCO3)</td>
<td>200-800 ppm</td>
</tr>
<tr>
<td>Phosphate (PO4)</td>
<td>30-60 ppm</td>
</tr>
<tr>
<td>Polymer (dispersant) or Tannin</td>
<td>5-10 ppm or medium color, respectively</td>
</tr>
<tr>
<td>Component</td>
<td>Limit</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>Dissolved Solids (water tube boilers)</td>
<td>3000-3500 ppm</td>
</tr>
<tr>
<td>Dissolved Solids (fire tube boilers)</td>
<td>3500-5000 ppm</td>
</tr>
<tr>
<td>Suspended Solids</td>
<td>15 ppm Maximum</td>
</tr>
<tr>
<td>Sodium Sulfite</td>
<td>20-40 ppm</td>
</tr>
<tr>
<td>Silica</td>
<td>Less than 200 ppm</td>
</tr>
<tr>
<td>Dissolved Oxygen</td>
<td>Less than 7 ppb</td>
</tr>
<tr>
<td>Iron</td>
<td>Less than 10 ppm</td>
</tr>
<tr>
<td>pH (Condensate)</td>
<td>7.5 – 8</td>
</tr>
<tr>
<td>Conductivity (Condensate)</td>
<td>Less than 35 micromhos</td>
</tr>
<tr>
<td>Hardness (Condensate and makeup)</td>
<td>Less than 2 ppm</td>
</tr>
</tbody>
</table>

The above limits apply to boilers operating above 100 kPa 15 psi up to 2070 kPa 300 psi. Above 2070 kPa 300 psi these limits decrease. Use ABMA or chemical vendor recommended limits above 2070 kPa 300 psi.

2.3.6.2 Water Softening System

**************************************************************************
NOTE: The makeup water analysis and the boiler manufacturer’s recommended feed water conditions will be used to determine the need for a water softener. Generally, all boilers operating above 100 kPa 15 psi require softened water.
**************************************************************************

Provide the water softening system as specified in Section 22 31 00 WATER SOFTENERS, CATION-EXCHANGE (SODIUM CYCLE).

2.3.6.3 Boiler Water Treatment System

Provide water treatment system capable of automatically feeding chemicals to prevent corrosion and scale within the boiler and condensate system. Ensure automatic chemical feed systems feed chemicals into the boiler based on makeup water rate. Use electrical signals from a water meter on the makeup water line to control the output of chemical feed pumps.

2.3.6.4 Steam Boiler Chemical Feed Pumps and Tanks

**************************************************************************
NOTE: The required maximum pump flow rate will be shown on the drawings. The flow rate will depend upon the makeup water flow rate, the chemical composition of the makeup water and the concentration of the chemical supplied. A water treatment company should be consulted for determining the proper maximum pump flow rate.
**************************************************************************

A company regularly engaged in water treatment for
mechanical systems will be consulted to determine the number of tanks required to be shown on the drawings. The number will depend on the size of the boiler, makeup water flow rate, and makeup water composition. A potable water line will be provided near the tanks for the mixing of chemicals.

**************************************************************************

a. Furnish chemical feed pumps and tanks as a package with the pumps mounted on and piping connected to the tank. Use chemical feed pumps that are positive displacement diaphragm type. Ensure the pump cylinders, plungers, ball check valves, and check valve bodies are fabricated of corrosion resistant materials suitable for the chemicals being pumped. Ensure cylinders are replaceable for increased or reduced pressure or capacity ranges. Ensure the flow rate of the pumps is adjustable from 0 to 100 percent while in operation. Ensure volumetric accuracy of the pumps is within one percent over the range indicated. Pump capacities are required to be adjustable by positioning crank pin with micrometer setscrews. Divide stroke length scale in percentage graduations engraved on scale.

b. Ensure the discharge pressure of pumps is not less than 1.5 times the line pressure at the point of connection. Provide pumps with a pressure relief valve and a check valve mounted in the pump discharge. Control the pumps by an external controller/timer receiving signals from the makeup water meter.

c. Provide drive motors rated for 110 volt, single phase and are equipped with drip-proof enclosures. Provide tanks constructed of [materials compatible with the chemicals to be stored in the tank] [high density polyethylene] [stainless steel] [fiber reinforced plastic] with a hinged cover and mounted on legs. Ensure tanks have filling and drain connections and gauge glass. Furnish each tank with one pump, mounted and piped with pipe and fittings suitable for working pressures and compatible with the chemicals in the tank it is in contact with, with suction strainer and stainless steel screen, and with 13 mm 1/2 inch relief valve with steel body and stainless steel trim. Shape tank bottom to be dished concave to a radius equal to the diameter of the tank. Ensure the tank for sodium sulfite is equipped with a floating cover to minimize contact with air. Provide a motor-driven agitator. Size the tanks to have sufficient capacity to require recharging only once per [7] [14] [21] [_____] days during normal operation.

2.3.6.5 Steam Boiler Chemical Injection Assemblies

Provide an injection assembly at each chemical injection point located along the boiler piping as indicated. Provide injection assemblies that are constructed of stainless steel. Extend the discharge of the assemblies to the centerline of the piping. Include a shutoff valve and check valve with each assembly at the point of entrance into the water line.

2.3.6.6 Steam Boiler Water Meter

Provide the water meter with an electric contacting register and remote accumulative counter. Install the meter within the makeup water line, as indicated.
2.3.6.7 Steam Boiler Timers

Provide timers that are automatic reset, adjustable type, and electrically operated. Design timers to work with the contacting head water meters. Include the water meter cable with the timer. Ensure timers control operation of the chemical feed pumps. Ensure timers are suitable for a 120 volt current. Use timers to control the electrical signals from the water meters to the chemical feed pumps.

2.3.6.8 Steam Boiler Control Panel

**************************************************************************
NOTE: The MAN-OFF-AUTO switch should be deleted for continuously fed systems.
**************************************************************************

Provide control panel constructed of a NEMA 12, single door, wall-mounted box conforming with NEMA 250. Ensure the panel is constructed of [coated steel] [stainless steel] with a hinged door and lock. Ensure the panel contains, as a minimum, the following functions identified with a laminated plastic nameplate:

a. Main power switch and indicating light
b. MAN-OFF-AUTO selector switch
c. Indicating lamp for each chemical feed pump
d. Indicating lamp for the water softener

2.3.6.9 Boiler Blowdown

**************************************************************************
NOTE: Typically, automatic blowdown will be economical for boilers with capacities greater than 2.9 MW 10,000,000 Btuh.
**************************************************************************

Provide the boiler with [continuous blowdown] [automatic blowdown based upon conductivity or boiler load]. Provide a bottom blowdown connection and valve to allow removal of solids and water from the bottom of the boiler.

2.3.6.10 Boiler Chemical Piping

**************************************************************************
NOTE: If steel piping is selected, an interior coating may be required depending upon the chemicals used.
**************************************************************************

Fabricate the piping and fittings of [steel] [stainless steel].

2.3.6.11 Boiler Test Kits

Provide one test kit of each type required to determine the water quality as outlined in paragraph Boiler Water Limits above and within the operation and maintenance manuals.

2.3.7 Supplemental Components/Services
NOTE: All drain and makeup water piping should be indicated on the drawings.

Ensure drain and makeup water piping complies with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE. Connect drains to sanitary sewer systems by means of an indirect waste connection.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy, before performing any work.

3.2 INSTALLATION

Provide all chemicals, equipment and labor necessary to bring all system waters in conformance with the specified requirements. Perform all work in accordance with the manufacturer's published diagrams, recommendations, and equipment warranty requirements.

3.2.1 Piping

Fabricate all connections between dissimilar metals using dielectric unions.

3.3 FIELD QUALITY CONTROL

3.3.1 Tests

If the waters of the mechanical systems are not in conformance with the specified requirements or in accordance with manufacturer's recommendations, the contractor is required to direct the water treatment company to take corrective action to achieve compliance. Perform daily operational tests in the directed frequencies to maintain required control to prevent corrosion, scaling and damage to equipment during operation. Submit test schedules, at least 2 weeks prior to the start of related testing, for the condenser/chilled/boiler/condensate/feedwater water quality tests. Identify the date, time, frequency and collection location for each test within the schedules.

3.3.2 Condenser Water Quality Tests

3.3.2.1 Small Systems (weekly)

Once a week, for cooling systems with a capacity of 175.8 kW 50 tons or less, ensuring the following items are recorded.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[___]</td>
</tr>
<tr>
<td>Total Alkalinity (as CaCO3)</td>
<td>[___] ppm (mg/L)</td>
</tr>
<tr>
<td>Conductivity</td>
<td>[___] micromho/cm</td>
</tr>
</tbody>
</table>

3.3.2.2 Tests for Large Systems (daily)

Daily, for cooling systems with a capacity larger than 175.8 kW 50 tons,
ensuring the following items are recorded.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Total Alkalinity (as CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Conductivity</td>
<td>[_____] micromho/cm</td>
</tr>
<tr>
<td>Phosphate</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Zinc, if used (Zn)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Molybdate, if used (Mo)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
</tbody>
</table>

3.3.3 Chilled Water Testing (monthly)

Perform the following tests on chilled water on a monthly basis.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Nitrite or Molybdate</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Conductivity</td>
<td>[_____] micromho/cm</td>
</tr>
</tbody>
</table>

3.3.4 Hot Water Boiler Water Quality Testing

3.3.4.1 Low and Medium Temperature Systems (monthly)

Complete and record monthly testing for the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Nitrite or Molybdate</td>
<td>[_____] ppm (mg/L)</td>
</tr>
</tbody>
</table>

3.3.4.2 High Temperature Hot Water Systems (daily)

Complete and record daily testing for the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Sulfite</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Hardness</td>
<td>[_____] ppm (mg/L)</td>
</tr>
</tbody>
</table>

3.3.5 Steam Boiler Water Testing

3.3.5.1 Small Steam Systems

The type of treatment required for small steam systems (below 0.25 MW 25 hp) varies greatly depending on local water and system conditions. Base the
determination of the type of treatment and frequency of testing on the recommendations of by the water treatment chemical vendor.

3.3.5.2  Medium Steam Systems (twice weekly)

Record the following items twice a week for steam boiler systems operating between 0.25 MW 25 hp and 1 MW 100 hp and utilize data for operation purposes.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>P Alkalinity (as CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Total Dissolved Solids</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Phosphate (PO4)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Sulfite (NaSO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
</tbody>
</table>

3.3.5.3  Large Steam Systems (daily)

Record the following items daily for steam boiler systems operating above 100 kPa 15 psi and 1 MW 100 hp and utilize data for operational purposes.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Sulfite (NaSO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>P Alkalinity (as CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Conductivity</td>
<td>[_____] micromho/cm</td>
</tr>
<tr>
<td>Neutralized Conductivity</td>
<td>[_____] micromho/cm</td>
</tr>
<tr>
<td>Total Dissolved Solids</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Phosphate (PO4)</td>
<td>[_____] ppm (mg/L)</td>

<tr>
<td>Makeup Water Hardness (as CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
</tbody>
</table>

3.3.6  Quality Assurance Testing

**************************************************************************

NOTE: It is important to require Quality Assurance (QA) testing performed by an independent industrial water treatment laboratory/consultant to sustain good water chemistry control. Systems without good chemistry control will experience higher equipment replacement costs, energy and operating costs, higher water usage, more plant shutdowns, higher and
Conduct QA testing periodically by an independent water treatment lab/consultant to verify to managers that the mechanical and water treatment systems are being maintained properly. Provide the QA evaluation reports to the government COR.

### 3.3.6.1 Condenser Water QA Tests

Submit test reports in bound 216 by 279 mm 8-1/2 by 11 inch booklets. Within the reports, identify the chemical composition of the condenser water. Also include in the reports a comparison of the manufacturer's or chemical vendor's recommended operating conditions for the cooling tower and condenser in relation to the actual condition of the condenser water. Document any required corrective actions undertaken within the report.

a. For cooling systems with a capacity of **175.8 kW 50 ton** or less, the perform following tests

<table>
<thead>
<tr>
<th>Presence of scale/corrosion</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Polyphosphate</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Biocide</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Total Alkalinity (as CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Calcium Hardness (as CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Conductivity</td>
<td>[_____] micromho/cm</td>
</tr>
<tr>
<td>Written evaluation summary</td>
<td></td>
</tr>
</tbody>
</table>

b. For cooling systems with capacities greater than **175.8 kW 50 ton**, analyze the condenser water a minimum of once a month for a period of one year by the water treatment company. Ensure the analysis includes the following information recorded in accordance with ASTM D596.

<table>
<thead>
<tr>
<th>Date of Sample</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperatures (before &amp; after condenser)</td>
<td>[<em><strong><strong>] &amp; [</strong></strong></em>] degrees C</td>
</tr>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Silica (SiO2)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Iron (total, as Fe(2)O(3))</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Copper (Cu)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Calcium Hardness(CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
</tbody>
</table>
3.3.6.2 Chilled Water Quality Assurance Testing (quarterly)

Perform the following tests quarterly on chilled water.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>[_____] ppm (mg/L)</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Nitrite or Molybdate</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Conductivity</td>
<td>[_____] micromho/cm</td>
</tr>
<tr>
<td>Iron (total, as Fe(2)O(3))</td>
<td>[_____] ppm (mg/L)</td>
</tr>
</tbody>
</table>

Written evaluation summary
3.3.6.3 Hot Water Boiler Water Quality Assurance Testing

a. Complete quarterly testing of Low and Medium Temperature Systems and record the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Nitrite or Molybdate</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Iron (total, as Fe(2)O(3))</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Written evaluation summary</td>
<td></td>
</tr>
</tbody>
</table>

b. Have an independent consultant analyze the hot water boiler water once a month for a period of 1 year. Include the following information recorded in accordance with ASTM D596 in the monthly report.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Sulfite (Na2SO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Hardness (as CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Iron (total, as Fe(2)O(3))</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Written evaluation summary</td>
<td></td>
</tr>
</tbody>
</table>

3.3.6.4 Steam Boiler Water QA Tests

Submit the water quality test report identifying the chemical composition of the boiler, feedwater and condensate water. Include in the report a comparison of the condition of the boiler water with the manufacturer's or chemical vendor's recommended conditions. Document any required corrective action within the report.

a. Small and Medium Steam Boiler Systems (quarterly) are systems operating between 0.25 MW 25 hp and 1 MW 100 hp. Perform the following tests quarterly.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>
</tr>
<tr>
<td>Sulfite, if used, (NaSO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>P Alkalinity (as CaCO3)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Total Dissolved Solids</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Phosphate, if used, (PO4)</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Polymer, if used</td>
<td>[_____] ppm (mg/L)</td>
</tr>
<tr>
<td>Iron (total, as Fe(2)O(3))</td>
<td>[_____] ppm (mg/L)</td>
</tr>
</tbody>
</table>
Large steam boilers are those operating above 100 kPa 15 psi and 1 MW 100 hp. Retain an independent consultant to analyze the boiler water at a minimum of once a month for a period of 1 year. Include the following information recorded in accordance with ASTM D596 in the monthly report.

<table>
<thead>
<tr>
<th>Date of Sample</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>[_____]</td>

3.3.7 Corrosion Testers

**************************************************************************
NOTE: Choose from the systems below to be monitored with corrosion testers.
**************************************************************************

Install corrosion coupon and rack systems to verify corrosion control in the systems. Install testers or coupons in flowing system water through a sidestream or rack system. Test both mild steel and copper metal samples in the corrosion testers in accordance with ASTM D2688. Replace and analyze samples every 3 months. Rates of corrosion less than 3 mpy for steel and 0.2 mpy for copper are acceptable. Install corrosion testers on the piping systems of the following systems.

- Condenser loop
- Chilled water system
- Hot water loop
- Condensate

3.4 CLOSEOUT ACTIVITIES

3.4.1 Training Course

Submit a schedule, at least 2 weeks prior to the date of the proposed training course that identifies the date, time, and location for the training. Conduct a training course for the operating staff as designated by the Contracting Officer. Conduct the training to include a total of [_____] hours of normal working time and start after the system is functionally completed but prior to final acceptance tests. Submit field instructions, at least 2 weeks prior to construction completion, including equipment layout, wiring and control diagrams, piping, valves and control sequences, and typed condensed operation instructions. Include within the condensed operation instructions all preventative maintenance procedures, methods of checking the system for normal and safe operation, and procedures for safely starting and stopping the system. Frame the posted instructions under glass or laminated plastic and post where indicated by the Contracting Officer. Ensure the field instructions cover all of the items contained in the Operation and Maintenance Manuals as well as demonstrations of routine maintenance operations.

3.5 INSPECTIONS

3.5.1 Inspection General Requirements

Thirty days after project completion, inspect the cooling tower and condenser for problems due to corrosion, scale, and biological growth. If the cooling tower and condenser are found not to conform to the manufacturer's recommended conditions, and the water treatment company recommendations have been followed; instruct the water treatment company to provide all chemicals and labor for cleaning or repairing the equipment as required by the manufacturer's recommendations.

3.5.2 Boiler/Piping Test

**************************************************************************
NOTE: If a steam boiler is not used, delete the reference to condensate piping.
**************************************************************************
Thirty days after project completion, inspect the boiler and condensate piping for problems due to corrosion and scale. If the boiler is found not to conform to the manufacturer's recommendations, and the water treatment company recommendations have been followed, instruct the water treatment company to provide all chemicals and labor for cleaning or repairing the equipment as required by the manufacturer's recommendations. If corrosion is found within the condensate piping, proper repairs are required to be made by the water treatment company at no additional cost.

  3.16.1 Operation and Maintenance Manuals
  3.16.2 Operation And Maintenance Training

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for air supply, distribution, ventilation, and exhaust portions of an HVAC system.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Coordinate the use of this specification with other sections, as appropriate, in order to specify a complete HVAC built-up system.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text are automatically deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SYSTEM DESCRIPTION

Furnish ductwork, piping offsets, fittings, and accessories as required to provide a complete installation. Coordinate the work of the different trades to avoid interference between piping, equipment, structural, and
electrical work. Provide complete, in place, all necessary offsets in piping and ductwork, and all fittings, and other components, required to install the work as indicated and specified.

1.2.1 Mechanical Equipment Identification

The number of charts and diagrams must be equal to or greater than the number of mechanical equipment rooms. Where more than one chart or diagram per space is required, mount these in edge pivoted, swinging leaf, extruded aluminum frame holders which open to 170 degrees.

1.2.1.1 Charts

Provide chart listing of equipment by designation numbers and capacities such as flow rates, pressure and temperature differences, heating and cooling capacities, horsepower, pipe sizes, and voltage and current characteristics.

1.2.1.2 Diagrams

Submit proposed diagrams, at least 2 weeks prior to start of related testing. Provide neat mechanical drawings provided with extruded aluminum frame under 3 mm 1/8-inch glass or laminated plastic, system diagrams that show the layout of equipment, piping, and ductwork, and typed condensed operation manuals explaining preventative maintenance procedures, methods of checking the system for normal, safe operation, and procedures for safely starting and stopping the system. After approval, post these items where directed.

1.2.2 Service Labeling

Label equipment, including fans, air handlers, terminal units, etc. with labels made of self-sticking, plastic film designed for permanent installation. Provide labels in accordance with the typical examples below:

<table>
<thead>
<tr>
<th>SERVICE</th>
<th>LABEL AND TAG DESIGNATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Air handling unit Number</td>
<td>AHU - [_____]</td>
</tr>
<tr>
<td>Control and instrument air</td>
<td>CONTROL AND INSTR.</td>
</tr>
<tr>
<td>Exhaust Fan Number</td>
<td>EF - [_____]</td>
</tr>
<tr>
<td>VAV Box Number</td>
<td>VAV - [_____]</td>
</tr>
<tr>
<td>Fan Coil Unit Number</td>
<td>FC - [_____]</td>
</tr>
<tr>
<td>Terminal Box Number</td>
<td>TB - [_____]</td>
</tr>
<tr>
<td>Unit Ventilator Number</td>
<td>UV - [_____]</td>
</tr>
</tbody>
</table>

Identify similar services with different temperatures or pressures. Where pressures could exceed 860 kilopascal 125 pounds per square inch, gage, include the maximum system pressure in the label. Label and arrow piping in accordance with the following:
a. Each point of entry and exit of pipe passing through walls.

b. Each change in direction, i.e., elbows, tees.

c. In congested or hidden areas and at all access panels at each point required to clarify service or indicated hazard.

d. In long straight runs, locate labels at distances within eyesight of each other not to exceed 22 meter 75 feet. All labels must be visible and legible from the primary service and operating area.

<table>
<thead>
<tr>
<th>For Bare or Insulated Pipes</th>
</tr>
</thead>
<tbody>
<tr>
<td>for Outside Diameters of</td>
</tr>
<tr>
<td>13 thru [_____] mm1/2 thru 1-3/8 inch</td>
</tr>
<tr>
<td>40 thru [_____] mm1-1/2 thru 2-3/8 inch</td>
</tr>
<tr>
<td>65 mm and larger 2-1/2 inch and larger</td>
</tr>
</tbody>
</table>

1.2.3 Color Coding

******************************************************************************

NOTE: The MIL-STD-101 system is for ground based piping systems and compressed gas cylinders. The color coding is not compatible with ASME A13.1 which is commonly used for facilities work

******************************************************************************

Color coding of all piping systems must be in accordance with [ASME A13.1] [MIL-STD-101].

1.3 SUBMITTALS

******************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

For Navy projects, delete the following submittal items and associated bracketed information: Drawings, Test Procedures, Diagrams, and Bolts.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
    Detail Drawings; G, [____]

SD-03 Product Data
    Metallic Flexible Duct
    Insulated Nonmetallic Flexible Duct Runouts

1.4 QUALITY ASSURANCE

Except as otherwise specified, approval of materials and equipment is based on manufacturer's published data.

a. Where materials and equipment are specified to conform to the standards of the Underwriters Laboratories, the label of or listing with reexamination in UL Bld Mat Dir, and UL 6 is acceptable as sufficient evidence that the items conform to Underwriters Laboratories requirements. In lieu of such label or listing, submit a written certificate from any nationally recognized testing agency, adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the specified requirements. Outline methods of testing used by the specified agencies.

b. Where materials or equipment are specified to be constructed or tested, or both, in accordance with the standards of the ASTM International (ASTM), the ASME International (ASME), or other standards, a manufacturer's certificate of compliance of each item is acceptable as proof of compliance.

c. Conformance to such agency requirements does not relieve the item from compliance with other requirements of these specifications.

d. Where products are specified to meet or exceed the specified energy efficiency requirement of FEMP-designated or ENERGY STAR covered product categories, equipment selected must have as a minimum the efficiency rating identified under "Energy-Efficient Products" at http://femp.energy.gov/procurement.[ Equipment having a lower efficiency may be specified if the designer determines such equipment to be more life-cycle cost effective.]

1.4.1 Prevention of Corrosion

********************************************************************************

NOTE: Refer to sub-section titled "Painting" for painting requirements.

********************************************************************************

Protect metallic materials against corrosion. Provide rust-inhibiting treatment and standard finish for the equipment enclosures. Do not use aluminum in contact with earth, and where connected to dissimilar metal. Protect aluminum by approved fittings, barrier material, or treatment.
Provide hot-dip galvanized ferrous parts such as anchors, bolts, braces, boxes, bodies, clamps, fittings, guards, nuts, pins, rods, shims, thimbles, washers, and miscellaneous parts not of corrosion-resistant steel or nonferrous materials in accordance with ASTM A123/A123M for exterior locations and cadmium-plated in conformance with ASTM B766 for interior locations. Provide written certification from the bolt manufacturer that the bolts furnished comply with the requirements of this specification. Include illustrations of product markings, and the number of each type of bolt to be furnished in the certification.

1.4.2 Asbestos Prohibition

Do not use asbestos and asbestos-containing products.

1.4.3 Ozone Depleting Substances Technician Certification

**************************************************************************
NOTE: The following paragraph requires a certification for technicians who work on equipment that could release ozone depleting refrigerants, such as R-123, into the atmosphere. This is required as of January 1, 2018 to meet the requirements of 40 CFR 82, Subpart F.
**************************************************************************

All technicians working on equipment that contain ozone depleting refrigerants must be certified as a Section 608 Technician to meet requirements in 40 CFR 82, Subpart F. Provide copies of technician certifications to the Contracting Officer at least 14 calendar days prior to work on any equipment containing these refrigerants.

1.4.4 Detail Drawings

Submit detail drawings showing equipment layout, including assembly and installation details and electrical connection diagrams; ductwork layout showing the location of all supports and hangers, typical hanger details, gauge reinforcement, reinforcement spacing rigidity classification, and static pressure and seal classifications. Include any information required to demonstrate that the system has been coordinated and functions properly as a unit on the drawings and show equipment relationship to other parts of the work, including clearances required for operation and maintenance. Submit drawings showing bolt-setting information, and foundation bolts prior to concrete foundation construction for all equipment indicated or required to have concrete foundations. Submit function designation of the equipment and any other requirements specified throughout this Section with the shop drawings.

1.4.5 Test Procedures

Conduct performance tests as required in Section 23 05 93 Testing, Adjusting and Balancing for HVAC and Section 23 09 00 Instrumentation and Control for HVAC.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect stored equipment at the jobsite from the weather, humidity and temperature variations, dirt and dust, or other contaminants. Additionally, cap or plug all pipes until installed.
PART 2   PRODUCTS

2.1 STANDARD PRODUCTS

**************************************************************************

NOTE: Use this paragraph for Air Force and Army projects.

In order to comply with UFC 1-200-02, designs must achieve energy consumption levels that are at least 30 percent below the baseline established in the 2010 publication of ASHRAE 90.1. The Designer of Record must design HVAC systems that assist in achieving this requirement.

**************************************************************************

Provide components and equipment that are "standard products" of a manufacturer regularly engaged in the manufacturing of products that are of a similar material, design and workmanship. "Standard products" is defined as being in satisfactory commercial or industrial use for 2 years before bid opening, including applications of components and equipment under similar circumstances and of similar size, satisfactorily completed by a product that is sold on the commercial market through advertisements, manufacturers' catalogs, or brochures. Products having less than a 2-year field service record are acceptable if a certified record of satisfactory field operation, for not less than 6000 hours exclusive of the manufacturer's factory tests, can be shown. Provide equipment items that are supported by a service organization. In product categories covered by ENERGY STAR or the Federal Energy Management Program, provide equipment that is listed on the ENERGY STAR Qualified Products List or that meets or exceeds the FEMP-designated Efficiency Requirements.

2.2 STANDARD PRODUCTS

**************************************************************************

NOTE: Use this paragraph for Navy projects.

**************************************************************************

Except for the fabricated duct, plenums and casings specified in paragraphs "Metal Ductwork" and "Plenums and Casings for Field-Fabricated Units", provide components and equipment that are standard products of manufacturers regularly engaged in the manufacturing of products that are of a similar material, design and workmanship. This requirement applies to all equipment, including diffusers, registers, fire dampers, and balancing dampers.

a. Standard products are defined as components and equipment that have been in satisfactory commercial or industrial use in similar applications of similar size for at least two years before bid opening.

b. Prior to this two year period, these standard products must have been sold on the commercial market using advertisements in manufacturers' catalogs or brochures. These manufacturers' catalogs, or brochures must have been copyrighted documents or have been identified with a manufacturer's document number.

c. Provide equipment items that are supported by a service organization. In product categories covered by ENERGY STAR or the Federal Energy Management Program, provide equipment that is listed on the ENERGY STAR
Qualified Products List or that meets or exceeds the FEMP-designated Efficiency Requirements.

2.3 IDENTIFICATION PLATES

In addition to standard manufacturer's identification plates, provide engraved laminated phenolic identification plates for each piece of mechanical equipment. Identification plates are to designate the function of the equipment. Submit designation with the shop drawings. Provide identification plates that are layers, black-white-black, engraved to show white letters on black background. Letters must be upper case. Identification plates 40 mm that are 1-1/2-inches high and smaller must be 1.6 mm 1/16-inch thick, with engraved lettering 3 mm 1/8-inch high; identification plates larger than 40 mm 1-1/2-inches high must be 3 mm 1/8-inch thick, with engraved lettering of suitable height. Identification plates 40 mm 1-1/2-inches high and larger must have beveled edges. Install identification plates using a compatible adhesive.

2.4 EQUIPMENT GUARDS AND ACCESS

**************************************************************************

NOTE: Catwalks, ladders, and guardrails could be required. If so, select the applicable item and indicate on drawings. If not applicable, delete the entire last sentence.

**************************************************************************

Fully enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personnel contact according to OSHA requirements. Properly guard or cover with insulation of a type specified, high temperature equipment and piping exposed to contact by personnel or where it creates a potential fire hazard. The requirements for catwalks, operating platforms, ladders, and guardrails are specified in Section 08 31 00 ACCESS DOORS AND PANELS.

2.5 ELECTRICAL WORK

**************************************************************************

NOTE: Show the electrical characteristics, motor starter type(s), enclosure type, and maximum rpm on the drawings in the equipment schedules.

Where reduced-voltage motor starters are recommended by the manufacturer or required otherwise, specify and coordinate the type(s) required in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Reduced-voltage starting is required when full voltage starting interferes with other electrical equipment and circuits and when recommended by the manufacturer. Where adjustable speed drives (SD) are specified, reference Section 26 29 23 ADJUSTABLE SPEED DRIVE SYSTEMS UNDER 600 VOLTS. The methods for calculating the economy of using an adjustable speed drive is described in UFC 3-520-01 INTERIOR ELECTRICAL SYSTEMS.

**************************************************************************

a. Provide motors, controllers, integral disconnects, contactors, and controls with their respective pieces of equipment, except controllers
indicated as part of motor control centers. Provide electrical equipment, including motors and wiring, as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide manual or automatic control and protective or signal devices required for the operation specified and control wiring required for controls and devices specified, but not shown. For packaged equipment, include manufacturer provided controllers with the required monitors and timed restart.

b. For single-phase motors, provide high-efficiency type, fractional-horsepower alternating-current motors, including motors that are part of a system, in accordance with NEMA MG 11. Provide premium efficiency type integral size motors in accordance with NEMA MG 1.

c. For polyphase motors, provide squirrel-cage medium induction motors, including motors that are part of a system, and that meet the efficiency ratings for premium efficiency motors in accordance with NEMA MG 1. Select premium efficiency polyphase motors in accordance with NEMA MG 10.

d. Provide motors in accordance with NEMA MG 1 and of sufficient size to drive the load at the specified capacity without exceeding the nameplate rating of the motor. Provide motors rated for continuous duty with the enclosure specified. Provide motor duty that allows for maximum frequency start-stop operation and minimum encountered interval between start and stop. Provide motor torque capable of accelerating the connected load within 20 seconds with 80 percent of the rated voltage maintained at motor terminals during one starting period. Provide motor starters complete with thermal overload protection and other necessary appurtenances. Fit motor bearings with grease supply fittings and grease relief to outside of the enclosure.

e. Where two-speed or variable-speed motors are indicated, solid-state variable-speed controllers are allowed to accomplish the same function. Use solid-state variable-speed controllers for motors rated 7.45 kW 10 hp or less and adjustable frequency drives for larger motors. Provide variable frequency drives for motors as specified in Section 26 29 23 ADJUSTABLE SPEED DRIVE SYSTEMS UNDER 600 VOLTS.

2.6 ANCHOR BOLTS

Provide anchor bolts for equipment placed on concrete equipment pads or on concrete slabs. Bolts to be of the size and number recommended by the equipment manufacturer and located by means of suitable templates. Installation of anchor bolts must not degrade the surrounding concrete.

2.7 SEISMIC ANCHORAGE

**************************************************************************
NOTE: Retain this paragraph only when equipment is to be installed in areas of seismic activity.
**************************************************************************

Anchor equipment in accordance with applicable seismic criteria for the area and as defined in SMACNA 1981

2.8 PAINTING

**************************************************************************
NOTE: Use upgraded materials/coatings in humid
**************************************************************************
locations or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as indentified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations. For projects in these locations, include the sentence below to paint in accordance with Section 09 96 00 HIGH PERFORMANCE COATINGS; designer to edit and include Section 09 96 00.

**************************************************************************

Paint equipment units in accordance with approved equipment manufacturer's standards unless specified otherwise. Field retouch only if approved. Otherwise, return equipment to the factory for refinishing. Paint in accordance with Section 09 96 00 HIGH-PEFORMANCE COATINGS.

2.9 INDOOR AIR QUALITY

Provide equipment and components that comply with the requirements of ASHRAE 62.1 unless more stringent requirements are specified herein.

2.10 DUCT SYSTEMS

**************************************************************************

NOTE: Identify all pressure classification for all ductwork in accordance with SMACNA 1966, including points of changes in pressure classification, on the drawings. Indicate pitch of ductwork, low spots in ductwork, and means of disposing of condensate, where required. Size outdoor air intakes so that rain and snow are not drawn into the ductwork. Slope watertight intakes to a drain line and provide means to dispose of the water. The requirement that outdoor air intake ducts and plenums be fabricated watertight with soldered or brazed joints and seams can be eliminated where rain or snow does not get drawn into the outdoor air intake.

Limit the use of flexible duct (due to the inordinate pressure drop and corresponding fan energy consumption that it causes). Show the extent of flexible duct on the drawings. Ensure that the restrictions in these standards pertaining to the use of non-metallic materials in air distribution plenums are adhered to.

The flammability and combustibility of non-metallic duct materials is controlled by NFPA 90A, 90B, and 91. Show the extent of non-metallic duct on the drawings when these standards limit its use.

The minimum duct seal level must conform to ASHRAE 90.1 including: Outdoor supply ducts and return ducts must meet seal level A. Outdoor exhaust ducts must meet a seal level C. Unconditioned space supply ducts with 50 mm 2 inches w.c. or less must meet seal level B and greater than 50 mm 2 inches w.c. must meet seal level A. Unconditioned space exhaust
duct must meet seal level C and return duct must meet seal level B. Conditioned space supply ducts with 50 mm 2 inches w.c. or less must meet seal level C and greater than 50 mm 2 inches w.c. must meet seal level B. Conditioned space exhaust duct must meet seal level B and return duct must meet seal level C.

For Navy projects all ductwork must meet the requirements of Seal Class A.

**************************************************************************

2.10.1 Metal Ductwork

Provide metal ductwork construction, including all fittings and components, that complies with SMACNA 1966, as supplemented and modified by this specification.

a. Construct ductwork meeting the requirements for the duct system static pressure specified in APPENDIX D of Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC.

b. Provide radius type elbows with a centerline radius of 1.5 times the width or diameter of the duct where space permits. Otherwise, elbows having a minimum radius equal to the width or diameter of the duct or square elbows with factory fabricated turning vanes are allowed.

c. Provide ductwork that meets the requirements of Seal Class [A][C]. Provide ductwork in VAV systems upstream of the VAV boxes that meets the requirements of Seal Class A.

d. Provide ductwork that meets the requirements of Seal Class A. Provide ductwork in VAV systems upstream of the VAV boxes that meets the requirements of Seal Class A.

e. Provide sealants that conform to fire hazard classification specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS and are suitable for the range of air distribution and ambient temperatures to which it is exposed. Do not use pressure sensitive tape as a sealant. Provide duct sealant products that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168 (HVAC duct sealants are classified as "Other" within the SCAQMD Rule 1168 sealants table). Provide validation of indoor air quality for duct sealants.

f. Make spiral lock seam duct, and flat oval with duct sealant and lock with not less than 3 equally spaced drive screws or other approved methods indicated in SMACNA 1966. Apply the sealant to the exposed male part of the fitting collar so that the sealer is on the inside of the joint and fully protected by the metal of the duct fitting. Apply one brush coat of the sealant over the outside of the joint to at least 50 mm 2 inch band width covering all screw heads and joint gap. Dents in the male portion of the slip fitting collar are not acceptable.

g. Fabricate outdoor air intake ducts and plenums with watertight soldered or brazed joints and seams.
2.10.1.1 Metallic Flexible Duct

a. Provide duct that conforms to UL 181 and NFPA 90A with factory-applied insulation, vapor barrier, and end connections. Provide duct assembly that does not exceed 25 for flame spread and 50 for smoke developed. Provide ducts designed for working pressures of 497 Pa 2 inches water gauge positive and 373 Pa 1.5 inches water gauge negative. Provide flexible round duct length that does not exceed 1525 mm 5 feet. Secure connections by applying adhesive for 51 mm 2 inches over rigid duct, apply flexible duct 51 mm 2 inches over rigid duct, apply metal clamp, and provide minimum of three No. 8 sheet metal screws through clamp and rigid duct.

b. Inner duct core: Provide interlocking spiral or helically corrugated flexible core constructed of zinc-coated steel, aluminum, or stainless steel; or constructed of inner liner of continuous galvanized spring steel wire helix fused to continuous, fire-retardant, flexible vapor barrier film, inner duct core.

c. Insulation: Provide inner duct core that is insulated with mineral fiber blanket type flexible insulation, minimum of 25 mm 1 inch thick. Provide insulation covered on exterior with manufacturer's standard fire retardant vapor barrier jacket for flexible round duct.

2.10.1.2 Insulated Nonmetallic Flexible Duct Runouts

Use flexible duct runouts only where indicated. Runout length is indicated on the drawings, and is not to exceed 1.5 m 5 feet. Provide runouts that are preinsulated, factory fabricated, and that comply with NFPA 90A and UL 181. Provide either field or factory applied vapor barrier. Provide not less than 0.60 L 20 ounce glass fabric duct connectors coated on both sides with neoprene. Where coil induction or high velocity units are supplied with vertical air inlets, use a streamlined, vaned and mitered elbow transition piece for connection to the flexible duct or hose. Provide a die-stamped elbow and not a flexible connector as the last elbow to these units other than the vertical air inlet type. Insulated flexible connectors are allowed as runouts. Provide insulated material and vapor barrier that conform to the requirements of Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Do not expose the insulation material surface to the air stream.

2.10.1.3 General Service Duct Connectors

Provide a flexible duct connector approximately 150 mm 6 inches in width where sheet metal connections are made to fans or where ducts of dissimilar metals are connected. For round/oval ducts, secure the flexible material by stainless steel or zinc-coated, iron clinch-type draw bands. For rectangular ducts, install the flexible material locked to metal collars using normal duct construction methods. Provide a composite connector system that complies with NFPA 701 and is classified as "flame-retardent fabrics" in UL Bld Mat Dir.

2.10.1.4 High Temperature Service Duct Connections

Provide material that is approximately 2.38 mm 3/32 inch thick, 1.2 to 1.36 kg per square meter 35 to 40-ounce per square yard weight, plain weave fibrous glass cloth with, nickel/chrome wire reinforcement for service in excess of 650 degrees C 1200 degrees F.
2.10.1.5 Aluminum Ducts

ASTM B209M ASTM B209, alloy 3003-H14 for aluminum sheet and alloy 6061-T6 or equivalent strength for aluminum connectors and bar stock.

2.10.1.6 Copper Sheets

ASTM B152/B152M, light cold rolled temper.

2.10.1.7 Corrosion Resisting (Stainless) Steel Sheets

ASTM A167

2.10.2 Duct Access Doors

**************************************************************************

NOTE: Provide duct access doors at regular intervals to facilitate the cleaning of duct systems for applications requiring clean air supplies, such as hospitals, laboratories, electronics servicing and similar activities.

**************************************************************************

Provide hinged access doors conforming to SMACNA 1966 in ductwork and plenums where indicated and at all air flow measuring primaries, automatic dampers, fire dampers, coils, thermostats, and other apparatus requiring service and inspection in the duct system. Provide access doors upstream and downstream of air flow measuring primaries and heating and cooling coils. Provide doors that are a minimum 375 by 450 mm (15 by 18 inches), unless otherwise shown. Where duct size does not accommodate this size door, make the doors as large as practicable. Equip doors 600 by 600 mm (24 by 24 inches) or larger with fasteners operable from inside and outside the duct. Use insulated type doors in insulated ducts.

2.10.3 Fire Dampers

**************************************************************************

NOTE: Indicate the location of each fire damper and details of the damper installations according to NFPA 90A. Three-hour rated fire dampers must be specifically identified on the drawings. Use pressure relief damper upstream of the fire damper for Army and Air Force projects only.

**************************************************************************

Use 1.5 hour rated fire dampers unless otherwise indicated. Provide fire dampers that conform to the requirements of NFPA 90A and UL 555. Perform the fire damper test as outlined in NFPA 90A. Provide a pressure relief door upstream of the fire damper. If the ductwork connected to the fire damper is to be insulated then provide a factory installed pressure relief damper. Provide automatic operating fire dampers with a dynamic rating suitable for the maximum air velocity and pressure differential to which it is subjected. Provide fire dampers approved for the specific application, and install according to their listing. Equip fire dampers with a steel sleeve or adequately sized frame installed in such a manner that disruption of the attached ductwork, if any, does not impair the operation of the damper. Equip sleeves or frames with perimeter mounting angles attached on both sides of the wall or floor opening. Construct ductwork in fire-rated floor-ceiling or roof-ceiling assembly systems with air ducts that pierce
the ceiling of the assemblies in conformance with UL Fire Resistance. Provide [curtain type with damper blades] [in the air stream] [out of the air stream] [or] [single blade type] [or] [multi-blade type] fire dampers. Install dampers that do not reduce the duct or the air transfer opening cross-sectional area. Install dampers so that the centerline of the damper depth or thickness is located in the centerline of the wall, partition or floor slab depth or thickness. Unless otherwise indicated, comply with the installation details given in SMACNA 1819 and in manufacturer's instructions for fire dampers. Perform acceptance testing of fire dampers according to paragraph DAMPER ACCEPTANCE TEST and NFPA 90A.

2.10.4 Manual Balancing Dampers

**************************************************************************
NOTE: Use this paragraph for Air Force and Army projects.

Show all volume dampers on the drawings. Do not rely upon diffuser and register volume dampers for balancing.
**************************************************************************

Furnish manual balancing dampers with accessible operating mechanisms. Use chromium plated operators (with all exposed edges rounded) in finished portions of the building. Provide manual volume control dampers that are operated by locking-type quadrant operators. Install dampers that are 2 gauges heavier than the duct in which installed. Unless otherwise indicated, provide opposed blade type multileaf dampers with maximum blade width of 300 mm 12 inches. Provide access doors or panels for all concealed damper operators and locking setscrews. Provide stand-off mounting brackets, bases, or adapters not less than the thickness of the insulation when the locking-type quadrant operators for dampers are installed on ducts to be thermally insulated, to provide clearance between the duct surface and the operator. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

2.10.5 Manual Balancing Dampers

**************************************************************************
NOTE: Use this paragraph for Navy projects.

Show all manual volume dampers on the drawings. Do not rely upon diffuser and register volume dampers for balancing.
**************************************************************************

a. Furnish manual balancing dampers with accessible operating mechanisms. Use chromium plated operators (with all exposed edges rounded) in finished portions of the building. Provide manual volume control dampers that are operated by locking-type quadrant operators.

b. Unless otherwise indicated, provide opposed blade type multileaf dampers with maximum blade width of 300 mm 12 inches. Provide access doors or panels for all concealed damper operators and locking setscrews. Provide access doors or panels in hard ceilings, partitions and walls for access to all concealed damper operators and damper locking setscrews. Coordinate location of doors or panels with other affected contractors.
c. Provide stand-off mounting brackets, bases, or adapters not less than the thickness of the insulation when the locking-type quadrant operators for dampers are installed on ducts to be thermally insulated, to provide clearance between the duct surface and the operator. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

2.10.5.1 Square or Rectangular Dampers

2.10.5.1.1 Duct Height 300 mm 12 inches and Less

2.10.5.1.1.1 Frames

<table>

2.10.5.1.1.4 Axle Bearings

Support the shaft on each end at the frames with shaft bearings. Press fit shaft bearings configuration to provide a tight joint between blade shaft and damper frame.
2.10.5.1.1.5 Control Shaft/Hand Quadrant

Provide dampers with accessible locking-type control shaft/hand quadrant operators.

Provide stand-off mounting brackets, bases, or adapters for the locking-type quadrant operators on dampers installed on ducts to be thermally insulated. Provide a minimum stand-off distance of 50 mm 2 inches off the metal duct surface. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

2.10.5.1.1.6 Finish

Mill Galvanized

2.10.5.1.2 Duct Height Greater than 300 mm 12 inches

2.10.5.1.2.1 Dampers

Provide dampers with multi-leaf opposed-type blades.

2.10.5.1.2.2 Frames

Maximum 1200 mm 48 inches in height; maximum 1200 mm 48 inches in width; minimum of 1.6 mm 16 gauge galvanized steel, minimum of 127 mm 5 inches long.

2.10.5.1.2.3 Blades

Minimum of 1.6 mm 16 gauge galvanized steel; 150 mm 6 inch nominal width.

2.10.5.1.2.4 Blade Axles

To support the blades of round dampers, provide galvanized square steel shafts supporting the blade the entire duct diameter frame-to-frame. Provide axle shafts that extend through standoff bracket and hand quadrant.

2.10.5.1.2.5 Axle Bearings

Support the shaft on each end at the frames with shaft bearings constructed of oil-impregnated bronze, or solid nylon, or a solid plastic equivalent to nylon. Press fit shaft bearings configuration to provide a tight joint between blade shaft and damper frame.

2.10.5.1.2.6 Blade Actuator

Minimum 50 mm 1/2 inch diameter galvanized steel.
2.10.5.1.2.7 Blade Actuator Linkage

Mill Galvanized steel bar and crank plate with stainless steel pivots.

2.10.5.1.2.8 Control Shaft/Hand Quadrant

Provide dampers with accessible locking-type control shaft/hand quadrant operators.

Provide stand-off mounting brackets, bases, or adapters for the locking-type quadrant operators on dampers installed on ducts to be thermally insulated. Provide a minimum stand-off distance of 50 mm 2 inches off the metal duct surface. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

2.10.5.1.2.9 Finish

Mill Galvanized

2.10.5.2 Round Dampers

2.10.5.2.1 Frames

2.10.5.2.3 Blade Axles

To support the blades of round dampers, provide galvanized steel shafts supporting the blade the entire duct diameter frame-to-frame. Provide axle shafts that extend through standoff bracket and hand quadrant.
### 2.10.5.2.4 Axle Bearings

Support the shaft on each end at the frames with shaft bearings constructed of oil-impregnated bronze, nylon, or a solid plastic equivalent to nylon. Axle bearings intended for low leakage at the damper frame must be neoprene, nitrile, or equivalent of 60 or greater durometer to reduce damper blade vibration. Press fit shaft bearings configuration to provide a tight joint between blade shaft and damper frame.

### 2.10.5.2.5 Control Shaft/Hand Quadrant

Provide dampers with accessible locking-type control shaft/hand quadrant operators.

Provide stand-off mounting brackets, bases, or adapters for the locking-type quadrant operators on dampers installed on ducts to be thermally insulated. Provide a minimum stand-off distance of 50 mm 2 inches off the metal duct surface. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

### 2.10.5.2.6 Finish

Mill Galvanized

### 2.10.6 Automatic Balancing Dampers

Provide dampers as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS.

### 2.10.7 Automatic Smoke-Fire Dampers

**************************************************************************
NOTE: Use this paragraph for Navy projects only. When this paragraph is not used, delete "Automatic Smoke-Fire Dampers" from the submittal list.

SECTION 23 30 00 Page 32
For smoke-fire dampers, use UL 555S Class III, unless the particular building and application such as hospital dictates the use of UL 555S Class II instead.

Multiple blade type, 82 degrees C 180 degrees F fusible fire damper link; smoke damper assembly to include [pneumatically powered][electric] damper operator. UL 555 as a 1.5 hour rated fire damper; further qualified under UL 555S as a leakage rated damper. Provide a leakage rating under UL 555S that is no higher than Class [II][ or ][III] at an elevated temperature Category B (121 degrees C 250 degrees F for 30 minutes). Ensure that pressure drop in the damper open position does not exceed 25 Pa 0.1 inch water gauge with average duct velocities of 13 m/second 2500 fpm.

2.10.8 Automatic Smoke Dampers

NOTE: Use this paragraph for Navy projects only. When this paragraph is not used, delete "Automatic Smoke Dampers" from the submittal list.

For smoke-fire dampers, use UL 555S Class III, unless the particular building and application such as hospital dictates the use of UL 555S Class II instead.

UL listed multiple blade type, supplied by smoke damper manufacturer, with pneumatic electric damper operator as part of assembly. Qualified under UL 555S with a leakage rating no higher than Class II or III at an elevated temperature Category B (121 degrees C 250 degrees F for 30 minutes). Ensure that pressure drop in the damper open position does not exceed 25 Pa 0.1 inch water gauge with average duct velocities of 13 m/second 2500 fpm.

2.10.9 Air Supply And Exhaust Air Dampers

NOTE: Use this paragraph for Air Force and Army projects.

Provide outdoor air supply and exhaust air dampers that have a maximum leakage rate when tested in accordance with AMCA 500-D as required by ASHRAE 90.1 - SI ASHRAE 90.1 - IP, including maximum Damper Leakage for:

a. Climate Zones 1, 2, 6, 7, 8 the maximum damper leakage at 250 Pa 1.0 inch w.g. for motorized dampers is 20 L/s per square m 4 cfm per square foot of damper area and non-motorized dampers are not allowed.

b. All other Climate Zones the maximum damper leakage at 250 Pa 1.0 inch w.g. is 50 L/s per square m 10 cfm per square foot and for non-motorized dampers is 100 L/s per square m 20 cfm per square foot of damper area.

Dampers smaller than 600 mm 24 inches in either direction may have leakage of 200 L/s per square m 40 cfm per square foot.
2.10.10  Air Deflectors (Volume Extractors) and Branch Connections

**************************************************************************
NOTE: Air deflectors are for Army and Air Force projects only.
**************************************************************************

Provide air deflectors (volume extractors) at all duct mounted supply outlets, at takeoff or extension collars to supply outlets, at duct branch takeoff connections, and at 90 degree elbows, as well as at locations as indicated on the drawings or otherwise specified. Conical branch connections or 45 degree entry connections are allowed in lieu of deflectors for branch connections. Furnish all air deflectors (volume extractors), except those installed in 90 degree elbows, with an approved means of adjustment. Provide easily accessible means for adjustment inside the duct or from an adjustment with sturdy lock on the face of the duct. When installed on ducts to be thermally insulated, provide external adjustments with stand-off mounting brackets, integral with the adjustment device, to provide clearance between the duct surface and the adjustment device not less than the thickness of the thermal insulation. Provide factory-fabricated air deflectors consisting of curved turning vanes or louver blades designed to provide uniform air distribution and change of direction with minimum turbulence or pressure loss. Provide factory or field assembled air deflectors (volume extractors). Make adjustment from the face of the diffuser or by position adjustment and lock external to the duct. Provide stand-off brackets on insulated ducts as described herein. Provide fixed air deflectors (volume extractors), also called turning vanes, in 90 degree elbows.

2.10.11  Plenums and Casings for Field-Fabricated Units

**************************************************************************
NOTE: If field-fabricated air handling units are not used, delete this paragraph entirely. Delete inapplicable sentences or items. Delete the push-button station if not required.
**************************************************************************

2.10.11.1  Plenum and Casings

Fabricate and erect plenums and casings as shown in SMACNA 1966, as applicable. Construct system casing of not less than 1.6 mm 16 gauge galvanized sheet steel. Furnish cooling coil drain pans with 25 mm 1 inch threaded outlet to collect condensation from the cooling coils. Fabricate drain pans from not lighter than 1.6 mm 16 gauge steel, galvanized after fabrication or of 1.3 mm 18 gauge corrosion-resisting sheet steel conforming to ASTM A167, Type 304, welded and stiffened. Thermally insulate drain pans exposed to the atmosphere to prevent condensation. Coat insulation with a flame resistant waterproofing material. Provide separate drain pans for each vertical coil section, and a separate drain line for each pan. Size pans to ensure capture of entrained moisture on the downstream-air side of the coil. Seal openings in the casing, such as for piping connections, to prevent air leakage. Size the water seal for the drain to maintain a pressure of at least 500 Pa 2 inch water gauge greater than the maximum negative pressure in the coil space.

2.10.11.2  Casing

Terminate casings at the curb line and bolt each to the curb using
galvanized angle, as indicated in SMACNA 1966.

2.10.11.3 Access Doors

**************************************************************************
NOTE: Determine whether an electrical push-button to stop the fan by a person inside the casing is required. If required, check the drawings to ensure that the item is shown, and properly coordinated with electrical drawings. Use push-button stations for Army and Air Force projects only.
**************************************************************************

Provide access doors in each section of the casing. Weld doorframes in place, gasket each door with neoprene, hinge with minimum of two brass hinges, and fasten with a minimum of two brass tension fasteners operable from inside and outside of the casing. Where possible, make doors 900 by 450 mm 36 by 18 inches and locate them 450 mm 18 inches above the floor. Where the space available does not accommodate doors of this size, use doors as large as the space accommodates. Swing doors so that fan suction or pressure holds doors in closed position, airtight. Provide a push-button station, located inside the casing, to stop the supply.

2.10.11.4 Factory-Fabricated Insulated Sheet Metal Panels

Factory-fabricated components are allowed for field-assembled units, provided all requirements specified for field-fabricated plenums and casings are met. Provide panels of modular design, pretested for structural strength, thermal control, condensation control, and acoustical control. Seal and insulate panel joints. Provide and gasket access doors to prevent air leakage. Provide panel construction that is not less than one mm 20 gauge galvanized sheet steel, assembled with fasteners treated against corrosion. Provide standard length panels that deflect not more than 13 mm 1/2 inch under operation. Construct details, including joint sealing, not specifically covered, as indicated in SMACNA 1966. Construct the plenums and casings to withstand the specified internal pressure of the air systems.

2.10.11.5 Duct Liner

**************************************************************************
NOTE: If duct liner is used, remove this paragraph.
**************************************************************************

Unless otherwise specified, duct liner is not permitted.

2.10.12 Sound Attenuation Equipment

**************************************************************************
NOTE: Use sound attenuators or acoustical duct liner only where acoustical treatment is required and there are no other suitable alternatives. Do not use acoustical duct liner in medical facilities.

Refer to UFC 3-450-02, Power Plant Acoustics, for noise criteria. Include sound power levels required in the appropriate schedule on the drawings.
**************************************************************************
2.10.12.1 Systems with total pressure above 1 kPa 4 Inches Water Gauge

Provide sound attenuators on the discharge duct of each fan operating at a total pressure above 1 kPa 4 inch water gauge, and, when indicated, at the intake of each fan system. Provide sound attenuators elsewhere as indicated. Provide factory fabricated sound attenuators, tested by an independent laboratory for sound and performance characteristics. Provide a net sound reduction as indicated. Maximum permissible pressure drop is not to exceed 157 Pa 0.63 inch water gauge. Construct traps to be airtight when operating under an internal static pressure of 2.5 kPa 10 inch water gauge. Provide air-side surface capable of withstanding air velocity of 50 m/s 10,000 fpm. Certify that the equipment can obtain the sound reduction values specified after the equipment is installed in the system and coordinated with the sound information of the system fan to be provided. Provide sound absorbing material conforming to ASTM C1071, Type I or II. Provide sound absorbing material that meets the fire hazard rating requirements for insulation specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. For connection to ductwork, provide a duct transition section. Factory fabricated double-walled internally insulated spiral lock seam and round duct and fittings designed for high pressure air system can be provided if complying with requirements specified for factory fabricated sound attenuators, in lieu of factory fabricated sound attenuators. Construct the double-walled duct and fittings from an outer metal pressure shell of zinc-coated steel sheet, 25 mm 1 inch thick acoustical blanket insulation, and an internal perforated zinc-coated metal liner. Provide a sufficient length of run to obtain the noise reduction coefficient specified. Certify that the sound reduction value specified can be obtained within the length of duct run provided. Provide welded or spiral lock seams on the outer sheet metal of the double-walled duct to prevent water vapor penetration. Provide duct and fittings with an outer sheet that conforms to the metal thickness of high-pressure spiral and round ducts and fittings shown in SMACNA 1966. Provide acoustical insulation with a thermal conductivity "k" of not more than 0.0389 W/m-K 0.27 Btu/inch/square foot/hour/degree F at 24 degrees C 75 degrees F mean temperature. Provide an internal perforated zinc-coated metal liner that is not less than 0.7 mm 24 gauge with perforations not larger than 6.35 mm 1/4 inch in diameter providing a net open area not less than 10 percent of the surface.

2.10.12.2 System with total pressure of 1 kPa 4 Inch Water Gauge and Lower

Use sound attenuators only where indicated. Provide factory fabricated sound attenuators that are constructed of galvanized steel sheets. Provide attenuator with outer casing that is not less than 0.85 mm 22 gauge. Provide fibrous glass acoustical fill. Provide net sound reduction indicated. Obtain values on a test unit not less than 600 by 600 mm 24 by 24 inches outside dimensions made by a certified nationally recognized independent acoustical laboratory. Provide air flow capacity as indicated or required. Provide pressure drop through the attenuator that does not exceed the value indicated, or that is not in excess of 15 percent of the total external static pressure of the air handling system, whichever is less. Acoustically test attenuators with metal duct inlet and outlet sections while under the rated air flow conditions. Include with the noise reduction data the effects of flanking paths and vibration transmission. Construct sound attenuators to be airtight when operating at the internal static pressure indicated or specified for the duct system, but in no case less than 500 Pa 2 inch water gauge.
2.10.12.3 **Acoustical Duct Liner**

Use fibrous glass designed or flexible elastomeric duct liner for lining ductwork and conforming to the requirements of ASTM C1071, Type I and II. Provide uniform density, graduated density, or dual density liner composition, as standard with the manufacturer. Provide not less than 25 mm (1 inch) thick coated lining. Where acoustical duct liner is used, provide the thermal equivalent of the insulation specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS for liner or combination of liner and insulation applied to the exterior of the ductwork. Increase duct sizes shown to compensate for the thickness of the lining used. In lieu of sheet metal duct with field-applied acoustical lining, provide acoustically equivalent lengths of fibrous glass duct, elastomeric duct liner or factory fabricated double-walled internally insulated duct with perforated liner.

2.10.13 **Diffusers, Registers, and Grilles**

**************************************************************************
NOTE: Coordinate with paragraph Sound Attenuation Equipment.
If diffusers or registers or grilles are not required, delete reference to the omitted items. Delete specified performance characteristics peculiar to the omitted items. If any one or two of the three types of units are omitted, delete the corresponding subparagraph.
**************************************************************************

Provide factory-fabricated units of [steel] [corrosion-resistant steel] [or aluminum] that distribute the specified quantity of air evenly over space intended without causing noticeable drafts, air movement faster than 0.25 m/s (50 fpm) in occupied zone, or dead spots anywhere in the conditioned area. Provide outlets for diffusion, spread, throw, and noise level as required for specified performance. Certify performance according to ASHRAE 70. Provide sound rated and certified inlets and outlets according to ASHRAE 70. Provide sound power level as indicated. Provide diffusers and registers with volume damper with accessible operator, unless otherwise indicated; or if standard with the manufacturer, an automatically controlled device is acceptable. Provide opposed blade type volume dampers for all diffusers and registers, except linear slot diffusers. Provide linear slot diffusers with round or elliptical balancing dampers. Where the inlet and outlet openings are located less than 2 m (7 feet) above the floor, protect them by a grille or screen according to NFPA 90A.

2.10.13.1 **Diffusers**

Provide diffuser types indicated. Furnish ceiling mounted units with anti-smudge devices, unless the diffuser unit minimizes ceiling smudging through design features. Provide diffusers with air deflectors of the type indicated. Provide air handling troffers or combination light and ceiling diffusers conforming to the requirements of UL Electrical Construction for the interchangeable use as cooled or heated air supply diffusers or return air units. Install ceiling mounted units with rims tight against ceiling. Provide sponge rubber gaskets between ceiling and surface mounted diffusers for air leakage control. Provide suitable trim for flush mounted diffusers. For connecting the duct to diffuser, provide duct collar that is airtight and does not interfere with volume controller. Provide return or exhaust units that are similar to supply diffusers.
2.10.13.2 Perforated Plate Diffusers

**************************************************************************
NOTE: Use this paragraph for Navy projects only.
**************************************************************************
Provide adjustable [one-way,] [two-way,] [three-way,] [or ] [four-way] air pattern controls as indicated. Provide diffuser faceplates that do not sag or deflect when operating under design conditions.

2.10.13.3 Linear Diffusers

**************************************************************************
NOTE: Use this paragraph for Navy projects only.
**************************************************************************
Make joints between diffuser sections that appear as hairline cracks. Provide alignment slots for insertion of key strips or other concealed means to align exposed butt edges of diffusers. Equip with plaster frames when mounted in plaster ceiling. Do not use screws and bolts in exposed face of frames or flanges. Metal-fill and ground smooth frames and flanges exposed below ceiling. Furnish separate pivoted or hinged adjustable air-volume-damper and separate air-deflection blades.

2.10.13.4 Security Ceiling Diffusers

**************************************************************************
NOTE: Use this paragraph for brig facilities only.
**************************************************************************
Provide diffusers that are steel with faceplate, fixed diffusion louvers, with flat surface margin, and an opposed blade damper. Provide faceplate that is 1.9 mm 14 gage minimum with 13 by 13 mm holes on 5 mm 1/2 by 1/2 inch holes on 3/16 inch spacing and a minimum free area of 45 percent.

2.10.13.5 Registers and Grilles

Provide units that are four-way directional-control type, except provide return and exhaust registers that are fixed horizontal or vertical louver type similar in appearance to the supply register face. Furnish registers with sponge-rubber gasket between flanges and wall or ceiling. Install wall supply registers at least 150 mm 6 inches below the ceiling unless otherwise indicated. Locate return and exhaust registers 150 mm 6 inches above the floor unless otherwise indicated. Achieve four-way directional control by a grille face which can be rotated in 4 positions or by adjustment of horizontal and vertical vanes. Provide grilles as specified for registers, without volume control damper.

2.10.13.6 Registers

**************************************************************************
NOTE: Use this paragraph for Navy projects only.
Delete paragraph, "Registers and Grilles," when this paragraph is used.
**************************************************************************
Double-deflection supply registers. Provide manufacturer-furnished volume dampers. Provide volume dampers of the group-operated, opposed-blade type
and key adjustable by inserting key through face of register. Operating mechanism must not project through any part of the register face. Automatic volume control devices are acceptable.[ Provide exhaust and return registers as specified for supply registers, except provide exhaust and return registers that have a single set of nondirectional face bars or vanes having the same appearance as the supply registers.[ Set face bars or vanes at [_____] degrees.]

2.10.13.7 Security Supply Air Registers Except in Cells

******************************************************************************
NOTE: Use this paragraph for brig facilities only.
******************************************************************************

Provide supply air registers, except in prisoner cells and prisoner holding cells, that are steel with individually adjustable horizontal and vertical vanes, perforated faceplate, flat surface margin and opposed blade damper. Put vertical vanes in front; with 19 mm 3/4 inch o.c. vane spacing. Provide a 1.9 mm 14 gage (minimum) perforated faceplate with 13 by 13 mm holes on 5 mm 1/2 by 1/2 inch holes on 3/16 inch spacing and a minimum free area of 45 percent.

2.10.13.8 Security Return and Other Air Registers Except in Cells

******************************************************************************
NOTE: Use this paragraph for brig facilities only.
******************************************************************************

Provide return, exhaust, transfer and relief air registers, except in prisoner cells and prisoner holding cells, that are steel with perforated faceplate, flat surface margin, opposed blade damper, and duct mounting sleeve. Provide 14 gage (minimum) faceplate with 13 by 13 mm holes on 5 mm 1/2 by 1/2 inch holes on 3/16 inch spacing and a minimum free area of 45 percent.

2.10.13.9 Security Supply Air Registers in Cells

******************************************************************************
NOTE: Use this paragraph for brig facilities only.
******************************************************************************

Provide supply air registers in prisoner cells and prisoner holding cells that are steel with perforated faceplate, flat surface margin, extension sleeve, opposed blade damper, and back mounting flanges. Provide a 1.9 mm 14 gage (minimum) faceplate with 13 by 13 mm holes on 5 mm 1/2 by 1/2 inch holes on 3/16 inch spacing and a minimum free area of 45 percent. Provide a 14 gage (minimum) wall sleeve.

2.10.13.10 Security Return and Other Type Air Registers in Cells

******************************************************************************
NOTE: Use this paragraph for brig facilities only.
******************************************************************************

Provide steel return, exhaust, transfer and relief air registers in prisoner cells and prisoner holding cells with perforated faceplate, flat surface margin, wall sleeve, opposed blade damper, and back mounting flanges. Provide 1.9 mm 14 gage (minimum) faceplate with 13 by 13 mm holes on 5 mm 1/2 by 1/2 inch holes on 3/16 inch spacing and a minimum free area
of 45 percent. Provide a 14 gage (minimum) wall sleeve.

2.10.14 Louvers

******************************************************************************
NOTE: Ensure that louver selection includes consideration of parameters such as pressure drop and water penetration.
******************************************************************************

Provide louvers for installation in exterior walls that are associated with the air supply and distribution system as specified in Section [07 60 00 FLASHING AND SHEET METAL] [08 91 00 METAL WALL] [AND] [DOOR] LOUVERS.

2.10.15 Air Vents, Penthouses, and Goosenecks

Fabricate air vents, penthouses, and goosenecks from galvanized steel [or aluminum] sheets with galvanized [or aluminum] structural shapes. Provide sheet metal thickness, reinforcement, and fabrication that conform to SMACNA 1966. Accurately fit and secure louver blades to frames. Fold or bead edges of louver blades for rigidity and baffle these edges to exclude driving rain. Provide air vents, penthouses, and goosenecks with bird screen.

2.10.16 Bird Screens and Frames

Provide bird screens that conform to ASTM E2016, No. 2 mesh, aluminum or stainless steel. Provide "medium-light" rated aluminum screens. Provide "light" rated stainless steel screens. Provide removable type frames fabricated from either stainless steel or extruded aluminum.

2.10.17 Radon Exhaust Ductwork

Fabricate radon exhaust ductwork installed in or beneath slabs from Schedule 40 PVC pipe that conforms to ASTM D1785. Provide fittings that conform to ASTM D2466. Use solvent cement conforming to ASTM D2564 to make joints. Otherwise provide metal radon exhaust ductwork as specified herein.

2.11 AIR SYSTEMS EQUIPMENT

******************************************************************************
NOTE: Required items in this paragraph are determined by whether field-fabricated air handling units apply or whether equipment external to air handling units are used in the distribution system.
******************************************************************************

2.11.1 Fans

******************************************************************************
NOTE: Coordinate with paragraph Sound Attenuation Equipment. Include any applicable noise criteria in appropriate equipment schedule on the drawings.
******************************************************************************

Refer to UFC 3-450-02, Power Plant Acoustic, for vibration criteria. Detail vibration isolation required on the drawings and include it in the appropriate schedule.
Design and detail ductwork near air moving devices to minimize system effect on the fans in accordance with AMCA 201. Add system effect to the duct friction loss and indicate fan static pressure on drawings for the designed ductwork configuration.

Indicate the location of each duct smoke detector in the HVAC system and include the detectors on the schematic and associated ladder diagram. Provide duct smoke detectors according to NFPA 90A. Duct detectors are intended to shut associated air distribution fans and smoke dampers, if provided. Duct smoke detectors are not for use inside ducts where ambient temperatures exceeds 38 degrees C 100 degrees F.

When the building is equipped with a fire alarm system, connect the duct smoke detectors to the fire alarm control panel (FACP) for alarm initiation. Show wiring to the FACP for either new or existing fire alarm systems.

Fans with motors greater than 0.5 kW 3/4 hp must have automatic controls capable of shutting off fans when not required.

HVAC systems having a total fan system power exceeding 3.7 kW 5 hp must meet the provisions of ASHRAE 90.1. These include ASHRAE 90.1, Table 6.5.3.1, Fan Power Limitation:

For supply air volumes less than 9,400 L/s 20,000 cfm the allowable nameplate motor power for a constant volume fan is 1.9 kW/1000 L/s 1.2 hp/1000 cfm and for a variable volume fan is 2.7 kW/1000 L/s 1.7 hp/1000 cfm.

For supply air volumes of 9,400 L/s 20,000 cfm and greater the allowable nameplate motor power for a constant volume fan is 1.7 kW/1000 L/s 1.1 hp/1000 cfm and for a variable volume fan is 2.4 kW/1000 L/s 1.5 hp/1000 cfm.

Test and rate fans according to AMCA 210. Calculate system effect on air moving devices in accordance with AMCA 201 where installed ductwork differs from that indicated on drawings. Install air moving devices to minimize fan system effect. Where system effect is unavoidable, determine the most effective way to accommodate the inefficiencies caused by system effect on the installed air moving device. The sound power level of the fans must not exceed 85 dBA when tested according to AMCA 300 and rated in accordance with AMCA 301. Provide all fans with an AMCA seal. Connect fans to the motors either directly or indirectly with V-belt drive. Use V-belt drives designed for not less than 150 percent of the connected driving capacity. Provide variable pitch motor sheaves for 11 kW 15 hp and below, and fixed pitch as defined by AHR Guideline D (A fixed-pitch sheave is provided on both the fan shaft and the motor shaft. This is a non-adjustable speed drive.). Select variable pitch sheaves to drive the fan at a speed which can produce the specified capacity when set at the
approximate midpoint of the sheave adjustment. When fixed pitch sheaves are furnished, provide a replaceable sheave when needed to achieve system air balance. Provide motors for V-belt drives with adjustable rails or bases. Provide removable metal guards for all exposed V-belt drives, and provide speed-test openings at the center of all rotating shafts. Provide fans with personnel screens or guards on both suction and supply ends, except that the screens need not be provided, unless otherwise indicated, where ducts are connected to the fan. Provide fan and motor assemblies with vibration-isolation supports or mountings as indicated. Use vibration-isolation units that are standard products with published loading ratings. Select each fan to produce the capacity required at the fan static pressure indicated. Provide sound power level as indicated. Obtain the sound power level values according to AMCA 300. Provide standard AMCA arrangement, rotation, and discharge as indicated. Provide power ventilators that conform to UL 705 and have a UL label.

2.11.1.1 Centrifugal Fans

Provide fully enclosed, single-width single-inlet, or double-width double-inlet centrifugal fans, with AMCA Pressure Class I, II, or III as required or indicated for the design system pressure. Provide impeller wheels that are rigidly constructed and accurately balanced both statically and dynamically. [Provide forward curved or backward-inclined airfoil design fan blades in wheel sizes up to 750 mm 30 inches. Provide backward-inclined airfoil design fan blades for wheels over 750 mm 30 inches in diameter]. [Provide open-wheel radial type booster fans for exhaust dryer systems, and fans suitable for conveying lint and the temperatures encountered. Equip the fan shaft with a heat slinger to dissipate heat buildup along the shaft. Install an access (service) door to facilitate maintenance to these fans.] Provide fan wheels over 900 mm 36 inches in diameter with overhung pulleys and a bearing on each side of the wheel. Provide fan wheels 900 mm 36 inches or less in diameter that have one or more extra long bearings between the fan wheel and the drive. Provide sleeve type, self-aligning and self-oiling bearings with oil reservoirs, or precision self-aligning roller or ball-type with accessible grease fittings or permanently lubricated type. Connect grease fittings to tubing for serviceability from a single accessible point. Provide L50 rated bearing life at not less than 200,000 hours as defined by ABMA 9 and ABMA 11. Provide steel, accurately finished fan shafts, with key seats and keys for impeller hubs and fan pulleys. Provide fan outlets of ample proportions, designed for the attachment of angles and bolts for attaching flexible connections. Provide[manually] [automatically] operated inlet vanes on suction inlets. Provide [manually] [automatically] operated outlet dampers.] Unless otherwise indicated, provide motors that do not exceed 1800 rpm and have [open] [dripproof] [totally enclosed] [explosion-proof] enclosures. [Provide [manual] [magnetic] [across-the-line] [reduced-voltage-start] type motor starters with [general-purpose] [weather-resistant] [watertight] enclosure.] [Provide remote manual switch with pilot indicating light where indicated.]

2.11.1.2 In-Line Centrifugal Fans

Provide in-line fans with centrifugal backward inclined blades, stationary discharge conversion vanes, internal and external belt guards, and adjustable motor mounts. Mount fans in a welded tubular casing. Provide a fan that axially flows the air in and out. Streamline inlets with conversion vanes to eliminate turbulence and provide smooth discharge air flow. Enclose and isolate fan bearings and drive shafts from the air stream. Provide precision, self aligning ball or roller type fan bearings.
that are sealed against dust and dirt and are permanently lubricated. Provide L50 rated bearing life at not less than 200,000 hours as defined by ABMA 9 and ABMA 11. Provide motors with [open][dripproof][totally enclosed] [explosion-proof] enclosure.] [Provide [manual] [magnetic] motor starters across-the-line with [general-purpose] [weather-resistant] [explosion-proof] enclosures.][ Provide remote manual switch with pilot indicating light where indicated.]

2.11.1.3 Axial Flow Fans

Provide axial flow fans complete with drive components and belt guard, with steel housing, cast fan wheel, cast or welded steel diffusers, fan shaft, bearings, and mounting frame as a factory-assembled unit. Provide fan wheels that are dynamically balanced and keyed to the fan shaft, with radially projecting blades of airfoil cross-section. Enclose and isolate fan bearings and drive shafts from the air stream. Permanently lubricate fan bearings or provide them with accessible grease fittings. Provide precision self-aligning ball or roller type fan bearings that are sealed against dust and dirt. Provide fan bearings that have a L50 rated bearing life at not less than 200,000 hours of operation as defined by ABMA 9 and ABMA 11. Provide fan inlets with an aerodynamically shaped bell and an inlet cone. Install diffuser or straightening vanes at the fan discharge to minimize turbulence and provide smooth discharge air flow. Furnish fan unit with [inlet and outlet flanges,] [inlet screen,] [duct equalizer section,] and [manual] [automatic] operation adjustable inlet vanes. Unless otherwise indicated, provide motors that do not exceed 1800 rpm and have [open] [dripproof] [totally enclosed] [explosion-proof] enclosure. [Provide [manual] [magnetic] motor starters across-the-line with [general-purpose] [weather-resistant] [explosion-proof] enclosure.] [Provide remote manual switch with pilot indicating light where indicated.]

2.11.1.4 Panel Type Power Wall Ventilators

Provide propeller type fans, assembled on a reinforced metal panel with venturi opening spun into panel. Provide direct or V-belt driven fans with wheels less than \( 600 \text{ mm} \) \( 24 \text{ inches} \) in diameter and provide V-belt driven fans with wheels \( 600 \text{ mm} \) \( 24 \text{ inches} \) in diameter and larger. Provide fans with wall mounting collar. Provide lubricated bearings. Equip fans with wheel and motor side metal or wire guards which have a corrosion-resistant finish. Provide [dripproof][totally enclosed fan cooled][explosion-proof] type motor enclosure. Install [gravity][motor operated] backdraft dampers where indicated.

2.11.1.5 Centrifugal Type Power Wall Ventilators

Provide [direct][ or ][V-belt] driven centrifugal type fans with backward inclined, non-overloading wheel. Provide removable and weatherproof motor housing. Provide unit housing that is designed for sealing to building surface and for discharge and condensate drippage away from building surface. Construct housing of heavy gauge aluminum. Equip unit with an [aluminum or plated steel wire discharge bird screen,] [disconnect switch,] [[anodized aluminum][stainless steel] wall grille,] [manufacturer's standard [gravity][motor-operated] damper,] an airtight and liquid-tight metallic wall sleeve. Provide [totally enclosed fan cooled] [dripproof] [explosion-proof] type motor enclosure. Use only lubricated bearings.

2.11.1.6 Centrifugal Type Power Roof Ventilators
NOTE: Delete kitchen exhaust fan when not required.

Provide [direct] [or] [V-belt] driven centrifugal type fans with backward inclined, non-overloading wheel. Provide hinged or removable and weatherproof motor compartment housing, constructed of heavy gauge aluminum. Provide fans with [birdscreen,] [disconnect switch,] [[gravity] [motorized] dampers,] [sound curb,] [roof curb,] and [extended base]. Provide [dripproof] [explosion-proof] type motor enclosure. Provide centrifugal type kitchen exhaust fans according to UL 705 and NFPA 96, fitted with V-belt drive, round hood, and windband upblast discharge configuration, integral residue trough and collection device, with motor and power transmission components located in outside positively air ventilated compartment. Use only lubricated bearings. If there is a conflict between NFPA 96 and UL 705 the most stringent wording must be adhered to.

2.11.1.7 Propeller Type Power Roof Ventilators

Provide [direct] [or] [V-belt] driven fans. Provide hinged or removable weathertight fan housing, fitted with framed rectangular base constructed of aluminum or galvanized steel. Provide [totally enclosed fan cooled] [explosion-proof] type motors. Furnish motors with nonfusible, horsepower rated, manual disconnect mount on unit. Furnish fans with [gravity] [motor operated] dampers, [birdscreen] [sound curb] [roof curb]. Use only lubricated bearings.

2.11.1.8 Air-Curtain Fans

Provide fans that conform to AMCA 220 with AMCA seal. Furnish air curtains with a weatherproof housing constructed of high impact plastic or minimum 1.3 mm 18 gauge rigid welded steel. Provide backward curved, non-overloading, centrifugal type fan wheels, accurately balanced statically and dynamically. Provide motors with totally enclosed fan cooled enclosures. Provide remote manual type motor starters with weather-resistant enclosure actuated when the doorway served is open. Provide air curtains that attain the air velocities specified within 2 seconds following activation. Provide bird screens at air intake and discharge openings. Provide air curtain unit or a multiple unit installation that is at least as wide as the opening to be protected. Provide the air discharge openings to permit outward adjustment of the discharge air. Place installation and adjust according to the manufacturer's written recommendation. Furnish directional controls on air curtains for service windows for easy clean or convenient removal. Design air curtains to prevent the adjustment of the air velocities specified. Make the interior surfaces of the air curtain units accessible for cleaning. Provide certified test data indicating that the fan can provide...
the air velocities required when fan is mounted as indicated. Provide air curtains designed as fly fans unless otherwise indicated. [Provide air curtains designed for use in service entranceways that develop an air curtain not less than 75 mm [3 inches] thick at the discharge nozzle. Provide air velocity that is not less than 8 m/s [1600 fpm] across the entire entryway when measured 900 mm [3 feet] above the floor.] [Provide air curtains designed for use on customer entranceways that develop an air curtain not less than 200 mm [8 inches] thick at the discharge opening. Provide velocity that is not less than 3 m/s [600 fpm] across the entire entryway when measured 900 mm [3 feet] above the floor. Equip recirculating type air curtains with readily removable filters, or design the filters for in-position cleaning. Provide readily accessible and easily cleanable air capture compartment or design for in-position cleaning.] [Provide air curtains designed for use on service windows that develop an air curtain not less than 200 mm [8 inches] thick at the discharge opening. Provide air velocity that is not less than 3 m/s [600 fpm] across the entire opening of the service window measured 900 mm [3 feet] below the air discharge opening.]

2.11.1.9 Ceiling Exhaust Fans

2.11.2 Coils

**************************************************************************
NOTE: Research local conditions to determine the effect of corrosive atmosphere on dissimilar metals. Where condenser or evaporator coils are to be installed in corrosive atmospheres, rewrite the specification for coils and fins for these specific conditions. Consider the following coil and fin combinations based on past experience with the suitability of these materials in dealing with the local conditions.

a. Copper coil and aluminum fins, coated.

b. Copper coil and copper fins, coated.

c. Aluminum coil and aluminum fins, coated.

d. Aluminum coil and aluminum fins, uncoated.

e. Copper coil and copper fins, uncoated.

Provide either phenolic, vinyl or epoxy/electrodeposition coating. For coils with relatively close fin spacing such as those found in most unitary equipment, the phenolic or epoxy/electrodeposition coating is preferred, as these have less tendency to bridge across the fins than vinyl, better thermal conductivity than vinyl and in many conditions weathers better than vinyl.
Provide fin-and-tube type coils constructed of seamless [copper][red brass] tubes and [aluminum][ or ][copper] fins mechanically bonded or soldered to the tubes.[ Provide copper tube wall thickness that is a minimum of [0.406][0.508][0.6096] mm [0.016][0.020][0.024] inches].[ Provide red brass tube wall thickness that is a minimum of [0.89][1.24] mm [0.035] [0.049] inches]. [Provide aluminum fins that are [0.14] [0.0055] inch minimum thickness.][ Provide copper fins that are 0.114 mm 0.0045 inch minimum thickness.] Provide casing and tube support sheets that are not lighter than 1.6 mm 16 gauge galvanized steel, formed to provide structural strength. When required, provide multiple tube supports to prevent tube sag. Mount coils for counterflow service. Rate and certify coils to meet the requirements of AHRI 410.[ Provide factory applied phenolic, vinyl or epoxy/electrodeposition coating.]

2.11.2.1 Direct-Expansion Coils

Provide suitable direct-expansion coils for the refrigerant involved. Provide refrigerant piping that conforms to ASTM B280 and clean, dehydrate and seal. Provide seamless copper tubing suction headers or seamless or resistance welded steel tube suction headers with copper connections. Provide supply headers that consist of a distributor which distributes the refrigerant through seamless copper tubing equally to all circuits in the coil. Provide circuited tubes to ensure minimum pressure drop and maximum heat transfer. Provide circuiting that permits refrigerant flow from inlet to suction outlet without causing oil slugging or restricting refrigerant flow in coil. Provide field installed coils which are completely dehydrated and sealed at the factory upon completion of pressure tests. Pressure test coils in accordance with UL 1995.

2.11.2.2 Water Coils

Install water coils with a pitch of not less than 10 mm/m 1/8 inch/foot of the tube length toward the drain end. Use headers constructed of cast iron, welded steel or copper. Furnish each coil with a plugged vent and drain connection extending through the unit casing. Provide removable water coils with drain pans. Pressure test coils in accordance with UL 1995.

2.11.2.3 Steam Heating Coils

Construct steam coils from cast semisteel, welded steel or copper headers, and [red brass][copper] tubes. Construct headers from cast iron, welded steel or copper. Provide fin tube and header section that float within the casing to allow free expansion of tubing for coils subject to high pressure steam service. Provide each coil with a field or factory installed vacuum breaker. Provide single-tube type coils with tubes not less than 13 mm 1/2 inch outside diameter, except for steam preheat coils. Provide supply headers that distribute steam evenly to all tubes at the indicated steam pressure. Factory test coils to ensure that, when supplied with a uniform face velocity, temperature across the leaving side is uniform with a maximum variation of no more than 5 percent. Pressure test coils in accordance with UL 1995.
2.11.2.4 Steam Preheat (Nonfreeze) Coils

Provide steam-distribution-tube type steam (nonfreeze) coils with condensing tubes not less than 25 mm 1 inch outside diameter for tube lengths 1.5 m 60 inches and over and 13 mm 1/2 inch outside diameter for tube lengths under 1.5 m 60 inches. Construct headers from cast iron, welded steel, or copper. Provide distribution tubes that are not less than 15 mm 5/8 inch outside diameter for tube lengths 1.5 m 60 inches and over and 10 mm 3/8 inch outside diameter for tube lengths under 1.5 m 60 inches with orifices to discharge steam to condensing tubes. Install distribution tubes concentric inside of condensing tubes and hold securely in alignment. Limit maximum length of a single coil to 3.66 m 144 inches. Factory test coils to ensure that, when supplied with a uniform face velocity, temperature across the leaving side is uniform with a maximum variation of no more than 5 percent. Pressure test coils in accordance with UL 1995.

2.11.2.5 Electric Heating Coil

**************************************************************************
NOTE: Use this paragraph for Navy projects only.
Choose the second set of brackets if an air-conditioning unit for EDP is specified.
**************************************************************************
Provide an electric duct heater coil in accordance with UL 1995 and NFPA 70. Provide duct- or unit-mounted coil. Provide [nickel chromium resistor, single stage, strip] [nickel chromium resistor, single stage, strip or stainless steel, fin tubular] type coil. Provide coil with a built-in or surface-mounted high-limit thermostat interlocked electrically so that the coil cannot be energized unless the fan is energized. Provide galvanized steel or aluminum coil casing and support brackets. Mount coil to eliminate noise from expansion and contraction and for complete accessibility for service.

2.11.2.6 Eliminators

**************************************************************************
NOTE: Use this paragraph for Navy projects only.
**************************************************************************
Equip each cooling coil having an air velocity of over 2 m/s 400 fpm through the net face area with moisture eliminators, unless the coil manufacturer guarantees, over the signature of a responsible company official, that no moisture can be carried beyond the drip pans under actual conditions of operation. Construct of minimum 24 gage [zinc-coated steel] [copper] [copper nickel] [or] [stainless steel], removable through the nearest access door in the casing or ductwork. Provide eliminators that have not less than two bends at 45 degrees and are spaced not more than 63 mm 2-1/2 inches center-to-center on face. Provide each bend with an integrally formed hook as indicated in the SMACNA 1884.

2.11.2.7 Sprayed Coil Dehumidifiers

**************************************************************************
NOTE: Use this paragraph for Navy projects only.
**************************************************************************
Provide assembly with reinforced, braced, and externally insulated
galvanized steel casing, vertical in-line spray pump, bronze self-cleaning spray nozzles, galvanized steel pipe spray headers, adjustable float valve with replaceable neoprene seat, manufacturer's standard cooling coil, and welded black steel drain tank. Provide overflow drain, make-up, and bleed connection.

2.11.2.8 Corrosion Protection for Coastal Installations

******************************************************************************
NOTE: Use this paragraph for Navy projects only.

Specify corrosion protection for exterior HVAC equipment, including air handling units, heat exchanger coil surfaces, equipment casings, air-cooled water chiller coils, heat pumps, and air conditioning units, that is exposed to the weather within 8 km (5 miles) of a sea (salt) water coast.

At these coastal locations, this corrosion protection is also required on HVAC equipment within buildings that are subject to the outside weather conditions. Specifically, equipment requiring protection is defined as the first HVAC equipment (excluding louvers) met by the outside air in the supply air ductwork system.

Specifier will survey the HVAC equipment market place, find and specify the manufacturer's standard off-the-shelf anti-corrosion options for "coastal" or "sea coast" installations. Specify the various systems (utilizing the word "or") offered by three competitive equipment selections. This approach is by far less costly than specifying custom corrosion protection.

Manufacturer's standard off-the-shelf anti-corrosion options for "coastal" or "sea coast" installations also vary with type and size of HVAC equipment.

After thorough investigation of the commercial market, determines manufacturer's standard off-the-shelf anti-corrosion options are not available for the selected equipment, contact the Mechanical Design Branch, NAVFAC LANT for consultation if the need for this protection is considered mandatory by the station.

For installations at MCAS Cherry Point and MCB Camp LeJeune, including New River, and installations at NAS Oceana including Dam Neck, specify corrosion protection for all outside, and specific inside HVAC equipment exposed to the weather. Follow the guidance specified in the criteria NOTE above.

******************************************************************************

[_____]
2.11.3 Air Filters

**************************************************************************
NOTE: Select filters based on the functional needs of the area served, including indoor air quality. The combination of the extended surface pleated panel filters and the extended surface nonsupported pocket filters or the cartridge filter of the same efficiency are intended to fulfill the filtration requirements in UFC 3-410-01, Heating, Ventilating, and Air-Conditioning Systems for areas where indoor air quality is of primary concern. Consider limiting the variety of filter sizes required to minimize inventory requirements for system maintenance.

In the event the retention of efficiency values in the specification becomes too cumbersome, revise the requirements by referring to the efficiencies indicated on the drawings, to show for each air handling unit or system the efficiency of the air filters required, and the maximum initial resistance.

**************************************************************************

List air filters according to requirements of UL 900, except list high efficiency particulate air filters of 99.97 percent efficiency by the DOP Test method under the Label Service to meet the requirements of UL 586.

2.11.3.1 Extended Surface Pleated Panel Filters

Provide 50 mm 2 inch depth, sectional, disposable type filters of the size indicated with a MERV of 8 when tested according to ASHRAE 52.2. Provide initial resistance at 2.54 m/s 500 fpm that does not exceed 0.09 kPa 0.36 inches water gauge. Provide UL Class 2 filters, and nonwoven cotton and synthetic fiber mat media. Attach a wire support grid bonded to the media to a moisture resistant fiberboard frame. Bond all four edges of the filter media to the inside of the frame to prevent air bypass and increase rigidity.

2.11.3.2 Extended Surface Nonsupported Pocket Filters

Provide [750][_____] mm [30][_____] inch depth, sectional, replaceable dry media type filters of the size indicated with a MERV of 13 when tested according to ASHRAE 52.2. Provide initial resistance at [2.54][_____] m/s [500][_____] fpm that does not exceed [0.1125][_____] kPa [0.45][_____] inches water gauge. Provide UL Class 1 filters. Provide fibrous glass media, supported in the air stream by a wire or non-woven synthetic backing and secured to a galvanized steel metal header. Provide pockets that do not sag or flap at anticipated air flows. Install each filter [with an extended surface pleated panel filter as a prefilter] in a factory preassembled, side access housing or a factory-made sectional frame bank, as indicated.

2.11.3.3 Cartridge Type Filters

Provide 305 mm 12 inch depth, sectional, replaceable dry media type filters of the size indicated with a MERV of 13 when tested according to ASHRAE 52.2. Provide initial resistance at [2.54][_____] m/s [500][_____] fpm that does not exceed [0.14][_____] kPa [0.56][_____] inches, water gauge. Provide UL
class 1 filters, and pleated microglass paper media with corrugated aluminum separators, sealed inside the filter cell to form a totally rigid filter assembly. Fluctuations in filter face velocity or turbulent airflow have no effect on filter integrity or performance. Install each filter [with an extended surface pleated media panel filter as a prefilter] in a factory preassembled side access housing, or a factory-made sectional frame bank, as indicated.

2.11.3.4 Sectional Cleanable Filters

**************************************************************************
NOTE: Delete washing and charging racks when not required.
**************************************************************************

Provide [25][50] mm [1][2] inch thick cleanable filters. Provide viscous adhesive in 20 L 5 gallon containers in sufficient quantity for 12 cleaning operations and not less than one L one quart for each filter section. Provide one washing and charging tank for every 100 filter sections or fraction thereof; with each washing and charging unit consisting of a tank and [single][double] drain rack mounted on legs and drain rack with dividers and partitions to properly support the filters in the draining position.

2.11.3.5 Replaceable Media Filters

Provide the [dry-media][viscous adhesive] type replaceable media filters, of the size required to suit the application. Provide filtering media that is not less than 50 mm 2 inches thick fibrous glass media pad supported by a structural wire grid or woven wire mesh. Enclose pad in a holding frame of not less than 1.6 mm 16 gauge galvanized steel, equipped with quick-opening mechanism for changing filter media. Base the air flow capacity of the filter on net filter face velocity not exceeding [1.5][_____] m/s [300][_____] fpm, with initial resistance of [32][_____] Pa [0.13][_____] inches water gauge. Provide MERV that is not less than [_____] when tested according to ASHRAE 52.2.

2.11.3.6 Automatic Renewable Media Filters

Provide the following:

a. Automatic, renewable media filters consisting of a horizontal or vertical traveling curtain of adhesive-coated bonded fibrous glass supplied in convenient roll form, and filter that does not require water supply, sewer connections, adhesive reservoir, or sprinkler equipment as part of the operation and maintenance requirements.

b. Basic frame that is fabricated of not less than 2 mm 14 gauge galvanized steel, and sectional design filters with each section of each filter fully factory assembled, requiring no field assembly other than setting in place next to any adjacent sections and the installation of media in roll form.

c. Each filter complete with initial loading of filter media drive motor adequate to handle the number of sections involved, and [painted steel] [stainless steel] control box containing a warning light to indicate media runout, a runout switch, and a Hand-Off-Auto selector switch.

d. Media feed across the filter face in [full-face increments]
[increments] automatically controlled as determined by [filter pressure differential] [time interval control] [time interval control with pressure override] [photo electric control] to provide substantially constant operating resistance to airflow and varying not more than plus or minus 10 percent. Roll or enclose media in such a way that collected particulates can not re-entrain.

e. Rolls of clean media, no less than 19.8 m 65 feet long, rerolled on disposable spools in the rewound section of the filter after the media has accumulated its design dirt load. Equip rewind section with a compression panel to tightly rewind used media for ease of handling. Provide media made of continuous, bonded fibrous glass material, UL Class 2, that does not compress more than 6 mm 1/4 inch when subjected to air flow at 2.54 m/s 500 fpm. Factory charge media with an odorless and flame retardant adhesive which does not flow while in storage nor when subjected to temperatures up to 79.4 degrees C 175 degrees F. Support media on both the leaving and entering air faces. Clean media must have initial resistance that does not exceed 45 Pa 0.18 inch water gauge at its rated velocity of 2.54 m/s 500 fpm. Set control so that the resistance to air flow is between 100 and 125 Pa 0.40-and 0.50 inch water gauge unless otherwise indicated.

f. Dust holding capacity, of 80 percent average arrestance under these operating conditions, when operating at a steady state with an upper operating resistance of 125 Pa 0.50 inch water gauge, that is at least 592 (55) grams of ASHRAE Standard Test Dust per square meter foot of media area, when tested according to the dynamic testing provisions of ASHRAE 52.2.

g. The horizontal type automatic renewable media filters, when used in conjunction with factory fabricated air handling units, that are dimensionally compatible with the connecting air handling units, and horizontal type filter housings with all exposed surfaces factory insulated internally with 25 mm 1 inch, 24 kg/cubic meter 1-1/2 pound density neoprene coated fibrous glass with thermal conductivity not greater than 0.04 W/m-K 0.27 Btu/hour/degree F/square foot/inch of thickness.

h. Access doors for horizontal filters with double wall construction as specified for plenums and casings for field-fabricated units in paragraph DUCT SYSTEMS.

2.11.3.7 Electrostatic Filters

Provide the following:

a. The combination dry agglomerator/extended surface, nonsupported pocket electrostatic filters or the combination dry agglomerator/automatic renewable, media (roll) type electrostatic filters, as indicated (except as modified). Supply each dry agglomerator electrostatic air filter with the correct quantity of fully housed power packs and equip with silicon rectifiers, manual reset circuit breakers, low voltage safety cutout, relays for field wiring to remote indication of primary and secondary voltages, with lamps mounted in the cover to indicate these functions locally. Equip power pack enclosure with external mounting brackets, and low and high voltage terminals fully exposed with access cover removed for ease of installation. Furnish interlock safety switches for each access door and access panel that permits access to either side of the filter, so that the filter is de-energized
in the event that a door or panel is opened.

b. Ozone generation within the filter that does not exceed five parts per one hundred million parts of air. Locate high voltage insulators in a serviceable location outside the moving air stream or on the clean air side of the unit. Fully expose ionizer wire supports and furnish ionizer wires precut to size and with formed loops at each end to facilitate ionizer wire replacement.

c. Agglomerator cell plates that allow proper air stream entrainment of agglomerates and prevent excessive residual dust build-up, with cells that are open at the top and bottom to prevent accumulation of agglomerates which settle by gravity. Where the dry agglomerator electrostatic filter is indicated to be the automatic renewable media type, provide a storage section that utilizes a horizontal or vertical traveling curtain of adhesive-coated bonded fibrous glass for dry agglomerator storage section service supplied in 19.8 m 65 foot lengths in convenient roll form. Otherwise, provide section construction and roll media characteristics as specified for automatic renewable media filters. Also a dry agglomerator/renewable media combination with an initial air flow resistance, after installation of clean media, that does not exceed 62.3 Pa 0.25 inch water gauge at 2.54 m/s 500 fpm face velocity.

d. A MERV of the combination that is not less than 15 when tested according to ASHRAE 52.2 at an average operating resistance of 125 Pa 0.50 inch water gauge. Where the dry agglomerator electrostatic filter is indicated to be of the extended surface nonsupported pocket filter type, provide a storage section as specified for extended surface non-supported pocket filters, with sectional holding frames or side access housings as indicated.

e. A dry agglomerator/extended surface nonsupported pocket filter section combination with initial air flow resistance, after installation of clean filters, that does not exceed 162 Pa 0.65 inch water gauge at 2.54 m/s 500 fpm face velocity, with a MERV of the combination not less than 16 when tested according to ASHRAE 52.2. Furnish front access filters with full height air distribution baffles and upper and lower mounting tracks to permit the baffles to be moved for agglomerator cell inspection and service. When used in conjunction with factory fabricated air handling units, supply side access housings which have dimensional compatibility.

2.11.3.8 High-Efficiency Particulate Air (HEPA) Filters

**************************************************************************

**NOTE:** Use high-efficiency particulate air filters in CLEAN ROOMS (White Rooms or Dust Controlled Facilities), clean work stations, and for critical areas of hospitals. Show the efficiency of the prefilter on the drawings. Provide efficiency that is sufficient for the anticipated contamination load and the degree of prefiltration required. Reference ASME AG-1 either all or in part when extreme temperature or humidity requirements exist. Ensure that requirements added to text from ASME AG-1 are essential to customer’s needs to prevent unnecessary expenses from being added to the project, as this standard is not intended for routine commercial
Provide HEPA filters that meet the requirements of IEST RP-CC-001 and are individually tested and certified to have an efficiency of not less than [95] [99.97] percent, and an initial resistance at [_____] m/s fpm that does not exceed [_____] Pa inches water gauge. Provide filters that are constructed by pleating a continuous sheet of filter medium into closely spaced pleats separated by corrugated aluminum or mineral-fiber inserts, strips of filter medium, or by honeycomb construction of the pleated filter medium. Provide interlocking, dovetailed, molded neoprene rubber gaskets of 5-10 durometer that are cemented to the perimeter of the [upstream] [downstream] face of the filter cell sides. Provide self-extinguishing rubber-base type adhesive or other materials conforming to fire hazard classification specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Provide filter cell sides that are [19 mm 3/4 inch thick exterior grade fire-retardant plywood] [cadmium plated steel] [galvanized steel] assembled in a rigid manner. Provide overall cell side dimensions that are correct to 2 mm 1/16 inch, and squareness that is maintained to within 3.2 mm 1/8 inch. Provide holding frames that use spring loaded fasteners or other devices to seal the filter tightly within it and that prevent any bypass leakage around the filter during its installed life. Provide air capacity and the nominal depth of the filter as indicated. Install each filter in a factory preassembled side access housing or a factory-made sectional supporting frame as indicated. Provide prefilters of the type, construction and efficiency indicated.

2.11.3.9 Holding Frames

Fabricate frames from not lighter than 1.6 mm 16 gauge sheet steel with rust-inhibitor coating. Equip each holding frame with suitable filter holding devices. Provide gasketed holding frame seats. Make all joints airtight.

2.11.3.10 Filter Gauges

Provide dial type filter gauges, diaphragm actuated draft for all filter stations, including those filters which are furnished as integral parts of factory fabricated air handling units. Provide gauges that are at least 98 mm 3-7/8 inches in diameter, with white dials with black figures, and [graduations] [graduated in 0.0025 kPa 0.01 inch of water] with a minimum range of 0.25 kPa 1 inch of water beyond the specified final resistance for the filter bank on which each gauge is applied. Provide each gauge with a screw operated zero adjustment and two static pressure tips with integral compression fittings, two molded plastic vent valves, two 1.5 m 5 foot minimum lengths of 6.35 mm 1/4 inch diameter [aluminum] [vinyl] tubing, and all hardware and accessories for gauge mounting.

2.12 AIR HANDLING UNITS

NOTE: To prevent condensate overflow, calculate the size of condensate drain pans for air handling units where abnormally high latent loads are encountered such as high humidity locations or units operating with 100 percent outside air. Where the potential exists for a manufacturer's standard condensate pan to be smaller than the size calculated, include the
size required in the equipment schedule on the drawings.

For AHU's intended for outdoor installation, note on equipment schedule that AHU roof (used for Army projects only) must slope a minimum of 6 mm/300 mm 1/4 in per ft and overhang wall panels by a minimum of 50 mm 2 inches.

**************************************************************************

2.12.1 Field-Fabricated Air Handling Units

Provide built-up units as specified in paragraph DUCT SYSTEMS. Provide fans, coils spray-coil dehumidifiers, and air filters as specified in paragraph AIR SYSTEMS EQUIPMENT for types indicated.

2.12.2 Factory-Fabricated Air Handling Units

**************************************************************************

NOTE: Coordinate with paragraph Fans and paragraph Coils.

**************************************************************************

Provide [single-zone draw-through type][ or ] [single-zone blow-through type][ or ] [multizone blow-through type][ blow-through double-deck type][ blow-through triple deck type] units as indicated. Units must include fans, coils, airtight insulated casing, [prefilters,] [secondary filter sections,][ and ] [diffuser sections where indicated,] [air blender] adjustable V-belt drives, belt guards for externally mounted motors, access sections where indicated, [mixing box] [combination sectional filter-mixing box,] [[pan][drysteam][spray type] humidifier,] vibration-isolators, and appurtenances required for specified operation. Provide vibration isolators as indicated. Physical dimensions of each air handling unit must be suitable to fit space allotted to the unit with the capacity indicated. Provide air handling unit that is rated in accordance with AHRI 430 and AHRI certified for cooling.

2.12.2.1 Casings

Provide the following:

a. [Casing sections [[single] [50 mm 2 inch double] wall type] [as indicated], constructed of a minimum 1.3 mm 18 gauge galvanized steel, or 1.3 mm 18 gauge corrosion-resisting sheet steel conforming to ASTM A167, Type 304.][Inner casing of double-wall units that are a minimum one mm 20 gauge solid galvanized steel or corrosion-resisting sheet steel conforming to ASTM A167, Type 304.] Design and construct casing with an integral insulated structural galvanized steel frame such that exterior panels are non-load bearing.

b. Individually removable exterior panels with standard tools. Removal must not affect the structural integrity of the unit. Furnish casings with access sections, according to paragraph AIR HANDLING UNITS, inspection doors, and access doors, all capable of opening a minimum of 90 degrees, as indicated.

c. Insulated, fully gasketed, double-wall type inspection and access doors, of a minimum 1.3 mm 18 gauge outer and one mm 20 gauge inner panels made of either galvanized steel or corrosion-resisting sheet
steel conforming to ASTM A167, Type 304. Provide rigid doors with heavy duty hinges and latches. Inspection doors must be a minimum 300 mm 12 inches wide by 300 mm 12 inches high. Access doors must be a minimum 600 mm 24 inches wide, the full height of the unit casing or a minimum of 1800 mm 6 foot, whichever is less. [Install a minimum 200 by 200 mm 8 by 8 inches sealed glass window suitable for the intended application, in all access doors.]

d. Double-wall insulated type drain pan (thickness equal to exterior casing) constructed of 1.4 mm 16 gauge [galvanized steel] [corrosion resisting sheet steel conforming to ASTM A167, Type 304], conforming to ASHRAE 62.1. Construct drain pans water tight, treated to prevent corrosion, and designed for positive condensate drainage. When 2 or more cooling coils are used, with one stacked above the other, condensate from the upper coils must not flow across the face of lower coils. Provide intermediate drain pans or condensate collection channels and downspouts, as required to carry condensate to the unit drain pan out of the air stream and without moisture carryover. Construct drain pan to allow for easy visual inspection, including underneath the coil without removal of the coil and to allow complete and easy physical cleaning of the pan underneath the coil without removal of the coil. Provide coils that are individually removable from the casing.

e. Casing insulation that conforms to NFPA 90A. Insulate single-wall casing sections handling conditioned air with not less than 25 mm 1 inch thick, 24 kg/cubic meter 1-1/2 pound density coated fibrous glass material having a thermal conductivity not greater than 0.033 W/m-K 0.23 Btu/hr-sf-F. Insulate double-wall casing sections handling conditioned air with not less than 50 mm 2 inches of the same insulation specified for single-wall casings. Foil-faced insulation is not an acceptable substitute for use with double wall casing. Seal double wall insulation completely by inner and outer panels.

f. Factory applied fibrous glass insulation that conforms to ASTM C1071, except that the minimum thickness and density requirements do not apply, and that meets the requirements of NFPA 90A. Make air handling unit casing insulation uniform over the entire casing. Foil-faced insulation is not an acceptable substitute for use on double-wall access doors and inspections doors [and casing sections].

g. Duct liner material, coating, and adhesive that conforms to fire-hazard requirements specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Protect exposed insulation edges and joints where insulation panels are butted with a metal nosing strip or coat to meet erosion resistance requirements of ASTM C1071.

h. A latched and hinged inspection door, in the fan and coil sections. Plus additional inspection doors, access doors and access sections [_____] [where indicated].

2.12.2.2 Heating and Cooling Coils

Provide coils as specified in paragraph AIR SYSTEMS EQUIPMENT.

2.12.2.3 Air Filters

Provide air filters as specified in paragraph AIR SYSTEMS EQUIPMENT for types and thickness indicated.
2.12.2.4 Fans

**************************************************************************
NOTE: Coordinate with paragraph Sound Attenuation Equipment.

Refer to UFC 3-450-02, Power Plant Acoustics, for vibration criteria. Detail vibration isolation required and include it in the appropriate schedule on the drawings.
**************************************************************************

Provide the following:

a. Fans that are double-inlet, centrifugal type with each fan in a separate scroll. Dynamically balance fans and shafts prior to installation into air handling unit, then after it has been installed in the air handling unit, statically and dynamically balance the entire fan assembly. Mount fans on steel shafts, accurately ground and finished.

b. Fan bearings that are sealed against dust and dirt and are precision self-aligning ball or roller type, with L50 rated bearing life at not less than 200,000 hours as defined by ABMA 9 and ABMA 11. Provide bearings that are permanently lubricated or lubricated type with lubrication fittings readily accessible at the drive side of the unit. Support bearings by structural shapes, or die formed sheet structural members, or support plates securely attached to the unit casing. Do not fasten bearings directly to the unit sheet metal casing. Furnish fans and scrolls with coating indicated.

c. Fans that are driven by a unit-mounted, or a floor-mounted motor connected to fans by V-belt drive complete with belt guard for externally mounted motors. Furnish belt guards that are the three-sided enclosed type with solid or expanded metal face. Design belt drives for not less than a 1.3 service factor based on motor nameplate rating.

d. [Motor sheaves that are variable pitch for 20 kW 25 hp and below and fixed pitch above 20 kW 25 hp as defined by AHRI Guideline D.] Where fixed sheaves are required, the use of variable pitch sheaves is allowed during air balance, but replace them with an appropriate fixed sheave after air balance is completed. Select variable pitch sheaves to drive the fan at a speed that produces the specified capacity when set at the approximate midpoint of the sheave adjustment. Furnish motors for V-belt drives with adjustable bases, and with [open][splashproof][totally enclosed] enclosures.

e. Motor starters of [manual][magnetic][across-the-line][reduced-voltage-start] type with [general-purpose][weather-resistant][watertight] enclosure. Select unit fan or fans to produce the required capacity at the fan static pressure with sound power level as indicated. Obtain the sound power level values according to AMCA 300, ASHRAE 68, or AHRI 260 I-P.

2.12.2.5 Access Sections and Filter/Mixing Boxes

Provide access sections where indicated and furnish with access doors as...
shown. Construct access sections and filter/mixing boxes in a manner identical to the remainder of the unit casing and equip with access doors. Design mixing boxes to minimize air stratification and to promote thorough mixing of the air streams.

2.12.2.6 Diffuser Sections

Furnish diffuser sections between the discharge of all housed supply fans [and cooling coils of blow-through single zone units] [and] [filter sections of those units with high efficiency filters located immediately downstream of the air handling unit fan section]. Provide diffuser sections that are fabricated by the unit manufacturer in a manner identical to the remainder of the unit casing, designed to be airtight under positive static pressures up to [2][_____] kPa [8][_____] inches water gauge and with an access door on each side for inspection purposes. Provide a diffuser section that contains a perforated diffusion plate, fabricated of galvanized steel, Type 316 stainless steel, aluminum, or steel treated for corrosion with manufacturer's standard corrosion-resisting finish, and designed to accomplish uniform air flow across the down-stream [coil][filters] while reducing the higher fan outlet velocity to within plus or minus 5 percent of the required face velocity of the downstream component.

2.13 TERMINAL UNITS

**************************************************************************

NOTE: Coordinate with paragraph Sound Attenuation Equipment.
**************************************************************************

2.13.1 Room Fan-Coil Units

Provide base units that include galvanized coil casing, coil assembly drain pan [valve and piping package,] [outside air damper,] [wall intake box,] air filter, fans, motor, fan drive, motor switch, an enclosure for cabinet models and casing for concealed models, leveling devices integral with the unit for vertical type units, and sound power levels as indicated. Obtain sound power level data or values for these units according to test procedures based on AHRI 350. Sound power values apply to units provided with factory fabricated cabinet enclosures and standard grilles. Values obtained for the standard cabinet models are acceptable for concealed models without separate test provided there is no variation between models as to the coil configuration, blowers, motor speeds, or relative arrangement of parts. Provide automatic valves and controls as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS. Fasten each unit securely to the building structure. Provide units with capacity indicated. Provide room fan-coil units that are certified as complying with AHRI 440, and meet the requirements of UL 1995.

2.13.1.1 Enclosures

Fabricate enclosures from not lighter than 1.3 mm 18 gauge steel, reinforced and braced. Provide enclosures with front panels that are removable and have 7 mm 1/4 inch closed cell insulation or 13 mm 1/2 inch thick dual density foil faced fibrous glass insulation. Make the exposed side of a high density, erosion-proof material suitable for use in air streams with velocities up to 23 m/s 4,500 fpm. Provide a discharge grille that is [adjustable] [fixed] and that is of such design as to properly distribute air throughout the conditioned space. Plastic discharge and
return grilles are acceptable provided the plastic material is certified by the manufacturer to be classified as flame resistant according to UL 94 and the material complies with the heat deflection criteria specified in UL 1995. Provide galvanized or factory finished ferrous metal surfaces with corrosion resistant enamel, and access doors or removable panels for piping and control compartments, plus easy access for filter replacement. Provide duct discharge collar for concealed models.

2.13.1.2 Fans

Provide steel or aluminum, multiblade, centrifugal type fans. In lieu of metal, fans and scrolls could be of non-metallic materials of suitably reinforced compounds with smooth surfaces. Dynamically and statically balance the fans. Provide accessible assemblies for maintenance. Disassemble and re-assemble by means of mechanical fastening devices and not by epoxies or cements.

2.13.1.3 Coils

Fabricate coils from not less than 10 mm 3/8 inch outside diameter seamless copper tubing, with copper or aluminum fins mechanically bonded or soldered to the tubes. Provide coils with not less than 13 mm 1/2 inch outside diameter flare or sweat connectors, accessory piping package with thermal connections suitable for connection to the type of control valve supplied, and manual air vent. Test coils hydrostatically at 2000 kPa 300 psi or under water at 1700 kPa 250 psi air pressure. Provide coils suitable for 1400 kPa 200 psi working pressure. Make provisions for coil removal.

2.13.1.4 Drain Pans

Size and locate drain and drip pans to collect all water condensed on and dripping from any item within the unit enclosure or casing. Provide condensate drain pans designed for self-drainage to preclude the buildup of microbial slime and thermally insulated to prevent condensation and constructed of not lighter than 0.9 mm 21 gauge type 304 stainless steel or noncorrosive ABS plastic. Provide insulation with a flame spread rating not over 25 without evidence of continued progressive combustion, a smoke developed rating no higher than 50, and of a waterproof type or coated with a waterproofing material. Design drain pans so as to allow no standing water and pitch to drain. Provide minimum 19 mm 3/4 inch NPT or 15 mm 5/8 inch OD drain connection in drain pan. Provide plastic or metal auxiliary drain pans to catch drips from control and piping packages, eliminating insulation of the packages; if metal, provide auxiliary pans that comply with the requirements specified above. Extend insulation at control and piping connections 25 mm 1 inch minimum over the auxiliary drain pan.

2.13.1.5 Manually Operated Outside Air Dampers

Provide manually operated outside air dampers according to the arrangement indicated, and parallel airfoil type dampers of galvanized construction. Provide blades that rotate on stainless steel or nylon sleeve bearings.

2.13.1.6 Filters

Provide disposable type filter that complies with ASHRAE 52.2. Provide filters in each unit that are removable without the use of tools.
2.13.1.7 Motors

**************************************************************************
NOTE: Edit depending on whether the units are freestanding, built-in or both. Values for high static motors cover 115V, 230V, and 277V.
**************************************************************************

Provide motors of the permanent split-capacitor type with built-in thermal overload protection, directly connected to unit fans. Provide motor switch with two or three speeds and off, manually operated, and mounted on an identified plate [inside the unit below or behind an access door][ or ][adjacent to the room thermostat][as indicated]. In lieu of the above fan speed control, a solid-state variable-speed controller having a minimum speed reduction of 50 percent is allowed. Provide motors with permanently-lubricated or oilable sleeve-type or combination ball and sleeve-type bearings with vibration isolating mountings suitable for continuous duty. Provide a motor power consumption, shown in watts, at the fan operating speed selected to meet the specified capacity that does not exceed the following values:

2.13.2 Coil Induction Units

Provide base unit that includes air plenums, air-discharge nozzles, air discharge grilles, recirculation grilles, water coil assembly, valve and piping package, condensate drain pan, and adjustable air-balancing dampers, plus an enclosure for cabinet models and casing for concealed models. Make each unit capable of producing not less than the capacity indicated without exceeding the indicated static pressure. Provide a sound power level as indicated with power level data or values for these units based on tests conducted according to ASA S12.51. Sound power values apply to units provided with factory fabricated cabinet enclosures and standard grilles. The values obtained for the standard cabinet models are acceptable for concealed models without separate tests, provided there is no variation between models as to coil configuration, air discharge nozzles, air balancing dampers, or relative arrangement of parts. Provide automatic valves and controls as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS. Secure each unit to the building structure. Provide units with capacity indicated.

2.13.2.1 Enclosures

Fabricate enclosures from not lighter than 1.2 mm 18 gauge steel, reinforced and braced. Provide a removable front panel of enclosure and insulate when required acoustically and to prevent condensation. Provide discharge grilles that are [adjustable][integrally stamped] and properly distribute air throughout the conditioned space. Plastic discharge and return grilles are not acceptable. Provide access doors for all piping and control compartments.

2.13.2.2 Air Plenums

Fabricate plenums from galvanized steel with interior acoustically baffled and lined with sound absorbing material to attenuate the sound power from the primary air supply to the room. Provide heat-resistant nozzles that are integral with or attached airtight to the plenum. Where coil induction units are supplied with vertical runouts, furnish a streamlined, vaned, mitered elbow transition piece for connection between the unit and ductwork. Provide an adjustable air-balancing damper in each unit.

2.13.2.3 Coils

Fabricate coils from not less than 10 mm 3/8 inch outside diameter seamless copper tubing, with copper or aluminum fins, mechanically bonded or soldered to the tubes. Furnish coil connections with not less than 13 mm 1/2 inch outside diameter flare or sweat connectors, accessory piping package with terminal connections suitable for connection to the type of control valve supplied, and manual air vent. Test coils hydrostatically at

2000 kPa 300 psi or under water at 1700 kPa 250 psi air pressure and provide coils suitable for 1400 kPa 200 psi working pressure.

2.13.2.4 Screens

Provide easily accessible lint screens or throwaway filters for each unit.

2.13.2.5 Drain Pan

Size and locate drain and drip pans to collect condensed water dripping from any item within the unit enclosure. Provide drain pans constructed of not lighter than 0.9 mm 21 gauge steel, galvanized after fabrication, and thermally insulated to prevent condensation. Provide insulation that has a flame spread rating not over 25 without evidence of continued progressive combustion, a smoke developed rating no higher than 50, and that is a waterproof type or coated with a waterproofing material. In lieu of the above, drain pans constructed of die-formed 0.8 mm 22 gauge steel are allowed, formed from a single sheet and galvanized after fabrication and insulated and coated as for the 0.9 mm 21 gauge steel material or of die-formed 0.9 mm 21 gauge type 304 stainless steel insulated as specified above. Pitch drain pans to drain. Provide drain connection when a condensate drain system is indicated. Make connection a minimum 19 mm 3/4 inch NPT or 15 mm 5/8 inch OD.

2.13.3 Variable Air Volume (VAV) and Dual Duct Terminal Units

******************************************************************************

NOTE: Delete reheat coils when not required.

******************************************************************************

a. Provide VAV and dual duct terminal units that are the type, size, and capacity shown, mounted in the ceiling or wall cavity, plus units that are suitable for single or dual duct system applications. Provide actuators and controls as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS. For each VAV terminal unit, provide a temperature sensor in the unit discharge ductwork.

b. Provide unit enclosures that are constructed of galvanized steel not lighter than 0.85 mm 22 gauge or aluminum sheet not lighter than 1.3 mm 18 gauge. Provide single or multiple discharge outlets as required. Units with flow limiters are not acceptable. Provide unit air volume that is factory preset and readily field adjustable without special tools. [Provide reheat coils as indicated.]

c. Attach a flow chart to each unit. Base acoustic performance of the terminal units upon units tested according to AHRI 880 I-P with the calculations prepared in accordance with AHRI 885. Provide sound power level as indicated. Show discharge sound power for minimum and [375][_____] Pa [1-1/2][_____] inches water gauge inlet static pressure. Provide acoustical lining according to NFPA 90A.

2.13.3.1 Constant Volume, Single Duct Terminal Units

Provide constant volume, single duct, terminal units that contain within the casing, a constant volume regulator. Provide volume regulators that control air delivery to within plus or minus 5 percent of specified air flow subjected to inlet pressure from 200 to 1500 Pa 3/4 to 6 inch water gauge.
2.13.3.2 Variable Volume, Single Duct Terminal Units

Provide variable volume, single duct, terminal units with a calibrated air volume sensing device, air valve or damper, actuator, and accessory relays. Provide units that control air volume to within plus or minus 5 percent of each air set point volume as determined by the thermostat with variations in inlet pressures from 200 to 1500 Pa 3/4 to 6 inch water gauge. Provide units with an internal resistance not exceeding 100 Pa 0.4 inch water gauge at maximum flow range. Provide external differential pressure taps separate from the control pressure taps for air flow measurement with a 0 to 250 Pa 0 to 1 inch water gauge range.

2.13.3.3 Variable Volume, Single Duct, Fan-Powered Terminal Units

Provide variable volume, single duct, fan-powered terminal units with a calibrated air volume sensing device, air valve or damper, actuator, fan and motor, and accessory relays. Provide units that control primary air volume to within plus or minus 5 percent of each air set point as determined by the thermostat with variations in inlet pressure from 200 to 1500 Pa 3/4 to 6 inch water gauge. Provide unit fan that is centrifugal, direct-driven, double-inlet type with forward curved blades. Provide either single speed with speed controller or three-speed, permanently lubricated, permanent split-capacitor type fan motor. Isolate fan/motor assembly from the casing to minimize vibration transmission. Provide factory furnished fan control that is wired into the unit control system. Provide a factory-mounted pressure switch to operate the unit fan whenever pressure exists at the unit primary air inlet or when the control system fan operates.

2.13.3.4 Dual Duct Terminal Units

Provide dual duct terminal units with hot and cold inlet valve or dampers that are controlled in unison by single or dual actuators. Provide actuator as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS. Provide unit that controls delivered air volumes within plus or minus 5 percent with inlet air variations from 250 to 2000 Pa 1 to 8 inch water gauge in either duct. Include mixing baffles with the unit casing. Provide cabinet and closed duct leakage that does not exceed 2 percent of maximum rated air volume. Provide units with an internal resistance that does not exceed [_____] Pa inch water gauge at maximum flow range.

2.13.3.5 Ceiling Induction Terminal Units

**************************************************************************
NOTE: Do not use ceiling induction units on NAVFAC projects.
**************************************************************************

Provide ceiling induction unit with a calibrated primary air volume sensing device, primary air valve, induced air damper, and insulated induction tube. Arrange unit to induce air from the ceiling plenum to maintain a maximum total flow circulated to the conditioned space. Vary primary air upon demand of the room thermostat. Upon a demand for maximum cooling, provide a unit that delivers 100 percent primary air and, at minimum cooling, delivers [50] [25] percent primary air. Provide a terminal unit capable of closing to full shut off without additional actuators or linkage changes. Provide terminals that reset primary air volume within plus or minus 5 percent determined by the thermostat regardless of upstream changes.
in the static pressure. Provide a minimum inlet static pressure that does not exceed 250 Pa 1 inch water gauge, including a maximum of 75 Pa 0.3 inch water gauge downstream static pressure. Provide external differential pressure taps separate from control pressure taps for primary air flow measurement with 0 to 250 Pa 0 to 1 inch water gauge range. Make each unit normally [open] [closed] upon loss of pneumatic pressure. Factory pipe actuator and accuracy controls requiring only field installation of 138 kPa 20 psi pneumatic main air and room thermostat.

2.13.3.6 Series Fan Powered Variable Air Volume (VAV) Terminals

**************************************************************************
**NOTE:** For evaporator variable airflow applications such as VAV or multizone, provisions for capacity control and minimum capacity must be indicated. Provide capacity control by compressor unloading or multiple compressors. For minimum capacity control, provide these applications with factory installed hot-gas bypass.**************************************************************************

Provide units factory assembled, designed, tested, rated in accordance with AHRI 880 I-P, that are AHRI certified, listed in the AHRI DCAACP and that produce a supply air discharge mix by modulation of conditioned primary air and recirculating of return air. Provide units that include casing, centrifugal fan and motor, primary VAV damper or valve, electronic volume regulator, discharge air damper, primary air inlet cone with high and low pressure flow sensors, recirculating air filter frames, filter, and electrical disconnect. [Provide hot water heating coils integral to the terminal, or provide insulated hot water coil section attached to the discharge of the terminal.]

2.13.3.6.1 Casing

Provide removable full bottom access panels for servicing internal components without disturbing duct connections. Insulate inside of casing with manufacturer's standard insulation. Provide units that have recirculating air inlet equipped with filter frame, round primary damper or valve, and unit mounting brackets.

2.13.3.6.2 Fans and Motors

Provide centrifugal, forward curved, multiblade, fan wheels with direct-drive motors. Provide motors that are the high efficiency permanent-split capacitor type with thermal overload protection, permanently lubricated bearings, and have three speeds or are equipped with solid state speed controllers. Provide isolation between fan motor assembly and unit casing. Provide fan and motor that is removable through casing access panel.

2.13.3.6.3 Flow Sensor

Provide ring or cross type sensor with minimum of two pickup points which average the velocity across the inlet. Obtain flow measurement within plus or minus 5 percent of rated airflow with 1.5 diameters of straight duct upstream of unit and inlet static variation of 124 to 1240 Pa 0.5 to 5.0 inches water gauge. Supply flow measuring taps and calibration flowchart with each unit for field balancing airflows.
2.13.3.6.4 Primary VAV Damper or Valve

Provide galvanized steel damper blade that closes against gasket inside unit. Connect damper to operating shaft with a positive mechanical connection. Provide nylon bearing for damper shaft. Cylindrical die cast aluminum valve inlet tapered to fit round flexible ducts with integral flow diffuser and beveled self-centering disc. Provide damper or valve leakage at shutoff that does not exceed 2 percent of capacity at 250 Pa 1 inch water gauge pressure.

2.13.3.6.5 Regulator

Provide electronic volume regulator. Electronic controls contained in NEMA ICS 6, Type 1 enclosure sealed from airflow. Provide unit with controls mounted on side or on air valve. System powered regulators are not permitted. Provide volume regulator that resets primary air volume as determined by thermostat, within upstream static pressure variation noted in paragraph titled "Flow Sensor." Provide volume regulators that are field adjustable, factory set and calibrated to indicated maximum and minimum primary airflows, direct acting and normally [open] [closed] upon loss of pneumatic pressure.

2.13.3.6.6 Electrical

Provide unit that incorporates single point electrical connection with electrical disconnect. Provide electrical components that are UL or ETL listed, installed in accordance with NFPA 70 and mounted in control box. Units UL or ETL listed as an assembly do not require airflow switch interlock with electric heating coil, when factory assembled.

2.13.3.6.7 Filters

Provide UL listed throwaway 25 mm one inch thick fiberglass filters, standard dust-holding capacity.

2.13.3.7 Reheat Units

2.13.3.7.1 Hot Water Coils

Provide fin-and-tube type hot-water coils constructed of seamless copper tubes and copper or aluminum fins mechanically bonded or soldered to the tubes. Provide headers that are constructed of cast iron, welded steel or copper. Provide casing and tube support sheets that are 1.6 mm 16 gauge, galvanized steel, formed to provide structural strength. Provide tubes that are correctly circuited for proper water velocity without excessive pressure drop and are drainable where required or indicated. At the factory, test each coil at not less than 1700 kPa 250 psi air pressure and provide coils suitable for 1400 kPa 200 psi working pressure. Install drainable coils in the air handling units with a pitch of not less than 10 mm per m 1/8 inch per foot of tube length toward the drain end. Coils must conform to the provisions of AHRI 410.

2.13.3.7.2 Steam Coils

Provide steam coils constructed of cast semisteel, welded steel, or copper headers, red-brass or copper tubes, and copper or aluminum fins mechanically bonded or soldered to the tubes. Roll and bush, braze or weld tubes into headers. Provide coil casings and tube support sheets, with collars of ample width, that are not lighter than 1.6 mm 16 gauge.
galvanized steel formed to provide structural strength. When required, furnish multiple tube supports to prevent tube sag. Float the fin tube and header section within the casing to allow free expansion of tubing for coils subject to high pressure steam service. Provide coils that are factory pressure tested and capable of withstanding 1700 kPa 250 psi hydrostatic test pressure or 1400 kPa 250 psi air pressure, and are for [700] [1400] kPa [100] [200] psi steam working pressure. Provide steam-distribution tube type preheat coils with condensing tubes having not less than 15 mm 5/8 inch outside diameters. Provide distribution tubes that have not less than 10 mm 3/8 inch outside diameter, with orifices to discharge steam to condensing tubes. Install distribution tubes concentric inside of condensing tubes held securely in alignment. Limit the maximum length of a single coil to 120 times the diameter of the outside tube. Other heating coils must be single tube type with an outside diameter not less than 13 mm 1/2 inch. Provide supply headers that distribute steam evenly to all tubes at the indicated steam pressure. Provide coils that conform to the provisions of AHRI 410.

2.13.3.7.3 Electric Resistance Heaters

Provide the duct-mounting type electric resistance heaters consisting of a nickel-chromium resistor mounted on refractory material and a steel or aluminum frame for attachment to ductwork. Provide electric duct heater that meets the requirement of Underwriters Laboratories and NFPA 70 and is provided with a built-in or surface-mounted high-limit thermostat. Interlock electric duct heaters electrically so that they cannot be energized unless the fan is running.

2.13.4 Unit Ventilators

Provide unit ventilators that include an enclosure, [galvanized casing,] [cold-rolled steel casing with corrosion resistant coating,] coil assembly, [resistance heating coil assembly,] [valve and piping package,] drain pan, air filters, fan assembly, fan drive, motor, motor controller, dampers, damper operators, and sound power level as indicated. Obtain sound power level data or values for these units according to test procedures based on AHRI 350. Sound power values apply to units provided with factory fabricated cabinet enclosures and standard grilles, when handling standard flow for which the unit air capacity is rated. Secure each unit to the building structure. Provide the unit ventilators with capacity indicated. Provide the year-round classroom type unit ventilator with automatic controls arranged to properly heat, cool, and ventilate the room. Provide automatic valves and controls as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS. Make the sequence of control any one of the standard ANSI cycles specified in paragraph CONTROLS.

2.13.4.1 Enclosures

Fabricate enclosures from not lighter than 1.6 mm 16 gauge galvanized steel, reinforced and braced, or all welded framework with panels to provide equivalent strength. Provide casing that is acoustically and thermally insulated internally with not less than 13 mm 1/2 inch thick dual density fibrous glass insulation. Make the exposed side a high density, erosion-proof material suitable for use in air streams with velocities up to 246 m/s 4500 fpm. Fasten the insulation with waterproof, fire-resistant adhesive. Design front panel for easy removal by one person. Provide discharge grilles that [have adjustable grilles or grilles with adjustable vanes and] properly distribute air throughout the conditioned space. Provide return grilles that are removable where front panel does not
provide access to interior components. Plastic discharge or return grilles are not acceptable. Furnish removable panels or access doors for all piping and control compartments. Provide fan switch that is key operated or accessible through a locked access panel. Install gaskets at the back and bottom of the unit for effective air seal, as required.

2.13.4.2 Electric Resistance Heating Elements

Provide electric resistance heating elements that are of the sheathed, finned, tubular type, or of the open resistance type designed for direct exposure to the air stream. Provide heating element electrical characteristics as indicated. Where fan motor or control voltage is lower than required for the electric-resistance heating element, install a fused factory mounted and wired transformer.

2.13.4.3 Fans

Provide fans that meet the requirements as specified in paragraph AIR SYSTEMS EQUIPMENT. Provide galvanized steel or aluminum, multiblade, centrifugal type fans, dynamically and statically balanced. Equip fan housings with resilient mounted, self-aligning permanently lubricated ball bearings, sleeve bearings, or combination ball and sleeve bearings, capable of not less than 2000 hours of operation on one oiling. Provide direct-connected fans.

2.13.4.4 Coils

Provide coils that are circuited for a maximum water velocity of 2.4 m/s 8 fps without excessive pressure drop and are otherwise as specified for hot water coils in paragraph TERMINAL UNITS.

2.13.4.5 Drain Pans

Size and locate drain and drip pans to collect all condensed water dripping from any item within the unit enclosure. Provide drain pans constructed of not lighter than 1.2 mm 18 gauge steel, galvanized after fabrication, and thermally insulated to prevent condensation. Provide insulation that is coated with a fire-resistant waterproofing material. In lieu of the above, drain pans constructed of die-formed 1.0 mm 20 gauge steel is allowed, formed from a single sheet and galvanized after fabrication and insulated and coated as for the 1.3 mm 18 gauge steel material, or of die-formed 1.3 mm 18 gauge type 304 stainless steel insulated as specified above. Pitch drain pans to drain. Furnish drain connection unless otherwise indicated. Make the minimum connection 19 mm 3/4 inch NDT or 18 mm 5/8 inch OD.

2.13.4.6 Filters

Disposable type rated in accordance with ASHRAE 52.2, installed upstream of coil.

2.13.4.7 Dampers

Provide an outside air proportioning damper on each unit. In addition, provide a vane to prevent excessive outside air from entering unit and to prevent blow-through of outside air through the return air grille under high wind pressures. Where outside air and recirculated air proportioning dampers are provided on the unit, an additional vane is not required. Provide face and bypass dampers for each unit to ensure constant air volume at all positions of the dampers. Furnish each unit with a factory
installed control cam assembly, pneumatic motor, or electric motor to operate the face and bypass dampers and outside air damper or outside air and recirculated air dampers in the sequence as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS.

2.13.4.8 Motors

************************************************************************************
NOTE: Edit based on whether the units are freestanding, built-in, or both.
************************************************************************************

Provide permanent split-capacitor type motors with built-in thermal overload protection and automatic reset. Mount motor on a resilient mounting, isolated from the casing and suitable for operation on electric service available. Provide a manually operated motor switch that provides for 2 or 3 speeds and off, mounted on an identified plate [inside the unit below or behind an access door] [or] [adjacent to the room thermostat] [as indicated]. In lieu of speed control, provide a solid state variable speed controller having minimum speed reduction of 50 percent.

2.13.4.9 Outside Air Intakes

Provide the manufacturer's standard design outside air intakes furnished with 13 mm 1/2 inch mesh bird screen or louvers on 13 mm 1/2 inch centers.

2.14 ENERGY RECOVERY DEVICES

2.14.1 Rotary Wheel

************************************************************************************
NOTE: Show energy recovery device supply/exhaust filters, preheat coils, backdraft dampers, exhaust dampers, recirculation dampers, face and bypass dampers, drainage provisions, controls and like ancillaries on the drawings and supplement by the specifications as necessary. Select minimum acceptable energy transfer effectiveness and maximum acceptable cross-contamination.
Delete moisture resistance and chain drive if not required.
************************************************************************************

Provide unit that is a factory fabricated and tested assembly for air-to-air energy recovery by transfer of sensible heat from exhaust air to supply air stream, with device performance according to ASHRAE 84 and that delivers an energy transfer effectiveness of not less than [70][85][_____] percent with cross-contamination not in excess of [0.1][1.0][_____] percent of exhaust airflow rate at system design differential pressure, including purging sector if provided with wheel. Provide exchange media that is chemically inert, moisture-resistant, fire-retardant, laminated, nonmetallic material which complies with NFPA 90A. Isolate exhaust and supply streams by seals which are static, field adjustable, and replaceable. Equip chain drive mechanisms with ratcheting torque limiter or slip-clutch protective device. Fabricate enclosure from galvanized steel and include provisions for maintenance access. Provide recovery control and rotation failure provisions as indicated.
2.14.2 Run-Around-Coil

**************************************************************************

NOTE: Delete "factory fabricated and tested" if not required.

Coordinate with paragraph Glycol Solution in Section 23 64 26 CHILLED, CHILLED-HOT, AND CONDENSER WATER PIPING SYSTEMS. Glycol is considered a hazardous waste. If the base does not have a used glycol waste program, using glycol can be an expensive maintenance item.

**************************************************************************

Provide assembly that is factory fabricated and tested air-to-liquid-to-air energy recovery system for transfer of sensible heat from exhaust air to supply air stream and that delivers an energy transfer effectiveness not less than that indicated without cross-contamination with maximum energy recovery at minimum life cycle cost. Computer optimize components for capacity, effectiveness, number of coil fins per inch, number of coil rows, flow rate, heat transfer rate of [_____] percent by volume of [ethylene][propylene] glycol solution, and frost control. Provide coils that conform to paragraph AIR HANDLING UNITS. Provide related pumps, and piping specialties that conform to requirements of [Section 23 63 00.00 COLD STORAGE REFRIGERATION SYSTEMS][Section 23 57 10.00 10 FORCED HOT WATER HEATING SYSTEMS USING WATER AND STEAM HEAT EXCHANGERS][23 69 00.00 20 REFRIGERATION EQUIPMENT FOR COLD STORAGE] [_____].

2.14.3 Heat Pipe

**************************************************************************

NOTE: Include face air velocity, static pressure drop, temperature requirements for entering and leaving air or exhaust streams on the equipment schedule for heat pipes.

Delete flexible connectors if not required.

**************************************************************************

Provide a device that is a factory fabricated, assembled and tested, counterflow arrangement, air-to-air heat exchanger for transfer of sensible heat between exhaust and supply streams and that delivers an energy transfer effectiveness not less than that indicated without cross-contamination. Provide heat exchanger tube core that is [15][18][25] mm [1/2][5/8][1] inch nominal diameter, seamless aluminum or copper tube with extended surfaces, utilizing wrought aluminum Alloy 3003 or Alloy 5052, temper to suit. Provide maximum fins per unit length and number of tube rows as indicated. Provide tubes that are fitted with internal capillary wick, filled with a refrigerant complying with ASHRAE 15 & 34, selected for system design temperature range, and hermetically sealed. Refrigerants containing chlorofluorocarbons (CFC) are prohibited. Provide heat exchanger frame that is constructed of not less than 1.6 mm 16 gauge galvanized steel and fitted with intermediate tube supports, and flange connections. Provide tube end-covers and a partition of galvanized steel to separate exhaust and supply air streams without cross-contamination and in required area ratio. Provide a drain pan constructed of welded Type 300 series stainless steel.) Provide heat recovery regulation by [system face and bypass dampers and related control system as indicated][interfacing with manufacturer's standard tilt-control mechanism.
for summer/winter operation, regulating the supply air temperature and frost prevention on weather face of exhaust side at temperature indicated. Coil must be fitted with pleated flexible connectors.

2.14.4 Desiccant Wheel

Provide counterflow supply, regeneration airstreams, a rotary type dehumidifier designed for continuous operation, and extended surface type wheel structure in the axial flow direction with a geometry that allows for laminar flow over the operating range for minimum air pressure differentials. Provide the dehumidifier complete with a drive system utilizing a fractional-horsepower electric motor and speed reducer assembly driving the rotor. Include a slack-side tensioner for automatic take-up for belt-driven wheels. Provide an adsorbing type desiccant material. Apply the desiccant material to the wheel such that the entire surface is active as a desiccant and the desiccant material does not degrade or detach from the surface of the wheel which is fitted with full-face, low-friction contact seals on both sides to prevent cross leakage. Provide rotary structure that has underheat, overheat and rotation fault circuitry. Provide wheel assembly with a warranty for a minimum of five years.

2.14.5 Plate Heat Exchanger

Provide energy recovery ventilator unit that is factory-fabricated for indoor installation, consisting of a flat plate cross-flow heat exchanger, cooling coil, supply air fan and motor and exhaust air fan and motor. The casing must be 1 mm 20 gauge G90, galvanized steel, double wall construction with 25 mm one inch insulation. Provide fibrous desiccant cross-flow type heat exchanger core capable of easy removal from the unit.

2.15 FACTORY PAINTING

Factory paint new equipment, which are not of galvanized construction. Paint with a corrosion resisting paint finish according to ASTM A123/A123M or ASTM A924/A924M. Clean, phosphatize and coat internal and external ferrous metal surfaces with a paint finish which has been tested according to ASTM B117, ASTM D1654, and ASTM D3359. Submit evidence of satisfactory paint performance for a minimum of 125 hours for units to be installed indoors and 500 hours for units to be installed outdoors. Provide rating of failure at the scribe mark that is not less than 6, average creepage not greater than 3 mm 1/8 inch. Provide rating of the inscribed area that is not less than 10, no failure. On units constructed of galvanized steel that have been welded, provide a final shop docket of zinc-rich protective paint on exterior surfaces of welds or welds that have burned through from the interior according to ASTM D520 Type I.

Field paint factory painting that has been damaged prior to acceptance by the Contracting Officer in compliance with the requirements of paragraph FIELD PAINTING OF MECHANICAL EQUIPMENT.

2.16 SUPPLEMENTAL COMPONENTS/SERVICES

2.16.1 Chilled, Condenser, or Dual Service Water Piping

The requirements for chilled, condenser, or dual service water piping and accessories are specified in Section 23 64 26 CHILLED, CHILLED-HOT, AND CONDENSER WATER PIPING SYSTEMS
2.16.2 Refrigerant Piping

The requirements for refrigerant piping are specified in Section 23 23 00 REFRIGERANT PIPING.

2.16.3 Water or Steam Heating System Accessories

The requirements for water or steam heating accessories such as expansion tanks and steam traps are specified in Section [23 52 00 HEATING BOILERS][23 21 13.00 20 LOW TEMPERATURE WATER (LTW) HEATING SYSTEM][23 22 26.00 20 STEAM SYSTEM AND TERMINAL UNITS].

2.16.4 Condensate Drain Lines

Provide and install condensate drainage for each item of equipment that generates condensate in accordance with Section [22 00 00 PLUMBING, GENERAL PURPOSE][23 64 26 CHILLED, CHILLED-HOT, AND CONDENSER WATER PIPING SYSTEMS] except as modified herein.

2.16.5 Backflow Preventers

The requirements for backflow preventers are specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.16.6 Insulation

The requirements for shop and field applied insulation are specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.16.7 Controls

The requirements for controls are specified in [Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS][Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC][Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS].

2.17 RADIANT PANELS

**************************************************************************
NOTE: There are currently no performance certification requirements or standards in the US for radiant ceiling panels. Until those performance certification procedures are developed, accepted and published, the European Standards DIN EN 14037 and DIN EN 14240 will be utilized.
**************************************************************************

**************************************************************************
NOTE: For radiant cooling panels, special care must be taken to avoid condensation on the panels. The design must include a sequence of operation to circulate chilled water to the panels at a temperature slightly above the room dew point temperature and must be able to adjust the chilled water temperature as required based on changes in the room relative humidity.
**************************************************************************
2.17.1 Hydronic Modular Panels

2.17.1.1 Panels

Modular radiant panels will fit into a standard 600 mm x 600 mm [24 inch x 24 inch] or 600 mm x 1200 mm [24 inch x 48 inch] suspended T-Bar ceiling grid or flush mounted on a drywall ceiling. For flush mounted ceiling applications, the manufacturer will provide a one piece extruded aluminum frame. Panels must be supported from the T-bar assembly. Panels must be [14 gauge] or [16 gauge] extruded aluminum or sheet steel.

2.17.1.2 Heat Sink

The modular panels must use extruded aluminum with integrated heat sinks on the back to transfer heat between copper tubes and the panel face.

2.17.1.3 Water Tubes

Tubes must consist of ASTM B75/B75M [13 mm] [1/2 inch] [16 mm] [5/8 inch] O.D. nominal copper tubing. Water connections will be suitable for solder or compression fittings. Heat pads will be used between the soldered fitting and the panel to protect the panel surface. The manufacturer will provide water pressure drop data as well as heating and cooling output data derived from tests in accordance with DIN EN 14037 (heating) and DIN EN 14240 (cooling). The panels will have the capacity to have multiple passes with connections either on the [same end] or [opposite ends], dependent on the number of passes.

2.17.1.4 Finish

All visible components must be powder coated with highly emissive powder coat polyester paint for optimal radiative properties as well as durability and easy cleaning. Standard finish color must be white.

2.17.1.5 Performance

Manufacturer will provide water pressure drop data as well as heat and cool output data derived from tests in accordance with DIN EN 14037 (heating) and DIN EN 14240 (cooling).

2.17.1.6 Capacity

******************************************************************************
NOTE: Include the last bracketed sentence if it is deemed necessary to confirm heating and/or cooling capacity after the panels are installed.
******************************************************************************

Modular radiant panel capacity will be tested and certified by manufacturer in accordance with DIN EN 14037 (heating) and DIN EN 14240 (cooling) to meet the required performance. Should any performance rating, chilled or hot water supply temperature, water pressure drop, etc. deviate from the schedule, the manufacturer will submit the updated capacity. [The manufacturer will have factory testing facility available to perform performance test of units in accordance with said standard.]

2.17.1.7 Water Connections

Connections will be shipped sealed to limit the introduction of dust and
dirt during shipping and construction.

2.17.1.8 Installation

Panels will be installed as recommended by the manufacturer.

2.17.1.9 Accessories

Stainless steel braded hoses, 300 mm 12 inches or 450 mm 18 inches long will be supplied with the panels.

The top of the heating and cooling panels must be covered with 38 mm-1/2 inches thick 16 kg/m3 1 lb/cu ft formaldehyde-free fiber glass insulation with a minimum R = 0.79 m2 deg C/W4.5 (hr ft2 deg F)/BTU. The insulation must be covered with a foil scrim kraft vapor barrier facing.

2.17.2 Hydronic Linear Panels

2.17.2.1 Panels

Linear radiant panels must use extruded aluminum with integrated heat sinks on the back to transfer heat between copper tubes and the panel face. The linear radiant panel is to radiate or absorb heat from or to the zone below. Panels must be [14 gauge] or [16 gauge] extruded aluminum.

2.17.2.2 Heat Sink

The modular panels must use extruded aluminum with integrated heat sinks on the back to transfer heat between copper tubes and the panel face.

2.17.2.3 Water Tubes

Tubes must consist of ASTM B75/B75M 13 mm 1/2 inch or 16 mm 5/8 inch O.D. nominal copper tubing. Water connections will be suitable for solder or compression fittings. The manufacturer will provide water pressure drop data as well as heating and cooling output data derived from tests in accordance with DIN EN 14037 (heating) and DIN EN 14240 (cooling).

2.17.2.4 Mounting

Units must be provided with mounting hardware as required for mounting in T-Bar applications or ceiling flush mounting. The manufacturer's standard hardware for mounting panels abutting each other must be submitted for approval.

2.17.2.5 Finish

All visible components must be powder coated with highly emissive powder coat polyester paint for optimal radiative properties as well as durability and easy cleaning. Standard finish color must be white.

2.17.2.6 Performance

Manufacturer must provide water pressure drop data as well as heat and cool output data derived from tests in accordance with DIN EN 14037 (heating) and DIN EN 14240 (cooling).
2.17.2.7 Capacity

**************************************************************************
NOTE: Include the last bracketed sentence if it is deemed necessary to confirm heating and/or cooling capacity after the panels are installed.
**************************************************************************

Modular radiant panel capacity must be tested and certified by manufacturer in accordance with DIN EN 14037 (heating) and DIN EN 14240 (cooling) to meet the required performance. Should any performance rating, chilled or hot water supply temperature, water pressure drop, etc. deviate from the schedule, the manufacturer must submit the updated capacity. [The manufacturer must have factory testing facility available to perform performance test of units in accordance with said standard.]

2.17.2.8 Water Connections

Connections will be shipped sealed to limit the introduction of dust and dirt during shipping and construction.

2.17.2.9 Accessories

Stainless steel braided hoses, 300 mm12 inches or 450 mm18 inches long will be supplied with the panels.

The top of the heating and cooling panels must be covered with 38 mm1-1/2 inches thick 16kg/m3 lb/cu ft formaldehyde-free fiber glass insulation with a minimum R = 0.79 m2 deg C/W4.5 (hr ft2 deg F)/BTU. The insulation must be covered with a foil scrim kraft vapor barrier facing.

2.17.3 Prefabricated Radiant-Heating Electric Panels

2.17.3.1 Description

Sheet metal enclosed panel with heating element suitable for [lay-in installation flush with T-bar ceiling grid] [surface mounting] [recessed mounting]. Comply with UL 2021

2.17.3.2 Panel

Minimum 0.7 mm0.027 inch thick, galvanized steel sheet back panel riveted to minimum 1.0 mm0.040 inch thick, galvanized steel sheet front panel with fused-on crystalline surface.

2.17.3.3 Heating Element

Powdered graphite sandwiched between sheets of electric insulation.

2.17.3.4 Electrical Connections

Nonheating, high-temperature, insulated-copper leads, factory connected to heating element.

2.17.3.5 Exposed-Side Panel Finish

[Apply silk-screened finish to match appearance of Architect selected acoustical ceiling tiles.] [Baked-enamel finish in color as selected by Architect.]
2.17.3.6 Surface-Mounting Trim

Sheet metal with baked-enamel finish in color as selected by Architect.

2.17.3.7 Wall Thermostat

Bimetal, sensing elements; with contacts suitable for [low] [line]-voltage circuit, and manually operated on-off switch with contactors, relays, and control transformers.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

a. Install materials and equipment in accordance with the requirements of the contract drawings and approved manufacturer's installation instructions. Accomplish installation by workers skilled in this type of work. Perform installation so that there is no degradation of the designed fire ratings of walls, partitions, ceilings, and floors.

b. No installation is permitted to block or otherwise impede access to any existing machine or system. Install all hinged doors to swing open a minimum of 120 degrees. Provide an area in front of all access doors that clears a minimum of [910][_____] mm [3][_____] feet. In front of all access doors to electrical circuits, clear the area the minimum distance to energized circuits as specified in OSHA Standards, part 1910.333 (Electrical-Safety Related work practices) and an additional [910][_____] mm [3][_____] feet.

c. Except as otherwise indicated, install emergency switches and alarms in conspicuous locations. Mount all indicators, to include gauges, meters, and alarms in order to be easily visible by people in the area.

3.2.1 Condensate Drain Lines

Provide water seals in the condensate drain from all [units] [units except room [fan-coil units][ and ][coil-induction units]]. Provide a depth of each seal of 50 mm 2 inches plus 0.1 mm for each Pa the number of inches, measured in water gauge, of the total static pressure rating of the unit to which the drain is connected. Provide water seals that are constructed of 2 tees and an appropriate U-bend with the open end of each tee plugged. Provide pipe cap or plug cleanouts where indicated. Connect drains indicated to connect to the sanitary waste system using an indirect waste fitting. Insulate air conditioner drain lines as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.2.2 Equipment and Installation

Provide frames and supports for tanks, compressors, pumps, valves, air handling units, fans, coils, dampers, and other similar items requiring supports. Floor mount or ceiling hang air handling units as indicated. Anchor and fasten as detailed. Set floor-mounted equipment on not less than
150 mm 6 inch concrete pads or curbs doweled in place unless otherwise indicated. Make concrete foundations heavy enough to minimize the intensity of the vibrations transmitted to the piping, duct work and the surrounding structure, as recommended in writing by the equipment manufacturer. In lieu of a concrete pad foundation, build a concrete pedestal block with isolators placed between the pedestal block and the floor. Make the concrete foundation or concrete pedestal block a mass not less than three times the weight of the components to be supported. Provide the lines connected to the pump mounted on pedestal blocks with flexible connectors. Submit foundation drawings as specified in paragraph DETAIL DRAWINGS. Provide concrete for foundations as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.2.3 Access Panels

Install access panels for concealed valves, vents, controls, dampers, and items requiring inspection or maintenance of sufficient size, and locate them so that the concealed items are easily serviced and maintained or completely removed and replaced. Provide access panels as specified in Section 08 31 00 ACCESS DOORS AND PANELS.

3.2.4 Flexible Duct

Install pre-insulated flexible duct in accordance with the latest printed instructions of the manufacturer to ensure a vapor tight joint. Provide hangers, when required to suspend the duct, of the type recommended by the duct manufacturer and set at the intervals recommended.

3.2.5 Metal Ductwork

Install according to SMACNA 1966 unless otherwise indicated. Install duct supports for sheet metal ductwork according to SMACNA 1966, unless otherwise specified. Do not use friction beam clamps indicated in SMACNA 1966. Anchor risers on high velocity ducts in the center of the vertical run to allow ends of riser to move due to thermal expansion. Erect supports on the risers that allow free vertical movement of the duct. Attach supports only to structural framing members and concrete slabs. Do not anchor supports to metal decking unless a means is provided and approved for preventing the anchor from puncturing the metal decking. Where supports are required between structural framing members, provide suitable intermediate metal framing. Where C-clamps are used, provide retainer clips.

3.2.5.1 Underground Ductwork

*****************************************************************************
NOTE: Due to potential contaminants of air-stream, such as pesticides and corrosion, use underground ductwork only for exhaust air.
*****************************************************************************

Provide PVC plastisol coated galvanized steel underground ductwork with coating on interior and exterior surfaces and watertight joints. Install ductwork as indicated, according to ACCA Manual 4 and manufacturer’s instructions. Maximum burial depth is 2 m 6 feet.

3.2.5.2 Radon Exhaust Ductwork

*****************************************************************************
NOTE: Design subslab ventilation for radon mitigation as prescribed in TM 5-810-1.

Perforate subslab suction piping where indicated. Install PVC joints as specified in ASTM D2855.

3.2.5.3 Light Duty Corrosive Exhaust Ductwork

For light duty corrosive exhaust ductwork, use PVC plastisol coated galvanized steel with PVC coating on interior [surfaces] and exterior surfaces] and epoxy wash primer coating on exterior surfaces.

3.2.6 FRP Ductwork

NOTE: Study characteristics of exhaust stream constituents and contaminant materials to determine service life and safety controlling parameters. Consider that constituents concentrate upon evaporation of carrier. Some concentrates detonate upon impact. Design to preclude concentrate high-allow for out water washing. Review fire protection provisions, and the need for fire stops. The manufacturer cannot be held responsible for performance of his product, unless the specification delineates product exposure. Modify or supplement specification criteria as necessary.

Provide fibrous glass reinforced plastic ducting and related structures that conform to SMACNA 1403. Provide flanged joints where indicated. Crevice-free butt lay-up joints are acceptable where flanged joints are not indicated. When ambient temperatures are lower than 10 degrees C 50 degrees F, heat cure joints by exothermic reaction heat packs.

3.2.7 Kitchen Exhaust Ductwork

NOTE: Show on the drawings the requirements in NFPA 96 pertaining to enclosures around kitchen exhaust ducts.

The referenced SMACNA HVAC Duct Construction Manual does not cover negative pressures in excess of 747 Pa 3 inches water gauge. If the static pressure within the duct can exceed 75 mm 3 inches negative, then the spacing and duct thickness must be indicated on the drawings and the paragraph accordingly.

Specify stainless steel duct for projects in humid locations or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.
3.2.7.1 Ducts Conveying Smoke and Grease Laden Vapors

Provide ducts conveying smoke and grease laden vapors that conform to requirements of NFPA 96. Make seams, joints, penetrations, and duct-to-hood collar connections with a liquid tight continuous external weld. Provide duct material that is a [minimum 1.3 mm 18 gauge, Type 304L or 316L, stainless steel] [minimum 1.6 mm 16 gauge carbon steel]. [Include with duct construction an external perimeter angle sized in accordance with SMACNA 1966, except place welded joint reinforcement on maximum of 600 mm 24 inch centers; continuously welded companion angle bolted flanged joints with flexible ceramic cloth gaskets where indicated; pitched to drain at low points; welded pipe coupling-plug drains at low points; welded fire protection and detergent cleaning penetration; steel framed, stud bolted, and flexible ceramic cloth gasketed cleaning access provisions where indicated. Make angles, pipe couplings, frames, bolts, etc., the same material as that specified for the duct unless indicated otherwise.]

3.2.7.2 Exposed Ductwork

Provide exposed ductwork that is fabricated from minimum 1.3 mm 18 gauge, Type 304L or 316L, stainless steel with continuously welded joints and seams. Pitch ducts to drain at hoods and low points indicated. Match surface finish to hoods.

3.2.7.3 Concealed Ducts Conveying Moisture Laden Air

Fabricate concealed ducts conveying moisture laden air from minimum [1.3 mm 18 gauge, Type 300 series, stainless steel] [1.6 mm 16 gauge, galvanized steel] [0.55 mm 16 ounce, tempered copper sheet]. Continuously weld, braze, or solder joints to be liquid tight. Pitch ducts to drain at points indicated. Make transitions to other metals liquid tight, companion angle bolted and gasketed.

3.2.8 Acoustical Duct Lining

Apply lining in cut-to-size pieces attached to the interior of the duct with nonflammable fire resistant adhesive conforming to ASTM C916, Type I, NFPA 90A, UL 723, and ASTM E84. Provide top and bottom pieces that lap the side pieces and are secured with welded pins, adhered clips of metal, nylon, or high impact plastic, and speed washers or welding cup-head pins installed according to SMACNA 1966. Provide welded pins, cup-head pins, or adhered clips that do not distort the duct, burn through, nor mar the finish or the surface of the duct. Make pins and washers flush with the surfaces of the duct liner and seal all breaks and punctures of the duct liner coating with the nonflammable, fire resistant adhesive. Coat exposed edges of the liner at the duct ends and at other joints where the lining is subject to erosion with a heavy brush coat of the nonflammable, fire resistant adhesive, to prevent delamination of glass fibers. Apply duct liner to flat sheet metal prior to forming duct through the sheet metal brake. Additionally secure lining at the top and bottom surfaces of the duct by welded pins or adhered clips as specified for cut-to-size pieces. Other methods indicated in SMACNA 1966 to obtain proper installation of duct liners in sheet metal ducts, including adhesives and fasteners, are acceptable.

3.2.9 Dust Control

To prevent the accumulation of dust, debris and foreign material during
construction, perform temporary dust control protection. Protect the
distribution system (supply and return) with temporary seal-offs at all
inlets and outlets at the end of each day's work. Keep temporary
protection in place until system is ready for startup.

3.2.10 Insulation

Provide thickness and application of insulation materials for ductwork,
piping, and equipment according to Section 23 07 00 THERMAL INSULATION FOR
MECHANICAL SYSTEMS. Externally insulate outdoor air intake ducts and
plenums [up to the point where the outdoor air reaches the conditioning
unit][ or ][up to the point where the outdoor air mixes with the return air
stream].

3.2.11 Duct Test Holes

**************************************************************************

NOTE: Show the location of duct test holes on the
drawings. Locate holes so as to implement the
requirements of Section 23 05 93 TESTING, ADJUSTING,
AND BALANCING OF HVAC SYSTEMS.
**************************************************************************

Provide holes with closures or threaded holes with plugs in ducts and
plenums as indicated or where necessary for the use of pitot tube in
balancing the air system. Plug insulated duct at the duct surface, patched
over with insulation and then marked to indicate location of test hole if
needed for future use.

3.2.12 Power Roof Ventilator Mounting

Provide foamed 13 mm 1/2 inch thick, closed-cell, flexible elastomer
insulation to cover width of roof curb mounting flange. Where wood nailers
are used, predrill holes for fasteners.

3.2.13 Power Transmission Components Adjustment

Test V-belts and sheaves for proper alignment and tension prior to
operation and after 72 hours of operation at final speed. Uniformly load
belts on drive side to prevent bouncing. Make alignment of direct driven
couplings to within 50 percent of manufacturer's maximum allowable range of
misalignment.

3.3 EQUIPMENT PADS

Provide equipment pads to the dimensions shown or, if not shown, to conform
to the shape of each piece of equipment served with a minimum 75 mm 3-inch
margin around the equipment and supports. Allow equipment bases and
foundations, when constructed of concrete or grout, to cure a minimum of
[28][14][_____] calendar days before being loaded.

3.4 CUTTING AND PATCHING

Install work in such a manner and at such time that a minimum of cutting
and patching of the building structure is required. Make holes in exposed
locations, in or through existing floors, by drilling and smooth by
sanding. Use of a jackhammer is permitted only where specifically
approved. Make holes through masonry walls to accommodate sleeves with an
iron pipe masonry core saw.
3.5 CLEANING

******************************************************************************************
NOTE: Cover general cleaning and rubbish removal requirements in Division 01.
******************************************************************************************

Thoroughly clean surfaces of piping and equipment that have become covered with dirt, plaster, or other material during handling and construction before such surfaces are prepared for final finish painting or are enclosed within the building structure. Before final acceptance, clean mechanical equipment, including piping, ducting, and fixtures, and free from dirt, grease, and finger marks. When the work area is in an occupied space such as office, laboratory or warehouse [_____] protect all furniture and equipment from dirt and debris. Incorporate housekeeping for field construction work which leaves all furniture and equipment in the affected area free of construction generated dust and debris; and, all floor surfaces vacuum-swept clean.

3.6 PENETRATIONS

******************************************************************************************
NOTE: Where sleeves are installed in the bearing walls, the designer must provide design details in drawings of the structural steel sleeves. Consult with structural engineers for the design details.
******************************************************************************************

Provide sleeves and prepared openings for duct mains, branches, and other penetrating items, and install during the construction of the surface to be penetrated. Cut sleeves flush with each surface. Place sleeves for round duct 380 mm 15 inches and smaller. Build framed, prepared openings for round duct larger than 380 mm 15 inches and square, rectangular or oval ducts. Sleeves and framed openings are also required where grilles, registers, and diffusers are installed at the openings. Provide 25 mm one inch clearance between penetrating and penetrated surfaces except at grilles, registers, and diffusers. Pack spaces between sleeve or opening and duct or duct insulation with mineral fiber conforming with ASTM C553, Type 1, Class B-2.

3.6.1 Sleeves

Fabricate sleeves, except as otherwise specified or indicated, from 1 mm 20 gauge thick mill galvanized sheet metal. Where sleeves are installed in bearing walls or partitions, provide black steel pipe conforming with ASTM A53/A53M, Schedule 20.

3.6.2 Framed Prepared Openings

Fabricate framed prepared openings from 1 mm 20 gauge galvanized steel, unless otherwise indicated.

3.6.3 Insulation

Provide duct insulation in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS continuous through sleeves and prepared openings except firewall penetrations. Terminate duct insulation at fire dampers and flexible connections. For duct handling air at or below 16
degrees C 60 degrees F, provide insulation continuous over the damper collar and retaining angle of fire dampers, which are exposed to unconditioned air.

3.6.4 Closure Collars

Provide closure collars of a minimum 100 mm 4 inches wide, unless otherwise indicated, for exposed ducts and items on each side of penetrated surface, except where equipment is installed. Install collar tight against the surface and fit snugly around the duct or insulation. Grind sharp edges smooth to prevent damage to penetrating surface. Fabricate collars for round ducts 380 mm 15 inches in diameter or less from 1 mm 20 gauge galvanized steel. Fabricate collars for square and rectangular ducts, or round ducts with minimum dimension over 380 mm 15 inches from 1.40 mm 18 gauge galvanized steel. Fabricate collars for square and rectangular ducts with a maximum side of 380 mm 15 inches or less from 1 mm 20 gauge galvanized steel. Install collars with fasteners a maximum of 150 mm 6 inches on center. Attach to collars a minimum of 4 fasteners where the opening is 300 mm 12 inches in diameter or less, and a minimum of 8 fasteners where the opening is 500 mm 20 inches in diameter or less.

3.6.5 Firestopping

Where ducts pass through fire-rated walls, fire partitions, and fire rated chase walls, seal the penetration with fire stopping materials as specified in Section 07 84 00 FIRESTOPPING.

3.7 FIELD PAINTING OF MECHANICAL EQUIPMENT

Clean, pretreat, prime and paint metal surfaces; except aluminum surfaces need not be painted. Apply coatings to clean dry surfaces. Clean the surfaces to remove dust, dirt, rust, oil and grease by wire brushing and solvent degreasing prior to application of paint, except clean to bare metal on metal surfaces subject to temperatures in excess of 50 degrees C 120 degrees F. Where more than one coat of paint is specified, apply the second coat after the preceding coat is thoroughly dry. Lightly sand damaged painting and retouch before applying the succeeding coat. Provide aluminum or light gray finish coat.

3.7.1 Temperatures less than 50 degrees C 120 degrees F

Immediately after cleaning, apply one coat of pretreatment primer applied to a minimum dry film thickness of 0.0076 mm 0.3 mil, one coat of primer applied to a minimum dry film thickness of 0.0255 mm one mil; and two coats of enamel applied to a minimum dry film thickness of 0.0255 mm one mil per coat to metal surfaces subject to temperatures less than 50 degrees C 120 degrees F.

3.7.2 Temperatures between 50 and 205 degrees C 120 and 400 degrees F

Apply two coats of 205 degrees C 400 degrees F heat-resisting enamel applied to a total minimum thickness of 0.05 mm two mils to metal surfaces subject to temperatures between 50 and 205 degrees C 120 and 400 degrees F.

3.7.3 Temperatures greater than 205 degrees C 400 degrees F

Apply two coats of 315 degrees C 600 degrees F heat-resisting paint applied to a total minimum dry film thickness of 0.05 mm two mils to metal surfaces subject to temperatures greater than 205 degrees C 400 degrees F.
3.7.4 Finish Painting

************************************************************************************
NOTE: Use this paragraph for Air Force and Army projects.
Coordinate color code marking with Section 09 90 00.
************************************************************************************

The requirements for finish painting of items only primed at the factory, and surfaces not specifically noted otherwise, are specified in Section 09 90 00 PAINTS AND COATINGS.

3.7.5 Color Coding Scheme for Locating Hidden Utility Components

************************************************************************************
NOTE: Use this paragraph for Air Force and Army projects.
Coordinate the Color Code Table with the installation. Delete identification plate specified in Section 09 90 00 PAINTS AND COATINGS if color coding scheme is specified.
************************************************************************************

Use scheme in buildings having suspended grid ceilings. Provide color coding scheme that identifies points of access for maintenance and operation of components and equipment that are not visible from the finished space and are accessible from the ceiling grid, consisting of a color code board and colored metal disks. Make each colored metal disk approximately 13 mm 3/8 inch diameter and secure to removable ceiling panels with fasteners. Insert each fastener into the ceiling panel so as to be concealed from view. Provide fasteners that are manually removable without the use of tools and that do not separate from the ceiling panels when the panels are dropped from ceiling height. Make installation of colored metal disks follow completion of the finished surface on which the disks are to be fastened. Provide color code board that is approximately 1 m 3 foot wide, 750 mm 30 inches high, and 13 mm 1/2 inches thick. Make the board of wood fiberboard and frame under glass or 1.6 mm 1/16 inch transparent plastic cover. Make the color code symbols approximately 19 mm 3/4 inch in diameter and the related lettering in 13 mm 1/2 inch high capital letters. Mount the color code board [where indicated] [in the mechanical or equipment room]. Make the color code system as indicated below:

<table>
<thead>
<tr>
<th>Color</th>
<th>System</th>
<th>Item</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

3.8 IDENTIFICATION SYSTEMS

************************************************************************************
NOTE: There is a similar requirement for identification in Section 22 00 00 PLUMBING, GENERAL PURPOSE. Ensure that color coding for all mechanical systems is coordinated.
************************************************************************************
NOTE: Delete when identification tags are not considered necessary on small projects.

Provide identification tags made of brass, engraved laminated plastic, or engraved anodized aluminum, indicating service and item number on all valves and dampers. Provide tags that are 35 mm 1-3/8 inch minimum diameter with stamped or engraved markings. Make indentations black for reading clarity. Attach tags to valves with No. 12 AWG 2 mm 0.0808-inch diameter corrosion-resistant steel wire, copper wire, chrome-plated beaded chain or plastic straps designed for that purpose.

3.9 DUCTWORK LEAK TEST

NOTE: Omit this paragraph for Navy projects.
Delete the bracketed portion of "Test Procedures" in SD-03, and "Performance Tests" in SD-06 of this Section.

This paragraph may be omitted where all ductwork is constructed to static pressure Class 125, 250, or 500 Pa 1/2, 1, or 2 inch W.G.. Delete the corresponding requirements in SD-06 of this Section and corresponding paragraph in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS when this paragraph is deleted.

Otherwise, derive the leakage rate for each system based on procedure outlined in SMACNA 1972 CD for Seal Class A. If round/oval metal ductwork only is specified, use C sub L = 3, otherwise C sub L = 6 may be used. Make the value of P used equal to the highest duct static pressure class; i.e., 3, 4, 6, or 10, for the ductwork to be tested. Where major components such as fans, coils, filters, etc. are included in ductwork test, include an appropriate allowance in the maximum allowable leakage rate.

Use this paragraph in Air Force and Army projects.

Perform ductwork leak test for the entire air distribution and exhaust system, including fans, coils, [filters, etc.][filters, etc. designated as static pressure Class 750 Pa 3 inch water gauge through Class 2500 Pa 10 inch water gauge.] Provide test procedure, apparatus, and report that conform to SMACNA 1972 CD. The maximum allowable leakage rate is [_____] L/s cfm. Complete ductwork leak test with satisfactory results prior to applying insulation to ductwork exterior or concealing ductwork.

3.10 DUCTWORK LEAK TESTS

NOTE: Use this paragraph in Navy Projects.

The requirements for ductwork leak tests are specified in Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC.
3.11 DAMPER ACCEPTANCE TEST

Submit the proposed schedule, at least 2 weeks prior to the start of test. Operate all fire dampers and smoke dampers under normal operating conditions, prior to the occupancy of a building to determine that they function properly. Test each fire damper equipped with fusible link by having the fusible link cut in place. Test dynamic fire dampers with the air handling and distribution system running. Reset all fire dampers with the fusible links replaced after acceptance testing. To ensure optimum operation and performance, install the damper so it is square and free from racking.

3.12 TESTING, ADJUSTING, AND BALANCING

The requirements for testing, adjusting, and balancing are specified in Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC. Begin testing, adjusting, and balancing only when the air supply and distribution, including controls, has been completed, with the exception of performance tests.

3.13 PERFORMANCE TESTS

Conduct performance tests as required in Section 23 05 93 Testing, Adjusting and Balancing for HVAC and Section 23 09 00 Instrumentation and Control for HVAC.

3.14 CLEANING AND ADJUSTING

Provide a temporary bypass for water coils to prevent flushing water from passing through coils. Inside of [room fan-coil units][coil-induction units,] [air terminal units,] [unit ventilators,] thoroughly clean ducts, plenums, and casing of debris and blow free of small particles of rubbish and dust and then vacuum clean before installing outlet faces. Wipe equipment clean, with no traces of oil, dust, dirt, or paint spots. Provide temporary filters prior to startup of all fans that are operated during construction, and provide new filters after all construction dirt has been removed from the building, and the ducts, plenums, casings, and other items specified have been vacuum cleaned. Perform and document that proper "Indoor Air Quality During Construction" procedures have been followed; provide documentation showing that after construction ends, and prior to occupancy, new filters were provided and installed. Maintain system in this clean condition until final acceptance. Properly lubricate bearings with oil or grease as recommended by the manufacturer. Tighten belts to proper tension. Adjust control valves and other miscellaneous equipment requiring adjustment to setting indicated or directed. Adjust fans to the speed indicated by the manufacturer to meet specified conditions. Maintain all equipment installed under the contract until close out documentation is received, the project is completed and the building has been documented as beneficially occupied.

3.15 RADIANT PANELS

3.15.1 Installation

Install radiant panels level and plumb, maintaining sufficient clearance for normal services and maintenance.
3.15.2 Soldering

When soldering copper fittings at the panel, a heat pad will be used to protect the panel finish.

3.15.3 Connections

Install piping adjacent to radiant panels to allow for service and maintenance.

3.16 OPERATION AND MAINTENANCE

3.16.1 Operation and Maintenance Manuals

Submit [six] [_____] manuals at least 2 weeks prior to field training. Submit data complying with the requirements specified in Section 01 78 23 OPERATION AND MAINTENANCE DATA. Submit Data Package 3 for the items/units listed under SD-10 Operation and Maintenance Data.

3.16.2 Operation And Maintenance Training

**************************************************************************
NOTE: Determine the number of hours of instruction based on the number and complexity of the systems specified.
**************************************************************************

Conduct a training course for the members of the operating staff as designated by the Contracting Officer. Make the training period consist of a total of [_____] hours of normal working time and start it after all work specified herein is functionally completed and the Performance Tests have been approved. Conduct field instruction that covers all of the items contained in the Operation and Maintenance Manuals as well as demonstrations of routine maintenance operations. Submit the proposed On-site Training schedule concurrently with the Operation and Maintenance Manuals and at least 14 days prior to conducting the training course.

NOTE: This guide specification covers the requirements for exposed flexible tubing, vehicle tailpipe and welding fume exhaust systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The designer should be familiar with the current American Conference of Governmental Industrial Hygienists' "Industrial Ventilation: A Manual of Recommended Practice" and the applicable requirements in the most current editions of AHSRAE Handbooks before preparing the design.

The exhaust system layout, including all ductwork, ductwork components (including supports, hangars and anchors), flexible connections, cleanouts and test ports will be shown on the drawings.
1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SYSTEM DESCRIPTION

Construct, complete and operational, an exhaust system as specified herein. Provide adequate air exhaust quantities and velocities. Properly size all duct for pressure loss and adequate velocity including locating intakes, ductwork size, layout, equipment and controls. Base construction of the exhaust system on the referenced publications, and other provisions as specified herein. Furnish ductwork offsets, fittings, and any other accessories required, as specified, to provide a complete exhaust system installation and to eliminate interference with other construction. Provide controls as specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
1.4 QUALITY ASSURANCE

1.4.1 Detail Drawings

Submit [3] [_____] copies of the Exhaust System Drawings, no later than [21] [_____] days prior to the start of exhaust system installation. Include a complete list of equipment and materials, including manufacturer's descriptive and technical literature, performance charts and curves, catalog cuts, installation instructions, complete duct, wiring, and schematic diagrams and any other details to demonstrate that the system has been coordinated and will properly function as a unit. Also show proposed layout and anchorage of equipment and appurtenances, and equipment in relation to other parts of the work including clearances required for maintenance and operation.

1.4.2 Exhaust System Specialist

Submit the name and documentation of certification of the proposed Exhaust System Specialists, no later than [14] [_____] days after the Notice to Proceed and prior to the submittal of the exhaust system drawings and

SECTION 23 35 16.17 10 Page 7
hydraulic calculations. Prepare a list of the submittals from the Contract Submittal Register that relate to the successful installation of the exhaust systems(s). Submit the list no later than [7] [_____] days after the approval of the Exhaust System Specialist. The related submittals identified on this list must be accompanied by a letter of approval signed and dated by the Exhaust System Specialist when submitted to the Government. The Exhaust System Specialist must be regularly engaged in the installation of the type and complexity of system specified in the Contract documents, and will have served in a similar capacity for at least three systems that have performed in the manner intended for a period of not less than 6 months.

1.5 DELIVERY, STORAGE, AND HANDLING

House all equipment delivered and placed in storage in a manner to preclude any damage from the weather, humidity and temperature variations, dirt and dust, or other contaminants. Additionally, cap or plug all ductwork, flexible connections and pipes until installed.

1.6 EXTRA MATERIALS

Submit spare parts data for each item of equipment and material specified. Include a complete list of parts and supplies, with current unit prices and source of supply, and a list of parts recommended by the manufacturer to be replaced after 1 year and 3 years of service. Include a list of special tools and test equipment required for maintenance and testing of the products supplied.

PART 2 PRODUCTS

2.1 STANDARD PRODUCTS

a. Provide materials and equipment which are standard products of a manufacturer regularly engaged in the manufacture of the product and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Submit manufacturer's catalog data included with the Exhaust System Drawings for all items specified herein. Highlight data to show model, size, options, etc., that are intended for consideration. Demonstrate compliance with all contract requirements. In addition, provide a complete equipment list that includes equipment description, model number and quantity.

b. Where an integrated, packaged exhaust system is furnished, all items will be the product of the system manufacturer. System component parts may be by other manufacturers. Provide equipment by a service organization that is capable of responding to service calls within [four hours] [______].

c. Asbestos and asbestos-containing products are not acceptable.

2.2 NAMEPLATES

Furnish a nameplate that identifies the manufacturer's name, address, type or style, model or serial number, and catalog number on all equipment.

2.3 EQUIPMENT GUARDS AND ACCESS

**************************************************************************

NOTE: Catwalks, ladders, and guardrails may be
required. If so, select the applicable item and indicate on drawings. If not applicable, delete the entire last sentence.

**************************************************************************

Fully enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personnel contact according to OSHA requirements. Properly guard or cover high temperature equipment and piping exposed to contact by personnel or where it creates a potential fire hazard with insulation of a type specified. Provide [catwalks,] [operating platforms,] [ladders,] [and] [guardrails] where shown and construct according to Section [08 31 00 ACCESS DOORS AND PANELS][05 51 33 METAL LADDERS].

2.4 DUCTWORK COMPONENTS

**************************************************************************

NOTE: Provide duct access doors at regular intervals to facilitate the cleaning of duct systems for applications requiring clean air supplies, such as hospitals, laboratories, electronics servicing and similar activities.

**************************************************************************

2.4.1 General

Provide duct constructed of [galvanized] [stainless steel] sheets of the minimum gauge thickness for ducts as required in [SMACNA 1922] [SMACNA 1520]. Construct and seal ducts in accordance with [SMACNA 1922] [SMACNA 1520] for a negative pressure of [_____] Pa inch water gauge static pressure. Unless otherwise approved, provide ducts that are round with longitudinal lock seam and conform to the dimensions indicated. Provide ducts that are straight and smooth on the inside with airtight joints. Where ducts with crimped ends are used to make up joints, the joints must have crimp and bead. The bead must provide a rigid stop for the mating open end to seat against. Steel spiral wound duct is not acceptable.

2.4.2 Fittings

Furnish reducing fittings that have a minimum of 1 mm increase in diameter per 8 mm 1 inch increase in diameter per 8 inches in length. Elbows that have a centerline radius less than 1.5 times the diameter are not permitted. Stub branches into mains at main expansion points at an angle of not more than 30 degrees with the centerline of the main duct in the direction of air flow, unless otherwise indicated or approved. Where riser ducts with single or multiple inlets are indicated, connect the riser duct into the bottom of the main duct at an angle as specified for branches. Where flexible connections connect to the main duct, brace the duct branch takeoff or stub with approved metal straps or members.

2.4.3 Cleanout

Provide cleanout on the end of the main ductwork opposite the end of the fan suction connection. Size the cleanout opening to the approximate inside area of the duct. Provide removable airtight caps or flange type covers of minimum gauge thickness as the main duct. Provide other cleanout openings where indicated.
2.4.4 Apparatus Connections

Where sheet metal connections are made to fan suction and discharge, or where ducts of dissimilar metals are connected, install an approved noncombustible flexible connection approximately 150 mm 6 inches and securely fasten by zinc-coated steel clinch-type draw bands for round ducts. For rectangular ducts, install the flexible connections locked to metal collars using normal duct construction methods.

2.4.5 Duct Test Holes

Provide test holes with covers where indicated, directed, or where necessary in ducts and plenums for using Pitot tubes for taking air measurements to balance the air systems.

2.4.6 Duct Sleeves and Framed Openings

Provide duct sleeves for all round ducts 375 mm 15 inch diameter or less passing through floors, walls, ceilings, or roofs. Provide sleeves in non-load bearing walls fabricated of 1.0 mm 20 gauge steel sheets conforming to ASTM A924/A924M. Provide sleeves in load-bearing walls fabricated of standard-weight galvanized steel pipe conforming to ASTM A53/A53M. Install round ducts larger than 375 mm 15 inch diameter and all square and rectangular ducts passing through floors, walls, ceilings, or roofs through framed openings. Furnish structural steel members for framed openings conforming to ASTM A36/A36M. Provide 25 mm 1 inch clearance between the duct and the opening. Provide closure collars of galvanized steel no less than 100 mm 4 inches wide on each side of walls or floors where sleeves or framed openings are provided. Fabricate collars for round ducts 375 mm 15 inch diameter or less from 1.0 mm 20 gauge galvanized steel. Fabricate collars for round, square or rectangular ducts with minimum dimension over 375 mm 15 inches from 1.2 mm 18 gauge galvanized steel.

2.5 EXHAUST HOSE SYSTEM

**************************************************************************
NOTE: The following may be used as a guide in selecting materials based on maximum temperature for exhaust hose. A variety of hose is available that can handle various temperature as suitable for the application.

a. Galvanized steel, 315 degrees C 600 degrees F (for 0.3 mm 0.012 thickness).

b. Stainless steel, (for 0.3 mm 0.012 inch thickness) 540 degrees C 1000 degrees F.

c. Heat-resistant wire reinforced glass fiber and neoprene, 120 degrees C 250 degrees F.

d. Heat-resistant wire reinforced glass fiber and silicone, 315 degrees C 600 degrees F.

e. Heat resistant thermoplastic, reinforced with a layer of polyester rated for 149 degrees C 300 degrees F.
f. Double layered, chemically treated, woven glass fabric mechanically joined to an outer steel coil. Temperature resistance is to 815.5 degrees C 1500 degrees F.

Also of importance is that the design incorporate adjustment or shut-off dampers at each adapter or receptor.

2.5.1 Tailpipe Adapters

Provide tapered-cone adapters with spring clips or other suitable devices for exhaust pipe attachment. The adapter must fit [_____] mm inch nominal diameter exhaust pipe.

2.5.2 Welding Fume Receptors

Construct welding fume receptors of minimum 1.0 mm 20 gauge thick aluminum and equip with 13 mm 1/2 inch mesh receptor screens; with swivel connections, and magnets on receptor base.

2.5.3 Flexible Exhaust Hose

Flexible exhaust hose must be [0.30 mm 0.012 inch minimum strip thickness of stainless steel] [0.30 mm 0.012 inch minimum strip thickness of galvanized steel] [approved heat-resistant wire-reinforced glass fiber and neoprene tubing] [approved heat-resistant wire reinforced glass fiber and silicone tubing]. [Provide wye connectors where shown]. Provide flexible tubing inside diameter and length as shown. Connect the tubing to the bottom of the ductwork. Provide a flanged connection where the flexible tubing and overhead ductwork are joined. The flanged connection must consist of steel flanges not less than 200 mm 0.078 inch thick, 3.175 mm 1/8 inch gasket. Provide gasket suitable for the system design temperature shown, in accordance with ASME B16.21, full face or self-centering flat ring type. It must contain aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR). Size or design the flange to suit the hose as approved. [The connection of the neoprene hose may be installed with an approved hose clamp or as recommended by the manufacturer.]

2.5.4 Exhaust Hose Suspension System

Suspend the flexible tubing overhead when not in use; allowing it to be lowered to the operating level, when required. Furnish the suspension system complete with cable, and operating mechanism. The suspension system must be [counter-weighted type] or [manually operated balancer type with safety ratchet lock or automatic brake having slip resistant hand grip].

2.6 DAMPERS

NOTE: Indicate the location of dampers and the types required. Details of the dampers will be shown on the drawings. Shutoff dampers may be shown on the drawings to be provided at each individual tailpipe exhaust adapter. The use of these dampers at inactive stations will reduce infiltration and may reduce the energy required for heating. When
Shutoff dampers are provided in the individual branch tailpipe adapters, adjust the exhaust fan capacity for systems which have four stations. Systems having more than four branches provided with shutoff dampers must have a fan capacity equal to four branches plus 50 percent of the capacity of the number of branches over four.

Provide dampers of the type indicated and install where shown. Provide circular disk dampers with quadrant locking device or blast gate type. Damper blades less than 1.6 mm 16 gauge thickness of stainless steel are not permitted. Provide blast gate dampers consisting of two piece construction with adjustable sliding gate and setscrew.

2.7 MATERIALS

Provide materials conforming to the following requirements.

2.7.1 Screen

ASTM E2016, type and class as required for the application.

2.7.2 Iron and Steel Sheets

2.7.2.1 Galvanized Iron and Steel

ASTM A924/A924M, Coating Designation G90.

2.7.2.2 Uncoated Steel

ASTM A1011/A1011M, condition, and type best suited to intended use.

2.7.2.3 Stainless Steel

ASTM A167, Type 304.

2.7.3 Steel Structural Shapes

ASTM A36/A36M.

2.7.4 Solder Silver

AWS A5.8/A5.8M, brazing alloy; grade to suit application.

2.7.5 Solder

ASTM B32, composition to suit application.

2.7.6 Bolts and Nuts

Furnish bolts and nuts, except as required for high temperature exhaust applications, in accordance with ASTM A307. Use bolts and nuts for exhaust applications where the temperature of the bolt may rise above 200 degrees C 400 degrees F or use as flange bolts in corrosion resistant material in accordance with ASTM A193/A193M Class 2. Mark the bolt head to identify the manufacturer and the standard with which the bolt complies in accordance with ASTM A307 or ASTM A193/A193M as applicable.
2.8 ELECTRICAL WORK

**************************************************************************
NOTE: Electrical characteristics, motor starter type, enclosure type, and maximum rpm should be shown on the drawings in the equipment schedules.
**************************************************************************

Provide specified electrical motor-driven equipment complete with motor, motor starter, and controls. Unless otherwise specified, provide electric equipment, including wiring and motor efficiencies, according to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical characteristics and enclosure type as shown. Unless otherwise indicated, motors of 745 W 1 hp and above must be high efficiency type. Provide motor starters complete with thermal overload protection and other appurtenances necessary. Provide each motor according to NEMA MG 1 and of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Manual or automatic control and protective or signal devices required for the operation specified, and any control wiring required for controls and devices, but not shown, must be provided. Where two-speed or variable-speed motors are indicated, solid-state variable-speed controller may be provided to accomplish the same function. Utilize solid-state variable-speed controllers for motors rated 7.45 kW 10 hp or less. Use adjustable frequency drives for larger motors.

2.9 AIR MOVING DEVICES

**************************************************************************
NOTE: Drawings will indicate fan capacity, CFM total static pressure, sound/power level, arrangement, rotation, discharge and motor horsepower. Details for weather hoods and flashing and locations for bird screens and location of remote manual switches will be indicated on the drawings.
**************************************************************************

2.9.1 General

Test and rate fans in accordance with the standards of AMCA 210, Type "D" Ducted Inlet, Ducted Outlet Configuration. [Fans having a capacity of less than 200 L/s 400 cubic feet/minute will be directly connected to the motor shaft] [Where V-belt drives are used, design such drives for no less than 150 percent of the connected driving capacity, and adjust motor sheaves to provide no less than an overall 20 percent speed variation. Select sheaves to drive the fan at such speed as to produce the specified capacity when set at the approximate midpoint of the sheave adjustment. Provide motors for V-belt drives with adjustable rails or bases]. Provide fans with personnel screens or guards on both suction and supply ends except where ducts or dampers are connected to the fan. Provide fans and motors with vibration isolation supports or mountings. Vibration isolation units must be standard products with published load ratings, and mus be single rubber-in-shear, neoprene coated fiberglass, double rubber-in-shear springs, or springs under inertia base. Select each fan to produce the capacity required at the fan total pressure indicated. Provide standard AMCA arrangements unless otherwise indicated and provide the rotation and discharge as indicated. Provide fans with nonoverloading characteristics. Construct fan housing with no less than 1.5 mm 16 gauge thick steel. Construct fan impellers to meet AMCA Spark Resistance "B" Classification
and accurately balance both statically and dynamically when installed in the assembled fan unit. Coat impellar and housing in the air stream with neoprene, epoxy, phenolic resins, or otherwise be suitable to resist the corrosive gases and temperatures produced. Fans must be free of objectionable vibration or noise. Certified performance curves indicating that the fan supplied will operate in its most efficient operating range will be provided. In addition, furnish "sound power" ratings with each fan. Provide fans indicated to be mounted on exterior of building with weatherproof covers for the motor drive unit or other weatherproofing as recommended by the manufacturer. Select each fan to produce the capacity required at the fan total pressure indicated. Provide weather hoods, flashing, and bird screens where indicated.

2.9.2 Fans

**************************************************************************
NOTE: Refer to UFC 3-450-01, Noise and Vibration Control for Mechanical Equipment, for vibration criteria. Vibration isolation required should be shown and included in the appropriate schedule on the drawings.
**************************************************************************

Provide sound power level as indicated and obtain values according to AMCA 300. Indicate Standard AMCA arrangement, rotation, and discharge. Test and rate fans according to AMCA 210. Select each fan to produce the capacity required at the fan static pressure indicated. Fans may be connected to the motors either directly or indirectly with V-belt drive. Design V-belt drives for no less than [150] [140] [120] percent of the connected driving capacity. Provide variable pitch motor sheaves for 11 kW 15 hp and below and fixed pitch as defined by AHRI Guideline D. Select variable pitch sheaves to drive the fan at a speed which will produce the specified capacity when set at the approximate midpoint of the sheave adjustment. When fixed pitch sheaves are furnished, provide a replaceable sheave when needed to achieve system air balance.

2.9.2.1 Protective Devices

Provide motors for V-belt drives with adjustable rails or bases. Provide removable metal guards for all exposed V-belt drives, and provide speed-test openings at the center of all rotating shafts. Provide fans with personnel screens or guards on both suction and supply ends, except that the screens need not be provided, unless otherwise indicated, where ducts are connected to the fan. Provide fan and motor assemblies with vibration-isolation supports or mountings as indicated. Vibration-isolation units must be standard products with published loading ratings.

2.9.2.2 Centrifugal Fans

Centrifugal fans must be fully enclosed, single-width single-inlet, or double-width double-inlet, AMCA Pressure Class I, II, or III as required or indicated for the design system pressure. Provide rigidly constructed impellar wheels, accurately balance both statically and dynamically. [Fan blades may be forward curved, backward-inclined or airfoil design in wheel sizes up to 750 mm 30 inches. Fan blades for wheels over 750 mm 30 inches in diameter must be backward-inclined or airfoil design]. These fans must be suitable for the temperatures encountered. Provide fan shaft with a heat slinger to dissipate heat buildup along the shaft. Supply an access
provide the service door to facilitate maintenance with these fans. Fan wheels over 900 mm 36 inches in diameter must have overhung pulleys and a bearing on each side of the wheel. Indirect drive fan wheels 900 mm 36 inches or less in diameter may have one or more extra long bearings between the fan wheel and the drive. Provide bearings that are sleeve type, self-aligning and self-oiling with oil reservoirs, or precision self-aligning roller or ball-type with accessible grease fittings or permanently lubricated type. Connect grease fittings to tubing and service from a single accessible point. Bearing life must be L50 rated at not less than 200,000 hours as defined by ABMA 9 and ABMA 11. Provide steel fan shafts, accurately finish, and provide key seats and keys for impeller hubs and fan pulleys. Provide each fan outlet of ample proportions and design for the attachment of angles and bolts for attaching flexible connections. Provide motors, unless otherwise indicated, that do not exceed 1800 rpm and have [open] [dripproof] [totally enclosed] [explosion-proof] enclosures. [Provide motor starters that are [manual] [magnetic] [across-the-line] [reduced-voltage-start] type with [general-purpose] [weather-resistant] [watertight] enclosure.] [Provide remote manual switch with pilot indicating light where indicated.]

2.9.3 In-Line Centrifugal Fans

Provide in-line centrifugal fans consisting of welded tubular casings, centrifugal backward inclined blades, stationary discharge conversion vanes, internal and external belt guards, and adjustable motor mounts. Air must enter and leave the fan axially. Inlets must be streamline with conversion vanes to eliminate turbulence and discharge air flow smoothly. Enclose fan bearings and drive shafts and isolate from air stream. Provide fan bearings that are sealed against dust and dirt and permanently lubricated or lubricative type with grease lines extending to the exterior of the housing. Bearing life must be L50 rated at not less than 200,000 hours as defined by ABMA 9 and ABMA 11. Provide motors that have [open] [dripproof] [totally enclosed] [explosion-proof] enclosure. Provide motor starters that are [manual] [magnetic] across-the-line with [general-purpose] [weather-resistant] [explosion-proof] enclosure. [Provide remote manual switch with pilot indicating light where indicated.]

2.10 FACTORY COATING

Provide factory finished equipment and component items, when fabricated from ferrous metal as defined by ASTM (or similar) standard, with the manufacturers standard finish except provide weather-resistant finishes that will withstand 500 hours exposure to the salt spray test specified in ASTM B117 to items located outside of building.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Install work as shown and according to the manufacturer's diagrams and recommendations.
3.3 **INSPECTION**

The Exhaust System Specialist must (1) Inspect the exhaust system periodically during the installation. (2) Witness the final tests, and sign approval of the test results. (3) Certify in writing that the system has been installed in accordance with the contract requirements. Bring any discrepancy to the attention of the Contracting Officer in writing, no later than three working days after the discrepancy is discovered.

3.4 **EXHAUST SYSTEM INSTALLATION**

3.4.1 **General Requirements**

Perform welding and brazing conforming to ASME BPVC SEC IX. Install horizontal sections of the main duct with the longitudinal lock seam on the top. Seal slip joints in accordance with [SMACNA 1922] [SMACNA 1520]. Support and anchor riser duct to the structure as indicated. Attach main duct to the structural members of the building as recommended by [SMACNA 1922] [SMACNA 1520].

3.4.2 **Building Surface Penetrations**

**************************************************************************

NOTE: Indicate penetration and sleeve and packing details on the drawings in accordance with TM-5-812-2, Section 07 84 00 FIRESTOPPING.

**************************************************************************

Utilize sleeves or framed openings where duct penetrates building surfaces. Penetrations must be sealed[, and fireproofed in accordance with Section 07 84 00 FIRESTOPPING]. Pack the space between the sleeve or framed opening and the duct with mineral wool or other approved material. Install closure collars around the duct on both sides of the penetrated surface. Collars must fit tight against the building surfaces and snugly around the duct.

3.5 **PIPE COLOR CODE MARKING**

**************************************************************************

NOTE: Designer will coordinate color code marking with Section 09 90 00 PAINTS AND COATINGS. Color code marking for piping which are not listed in Table I of Paragraph Pipe Color Code Marking of UFGS Section 09 90 00 will be added to the table.

**************************************************************************

Provide color code marking of piping as specified in Section 09 90 00 PAINTS AND COATINGS.

3.6 **ONSITE TRAINING**

Submit proposed Onsite Training schedule, at least [14] [_____] days prior to the start of related training for the operating staff as designated by the Contracting Officer. The training period must consist of a total [8] [_____] hours of normal working time and must start after the system is functionally completed but prior to final acceptance tests. The field instructions must cover all of the items contained in the approved operation and maintenance manuals, as well as demonstrations of routine maintenance operations. Submit [6] [_____] manuals listing step-by-step
procedures required for system startup, operation, shutdown, and routine maintenance, at least 14 days [_____] prior to on-site training. Include the manufacturer's name, model number, list of parts and tools that should be kept in stock by the owner for routine maintenance including the name of a local supplier, simplified wiring and controls diagrams, troubleshooting guide, and recommended service organization (including address and telephone number) for each item of equipment. [Each service organization submitted must be capable of providing [4] [_____] hour on-site response to a service call on an emergency basis.] Notify the Contracting Officer at least 14 days prior to date of proposed conduction of the training course.

3.7 FINAL ACCEPTANCE TESTS

Balance each exhaust system and inlet to produce the indicated air quantities within 10 percent at the conditions shown. Set control devices to control at the points indicated or directed. Lubricate bearings, and check the speed, direction or rotation of each fan. Check the running current of each motor. Upon completion, and prior to acceptance of the installation, test the exhaust system at operating conditions to demonstrate satisfactory functional and operating efficiency.

a. Operating tests must cover a period of not less than 2 hours for each system, and conduct all tests in the presence of the Contracting Officer. If tests do not demonstrate satisfactory operation of the exhaust system, correct deficiencies and retest. Provide all instruments, facilities, and labor required to properly conduct the tests. The electricity required for testing will be furnished by the Government.

b. Submit [3] [_____] copies of the completed Final Acceptance Tests Reports, no later that [7] [_____] days after the completion of the Tests. Sign all items in the Final Acceptance Report. Submit proposed diagrams, instructions, and other sheets, concurrent with the Final Acceptance Test Procedures. Post framed instructions under glass or in laminated plastic where directed, including wiring and control diagrams showing the complete layout of the entire system. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system in typed form, frame as specified above for the wiring and control diagrams and post beside the diagrams. Post the framed instructions before acceptance testing of the systems.

c. Submit proposed procedures for Final Acceptance Tests, no later than [14] [_____] days prior to the proposed start of the tests.

d. Submit proposed date and time to begin Final Acceptance Tests, with the Final Acceptance Test Procedures. Provide notification at least [14] [_____] days prior to the proposed start of the test.

      3.1.14.1 General Requirements for Protective Coating Work
      3.1.14.2 Baked, Unmodified Phenolic System
      3.1.14.3 Inorganic Zinc Coating System
      3.1.14.4 Field Inspection of Protective Coating Work
   3.1.15 Factory and Field Painting and Finishing
      3.1.15.1 Factory Work
      3.1.15.2 Field Work

3.2 TESTING, ADJUSTING, AND BALANCING
   3.2.1 Ductwork Structural Integrity and Leakage Testing
   3.2.2 Power Transmission Components Adjustment
   3.2.3 Preliminary Tests
   3.2.4 Testing, Adjusting, and Balancing Work
   3.2.5 Systems Volume Acceptance Criteria
   3.2.6 Sound Level Tests

3.3 SYSTEM[S] OPERATION DEMONSTRATION

3.4 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for blower and exhaust systems for removal of flammable vapors including paint spraying residue, corrosive fumes, dust, and stock conveying.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification also includes plastic duct systems for removal of nonflammable corrosive fumes and vapors. Materials must be selected by the designer to suit project requirements. The system must be designed in accordance with NFPA 91. Ventilation and exhaust systems and components for removal of smoke and grease laden vapors from commercial type cooking equipment are covered in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT and 23 30 00 HVAC AIR DISTRIBUTION. Laboratory fume hoods are covered in Section 11 53 00 LABORATORY EQUIPMENT AND FUME HOODS. The design agency (EFD, OICC, PWC, etc.) must ensure review of the ventilation system design by the appropriate Naval Medical Command.
(NAVMEDCOM) activity in accordance with NAVOSH requirements. For high temperature applications, the designer must specify special fans and duct material as required for the particular application.

**************************************************************************

NOTE: The following information must be shown on the project drawings:

1. Arrangement plan and details for fans, ducts, and accessories.

2. Duct pressure classes or duct operating pressures. Design duct for maximum negative pressure practical to accommodate improper operation or poor maintenance.

3. Equipment schedules.

4. Equipment foundations and supports.

5. Structural supports for ducts where required.

6. The design of industrial ventilation systems and the editing of this section should be performed by professional engineers or industrial hygienists with a sound knowledge of industrial ventilation. Design should conform to the ACGIH-2092S Industrial Ventilation: A Manual Of Recommended Practice; ASSE Z9.2, Fundamentals Governing the Design and Operation of Local Exhaust Ventilation Systems; AIHA Z9.3, Spray Finishing Operations - Safety Code for Design, Construction and Ventilation; UFC 3-410-04N, "Industrial Ventilation"; and other references as applicable. Fan arrangements should be selected to eliminate system effects identified in ANSI/AMCA 201.

**************************************************************************

PART 1   GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically
be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 GENERAL REQUIREMENTS

1.2.1 SMACNA Duct Construction Manuals

The recommendations in the Sheet Metal and Air Conditioning Contractors' National Association (SMACNA) duct construction manuals must be considered mandatory requirements. Substitute the word "must" for "should" in these manuals.

1.2.2 Fan Data

[For fans include fan curves or rating tables and derating factors.]
Provide certified performance curves showing total pressure, power, and mechanical efficiency versus flow rate of the operating density and fan speed. All areas of unstable operation must be indicated. For fans equipped with adjustable capacity controls such as variable inlet or vaneaxial fans with adjustable blade settings, minimum and maximum performance must be indicated along with performance for fire intermediate settings.

1.2.3 Natural Ventilation

Evaluate natural ventilation for appropriate spaces, and design air distribution systems to operate in the same direction as natural ventilation to reduce energy cost of pumping outdoor air.

1.2.4 Industrial Ventilation and Exhaust Systems

Submit drawings including fan installation drawings; duct systems[, including welding and vehicle exhaust]; supports and anchor location and load imposed.
1.2.5 Start-Up Tests

Submit start-up tests reports in accordance with the paragraph TESTING, ADJUSTING, AND BALANCING. Submit final test report for [the] system[s] tested, describing all test apparatus, instrumentation calculations, factors, flow coefficients, sound levels, and equipment data based on ACGIH-2092S recommended forms or reasonable facsimiles thereof to suit project conditions. Adjustment and setting data must be included in test report. Submit sound level test reports for high noise level equipment.

1.2.6 Related Requirements

Conform to Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS as well as additional requirements specified herein.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.]

Submit the following in
accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-11 Closeout Submittals

Posted Operating Instructions
Submit text of posted operating instructions for ventilation and exhaust systems.

1.4 QUALITY ASSURANCE

1.4.1 Welders' Identification
Submit a listing of the names and identification symbols to be used to identify the work performed by the welder or welding operator who after completing a welded joint must identify it as his work by applying his assigned symbol for a permanent record.

1.4.2 Fiberglass Fan Servicer Experience Information
Submit text.

1.4.3 Qualified Personnel
Operations involving joining thermoplastic ductwork by solvent or hot gas and joining fiberglass ductwork by laminating must be performed by personnel certified by the manufacturer as qualified for the work.

1.4.4 Qualification of Welders
Qualify each welder or welding operator by tests using equipment, welding procedures and a base metal and electrode or filler wire from the same compatible group number that will be encountered in the applicable welding test procedures. Welders or welding operators who make acceptable procedure qualification test welds will be considered performance qualified for the welding procedure used. Determine performance qualification in accordance with AWS D1.1/D1.1M. Notify the Contracting Officer 24 hours in advance as to the time and place of tests and wherever practical perform
the tests at the work site].

1.4.5 TAB Requirements

Requirements are specified in Section 23 05 93 TESTING, ADJUSTING AND BALANCING and Section 23 08 01.00 20 TESTING INDUSTRIAL VENTILATION SYSTEMS.

1.5 POSTED OPERATING INSTRUCTIONS

Provide for ventilation and exhaust system. In addition, permanently mark, drill, and pin as an integral part of device, final adjustment and settings pursuant to testing, adjusting, and balancing.

1.6 SAFETY PRECAUTIONS

1.6.1 Guards and Screens

Provide metal personnel safety guards for normally accessible unducted fan inlets and discharges and moving power transmission components in accordance with OSHA 29 CFR 1910.219.

1.6.2 Welding

Conform to AWS Z49.1 for safety in welding and cutting.

PART 2 PRODUCTS

2.1 FANS, GENERAL REQUIREMENTS FOR

2.1.1 General Performance, Component, and Other Requirements

Fans must have certified performance ratings as evidenced by conformance to the requirements of AMCA 211, and must be listed in AMCA CRP, or must be currently eligible for such listing. Fans must generally be in accordance with AMCA 99 unless superseded by other requirements stated elsewhere herein. Determine performance data for fans in accordance with AMCA 210. Select fans to minimize the exposure of personnel working in or occupying the immediate installation area. The total sound power level of the fan tests must not exceed 90 dBA when tested per AMCA 300 and rated per AMCA 301, or it must be provided with an appropriate attenuation device or devices. Scheduled fan performance is the performance required under specified or indicated installation conditions with specified or indicated accessories. The net installed air performance of the fan, with accessories/appurtenances in place, must be sufficient to meet the scheduled performance within the limits of the fan rating certification tolerance. Affix the manufacturer's product identification nameplate to each unit. Apply additional requirements for specific service or generic type or class of fan. If nonuniform air flow conditions are likely to be encountered, contact the fan manufacturer to ensure that the fan is rated for the additional fan inlet and outlet effect. Install fans to minimize fan system effect in accordance with AMCA 201. Fans must be listed in the Directory of Products licensed to use AMCA seal.

2.1.2 Bearings and Lubrication

**************************************************************************

NOTE: Sleeve type bearings should be specified or indicated on drawings where low noise levels are required.
Precision anti-friction or sleeve type with provisions for self-alignment and for radial and thrust loads imposed by the service. Provide water-cooled bearings where required for the service or recommended by the manufacturer.

2.1.2.1 Anti-friction Bearings

(Extreme reliability)

Constructed of steel alloys with a certified L-10 minimum rated life of [20,000] [40,000] [80,000] hours under load conditions imposed by the service. Rated and selected in accordance with ABMA 9 and ABMA 11. Provide with dust-tight seals suitable for environment and lubricant pressures encountered; cast ferrous metal housing, bolted-split pillow block type where located within fan casings; grease lubricated with provisions to prevent overheating due to excess lubricant; surface ball check type grease supply fittings. Provide manual or automatic grease pressure relief fittings visible from normal maintenance locations. Include lubrication extension tubes where necessary to facilitate safe maintenance during operation and fill tubes with lubricant prior to equipment operation. Prelubricated, sealed, anti-friction bearings, which conform to above specified materials and L-10 life requirements, may be provided for fans requiring less than 0.37 kW 1/2 horsepower.

2.1.2.2 Sleeve Bearings

Premounted, self-aligning, continuous oil supply, single or double ring lubricated, insert type, with suitable provisions for shaft expansion and such thrust as may be imposed by service loads. Provide water cooling for shaft surface speed exceeding 6.1 meters per second 1200 feet per minute. Provide each sleeve bearing with approximately 473 mL 16 ounce capacity constant level oiler and oil level gage. Include on sleeve bearing submittal data: Bearing manufacturing source, type, lubricant, clearances, "L/D" ratio, antifriction metal, belt angle, shaft speed, shaft critical speed, Brinell hardness at journal, and shaft surface finish at journal in micro-inches.

2.1.3 Motors and Motor Starters

**NOTE:** The motor control requirements should be coordinated with the Electrical Section and will depend on field conditions. The following types of motor starters should be used as a guide only. When electrical power circuits to which ventilation and exhaust equipment are connected are heavily loaded, the full voltage across the line starting may result in excessive voltage drop on the circuits.

Conform to NEMA MG 1 and NEMA ICS 1 and NEMA ICS 2. Motors less than 3/4 kW one hp must meet NEMA High Efficiency requirements. Motors 3/4 kW one hp and larger must meet NEMA Premium Efficiency requirements. Motors must not exceed 1800 rpm, unless otherwise indicated, and must be variable-speed, [open] [dripproof] [enclosure] [totally enclosed fan cooled] [explosion proof] type. Provide [manual] [magnetic-across-the-line] [reduced voltage] [part-winding] [wye-delta] type motor starters with [general-purpose NEMA 1] [weather resistant NEMA 3R] [watertight NEMA 4] [moisture and dusttight NEMA 12] enclosure in accordance with NEMA ICS 6. Provide single-phase motors with inherent thermal overload protection with manual reset. Provide three-phase motors with thermal overload protection in the control panel. Provide permanently lubricated or grease-lubricated ball or roller bearings; auxiliary lubrication and relief fittings on outside of fan casing; arrange grease lines to minimize pressure on bearing seals. Motor power must not be less than brake power required with blades set at maximum pitch angle at any air delivery from the indicated amount down to 50 percent thereof.

2.1.4 Guards and Screens

Construct guards and screens to provide, as applicable: required strength and clearance with minimal reduction in free area at fan inlets and discharges; cooling; access panels for tachometer readings; ease of sectional disassembly for maintenance and inspection functions where guard total weight exceeds 22.70 kg 50 pounds; weather protection where components are weather exposed. Installed guards and screens must not negate noise control and vibration isolation provisions. [ For burn
protection, insulate surfaces when service temperatures exceed 60 degrees C 140 degrees F as part of work under Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.1.5 Power Transmission Components

2.1.5.1 Fan Drives

[Direct] [or] [V-belt] type as indicated. V-belt drives must conform to RMA IP-20 and RMA IP-22. Drives must be applied in accordance with the manufacturer's published recommendations, unless specified otherwise. Base power rating of a V-belt drive on maximum pitch diameter of sheaves. Provide classical belt section adjustable sheave type, with a minimum service factor of 1.5 for drives with motors rated up to and including 22 kW 30 hp. [Provide classical section or narrow section, fixed sheave or adjustable sheave type with a minimum 1.5 service factor for drives with motors rated over 22 kW 30 hp.][ Provide at least two belts for drives with motors rated one hp and above.]

2.1.5.2 Sheaves

Statically and dynamically balanced, machined cast ferrous metal or machined carbon steel, bushing type, secured by key and keyway. Pitch diameter or fixed sheaves and adjustable sheaves, when adjusted to specified limits, must not be less than that recommended by NEMA MG 1. Select adjustable sheaves that provide the required operating speed with the sheave set at midpoint of its adjustment range. The adjustment range for various size and type belts must be: 16 percent, minimum for Classical section belts; 12 percent, minimum for Narrow section belts. [Belt deflection in adjustable sheave drives must not exceed 1 1/2 degrees.]

Provide companion sheaves for adjustable sheave drives with wide groove spacing to match driving sheaves, except that standard fixed pitch spacing may be used for all two-through-four groove drives whose center-to-center dimensions exceed the following: "A" and "B" Section 406 mm 16 inches; "C" Section 635 mm 25 inches; "D" Section 914 mm 36 inches. Furnish endless, static dissipating, oil-resistant, synthetic cloth or filament reinforced elastomer construction belts.

2.1.6 Special Construction for Hazardous Areas

2.1.6.1 Spark-Resistant

Construct [specified or indicated] units in accordance with AMCA 99-0401; Type [A] [B] [C]. Provide [Type B] [or] [Type C] construction and electrical grounding of fan parts and grounding to building structure where fume or vapor handling systems conforming to NFPA 91 are specified. Do not place bearings in the air stream.

2.1.6.2 Explosion Proof

Construct fans to AMCA 99-0401, Type [A] [B] [C] spark-resistant requirements where explosion-proof electrical components are specified or indicated to conform to NFPA 70, Class [_____], Group [_____], Division [_____] requirements.

2.1.7 Protective Coating for Fans

Prepare and coat fans as follows: Replace bolts required to provide access or adjustment and normally threaded into the coated surface with studs or
bolts having heads continuously welded inside. Omit sharp edges, self-tapping screws, and permanent threads protruding into the coated surface. Eliminate hairline cracks and sharp inside corners by continuous welding, brazing, or filling with high melting point solder. Seal impeller hub to the shaft. Construct housing split to use external throughbolts. Flange inlet and outlet and consider as fan interior. Peen or grind welds smooth, and grind outside corners to approximately 1.60 mm 1/16 inch radius. Sandblast metal surfaces to white metal in accordance with SSPC SP 5/NACE No. 1. Coat interior surfaces of housing in contact with airstream, including inlet, impeller and shaft, flange faces, shaft seal, [exterior surfaces of housing], and bearing and motor pedestal. Do not coat bearings, coupling, motor, drive, or other auxiliaries. Finish fan in accordance with the manufacturer's standard practice. Coat fan with [phenolic] [epoxy] [_____]. Coat fan as indicated. Statically and dynamically balance the fan in two planes after coating and finishing, and where material has been removed, refinish and rebalance the fan as specified herein.

2.2 CENTRIFUGAL FANS

2.2.1 General Requirements for Centrifugal Fans

**************************************************************************

NOTE: See Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL for guidance given in guide specification technical notes. Definite requirements should be specified in contract specification for bidders' information.

**************************************************************************

Provide fan of [forward-curved] [radial] [backward inclined] [airfoil] type blades with [manual] [or] [automatic inlet vanes] [as indicated]. Arrange fans for indicated service, and construct for the applicable AMCA 99 Class pressure ratings as indicated for system design pressure and temperature. Fan shaft must be solid steel, ground and finished as required for the service, with first critical speed a minimum 25 percent higher than cataloged fan speed. Select fan for maximum efficiency, minimum noise, and stability during all modes of system operation. Vibration isolation mountings must be spring type and limit vibration transmissibility to a maximum [_____] [5] percent of the unbalanced force at lowest equipment speed, unless otherwise specified or indicated.] Arrangement and drives must be as indicated.

2.2.2 Industrial Exhauster[s]

**************************************************************************

NOTE: Use industrial exhausters for high particulate loading applications.

**************************************************************************

Single-width, single-inlet type arranged for indicated service and constructed for duty at indicated system design pressure and temperature not to exceed [66] [93] [177] [260] [371] degrees C [150] [200] [350] [500] [700] degrees F. Continuously welded [carbon] [alloy] [copper bearing alloy] [Type [_____] [304L] [316L] stainless] [steel] [_____] alloy aluminum] scroll with required reinforcement, flanged inlet and outlet connections, [cone] inlet [bolted] [welded] to scroll side sheet, threaded and plugged scroll drain, [quick] [or] [bolted] access door with gasket; [Carbon] [alloy] [Type [_____] stainless] steel shaft, [fitted with] [heat
slinger] [shaft seal] [grease lubricated stuffing box]; continuously welded [carbon] [alloy] [copper bearing alloy] [Type [_____] [304L] [316L] stainless] [steel] [____ alloy aluminum] impeller assembly. [____] [radial] [paddle type (open radial)] [backplated paddle] type impeller blades [with inlet shroud]. [Provide protective coating of [_____] on fan surfaces exposed to [air] [fume] [vapor] stream; Motor must be totally enclosed type.] Mount complete assembly including motor, power transmission components, and guards on a common vibration isolation base with spring mountings [conforming to requirements indicated].

2.2.3 Utility Set[s]

Single-width, single-inlet, nonoverloading scroll type. Scroll must be [intermittently] [or] [continuously] welded [carbon] [Type [304L] [316L] stainless] [steel] [____ alloy aluminum] with required reinforcement, [flanged inlet and outlet connections], streamline orifice inlet bolted [and gasketed] to scroll side sheet, [threaded and] [plugged] [piped] [scroll drain,] [access door with gasket]. [Carbon] [Type [304] [316] stainless] [steel] [monel] shaft finished as required [and fitted with] [heat slinger] [shaft seal] [grease lubricated stuffing box]; welded [carbon] [Type [304L] [316L] stainless] [steel] [____ alloy aluminum] impeller assembly; [backward inclined] flat or single thickness airfoil type impeller blades. Provide protective coating of [_____] for [fan surfaces exposed to [air] [fume] [vapor] stream and weather.] Motor and power transmission components must be enclosed in ventilated weathertight hood. [Discharge must be fitted with an automatic gravity shutter constructed from [specified stainless steel] [aluminum].] [Mount complete assembly from individual points of support on rails and vibration isolated by double-rubber-in-shear mountings] [conforming to requirements indicated].

2.2.4 In-line Centrifugal Fans

Welded steel casings, centrifugal backward inclined blades, stationary discharge conversion vanes, internal and external belt guards and adjustable motor mounts. Inlet and outlet connections for fan casings to duct work and equipment casings, may be of the slip fit or flanged type. [Provide guards for discharges. Rate fans with guards in place.] Air must enter and leave the fan axially. Inlet must be streamlined and conversion vanes must eliminate turbulence and provide smooth discharge air flow. Enclose fan bearings and drive shafts, and isolate from the air stream. Fan bearings must be mechanically sealed against dust and dirt and must be self-aligning, pillow block ball or roller type. Motor and drive must be provided by fan manufacturer.

2.2.5 Fiberglass Centrifugal Fans

******************************************************************************
NOTE: Show intended service on drawing fan schedule or specify here. Revise paragraph if special chemical or corrosion resistance is required in accordance with manufacturer's recommendations.
******************************************************************************

ASTM D4167. Construct of fire retardant fiberglass with a flame spread rating at least equal to or less than that of the duct system. Housing and fan impeller must be fiberglass. Shaft and fan support stand must be steel with protective coating. Provide exterior gel coat, coating, or paint with ultraviolet light inhibiting properties for fans exposed to sunlight. Fiberglass fans must be suitable for [the intended service.] [use in
[______]. Provide with flanged outlet [and inlet] connections, [threaded [and plugged]] scroll drain, bolted access and inspection doors, and epoxy coated steel fan base and motor mount.

2.3 [VANEAXIAL] [TUBEAXIAL] FANS

Direct-connected with adjustable blade impeller or V-belt driven. When direct connected, fans must be driven by totally-enclosed, air-over (TEAO), flanged or end mounted motors. When belt-driven, provide internal and external belt guards and adjustable motor mounts.

2.3.1 Fan Impeller Blades

Air-foil type [with stationary guide vanes], designed to provide the efficiency [and sound level] indicated. In fan selection, consider and account for any losses due to the size of the motor in relation to the fan hub diameter. Impeller blades of direct-driven fans must be adjustable to permit varying performance over a range of volume and pressure. Index the hub to facilitate setting the angle of the blades uniformly and accurately from minimum to maximum angle; provide stops to avoid overloading motor. Furnish motor with the factory blade maximum setting included in the fan nameplate data.

2.3.2 Fan Casings

Cylindrical, or welded steel construction, with flanged inlets and outlets. Assemble motor support [and guide vanes] by welding. Provide casings with bolted or hinged access plates adequate for inspection and servicing of internal parts.

2.4 BATHROOM AND KITCHEN FANS

**************************************************************************
NOTE: Quiet operation will increase the likelihood that occupants will use fans.
**************************************************************************

Power used must be a maximum of 13 watts for 50 cfm fans; 15 watts for 70 cfm fans; 17 watts for 90 cfm fans; and 20 watts for 100 cfm fans. Noise levels must not exceed 0.5 sones for 50 to 70 cfm fans; 1.0 sones for 90 cfm fans; and 1.5 sones for 100 cfm fans. Fan lights must be compact fluorescent.

2.5 BASIC MATERIALS

2.5.1 Coated and Uncoated Carbon Steel Sheets, Plates, and Shapes

2.5.1.1 Mill Galvanized Steel Sheet

ASTM A653/A653M, lock forming quality, Coating G-90[, 204 degrees C 400 degrees F, maximum].

2.5.1.2 Mill Galvanized Steel Shapes

ASTM A36/A36M galvanized in accordance with [ASTM A123/A123M] [ASTM A653/A653M].
2.5.1.3 Uncoated (Black) Carbon Steel Sheet

ASTM A1011/A1011M.

2.5.1.4 Uncoated (Black) Carbon Steel Plates and Shapes

ASTM A36/A36M.

2.5.2 Corrosion Resistant (Stainless) Steel

ASTM A167, Type 304L or Type 316L with mill finish, except as otherwise specified.

2.5.3 Corrosion Protection

Treat equipment fabricated from ferrous metals that do not have a zinc coating conforming to [ASTM A123/A123M] [ASTM A653/A653M] for prevention of corrosion with a factory coating or paint system that will withstand 125 hours in a salt-spray fog test except that equipment located outdoors must withstand 500 hours. Perform salt-spray fog test in accordance with ASTM B117. Each specimen must have a standard scribe mark as defined in ASTM D1654. Upon completion of exposure, evaluate and rate the coating or paint system in accordance with procedures A and B of ASTM D1654. The rating of failure at the scribe mark must be not less than six (average creepage not greater than 3 mm 1/8 inch). The rating of the unscribed area must be less than ten (no failure). Thickness of coating or paint system on the actual equipment must be identical to that on the test specimens with respect to materials, conditions of application, and dry-film thickness.

2.6 HEAT RECOVERY SYSTEMS

Heat recovery systems must be utilized in ventilation units (100 percent outside air units) where the temperature differentials between supply air and exhaust air is significant. Heat recovery systems must operate at a minimum of 70 percent efficiency. The heat recovery systems must have factory-installed microprocessor controller that in turn can be connected to a Direct Digital Control (DDC) Building Automation System to monitor temperatures, [wheel operation,] filter cleanliness, defrost control, and other critical conditions. Prefilters must be provided in all heat recovery systems before the heat recovery equipment.

2.6.1 Unit Casing

******************************************************************************

NOTE: Include bracketed sentences unless condensate drain is not needed or cross contamination is prevented by other methods.

******************************************************************************

Provide a self supporting unit casing constructed of minimum 1.1 mm 0.04 inches thick extruded aluminum profiles and aluminum zinc sheet steel that create a double wall.[ The base of the casing must be constructed as a continuous condensate drain with a total of four connection possibilities.] The casing bottom, top, and sides must be insulated with 50 mm 2 inch thick fibrous glass insulation with a minimum density of 96 kg per cubic meter 6 lb per cubic foot or another material with equivalent insulating value.[ Provide a partition to isolate the exhaust and supply airstreams from each other to avoid cross contamination.] Partition must
be a minimum of \[1.9\m[0.075]\] mm \[0.075\] inches [galvanized steel] [aluminum]. Provide stainless steel casing for corrosive air streams. The casing must be designed for diagonal mounting of the heat exchanger access from the side for maintenance and cleaning. The casing must be designed with an integral defrost control damper on the heat exchanger section for defrost control. Provide full size access doors for checking the heat exchanger section.

2.6.2 Heat Exchanger Section

2.6.2.1 Enthalpy Wheel

A desiccant-impregnated enthalpy wheel with variable speed rotary wheel must be used in the supply and exhaust systems. Wheels must contain media made of a lightweight polymer that is coated with a corrosion-resistant finish. Etched or oxidized surfaces are not acceptable. Heat transfer surfaces must be coated with a non-migrating (permanently bonded) absorbent.[ Desiccant must be silica gel for maximum latent energy transfer.] Wheel must allow laminar flow but not radial, and prevent leakage, bypassing, and cross contamination by cross flow within wheel. The wheel must have rotor seals specifically designed to limit cross-contamination, and a rotation detector. Should rotation stop, the rotation detector must alarm the HVAC control system. Wheel must not condense water directly or require a condensate drain for summer or winter operation. Performance rating must be in accordance with AHRI 1060 I-P.

2.6.2.2 Heat Pipe

For sensible heat recovery a run-around type heat pipe must use refrigerant to absorb heat from the air stream at the air intake and reject the heat back into the air stream at the discharge of the air-handling unit. The heat transfer between air streams must take place in a counterflow arrangement. The unit must have no moving parts and must be one piece construction. Tube core must be \[18\][25][0.18] mm \[5/8\][1][0.007] inch OD seamless aluminum tubing permanently expanded into the fins to form a firm, rigid and complete metal pressure contact between the tube and fin collar of all operating conditions. Provide copper tubes and copper fins for corrosive air streams. Secondary surfaces must be of continuous plate type aluminum fins, \[0.18\][0.007] inch thick, and of corrugated design to produce maximum heat transfer efficiencies. System must have solenoid valve control to operate under partial load conditions.

2.6.2.3 Run-around Coil

The run-around coils must be used at the exhaust discharge from the building and at the fresh air intake into the building.[ A glycol run-around coil must be used with control valves and a pump for part load conditions.]

2.6.2.4 Sensible Heat Recovery Unit

[A cross-flow, air-to-air (z-duct) heat exchanger must recover the heat in the exhaust and supply air streams. Z-ducts must be constructed entirely of sheet metal.] [Heat wheels must be used for sensible heat recovery. Unit must have variable speed drive for controlling the temperature leaving the unit. Wheels must contain media made of a lightweight polymer that is coated with a corrosion-resistant finish. Etched or oxidized surfaces are not acceptable. Wheel must allow laminar flow but not radial, and prevent leakage, bypassing, and cross contamination by cross flow within wheel.
The wheel must have rotor seals specifically designed to limit cross-contamination, and a rotation detector. Should rotation stop, the rotation detector must alarm the HVAC control system. Wheel must not condense water directly or require a condensate drain for summer or winter operation. Performance rating must be in accordance with AHRI 1060 I-P.

2.6.3 Defrost Control Damper Section

Provide an integral defrost control damper section with electric damper motor for defrost control of the heat exchanger section. The defrost control dampers must be mounted upstream of the heat exchanger section and must be capable of preventing frost build-up on the plates of the heat exchanger. Drain pan must be stainless steel. The damper motor must be located outside of both airstreams.

2.6.4 Angle Filter Box

Provide a side access, galvanized steel duct mounted filter box assembly with integral holding frames suitable for accommodating [50 mm] thick filters with a minimum efficiency reporting value of 13. Provide filter box constructed of minimum 1.3 mm thick galvanized steel with extruded aluminum tracks and individual universal holding frames with polyurethane foam gaskets and positive sealing clips designed to accommodate various standard size filters in various efficiency ranges. Provide access doors with positive sealing, heavy duty quick opening half-twist latches and sponge neoprene gasketing on each side of filter box for removal and replacement of filters. For each filter box provide one manehelic gauge or inclined manometer with static pressure taps, shut-off and vent cocks, and aluminum tubing with range 50 to 1470 Pa 0.0073 to 0.21 psi.

2.7 FIRE DAMPERS

**************************************************************************
NOTE: Use 1 1/2 hour rated damper for up to 2 hour fire walls. Use 3 hour rated damper only for 3 hour or 4 hour fire walls.
**************************************************************************

Provide [single leaf] [guillotine] [recessed] [hinged] [type] [curtain type with interlocking blades] [with frame and operating mechanism housed out-of-[air] [fume] [vapor] stream,) constructed and rated in accordance with AMCA 500-D. Furnish dampers for indicated stream flow, to equal or exceed fire resistance rating of [1 1/2 hours] [3 hours]. Fire damper must be rattle-free and must cause a minimum [5] [10] percent increase in stream velocity or system static pressure. [ For [_____] system[s], stream exposed materials of construction must be [_____] ] Provide building penetration collars in accordance with AMCA 500-D [and NFPA 91], [unless otherwise indicated]. Provide one spare fusible link for testing of each fire damper operation and one spare fusible link for each fire dampers, but not less than two.

2.8 MISCELLANEOUS MATERIALS

2.8.1 Filler Metal, Welding

AWS filler metal specification and grade compatible with base materials to develop full joint strength.
2.8.2 Flashing Materials

[Mill galvanized, phosphatized, steel sheet with minimum spangle, conforming to ASTM A653/A653M, Coating G90, 24 gage minimum thickness. Mill No. 1 or 2D finished, stainless steel, fully annealed, soft temper, conforming to ASTM A167, Type 304, 0.38 mm 0.015 inch minimum thickness. Mill finished copper, conforming to ASTM B152/B152M, minimum 1487 gram per square meter 16 ounces per square foot.][ As specified in Section [07 60 00 ] FLASHING AND SHEET METAL.]

2.8.3 Flexible Connectors

2.8.3.1 General Service

Airtight, fire-retardant, fume and vapor resistant, chloroprene or chlorosulfonated polyethylene impregnated, woven fibrous glass fabric, rated for continuous service at 121 degrees C 250 degrees F, conforming to UL 214, with 678 gram per square meter 20 ounce per square yard weight for service at 498 Pa 2 inches water gage and under and 1017 gram per square meter 30 ounce per square yard weight for service over 498 Pa 2 inches water gage. Provide with or without integral 24 gage mill galvanized sheet metal connectors.

2.8.3.2 Acoustic Service

Provide as second layer for nonpressure service to 60 degrees C 140 degrees F, leaded sheet vinyl, a minimum 1.40 mm 0.055 inches thick, weighing a minimum 20.60 kg per square meter 0.87 pounds per square foot, capable of 10 dBA attenuation in 10 to 10,000 Hz range, suitable for solvent seam or overlap joining and banding.

2.8.3.3 [Fume] [Dust Collection] Service

[3 mm][1/8 inch] [_____] thick, single-ply, synthetic fabric reinforced chloroprene suitable for 107 degrees C 225 degrees F.

2.8.3.4 High Temperature Service

a. Bellows type metal expansion joints, temperature range minus 29 degrees C to [427] [538] degrees C 20 degrees F to [800] [1000] degrees F, plus or minus 25 kPa 100 inches water gage [with interior liner [and exterior cover]].

b. Fabric reinforced, insulated, elastomeric cover expansion joint for operating temperature up to [204 degrees C] [400 degrees F][_____] [belt] [or] [flange] type for [10 kPa gage] [40 inches water gage] [_____] positive or negative pressure [, with interior liner or baffle].

2.8.4 Flexible Duct

****************************************************************************************************************
NOTE: The designer must indicate on the drawings the types of flexible duct required.
****************************************************************************************************************

2.8.4.1 Metallic Type

Single-ply [zinc-coated carbon steel] [mill galvanized carbon steel] [Type 316 stainless steel] [two-ply aluminum], [self-supporting to 2.50 meters 8
foot spans] with corrugated and interlocked, folded and knurled type seam construction, bendable without damage through 180 degrees with a throat radius approximately 10 times the duct diameter, airtight, rated for positive or negative working pressure of 3735 Pa 15 inches water gage at [177 degrees C 350 degrees F for aluminum] [343 degrees C 650 degrees F for galvanized steel and stainless steel] UL 181, Class 1 rated, conforming to NFPA 91.

2.8.4.2 Wire Reinforced Fabric Type

Elastomer impregnated woven synthetic fabric, bonded to and supported by corrosion protected or corrosion resistant spring steel helix, rated for positive or negative working pressure of [3735 Pa gage at 121 degrees C] [15 inches water gage at 250 degrees F] [_____] UL 181, Class 1 labeled. Provide with manufacturer's standard metallic connection collar and clamping fastener assembly [fitted with] [dampers] [and] [extractors] [as indicated].

2.8.4.3 Ball Joints

Fabricated from cast iron or formed sheet metal with outer sections secured with bolts. Provide each half of the ball joint with tubular stubs for connecting ducts.

2.8.4.4 Slip Joints

Fabricated from tubular sheet metal sections. Provide outer tube with formed steel flat bar clamps. Where required or indicated, provide a chain or other means to fix relative longitudinal position of outer and inner joint sections.

2.8.5 Gaskets

2.8.5.1 Elastomer Buna N

Sheet, 3 mm 1/8 inch thick, conforming to ASTM D2000, Type 2BG410B14.

2.8.5.2 Elastomer Chloroprene

Sheet, 3 mm 1/8 inch thick, conforming to ASTM D2000, Type 2BE410B14.

2.8.5.3 Rubber

Sheet, 3 mm 1/8 inch thick red or black, natural, reclaimed, synthetic rubber or mixture thereof, conforming to ASTM D1330.

2.8.6 Protective Coating Materials

2.8.6.1 Baked Unmodified Phenolic

MIL-DTL-12276, Type II.

2.8.6.2 Epoxy Coating

Conform to MIL-PRF-23236, Type I, Class 1 or MIL-DTL-24441 system, Formula 150 green primer 0.076 mm 3 mils, Formula 151 haze gray 0.076 mm 3 mils, and Formula 152 white 0.076 mm 3 mils.
2.8.6.3  Inorganic Zinc Coating

SSPC Paint 20, Type I-C (Self-cure type).

2.8.6.4  Galvanizing Repair Paint

Conform to MIL-P-21035.

2.8.7  Sealants

2.8.7.1  Elastomeric

Sealant specified in these specifications or referenced standards as elastomeric or without further qualification, must be silicone, polyurethane, polysulfide, polyisobutylene, or acrylic terpolymer suitable for the service. For sealing of nongasketed duct joints during fabrication or assembly, sealant must be polyurethane, acrylic terpolymer or polysulfide. Sealants must conform to the following:

a. Silicone: Conforming to FS TT-S-001543, single component type, not requiring primed substrate, with manufacturer published estimated life of 30 years and a maximum 5 percent shrinkage when cured.

b. Polyurethane: Conforming to ASTM C920, Type 2, Class A, single component type, not requiring primed substrate, with manufacturer published estimated life of 20 years and a maximum 10 percent shrinkage when cured.

c. Polysulfide: Conforming to ASTM C920, Type 2, Class A, single component type, not requiring primed substrate, with manufacturer published estimated life of 20 years and a maximum 10 percent shrinkage when cured.

d. Polyisobutylene/Butyl: Conforming to CID A-A-272, Type 1, single component type, not requiring primed substrate, with manufacturer published estimated life of 10 years and a maximum 15 percent shrinkage when cured.

e. Acrylic Terpolymer: Conforming to ASTM C920, single component type, not requiring primed substrate, with manufacturer's published estimated life of 20 years and a maximum 10 percent shrinkage when cured.

f. Provide sealants and non-aerosol adhesive products meeting either emissions requirements of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type) or VOC content requirements of SCAQMD Rule 1168 (HVAC duct sealants must be classified in the "Other" category within the SCAQMD Rule 1160 sealants table). Provide validation of indoor air quality for duct sealants.

2.8.7.2  Heat Shrinking over Round Exterior Duct

High molecular weight, irradiated polyethylene band with interior heat activated epoxy adhesive coating for heat shrinking and epoxy extrusion over round, exterior, duct joints.

2.8.7.3  Hard Cast Caulking for Exterior Ducts

Mineral and adhesive impregnated woven fiber tape with adhesive activator for exterior round or rectangular duct joints.
2.8.7.4 Caulking of Building Surface Penetration

Foamed silicones, two-component, fire-resistant, [gamma radiation resistant], low-exotherm, room temperature vulcanizing silicone.

2.9 SPECIALTIES

Steel, cast iron, stainless steel, nonferrous metal, or plastic to match duct construction, or as indicated.

2.9.1 Access Ports, Test

With gasketed screw cap and flange, to suit exhaust service[, 25 mm one inch nominal pipe size].

2.9.2 Damper Regulators

Incremental position indicating and locking type, with satin finish chrome plated, flush surface mounting cover and regulator box where concealment is required in finished spaces. For splitter dampers, provide splitter tip mounted trunnion brackets with self-locking screw regulator or rods with external swivel joint brackets.

2.9.3 Blast Gates

Provide means for locking in adjusted position with bolt and nut.

2.9.4 Cast Iron Access Door

Cast iron frame, [hinged and] gasketed cast iron door, quick closing clamps for watertight sealing[, size as indicated][, 152 by 229 mm 6 by 9 inches minimum size].

2.10 SUPPORTS AND HANGERS

**************************************************************************

NOTE: The designer must design all supports, including wind bracing for stacks, and show all important details on the drawings. SMACNA Accepted Industry Practice for Industrial Duct Construction is illustrative and does not fix sizes of supports or allowable loads. Refer to SMACNA round and rectangular duct construction standards for design tables and other information.

**************************************************************************

2.10.1 General Requirements for Supporting Elements

Provide ducting systems and equipment supporting elements including but not limited to building structure attachments; supplementary steel; hanger rods, stanchions and fixtures; vertical duct attachments; horizontal duct attachments; anchors; supports. Design supporting elements for stresses imposed by systems, with a minimum safety factor of 4.0 based on duct being 50 percent full of particulate conveyed. Supporting elements must conform to SMACNA 1403, SMACNA 1922, SMACNA 1520, [SMACNA 1378,] and NFPA 91, as applicable, and modified and supplementary requirements specified herein. Do not use weld studs and powder actuated anchoring devices to support mechanical systems components without prior approval.
2.10.2 Vertical Attachments

Provide in accordance with SMACNA Standards, except mill galvanized iron straps must be a minimum of \(25 \, \text{mm}\) one inch wide, 16 gage thick.

2.10.3 Horizontal Attachments

Provide as indicated in accordance with SMACNA Standards.

2.10.4 Supplementary Steel

Provide where required to frame structural members between existing members or where structural members are used in lieu of commercially rated supports. Such supplementary steel must be fabricated in accordance with the AISC 360.

2.10.5 Vibration Isolators

******************************************************************************
NOTE: See Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL for guidance given in guide specification technical notes. Definite requirements should be specified in contract specification for bidders' information.
******************************************************************************

[Provide vibration isolators with in-series, contained, steel springs, chloroprene elastomer elements, and fasteners for connecting to building structure attachments. Devices must be loaded by support system in operating condition to produce required static spring deflection without exceeding 75 percent of device maximum load rating.] [Conform to Section [22 05 48.00 20] MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL.]

2.11 DUCTWORK, DUST [AND FUME] COLLECTION

2.11.1 General Requirements for Dust [and Fume] Collection Ductwork

******************************************************************************
NOTE: Delete all welded seams and flanged joints when not required. However, factors such as water intrusion under negative pressure in weather exposure should be considered when construction which is not leak-tight is permitted for the project. Duct conveying fumes subject to condensation should be leak-tight.
******************************************************************************

******************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.
Research has shown that products are available meeting the recycled content requirements stated below.
******************************************************************************
[Where specified or indicated] fabricate system ductwork from black carbon steel [, with welded seams and flanged and gasketed joints]. Provide steel with a minimum of 70 percent recycled content. Provide data identifying percentage of recycled content of ductwork steel components. Construct duct to handle [wood dust] particulate with an influent loading of [15,000 grains per standard liter per second (L/s)] [actual L/s] [7,000 grains per standard cubic feet per minute (scfm)] [actual cubic feet per minute (acfm)] [_____]}. Provide ductwork in accordance with best practice recommendations and requirements of SMACNA 1922 and SMACNA 1520, for [Class I] [Class II] [Class III] [Class IV] duct and requirements specified or indicated.

2.11.2 Fabrication of Dust [and Fume] Collection Ductwork

**************************************************************************
NOTE: Delete all welded seams and flanged joints when not required. However, factors such as water intrusion under negative pressure in weather exposure should be considered when construction which is not leak-tight is permitted for the project. Duct conveying fumes subject to condensation should be leak-tight.
**************************************************************************

Provide indicated sizes, lengths and configuration without deviation unless otherwise approved. Assemble ductwork airtight [as defined under paragraph DUCTWORK STRUCTURAL INTEGRITY AND LEAKAGE TESTING in this section] and include necessary reinforcements, bracing, supports, framing, gasketing and fastening to guarantee rigid construction and freedom from vibration, airflow induced motion, and excessive deflection. For [system] system, provide SMACNA Class 1 construction with any of the reference standard seams and connections being acceptable [, except [_____]]. For [system] system, provide SMACNA Class [2] [3] [4] construction with welded duct and fitting seams and welded companion angle or Van-Stone flanges. Welding must conform to requirements specified herein. Provide flanges at [branches] [hoods,] [equipment] [and] [enclosure connections,] where necessary for ease of access to equipment or maintenance disassembly, and where indicated. Provide elbows and fittings a minimum 2 gages heavier than straight ducts of equal diameter.

2.11.3 Radius Elbows

Fabricated from butt welded specified piece gore sections or from formed welded or seamless tubing to a minimum centerline radius of [2.0] [2.5] [_____] diameters. Assemble, weld, and finish ground gore sections to eliminate internal projections. Construct gored elbow in accordance with the following:

<table>
<thead>
<tr>
<th>400 mm diameter and less 16 inches diameter and less</th>
<th>Over 400 mm diameter Over 16 inches diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>90 degree - 5 piece minimum</td>
<td>90 degree - 7 piece minimum</td>
</tr>
<tr>
<td>60 degree - 4 piece minimum</td>
<td>60 degree - 6 piece minimum</td>
</tr>
<tr>
<td>45 degree - 3 piece minimum</td>
<td>45 degree - 5 piece minimum</td>
</tr>
</tbody>
</table>
### 2.11.4 Flanged Joints

Gasketed with full face gaskets 3 mm 1/8 inch thick red or black rubber as specified under paragraph MISCELLANEOUS MATERIALS in this section.

### 2.11.5 Access Doors

Provide hinged, gasketed, and fitted with snap-action closures access doors. Equip access door with gaskets of common weather stripping type, foamed, closed-cell, elastomer with pressure sensitive adhesive back. Provide cleanout adjacent to every bend and vertical riser. In horizontal duct runs, locate cleanout door with maximum of spacing of 4 meters 12 feet for ducts 300 mm 12 inches or less in diameter and 6 meters 20 feet for larger ducts.

### 2.11.6 Flexible Connectors

[Provide drawband secured flexible connectors, conforming to requirements specified under paragraph MISCELLANEOUS MATERIALS in this section, utilizing 3 mm 1/8 inch thick reinforced elastomer, fabricated into a cylindrical shape by vulcanizing or otherwise bonding longitudinal seam.] [Provide flange secured flexible connectors, conforming to requirements specified under paragraph MISCELLANEOUS MATERIALS in this section, utilizing bellows type metal expansion joint. Where service temperature exceeds 149 degrees C 300 degrees F, insert 25 mm one inch thickness of mineral wool.]

### 2.12 PROTECTIVELY COATED STEEL DUCTS

Ductwork, Protectively Coated Steel, For Corrosive Fume and Vapor Exhaust:

#### 2.12.1 General Requirements for Protectively Coated Steel Ductwork

******************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research has shown that products are available meeting the recycled content requirements stated below.

******************************************************************************

Fabricate [_____] system ductwork from black carbon steel with welded seams, flanged and gasketed joints and protectively coated interior surfaces including flange faces, provide steel with a minimum of 70 percent recycled content. Provide data identifying percentage of recycled content of protectively coated steel ducts. Construct ductwork to handle [_____] [fumes] [condensing] [noncondensing] [vapors] containing [______]. Spiral welded duct is prohibited. Provided ductwork in accordance with best
practice recommendations and requirements of SMACNA 1922 and SMACNA 1520, for Class [IV] [_____] duct.

2.12.2 Protective Coating

Provide [_____] [and] [_____] protective coatings as specified under PROTECTIVE COATING MATERIALS, a subparagraph of MISCELLANEOUS MATERIALS in this section. Provide [_____] coating to interior of duct [and related fan] surfaces. Coat exterior duct [and related fan] surfaces with same protective coating as specified for exterior surfaces [primed with] [inorganic zinc coating] [_____]. [Exterior fan surfaces must be finished [protectively coated] [primed] [as specified under paragraph, "____".]] [Field finish exterior surfaces which have only been primed, as specified in Section 09 90 00 PAINTS AND COATINGS.]

2.12.3 Fabrication of Protectively Coated Ductwork

Construct protectively coated ductwork for corrosive fume and vapor exhaust in accordance with SMACNA 1922 and SMACNA 1520 and as specified herein. Provide indicated sizes, lengths and configuration without deviation, unless otherwise approved. Spiral welded duct is prohibited. Install ductwork to be water washable, watertight, self-draining, and airtight [as defined under paragraph DUCTWORK STRUCTURAL INTEGRITY AND LEAKAGE TESTING in this section]. Provide necessary reinforcements, bracing supports, framing, gasketing, and drainage provisions, and fastening to guarantee rigid construction and freedom from vibration, airflow induced motion, and excessive deflection. Rigid construction is required to prevent damage to or failure of protective coating during construction, transport, erection, and on-off system operation. Only companion angle flanged joints must be permitted. Weld ducting and fittings seams. Avoid seams in bottom 80 mm 3 inches of ducting and in corners wherever practical by bending of corners and arranging seams high in the side sheets or top sheet. Cracks, laps, sharp inside corners, sharp sheared edges, weld "icicles," flux, pits, weld spatter, burrs, and similar defects which contribute to coating discontinuities must be eliminated by the following: a) welding continuously, b) grinding of metal flush with surface or to 0.8 mm 1/32 inch radius or to maximum radius permitted by thinner metals, c) Utilizing other fabrication techniques and subsequent surface preparation abrasive blasting. Removed from the job site for repair rejected ducting not conforming to these requirements and which exhibit coating thickness deficiency. Welding must conform to requirements specified herein. Continuously weld companion flange angles to the inside of the duct and intermittently weld with 25 mm one inch welds every 100 mm 4 inches on outside of duct. Intermittently weld girth and transverse reinforcements to duct surface for 25 mm one inch on 152 mm 6 inch centers or spot welded on 100 mm 4 inch centers. Weld and grind flange and reinforcement angles at corners or ends to form continuous frames. Provide flanges at [branches,] [hoods,] [equipment] [and] [enclosure connections,] where necessary for ease of access to equipment or maintenance disassembly, and where indicated. Limit duct lengths in accordance with size, to permit complete and ready access for welding, grinding, blasting, coating, coating continuity checking and testing, and visual inspection during fabrication and immediately prior to erection.

2.12.4 Radius Elbows

Fabricated radius elbows from butt welded specified piece gore sections or from formed welded or seamless tubing to a minimum centerline radius of [2.0] [_____] diameters and preferably 2.5 times the duct diameter.
Assemble, weld, and finish ground gore sections to prevent internal crevices and projections. Construct gored elbow in accordance with the following:

<table>
<thead>
<tr>
<th>Diameter and Less</th>
<th>Over Diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>90 degree - 5 piece minimum</td>
<td>90 degree - 6 piece minimum</td>
</tr>
<tr>
<td>60 degree - 4 piece minimum</td>
<td>60 degree - 5 piece minimum</td>
</tr>
<tr>
<td>45 degree - 3 piece minimum</td>
<td>45 degree - 4 piece minimum</td>
</tr>
<tr>
<td>30 degree - 3 piece minimum</td>
<td>30 degree - 3 piece minimum</td>
</tr>
<tr>
<td>15 degree - 2 piece minimum</td>
<td>15 degree - 2 piece minimum</td>
</tr>
</tbody>
</table>

2.12.5 Flanged Joints

Gasketed with full-face gaskets which are one-piece, heat, adhesive or solvent vulcanized, or bonded and assembled to prevent drainage and limit extrusion or cavity at joint.

2.12.6 Access and Cleanout Door Openings

Provide access plates upstream and downstream of equipment installed in ductwork, at locations to facilitate duct cleaning (such as in horizontal runs, near elbow junctions, and vertical runs), and where indicated. For ducts 300 mm 12 inches diameter or less, locate cleanout or access openings a minimum of 3.70 meters 12 feet apart. Provide 250 by 300 mm 10 by 12 inches minimum size access opening; unless otherwise indicated or prevented by duct dimension. Locate opening a minimum of 80 mm 3 inches from bottom of duct. Frame access openings by welded and ground miter joint 5 mm 3/16 inch thick strap iron, or angle iron, with 6 mm 1/4 inch stainless steel bolt or stud assembly to duct on 100 mm 4 inch centers. Fabricate plates out of 300 series corrosion-resistant steel or polyvinyl chloride faced sheet backed by 16 gage sheet metal, reinforced as required for larger sizes, or constructed of heavier gage metal. Ensure only corrosion resistant materials are expose to duct interior. Provide one "U" handle on access plates through 250 by 300 mm 10 by 12 inches and two "U" handles on larger sizes. Locate access openings at points which will permit ready access to duct internals with no duct cutting. Where access through equipment or access doors specified herein is not available at a specific point, provide 200 mm 8 inch diameter gasketed access plates spaced on maximum 3 meters 10 foot centers. Where penetration of duct surfaces is approved or specified, provide 300 series corrosion resistant steel fastener assemblies. Provide hex type, cadmium plated flange fastener bolts and nuts and [3 mm1/8 inch thick acid resistant chloroprene] [3 mm1/8 inch thick Buna N] joint gaskets.

2.13 THERMOPLASTIC DUCTWORK

**************************************************************************
NOTE: Duct systems of plastic material may be used to handle only nonflammable corrosive fumes and vapor when conventional metal duct systems will not be adequate.
**************************************************************************
NOTE: SMACNA Thermoplastic Duct (PVC) Construction Manual is applicable to fume exhaust systems construction and installation requirements for round and rectangular PVC ductwork for positive and negative pressure systems operating in environments up to 27 degrees C at 498 Pa, 1493 Pa, and 2488 Pa 80 degrees F at 2 inches, 6 inches, and 10 inches water gage. The requirements of this standard are applicable specifically to Classes 12454-B and 12454-C PVC compounds as defined in ASTM D1784, Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds. The designer must indicate on the drawings the static pressure classification (498 Pa, 1493 Pa, or 2488 Pa2 inches, 6 inches, or 10 inches water gage positive or negative) to which each duct system (or each portion of a duct system) is to be constructed.

2.13.1 Ductwork

Construct ductwork, fittings, hoods, and accessories in accordance with SMACNA 1378 and NFPA 91. Fabricate supplementary steel in accordance with the AISC 360.

2.13.2 Product Requirements

Provide duct system from a manufacturer recognized in the field of fabrication of PVC material. Fabricating personnel must be certified by the manufacturer as qualified to perform the work in accordance with the specified requirements.

2.13.3 Basic Ductwork Materials

Fabricate ducts, hoods, accessories and components in sheet form from materials conforming to ASTM D1927, [Type I, Grade 1] [Type I, Grade 2]. Utilize extrusions of the same compounds as specified for duct. Solvent cement must conform to ASTM D2564. Construct metal components, when permitted to be located interior to the duct, of [Type] [304 or 304L] [316 or 316L] [_____] [corrosion resistant steel] [_____].

2.13.4 Fasteners

Where penetration of duct surfaces is approved or specified, provide Type 316 corrosion resistant steel fastener assemblies encapsulated with polyester on duct interior, unless total disassembly is intended. Provide flange fastener bolts and nuts of hex type only, cadmium plated, unless exposed to corrosive fumes; in which case provide Type 316 stainless steel. Equip bolted assemblies with two oversized washers, except where assembled with metallic reinforcement contact. Plastic bolting is prohibited.

2.13.5 Joint Gaskets

Provide [3 mm1/8 inch thick acid resistant chloroprene.] [3 mm1/8 inch thick Buna N.]
2.13.6 Fabrication

Construct water washable, watertight, self-draining, and airtight ductwork as specified or indicated. Provide required reinforcements, bracing, supports, framing, gasketing, sealing, resilient mounting, drainage provisions, and fastening to guarantee rigid construction and freedom from vibration, airflow induced motion and noise, and excessive deflection at specified maximum system pressure and velocity.

2.13.6.1 Flanges

Provide flanges at all branches on maximum 6 meters 20 foot centers in ducting sized 400 mm 16 inches and under, on maximum 2.40 meters 8 foot centers in duct sized over 400 mm 16 inches, where required for ease of access to equipment, at hoods, enclosure connections and where indicated. Furnish one piece, heat, adhesive, or solvent vulcanized or bonded full face gaskets at flange joints.

2.13.6.2 Access Plates

Provide access plates upstream and downstream of equipment in ducts at locations to facilitate duct cleaning, and where indicated. Locate access openings a minimum of 50 mm 2 inches above bottom of duct and externally frame with welded and ground miter joint steel which is isolated from duct interior. Construct access plate with PVC on interior side, backed with steel on exterior side. Provide stainless steel access plate fasteners. For ductwork cleaning access, provide 200 mm 8 inch diameter gasketed access plates on maximum 3 meters 10 foot on centers, except where access is available through an air terminal device or other required access.

2.14 FIBERGLASS DUCTWORK

******************************************************************************
NOTE: Duct systems of plastic material may be used to handle only nonflammable corrosive fumes and vapor when conventional metal duct systems will not be adequate.
******************************************************************************

Ductwork, Fiberglass for Nonflammable [Corrosive] [Fume] [Vapor] Exhaust:

2.14.1 Fiberglass Ductwork

Construct ductwork, fittings, accessories, and material of construction in accordance with NFPA 91, and ASTM C582. Fabricate supplementary steel in accordance with the AISC 360.

2.14.2 Basic Ductwork Materials

******************************************************************************
NOTE: Fill in resin characteristics from ASTM C582 if necessary. Verify suitability of Type 316 stainless steel for the specific chemical exposure; for example, chromic acid attacks Type 316 stainless steel. Revise as required.
******************************************************************************

******************************************************************************
NOTE: Designer must verify that products meeting

SECTION 23 35 19.00 20 Page 35
the indicated minimum recycled content are available, preferably from at least three sources, to ensure adequate competition. If not, write in suitable recycled content values that reflect availability and competition.

**************************************************************************

Fabricate ducts, accessories and components in sheet form from materials conforming to ASTM C582 [, RTP [_____]]. Provide exterior gel coat, coating or paint with ultraviolet light inhibiting properties for ducts exposed to sunlight. Construct metal components, when permitted to be located interior to the duct, of Type 316 corrosion resistant steel.

2.14.3 Fasteners

Where penetration of duct surfaces is approved or specified, provide Type 316 corrosion resistant steel fastener assemblies encapsulated with polyester on duct interior, unless total disassembly is intended. Provide flange fastener bolts and nuts of hex type only, cadmium plated, unless exposed to corrosive fumes; in which case provide Type 316 stainless steel. Equip bolted assemblies with two oversized washers, except where assembled with metallic reinforcement contact. Plastic bolting is prohibited.

2.14.4 Joint Gaskets

Provide [3 mm1/8 inch thick acid resistant chloroprene.] [3 mm1/8 inch thick Buna N.]

2.14.5 Fabrication

Construct water washable, watertight, self-draining, and airtight ductwork as specified or indicated. Provide required reinforcements, bracing, supports, framing, gasketing, sealing, resilient mounting, drainage provisions, and fastening to guarantee rigid construction and freedom from vibration, airflow induced motion and noise, and excessive deflection at specified maximum system pressure and velocity.

2.14.5.1 Flanges

Provide flanges at all branches on maximum 6 meters 20 foot centers in ducting sized 400 mm 16 inches and under, on maximum 2.40 meters 8 foot centers in duct sized over 400 mm 16 inches, where required for ease of access to equipment, at hoods, enclosure connections and where indicated. Furnish one piece, heat, adhesive, or solvent vulcanized or bonded full face gaskets at flange joints. Provide flanges at dissimilar material joints, such as between fiberglass reinforced plastic (FRP) and PVC.

2.14.5.2 Access Plates

Provide access plates upstream and downstream of equipment in ducts at locations to facilitate duct cleaning, and where indicated. Locate access openings at least 50 mm 2 inches above bottom of duct and externally frame with welded and ground miter joint steel which is isolated from duct interior. Construct access plate with fiberglass on interior side, backed with steel on exterior side. Provide Type 316 stainless steel access plate fasteners. For ductwork cleaning access, provide 200 mm 8 inch diameter gasketed access plates on not more than 3 meters 10 foot centers, except where access is available through an air terminal device or other required access provision.
2.15 VEHICLE TAIL PIPE EXHAUST SYSTEM

**************************************************************************
NOTE: Specifications included are for maintenance work. Dynamometer applications require revised specifications with special considerations for high temperatures involved. Following are kW/cms horsepower/CFM of exhaust gas recommendations for sizing system and hoses for maintenance work applications.

Maintenance-gasoline: 223 (kW/0.07 m³/s; 261/0.09; 373/0.19 299 (HP)/150 (CFM); 350/200; 500/400

Maintenance-diesel: 224/0.19; 373/0.28; 522/0.47 300/400; 500/600; 700/1000

Turbo-charged diesel: to 373/0.66 500/1400
**************************************************************************

2.15.1 General Requirements for Vehicle Tail Pipe Exhaust System

Provide a hanging [exposed overhead] [disappearing overhead] [disappearing underfloor] [nondisappearing (plug-in underfloor)] type vehicle tail pipe exhaust system. Construct and install in accordance with applicable requirements of NFPA 91.

2.15.2 Ductwork

Construct ducts and miter or stamped fittings with galvanized steel. Duct sheet metal gages must conform to Class I in SMACNA 1922 and SMACNA 1520.

2.15.2.1 Suction Side Ductwork

Construct suction side ductwork with lock groove seam longitudinal joints. Connect circumferential joints between sections with push-on or bead and crimp type, secured with a minimum 4 rivets or screws on ducts up to and including 100 mm 4 inches diameter, and with screws or rivets a minimum 80 mm 3 inches on center on larger sizes of duct. Lap joints in the direction of air flow. On disappearing overhead systems, assemble roller duct sections using pop rivets. Solder all joints or construct ductwork leak-tight as for discharge side ductwork below.

2.15.2.2 Discharge Side Ductwork

Construct ductwork on the discharge side of the fan leak-tight with joints and seams welded, brazed, or soldered. Provide flanges with suitable gaskets, where required. Repair damaged galvanizing with galvanizing repair compound.

2.15.3 Fan

**************************************************************************
NOTE: The criteria for special AMCA construction for protective coating can be further delineated here or incorporated into referenced paragraph, if this is the only fan. Specify welded Class II construction only where required.
NOTE: See Section 22 05 48.00 20, MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL for guidance given in guide specification technical notes. Definite requirements should be specified in contract specification for bidders’ information.

Comply with paragraph CENTRIFUGAL FANS in this section [, subparagraph UTILITY SET,] and special requirements for protective coatings.[ Provide unit of all welded construction, utilizing minimum 14-gage carbon steel in AMCA Class II construction.] [Internal and external protective coating must be manufacturer's standard, engineered quality type, with properties comparable to [air-dry or baked phenolic,] [or] [epoxy] applied in multiple coats of 0.10 to 0.15 mm 4 to 6 mil dry film thickness.] [Mount entire assembly for vibration isolation on structural steel base and spring or elastomer type isolators with minimum transmissibility of [10] [5] percent.][ Provide split sleeve or flexible connection at fan inlet.]

2.15.4 Flexible Tail Pipe Exhaust Tubing and Connectors

Provide interlocking helical seam metallic type construction of 0.3 mm 0.012 inch minimum thickness up to and including 150 mm 6 inch diameter and 0.51 mm 0.020 inch minimum thickness over 150 mm 6 inches diameter Type 302, 304, or 321 corrosion-resistant steel [with inside diameter] [and length as shown.] [of] [80] [100] [125] [150] [200]mm and [_____] meters in length [3] [4] [5] [6] [8] [inches] and [_____] feet in length. Connect to duct by welding or with screws or flanged joint with gasket [and fit with tail pipe adapters constructed of minimum 20 gage Type 300 or 400 Series stainless steel, and which include provisions for secure tail pipe attachment]. Secure hose terminal connections by screws, clamps, or flanged connections.[ Provide winch operated hose assembly.]

2.15.5 Supporting Elements

Support ducting [as indicated] with anti-sway bracing to resist perceptible movement in response to forces imposed by flexible tubing location on handling. Suspend tubing from overhead location and provide means to raise and lower for use. Assemble suspension system with rigid pulley restraint, 3 mm 1/8 inch diameter aircraft cable, pulleys, and manually operated winch fitted with safety ratchet lock and slip resistant hand grip.

2.16 WELDING FUME EXHAUST SYSTEM

2.16.1 General Requirements for Welding Fume Exhaust System

Provide a [hanging] [long reach type] welding fume exhaust system as specified and indicated. Construct and install in accordance with applicable requirements of NFPA 91.

2.16.2 Ductwork

Construct ducts and stamped fittings with galvanized steel. Duct sheet metal gages must conform to Class I in SMACNA 1922 and SMACNA 1520.
2.16.2.1 Suction Side Ductwork

Construct suction side ductwork with lock groove seam longitudinal joints. Connect circumferential joints between sections with push-on or crimp and bead type, secured with a minimum 4 rivets or screws up to and including 100 mm 4 inches diameter, and with screws or rivets a maximum 80 mm 3 inches on center on larger sizes of duct. Lap joints in the direction of air flow.

2.16.2.2 Discharge Side Ductwork

Construct ductwork on the discharge side of the fan leak-tight with joints and seams welded, brazed, or soldered. Provide flanges with suitable gaskets, where required. Repair damaged galvanizing with galvanizing repair compound.

2.16.3 Fan

**************************************************************************
NOTE: The criteria for special AMCA construction for protective coating can be further delineated here or incorporated into referenced paragraph, if this is the only fan. Specify welded Class II construction only where required.
**************************************************************************

**************************************************************************
NOTE: See Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL for guidance given in guide specification technical notes. Definite requirements should be specified in contract specification for bidders' information.
**************************************************************************

Comply with paragraph CENTRIFUGAL FANS [, subparagraph UTILITY SET,] in this Section and special requirements for protective coatings.[ Provide unit of all welded construction, utilizing a minimum 14-gage carbon steel in AMCA Class II construction.][ Internal and external protective coating must be manufacturer's standard, engineered quality type, with properties comparable to [air-dry or baked phenolic,] [or] [epoxy] applied in multiple coats of 0.10 to 0.15 mm 4 to 6 mil dry film thickness.] [Mount entire assembly for vibration isolation on structural steel base and spring or elastomer type isolators with a minimum transmissibility of [10] [5] percent.][ Provide split sleeve or flexible connection at fan inlet.]

2.16.4 Flexible Welding Fume Exhaust Tubing and Connectors

Provide corrosion protected, spring steel helix reinforced, neoprene impregnated, woven fibrous glass fabric laminate, flexible tubing with cuffed ends or equivalent construction, and with an inside diameter [and length as shown.] of [100] [125] [150] mm [and [_____] meters in length] [4] [5] [6] inches [and [_____] feet in length]. Connect to duct with clamp or gasketed flange [and fit with swivel connected conical fume hood, constructed of minimum 20 gage aluminum [or 26 gage galvanized steel] [or ABS plastic] and fitted with 13 mm 1/2 inch mesh intake screen and magnets for holding receptor in fixed location]. Secure tubing to terminal devices by clamping.[ Provide spring or weight counterbalanced supporting arms for flexible hose section of long reach system.]
2.16.5  Supporting Elements

Support ducting [as indicated] with anti-sway bracing to resist perceptible movement in response to forces imposed by flexible tubing location on handling. Suspend tubing from overhead location [and provide means to raise and lower for use]. [Assemble suspension system with rigid pulley restraint, 3 mm 1/8 inch diameter aircraft cable, pulleys, and manually operated winch fitted with safety ratchet lock and slip resistant hand grip.] [Support movable portion of long reach system with brackets.] Observe that hood remain in a fixed position after manual adjustment.

2.17  STACKHEADS

Provide SMACNA 1403 no loss type stackheads for vertical discharge to the atmosphere unless indicated otherwise. Weather caps are prohibited. Provide bracing or guy wires for wind loads on stacks as indicated. Discharge stacks should be vertical and terminate at a point where height or velocity prevents reentry of exhaust air.

PART 3  EXECUTION

3.1  INSTALLATION

3.1.1  Installation Requirements

**************************************************************************
NOTE: Ductwork for Class 2, 3, and 4 service and supporting elements must be able to sustain working live loads imposed by ducting 50 percent filled with particulate material being conveyed. Provide supplementary structural steel for the support of system components.
**************************************************************************

Install in accordance to NFPA 91, and SMACNA 1922, and SMACNA 1520. Provide mounting and supports for equipment, ductwork, and accessories, including structural supports, hangers, vibration isolators, stands, clamps and brackets, access doors, blast gates, and dampers. Install accessories in accordance with the manufacturer’s instructions. Construct positive pressure duct inside buildings airtight.

3.1.1.1  Wood Facilities

**************************************************************************
NOTE: Include paragraphs when appropriate. For other projects, edit as required and include appropriate references.
**************************************************************************

For [wood processing] [and] [woodworking] facilities, conform to NFPA 664.

3.1.1.2  Aluminum Facilities

**************************************************************************
NOTE: Include paragraphs when appropriate. For other projects, edit as required and include appropriate references.
**************************************************************************
For aluminum [processing] [and] finishing facilities, conform to NFPA 65.

3.1.2 Electrical Ground Continuity

Where electrical ground continuity is required, provide brazed connection insulated, multi-strand, copper wire jumpers across points of discontinuity. Provide connection to ground and continuity testing as part of the work of Division 16.

3.1.3 Special Installation Requirements

Special installation requirements for protectively coated steel ductwork for corrosive fume and vapor exhaust: Slope horizontal ducts [25] [_____] mm in [12] [_____] meters [one] [_____] inch in [40] [_____] feet in the direction of airflow or [25] [_____] in [3] [_____] meters [one] [_____] inch in [10] [_____] feet in the direction opposite to airflow. Where necessary, slope duct to common drainage point. Provide drains at low points, at internal duct restrictions, at base of risers and where indicated. Provide drain connections of 25 mm one inch pipe size corrosion resistant steel couplings welded to duct and provided with polytetrafluoroethylene paste lubricated PVC plug where drainage piping is not indicated. Provide drain lines with a trap of 25 mm one inch greater depth than the positive or negative pressure in the duct but not less than 50 mm 2 inches. Provide duct support system to include additional weight due to collection or [condensate] [and] washing water in nondrainable deflected surface and other areas. Provide duct supports and building structure attachments in accordance with SMACNA 1922 and SMACNA 1520.

3.1.4 Special Requirements for Installation of Thermoplastic Ductwork

Requirements for installation of thermoplastic ductwork for nonflammable corrosive fume and vapor exhaust:

3.1.4.1 Slope

3.1.4.2 Drains

Provide drains at all low points, at internal to duct drainage restrictions, at base of risers, and where indicated. Provide drain connections of 25 mm one inch IPS couplings with polytetrafluoroethylene paste lubricated plug where drainage piping is not indicated, and where piping is indicated, provide PVC Type DWV piping conforming to ASTM D2665 to points indicated. Provide trap of 25 mm one inch greater depth than the positive or negative pressure in the duct but not less than 50 mm 2 inches.

3.1.4.3 Duct Supports

Isolate duct support contact surfaces from supporting steel by 6 mm 1/4 inch thick closed-cell foamed cellular elastomer insulation material of a width greater than support. Provide duct support system to include additional weight due to collection of condensate and washing water in nondrainable, deflected surface and other areas.
3.1.5 Special Requirements for Installation of Fiberglass Ductwork

Requirements for installation of fiberglass ductwork for nonflammable corrosive fume and vapor exhaust:

3.1.5.1 Slope

3.1.5.2 Drains

Provide drains at all low points, at internal drainage restrictions, at base of risers, and where indicated. Provide drain connections of 25 mm one inch IPS couplings with polytetrafluoroethylene paste lubricated plug where drainage piping is not indicated, and where piping is indicated, provide PVC Type DWV piping conforming to ASTM D2665 to points indicated. Provide a trap of one inch greater depth than the positive or negative pressure in the duct but not less than 50 mm 2 inches.

3.1.5.3 Duct Supports

Isolate duct support contact surfaces from supporting steel by 6 mm 1/4 inch thick closed-cell foamed cellular elastomer insulation material of a width greater than support. Design duct supporting system to include additional weight due to collection of condensate and washing water in nondrainable, deflected surface and other areas.

3.1.6 Miscellaneous Sheet Metal Work

Provide [_____] and [_____] fabricated from [mill galvanized steel] [black steel and protectively coated] [aluminum] [_____] as indicated. Sheet metal thickness, reinforcement and fabrication, where not indicated, must conform to SMACNA 1403.

3.1.7 Building Penetrations

3.1.7.1 General Penetration Requirements

Provide properly sized, fabricated, located, and trade coordinated sleeves and prepared openings, for duct mains, branches, and other item penetrations, during the construction of the surface to be penetrated. Provide sleeves for round duct 380 mm 15 inches and smaller and prepared openings for round duct larger than 380 mm 15 inches and square or rectangular duct. Fabricate sleeves, except as otherwise specified or indicated, from 20 gage, 1.00 mm 0.0396 inch thick mill galvanized sheet metal. Sleeves penetrating load bearing surfaces must be standard weight galvanized steel pipe. Provide roof penetrations as shown in SMACNA 1403.

3.1.7.2 Framed Opening

Provide framed openings in accordance with approved shop drawings. Refer to paragraph FIRE DAMPERS in this section, for related work.
3.1.7.3 Clearances

Provide a minimum 25 mm one inch clearance between penetrating and penetrated surfaces. Fill clearance space with bulk fibrous glass or mineral wood [or foamed silicone] and seal and close.

3.1.7.4 Tightness

Penetration must be [weathertight] [fireproof where fire rated surfaces are penetrated] [vaportight to prevent vapor transmission to conditioned spaces] [sound tight to prevent sound transmission to or between normally occupied or finished spaces] [deleterious or hazardous substance-tight where] [toxic] [flammable] [_____] [substances or gases could migrate].

3.1.7.5 Sealants

Provide sealant of [_____] [elastomeric] type [or foamed silicone type], as specified under paragraph SEALANTS in this section. Apply to oil free surfaces to a minimum 10 mm 3/8 inch depth.

3.1.7.6 Closure Collars

Provide a minimum 100 mm 4 inches wide, unless otherwise indicated, for exposed ducts and items on each side of penetrated surface, except where equipment is installed. Install collar tight against the surface and fit snugly around penetrating item without contact. Grind sharp edges smooth to prevent damage to penetrating surface. Fabricate collars for round ducts 380 mm 15 inches in diameter or less from 20 gage, 1.00 mm 0.0396 inch nominal thickness, mill galvanized steel. Attach collars a minimum of 4 fasteners to where the opening is 300 mm 12 inches in diameter or less, and a minimum of 8 fasteners where the opening is 500 mm 20 inches in diameter or less. Fabricate collars for square and rectangular ducts with a maximum side of 380 mm 15 inches or less from 20 gage, 1.00 mm 0.0396 inch nominal thickness, mill galvanized steel. Fabricate collars for round, square, and rectangular ducts with minimum dimension over 380 mm 15 inches from 18 gage, 1.40 mm 0.0516 inch in nominal thickness, mill galvanized steel. Install collars with fasteners a maximum of 150 mm 6 inches on center. Where penetrating items are irregularly shaped and where approved, smoothly finished, fire-retardant, foamed silicone elastomer may be utilized without closure collar.

3.1.8 Installation of Fire Dampers

Install fire dampers at locations indicated. Provide units and connecting ductwork in accordance with applicable provisions of [NFPA 91], [UL Bld Mat Dir], AMCA 500-D [and UL 33], [and as indicated]. Install retaining angles, sleeves, break-away connections, and duct access doors at each damper, as required. Minimum thickness of sleeves must be 14 gage [, except as otherwise indicated]. Duct access doors must be hinged [and fitted with UL listed glass viewing port assembly]. Prior to acceptance, simulate conditions to cause each unit to function automatically. Apply safe, nonflame, heat source to fusible links and replace test activated fusible links.

3.1.9 Installation of Flexible Connectors

Flexibly connect duct connected and vibration isolated fans [, ducts crossing building expansion joints] and specified or indicated components [, except where direct connections are specified or indicated]. When fans
are started, stopped, or operating, flexible connector surfaces must be curvilinear, free of stress induced by misalignment or fan reaction forces, and must not transmit vibration. Leakage must not be perceptible to the hand when placed within 150 mm 6 inches of the flexible connector surface or joint. Provide a minimum of 150 mm 6 inches and a maximum of 610 mm 2 feet active length with a minimum of 25 mm one inch of slack, secured at each end by folding in to 24 gage sheet metal or by metal collar frames.

3.1.10 Installation of Supports

3.1.10.1 Selection

Select duct and equipment support system taking into account the best practice recommendations and requirements of SMACNA 1922, SMACNA 1520, and NFPA 91; location and precedence of work under other sections; interferences of various piping and electrical work; facility equipment; building configuration; structural and safety factor requirements; vibration and imposed loads under normal and abnormal service conditions. Indicated support sizes, configurations, and spacings are the minimal type of supporting component required for normal loads. Where installed loads are excessive for the normal support spacings, provide heavier duty components or reduce the element spacing. After system start-up, replace or correct support elements which vibrate and cause noise or possible fatigue failure. Exercise special care to prevent cascading failure.

3.1.10.2 General Requirement for Supports

**************************************************************************
NOTE: See Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL for guidance given in guide specification technical notes. Definite requirements should be specified in contract specification for bidders' information.
**************************************************************************

Securely attach supporting elements to building structural steel or structural slabs. Where supports are required between building structural members provide supplementary structural steel as specified for work under this section. On submittals show location of supports and anchors and loads imposed on each point of support or anchor. Do not hang ductwork or equipment from piping, or other ducts or equipment. Attach supports to structural framing member and concrete slab. Do not anchor supports to metal decking unless a means is provided and approved for preventing the anchor from puncturing the metal decking. Where supports are required, between structural framing members, provide suitable intermediate metal framing. Where C-clamps are used, provide retainer clips. A maximum span of 3 meters 10 feet must exist between any two points, with lesser spans as specified or as required by duct assemblies, interferences, and loads imposed or permitted. Provide a minimum one set of two vertical support elements for each point of support and each length of duct, except as otherwise specified. Install supports on both sides of all duct turns, branch fittings, and transitions. Cross-brace hangers sufficiently to eliminate sway. Perforated strap hangers are prohibited. Where ductwork system contains heavy equipment, hang such equipment independently of the ductwork. Duct supports must be vibration isolated from structure at points indicated. Provide vibration isolators in indicated discharge ducting system for a minimum distance of [15 meters] [50 feet] [_____] beyond the fan. Coordinate deflection of duct and equipment mountings and conform to Section [22 05 48.00 20] MECHANICAL SOUND VIBRATION AND SEISMIC
CONTROL.[ The location of supporting elements must be limited by the allowable load on the purlin which must be limited to that no greater than the moment produced by 4450 Newton one Kip load at mid-span of purlin. When the hanger load exceeds these limits, provide reinforcing of purlin[s] or additional support beam[s]. When an additional beam is used, the beam must bear on the top chord of the roof trusses and bearing must be over gusset plates of top chord. Stabilize beam by connection to roof purlin along bottom flange.]

3.1.10.3 Methods of Attachment

Clamp, or weld when approved, attachment to building structural steel in accordance with AWS D1.1/D1.1M. Construct masonry anchors selected for overhead applications of ferrous materials only. Install masonry anchors in rotary, non-percussion, electric drilled holes. Self-drilling anchors may be used provided masonry drilling is performed with electric hammers selected and applied in such a manner as to prevent concrete spalling or cracking. Pneumatic tools are prohibited.

3.1.11 Welding

Welding test agenda must be done in accordance with the applicable provisions of AWS D1.1/D1.1M and AWS D1.3/D1.3M.

3.1.12 Test Ports

*****************************************************************************************
NOTE: The designer must indicate on the drawings the location of test ports required for proper testing, including static pressure, velocity pressure, and test openings for sampling discharge stack or duct. See ACGIH–2092S Industrial Ventilation: A Manual Of Recommended Practice for recommendations in the chapter on testing.
*****************************************************************************************

Provide test access ports at points required for work under paragraph TESTING, ADJUSTING, AND BALANCING in this section. Locate test ports in straight duct as far as practical downstream of fans, change of direction fittings, takeoffs, interior to duct accessories, and like turbulent flow areas.

3.1.13 Ductwork Cleaning

Protect duct openings from construction debris using temporary caps, flanges, or other approved means. Clean ductwork in accordance with manufacturer's recommendations [and the North American Insulation Manufacturers Association (NAIMA) Guide on Cleaning of Duct Board Materials]. Clean dirty duct interior with high velocity water and oil-free air streams or by vacuum cleaning as required by project conditions. ][Test watertight duct work for proper support, leakage, and unacceptable drainage provisions by intermittently spraying interior with garden hose nozzle, at a rate of 0.2 liter per second 3 gallons per minute, exercising care to prevent excessive water accumulation.] After construction is complete but accessible and prior to acceptance, remove all construction debris from exterior surfaces. Do not close duct inspection ports until inspected by the Contracting Officer.
3.1.14 Protective Coating Work

3.1.14.1 General Requirements for Protective Coating Work

Provide protective coating on interior [and exterior] surfaces of [_____] [and] [interior] [and] [exterior] surfaces of [_____] [and] [_____] system as specified hereafter. Prime coat exterior surfaces of [_____] [and] [_____] with [_____] [inorganic zinc coating as part of work under this section] [.] [, for field finishing of exterior surfaces as part of work under Section 09 90 00 PAINTS AND COATINGS.] Brush primer, or protective coating where no primer is specified, onto corners and into crevices and welds, working the material into irregular surfaces for a holiday free finish.

3.1.14.2 Baked, Unmodified Phenolic System

a. General: The following must govern for a protective coating system based on unmodified phenol-formaldehyde resin intended for shop application to [black carbon steel] [_____] surfaces in [fume] [vapor] exhaust service with possibility of materials concentration by condensation and subsequent evaporation. Shop apply coating by an applicator approved or licensed by the coating manufacturer.

b. Surface Preparation: Clean and blast surfaces with dry abrasive to "White Metal" and critical profile and anchor pattern in accordance with SSPC SP 5/NACE No. 1, and requirements and recommendations of the coating manufacturer.

c. Application: The complete system must include the application of two coats of red pigmented base followed by not less than one coat of the clear finish, to provide a total minimum dry film thickness of [0.15 mm] [6 mils] [______]. Apply coating materials by conventional industrial pressure spray equipment. Use only those thinners and cleaners in amounts recommended by the manufacturer. Heat-cure each coat between coats and bake surfaces after the last coat in accordance with manufacturer's applicable published instructions and specific instructions for the specified application. Baking time between coats must be a minimum 1 1/2 to 2 hours at 93 to 121 degrees C 200 to 250 degrees F. Baking after top coat must be one hour at 93 to 177 degrees C 200 to 350 degrees F, plus 2 hours final bake at a temperature of [177] [204] degrees C [350] [400] degrees F. Other baking schedules to achieve required quality coating may be proposed.

d. Repair: Return damaged surfaces to the applicator's shop for repair, unless otherwise approved by the Contracting Officer.

3.1.14.3 Inorganic Zinc Coating System

a. General Requirements, Inorganic Zinc Coating System: The following must govern for a protective coating system primer based on inorganic zinc coating intended for shop application to [_____] [specified] black carbon steel surfaces with subsequent field finishing with compatible tie coat and [epoxy] [acrylic latex] [modified acrylic] [chlorinated rubber] top coat [applied as part of work under Section 09 90 00 PAINTS AND COATINGS.]

c. Application: Apply one coat at [0.05 to 0.10] [0.10 to 0.13] mm [2 to
3) [3 to 5] mils dry film thickness by airless or conventional spray equipment. Use only those thinners and cleaners in amounts recommended by the manufacturer.

d. Repair: Field repair damaged surfaces in accordance with manufacturer's instructions.

3.1.14.4 Field Inspection of Protective Coating Work

Visually inspect coated surfaces from a maximum distance of 1.5 meters 5 feet with special attention given to corners and crevices. Check coating thickness in accordance with SSPC Paint 11. Perform inspection immediately prior to erection of ductwork and equipment and in the presence of the Contracting Officer. Repair coating as required. Apply additional coating if thickness is not sufficient.

3.1.15 Factory and Field Painting and Finishing

3.1.15.1 Factory Work

Factory finish interior ferrous metal and other specified metallic equipment and component surfaces with manufacturer's standard surface preparation, primer, and finish coating. Factory finish exterior to building space ferrous metal surfaces and other exterior to building and interior to building metallic or nonmetallic surfaces with specified protective coating system in accordance with the paragraph PROTECTIVE COATING MATERIAL in this section and otherwise with manufacturer's standard surface preparation, primer and finish which meet the requirements of paragraph CORROSION PREVENTION.

3.1.15.2 Field Work

Touch-up or if necessary, repaint factory applied finishes which are marred, damaged, or degraded during shipping, storage, handling, or installation to match the original finish. Clean and prime field or shop fabricated ferrous metals required for the installation specified under this section in accordance with the applicable provisions of Section [09 90 00] PAINTS AND COATINGS. Painting of surfaces not otherwise specified and finish painting of items only primed at the factory or elsewhere, are specified as part of the work under Section [09 90 00] PAINTS AND COATINGS.

3.2 TESTING, ADJUSTING, AND BALANCING

3.2.1 Ductwork Structural Integrity and Leakage Testing

**************************************************************************
NOTE: In addition to significant energy losses, air leakage from HVAC ducts and air handling units can cause significant IAQ problems due to unexpected airflow between indoors and outdoors, and between areas within the building. Air leakage from supply or return duct work contributes to the condensation of humid air in building cavities and/or on the neighboring surfaces. Air leakage can be especially problematic for ducts or AHUs that are located outside the conditioned spaces.
**************************************************************************
Inspect and test systems pressure rated higher than 498 Pa (2 inches water gage) for structural integrity and leakage as systems or sections during construction but after erection, as work progresses, in system or section lengths not exceeding 30 meters (100 feet). Test for structural integrity at [_____] percent in excess of system fan positive or negative total pressure. Test for leakage at [_____] percent in excess of system fan positive or negative total pressure. Leakage test procedure and apparatus must be in accordance with SMACNA 1972 CD. Total leakage, prorated to length of duct under test, must not exceed one percent of system capacity. Confirm that duct leakage is less than three percent of coil airflow for new systems and less than six percent for existing systems. Do not permit leakage in positive pressure ducts in buildings carrying flammable or toxic materials.

3.2.2 Power Transmission Components Adjustment

Test and adjust V-belts and sheaves for proper alignment and tension preliminary to operation and after 72 hours of operation at final speed, in the presence of the Contracting Officer. Belts on drive side must be uniformly loaded, not bouncing. Align direct-drive couplings to less than half of manufacturer's allowable range of misalignment.

3.2.3 Preliminary Tests

Conduct an operational test on the entire exhaust duct systems, components, and equipment for a period of not less than 6 hours after power transmission components are adjusted. Replace filters, if any, after preliminary tests and prior to conducting final acceptance tests.

3.2.4 Testing, Adjusting, and Balancing Work

Perform work in accordance with the applicable and recommended procedures of: ACGIH-2092S. Provide apparatus, certified, calibrated, instrumentation including that to measure sound levels, motor current, and power factor. Unless approved otherwise, instruments must be limited to manometers and approved aneroid type gages (such as a Magnehelic). Velometers may be used for low velocity measurements if approved by the Contracting Officer.

3.2.5 Systems Volume Acceptance Criteria

Systems final volume must be within the following limits:

Fan: Plus 10 percent, minus zero percent of design volume at design temperature

Hood or Equipment: Plus or minus [5] [10] percent of design volume at design temperature

Note: Tolerances must be taken on clean or dirty conditions as indicated on the drawings.

3.2.6 Sound Level Tests

Report to the Contracting Officer in writing, sound levels higher than 84 dBA at hoods or at workers' normal operating positions at equipment in addition to being included in the required test reports.
3.3 SYSTEM[S] OPERATION DEMONSTRATION

After systems and equipment testing, adjusting, and balancing has been completed and accepted, demonstrate the complete and correct functioning of systems equipment and controls by operation through normal ranges and sequences, and by simulation of abnormal conditions, [including the manual tripping of fire dampers]. Manually and automatically cause every device to function as intended. Readjust, as necessary, any settings and after sufficient operating time, but not less than [6] [_____] hours, verify ability of equipment and controls to establish and maintain stable and accurate operation and required system performance. Note any abnormal deviations, such as excessive vibration, noise, and heat, binding damper mechanisms, and incorrect fan rotation. Make any necessary repairs, replacements or adjustments.

3.4 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

<table>
<thead>
<tr>

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up
to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

SD-10 Operation and Maintenance Data
1.3 QUALITY ASSURANCE

**************************************************************************
NOTE: Review ASME NQA-1 and include or exclude requirements as necessary. ASME NQA-1 is used for safety class filtration systems that perform a fail-safe function, typically for containment of highly toxic materials.
**************************************************************************

1.3.1 General

 Manufacture the filtration units and stand-alone isolation dampers under a quality assurance program that meets the requirements stated in ASME NQA-1.

1.3.2 Welding

 Qualify welding procedures, welders, and welding operators in accordance with ASME BPVC SEC IX. Submit a copy of qualified welding procedures, and a list of names and identification symbols of qualified welders and welding operators, at least 2 weeks prior to the start of welding operations. Perform all welding in accordance with the requirements specified in ASME BPVC SEC IX and as required by ASME N509. Pressure retaining weld joints must comply with the requirements of ASME BPVC SEC IX.

1.4 DELIVERY, STORAGE, AND HANDLING

 Mount the filtration system with protective shipping skids, crated or covered, blocked, braced, and cushioned as necessary to prevent physical damage during shipping. Submit certification of compliance, including a certified list of materials. Protect equipment delivered and placed in storage from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM REQUIREMENTS

2.1.1 General

 a. Provide ductwork, fittings, and accessories as required to provide a complete installation and to eliminate interference with other construction. The CBR Air Filtration System must include ASTM A240/A240M Type 304 stainless steel bag-in/bag-out housing, isolation dampers located where indicated, roughing filter, pre-filter, HEPA filters, carbon adsorbers, [post-filter], in-place test sections, and a [blow-through] [draw-through] fan unit mounted on a structural steel equipment skid as indicated. Provide the filtration system with filtration element removal trays, removable access doors, [filtration element banding kits,] pressure ports, pressure gauges, duct transitions, flexible connections, test blanks, and other appurtenances required for the specified operation.

 b. The filtration system physical dimensions must be suitable to fit the
space allotted. Join together sections of the filtration system in series to make a system that meets the required capacity. Mechanically test the filtration system for leaks while in the factory.

c. The filtration system must be suitable for continuous operation with an air stream temperature of up to 57.2 degrees C 135 degrees F and suitable for radioactive and chemical warfare service. The system must also meet the applicable requirements of ASME AG-1, ASME N509, and UL 586. Systems located in temperature controlled areas that filter conditioned air or low temperature ambient air must be [externally or internally insulated as indicated] [of double walled construction with thermal insulation in the interstitial space].

d. The filtration system must meet the requirements of ASHRAE 90.1 - SI
ASHRAE 90.1 - IP.

2.1.2 Structural Design

**************************************************************************
NOTE: Seismic protection is required for filtration systems that perform a safety function during and after a seismic event. Manufacturer's standard equipment is normally considered qualified for the requirements specified below. Review ASME AG-1, Section AA-4000, and provide specific additional requirements for the design application.

Coordinate seismic protection requirements with UFC 3-301-01.
**************************************************************************

Structurally design and test the filtration system, components, and accessories and submit appropriate documentation and certification as required by ASME AG-1 Section AA. The service condition of the filtration system must meet level [A] [B] [C] [D] service limits with the design loads indicated. Verify the structural design of the filtration system, components, and accessories by analysis, testing, or a combination of analysis and testing. The filtration system must be subjected to [5] [_____] operating based earthquakes (OBE) and one safe shutdown earthquake (SSE) as indicated by the required response spectrum. Each OBE and SSE must have a minimum test duration of [30] [_____] seconds. Ensure the seismic protection requirements of the filtration system, components, and accessories comply with Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT.

2.2 STANDARD PRODUCTS

Provide components and equipment which are standard products of a manufacturer regularly engaged in the manufacturing of products that are of a similar material, design, and workmanship and have been in satisfactory commercial or industrial use for 5 years before bid opening. Submit a statement demonstrating successful completion of similar services on at least five projects of similar size and scope, at least 2 weeks prior to submittal of other items required by this section. Include manufacturer's catalog data for the specified items. Highlight the data to show model, size, options, etc., that are intended for consideration.

a. Include the 5-year experience applications of components and equipment under similar circumstances and of similar size. The 5 years must be
satisfactorily completed by a product which has been sold or is offered for sale on the commercial market through advertisements, manufacturer's catalogs, or brochures. Products having less than a 5-year field service record will be acceptable if a certified record of satisfactory field operation, for not less than 15,000 hours exclusive of the manufacturer's factory tests, can be shown. Submit proposed schedule for factory tests, at least 2 weeks prior to the start of related tests.

b. The equipment items must be supported by a service organization. Asbestos and asbestos-containing products are not acceptable.

c. Demonstrate compliance with contract requirements for the following:

(1) Filtration System

(2) Filtration Elements including Roughing Filter, Pre-filter, HEPA Filter, Carbon Adsorber,[ Post-Filter], Gasket Seal, Fluid Seal and Bag-In/Bag-Out Assembly and Banding Kits

(3) Isolation Dampers and Damper Operators

(4) Fan Units

(5) Flexible Connection

(6) Pressure Gauge

(7) Manufacturer's Quality Assurance Program

(8) Testing Agency Qualifications

2.3 NAMEPLATES

Provide equipment with a nameplate that identifies the manufacturer's name, address, type or style, model or serial number, and catalog number. Provide each filtration element access door with a metal nameplate of the same material as the filter housing, fastened to the exterior which states the critical replacement components and part numbers for the equipment contained inside. Include filtration element model number, filtration element efficiency, and size on the nameplate. Provide each filtration element housing with an external metal pocket, for holding the operation and maintenance instruction manual, which must be provided with the housing. If housing is exposed to the weather, provide metal pocket that is weather resistant and equipped with weep holes. Provide instructions which are complete and detailed for the actual filtration system provided.

2.4 FILTRATION SYSTEM HOUSING

********************************************************************************

NOTE: A bag-in/bag-out housing is primarily used for filtration systems that continuously filter contaminants. For filtration systems in standby mode or that will not likely filter contaminants, a bag-in/bag-out housing is not required. A blow-through filtration system will be used when located in a contaminated environment and a draw-through filtration system arrangement will be used when located in a clean environment.
Provide housings of [single] [50 mm 2 inch double] [100 mm 4 inch double] wall construction, fabricated of a minimum 2 and 3 mm 12 and 14 gauge ASTM A240/A240M Type 304 stainless steel, with all pressure boundary joints, seams, and penetrations welded airtight. The housing must conform to ASME N509. Provide housings of a [single] [dual] side servicing bank type arrangement. Equip a housing two or more filtration elements wide with a filtration element removal rod. Design and construct the housing for a pressure of 5,000 Pa 20 inches wg and with an integral structural steel frame. Provide lifting lugs with a minimum of 50 mm 2 inch diameter eyeholes, made of the same material as the housing, on the top of each filtration unit. All portions of the filtration system housing must be free of sharp edges and burrs.

2.4.1 Filtration Element Access Door

Provide each filtration element location with an access door to remove the filtration element and replace it with another. Provide [single-wall] [double-wall insulated] type access doors, fully gasketed to the filtration system housing. Provide each rigid access door with at least four tie-down latches [with locking hasps] [with tamper-proof fasteners]. Design the access door such that, when removed, no sharp projections remain [and access to the bag-out port is not impeded]. [When the access door is closed, it must not press against the bag-out port or the PVC bag.]

2.4.2 Filtration Element Sealing Mechanism

[Filtration elements provided with gasket seals must have a sealing mechanism that is a replaceable unit, constructed of series 300 stainless steel, providing a total clamping force of 6200 N 1400 lbs per filtration element in accordance with DOE HDBK-1169.] [Filtration elements provided with fluid seals must have a series 300 stainless steel replaceable sealing mechanism that engages and disengages the element on the housing mounting frame's knife edge.]

2.4.3 Casings and Insulation

Field insulate casings as specified in Section 23 30 00 HVAC AIR DISTRIBUTION, paragraph: Casings. Place all of the required insulation for double wall type casing sections inside the cavity area.

2.4.4 Housing Man-Entry Doors

Provide [single wall] [50 mm 2 inch] [100 mm 4 inch thick double wall type access doors injected with a minimum of 0.028 kg/cubic meter 2.2 pounds/cubic foot of polyurethane foam]. Finish each door with the same material as the housing front and back. [Bond interior and exterior panels to create a seamless rigid panel with a minimum insulating value of] [R-13] [______]. Door panels must [use a high density polyurethane thermal break and] incorporate an extruded gasket and be impervious to virtually all chemicals and be highly flexible in extreme heat or cold. Provide heavy duty stainless steel hinges and a minimum 200 by 200 mm 8 by 8 inch [single] [double] pane safety glass view windows with integral wire mesh reinforcing. Using test method ASTM E283 confirm zero total CFM air leakage at 1250 Pa 5.0 inches wg static pressure for a 600 by 1500 mm 24 by 60 inch [out] [in] swing door with two hinges and two latch points operable from inside and outside the housing.
2.4.5 Housing Leak and Pressure Test

NOTE: Use housing leakage rate of 0.20 percent of housing volume for all-welded man-entry steel housings and 0.05 percent for small single-filter housings.

Factory leak test the filtration system housing in accordance with ASME AG-1, Section 6, using the pressure decay method. The maximum housing leakage rate acceptance criteria is in accordance with DOE HDBK-1169 table 4.5, which is [0.05] [0.20] percent of housing volume at 2480 Pa 10 inches wg pressure differential. Test the housing both positively and negatively to the design pressure of [5,000] [_____] Pa [20] [_____] inches wg before performing the DOE HDBK-1169 housing leak acceptance criteria test.

2.5 FILTRATION ELEMENTS

Provide air filtration elements listed in accordance with UL 900. High-efficiency particulate air filters and carbon adsorbers must meet the requirements indicated.

2.5.1 Roughing Filter

Provide [50] [100] mm [2] [4] inch deep UL 586 Class II roughing filter, rigid pleat panel filter, consisting of cotton and synthetic media, heavy gauge expanded metal support grid, and rigid board enclosing frame. Provide roughing filter having a particle size removal efficiency (PSE) of 25 to 30 percent based on ASHRAE 52.2. Initial resistance at [_____] m/s feet/second must not exceed [_____] Pa inches wg.

2.5.2 Pre-filter and Post-filter

NOTE: Post filters are required by ASME N 509, are located downstream of adsorbers for carbon fines collection, and used for non-military applications.

Provide extended, dry media type [pre-filter] [pre-filter and post-filter], [100] [150] [300] mm [4] [6] [12] inch deep, with a particle size removal efficiency (PSE) of 95 percent based on ASHRAE 52.2. Initial resistance at [_____] m/s feet/second must not exceed [_____] Pa inches wg.

2.5.3 High-Efficiency Particulate Air (HEPA) Filter

NOTE: Frames constructed of plywood are usually used in applications where disposal of filters is by incineration.

Provide HEPA filters and frames meeting the materials, design, inspection, fabrication, quality assurance, and nameplate marked as specified in ASME AG-1, Section FC, and having a 99.97 percent efficiency with a 0.3 µm micron diameter particle size as determined by the dioctyl phthalate (DOP) test method in accordance with IEST RP-CC-001. Qualify and label HEPA filters in accordance with UL 586. HEPA filters must have the indicated
capacity and pressure drop for clean filters. Provide [Type II - stainless steel sheet, Type 304] [Type IV plywood] construction filter frames as defined in ASME AG-1, Section FC. Manufacture the HEPA filter media in accordance with ASME AG-1, Section FC. Provide filtration media frames with an integral perimeter gasket seal. Initial resistance at [_____] m/s feet/second of filter face area must not exceed [_____] Pa inch wg.

2.5.4 Carbon Adsorber

**************************************************************************

NOTE: To remove all chemical warfare agents (included in FM 3-9) from an air stream use impregnated ASZM-TEDA carbon media. To remove chemical agents that only have low volatility (vapor pressure less than 1,000 Pa 4 inches wg) use activated carbon conforming to ASME AG-1. Many toxic industrial chemical vapors are not effectively removed by ASZM-TEDA carbon.

Commercial carbon adsorbers are typically designed for 235 sL/s 500 scfm when configured as a single stage system; however, designs for various air flow capacities 165 to 354 sL/s 350 to 750 scfm are available as indicated in the table below.

<table>
<thead>
<tr>
<th>Adsorber Air Flow Rate</th>
<th>Nominal Adsorber Depth, mm inches</th>
<th>Single Stage, L/s cfm</th>
<th>Dual Stage, L/s cfm</th>
</tr>
</thead>
<tbody>
<tr>
<td>35514</td>
<td>177375</td>
<td>354750</td>
<td></td>
</tr>
<tr>
<td>40516</td>
<td>236500</td>
<td>4721000</td>
<td></td>
</tr>
<tr>
<td>45518</td>
<td>295625</td>
<td>5901250</td>
<td></td>
</tr>
<tr>
<td>51024</td>
<td>354750</td>
<td>7081500</td>
<td></td>
</tr>
</tbody>
</table>

The air flow rates listed above are at 0.25 seconds residence time.

Care should be taken to maintain residence time of air passing through the carbon adsorber. For example, placing two adsorbers in series maintains the residence time while doubling the airflow capacity.

At 472 sL/s 1000 scfm the ASZM-TEDA adsorber uses a 12 x 30 mesh of carbon media that has a pressure drop of approximately 1,500 Pa 6 inches wg per carbon adsorber stage. Activated carbon adsorbers, conforming to ASME AG-1 and using 8 x 16 mesh carbon, have a pressure drop of approximately 682 Pa at 472 sL/s 2.75 inches wg at 1000 scfm per carbon adsorber stage.

**************************************************************************
Provide carbon adsorbers consisting of six 50 mm 2 inch thick panels configured as a V-bed similar to the shape of a Type I cell in accordance with IEST RP-CC-008. The adsorber consists of [ASZM-TEDA carbon conforming to MIL-DTL-32101] [non-impregnated highly activated carbon conforming to ASME AG-1, Section FF]. Provide carbon adsorber meeting the requirements for airflow resistance, refrigerant leak test, dimethylmethylphosphonate (DMMP) breakthrough life test, moisture content, cyanogen chloride (CK) gas life, and gas life capacity testing. Provide carbon adsorber having an airflow rate capacity as indicated and designed to adsorb chemical vapor with an overall system minimum residence time of [0.25] [_____] seconds. Use ASTM A240/A240M Type 304 stainless steel for all inner and outer case materials. Design the adsorber to include a means to obtain samples of the adsorbent. The preferred method incorporates a set of sample canisters. Other methods or designs are acceptable if it can be shown that a representative sample of the total bed thickness is produced without voids or that result in a bypass condition. Provide carbon adsorber frames with an integral perimeter [gasket seal] [fluid seal]. Submit documentation, including table and/or schematic, identifying outline or significant interface dimensions, certified list of materials, adsorbent type and its certified test reports, welder qualifications, certified test reports for all performance requirements specified, certification of compliance with specified packaging and shipping requirements.

2.5.4.1 Airflow Resistance

The airflow resistance must be [750 Pa 3.0 IWG +/- 10 percent] [1,500 Pascal 6.0 IWG] [[_____] Pascal IWG +/- 10 percent] at the rated air flow with an air stream temperature of 21 degrees C 70 degrees F and a barometric pressure of 760 mm 29.92 inches Hg. Test each cell to be delivered to the Purchaser at the manufacturer's location prior to packaging. Mark airflow resistance and certification on each cell. Reject any cell not meeting the airflow resistance requirement. Install the cell in the test tunnel in its service orientation and the airflow through the cell adjusted to [236 L/s 500 SCFM +/- 5 percent] [472 L/s 1,000 SCFM +/- 5 percent] [_____] L/s SCFM +/- 5 percent]. Perform the following: 1) Record the barometric pressure. 2) Measure and record the air stream temperature. 3) Determine and record the difference in the static pressure head upstream of the cell to that downstream of the cell. Subtract the test fixture resistance so that the recorded resistance is that of the cell. If testing occurs at nonstandard conditions, calculate and record the airflow resistance, and correct the test measurements to standard conditions.

2.5.4.2 Refrigerant Leak Test

Each cell to be delivered to the Purchaser must have been tested by the manufacturer prior to packaging. During the test, the downstream concentration of the refrigerant gas cannot exceed 0.0005 times the upstream concentration. Reject cells that do not meet this requirement. Install the cell in the test tunnel in its service orientation and the airflow to [236 L/s +/- 12 L/s 500 SCFM +/- 25 SCFM] [472 L/s +/- 24 L/s 1,000 SCFM +/- 50 SCFM]. Challenge the cell with a refrigerant vapor (R-134a or equivalent) at a concentration equivalent to at least 20,000 times the minimum sensitivity of the monitor used to measure filter leakage. Locate the challenge-gas injection port in such a manner to ensure uniform mixing of the tracer gas. Locate the downstream test port to ensure a representative sample. Qualification data to verify test port selection must be on file for inspection upon request. Inject the leak tracer chemical (refrigerant) continuously into the filter influent over an interval sufficient to ensure the effluent monitor is capable of accurately...
measuring the required leakage level.

2.5.4.3 Dimethylmethylphosphonate (DMMP) Breakthrough Life Test

**************************************************************************
NOTE: For production lots consisting of a large number of filters, less than 10 percent of the filters can be tested to obtain a high level of confidence of acceptable performance.
**************************************************************************

The adsorber cell being destructively tested for DMMP gas life value as specified for a minimum of [50] minutes when subjected to the rated air flow at 52 degrees C 125 degrees F, at less than 40 percent relative humidity and having an inlet concentration indicated. Test cells which are filled with an adsorbent meeting the specified requirements will be randomly selected by the Contracting Officer from the lot. The number of cells required for DMMP testing is 10 percent, rounded down for the total number of adsorbers in the lot, but not less than one. Therefore, the required number of deliverables is equal to the number required for the system plus the number of cells to undergo this destructive testing. Hard-mount each test cell to a rough handling machine in its service orientation and vibrate for 10 minutes at a frequency of 200 cycles per minute at an amplitude of 19.1 mm +/- 0.32 mm 3/4 inch +/- 1/8 inch in accordance with MIL-STD-282, Test Method 105.11. Immediately following the rough handling, DMMP breakthrough life test the cells at the same test facility the cells were rough handled in order to minimize carbon redistribution. If at least one cell fails to meet the criteria, reject the lot. Adjust the filling procedure and submit another lot for DMMP breakthrough life test. Just prior to running the DMMP test, measure and record airflow resistance data for the sample cell and the airflow resistance calculated at standard conditions as indicated. Install cell in the test tunnel in its service orientation. Adjust airflow to [236 L/s 500 SCFM +/- 5 percent] [472 L/s 1,000 SCFM +/- 5 percent]. Run the test to cell life. Test the cell for DMMP breakthrough life at the following test parameters:

<table>
<thead>
<tr>
<th>Challenge Concentration</th>
<th>5,000 (400 mg/m3 1050 ppm +/- 80 ppm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Breakthrough Concentration</td>
<td>0.02 mg/m3 0.004 ppm</td>
</tr>
<tr>
<td>Relative Humidity</td>
<td>less than 40 percent</td>
</tr>
<tr>
<td>Temperature</td>
<td>45 degrees C +/- 5 degrees C 113 degrees F +/- 9 degrees F</td>
</tr>
</tbody>
</table>

a. For the adsorber cell to be acceptable, the breakthrough time for the DMMP concentration of the filter effluent to increase to 0.02 mg/m3 0.004 ppm must be as indicated. While the challenge concentration is permitted to vary within the stated range during the course of the test, normalize the breakthrough time measured to the 5000 mg/m3 1050 ppm concentration by the following calculation:

\[
\text{Corrected breakthrough time} = \frac{\text{Measured breakthrough time} \times \text{Average concentration during test}}{5000 \text{ mg/m}^3 \text{ 1050 ppm}}
\]

b. Corrected breakthrough time = Measured breakthrough time x Average concentration during test x 5000 mg/m3 1050 ppm.

c. The DMMP vapor in air challenge concentration must be created to ensure uniform mixing of the DMMP vapor with the air once it reaches the test
cell. Have qualification testing to verify the DMMP vapor concentration is uniform across the cell face on file and available for inspection. Operate the test tunnel at the rated flow. Challenge the inlet face of the cell as specified above. Record the total time from the start of the cell challenge until the breakthrough concentration is reached (i.e. the life of the cell) as the breakthrough time. This testing will be performed by the Government at the following location:

Quality Evaluation Laboratory, Engineering Directorate, U.S. Army Edgewood Research, Development and Engineering Center, Aberdeen Proving Ground, MD 21010-5423
(410) 436-2284
(410) 436-4804 (FAX)

2.5.4.4 Moisture Content/Cyanogen Chloride (CK) Gas Life Sampling

Obtain a minimum 0.45 kg one pound specimen of carbon during filling of the first cell, the middle cell, and the last cell of the day. Place each carbon specimen in an open container or in a cloth bag and accompany its cell through the assembly line. Do not expose the specimen to refrigerant. Label the carbon specimen to match it to its adsorber cell. Upon completion of the lot, choose a sample from the specimens in each quarter of the lot. Ship these 4 samples for testing by the Government at the location indicated above.

2.5.4.5 Moisture Content

Sample carbon as indicated and moisture content of each carbon adsorbing cell cannot exceed 3 percent by weight when tested. Determine the moisture content of the carbon samples in accordance with ASTM D2867, except the oven temperature is 103 to 107 degrees C 217 to 225 degrees F and the drying time is 3 hours. Should any sample fail to meet the moisture requirements, remove all cells fabricated following the last cell represented by a sample carbon which did meet the requirement and before the carbon represented by the next carbon sample which does meet the requirement from the production lot. These cells may be dried at a temperature not to exceed 66 degrees C 150 degrees F by blowing air less than 10 percent relative humidity at rated flow for 3 hours, immediately before packaging.

2.5.4.6 CK Gas Life Test

After completion of all manufactures steps, the adsorber cell's carbon must comply with the CK gas sorption requirement of MIL-DTL-32101 for unaged carbon. Determine the CK Gas Life of the carbon samples in accordance with MIL-DTL-32101. Reject the production lot of cells if any sample fails to meet the CK gas life requirements as indicated.

2.5.5 Gasket Seal

Mount and seal an interlocking dovetailed gasket to the perimeter of the upstream face of the filtration element frame in accordance with ASME AG-1, Section FC. Provide oil resistant expanded cellular elastomer gasket conforming to ASTM D1056 Grade 2C2, and able to withstand the specified applied clamping force without loss of seal resilient memory.

2.5.6 Fluid Seal
**NOTE:** Fluid seals are limited to low-temperature filtration applications.

Provide filtration element frames having an integral channel filled with a fluid seal. The fluid seal must engage a continuous knife-edge on the housing mounting frame. The fluid seal must be highly viscous, odorless, biostatic, self-healing, non-evaporating, non-Newtonian, radiation and chemical resistant, insoluble in water, silicone compound, and suitable for a temperature range of -50 to 202 degrees C (-58 to 396 degrees F). Seal the channel before the fluid seal is placed into the channel. The fluid seal cannot pull out of the groove or leave a residue on the housing mounting frame knife-edge.

2.6 **BAG-IN/BAG-OUT ASSEMBLY AND BANDING KITS**

Provide each filtration element access location with a bag-in/bag-out assembly and 0.20 mm 8 mil transparent PVC bag sized to completely enclose the element and suitable for 57.2 degrees C 135 degrees F ambient environment. Locate the assembly inside the access door. Provide the bag with an elastic shock cord hemmed into its mouth and secured by a strap to the assembly to prevent bag slippage during the filtration element bagging procedure. Test the bag at the factory to ensure it has no leaks. Provide an additional quantity of [one complete set of] [_____] spare bags to the Contracting Officer. Provide one complete banding kit with each filtration unit equipped with a bag-in/bag-out assembly. The banding kit must provide a secure clamping off of the bag between the housing and the spent filtration element. Provide with each kit a banding tool, a bag-cutting tool, and two sets of plastic ties, stainless steel bands, and replacement bags. Also provide additional tools required to complete the bag-in/bag-out procedure.

2.7 **IN-PLACE DOP/GAS AEROSOL TEST SECTION**

**NOTE:** Test sections are necessary to perform leakage tests and to locate leaks in multiple filter arrays. Filters or adsorbers placed in series will require a test and sample combination section between stages.

A swing-away mixing device is only used in leakage testing. The device swings out of the way in normal filtration operation.

Upstream injection and downstream sampling sections are required if particulate is to be filtered from the air stream.

Provide the test sections as an injection, sampling, and/or injection and sampling combination as indicated, constructed in a manner identical to the remainder of the filtration system housing and meeting the applicable design parameters of ASME N509. Where a second stage of [HEPA filters] [or] [carbon adsorbers] is required, use an injection and sampling combination test section between the first and second stages. Construct the test sections such that adjoining parallel test sections are isolated from each other. This will permit [individual efficiency and mechanical seal test of each HEPA filter] [and] [mechanical seal tests of the carbon
adsorber] and supporting framework in accordance with ASME AG-1. The pressure drop across each test section must be no greater than 62 Pa at 472 L/s 0.25 inches wg at 1000 cfm during the test. Stationary baffle type test sections are not acceptable. Furnish the test section with swing-away mixing devices. Provide injection and sample ports and apparatus to form an integral part of the test section.

2.8 IN-PLACE TEST PORTS

**************************************************************************
NOTE: If only gas adsorption is to be performed by the filtration system in lieu of upstream and downstream sampling sections, aerosol injection and sample ports may be used.
**************************************************************************

[Provide upstream challenge aerosol inlet and sample ports for each [HEPA filter] [or] [carbon adsorber] section. Provide a 13 mm 1/2 inch NPT Type 304 stainless steel coupling with plug test port, used for upstream sampling, located upstream of the HEPA filter and welded to the top side of the filtration system housing.] [Provide three additional test ports shipped loose for field installation into the ductwork; one used for injection upstream, one used for sampling before the filter housing, and one used for downstream sampling of the filtration system housing. Locate upstream inlet and sample port and downstream sample port to provide uniform mixing during field-testing as required by ASME N509 and ASME AG-1.]

2.9 WEATHER COVER

Protect filtration systems located in unsheltered areas by using an integral weather cover. Construct the weather cover of the same material as the filter housing and mechanically fasten, including gasket, to the filter housing.

2.10 ISOLATION DAMPERS

**************************************************************************
NOTE: Depending on system design requirements, isolation dampers may or may not be part of the filtration system design. The gasket material must be butyl rubber for Class 0, zero leakage dampers, and EPDM for Class 1 low leakage dampers.
**************************************************************************

Provide isolation dampers as an integral part of the filtration system. [Provide an individual damper to isolate the filtration system.] [Provide multiple dampers to isolate individual sections of the filtration system.] Classify, construct, inspect, and test dampers in accordance with ASME N509 construction Class B as a single blade damper or a combination of single blade dampers. The leakage of the isolation dampers must conform to ASME AG-1, Section DA, Class [0, zero leakage] [1, low leakage]. Construct the blade/disk, frame, shafts, and linkages of Type 304 stainless steel. Provide the dampers with Type 304 stainless steel disk with a [butyl rubber] [EPDM] gasket. The isolation damper disk gasket (seal) and shaft seal must be replaceable. Operate each isolation damper by an independent electrically-actuated drive mechanism [with manual backup]. Provide isolation dampers of all welded design. [Factory drill in isolation damper flanges 11 mm 7/16 inch holes, located on the filtration unit [as indicated] and no more than 100 mm 4 inches apart as described in
Reinforce the flanges with flat stock of the same material to provide a combined minimum thickness of 6 mm 1/4 inch.

2.10.1 Electrically and Manually Actuated Isolation Damper Operators

Operate damper operators in an automatic mode [with manual backup]. Provide an electric/manual operator of sufficient capacity to operate the damper under all conditions, and to guarantee tight close-off of the damper against all system pressures encountered. The maximum force required to manually actuate the damper is 11.3 kg 25 pounds. Provide controls as specified in [Section 23 09 23.01 LONWORKS DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS] [Section 23 09 23.02 BACNET DIRECT DIGITAL CONTROL FOR HVAC AND OTHER BUILDING CONTROL SYSTEMS].

2.10.2 Fan Unit

Provide fans, airflow control dampers, and actuators as specified in Section 23 30 00 HVAC AIR DISTRIBUTION. Provide single-inlet, centrifugal type fans, with the fan [inlet] [outlet] connected to the filtration unit with a flexible duct connector and duct transition to the filtration unit housing. Control the fan by [a manually] [an automatic electrically] actuated, [inlet vortex] [outlet opposed blade] damper suitable for the specified static pressure.

2.10.3 Flexible Duct Connectors

Provide a flexible duct connector approximately 152 mm 6 inches in width where sheet metal connections are made to the fan unit. Lock the flexible material, chemically resistant butyl rubber, to metal collars and install using normal duct construction methods. The flexible material must withstand the indicated system pressures. Provide composite connector system in compliance with NFPA 701 and classified as flame-retarded fabrics in UL 723.

2.11 DUCTWORK AND DUCT TRANSITIONS

Provide ductwork and duct transitions of stainless steel, and as specified in Section 23 30 00 HVAC AIR DISTRIBUTION.

2.12 THERMAL INSULATION

Provide thermal insulation for ductwork and equipment as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.13 PRESSURE GAUGE

Provide dial type pressure gauges, diaphragm operated, with two pressure relay switches for low and high limit relay control. Incorporate adjustable switch point indicators for continuous indication of switch settings into the gauges. Provide gauges for roughing filter, pre-filter, HEPA filter banks, post filter, and total filter system pressure drop. Provide gauges that are at least 98 mm 3-7/8 inches in diameter, have white dials with black figures with graduations, and a minimum range of 250 Pa 1 inch wg beyond the specified final resistance for the individual filter served. Incorporate a screw operated zero adjustment into each gauge and furnish complete with stainless steel compression fittings and tubing. Mount all hardware in one location and test at the factory. All gauges must have a dual dial scale readout in units of pascals and inches water
2.14 PRESSURE PORTS

**************************************************************************
NOTE: Pressure ports are not needed for carbon adsorber elements.
**************************************************************************

Locate static pressure ports on the filtration unit upstream and downstream of each roughing filter, pre-filter, HEPA filter bank, and post filter. Use 6 mm 1/4 inch 300 series stainless steel pipe nipples and caps for port connections.

PART 3 EXECUTION

3.1 INSTALLATION AND ERECTION

Install and erect CBR Air filtration systems in accordance with ASME N509, as indicated on the drawings, and in accordance with the manufacturer's diagrams and recommendations.

Submit drawings consisting of equipment layout including assembly and installation details and electrical connection diagrams; ductwork layout showing the location of all supports, typical support details, gauge reinforcement, reinforcement spacing rigidity classification, and static pressure and seal classifications; and pressure gage tubing layout showing the location of all gages. Include in the drawings a table and/or schematic identifying outline or significant interface dimensions and any information required to demonstrate that the system has been coordinated and properly functions as a unit, and shows equipment relationship to other parts of the work, including clearances required for operation and maintenance.

3.2 ACCEPTANCE TESTS

Conduct all acceptance tests in accordance with the procedures in ASME AG-1 and as required by MIL-PRF-32016.

a. Submit proposed test schedules for adjusting and balancing, housing leak and pressure, air-aerosol mixing uniformity, damper operation and leakage, system bypass, performance tests of systems and test procedures, at least 2 weeks prior to the start of related testing.

b. Submit certified test report for adsorbent filtration type, for filtration unit factory acceptance test, filtration unit field test, isolation damper acceptance test, air-aerosol mixing uniformity test, damper operation and leakage test, housing leak and pressure test, system bypass test, and performance tests in booklet form, upon completion of testing. Document, in the report, phases of tests performed including initial test summary, repairs/adjustments made, and final test results.

3.2.1 Visual Inspection

Perform visual inspection in accordance with ASME AG-1.
3.2.2 Airflow Capacity and Distribution Test

Measure the airflow across each filtration element bank to verify that it meets the designed flow rate under actual field conditions. Also verify that the airflow is distributed evenly across each filtration element bank as required by ASME AG-1 which is +/- 20 percent of the average airflow through each filter bank. Perform all tests in accordance with ASME AG-1.

3.2.3 Air-Aerosol Mixing Uniformity Test

Introduce a challenge gas into the air system to verify that it has uniformly mixed before entering the filtration element bank. Follow and comply with the test procedure in ASME AG-1.

3.2.4 Damper Operation and Leakage Test

Test the damper to verify that it operates as specified. Measure and record the air leakage rate through the isolation dampers. Functionally test the damper as required in ASME AG-1. [Apply the pressure decay or bubble test method leakage test for Class 0 dampers as specified in ASME AG-1.] [Perform the leakage test for Class 1 dampers in accordance with ASME AG-1.]

3.2.5 System Bypass Test (Filter and Adsorber Mounting Frame)

Remove and replace the filtration elements at each [HEPA] [HEPA and Carbon Adsorber] mounting frame housing location with a test blank. Test the filtration element housing and housing seal in accordance with ASME AG-1. Measure and record the air that bypasses the test blank as an air leakage rate, repair by seal welding and retest. Caulking or other temporary sealing measures are not allowed. The acceptable leakage rate is zero percent. After testing is completed, remove the blank and reinstall the filtration elements. Turn over the test blank to the Contracting Officer.

3.3 FIELD TRAINING

**************************************************************************
**NOTE: The number of hours of instruction should be determined based on the number and complexity of the systems specified.**************************************************************************

Submit proposed schedule for field training, at least 2 weeks prior to the start of related field training. Conduct a training course for operating and maintenance personnel as designated by the Contracting Officer. Provide training for a period of [_____] hours of normal working time. Start training after the system is functionally complete but prior to the performance tests. The field instruction must cover all of the items contained in the approved Operating and Maintenance Instructions and the FIltration Unit Manuals.

Submit [6] [_____] manuals in [hard copy form] [in electronic form (PDF) on DVD] listing step-by-step procedures required for system startup, operation, shutdown, and routine maintenance, at least 2 weeks prior to field training. The manuals must include the manufacturer's name, model number, parts list, list of parts and tools that should be kept in stock by the owner for routine maintenance including the name of a local supplier, troubleshooting guide, and recommended service organization (including address and telephone number) for each item of equipment. Each service
organization submitted must be capable of providing [4][_____] -hour on-site response to a service call on an emergency basis.

3.4 FIELD ACCEPTANCE TEST

**************************************************************************
NOTE: A number of factors will determine the efficiency of a carbon adsorber system; generally, 8 x 16 mesh carbon granules provide at least 99.9 percent efficiency. Select the appropriate concentration reduction value for the field tests.
**************************************************************************

After installation, field test the filtration system for leaks using a mechanical test method. Also test the system for leaks between the filter element and its housing. Perform testing after installation by an independent testing agency in accordance with ASME AG-1. Submit testing agency certification prior to in-place filtration element testing in accordance with ASME NQA-1 or provide documentation demonstrating previous experience with similar systems as approved by the Contracting Officer. [Challenge the carbon adsorber system housing and carbon adsorber with refrigerant vapor R-134a or equivalent with the downstream concentration not to exceed [0.001] [0.0001] times the upstream concentration.] [The HEPA filter DOP aerosol penetration must be less than 0.03 percent.]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for high temperature water plants of capacities over 2,930 kW (10,000,000 Btuh), producing water at temperatures of 115 to 227 degrees C (240 to 440 degrees F) at pressures up to 2.8 MPa (400 psig).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically...
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
1.3 QUALITY ASSURANCE

1.3.1 Welding Qualifications

NOTE: Where pipeline, structural, or other welding is required on the same project, tests will be required accordingly. Testing may be by the coupon method as prescribed in the welding code or by special radiographic methods. If the need exists for more stringent requirements for weldments, delete the first bracketed statement and the welding submittal.

[Weld piping in accordance with qualified procedures using performance qualified welders and welding operators. Submit a copy of qualified welding procedures and a list of names and identification symbols of qualified welders and welding operators. Qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and perform the tests at the work site if practicable. The welder or welding operator must apply his assigned symbol near each weld he makes as a permanent record. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] [Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING.]
1.3.2  Calculations

Submit manufacturer's design data and structural computations, calculations for walls, roof, foundations, and other features for specialty type of construction, along with design data for lateral forces that may be encountered due to wind loads and seismic forces.

1.4  DELIVERY, STORAGE, AND HANDLING

Store all equipment delivered and placed in storage with protection from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.5  EXTRA MATERIALS

Submit spare parts data for each different item of equipment specified, after approval of the drawings and not later than [_____] months before the date of beneficial occupancy. Include a complete list of spare parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [1] [and] [3] year[s] of service.

PART 2  PRODUCTS

2.1  MATERIALS AND EQUIPMENT

2.1.1  Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least 5 years prior to bid opening.

Equipment items must be supported by service organizations. Submit a certified list of qualified permanent service organizations for support of the equipment which includes their addresses and qualifications. These service organizations must be reasonably convenient to the equipment installation and able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

2.1.2  Nameplates

Secure to each major item of equipment a plate with the manufacturer's name, address, type or style, model or serial number, thermal output or flow rate, and catalog number.

2.1.3  Prevention of Rust

Unless otherwise specified, factory prime paint surfaces of ferrous metal subject to corrosion with a rust inhibiting coating and subsequently factory finish paint in accordance with the manufacturer's standard practice. Prime and paint equipment exposed to high temperature when in service with the manufacturer's standard heat resistant paint to a minimum thickness of 0.025 mm 1 mil.

2.1.4  Equipment Guards and Access

Fully enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personnel contact.
Provide guard or specified insulation cover for high temperature equipment and piping exposed to contact by personnel or where it creates a fire hazard. Provide items such as catwalks, operating platforms, ladders, and guardrails where shown, and constructed in accordance with Section [08 31 00 ACCESS DOORS AND PANELS][05 51 33 METAL LADDERS].

2.1.5 Use of Asbestos Products

******************************************************************************

NOTE: The first clause in brackets should be used when it is known that substitutes are available for any asbestos products which might be included with the equipment. The second clause in brackets should be used when it is possible or definitely known that asbestos products for which no technically acceptable substitute exists may be included with the equipment.

******************************************************************************

[Products which contain asbestos are prohibited. This prohibition includes items such as packings or gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material.] [Except as provided below, products which contain asbestos are prohibited. This prohibition includes items such as packings and gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material. Asbestos products are acceptable only in exceptional cases where the Contractor states in writing that no suitable substitute material exists, and, in addition, the Contractor furnishes to the Contracting Officer a copy of U.S. Department of Labor, Occupational Safety and Health Administration "Material Safety Sheet" (Form OSHA-20), completed by the asbestos manufacturer, stating that the product is not an asbestos health hazard.]

2.2 HIGH TEMPERATURE WATER GENERATORS

Submit detail drawings consisting of schedules, performance charts, brochures, diagrams, drawings, and instructions necessary for installation of the HTW generating units and associated equipment, and for piping, wiring, devices, trenches, and related foundations. Complete setting plans certified by the HTW generator and burner manufacturers. Detail drawings for HTW generators and appurtenances, including coal and ash handling equipment indicating clearances required for maintenance and operation containing complete wiring and schematic diagrams, equipment layout and anchorage, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Include manufacturer's written instructions indicating optimum pressure at all manometer connectors. Provide, for each HTW generator (boiler), with a label indicating the capacity when operating at [_____] degrees C degrees F entering water temperature and [_____] degrees C degrees F outlet temperature with a water flow of [_____] kg/second pounds/hour. Design the HTW generators for a maximum allowable working pressure of [_____] kPa psig at [_____] degrees C degrees F. Provide in the design, equipment layout and accessory locations permitting accessibility for maintenance and service with the following design conditions:

a. Site elevation, [_____] m feet.

b. Ambient air temperatures, [_____] degrees C degrees F to [_____] degrees C degrees F.
c. Reference air temperature, 27 degrees C 80 degrees F.

Provide HTW generators capable of operating continuously at maximum specified capacity without damage or deterioration to the generator, its setting, or firing equipment or auxiliaries with automatic operation while burning the fuel specified. Provide HTW generators to operate on [coal meeting the requirement of paragraph FUEL BURNING EQUIPMENT][fuel oil conforming to grade number of ASTM D396][a combination of coal and fuel oil conforming to ASTM D396][natural gas].

2.2.1 Capacity

Provide HTW generators which operate at rated capacity continuously without exceeding the furnace heat release, volumetric and radiant, furnace exit temperature, and gas exit temperature specified. Include generator fans, motors, drives, and similar equipment with at least 10 percent excess capacity to allow for field variations in settings and to compensate for any unforeseen increases in pressure losses in appurtenant piping and ductwork.

2.2.2 Electrical Equipment

Provide electric motor-driven equipment complete with motors and necessary motor control devices, specifying motors and motor control devices in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM including requirements for hazardous area locations with electrical characteristics and enclosure type indicated. Provide integral size premium efficiency type motors in accordance with NEMA MG 1.

2.2.2.1 Motor Ratings

Provide motors suitable for the voltage and frequency required. Provide three phase for 373 W 1/2 horsepower motor and larger unless otherwise indicated with ratings adequate for the duty imposed, but not less than indicated.

2.2.2.2 Motor Starters

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

Provide motor starters where a motor starters are not indicated, in a motor control center on the electrical drawings, under this section of the specifications with complete with properly sized thermal overload protection and other equipment at the specified capacity including an allowable service factor, and other appurtenances necessary. Provide, whether indicated or not, manual or automatic control and protective or signal devices required for the operation specified, and any wiring required to such devices. Where two-speed or variable-speed motors are indicated, solid-state variable-speed controllers may be provided to accomplish the same function.

2.2.3 Heating Plant Requirements

Provide plant fired [package type][field-erected type], [coal-][fuel
oil-[combination coal/fuel oil-], controlled circulation, HTW generators; expansion vessels; nitrogen pressurization system; makeup water equipment; fuel systems; pumps; and all controls, piping, insulation, miscellaneous plant equipment and other accessories indicated or necessary to provide a complete and operable system.

2.2.4 HTW Generator Design Requirements

2.2.4.1 Radiant Heat Input

Limit the radiant heat input for the effective radiant heating surface of controlled circulation watertube HTW generators to a maximum of 394 kW/square meter 125,000 Btuh/square foot.

2.2.4.2 Maximum Heat Input

Limit the maximum heat input per cubic meter cubic foot of furnace volume to 931 MJ/cubic meter 25,000 Btu/cubic foot with spreader stokers and watertube boilers and 1,677 MJ/cubic meter 45,000 Btuh/cubic foot with underfeed stokers.

2.2.4.3 Combustion Gas Temperature

Provide the combustion gas temperature at the furnace exit with [minimum of 56 degrees C 100 degrees F less than the ash fusion softening temperature (reducing atmosphere) of the coal specified] [or] [maximum of 1150 degrees C 2100 degrees F when furnace is oil-fired].

2.2.4.4 Design Requirements

Provide manufacturer certification for the HTW generator controlled, forced-circulation, watertube, once-through type designed and constructed for high temperature water service conforming to, unless modified, the applicable construction and performance requirements of ASME BPVC SEC I and ASME BPVC SEC VII with the following additional requirements:

a. Water pressure drop not exceeding 105 kPa 15 psi based on a water temperature differential of 83 degrees C 150 degrees F, generator inlet to outlet.

b. The generator with no steam space or other spaces where steam can be trapped, with vented headers at high points as required.

c. Provide design for horizontal flow or upflow of water tubes and headers located in any radiant heat transfer zone.

d. Tubes and headers located outside the primary radiant heat transfer zones may be designed for downflow of water.

e. Provide generator designed for equalization of water flow through the tube circuits with radiant and convective heating surfaces arranged for series water flow to insure uniform flow distribution and temperature rise with proportioned flow to the heat input to prevent formation of steam in any tubes or headers to the extent that flow distribution becomes unbalanced. Distribution of flow may be controlled by limiting the number of flow paths in parallel, or by using restrictors (orifices), when required, in each group of parallel flow paths to increase pressure drop and to insure that all groups have the same pressure drop.
2.2.4.5 Spreader Stoker Units

Provide a maximum loading of 2206 kW/square meter 700,000 Btuh/square foot of grate area for spreader stoker units with continuous or intermittent automatic mechanical ash discharge grates, with a maximum loading of 1,419 kW/square meter 450,000 Btuh/square foot of grate area for the traveling grate type.

2.2.4.6 Underfeed Dumping Grate Units

Provide for underfeed dumping grate units, excluding side dumping areas, a maximum loading per square meter square foot of grate of 1,419 kW 450,000 Btuh, assuming a 10 percent maximum ash content and 1200 degrees C 2200 degrees F minimum ash softening temperature.

2.2.4.7 Effective Radiant Heating Surface

Effective radiant heating surface side receiving heat, excluding refractory lined surfaces, is defined as the heat exchange surface within the furnace boundaries which is directly exposed to radiant heat of the flame on one side and to the medium being heated on the other. This surface includes plain or finned tubes and headers and plain surfaces which may be bare, metal covered, or metallic core covered. Base computations of effective radiant heating surfaces on the following:

2.2.4.7.1 Bare, Metal Covered, or Metallic Core Covered Tubes and Headers

The projected area, external diameter times length, of the tube or header.

2.2.4.7.2 Extended Surfaces, Metal and Metallic Surfaces Extending from the Tubes or Headers

80 percent of the flat projected area, except metal blocks not integral with tubes or headers; extended surfaces less than 6.4 mm 1/4 inch thick or more than 32 mm 1-1/4 inches long; that portion of the extended surface which is more than one tube or header radius from the tube or header from which it extends, are not included.

2.2.4.7.3 Furnace Exit Tubes

The projected area of those portions of the first two rows of exit tubes receiving radiant heat from the fire.

2.2.4.8 Furnace Volume

Furnace volume is defined as the cubical volume between the top of the grate and the first plane of entry into, or between, the tubes. If screen tubes are utilized, they constitute the plane of entry.

2.2.4.9 Burners

Conform burners to requirements of NFPA 85, UL 296, and UL 726, except as otherwise specified. Equip flame safeguard controls with repetitive self-checking circuits.

2.2.4.10 Generator

Provide HTW generator with continuous capacity within the specified range
at the specified pressure with boiler feed water at approximately [_____] degrees C degrees F, with flue gas outlet temperature [_____] degrees C degrees F, based on excess air of [_____] percent and carbon loss of [_____] percent, at all loads above 50 percent of maximum continuous capacity. Base output capacity on tests of the HTW generator [and burner] as a unit.

2.2.4.11 Nameplates

Provide each HTW generator with nameplates stamped with:

a. Maximum continuous capacity in Watts Btuh.
b. Radiant heating surface in square meters square feet.
c. Total heating surface in square meters square feet.
d. Design pressure in Pa psig.

2.3 HIGH TEMPERATURE WATER GENERATOR DETAILS

Mercury is prohibited for use in thermometers.

2.3.1 HTW Generators and Components

Provide HTW generators [site assembled] [shop assembled] type and arranged to suit firing equipment as specified, designed for continuous operation at the capacity indicated and designed to burn [fuel oil specified] [and] [coal of size and analysis specified]. For watertube, waterwall type HTW generating units provide complete with [oil burners] [and] [stokers for coal firing], forced and induced draft fans, control and instrument panel with limit and automatic controls, soot blowers, [over fire air system,] feedwater regulator, low water flow cutoff and alarm, feed piping, and all other fittings, auxiliaries, and appurtenances necessary for safe and efficient operation, with matched firing equipment and boiler adjusted in accordance with the boiler manufacturer's requirements. [Provide factory-fabricated HTW generator assembled on a steel foundation or foundations, or shipped in not more than three complete subunits to minimize field erection.] Provide combustion controls.

2.3.1.1 Headers

Provide header-and-tube boiler construction with header diameter limited to accommodate the water flow and required distribution with a reasonable pressure drop. The use of drums or excessive header sizes is not acceptable. Provide seamless steel ASTM A106/A106M, Grade B headers which are not in primary radiant furnace section with uninsulated bottom portion of header at tube connection. Attach tube to headers by strength welding or by rolling, seal welding, and rerolling in accordance with ASME BPVC SEC I. Rolling of tubes into headers only is not acceptable.

2.3.1.2 Tubes

Provide electric welded or seamless steel tubes with boilers having water-cooled furnace walls of a design suitable for the application. Design tubes located in the primary furnace for horizontal or upflow of water. Distribute the water to the heating surface in proportion to the heat absorbing capacities of these surfaces. Locate tube heat absorbing surfaces so that radiant and convection sections provide for series flow of
water, from generator inlet to outlet, to ensure uniform water distribution and uniform temperature rise from inlet to outlet. Provide flow orifices where required with each orifice protected from clogging by individual strainers or by the master strainer located in the HTW generator return line. Provide individual access opening for individual strainers with machined surfaced shoulder type a. Provide individual access openings with stainless steel filled gaskets with all header gasket surfaces machined to provide proper seating of gasket.

2.3.1.3 Baffles

Arrange either water-cooled or a refractory material or metal suitable for temperatures encountered baffles to bring the products of combustion into contact with the heating surfaces. If used, provide steel plate or refractory baffles with water cooling on the radiant heat (furnace) side and the generator's convection section having counterflow, water-to-gas, to provide an integral economizer arrangement for optimum heat absorption, gas-to-water, with draft loss held to a minimum.

2.3.1.4 Furnace

Provide water-cooled furnace with the combustion space provided with water cooling on sidewalls, rear wall, roof, and front, except the portion of the front wall section required for [stoker installation] [and] [burner installation]. For stoker-fired generators, provide water-cooled furnace side walls and rear wall with vertical tubes with center-to-center spacing not to exceed twice the tube diameter, and furnished with cast-iron, water-cooled armor block at the grate line to a height of not less than 380 mm 15 inches above the grate line. Provide readily replaceable (without the use of special tools required) keyed armor block held in place without the use of bolts, pins, or mastic.

2.3.1.5 Supports

Support HTW generators and firing equipment from the foundations with structural steel independent of all brickwork, with HTW generator supports permitting free expansion and contraction of each portion of the HTW generator without placing undue stress on any part of the HTW generator or setting.

2.3.1.6 Access Doors

Provide access doors in sufficient number, of adequate size, and properly located for cleaning, inspection, and repair of all areas in the complete assembly with gas-tight doors, and with interior surfaces exposed to direct radiation and high temperature provided with approved lining refractory material to prevent excessive heat losses and warping of doors. Provide hinged doors for those too large or bulky for hand removal. Provide at least one observation port with cast-iron cover on the front and rear wall of the furnace.

2.3.1.7 Miscellaneous

Provide pipe connections for water inlet and drain outlet, with drain valves, relief valves, blowoff, air supply to soot blowers, gauge and vent, chemical feed, and instruments. Provide HTW generators with necessary jets for furnace turbulence, the number and arrangement as recommended by the HTW generator manufacturer. Provide soot blowers, if required by the manufacturer, and a suitable smoke outlet with steel frame, damper, and
damper shaft, with damper having a high temperature roller or ball bearings at both ends of the shaft and with suitable operating arm and rod.

2.3.2 HTW Generator Setting Materials

Provide materials conforming to the following:

a. Firebrick: ASTM C27, class as recommended by the HTW generator manufacturer.

b. Insulating Brick: ASTM C155, Class A.

c. Castable Refractory: ASTM C401. The minimum modulus of rupture for transverse strength must not be less than 4137 kPa 600 psi after being heat-soaked for 5 hours or more at a temperature in excess of 1370 degrees C 2500 degrees F.

d. Mortar, Air-Setting, Refractory: As recommended by the HTW generator manufacturer.

f. Tile, Load-Bearing, Hollow: ASTM C34, Grade LBX.

g. Iron and Steel Sheets: Galvanized, ASTM A653/A653M; gauge numbers specified refer to United States Standard gauge. Uncoated, black: ASTM A568/A568M, or ASTM A36/A36M.

2.3.2.1 HTW Generator Casing

**************************************************************************

NOTE: On water tube type HTW generators that will be used intermittently, welded wall construction is recommended to minimize corrosion. In other applications, or with fuels containing not more than 0.5 percent sulfur, a casing type enclosure is suitable.

**************************************************************************

[Provide HTW generator with steel-encased wall construction with fabrication details as recommended by the HTW generator manufacturer, and with wall and roof lining consisting of a continuous screen of closely spaced water tubes. Provide double wall construction for HTW generators with reinforced, welded, gas-tight inner casing constructed of not lighter than 3.416 mm 10 gauge black steel sheets, and outer casing constructed of not less than 1.897 mm 14 gauge steel sheets. Outer casing may be either bolted or welded. Reinforce inner casing with structural steel to provide rigidity and prevent buckling. Abut inner casing in furnace section with furnace tubes containing no foreign sealer between the tube steel and the casing steel, and with casing not attached to tubes. Support each horizontal tube independently of casing at intervals not exceeding 1.8 m 6 feet with inner casing applied so as to form expansion joints at the point of tube support. Where refractory is installed at access doors, provide the double casing constructed to form a gas-tight seal with combustion gases unable to enter between inner and outer casing. Check all welded joints and openings by a pressure test. Repair any casing leakage and make pressure-tight. Provide reinforced panels that do not exceed the maximum deflection of 1/360 of the length of the maximum span. Apply block insulation between the inner and outer casings and hold securely with]
insulating pins. Provide the casing, when tested, capable of holding a pressure of 1.5 times the predicted maximum furnace operating pressure. [Provide HTW generator walls of welded-wall construction with fin width limited to 19 mm 3/4 inch to prevent overheating of the fins under all operating conditions. Designs exceeding 19 mm 3/4 inch may only be used when provided with supporting calculations and are subject to Contracting Officer review for approval. Provide seamless type tubes with continuous fin-to-tube weld and on both the front (fireside) and back side of the fin. Provide a minimum of 6.4 mm 1/4 inch thick fins. Pressure test all welded joints and openings repairing any casing leakage making it pressure tight. Limit the maximum deflection of the reinforced panels to 1/360 of the length of the maximum span with the unit capable of holding a pressure of 1.5 times the predicted maximum furnace operating pressure.]

2.3.2.2 Walls

**************************************************************************
NOTE: For personnel safety, the design temperature of the casing surface should not exceed 65 degrees C 150 degrees F. Should the designer wish to use a design surface temperature between 55 and 65 degrees C 130 and 150 degrees F, an economic evaluation must be performed. The evaluation must determine if the additional capital costs for insulation outweigh the cost savings due to reduced boiler radiation losses.
**************************************************************************

[Provide high-duty refractory behind the waterwall tubes of not less than 65 mm 2-1/2 inches thick conforming to manufacturer's requirements.] Provide high temperature block and mineral wool blanket between the refractory backup and steel casing or between an inner and outer casing with thickness of insulation such that an average casing temperature in the furnace area does not exceed [55] [_____] degrees C [130] [_____] degrees F with a surface air velocity of 508 mm/second 100 fpm, and an ambient air temperature of 25 degrees C 80 degrees F when operating at full capacity.

2.3.2.3 HTW Generator Roof

**************************************************************************
NOTE: For personnel safety, the design temperature of the casing surface should not exceed 65 degrees C 150 degrees F. Should the designer wish to use a design surface temperature between 55 and 65 degrees C 130 and 150 degrees F, an economic evaluation must be performed. The evaluation must determine if the additional capital costs for insulation outweigh the cost savings due to reduced boiler radiation losses.
**************************************************************************

Provide refractory lining conforming to manufacturer's requirements consisting of not less than 65 mm 2-1/2 inches of high-duty refractory backup behind the roof tubes and sufficient thickness of high temperature block insulation or mineral-wool blanket suitable for the temperature encountered to limit casing temperature in the furnace area to [55] [_____] degrees C [130] [_____] degrees F, with a surface air velocity of 508 mm/second 100 fpm and an ambient air temperature of 25 degrees C 80 degrees F when operating at full capacity. Provide insulation neatly against a metal ring for manholes and other inspection and access openings, and identification plates and stamps.
2.3.2.4 Bridge Walls

Provide for bridge walls exposed on all sides to radiant heat and the products of combustion constructed of super-duty refractory not less than 457 mm 18 inches thick, conforming to manufacturer's requirements. Provide for walls having only the front side exposed to radiant heat and the products of combustion, a front facing and cap constructed of 225 mm 9 inches of super-duty refractory and back facing of not less than 225 mm 9 inches of low-duty firebrick with the base of the wall constructed of common brick.

2.3.2.5 Settling Chamber

Provide settling chamber for the removal of fly ash below the last pass of each HTW generator with easy means for frequent cleaning without shutting down the HTW generators.

2.3.2.6 Expansion Joints

Provide expansion joints as required and where indicated to permit all brickwork to expand freely without interference with the boiler, with joints of adequate width, tightly sealed against leakage and free from mortar, with the outer 100 mm 4 inches sealed with resilient mineral wool suitable for 925 to 1095 degrees C 1700 to 2000 degrees F. Provide a series of 3 mm 1/8 inch wide vertical openings, spaced 1.8 m 6 feet apart, on the furnace side of the wall. Make provision for expansion and contraction between boiler foundation and floor as specified.

2.3.2.7 Firebrick

Lay up firebrick in air-setting mortar with each brick dipped in mortar, rubbed, shoved into its final place, and then tapped with a wooden mallet until it touches the adjacent bricks. Mortar thick enough to lay with a trowel is not permitted. Provide a maximum mortar joint thickness not exceeding 3 mm 1/8 inch and an average joint thickness not exceeding 1.6 mm 1/16 inch.

2.3.2.8 Plastic Refractory

Install plastic refractory in accordance with the manufacturer's recommendation and by workmen skilled in its application.

2.3.3 Boiler Fittings and Appurtenances

Provide HTW generator fittings and appurtenances suitable for a HTW working pressure of [_____] Pa psig and [_____] degrees C degrees F for each HTW generator in accordance with ASME BPVC SEC I.

2.3.3.1 Thermometer

Provide thermometer for HTW generator inlet water and outlet water for each HTW generator in a visible location on the HTW generator.

2.3.3.2 Pressure Gauge

Provide pressure gauge for each HTW generator in a visible location on the HTW generator.
2.3.3.3 Relief Safety Valves

Provide HTW generator relief safety valves such that the discharge is through piping extended to the plant blowoff tank with relief valves sized, and constructed, with set pressures as determined in accordance with ASME BPVC SEC I.

2.3.3.4 Drain Valves

Provide drain valves in tandem at each drain point of blowdown as recommended by the HTW generator manufacturer. Provide piping conforming to the requirements of ASME BPVC SEC I and extra strong weight black steel pipe conforming to ASTM A53/A53M. Provide drain valves conforming to ASME BPVC SEC I, the balanced seatless type unless otherwise approved.

2.3.4 Soot Blowers

When required, provide HTW generator with air powered, automatic sequencing and intermittent puff type soot blower system, with a soot blower control unit suitable for mounting on the generator control panels. Provide controllers that automatically rotate the soot blower units in successive steps, each step involving no more than a 69 kPa 10 psi drop in air pressure at the receiver. After one unit is operated in successive steps through its cycle, the controller shifts the operation to the second soot blower unit, and so on, until all units on that generator have been operated, after which the controller shuts down automatically by the sequence controls. Provide the soot blower heads with elements of suitable chrome alloy material for the temperatures encountered in the HTW generator, and with a sequence timer provisioned for manual selection of the soot blower units to be used.

2.4 FUEL BURNING EQUIPMENT

**************************************************************************

NOTE: The designer must include all the required data for proper design of the boiler. Delete all references to coal and stokers where oil is the only fuel to be utilized.

Delete paragraphs describing stoker equipment that are not required. Stokers and stoking equipment selected will be based on the following:

Boilers having output capacities of 3,517 kW 12,000,000 Btuh or more will be equipped with mechanically-driven grates operating continuously or intermittently. Dump grates will not be permitted in boilers in this size range. Spreader stokers will be specified when bituminous coal with ash content on a dry basis in excess of eight percent or ash fusion temperature lower than 1200 degrees C 2,200 degrees F is to be used. Pulsating grate units will be water-cooled and complete with automatic coal feed and continuous ash removal. Conveyor stokers may be specified if suitable for the type of coal available. Chain or traveling grate may be specified by deletion of one type of grate, or the choice between the two types may be left to the Contractor by including both types in
the description. The following is a general guide in determining which type of grates to investigate:

### 2.4.1 Spreader Stokers

Provide overfeed self-feeding type spreader stokers suitable for burning a portion of the coal in suspension, but sized assuming 100 percent combustion on the grate. [Coal must be evenly distributed across the full width of the grate by not less than [____] feeder units. Provide unit designed for operation of any feeder independently of the others, or possible to operate all feeders simultaneously.] Provide feeders capable of handling and uniformly distributing coal over the grate area. Provide mechanical-rotating type feeders with no moving parts within the combustion chamber, and where moving parts are exposed to excessive heat, protect bearings with suitable water jackets. Provide grease or oil lubrication for all bearings. Provide stoker designed for readily adjustable feed distribution of coal on the grates.
2.4.1.1 Grates

Provide high air resistant type grates for stoker spreader firing, arranged for powered mechanical or compressed air actuated dumping in sections. Provide openings for proper distribution of air under the fuel bed. [Provide grates in sections to match the feeders with provisions for shutting off the forced draft to each section so that any section of the grate can be cleaned while the others remain in service.] Provide heavy-duty, heat-resisting cast-iron grates. Provide mechanical dumping with [air-] [water-] actuated power cylinders connected to the grates, and furnish grates complete with cylinders, linkages, valves, and piping as required, with each section dumping independently of other sections. Provide necessary over fire air jets complete with fans, ducts, and air control valves as required for proper turbulence and combustion. Provide grate drives that operate independent of feeder drives to provide independent speed variation of feeders and grates.

2.4.1.2 Traveling Grates

Provide high air resistant type traveling grates especially designed for spreader stoker firing and for continuous ash discharge. Provide openings for proper distribution of air under the fuel bed with generator grates being heavy-duty, heat-resisting cast-iron, and individual replaceable sections without taking the grate out of service. Hold leakage to a minimum with air seals around grate. Furnish moving grates complete with supporting steel, shafts, sprockets, chain, gears, skid bars, and bearings as required, with the front end of the grates where the ash is discharged enclosed with a dust-tight enclosure made of heavy cast-iron plates not less than 16 mm 5/8 inch thick and properly protected with firebrick where exposed to the furnace or of refractory lined steel plate. Fit the vertical fronts of the enclosure with refractory lined inspection and access doors, one for each feeder. Seal the roof of the enclosure with refractory to protect the metal parts from the furnace temperature. Enclose the underside of the grates to form a chamber. Provide hopper for receiving the ashes constructed as indicated or as recommended by the manufacturer. Provide over-fire air jets as required for proper turbulence and combustion.

2.4.1.3 Vibrating Grate

Provide high air resistant type vibrating grate especially designed for spreader stoker firing and for continuous ash discharge, with either air- or water-cooled with openings to provide proper distribution of air under the fuel bed. Provide heavy-duty, heat-resisting cast-iron grates with individual replaceable sections. Provide a manual adjustment to regulate the ash bed thickness, with ashes automatically discharged to the ash pit. Enclose the front of the grates where the ash is discharged with a dust-tight enclosure of heavy cast-iron plates not less than 16 mm 5/8 inch thick and properly protected with firebrick where exposed to the furnace, or of refractory-lined steel plate. Fit the vertical fronts of this enclosure with refractory-lined inspection and access doors, one to each feeder. Seal the roof of this enclosure with refractory for protecting the metal parts from the furnace temperature. Enclose the underside of the grates to form a chamber with a hopper for receiving the ashes with over-fire air jets provided for turbulence and combustion.

2.4.1.4 Controls

Provide stoker controls that accurately regulate the coal feed rate, of the
type required for connection to the combustion control system with a manual
setting of the coal feed rate with variation of stoker feed as required to
maintain any desired capacity between 50 and 110 percent of boiler capacity
without disconnecting linkage. Provide separate feeder and grate drives,
with grate driven through a variable speed transmission with devices for
changing speed interlocked with fuel feed regulation. Provide manual
adjustment of grate speed for allowing synchronization with fuel feed.
Provide all gears and chains of the variable speed transmission and gear
reduction units, as required, run in a bath of oil and enclosed in a
dust-tight and oil-tight case.

Provide a forced lubrication system with fittings located outside the
setting. Provide antifriction bearings with hardened inner and outer races
fitted with dust seals and easily accessible forced lubrication fittings
for front and rear shafts of the grates with safety release devices to
protect the mechanism from foreign materials or obstructions. Provide
electric motor driven stoker with electric motor [totally enclosed,
fan-cooled] [totally enclosed fan-cooled for installation in Class II,
Division 1, Group F hazardous location in accordance with NFPA 70], and
motor starter magnetic [across-the-line] [reduced voltage start] type with
[general-purpose] [dust-tight] [explosion-proof] enclosure.

2.4.1.5 Hoppers

Construct hoppers of steel plates not less than 6.4 mm 1/4 inch thick and
capacity of not less than [_____] kg pounds per feeder, provided with
cleanout doors in the front of each feeder. Fit coal feed to the hoppers
with concave type transitions to ensure the proper distribution of coal and
coil fines across the width of the hoppers. Provide stoker front plate
forming the front of the boiler for the full width of the boiler and from
the firing floor to some point above the stoker where it connects to the
boiler structural framing. Provide a front of cast-iron or steel plate
refractory lined with [auxiliary firing doors and] cleanout doors of
refractory lined cast-iron. Structurally frame as required to support the
stoker and its components from the boiler foundation or boiler room floor.
Divide the area under the grates into not less than four air-tight zones
for supply of forced draft having zone control dampers with external
indicating operating and locking devices with all pressure parts for
water-cooled grates including watertubes, headers, and valves furnished by
the stoker manufacturer for boiler pressure specified and constructed in
accordance with ASME BPVC SEC I.

2.4.1.6 Air Systems

Provide spreader stokers with over-fire turbulence and cinder and dust
reinjection systems. Use [air][ or ][steam] as the transport medium.
Provide systems with operating air by a single, low volume high-pressure
fan driven by a splash-proof electric motor. Provide reinjection system
ejectors properly designed, located, and sized for maximum fly ash pickup
from all points. Equip nozzles for each system with manometer connections
and heavy-duty adjustable dampers fitted with locking devices and position
indicators and with nozzles providing maximum combustion efficiency and
furnace turbulence. Provide a manometer connection and a permanent
manometer immediately downstream from the main reinjection air supply
damper. Provide a portable manometer.
2.4.2 Underfeed Stokers

2.4.2.1 Ram-Type Stokers

For single retort, provide electric motor drive, with all necessary auxiliary equipment, heavy-duty ram-type stokers equipped with stationary or moving grates and side dump plates, with compressed air actuated dumping power cylinders, and stokers capable of handling the coal specified. Provide hopper feed into the retort by means of a that evenly distributes along the full length of the retort with auxiliary pusher blocks on a pusher rod located at the bottom of the retort actuated by the coal ram. Provide dampers between ash pits and main air chamber under stoker to permit control of air distribution to the grate surface arranged for operation from the front plate of the boiler. Provide a design where the air distribution is such that the air pressure is greatest where the fuel bed is the thickest with air quantity varying in direct proportion to the coal feed rate controlled automatically.

2.4.2.2 Grate Surface

Provide a grate surface with an underfeed retort area, air admitting tuyeres, side combustion grates, and the side dumping plates, with retorts being sectional construction of large capacity and proper shape to distribute coal uniformly over the entire grate surface with a minimum of moving parts within the furnace. Provide stokers having total grate width of more than 2.1 m 7 feet with movable grates providing positive lateral feeding of the coal from the retort toward the dump plates. Provide retort and grate sections constructed of heavy-duty, heat-resisting cast-iron, and cored for proper air distribution, being designed for easy replacement of individual sections. Provide ash dump plates with necessary levers and linkage for hand operation from the front of the boiler.

2.4.2.3 Ram Feed

Provide mechanical, pneumatic, or hydraulic driven by an electric motor connected through an efficient gear reduction unit, crank shaft, and connecting rod for ram feed. Provide [totally enclosed fan-cooled type] [totally enclosed fan-cooled type for installation in a Class II, Division 1, Group F hazardous location motors in accordance with NFPA 70]. [Provide motor starter with magnetic [across-the-line] [reduced voltage start] type with [general-purpose] [dust-tight] [explosion-proof] enclosure.] Provide stoker controls for connection to the combustion control system to accurately regulate the coal feed rate with manual setting of the coal feed rate possible without disconnecting linkage, with variation of stoker feed as required to maintain any desired capacity between 25 and 110 percent of boiler capacity in 10 or more equal increments. Regulate the coal feed rate by varying the time increments between strokes of the ram. Provide a throw-out release protecting the coal feeding mechanism from injury in case foreign materials obstruct normal operation.

2.4.2.4 Hoppers

Provide hoppers constructed of steel plates not less than 6.4 mm 1/4 inch thick and capacity of not less than [_____] kg pounds, with cleanout doors. Provide stoker front plate to form the front of the boiler for the full width of the boiler and extend from the firing floor to some point above the stoker where it connects to the boiler structural framing. Provide cast-iron or steel plate front, refractory lined with [auxiliary firing doors and] cleanout doors of refractory-lined cast-iron. Provide
structural framing as required to support the stoker and its components from the boiler foundation or boiler room floor. Provide water spray pipes and nozzles for quenching the ashes in the ash pit.

2.4.3 Conveyor Stokers

Provide grate level feed, forced draft [chain grate] [traveling grate] type conveyor stokers complete with hoppers, feed gate, drive shaft, sprocket wheels, grate, drive, and all necessary auxiliary equipment. Provide stokers capable of handling the coal specified. Feed coal automatically at a constant rate from the hopper onto the moving grate and evenly distribute across the full width of the grate. Provide stoker frame with no less than four air-tight zones for supply of forced draft and have suitable zone control dampers with external indicating, operating, and locking devices.

2.4.3.1 Grates

Provide grates with individual sections constructed of heavy-duty, heat-resisting cast-iron, fitted or cored for proper air distribution, and designed for easy replacement of individual sections. [Provide chain grates with staggered links connected by pins to form a continuous flat chain the full width of the furnace.] [Provide traveling grates with grate blocks mounted on carrier bars which, in turn, are fastened to two or more drive chains to form a continuous flat grate surface the full width of the furnace.] Support continuous grates at the ends by suitable sprockets and at intermediate points on suitable tracks or skids.

2.4.3.2 Conveyor Grate

Drive conveyor grate by [electric motor connected through a suitable speed-reduction unit] [hydraulically-operated variable speed drive] with all gears and chains required for the drive enclosed in a dust-tight and oil-tight housing. Provide main shafts for the grates with a forced system of lubrication [with fittings located outside the casing] [having self-lubricating bearings]. [Provide a forced lubrication system with bearings fitted with dust seals and easily accessible forced lubrication fittings.] Provide stoker controls suitable for connection to the combustion control system to accurately regulate the coal feed rate with manual setting of the coal feed rate by varying stoker feed as required to maintain any desired capacity between 25 to 125 percent of boiler capacity possible without disconnecting linkage. Change feed rate by varying the speed of the grate. Automatically vary air volume in direct proportion with the feed rate with feed rate varying in not less than 10 equal increments. Provide [totally enclosed fan-cooled type] [totally enclosed fan-cooled type electric motor suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Provide [manual] [magnetic] [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [dust-tight] [explosion-proof] enclosure.]

2.4.3.3 Hoppers

Construct hoppers of steel plates not less than 6.4 mm 1/4 inch thick, having a capacity of not less than [_____] kg pounds, and provided with suitable cleanout doors. Fit coal feed to the hoppers with concave type transitions to insure the proper distribution of coal and coal fines across the width of the hoppers. Construct stoker frame of cast-iron, cast steel, or forgings, with all parts of the stoker, except the grates, properly cooled or otherwise protected from the furnace heat to prevent damage by
warping or undue expansion. Provide stoker front plate to form the front of the boiler for the full width of the boiler and extend from the firing floor to some point above the stoker where it connects to the boiler structural framing. Provide cast-iron or steel plate, refractory-lined with cleanout doors of refractory-lined cast iron front with structural framing as required to support the stoker and its components from the boiler foundation or boiler room floor. Discharge ash at the end of the grate into a [bunker] [pit] as indicated. [Provide a bunker with a dust-tight enclosure made of steel plates not less than 6.4 mm 1/4 inch thick, properly protected with firebrick where exposed to the furnace, and fitted with cast-iron, refractory-lined inspection and access doors, and have provisions for ash removal.]

2.4.4 Vibrating Grate Stokers

Provide grate level feed, forced draft type vibrating grate stokers with the vibrating action of the grate used to feed the coal from the hopper through the furnace and to discharge the ashes into the ash pit. Provide stokers capable of handling the specified coal, complete with hopper, feed gate, grate, drive mechanism, and all necessary auxiliary equipment. Automatically feed coal from the hopper onto the grate and evenly distribute across the full width of the grate. Provide a manual adjustment to regulate the fuel bed thickness. Ashes must be automatically and continuously discharged to the ash pit. Divide the area under the grates into not less than four air-tight zones for forced draft supply with suitable zone control dampers with external indicating, operating, and locking devices.

2.4.4.1 Grates

Provide grates that are either air-cooled or water-cooled with grate bars in intimate contact with the water tubes and with individually replaceable sections of iron or steel suitable for the temperatures encountered. Provide all pressure parts including water tubes, headers, and valves suitable for boiler pressure specified and constructed in accordance with ASME BPVC SEC I, with grate sections properly designed for even air distribution over the entire grate area.

2.4.4.2 Controls

Provide stoker controls designed for connection to the combustion control system accurately regulating the coal feed rate and arranged for manual operation, independent of the combustion control system. Change the length of time of vibrations to vary the coal feed rate with a vibration generator belt-connected or gear-connected to the electric motor. Provide a unit free of any vibration that may damage other parts of the boiler or the building structure. Provide bearings requiring lubrication with easily accessible lubrication fittings. Automatically vary combustion air volume in direct proportion with the coal feed rate. Drive stoker by electric motor that are high starting torque [totally enclosed, nonventilated] [totally enclosed, fan-cooled] totally enclosed, fan-cooled suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70, with magnetic, reversing [across-the-line] [reduced voltage start] type motor starter and [general-purpose] [dust-tight] [explosion-proof] enclosure.

2.4.4.3 Hoppers

Construct hoppers of steel plates not less than 6.4 mm 1/4 inch thick,
having a capacity not less than [_____] kg pounds, and provided with a suitable method of cleanout. Provide furnace arches of a design suitable for the intended use and a type that will insure proper combustion of the fuel. Inclue the lower furnace sidewall headers in a waterwall boiler to accommodate the inclined grate arrangement. Provide stoker front that forms the front of the boiler for the full width of the boiler and extends from the firing floor to some point above the stoker where it connects to the boiler structural framing. Provide cast-iron or steel plate refractory lined front with cleanout and access doors of refractory-lined cast-iron and structural framing as required supporting the stoker and its components from the boiler foundation or boiler room floor. Discharge the ash at the end of the grate the ash into a [bunker] [pit] as indicated. Provide dust tight enclosure for the bunker constructed of steel plates not less than 15.9 mm 5/8 inch thick, protected with firebrick where exposed to the furnace and fitted with cast-iron, refractory-lined inspection and access doors, and provisions for ash removal.

2.4.5 Burners

**************************************************************************
NOTE: The designer must include all the required data for proper design of the boiler. Delete all references to coal and stokers where oil is the only fuel to be utilized.
**************************************************************************

Provide each HTW generator with oil-fired burner or burners with burner assembly and control systems conforming to NFPA 85, UL 296, and UL 726, except as otherwise specified, and with supervised manual, semiautomatic, and fully automatic combustion safety controls conforming to NFPA 85 and ASME CSD-1.

2.4.6 Fuel Oil Pumping and Heating Sets

Provide a duplex integrated, shop-fabricated oil pumping and heating set, assuring 100 percent standby with the oil heated by medium temperature water. Provide two positive displacement oil meters, include with each set an electric oil heater of sufficient capacity to heat the specified fuel oil to ignition temperature at low generator load until enough HTW is generated to operate the high temperature water-to-low temperature water (LTW) heat exchanger and the LTW-to-oil heater. Control electric heater by a magnetic starter with a manually-operated ON-OFF switch in series with a thermostatic control. When oil temperature is raised to proper level and maintained by the LTW heater, automatically disconnect the electric heater by the thermostatic control. Provide electric-motor driven fuel pumps with each pump having the capacity of not less than [_____] L/second gpm at a discharge pressure of [_____] kPa psig and a suction lift of 3 m 10 feet.

2.5 COMBUSTION CONTROL EQUIPMENT

**************************************************************************
NOTE: Paragraphs describing inapplicable types of combustion control equipment will be deleted. The type of combustion control system specified for a project will depend largely on the boiler capacity, the fuel, initial cost, and cost of operation. Basically, the types should be as follows (the boiler capacities are expressed in MW Btuh):
**************************************************************************
Use a single manufacturer for the automatic combustion control equipment system to be installed for each boiler in accordance with the manufacturer's recommendations. Locate controllers on the designated heating plant master control center panel. Provide equipment capable of operating either pneumatically, electrically, or electronically. Pneumatic control systems must conform to CAGI B19.1. Install air filter regulator sets at each control valve and transmitter in the system with the master air filter regulator set on the control panel being the dual type where one side can be cleaned and repaired while the other is operating. Protect exterior control air piping and devices from freezing by use of regenerative desiccant dryers. Provide each system with a selector switch or other means of manual control of the firing rate when required. Provide electrical control devices rated at 115 volts and connected as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Wire operating and limit controls to interrupt the ungrounded circuit conductor. Conform controls and instruments to the requirements of ASME CSD-1, NFPA 85, UL 296, and UL 726, except as otherwise specified. Provide individual control for each boiler. For multiple boiler installations, provide a means to base load on individual boilers while on automatic control.

2.5.1 Combustion Controls

Provide [positioning] [semi-metering] [metering] [metering with oxygen compensation] type combustion controls. Provide a plant master controller sensitive to temperature transmitter in return water header to provide anticipatory signals to all generator master controllers with generator master or submaster controllers reacting to anticipatory signals from plant master and then adjust firing rate as necessary in response to generator outlet temperature indication to maintain preset temperature at each generator outlet. Plus or minus 3 percent is the limit for precision of pressure or temperature control of the set point of the boiler pressure in kPa psig, or the temperature in degrees C degrees F during any load swings of up to 10 percent of the boiler capacity per minute over the entire turndown range.

2.5.2 Stoker Controls

Interlock the combustion control system with the grate drive to balance the ash discharge with the firing rate. The coal feed flow rate may be used as the index of fuel feed. Provide stoker controls to as outlined for the stoker specified.
2.5.3 Positioning Type Combustion Control Equipment

Provide separate parallel type positioning controllers for fuel feed and air flow, and both are modulated by the boiler load. Provide manual means for readily adjusting the fuel-to-air ratio for the most efficient combustion and an adjustable compensating device to maintain the proper ratio of fuel and air over the entire range of operation to provide combustion efficiency within the range specified. Provide a furnace draft controller, when required. Flush-mount all controllers on the control and instrument panel; all adjustments and calibrations of fuel feed, air flow and furnace draft, on the front of the panel.

2.5.4 Semi-Metering Type Combustion Control Equipment

Provide two controllers per boiler, one for fuel feed and one for air flow, with the first of these positioned in proportion to the boiler load to deliver a proportionate impulse to the second controller which functions in direct relation to that impulse; the second controller then measuring the fuel feed or air flow provided and automatically making necessary adjustments to maintain the fuel-to-air ratio for which it is set over the entire range of operation. Provide furnace draft or pressure controllers where required. Flush-mount all controllers on the control and instrument panel; make all adjustments and calibrations of fuel feed, air flow, and furnace draft or pressure, at the front of the panel, and provide indicators to show the amount of adjustment and the results obtained.

2.5.5 Metering Type Combustion Control Equipment

Provide metering controls with adequate means for automatically adjusting both fuel feed and air flow in strict relation to the load requirements, in addition to measuring the rates of fuel feed and air flow and maintaining the required ratios over the full range of boiler operation. In addition to the master controller, provide separate controllers for fuel feed and air flow responding either in parallel or series. Include air flow-fuel flow cross limiting devices. [If required by a particular system, a separate fuel-to-air ratio controller may be provided.] Measure the actual rate of fuel flow in the fuel line to the burner, and measure the actual air flow by a differential orifice in the forced draft duct. Operation of either controller for both functions is not acceptable. In addition, provide a separate controller to control the draft or pressure in the boiler furnace. Flush-mount controllers on the control and instrument panel; make all adjustments and calibrations of fuel feed, air flow, fuel-to-air ratio, and furnace draft or pressure, at the front of the panel and provide indicators to show the degree of adjustment.

2.5.6 Combustion Control with Oxygen Trim

Flue gas oxygen trim may be provided as an adjunct to the metering system of control. Determine the oxygen content in combustion gases; from this, send an impulse to the oxygen controller, which readjusts the air flow to maintain the required oxygen content. Provide the oxygen set point as a function of generator load with operator biasing capability limiting the amount of oxygen controller trim to prevent potentially hazardous conditions created by equipment failure or faulty operation.

2.5.7 HTW Generator Limit Controls

Provide low generator water flow and high generator temperature controls
with the limit controls interlocked with the combustion control system to provide for generator alarm and shutdown.

2.5.8 Burner Control/Fuel Safety System

2.5.8.1 Design Requirements

Provide a microprocessor-based (distributed digital or programmable controller) or relay type control system with a dedicated hardwired insert panel furnished for monitoring and operator interface with the burner control/fuel safety system with the panel also providing the operator with direct fuel tripping capability in emergency situations. Subdivide the burner control system to permit inservice checkout and maintenance without impairing the reliability of the overall control system. Provide logic cabinets that include status indicating lights for all logic inputs and outputs and for monitoring availability of control power to all subsystems as required to facilitate troubleshooting. Provide indication of equipment status and system permissives at the operator interfaces. Include, where common power supplies internal to the system are furnished, a full-capacity on-line backup supply. Provide alarm for failure of either power supply.

2.5.8.1.1 Maintenance and Reliability Requirements

In general, maintenance is accomplished on-line and without imposing any special restrictions on overall plant operation. Provide diagnostic routines, interchangeable electronic cards or boards, and clear written procedures as a minimum requirement of this specification. For reliability, incorporate both software and hardware into the system design, including redundancy, loop distribution, component specifications and testing, and quality control to assure the highest level of system reliability.

2.5.8.1.2 Adverse Electrical Conditions

Provide equipment capable of operating as specified and without damage within the electrical environment of the plant, including, but not necessarily limited to, high-voltage, high-frequency surges caused by electro-mechanical equipment, energy coupled between conductors by capacitance and mutual inductance, and imperfect grounds. Provide input and output isolation, shielding, separation of circuits, surge suppression, or other measures which may be required to meet these provisions. Inputs, outputs, and other connections must meet the surge to withstand requirements of IEEE C37.90.

2.5.8.2 System Design

Provide a compatible burner control system in all respects with the HTW generator and auxiliary equipment. The system design must meet the requirements specified in NFPA 85. Provide a burner control system incorporating a continuous purge of the furnace to insure that the HTW Generator is free of any accumulation of combustibles; in addition, provide a burner control that supervises the operation of the fuel-air equipment associated with fuel oil burners, accepts operator commands and, if the required permissives are met, perform the required operation. Provide continuously monitored equipment and alarm any deviation while the system either corrects the deviation of shuts down equipment as necessary to avoid hazardous furnace conditions or equipment damage. Provide a system that monitors the operation of the fuel equipment and if the equipment fails to respond to command from the burner control system, initiates the equipment
trip sequence. Provide system indications to allow the operator to
determine the equipment that initiated a trip of fuel equipment, shutting
down the tripped equipment reset of the trip is permitted. Include a fuel
safety subsystem in the burner control system that includes a master fuel
trip (MFT) system, ignition oil trip system, and main fuel oil trip system;
including a hardwired relay in each system which may directly operate from
the operator insert panel. Include inputs to the MFT, in addition to those
associated with the burner control system, those that are required to
provide overall HTW generator protection. Provide a system that interfaces
with the combustion control system to position and monitor devices for
startup and shutdown which are normally modulated during on-line
operation. Design the burner control system to operate reliably,
minimizing the number of false trips.

2.5.8.3 System Functional Requirements

2.5.8.3.1 Operating Modes

It is the operator's responsibility to initiate the start and stop
sequences listed below. Once initiated the burner control system must
automatically place the oil burner in service or remove it from service.
The steps each of which require operator initiation are:

a. Purge
b. Igniter control
c. Feeder control
d. Main oil burner

2.5.8.3.2 Furnace Purge and Boiler Monitor

Provide a furnace purge control to incorporate prelight off and post purges
of the furnace to insure that the HTW generator is free of any accumulation
of combustibles, which indicates to the operator, after which the operator
will reset the master fuel trip relay. Provide a furnace purge on any
master fuel trip. Provide the HTW generator monitor that prevents starting
any fuel equipment if the furnace firing permissives are not met, with the
furnace purge control providing indications to the operator of the status
and the progress of the furnace purge, extinguishing permissive indications
when the MFT relay is reset.

2.5.8.3.3 Igniter Control

An igniter group consists of all the igniters associated with a main oil
burner. Igniters associated with a burner group will be controlled from a
separate electropneumatic igniter control package. Provide sequential
starting of igniters between burner groups to be started and stopped from
the insert panel and local pushbuttons. An igniter fuel trip (IFT) first
out indication will be provided to indicate the initiating cause of the IFT
and extinguished only when the IFT relay is reset.

2.5.8.3.4 Main Oil Burner Control

Starting and stopping of each main oil burner may be accomplished either
locally or from the insert panel. Proven igniter groups is one of the
permissives required for starting. Provide fuel oil trip first out
indications and a main fuel oil trip (FOT) relay.
2.5.8.3.5 Fuel Safety Subsystem

The fuel safety subsystem comprises the MFT system, main FOT system, and IFT system. Each fuel safety system provides the protection for its respective fuel and includes a dedicated hardwired relay which may be directly operated from operator insert panel. The MFT system provides overall HTW generator protection, also includes a dedicated hardwired relay, and directly trips all other fuel safety system relays. Design the system to de-energize to trip.

2.5.8.3.6 Flame Monitoring

Individual self-checking flame scanners are required for each burner. Igniter flame safety devices must discriminate individually from any flame that may exist at other burner locations. Discriminate burner flame individually from the associated igniter flame and any other flame that may exist in the furnace. Igniter and burner flame discrimination must cover the range from startup to full load operation. Blocking interlocks from closed valves in flame discrimination circuits to avoid false flame indication are not acceptable. If required to obtain satisfactory flame discrimination, include extended tube scanners. Individual flame detector output level indicators are required. If required, provide provisions for cooling and cleaning.

2.5.8.3.7 Enclosures

The system logic cabinets contain all control devices, power supplies, circuit protective devices, cable plugs, and terminal blocks. Provide spare space to accommodate a minimum of 20 percent additional devices. Make the cabinets accessible from both front and back, each having gasketed hinged doors with latches. Do not exceed door width of 610 mm 24 inches. Natural draft cooling of the control system cabinets is preferred. If cabinet cooling fans are furnished, alarm the loss of any fan.

2.5.8.3.8 Local Termination Boxes

Include local junction boxes, one at each burner level containing separate pushbuttons and indicating lights for local control of each igniter group. In addition, include terminals for field wiring, internal wiring, cable connectors for intersystem wiring, circuit breakers, and if required by the system, relays and reversing starters in the terminal boxes. Configure terminal boards for field wiring to allow 20 percent spare connections.

2.5.8.3.9 Interconnecting Cable Requirements

Interconnect cables between the logic cabinet, insert panel, and local burner junction boxes via prefabricated plug-in cables, including connectors. Also, provide flame scanner cables.

2.5.8.3.10 Buffered Output Signals

Fully isolate output signals required for tripping, control, and monitoring from each other. Isolate such that an open or short circuit in the related equipment does not affect other control systems.

2.6 HEATING PLANT PANELS AND INSTRUMENTS

Do not use Mercury in thermometers.
2.6.1 HTW Generator Instrument and Control Panel

Size the HTW generator instrument and control panel to contain all controls, instruments, gauges, and meters. Provide free-standing panel with faceplate of not less than 4.8 mm 3/16 inch steel, reinforced, and finished with the manufacturer's standard finish coating. Mount the units flush on the panel as far as practicable. Enclose the back of the panel with sheet metal and with adequate removable access panels or doors for maintenance and removal of any unit without interfering with other units. Provide latching equipment and hardware. Indentify each recorder, indicator, and control unit with engraved metal or laminated plastic nameplates securely fastened to the panel. Provide the panel with continuous, rapid-start, fluorescent light fixtures mounted with reflectors providing suitable shielding to illuminate all controls, instruments, gauges, and meters. Terminate all field piping connections in one bulkhead-mounted manifold located to conform with the installation requirements of the system. Terminal all field electrical wiring in a mounted color-coded terminal strip so located as to conform with the installation requirements of the system. If a pneumatic control system is provided, include duplex air supply filter and regulator set, mounted on the rear of the panel with properly identified pneumatic terminal blocks and low-point drain in the panel. No high-pressure lines are allowed to enter the panel. Provide control equipment with the necessary operating switches, indicating lights, gauges, alarms, the combustion control system, and the generator and fuel safety interlock systems. If the package type boiler burner units with integral controls are furnished, the control equipment for each boiler may be mounted on a separate free-standing panel in accordance with the requirements above for instrument and control panel. Panel-mount and test at the factory controllers and indicators specified or required, complete with relays, transformers, switches, wiring, valves, and piping. Color-code or otherwise identify all wiring and piping within the panel.

2.6.2 Indicators

Provide flush mounted indicators with a vertical scale from 100 to 150 mm 4 to 6 inch length with scales in engineering units with an accuracy of plus or minus 1 percent of full scale. Indicators may be either electronic or pneumatic with zero adjustments, receiving standard signals from locally mounted transmitters.

2.6.3 Recorders

Provide servo mechanism type, multiple pen type, [circular] [strip chart] type recorders with minimum chart width of 100 mm 4 inches, accuracy of plus or minus 1/2 percent of full scale, and each pen having a separate scale calibrated in engineering units. Provide 120 volts ac chart drive and 1 year's supply of chart paper.

2.6.4 Panel Display

As a minimum, display the following parameters on the panel:

<table>
<thead>
<tr>
<th>Indicator Point</th>

### 2.6.5 Hot Water and Feedwater Flow Measurement

Provide square edge, concentric, paddle type, designed for flange taps orifice plates to measure hot water and feedwater flow to each generator with nozzles and orifice plates flange-mounted type, made of stainless steel. Minimum straight pipe runs in accordance with AGA XR0603.

### 2.6.6 Pressure Gauges

Provide heavy-duty industrial type pressure gauges with phenolic case, solid front, rear blowout, threaded ring, shatterproof glass, and $13 \text{ mm } 1/2$ inch NPT bottom connection installed for proper operation with stainless steel Bourdon spring-type having $114 \text{ mm } 4-1/2$ inch dial sizes installed where it is clearly visible from the operating level, and all requisite piping and gauge cocks described, or required above. Provide pressure gauges on high temperature service with pigtail siphons. Provide pump discharge gauges located on pump discharge lines with pulsation dampeners or snubbers with gauge ranges selected so that at normal operation the pointer is at approximately 50 percent of range. Provide gauges for the following services:

- Expansion Tank
- Dump Tank
- Master Control Center
- Circulation Pump Panel
- Distribution System Mains
- Control Panel
- Makeup Pumps
- Emergency Feed Pump
- Water Main
- Chemical Feed Pumps
- Air Compressors
- Fuel Oil Supply Header
- Generator Pressure
- HTW Water Inlet and Outlet Duplex

### 2.6.7 Dial Indicating Thermometers

Provide bimetallic type with stainless steel case and stem, with thermowells and having a $127.0 \text{ mm } 5$ inch dial and plus or minus 1 percent accuracy.

#### 2.6.7.1 Expansion Tank and Dump Tank Thermometers

Provide three thermometers on each tank; at the drum centerline, at the top 1/3 point, and at the lower 1/3 point of the drum.

#### 2.6.7.2 Inlet and Outlet Gauges of HTW Generators

Provide inlet and outlet gauges of HTW generators as above, as applicable.
2.6.8  Remote Reading Temperature Indicators

2.6.8.1  Pump Thermometers

Provide HTW generator and distribution system circulation pump panel dial type, liquid filled, surface panel mounting, back-connected thermometers in 150 mm 6 inch turret type phenolic case, with range 35 to 260 degrees C 100 to 500 degrees F, with self-compensating stainless steel 3 m 10 foot long capillary having a stainless steel separable socket with a 65 mm 2-1/2 inch extension neck, 150 mm 6 inch bulb length, 19 mm 3/4 inch IPS connection.

2.6.8.2  Pipeline Thermometers

Provide pipeline thermometers similar to above, with 65 mm 2-1/2 inch extension neck separable sockets, where accessible, and with required capillary length where not accessible, for direct reading.

2.6.8.3  Flue Gas and Fuel Oil (if Oil-Fired) Thermometers

Provide vertical scale, moving pointer type temperature indicators, in semiflush mounting dust-tight case, with curved translucent scales, internally illuminated, with instrument scale graduations, figures, and range suited for the indicated service, employing a diaphragm measuring element with linkage actuation of the indication pointer. Provide gas-filled bulb type thermal sensing element with spirally wound, bronze armored flexible copper connection tubing to the instrument, and instrument accuracy of 2 percent of full scale range with a sensitivity of 0.2 percent of full scale range.

2.6.8.4  Separable Sockets

At all points of recording, controlling, or integrating instrument temperature bulb insertion, install a stainless steel separable socket having a screwed cover and attachment chain adjacent to a temperature bulb for insertion of a test thermometer.

2.6.9  Oxygen Analyzer

If oxygen compensation controls are furnished, provide an oxygen analyzer to indicate, record, and control the percentage of net excess oxygen in, and the average temperature of the flue gas leaving, the boiler. Provide a direct probe type oxygen analyzer utilizing an in situ zirconium sensing element inserted directly into the process flue gas stream and in direct contact with the process gases. Provide a sensing element contained within a protective shield mounted to the ductwork by an adapter plate. Provide analyzer equipped to allow daily automatic calibration check without removing the analyzer from the process, where as sample gases may be injected directly on the sensing element while the analyzer is in the process. Include any temperature compensation of control required with the output signal range from 4 to 20 mA dc and representing 0 to 10 percent as a linear function.

2.6.10  Flue Gas Opacity Monitor

Provide a flue gas monitoring system with continuous measurement, indication, and recording of smoke opacity from each boiler, and with the stack units including a light source and a light detecting or receiving unit mounted in the stack or main breeching, as recommended by the manufacturer. Provide a control or transmitter unit with electronic
solid-state circuitry and meter or digital type indicator, and provide an output signal for 0 to 100 percent opacity. In addition, provide the control unit with calibration and alarm adjustments for compliance with Federal, State, and local environmental regulations, and a control or transmitter unit and recorder with a dust-tight metal enclosure. Provide a purging air system to clean light source lens and light detector lens. Provide the control unit with adjustable alarm output contacts for various smoke densities.

2.6.11 Fuel Flow Meter

Provide a volumetric measurement type flow meter incorporating a rotary, positive displacement piston body with gear train driven generator and totalizing register, a panel-mounting meter to indicate fuel oil rate of flow in gallons per minute, and a transmitter output signal of 4 to 20 mA dc to be used for combustion control, with a bronze with hard-cast bronze measuring piston. Provide a totally enclosed generator with grease-packed ball bearings, silver commutator, and brushes. Mount the totalizing register on top of the generator housing and calibrate in liters U.S. gallons.

2.6.12 Water Flow Meter

Provide a water flow recorder with totalizer for each generator and a recorder conforming to the requirements specified for the HTW temperature recorder except that flow rates are to be recorded in L/sec gpm.

2.6.13 Btu Recorder

Provide a recording totalizer which integrates temperature difference and water flow to provide the net J Btu output of the generator for each HTW generator.

2.6.14 Makeup Water Meter

Provide a makeup, positive displacement type water meter in the treated water line suitable for operation with water at 21 degrees C 70 degrees F and 450 kPa 65 psig with the complete meter assembly to include meter isolation valves and a valved bypass and strainer on the inlet side of the meter, and 254.0 mm 10 inch diameter vertical type dial calibrated in L gallons having two hands; 380 L 100 gallons indicated on one hand and 7570 L 2000 gallons on the other hand. Provide the hands with a manual reset device. Provide a totalizing register with all bearings self-lubricating if submerged. Provide a meter capacity of [_____] L/sec gpm.

2.6.15 Master Control Center

Provide a centrally located master control center to serve as the central control and recording station for the plant, also serving as a central point for miscellaneous functions including the various alarm circuits with their annunciators and audible signals, and the controls for the system. The units to be installed on the panel are specified under the various paragraphs of this specification. Install all necessary electric wiring for instruments, panel lighting, and equipment requiring electrical connections. Install all necessary transformers, separate relays, switches, and fuses in a fully enclosed junction box with a safety switch with fuses serving the 120-volt power supply to the plug-in strip and any other power supply as required for control circuits. Provide all wire suitable for boiler room requirements and install according to NFPA 70.
Install and support in place on the rear of the panel and test at the factory all necessary interconnecting piping, terminal block, valves, and fittings required for the control equipment.

2.6.15.1 Panel Board

Provide a free-standing master panel board, floor-mounted on a 100 mm 4 inch concrete curb and provided with vibration isolators between panel and anchor bolts. Construct the control panel of specially leveled steel sheet not less than 4.8 mm 3/16 inch thick with adequate structural steel framework to provide a rigid unit, and with the panel gaskets and other seals necessary to form a dust-tight enclosure of the controls conforming to NEMA ICS 1 standards. Identify all controls and instruments using nameplates. Match the panelboard with the boiler control units and distribution panel in appearance, unless it is a console type. Provide each panel with a suitable plug-in strip on the rear of the panel for any required plug-in electrical connections of the instruments with all necessary piping or electrical connections and all necessary devices for a complete operating installation. Provide suitable single strip, rapid start fluorescent lighting with a panel-mounted toggle switch for a panel hood, with a single, pull chain, ceiling light receptacle installed in the interior of the panel enclosure and wired to the common point of electrical supply.

2.6.15.2 Distribution Zone Valve Controls

Provide a manual valve control for each zone control valve on the master panel, with instruments to indicate the position of each valve operator.

2.6.15.3 Expansion Tank Water Level Indicator

On the master control panel provide a remote reading, liquid level indicator type water level indicator, with the indicating scale showing uniform divisions for all level changes, and requiring no liquids for calibration other than the expansion drum water, suitable for 2,758 kPa 400 psig operating pressure, and connected and calibrated to show indicated levels of [_____] mm inches to [_____] mm inches above the outside bottom of the expansion tank. Locate the primary or transmitting elements at the liquid level control station, so located and calibrated that the center point of the indicator shows the normal water level in the tank at [_____] mm inches above the tank bottom.

2.6.15.4 Annunciator

Provide an annunciator system with a semiflush mounted panel which indicates and alarms on the following:

a. Expansion Tank:
   - Overflow level
   - Normal level
   - Combustion cutout level
   - High pressure
   - Low pressure

b. Dump tank:
   - Overflow level
   - High pressure
Low pressure

c. HTW generator (each) - safety shutdown

d. Fuel (to suit firing system):
   - Low fuel oil header pressure
   - Low fuel oil storage level
   - Low stoker hopper level
   - Low coal bunker level

e. Air:
   - Low service air pressure
   - Low instrument air pressure if pneumatic controls are used

f. Distribution zones (each) - low return pressure

Provide the annunciator with lamp test and acknowledge push buttons, with the operational sequence as follows:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Light/Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Light off, horn off</td>
</tr>
<tr>
<td>Alarm</td>
<td>Light flashing, horn on</td>
</tr>
<tr>
<td>Alarm acknowledged</td>
<td>Light on, horn off</td>
</tr>
<tr>
<td>Return to normal</td>
<td>Light off, horn off</td>
</tr>
</tbody>
</table>

Provide the system with devices to actuate the annunciator from the above sources, unless otherwise specified.

2.6.15.5 Liquid Level Control Stations

Provide liquid level control stations at the expansion tank and dump tank, and include adequate detection, sensing, and actuating devices to provide signals for the annunciator system and to control the overflow system. The levels for carrying out the above functions are as indicated.

2.6.15.5.1 Expansion Tank Overflow Controller

Provide overflow control system from the expansion tank. Provide the expansion tank that overflows on control signal from the control station specified above which actuates a motorized normally-closed valve allowing water to relieve to the dump tank.

2.6.15.5.2 Dump Tank Overflow Controller

Provide an overflow control system from the dump tank with the dump tank overflowing on a control signal from the controller which actuates a motorized normally-closed valve allowing water to relieve to the blowdown tank.

2.6.15.6 Distribution Zones Control Station

Provide a control station for distribution zones valve control with one manual valve control for each zone. Provide the instrument that indicates
the position of the valve operator with remote control and adjustment of the valve. Provide a motorized gate valve for the controlled valve in the distribution zone supply line for emergency shutoff and flow modulation, with the motorization of the valve being such that any partial opening of the valve may be held positively without drift or consumption of a power means. Conform the valve body to the requirements for valves specified in paragraph PIPING.

2.6.15.7 Plant Master Controller

Provide a plant master controller for nitrogen pressurized systems that reacts in response to temperature transmitter signals from a temperature sensing element in the return water header and provides the necessary signals to the HTW generator master controllers with a manual selector station for selecting either automatic control or manual control and a means for adjusting the set point return water temperature control.

2.6.15.8 Clock

Provide an electric synchronous motor type clock, except as modified herein. Provide a surface mounted, suitable for operation on 115-volt, 60 Hz single-phase electric service with a white dial, 380 mm 15 inch size, easy-to-read black numerals, black hands, red sweep second hand, and external manual reset knob at bottom of case. Provide a motor gear train sealed in a permanent oil bath.

2.6.16 Panel Piping and Wiring

Pneumatically or electrically, or both, transmit high-pressure and high-temperature values to the panel. Transmit pneumatic signal at 0.69 to 104 kPa 3 to 15 psig and include piping connectors to indicators with 6.4 mm 1/4 inch OD copper tubing conforming to ASTM B68/B68M. Transmit flow signals either pneumatically or electrically to the panel-mounted receiver. Run copper tubing connections and electric wiring to a terminal block located on the inside of the panel front near the bottom with wiring terminated at an identified terminal strip. Provide wiring suitable for boiler room requirements and install according to NFPA 70.

2.6.17 Pilot Lights

Provide factory-built cabinet with assembled pilot lights, suitable for flush mounting in cutouts in boiler control panel, complete with extruded trim, clamps, and sheet metal rear housing, and finished in baked black enamel. Provide white plastic and engraved in black ink lens with lettering 19 mm 3/4 inch high and black. Provide two 6 watts, 24 volts dc, S-6 incandescent type lamps, supplied with color caps, one red and one green per pilot light, independently wired lamps per pilot, with black lens bezels unless otherwise indicated.

2.6.18 Continuous Emissions Monitoring

**************************************************************************
NOTE: A continuous emissions monitoring system (CEMS) is required by the Clean Air Act Amendment (CAAA) of 1990 if the fuel utilized is oil or coal and the heat input is 3 megawatts 1 million BTU/HR or greater. A CEMS may also be required by state or local laws. If a CEMS is necessary, review the CAAA and the relevant state or local law early in the
project to allow time to incorporate the required CEMS specification and to determine which fine gas emissions will be included in the required reports. Before acceptance of the installation, furnish the Contracting Officer with a written test report which provides documentation that the CEMS equipment has passed factory and field certification tests required by federal, state and local regulations. The investigation will determine if the reported values may be calculated or should be direct measurements. Fill in the data to state what method of measurement or calculation will be utilized for the determination of the report variable.

Emerging flue gas flow monitor technologies are available. The traditional differential pressure technique specified uses familiar equipment that can be maintained by plant personnel. This type of measurement device has reliably satisfied regulatory requirements. The possible use of other technologies should include a thorough investigation of flue gas flow monitor regulatory requirements and in-house maintenance capabilities.

******************************************************************************

a. Provide continuous emissions monitoring system (CEMS) equipment as a system by a single manufacturer, meeting the requirements of applicable federal regulations, State of [_____] and local regulations, for each boiler in accordance with manufacturer's recommendations and under the direct supervision of the CEMS equipment manufacturer.

b. Include in the reported data [sulfur dioxide (SO2)] [oxides of nitrogen (NOx)] [carbon dioxide (CO2)] [particulate matter (PM)] and other information required by federal, state, and local regulations. Base SO2 reporting on [analyzer measurement] [fuel flow and percent sulfur calculation] [daily heat input calculation]. Base nitrous oxides, carbon dioxide and particulate matter reporting on analyzers.

c. Provide the CEMS equipment with the central processing unit, printer, hard disk drive, and optical disc drive, with the optical disc drive functioning as a recorder. Provide the manufacturer's software to generate the required reports in a format acceptable to the federal, state and local regulatory agencies. Provide a CRT screen as the operator interface to the CEMS equipment.

2.7 NITROGEN PRESSURIZATION SYSTEM

Provide a complete system of nitrogen pressurization, including necessary equipment, parts, pressure vessels, piping, valves, devices, and accessories allowing proper HTW expansion and contraction, and control of makeup water with a minimum loss of nitrogen and HTW while maintaining the system pressures corresponding to the operating range of the combustion control of 5.5 degrees C 10 degrees F above or below the boiler-outlet water temperature, without steaming in the system.

2.7.1 Expansion Tank

Provide one expansion tank constructed, hydrostatically tested at the factory, stamped, and certified in accordance with ASME BPVC SEC VIII D1
for an operating pressure of [_____] kPa psig and temperature of [_____] degrees C degrees F, with connections and piping inserts adequately supported structurally as required for the service. Provide a standard manhole, actuating device for feed water control, alarm devices, gauge glasses, floats, and controls as required, for the proper functioning of the expansion tank.

2.7.2 Dump Tank

Provide dump tank, hydrostatically tested at the factory, constructed, stamped, and certified in accordance with ASME BPVC SEC VIII D1 for an operating pressure of [_____] kPa psig and [_____] degrees C degrees F, with connections and piping inserts adequately supported structurally as required for the service, also with a standard manhole, actuating services for makeup water control, alarm devices, gauge glasses with shields, floats, and controls as required, for the proper functioning of the dump tank.

2.7.3 Expansion Tank and Dump Tank Fittings

Tank fittings conforming to ASME BPVC SEC VIII D1 and including the following:

a. Pressure gauge.

b. Water level gauge.

c. Level controls.

d. Thermometer.

e. Drain valves; hard seat, seatless pattern; rating 400 to 600 pound class.

f. Vent valves; Class 600 600 pound steel bar stock, OS&Y.

g. Safety relief valves conforming to ASME B16.34, and suitable for a HTW expansion drum at working pressure of [_____] kPa psig, with all internal parts are of steel or stainless steel with hard facing allowable.

2.8 BLOWOFF SYSTEM

2.8.1 Sample Cooler

Provide a water-cooled, shell-and-tube type heat exchanger with stainless steel tubes suitable for cooling the blowoff (before sampling) sample cooler. Connect the cooler to a header and valved so that the operator can obtain a sample of properly cooled blowoff from any boiler as desired. Support the cooler and provide a steel sampling cock with a sampling glass container suitable for handling the water temperature to be encountered and a hydrometer or equivalent device suitable for measuring the concentration of solids in the boiler blowoff and reading in parts per million.

2.8.2 Blowoff Tank

Provide a concrete blowoff tank with bolted manhole cover, cover plate with disappearing lifts, inlet blowoff connection equipped with mixing nozzle, vent, overflow and drain connection.
2.9 WASTE HEAT RECOVERY EQUIPMENT

**************************************************************************
NOTE: For the efficiencies specified, waste heat recovery will be required. Designer must consult with HTW generator manufacturers to select the most appropriate unit for the size of HTW generator being designed.
**************************************************************************

Equip each boiler with [an economizer] [an air preheater], which may be separate from or integral with the boiler and complete with insulation and jackets, casings, supports, and access doors, and with provisions for tube or tube bundle removal and for cleaning.

2.9.1 Economizers

Provide economizers of a type normally provided by the boiler manufacturer and including [finned tubes] [bare tubes] baffles and headers, and provisions for cleaning and tube bundle removal, constructed of materials capable of withstanding the maximum boiler exit gas temperature plus 28 degrees C 50 degrees F. Use tubes conforming to ASME BPVC SEC I. Design and install as to preclude cold-end corrosion under any load condition, with economizer tube metal temperature being above the maximum flue gas dewpoint for the fuel being fired under all load conditions.

2.9.2 Air Preheaters

Provide air preheaters normally provided by the boiler manufacturer and being the recuperative tube plate or regenerative type constructed of materials adequate to withstand the corrosion effects of the flue gases with the overall installation precluding cold-end corrosion of the air preheater under any load condition. Temperatures of all metals in contact with flue gas must be above the flue gas maximum dewpoint temperature for the fuel being fired under all load conditions. Provide air-preheat or automatic bypass control integrated with the combustion control system.

2.10 DRAFT FANS

**************************************************************************
NOTE: Induced draft fan outlet dampers may not be required in single fan/single boiler installations, except to eliminate the stack effect during outages.
**************************************************************************

Provide [backward curved blades] [radial tip blades] or axial flow type centrifugal fans conforming to AMCA 801 [Type I] [Type II] furnished as an integral part of boiler design. Size each fan for an output volume and static pressure rating sufficient for pressure losses, excess air requirements at the burner or grate, leakages, temperature, and elevation corrections for a dirty boiler with worst ambient conditions, all at full combustion to meet net rated output at normal firing condition, with fan sizing including minimum margins of 10 percent volume and 21 percent static pressure, plus margins of 5 degrees C 10 degrees F for forced-draft fans and 22 degrees C 40 degrees F for induced-draft fans. Design induced-draft fans for handling hot flue gas at the maximum outlet temperature adjusted for surface fouling. [Provide induced-draft fans with outlet dampers.]

Noise levels for fans must not exceed 85 decibels at 914 mm 3 foot station,
with [air cooled] [or] [water-cooled] fan bearings, and backward curved fan blade type with bearings not requiring water cooling may be of the self-aligning antifriction type. [Provide scroll sheets and rotor blades with liners.]

2.10.1 Draft Fan Control

**************************************************************************
NOTE: Variable speed control, inlet vane control and inlet damper control are, in descending order of efficiency, capable of control draft fan conditions. The choice is based on economics. However, in erosive services, inlet vane control is not desirable.
**************************************************************************

Provide forced-draft centrifugal fans with [inlet vane controls] [variable speed control]. Provide induced-draft centrifugal fans with [inlet vane control] [inlet damper control] [variable speed control] and [axial propeller fans having variable propeller pitch control.] Provide inlet vanes or dampers suitable for use with combustion control equipment.

2.10.2 Draft Fan Drives

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

Provide electric motor driven fans with electric motor being [drip-proof] [totally enclosed nonventilated] [totally enclosed fan-cooled] [totally enclosed fan-cooled, suitable for installation in a Class II, Division 1, Group F, hazardous location conforming to NFPA 70]. [Provide magnetic [across-the-line] [reduced voltage start] type motor starters with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure and furnished with four auxiliary interlock contacts.]

2.11 AIR DUCTS

Design air ducts connecting the forced-draft fan units with the stoker plenum chamber to convey air with a minimum of pressure loss due to friction. Provide galvanized sheet metal ductwork conforming to, with ducts straight and smooth on the inside with laps made in direction of air flow, and externally braced, installed and anchored as to be completely free from vibration. Provide access and inspection doors as required. Construct ducts with long radius elbows having a centerline radius 1.5 times the duct width, or where the space does not permit the use of long radius elbows, short radius or square elbows with factory-fabricated turning vanes may be used. Provide substantially air-tight duct joints of adequate strength for the service, with 38 \times 38 \times 3.2 \text{ mm} 1-1/2 \times 1-1/2 \times 1/8 \text{ inch} structural steel angles used where required for strength or rigidity. Duct walls thickness as follows:
<table>
<thead>
<tr>
<th>Duct, Maximum Dimension</th>
<th>Galvanized Steel Sheet, Minimum Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up through 1525 mm</td>
<td>1.613 mm 16 gauge</td>
</tr>
<tr>
<td>Up through 60 inches</td>
<td></td>
</tr>
<tr>
<td>1526 m and larger</td>
<td>2.753 mm 12 gauge</td>
</tr>
<tr>
<td>and larger</td>
<td></td>
</tr>
</tbody>
</table>

2.12 BREECHING

Construct breeching of not less than 3.416 mm 10 gauge steel sheets conforming to ASTM A36/A36M and with adequate reinforcement and bracing with structural steel angles not smaller than 50 x 50 x 6.4 mm 2 x 2 x 1/4 inches, and all welded joints, longitudinal seams and angles. Provide expansion joints as required to suit the installation, being flexible type requiring no packing. Providing breeching with angle flanges and gaskets for connection to boilers, fans, equipment, or stacks. Provide gas-tight breeching connections, caulked-tight all around and sealed with cement to form an air-tight joint. Provide clean-out openings of suitable size and at approved locations for access to all sections of the breeching with tight-fitting, hinged, cast-iron doors with cast-iron frames. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping for combustion gases.

2.13 STACKS

Provide self-supporting, double-wall insulated type stacks for individual boilers. Provide for each stack, unless otherwise indicated, complete with structural steel base, base plates, anchor bolts and nuts, cleanout door, [induced-draft fan] [boiler] connection and a thermometer well. Stub stacks for packaged boiler units may be supported directly on the boiler providing the boiler structure is designed to accommodate such an arrangement. Provide insulation suitable for sustained flue gas temperature of 485 degrees C 900 degrees F with intermittent temperatures up to 650 degrees C 1200 degrees F and the wall section "U" factor of approximately 0.26. Fabricate stacks of high-strength, low alloy, structural steel resistant to atmospheric corrosion and conforming to ASTM A242/A242M for both inner and outer shell. Provide inner shells of each section with an air-sealed and concealed expansion and contraction device to allow for differential expansion of inner and outer shells. Extend stacks above the roof to the height indicated. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping for combustion gases.

2.14 ELECTRIC MOTOR-DRIVEN PUMPS

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

Provide electric motor-driven pumps with motors that are [splash-proof] [totally enclosed, nonventilated] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type, suitable for installation in a Class
II, Division 1, Group F hazardous location in accordance with NFPA 70. Provide [manual] [[magnetic] [across-the-line] [reduced voltage start]] type motor starter with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.

2.14.1 HTW Circulating Pumps

Design and size HTW circulating pumps for specific applications. Provide pumps having a combined rating of flow and head that results in a power rating less than 185 kW 250 bhp to meet the design requirements of API STD 610, being end-suction, top discharge, and supported at its centerline. Provide horizontal-split case, multi-stage centrifugal pumps for sizes above 185 kW 250 bhp. Provide volute or diffuser design casing construction, supported at its casing centerline. Provide all pumps nominally rated for excess capacity of 10 percent above the maximum continuous rating of the service. Provide the required Net Positive Suction Head (NPSH) at the pump design flow, head, and speed not exceeding 80 percent of the available system NPSH at the same flow, assuming a low level in the storage tank. Provide the pump's suction specific speed not to exceed 9000 at the pump's best efficiency point (BEP) reflecting a guaranteed NPSH requirement of 3 percent breakdown criteria. Select a pump based on a constantly rising to shutoff with no point of inflection, and with no restriction to operation at any point from minimum continuous flow to design flow.

2.14.1.1 Suction and Discharge Flanges

Provide pumps with integrally cast suction and discharge flanges drilled to meet the design pressure of the application. Provide feed pumps designed for an operating temperature of not less than 205 degrees C 400 degree F, with casings drilled, tapped, and provided with vent and drain connections. Pumps designed for this service do not require cooling at ratings below 375 kW 500 bhp for both frame cooling and seal cooling. For pumps below 375 kW 500 bhp, provide antifriction radial and thrust bearings, lubricated by flinger rings in a sealed housing with mechanical seals, and with air-cooled flush piping conforming to API STD 610, Plan 23. For pumps above 375 kW 500 bhp, provide a single cooling circuit for both cooling the oil being delivered by a forced oil system to sleeve radial bearings and a floating shoe thrust bearing, coupled with the seal coolers for both stuffing boxes and mechanical seals. In both cases, provide site-convertible stuffing to a packed box. Provide for maximum leakage no more than 0.025 L/hour 25 cc/hr for a seal life of no less than 25,000 hours, and bearing rating not less than 100,000 hours (L-10 life) at the point of maximum load, as defined by ABMA 9.

2.14.1.2 Structural Steel Bases

Support pumps on structural steel bases that do not require grouting in order to impart strength to the pump for static and dynamic loading from the piping system, with bases pitched to a low point drain. Shop align complete pump and motor assembly using shims on both the pump and the motor.

2.14.1.3 Pump Coupling and Guard

Provide pumps with nonlubricated flexible-disc couplings and a coupling guard. Provide spacer-type couplings to permit removal of the mechanical seals and limited-end-float-type for pumps with sleeve bearings.
2.14.1.4 Recirculation Control Valve

Provide pumps with a self-contained automatic recirculation control valve sized for nominally 25 percent of the pump's BEP flow.

2.14.1.5 Pump Testing

Subject pumps to shop hydrostatic testing. Subject one pump in each service to complete shop performance tests to demonstrate that, at rated capacity, head is within a margin of plus 3 percent and minus 0 percent of design; efficiency is within a tolerance of minus 0 percent; NPSH at the pump's BEP and at the rated condition is within a margin of plus 0 percent and minus 10 percent. Conduct performance tests in accordance with API STD 610. Procedures and results are subject to the approval of the Contracting Officer.

2.14.1.6 Instrument Panel

Provide each HTW circulation pump with an instrument panel, with construction and arrangement of the gauge panel as indicated. Provide nameplates having letters 6 mm 1/4 inch high designating the pump number and service. Provide surface panel mounted gauges. Provide the instruments specified above and include one single-element pressure gauge for the pump suction, one duplex pressure gauge with two elements to indicate flow pressure on each side of the pump discharge regulating valve, and one dial type thermometer to indicate the discharge temperature.

Provide identification letterings located either on the gauge dial or on a nameplate adjacent to the gauge identifying the service of the gauge, with a stainless steel socket with cover for a separable socket-type test thermometer installed in the pump discharge piping at each circulation pump for future insertion of a test thermometer. Provide pressure gauges with a gauge valve and a pigtail siphon as specified installed at the point of connection with the main piping. Provide pulsation dampeners or snubbers for pressure gauges connected to the pump discharge.

2.14.2 Emergency Makeup Water Pump

Provide centrifugal type emergency makeup water pump; split case, 2 stage type with closed impellers and radial or mixed flow. Design the pump to handle high temperature water at 122 degrees C 250 degrees F, specific gravity of 0.942, pH of 9.5 to 10.5, and the capacity and head indicated.

2.14.3 Makeup Water Pumps

*************************************************************************
NOTE: If inadequate NPSH is available, give consideration to substituting either a double suction or positive displacement pump.
*************************************************************************

Provide horizontal, end-suction, single-stage, centrifugal, motor-driven makeup water pumps. Provide pumps having stainless steel shafts, bronze impellers, and stuffing boxes. Lubricate by splash oil with oil level sight glass provided. Subject pumps to the same tests specified for the HTW circulating pumps.

2.14.4 LTW Circulation Pump

Provide centrifugal type, end suction, single stage type with closed, open,
or semi-open impellers, radial or mixed flow, designed to handle low temperature water at 110 degrees C 225 degrees F, and the capacity and head indicated.

2.15 LTW EXPANSION TANK

Provide LTW expansion tank in connection with the LTW water heater constructed in accordance with ASME BPVC SEC VIII D1 and with a protected gauge glass and manual air vent. Hydrostictically test the tank at 1-1/2 times the working pressure or at 690 kPa 100 psig, whichever is greater.

2.16 HEAT EXCHANGERS

2.16.1 Water Heaters

Provide water heaters of the types scheduled and with thermostatic control valves, valved bypasses, strainers, and temperature/pressure relief valves. Provide thermometers where indicted, and temperature and pressure relief valves conforming to the requirements of ANSI Z21.22/CSA 4.4. Provide separate valves if input exceeds 29.3 kW 100,000 BTU/H or storage capacity exceeds 454 L 120 gallons. Provide thermostatic control valves installed in the HTW return line from each water heater coil, installed to operate in conjunction with a remote bulb temperature controller, and conforming to the requirements of paragraph THERMOSTATIC REGULATING VALVE. Provide flanged valves, minimum Class 300 300 pound class, and sized for the service by the manufacturer. Provide shell-and-tube design instantaneous water heaters conforming to the applicable requirements of TEMA Stds, Class C with the heater shell being steel and designed for [_____] kPa psi and [_____] degrees C degrees F temperature, and U-tube type coil designed for high temperature water at [_____] kPa psi pressure. Provide 16 mm 5/8 inch or 19 mm 3/4 inch size, constructed of No. 16 AWG cupronickel (90 percent/10 percent) coil tubing.

2.16.2 LTW Heat Exchanger for Fuel Oil Heating

Provide instantaneous shell-and-tube type heater conforming to the applicable requirements of TEMA Stds, Class C, with a steel shell and designed for [_____] kPa psi and [_____] degrees C degrees F temperature. Provide with U-tube type coil designed for HTW at [_____] kPa psi pressure, constructed of No. 16 AWG 16 mm 5/8 inch or 19 mm 3/4 inch cupronickel (90 percent – 10 percent) tubing.

2.17 CHEMICAL TREATMENT AND WATER SOFTENING EQUIPMENT

2.17.1 Chemical Feeder

Provide an automatic proportioning, shot type, or pump type chemical feeder unit for each boiler, including all appurtenances necessary for satisfactory operation, with size and capacity of feeder based on local requirements and water analysis.

2.17.2 Chemical Feed Pumps and Tanks

Provide chemical feed pumps with pump cylinders, plungers, ball check valves, and check valve bodies of corrosion resistant materials suitable for the chemicals being pumped and tanks as a complete package assembly with the pumps mounted on and piping connected to the tank. Volumetric accuracy of the pumps must be within one percent over the range indicated. Provide with adjustable pump capacities by positioning crank pin with
micrometer setscrews. Provide stroke length scale divided in percentage graduations engraved on scale. Provide replaceable cylinders for increased or reduced pressure or capacity ranges. Provide drive motors suitable for the electrical power available and having drip-proof enclosures. Provide tanks made of polypropylene and mounted on legs with filling and drain connections, gauge glass and hinged cover. Provide each tank with one pump, mounted and piped with black iron pipe and fittings, with suction strainer and stainless steel screen, and with 13 mm 1/2 inch relief valve with steel body and stainless steel trim. Provide tank with bottom dished concave to a radius equal to the diameter of the tank. Provide tanks suitable for phosphate or caustic feed and sulfite feeding, provide a motor-driven agitator. Design the pump to feed the chemical solutions into the HTW return line to the system circulating pumps and have the capacity to feed a maximum of 5.3 mL/sec 5 gph.

2.17.3 Water Softening Equipment

**************************************************************************
NOTE: If softening equipment for makeup water is not required, as determined in accordance with UFC 3-410-01, entire paragraph should be deleted. If water softening equipment is required, list desired water treatment conditions; e.g., pH level, hardness, chemical concentrations.
**************************************************************************

Provide a [single] [double] unit automatic water softener system as indicated, designed for a working pressure of [_____] Pa psig, complete with raw and regenerate water distribution; under drain; inlet and outlet connection in upper and lower header respectively; resin removal connecting pipe legs; control valve for service, backwash, regenerate, and rinse; water meters, pressure gauges, brine storage, and measuring tank and controls for automatic operation. Provide either hot-dipped galvanized after fabrication or polypropylene brine tank[s], brine piping either all copper pipe and fittings or Schedule 80 PVC and fittings. Provide equipment having a total capacity between regenerations of not less than [_____] liters gallons of water of [_____] g grains hardness when operating at a sustained softening rate of [_____] L/sec gpm, and based on the data below. Provide test sets for pH comparator for the range [_____] to [_____] sulfide comparator, and phosphate comparator.

2.17.3.1 Water Analysis

The source of the raw water is [______]. The analysis of the water is approximately as follows:

<table>
<thead>
<tr>
<th>Constituents*</th>

*Numbers in parentheses are subscripts.

2.17.3.2 Zeolite

Provide high capacity polystyrene base sulphonic synthetic type zeolite, with not less than [_____] cubic meters cubic feet of zeolite with each reactor tank.

2.17.3.3 Reactor Tank

Provide reactor tank sized on allowing a freeboard above the zeolite bed of not less than 50 percent of the zeolite bed depth, and a maximum flow rate of 0.679 L/square meter per second one gallon/square foot per minute for each 111 mm 4-3/8 inches of zeolite bed depth.

2.17.3.4 Softening System

Provide the softening system complete with all piping, control, and power wiring, and a complete initial charge of rock salt installed in the brine tank as recommended by the softener manufacturer.

2.17.3.5 Water Test Kit

Provide a water test kit in a strong carrying case, complete with test
containers, reagents, and instructions for testing the raw and effluent water.

2.17.3.6 Treated Water Storage Tank

Provide a treated water storage tank as indicated, having a capacity of not less than [_____] liters gallons, fabricated from steel plates not less than 4.76 mm 0.1875 inch thick for shell and heads, constructed in accordance with ASME BPVC SEC VIII D1 for a design working pressure of 520 kPa 75 psig, with dished or concave heads to a radius equal to the diameter of the tank, and hydrostatically tested at the factory at not less than 690 kPa 100 psig. Provide the tank with the connections indicated, an 200 mm 8 inch copper ball float, lever-operated control valve, valve bypass and accessories, and a protected gauge glass.

2.18 HTW SPECIALTIES

2.18.1 Sediment Trap and Blender

Provide a hydrostatically tested sediment trap constructed, stamped, and certified in accordance with ASME BPVC SEC VIII D1 for an operating pressure of [_____] Pa psig and [_____] degrees C degrees F, with the receiver sized for maximum plant flow condition of [_____] L/second gpm and maximum flow velocity of 150 mm/second 0.5 fps. Flange and dish receiver heads and flange all tank nozzles 50 mm 2 inches and larger Class 300 300 pound class. Provide an inspection handhole.

2.18.2 Line Mixer

Fabricate the line mixer as indicated using seamless steel welding pipe fittings with the area of holes drilled in the HTW injector pipe equal or exceed 1.5 times the cross-sectional area of the injector pipe.

2.18.3 Liquid Level Control Column

Provide the column fabricated as indicated of seamless steel pipe and standard welding fittings, using forged steel pipe weldolets for gauge glass piping connections and float switch connections.

2.19 AIR COMPRESSORS

Provide the air compressor units conforming to ASME PTC 10, with compressor speeds not to exceed 900 rpm and motor speed not to exceed 1750 rpm, except as specified otherwise.

2.19.1 Service Air Compressors

Provide the service air requirements as indicated with receivers sized as indicated. Provide units suitable for heavy-duty service (soot blowing), with simplex type compressors, single-stage, double-acting, with water-jacketed cylinder; fitted with intake and discharge valves of the lightweight feather, disc or plate type; and provided with all necessary controls, water-cooled aftercooler, moisture separator, drive, receiver, relief valves, and cooling water controls as indicated or required. Provide the compressor air intake with a low drop type air suction filter/silencer suitable for outdoor installation. Provide shell-and-tube type after cooler designed for air flow through the tubes with steel shell internal baffle plates and Admiralty metal tubes expanded into Muntz metal tube sheets. Provide moisture separator with an automatic water discharge...
trap and level gauge. Provide vertical type air receiver constructed in accordance with ASME BPVC SEC VIII D1 and equipped with flanged inlet and outlet connections, valved drain connection, 150 mm 6 inch dial pressure gauge, pop safety valves, and regulator connections. Provide cooling water controls for regulating compressor cylinder water temperature and after cooler water temperature of the thermostatic valve type and being installed with a three-valve bypass in the water outlet lines ahead of open sight drain funnels. Equip the compressor with adjustable, pressure type unloader controls suitable for continuous compressor operation.

### 2.19.2 Instrument Air Compressors

**NOTE:** The designer should determine if two redundant full size instrument air compressors will be required as loss of air will cause unit shutdown unless other provisions are made, such as crossties to the soot blower/service air system. Delete paragraph if not required.

Provide an electric motor-driven oil-free automatic air compressor unit and a refrigerating drying unit, with the air compressor capable of delivering at a pressure of [_____] kPa psig not less than 0.00472 cubic meter/sec 10 scfm dry air at an atmospheric dew point of -18 degrees C 10 degrees F with entering air at 35 degrees C 95 degrees F, saturated, and the air compressor unit sized to run not more than 60 percent of the time when all controls are in service. Provide the air compressor unit complete with all necessary accessories including automatic pressure control equipment, relief valves, check valves, air filters, moisture traps, and a receiver with ample capacity for emergency operation of the controls for 15 minutes after compressor shutdown. Provide a vertical constructed receiver in accordance with ASME BPVC SEC VIII D1, with relief valve and drain fittings. Provide a self-contained, refrigerated type air dryer, complete with refrigeration compressor, heat exchanger, automatic controls, and moisture removal trap or a regenerative desiccant type dryer, as required. Provide a hermetically-sealed type refrigeration unit capable of continuous operation at maximum load conditions.

### 2.20 PIPING

Unless otherwise specified herein, provide pipe and fittings conforming to the requirements of ASME B31.1.

#### 2.20.1 Pipe

Pipe material as specified in TABLE I, except fuel oil pipe material must comply with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

#### 2.20.2 Fittings

Pipe fittings as specified in TABLE II, except fuel oil fittings must comply with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

#### 2.20.3 Nipples

Nipples conforming to ASTM A733, Type I or II, as required to match adjacent piping.
2.20.4 Unions

Unions conforming to ASME B16.39, type as required to match adjacent piping.

2.20.5 Pipe Threads

Pipe threads conforming to ASME B1.20.2M/ASME B1.20.1, right- or left-hand tapered thread as required.

2.20.6 Pipe Expansion

2.20.6.1 Expansion Joints

Design expansion joints for a HTW working pressure not less than [_____] kPa psig and in accordance with applicable requirements of ASME B31.1 and EJMA Stds. Provide flanges for end connections. [Provide service outlets where indicated or required.] Provide Type II joints suitable for repacking under full line pressure.

2.20.6.2 Flexible Ball Joints

Construct flexible ball joints of [stainless steel] [carbon steel] or other alloys as appropriate for the service intended, complete with flanged joints or welded end as required and capable of absorbing the normal operating axial, lateral, or angular movements or combination thereof. Design and construct the ball-type joint in accordance with ASME B31.1 and ASME BPVC SEC VIII D1 where applicable. Conform flanges to the diameter and drilling of ASME B16.5. Provide molded gaskets suitable for the service intended.

2.20.7 Valves

Install valves at all indicated locations, where specified, and where required for proper functioning and servicing of the system. Provide motor-operated valves capable of closing speeds of 2.5 to 5.1 mm/sec 6 to 12 inches/minute, with motor operators equipped with position indicators, valve stem protectors above the motor operating units, and auxiliary handwheels for manual operation of the valves in the event of power failure, and motors suitable for operation on the electric current characteristics indicated.

2.20.7.1 Check Valves

**************************************************************************
**NOTE: The designer will indicate the type of valves, vertical lift or horizontal, on the drawings.**************************************************************************

a. Valves for Class 125 125 pound class steel piping conforming to the following:

   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 3 or 4, Class 125.

   (2) Sizes 80 mm 3 inches through 600 mm 24 inches, cast-iron: MSS SP-71, Type III or IV, Class 125.

b. Valves for Class 150 150 pound class steel piping conforming to the following:
(1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Class 150 minimum.

(2) Sizes 80 mm 3 inches through 600 mm 24 inches, steel: ASME B16.34, Class 150 minimum, flanged ends, swing disc.

c. Valves for Class 300 300 pound class steel piping conforming to the following:

(1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Class 300 minimum.

(2) Sizes 80 mm 3 inches through 600 mm 24 inches, steel: ASME B16.34, Class 300 minimum flanged ends, swing disc.

2.20.7.2 Gate Valves

Unless otherwise indicated or specified, gate valves used as shutoff valves at main headers and elsewhere, as indicated, provide chain-operated type with sufficient chain for easy operation from the operating floor or walkway for gate valves 200 mm 8 inches and larger provide a globe valve bypass. Provide wedge disc type gate valves with outside screw and yoke and bonnet bushings. Provide valve bodies with straight-through ports without recesses except between seats to assure minimum turbulence, erosion, and resistance to flow. Provide motor-operated gate valves installed in the HTW supply and return mains, where indicated, to isolate the distribution zones from the plant in case of a line break. Provide valves that close by a pressure switch operated by return main water pressure with Bourdon tube, actuated mercury switch type pressure switch and with an adjustable operating range of 345 to 2413 kPa 50 to 350 psi. Provide a three-position selector switch for automatic or manual operation of the valve position.

a. Valves for Class 125 125 pound class steel piping conforming to the following:

(1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1 or 2, Class 125.

(2) Sizes 80 mm 3 inches through 1200 mm 48 inches, cast-iron: MSS SP-70, Type I, Class 125, Design OT or OF (OS&Y), bronze trim.

b. Valves for Class 150 150 pound class steel piping conforming to the following:

(1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1 or 2, Class 150 minimum.

(2) Sizes 80 mm 3 inches through 610 mm 24 inches, steel: ASME B16.34, Class 150 minimum, flanged ends.

c. Valves for Class 300 300 pound class steel piping conforming to the following:

(1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1 or 2, Class 300 minimum.

(2) Sizes 80 mm 3 inches through 610 mm 24 inches, steel: ASME B16.34,
Class 300 minimum, flanged ends.

2.20.7.3 Globe Valves and Angle Valves

Provide globe type valves having outside screw and yoke with bolted bonnets, stainless steel trim, and flat seats, and large and deep boxes, but not the reversed cup type. Install valves with the stem horizontal or above. Provide a distribution system bypass motor-operated globe-valved piping connection between the supply and return mains, where required, installed to ensure uninterrupted water flow to the HTW generator in case of low return pressure. While in operation, valve must modulate to the open position on low return main pressure signal. Provide a three position selector switch for automatic or manual selection of valve position. Install for each distribution zone, a manually-operated handwheel or chainwheel globe valve in each high temperature return main to control the flow and the resultant differential temperature drop through each system.

a. Valves for Class 125 125 pound class steel piping conforming to the following:
   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1, 2, or 3, Class 125.
   (2) Sizes 80 mm 3 inches through 300 mm 12 inches, cast-iron: MSS SP-85, Type III and Type IV, Class 125.

b. Valves for Class 150 150 pound class steel piping conforming to the following:
   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1, 2, or 3, Class 150 minimum.
   (2) Sizes 80 mm 3 inches through 610 mm 24 inches, steel: ASME B16.34, Class 150 minimum, flanged ends.

c. Valves for Class 300 300 pound class steel piping conforming to the following:
   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1, 2, or 3, Class 300 minimum.
   (2) Sizes 80 mm 3 inches through 610 mm 24 inches, steel: ASME B16.34, Class 300 minimum, flanged ends.

2.20.7.4 Thermostatic Regulating Valve

2.20.7.4.1 Cooling Water Control Valves

Install a thermostatically-operated flow control valve in the cooling water piping from each HTW circulating pump, each air compressor, and each aftercooler to control the flow of the cooling water automatically, to prevent the waste of water, and provide proper operating temperature for the bearings. Provide a valve matching the piping size to which it is connected, suitable for operation on 1,034 kPa 150 psi water pressure, with threaded ends, and direct-acting to open on temperature increase. Provide the valve body to have a 3.2 mm 1/8 inch hole drilled through the wall separating the inlet and outlet ports so that water circulation is not completely shut off. Provide the valve with a nonmetallic disc and means for preventing the water from coming in contact with the range spring and
sliding parts, with a manual adjustment of the setting of 29 to 51 degrees C | 85 to 125 degrees F and factory set for 38 degrees C 100 degrees F.
Provide a temperature bulb for closed tank immersion with 13 mm 1/2 inch NPT connector.

2.20.7.4.2 Makeup Water Heater Control Valve

Install a temperature controller in the high temperature return water line from the feedwater heater coil. Provide a motor-operated valve and operate in conjunction with the remote bulb temperature controller, with both valve and controller the reverse-acting type failing in the closed position. Provide the normal operating range fully open at 79 degrees C 175 degrees F and fully closed at 100 degrees C 210 degrees F feedwater temperature with the controller modulating the flow between these points. Provide a valve with a cast steel body, stainless steel trim, and lubricated deep-type stuffing box with packing suitable for the conditions, and with the valve disc top-and-bottom guided of the equal percentage type. Provide a single seated valve for tight closing, [_____] mm inch body size, flanged, passing [_____] kg/sec pounds/hour of HTW at a maximum pressure drop of 15 m 50 foot head.

2.20.7.4.3 LTW Heater Control Valve

Install a thermostatic control valve to operate in conjunction with a remote bulb temperature controller with the valve operating range of 93 to 110 degrees C 200 to 225 degrees F and with valve modulating the flow of HTW to maintain LTW between these temperatures. Provide valve with a cast steel body with stainless steel trim, and lubricated deep-type stuffing box with packing suitable for the temperature and pressure conditions and be single-seated, [_____] body size, to pass [_____] kg/sec pounds/hour of HTW at a maximum pressure drop of 15 m 50 foot head. Provide the temperature bulb for pipeline insertion with 19 mm 3/4 inch NPT connector with all necessary appurtenances including bypass valve and combination temperature-pressure relief valve.

2.20.7.4.4 Domestic Water Heater Control Valve

Install a thermostatic control valve to operate in conjunction with a remote bulb temperature controller with the valve operating range of 38 to 70 degrees C 100 to 160 degrees F, adjustable and modulating the flow of HTW to the heater between these temperatures. Provide valve with a cast steel body with stainless steel trim and lubricated deep-type stuffing box with packing suitable for the temperature and pressure conditions, and be single-seated, [_____] body to pass [_____] kg/sec pounds/hour of HTW at a maximum pressure drop of 15 m 50 foot head. Provide temperature bulb for pipeline insertion with 19 mm 3/4 inch NPT connector with all necessary appurtenances including bypass valve, strainer, and combination temperature-pressure relief valve.

2.20.8 Back Pressure Relief Valves

Provide back pressure relief valves with steel bodies and equipped with corrosion resistant trim and valve seats, which are guided and provide positive closing so that no leakage can result, with adjustment of the desired back pressure covering the range between 13 to 70 kPa 2 to 10 psig. Provide external adjustment with adjustable stuffing boxes having renewable packing for any shafts extending through the valve body.
2.20.9 Exhaust Heads

Provide exhaust heads for the discharge of flash steam to atmosphere, constructed of one-piece steel plate, semisteel, or cast-iron with suitable baffle arrangement for the removal of entrained condensate and oil, and with drain connection, and with flow area through unit being larger than connecting pipe.

2.20.10 Strainers

Provide strainer body connections of the same size as the pipelines in which the connections are installed. Provide heavy and durable cast steel strainer bodies that have arrows clearly cast on the sides to indicate the direction of flow. Equip each strainer with an easily removable cover and sediment basket, with the basket not less than 0.063 mm 0.0025 inch thick stainless steel, with enough small perforations to provide a net free area through the basket of at least 3.30 times that of the entering pipe, and with the flow into the basket and out through the perforations.

2.20.11 Pipe Hangers, Inserts, and Supports

Pipe hangers, inserts, and supports conforming to MSS SP-58, except as modified herein.

2.20.11.1 Types 5, 12, and 26

Do not use Types 5, 12, and 26.

2.20.11.2 Type 3

Do not use Type 3 on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe and if the clamp bottom does not extend through the insulation and the top clamp attachment does not contact the insulation during pipe movement.

2.20.11.3 Type 18

Secure Type 18 inserts to concrete forms before concrete is placed. Continuous inserts which allow more adjustment may be used if they otherwise meet the requirements for Type 18 inserts.

2.20.11.4 Types 19 and 23

Torque Types 19 and 23 C-clamps in accordance with MSS SP-58 and have both locknuts and retaining devices furnished by the manufacturer. Field-fabricated C-clamp bodies or retaining devices are not acceptable.

2.20.11.5 Type 20

Provide Type 20 attachments used on angles and channels with an added malleable-iron heel plate or adapter.

2.20.11.6 Type 24

Type 24 may be used only on trapeze hanger systems or on fabricated frames.
2.20.11.7 Type 39 Saddle or Type 40 Shield

Where Type 39 saddle or Type 40 shield is permitted for a particular pipe attachment application, use the Type 39 saddle on all pipe 100 mm 4 inches and larger.

2.20.11.8 Horizontal Pipe Supports

Space horizontal pipe supports as specified in MSS SP-58 and install a support not over 300 mm 1 foot from the pipe fitting joint at each changes in direction of the piping. Do not space pipe support over 1.5 m 5 feet apart at valves. In the support of multiple pipe runs on a common base member, use a clip or clamp where each pipe crosses the base support member. For spacing of the base support members, do not exceed the hanger and support spacing required for any of the individual pipes in the multiple pipe run. Rigidly connect the clips or clamps to the common base member. Provide a clearance of 3 mm 1/8 inch between the pipe and clip or clamp for all piping which may be subjected to thermal expansion.

2.20.11.9 Vertical Pipe Supports

Support vertical pipe at each floor, except at slab-on-grade, and at intervals of not more than 4.5 m 15 feet not more than 2.4 m 8 feet from end of risers, and at vent terminations.

2.20.11.10 Type 35 Guides with Slides

Provide Type 35 guides of steel, reinforced polytetrafluoroethylene (PTFE) or graphite slides, where required, to allow longitudinal pipe movement. Provide lateral restraints as required. Use slide materials suitable for the system operating temperatures, atmospheric conditions, and bearing loads encountered.

a. Where steel slides do not require provisions for restraint of lateral movement, an alternate guide method may be used. On piping 100 mm 4 inches and larger, a Type 39 saddle may be welded to the pipe and freely rest on a steel plate. On piping under 100 mm 4 inches, a Type 40 protection shield may be attached to the pipe or insulation and freely rest on a steel slide plate.

b. Where there are high system temperatures and welding to piping is not desirable, then include a pipe cradle with, welded to the guide structure and strapped securely to the pipe. Separate the pipe from the slide material by at least 100 mm 4 inches, or by an amount adequate for the insulation, whichever is greater.

2.20.11.11 Pipe Hangers on Horizontal Insulated Pipes

Size pipe hangers on horizontal insulated pipes, except Type 3, based on the outside diameter of the insulation.

2.20.11.12 Piping in Trenches

**************************************************************************
NOTE: Detail of piping supported in trenches will be shown on the drawings.
**************************************************************************

Support piping in trenches as indicated.
2.21 INSULATION

Shop and field applied insulation as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.22 TOOLS

Furnish special tools and all uncommon tools necessary for the operation and maintenance of boilers, stokers, pumps, fans, controls, meters, special piping systems, and other equipment. Provide a cabinet for small hand tools, mounted where directed.

2.22.1 Smoke Pipe Cleaner

Provide jointed handle cleaner of sufficient length to clean breeching and smoke connections without dismantling.

2.22.2 Firing Tools

Provide firing tools including hoe, poker, and slice bar for each boiler.

2.22.3 Wrenches and Gaskets

Provide wrenches as required for opening boiler manholes, handholes, and cleanouts. Also provide one set of extra gaskets, packaged and identified, for boiler manholes and handholes, for pump barrels, and other similar items of equipment.

2.23 FUEL OIL TANKS

2.23.1 Fuel-Oil Storage Tanks

Provide in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.23.2 Hot-Water Coil

Provide coil constructed of 25 mm 1 inch seamless steel tubing in each tank for No. 6 fuel oil and install around the suction end of the oil line. Provide coil in each tank with the capacity to heat from [_____] to [_____] degrees C degrees F the maximum demand of all oil burners connected to the tank when supplied at 115 degrees C 240 degrees F. Provide heater with automatic temperature-control valve, with strainer and three-valve by-pass in heated water supply line, and with check valve and cutoff valve in return line. Provide an additional manhole located above the heater for removal of the heater as a unit.

2.23.3 Tank Accessories

Provide accessories in compliance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.24 COAL HANDLING EQUIPMENT

2.24.1 Screw Conveyor

**************************************************************************

NOTE: Where motor starters for mechanical equipment

**************************************************************************
provide screw conveyor for the lateral distribution of coal, consisting of steel screw conveyor with capacity of not less than [_____] cubic meters/sec cubic feet/hour when handling coal of the specified maximum lump size. Base the maximum capacity of the conveyor on the screws carrying not more than 30 percent of their cross section (except feeder conveyors), and the maximum speed of conveyor at 60 rpm. Assemble conveyor and housing in sections, with the sectional flights mounted on steel pipe and connected by coupling shafts. A feeder conveyor may be installed to assume the proper distribution of the load. Mount both the feeder screw and the extended screw flights on the same pipe. Provide conveyor with sectional supporting hanger bearings of the babbitted type. Do not exceed 3.6 m 12 feet conveyor length between bearings. Provide trough ends fabricated of cast-iron type with feet and fitted with babbitted bearings, with the drive located at the discharge end of the conveyor, and consisting of an electric gear motor and chain drive. Provide the chain drive from the motor to the reducer enclosed in an oil-tight casing. Absorb the thrust in either direction by the thrust bearings. The motor may be mounted on top of the trough. Provide a dust-proof trough conveyor housing of not less than 4.8 mm 3/16 inch steel with a 1.897 mm (14 gauge) 14 gauge steel cover. Provide discharge spout and coal gate as indicated. Also provide an approved type of supporting saddle. Space supports at not more than 3 m 10 foot intervals. Provide [totally enclosed, nonventilated] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in conformance with NFPA 70 motor enclosure. [Provide [manual] [[magnetic] [across-the-line] [reduced voltage start]] type motor starter with [weather-resistant] [dust-tight] [explosion-proof] enclosure.] Provide dust controlling covers and inlet and discharge enclosures for each conveyor.

2.24.2 Belt Conveyor

Provide belt trough type conveyor, as indicated, with the belt conveyor on a maximum incline not exceeding 15 degrees. Provide conveyor support frame of sufficient rigidity to maintain belt alignment, at least 75 mm 3 inches clearance to prevent damage to the edge of the belt on its return run, and adjustments for aligning shafts. Provide decking placed on top of the stringers to protect the return belt from coal sifting and to provide lateral stiffness. Provide idlers as a rigid framework that maintains permanent alignment of well-balanced, smooth-running, easy turning idler rolls in accordance with CEMA Belt Book. Pressure lubricate ball or roller bearings. Provide 20-degree or 35-degree three-roll type idlers spaced on 1200 mm 4 foot centers, except under loading points and skirts. Space return idlers on 3 m 10 foot centers. Provide Grade 2 belting with field-vulcanized splices as defined in RMA Conveyor and Elevator Belt Technical Information. Design pulleys in accordance with CEMA B105.1, constructed of heavy welded steel, true to diameter and accurately bored, key seated and tightly fitted to the shafts. Provide pulley face width for belts 1.1 m 42 inches wide and smaller, that are 150 m 500 feet or more in length, to belt width plus 100 mm 4 inches; less than 150 m 500 feet in
length, to belt width plus 75 mm 3 inches. Pulley face width for belts 1200 mm 48 inches and larger must be belt width plus 150 mm 6 inches. Provide drive pulleys with 19 mm 3/4 inch thick vulcanized and grooved lagging. Provide snub pulleys with 9.5 mm 3/8 inch vulcanized smooth lagging. Support all conveyor pulley shaft assemblies by two heavy-duty antifriction bearings having a minimum life expectancy of 50,000 hours for 90 percent of bearings in accordance with ABMA 11 for roller bearings. The pulley diameter must be sufficiently large to meet the requirements of the duck weight and ply of the belt to permit flexing of the belt around the pulley circumference without damaging the belt or shortening the belt life. Drive the conveyor by a [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in Class II, Division 1, Group F hazardous location in conformance with NFPA 70] electric motor connected to a drive-shaft-mounted speed reducer unit by a [roller chain drive] [V-belt drive] [flexible coupling]. [Provide [manual] [magnetic] [across-the-line] [reduced voltage start]] type motor starter with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.] Provide belt conveyors with belt misalignment switches, emergency stop pull cords and pull switches, galvanized expanded metal shields over tail pulley, zero speed switches, loading skirts, plugged chute switches, walkways, supports, belt takeups, belt cleaners, skirt boards, and pulley scrapers. Provide dust controlling covers and inlet and discharge enclosures for each conveyor.

2.24.3 Flight Conveyor

**************************************************************************
**NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.**************************************************************************

Provide [scraper] [shoe-suspended] flight conveyor arranged generally as indicated and of the single-strand type having capacity not less than [_____] metric tons/hour tons/hour when handling coal with approximate weight of 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches diameter. Base the capacity on a maximum speed of 508 mm/sec 100 fpm with conveyor operating up a [_____] degree incline. Provide drop-forged steel type chain with flights made of either steel or malleable-iron, spaced at least three times the largest lump size. Protect foot shaft screw takeup with adjustment of not less than 300 mm 12 inches. Make trough of 4.8 mm 3/16 inch steel plate, minimum. Line all sliding surfaces in contact with the chain or flights with 19 mm 3/4 inch thick, removable, ultra high molecular weight polyethylene liners. Provide each side of trough with a warning sign, visible on each floor level and at frequent intervals; "DANGER - DO NOT WELD - FLAMMABLE PLASTIC LINER."

Provide conveyor with discharge openings as indicated, each of which provided with rack-and-pinion-operated gates with handwheels. Provide motor to drive conveyor through a speed reduction unit which is either direct-connected or roller-chain-connected to the drive shaft. Provide [totally enclosed, nonventilated type motor] [totally enclosed, fan-cooled type motor] [totally enclosed, fan-cooled type motor suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Provide [manual] [magnetic] [across-the-line] [reduced voltage start]] motor starter type with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.] Construct conveyor frame essentially as indicated, with additional bracing as required for rigidity, and with dust controlling
covers and inlet and discharge enclosures.

2.24.4 Bucket Elevators

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

Provide dust tight vertical bucket elevators complete with continuous chain and attached buckets, upper and lower sprockets, gears, shafts, bearings, casing with flanged connections including top hood and discharge spout, bottom boot, access doors, electric motor drive, and all accessories. Provide [vertical spaced centrifugal discharge] [positive discharge] [continuous bucket type] bucket elevators with capacity of not less than [_____] metric tons/hour tons/hour when handling coal weighing approximately 800 kg/cubic meter 50 pcf, and with linear velocity as indicated below:

<table>
<thead>
<tr>
<th>Type of Bucket Elevator</th>
<th>Linear Velocity (meters per second) (feet per minute)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Centrifugal discharge</td>
<td>1.1–1.6 225–305</td>
</tr>
<tr>
<td>Continuous bucket</td>
<td>0.51–0.69 100–135</td>
</tr>
<tr>
<td>Positive discharge</td>
<td>0.61 120 Max</td>
</tr>
</tbody>
</table>

Construct the head shaft and foot shaft of cold-rolled steel with the shaft diameters in accordance with manufacturer's standards, and with both shafts mounted in roller bearings with forced-type lubricating fittings. Provide screw takeup with adjustment of not less than 229 mm 9 inches for the foot shaft. Install an automatic backstop on the head shaft to prevent any backward motion of the chain. Provide boot plates [loading legs of continuous bucket elevator,] and bottom plate of stub discharge chute a minimum of 4.8 mm 3/16 inch thick steel, and other flat casing members a minimum of 2.657 mm (12 gauge) 12 gauge thick steel. Provide corner angles and stiffeners to make the elevator self-supporting. In addition, tie the elevator to the adjoining structure at close enough spacing to increase the rigidity of the elevator. Provide the boot section with clean-out doors, as well as front and back removable panels. Also provide an inspection door in the intermediate section at operating level large enough to remove a bucket from either run of the chain. Drive the elevator by an electric motor installed in a housing at the top of the flight. Provide [totally enclosed, nonventilated motors] [totally enclosed, fan-cooled type motors] suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70. [Provide [manual] [magnetic] [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [weather resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.] Install a platform and a compliant safety access ladder adjacent to the motor for servicing the motor and equipment mounted in the hood. Locate controls for the operation of the elevator as indicated. Provide dust control covers and inlet and discharge enclosures for each conveyor.

2.24.5 Vibrating Conveyor

**************************************************************************
NOTE: Where motor starters for mechanical equipment
**************************************************************************
Provide electric-motor driven, mechanical vibrating type vibrating conveyor with a capacity of [_____] metric tons/hour when handling coal weighing approximately 800 kg/cubic meters 50 pcf, with maximum lump size of [_____] mm inches in diameter, and with conveying length as indicated. Fabricate the conveyor trough of [_____] mm gauge steel, [_____] mm inches in width and [_____] mm inches deep [and provided with dust-tight cover]. Provide conveyor pans of 9.5 mm 3/8 inch thick, Type 304L solid stainless steel plate. Mount the trough on vibrator bars, torsion bars, or coil springs attached to yoker legs of rigid cross brace construction and fabricated of corrosion-resistant material with hardened steel encased rubber bushings at articulation points. Fabricate the base of steel channels or angles bolted directly to [building support] [concrete foundations]. Drive through an eccentric shaft supported by a double row of self-aligning ball-or roller-bearing pillow blocks. Impart positive action motion to the trough by a cast steel connecting rod attached to the trough by rubber-bushed wristpin and securely locked by taper lock bushings. Provide [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type suitable for installation in Class II, Division 1, Group F hazardous location in accordance with NFPA 70] electric motor connected to the eccentric shaft by V-belt drive. [Provide [manual] [[magnetic] [across-the-line] [reduced voltage start]] type motor starter with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.

2.24.6 Gravimetric Weigh Feeder

Provide metering belt type weigh feeder device designed to operate at a variable rate ranging from 10 percent of maximum capacity to [_____] metric tons/hour with an automatic flow rate. Provide a silicon-controlled, rectifier dc drive to automatically adjust the belt speed to maintain the rate of material flow, as set on the controller. The weight feeders conforming to or exceeding the requirements of NIST HB 44, [Southern] [Eastern] [Western] Weighing and Inspection Bureau. Provide the weigh feeders with an accuracy of 1/2 of 1 percent of flow rates over their total variable rated capacity. Provide the feeder with a flexible boot for connecting the gate to the feeder inlet chute which, in turn, is flared to produce a feed opening tapering from [_____] wide to [_____] wide with the direction of flow of material. The belts for feeders conforming to the RMA IP-1, fire-resistant type conforming to the standards of 30 CFR 1 Schedule 28, Part 34 of the MSHA. Provide top belt cover thickness of 6 mm 1/4 inch with bottom cover 3 mm 1/8 inch thick. Provide belt edges with a minimum 25 mm 1 inch flanges and sealed by carrying the cover around the carcass edges during manufacture. Provide cover and skim coat material comparable to those meeting the requirements of RMA IP-1, Grade 2 for impact and abrasion resistance. Provide the weight sensor constructed of heavy-duty, industrial, electronic force transducer flexure-mounted to the force collection system. Provide remote indicating meter and a six-digit totalizing counter located, installed, and connected in the boiler control panel. Provide unit frame of rigid support for the material load, belt, and idlers. Shop assemble the unit complete with drive and all appurtenances, being dust-tight in operation.

2.24.7 Track Hoppers

Provide standard double hopper design with a belt or vibrating-type feeder
as indicated, having a capacity of approximately [_____] metric tons tons and constructed of not less than 9.5 mm 3/8 inch thick, Type 304L stainless steel plates, with slopes of not less than 55 degrees and stiffened with angles. The hoppers may also be of ASTM A36/A36M mild steel, minimum 6 mm 1/4 inch thick with replaceable liners 6 mm 1/4 inch thick, ASTM A167, Type 304L, stainless steel. Provide flat heads on all rivets and field bolts inside the hopper. Suspend the hopper from the track girders by heavy bolts and cast washers, or carry the sides to the bottom of the track and support by flanges fastened to concrete ledge continuously around the hopper with the concrete forming the top portion of hopper sides. Provide track girders consisting of wide flange beams conforming to AREMA Eng Man for loading plus impact, complete with bearing plates, WF cross struts, and rail clips. Fit the top of hopper with sections of grating made with steel bars sized [_____] by [_____] mm inches, and cross rods [_____] mm inches in diameter, to form openings [_____] mm inches square.

2.24.7.1 Rack-and-Pinion Gate

Provide a self-cleaning type rack-and-pinion gate at each hopper outlet. Provide [hand] [motor]-operated sliding plate of 9.5 mm 3/8 inch thick carbon steel, formed into the shape of a winged U with the gate plate surface completely protected by an overlapping liner of 3 mm 1/8 inch thick, ASTM A167, Type 304L stainless steel. Use 4.8 mm 3/16 inch thick ASTM A167, Type 304L stainless steel where in contact with coal flow for gate body material, except for the dust cover.

2.24.7.2 Vibrating or Belt Feeders

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

provide vibrating or belt feeders of manufacturer's standard design for the service required. Provide [totally enclosed, nonventilated] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70] motor. [Provide [manual] [magnetic] [across-the-line] [reduced voltage start] type motor starters with [weather-resistant] [dust-tight] [explosion-proof] enclosure.]

2.24.8 Truck Hoppers

Provide standard double hopper design with a belt or vibrating type feeder as indicated having the capacity of approximately [_____] metric tons tons and constructed of 9.5 mm 3/8 inch thick Type 304L stainless steel plates, minimum, with slopes of at least 55 degrees, and stiffened with 6.4 mm 1/4 inch angles, minimum. The hopper may also be of ASTM A36/A36M mild steel, minimum 6.4 mm 1/4 inch thick with replaceable liners 6.4 mm 1/4 inch thick, ASTM A167, Type 304L stainless steel. Use flat head type rivets and field bolts inside the hopper. Support the hopper by a flange fastened to the concrete ledge continuously around the hopper, with the concrete forming the top portion of hopper sides. Fit the top of hopper with section of bar grating made with [_____] by [_____] mm inch mild steel bars and [_____] mm inch diameter cross rods to form openings [_____] mm inches square. Provide a supporting beam not less than [_____] mm inches deep, [_____] kg/meter pounds/foot, in a wide flange member, under the grating.
2.24.8.1 Rack-and-Pinion Gate

Provide a self-cleaning type rack-and-pinion gate at each hopper outlet. Provide a [hand] [motor]-operated sliding plate of 9.5 mm 3/8 inch thick carbon steel, formed into the shape of a winged U with the gate plate surface completely protected by an overlapping liner of 3.2 mm 1/8 inch thick, ASTM A167, Type 304L stainless steel. Provide the gate body material, except for the dust cover, of 4.8 mm 3/16 inch thick ASTM A167, Type 304L stainless steel where in contact with coal flow.

2.24.8.2 Vibrating or Belt Feeders

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

Provide vibrating or belt feeders complete with control of manufacturer's standard design for the service required. Provide [totally enclosed, nonventilated] [totally enclosed, fan-cooled] [totally enclosed, fan-cooled type, suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70] motors. [Provide [manual] [[magnetic] [across-the-line] [reduced voltage start]] type motor starter with [weather-resistant] [dust-tight] [explosion-proof] enclosure.]

2.24.9 Vibrator

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

Provide electromagnetic type vibrator with variable power control that produces mechanical pulsating motion, with the net weight of the vibrator [___] kg pounds and power input [___] watts, [___] amperes at [___] volts ac, and provide 3600 vibrations per minute or 7200 vibrations for heavy duty applications. Provide semi noiseless vibrator with mounting plates for welding to hoppers as indicated, each complete with an eye bolt for attaching a safety chain. Provide vibrator electric control suitable for separate wall mounting complete with an electronic valve for changing alternating current to mechanical pulsating waves and a dial switch or rheostat to vary the power of vibration. Provide vibrators with Division I, Class II, Group F rating in the areas where coal dust is present, in accordance with NFPA 70.

2.24.10 Car Heaters

**************************************************************************
NOTE: The designer will determine if electrical facilities are sufficient to provide the power requirements of electric car heaters or if gas-fired heaters must be used. The designer will determine if the location and climatic conditions will require sidecar panels or undercar heaters, or a combination of both types of heaters.
**************************************************************************
2.24.10.1  Gas-Fired Heaters

Provide infrared radiant type gas-fired heaters located between rails and along the walls of the shed with heater input capacity of approximately 90 kW (300,000 Btuh). Provide perforated, heavy-gauge stainless steel cover for the heater, that is not affected by water or coal falling from the car, with windproof burner pilot, main gas solenoid valve, safety switch to interrupt gas supply to burner if pilot is not burning, furnished with manual cutoff valves and pressure regulator, with electric blower for furnishing combustion air to the burner, and with all other controls and accessories as recommended by the heater manufacturer for a complete installation, in compliance with ANSI Z83.19/CSA 2.35 and UL 795.

2.24.10.2  Electric Infrared Radiant Heaters

Provide electric infrared radiant heaters as weatherproof car thawing equipment, with radiating surfaces of alloy tubing enclosing electrically insulated conductors, designed for hazardous area locations. Provide equipment in modular lengths suitable for both 45 and 90 metric tons (50 and 100 ton) capacity cars and designed for not requiring [manual] [automatic] disconnection of units during thawing operations. Provide heaters for sidecar or undercar heating banks, or both, capable of operating as independent units designed for maintaining a balanced three-phase distribution system with heating conductor units, including factory assembled connections for attachment to water-tight terminal boxes, supported on corrosion-resistant metal framing and having rust-resistant steel reflectors with an approved coating. Provide heaters connections wired using NEMA 4 enclosures, in accordance with NEMA ICS 1, suitable for cleaning by hosing down with water.

2.24.11  Coal Spouts, Chutes, Inlet Boxes, and Outlet Hoppers

Construct coal spouts, chutes, inlet boxes, and outlet hoppers of ASTM A36/A36M steel members not lighter than 3.416 mm (10 gauge) 10 gauge, adequately reinforced and braced with angle frames, and with all joints dust tight. Slope as steep as possible, but not less than 55 degrees off horizontal. Provide stainless steel or ultra-high molecular weight polyethylene (UHMWP) liners. If UHMWP liners are used, provide each side of chute at each floor level with a warning sign "DANGER - DO NOT WELD - FLAMMABLE PLASTIC LINER." Provide impact liners. Provide access openings and inspection openings with cover plates as indicated and required. [Provide silo frames constructed of heavy channel frames the full size of the silo opening and with concealed steam pipe and coil around opening.] [Provide outlet hoppers with rack-and-pinion type gates and lined with austenitic stainless steel [_____] mm inches thick, conforming to ASTM A167, Type 304L]. Use rack-and-pinion type gates for track hoppers.

2.24.12  Car Spotter

Provide electric-motor driven car spotter having a capstan mounted vertically on a rigid housing that completely encloses the gears, including helical gears and worm gear; fabricate the helical gears of high grade steel accurately finished and splash-lubricated, and fabricate the worm gear of bronze. Mount all of the mechanism on a steel base rigidly welded to maintain alignment. Provide the unit coupled to, and driven by, a separate, [_____] W hp, totally enclosed, nonventilated, hoist-type motor with a full-load speed of 1720 rpm. Provide roller-chain flexible type coupling enclosed in a revolving casing and protected by a heavy steel guard. Provide a unit with a starting pull of 23 kN 5000 pounds, a running
pull of 11 kN 2500 pounds, and an average rope speed not in excess of 230 mm/sec 45 fpm, complete with [_____] m feet of [32 mm 1-1/4 inch diameter manila rope with a breaking strength of 60 kN 13,500 pounds, minimum,] [19 mm 3/4 inch diameter marline-covered standard steel wire rope with a breaking strength of 170 kN 37,600 pounds, minimum,] and a steel car pulling hook with an allowable rope pull of 45 kN 10,000 pounds, so fabricated as to be readily attachable to, and removable from, the car frames.

2.24.13 Coal Bunkers

Provide suspension coal bunkers of size and capacity indicated, constructed of ASTM A36/A36M steel plate, reinforced and braced as required, and installed dust-tight, of a design optimized for coal flow, not susceptible to rat-holing or hangups. Provide cylindrical or silo type bunkers to reduce stagnation for each boiler, each with conical discharge hoppers and slopes not less than 70 degrees, with the outlet cone manufactured of, or lined with, ASTM A167, Type 304L stainless steel. Provide rack and pinion type coal shutoff valves, self-cleaning, and dust tight for bunkers. Use corrosion resistant steel for valve materials exposed to flowing coal. Provide an emergency diverter for emptying the bunker.

2.24.14 Coal Storage Silos

2.24.14.1 Silo Walls

Silo walls may be slip-formed, cast-in-place reinforced concrete, precast concrete, or other approved construction materials. Use concrete having a 28-day compressive strength in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Provide silo roof of reinforced concrete complete with 600 mm 24 inch square, weatherproof, hinged access door, and handrail and steel toe-board all around roof of the silo. Provide live storage shelf for the silo of reinforced concrete sloped not less than 60 degrees from horizontal and supported by steel beams corbelled from the inside walls of the silo. Provide live storage outlet hopper to chute and feeders constructed of not lighter than 9.5 mm 3/8 inch steel with a silo reserve storage floor constructed of reinforced concrete, sloped not less than 60 degrees and laid on well-tamped fill material. Provide reclaim outlet hopper to the chute feeding the flight feeder constructed of not lighter than 9.5 mm 3/8 inch steel.

2.24.14.2 Concrete Stave Silo

Finish the interior finish with a three-coat concrete parget, consisting of a brush coat, scratch coat, and a finish trowel coat applied, one after the other, to produce a smooth monolithic finish. Work the parget into the vertical and horizontal grooves to permanently interlock the concrete staves.

2.24.14.3 Exteriors of Stave And Concrete Silos

Cover the exteriors of stave and concrete silos with a brush coat of gray cement applied over all hoops, lugs, and staves to produce a homogeneous finish.

2.24.14.4 High- and Low-Level Switch

Mount a normal high-level and emergency high-level control switch at the top of the silo to shut off the feeding system when the silo is full of
coal. Provide a low-level switch at the low level of the silo's live storage shelf, as indicated, to signal by light that coal is at a low level in the live storage compartment and also provide switches near the bottom of the silo, as indicated, to signal by light that coal is at a low level in the reserve storage compartment. Provide switches for Class II, Division 1, Group F hazardous location in accordance with NFPA 70.

2.24.15 Coal Crusher

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.

Select the appropriate type of crusher, based on the throughput requirements and an economic analysis.
**************************************************************************

Provide [roll crusher] [hammermill] coal crusher for maximum lump size of [_____] mm inches with a minimum capacity of [_____] metric tons/hour tons/hour when handling average size bituminous coal. Provide a heavy-duty cast or welded heavy steel plate housing with the interior of the housing fitted with replaceable liners, constructed of abrasion resistant steel. Provide replaceable breaker plate, grates, rolling rings, swing hammers, and other parts of the unit subject to excessive wearing. Fit the crusher with provisions to trap and reject hard foreign objects without damaging the crusher. Provide shafts constructed of forged, heat-treated alloy steel with bearings mounted in dust-tight housings. Provide [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70] motor. Provide [manual] [magnetic] [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.

2.24.16 Vibrating Feeders

Provide [electro-magnetic] [electro-mechanical] [single input (Brute Force)] type vibrating feeders with a capacity of 0 to [_____] metric tons/hour tons/hour when handling coal weighing approximately 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches in diameter, and fitted with replaceable feeder pans and skirts [6.4] [9.5] [12.7] mm [1/4] [3/8] [1/2] inch thick, Type 304 solid stainless steel plate without liners. Fabricate the feeder pan to [_____] mm inches in width, [_____] mm inches in length, and [_____] mm inches deep. Provide dust control covers of 3.416 mm (No. 10 gauge) No. 10 gauge thick steel for each unit. Provide [two] [four] rectangular poke holes ([one] [two] each side) with 6.4 mm 1/4 inch thick Type 304L stainless steel sliding covers. Fabricate all feeder parts coming in contact with coal of, or lined with, Type 304 stainless steel. All feeders must automatically compensate for material headloads and weight effect to maintain a constant feed and must not damper out when operating under full silos or bins. Do not exceed 10 degrees slope on pan. Provide the vibratory feeders with [foot] [suspension] mounted supports. Provide suspended feeders with safety cables with their drives located [above] [below] trough. Provide [totally enclosed, nonventilated type motors] [totally enclosed, fan-cooled type motors suitable for installation in Class II, Division I, Group F hazardous location in accordance with NFPA 70].
2.24.17 Tripper

Provide the tripper of steel construction, motor propelled, automatically reversible, or manually controlled; equipped with antifriction bearings throughout, rolled or forged steel wheels, hand-operated rail clamps for optional operation in a fixed location, scraper, and crossover walk with handrail and with the traversing speed not exceeding 127 mm/second 25 fpm, and include a motor brake. Provide the chute one way toward the center of the silo sloping at not less than 55 degrees. Provide a plow type seal with all necessary components for installation to suit the bunker/silo slot. Provide the tripper with [_____] W hp motor, all reversing and end travel limit switches, cable reel, and 14 No. 12 AWG conductor cable (13 slip rings) and supports for the starter, with two push-button stations mounted, one on each side of the tripper. Provide both stations with forward-reverse and tripper stop-run push buttons. Provide the conveyor frame with a ladder type cable tray to contain the cable from the reel. Mount reversing switches on the tripper and actuate by track dogs to permit reversal of the tripper over each extreme silo. Mount limit switches on the tripper to operate immediately beyond both extreme limits of tripper reversal. Provide a plugged chute switch. Provide all tripper controls, including limit switches and reversing switches, in explosion-proof enclosures approved for Class II, Division 1, Group F service, in accordance with NFPA 70. Include pulley assemblies, shafts, bearings, carrying and return idlers, tripper framing and supports.

2.24.18 Trackmobile

Provide trackmobile with a [_____] liter cubic inch industrial gasoline engine for moving/switching [_____] rail cars on the track and hauling carts and other portable vehicles while traveling on its road wheels. Design the trackmobile to ride on [_____] mm inch gauge track with heat treated, cast steel, rail wheels keyed on tapered axles, and solidly mounted suspension system. Provide heavy duty, [_____] ply, [_____] by [_____] tires, roller-bearing mounted road wheels, with retractable suspension. Provide heavy-duty, cast steel coupler, remotely controlled from cab. Do not exceed maximum speed on rail of (km/hour) (mph) low [____:], high [____:]; on road, low [____:], high [____:]. The trackmobile must be able to operate on a maximum grade of [____:] percent and minimum curve of [____:] foot radius and be equipped with [air brakes] [self-energizing drum and shoe type, hydraulic service], cab heater and defroster, sanders, [electric horn] [air horn] strobe light, front and rear lights, back-up alarm, [enclosed cab] [open cab] with windshield wipers [,radio remote control,] and power steering.

2.24.19 En-Masse Chain Conveyors

These conveyors move materials horizontally and/or vertically, with multiple discharge points and in a dust-tight and completely enclosed unit. Provide conveyors at length indicated but do not exceed 75 m 250 feet, and capacity of [____:] metric tons/hour tons/hour when handling coal with approximate weight of 800 kg/cubic meter 50 pcf and with maximum lump size of [____:] mm inches diameter. Base the maximum capacity on a chain speed not to exceed 800 mm/sec 160 fpm. Provide a drop-forged, case hardened, steel alloy of the single-strand type chain with flights welded to the chain links, or integral chain and flights type, with link hardness at 500-600 BHN. Provide a dust tight conveyor casing of 6.4 mm 1/4 inch thick ASTM A242/A242M high strength, low alloy steel with 3.416 mm (No. 10 gauge) No. 10 gauge cover of the same material. Provide the casing with T-1 steel (ASTM A514/A514M, Type B) removable liners, with liners being 19 mm
**NOTE:** When specifying boilers with capacity of 4.1 MW 14 million Btuh or less per boiler, paragraph Ash Hopper and subsequent paragraphs will be deleted, except applicable portions of paragraph Ash Silo through paragraph Rotary, Dustless Unloader will be retained.

Provide dry pneumatic type ash handling system in stoker fired boilers, which gathers ash from the boiler forward ash discharge grate hopper and from [economizer] [air preheater] ash discharge hopper and other filtration systems and discharges to the ash storage silo located outside of the building. Coordinate the entire system to fit the equipment supplied. Include ash dust control conditioners to reduce fugitive dust emissions during discharge of ash from the storage silo.

2.25.1 Ash Hopper

Construct the ash removal hopper for each boiler of 6.4 mm 1/4 inch thick steel plate, minimum, with suitable external structural steel supports for connection to boiler ash hopper and necessary internal anchors for holding refractory lining in place, with refractory lining 225 mm 9 inches thick on vertical walls and 150 mm 6 inches thick on feed plates. Provide each hopper with a sliding ash gate and dach boiler sliding gate unit with an access compartment to allow gathering and cooling of ash. provide a cast-iron grate along with a manually-operated air-tight inlet valve for feeding ash into the pneumatic gathering line. Provide a hinged, steel access gate at each compartment. Provide spring loaded air intakes at the end of each header. Base the structural integrity of the hopper on the ash weight of 1120 kg/cubic m 70 pcf.
2.25.1.2 Clinker Grinder

**************************************************************************
NOTE: Delete this paragraph if coal analysis indicates no possibility of slag formation.
**************************************************************************

Provide the clinker grinder unit with [_____] mm inch wide double roll for each hopper outlet gate housing, with grinders having manganese steel rolls and cast-iron housings and with grinder shafts mounted on outboard bearings protected by a stuffing box and gland assembly. Provide grinder shafts through stuffing boxes equipped with packing rings and lantern rings for seal water flow. Provide a reversing mechanism to reverse direction of the clinker grinder rolls should an obstruction stall the grinder. Provide a 9.5 mm 3/8 inch steel plate ejector feed hopper below each clinker grinder to feed the inlet of the pneumatic ash gathering system, with fixed passages in the clinker grinders preventing discharge of particles too large to be handled by the pneumatic conveying system. Drive each clinker grinder with a totally enclosed type motor and provide with a reversing starter, pressure switch for seal water control, diaphragm-operated seal water valve, and a solenoid valve. Design units for the characteristics of the coal specified and provide capability of handling bottom ash at a rate exceeding the conveying system capacity.

2.25.1.3 Conveyor Piping

Make conveyor pipe and fittings of an abrasive-resisting alloy metal cast by the sand-spun process, having a minimum Brinell hardness of 280, with wall thickness not less than 13 mm 1/2 inch and pipe lengths not exceeding 5.5 m 18 feet. Make joints air tight with flanges or sleeve pipe couplings. Provide fittings to have a Brinell hardness number of approximately 400 and with removable wearbacks, where applicable, or of the integral wearback type. Design ash inlet fittings so that the ash cannot overload or clog the conveyor pipeline. Provide adjustable supports or hangers. Provide vacuum hose connections as indicated and include 4.6 m 15 foot lengths of vacuum hose with quick connectors and four floor sweep-up nozzles.

2.25.1.4 Vacuum and Combination Vacuum/Pressure Systems

2.25.1.4.1 Vacuum System

Provide pneumatic suction type ash conveying equipment, complete with vacuum pumps and all component parts necessary for complete and successful operation, sized approximately twice the predicted accumulation rate. The system must have the capacity to convey and empty not less than [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf. Base the tonnage on average handling rate and not on the instantaneous rate.

2.25.1.4.2 Combination Vacuum/Pressure Systems

Provide vacuum/pressure equipment that is commercially produced for this particular type of service and including a pressure vessel equipped with a filter section at the top and an aeration ring at the bottom. Draw material into the unit by vacuum, with the air separated from the material in the top filter section and exhausted through a silencer. Provide a high level indicator within the vessel that can through a silencer and filter unit and discharging the pressurized air into the vessel. Utilize part of
the air to clean the filter and pass part of the air through the aeration ring of the vessel to pick up material and convey it under pressure to the storage silo. Furnish the unit complete with all automatic air control valves to control air flow to and from the vessel continuously through the two modes of the operating cycle continuing automatically until switched off at the control cabinet. Provide skid mounts for all automatic valves, interconnecting piping, and the vacuum/pressure vessel must be skid-mounted with vacuum/pressure pump mounted separately. The control cabinet may be mounted separately or skid-mounted on the vacuum/pressure vessel skid. Provide unit capacity to be approximately [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf. Provide piping sizes for ash collection system designed to fit the unit supplied. Use a vacuum/pressure system where storage silo is more than 150 m 500 feet from the boiler plant. Provide a vacuum system should be used for capacities of less than 45 metric tons/hour 50 tons/hour per system.

2.25.1.4.3 Pump Unit

**************************************************************************
NOTE: Where characteristics of the fly ash require additional treatment, incorporate a water spray in the filtering unit. If not required, delete the portion included in the brackets. Air discharged to the atmosphere must meet the local air pollution standards.
**************************************************************************

Size the vacuum or vacuum/pressure pump unit to match system design requirements with pump unit being liquid-ring type having round rotor with curved blades rotating in an elliptical casing. Provide the required pumping action with water alternately entering and leaving the chambers within the rotor vanes. Provide water within the casing that does not act as an air cleansing agent with the operation and maintenance of the unit not being affected by dust-laden air. Provide base-mounted unit with electric motor drive and all required heat exchangers, separators, and control valves. Provide the vacuum pump inlet piping with a vacuum filter unit to remove the fly ash obtained from the economizer ash hopper. Provide a filter unit in a metal housing that contains filter bags removing all fly ash before discharge to the atmosphere and an automatic air purge back-washing system. [Incorporate a water spray into the filtering unit.]

2.25.1.4.4 Control Cabinet

Provide a control cabinet for the complete operation of the system and include all running indicating lights as required. Provide a push-button switch conveniently located in the boiler house to start and stop the system. Provide a vacuum breaker, operating automatically from a timer, in the bottom ash conveyor line to break the system vacuum.

2.25.1.4.5 Controls

Provide a selector switch set to automatic position to start the unit in the vacuum cycle with the controls for the combination vacuum/pressure system. Provide a high-level indicator in vacuum/pressure vessel to actuate necessary controls to cut off the vacuum gathering system and pressurize the vessel for pressure discharge of collected material. Provide a low-pressure switch in the control panel that senses the pressure drop in conveying pressure and returns the unit to vacuum operation. Provide a unit that operates continuously in this manner until manually...
shut down. Provide a selector switch that in the manual position shuts the
unit down after filling. Discharge is then accomplished by pressing the
manual discharge button. Provide a high vacuum switch with time delay to
shut the system down automatically in the event none of the inlet valves
are actuated. Provide heavy duty switches and controls in accordance with
NEMA ICS 1.

2.25.1.4.6 Automatic Air Valve

Provide an automatic air valve at economizer or air preheater ash inlet
hopper discharge slide gate to allow air into system without causing a
vacuum within the boiler ash hopper. Provide slide gate as part of the ash
system to be manually-operated and interlocked to actuate the automatic air
inlet valve.

2.25.1.5 Ash Silo

Provide an ash storage silo with a capacity of not less than [_____] metric
tons tons of ash and fly ash considered to have an average weight of [_____] kg/cubic meter pcf with the capacity based on a minimum of 24 hours [60
hours if ash cannot be removed on weekends]. Construct the silo of welded
steel with a cone bottom for truck filling and supported on a structural
steel tower with all elements exposed to the exterior designed for wind
loads of [_____] kg/square meter psf. Provide a 4.3 m 14 foot clearance
under the hopper outlet fitting or appurtenance. Provide silo with steel
ladder and safety cage from the ground level to roof, steel ladder inside
storage bin, and an angle railing around the roof perimeter, with a minimum
plate thickness of 6.4 mm 1/4 inch. Provide silo complete with all
accessories required for an operable installation including, but not
limited to, high ash level detector, roof manhole, pressure and relief
valve, and other roof openings, as necessary. Finish the interior coating
with coal-tar epoxy conforming to SSPC Paint 16.

2.25.1.5.1 Ash Storage Silo

Provide an ash storage silo for vacuum system with two stage separators
[and a tertiary bag filter], with the primary receiver being cylindrical
and constructed entirely of sectional steel or cast plates suitable for
this special service. Provide a receiver not less than 900 mm 3 feet diameter. Provide flanges and bolts on the outside, and the impact of ash
directed against heavy iron wear plates of abrasive-resistant alloy.
Provide the receiver with an air-tight discharge passage not less than 450
mm 18 inches in diameter for free flow of clinkers and include a means for
positive, periodic, and automatic operation in dumping its entire contents
into the silo. Design the system so that all suction is positively shut
off from the receiver during its dumping period so that no dust can be
sucked out through the exhaust while the discharge of the receiver is open
or opening with the air from the primary receiver entering an external
secondary separator removing 90 percent of the dust not collected by the
primary receiver. Provide a combined efficiency of the primary and
external secondary separators [and tertiary bag filter] of not less than 98
percent. Provide the secondary separator similar to the primary receiver
in construction but of smaller and of lighter material. Do not allow any
part of the discharger to extend into the main storage bin. Construct the
housing of 6.4 mm 1/4 inch steel plate with a tight-closing access door
provided as an enclosure for the discharger.
2.25.1.5.2 Silo Vent Filter

Mount the silo vent filter unit on top of the silo, acting as an air release unit to separate the air from the ash, with the ash dropping into the silo. Provide automatic back cleaning of the bag filters utilizing plant air at approximately 690 to 860 kPa (100 to 125 psig) that is actuated whenever the ash handling system is in use, and with dust released from the filter bags in the back cleaning operation falling into the storage silo. Provide housing to allow the unit to operate exposed to the weather in ambient temperatures ranging from -40 degrees C to plus 55 degrees C (-40 to plus 130 degrees F).

2.25.1.5.3 Rotary, Dustless Unloader

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

Provide a rotary, dustless unloader to eliminate all dust in unloading ash and dust from the ash storage silo. Do not add water to the ashes in the conveyor or in the storage bin. Provide a dustless unloader to add water to the ash in controlled quantities so that no surplus water runs or drips from the ash after discharge with the discharged ash being muddy but loose and free flowing. Water valve must open only when drive motor is running. Provide an unloader with capacity of not less than 27 metric tons (30 tons) of conditioned ash per hour. Design the rotating unit so that all bearings are located on the outside and not in contact with the material handled. Provide a platform for access to unit, with a handrail and a safety ladder to grade. Provide a totally enclosed type motor for outdoor operation. [Provide [manual] [[magnetic] [across-the-line] [reduced voltage start]] type motor starter with [weather-resistant] [water-tight] [dust-tight] enclosure.]

2.25.1.6 Conveyor Type Ash Handling System

**************************************************************************
NOTE: When specifying boilers with capacity greater than 4.1 MW (14 million Btuh) per boiler, this paragraph through paragraph Elevator Conveyor will be deleted.
**************************************************************************

Provide funnel shaped ash pits, constructed of 6.4 mm (1/4 inch) steel plate, minimum, and covered with a heavy grating with openings approximately 50 mm (2 inches) square to receive ashes and clinkers discharged from the boiler ash hoppers into ash pits located directly below the ash hopper doors. Arrange combination drag chain conveyor for horizontal conveying and an elevator conveyor for vertical conveying of ashes as indicated to take ashes from the bottom of the ash pits for discharge into the ash silo. Provide conveyors to have a capacity of not less than [_____] metric tons/hour when handling ashes weighing approximately [_____] kg/m³ pcf at a maximum speed of 508 mm/second (100 fpm). Provide doors for access to all parts, as required. Provide [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type motors] [totally enclosed, fan-cooled type motors suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Provide [manual] [[magnetic] [across-the-line] [reduced voltage start]] type motor starters]
with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.

2.25.1.6.1 Drag Chain Conveyor

Provide a drag chain conveyor of a single strand of wide, heat treated, high alloy, drop forged rivetless drag chain with a [_____] mm inch pitch, [_____] mm inch overall width, and [_____] kg pounds working strength, and having a hardness of 460-510 Brinell, with the upper strand of the chain conveying the ash in a trough constructed of 9.5 mm 3/8 inch cast-iron extending from [_____] mm inches in front of the foot shaft to [_____] mm inches behind the head shaft and set flush with the floor. Carry the return strand of chain in angle runways set flush with the trench floor. Drive the drag chain conveyor by a [_____] mm inch pitch roller chain and [_____] mm inch pitch diameter, [_____] tooth sprocket on the drive shaft, and a [_____] mm inch pitch diameter, [_____] tooth sprocket on the elevator foot shaft.

2.25.1.6.2 Elevator Conveyor

Provide elevator conveyor of a single strand chain positive discharge type with head and takeup with the casing constructed of 2.657 mm (12 gauge) 12 gauge steel, minimum, with 9.5 mm 3/8 inch thick boot plates. Provide the head-end drive to include a gear motor and steel roller chain complete with drive brackets, guards, and backstop. Equip the elevator with head-end platform and ladder.

2.25.2 Ash Handling Controls

Provide a control panel for the ash handling system control containing all necessary instrumentation, including selector switches, annunciators, push buttons, and ammeters required for monitoring and operation of the ash handling system, with graphically display of the system. In addition, provide a panel containing all necessary timers, relays, and terminal blocks that are required for the control system with control and monitoring of the ash removal system from a single panel having pushbuttons to start automatic operation of each system and also pushbuttons for individual control of each component. Provide the panel with sufficient instrumentation to observe the removal operations and controls to permit effective emergency control, with local control stations at each ash removal point for local manual operation. Provide local selector switches so that equipment may be operated manually for test and maintenance purposes. Control the operation of the bottom ash system by a microprocessor-based control system, a solid-state programmable controller, or an electro-mechanical system. Provide for controls and instrumentation located indoors with NEMA 12 rating, in accordance with NEMA ICS 1. Provide NEMA 4 rating for all outdoor components in accordance with NEMA ICS 1. Factory mount major equipment components, including control panels and devices, prewired, tubed, and tested to the maximum practical extent with the controls for fully automatic and sequential operation of the ash handling system. Design these controls so that manual steps, such as continuous monitoring and regulation are not required. Incorporate safety interlocks to assure that proper permissive conditions have been met prior to changing the operating status of major system components. Provide automatic shutdown of the ash handling system, or portion thereof, with alarms, should unsafe conditions arise during operation of the system. Provide facilities for monitoring and control of the ash handling system for the following functions:
a. Manual start of the automatic control operations.

b. Selection of operating components.

c. Override of the automatic control sequences, both at the ash handling control panel and locally.

d. Manual operation, either remotely from the control center or locally.

e. Emergency shutdown on a unit or system basis.

f. Status monitoring at the ash handling control panel of the operation of the ash handling system and its components.

The automatic controls for bottom ash collection transport must operate as specified. When a start command has been manually initiated, the automatic ash collection and transport sequences for the unit progress through their complete cycles, shutting down the after completion of the cycles.

Include an annunciator system, complete with audio and visual alarms, as part of the ash handling control panel, with the annunciator system receiving inputs from devices and system logic, indicating any out-of-specification or trip condition. Provide recorders to provide a permanent record of selected variables that relate to the ash handling system's performance and operation. Provide control stations supplied with analog control loops that provide bumpless transfer between the manual and automatic modes of operation, with the manual mode of operation providing direct control of the end device with no intervening analog control components unless those components are powered by the same source as the end device.

2.25.3 Submerged Drag Chain Conveyor (SDCC)

Design submerged drag chain conveyor to extract ash at normal capacity [_____] metric tons/hour TPH and maximum capacity [_____] metric tons/hour TPH, based on a dry ash density of approximately [_____] kg/cubic meter pcf with the maximum chain speed of 76 mm/sec 15 fpm. Design the SDCC for continuous operation having a storage capacity of [_____] cubic meters cubic feet accumulation with the SDCC having an upper compartment filled with water and a dry lower compartment, and with the equipment maintaining water temperature at approximately 60 degrees C 140 degrees F. Provide a dewatering slope an angle of [_____] degrees with the horizontal and a top trough of not less than 9.5 mm 3/8 inch thick carbon steel plate, welded construction, lined with renewable abrasion resistant steel wear plates, with a minimum thickness of 13 mm 1/2 inch and 380 BHN. Grind all welds smooth. Provide the necessary track guide angles, hold-down angles, and carbon steel chain protectors. Provide the minimum depth of water in the upper trough [_____] meters feet. The return chain bottom trough must be dry, constructed of 9.5 mm 3/8 inch thick steel plate, stiffened and braced with structural shapes and water-tight. Provide chain track angles with a minimum 13 mm 1/2 inch thick steel replaceable wear flats with a minimum 300 BHN and include wear strips under the return flights, minimum 13 mm 1/2 inch thick and 50 mm 2 inches wide. Provide a double strand round-link or ship-type conveyor chain, case hardened, corrosion and abrasion resistant, chrome-nickel-alloy, annealed and carburized with surface hardness between 500-630 BHN, with design strength and pitch based on operating conditions. Provide conveyor flights [_____] mm inches deep by [_____] mm inches thick T-1 steel plates attached on both ends to the chain with each flight provided with top wear pads and bottom wear strips of abrasion resistant steel plate of 300 BHN minimum. Provide a chain tensioner at the tail end.
of SDCC for maintaining proper tension in both strands of the chain. Include cast-iron idler wheel, bearings, shaft, guide block and bearing housing for the assembly. Fabricate the idler assemblies for both troughs to include heavy duty spherical roller type bearings with external lubrication fittings. Include cast iron wheels with removable, surface hardened, toothed segments, drive shaft, bearings for the chain drive assembly. Provide a hydrostatic driven unit coupled with a low speed, high torque hydraulic motor, built-in torque limiting valves for preventing damage to load train or electric motor for the conveyor, with speed regulation, self-lubrication, internal cooling, and dynamic braking provided with the drive, and include inching capability. Provide hinged inspection doors, windows, and removable panels along the conveyor to permit access and observation at critical points. Construct inspection doors, windows, and removable panels in mild steel with stainless steel hardware and make completely water-tight. Provide water cooling and drainage connections through flanged connections to the conveyor trough with provision for continuous water flow into the top trough of the conveyor including two overflow connections, one for normal level and one high level, including high level alarm and an overflow weir box to prevent drain clogging. Provide chain cleaning sprays.

2.25.4 Dense Phase Ash Handling

Provide a pneumatic dense phase type, complete with transfer vessels, solenoid valves, air receiver tank, air producer and ash conveying piping for the ash conveying system. Design the ash handling system to handle [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf with each transport vessel bolted to the hopper discharge flange where ash flows into vessel by gravity until a level indicator indicates the vessel is full. The transport vessel inlet valve then closes, and transport air between 170 to 345 KPa 25 to 50 psi enters the vessel through a fluidizing unit located at the bottom of the vessel. When the vessel has been brought to transport air pressure, the transport line valve opens and a "slug" of fly ash is transported to the storage silo. Provide Schedule 40 transporting pipe, standard black iron pipe [_____] mm inches diameter. Base design on the material velocities in the transportation pipe of [_____] meters/sec fpm but not in excess of 5 meters/sec 1000 fpm utilizing 210 to 415 KPa 30 to 60 psi compressed air to fluidize the transmit ash.

2.25.5 Fly Ash Collectors

Fly ash collectors are as specified in Section 44 10 00 AIR POLLUTION CONTROL. Provide and size ash collectors to handle total flue gas at maximum boiler load and stack temperature, and include induced draft equipment. Coordinate fly ash collector requirements with boiler draft and control requirements.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 ERECTION OF BOILER AND AUXILIARY EQUIPMENT

Install boiler and auxiliary equipment as indicated and in accordance with
3.3 EARTHWORK

Perform excavation and backfilling for tanks and piping as specified in Section 31 00 00 EARTHWORK, except conform backfill for fiberglass reinforced fuel tanks to the manufacturer's installation instructions.

3.4 STORAGE TANK INSTALLATION

Install storage tank installation in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.5 PIPING INSTALLATION

Cut pipe accurately to measurements established at the jobsite, install without cold springing, and clear windows, doors, and other openings. Cutting or other weakening of the building structure to facilitate piping installation is not permitted. Free piping of burrs, oil, grease, and other foreign matter and install to permit free expansion and contraction without damaging building structure, pipe, joints, or hangers. Use fittings to make changes in direction, except that bending of pipe 100 mm 4 inches and smaller will be permitted provided a pipe bender is used and wide sweep bends are formed. The centerline radius of bends must not be less than 6 diameters of the pipe. Bent pipe showing kinks, wrinkles, flattening, or other malformations will not be accepted. Carbon steel piping to be bent conforming to ASTM A53/A53M, Grade A, standard, or Grade B extra-heavy weight. Carry vent pipes through the roof and properly flash. Unless otherwise indicated, pitch down horizontal supply mains in the direction of flow with a grade of not less than 25 mm in 12 m 1 inch in 40 feet. Cap or plug open ends of pipelines and equipment during installation to keep dirt or other foreign materials out of the systems. Undercoat pipe not otherwise specified. Unless otherwise specified or shown, make connections to equipment with malleable-iron unions for steel pipe 65 mm 2-1/2 inches or less in diameter and with flanges for pipe 80 mm 3 inches or more in diameter, with unions for copper pipe or tubing made of brass or bronze. Provide cathodic protection for connections between ferrous piping and copper piping, electrically isolated from each other with dielectric couplings or other approved methods. Use reducing fittings for changes in pipe sizes. For horizontal HTW lines, provide eccentric type reducing fittings to maintain the top of the lines at the same level.

3.5.1 Pipe Sleeves

Provide pipe sleeves fitted into place at the time of construction for pipes and tubes passing through concrete or masonry walls or concrete floors or roofs. Install a waterproofing clamping flange as indicated. Do not install sleeves in structural members except where indicated or approved. Provide details for rectangular and square openings. Extend each sleeve through its specified wall, floor, or roof, and cut flush with each surface, except extend sleeves through floors and roofs above the top surface at least 150 mm 6 inches for proper flashing or finishing. Provide membrane clamping rings where membranes are penetrated. Unless otherwise indicated, size sleeves to provide a minimum clearance of 6 mm 1/4 inch between bare pipe and sleeves or between jacket over insulation and sleeves. Provide galvanized steel pipe sleeves in bearing walls, waterproofing membrane floors, and wet areas. Sleeves in nonbearing walls, floors, or ceilings may be galvanized steel pipe or galvanized sheet metal with lock-type longitudinal seam. Except in pipe chases or interior walls,
seal the annular space between pipe and sleeve or between jacket over insulation and sleeve in nonfire rated walls, partitions, and floors as indicated and specified in Section 07 92 00 JOINT SEALANTS and in fire rated walls, partitions, and floors seal as indicated and specified in Section 07 84 00 FIRESTOPPING. Provide metal jackets over insulation passing through exterior walls, fire walls, fire partitions, floors, or roofs, no thinner than 152.4 micrometers 0.006 inch thick aluminum, if corrugated, and 0.4064 mm 0.016 inch thick aluminum, if smooth, and secured with aluminum or stainless steel bands not less than 10 mm 3/8 inch wide and not more than 200 mm 8 inches apart. When penetrating roofs, before fitting the metal jacket into place, run a 13 mm 1/2 inch wide strip of sealant vertically along the inside of the longitudinal joint of the metal jacket from a point below the backup material to a minimum height of 900 mm 36 inches above the roof. If the pipe turns from vertical to horizontal, run the sealant strip to a point just beyond the first elbow. When penetrating waterproofing membrane for floors, extend the metal jacket must extend from a point below the backup material to a minimum distance of 50 mm 2 inches above the flashing. For other areas, the metal jacket from a point below the backup material to a point 300 mm 12 inches above floor; or when passing through walls above grade, extend jacket a minimum of 100 mm 4 inches beyond each side of the wall.

3.5.1.1 Pipes Passing through Waterproofing Membranes

In addition to the pipe sleeves referred to above, provide for pipes passing through roof or floor waterproofing membranes with a 1.8 kg 4 pound lead flashing or a 453 g 16 ounce copper flashing, each within an integral skirt or flange, with flashing formed, and the skirt or flange extending not less than 200 mm 8 inches from the pipe and must set over the roof or floor membrane in a troweled coating of bituminous cement. Extend the flashing up the pipe a minimum of 250 mm 10 inches above the roof or floor. Seal the annular space between the flashing and the bare pipe or between the flashing and the metal-jacket-covered insulation as indicated. Pipes up to and including 250 mm 10 inches in diameter passing through roof or floor waterproofing membrane may be installed through a galvanized steel sleeve with caulking recess, anchor lugs, flashing clamp device, and pressure ring with brass bolts. Clamp waterproofing membrane into place and place sealant in the caulking recess. In lieu of a waterproofing clamping flange and caulking and sealing of annular space between pipe and sleeve or conduit and sleeve, a modular mechanical-type sealing assembly may be installed. Provide seals consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe/conduit and sleeve with corrosion protected carbon steel bolts, nuts, and pressure plates, with the links loosely assembled with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and each nut. After the seal assembly is properly positioned in the sleeve, tighten the bolts to cause the rubber sealing elements to expand and provide a water-tight seal between the pipe/conduit and the sleeve. Size each seal assembly as recommended by the manufacturer to fit the pipe/conduit and sleeve involved. If the use modular mechanical-type seals is elected, provide sleeves of the proper diameters.

3.5.1.2 Optional Counterflashing

As alternates to caulking and sealing the annular space between the pipe and flashing or metal-jacket-covered insulation and flashing, counterflashing may be accomplished by utilizing standard roof coupling for threaded pipe up to 150 mm 6 inches in diameter; lead flashing sleeve for dry vents and turning the sleeve down into the pipe to form a waterproof
joint; tack-welded or banded-metal rain shield around the pipe and sealing as indicated.

3.5.2 Pipe Joints

Provide welded or flanged joints between sections of pipe and fittings on all HTW piping. On auxiliary piping, except as otherwise specified, provide threaded fittings 25 mm 1 inch and smaller. Provide threaded or welded fittings 32 mm 1-1/4 inches up to, but not including, 65 mm 2-1/2 inches. Provide flanged or welded fittings 65 mm 2-1/2 inches and larger. Weld pipe and fittings 32 mm 1-1/4 inches and larger installed in inaccessible conduits or trenches beneath concrete floor slabs. Provide black malleable-iron unions for pipe 50 mm 2 inches or smaller in diameter, and with flanges for pipe 65 mm 2-1/2 inches or larger in diameter for connections to equipment.

3.5.2.1 Threaded Joints

Make threaded joints with tapered threads properly cut and made perfectly tight with a stiff mixture of graphite and oil, or polytetrafluoroethylene tape or equal, applied to the male threads only, and in no case to the fittings.

3.5.2.2 Welded Joints

Fusion weld joints in accordance with ASME B31.1, unless otherwise required. Provide only weld fittings for changes in direction of piping; mitering or notching pipe to form elbows and tees or other similar type construction is not acceptable. Branch connections may be made with either welding tees or forged branch outlet fittings, either being acceptable without size limitation. Provide forged and flared branch outlet fittings, where used, for improvement flow where attached to the run, reinforced against external strains, and designed to withstand full pipe bursting strength.

3.5.2.2.1 Beveling

Field and shop bevels in accordance with the recognized standards and done by mechanical means or flame cutting. Where beveling is done by flame cutting, clean surfaces of scale and oxidation before welding.

3.5.2.2.2 Alignment

Before welding, align the component parts to be welded so that no strain is placed on the weld when finally positioned. Align height so that no part of the pipe wall is offset by more than 20 percent of the wall thickness. Set flanges and branches true, preserving the alignment during the welding operation. Provide welds of the same quality for tack welds, made by the same procedure as the completed weld; otherwise, remove tack welds during the final welding operation.

3.5.2.2.3 Erection

Where the temperature of the component parts being welded reaches 0 degrees C 32 degrees F or lower, heat the material to approximately 38 degrees C 100 degrees F for a distance of 900 mm 3 feet on each side of the weld before welding, finishing the weld before the materials cool to 0 degrees C 32 degrees F.
3.5.2.4 Defective Welding

Remove and replace defective welds, repairing defective welds in accordance with ASME B31.1.

3.5.2.5 Electrodes

After filler metal has been removed from its original package, protect or store so that its characteristics or welding properties are not affected. Do not use electrodes that have been wetted or that have lost any of their coating.

3.5.2.3 Flanges and Unions

Face flanges and unions true, and make square and tight. Provide gaskets of nonasbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16 inch thickness, full-face or self-centering flat ring type. Provide gaskets with aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR) using NBR binder for hydrocarbon service. Provide union or flange joints in each line immediately preceding the connection to each piece of equipment or material requiring maintenance such as coils, pumps, control valves, and other similar items.

3.5.3 Supports

3.5.3.1 General

**************************************************************************

NOTE: Mechanical and electrical layout drawings and specifications for ceiling suspensions should contain notes indicating that hanger loads between panel points in excess of 23 kg 50 pounds must have the excess hanger loads suspended from panel points.

**************************************************************************

Fabricate hangers used to support piping 50 mm 2 inches and larger to permit adequate adjustment after erection while still supporting the load. Install pipe guides and anchors to keep pipes in accurate alignment, to direct the expansion movement, and to prevent buckling, swaying, and undue strain. Support by variable spring hangers and supports or by constant support hangers, piping subjected to vertical movement, when operating temperatures exceed ambient temperatures. [Do not exceed 23 kg 50 pounds for pipe hanger loads suspended from steel joist between panel points. Suspend pipe loads exceeding 23 kg 50 pounds from panel points.]

3.5.3.2 Seismic Requirements

**************************************************************************

NOTE: Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.

**************************************************************************

Support and brace piping and attached valves to resist seismic loads [as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR...
MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC] [as indicated]. Provide structural steel required for reinforcement to support piping, headers, and equipment as specified under Section 05 12 00 STRUCTURAL STEEL.

3.5.3.3 Structural Reinforcements

Provide structural steel reinforcements required to support piping, headers, and equipment, but not shown, as specified under Section 05 12 00 STRUCTURAL STEEL.

3.5.4 Anchors

Provide anchors wherever necessary, or indicated, to localize expansion or prevent undue strain on piping. Provide anchors of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Install anchor braces in the most effective manner to secure the desired results, using turnbuckles where required. Do not attach supports, anchors, or stays where they will injure the structure or adjacent construction during installation or by the weight of expansion of the pipeline.

3.5.5 Pipe Expansion

3.5.5.1 Expansion Loop

************************************************************************
NOTE: Wherever possible, provisions for expansion of supply-and-return pipes will be made by changes in the direction of the run of the pipe or by field fabricated expansion bends. Where restrictions in space prevent such provisions for expansion, expansion joints will be installed and blank will filled as appropriate. Bracketed portion will be deleted if inapplicable.
************************************************************************

Provide expansion loop to ensure adequate expansion of the main straight runs of the system within the stress limits specified in ASME B31.1. Cold spring loops and install where indicated. Provide pipe guides as indicated. Except where otherwise indicated, utilize expansion loops and bends to absorb and compensate for expansion and contraction instead of expansion joints.

3.5.5.2 Expansion Joints

************************************************************************
NOTE: If expansion joints are required, this paragraph will be deleted. Where restrictions in space prevent such provisions for expansion, expansion joints will be installed and blank will be filled as appropriate. Bracketed portion will be deleted if inapplicable.
************************************************************************

Provide expansion joints for either single or double slip of the connected pipes, as required and indicated, and for not less than the traverse indicated. Provide anchor bases or support bases as indicated or required. Make initial setting in accordance with the manufacturer's
recommendation to allow for an ambient temperature at time of installation. Install pipe alignment guides as recommended by the joint manufacturer, but in any case not more than 1.5 m 5 feet from expansion joint, except that in lines 100 mm 4 inches or smaller install guides no more than 600 mm 2 feet from the joint.

3.5.6 Valves

Install gate valves and globe valves with the stem horizontal or above. Install swing check valves in horizontal piping with the cap or bonnet up, or in vertical piping with the flow upward. Always install lift or piston check valves in horizontal piping with the cap or bonnet up.

3.6 BURIED PIPING INSTALLATION

3.6.1 Protective Coating for Underground Steel Pipe

Provide steel pipe installed underground with a protective covering, mechanically applied in a factory or field plant especially equipped for the purpose. Apply for specials and other fittings which cannot be coated and wrapped mechanically with a protective covering applied by hand, preferably at the plant applying the covering to the pipe. Do not field apply coatings until the piping has satisfactorily passed the leak or hydrostatic test. Coat and wrap field joints by hand in a manner and with materials that will produce a covering equal in effectiveness to that of the mechanically-applied covering.

3.6.2 Cleaning of Surfaces to be Coated

Solvent wash steel surfaces to assure an oil-and-grease-free surface, and blast-clean to bare metal as specified in SSPC SP 6/NACE No.3. For areas that cannot be cleaned by blasting, clean to bare metal by powered wire brushing or other mechanical means. Provide an air supply for blasting that is free from oil and moisture. Following cleaning, wipe the surfaces with coal-tar solvent naphtha and allow to dry. Ensure the surfaces to be coated are free of all mill scale and foreign matter such as rust, dirt, grease, oil, and other deleterious substances. Apply coating to surfaces as soon as practicable after the cleaning operation.

3.6.3 Coating

Coat buried steel piping with one of the following methods:

3.6.3.1 Epoxy Coating System

The epoxy coating system, conforming to the AWWA C213. Factory coat fittings, valves, and joints with materials identical to those used on the pipe, or may be field-coated with a 2-part epoxy system recommended by the manufacturer of the pipe coating system. Field protection may also be provided for joints and fittings with a coal tar tape hot applied over a compatible primer.

3.6.3.2 Bituminous Pipe Coating

************NOTE: If coating system similar to coal tar coating and wrapping is required using different materials, rewrite this paragraph. Where excessively corrosive soils are encountered, give the piping a second***
coating of coal-tar enamel and a second wrapper of felt.

Provide bituminous protective system of coal-tar enamel and primer coating system, consisting of a coal-tar priming coat, a coal-tar enamel coat, a wrapper of coal tar saturated felt, and a wrapper of kraft paper, or a coat of water-resistant white-wash, applied in the order named and conforming to the requirements of AWWA C203 in all respects as to materials, methods of application, tests, and handling, except do not apply an interior lining. Coat and wrap joints and fittings.

3.6.3.3 Polyethylene Pipe Coating

Provide factory-applied system, with continuous extruded polyethylene coating and adhesive undercoat application procedure, including surface preparation, conforming to NACE SP0185, Type A. Provide tape wrapped joints, valves, flanges, and other irregular surfaces as outlined under the tape wrapping system, except apply the tape half-lapped, and prime all extruded polyethylene coating and adhesive undercoat surfaces to be tape-wrapped with a compatible primer before application of tape. Use the primer recommended by the tape manufacturer and approved by the applicator of the extruded polyethylene coating. Repair damaged areas of extruded polyethylene coating by tape-wrapping as described under the tape-wrapping system, except press any residual material from the extruded polyethylene coating into the break or trim off. Prime all areas to be taped and apply the tape half-lapped.

3.6.3.4 Tape-Wrap Pipe Coating

Prime cleaned surfaces before applying tape as recommended by the manufacturer of the tape. Provide approved, pressure-sensitive, organic plastic tape with a minimum nominal thickness of 0.51 mm 0.020 inch, conforming to ASTM G21 for fungus resistance. Apply tape to clean, dry, grease-free, and dust-free surfaces only. Wire brush all weld beads and remove all burrs and weld spatter. Cover weld beads with one wrap of tape before spiral wrapping. At each end of straight runs, apply a double wrap of one full width of tape at right angles to the axis of the spiral wrapping. Remove any kraft paper protective wrapping from the pipe before the tape is applied. Provide wrap protection for material which is wrapped before it is placed in its final position at sling points with roofing felt or other approved heavy shielding material, or handle with canvas slings. Repair damaged wrapping as specified. Wrap pipe in straight runs spirally, half-lapping the tape as it is applied. For pipe smaller than 100 mm 4 inches, apply one layer half-lapped. For pipe 100 mm 4 inches and larger, apply two layers half-lapped with the second layer wrapped opposite-hand to the first. Spirally wrap joints, coupling fittings, and similar units and damaged areas of wrapping, beginning with one complete wrap 75 mm 3 inches back from each edge of the corresponding size of straight pipe. On irregular surfaces such as valves and other accessories, apply one layer half-lapped and stretched to conform to the surface, followed by a second layer half-lapped and applied with tension as it comes off the roll.

3.6.3.5 Coating Inspection and Testing

After field coating of the pipe joints, inspect the entire pipe with an electric holiday detector having an operating crest voltage of from 12,000 to 15,000 volts when using a full-ring, spring-type coil electrode. Provide a holiday detector equipped with a bell, buzzer, or other audible
signal which operates when a holiday is detected. Repair detected holidays in the protective covering. Occasional checks of holiday detector potential will be made by the Contracting Officer to determine suitability of the detector. Perform the inspection for holidays just before covering the pipe with backfill and take every precaution during backfill to prevent damage to the protective covering. Furnish all equipment and labor necessary for inspection.

3.6.4 Installing Buried Piping

Carefully handle pipe and accessories to assure a sound, undamaged condition with special care taken to not damage coating when lowering pipe into a trench and when backfilling. Install nonmetallic pipe in accordance with pipe manufacturer's instructions.

a. Submit Proposed diagrams, instructions, and other sheets, before posting. Post framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, where directed. Prepare in typed form, and frame as specified, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system above, including the wiring and control diagrams posted beside the diagrams. Post the framed instructions before acceptance testing of the systems.

b. Lay underground pipelines with a minimum pitch of 25 mm/15 m 1 inch/50 feet. Provide minimal coverage for horizontal pipe sections of 450 mm 18 inches, laying piping free of traps and draining toward tank. Solidly rest the full length of each section of underground pipe on the pipe bed with piping connections to equipment as indicated, or as required, by the equipment manufacturer.

c. Provide two swing elbows [or flexible connectors] at each tank connections to allow for differential settlement. Thoroughly clean the interior of the pipe of all foreign matter before being lowered into the trench and keep clean during installation. Do not lay the pipe in water or when the trench or weather conditions are unsuitable.

d. Securely close open ends of pipe and fittings so that water, earth, or other substances cannot enter the pipe or fittings when work is not in progress. Replace any pipe, fittings, or appurtenances found defective after installation. Make threaded joints with tapered threads perfectly tight with joint compound applied to the male threads only. This requirement does not apply for the gauging hatch or similar connections directly over the tank where the line terminates in a fitting within a cast-iron manhole designed to allow for differential settling.

e. Weld pipe to structural steel where steel piping is to be anchored to the structural steel member of the anchor and patch the abraded area with protective coating or covering as specified. Fit piping passing through concrete or masonry construction with sleeves of sufficient length to pass through the entire thickness of the associated structural member and large enough to provide a minimum clear distance of 13 mm 1/2 inch between the pipe and sleeve, except where otherwise indicated. Sleeves through concrete may be 0.912 mm (20 gauge) 20 gauge metal, fiber, or other approved material. Accurately locate sleeves on center with the piping and securely fasten in place. Caulk and fill...
the space between the sleeves and the pipe with bituminous plastic cement or mechanical caulking units designed for such use.

3.7 FIELD PAINTING AND COATING

**************************************************************************
NOTE: Where identification of piping is required by the using service, this paragraph will be amplified to include appropriate requirements either directly or by reference to a separate section. Air Force requirements are covered in AFM 88-15.
**************************************************************************

Except as otherwise specified, prepare, clean and paint ferrous metal as specified in Section 09 90 00 PAINTS AND COATINGS. Apply protective coating to buried steel as specified. Paint exposed pipe covering as specified in Section 09 90 00 PAINTS AND COATINGS. Do not paint aluminum sheath over insulation.

3.8 MANUFACTURER'S SERVICES

3.8.1 Manufacturer's Representative

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified, to supervise the installing, adjusting, and testing of the equipment.

3.8.2 Field Training

Conduct a field training course for designated operating staff members. Submit proposed schedule for field training, at least 2 weeks prior to the start of related training. Provide training for a total period of [_____] hours of normal working time, starting after the system is functionally complete, but prior to final acceptance tests. Provide field training to cover all of the items contained in the approved operating and maintenance instructions. Submit operating instructions, prior to the field training course and [6] [_____] copies of operating instructions outlining the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features in the instructions. Submit maintenance instructions, prior to the field training course; [6] [_____] complete copies of maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed in the instructions.

3.9 TESTS

**************************************************************************
NOTE: Before occupancy of a facility inspect the boilers in accordance with the Code of Boiler and Pressure Vessel Inspectors (BPVI) and the American Society of Mechanical Engineers (ASME). Inspectors must be certified in accordance with BPVI standards.
**************************************************************************

Submit the proposed performance test procedure for required tests, 30 days prior to the proposed test date, containing a complete description of the
proposed test, along with calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in the tests. Do not commence the testing until the procedure has been approved. Submit the complete plan for water treatment, including proposed chemicals to be used and nationally recognized testing codes applicable to the system, prior to system startup. Submit all test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate for each test report, the final position of controls. Include the action settings for all automatic controls in the form of a typed, tabulated list indicating the type of control, location setting, and function. Provide a written statement from the manufacturer's representative certifying that combustion control equipment has been properly installed and is in proper operating condition, upon completion of the installation.

3.9.1 Hydrostatic Tests

Following erection, hydrostatically test each HTW generator proving tight under a gauge pressure of 1.5 times the specified working pressure. Following the installation of all piping and boiler house equipment, but before the application of any insulation, perform hydrostatic tests to prove the system tight under gauge pressures of 1.5 times the specified working pressure. Conduct tests under the direction of, and subject to, the approval of the Contracting Officer. Adjust all equipment and controls before the scheduled operational test. Submit the testing schedule least 15 days before scheduled test.

3.9.1.1 Water Sides Including Fittings and Accessories

Hydrostatically test water sides in accordance with the requirements of ASME BPVC SEC I and ASME BPVC SEC VIII D1 as applicable. The ASME stamp will be accepted as evidence of this test.

3.9.1.2 Generator Casing, Air Casings, and Ducts

Pneumatically test air casing and ducts exterior to the generators at the maximum working pressure using the soap bubble or smoke bomb method to verify tightness. Test the gas sides of the generators normally operated under pressure for tightness at 1-1/2 times the predicted operating pressure in the furnace at maximum predicted output. Tightly seal, by suitable means blanking off all generator openings, prior to testing. Admit air to the generator until the test pressure is reached and then hold. If in a 10-minute period the pressure drop does not exceed 1.2 kPa 5 inches water gauge, the casing is regarded as tight and accepted. Use air pressure and smoke bomb or comparative CO(2) readings for induced draft generators.

3.9.1.3 Fuel Oil Test

After the system has been flushed and operationally tested, leak test the underground portion of the system in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.9.1.4 Fuel Systems for Oil-Fired HTW Generators

Hydrostatically test the part of the preassembled fuel oil system that is furnished integrally with the generator at 1.5 times the maximum operating
pressure. Pneumatically test the part of the preassembled gas system that is furnished integrally with the generator at operating pressure using the soap bubble test method to verify tightness of the gas system.

3.9.2  Fire Safety for Oil-Fired HTW Generators

Conduct test as necessary to determine compliance with the applicable UL safety standards. The presence of the UL label may be accepted as evidence of compliance in this respect.

3.9.2.1  Oil-Fired Generators

Oil-fired generators must meet the test requirements of UL 726.

3.9.2.2  Oil Burners

Oil burners must meet the test requirements of UL 296.

3.9.3  Capacity and Efficiency Tests

Determine the capacity and efficiency at the specified capacity of the generator in accordance with the ASME PTC 4 for steam generating units. Determine the efficiency by the direct input-output method and check with the loss method computation. Make test runs at the maximum capacity for 4 hours; at the minimum capacity and at 50 percent capacity for 2 hours each, respectively. Submit test reports and performance curves. Balance the system within 5 percent of that indicated before any operational tests are conducted. Make corrections and adjustments as necessary to produce the required conditions. Use approved methods to measure all rates of flow. Provide a qualified test engineer, observed by a representative of the Contracting Officer, to conduct efficiency and general performance tests on the boilers. Set up, calibrate, test, and ready test apparatus for testing the boiler before the arrival of the Contracting Officer's representative. Furnish calibration curves or test results furnished by an independent testing laboratory for each instrument, meter, gauge, and thermometer to be used in efficiency and capacity test before the test. Provide a test report including logs, heat balance calculations, and tabulated results together with conclusions, [delivered in quadruplicate,] including an analysis of the fuel being burned on the test. Include in the analysis all pertinent data tabulated in the ASME PTC 4 abbreviated efficiency test. Provide and install all necessary temporary piping valves, controls, heat exchanger, and cooling water provisions to provide a load for testing each HTW generator. If any system load is available, the Contracting Officer will provide for loading the heating system for the test, but full-load capability will probably require a supplementary heat exchanger for the test.

3.9.4  Operating Tests

After adjustment and achievement of stable operation of the HTW generators, test each continuously for 12 hours, minimum, to demonstrate control and operational conformance to the requirements of this specification under varying load conditions ranging from the specified capacity to the minimum burner or stoker turndown ratio without on-off cycling. In each case, cover the periods for the capacities tabulated below:
### Waterwall Watertube Boilers

<table>
<thead>
<tr>
<th>Time (minimum)</th>
<th>Percent of Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>First 2 hours</td>
<td>50</td>
</tr>
<tr>
<td>Next 2 hours</td>
<td>75</td>
</tr>
<tr>
<td>Next 6 hours*</td>
<td>100</td>
</tr>
<tr>
<td>Next 2 hours</td>
<td>110</td>
</tr>
</tbody>
</table>

* The efficiency tests may be conducted either concurrently with the operating tests or separately at the option of the Contractor. Efficiency may be no less than that specified.

### 3.9.5 Test of Fuel Burning Equipment

Test automatic oil burners for capability to provide high temperature water in accordance with demand when on-off cycling is required. Fuel burning equipment that exhibits excessive or unexplained loss of ignition, nuisance shutdown due to faulty burner, stoker, or control operation, improper flame, excessive carbon deposits or slag, or necessity for difficult or frequent adjustments must be rejected. Include the following as applicable to the type of HTW generator.

#### 3.9.5.1 Sequencing

[Start, operate] [Operate,] and stop the HTW generator in accordance with the specified operating sequence.

#### 3.9.5.2 Flame Safeguard

Verify the operation of the flame safeguard control on oil- or gas-fired generators by simulated flame and ignition failures. Test burners having continuous or intermittent pilots by simulating main flame failure while the pilot is burning. Use a stop watch for the trial-for-pilot ignition, trial-for-main-flame ignition, combustion control reaction, and valve closing verified times.

##### 3.9.5.2.1 Immunity to Hot Refractory

Operate the burner at high fire until the combustion chamber refractory reaches maximum temperature, then close the main fuel valve manually dropping out the combustion safeguard immediately causing the safety shutoff valves to close within the specified control reaction and valve closing times.

##### 3.9.5.2.2 Pilot Intensity Required

Gradually reduce the fuel supply to the pilot flame to the point where the combustion safeguard begins to drop out (sense "no flame") but holds in until the main fuel valve opens. At this point of reduced pilot fuel supply, the pilot flame must be capable of safely igniting the main burner. If the main fuel valve can be opened on a pilot flame of insufficient intensity to safely light the main flame, reject the generator.
3.9.5.2.3 Turndown Ratio

Verify the specified turndown ratio by firing at the minimum firing rate.

3.9.5.2.4 HTW Generator Limit and Fuel Safety Interlocks

Simulate the interlock actuating conditions for each generator limit and fuel and safety interlock for the safety shutdown. Specify specific manner in which the safety shutdowns occur.

3.9.5.2.5 Combustion Controls

Demonstrate the accuracy range and smoothness of operation of the combustion controls by varying the demand throughout the entire firing range required by the turndown ratio specified for the [burner] [and] [stoker] and in the case of automatic sequenced burners by further varying the firing rate to require on-off cycling. Note the control accuracy as specified.

3.9.5.2.6 Safety Valves

Do not test safety valves on HTW generators under operating conditions.

3.9.5.2.7 Blowdown Valves and Try Cocks

Test blowdown valves and try cocks for proper operation.

3.9.5.2.8 Fans, Heaters, Pumps, and Motors

Test draft fans, fuel oil heaters, fuel pumps, and electric motors when necessary to determine compliance with the referenced standards. Closely observe the operation of fans, [fuel oil heaters] [stokers] [fuel pumps] and electric motors for possible defects or nonconformance.

3.9.6 Test of Water Treatment Equipment

Test of water treatment equipment must meet the requirements specified for capacity and quality of effluent. Tests for ion-exchange units must cover at least two complete regenerations and capacity runs.

3.9.7 System Balancing

During operating tests, observe the preliminary system balancing results and log the flow rates. Where an auxiliary heat exchanger is not required for the test load, perform final system balancing during the operating test. Where the auxiliary heat exchanger is required, provide sufficient temporary piping to shunt the water flow through the various system control valves to allow an approximate flow balance of the system.

3.10 CLEANING OF HTW GENERATORS AND PIPING

3.10.1 HTW Generator Cleaning

After the hydrostatic tests have been made, and before performance of the operating tests, thoroughly and effectively clean the boilers of foreign materials. Wherever possible, wire brush surfaces in contact with water to remove loose material. The following procedure may be used or an alternate standard procedure may be submitted for review and approval. Fill HTW
generators with a solution consisting of the following proportional ingredients for every 3785 L 1000 gallons of water, and operated at approximately 210 to 345 kPa 30 to 50 psig for a period of 24 to 48 hours:

a. Use 11 kg caustic soda 24 lb. caustic soda; 3.6 kg sodium nitrate 8 lb. sodium nitrate; 11 kg disodium phosphate, anhydrous 24 lb. disodium phosphate, anhydrous; and 230 g approved wetting agent 1/2 lb. approved wetting agent.

b. Thoroughly dissolve chemicals in the above proportions, or as otherwise approved, in the water before being placed in the HTW generator. After the specified boiling period, allow the boilers to cool, and then drain and thoroughly flush. Clean piping by operating the HTW generators for a period of approximately 48 hours.

3.10.2 HTW Generator Water Conditioning

Provide HTW generator water conditioning including chemicals, chemical treatment, and blowdown during periods of boiler operation to prevent scale and corrosion in HTW generators and in supply and return distribution systems from the initial startup of the system, through the testing period, and to final acceptance of the completed work, but for at least 30 days of operation. Use approved chemicals and method of treatment.

3.6 Schedule

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing, installing, adjusting, and testing of a dry flue gas desulfurization (FGD) scrubber(s) and fabric filter baghouse(s) system.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The dry FGD scrubber(s) is intended to be used for flue gas sulfur dioxide removal and collection associated with coal-fired boilers. Coal-fired boilers applicable to this specification are those designed with capacities ranging between 6.30 and 31.50 kg of steam per second 50,000 and 250,000 pounds of steam per hour. The design shall be as a system where one manufacturer is responsible for the fabric filter baghouse and the dry FGD scrubber. There are probably no manufacturers that can meet all the specifications. Discretion must be exercised to determine which deviations are acceptable. Removing either the dry FGD or the fabric filter baghouse out as a separate design or purchase is not acceptable.
PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 GENERAL REQUIREMENTS

1.2.1 Mechanical General Requirements

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section.

1.2.2 Electrical General Requirements

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, applies to this section.

1.2.3 General Application of Reference Specifications

In regard to referenced Federal Specifications and Military Specifications, the following exceptions apply:

a. Preproduction samples are not required.

b. Certified test reports are not required.
c. The preservation and packing requirements shall be the manufacturer's standard method.

1.2.4 Steam Generators

**************************************************************************
NOTE: Use fuel oil that is available at activity and that can be burned in the steam generators. A similar fuel oil should be used in all steam generators. The maximum steam demand shall be determined by the activity and the number of steam generators shall reflect turn down ratios, low steam demand, and swing conditions.
**************************************************************************

The steam generators will be [stoker] [pulverizer] coal-fired and will also be capable of 100 percent oil firing. Boilout and start-up of the boilers will be with No. [_____] fuel oil. The steam generators will be used to supply steam to [a steam distribution system serving process and space heating loads] [a cogeneration system]. Consequently, the units will operate with a wide load range and rapid load changes. The maximum steam demand can be met by operation of [_____] steam generators. A steam generator will be available for emergency or standby service.

1.3 DEFINITIONS

**************************************************************************
NOTE: Refer to ICAC FGD1 for additional flue gas desulfurization terminology.
**************************************************************************

a. Adiabatic Saturation Temperature: The temperature resulting when water is evaporated into the flue gases, in adiabatic process, until the flue gases are saturated. The adiabatic saturation temperature is equal to the wet-bulb temperature.

b. Approach Temperature: The temperature difference between the actual temperature of a given gas-vapor mixture and the adiabatic saturation temperature of that gas-vapor mixture.

c. Spray/Dryer: An apparatus in which flue gas is contacted with a slurry or solution such that the flue gas is adiabatically humidified and the slurry or solution is evaporated to apparent dryness.

d. Stoichiometry: The moles of slaked sorbent introduced to the system divided by the moles of sorbent theoretically required for complete reaction with all of the sulfur dioxide entering the system whether or not it is all removed.

1.4 DESIGN REQUIREMENTS

1.4.1 Detail Drawing

1.4.1.1 Dust Collector System

Submit drawings and diagrams necessary to erect, install, startup, and place the FGD system into regular operation. Indicate the kind, size,
arrangement, weight of each component, and breakdown for shipment; the external connections, location of local controls, remote control panels, anchorages, and support required; the dimensions needed for installation and correlation with other materials and equipment; and structural steel and foundations. Submit fabrication details including reinforcing and embedded items cutouts, holes, welds, and attachments, and identify components with piece mark numbers. Include the erection, assembly, and installation sequences, and the tolerances to be maintained in erection, assembly, and installation.

1.4.1.2 Dust Collector Components

Submit drawings for each component showing design and assembly. Include the arrangement of internal apparatus and components, and the location of internal piping, tubing, valves, wireways, busses, and terminal blocks, and flow diagrams with flow rates, pressures, temperatures, valving, and instrumentation. Submit drawings for each gage board, instrument rack, mounting plate, and transmitter bracket showing at least the construction features, bracing, brackets, device mounting holes, and dimensions required for fabrication. Submit schematic drawings of processing sensing lines for each type of installation, instrument, or special case including water level columns and draft lines. Submit layout drawings of control boards and system cabinets showing component arrangement. Submit drawings for each graphic subpanel, to include symbols, flow lines, indicating lights, switches and other devices. Damper submittals shall indicate information for the general arrangement and outline, insulation, instrumentation, erection, electric motors, details of seal air systems, and design flows and pressures for transmittal to damper manufacturers. For instrument and control devices, submit outline drawings and listing of tag numbers for each type of device furnished. One drawing may be used for devices of the same type, but the drawing shall be marked to list the tag number of devices to which it applies. Indicate tag numbers on device drawings, instrument lists, functional diagrams, and logics. Include drawings that apply to each item listed below.

a. Spray dryer sulfur dioxide absorbers
b. Lime system
c. Dampers
d. Instruments and control devices
e. Control panels
f. Electric motors
g. Atomizers
h. Fabric filter baghouse
i. Ductwork
j. Expansion joints
k. Fans
l. Pumps
m. Access systems

1.4.1.3 Piping Drawings

Submit general arrangement and outline, piping fabrication, erection, piping connection, valves, pipe hangers, insulation, and instrumentation. Contractor shall submit complete drawings for piping furnished in plan and elevation. Submit dimensions required for fabrication and assembly of piping components and location of field joints and identify components with piece mark numbers, location of hangers and supports, and the location of instrument, vent, and drain connections. Submit drawings showing approximate field routing for instrument control tubing bundles. Include details of engineered hanger assemblies showing plan location, elevations of piping and support steel in the design, cold and hot positions, design loads, and a complete bill of materials.

1.4.1.4 Wiring Diagrams

Include a wiring diagram with each wire or wire bundle shown by a line, or a point-to-point type wiring diagram with individual wire designations listed at the location of each termination and identify device and equipment terminals, and internal and external connection terminal blocks.

1.4.1.5 Schematic Control Diagrams

Submit elementary diagrams of control and alarm functions, both internal and external to the equipment, wire colors, ANSI symbols circuit designations, and identify external connection terminals and terminal blocks. Submit process and piping instrumentation diagrams, analog control system functional diagrams and associated logic, logic diagrams of digital systems, flow charts or word logic of software systems, description of operation of each control system, electrical interconnection drawings showing external terminal blocks for each input, output, and power cable connection and destination of other end of cable, analog and digital signal input and output lists, and nameplate lists.

1.4.1.6 Printed Circuitboards Information

Include a schematic diagram and board photographs or component layout drawings, with parts labeled, for each type of board and as a parts list containing complete description of discrete components and integrated circuits.

1.4.2 Calculations

Submit hangar load calculations and equipment foundation design loading requirements for conditions of testing and operation including a loading plan showing design base loads for each piece of equipment and equipment support. Submit FGD system panelboard heat load for use in design of control room air-conditioning system.

1.4.3 Additional Product Data

For resistance temperature detectors, submit calibration curve showing predicted resistance versus temperature for the range of 0 °C to 1,000 degrees C 32 to 1832 degrees F. For vanes and dampers requiring control drives, submit the maximum allowable torque and forces to avoid damage to the damper or vane components. For insulation, include a tabulation including manufacturer, manufacturer's designation, and complete
specifications including density, thermal conductivity, sound transmission loss, flexural strength, compressive strength, temperature rating, and dimensional stability. Submit detailed specifications of any rubber hose and rubber-lined pipe proposed for use. For electric motors, submit nameplate data for motors including the manufacturer's name, model, serial number, type and frame designation, power horsepower rating, and time rating. For fans, provide octave band sound pressure levels, fan performance curves, class, air flow, pressure, power horsepower, and efficiency. For draft equipment, submit certified performance data including performance curves showing flow vs. head, efficiency and brake power horsepower from zero flow to at least 120 percent of maximum design flow.

1.5 QUALITY ASSURANCE

1.5.1 Manufacturer Experience

**************************************************************************
NOTE: Contractor equipment used for experience requirements shall be at least as efficient as local or state percent sulfur dioxide removal regulations.
**************************************************************************

The Contractor shall have successfully met air pollution emission requirements on two coal-fired boilers each with a minimum of 4719 L/s 10,000-actual cubic feet per minute (acfm) or larger similar spray dryer sulfur dioxide absorber and fabric filter baghouse systems. The completed system shall have utilized lime slurry as the absorbent material. Slurry atomization shall have been by rotary atomization or by two-fluid nozzle atomization. The completed system spray dryer sulfur dioxide absorber shall have been designed for and operated at inlet flue gas temperatures of 177 degrees C 350 degrees F or less, and shall have achieved at least ______ percent sulfur dioxide removal including sulfur dioxide removal in the baghouse during performance testing. The Contractor shall have also successfully met air pollution emission requirements at least five fabric filter baghouse installations of a size comparable to or larger than that [proposed][bid]. At least two of the five installations shall have been a fly ash application and at least two of the five shall have utilized the pulse jet cleaning method. The Contractor shall also have provided at least one dry FGD system on a coal-fired boiler that has been utilizing a spray dryer sulfur dioxide absorber and a fabric filter baghouse is in operation at least 24 months prior to the close of bid date for the proposed system. The previous commercial system shall have the following design features in common with the system to be provided under this contract:

a. Lime slurry preparation system including storage bin and lime slaker;

b. Rotary atomization, or two-fluid nozzle atomization using compressed air;

c. Spray dryer design inlet temperature of 177 degrees C 350 degrees F or lower; and

**************************************************************************
NOTE: 80 to 85 percent sulfur dioxide removal is possible with most commercial units. Negotiate with most commercial units. Negotiate with state and local air pollution authorities prior to bidding
emission trading should be utilized. Emission trading includes trading, off-sets, and banking. Ensure that any reductions in emissions are banked for future use or sale.

**************************************************************************

d. Minimum [_____] percent sulfur dioxide removal over a gas flow range of 30 percent to 100 percent of design gas flow. Process control system used and instrumentation provided shall be the same as those in applications at pilot plant or commercial installations use for qualifying experience.

1.5.1.1 Auxiliary Manufacturer Experience

The lime slurry individual equipment may be the manufacturer's standard, but the particular combination of that equipment into a lime slurry preparation system shall have a history of successful and reliable operation for a period of at least three years. Mechanical draft equipment and appurtenances and ductwork and expansion joint equipment and materials shall have an acceptable history of satisfactory reliable operation in industrial steam plant use for a period of at least three years at comparable temperature, pressure, voltage, and design stress levels. The Contractor shall provide information necessary to demonstrate history of operation.

1.5.2 Certificates

1.5.2.1 Pipe Welding Procedures

Submit the welding procedures and the heat treatment records for pipe fabrication.

1.5.2.2 Weld Testing Procedures

Describe procedures for nondestructive testing which shall be performed on the welds or base material of the fans.

1.5.2.3 Welding Shops

Submit certification that welding shops are qualified as specified.

1.5.2.4 Qualifying Experience Certification

Submit proof that the dust collector manufacturer has installed the following systems:

a. Spray dryer system
b. Lime slurry system
c. Mechanical draft equipment
d. Fabric filter baghouse
e. Dry FGD systems

Manufacturer shall certify that no failures have occurred on this type collector built by the manufacturer within 5 years preceding contract award date, as required by paragraph entitled "Certification."
1.5.2.5 **Factory Test Certification**

Submit certificates of completion of factory tests of mechanical draft equipment.

1.5.2.6 **Dry FGD System Experience Certification**

Indicate compliance with paragraph entitled "Quality Assurance." Submit a listing of other applications of the [proposed] [bid] dry scrubber system within the range of 4719 to 47,190 L/s 10,000 to 100,000 acfm and shall have demonstrated operation for 8,000 hours. Include a narrative description of the specific design changes which must be made to apply application experience to dry flue gas desulfurization (FGD) systems. Specifically note the use of the completed dry FGD system test results to verify the feasibility of the design changes. Information to be contained in the certificate shall include:

a. List of at least two installations meeting the requirements set forth in the paragraph entitled "Manufacturer Experience."

b. Owner and location of each such installation including name of contact, address, and telephone number.

c. Design inlet gas volume, actual liter per second cubic feet per minute; inlet gas temperature, degrees C degrees F; inlet dust loading, grams per liter grains per acf; outlet dust loading; grams per liter grains per acf; and dry FGD system model number.

d. Type of coal-fired boiler.

e. Description of fabric filter bag material and cleaning mechanism.

f. Completed bid forms for dry FGD systems.

1.5.3 **Test Reports**

1.5.3.1 **Pump Tests Reports**

Include certified curves showing pump performances.

1.5.3.2 **Damper Tests Reports**

In each damper factory test report, report, discuss the test conditions, results, defects found and corrective action taken. In lieu of factory tests on poppet dampers, include the results of field tests performed on similar installations.

1.5.3.3 **Dust Collector Model Tests Report**

Submit model test reports within 30 days of test completion. The test reports shall include a scale drawing of the model showing actual dimensions and a scale drawing of the full-size installation showing modifications made and devices added to the ductwork and transitions as a result of the model study. The test report shall also include uniform gas velocity diagrams and histograms, indicating the root mean square velocity deviation, standard deviations, and mean velocity, at strategic locations which shall include, but not be limited to the following:
a. Inlet to spray dryer sulfur dioxide absorbers.
b. Inlet to baghouse.
c. Inlet to each fabric filter baghouse module.
d. Inlets to induced draft fans.
e. Stack inlet.
f. Two stack diameters located downstream of the stack inlet.

Submit a complete explanation of the test procedures including flow rates, pressures, sample calculations and assumptions prior to testing. Deviations in dynamic or geometric similitude by the model from the full-size installation shall be listed and justified. Conclusions that show type and location of devices required for proper gas distribution and modifications necessary to the proposed ductwork, that result from model testing, shall be incorporated into the Contractor's final ductwork design. The report should recommend the location of test ports, the location and type of flow distribution devices in stack, and the location of gas flow instrumentation points and monitors. Provide a complete listing of pressure drop data taken at each pressure tap during each test run and also include data from runs before and after the addition of supplemental flow distribution devices that correct distribution problems identified by initial runs. Pressure taps shall be located as required to accurately determine the pressure drop across critical ductwork components and the effect of the additional distribution devices on the pressure drop. Submit with the report a complete set of photographs and videotapes recordings of model during air flow test.

1.5.3.4 Instrument Calibration and Testing

For instrument calibration and testing, certify that instruments were calibrated and testing readings indicated are true, that computations required for testing are accurate, that acceptable methods were used, and that the equipment satisfactorily performed in accordance with the requirements.

1.5.4 Records

Submit text of each required posted operating instructions. For device purchase information, submit data or specification sheets for each device furnished by this contract. These sheets shall be the actual sheets used for ordering and fabrication, and shall include the final vendor's own sheets, where applicable, in addition to the Contractor's purchase order forms. Provide an index for the data sheets. These sheets shall include technical data for the devices including tag number, manufacturer, complete catalog or model number, scale range, complete electrical information including current voltage ratings, contact action (SPST, DPDT, etc.), data or specification sheet number, scheduling information showing dates for ordering, fabrication, shipment, etc., manufacturer's data for tubing, fittings, valves and accessories, and material.

1.5.5 Model Test

**************************************************************************
NOTE: Contracting Officer shall have authority to select an experienced modeller from list supplied by
contractor.

**************************************************************************

NOTE: Test model system scale shall meet good engineering practices. In no case shall scale be less than 1:100 1/8 scale.

**************************************************************************

NOTE: Dust used for testing shall be sifted, bleached wheat flour or approved vendor selection.

**************************************************************************

Conduct a three-dimensional model study as defined in ICAC EP-7 to verify air flow design of the spray dryer sulfur dioxide absorbers, ductwork, fabric filter baghouse, and inlet transition to stack and to determine the flow distribution and requirements for distribution devices to provide adequate operating conditions in all of the equipment. The model study shall be used by the Contractor to determine flow distribution and pressure drop through out the system. Make necessary modifications to the model to minimize pressure drop in ductwork. The scope of the model study shall begin at the [economizer][air heater] outlets and end in the inlet transition to the stack. Model shall represent the complete system, as specified, reduced to not less than 1:100 1/8 scale. Test model shall have dimensional tolerance of plus or minus 1 1/2 mm 1/16 inch. Dynamic and geometric similitude shall be observed in all phases of the model study. Flow conditions in the spray dryer sulfur dioxide absorbers, fabric filter baghouse, ductwork, and inlet transition to the stack shall be tested and the results submitted to the Contracting Officer. Flow and dust distribution tests shall be performed at 30 percent, 50 percent, 75 percent, 100 percent, and 125 percent of maximum continuous flow rating. The Contractor shall notify the Contracting Officer no less than 15 working days before the tests are scheduled to be made so that Contracting Officer may witness test. Dust used for testing shall be [_____] 1.5.6 Tabulations

Submit a tabulation of piping connections with each assigned a unique designation including size and type of each connection in all views. Submit a tabulation of valves furnished, with each assigned a unique designation including manufacturer, pressure and temperature rating, body material, trim material, and manufacturer's model or figure number, and a detailed cross section of each different model or figure number, and valve. Submit a tabulation of instruments and instrument connections furnished in spray dryer sulfur dioxide absorbers, fabric filter baghouse, ductwork, and auxiliary equipment. Assign a unique alphanumeric designation and show type, location, and quantity for each connection.

1.6 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity
or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Tabulation of piping connections
Tabulation of valves
Instruments and instrument connections

SD-02 Shop Drawings

Dust collector system
Dust collector components
Piping drawings
Wiring diagrams
Schematic control diagrams
Printed circuitboards

Model testing shall be completed and approved prior to submittal
of drawings. Drawings of typical installations will be acceptable provided that the individual applications are noted.

SD-03 Product Data

Vanes and dampers
Insulation
Mechanical draft equipment
Pumps
Atomizers
Motors
Lime system component equipment
Instrumentation and control devices
Piping
Ductwork
Fabric filter baghouse
Fans
Expansion joints
Bag material
Fabric filter
Valves
Spray dryer sulfur dioxide absorbers
Control panels
Monorail and hoist
Resistance temperature detectors
Rubber hose and rubber-lined pipe

SD-05 Design Data

Equipment foundation design loading requirements
Hangar load calculations
FGD system panelboard heat load
Guillotine dampers design pressures and flows

SD-06 Test Reports
Lime system component equipment
Instrumentation and control devices
Atomizers
Piping
Pump tests
Bag material
Fans
Motors
Damper tests
Mechanical draft equipment
Instrumentation and control devices
Dust collector model tests
Smoke tests
System stoichiometry tests
System power consumption tests
Instrument calibration and testing

Include field data sheets and show the calculation of stoichiometry with stoichiometry field test report. Include an explanation of the method used for the system power consumption determination.

SD-07 Certificates
Pipe welding procedures
Weld testing procedures
Welding shops
Qualifying experience certification
Dry FGD system experience certification
Factory test certification

SD-10 Operation and Maintenance Data
Atomizers, Data Package 3
Fans, Data Package 2
Lime system component equipment, Data Package 2
Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Include the manufacturer's recommended supply list for each type of instrumentation recorder furnished. The lists shall include as minimum information, the chart paper type, size, and order number, ink type (cartridge or pen) order number, capillary tube order number, and pen point order number.

**SD-11 Closeout Submittals**

**Device purchase information**

**Posted operating instructions**

1.7 DELIVERY AND STORAGE

Equipment shall be shipped factory assembled, except when the physical size, arrangement, or configuration of the equipment, or shipping limitations, makes the shipment of assembled equipment impracticable.

1.8 AMBIENT ENVIRONMENTAL REQUIREMENTS

**************************************************************************
**NOTE: Insert extreme temperatures experienced at site. Do not use heating or cooling design conditions.**************************************************************************

The dry FGD system design shall be such that the electrical equipment shall perform satisfactorily in the ambient environment of [_____] to [_____] degrees C degrees F and [_____] to [_____] percent relative humidity.

1.9 EXPERIENCE CLAUSE

1.9.1 Certificate

**************************************************************************
**NOTE: Select air flows, temperatures, and dust loadings similar to design conditions.**************************************************************************

Units which have been replaced within 3 years of start-up, have had retrofit, overhaul, or repair cost exceeding 10 percent of the original price of the collector (excluding transportation and erection), have failed to meet specified removal efficiency, or have allowed emissions to exceed specified limits shall be considered failures. Off-line time exceeding five percent of the planned annual operation or 300 hours per annum, whichever is less, within the first 3 years of operation due to collector
or component failure shall be considered a failure. System failure due to natural disaster or a result of damage from fire or explosion in appurtenant structures will not be considered failure. Pilot or research projects will be excluded from failure analysis. The certificate must certify that the manufacturer has constructed not less than two dry FGD systems of the same design as proposed for this project treating flue gas from a boiler with [automatic][manual] combustion control [and a mechanical cyclone-type dust collector]. Each dry FGD system shall have performed satisfactorily, normal maintenance or downtime of the associated [boiler][dust collector] included, for a period of not less than 2 years treating at least [_____] L/s acfm of inlet gas at a temperature of at least [_____] degrees C degrees F, with inlet dust loading of at least [_____] grams per liter grains per acf and outlet dust loading of at most [_____] grams per actual liter grains per actual cubic feet. In determining this experience:

a. Only collection of fly ash as produced by [pulverized coal-fired boilers] [stroker coal-fired boilers] is considered as equivalent experience.

b. Only experience at the maximum continuous flow rate, plus or minus 40 percent, maximum continuous inlet flue gas temperature, plus or minus 46 degrees C 50 degrees F, and maximum continuous inlet dust loading, plus or minus 50 percent, is acceptable.

1.10 OPERATOR TRAINING PROGRAM

Provide an organized training program for the Government's operating personnel including the system specified herein. The purpose of the training program is to familiarize personnel with the operation and maintenance of the flue gas cleaning system and the individual equipment components. The training program shall be designed to provide the operators with a working knowledge of the theory and principles of operation of the system, the activities required for operation and control of the system and the tools and techniques required for maintenance of the system. The training program shall provide classroom instruction, testing, and hands-on training to ensure that operators who complete the organized program will be able to operate and maintain the flue gas cleaning system for the Government. Furthermore, the training manuals and testing materials shall provide information so that, in conjunction with the operation and maintenance manuals furnished under this contract, future training of new operators can be accomplished without the assistance of the Contractor.

1.10.1 Training Manuals

Provide training manuals covering the complete FGD system and including separate sections devoted to each major equipment item including spray dryer sulfur dioxide absorbers, fabric filter baghouses, lime system, induced draft fans, and system control panel. Each section shall include equipment description, principles of operation, control philosophy, control hardware, and relation to other equipment. Furnish [_____] copies and an original of the complete training manual.

1.10.2 Testing Program

Furnish a written testing program designed to objectively determine the individual level of comprehension of the material presented in the training program to the participants. Use the testing program in conjunction with
the classroom instruction. Provide [_____] copies of the complete testing program.

1.10.3 Classroom Instruction

Develop and present 40-hour course of organized classroom instruction by experienced engineers. The classroom instruction shall cover theory and principle of operation and shall utilize and augment the information provided in the training manuals. Administer the testing program at the conclusion of the course. Present the course at least twice in order to accommodate Government operating personnel. The Contractor shall arrange with the Contracting Officer for classroom space and times for the classes to be given.

1.10.4 Field Instructions

Service engineer shall provide 8-hour per day supervision of the system for a period of 30 days after start-up to assist and instruct Government's operations. Instruction shall include, but not be limited to the following:

a. Actual start-up and shutdown of the FGD system for each boiler.

b. Indoctrination to the lime handling system, stressing safety.

c. Remove and install one atomizer.

d. Disassemble and assemble one atomizer to the extent required for normal maintenance.

e. Review of instrument, gage, and control functions in the control room.

f. Deliberate upset of FGD system and instruction on making necessary corrections.

g. Simulation of induced fan failure.

h. Review of fabric filter baghouse maintenance including removal and replacement of bags.

1.10.5 Video Recording

Furnish color video tapes made during field instruction or prepared color video tapes covering the field instruction material. Video tapes instruction and hands-on-training, along with prepared video instruction tapes, shall become the property of the Government.

1.11 MODEL DELIVERY

The model shall remain the property of the Government, and shall be delivered to the Government upon request by the Contracting Officer within one year of start-up. The model shall include a support table as part of the deliverable items.

1.12 POSTED OPERATING INSTRUCTIONS

Provide for the following:

a. Atomizers
b. Lime feeders  
c. Baghouse  
d. Lime slakers  
e. Lime unloading

PART 2 PRODUCTS

2.1 APPLICATION

**************************************************************************
NOTE: Refer to ICAC FGD1 for additional flue gas desulfurization terminology.
**************************************************************************

The Flue Gas Cleaning System and induced draft fans shall be used to control emissions of sulfur dioxide and particulate matter and furnace draft from steam generators. The steam generators will be [stoker][pulverized] coal-fired and will also be capable of 100 percent oil firing. Boilout and start-up of the boilers will be with No. [_____] fuel oil. The steam generators will be used to supply steam to [a steam distribution system serving process and space heating loads][a cogeneration system]. Consequently, the units will operate with a wide load range and with rapid load changes. The maximum steam demand can be met by operation of [_____] steam generators. A steam generator will be available for emergency or standby service. A separate FGD system for each steam generator as indicated. Also, provide facilities for reagent storage, preparation, and feed. The system shall be designed to use lime as the alkali material.

2.2 EQUIPMENT AND MATERIALS PROVIDED UNDER THIS CONTRACT

**************************************************************************
NOTE: It is not the intent of this specification to require a reagent recycle system. Life cycle cost analyses indicate that the reasonably expected lime savings do not justify the additional capital and operating costs for a recycle system. Proposers or bidders including a recycle system as an essential portion of their process must include in their scope of supply equipment and material required for a complete and operational recycle system including all necessary instrumentation and controls. The proposer's or bidder's scope of supply must include all ash handling and conveying equipment associated with the recycle system.
**************************************************************************

Equipment to be provided under this contract includes the items listed below and other equipment required for a complete and operable FGD system although not specifically mentioned in these specifications. The following items are listed for the convenience of the Contractor in understanding the scope of supply.

2.2.1 Spray Dryer Sulfur Dioxide Absorbers

**************************************************************************
Provide spray dryer sulfur dioxide absorbers, complete with slurry atomizers, inlet gas dispersers, conveying system for continuous removal of absorber products, absorber product holding bin(s), frames for penthouse and hopper enclosures, mechanism for atomizer removal, and spare atomizers. For systems utilizing two-fluid nozzle atomizers, provide a dedicated air compressor system to provide air for slurry atomization.

2.2.2 Fabric Filter Baghouse

Provide fabric filter baghouses, complete with inlet and outlet manifolds, pulse jet or reverse gas cleaning systems, bags, bag attachment and support hardware, and frames for penthouse and hopper level enclosures.

2.2.3 Lime Slurry Preparation System

Provide lime slurry preparation system including lime feed bin, fill pipe and truck unloading connection, bin vent filter, bin vibrators, lime feeders, slakers, grit removal equipment, slaker product tank, agitators, and drives. Provide accessory equipment and control panels to control lime slurry preparation system. Provide tanks as required by specific system design including slurry mixing tanks, feed tanks, and head tanks.

2.2.4 Pumps, Valves, and Motors

Provide pumps including slurry feed pumps and process water pumps. Provide sump pumps as required as a result of the specific system design. Provide water, slurry and air piping (excluding field-installed instrument air tubing), piping support systems, valves, and expansion joints required for the FGD system within the battery limits indicated. Provide electric motors for induced draft fans, pumps, and other equipment included in this system. Provide motor control centers as required for motors furnished under this contract rated at 480 volts and less. Provide separate motor control centers for each spray dryer absorber-baghouse unit, and for the lime slurry preparation system, complete with internal controls wired and interlocked together and brought out to terminal blocks for remote field connection by the Contractor.

2.2.5 Ductwork and Draft Equipment

Provide induced draft fans including inlet boxes, dampers, and drives. Provide ductwork between [economizer][air heater] outlet interfaces and stack inlet including spray dryer absorber bypass reheat ducts, as necessary. Provide test ports. Provide expansion joints, turning vanes, dampers, damper operators, and seal air systems including fabric filter baghouse dampers. Provide gas distribution devices in ductwork ahead of baghouse to assure even flow of gases into baghouse.

2.2.6 Instrumentation and Control Devices

Provide system controls and instrumentation including local control panels and a remote control panel to be located in the main plant control room.

2.2.7 Structural and Miscellaneous Steel

Provide structural and miscellaneous steel including structural steel for
support of equipment, ductwork, platforms, walkways and stairs, and miscellaneous framing. Provide stairs, walkways and access platforms, and as required for normal operation and maintenance.

2.3 SITE FABRICATED AUXILIARY CONSTRUCTION

**************************************************************************
NOTE: Penthouse and hopper enclosures shall be specified. Enclosed areas improve maintenance and lower heating requirements.
**************************************************************************

Provide concrete foundations with anchor bolts conforming to ASTM A307 for structural steel columns and equipment. Also, provide metal siding and roofing, insulation, doors, windows, and heating and ventilating equipment for spray dryer sulfur dioxide absorber, for fabric filter baghouse penthouse and hopper enclosures, and for the lime slurry preparation system enclosure. Provide insulation and lagging including necessary subgirts for spray dryer sulfur dioxide absorbers, baghouses, and ductwork. Also, provide insulation and heat tracing for piping, as necessary, and in accordance with the equipment specification requirements. Provide a remote bulk lime storage silo, conveying system, and piping for connection to Contractor's lime feed bin fill piping. Provide ash conveying equipment from hopper flanges on the fabric filter baghouses and the absorber product holding bins. Also, water storage tanks along with potable (non-process) water piping, fire protection water piping, and field-installed instrument air tubing. Provide electrical field wiring and conduit, lighting, and motor control centers for 4,000-volt motors.

2.4 SITE CONDITIONS

**************************************************************************
NOTE: Dry and Wet Bulb Temperature and Duration:
**************************************************************************

<table>
<thead>
<tr>

Contractor shall use site conditions of elevation, design ambient temperature, and design dry and wet bulb temperature, and duration (differentiate for different seasons including frequency of occurrence of higher temperatures) specified.

2.5 OPERATING INSTRUCTIONS

2.5.1 Steam Generators

The system shall be designed for operation with [the boiler(s) specified in [_____] [boiler(s) manufactured by [_____] Type [_____] Model No. [_____]]. The steam generator is [a new] [an existing] [pulverized coal-fired] [spreader stoker-fired] [underfeed stoker-fired] boiler. Operating conditions for each steam generator at its maximum rating are:

a. Type firing [_____]  
b. Steam flow, kg/s lb/hr [_____]  
c. Steam pressure, kPa (gage) psig [_____]  
d. Steam temperature, degrees C degrees F [_____]  
e. Gross heat input, kW 106 Btu/hr [_____]  
f. Excess air leaving boiler, percent [_____]  
g. Grade elevation, meters feet above mean sea level [_____]  

For purposes of the proposal, the Contractor shall assume that the gross heat input at any fractional load rating is that same fraction of the maximum rated heat input given above.

2.5.2 Fuels

The steam generator shall utilize a fuel with following properties:

Coal:

NOTE: Coal sources vary year to year when purchased by Defense Fuel Supply Agency (DFSA). Request a contract for a longer period of time. Specified coal properties shall be maintained throughout length of contract.
**a. Source:**

</tr>
</tbody>
</table>
Oil burned in the steam generators will be grade [_____] fuel oil conforming to ASTM D396. Boiler combustion is controlled [manually] [automatically]. The standby fuel is [_____] .

2.5.3 Lime

******************************************************************************
NOTE: Contract for lime shall be for a period longer than one year. Ca0 content and amount of grit shall be maintained throughout length of contract.
******************************************************************************

The lime to be used in the system will be high-calcium pebble quicklime (20 mm by 0) (3/4 inch by 0). The high-calcium pebble quicklime will have a "high" reactivity as defined and as determined by ASTM C110. The expected chemical analysis based on ASTM C25 is as follows:

<table>
<thead>
<tr>
<th>Typical, Percent</th>
<th>Range, Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ca0 (Available)</td>
<td>92.0</td>
</tr>
<tr>
<td>Ca0 (Total)</td>

<td>0.7</td>
</tr>
<tr>
<td>Fe2O3</td>
<td>0.09</td>
</tr>
<tr>
<td>A12O3</td>
<td>0.07</td>
</tr>
</tbody>
</table>

2.5.4 Slaking Water

The water to be used for lime slaking will be boiler blowdown which has been diluted with city water for cooling to a temperature of 38 degrees C 100 degrees F. The following water quality criteria will be maintained:

<table>
<thead>
<tr>
<th>Constituent</th>
<th>Concentration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Combined sulfate, sulfite and bisulfate ions</td>
<td>Less than 500 mg/l</td>
</tr>
<tr>
<td>Constituent</td>
<td>Concentration</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Total dissolved solids</td>
<td>Less than 1,000 mg/l</td>
</tr>
<tr>
<td>Total suspended solids</td>
<td>Less than 100 mg/l</td>
</tr>
</tbody>
</table>

2.5.5 Process Water

**************************************************************************
NOTE: Due to the variable proportioning of the plant wastewater streams which will make up the process water, the quality of this water is expected to be more variable than that of the slaking water.
**************************************************************************

FGD system processes other than lime slurry preparation and slurry line flushing will utilize plant wastewater. Plant wastewater will consist of a mixture of variable proportions of boiler blowdown, cooling tower blowdown, process wastewater and potable water.

2.5.6 Compressed Air

**************************************************************************
NOTE: When retrofitting an existing power plant specify increased volume for compressed air system. Insulate system where applicable. Compressed air supplies will be as follows.
**************************************************************************

1. Service Air: [_____] kPa (gage) psig, dew point up to [_____] degrees C degrees F at [_____] kPa (gage) psig.

2. Instrument Air: [_____] kPa (gage) psig, dew point [_____] degrees C degrees F at [_____] kPa (gage) psig.

3. Instrument Air (for outdoor use): [_____] kPa (gage) psig, dew point [_____] degrees C degrees F at [_____] kPa (gage) psig.

**************************************************************************

The FGD system utilizes compressed air supplies for service air and indoor and outdoor instrument air.

2.6 DESIGN PARAMETERS

2.6.1 Expected Flue Gas Conditions

**************************************************************************
NOTE: Pressures, rates, and duration of sootblowing will depend on site conditions and acceptable operating procedures.
**************************************************************************

Flue gas conditions leaving each steam generator are expected to be as follows: (at [economizer][air heater] outlet, except as noted).
<table>
<thead>
<tr>
<th></th>
<th>Design</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Gas flow, L/s</td>
<td></td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Normal operation**

**During sootblowing**

| f. S02, lb/hr (full load) |        |       |

Conditions during sootblowing are based on the injection of steam [_____] kPa (gage) psig at a rate of [_____] kg/s lbs/min during the sootblowing cycle. The cycle is expected to last approximately [_____] minutes.

2.6.2 Spray Dryer Absorbers

**************************************************************************
NOTE: Specified percent sulfur dioxide removal must be identical to paragraph entitled "QUALITY ASSURANCE."
**************************************************************************

Each spray dryer absorber shall be designed in conjunction with its associated fabric filter baghouse to remove a minimum of [_____] percent of the sulfur dioxide present in the flue gas leaving the steam generator for any flue gas condition specified and burning any coal within the range specified.
2.6.3 Fabric Filter Baghouses

NOTE: Emission rates will depend upon local or state air pollution regulations. Negotiations with the agencies may be necessary.

NOTE: Typical fly ash densities are 560 kg/m$^3$ 35 lbs/ft$^3$ for hopper design capacity and 1440 kg/m$^3$ 90 lbs/ft$^3$ for hopper design load.

NOTE: Dry and Wet Bulb Temperature and Duration:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Season</th>
<th>Temperature (Degrees</th>
<th>Frequency of Occurrence of Higher Temperatures</th>
</tr>
</thead>
<tbody>

Each fabric filter baghouse shall be designed to reduce maximum particulate emissions leaving the baghouse to not more than [_____] kg/10^6 kJ lbs/10^6 Btu of heat input to the boiler for any gas flow conditions specified and burning any coal within the specified range. Each fabric filter baghouse shall be divided into a minimum of flue modules. The maximum air-to-cloth ratio excluding one module for cleaning and one module for maintenance shall be 4.0 for pulse-jet units or 2.25 including the reverse gas volume, for reverse gas units with the spray dryer operating at the design gas flow specified in paragraph entitled "Expected Flue Gas Conditions." Calculation of air-to-cloth ratio for reverse gas fabric filter baghouses shall exclude thimble, ring, and cuff area covered by bags. Pulse-jet fabric filter baghouses, if provided, shall be designed for off-line...
cleaning during normal operation with the capability for on-line cleaning when required. Reverse gas fabric filter baghouses shall provide a maximum of three-bag reach. Reverse gas bag cleaning systems shall provide a minimum of 9 liter per second per square meter 1.75 cubic feet per minute per square foot of fabric to be cleaned. Hopper capacity shall allow for a minimum of ten hours storage at maximum fly ash and absorber product material loading. Hopper design capacity shall be based on a fly ash density of [_____] kilogram per cubic meter pounds per cubic feet. Hopper design strength shall be based on fly ash density of [_____] kg per cubic meter pound per cubic feet plus the support of 454 kg 1,000 pounds of ash handling equipment per hopper. Structural design shall be based on the assumption that the hopper is full of ash up to the bottom of the bags for pulse-jet units or up to the tube sheet for reverse gas units. Fabric filter baghouse structural design temperature range: [_____] to [_____] degrees C degrees F.

2.6.4 Lime Slurry Preparation System

**************************************************************************
NOTE: Design slaker enclosure with adequate access area around feeders, slakers, and grit removal equipment to perform required maintenance.
**************************************************************************

A single lime slurry preparation system shall serve all spray dryer absorbers. The lime feed bin shall be sized to store at least the quantity of lime required for 72 hours operation of two steam generators at the maximum sulfur dioxide rate specified and at the guaranteed stoichiometry. The minimum storage volume shall be [_____] cubic meter feet. Provide the bin with two conical hoppers. The lime feed bin shall be capable of receiving lime either directly from self-unloading blower trucks or from a remote silo and pneumatic conveying system to be provided by the Contractor. Lime shall be slaked with detention or paste-type slakers. Two full-capacity lime feeders and slakers shall be provided. Each lime feeder and slaker shall be sized to provide 110 percent of the slurry quantity required during operation of 2 steam generators at the maximum sulfur dioxide rate specified. The turndown capability from this design capacity shall be at least 10 to one. The lime slurry preparation system shall provide 100 percent installed spare capacity feeders, slakers, and grit removal equipment. The lime slurry system will operate with one equipment train in operation and one as backup. The FGD system control panel in the steam plant control room shall provide complete operational monitoring of and alarm annunciation for each equipment train. Capability for emergency shutdown of the lime slurry preparation system shall be provided at the FGD system control panel. Failure of the operating equipment train to respond to the automatic start signal from the low tank level switch shall be alarmed in the control room. The slurry tank storage capacity between the low and low-low levels shall be sufficient to allow time for the control room operator to dispatch operations personnel to the lime slurry preparation system to start-up the backup train and to provide slurry to the tank before the low-low level is reached. Enclosed feeders shall include equipment to protect the lime from moisture. Slakers shall discharge slurry by gravity flow into product tank. Slurry preparation system shall include positive means of removing sufficient grit from the slurry to assure proper operation of the slurry feed system and the spray atomizers. Grit shall be conveyed to a disposal bin provided by the Government. Provide emergency eyewash stations at each level in the lime slurry preparation system enclosure. Provide piping to exterior of enclosure for connection to potable water piping system provided by the
2.6.5 Ductwork

**************************************************************************
NOTE: Ductwork velocities shall be such to maintain self-cleaning conditions.
**************************************************************************

Ductwork upstream of the fabric filter baghouse outlets shall be designed for a velocity of [_____] meter per second feet per minute at the design flue gas flow, specified in paragraph entitled "Expected Flue Gas Conditions." Ductwork downstream of the fabric filter baghouse outlets shall be designed for a velocity of [_____] m/s fpm at the design flue gas flow, specified in paragraph entitled "Expected Flue Gas Conditions." Ductwork from the fabric filter baghouse outlet to the stack inlet shall be designed to withstand a transient internal pressure (80 percent of yield strength) range of minus 2490 Pa to plus 7470 Pa 10 inches Water Column (WC) to plus 30 inches WC without permanent deformation of any structural member at yield or in buckling.

2.6.6 Induced Draft Fans

**************************************************************************
NOTE: Pressures and air flows will be site specific and will require system analysis.
**************************************************************************

**************************************************************************

Test block flow capacity shall be [_____] actual liter per second cubic feet per minute. Test block static pressure shall be 140 percent of the static pressure required to withdraw [_____] L/s cfm from the [economizer][air heater] outlet interface through the FGD system and to provide [_____] Pa inches WC at the stack inlet plus [_____] Pa inches WC which is equal to 140 percent of the static pressure required to withdraw the design flow from the steam generator to the [economizer] [air heater] outlet. The static pressure requirement shall be based upon normal operation of the FGD system, except that the fan inlet temperature shall be assumed to have the value specified in paragraph entitled "Sulfur Dioxide Removal Performance Guarantees." The design and construction of the fan shall be capable of withstanding operation at the maximum gas flow and temperatures which would result, if the spray dryer was not in operation. Test block capacity and static pressure shall be calculated assuming inlet gas temperature to be 93 degrees C 200 degrees F. Design ambient temperature for lubrication system shall be [_____] degree C degree F to [_____] degree C degree F. Induced draft fan speed shall not exceed [_____] rpm.

2.6.7 Sulfur Dioxide Removal Performance Guarantees

************************************************************************************************************

NOTE: Stoichiometry for dry scrubbing is defined as the moles of fresh slaked sorbent introduced to the system divided by the moles theoretically required for complete reaction with all of the sulfur dioxide entering the system whether or not it is all removed. This is opposed to wet scrubbing where stoichiometry is generally based on moles of sulfur dioxide removed by the system. Absorbent stoichiometry directly affects sulfur dioxide removal in the spray dryer. For example, a reported stoichiometric ratio of 1.2 for a dry system achieving 80 percent sulfur dioxide removal would be equivalent to 1.5 for a wet scrubbing system. The absorbent stoichiometry may be raised by an increase in the amount of absorbent fed to the spray dryer. A higher absorbent stoichiometry enhances removal of sulfur dioxide.

************************************************************************************************************

************************************************************************************************************

NOTE: The compensatory damages for exceeding the guaranteed stoichiometry will be determined on the basis of $_____ for each 45 g mole CaO/g mole 0.10 lb mole CaO/lb mole sulfur dioxide increase above the guaranteed stoichiometric ratio. Deduction of compensatory damages, if any, shall be included in the processing of the final payment. The compensatory damages exceeding guarantees power consumption will be determined on the basis of $_____ /kW. Deduction of compensatory damages, if any, shall be included in the processing of the final payment. The total power consumption will be measured at the Government's power input to the FGD system during the final acceptance tests.

************************************************************************************************************
The guaranteed sulfur dioxide removal efficiency of the Flue Gas Cleaning System shall not be less than [_____] percent and the outlet sulfur dioxide emission shall not exceed [_____] kg/106 kJ lb/106 Btu for any load on the steam generators down to 30 percent of maximum rating while in any normal operating mode (excluding sootblowing) and burning any coal within the range specified, when the Government provides lime, water, compressed air, and other utilities to the interface points in accordance with the Contractor's process flow diagrams, material balances, and these specifications. Contractor shall guarantee the removal efficiency specified with any two boilers and their associated flue gas cleaning equipment in operation at full load. For [_____] percent sulfur dioxide removal efficiency, the Contractor shall guarantee the maximum system stoichiometry (lb-mole of CaO per lb-mole of SO2 entering the system) at both 100 percent and 50 percent of the maximum rating of the steam generator and burning any coal within the range specified. The guarantee at 50 percent rating shall be based on 50 percent of the design gas flow by weight and an inlet gas temperature of 121 degrees C 250 degrees F. Contractor shall specify minimum quality of lime on which stoichiometry calculations are based as 90 percent available CaO by weight. Any increase in the guaranteed stoichiometry at 50 percent rating and firing the average coal will reduce the contract price. The operating stoichiometry will be measured during the final acceptance tests. The measurements will be made under normal operation and no special cleaning, adjustments or other preparations will be allowed. Contractor shall include in the design of the FGD system the necessary provisions for accurate determination of operating stoichiometry. The proposal shall include a description of the method by which stoichiometry may be determined. Contractor shall guarantee that an atomizer can be changed out while the steam generator which it serves is operating.

2.6.8 Particulate Removal Performance Guarantees

**************************************************************************
NOTE: Emission rates will depend upon local or state air pollution regulations. Negotiations with the agencies may be necessary.
**************************************************************************

The maximum particulate emission leaving the fabric filter baghouses shall not exceed [_____] kg/106 kJ lb/106 Btu for any flue gas conditions as specified while in any operating condition and burning any coal within the ranges specified. The maximum particulate emission shall be defined as the average of three complete test runs which shall include a proportional part of the boiler sootblowing cycle. Bag life shall be guaranteed for a minimum of two years after date of first flue gas passage through the bags. Fabric filter baghouse will normally be bypassed during 100 percent oil firing due to plugging of bags, bag guarantee shall be based upon coal/oil and soot combination firing only. Soot blowing, with fabric filter baghouse in operation, shall not void guarantee. If 10 percent or more of the bags in any given compartment fail within the guarantee period, the Contractor shall replace and install all bags in that compartment at his own expense. Replacement of bags on a one-by-one as-fails basis will not normally be allowed. However, the Contractor will be granted the opportunity to locate and replace bags which fail within 30 days of initial start-up of each baghouse due to deficiencies in manufacture or improper installation.
2.6.9 Lime Slurry System Performance Guarantees

The Contractor guarantees that the Gas Cleaning System shall meet the above specified performance, based on the process material balances submitted. The guaranteed process material balances shall be based on the following: (a) Lime analysis and coal analysis as specified, (b) slaking water analysis and temperature as specified, and (c) specified gas flows and operating conditions. The Contractor shall guarantee the capacity of each lime slaker at 110 percent of lime quantity required at maximum sulfur dioxide rate.

2.6.10 Draft Equipment Performance Guarantees

The Contractor shall guarantee that dampers have no leakage of flue gas to the atmosphere. The Contractor shall guarantee the maximum leakage across each damper when the dampers are in the closed position and are operating at the design conditions.

2.6.11 FGD System Operational Performance Guarantees

**************************************************************************
NOTE: The compensatory damages for exceeding the guaranteed stoichiometry will be determined on the basis of $_____ for each 45 g mole CaO/g mole 0.10 lb mole CaO/lb mole sulfur dioxide increase above the guaranteed stoichiometric ratio. Deduction of compensatory damages, if any, shall be included in the processing of the final payment. The compensatory damages exceeding guarantees power consumption will be determined on the basis of $_____ /kW. Deduction of compensatory damages, if any, shall be included in the processing of the final payment. The total power consumption will be measured at the Government's power input to the FGD system during the final acceptance tests.
**************************************************************************

The Contractor shall guarantee the maximum FGD system power consumption with one boiler unit in operation at the maximum rating and burning any coal within the range specified. The guaranteed maximum power consumption shall include the power consumption for equipment of the FGD system provided under this contract which would be in use when one boiler is in operation. Any increase in this total guaranteed power consumption will reduce the contract price. The total power consumption will be measured at the Government's power input to the FGD system during the final acceptance tests. Specifically, watt-hour meters accurate to within one percent will be used to measure average power consumption at the motor control centers, the induced draft fan drive motor and the atomization air compressor drive motor (if applicable) during the period of the performance tests. The measurements will be made under normal operation and no special cleaning, adjustments or other preparations will be allowed. Design and operation of the FGD system shall be based upon the requirement that stack inlet temperature differential above acid dew point shall not drop below minus 7 degrees C below 20 degrees F and that fabric filter baghouse inlet temperature differential above acid dew point shall not drop below 17 degrees C 30 degrees F. Operating temperatures will be maintained at or above these levels during performance testing. The Contractor shall guarantee the maximum pressure drop across the entire system at design flue gas flow rate. The Contractor shall guarantee that the sound levels
specified for the baghouses, pumps, motors, and valves will not be exceeded.

2.7 SPRAY DRYER ABSORBERS

**************************************************************************

Furnish and deliver [_____] spray dryer absorbers, complete with slurry atomizer units and accessories for a complete and operable installation. Each spray dryer absorber shall meet the performance criteria specified in paragraph entitled "Sulfur Dioxide Removal Performance Guarantees." The absorbers shall be constructed of steel plate of 6 mm 1/4 inch minimum thickness, conforming to ASTM A36/A36M. Structural steel design shall be as specified in paragraph entitled "Structural and Miscellaneous Steel." Structural design temperature range shall be [_____] to 400 degrees F. External stiffening ribs shall be spaced as required to provide support for the vessel shell, equipment, walkways, penthouse, monorail, and hoist. Stiffeners shall be sized and positioned to provide a uniformly curved surface for the installation of insulation and lagging. Structural welded seams shall be seal welded. Joints shall be provided so that they can be assembled airtight. Each spray dryer absorber shall be provided with the necessary framing for a penthouse to provide shelter of atomizers, motors, lubrication systems, control devices and other equipment located above the spray chamber. Emergency eyewash stations shall be provided in each penthouse. Potable water piping to eyewash stations will be provided by the Contractor. The penthouse design shall be such that the overall cylindrical appearance of the absorber shall be maintained. The rotating assembly of each atomizer unit shall be tested for dynamic and static balance using the actual driver. Complete test reports shall be submitted to the Contracting Officer. Notify the Contracting Officer, in writing, at
least 20 days in advance of the tests so that he or his representative can be present. The motor drivers shall be tested as specified in paragraph entitled "Pumps, Valves, Motors." Two-fluid nozzle atomizer assemblies shall be tested for proper atomization performance, plugging resistance and wear resistance during actual flow of lime slurry and compressed air through the nozzle, as required during operation. Submit information on the categories general arrangement, foundation design, structural fabrication, piping, erection, insulation, instrumentation, wiring, and electric motors. Exterior ferrous metal surfaces of the spray dryer absorber systems including, but not limited to, absorber vessels, holding bins, support steel, manifolds, handrails and kickplate shall be properly cleaned and shop primed, as specified. Mechanical and electrical component equipment, such as atomizer machinery and control panels shall be provided with the manufacturer's standard finishes. Ferrous surfaces which should not be painted and are subject to corrosion shall be protected for the period during shipment and storage with a suitable rust-preventative compound as recommended by manufacturer.

2.7.1 Spray Dryer Absorber Vessel

The spray dryer vessel shall be cylindrical with a 60-degree conical bottom section or with a trough-shaped bottom section with a minimum sideslope of 60 degrees above the horizontal. Provide replaceable wear plates, where necessary. The absorber vessel shall be gas-tight and designed for a transient condition (80 percent of yield strength) at internal pressures of at least plus 4980 and minus 7470 Pa 20 and minus 30 inches water gage. Stiffeners shall be of equal depth to provide a uniform surface to receive insulation. The bottom section of the vessel shall be provided with hopper heaters as specified in paragraph entitled "Fabric Filter Baghouse." Heaters shall cover the bottom one-third of the hopper surface area. Provide the hopper with poke holes, flanged discharge opening, mechanical vibrators, strike plate and nuclear level switches, as specified in paragraph entitled "Hoppers." A minimum of one access door on side of vessel, as specified in paragraph entitled "Access," shall be provided for access to the vessel interior for maintenance. Provide access doors with external latches and tightening devices which will allow for gasket shrinkage and yet produce a gas-tight seal. Doors shall be provided with means for padlocking in the open position. Access shall be sufficient to allow inspection of the vessel interior and removal and replacement of any internal parts subject to erosion or corrosion.

2.7.2 Spray Dryer Atomizers

Each spray dryer sulfur dioxide absorber shall be provided with slurry atomizers of the rotary or two-fluid nozzle type, as specified in the following sections. Equip the spray dryer sulfur dioxide absorbers with vanes, dampers, dispersers, and distributors required to ensure proper contact of the flue gas with the atomized lime slurry. These devices shall be designed to prevent maldistribution and short circuiting of flue gas and localized abrasive impingement of fly ash on absorber internals. The gas dispersers shall be designed to prevent the atomizer spray from impinging on or wetting the vessel wall. Design the gas distribution devices to provide contact between the gas and the atomized slurry as necessary to maintain system performance throughout the gas flow range. Materials of construction shall be suitable for use in the flue gas environment.

2.7.2.1 Rotary Atomizers

Provide a single slurry atomizer for each spray dryer absorber, complete
with electric motor drive, power transmission assembly, lubrication system, atomizer wheel, and operational monitoring and control system. Atomizers supplied under this paragraph shall be of the rotary design and shall have a proven record of efficient and reliable service in previous lime slurry applications. Provide atomizers with quick disconnects on the atomizer motor and feed system to allow rapid changeout of atomizers while the steam generators are on-line. The atomizers motor drive shall be as specified in paragraph entitled "Pumps, Valves, Motors." The transmission connecting the drive motor to the atomizer shall be of the belt or gear-box type. The transmission assembly shall be designed to produce the wheel tip speed required for proper slurry atomization over the range of operating conditions, and shall be provided with a simple means of changing the wheel tip speed, so that the design value can be changed if operational experience indicates the need for adjustment. The wheel tip speed shall be a minimum of 137 meters per second 450 feet per second. Gear units shall comply with all applicable AGMA standards. Bearings shall be the manufacturer's standard design for this application. Bearings shall have an operating life of at least 6,000 hours. Provide a complete lubrication system for each installed atomizer including necessary pumps, reservoirs, filters, heat exchangers, piping, valves, instrumentation and controls, and other accessories, as required, to circulate, clean, and cool the lubricating oil for the atomizer drive and transmission bearings. The lubrication system shall be designed with redundant features and controls required to provide safe and reliable operation of the atomizer and to prevent damage to the atomizer motor or transmission assembly due to loss of lubrication. The atomizer wheel shall be designed so that parts exposed to abrasion from the slurry are wear resistant and replaceable. The wheel body shall be constructed of stainless steel. The orifices in the wheel shall be provided with silicon carbide inserts. The wheel shall be dynamically balanced to minimize vibration of the atomizer unit. Provide instrumentation and controls as specified in Section entitled "Instrumentation and Controls." Include as a minimum the monitoring of the following atomizer operating conditions: motor amperage, lubricating oil pressure, oil temperature, oil reservoir level, motor temperature, atomizer vibration, slurry feed rate, and water feed rate. One complete, ready to run, spare atomizer including motor and drive shall be provided for the Flue Gas Cleaning System. Provide two stands for storing one spare atomizer in an upright position. Provide a stand to hold one atomizer for maintenance. Provide two complete, ready to install, spare atomizer wheels. Two complete sets of tools, as required to disassemble and assemble the entire atomizer, shall be provided. Atomizers shall be designed so that normal maintenance can be performed by plant maintenance personnel who have been trained, as specified in paragraph entitled "Operator Training Program."

2.7.2.2 Two-Fluid Nozzle Atomizers

**************************************************************************
NOTE: Alternate arrangement applicable only when plant design includes idle boiler at plant maximum demand load.
**************************************************************************

Provide multiple-slurry atomizers for each spray dryer absorber, each with its own flue gas plenum to ensure adequate contact of the flue gas with the atomized slurry. Atomizers supplied under this paragraph shall be of the two-fluid nozzle design using compressed air as the atomizing fluid and shall have a proven record of efficient and reliable service in previous lime slurry applications. Atomizers shall be provided with quick
disconnects on the compressed air and lime slurry feed lines to allow rapid
cchangeout of atomizers while the steam generators are on-line. Air
ccompressors shall be as specified in this paragraph. Nozzles shall be the
internal mixing type so that the compressed air and the lime slurry are
mixed internally to the nozzle orifice, resulting in the atomization of the
slurry. Internal surfaces of the nozzle which are subject to wear shall be
made of a suitable abrasion-resistant material and shall be easily
replaceable. Atomizer operation shall be monitored remotely in the steam
plant control room and locally in the absorber penthouse. Provide
instrumentation, controls, and alarms, as necessary, to ensure proper
operation of the atomizers. Slurry flow and pressure and air flow and
pressure in each atomizer feed line shall be monitored continuously.
Provide flow and pressure switches to indicate nozzle flow malfunction.
Control system shall automatically isolate any malfunctioning atomizer and
provide alarm annunciation in steam plant control room. Sufficient control
interlocks shall be furnished to assure that air flow to nozzle commences
first and terminates last relative to slurry flow during atomizer start-up
and shutdown. Atomizers shall be designed so that normal maintenance can
be performed by plant maintenance personnel who have been trained, as
specified in paragraph entitled "Operator Training Program." The dedicated
air compressor system provided with FGD systems utilizing two fluid-nozzle
atomization shall be complete with two air compressors, one operating and
one backup, and necessary controls and accessories required for automatic
operation. Each compressor shall be sized to provide at least 120 percent
of the maximum atomization air flow and pressure required. [As an
alternative to the preceding specified arrangement, individual air
compressees may be provided for each spray dryer absorber. Each unit shall
be sized to provide at least 120 percent of the maximum atomization air
flow and pressure required for operation of one spray dryer, and with all
[_____] units connected together, so that the unit normally dedicated to
the spray dryer for the idle boiler provides the required backup.] [For
either arrangement], [the] following features shall be provided: The air
compresors and all controls and accessories specified herein shall be
located inside an enclosure to provide an environment suitable for
compressor operation. Provide the structural and miscellaneous steel for
framing of the enclosure. Instrumentation and controls shall provide both,
local and remote monitoring, alarm annunciation, and automatic transfer to
backup unit in the event of failure of the operating unit.

2.7.2.3 Spare Equipment

One complete spare atomizer assembly shall be provided for every two
installed assemblies. Spare atomizer assemblies shall require only the
connection of lime slurry and air feed lines to allow insertion and
operation in place of a malfunctioning assembly. In addition, provide
spare nozzle wearing surface component parts, and other atomizer component
parts as required for one year's operation. Provide two complete sets of
tools required for disassembly and assembly of atomizer units.

2.7.3 Monorail and Hoist

Provide permanent hoist and monorail system for each spray dryer absorber,
as required, to install and remove atomizers. Monorail and hoist system
shall conform to NFPA 70. Monorail shall extend beyond edge of absorber
with sufficient clearance to allow lowering of atomizer assembly to ground
level and raising from ground level. Hoisting system shall be designed in
accordance with MHI MH27.1 and ASME HST-4. Provide wire rope electric
hoist with motor-operated trolley. Rope drum shall be sized for full lift
from ground level. Hoist capacity shall be 150 percent of heaviest piece
of equipment to be lifted during atomizer installation or removal or 908 kilograms 2,000 pounds, whichever is heavier. Capacity shall be clearly indicated on hoisting equipment. Factor of safety for hoisting equipment shall be not less than five on load-sustaining parts based on ultimate strength. Hoist shall be provided with automatic mechanical load brake and electric motor brake, either of which will sustain rated load in any position. Monorail shall have minimum capacity of 150 percent of heaviest piece of equipment to be lifted or 908 kg 2,000 pounds, whichever is heavier. Provide angle stops on the monorail at each end to prevent trolley over-travel. Provide 460 volt, 3-phase, 60-hertz, totally-enclosed, roller ball-bearing type motor rated on 30-minute, 55-degree C rise-duty basis, specifically designed for NEMA Class 2--Light Duty Industrial Service for cranes. Monorail and hoist control shall be by push button station suspended from hoist on pendant cord of sufficient length to allow operation from penthouse floor or walkway level. Push buttons shall control all hoist and trolley motions and shall provide "dead-man" control action. Enclosed reversing-type magnetic starters shall be mounted on hoist. Upper and lower limit switches shall be provided to prevent hood over-travel. Provide double-acting limit switch to prevent trolley over-travel in either direction. Conductor system shall be rigid enclosed safety-type runway conductor, supported and insulated to conform to NFPA 70.

2.7.4 Absorber Product Removal System

Provide necessary equipment, structural support steel, instrumentation, and controls required for continuous removal, transfer, and short-term storage of absorber product material and fly ash from the bottom hopper section of each spray dryer absorber vessel. The design capacity of the conveying equipment provided shall be at least 120 percent of the maximum expected rate of accumulation of fly ash and absorber product in the vessel based on the specified maximum inlet loadings of sulfur dioxide and particulate. The Contractor's conveying system shall continuously transfer the collected material to a holding bin or bins from which the ash handling system will intermittently convey it to an ash silo. The total capacity of the holding bins provided shall be not less than that required to store the quantity of fly ash and absorber product material representing ten hours of operation of the conveying system at design capacity. The holding bin or bins shall be provided with auxiliary equipment, controls and instrumentation required to keep the control room operator informed as to the system status, minimize fugitive dust emissions and maintain the flow of material to the ash handling system when needed. Structural design requirements shall be as specified. Structural design shall be based on a density of 47 kg per cubic meter 100 pounds per cubic feet. Capacity shall be based on a density of 16.5 kg per cubic meter 35 pounds per cubic feet. Provide a flanged outlet connection for interface with the ash handling system to be provided by the Contractor.

2.8 FABRIC FILTER BAGHOUSES

******************************************************************************
NOTE: The use of an electrostatic precipitator (ESP) with the dry scrubber instead of a fabric filter baghouse is not acceptable.
******************************************************************************

Provide [_____] fabric filter baghouses, complete with flue gas bypass, inlet and outlet flue gas manifolds, dampers, bags and bag attachment with support hardware, ash collection hoppers, pulse jet or reverse gas cleaning systems, and accessories required for a complete and operable installation.
Each fabric filter baghouse shall meet the performance criteria specified in paragraph entitled "Particulate Removal Performance Guarantees." The fabric filter baghouses will be operated on the suction side of the induced draft fans, as indicated. Each fabric filter baghouse shall have a minimum of four lighted modules. The modules shall be arranged in two rows with the inlet and outlet flue gas manifolds located between the rows of modules. The design and arrangement of the fabric filter baghouses shall complement the spray dryer absorbers, fans and ductwork such that the complete Flue Gas Cleaning System installation meets the space requirements indicated. Each fabric filter baghouse shall be provided with framing for a penthouse area as required to allow bag replacement, [damper and damper operator maintenance] [and] [pulse valve maintenance] in a protected environment. Structural design requirements shall be as specified in the paragraphs entitled "Fabric Filter Baghouses," "Structural and Miscellaneous Steel," and in this paragraph. Submit information on the categories general arrangement, foundation design, structural fabrication, piping, erection, insulation, instrumentation, internal arrangement, and valves. Exterior ferrous metal surfaces of the baghouse system including, but not limited to, fabric filter baghouse modules, hoppers, support structures, manifolds, handrails, and kickplate shall be properly cleaned and shop primed, as specified. Surfaces that will be exposed to the flue gas flow need not be painted, but shall be protected during shipment and storage with a suitable rust-preventative coating, as recommended by manufacturer. The fabric filter baghouses shall conform to ICAC F-2, ICAC F-3, and ICAC F-5.

### 2.8.1 Pulse Jet Cleaning Systems

**NOTE:** Air compressor is specified in paragraph entitled "Two-Fluid Nozzle Atomizers."

Factors involved in selecting fabric filter bag materials include:

1. Duration of cleaning.
2. Type of cleaning arrangements.
3. System temperature level.
4. Coal type.
5. Sulfur dioxide removal efficiency.

NEEDED felts are most commonly specified for pulse-jet units. Precoat bags with fly ash prior to operation. Fabric specifications are dependent upon material.

**NOTE:** Insert appropriate Section number in the blanks below.

The fabric filter baghouse assembly shall be of modular construction. The
inner housing casing and tube sheet of each module shall be fabricated from carbon steel plate of 5 mm 3/16 inch minimum thickness, conforming to ASTM A36/A36M. The inner casing shall be of welded construction, gastight and watertight, designed for a transient condition (80 percent of yield strength) at internal pressures of at least plus 4980 and minus 7470 Pa plus 20 and minus 30 inches water gage. Joints shall be sealed by continuous fillet or continuous complete penetration groove welds, as applicable. The tube sheet opening arrangement and bag clearance shall limit gas velocity between the bags at any point within the module to not more than 1.27 m/s 250 ft/min at design conditions. Bag to wall clearance used in calculating gas velocity shall not exceed bag to bag clearance. Minimum bag clearance shall be 50 mm 2 inches. Additional space shall be provided between rows of bags, as necessary, to clear access door supports crossing the tube sheet. Tube sheet shall be continuous fillet or continuous complete penetration groove welded gastight so that all flue gas must pass through the bags. No caulking or sealing materials shall be used. Tube sheet shall be arranged for individual top bag and cage removal and reinforced, as required for pedestrian traffic (minimum support shall be 488 kg per square meter 100 pounds per square foot). Modules shall have shop insulated, double-cased lift-off doors with quick-opening handles for access to the tube sheet. Doors shall have high-temperature gaskets to prevent air infiltration. Multiple tube sheet access doors shall be provided such that each door shall be easily removable by two men. The doors shall be provided with lifting handles. Top surface of access doors shall be 6 mm 1/4 inch thick ASTM A36/A36M four-way raised pattern floor plate. The manufacturer's standard tube sheet access door arrangement and design will be considered provided the design provides adequate insulation and protection against infiltration. The bag cleaning system shall be designed to ensure efficient cleaning operation with a minimum pressure drop across the system and with the gentlest possible cleaning mechanism to ensure long bag life. Source of compressed air is specified under Section [_____] COMPRESSED AIR SYSTEMS. Compressed air used in the cleaning system shall pass through a dryer/filter system. The dryer shall be provided to remove moisture from compressed air used in system. Dryer shall remove sufficient moisture to provide a maximum dewpoint of [_____] degree C at 690 kpa (gage) degree F at 100 psig. A filter system shall be provided to clean compressed air used in system. Filter system shall remove a minimum of 90 percent to 95 percent of particles greater than 0.6 microns in diameter. Filters shall be sized to operate for 90 days without service under normal operating conditions and shall be easily accessible for inspection and service. Dryer/filter system shall be sized for 120 percent of design air flow. Dewpoint should be 6 degrees C 10 degree F lower than design minimum temperature. In no case should a dewpoint be greater than 2 degrees C 35 degrees F. Each module shall have a factory-installed compressed air header, pulse valves, and distribution piping. Valves and wiring shall be located in a weather protected enclosure with forced air ventilation to prevent freezing or overheating. The enclosure shall be readily accessible through hinged doors. Diaphragm valves shall be factory prewired to a junction box. Entire pulsing system shall be removed with top door or other provisions shall be made such that piping does not interfere with bag replacement. Connections to compressed air headers and distribution pipes shall be made with flexible hose with automatic shutoff quick connect fittings for ease of removal during maintenance. Each row of bags shall be serviced by its own pulse valve and distribution pipe so that only one row of bags shall be cleaned per each compressed air pulse. The pulse valves shall be heavy-duty diaphragm type with solenoid actuators and stainless-steel internals. Pulse valves shall be designed to limit noise from pulse valve operation to not more than 84 dBA measured 1 1/2 meters
five feet from the valves. Compressed air and instrument air piping for each fabric filter baghouse shall be piped back to a single point within the battery limits of the collector(s) as indicated for connection with the steam plant piping system to be provided by the Contractor. Contractor's piping shall include shut off valves, pressure gages, pressure regulating stations, filters, surge tanks, and other equipment required for complete operation of the cleaning system. For off-line cleaning modules shall be sequentially isolated by closing the outlet valve. Manufacturer to recommend off-line times. When the module is off-line, each row of bags shall be individually pulsed with 483 to 690 kPa (gage) 70 to 100 psig compressed air through a solenoid-piloted, heavy duty diaphragm valve. Each bag support cage shall be fitted with a diffuser element. After bags are cleaned, the module shall be held off-line for a period of time sufficient to allow the dust to settle into the hopper. The bags to be furnished shall be of a fabric type, weight, finish, and construction suitable for the intended service. Bags shall be suitable for continuous exposure to the flue gas temperature conditions at the economizer outlet. Bags and cages shall be provided with coatings as necessary to minimize abrasion and to resist acid or alkali attack. Bags shall not be more than 150 mm 6 inches in diameter and not more than 4 1/2 meters 15 feet in length. Bag cage design and construction shall be suitable for the intended service. Bags shall be clamped at top between cage and tube sheet in such a manner that bags will not sway, but can be readily removed without special tools. The manufacturer's standard cage design will be considered, provided that it has a proven record of reliable services with the bag material proposed. The method of attachment of bags and cages to the tube sheet shall provide proper air seal, bag tension, and cage alignment. If venturis are provided, they shall be the manufacturer's standard type for this application. Special care shall be taken to assure there are no rough spots on cages to cause bag abrasion. Provide equipment and materials necessary for bag leak detection. Leak detection system provided shall utilize a fluorescent powder for detection with ultraviolet light. Furnish portable light and sufficient powder for one year of normal inspections. Furnish sufficient bag capping devices for 5 percent of the total installed number of bags. The Contractor shall precoat the bags for initial start-up on oil.

2.8.1.1 Spare Equipment

Ten percent extra bags and two percent extra cages shall be furnished.

2.8.2 Reverse Gas Cleaning System

******************************

NOTE: Factors involved in selecting fabric filter bag materials include:

1. Duration of cleaning.
2. Type of cleaning arrangements.
3. System temperature level.
4. Coal type.
5. Sulfur dioxide removal efficiency.

NEELEDLED felts are most commonly specified for pulse-jet units. Precoat bags with fly ash prior to
operation. Fabric specifications are dependent upon material.

**************************************************************************

NOTE: Specify air pressure available for pneumatic operators or electrical characteristics available for electric operators.

**************************************************************************

The baghouse assembly shall be of modular construction. The inner housing casing and tube sheet of each module shall be fabricated from carbon-steel plate of 6 mm 1/4 inch minimum thickness, conforming to ASTM A36/A36M. The inner casing shall be of all-welded construction, gastight and watertight designed for a transient condition (80 percent of yield strength) at internal pressures of at least plus 498 and minus 7470 Pa 20 and minus 30 inches WC. Joints shall be sealed by continuous fillet or continuous complete penetration groove welds as applicable. Tube sheets shall be continuous fillet or complete penetration groove welded gastight so that flue gas must exit through the thimbles. Thimbles shall be fabricated of carbon-steel plate with a minimum thickness of 12 gage and minimum length of one nominal bag diameter and shall be spaced on not less than 241 mm 9 1/2 inch centers for 200 mm 8 inch diameter bags and not less than 356 mm 14 inch centers for 300 mm 12 inch diameter bags. Thimbles shall be inline and not staggered. Tubeshell/baghanger alignment shall be within 3 mm 1/8 inch for plumb and centering hanger adjustment shall be provided to allow maintenance of bag alignment. Internal walkways with kickplates shall be provided to access both upper and lower bag supports. Upper access walkways shall be at least 457 mm 18 inches wide. Lower access walkways shall be at least 610 mm 24 inches wide. If the upper walkways are located between upper support frames, upper walkways shall be one meter 3 feet below the upper support frame and a crawl space at least 1.22 meters 4 feet high shall be provided above the support frames. Each reverse gas fabric filter baghouse shall be provided with a bag cleaning system including two 100 percent capacity reverse gas fans, connecting ductwork, dampers, and automatic controls. Each fan shall be provided with automatic operated inlet louver dampers for control and shutoff. Automatic-operated dampers shall also be provided to isolate the "standby" fan and the modules not being cleaned. The reverse gas-cleaning system shall provide for gradual reinflation of the bags after cleaning. The reverse gas for cleaning shall be taken from the outlet plenum. Reverse gas fans shall be specified in paragraph entitled "Ductwork and Draft Equipment." Motor drives shall be as specified in entitled "Pumps, Valves, Motors." Louver dampers for reverse gas fans shall be as specified in paragraph entitled "Ductwork and Draft Equipment." The collector manufacturer shall furnish valves necessary for each module to cause effective reverse air cleaning of each module. The clean gas outlet valve and the reverse air inlet valve for each module shall be of the [air cylinder] [electric motor] operated, poppet-type arranged for manual lockout capability with position indicating switches at both ends of the travel. The clean gas outlet valves shall be the adjustable slow opening type arranged for manual lockout capability with position indicating switches at both ends of the travel. The clean gas outlet valve shall be arranged to fail-safe in the closed position. The dirty gas inlet valve for each module shall be of the manually operated, poppet-type or butterfly-type suitable for isolating each module for maintenance. The manual operator shall be of a type that is readily accessible. Bags shall be suitable for continuous exposure to the flue gas temperature conditions at the economizer outlet. Bags shall be provided with coatings, as necessary, to minimize abrasion and to resist acid and
alkali attack. Bags shall be 300 mm 12 inches in diameter and a maximum of 10 meters 35 feet in length or 200 mm 8 inches in diameter and a maximum of 7.32 meters 24 feet in length. Each bag shall have at least eight for 300 mm 12 inch bags or five for 200 mm 8 inch bags sewn-in rings of welded steel, galvanized or cadmium plated, or welded stainless steel after fabrication. Bags shall attach to the thimbles by means of quick release clamps. Clamps shall not require tools for adjustments or installation. Upper bag suspensions shall provide for ease of adjustment, tensiding, and bag replacement. The suspension shall not use threaded members such as bolts and nuts for adjustment or attachment of bags. Bag caps and other suspension hardware that comes in direct contact with the bag fabric shall be cadmium-plated steel or stainless steel. The method of attaching the bags to the cap and thimble shall provide a leakproof seal. The Contractor shall supply insert materials necessary to precoat the bags for initial start-up on oil.

2.8.2.1 Spare Equipment

Furnish ten percent extra bags and ten percent extra clamps.

2.8.3 Bag Guarantee

Bags and cages, or bags and sliprings, as applicable, shall be guaranteed for 2 calendar years from startup. In case of failure during that period, Contractor shall supply a replacement without cost to Government. Contractor shall provide the number of spare bags, and cages, if applicable, required to replace the bags in baghouse. These bags, and cages if applicable, shall not be used as replacement during startup and testing. If bag, and cage, if applicable, replacement exceeds 10 percent in any compartment during the first 2 years, replacement of all bags, and cages, if applicable, in that compartment shall be provided by the Contractor at no cost to the Government. The replacement bags, and cages, if applicable, shall be guaranteed for an additional 2 years. Bags shall be inspected for creases, folds, abrasions, holes, and tears prior to installation. Any bag with one or more of the preceding imperfections shall be rejected. Cages or rings, as applicable, shall be inspected for corrosions, sharp edges, bends, bad or broken welds, eccentricity, or burrs prior to installation. Any cage or ring with one or more of the preceding imperfections shall be rejected.

2.8.4 Bag Quality Assurance

**************************************************************************
NOTE F: Factors involved in selecting fabric filter bag materials include:

1. Duration of cleaning.
2. Type of cleaning arrangements.
3. System temperature level.
4. Coal type.
5. Sulfur dioxide removal efficiency.

NEEDLED felts are most commonly specified for pulse-jet units. Precoat bags with fly ash prior to operation. Fabric specifications are dependent upon
Bag manufacturer shall furnish following actual test data for each bag material lot used:

- Permeability (ASTM D737)
- MIT Flex (ASTM D2176)
- Tensile Strength (ASTM D1682--Method IR-T)
- Mullen Burst (ASTM D3887)
- Weight (ASTM D3776/D3776M)
- Thickness (ASTM D1777)
- Count (ASTM D3775)
- Yarn Weight (ASTM D578/D578M)
- Fabric Treatment Content

The fabric shall meet the following specifications.

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>

Provide material lot analyses prior to manufacture of bags. Prior to processing, the yarn shall be inspected for cleanliness, binder content, broken filaments, denier and tensile strength. Substandard yarns shall be rejected. Sizing applied to yarns shall be removed from the fabric prior to applying the finish. Stitching used in filter bag fabrication shall be made using [_____] thread. Filter bags shall be packaged and protected as necessary to prevent damage during shipping and outdoor storage at the job site. Material not meeting the requirements of this specification shall be rejected and replaced with materials of the specified type and quality at no additional expense to the Government. The Contracting Officer or his representative shall have uninhibited access to areas in which the fabrication of materials governed by the specifications takes place.

2.8.5 Hoppers

Hoppers shall be pyramidal-type fabricated from ASTM A240/A240M, type 317L.
cold-rolled steel plate having a minimum thickness of 6 mm 1/4 inch. Hoppers shall be properly stiffened, from the outside only, and shall be constructed with a minimum valley angle of 60 degrees from the horizontal. Hoppers shall be of welded construction and shall be welded to the modules to form a gas-tight unit. Welded joints shall be sealed by continuous fillet or continuous complete penetration groove welds as applicable. Hoppers shall span no more than one module. Steel reinforcements not in contact with the gas or ash may be either type 317L stainless steel or ASTM A242/A242M structural steel. If the latter is used, welding rods shall be specifically selected for the service. Provide protection of rods against moisture whether for factory or field assembly. Provide key interlocked access doors on each hopper on both sides of any hopper baffle. Hopper access doors shall be interlocked to fly ash level detectors to prevent access when the nuclear level detectors are operational. Doors shall be in accordance with the requirements specified in paragraph entitled "Structural and Miscellaneous Steel." Each hopper shall be furnished with provisions for attachment of vibrators. Hoppers shall have adequate flexibility for vibrating. Each hopper shall be provided with two 100 mm 4 inch poke holes with a tee wash connection and screw caps. Poke holes shall be positioned to permit downward thrusts into the hopper. A special plate reinforced "pounding area" shall be furnished on each hopper face for external manual vibrating. Each pounding plate shall be 300 by 300 by 25 mm 12 by 12 inches by 1 inch thick plate steel ASTM A36/A36M. A work platform with stairs shall be provided to each pounding area for units with pounding areas more than 1 1/2 meters five feet above ground. Approve location and arrangement of poke holes and pounding areas by the Contracting Officer. Pounding plate shall not be insulated. Insulation shall be neatly finished at this discontinuity. Each hopper shall include a 300 mm 12 inch diameter 57 kg 125 pound flat face flanged outlet connection to match ash conveying system to be provided by the Contractor. Provide access hatch not less than 200 by 200 mm 8 by 8 inch for cleanout within 200 mm 8 inches above the flange. Ash valve shall be a minimum of 150 mm 6 inch diameter. Bolt-down type hatch is acceptable for clean-out hatch. Provide each hopper with two mechanical vibrators, to be located at mid-height on opposite sides. Vibrator controls shall be interfaced with ash collection system to provide vibrator operation only at the inception and during an evacuation cycle. Operation shall be automatic. Manual override control for hopper vibrators and evacuation system shall be provided in hopper area and shall be enclosed in cases to prevent accidental energization of systems. A warning shall be placed over the vibrator manual control with the following inscription: "Warning: Vibrator Control. Do not activate unless hopper evacuation system is operating." Provide nuclear hopper level switches as specified in paragraph entitled "Instrumentation and Controls." Provide a hopper heater system for each fabric filter baghouse. Each system shall be as specified herein. Hopper heaters for each hopper shall be furnished by the collector manufacturer and shall include material required for mounting. The system shall be designed to provide a 93 degrees C 200 degrees F rise in temperature in the hopper, in the vicinity of the heaters, during offline and startup conditions. The system shall be designed to provide maximum heater coverage between hopper stiffeners. The system shall be designed with a minimum heating safety factor of 1.1 and a minimum wind heat loss factor of 1.12. The system shall include a flexible throat heater for each hopper. Heaters shall be of modular design except for throat heaters. Flexible electric heating blankets or tapes, capable of withstanding 454 degrees C 850 degrees F, shall be used for areas where modular equipment will not fit. Heater modules shall be designed for easy installation. Heater modules shall cover at least 20 percent of the hopper area (covered hopper area not to include exposed areas of poke holes, level detectors,
strike plates, stiffeners, access doors, etc.), shall cover the bottom portion of the hopper to the maximum extent possible, and shall extend at least 50 percent up the hopper height. Hopper throats shall be heated with blanket or tape heaters. Equipment furnished shall be designed and tested to withstand natural and induced vibrations including manual rapping of the strike plates. The hopper heater system shall be individually thermostatically controlled with adjustable setpoint between 66 to 121 degrees C 150 to 250 degrees F internal skin temperature, the minimum specified ambient temperature, and shall be furnished and installed complete including power, control, and alarm components. Heater voltage shall be [_____] volts AC. Control voltage shall be 120 volts AC. Modular heaters shall be furnished complete. Heater modules shall be self-contained. The modules shall have a flexible heating face to conform to the irregularities of the hopper surface, providing intimate contact between the heaters and the hopper, and providing maximum heat transfer. Hopper heaters shall be of low watt density design (maximum of three watts per 645 square mm square inch of resistance element) with a minimum of six parallel resistance paths per heater (continuous blanket type elements shall be deemed to meet the multipath requirement). Each heating element in the module shall be capable of being operated at 2152 watts per square meter 200 watts per square foot. Heating elements shall be made of 600 series stainless steel alloy or nichrome encased in a 20 gage minimum aluminum or aluminized steel mounting pan or casing. Cold lead wires and interconnecting wires shall be multistrand copper wire with high temperature (454 degrees C) (850 degrees F) insulation. Cold leads shall be furnished with strain relief constructed in such a manner as to prevent damage to the heater modules due to rough handling. Leads shall be of sufficient length to reach the terminal box. Splices shall not be permitted in leads from modules, tapes, or blankets to the terminal box. Each module, blanket, or tape shall be tested for electrical integrity at 1,000 volts prior to installation. Individual modules shall be designed to fit between the hopper stiffeners and other hopper well obstructions to provide the maximum coverage possible. Heating units supplied shall have metal labels firmly attached to the unit listing the wattage and voltage of the unit. Heating units and mounting hardware shall be constructed of high temperature materials capable of withstanding 454 degrees C 850 degrees F. Heating units shall be insulated with high temperature woven glass cloth or mineral fiber. Mica or magnesium oxide insulated heaters shall not be provided. Cold leads from each heater shall be provided for external circuit connection. The cold leads shall be contained in hot-dip galvanized NEMA Type 4, as defined in NEMA ICS 6, cast iron fitting for connection to field installed solid conduit or waterproof raceway. NEMA 4 as defined in NEMA ICS 6 hopper heater terminal boxes with terminal blocks for connection to heater leads and thermostat leads shall be provided. Terminal blocks in each terminal box shall contain a sufficient number of terminals to connect the heaters for each hopper, one control thermostat, and one low temperature alarm thermostat. The thermostats for monitoring hopper temperature shall be 120 volts AC adjustable type in NEMA 4 enclosures. Each hopper heater terminal box, fed from a panel, shall include one 3-pole fused main switch, magnetic contractor and alarm relay with two normally open contacts, terminal blocks for power, control and alarm circuits, a fused control transformer having a 120-volt secondary, and auxiliary relays for automatic operation of the heater system. The cover shall have the following devices mounted, for each contractor: "HAND," "OFF," "AUTO" selector switch.

a. 120 volt red light--"ON" with integral transformer.

b. 120 volt white light--"LO TEMP" alarm with integral transformer.
c. Device and enclosure nameplates.

The following components shall be provided for each fabric filter baghouse for thermostatic control of the hopper heater system:

a. A master hopper heater control panel.

b. Hopper heater terminal panels at each hopper. The contractor shall furnish materials, tools, and labor required for connections of circuits and wiring between local hopper heater control panels and the master heater control panel.

This panel shall contain relays, contractors (fused switches or circuit breakers), control transformers, and other devices required for complete control of the heater system. Master heater control panel shall be located as indicated. Panel components shall be factory installed and wired in a NEMA 4 enclosure and shall include the following.

a. A main-fused switch or circuit breaker.

b. A fused switch or circuit breaker, contractor alarm relay, with two normally open contacts. A selector switch, "HAND," "OFF," "AUTO," red "ON" light, and white "LOW TEMP" alarm light for each local heater panel. The contractor shall have a 120-volt operating coil.

c. Device and enclosure nameplates.

d. Auxiliary relays and equipment required for operation of the heating and alarm systems.

2.8.6 Manifolds and Draft Equipment

Furnish inlet and outlet manifold ducts as part of each fabric filter baghouse. Manifolds shall be sealed by continuous fillet or complete penetration groove welds to provide gas-tight construction, fabricated from minimum 6 mm 1/4 inch thick ASTM A36/A36M steel plate, and properly stiffened. Manifolds shall have necessary expansion joints conforming to the requirements of the paragraph entitled "Ductwork and Draft Equipment" and access doors and shall be supported from the fabric filter baghouse structure. Structural design shall be based on assumption the ducts may be 30 percent full of fly ash. Taper inlet manifolds to maintain a uniform gas velocity to all modules. Size manifolds to minimize pressure drop, but also so that velocities shall be between 28 to 30 meters per second 5,500 to 6,000 feet per minute at 100 percent of boiler load capacity to minimize ash drop out of the gas stream. Inlet manifold take-offs to each module shall be located in or near the bottom of the duct to assist in sweeping the dust into the modules. A replaceable, abrasion resistant baffle plate shall be furnished at the inlet to each module to prevent abrasion of the bags. Each module shall be provided with inlet and outlet dampers. Inlet and outlet dampers shall be the manufacturer's standard type. Each fabric filter baghouse shall be provided with bypass dampers to bypass the fabric filter baghouse during start-up and shutdown, during oil firing, and in the event of excessive flue gas moisture conditions due to spray dryer absorber malfunction. Bypass dampers shall be as specified in paragraph entitled "Ductwork and Draft Equipment."
2.9 LIME SLURRY PREPARATION SYSTEM

**************************************************************************

NOTE: Pressures, rates, and duration of sootblowing will depend on site conditions and acceptable operating procedures.
**************************************************************************

Provide a single lime slurry preparation system to serve [_____] spray dryer absorbers. Provide the lime slurry preparation system with equipment for receiving, storing, feeding, and slaking pebble quicklime, and for storing and pumping lime slurry of sufficient quantity and quality as required for use in the FGD system. Lime system component equipment and controls shall be as specified in paragraph entitled "Lime Slurry Preparation System," and herein. Motors shall be as specified in paragraph entitled "Pumps, Values, Motors." Provide structural and miscellaneous steel as required for support of equipment, framing of the equipment enclosure, and access to equipment, as specified. Structural design shall be as specified in paragraph entitled "Structural and Miscellaneous Steel." Equipment shall be arranged within the lime system enclosure to allow easy access for operation and maintenance. Arrange equipment on multiple levels as follows: Slurry storage tank and pumps shall be located on the lower level; lime feeders, slakers, and grit screens shall be located on a level above the tanks so that slurry flows by gravity into the tank. Headroom between each level and the structural supports for the level above shall be 3 meters 10 feet minimum. The lime system enclosure shall be located in the area between spray dryer absorbers. The plan area of the enclosure shall be not less than 37 square meters 400 square feet. The length and width of the enclosure shall be selected to be compatible with the Contractor's general arrangement to minimize displacement of the spray dryer absorbers. The length and width of the enclosure shall be selected to be compatible with the Contractor's general arrangement to minimize displacement of the spray dryer absorbers and fabric filter baghouses from the boiler centerlines. To provide for adequate lime system equipment layout the Contractor's structural framing arrangement may provide for connection of the enclosure for the lime system and that for one or both of the hopper enclosures for spray dryer absorbers and fabric filter baghouses from the boiler centerlines. Provide interior access to each lime system equipment level to provide Class one personnel access as specified in the paragraph entitled "Structural and Miscellaneous Steel." The enclosure framing shall allow for the location of an 2440 mm 8 foot wide roll-up door (to be provided by the Contractor) to provide access to the Government's grit disposal bin by forklift truck. Components shall be tested at the factory to verify proper operation of controls, motors, and equipment components. Notify the Contracting Officer, in writing, at least 30 days in advance of the final complete system factory tests, so that he may have a representative observe the tests. Provide information necessary to determine the structural design requirements of the concrete foundation pad. Provide necessary erection drawings and installation instructions. Include submittal information on the categories general arrangement, foundation design, piping, erection, instrumentation, internal arrangement, wiring, valves, and electric motors. The exterior of the lime storage and feed bin shall be cleaned and primed as specified in the paragraph entitled "Structural and Miscellaneous Steel." Other lime slurry preparation system component equipment shall be provided with the manufacturer's standard finish.
2.9.1 Lime Storage and Feed Bin

The lime preparation system shall have an integral storage and feed bin for pebble lime. The bin shall be shop fabricated, all welded construction of carbon steel plate with a minimum thickness of 6 mm 1/4 inch, conforming to ASTM A36/A36M. The bin shall be structurally supported as necessary to provide for enclosed areas for equipment levels directly beneath the bin cone hoppers. The lime preparation system structure shall be designed for wind, snow, seismic and other loads, as specified in paragraph entitled "Structural and Miscellaneous Steel." Structural design shall be based on a bulk density for pebble lime of 1040 kg per cubic meter 65 pounds per cubic foot. Bin diameter shall be 3.70 meters 12 feet. Bin height shall be based on pebble lime bulk density of 880 kg per cubic meter 55 pounds per cubic foot and angle or repose of 55 degrees. Bin shall be cylindrical with twin, 60 degree minimum conical bottom hoppers. Roof shall be sloped 1:12 for drainage. The roof shall have an inlet target box located at the center and provisions for mounting the bin vent filter, pressure relief valve and high-level switch. Provide for access to the interior of the bin from the roof through a hinged manway. Access, handrails, and kickplate for the roof shall be provided as specified in paragraph entitled "Structural and Miscellaneous Steel." A fill pipe shall be provided for transporting pebble lime from self-unloading trucks to the storage and feed bin. The fill pipe shall extend from the truck fill connection point, approximately 1.22 meters 4 feet above grade, to the center fill collar. The fill pipe shall be 100 mm 4 inch O.D. Schedule 40 carbon steel pipe. A 1219 mm 4 inch centerline radius bend shall be used for the direction change at the top of the fill tube riser. The fill tube shall be complete with a quick coupling hose connection with security chain, dust cap and limit switch at the truck connection point and a clean-out cap at the inlet target box. The inlet target box shall be provided with two openings for fill piping connections: One for use with the 100 mm 4 inch fill pipe to be provided under this contract and one for use with the pneumatic conveying system piping to be provided by the Contractor. The opening for use by the pneumatic conveying system piping shall be 150 mm 6 inches in diameter and shall be suitable for attachment of a reducer for compatibility with the conveying line size selected later for use with the pneumatic conveying system. Provide a bin vent filter for mounting on top of the bin, with retained dust discharge directly into storage bin. This unit shall have a venting capacity of at least 472 L/s 1,000 scfm. Filter bags must be readily removable for inspection or replacement without tools. Construction of filter manifold shall prevent filter bags from falling into storage bin. Operation of the filter shall be such that there will be no escape of dust during truck unloading. Filter unit shall be fabricated weatherproof and dripproof construction, with self-contained bag cleaning system and fan assemblies. Weather and dripproof gasketed access doors to bag compartment shall be provided. Parts of unit subject to service or maintenance shall be not more than 1 1/2 meters 5 feet above the bin roof and shall be accessible by a person standing on top of the bin without use of ladders or platforms. The bin filter exhaust fan shall be the squirrel-cage type, operating at less than 3,500 rpm, with mounting on the bin vent filter. This unit shall have air handling capacity of at least 472 L/s 1,000 scfm. It shall provide a negative pressure within the bin during unloading operations. The fan outlet shall be provided with a louvered damper which automatically opens during operation and closes when the bin is not being filled and shall be fitted with a removable bird and insect screen. Electric connections shall be NEMA 3R, rainproof. A disconnect switch in NEMA 3R steel enclosure shall be provided and mounted on the vent filter unit to allow local shutoff of power supply to electrical devices located at the bin roof level. Wiring connections to
these units shall be made by the Contractor. Two bin level switches shall be mounted at a high and at a low level on the bin. These switches are to be of the stainless steel, rotating-paddle type, electrically operated. Indicating lights coincident with these switches shall be provided in both the truck unloading panel and the main control panel. Top-mounted units must have extension shafts and guards. Side-mounted units shall be provided with inside shields and all units must be mounted adjacent to ladders or on top of storage bin. The lower bin switch shall be located to represent capacity in terms of complete truck loads of material, based on truck load capacity of \(18.82 \text{ cubic meter} \approx 665 \text{ cubic feet}\) per load of quicklime density at approximately 960 kg per cubic meter 60 pounds per cubic foot. One heavy-duty vibrator shall be connected to the outside of each bin cone and provided with suitable controllers and timers to allow pacing from the quicklime feeder. Each vibrator shall be interconnected with the associated feeder, in order that it operates in proportion to feed rate only when the bin gate is open and the feeder operates. Live bottom type bin dischargers may be provided in lieu of the outside vibrators. A manually-operated, dust-tight slide gate shall be mounted at the termination of each bin cone to allow isolation of the equipment below for maintenance.

2.9.2 Lime Slakers

The lime slakers shall be of the detention or paste type. The slakers shall be designed for continuous operation at the required capacity. Slaking temperature and slaking performance shall be automatically maintained, so that at least 90 percent of the calcium hydroxide particles formed are smaller that 2 microns in size, when lime quality is as specified. Slakers shall be capable of slaking all grades of 20 mm 3/4 inch pebble quicklime at a controlled temperature. Automatic controls shall be provided to inject excess water into the slaking chamber should the temperature exceed a preset limit. Slakers shall be provided with an exhaust system to prevent water vapor from rising into the feeder mechanism. The slakers shall be of all welded steel construction and shall be completely dust-tight. Access covers for all compartments shall be provided. Slakers shall be designed for ease of maintenance and shall be capable of shutdown for up to 24 hours without requiring cleanout prior to restart. Provide a hose connection at each slaker level for use by maintenance personnel. Lime feeders shall be of the gravimetric or volumetric type as required for compatibility with the lime slakers. Feeders shall be designed to prevent flooding of the slakers with lime. Feeders shall be capable of handling pebble quicklime, including fines. Feeders shall be dust-tight and shall be provided with dust-tight, stainless-steel inspection doors on the discharge side of the feeders. Flexible connections shall be provided between the bin cone outlets and the feeders. Feeders shall be provided with adjustable rate setters and totalizers. Each lime slaker shall be provided with a positive means of removing grit from the lime slurry prior to discharging the slurry to the tank. The grit removal system shall include classifiers or screens or both as required to remove any grit which could produce operational problems in the slurry pumps, piping, valves, or atomizers. The grit removal system shall include a means of rinsing the grit with water to minimize lime carryover to the grit disposal bin. The degritted slurry shall flow by gravity to the slurry tank. The grit shall be conveyed to a disposal bin (bin provided by the Government) located on the lower level within the lime system enclosure at a point accessible to a forklift truck. The Contractor shall provide conveyors and chutes as necessary to discharge grit to the disposal from a point not more than 1.83 meters 6 feet above the lower level floor. A slurry storage tank shall be located beneath the slakers in
the lime system enclosure. The tank shall be constructed of 6 mm 1/4 inch carbon steel. The slurry tank shall be designed with a minimum storage capacity of one hour at the maximum slurry use rate. The tank shall be covered to minimize contact of the slurry with air. The tank shall be provided with heavy-duty, top-mounted turbine agitators of a quantity and design as necessary to keep the slurry particles in uniform suspension without vortex formation. Tank shall have internal baffles to promote agitation. Agitators shall be interlocked with pump controls so that pumps cannot start unless at least one agitator is on. The tank shall be provided with level monitors required for proper system operation. Level switches shall be electrode probe type. Bubbler-type level switches are not acceptable. The tank shall be provided with all necessary inlet, outlet, and overflow connections. The bottom of the tank shall be pitched for drainage and provided with a cleanout easily accessible by maintenance personnel. The Contractor shall provide additional slurry tanks as required for his specific system design. Tanks furnished under this contract shall be shop fabricated, all-welded construction of carbon steel with a minimum shall thickness of 6 mm 1/4 inch. Structural design requirements of paragraph entitled "Structural and Miscellaneous Steel" including seismic design, are applicable to tanks furnished.

2.10 PUMPS, VALVES, MOTORS

Centrifugal pumps shall be used for applications for which unique flow and head requirements necessitate the use of positive displacement pumps. The general requirements specified in this paragraph shall be applicable to pumps furnished except as specifically noted. Positive displacement pumps furnished for use with lime slurry shall have a history of reliable operation for that application at pilot plant or commercial installations. Positive displacement slurry pumps for which shaft seals are necessary shall be provided with mechanical seals which do not require the use of seal water which could infiltrate into the slurry. Provide piping, valves, and fittings required to connect the spray dryer absorbers, lime slurry preparation system, fabric filter baghouses, pumps, and tanks complete with hangers and connection for instruments, vents, flushing, and drains as required. Provide properly sized bypasses for equipment and control valves. Instrumentation and controls shall be as specified in paragraph entitled "Instructural and Controls." Piping materials and fabrication shall conform to ASME B31.1 (Power Piping Code). Furnish alternating current high efficiency electric motors required to drive the equipment furnished under this Contract. Provide each pump assembly with the manufacturer's standard finish. Protect exposed machine surfaces with a rust-preventative compound. Cover flanged openings with plywood covers held by a minimum of four bolts. Plug or cap screwed connections with standard fittings.

2.10.1 Pumps

Furnish the pumps required or specified complete with motor drives, accessories, and field service. Provide 100 percent installed spare capacity for pumps. Provide water pumps for slaking water and cooling water supply as shown on the process flow diagram. These locate pumps at the water storage tanks to be provided by the Contractor. For purposes of the proposal, these tanks shall be assumed to be located at grade at a distance of 18.30 meters 60 feet from the piping interface point indicated. Contractor shall provide piping from these tanks to the points of application within his system. Each pump assembly shall include pump, driving motor, baseplate, drive coupling or multiple V-belt drive, and coupling guard, as applicable. Include dowelling of pumps to baseplate.
Each pump shall be of a design and construction for service intended. Overhead motor mounting structure shall have provision for drive belt tension adjustment. Structure shall be such that motor and mounting are supported independently of the pump bearing assembly. Provide structure to allow for removal of pump bearing assembly without disturbing the motor. Structure shall be of fabricated steel, and shall provide support for V-belt drive guard. Drive couplings and matched multiple V-belt drive (MVD) sets shall be rated at not less than 140 percent of the motor power. Guard for matched MVD sets shall have solid metal cover on pump side and expanded metal mesh on outboard end. Flexible drive coupling guards shall comply with applicable safety requirements. Flexible coupling guards shall be arranged for ease in disassembly or removal for access to couplings. Coupling guards shall be rigidly fastened to baseplate. Prevent any external thrust from being transmitted to the motor shaft under any operating conditions. Provide double-screw adjustment bases on nonadjustable horizontal arrangements. Suction and discharge connections shall be standard Class 150 ANSI flat-faced flanges, rubber lined, if pump is rubber lined. Furnish drawings and data as specified in paragraph entitled "Submittals." Include in submittals information for the general arrangement and outline, instrumentation, piping connection, electric motors sound pressure ratings, description of flushing system for slurry pumps, and performance curves.

2.10.1.1 Centrifugal Pumps

Pump speed shall be such that the upper limits of specific speed, as defined by the applicable figure of the HI M100 are not exceeded at any pump operating condition. Total dynamic head of pumps shall be maximum at zero flow and continuously decreasing from zero flow to design flow. Head capacity characteristics shall permit stable operation when pump is operating alone or in parallel with other pumps of the same designation. Pump shut-off head shall be more than 110 percent of design point head and less than 150 percent of design point head. Pump shaft critical speeds shall not occur from 10 percent of design point head. Pump shaft critical speeds shall not occur from 10 percent to 120 percent of design rpm. Pump shaft shall be free from excessive vibration at discharge rates from 10 percent to 120 percent of design delivery. Impeller shall not be maximum or minimum size for pump casing furnished to allow for possible future modification of head capacity furnished to allow for possible future modification of head capacity characteristic by changing impeller size. The maximum allowable sound pressure level shall be 84 dB for each pump-motor unit. Slurry pumps shall be vertically split-case, rubber-lined single-stage pumps designed for indoor service. Water pumps shall be vertically split-case single-stage pumps designed for outdoor service. Slurry pumps shall be provided with shaft seals which do not require water flushing. Provide water pumps with mechanical shaft seals which do not require an external source of seal water. Pumps shall be provided with flexible inlet and outlet connections.

2.10.1.2 Vertically Split-Case Rubber-Lined Pumps

Vertically split-case rubber-lined pumps shall be end suction, single-stage, single-suction centrifugal, of the volute type. Pump trim shall be stainless steel suitable for the service and designed for continuous operation at specified operating conditions. Pumps shall be frame mounted with pump shaft carried on its own bearings with multiple V-belt drive between pump and motor. Pumps shall have bottom horizontal discharge. Pump casing shall be split vertically into suction inlet assembly and pump assembly designed for ease of disassembly. Casing shall
have replaceable secured rubber liner, minimum 10 mm 3/8 inch thick designed for long life under operating conditions specified. Pump impeller shall be enclosed type, of soft natural rubber on steel skeleton. Pump shaft shall be provided with ceramic faced shaft sleeves designed to prevent water leakage between shaft and sleeve. Sleeve shall be adequately anchored to the shaft to prevent any rotation of the sleeve relative to the shaft. Shaft shall be keyed on the driven end for easy removal of the coupling half. Shaft shall be completely encased along its entire length within the wetted area by the impeller and shaft sleeves. Provide adequate fillets for changes in diameter. Pump bearings shall consist of two bearing assemblies, ball or tapered type roller type, mounted in an oil-filled or grease-lubricated housing. Provide adequate seals to prevent leakage of lubricant to outside and dust entry to inside of housing. Bearings shall have 60,000-hour minimum B-10 life under design conditions in accordance with ABMA 9 and ABMA 11. Design to limit maximum shaft deflection to 0.05 mm 0.002 inch. Provide with lubrication system consisting of a constant-level oiler with level indicator or easily accessible grease nipples as appropriate to the bearing design. Provide mechanical or centrifugal shaft seals conforming to paragraph entitled "Centrifugal Pumps." Furnish one spare set of shaft seals for each pump. Support frames for all vertically split pumps shall be fabricated of structural steel and heavy plate extending the full length of pump and driver. Design to adequately support equipment under operating conditions without grout fill inside the frame. Frame shall not be covered with a thin steel plate which requires grouting under the plate, but the frame may be filled with concrete as required for drainage. Grout shall be required under the basic frame only. Contractor to provide minimum 25 mm one inch pipe drain in the perimeter of the frame. Drawings shall indicate the required concrete fill lines for proper drainage. The pump shall be dowelled shall be dowelled to the frame in the shop; the driver shall be dowelled in the field. Furnish bolts or screws for attaching pumps and motor drives to the support frame. Frames shall have grouting holes, 100 mm 4 inch minimum size, to facilitate proper grouting, if area is covered. Materials of construction shall be as specified below.

2.10.1.3 Vertically Split-Case Pumps

Vertically split case pumps shall be end suction, single-stage, single-suction centrifugal, of the volute type. Pumps shall be bronze trimmed, and designed for continuous operation at specified operating conditions. Pumps shall be frame-mounted with pump shaft carried on its own bearings with flexible coupling between pump and motor. Pump orientation to fit piping arrangement. Pump casing shall be split into suction inlet assembly and pump assembly. Design for ease of disassembly, allowing the rotating assembly and bearing housing to be removed without disconnecting pipe or moving the motor. Provide renewable casing rings...
locked against rotation, with one ring mounted in suction inlet assembly and the other ring mounted in pump assembly. Provide with casing vent and drain connections. Pump casing shall be back pull out design. Pump impeller shall be enclosed type, fully machines throughout. Axial balance shall be obtained by balancing ports and rear sealing rings. Casing and impeller wear rings shall be of different hardness designed for long wearing qualities. Pump shaft shall be provided with shaft sleeve designed to prevent water leakage between shaft and sleeve. Sleeve shall be anchored to the shaft to prevent any rotation of the sleeve relative to the shaft. Shaft shall be keyed on the driven end for easy removal of the coupling half. Shaft shall be completely encased along its entire length within the wetted area by the impeller and shaft sleeves. Provide adequate fillets for changes in diameter. Design to limit the maximum shaft deflection at the stuffing box to 0.05 mm 0.002 inch. Pump bearings shall consist of two bearing assemblies, tapered-roller type, mounted in an oil-filled housing. Provide adequate seals to prevent leakage of oil to outside and dust entry to the inside. Bearings shall have 60,000 hour minimum B10 life under design head conditions. Bearing loading for thrust determination shall be at the most adverse operating condition of the pump. Provide with oil lubrication system including oil level indicator. Seals shall be single, mechanical type of the inside, balanced design. Seal face materials shall be selected to provide long life in the service intended. Factory-installed seal water piping shall be provided from pump discharge to inlet connection on seal housing as required to cool and lubricate the seal faces. Seal water loop shall include a valve or orifice to control flow. Provide a spare seal for each pump. Support frames for vertically split pumps shall be fabricated of structural steel and heavy plate extending the length of pump and driver, rigid enough to maintain alignment of machinery, and designed to adequately support equipment under all operating conditions without grout fill inside of the frame. Frame shall not be covered with a thin steel plate which requires grouting under the plate, but the frame may be filled with concrete as required for drainage. Grout shall be required under the basic frame only. Contractor to provide one inch minimum drain in the perimeter of the frame. Drawings shall indicate the required concrete fill lines for drainage. The pump shall be dowelled to the frame in the shop, the driver will be dowelled in the field by others. Furnish bolts or screws for attaching pumps and motor drives to the support frame. Frames shall have grouting holes, 100 mm 4 inch minimum size, to facilitate proper grouting. Materials of construction shall be as specified.

Vertical wet pit pumps shall be end suction, single-stage, single-suction centrifugal of the volute type. Pump trim shall be 316L stainless steel designed for continuous operation at specified operating conditions. Pumps shall be frame mounted with pump shaft carried on its own bearings with multiple V-belt drive between pump and motor. Provide suitable connections on the frame for lifting and lowering of the pump. Pump casing, pipe shaft column, discharge piping, and submerged materials, shall be rubber-coated a minimum of $6 \text{ mm} \ 1/4 \text{ inch}$ thick. Pump casing shall be split perpendicular to shaft. Provide renewable impeller wear rings locked against rotation. Casing shall have replaceable rubber liner, minimum $10 \text{ mm} \ 3/8 \text{ inch}$ thick designed for long life under operating conditions specified. Casing shall be rubber covered. Pump impeller shall be enclosed type of soft natural rubber on steel skeleton. Pump shaft shall be provided with hardened (minimum 450 BHN) stainless-steel shaft sleeves designed to prevent water leakage between shaft and sleeve. Sleeve shall be adequately anchored to the shaft to prevent any rotation of the sleeve relative to the shaft. Shaft shall be keyed on the driven end for easy removal of the coupling half. Shaft shall be completely encased along its entire length by the impeller and shaft sleeves. Shaft shall have fillets for changes in diameter. Shaft shall be designed to carry torsional and axial thrust loads. Shaft shall be one-piece construction. Shaft support column shall be rubber covered. Upper bearing assembly shall be ball or tapered-roller type, mounted in an oil-filled or grease-filled housing. Include adequate seals to prevent leakage of lubricant to outside and dust entry to the inside. Bearings shall have 60,000-hour minimum B10 life under design head conditions. Provide with adequate lubrication system. Provide with dust and oiltight seals. Pump shall have no submerged bearings. Provide shaft seals as specified in paragraph entitled "Vertically Split-Case Rubber-Lined Pumps." Pump baseplate shall be of fabricated steel, of adequate size and thickness to prevent excessive vibration and deflection. Provide holes for mounting of the pump and necessary piping as required. Baseplate shall be rubber-coated on the bottom side. Provide with shims, bolts, and other devices required for proper alignment and anchorage. Anchor bolts required in foundation will be furnished by the Contractor. Materials of construction shall be as specified below.

2.10.1.5 Factory Test and Reports

Pumps shall be tested for static and dynamic balance of rotating assemblies, for normal functioning in conformance with the "Standards of the Hydraulic Institute," and for performance at design conditions. The pump casing shall be hydrostatically tested at 150 percent of shutoff head. After completion of shop tests, install new gaskets and tighten all bolts so that pumps are ready for operation and so that no field disassembly, cleaning, or flushing is required. Notify the Contracting Officer at least 30 days in advance of tests so that a representative can be present.

2.10.2 Valves and Piping

Piping, valves, and pumps in slurry service shall include provisions for automatic and manual flushing, complete drainage and cleanout. Pipe drains shall drain back into a tank. Control and isolating valves and controls required for flushing operations shall be furnished. Furnish parallel piping systems to allow for flushing of one pipeline system with continued operation of the FGD system using the other. A description of provisions for flushing the piping systems shall be included as part of the system description. Slurry piping shall utilize flanged joints and long-radius (600 mm 24 inch minimum) bends. Piping shall be designed for the maximum operating and start-up pressure and temperature requirements of the service. Vent and bypass lines or other lines in intermittent service shall be sized for the available pressure drop. Bypass (recirculation) lines with control valves sized for the available pressure drop shall be provided on systems with varying demands as required to protect the pump. Piping for emergency service only shall be sized as required by the applicable code or based upon the available pressure drop. Piping systems shall be arranged to prevent plugging and settling out in lines and valves. Pipe hangers shall be corrosion-resistant as specified herein. Forces placed on equipment by piping shall not exceed the manufacturer's allowable levels. Piping materials and systems shall be compatible with the fluids handled. Fluid systems shall be designed so that circulation has a low sound level and there is no water hammer and so that vibration from equipment is not transmitted through the piping systems. The fluid systems shall be designed and constructed to produce less than 85 dBA sound level, free field, at one meter 3 feet distance from any part of the system in accordance with ASA S12.54. Velocities maintained in slurry systems shall be not less than 1.22 meters 4 feet per second nor more than 3.35 meters 11 feet per second under all conditions in line including low and high flow. Piping systems shall have high-point vents and low-point drains. Valves shall be located no higher than 1 1/2 meters 5 feet above maintenance platforms and a minimum of 2.13 m 7 foot headroom shall be maintained over walkways. Provide expansion devices and appurtenances to allow for expansion of the piping system. Piping shall be arranged and routed to be readily accessible for maintenance. Field connections shall be located to allow access for disconnection as required for maintenance. On-off control valves shall be provided in the suction and discharge piping of pumps.

2.10.2.1 Valves

Air and water valves shall be as follows: Valves 50 mm 2 inches and smaller shall be Class 200 bronze gate, globe or angle valves conforming to ASTM B61, valves larger than 50 mm 2 inches shall be Class 125 cast-iron gate, globe, or angle valves conforming to ASTM A126. Slurry valves shall be Class 150 polyfluorotetraethylene (PTFE) sleeve plug valves, rubber-lined diaphragm valves with a minimum rating of Class 150, Class 150 semisteel rubber-lined eccentric plug valves, Class 150 knife gate valves or rubber sleeve pinch...
valves. Pinch valves or rubber-lined diaphragm valves shall be used to modulate slurry flow. The pinch valve elastomers shall be neoprene reinforced with polyester. Elastomer sleeve diameter-to-length ratio shall be 1.3 minimum. Pinch valve closure mechanism shall close the valve from opposite sides of the sleeve simultaneously, with complete valve closure at the centerline of the pipe, and shall be provided with positive opening feature. Valves shall be provided with lever or handwheel operators with adjustable position stop. As used in this specification, the term "control valve" refers to an assembly, consisting of a valve body and an actuator, which is used for on-off or modulating opening and closing of the valve, regulating fluid flow, or pressure in response to signal(s) from a control system. Control valve bodies shall be as specified. Provide control valves as required to enable the FGD system to be operated from the steam plant control room. Control valves shall have indicators showing position of valve. Control valves shall have manual override to ensure immediate local control. Manual override shall override coil without damage to coil. Control valves shall be provided with isolating valves as necessary to allow for maintenance. Actuators shall be spring-and-cylinder double-acting cylinder or spring-and-diaphragm type actuators and shall have long-stroke design or special linkages, adapters as required for rotary-type valves. Actuators shall be sized as required for stable operation under maximum pressure drop conditions with 414 kPa (gage) 60 psig maximum air supply pressure available to actuator. Stable operation is defined as the ability of the actuator to position and hold the valve plug, elastomer sleeve or diaphragm accurately without pulsation, vibration, or sticking. Actuators shall be provided with stem travel indicator on yoke. Solenoid valves shall conform to the requirements as specified in paragraph entitled "Solenoid Valves." Provide with each open-closed control valve a limit switch assembly consisting of two DPDT switches, one to actuate in the open position and one to actuate in the closed position. Provide each modulating control valve with a position transmitter. Limit switches shall conform to the requirements of paragraph entitled "Limit Switches." Limit switches shall be furnished factory mounted to their respective control valves. Control valves shall be furnished with manual overrides on solenoid valves for local manual operation of the control valve.

2.10.2.2 Piping

Pipe furnished shall conform to the ASTM material specification specified and meet the dimension standards set forth in ASME B36.10M. Piping furnished shall be provided with the manufacturer's standard exterior surface preparation and coating as necessary to prevent rusting during shipping and storage. Random length pipe shipped to the jobsite shall be identified continuously along its length indicating schedule number and material. If this identification is in the form of a color code or colored stripe, copies of the color code shall be submitted for approval. Each piece of pipe shall be identifiable as to grade and schedule after erection. Water pipe shall be carbon steel, conforming to ASTM A53/A53M, Grade A or B. Pipe sizes 50 mm 2 inches and smaller shall be Schedule 80. Pipe sizes larger than 50 mm 2 inches shall be standard weight. Lime slurry piping shall be Schedule 80 carbon steel, ASTM A53/A53M, Revision B. Rubber hose or rubber-lined pipe may be used for lime slurry where approved by the Contracting Officer. Rubber hose and rubber-lined pipe shall be provided complete with flanges. Except for tubing as specified, air pipe shall be carbon steel, conforming to ASTM A53/A53M, Grade A or B. Pipe 50 mm 2 inches and smaller shall be Schedule 80. Pipe larger than 50 mm 2 inches shall be standard weight. Instrumentation and air tubing shall be seamless, fully annealed and suitable for bending. Steel tubing shall be 316 stainless steel conforming to ASTM A269/A269M, Grade TP 316. Copper
tubing shall conform to ASTM B75/B75M. Minimum wall thickness of tubing shall be as follows:

**************************************************************************
NOTE: Wall thickness selection depends on fluid, media, and pressure.

2.10.2.3 Fittings

Screwed fittings shall be Class 300 malleable iron conforming to ASME B16.3. Fittings shall be galvanized when used with galvanized pipe. Flanges shall conform to ASME B16.5. Steel pipe flanges shall be forged steel. Flanged fittings shall be cast steel. Steel flanges and fittings shall be of the same material and schedule as the pipe to which they connect. Flanges shall be provided with carbon steel bolts and nuts conforming to ASTM A307, Grade B. Bolts and nuts shall have hexagonal heads. Gaskets shall be heavy-duty Buna-N 1.59 mm 1/16 inch thick, full-faced, punched for bolts and pipe opening as required. Fittings shall conform to ASME B16.9 except that cast fittings are not acceptable. Butt-welded fittings shall be of the same material and schedule as the pipe to which they connect. Fittings shall be clean and free of all oxides, slag, and other impurities or foreign matter. Backing rings shall be split-ring type with knock-off...
spacer nubs.

2.10.2.4 Pipe Hangers

Pipe hanger assemblies, anchors and sway braces shall be designed by the hanger manufacturer and the Contractor in accordance with ASME B31.1, MSS SP-58, MSS SP-69 and as follows: (a) Make weight and moment balance calculations to determine the required supporting force on each hanger and the reaction on equipment, (b) design supports so that the spacing does not exceed that given in Table 121.1.4, ASME B31.1 Power Piping Code, except in the center spans of straight runs where the spacing may be increased 20 percent, (c) design the first rigid hanger in a system so that the restraining action of the hanger produces a bending stress no greater than 1/4th of the allowable stress listed in Appendix A of the Power Piping Code, (d) design supports at concentrated load so as to prevent excessive bending moments in system, (e) design for Seismic Zone [_____] in accordance with Section 22 05 48.00 20 MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL, (f) design supports and hanger such that the resultant reactions imposed on the equipment connections due to the weight of the piping system does not exceed a resultant force of plus or minus 45.4 kg 100 lbs or a resultant moment of plus or minus 671 meters per kg 1,000 feet per pound, and (f) provide spring supports in accordance with the following:

Hanger assemblies shall use the following materials in construction:

a. Hanger rods shall be hot-rolled carbon steel cut to length and threaded in the factory. (Continuous threaded rods are not acceptable).

b. Pipe clamps shall be carbon steel.

c. Clevises, turnbuckles, and eye nuts shall be forged steel.

d. Eye rods shall be welded type.

e. Protection saddles shall be carbon steel.
f. Hanger rod components located outdoors shall be galvanized with the exception of lugs and clips welded directly to pipes or structural members.

Pipe hanger assemblies, anchors, and sway braces shall utilize only acceptable type of components as outline in MSS SP-58 and MSS SP-69. Upper supports shall utilize types 22, 28, 29, and 33. Intermediate supports shall utilize types 13, 14, 16, 17, 51, 52, 53, 54, 55, and 56. Lower supports shall utilize types 2, 3, 4, 8, 24, 33, 35, 36, 37, 38, 39A, 39B, 40, 41, 44, 45, 46, 47, and steel plate lugs shop welded to the pipe.

2.10.2.5 Shipping and Handling

Materials for piping systems shall be prepared and marked for shipment and storage as specified. Each piece of piping fabrication shall be identified with a piece mark number which is repeated on each end of section and on each branch. Ship gaskets to the jobsite tagged with size, material, and pressure rating. Loose parts such as nuts, bolts, and gaskets shall be packaged for outdoor storage. Protect flanges with plywood or tempered hard fiberboard covers sealed and bolted to the flange with not less than four bolts. Protect threaded connections with thread protectors. Protect small connections with plastic inserts pressed into the connection and sealed with waterproof tape. Ship hangers to the jobsite with each hanger assembly individually bundled and tagged with the hanger assembly number. Coat-threaded connections with a suitable rust-preventative compound. Ship valves to the jobsite tagged with the appropriate valve number corresponding to the valve list. Ship valves with suitable covers to prevent entrance of foreign material into valve body. Protect valve threads, stems, and handwheels from damage.

2.10.3 Electric Motor Drives and Motor Control Center

Alternating current electric motors required to drive the equipment shall be continuous-duty type suitable for a steam plant environment where moderately abrasive conductive dusts and high humidity are present. Motors shall be self-ventilated. Motors shall be designed for full-voltage starting. Indoor motors shall be suitable for continuous operation at an ambient temperature of 50 degrees C to 122 degrees F. Outdoor motors shall be suitable for continuous operation at any ambient temperature from minus 10 degrees C to plus 40 degrees C to 14 degrees F to 104 degrees F. Motors shall have squirrel-cage rotors. The nameplate power rating of each motor at 1.0 service factor shall equal or exceed the power required to drive the connected equipment under the design conditions specified and within normal operating ranges. For each motor furnished, the nameplate power rating multiplied by the service factor shall equal or exceed the power required to drive the connected equipment under any operating condition. Motors shall be of high efficiency type.

2.10.3.1 Motors Rated 3/8 kW 1/2 Horsepower and Smaller

Motors shall be rated at 115 volts, single-phase, 60 hertz, and have a service factor of 1.0. The torque characteristics of each motor at voltages from 90 to 110 percent rated voltage shall be as required to accelerate the motor and driven equipment to full speed without damage to the motor or the driven equipment. Insulation shall be Class B or Class F, with Class B temperature rise in accordance with NEMA MG 1. Enclosures shall be fabricated of steel. Horizontal motors shall be mounted on a common baseplate with the driven equipment. Manual reset thermal overload protection shall be furnished integral to each motor. Enclosures shall be
totally enclosed nonventilated.

2.10.3.2 Motors Rated 1/2 Through 149 kW 3/4 Through 199 H.P.

NOTE: The efficiency of each motor shall not be less than that indicated in the following table:

**************************************************************************

Motors shall be rated at 460 volts, 3 phase, 60 hertz, and have service factor of 1.15 for open dripproof enclosures, and a service factor of 1.0 for all other enclosure types. Enclosures shall be fabricated of cast iron or aluminum. Enclosures for indoor service other than in the lime slurry preparation area shall be open dripproof, fully guarded. Enclosures for the lime slurry preparation area, and for outdoor service shall be totally enclosed nonventilated or totally enclosed fan cooled. Bearings shall be antifriction type, and shall have an ABMA-L10 rating life of not less than 80,000 hours at rated speed, and under the thrust loadings encountered within normal operating ranges. The thrust loading corresponding to an ABMA-L10 rating life of 5,000 hours at rated speed shall not be exceeded under any operating condition of the motor or the driven equipment.
Bearings shall be insulated when required to prevent bearing or shaft damage due to stray shaft currents. Each horizontal motor shall be mounted on a common baseplate with the driven equipment, or shall be furnished with separate sole plates and subsole plates to permit removal of the motor without disturbing the alignment of the driven equipment. Furnish space heaters for motors rated \(19 \text{ kW}\) or \(25 \text{ horsepower}\) and above. Space heaters shall be rated 120 volts, single-phase, 60 hertz. The torque characteristics of each motor at voltages from 90 to 110 percent rated voltage shall be as required to accelerate the motor and driven equipment to full speed without damage to the motor or the driven equipment. Insulation shall be Class B or Class F, with Class B temperature rise in accordance with NEMA MG 1. The motor "A" weighted sound level shall not exceed 84 dBA when measured to conform to IEEE 85 at a reference distance of one meter. Motors shall be of special high-efficiency and high-power factor design including the following design features: Low-loss lamination steel, increased stator and rotor length, increased winding cross section, high-efficiency cooling fan design, and optimized slot configuration and air gap. Information submitted with the compliance submittals shall include minimum guaranteed efficiency based on tests performed in accordance with IEEE 112, Method B, with accuracy improvement by segregated loss determination including stray load loss measurement. Information submitted shall include percent efficiency and percent power factor at full load, 3/4 load, and 1/2 load. Provide motor bearing thermocouples and motor winding resistance temperature detectors (RTDs) for motors \(15 \text{ kW}\) or \(20 \text{ horsepower}\) and larger. Thermocouples and RTD's shall be as specified in paragraph entitled "Temperature Monitor."

2.10.3.3 Motors Rated 150 Kilowatt 200 Horsepower and Larger

Motors shall be rated 4,000 volts, 3-phase, 60 hertz, have a service factor of 1.0 and conform to NEMA C50.41. The torque characteristics of each motor at voltages from 85 to 110 percent rated voltage shall be as required to accelerate the motor and driven equipment to full speed without damage to the motor or the driven equipment. Insulation shall be Class B or Class F, with Class B temperature rise in accordance with NEMA C50.41. Insulation systems shall be mica based. Each motor shall be furnished with not less than two resistance temperature detectors per phase, embedded in the stator windings. Detectors shall be rated 10 ohms at 25 degrees C as specified in paragraph entitled "Temperature Monitor." The acceleration times for each motor at voltages within the starting voltage specified, when connected to the driven equipment, shall not exceed the allowable locked-rotor times at those voltages. In addition to the starting capabilities specified in NEMA C50.41, following one start with the motor initially at a temperature equal to the rated-load operating temperature, each motor shall be capable of making additional starts with a cooling period at standstill between starts not greater than 45 minutes. Enclosures shall be fabricated of cast iron or steel, and shall be furnished with corrosion-resistant hardware. Enclosures shall be weather-protected NEMA Type II. Horizontal motors shall be furnished with sleeve type bearings. Bearings, bearing brackets, and end shields shall be split type when available for the frame size and enclosure furnished. For motors, furnish oil rings; oil reservoirs; sight glasses located to be readily observable, and marked with the proper oil level when running and at standstill; and drain and fill piping to a location where each bearing and reservoir can be flushed, drained, and refilled. At least one bearing shall be insulated when required to prevent bearing or shaft damage due to stray shaft currents. Each horizontal motor shall be mounted on a common baseplate with the driven equipment, or shall be furnished with separate sole plates and subsole plates to permit removal of the motor without disturbing the alignment of the driven equipment.
Thermostatically controlled heaters shall be furnished in each bearing oil reservoir of outdoor motors. Heaters rated 1,200 watts and less shall be rated 120 volts, single phase; heaters rated above 1,200 watts shall be rated 240 volts, single phase. One thermocouple type temperature detector shall be furnished for each sliding type bearing as specified in paragraph entitled "Slide Bearings." A vibration transducer mounting pad shall be furnished on the output shaft bearing housing of each motor connected to equipment specified with a bearing vibration system. Space heaters shall be furnished on each motor. Space heaters rated 1,200 watts and less shall be rated 120 volts, single phase; space heaters rated above 1,200 watts shall be rated 240 volts, single phase. Each motor power lead terminal box shall be Type II as defined in NEMA C50.41. Each box shall be sized to enclose connections to synthetic-insulated shielded power cables including preformed stress cones. Removable molded insulating boots shall be furnished for factory and field connections in each box. Accessory leads including temperature detector leads, space heater leads, and current transformer secondary leads shall be wired to the accessory terminal box. The motor "A" weighted sound level shall not exceed 84 dBA when measured to conform to IEEE 85 at a reference distance of one meter.

2.10.3.4 Motor Control Centers

Contractor shall furnish motor control centers with starters and controls for 3 phase motors rated less than 150 kW 200 hp. Separate motor control centers shall be provided for each of the spray dry absorber-fabric filter baghouse units and the lime slurry preparation system. The lime system motor control center shall be located within the system enclosure. Motor control centers shall be totally enclosed dead-front type suitable for use on 480-volt, 3-phase, 4-wire, 60-hertz system. Motor control centers shall conform to NEMA ICS 6 and UL 845. Motor control centers shall consist of individual vertical self-supporting sections, nominally 508 mm wide, 508 mm deep, 2286 mm high 20 inches wide, 20 inches deep, and 90 inches high, bolted together on floor sills. Sections shall be divided into compartments for control equipment and arranged for future additions at the ends. Structures shall be rigid and sufficiently braced to prevent movement of control centers when inserting or withdrawing removable units. Compartment doors shall be hinged full length and equipped with quick captive screws and neoprene gasket on each compartment door. Guide rails shall be provided for alignment of plug-in units. Plug-in units and doors shall be accurately constructed and aligned to prevent binding. Control centers shall be arranged for front mounting of equipment and control units shall be plug-in type with wiring accessible from the front. Plug-in units shall be draw-out or tilt-out type with provisions for padlocking in the disconnected position. Disconnecting stabs shall be pressure type of silverplated high-strength copper alloy. Control center disconnecting devices shall be provided with external operating handles arranged for padlocking in the "off" position and the compartment doors shall be interlocked to permit opening only when the disconnect device is in the "off" position. Control center enclosure shall be NEMA 1 and wiring shall be NEMA Class II, Type B. Control center main horizontal buses shall be rated as required for the connected loads, but not less than 600 amperes, and vertical buses for each section shall be rated as required for connected load, but not less than 300 amperes, both at a continuous rating at 50 degrees C 122 degrees F rise. Buses shall withstand stresses of short-circuit currents of 42,000 amperes rms. A ground bus shall be provided at the bottom for the full length of the motor control centers. Furnish each vertical section with continuously energized space heaters as required to prevent condensation during construction. Space heaters shall be applied at one-half rated voltage. Space heaters in a shipping section
shall be wired together and connected to a terminal block that is accessible before the motor control center is uncrated. Control center motor starters shall be circuit-breaker combination type and shall be rated at 460 volts, 3-phase, and shall be the NEMA size classifications required for motors furnished. Motor starter shall be magnetic, across-the-line, single speed, two speed or reversing as required. Each starter shall be provided with a control transformer rated 480/120 volts having a volt-ampere capacity to suit the control load including control devices, but not less than 100 VA. A fuse shall be provided in the 120-volt control circuit for each starter. Control connections shall be as required. Each starter shall be equipped with three thermal overload relays. Short-circuit rating of combination starter shall be 42,000 amperes rms symmetrical. Starters shall be wired to the terminal block for a remote auxiliary contact to be provided by the Contractor. The auxiliary contact will be wired in series with the stop push button, selector switch or control device to open the control circuit to the starter contractor when the auxiliary contact is opened. Each motor control center shall be equipped with two NEMA Size 1, two NEMA Size 2, and one NEMA Size C complete, spare, full-voltage, nonreversing motor starters. Control center circuit breakers shall be rated 600 volts ac, manually operated, trip free from the handle, and with a molded case. Breakers shall be 3 pole unless otherwise specified. Breakers used in combination motor starters shall be adjustable instantaneous only, coordinated to provide short-circuit protection for both the motor circuit and the thermal overload relays in the magnetic starter. Breakers shall contain inverse-time thermal overload protection and instantaneous magnetic short-circuit protection. Combination motor starter circuit breakers shall have a symmetrical interrupting capacity at 480 volts not less than the motor control center short-circuit ratings. If current-limiting fuses are used to achieve the specified short-circuit rating, a positive acting anti-single-phase trip mechanism must be furnished. Each motor control center shall be equipped with two 100 A, 3-pole, and one 225A, 3-pole, spare feeder circuit breakers. Include external handle which clearly indicates when breaker is "on," "off," or "tripped." Handle shall be lockable in the "off" position. Control centers shall be ambient compensated to 50 degrees C 122 degrees F. Control centers that utilize frame sizes 225 ampere and larger shall be furnished with interchangeable trip units. Circuit breakers shall conform to NEMA AB 1 and shall meet the appropriate classification of FS W-C-375.

2.10.3.5 Factory Tests

Perform factory tests on each motor rated 460 volts and below in conformance with NEMA MG 1, and IEEE 112 or IEEE 114. Tests shall include:

a. No-load current and speed tests at normal voltage and frequency,
b. high potential test, and
c. standard factory tests.

Perform factory tests on each motor rated above 460 volts in accordance with NEMA C50.41 and IEEE 112. Tests shall include:

a. Measurement of winding resistance,
b. no-load test with readings of current, power, and nominal speed at rated voltage and frequency,
c. mechanical vibration test,
d. direction of rotation versus phase sequence test,
e. insulation resistance test, and
f. high-potential test.

2.11 DUCTWORK AND DRAFT EQUIPMENT

Provide self cleaning ductwork for the Flue Gas Cleaning System from the economizer outlet to the stack inlet as indicated, including fabric filter baghouse reverse gas ducts, if required, complete with necessary expansion joints, transitions, structural slide bearings, dampers, turning vanes, and support steel. Provide 100 mm 4 inch pipe coupling test ports upstream and downstream of each spray dryer absorber and upstream of each guillotine system isolation damper. Test ports in horizontal ductwork shall be located in the side of the ductwork and test ports shall be of sufficient length to extend 102 mm 4 inches beyond the insulation and lagging to be provided by the Contractor. Test ports shall be Schedule 40 316 stainless steel, pipe conforming to ASTM A167 with screw plugs. Coat each plug with antiseize lubricant suitable for service at the design temperature extremes. Exact locations and number and arrangement of ports at each location shall be determined by the Contractor following the model test. Except for the ductwork between the spray dryer absorber and the fabric filter baghouse, duct runs in which the Contractor intends to locate test ports shall be arranged to conform to at least the minimum requirements of U.S. EPA Regulation 40 CFR 60, Method 1, relative to the spacing between test port locations and flow disturbances in the upstream and downstream directions. Final location and arrangement is subject to approval of the Contracting Officer. Structural design temperature range for ductwork shall be [_____] to [_____] degrees C degrees F. Long ductwork sections shall contain hoppers, clean-out doors, and structural support due to dust drop out. Ductwork and support steel shall be designed such that no loads will be applied to the ductwork provided by the Contractor at the interface points. The expansion joints, bolts, nuts, backing bars and gasketing at interface connections shall be by the Contractor. Carbon steel ductwork, support steel, access ways and access doors shall be designed as specified and as noted on the drawings. External and internal walls and partitions of the ductwork shall be of fully sealed by continuous fillet or continuous complete penetration groove welds, as applicable. Provide control instruments and required penetrations as specified in paragraph entitled "Instrumentation and Controls." Expansion joints shall be provided at interface points of ductwork included in this contract and as required to ensure that no stresses in ductwork and supports are transmitted to equipment to be provided by the Contractor. Contracting Officer will supply exact location, sizing and bolt hole patterns for connections at the economizer outlet ductwork and chimney inlet. Furnish and deliver dampers as indicated and as required for operation of FGD system including, but not limited to, fabric filter baghouse module inlet and outlet dampers, fabric filter baghouse bypass isolation dampers, induced draft fan inlet control dampers, and guillotine system isolation system dampers. Furnish damper units complete with operators and accessories and field service, as specified. Dampers and louvers shall conform to AMCA 500-D, AMCA 801, and AMCA 802. Provide mechanical draft equipment required for proper operation of the flue gas cleaning systems and boilers including, but not limited to, induced draft fans. Fans shall be complete with accessories and auxiliaries specified. Provide fan inlet dampers as specified in paragraph entitled "Dampers." Ductwork submittals shall include general arrangement
and outline information, foundation design information, structural fabrication information, internal arrangement and erection information, insulation and instrumentation information, and design calculations for stiffener requirements for internal pressure ratings. Drawings shall show details of ductwork connections, and layout and details as required for access platforms, ladders, and handrails, details of each expansion joint, details of slide bearing plates, and the expansion joint locations, the movements to be absorbed in each joint, construction details and flange-to-flange dimensions.

2.11.1 Ductwork

**************************************************************************
NOTE: Dimension interface of ductwork and the chimney to reduce pressure drop. Use maximum dimensions.
**************************************************************************

Ductwork shall be constructed with a minimum thickness of 6 mm 1/4 inch. Ductwork shall be designed for a transient condition (80 percent of yield strength) at internal pressure of at least plus 4980 and minus 7470 Pa 20 and minus 30 inches WC except as specified otherwise. Joints and seams shall be welded gas-tight by continuous fillet or continuous complete penetration groove welds. Provide with access doors, as specified, to provide access to each run of duct including both sides of dampers and gas distribution devices. Ductwork shall be designed to withstand a fallout particulate weight of 976 kg/square meter 200 lbs/square feet. Provide 10 mm 3/8 inch thick-turning vanes for turns 45 degrees and greater and where indicated by the model study. Properly brace and support with pipes and angles. Bracing with rods is not permitted. Turning vanes are not required in fabric filter baghouse manifold inlet and outlet transitions to and from modules. Gas velocity of the main flue gas stream shall be as specified in paragraph entitled "Ductwork." Provide gasket material bolts and nuts for flanged connections. Gaskets shall be of ethylene propylene terpolymer (EPDM) material. Provide flanges and expansion joints at ends of scope to match equipment to be provided by the Contractor. Bolt hole tolerance in flanges to be connected at interface points and to dampers shall be 3/4 mm 1/32 inch between adjacent holes and 1 1/2 mm 1/16 inch between any two holes on a side in the flange pattern after fabrications of the complete ductwork section. After fabrication of the ductwork section, measurement shall be made between holes across diagonals and bracing shall be installed to maintain flange bolt tolerance. Provide connections for temperature and pressure measurements as specified and as required of the control of the FGD system. Instrument connections shall be 50 mm 2 inch Schedule 40 pipe with screw caps and shall extend 150 mm 6 inches beyond the insulation and lagging on the ductwork. Instrument connections shall be provided with rod-out caps or plugs. Maximum plan width inside dimension of the breeching at interface with the chimney shall be [____].

2.11.1.1 Reverse Air Ductwork

Reverse air ductwork shall be constructed of sheet steel and all seams and connections shall be airtight. Means shall be provided to maintain the temperature in the reverse air ductwork above the dewpoint by circulation of clean flue gas.

2.11.2 Expansion Joints

**************************************************************************

**************************************************************************

Expansion joints shall be nonmetallic belt-type joints. Expansion joints shall be suitable for maximum expected or specified working pressures and for operation at design gas-flow velocities. Expansion joints shall include baffles able to withstand a fallout ash weight of 976 kg/sq m 200 lbs/sq ft and remain completely workable. Expansion joints shall be designed for temperature from [_____] to [_____] degrees C degrees F. Provide access to four sides of expansion joints, both interior and exterior to the ductwork. Each expansion joint shall include: minimum 80 by 80 by 6 mm 3 by 3 by 1/4 inch carbon steel angle flanges drilled for mounting to ductwork for joints where belt does not have molded flanges, a carbon steel backing bar, and internal baffle around full circumference of expansion joint; minimum of 3 mm 1/8 inch thick to prevent fly ash erosion and buildup in web of joint and not restrict the movement of the joint, and nuts and bolts required to attach the fabric to the flanges and the expansion joints to the ductwork. Bolt holes on maximum of 100 mm 4 inch centers. Belt materials shall be minimum 6 mm 1/4 inch thick, two-ply, aramid-or fiberglass-reinforced, solid fluoroelastomer polymer specially compounded for the intended service. Material shall be factory spliced to form endless belt without sewn joints. Bolt holes shall be factory punched.

2.11.3 Dampers

Dampers shall be designed for a Zone [_____] seismic risk area and a wind loading and additional loads as specified. The dampers shall be designed to be operated without manual assistance under temperatures and pressures specified and with normal accumulations of flue products. Dampers shall have provision for periodic lubrication with appropriate grease, if not permanently lubricated and sealed. Dampers shall be supplied with limit
switches which shall give positive indication of the damper position (open/close). Dampers except guillotine dampers shall have pneumatic operators. Guillotine dampers shall be provided with the manufacturer's standard motor operators as required for the service intended. Dampers shall fail in fail-safe position upon loss of power or air. Fabric filter baghouse bypass dampers shall be a double tight seal damper to provide for essentially zero leakage at maximum fabric filter baghouse design differential pressure. Bypass dampers shall be provided with an air reservoir of sufficient capacity as to activate damper upon loss of plant air. Inlet and outlet dampers shall be a minimum of 99 percent gas tight. Fabric filter baghouse module inlet and outlet damper operators shall be located outside of the gas stream and shall be accessible for maintenance with the unit in operation. Induced draft fan inlet control dampers shall be louver dampers in accordance with induced draft fan manufacturer's recommendations. Guillotine isolation dampers at stack inlet breeching shall be provided with control interlocks to prevent dampers from closing when the associated induced draft fan is operating. Provide positive means of preventing accidental closure of guillotine dampers. These dampers will be used to isolate the equipment upstream for maintenance. They shall be equipped with an external, locally-mounted audible alarm to signal loss of seal air for personnel safety. Each damper frame shall be of a rigid structural design to eliminate distortion or warpage which may interfere with the damper operation. Frames shall be flanged for bolting to connecting ductwork. Frames shall be designed to support a fly ash load of 1464 kg/sq m 300 lbs/sq ft on the bottom of the frame. Design frames to support a 908 kg 2,000 pound concentrated load due to uneven fly ash distribution, at a point that causes maximum deflection of the frame. Frames shall be designed to support the seal air fan system, related controls, motors, and drive mechanisms, and the entire damper unit with only one flange bolted to the ductwork. Include lifting lugs to ensure proper handling of the damper during transportation and erection. Frames on louver dampers shall be of a length greater by one inch than the width of the louver blades. Control drive units shall be as specified and shall provide a direct position readout at the damper by means of a mechanical position indicator showing percent of damper opening on flow control dampers. Control drives other than poppet damper actuators shall be equipped with a permanently mounted handwheel that is disengaged under conditions of pneumatic or motor operation.

2.11.3.1 Seal Air Systems

Each guillotine damper shall be provided with a seal air system. Each seal air system shall include two full-capacity seal air fans, one operating and one standby. Each fan shall be capable of supplying two times the guaranteed cfm leakage rate through the dampers at design conditions. Fans shall be as specified. Each fan shall be capable of maintaining a pressure between the seal chamber and the gas stream of at least 747 Pa 3 inches W.C. at the design conditions. Provide zero leakage isolation valves at the discharge of each fan. Valves shall be mild steel gate or butterfly valves. Provide check valves at the discharge of each fan to prevent backflow through the idle fan. Check valves shall have a replaceable soft fluoropelastomer seat, and shall be designed to prevent "flutter" when in the open position. Provide a manual control damper or valve in the seal air duct to permit seal chamber pressure to be controlled. Control damper or valve shall be mild steel, and shall have an easily visible position indicator. Provide an automatic isolation valve in the seal air duct to permit seal chamber pressure to be controlled. Control damper or valve shall be mild steel, and shall have an easily visible position indicator. Provide an automatic isolation valve at the connection of the seal air duct
to the seal air chamber. Valve shall be gate or butterfly type constructed of nickel-chromium alloy containing a minimum of 55 percent nickel, 20 percent chromium and 8 percent molybdenum and shall be suitable for corrosive environments. Provide pneumatic piston operator on the valve to operate on 552 to 862 kPa (gage) 80 to 125 psig instrument air. Tube and mount a four-way dual-coil solenoid valve, with Class H coils rated for 120-VAC service. Provide two dual-pole-dual-throw limit switches, one to actuate in the open position, one to actuate in the closed position. Limit switch housing shall meet NEMA 4 requirements. Piston actuator shall remain in last position if air supply fails. Provide three 50 mm 2 inch pipe nipples with caps and rod-out on the seal chamber of the damper, preferably on top of the damper, for attachment of seal chamber pressure instrumentation. Provide necessary instrumentation to monitor operation of seal air system and initiate alarm as specified for maintenance personnel protection. Provide 50 mm 2 inch port with rod-out on seal chamber and 50 mm 2 inch port with rod-out on ductwork to test seal air pressure differential. Port on ductwork shall extend 150 mm 6 inches beyond stiffeners to clear insulation and lagging. Provide caps or plugs. Seal air systems, where possible, shall be mounted on the damper frame. Installation shall be such that the system is easily accessible and instrumentation can be easily observed. Install such that there is complete access to linkages, drive units, bearings, and stuffing boxes. Isolation valve and blower shall be mounted such that condensation occurring between the damper and the isolation valve flows into the ductwork. If installation on the damper frame is not possible, a platform shall be provided to support the equipment.

2.11.3.2 Louver Dampers

Damper blade/shaft assembly shall be designed not only for the maximum allowed stress, but to limit the deflection under the maximum conditions at which the damper is to seal to L/14.4 or 6 mm L/360 or 1/4 inch, (whichever is less)(L = blade length in mm inches). Blade shall be of a rigid structural design, capable of handling thermal stresses and warping due to differential temperatures and pressures, without affecting damper operation. Stub shafts shall be pinned or bolted to the through shaft or blade in such a manner that individual damper blades can be easily removed. Pins or bolting materials shall be of carbon steel, with a design such that the connections are self-locking. Shafts shall be sized to deliver the full operator torque to any one blade, without exceeding one-third of the shaft yield stress when operating at the worst-case design conditions. Provide dust-tight stuffing boxes sealed with fluoroplastic packing material to seal the shaft openings. Stuffing boxes shall be designed such that the packing can be adjusted or removed from the outside of the duct, without removing or disturbing the bearings or the linkage. Adjusting nuts, washers, and bolts shall be 316 stainless steel conforming to UNS S31600 (.03 to .08C) and shall incorporate a self-locking design, such that vibrations in the damper unit will not cause backing out of the bolts. Bearings shall be permanently lubricated, self-aligning type. Bearings shall be mounted outboard of the damper unit and any insulation and lagging, in such a manner that leaking packing will not cause the bearing to become contaminated with fly ash. Each bearing and bearing mount shall be designed to withstand three times the stress transmitted from the load on the blades plus the operator output torque. Linkage system shall be located outside of the damper unit. Linkage system shall be fully adjustable to compensate for thermal expansion of the frame. Parts with threaded connections for adjustment shall be carbon steel. Provide lock nuts on the adjustable linkage to positively hold the linkage after adjustment. Design shall be such that each individual blade can be
adjusted. Clevis arms shall be pinned or bolted to the stub shaft. Arms shall be keyed to the shaft for easy removal. Clevis arm shall be carbon steel and linkage pins or bolts shall be 304 stainless steel conforming to UNS S30400 (.03 to .08C). Pins or bolts shall incorporate a self-locking design, such that operation or vibration of the unit will not cause loosening of the connections. Linkage system, including connections, shall be designed to withstand three times the stress transmitted from the load on the blades plus the operator output torque. Linkage system shall have provisions for locking with a heavy-duty padlock in such a manner that the damper cannot be operated until the padlock is removed. Sealing strips shall conform to ASTM B443. Strips shall be bolted into place with bolts and nuts fabricated of the same alloy as the strips. Connection shall be self-locking to prevent loosening of the connection. Seal strips shall be of a suitable length to enable easy replacement in the event of damage or failure. Sealing strips are not required for induced draft fan dampers. Louver dampers shall be either parallel or opposed blade. Blades shall be air-foil type, of rigid structural design. Blade skin and through shaft shall be compatible material for expansion and contraction. Blade shall be connected to through shaft with self-locking bolts or pins. Louver dampers except the induced draft fan inlet control dampers and dampers in vertical ducts shall be designed for staged closing. Operation of the blade shall be such that blades close, except the bottom blade. When the upper blades have closed, then the bottom blade will close. Provide two operators on the linkage system, one to operate the top blades, and one to operate the bottom blade. Design of the linkage shall be such that the number of blades operated by each operator may be changed with relative ease. To prevent ash buildup at bottom of hopper, install purge air system.

2.11.3.3 Poppet Dampers

Poppet dampers shall be vertically operating, with pneumatic operators, adjustable speed and stroke, shaft packing glands, replaceable seal plates, and machined steel seating cylinder and guide shaft. The dampers shall be equipped so they can be mechanically locked in a closed position to protect service personnel. Poppet damper shafts shall be out of the dirty gas stream wherever possible. Shafts exposed to the flue gases shall be provided with shaft seals. Poppet dampers shall be a minimum of 99.5 percent gas tight.

2.11.3.4 Guillotine Dampers

Guillotine dampers shall be bottom-entering dampers in paragraph entitled "Dampers." Guillotine dampers shall have bonnets over the top frame if required to prevent flue gas leakage to the atmosphere. Bonnet assembly shall be of carbon steel and shall have easily removable side plates for inspection of the damper drive assembly. Bonnet shall be designed for continuous-seal air purge. Guillotine dampers shall have a removable plate for access to the bottom frame seal. Damper blade shall be fabricated of plate, and shall be as rigid as necessary to withstand the maximum differential pressures specified. Provide blade with sealing strips around the periphery of the blade and on the seating surfaces of the frame. Local seals on both the upstream and downstream sides of the blade. Sealing strips, seal strip bolting materials and backing strips shall be as specified for louver dampers. Blade shall be designed to include provisions for thermal expansion such that the blade will not bind. Bearings shall be permanently lubricated, self-aligning type. Design shall be such that thermal gradients and long periods of time between damper operation will not cause bearings to bind or seize. Damper drive shall be designed to lift the damper blade evenly on both sides. Each drive, tie
rod, and bearing, shall be designed to withstand three times the load caused by the damper blade plus the operator output torque, at worst-case pressure and flow conditions. Upper frame shall be designed to support the blade, drive mechanisms, and attachments. Frame shall not sway and cause binding of the blade when operating at worst-case flow and pressure conditions. Pressures and flows provided to the damper manufacturers shall be approved by the Contracting Officer in advance. Damper shall include a mechanical crank for manual operation.

2.11.4 Mechanical Draft Equipment

Mechanical draft equipment and appurtenances shall have an acceptable history of satisfactory reliable service in industrial steam plant use for a period of at least three years at comparable temperature, pressure, voltage, and design stress levels. Newly developed equipment with less than three years actual service may be considered from established manufacturers, only if it has been adequately tested, at an approved lab meeting AMCA standards, meets the requirements of this Contract, and is approved by the Contracting Officer. Prior to shipment, the manufacturer shall thoroughly inspect parts of the equipment furnished to ensure sound material and first class workmanship. Rivets shall be tight and welds shall be full thickness and without undercutting. Keys shall fit snugly and rotors shall be secured firmly to the shafts. Welding on rotors for fans shall be examined by magnetic particle inspection. Magnetic particle inspection shall be performed on the root pass and the finished surfaces of all welds. On full-penetration welds, the backside of the root base shall be examined by magnetic particle inspection before depositing weld from the backside. Welds shall be free from undercutting in excess of 0.40 mm 1/64 inch in depth and free of cracks and fissures in excess of 6 mm 1/4 inch in length. Inspection of the fans for compliance may be made by the Contracting Officer. Notify the Contracting Officer, in writing, at least 45 days prior to start of assembly and welding of fan rotors so that he may have a representative present to inspect fan rotors during fabrication, if desired. This inspection of the fan rotors will include an examination of the weld grooves preparations on the material being joined in the assembly of the fan wheels, witnessing the actual welding being performed on the fan wheels, a visitation to the manufacturer's nondestructive testing facility, witnessing the nondestructive testing being performed on welds and base material of the fan wheel, and verifying that subassemblies are fabricated properly and in accordance with the manufacturer's drawings and specifications. Fans shall be designed and constructed to ensure reliability with a minimum number of scheduled outages for repairs and maintenance. Fans shall be suitable for continuous operation at full or part load. The fans and their ducts, flow-regulating devices and dampers shall be coordinated to give an installation which will be capable of operation without excessive vibration, fan noise, or air or gas vibrations. This satisfactory performance shall be maintained throughout the entire load range of the fans including operation at minimum flow settings with cold air. Fans over 19 kW 25 hp shall be two-bearing design with rotor suspended between bearings with no overhung wheels.

2.11.4.1 Fan Housing

Provide split housing so the rotor is accessible and removable for normal maintenance without disconnecting the housing from the inlet or outlet ducts or foundation and without moving the motor. Shape the housing for maximum streamline flow from inlet to outlet. Construct from mild steel plate. Brace with structural steel welded to the housing and designed for sufficient strength to prevent warping and excessive vibration under
operating conditions. Provide with gas-tight inspection doors. Provide with inlet and outlet connections of structural angle flanges for welding to similar flanges on the ductwork with bolts provided and used for alignment only, or for connections to similar flanges on the ductwork by means of gaskets and bolts. Bolts shall be spaced not more than 65 mm 2 1/2 inches apart. Provide with a 50 mm 2 inch drain pipe connection welded to the lowest point of the fan scroll. Provide nipple and cap. Housing will be supported from a concrete base. Housing shall be designed so a minimum distance of 600 mm 24 inches will exist between the bottom of the housing and the foundation to permit application of insulation and access to the housing drain connection. Shop paint fan housings in accordance with the specifications for painting of the ductwork to which they connect.

2.11.4.2 Fan Rotors and Shafts

**************************************************************************
NOTE: Rotors shall be balanced statically and dynamically so that vibration displacement at the bearings measured on the shaft at full load and full speed with a clean rotor will not exceed the following.

<table>
<thead>
<tr>
<th>Rotor Speed, rpm</th>
<th>Displacement, mm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 600</td>
<td>0.051</td>
</tr>
<tr>
<td>600 to 900</td>
<td>0.038</td>
</tr>
<tr>
<td>Above 900</td>
<td>0.025</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Rotor Speed, rpm</th>
<th>Displacement, inches</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 600</td>
<td>0.0020</td>
</tr>
<tr>
<td>600 to 900</td>
<td>0.0015</td>
</tr>
<tr>
<td>Above 900</td>
<td>0.0010</td>
</tr>
</tbody>
</table>

Weight adjustment for balancing shall be by either the addition or the removal of metal.
**************************************************************************

Fan rotors shall be designed and constructed to keep stresses from rotation or temperature differential at a safe and conservative level. Fan rotors shall be designed so the maximum calculated stress at any point on the rotor, under any normal condition such as continuous operation or starting acceleration, will not exceed 50 percent of the yield strength of the rotor material at the maximum operating temperature. Fan rotors shall have center plates and shroud plates of mild or alloy steel. Tie rods between plates or blades will not be permitted. Construct so that while the rotor is turning, the run-out of similar points on the rotor structure will not deviate from the median path by more than 0.375 percent of the wheel.
diameter. Rotors shall be designed and constructed so that the first critical speed of the rotor is not less than 33 percent above the normal operating speed for fans operating at temperatures up to 93 degrees C 200 degrees F and not less than 50 percent above the normal operating speed for fans operating at temperatures of 93 degrees C 200 degrees F and above. Fan shafts shall be forged and heat-treated steel, accurately machined, with ground and polished journal and thrust bearing surfaces. Shafts shall be provided with seals to minimize leakage where the shaft penetrates the housing.

2.11.4.3 Bearings

Bearings shall be suitable for continuous heavy-duty service and shall be self-aligning, sleeve-type journal bearings designed with adequate lubrication for coast down without an external oil supply. Install bearings in a horizontal split housing or pedestal of structural steel or cast iron. Pedestals shall allow removal of bearings without removing rotor and shall be suitable for shimming. Bearings shall be located external to the inlet boxes. Bearings on double-inlet fans shall be designed to withstand the thrust unbalance resulting from the shutoff of one inlet while the other inlet is open. Protect bearings from the weather on outdoor installations with a suitable rain hood and sun shield as recommended by the manufacturer. Each bearing shall have bearing temperature thermocouple as specified in paragraph entitled "Instrumentation and Controls." Bearing lubrication systems shall be specifically designed for air cooling except as noted below. Provide cooling air by inlet box suction. Inlet air filters shall be provided. Where the bearing surface rubbing speed exceeds 7.62 m/s 18,000 inches/minute bearings designed for water cooling shall be furnished. Each bearing shall be equipped with at least two machined oiling rings and an adequately sized integral lube oil reservoir with oil level gage. Reservoirs shall be equipped with immersion heaters designed to continuously maintain the lube oil in the bearing at starting temperature over the range of ambient temperature specified in paragraph entitled "Design Parameters." Immersion heaters shall be 120-volt AC single-phase and shall be complete with a thermostat located to accurately control lube oil temperature. Furnish bearing pedestals, mounting plates, and soleplates as required to mount the equipment on the concrete foundation. Contractor shall furnish the torque requirements of the foundation bolts for fans.

2.11.4.4 Motor Drive

Each fan shall be furnished with a single-speed motor drive. Each fan shall be equipped with a flexible coupling between the fan and motor drive. Coupling shall be rated at not less than 150 percent of the motor power at design fan speed. Design coupling to prevent any axial thrust from being transmitted to the driver under any normal operating condition.

2.11.4.5 Induced Draft Fan

Performance of the induced draft fan shall be as specified in paragraph entitled "Design Parameters." Induced draft fans shall be double inlet, double width. Provide one induced draft fan for each steam generator and its associated gas cleaning equipment as indicated. Each induced draft fan shall be equipped with dampers as specified in paragraph entitled "Mechanical Draft Equipment." Provide inlet control dampers for regulating the fan output. Inlet dampers shall be arranged for operation from one control drive at each fan. Control drive shall be as specified in
paragraph entitled "Analog Control System." Provide control signal from combustion controls. Induced draft fans shall have housing constructed of 10 mm 3/8 inch minimum thick mild steel. Housing shall be provided with wear-resistant liners of not less than 12.70 mm 1/2 inch thickness at all points of wear. Liners shall be easily replaceable. Interior bolt heads shall be protected from fly ash erosion. Fabricate housing of 19 mm 3/4 inch minimum thick, mild steel plate instead of separate liner plates, if desired. Induced draft fan rotors shall have radial blades with replaceable wearing surfaces over at least two-thirds of the blade width, at least equal to the thickness of the skin of the blade.

2.11.4.6 Reverse Air Fan

**************************************************************************
NOTE: Insert appropriate Section number in the blanks below.
**************************************************************************

The reverse air fans shall be heavy duty industrial type fans having single flanged inlets and outlets. Type of bearings and bearing lubrication shall be suitable for the temperatures encountered. Provide heat slingers. A quick-release gasketed inspection door shall be furnished on the housing. Fans shall be V-belt driven by a constant speed motor through adjustable speed sheaves. Mount motor on slide motor bases designed to adjust belt tension from a screw mechanism; furnish suitable belt guards. The fan shall be rated for flow, pressure, power, speed of rotation, and efficiency in accordance with AMCA 210 and the fan shall comply with AMCA 201 and the fan shall comply with AMCA 99. Motors shall be as specified in Section [_____] ELECTRICAL, for the service intended. Minimum reversing air flow shall be with 10 L/s per square meter 2 acfm per square foot of net cloth area under cleaning action.

2.11.5 Painting

Surfaces of ductwork and metal parts of expansion joints which will be exposed after installation of insulation and lagging shall be painted as specified in paragraph entitled "Ductwork and Draft Equipment." Areas that will not be exposed shall be painted as specified, except that a dry film thickness of 0.051 mm 2 mils shall be applied. Apply primer to steel surfaces, except the areas within 50 mm 2 inches adjacent to field welds. Surfaces that will be exposed to the flue gas flow need not be painted, but shall be protected during shipment and storage with a suitable rust-preventative coating. Damper frames, support steel and seal air ductwork not directly in the gas stream shall be shop-cleaned and painted as specified in paragraph entitled "Structural and Miscellaneous Steel." Damper operators, seal air valve operators, motors, seal air fans and limit switches shall be primed and painted per the equipment manufacturer's standard practice. Protect exposed machined surfaces with a suitable rust-preventative compound.

2.11.6 Factory Tests

Perform manufacturer's standard factory tests on mechanical draft equipment and material. Perform tests required by the applicable codes and these specifications. Notify the Contracting Officer in writing at least 45 days prior to factory tests so that he may have a representative witness the tests.
2.11.6.1 Damper Tests

Perform factory tests on dampers, except poppet dampers. Each damper which is provided with an integral frame shall be operated five times to test for smooth and trouble-free operation, at both ambient and design pressures. Each damper will then be checked to assure that no damage has been sustained to the frame, blades, or seals. Each damper which is provided with an integral frame shall be tested in an airtight chamber at design temperature and pressure to determine the amount of gas leakage across the damper and through the frame. Provide instruments to determine the amount of leakage and the static pressure against the damper. Each damper equipped with a seal system shall be tested for air leakage across the damper with the seal air system operating at design temperature and at the design differential pressure across the damper. Each seal air unit shall be tested to assure that design flow, temperature and pressures are being met. These tests shall be run independently from the damper tests, and prior to the damper tests.

2.11.6.2 Mechanical Draft Equipment Tests

**************************************************************************

NOTE: Overspeed test is as follows. If the operating temperature of the fan is less than 93 degrees C 200 degrees F, the wheel shall be Spun at 10 percent above the maximum operating speed for a period of not less than three minutes. If the operating temperature of the fan is 93 degrees C 200 degrees F or more, the wheel shall be spun for a period of not less than three minutes at the speed calculated from the following formula.

\[
\text{Test speed} = \frac{1.10 \times \text{(max oper spd)}}{\left(\frac{\text{(allowable stress at 38 C)}}{\text{(allowable stress at oper temp)}}\right)}
\]

\[
\text{Test speed} = \frac{1.10 \times \text{(max oper spd)}}{\left(\frac{\text{(allowable stress at 100 F)}}{\text{(allowable stress at oper temp)}}\right)}
\]

There shall be no permanent deformation of any part of the wheel as a result of overspeeding. After the test, welds shall be examined for cracks by magnetic particle testing or dye check.

**************************************************************************

Perform manufacturer's standard factory tests on mechanical draft equipment and material. Perform tests required by the applicable codes and these specifications. Fan wheels with tip speeds exceeding 127 meter per second 25,000 feet per minute, and which are not identical to fan wheels in successful commercial operation, shall be given an overspeed test. Factory test shall include mechanical balancing of rotating parts.
2.12 INSTRUMENTATION AND CONTROLS
