2.4 HEAT DISTRIBUTION PIPING

2.4.1 Steam and High Temperature Hot Water Pipe

Pipe material shall be steel; seamless, ASTM A53/A53M, Grade B or ASTM A106/A106M, Grade B; or electric resistance welded ASTM A53/A53M, Grade B; Schedule 40. Standard weight permitted for pipe sizes 300 mm 12 inches and above. ASTM A53/A53M, Type F furnace butt welded pipe is not allowed. No joints shall be allowed in the factory fabricated straight section of the carrier pipe. Factory fabricated piping sections as part of an expansion loop or bend shall have all welded joints 100 percent radiographed inspected in accordance with ASME B31.1. Radiographs shall be reviewed and interpreted by a Certified American Society for Nondestructive Testing (ASNT) Level III radiographer, employed by the testing firm, who shall sign the reading report.

2.4.1.1 Condensate Pipe

Steel; seamless, ASTM A53/A53M, Grade B or ASTM A106/A106M, Grade B, schedule 80; electric resistance welded ASTM A53/A53M, Grade B; Schedule 80. ASTM A53/A53M, Type F furnace butt welded pipe is not allowed. No joints shall be allowed in the factory fabricated straight section of the carrier pipe. Factory fabricated piping sections as part of an expansion loop or bend shall have all welded joints 100 percent radiographed inspected in accordance with ASME B31.1. Radiographs shall be reviewed and interpreted by an ASNT Certified Level II radiographer, employed by the testing firm, who shall sign the reading report.

2.4.1.2 Joints

Joints shall be butt-weld except socket-weld joints are permitted for pipe sizes 50 mm 2 inches and smaller. Dye penetrant inspection may be used in place of 100 percent radiographic inspection for pipe sizes 50 mm 2 inches and below. Indicate location and elevation of all field joints on detailed design layout drawings. Split-ring welding rings may be used.

2.4.2 Fittings

All welds in factory fittings shall be 100 percent radiographic inspected. All radiographs shall be reviewed and interpreted by a Certified ASNT Level III radiographer, employed by the testing firm, who shall sign the reading report. The Contracting Officer reserves the right to review all inspection records, and if any welds inspected are found unacceptable in accordance with ASME B31.1, the fitting shall be removed, replaced, and radiographically reexamined at no cost to the government.

2.4.2.1 Butt-Welded

Steel, ASTM A234/A234M, Grade B, ASME B16.9, same schedule as adjoining pipe. All elbows shall be long radius unless otherwise indicated. Tees shall be full size or reducing as required, having interior surfaces smoothly contoured. Split-ring welding rings may be used.

2.4.2.2 Socket-Welded

Forged steel, ASME B16.11, 13,800 kPa 2000 pound class will be used for pipe sizes 50 mm 2 inch and below. Dye penetrant inspection may be used in place of 100 percent radiographic inspection of welded fittings for pipe sizes 50 mm 2 inch and below.
2.5 **EXPANSION JOINTS, LOOPS AND BENDS**

Stresses shall be less than the maximum allowable stress from the Power Piping Code (ASME B31.1). Submit detailed design layout drawings and stress and anchor force calculations for all loops and bends. Show locations of all anchors, guides and supports. Base the calculations on rated characteristics (pressures and temperatures), specified herein, for both the supply and return lines.

PART 3 EXECUTION

3.1 GENERAL

3.1.1 UHDS Design

The UHDS manufacturer is responsible for the complete design of the UHDS, the product to be supplied, fabrication, witnessing installation and testing of the system within the design parameters established by the contract drawings and specifications and in compliance with the detailed design. The complete design of the UHDS shall be prepared, signed, and sealed by a Professional Engineer in the employ of the UHDS manufacturer.

3.1.2 Installation, Inspection, and Testing

The pre-engineered system shall be installed, inspected, and tested in accordance with the contract drawings and specifications, the UHDS manufacturer's standard procedures, detailed design layout drawings and any directions given by the UHDS manufacturer's representative. All work described in paragraph "UHDS Manufacturer's Representative's Responsibilities" shall be performed in the presence of the UHDS manufacturer's representative.

3.1.3 [Job Conditions]

Phasing of [demolition and construction] [construction] shall be in accordance with the provisions of Section 01 11 00 SUMMARY OF WORK, and as shown on contract drawings.

3.1.4 Interruption of Existing Service

The contractor shall arrange, phase and perform work and provide temporary facilities, materials, equipment, and connections to utilities, to assure adequate heat distribution service for existing installations at all times. Only such absolutely necessary interruptions as may be required for making connections shall be permitted, and only at such times when approval is obtained from the Contracting Officer. Interruptions to heat distribution service shall be only with prior approval, and be the minimum possible duration. All interruptions shall be [between the hours of [_____] thru [_____] [as scheduled under paragraph "PHASING" of Section 01 11 00 SUMMARY OF WORK] [as approved by the Contracting Officer].

3.1.5 Connecting to Existing Work

************************************************************************************************************
NOTE: Any connections to the UHDS distribution will only occur in manholes. Designer must ensure that a thorough survey of the aboveground and underground conditions is performed. The contract drawings must
identify all potential interferences or conflicts.

Connect new work to existing work in a neat and workmanlike manner. Connection shall be made only in manholes. Where an existing structure must be cut or existing utilities interfere, such obstruction shall be bypassed, removed, replaced or relocated, restored and repaired. Any changes required to the UHDS design as a result of interferences or conflicts must be approve by the UHDS designer and the Contracting Officer. Work disturbed or damaged shall be replaced to its prior condition, as required by Section 01 11 00 SUMMARY OF WORK.

3.1.6 Coordination

Coordinate the location of all items of equipment and work of all trades. Maintain operability and maintainability of the equipment and systems. Any relocation of equipment or systems to comply with the requirement of operability and maintainability shall be performed by the contractor at his cost.

3.1.7 Grading

Unless otherwise shown on the contract drawings or the detailed design layout drawings, steam/condensate and high temperature hot water supply/return lines shall be graded uniformly downward not less than 40 mm in 10 meters 5.0 inches in 100 feet to the lower point of entry between manholes and/or building entries.

3.1.8 Variations

Any variations from the approved detailed design layout drawings must be submitted to the Contracting Officer for approval. Variations must be signed and sealed by the UHDS manufacturers' professional engineer responsible for the complete design of the UHDS.

3.1.9 Storage and Handling

Equipment and material placed on the job shall remain in the custody of the Contractor until final acceptance whether or not the Contractor has been reimbursed for the equipment and material by the Government.

The Contractor is solely responsible for the protection of the equipment and material against damage from any source. Protect all materials against entry of water and mud by installing watertight protection on open ends at all times. Sections of the casing or carrier piping found to have been subjected to full or partial submergence in water (which would allow the insulation to become wet) shall be immediately replaced. Protect materials at all times while stored or during installation from damage from UV light. Materials awaiting installation shall be completely covered to protect from UV degradation.

Place all damaged items in new operating condition or replace damaged items as determined and directed by the Contracting Officer, at no additional cost to the Government.

3.2 DEMOLITION

NOTE: Ensure that Demolition specification is
Perform work in accordance with requirements for phasing. Completely remove all pipe, valves, fittings, insulation, and all hangers including the connection to the structure and any fastenings. Seal all openings in manhole or building walls after removal of piping. All material and equipment removed shall become the property of the Contractor and shall be removed from Government property within one week and shall not be stored in operating areas. All flame cutting shall be performed with adequate fire protection facilities available as required by safety codes and Contracting Officer.

3.2.1 Asbestos Removal

**NOTE: Existing systems may contain asbestos containing materials. Provisions must be made for an asbestos survey to be performed and abatement measures to be included in project specification if necessary.**

Conform to Section 02 82 00 ASBESTOS REMEDIATION.

3.3 PIPE, PIPING JOINTS AND FITTINGS

3.3.1 Welded Joints

Clean pipe and fittings inside and outside before and after assembly. Remove all dirt, scale, and other foreign matter from inside the piping by use of a pipe swab or pipe pig before connecting pipe sections, valves, equipment or fittings. Use eccentric connectors as necessary between casing sections to provide drainage of casing section between manholes and between manholes and buildings.

3.3.2 Fittings

All changes in direction shall be made with factory-built reinforced fittings. Field-fabricated fittings and miters are not permitted.

3.4 WELDING

The Contractor is entirely responsible for the quality of the welding and shall:

a. Conduct tests of the welding procedures used by his organization, determine the suitability of the procedures used, determine that the welds made shall meet the required tests, and also determine that the welding operators have the ability to make sound welds under standard conditions.

b. Comply with ASME B31.1.

c. Perform all welding operations required for construction and installation of the heat distribution system.
3.4.1 Qualification of Welders

Rules of procedure for qualification of all welders and general requirements for fusion welding shall conform with the applicable portions of ASME B31.1 and also as outlined below.

3.4.2 Examining Welders

The contractor shall examine each welder to determine the ability of the welder to meet the qualifications required. Test welders for piping for all positions, including welds with the axis horizontal (not rolled) and with the axis vertical. Each welder shall:

a. Weld only in positions in which he/she has qualified.
b. Identify welds with the specific code marking signifying name and number assigned.

3.4.3 Examination Results

Provide the Contracting Officer with a list of names and corresponding code markings. Retest welders which fail to meet the prescribed welding qualifications. Disqualify welders who fail the second test, for work on the project.

3.4.4 Beveling

Field bevels and shop bevels shall be done by mechanical means or by flame cutting. Where beveling is done by flame cutting, surfaces shall be thoroughly cleaned of scale and oxidation just prior to welding. Conform to specified standards.

3.4.5 Alignment

Utilize split welding rings for field joints on all carrier pipes above 50 mm two inches to assure proper alignment, complete weld penetration, and prevention of weld spatter reaching the interior of the pipe. Make field joints 50 mm two inches and smaller with welding sockets.

3.4.6 Erection

Piping shall not be split, bent, flattened, or otherwise damaged either before, during, or after installation. Where the pipe temperature falls to 0 degrees C 32 degrees F or lower, the pipe shall be heated to approximately 38 degrees C 100 degrees F for a distance of 300 mm one foot on each side of the weld before welding, and the weld shall be finished before the pipe cools to 0 degrees C 32 degrees F.

3.4.7 Defective Welds

Replace and reinspect defective welds in accordance with ASME B31.1. Repairing defective welds by adding weld material over the defect or by peening shall not be permitted. Welders responsible for defective welds must be requalified.

3.4.8 Electrodes

Electrodes shall be stored in a dry heated area, and be kept free of moisture and dampness during fabrication operations. Discard electrodes
that have lost part of their coating.

3.4.9 Radiographic Testing

An approved independent testing firm regularly engaged in radiographic testing shall perform radiographic examination of 100 percent of the field welds in the carrier piping of direct-buried systems in accordance with ASME B31.1. Furnish a set of films showing each weld inspected, a reading report evaluating the quality of each weld, and a location plan showing the physical location where each weld is to be found in the completed project, prior to installing casing field joints, backfilling and hydrostatic testing. All radiographs shall be reviewed and interpreted by a Certified American Society for Nondestructive Testing Level III radiographer, employed by the testing firm, who shall sign the reading report. The Contracting Officer reserves the right to review all inspection records, and if any welds inspected are found unacceptable they shall be removed, rewelded, and radiographically reexamined at no cost to the Government.

3.5 HEAT DISTRIBUTION SYSTEM INSTALLATION

The UHDS manufacturer's representative shall oversee the delivery, storage, and witness the installation and testing of the system. All work shall be in strict accordance with the requirements specified herein and with the printed instructions of the manufacturer. These specifications shall take precedence over the printed instructions, if conflicts arise. Printed instructions shall be submitted to the Contracting Officer prior to system installation.

3.5.1 Verification of Final Elevations

Prior to covering the top of the casing with backfill material, but after all temporary supports have been removed and initial backfilling of the conduit system has been accomplished, the Contractor shall measure and record the elevation of the top of the casing in the trench. Elevations shall be taken at every completed field joint, 1/3 points along each pipe section and top of elbows. This measurement shall be checked against the contract drawings. These measurements shall confirm that the conduit system has been installed to the elevations shown on the contract drawings. Slope shall be uniform to within 0.1 percent. These measurements shall be recorded by the Contractor, included in the UHDS manufacturer's representative daily report, and given to the Contracting Officer prior to covering the casing with backfill material.

3.5.2 Excavation, Trenching, and Backfilling

**************************************************************************
NOTE: The designer must coordinate the type of sand to be used with Section 31 00 00 EARTHWORK. Do not allow beach sand or any sand with large amounts of chlorides to be specified.
**************************************************************************

Perform all excavation, trenching, and backfilling as required by the UHDS manufacturer's design and as specified in Section 31 00 00 EARTHWORK. Pipe shall lay on a 305 mm 12 inch minimum sand bed and backfilled with sand on all sides to a minimum of 150 mm 6 inches as measured from outside of casing. Foundation for system must be firm and stable. Foundation and backfill must be free from rocks or substances which could damage the system coating. Concrete anchor and thrust blocks must be installed in
undisturbed earth. Backfilling must not commence until system has been satisfactorily pressure tested (both hydrostatic test of carrier and, for DDT systems, pneumatic test of casing). Minimum depth of burial to the top of the casing is 600 mm 24 inches. Maximum depth of burial to the top of the casing is 3 meters 10 feet.

3.5.3 UHDS Manufacturer's Representative Responsibilities

This shall be a person who regularly performs the duties listed below, is certified in writing by the UHDS manufacturer to be technically qualified and experienced in the installation of the system, and shall be authorized by the manufacturer to make and sign the daily reports specified herein. The UHDS Manufacturer's representative shall be present at the job site and witness when the following types of work are being performed:

a. Inspection and unloading.
b. Inspection of trench prior to commencing installation of system.
c. Inspection of concrete anchors and thrust blocks.
d. Hydrostatic testing of carrier piping.
e. Field joint closure work.
f. Pneumatic testing of DDT system casing.
g. Holiday test of conduit coating.
h. Repair of any coating.
i. Installation of cathodic protection system.
j. Initial backfill up to 250 mm 10 inches above the top of the casing.
k. Verification of final elevations. Elevation readings shall be witnessed and recorded.
l. Testing of cathodic protection system.
m. Operational tests

The UHDS manufacturer's representative is to notify the contractor immediately of any problems. If necessary, the UHDS manufacturer's representative will notify the Contracting Officer of problems requiring immediate action, otherwise the daily reports will note any problems encountered and indicate the corrective actions taken.

3.5.4 UHDS Manufacturer Representative's Reports

The UHDS manufacturer representative shall prepare and sign a written daily report. Present the original daily report to the Contracting Officer no later than one working day after it is prepared, and forward one copy to the manufacturer's main office. The report shall state whether or not the condition and quality of the materials used and the delivery, storage, installation and testing of the system are in accordance with the plans, specifications, and manufacturer's printed instructions and is satisfactory in all respects. When any work connected with the installation is unsatisfactory, the report shall state what corrective action has been
taken or shall contain the UHDS manufacturer's recommendations for corrective action. The report shall identify any conditions that could result in an unsatisfactory installation, including such items as open conduit ends left in the trench overnight and improper manhole entries. The daily reports are to be reviewed, signed and sealed, on a weekly basis, by the registered engineer responsible for the system design. Signed and sealed copies of the daily reports shall be submitted with the payment request. Requests for payment shall be denied if the weekly review is not accomplished.

Upon completion of the work and before final acceptance, deliver to the Contracting Officer a notarized Certificate of Compliance signed by a principal officer of both the manufacturing and the contracting firm, stating that the installation is satisfactory and in accordance with plans, specifications, and manufacturer's instructions.

The UHDS manufacturer will retain a copy of all daily reports and the Certificate of Compliance for 5 years after final acceptance of the system by the government.

3.5.5 Protection

Protect casing coating from damage during unloading, storage, rigging and installation. Protect casing and carrier pipe ends from water intrusion during unloading, storage, rigging and installation. Protect piping and all accessories from damage due to exposure to UV light.

3.5.6 Defective Material

The UHDS Manufacturer's Representative shall take prompt action to remove from the site all damaged or defective material, subject to rejection in accordance with the quality assurance provisions included in the manufacturer's submittals and printed instructions, and shall order prompt replacement of such material.

3.5.7 Cathodic Protection

******************************************************************************
NOTE: Designer must indicate on the contract drawings that dielectric separation is shown where UHDS enter buildings or at or above transition from underground to aboveground piping.
******************************************************************************

Provide cathodic protection for all steel casing systems and all buried exposed metal. Assume that 25 percent of the exterior of the UHDS is exposed metal. Cathodic protection systems shall have a minimum design life of 25 years and shall conform to [Section 26 42 13.00 20 CATHODIC PROTECTION BY GALVANIC ANODES] [Section 26 42 19.00 20 CATHODIC PROTECTION BY IMPRESSED CURRENT]. Provide dielectric pipe flanges and unions and isolation devices at all points necessary. Provide test stations at grade on each section of the piping system. Isolation flanges and unions shall be rated for the service temperature and pressure.

3.6 TESTS

Demonstrate leak-tightness of all piping systems by performing pressure tests (hydrostatic, pneumatic) and operational tests. Pressure test heat distribution system in conformance with requirements stated in this
specification and in printed instructions for the system supplied. Tests shall include carrier piping and casing. The carrier pipe shall be hydrostatically tested. Casings of DDT systems shall be pneumatically tested. Casing and end seals of WSL system will be tested for intrusion of water into the casing and insulation.

3.6.1 Holiday Testing of Direct-Buried System Steel Casings

Test entire exterior surface of the casing including the bottom exterior surface of the casing for faults in coating after installation in trench prior to backfilling. Use test method and voltage recommended by coating manufacturer. Repair any holidays found and retest. System shall not be backfilled until all holidays are eliminated.

3.6.2 Pneumatic, Hydrostatic and Operational Tests

Before conducting heat distribution system tests, flush lines with high pressure water until discharge shows no foreign matter and are deemed clean to the satisfaction of the Contracting Officer.

3.6.2.1 Pneumatic Test

The casing of DDT systems shall be pneumatically tested after welding and before field coating using air as the test medium. The test pressure shall be 103 kPa 15 psig. Persons not working on the test operations shall be kept out of the testing area while testing is proceeding. The test shall be made on the system as a whole or on sections that can be isolated. Joints in sections shall be tested prior to backfilling when trenches must be backfilled before the completion of other pipeline sections. The test shall continue for 24 hours from the time of the initial readings to the final readings of pressure and temperature. The initial test readings of the instrument shall not be made for at least 1 hour after the casing has been subjected to the full test pressure, and neither the initial nor final readings shall be made at times of rapid changes in atmospheric conditions. There shall be no indication of reduction of pressure during the test after corrections have been made for changes in atmospheric conditions in conformity with the relationship $T(1)P(2) = T(2)P(1)$, in which $T$ and $P$ denote absolute temperature and pressure, respectively, and the numbers denote initial (1) and final (2) readings. Pressure shall be measured with a mercury manometer, inclined manometer (slope gauge), or an equivalent device so calibrated as to be read in increments of not greater than one kPa 0.1 psi. [Pressure shall be measured with a pressure gauge conforming to ASME B40.100. A throttling type needle valve or a pulsation dampener and shutoff valve may be included. The diameter of the face shall be at least 114 mm 4.5 inches with a measurable range of 0 to 103 kPa 0 to 15 psig and graduations of not greater than 0.5 kPa 0.1 psig.] During the test, the entire system shall be completely isolated from all compressors and other sources of air pressure. Each joint shall be tested while under test pressure by means of soap and water or an equivalent nonflammable solution prior to backfilling or concealing any work. The testing instruments shall be approved by the Contracting Officer. All labor, materials and equipment for conducting the tests shall be furnished by the Contractor and shall be subject to inspection at all times during the tests. The Contractor shall maintain proper safety precautions for air pressure testing at all times during the tests.

3.6.2.2 Hydrostatic Test

Carrier piping shall be tested hydrostatically before insulation is applied.
at field joints and shall be proved tight at a pressure 1.5 times the heat distribution supply pressure of [_____] kPa [_____] psig for 2 hours. There shall be no indication of reduction of pressure during the test. Pressure shall be measured with a device calibrated as to be read in increments of not greater than one kPa 5.0 psi.

3.6.2.3 Operational Test

Prior to acceptance of the installation, Contractor shall subject system to operating tests simulating actual operating conditions to demonstrate satisfactory functional and operating efficiency. These operating tests shall cover a period of not less than six hours for each portion of system tested. Conduct tests at times as the Contracting Officer may direct.

a. The contractor shall provide calibrated instruments, equipment, facilities and labor, at no additional cost to the Government.

b. When failures occur, repair problems then repeat test.

3.6.3 Deficiencies

Deficiencies discovered shall be corrected at the Contractor's expense, to the satisfaction of the Contracting Officer. Major deficiencies or failure to correct deficiencies, to the satisfaction of the Contracting Officer, may be considered cause for rejecting the entire installation.

****************************************************************************************************************************************

NOTE: Include Section 02559 VALVE MANHOLES AND PIPING AND EQUIPMENT IN VALVE MANHOLES as part of the contract specifications for this job when there are manhole or steam pits. Include sealing of pipe penetrations through manhole walls in the design of the manhole.

****************************************************************************************************************************************

3.7 VALVE MANHOLES

Valve manholes, piping, and equipment in valve manholes shall be in accordance with the contract drawings and Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES.

3.8 BURIED UTILITY WARNING AND IDENTIFICATION

3.8.1 Plastic Marking Tape

Polyethylene plastic tape manufactured specifically for warning and identifying buried utility lines shall be supplied and installed. Tape shall be buried above the pipe during the trench backfilling operation and shall be buried approximately 300 mm 12 inches below grade. Tape shall be [0.1 mm 0.004 inch thick polyethylene] [polyethylene with a metallic core]. Tape shall be acid and alkali-resistant and shall have a minimum strength of 12 MPa 1750 psi lengthwise and 10.3 MPa 1500 psi crosswise with an elongation factor of 350 percent. [The tape shall be manufactured with integral wires, foil backing or other means to enable detection by a metal detector when the tape is buried up to one meter 3 feet deep. The metallic core of the tape shall be encased in a protective jacket or provided with other means to protect it from corrosion.] The tape shall be of a type specifically manufactured for marking and locating metallic underground utilities. Tape shall be 150 mm 6 inches wide and printed with a caution
and identification of the piping system over the entire tape length. Tape shall be yellow with bold black letters. Tape color and lettering shall be unaffected by moisture and other substances contained in the backfill material.

### 3.8.2 Markers for Underground Piping

**NOTE:** Indicate the location of the markers on the contract drawings for projects that require markers. Delete the paragraph if not needed in the project.

Markers for underground piping shall be located along the distribution and service lines. Markers shall be placed as indicated approximately 600 mm 2 feet to the right of the distribution system when facing in direction of flow in the supply line. The marker shall be concrete 150 mm 6 inch square or round section [600] [900] mm [2] [3] feet long. The top edge of the marker shall have a minimum 13 mm 1/2 inch chamfer all around. The letters [STEAM] [HTHW] [CONDENSATE] shall be impressed or cast on the top, and on one side of the markers to indicate the type of system that is being identified. Each letter shall be formed with a V-shaped groove and shall have a width of stroke at least 6 mm 1/4 inch at the top and depth of 6 mm 1/4 inch. The top of the marker shall protrude not more than [25] [50] [75] [100] mm [1] [2] [3] [4] inch(es) above finished grade.

### 3.9 THERMAL PERFORMANCE TESTING

The purpose of this section is to provide a basis for assuring the thermal performance of a heat distribution system procured under this specification. The equipment and procedures specified herein shall assure acceptable thermal performance upon installation. All materials and procedures described for this test shall be included as deliverables of the construction contract for the system unless otherwise noted. The methods used for the prescribed thermal performance measurements have been verified by several successful field studies. This work has clearly demonstrated that methods based on temperature measurements at the soil/casing interface are accurate, reliable, and repeatable.

#### 3.9.1 Equipment

#### 3.9.1.1 Casing Temperature Measurement

Before backfilling, temperature sensors shall be installed by adhesion with epoxy (epoxy used to adhere to exterior of casing shall be suitable to 260 degrees C 500 degrees F) to the exterior of every other field closure after welding, once the field coating has been applied and cured. A sensor shall be adhered with epoxy to the coated casing at the midpoint of every other pipe section between field joints, but no closer than 1.5 m 5 feet to any guide on the interior of the casing. After the sensors have been adhered to the casing, two complete wraps of duct tape shall be used to secure and protect the sensor. In all cases the radial position of the sensor shall be at 45 degrees from the top of the conduit at either the 1:30 or 10:30 position. The position chosen shall be the position facing away from the adjacent heat distribution system pipe, if present. All sensors shall be type T thermocouples in accordance with ISA MC96.1, copper constantan 20 gauge thermocouples, made from special limits grade thermocouple wire (accuracy plus or minus 0.40 degrees C 0.75 degrees F), with each conductor
insulated and an overall jacket on all conductors. Insulation on the thermocouple wires shall be suitable for service at temperature of carrier pipe. No splicing or other connections will be allowed in the thermocouple wire between sensor location and termination point. Each sensor shall be shown with a special symbol on the detailed design layout drawings and shall be identified by a number and/or letter code, starting from the upstream manhole.

3.9.1.2 Carrier Pipe Temperature Measurement

Carrier pipe temperature shall be measured within the manhole where the terminal equipment will be located. Carrier pipe temperature shall be measured by a sensor adhered with epoxy, suitable to 260 degrees C 500 degrees F directly to the exterior of the carrier pipe. Sensors shall be type T thermocouples in accordance with ISA MC96.1, copper constantan 20 gauge thermocouples, made from special limits grade thermocouple wire (accuracy plus or minus 0.40 degrees C 0.75 degrees F), with each conductor insulated and an overall jacket on all conductors. Insulation on the thermocouple wires shall be suitable for service at temperature of carrier pipe. No splicing or other connections will be allowed in the thermocouple wire between sensor location and termination point. The location of this sensor shall be at either the 1:30 or 10:30 position. At the location of the sensor the carrier pipe shall be insulated with an approved calcium silicate insulation of 125 mm 5 inches minimum thickness. This insulation shall extend at least 150 mm 6 inches on each side of the actual sensor location and shall be clad with an aluminum jacket.

3.9.1.3 Terminals

The wires from each casing or carrier pipe temperature sensor shall be extended into the nearest manhole and terminated in a NEMA ICS 4 type 4 waterproof enclosure, of suitable size, mounted near the top of the manhole at a location near the manhole entrance so as to be accessible without entrance into the manhole, where possible. The termination of the sensor wires shall be with a connector type OMEGA Miniature Jack Panel (MJP-*-*-T) or exact equal. The thermocouple jack panel shall be mounted to the back plate of the NEMA ICS 4 type 4 enclosure. The temperature sensors shall be labeled at their termination within the NEMA ICS 4 type 4 enclosure; a drawing showing the location of each temperature sensor shall be laminated and attached to the inside of the NEMA ICS 4 type 4 enclosure. The manufacturer's operating casing temperature factors for each temperature sensor location shall be laminated to a card attached to the inside of the NEMA ICS 4 type 4 enclosure. All temperature sensors shall be verified as operational by an independent laboratory, hired by the Contractor, after backfilling is complete but before the system is accepted.

3.9.2 Initial Thermal Performance Test

After the system construction is complete, including all backfilling, and the system has reached operating condition for not less than 48 hours nor more than 168 hours, all of the temperature sensors shall be read by an independent laboratory with experience and equipment appropriate for the sensors used. For each temperature sensor location the initial casing temperature shall be recorded. All of the temperature values of the temperature sensors shall be tabulated and submitted in accordance with requirements herein.
3.9.3 Warranty Thermal Performance Test

After not less than 9 months nor more than 11 months of continuous operation, all of the temperature values of the temperature sensors shall be read by an independent laboratory with experience and equipment appropriate for the sensors used. The temperature shall be tabulated and submitted in accordance with requirements herein.

3.9.4 System Failure

System shall be deemed a failure when the conduit surface temperature exceeds values in Table 3, that portion shall be repaired and temperatures again measured and recorded.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for heat distribution systems of the concrete trench type for water systems from 66 to 232 degrees C 150 to 450 degrees F and steam systems up to 1.72 MPa 250 psig.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: For a complete system include Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES. The designer will comply with the procedure as outlined in the following paragraphs 1 through 5 in determining site conditions and trench system design. If specific site conditions are not suitable for a concrete trench system in accordance with following guidance, refer to Section 33 63 23 EXTERIOR ABOVEGROUND STEAM DISTRIBUTION or Section 33 61 13 PRE-ENGINEERED UNDERGROUND HEAT DISTRIBUTION SYSTEM.

SITE CLASSIFICATION AND CONCRETE TRENCH DESIGN
GUIDANCE

1. Classification of the Site: A detailed site classification survey will be conducted by a geotechnical engineer using the following guidelines:

   a. The survey will be made after the general layout of the system has been determined and will cover the entire length of the proposed system. The geotechnical engineer must be a registered professional engineer with a minimum of 3 years of experience in the field of soil mechanics and foundation design.

   b. The survey should be conducted during the time of the year when the groundwater table is historically at its highest point; if this is not possible, water table measurements will be corrected, on the basis of professional judgment, to indicate the highest seasonal water table when water table is at its highest point.

   c. As a minimum, information on groundwater conditions, soil types, terrain, and precipitation rates and irrigation practices in the area of the system will be collected. This information will be obtained from available records at the installation.

   d. Information on groundwater conditions and soil types will be obtained through borings, test pits, or other suitable exploratory means. Generally, in areas of prior construction, a boring or test pit will be made at least every 30 m 100 feet along the line of the proposed system. In open undisturbed natural areas, the spacing of borings may be increased. Each exploratory hole should extend to a level at least 1.5 m 5 feet below the bottom of the tunnel. If a significant difference in underground conditions is found at adjacent exploratory points, additional explorations will be made between those points in order to determine where the change occurs. Upon completion of the survey, each exploration point will be classified on the basis of the criteria presented in Table 1, ALLOWABLE SOIL CHARACTERISTICS and the soil classification system in ASTM D2487. If the criteria of Table 1 is not met, the site conditions are not suitable for the use of a concrete trench.

<tr>
<td>C. Swelling Soils</td>
<td>Same as for A., above (See Note 3.)</td>
<td>Same as for A., above</td>
<td>Same as for A., above plus design of joint spacing and joint details to accommodate</td>
</tr>
</tbody>
</table>

1. Concrete trench systems will not be used if any of the conditions defined by these criteria are exceeded.

2. As shown in U.S. Weather Bureau (USWB) Tech. Paper 40 and confirmed with local data and local weather patterns.

3. Swelling soils are defined as those which experience large volume changes with changes in moisture content.

4. Lowest point of water entry is defined as the joint between trench wall and trench bottom.

2. DESIGN: The design will be completed based on the following soil conditions:

   a. Fine grained impervious soils. The highest groundwater level evident during the wettest period of the year should be a minimum of \(300 \text{ mm} \) \(1 \text{ foot}\) below the lowest point of water entry into the concrete trench system. The lowest point of entry is defined as the joint between the concrete trench wall and concrete trench bottom. The concrete trench bottom will be continuous with no openings. The above condition will allow the concrete trench to be constructed and will minimize potential infiltration of water into the trench. Open drainage ways, swales, or swampy/boggy areas will preclude use of a concrete trench system because of ground water level guidance in Table 1. The concrete trench system must be rerouted or regraded to bring the concrete trench out of the unsuitable conditions. The geotechnical engineer who performed the detailed site classification survey will provide regrading instructions and will select fill that will remain stable and will not be subject to future wash-outs.

   b. Coarse grained semipervious/pervious soils. The groundwater level during the wettest period of the year should be at least \(300 \text{ mm} \) \(1 \text{ foot}\) below the lowest point of water entry into the concrete trench system. For a water table \(300 \text{ to } 600 \text{ mm} \) \(1 \text{ to } 2 \text{ feet}\) below the lowest point of water entry the criteria of paragraph 2.a., above apply.
c. Swelling Soils with high swell potential. The design of the concrete trench system in materials having high swell potential will be in accordance with paragraph 2.a., above. Soils having a liquid limit (LL) greater than 50 and a plasticity index (PI) greater than 25 will require testing (consolidation swell) to determine the swell characteristics. When the results of the swell test indicate high swell potential, special considerations such as over excavation (width and depth) and replacement with nonexpansive fill, under-trench drainage system, or other methods of minimizing differential heave will be provided. The design of special features such as described above will be in accordance with instructions provided by the geotechnical engineer who performed the detailed site classification survey. Design of joint spacing and joint details to accommodate movements will be provided when required.

3. SETTLEMENT OF TRENCHES: Generally, settlement of concrete trenches will not be a problem since the unit load of the trench system will be similar to the existing unit overburden load. Backfill adjacent to the concrete trench must be compacted to prevent settlement which would create ponding. Positive slopes away from the concrete trench are required. Special care of backfill and compaction will be required where the system crosses existing streets to preclude settlement and cracking of the roadway adjacent to the trench from repeated traffic loads.

4. LOAD-BEARING QUALITIES: The soil in which the system will be installed should be investigated by an experienced geotechnical engineer responsible for other soils engineering work, and the location and nature of potential soils problems should be identified. Depending on the nature of the problem, the designer may choose to reroute the line, use a combination of concrete trench or aboveground low-profile systems, or elect to over-excavate and replace with nonexpansive fill.

5. CONCRETE TRENCH DESIGN: The concrete trench design will consist of poured concrete sides and floor with removable tops. Portions of the floor may be omitted at locations specified under course grained soils with water table 600 mm 2 feet or more below lowest point of water entry.

The depth of the concrete trench will be sufficient to provide adequate protection to the piping system and the floor of the trench must be sloped to provide adequate internal drainage, but in all cases will not be less than 150 mm 6 inches from the bottom surface of the suspended pipe insulation to the floor of the trench. There will also be a minimum of 75 mm 3 inches between the surface of the
pipe insulation and the adjoining trench walls, and a minimum of 100 mm 4 inches between surfaces of adjacent pipe insulation.

For those instances where natural drainage cannot be provided (storm water drainage system at least 600 mm 2 feet below trench bottom at all times), a dual sump pump will be provided with failure annunciator. This signal will be tied-in to the EMCS system, if any.

The tops of the concrete trenches will serve as sidewalks, if practical, and will be removable by use of a forklift or backhoe. Earth must not cover the tops. Covers will be close tolerance fit with a maximum gap tolerance build up of 3 mm 1/8 inch from all causes.

The pipes will be supported within the trenches by pipe supports fastened to the walls. In no case will they be supported from either the floor of the trench or from the removable top. All noninsulated ferrous parts of the piping, piping support system, or equipment will be hot-dipped galvanized. The pipe hanger design must provide for adequate system expansion and contraction.

Use minimum of 25 mm 1 inch pipe size for piping in trench system with all joints welded. Smaller pipe sizes and screwed joints are allowable in valve manholes.

Provide the following information on the contract drawings for the concrete Trench System, as applicable: (1) dimension on all runs of pipe; (2) pipe support spacings; (3) pipe support spacing at changes in direction and changes in elevation (MSS SP-58 is not applicable); (4) elevations of the pipe along the systems path; (5) sizes of the pipe; (6) location of all valve manholes; (7) location and details of all expansion loops, Z-and L-bends; (8) location of pipe anchors; (9) how changes in pipe direction are made; (10) thickness of the insulation on the pipe; (11) concrete trench details; (12) final elevations of concrete trench; (13) profile of trench showing all existing utilities; (14) valve manhole dimensions; (15) valve manhole cover details, including manway access details; (16) how valve manholes are drained and vented; (17) sump pump piping details; (18) sump pump capacity; (19) locations of inspection ports; (20) include specific requirements for modification to existing and new electrical wiring, devices, or equipment (dedicated service for sump pump); (21) steam drip trap locations with access and capacities; (22) system pipe vent locations with access details; (23) steam main drip leg sizes; and (24) other pertinent information and details required to clearly show the intent of the Concrete Trench Heat Distribution

SECTION 33 63 13.19 Page 9
System. Also, indicate any obstructions in the path of the distribution system that the Contractor may have to work around.

Provide and edit for the project all other guide specifications as applicable to the trench design, and include and edit for the project the following Sections: 31 00 00 EARTHWORK; 32 12 13 BITUMINOUS TACK AND PRIME COATS; 33 63 23 EXTERIOR ABOVEGROUND STEAM DISTRIBUTION; 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION; 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION; 03 30 00 CAST-IN-PLACE CONCRETE; 05 05 23.16 STRUCTURAL WELDING; 05 50 13 MISCELLANEOUS METAL FABRICATIONS; 07 13 53 ELASTOMERIC SHEET WATERPROOFING; 09 90 00 PAINTS AND COATINGS; 40 05 13.96 WELDING PROCESS PIPING; 26 20 00 INTERIOR DISTRIBUTION SYSTEM; and others as applicable to the project.

1.2 SUBMITTALS

******************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have
designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [Information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Heat Distribution System

SD-03 Product Data

Spare Parts

Support of the Equipment

SD-04 Samples

Insulation

SD-05 Design Data

1.3 DELIVERY, STORAGE, AND HANDLING

Store all materials and equipment delivered and placed in storage with protection from the weather; excessive humidity and excessive temperature variation; and dirt, dust, or other contaminants.

1.4 EXTRA MATERIALS

Submit spare parts data for each different item of material and equipment specified, after approval of the related submittals and not later than the start of the field tests. Include in the data a complete list of parts and supplies and source of supply.

PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS

2.1.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening.

Equipment items must be supported by service organizations. Submit a certified list of qualified permanent service organizations for support of the equipment which includes their addresses and qualifications. These service organizations must be reasonably convenient to the equipment installation and able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

2.1.2 Nameplates

Ensure each major item of equipment such as sump pumps, motors, steam traps, and pressure reducing valves is provided with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.1.3 Asbestos Prohibition

Asbestos and asbestos-containing products are not allowed.

2.1.4 Electrical Work

Provide motors, manual or automatic motor control equipment, and protective
or signal devices required for the operation specified under this section in accordance with NFPA 70 and Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

2.2 PIPING AND FITTINGS

Unless otherwise specified, provide all pipe, fittings, valves, and piping accessories conforming to the requirements of ASME B31.1, and be the proper type, class, and grade for pressure and temperature of the heating medium.

2.2.1 Steel Pipe

Provide steel pipe 50 mm 2 inches in diameter and larger that are seamless or electric-resistance welded conforming to ASTM A53/A53M, Grade B, Type E or S; or to ASTM A106/A106M, Grade B. Provide steel pipe 40 mm 1-1/2 inches in diameter and smaller that are seamless conforming to ASTM A106/A106M, Grade B. Provide condensate piping, gauge piping, and piping 19 mm 0.75 inch in diameter and smaller that are extra strong. Provide all other pipe that are standard weight.

2.2.1.1 Nipples

Provide nipples conforming to ASTM A733 as required to match adjacent piping.

2.2.1.2 Steel Flanges

**************************************************************************
NOTE: Use not less than Class 150 for steam up to 862 kPa 125 psig, not less than Class 300 for steam 863 to 1724 kPa 126 to 250 psig, and for high temperature hot water.
**************************************************************************

Provide steel flanges conforming to ASME B16.5 Class [150] [and] [or] [300] and matching valves or flanged fittings on which used. Ensure flanges have the manufacturer's trademark affixed in accordance with MSS SP-25 so as to permanently identify the manufacturer.

2.2.1.3 Pipe Threads

Provide pipe threads conforming to ASME B1.20.2M ASME B1.20.1. Pipe threads may be used only on pipe 19 mm 0.75 inch or smaller.

2.2.2 Fittings

Provide fittings, valves, flanges and unions that have the manufacturer's trademark affixed in accordance with MSS SP-25 so as to permanently identify the manufacturer.

2.2.2.1 Welded Fittings

Provide welded fittings conforming to ASTM A234/A234M, buttwelded or socket welded, standard weight or extra strong, as required to match connecting piping. Provide buttwelded fittings conforming to ASME B16.9, and socket welded fittings conforming to ASME B16.11.
2.2.2.2 Malleable Iron Fittings

Provide fittings conforming to ASME B16.3, ASTM A47/A47M, class as required to match connecting piping.

2.2.2.3 Unions

Provide unions conforming to ASME B16.39 as required to match adjacent piping.

2.2.3 Insulating Flanges and Dielectric Waterways

******************************************************************************

NOTE: Where dissimilar metals are to be joined, or when connecting to cathodically protected systems, electrically insulating flanges or dielectric waterways will be provided.

For flanges, use not less than Class 150 for up to 862 kPa 125 psig steam, not less than Class 300 for 863 to 1724 kPa 126 to 250 psig steam, and for high temperature hot water. Gaskets must have the following characteristics: (1) Impermeability with respect to the fluid/gas contained by the system; (2) Chemical stability with respect to the fluid/gas contained by the system; (3) Sufficient deformability so as to flow into the imperfections on the seating surfaces and provide intimate contact between the gasket and these surfaces; (4) Thermal stability with respect to the fluid/gas contained by the system; (5) Sufficient resiliency so as to support an adequate portion of the applied load when joint movements are not completely eliminated by the system design; (6) Sufficient strength to resist crushing under the applied load and blow-out under the system pressure; (7) Contain no products that could contaminate the fluid/gas contained by the system; (8) Contain no products that could cause corrosion of the seating surfaces; (9) Able to maintain integrity during handling and installation; (10) Able to be readily removed at the time of replacement; (11) Must have a sufficiently high dielectric strength; (12) Gaskets containing metallic graphite or wire cannot be used for this application; and (13) Must not contain asbestos.

******************************************************************************

Submit certificate from the material supplier of the electrically insulating flange gasket kits stating that the supplied material meets specified requirements and that provides evidence that satisfactory operating requirements have been met, before the materials are delivered. Certificate must be signed by an official authorized to certify in behalf of material supplier or product manufacturer and must identify quantity and date or dates of shipment or delivery to which the certificates apply. Install insulating flanges or flange gasket kits at every pipe connection from the trench system to an underground system and at dissimilar metals. Provide a kit consisting of a flange gasket, bolt sleeves, and one insulating washer and one steel washer for both ends of each bolt. Ensure the gasket kits are capable of electrically isolating the pipe at the
pressure and temperature of the heating medium at the point of application. Material of the type being used must have been installed in an installation which has been satisfactorily operating for not less than 2 years. Ensure that these kits are provided and properly installed according to manufacturer published instructions as indicated. Provide dielectric waterways with temperature and pressure rating equal to or greater than that specified for the connecting piping used for joining dissimilar metals, 19 mm 0.75 inch and smaller threaded pipe. Ensure waterways have metal connections on both ends suited to match connecting piping. Provide dielectric waterways internally lined with an insulator specifically designed to prevent current flow between dissimilar metals. Ensure dielectric flanges meet the performance requirements described herein for dielectric waterways.

2.3 VALVES

******************************************************************************

NOTE: Select the appropriate valves for the operating temperatures and pressures of all systems in the project. Delete valve types not included in project.

Use not less than Class 150 for up to 862 kPa 125 psig steam, not less than Class 300 for 863 to 1724 kPa 126 to 250 psig steam, and for high temperature hot water. For isolation and shutoff, use gate valves only. Steam pressure reducing valves are not normally part of the system. If needed, designer should refer to Section 23 70 01.00 10 CENTRAL STEAM-GENERATING SYSTEM, COAL-FIRED.

******************************************************************************

Unless otherwise specified, provide valves that comply with the material, fabrication, and operating requirements of ASME B31.1. Provide valves suitable for the temperature and pressure requirements of the system on which used. Provide valves for [steam] [hot water] conforming to ASME B31.1 Class [150] [and] [or] [300], as suitable for the application. [Provide valves for condensate services conforming to ASME B31.1 Class 150.]
Provide valves 150 mm 6 inches and larger with a 25 mm 1 inch minimum gate or globe [integral] bypass valve sized in conformance with MSS SP-45. Provide valves that have the manufacturer's trademark.

2.3.1 Steel Valves

Provide globe, gate, angle, and check valves conforming to the requirements of ASME B16.34 and ASME B31.1 for the temperature and pressure requirements of the system. Provide gate valves 65 mm 2-1/2 inches and smaller with a rising stem. Provide gate valves 80 mm 3 inches and larger with an outside screw and yoke.

2.3.2 Bronze Valves

2.3.2.1 Globe, Gate, and Angle Valves

Provide globe, gate, and angle valves conforming to requirements of MSS SP-80.
2.3.2.2 Check Valves

Provide check valves conforming to the requirements of MSS SP-80.

2.3.3 Packing

Provide valves with packing that does not contain asbestos. Provide valve stem packing that is die-formed, ring type specifically designated as suitable for the temperature and pressure of the service and compatible with the fluid in the system. Provide packing rings that are polytetrafluoroethylene with minimum 50 percent graphite filament top and bottom rings. Provide valves 40 mm 1-1/2 inches and smaller that have four or five packing rings. Provide valves 50 mm 2 inches and larger with at least six packing rings. Spiral or continuous packing will not be acceptable. Provide a metal insert having proper clearance around the valve stem at the bottom of the stuffing box and acting as a base for the packing material. Provide packing glands furnished with a liner of noncorrosive material and one piece construction with provisions for not less than two bolts for packing adjustment.

2.4 STEAM TRAPS

**************************************************************************
NOTE: The following paragraphs are applicable to steam systems only. Only these two types will be used. A schedule of steam trap selections will be shown on the drawings.

Trap capacity (kg per hour (pounds per hour during normal operation), pressure drop kPa psi, and pressure rating kPa psi of each trap will be included in this schedule. Show on drawings a vent valve or test valve connection downstream of traps for test of trap operation, a strainer ahead of trap, a check valve in outlet piping, and shut-off valves on both sides of trap for trap changeout. A means of bypassing the trap must be provided for system warm-up.

**************************************************************************

Provide class of trap bodies suitable for a working pressure of not less than 1.5 times the steam supply pressure, but not less than 1.38 MPa 200 psi, and traps capable of operation under a steam-supply pressure as indicated with trap capacities as shown when operating under the specified working conditions. Provide traps that fail open.

2.4.1 Bucket Traps

Provide inverted-bucket type bucket traps with automatic air discharge conforming to ASTM F1139.

2.4.2 Thermostatic Traps

**************************************************************************
NOTE: Specify thermostatic traps where the trap location is subject to freezing. Style B traps are bimetallic element traps.

**************************************************************************
Provide thermostatic type thermostatic traps with bimetallic element automatic air discharge conforming to ASTM F1139.

2.5 STRAINERS

**************************************************************************
NOTE: Delete for high temperature water systems.
**************************************************************************

Provide basket or Y-type strainers with connections the same size as the pipe lines in which the connections are installed. Provide heavy and durable strainer bodies of cast steel with bottoms drilled and plugged suitable for service temperatures and pressures utilized with arrows clearly cast on the sides to indicate the direction of flow. Each strainer is equipped with an easily removable cover and sediment basket with the body or bottom opening equipped with nipple and gate valve for blowdown. Provide 0.6350 mm 0.025 inch thick stainless steel, Monel or sheet brass strainer basket with small perforations of sufficient number to provide a net free area at least 2.5 times the area of the entering pipe. Provide cast steel bodies and stainless or Monel baskets for high temperature hot water systems.

2.6 PRESSURE GAUGES

**************************************************************************
NOTE: Delete if not required.
**************************************************************************

Provide pressure gauges conforming to ASME B40.100 with a minimum dial size of 110 mm 4-1/4 inches, a throttling type needle valve or a pulsation dampener, and shut-off valve.

2.7 THERMOMETERS

**************************************************************************
NOTE: Delete if not required.
**************************************************************************

Do not provide thermometers containing mercury.

2.7.1 Liquid in Glass

Provide liquid in glass type thermometer with well and separable corrosion-resistant steel socket. Provide thermometer on insulated pipe with an insulation stand-off provision. Provide thermometer with minimum scale length of 178 mm 7 inches.

2.7.2 Dial

Provide a dial type thermometer with a dial size of 90 mm 3.5 inches in diameter with stainless steel case, remote-type bulb or direct-type bulb as applicable, with an accuracy of plus or minus 1 degree C 2 degrees F and white face with black digits graduated in 1 degree C 2 degrees F increments. Provide thermometer wells of the separable socket type for each thermometer with direct-type bulb.
2.8 INSULATION AND JACKETING

2.8.1 Insulation for Piping in Concrete Trenches

Provide molded calcium silicate insulation for all piping, fittings, and valves conforming to ASTM C533, Type I, or molded mineral fiber insulation conforming to ASTM C547, Class 2, or cellular glass insulation conforming to ASTM C552. Provide factory or field applied insulation. Other than FOAMGLAS, do not use laminated construction in thicknesses less than 102 mm (4 inches). Provide insulation on piping in concrete trenches covered with aluminum or nonmetallic jacket.

2.8.2 Aluminum Jacket

Provide smooth sheet jacket, 0.4064 mm (0.016 inch) nominal thickness; ASTM B209M or ASTM B209, Type 3003, 3105, or 5005. Use aluminum jacket over calcium silicate insulation.

2.8.3 Nonmetallic Jacket

Provide nonmetallic jacket consisting of a 203 grams/square meter (6 ounces per square yard) fiberglass fabric impregnated with chlorosulfonated polyethylene (Hypalon) and a 0.038 mm (1.5 mils) polyvinyl fluoride film (Tedlar) bonded to it. Ensure overall thickness of the composite is 0.254 mm (0.010 inch) and weigh approximately 356 grams/square meter (10.5 ounces per square yard). Jacket may be either field or factory applied to the insulation. Do not use the jacket with any calcium silicate insulation. Use nonmetallic jacket with molded mineral fiber insulation.

2.8.4 Bands

Provide bands for aluminum jackets that are 10 mm (.38 inch) wide and 0.8128 mm (32 gauge) thickness made of aluminum or annealed stainless steel. Provide bands for insulation that are 13 mm (.5 inch) wide and 0.8128 mm (32 gauge) thickness made of annealed stainless steel.

2.8.5 Insulation for Flanges, Unions, Valves, and Fittings

Provide flanges, unions, valves, and fittings insulated with premolded prefabricated, or field fabricated segments of removable and reusable insulation of the same material and thickness as the manhole pipe insulation with the same thermal characteristics and thickness as the adjoining piping.

2.9 CONCRETE WORK

******************************************************************************
NOTE: Specify concrete work in detail in Section 03 30 00 CAST-IN-PLACE CONCRETE. Specify precast concrete work in detail in SECTION 03 42 13.00 10 PLANT-PRECAST CONCRETE PRODUCTS FOR BELOW GRADE CONSTRUCTION. Use applicable requirements of, and edit the above guide specifications and include all specific requirements pertinent to local conditions.
******************************************************************************

SECTION 33 63 13.19 Page 20
2.9.1 Concrete

2.9.1.1 Cast-in-Place Concrete

Provide as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.9.1.2 Precast Concrete Products

Provide as specified in [Section 03 42 13.00 10 PLANT-PRECAST CONCRETE PRODUCTS FOR BELOW GRADE CONSTRUCTION][Section 03 41 16.08 PRECAST CONCRETE SLABS (MAX. SPAN 8 FEET O.C.)].

2.9.2 Concrete Joint Sealants

Provide concrete joint sealants conforming to ASTM C920, Type M (multicomponent), Class 25, grade NS (nonsag) for vertical surfaces or grade P (pourable self-leveling).

2.9.3 Gasket Material

Provide gasket material used between concrete trench covers and trench wall tops that is 6 mm 0.25 inch thick neoprene pad with a minimum width of 50 mm 2 inches conforming to ASTM D1056.

2.9.4 Concrete Expansion Joints, Contraction Joints, and Waterstops

Provide concrete expansion joints, contraction joints, and waterstops as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.10 BITUMINOUS PAVING

******************************************************************************
NOTE: Delete if not required or if roads are constructed after tunnel crossings.
******************************************************************************

Provide bituminous course and tack coat used at street crossings as specified in Section 32 12 16 HOT-MIX ASPHALT (HMA) FOR ROADS and Section 32 12 13 BITUMINOUS TACK AND PRIME COATS.

2.11 MISCELLANEOUS METAL

******************************************************************************
NOTE: Include miscellaneous metals located in trenches or valve manholes in Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS.
******************************************************************************

Provide miscellaneous metal not otherwise specified conforming to Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS. Provide miscellaneous metal bolted together, shop welded, or assembled in the field, and pipe supports including structural cross support members and anchors that is hot-dip galvanized in accordance with Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS.

2.12 INSPECTION PORTS AND ACCESS COVERS

Provide inspection ports and access covers in concrete tops that are
standard cast iron frame and cover. Provide inspection ports that are 300 mm (12 inch) nominal diameter and access covers shall be 600 mm (24 inch) nominal diameter unless otherwise indicated.

**************************************************************************
NOTE: Expansion joints generally will not be used in the design of the piping layout. If no other method is available to handle the expansion problem in a specific location, the design layout using an expansion joint at a specific location must be justified by a design analysis and approved in the planning phase of the piping layout prior to including expansion joints in the specifications. If expansion joints or ball joints are required, the locations will be indicated on the drawings. Since expansion joints are high maintenance items, these must be located in a readily accessible location. The following requirements tailored as EXPANSION JOINTS must be included in this specification section.
**************************************************************************

2.13 BELLOWS TYPE JOINTS

Select bellows type or slip-type to satisfy specific design conditions. Provide joints that are flexible, guided expansion joints. Ensure the expansion element is stainless steel. Provide bellows type expansion joints that are in accordance with the applicable requirements of EJMA Stds and ASME B31.1 with internal liners.

2.14 EXPANSION JOINTS

Provide expansion joints for either single or double slip of connected pipes, as required or indicated, and for not less than the traverse indicated. Provide joints designed for hot water working pressure and are in accordance with applicable requirements of EJMA Stds and ASME B31.1. Provide joints designed for packing injection under full line pressure. Provide end connections flanged or beveled for welding as indicated. Provide joints with anchor base where required or indicated. Where adjoining pipe is carbon steel, the sliding slip must be seamless steel plated with a minimum of 0.0508 mm (2 mils) of hard chrome in accordance with ASTM B650. Provide joint components fabricated from material equivalent to that of the pipeline. Ensure initial setting are made in accordance with the manufacturer's recommendations to compensate for ambient temperature at time of installation. Install pipe alignment guides as recommended by the joint manufacturer, but in any case not be more than 1.5 m (5 feet) from expansion joint except for lines 100 mm (4 inches) or smaller; guides must be installed not more than 600 mm (2 feet) from the joint. Provide service outlets where indicated.

2.15 FLEXIBLE BALL JOINTS

Provide flexible ball joints constructed of alloys as appropriate for the service intended. Where so indicated, the ball joint must be designed for packing injection under full line pressure to contain leakage. Provide joint ends threaded to 50 mm (2 inches) only, grooved, flanged or beveled for welding as indicated or required, and be capable of absorbing a minimum of 15 degrees angular flex and 360 degrees rotation. Provide balls and sockets of equivalent material as the adjoining pipeline. Exterior
spherical surface of carbon steel balls must be plated with 0.0508 mm (2 mils) of hard chrome in accordance with ASTM B650. Provide ball type joints designed and constructed in accordance with ASME B31.1 and ASME BPVC SEC VIII D1, where applicable. Provide flanges conforming to ASME B16.5. Provide gaskets and compression seals compatible with the service intended.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 SITEWORK

3.2.1 Excavation, Trenching, and Backfilling

Provide excavation, trenching, and backfilling of concrete trench systems, [and relocation of interferences and modifications to existing facilities] in accordance with Section 31 00 00 EARTHWORK.

3.2.2 Removal, Replacement, or Relocation of Interferences

Remove, replace, or relocate interferences indicated or found during construction. Removal, replacement, or relocation must be as shown, or as approved by the Contracting Officer. Examples of interferences include:

a. Storm and sanitary sewers and manholes.

b. Water lines, gas lines, fire hydrants, and lawn sprinkler systems.

c. Power and communication lines, conduits, poles, and guys.

d. Fences, sidewalks, and signs.

e. Grass, shrubs, trees, and rocks.

3.2.3 Modifications to Existing Facilities

Modifications to existing facilities must be made as indicated. Examples of modifications include:

a. Removal and replacement of street or parking area pavements.

b. Removal and replacement of curbs, gutters, and sidewalks.

c. Reconstruction of existing valve manholes.

d. New heat distribution piping entrances to buildings, valve manholes, or trenches.

3.2.4 Electric Work

Provide any wiring required for the operation of the equipment specified, but not shown on the electrical drawings, in this section in accordance with Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION, and Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
3.2.5 Painting

Clean the heat affected zone of field welded galvanized surfaces and other galvanized surfaces damaged during installation in compliance with SSPC SP 10/NACE No. 2 and painted in accordance with Section 09 90 00 PAINTS AND COATINGS.

3.3 PIPING

3.3.1 General Piping Requirements

******************************************************************************
NOTE: Expansion joints generally will not be used in the design of the piping layout. If no other method is available to handle the expansion problem in a specific location, the design layout using an expansion joint at a specific location must be justified by a design analysis and approved in the planning phase of the piping layout prior to including expansion joints in the specifications. If expansion joints or ball joints are required, the locations will be indicated on the drawings. Since expansion joints are high maintenance items, these must be located in a readily accessible location. EXPANSION JOINTS tailoring requirements must be included in this specification section.
******************************************************************************

Accurately cut pipe to measurements established at the site and worked into place without springing or forcing. Ensure pipe is clear of all openings and equipment. Excessive cutting or other weakening of structural members to facilitate piping installation will not be permitted. Remove burrs from ends of pipe by reaming. Ensure installation permits free expansion and contraction without damage to joints or hangers. Install piping in accordance with ASME B31.1. Weld joints for piping in concrete trenches (except joints at traps, strainers, and at valves 19 mm 0.75 inch and smaller in steam, condensate, and drip lines, which may use unions or may be threaded). Do not attach supports, anchors, or stays where either expansion or the weight of the pipe will cause damage to permanent construction. Provide noninsulated ferrous parts of the piping, piping support system, or equipment that are hot-dip galvanized after fabrication in conformance with ASTM A123/A123M.

a. Ensure expansion of piping provide for by changes in the direction of the run of pipe or by expansion loops as shown.

b. Changes in direction may be made by bending the pipe, provided that a hydraulic pipe bender is used. Pipe to be bent must be steel conforming to ASTM A53/A53M or ASTM A106/A106M type and grade for bending, and class required to match adjoining pipe. Bent pipe showing kinks, wrinkles, or malformations will not be acceptable.

c. Pitch all piping, unless otherwise indicated, with a grade of not less than 25 mm in 6 m 1 inch in 20 feet toward drain points with slope maintained throughout the system, including through each leg of each expansion loop.

d. Properly cap or plug open ends of pipe lines and equipment during
installation to keep dirt and other foreign matter out of the system.

3.3.2 Welded Joints

Weld joints between sections of pipe and between pipe and fittings in accordance to the requirements specified in paragraph WELDING. Branch connections may be made with either welding tees or forged branch outlet fittings. Branch outlet fittings where used, must be forged and must be no larger than two nominal pipe sizes smaller than the main run. Branch outlet fittings must be flared for improved flow where attached to the run, reinforced against external strains, and designed to withstand full pipe bursting strength.

3.3.3 Flanged and Threaded Joints

******************************************************************************
NOTE: Flanged joints will be permitted for
dielectric isolation only.
******************************************************************************

3.3.3.1 Flanged Joints

Provide true faced joints with gaskets, square and tight. Provide electrically isolated flange joints at all connections to building underground systems and between dissimilar metals.

3.3.3.2 Threaded Joints

Provide joints with graphite or inert filler and oil, graphite compound, or polytetrafluoroethylene tape applied to the male threads only. Provide dielectric unions at connections of dissimilar metals in 19 mm 0.75 inch and smaller piping.

3.3.4 Reducing Fittings

3.3.4.1 Horizontal Water Heating Lines

In horizontal hot water heating lines, provide eccentric type reducing fittings to maintain the tops of adjoining pipes at the same level.

3.3.4.2 Horizontal Steam Lines

In horizontal steam lines, provide eccentric type reducing fittings to maintain the bottom of adjoining pipes at the same level.

3.3.5 Branch Connections

Ensure branches from mains branch off top of mains as indicated or as approved. Ensure connections allow unrestricted circulation, elimination of air pockets, and permit the complete drainage of the system.

3.3.6 Pipe Supports Exposed in Concrete Trenches

Securely support horizontal and vertical runs of pipe in concrete trenches. Provide adjustable pipe hangers having bolted hinged loops and turnbuckles or by other approved devices as shown on the drawings, and all conforming to MSS SP-58 for suspended pipe. Chain or flat steel strap hangers or single point supports will not be acceptable. Provide all pipe supports including the structural cross support member in accordance with Section
05 50 13 MISCELLANEOUS METAL FABRICATIONS.

3.4 WELDING

Perform welding and radiographic examination of all steel carrier pipe welds in accordance with Section 40 05 13.96 WELDING PROCESS PIPING. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.

3.5 RADIOGRAPHIC TESTING

Submit detail drawings for steam traps, valves, sump pumps, pressure gauges, thermometers and insulation, including a complete list of equipment and material, including manufacturer's descriptive and technical literature, performance charts and curves, catalog cuts, and installation instructions. Show on the drawings complete wiring and schematic diagrams, pipe stress calculations for any revised expansion loops, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show on the drawings proposed system layout, provisions for expansion, pipe anchors and guides, and layout and anchorage of equipment and appurtenances in valve manholes, and equipment relationship to other parts of the work including clearances for maintenance and operation.

a. Provide radiographic examination of all field welds in the steel carrier piping of the heat distribution system in accordance with ASME B31.1 performed as specified in Section 40 05 13.96 WELDING PROCESS PIPING. Provide an approved independent testing firm or firms regularly engaged in radiographic testing to perform a radiographic examination of all field welds in accordance with ASME B31.1.

b. Furnish a set of films showing each weld inspected, a reading report evaluating the quality of each weld, and a location plan showing the physical location where each weld is to be found in the completed project, prior to backfilling and hydrostatic testing. Provide a report that is reviewed and interpreted by a Certified Level III Radiographer employed by the testing firm with signature of reviewer/interpreter on the report readings for all radiographs.

c. The Contracting Officer reserves the right to review all inspection records, and if any welds inspected are found unacceptable they will be removed, rewelded, and radiographically examined at no cost to the Government.

3.6 INSULATION

Submit display sample sections for insulation of pipe, elbow, tee, valve, support point, and terminating points. After approval of material and prior to insulation of piping, prepare a display of insulated sections showing compliance with specifications, including fastening, sealing, jacketing, straps, waterproofing, supports, hangers, anchors, and saddles. Keep sample sections on display at the jobsite during the construction period until no longer needed. Install insulation so that it is not damaged by pipe expansion or contraction. Groove insulation installed over welds to assure a snug fit. Hold insulation in place with stainless steel straps. Install a minimum of 2 bands on each individual length of insulation with maximum spacing not exceeding 450 mm 18 inch centers. Submit performance test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove
compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate on each test report the final position of controls and valves.

3.6.1 Installation

Install material in accordance with published installation instructions of the manufacturer. Apply insulation materials only after piping tests are satisfied completed.

3.6.1.1 Preparation

Prior to application, thoroughly clean surfaces of moisture, grease, dirt, rust, and scale, and paint where required.

3.6.1.2 Thickness

******************************************************************************
NOTE: Delete inapplicable columns in Tables 1 and 2.
******************************************************************************

Provide the minimum thickness of insulation for [the heat distribution system] [and] [condensate return system] [each section of pipe] in accordance with Tables 1 and 2.

3.6.2 Insulation on Pipes Passing Through Sleeves

Install insulation continuously through sleeves. Provide aluminum jackets over the insulation. When penetrating building walls, extend aluminum jackets not less than 50 mm 2 inches beyond the sleeve on each side of the wall and be secured with an aluminum band on each side of the wall. Where flashing is provided, secure the jacket with one band not more than 25 mm 1 inch from the end of the jacket.

3.6.3 Covering of Insulation in Concrete Trenches

Provide aluminum jackets for pipe insulation, flanges, valves, and fittings.

3.7 CONCRETE TRENCH SYSTEM

**************************************************************************

NOTE: Provide details on plan/profile drawings showing concrete trench size, profile of existing grade, grading and drainage problems along trench route, elevations of trench floor and piping, and thickness of trench concrete cover.

**************************************************************************

Provide and install a concrete cast-in-place trench system with a removable top as shown on the drawings.

3.7.1 Concrete

**************************************************************************

NOTE: Concrete work will be specified in detail in Section 03 30 00 CAST-IN-PLACE CONCRETE, edit the spec and include all specific requirements pertinent to local conditions and designers General Notes.

**************************************************************************

Provide materials and methods for mixing and placing of concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.7.2 Joint Sealants

Seal concrete joints as indicated. Provide type II sealant (non-sagging) for vertical joints. Provide type I sealant for trench top butt joints. For all other joints, seal with Type I or Type II sealant. Provide trench bottom sealant finish flush with floor.

3.7.3 Concrete Trench Tops

**************************************************************************
NOTE: Tops must be square and not out of plane, and must be cast to lay flat in all directions. Provide notes on drawings.

Provide precast or cast-in-place concrete trench tops. Provide concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Ensure tops are flat and true and lay flat at all locations where contact on trench wall is to be made. Tolerances must be true planes within 4 mm in 3 m 0.012 inch in 8 feet as determined by 2.44 m 8 foot straight edge placed diagonally on top. Deviation from square or designated skew (difference in length of the two diagonal measurements) must be 3 mm in 2 m 0.012 inch in 6 feet or 6 mm 0.25 inch total, whichever is greater. Maximum permissible warpage of one corner out of the plane of the other three must be 5 mm per meter 0.06 inch per foot distance from the nearest adjacent corner. Do not install concrete trench tops with defects which affect the strength of the cover unit, or which are warped, honeycombed, contain visible air pockets, exposed aggregate, or other surface defects such as spalled, chipped, or broken edges, . Place neoprene gasket material on the top of concrete trench walls so as to provide a seal between the wall and the concrete trench covers. Surfaces of joints to be in contact with gasket material must be dry and free of oil, grease, dirt, loose concrete particles, or other foreign substances. Place gasket material in a continuous length along the wall as much as practical. Butt gasket ends tightly together at splices. Construct concrete trench tops in maximum lengths of 2.4 m 8 feet and minimum lengths of 1.2 m 4 feet and must be a minimum of 100 mm 4 inches thick, unless otherwise indicated. Provide each top section with means to accept a lifting device for removal of slab, as indicated on the drawings.

3.7.4 Concrete Trench Construction

NOTE: Provide details on the drawings of the concrete trenches and concrete walks. Provide details of the various trench sizes for the different sizes of heat distribution piping anticipated for this contract.

Where concrete trench tops are used in conjunction with sidewalks, provide sidewalk sections on the drawings between loop legs to maintain a continuous sidewalk.

Ensure inside edge and top of walls has smooth and even surfaces to accommodate trench tops.

3.7.5 Final Elevations

Slope the concrete trench floor continuously and drain toward valve manholes. Construct the concrete trench at the elevation shown on the drawings and grade the adjacent areas. Grade any cut or fill areas adjacent to the concrete trench back to the existing grade at a 1 to 10 slope, or as indicated. Take care to avoid forming pockets adjacent to the concrete trench; thereby, preventing surface drainage. Install the concrete trench floor and pipe parallel and maintain constant slope toward the drain points indicated.
3.7.6 Coordination with Existing Utilities

Before beginning work in a given area, all utility information must be field verified by surface markings made by the affected utility Owner's Representative. Notify the Contracting Officer in advance, and receive prior approval before excavating in any areas. The actual concrete trench routing may be offset or changed if approved by the Contracting Officer in order to reduce conflicts, interruptions, expedite the work, or for any other reason to the mutual benefit of the Contractor and the Government. Utility conflicts may be cast into the floor of the trench providing they do not interfere with concrete trench drainage and are approved by the Contracting Officer. [After the new heat distribution system is cut-in, the existing system can be removed.] [abandoned in place if not in conflict with the new construction and not shown to be removed on the drawings.]

3.7.7 Piping Support System

------------------------------
NOTE: Provide design details of pipe supports on drawings. Show sizes, shapes and means of how the system is to function. Supports may consist of welded plates, channels, structural tees, pipes or other support means.------------------------------

Do not install pipes, pipe supports, or other related items on the floor of the concrete trench system. Pipe support members spanning traversely across the tunnel must allow a minimum of 100 mm 4 inches clearance between structural member and concrete trench floor. Additional minimum clearances required from the pipe insulation surface must be as follows: 200 mm 8 inches to concrete trench floor, 150 mm 6 inches to side walls, 150 mm 6 inches to trench cover, and 150 mm 6 inches between adjoining pipes.

3.7.8 Pipe Expansion

------------------------------
NOTE: Coordinate this paragraph with the specified requirements in paragraph General Piping Requirements.------------------------------

Expansion must be accommodated by loops and bends as indicated on the drawings and specified. Pipe in the loops and bends must accommodate expansion while maintaining required insulation clearance from floors, walls, tops, and other pipes to avoid crushing or breaking of insulation. Expansion loops may be designed around obstacles such as utility manholes, structures, or trees to avoid construction conflicts. Maintain slopes of pipe and trench bottoms. Contractor must have the option to adjust the loop dimensions around obstacles based on final field measurements, if approved by the Contracting Officer. Submit pipe stress calculations for each revised expansion loop or bend based on the final actual measured lengths, or must submit dimensions to the Contracting Officer for verification of loop and bend sizes before proceeding with that segment of work. Ensure allowable pipe stresses are in accordance with ASME B31.1. Submit final expansion loop insulation method for approval to the Contracting Officer.
3.7.9 Concrete Trench Inspection Ports

**************************************************************************
NOTE: Show inspection ports on plan view and detail them on the drawings.
Provide inspection ports at appropriate locations to enable the user to observe elbows in expansion loops and bends, at high point pipe vents, approximately every 30 m (100 feet) of straight run, and at locations requiring frequent (monthly) observation.
**************************************************************************

3.7.10 Road/Drive Crossings

Install handicap ramp style curb cuts at all street and drive crossings as indicated.

3.7.11 Railroad Crossings

**************************************************************************
NOTE: Review railroad track removal/replacement with respective authority and coordinate all activities.
**************************************************************************

Restore tracks to their original condition as approved by the Contracting Officer after construction is complete.

3.8 TESTS

Conduct tests before, during, and after the installation of the system. Provide all instruments, equipment, facilities, and labor required to properly conduct the tests. Test pressure gauges for a specific test must be approved by the Contracting Officer and must have dials indicating not less than 1.5 times, nor more than 3 times the test pressure.

3.8.1 Cleaning of Piping

Prior to the hydrostatic and operating tests, flush the interior of the piping with clean water until the piping is free of all foreign materials. Flushing and cleaning out of system pipe, equipment, and components must not be considered completed until witnessed and accepted by the Contracting Officer. After flushing the system is completed, drain and fill the system with clean water. Provide temporary bypasses or temporary strainers around equipment and control valves to prevent clogging.

3.8.2 Field Tests

Conduct the following field tests when applicable to the system involved. If any failures occur, ensure adjustments or replacements as directed by the Contracting Officer and repeat the tests until satisfactory tests are completed.

3.8.2.1 Hydrostatic Tests of Service Piping

Hydrostatically test service piping before insulation is applied at field joints, and be proved tight at a pressure 1.5 times the working pressure

SECTION 33 63 13.19 Page 32
of [_____] kPa psig or at 1.38 MPa 200 psig, whichever is greater. Hydrostatic test pressure must not exceed 3.45 MPa 500 psig. Hydrostatic test pressures must be held for a minimum of 4 hours. If the hydrostatic test pressure cannot be held, make necessary adjustments or replacements and repeat the tests until satisfactory results are achieved.

3.8.2.2 Equipment Tests

Operate all pumps, valves, traps, alarms, controls, and any other operable item of equipment to verify proper operation and compliance with the specifications. Record and submit pump voltage, current, and discharge readings for approval in accordance with SUBMITTALS paragraph (SD-06).

3.8.2.3 Insulating Flange Test

Test insulating flanges for electrical isolation in accordance with the insulating flange manufacturer's standard test. This test must be witnessed and approved by the Contracting Officer.

3.8.2.4 Operational Tests

After installation of the concrete trench system, or testable portion thereof, conduct operational tests. Do not place trench covers prior to completion of operational tests. Operational tests must consist of operating the system at the pressure and temperature expected for the system when in normal service, and must demonstrate satisfactory operating effectiveness. Ensure the test on each system, or portion thereof, last a minimum of 24 hours.

3.8.2.5 Trench Water Removal Tests

After the above tests are completed, and before concrete trench and valve manhole covers are placed, clean the concrete trenches, sumps, and valve manholes of dirt and debris. Test concrete trench system to ensure gravity drainage of water is maintained in trench bottom from high points to drained low points. Verify water does not pond between high and low points, and that drained low points are operational either by use of sump pumps or by gravity drainage to storm drains, as indicated. Test must not be considered completed until witnessed and accepted by the Contracting Officer. Place trench tops and sealed immediately after approval by the Contracting Officer.

3.9 MAINTENANCE

Provide [six] [_____] [hard] [optical disc] copies of operation and [six] [_____] copies of maintenance manuals for the equipment furnished. Provide one complete set prior to performance testing, and the remainder upon acceptance. Detail in the operation manuals the step-by-step procedures required for system startup, operation, and shutdown and include the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features. List in the maintenance manuals routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides and include piping and equipment layout and simplified wiring and control diagrams indicating location of electrical components with terminals designated for wiring, as installed. Operation and maintenance manuals must be approved prior to performance testing.

-- End of Section Table of Contents --
NOTE:  This guide specification covers the requirements for Contractor designing and providing buried factory-prefabricated preinsulated pumped condensate piping systems for server ground water conditions.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE:  This guide specification includes requirements for concrete pipe anchors exterior of manholes, interface with each manhole, and the watershed to aboveground piping. The plastic carrier piping should be used for sizes 50, 80, 100, 150, 200, and 250 mm 2, 3, 4, 6, 8, and 10 inches. Therefore, the connecting system piping should be of equal size or increased to the next size of the plastic carrier piping. System design must conform to UFC 3-430-09, "Exterior Mechanical Utility Distribution".

NOTE:  The following information shall be shown on the project drawings:
1. Only drawings (not specifications) shall indicate capacity, efficiency, dimensions, details, sections, elevations, and location of equipment; space required for equipment maintenance.

2. Configuration, slope, and sizes for each piping system

3. Locations, sizes, and type of each valve and each trap

4. Details of manholes, piping within manholes, piping aboveground, and piping not in approved factory-prefabricated insulated conduit systems

5. Locations and details of thrust blocks, anchors, and connections between metal piping and plastic carrier piping

6. Trench cross section, sand bedding, and depth of bury

7. Details, sections, and elevations of piping through manholes, walls, floors, and entrance to buildings

**************************************************************************

**NOTE:** Exterior buried factory-prefabricated insulated piping system including concrete pipe anchors exterior of manholes, interface with each manhole, and the watershed to aboveground piping shall be designed by the Contractor. Manholes, piping within manholes, piping aboveground, and piping not in approved conduit systems shall be designed on the project drawings.

1.2 SYSTEM DESCRIPTION

Design and provide [new and modify existing] exterior buried factory-prefabricated preinsulated pumped condensate (hot water) return piping system complete and ready for operation. Provide identical buried factory-prefabricated insulated piping material up to the first flanged connection in manholes and aboveground. Design pressure and temperature ratings of system components shall be for working pressure of 862 kPa (gage) 125 psig condensate at 121 degrees C 250 degrees F.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the
District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

  * Cooling tanks
  * Manholes
  * Federal Agency buried piping system

  Show design and layout of piping system. Drawings shall have Professional Engineer Seal.

**SD-03 Product Data**

  * Pipe and fittings
  * Valves
  * Strainers
  * Pipe hangers and supports
  * Traps
  * Gages
  * Federal Agency Approved Brochure for plastic carrier piping
  * Thermometers

**SD-05 Design Data**

  * Federal Agency buried piping system
Submit calculations of system design. Calculations must have Professional Engineer Seal.

SD-07 Certificates

Certification of welder's qualifications

1.4 QUALITY ASSURANCE

1.4.1 Certification of Welder's Qualifications

Submit prior to site welding. Certifications shall not be more than one year old.

PART 2 PRODUCTS

2.1 PLASTIC CARRIER PIPING

2.1.1 Plastic Carrier Pipe and Fittings

Provide plastic carrier piping conforming to the Federal Agency Approved Brochure. Pipe, fittings, and adhesive shall be supplied by the same manufacturer. Pipe, fittings, flanges, and couplings shall have end connections of the adhesive bell and spigot type. Threaded piping, including pipe, fittings, flanges, and couplings, will not be permitted.

2.1.2 Flanged Connections

Provide flat face type flanged connections between plastic piping and metal piping. Plastic flanges shall be for connecting to ASME B16.5, Class 150 flanges.

2.1.3 Gaskets, Bolts, Nuts, and Washers

a. Gaskets: ASTM D1330, except the Shore A durometer hardness shall be 55 to 65, 3.20 mm 0.125 inch thick ethylene propylene, full face of flange. Provide one piece factory cut gaskets.

b. Bolts: ASTM A193/A193M, Grade B7. Extend a minimum of two full threads beyond the nut with the bolts tightened to the torque recommended by plastic pipe manufacturer.

c. Nuts: ASTM A194/A194M, Grade 7, with Teflon coated threads.

d. Washers: Provide steel flat circular washers under bolt heads and nuts.

2.2 STEEL PIPING

Provide steel piping in manholes and aboveground. Steam piping includes piping upstream of steam traps. Condensate piping includes piping downstream of steam traps.

2.2.1 Steam Pipe

a. ASTM A53/A53M: Type E (electric-resistance welded, Grade A or B) or Type S (seamless, Grade A or B), black steel. Provide Weight Class STD (Standard) for welding end connections. Provide Weight Class XS (Extra Strong) for threaded end connections.
b. ASTM A106/A106M: Grade A or B, black steel, Schedule No. 40 for pipe sizes through 250 mm 10 inches, and minimum pipe wall thickness of 9.50 mm 0.375 inch for pipe sizes 300 mm 12 inches and larger for welding end connections. Provide Schedule 80 for threaded end connections.

2.2.2 Condensate Pipe

Provide steel piping for other than exterior buried factory-prefabricated insulated pumped condensate return piping.

a. ASTM A53/A53M: Type E (electric-resistance welded, Grade A or B) or Type S (seamless, Grade A or B); black steel, Weight Class XS (Extra Strong).

b. ASTM A106/A106M: Grade A or B, black steel, Schedule No. 80.

2.2.3 Buried Steel Piping to Cooling Well or Drain

Provide direct buried steel condensate pipe and fittings with exterior coal tar epoxy painting system.

2.2.4 Threaded Fittings

ASME B16.11, or ASME B16.3, Class 150 for steam, Class 300 for condensate.

2.2.5 Socket Welding Fittings

ASME B16.11.

2.2.6 Buttwelding Fittings

ASME B16.9. Provide the same material and weight as the piping in which fittings are installed. Provide backing rings conforming to ASME B31.1 and be compatible with materials being welded.

2.2.7 Eccentric Reducing Fittings

ASME B16.9. Provide the same material and weight as the piping in which fittings are installed. Provide for changes in horizontal steam piping sizes.

2.2.8 Flanges and Unions

Provide flanges at connections to plastic piping.

2.2.8.1 Flanges

ASME B16.5, Class 150. Provide flat face flanged connections between plastic piping and metal piping.

2.2.8.2 Unions

ASME B16.39, Class 150 for steam, Class 250 for condensate.

2.2.9 Gaskets, Bolts, Nuts, and Washers

a. Gaskets: Provide ASME B16.21, composition ring 1.60 mm 0.0625 inch thick for steam and gravity condensate (steam) piping. Provide
ASTM D1330, except the Shore A durometer hardness shall be 55 to 65, 3.20 mm 0.125 inch thick, full face of flange for pumped condensate (hot water) piping. Provide one piece factory cut gaskets.

b. Bolts: ASTM A193/A193M, Grade B7. Extend a minimum of two full threads beyond the nut with the bolts tightened to the required torque.

c. Nuts: ASTM A194/A194M, Grade 7, with Teflon coated threads.

d. Washers: Provide steel flat circular washers under bolt heads and nuts.

2.3 VALVES

Provide with stems in the horizontal position or not greater than 45 degrees above the horizontal position. Valves shall have flanged end connections, except sizes smaller than 65 mm 2.5 inches in steel piping may have union end connections, or threaded end connections with a union on one side of the valve.

2.3.1 Valves for Condensate Service

Valves downstream of steam traps shall be for minimum working pressures of ASME Class 125.

2.3.1.1 Gate Valves

MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-70.

2.3.1.2 Globe and Angle Valves

MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-85.

2.3.1.3 Check Valves

MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-71. Provide swing check valves.

2.3.2 Valves for Steam Service

Valves upstream of steam traps shall be steel body for minimum working pressures of ASME Class 150.

2.3.2.1 Gate, Globe, and Angle Valves

ASME B16.34.

2.3.2.2 Check Valves

ASME B16.34, swing check.

2.4 PIPING ACCESSORIES

2.4.1 Pipe Hangers and Supports

Provide MSS SP-58 and MSS SP-69, of the adjustable type, except as specified or indicated otherwise. Tack-weld Type 39 pipe covering protection saddles to steel pipe for insulated piping. Provide steel
support rods. The finish of rods, nuts, bolts, washers, hangers, and supports shall be hot-dip galvanized after fabrication. Rollers, bases, and saddles may be painted with two coats of aluminum or light gray paint rated for use on hot metal surfaces up to 232 degrees C 450 degrees F in lieu of hot-dip galvanized. Provide stainless steel axles for rollers. Miscellaneous metal shall conform to ASTM A36/A36M, hot-dip galvanized after fabrication.

2.4.2 Strainers

Steel body in accordance with ASME B16.5 for minimum of ASME Class 150. Provide stainless steel strainer element with minimum diameter perforations of 0.40 mm 0.016 inch for steam, 0.80 mm 0.031 inch for steam mixed with condensate, and 1.20 mm 0.047 inch for condensate (hot water). Provide blow-off outlet with pipe nipple, gate valve, and discharge pipe nipple.

2.4.3 Traps

Steel body, internals of stainless steel, minimum of ASME Class 150, and of the types indicated.

2.4.4 Pipe Sleeves

Provide where piping passes entirely through walls and floors. Provide sleeves of sufficient length to pass through entire thickness of walls and floors. Provide 25 mm one inch minimum clearance between exterior of piping or pipe insulation or conduit and interior of sleeve or core-drilled hole. Firmly pack space with mineral wool insulation. Seal space at both ends of sleeve or core-drilled hole with plastic waterproof cement which will dry to a firm but pliable mass, or provide mechanically adjustable segmented elastomeric seal. In fire walls and fire floors, seal both ends of sleeves or core-drilled holes with UL listed fill, void, or cavity material.

a. Sleeves in Masonry and Concrete Walls and Floors: Provide hot-dip galvanized steel, ductile-iron, or cast-iron sleeves. Core drilling of masonry and concrete may be provided in lieu of sleeves when cavities in the core-drilled hole are grouted smooth.

b. Sleeves in Other Than Masonry and Concrete Walls and Floors: Provide 26 gage galvanized steel sheet.

2.4.5 Escutcheon Plates

Provide split hinge type metal plates for piping entering walls and floors in exposed spaces. Provide polished stainless steel plates or chromium-plated copper alloy plates in finished spaces. Provide paint finish on metal plates in unfinished spaces.

2.4.6 Cooling Tanks

Construct of steel for minimum working pressure of ASME Class 150.

a. Thermometers: Provide bimetal dial-type thermometers with stainless steel case, stem, and fixed thread connection; 125 mm 5 inch diameter dial with glass face gasketed within the case; accuracy within one percent of scale range. Provide scale range for the intended service.

b. Gages: Provide single style pressure gage for steam with 115 mm 4.5
2.4.7 Couplings

Provide special couplings for joining plastic condensate return pipe to ASTM A106/A106M steel pipe. Couplings shall be for working pressure of 862 kPa (gage) 125 psig hot water at 121 degrees C 250 degrees F. Couplings shall include carbon steel sleeve flared at each end, two Viton gaskets, two steel follower rings, and set of steel track bolts to properly compress the gaskets. Tighten bolts to torque recommended by coupling manufacturer. Provide 178 mm 7 inch long carbon steel sleeves for use with each nominal pipe size with minimum wall thickness as follows:

<table>

2.5 BURIED PIPING SYSTEM

Design and provide exterior buried factory-prefabricated preinsulated pumped condensate return piping in a conduit for which a Federal Agency Approved Brochure has been issued. In case of differences between the Approved Brochure and the project specification and drawings, the project specifications and drawings shall govern. Design, equipment, materials, installation, workmanship, fabrication, assembly, erection, examination, inspection, testing, and repair requirements shall be in accordance with the Approved Brochure.

2.5.1 System Design

Design the underground piping system including trench bed and pipe anchors.
in accordance with the Approved Brochure. Pipe expansion loops will not be permitted. Expansion design having lateral movement through manholes will not be permitted. Design shall include buried prefabricated preinsulated piping system including concrete pipe anchors exterior of manholes, interface with each manhole, and the watershed to aboveground piping. Provide manholes, piping within manholes, piping aboveground, and piping not in approved conduit systems as indicated; redesign will not be permitted. Earth horizontal resistant loading is 95.8 kPa 2000 psf.

2.5.2 System Requirements

Provide system approved for Class A [or Class B] ground water conditions. Minimum depth of burial shall be [914 mm] [36 inches] [_____] from center of carrier pipe to final ground surface. Provide insulation, completely filling the space between the carrier pipe and the conduit in accordance with the Approved Brochure.

2.5.3 Buried Warning and Identification Tape

Provide detectable aluminum foil plastic backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape shall be detectable by an electronic detection instrument. Provide tape in rolls, 80 mm 3 inches minimum width, color coded for the utility involved with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall read CAUTION BURIED STEAM PIPING BELOW or similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material. Bury tape with the printed side up at a depth of 300 mm 12 inches below the top surface of earth or the top surface of the subgrade under pavements.

PART 3 EXECUTION

3.1 INSTALLATION

Installation of exterior buried pumped condensate return piping system including equipment, materials, installation, workmanship, fabrication, assembly, erection, examination, inspection, and testing shall be in accordance with ASME B31.1, except as modified herein. Field assembly shall be in accordance with the Federal Agency Approved Brochure. Install piping straight and true to bear evenly on sand bedding material. Install valves with stems horizontal or above. Provide flanges and unions at valves, traps, strainers, connections to equipment, and as indicated.

3.1.1 Cleaning of Piping

Keep the interior and ends of new piping and existing piping affected by the Contractor's operations, cleaned of water and foreign matter during installation by using plugs or other approved methods. When work is not in progress, securely close open ends of pipe and fittings to prevent entry of water and foreign matter. Inspect piping before placing into position.

3.1.2 Demolition

Remove materials so as not to damage materials which are to remain. Replace existing work damaged by the Contractor's operations with new work of the same construction.
3.2 PLASTIC CARRIER PIPING

Exterior buried factory-prefabricated insulated pumped condensate (hot water) return piping system, including field joints, bedding, and initial backfill shall be in accordance with the Approved Brochure, except as modified herein.

3.2.1 Connections to Metal Pipe

Connections between plastic carrier pipe and metal pipe shall be flanged, with metal pipe anchored within 1500 mm 5 feet of the connection. Expansion and load forces of metal piping shall not be transmitted to the plastic carrier pipe or conduit. Do not bury flanged pipe connections. Provide flat circular steel washers under bolt heads and nuts on flanges; tighten bolts to the torque recommended by the plastic pipe manufacturer.

3.2.2 Field Joints

3.2.2.1 Plastic Carrier Piping Joints Without Concrete Anchor

Pressure test and approve piping joints. Provide with polyurethane or polyisocyanate insulation of the same type and thickness as the insulation on the carrier piping. Provide waterproof shrink sleeves to cover the insulation and overlap not less than 150 mm 6 inches of each end of conduit section.

3.2.2.2 Plastic Carrier Piping Joints With Concrete Anchor

Pressure test and approve piping joints. Provide concrete anchors (thrust blocks) for each elbow and tee. Provide waterproof end seals between the carrier piping and the conduit adjacent to each carrier pipe fitting. Encase the carrier pipe fitting and at least 50 mm 2 inches of each end of the conduit with a minimum of 150 mm 6 inches of concrete.

3.2.3 Concrete Thrust Blocks

Cast thrust blocks after completion of hydrostatic testing. Encase each elbow and tee of the carrier pipe in a concrete thrust block with a minimum of 0.30 square meter 3 square feet of thrust-bearing surface cast against undisturbed soil, a minimum pipe-to-bearing surface single dimension of 250 mm 10 inches perpendicular to the bearing surface, and a minimum volume of 0.25 cubic meter 9 cubic feet, except as indicated otherwise. Disturbed soil under and around thrust blocks shall be compacted. Provide concrete thrust blocks under this section as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE except the concrete shall be of 30 MPa 4000 psi minimum 28 day compressive strength, air entrained admixture (133 grams per cubic meter 3.6 ounces per cubic yard), with water-reducing admixture (814 grams per cubic meter 22 ounces per cubic yard).

3.3 STEEL PIPING

Test, inspect, and approve piping before burying, covering, or concealing. Provide fittings for changes in direction of piping and for connections. Stab type connections will not be permitted. Make changes in piping sizes through tapered reducing fittings; bushings will not be permitted. Jointing compound for pipe threads shall be Teflon pipe thread paste. Pipe nipples 150 mm 6 inches long and shorter shall be Schedule 80 steel pipe. Condensate piping shall include drip, vent, relief, and gage connecting piping.
3.3.1 Fittings and End Connections

For sizes less than 25 mm one inch provide threaded fittings and end connections. For sizes 25 to 50 mm 1 to 2 inches provide threaded or socket-welding or buttwelding fittings and end connections; provide threaded connections for threaded valves, traps, strainers, and threaded connections to equipment. For sizes 65 mm 2.5 inches and larger provide buttwelding fittings and end connections; provide flanged connections for flanged valves, traps, strainers, and flanged connections to equipment.

3.3.2 Welding

ASME B31.1, metallic arc process, including qualification of welders.

3.3.3 Pipe Hangers and Supports

Provide additional hangers and supports for concentrated loads in piping between hangers and supports, such as for valves.

3.4 NAMEPLATES

Provide laminated plastic nameplates for equipment, gages, thermometers, and valves. Nameplates shall be melamine plastic, 3.20 mm 0.125 inch thick, black with white center core. Surface shall be matte finish. Corners shall be square. Accurately align lettering and engrave into the white core. Minimum size of nameplates shall be 25 to 65 mm 1 by 2.5 inches. Lettering shall be minimum of 6.40 mm 0.25 inch high normal block style. Key the nameplates to a chart and schedule for each system. Frame charts and schedules under glass, and locate where directed near each system. Furnish two copies of each chart and schedule.

3.5 FIELD QUALITY CONTROL

Before final acceptance of the work, test each system to demonstrate compliance with contract requirements. Flush and clean piping before placing in operation. Flush piping at a minimum velocity of 2.40 meters per second 8 fps. Correct defects in work provided by Contractor and repeat tests until work is in compliance with contract requirements. Furnish potable water, electricity, instruments, connecting devices, and personnel for the tests.

3.5.1 Field Inspections

Prior to initial operation, inspect piping system for compliance with drawings, specifications, and manufacturer's submittals.

3.5.2 Field Tests of Carrier Piping

Do not cover the carrier piping joints with insulation or concrete anchors (thrust blocks), until the carrier piping joints have passed all field tests and testing requirements in the Approved Brochure for exterior buried factory-prefabricated insulated condensate return piping system.

3.5.3 Field Repairs of Plastic Carrier Pipe and Joints

Repair leaking and porous sections of pipe or joints by removing and replacing with new materials. Do not overwrap the fault with any type of patch or other material. If a joint is damaged during laying operation,
cut off the joint, bond a coupling to the severed end, and lay in the piping as a normal pipe. If damage occurs to a new pipe section after pipe has been laid, cut out damaged section and replace with a new pipe section in accordance with manufacturer's instructions.

3.6 FIELD PAINTING

After completion of field inspections and tests, clean and paint metal surfaces exposed to the weather and in manholes, including valves, strainers, traps, flow meters, pipe flanges, bolts, nuts, washers, pipe hangers and supports, expansion joints, and miscellaneous metal. Do not paint piping prior to the application of field-applied insulation. Do not paint stainless steel or aluminum jackets. Apply paint to clean dry surfaces. Clean surfaces to remove dust, dirt, rust, oil, and grease. Provide surfaces with two coats of enamel paint applied to a total minimum dry film thickness of 0.05 mm 2 mils. Apply the second coat of paint after the preceding coat is thoroughly dry. Color of finish coat shall be aluminum or light gray. Paint shall be rated for use on hot metal surfaces up to 232 degrees C 450 degrees F and for use on surfaces exposed to the weather.

3.7 CONNECTIONS TO EXISTING SYSTEMS

Notify the Contracting Officer in writing at least 15 days prior to the date the connections are required; receive approval before interrupting service. Provide materials required to make connections into existing systems and perform excavating, backfilling, and other incidental labor as required.

NOTE: This guide specification covers the requirements for exterior shallow trench heat distribution systems including concrete trench, manholes, piping, pipe anchors, pipe supports, interface with each manhole, and the watershed to aboveground piping.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: System design must conform to UFC 3-430-09, "Exterior Mechanical Utility Distribution."

NOTE: Following information shall be shown on project drawings:

1. Only drawings (not specifications) shall indicate capacity, efficiency, dimensions, details, plan view, sections, elevations, and location of equipment; and space required for equipment maintenance.

2. Configuration, slope, and sizes for concrete
trench and for each piping system.

3. Location, sizes, and type of each valve and each trap.

4. Details of expansion joints and expansion loops for piping.

5. Capacity, sizes, bypass valves, and piping for steam flow meters and pressure regulating valves.

6. Scale ranges for pressure gages and thermometers.

7. Whether piping is run in shallow concrete trenches, aboveground on pedestals or poles, on piers, under piers, in trenches on piers, or in manholes.

8. Details, sections, and elevations of shallow concrete trenches and manholes, piping within trenches and manholes, and piping aboveground.

ASTM A194/A194M (2018) Standard Specification for Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts for High-Pressure or High-Temperature Service, or Both

ASTM A615/A615M (2016) Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement

ASTM D229 (20132019) Standard Test Methods for Rigid Sheet and Plate Materials Used for Electrical Insulation

MANUFACTURERS STANDARDIZATION SOCIETY OF THE VALVE AND FITTINGS INDUSTRY (MSS)

1.2 SYSTEM DESCRIPTION

Provide [new and modify existing] exterior [steam and condensate] [hot water] piping system of shallow concrete trench type, complete and ready for operation. [Provide piping to and including main steam pressure regulating valves, bypass valves, safety-relief valves, and high pressure traps within each building.] Design pressure and temperature ratings of system components shall be for [working pressure of 1034 kPa (gage) 150 psig steam at 186 degrees C 366 degrees F and 862 kPa (gage) 125 psig condensate at 121 degrees C 250 degrees F] [hot water at 232 degrees C 450 degrees F].

1.3 SUBMITTALS

******************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that
the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

1.4 QUALITY ASSURANCE

1.4.1 Certification of Welder's Qualifications

Submit prior to site welding. Certification shall not be more than one year old.

PART 2 PRODUCTS

2.1 PIPE

[Steam piping includes piping upstream of steam traps. Condensate piping includes piping downstream of steam traps.]

2.1.1 [Steam] [Hot Water] Pipe

a. ASTM A53/A53M: Type E (electric-resistance welded, Grade A or B) or Type S (seamless, Grade A or B), black steel. Provide Weight Class STD (Standard) for welding end connections. Provide Weight Class XS (Extra Strong) for threaded end connections.

b. ASTM A106/A106M: Grade A or B, black steel, Schedule No. 40 for pipe sizes through 250 mm 10 inches, and minimum pipe wall thickness of 9.50 mm 0.375 inch for pipe sizes 300 mm 12 inches and larger for welding end connections. Provide Schedule No. 80 for threaded end connections.

2.1.2 Condensate Pipe

a. ASTM A53/A53M: Type E (electric-resistance welded, Grade A or B) or Type S (seamless, Grade A or B); black steel, Weight Class XS (Extra Strong).

b. ASTM A106/A106M: Grade A or B, black steel, Schedule No. 80.

2.1.3 Buried Steel Piping to Cooling Well or Drain

Provide direct buried steel condensate pipe and fittings with exterior coal tar epoxy painting system.

2.2 FITTINGS

2.2.1 Threaded Fittings

ASME B16.11, or ASME B16.3, Class [150 for steam, Class 300 for condensate] [300 for hot water].

2.2.2 Socket-Welding Fittings

ASME B16.11.
2.2.3 Buttwelding Fittings

**ASME B16.9.** Provide same material and weight as piping in which fittings are installed. Backing rings shall conform to **ASME B31.1** and be compatible with materials being welded.

2.2.4 Eccentric Reducing Fittings

**ASME B16.9.** Provide same material and weight as piping in which fittings are installed.

2.2.5 Flanges and Unions

a. **Flanges:** **ASME B16.5,** Class [150 or Class 300 as required] [300 for hot water].

b. **Unions:** **ASME B16.39,** Class [150 for steam, Class 250 for condensate] [300 for hot water].

2.2.6 Gaskets, Bolts, Nuts, and Washers

a. **Gaskets:** Provide gaskets suitable for the intended service. Provide spiral wound, non-asbestos gasket with centering ring per **ASME B16.20.**

b. **Bolts:** **ASTM A193/A193M,** Grade B7. Extend a minimum of two full threads beyond the nut with the bolts tightened to the required torque.

c. **Nuts:** **ASTM A194/A194M,** Grade 7, with Teflon coated threads.

d. **Washers:** Provide steel flat circular washers under bolt heads and nuts.

e. **Electrically Isolating (Insulating) Gaskets for Flanges:** Provide **ASTM D229** electrical insulating material of 1000 ohms minimum resistance. Provide one piece factory cut insulating gaskets between flanges. Provide silicon-coated fiberglass insulating sleeves between bolts and holes in flanges; bolts may have reduced shanks of a diameter not less than diameter at root of threads. Provide 3.20 mm 0.125 inch thick high-strength insulating washers next to flanges and provide stainless steel flat circular washers over insulating washers and under bolt heads and nuts. Provide bolts 13 mm 0.5 inch longer than standard length to compensate for thicker insulating gaskets and washers under bolt heads and nuts.

2.3 VALVES

Provide with stems in the horizontal position or not greater than 45 degrees above the horizontal position. Valves shall have flanged end connections, except sizes smaller than 65 mm 2.5 inches may have union end connections, or threaded end connections with a union on one side of valve.

2.3.1 Valves for [Steam] [Hot Water] Service

Valves [upstream of steam traps] shall be steel body for minimum working pressure of **ASME Class 150** [300 for hot water].

a. **Gate Valves, Globe Valves, Angle Valves, and Check Valves:** **ASME B16.34,** steel body, minimum of **ASME Class 150** [300 for hot water]. Provide swing check valves.
b. Steam Pressure Regulating Valves: Steel body, minimum of ASME Class 150, except as modified herein. Valve seats and disc shall be of replaceable heat-treated stainless steel. Valves shall be single seated; seat tight under dead end conditions, and move to the closed position in the event of pressure failure of the operating (controlling) medium. Provide strainer in inlet from external operating (controlling) medium. Valves shall be controlled by pilot valve with strainer at inlet from external pressure sensing piping. Valves shall be internally or externally steam traced for freeze protection. Valves shall be piston operated type or spring loaded diaphragm operated type with stainless steel springs.

c. Safety-Relief Valve: Minimum of ASME Class [150] [300 for hot water], with test lever. Valves shall have steel [or copper alloy] body with flanged inlet and outlet connections or threaded connections attached to threaded ASME Class [150] [300 for hot water] flanges. Valves shall be ASME rated for capacity indicated.

2.3.2 Valves for Condensate Service

Valves downstream of steam traps shall be for minimum working pressures of ASME Class 125.

a. Gate Valves: MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-70.

b. Globe and Angle Valves: MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-85.

c. Check Valves: MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-71. Provide swing check valves.

2.4 PIPING ACCESSORIES

2.4.1 Pipe Hangers and Supports

Provide MSS SP-58 and MSS SP-69, Type 46, of the adjustable type, except as specified or indicated otherwise. Tack-welded Type 39 pipe covering protection saddles to steel pipe for insulated piping. Provide steel support rods. Finish of rods, nuts, bolts, washers, hangers, and supports shall be hot-dip galvanized after fabrication. Rollers, bases, and saddles may be painted with two coats of aluminum or light gray paint rated for use on hot metal surfaces up to 232 degrees C 450 degrees F in lieu of hot-dip galvanized. Axles for rollers shall be stainless steel. Miscellaneous metal shall conform to ASTM A36/A36M, hot-dip galvanized after fabrication.

2.4.2 Strainers

Construct of steel in accordance with ASME B16.5 for minimum of ASME Class [150] [300 for hot water]. Provide stainless steel strainer element with perforations of [0.40 mm 0.016 inch for steam, 0.80 mm 0.031 inch for steam mixed with condensate, and] 1.20 mm 0.047 inch for [condensate (hot water)] [hot water]. Provide blow-off outlet with pipe nipple, gate valve, and discharge pipe nipple.

2.4.3 Traps

Steel body, internals of stainless steel, minimum of ASME Class 150, and of the types indicated.
2.4.4 Gages

Provide single style pressure gage with 115 mm 4.5 inch dial, brass or aluminum case, bronze tube, gage cock, pressure snubbers, and syphon. Provide scale range for the intended service.

2.4.5 Pipe Sleeves

Provide where piping passes entirely through walls and floors. Provide sleeves of sufficient length to pass through entire thickness of walls and floors. Provide 25 mm one inch minimum clearance between exterior of piping or pipe insulation, and interior of sleeve or core-drilled hole. Firmly pack space with mineral wool insulation. Seal space at both ends of sleeve or core-drilled hole with plastic waterproof cement which will dry to a firm but pliable mass, or provide mechanically adjustable segmented elastomeric seal. In fire walls and fire floors, seal both ends of sleeves or core-drilled holes with UL listed fill, void, or cavity material.

a. Sleeves in Masonry and Concrete Walls and Floors: Provide hot-dip galvanized steel, ductile-iron, or cast-iron sleeves. Core drilling of masonry and concrete may be provided in lieu of sleeves when cavities in the core-drilled hole are completely grouted smooth.

b. Sleeves in Other Than Masonry and Concrete Walls and Floors: Provide 26 gage galvanized steel sheet.

2.4.6 Escutcheon Plates

Provide split hinge type metal plates for piping entering walls and floors in exposed spaces. Provide polished stainless steel plates or chromium-plated finish on copper alloy plates in finished spaces. Provide paint finish on metal plates in unfinished spaces.

2.4.7 Electronic Steam Flow Meters

Meter shall be for minimum working pressure of ASME Class [150] [300]. Meter shall include an orifice plate, pressure transmitter, indicator, and totalizer. Provide meter for measuring steam flow in kg per second pounds per hour. Meter shall be for installation and operation in horizontal position.

a. Orifice Plate: Provide differential producing type orifice plate with circular hole for insertion into steam piping between two ASME B16.5 Class 300 welding neck orifice flanges. Orifice plate shall be Type 304 stainless steel. Furnish a dimensional report and flow versus differential curve with accuracy of plus or minus one percent over a 5 to 1 flow range. Orifice flanges shall have at least two radially-drilled and tapered holes for metering and two jack screws.

b. Pressure Transmitter: Provide solid state electronic type differential pressure transmitter. Transmitter shall utilize Type 316 stainless steel dual opposed rupture-proof bellows converted to produce a 4 to 20 mA dc output. Transmitter shall have a flow range of 0 to 0.40 kg per second 3000 pounds per hour of steam flow with accuracy of plus or minus 2 percent of full scale over a 5 to 1 flow range. House transmitter in a weatherproof enclosure designed for wall mounting. Bellows body shall be rated for not less than 6894 kPa (gage) 1000 psig. Power requirements are 120 volts ac. Provide transmitter complete with
condensate reservoirs, steel three-valve manifold for isolation and nulling, and blowdown valves.

c. Indicator: Provide electric indicator to continuously indicate steam flow by means of a 4 to 20 mA dc electrical input signal. Indicator shall have pivot and jewel suspension and a mirrored scale with uniform graduations over a steam flow range of 0 to 0.40 kg per second 3000 pounds per hour.

d. Totalizer: Provide totalizer that linearizes a 4 to 20 mA dc electrical input signal into digital signal scaled in kg pounds of steam flow, displays totalized steam flow on a six-digit nonresettable counter, and transmits each totalizer count to the output.

e. Output: An isolated, 500 volt minimum, ac or dc switch closure rated at 50 volts dc or 40 volts RMS ac, one ampere minimum capacity. Duration of closure shall be not less than 0.04 second or more than 0.06 second.

2.4.8 Steam Flow Meters

**************************************************************************
NOTE: Meters can have (a) six-dial counter, or (b) pressure compensated six-dial counter, or (c) remote totalizer, or (a) and (c). Meters cannot have (a) and (b), or (b) and (c).**************************************************************************

Meter shall be for minimum working pressure of ASME Class [150] [300] with steel pressure chambers [or ASME Class 250 with cast-iron pressure chambers]. Provide meter in horizontal pipe between two ASME B16.5 welding neck flanges. Provide rotary type meter for flow integration. Working parts shall be stainless steel or brass. Steam flow shall cause rotation of a rotor assembly at a speed directly proportional to rate of steam flow, as controlled by a damping liquid. Rotational speed of rotor assembly shall be reduced by gearing in damping liquid chamber. Final drive to exterior counter shall be by driving magnets; stuffing box shall not be allowed. Counter shall be enclosed in dust-tight cast-aluminum housing attached to, but easily removable from, meter. For steam pipe main sizes 100 mm 4 inches and smaller, provide meter directly in steam piping. For steam pipe main sizes larger than 100 mm 4 inches, provide meter in shunt bypass piping with two ASME B16.5 Class 300 welding neck orifice flanges in steam pipe main. In shunt bypass piping, provide two flanged gate valves calibrated by meter manufacturer. In steam pipe main, provide 3.20 mm 0.125 inch thick stainless steel orifice plate sized to suit meter capacity between two ASME B16.5 Class 300 welding neck orifice flanges. [Provide six-dial counter with electrical contactor to transmit signal to data terminal cabinet (DTC) for indicating steam flow in kg pounds.] [Provide pressure compensated six-dial counter to automatically and continuously correct steam flow meter readings for steam pressure variations.] [Provide remote totalizer for recording steam flow in kg pounds.]

2.4.9 Guided Slip Tube Expansion Joints

Internally-externally guided type, injected semiplastic type packing, with service outlets. Joints shall be for minimum working pressure of ASME Class [150] [300]. Provide single or double slip tube type as indicated. Provide flanged or buttwelding end connections as indicated.
2.4.10 Flexible Ball Expansion Joints

Provide chromium plated steel balls capable of 360 degree rotation plus 15-degree angular flex movement. Provide pressure molded composition gaskets for continuous operation temperature of 274 degrees C (525 degrees F). Joints shall be designed for minimum working pressure of ASME Class 150 [300]. Provide flanged or buttwelding end connections as indicated.

2.4.11 Bellows Expansion Joints

Type 304 stainless steel corrugated bellows, reinforced with rings, internal sleeves, and external protective covers or externally pressurized joints. Provide limit stops to limit total movement in both directions. Cold set joints to compensate for temperature at time of installation. Joints shall withstand 10,000 cycles over a 20 year period. Joints shall be for minimum working pressure of ASME Class 150 [300]. Provide single or double bellows expansion joint as indicated. Provide first pipe alignment guide no more than four pipe diameters from expansion joints; provide second pipe alignment guide no more than 14 pipe diameters from the first guide. Provide flanged or buttwelding end connections as indicated.

2.5 MANHOLE DRAINERS (EJECTORS)

Provide automatic type drainers to operate on 862 kPa (gage) 125 psig steam supply. Drainer shall operate when water level rises sufficiently in the sump and shall pump water from the sump. When water level is lowered by pumping action, pumping action shall stop until water again gathers in sump. Provide each drainer with controls to accomplish above sequence of operation. Drainer shall be constructed of stainless steel or corrosion-resistant copper and bronze. Piping from manhole drainers shall be ASTM A53/A53M, Weight Class XS (Extra Strong), hot-dip galvanized steel pipe with ASME B16.11 or ASME B16.3 Class 300, hot-dip galvanized threaded fittings. Provide steam pressure regulating valve assembly for manhole drainers for operation on steam system above 862 kPa (gage) 125 psig.

2.6 CONCRETE MANHOLES

Provide under this section as specified in Section 03 42 13.00 10 PLANT-PRECAST CONCRETE PRODUCTS FOR BELOW GRADE CONSTRUCTION, except as modified herein. Concrete shall be of 30 MPa 4000 psi minimum 28 day compressive strength, air-entrained admixture (133 grams per cubic meter 3.6 ounces per cubic yard), with water-reducing admixture (814 grams per cubic meter 22 ounces per cubic yard), reinforced with deformed steel bars. Construct manhole sides by one monolithic pour. Cast-iron steps with non-slip surfaces and spaces 300 to 400 mm 12 to 16 inches apart on centers shall be firmly embedded in concrete walls for access to bottom of manholes. Provide top of manhole as indicated.

2.7 NAMEPLATES

Provide laminated plastic nameplates for equipment, gages, thermometers, and valves. Nameplates shall be melamine plastic, 3.20 mm 0.125 inch thick, black with white center core. Surface shall be matte finish. Corners shall be square. Accurately align lettering and engrave into the white core. Minimum size of nameplates shall be 25 by 65 mm 1 by 2.5 inches. Lettering shall be minimum of 6.40 mm 0.25 inch high normal block style. Key the nameplates to a chart and schedule for each system to identify its function. Frame charts and schedules under glass, and locate where directed near each system. Furnish two copies of each chart and schedule.
2.8 SHALLOW CONCRETE TRENCH

a. Cast-in-Place Concrete: Provide concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE, except as modified herein. Concrete shall be 30 MPa 4000 psi minimum 28 day compressive strength, air entrained admixture (133 grams per cubic meter 3.6 ounces per cubic yard), with water-reducing admixture (814 grams per cubic meter 22 ounces per cubic yard), reinforced with ASTM A615/A615M deformed steel bars.

b. Precast Concrete: Provide as specified in Section 03 42 13.00 10 PLANT-PRECAST CONCRETE PRODUCTS FOR BELOW GRADE CONSTRUCTION, except as modified herein. Concrete shall be 30 MPa 4000 psi minimum 28 day compressive strength, air-entrained.

c. Gasket Material: Provide neoprene pad, not less than 50 mm 2 inch wide by 6.40 mm 0.25 inch thick, between concrete trench covers and concrete trench wall tops.

d. Backing Rods: Provide compressible, nonshrinkable, nonreactive with joint sealant and nonabsorptive type such as upholstery cord, cotton, jute, or plastic rod, all free of oils or bitumens.

e. Separating Tape: Provide polyethylene or polyester tape, 0.08 mm 3 mil minimum thickness or masking tape, rubber tape, or other barrier sheet, nonreactive, nonabsorptive, adhesive-back tape, 3.20 mm 0.12 inch wider than normal width of the joint.

f. Dowel Bars: Provide ASTM A615/A615M including supplementary requirements (S1), Grade 40 or 60 for plain billet-steel concrete reinforcement bars. Coat sliding portion of each bar with lacquer resisting primer. Remove burrs and projections from the bars. Fit the outer end of the sliding portion of each dowel with a tight-fitting metal sleeve which conforms to manufacturer's recommendation for the dowel bars.

g. Exterior Sealant: ASTM C920, Type S or Type M, Class 25. Provide Grade NS, Use NT, sealant for joints in vertical surfaces. Provide Grade P, Use T, sealant for joints in horizontal surfaces.

PART 3 EXECUTION

3.1 INSTALLATION

Installation of exterior heat distribution system including equipment, materials, workmanship, fabrication, assembly, erection, examination, inspection, and testing shall be in accordance with ASME B31.1, except as modified herein. Install piping straight and true to bear evenly on supports and sand bedding material. Install valves with stems horizontal or above centerline of pipe. Provide flanges or unions at valves, traps, strainers, connections to equipment, and as indicated.

a. Cleaning of Piping: Keep the interior and ends of new piping and existing piping affected by the Contractor's operations, cleaned of water and foreign matter during installation by using plugs or other approved methods. When work is not in progress, securely close open ends of pipe and fittings to prevent entry of water and foreign matter. Inspect piping before placing into position.
b. Demolition: Remove materials so as not to damage materials which are to remain. Replace existing work damaged by the Contractor's operations with new work of the same construction.

3.2 PIPING

Test, inspect, and approve piping before burying, covering, or concealing. Provide fittings for changes in direction of piping and for connections. Reducing branch connections in steel piping may be made with forged branch outlet reducing fittings for branches two or more pipe sizes smaller than mains. Branch outlet fittings shall be forged, flared for improved flow where attached to pipe, reinforced against external strains, and designed to withstand full pipe bursting strength. Stab type connections will not be permitted. Jointing compound for pipe threads shall be Teflon pipe thread paste. Pipe nipples 150 mm 6 inches long and shorter shall be Schedule 80 steel pipe. Make changes in piping sizes through tapered reducing fittings; bushings will not be permitted.

a. Fittings and End Connections: For sizes less than 25 mm 1 inch provide threaded fittings and end connections. For sizes 25 to 50 mm 1 to 2 inches provide threaded or socket-welding or buttwelding fittings and end connections; provide threaded connections for threaded valves, traps, strainers, and threaded connections to equipment. For sizes 65 mm 2.5 inches and larger provide buttwelding fittings and end connections; provide flanged connections for flanged valves, traps, strainers, and flanged connections to equipment.

b. Welding: ASME B31.1, metallic arc process, including qualification of welders.

c. Pipe Hangers and Supports: Provide additional hangers and supports for concentrated loads in piping between hangers and supports, such as for valves. Support steel piping as follows:

SECTION 33 63 16 Page 15
3.3 FIELD QUALITY CONTROL

3.3.1 Inspections

Prior to initial operation, inspect piping system for compliance with drawings, specifications, and manufacturer's submittals.

3.3.2 Piping Tests

Before final acceptance of the work, test each system in service to demonstrate compliance with contract requirements. Before insulation is applied, hydrostatically test each piping system at not less than \(1551\) kPa (gage) \(500\) psig in accordance with ASME B31.1, with no leakage or reduction in gage pressure for 2 hours. Flush and clean piping before placing in operation. Flush piping at a minimum velocity of \(2.40 \text{ meters per second} \) \(8 \text{ fps}\). Correct defects in work provided by Contractor and repeat tests until work is in compliance with contract requirements. Furnish potable water, electricity, instruments, connecting devices, and personnel for tests.

3.4 FIELD PAINTING

After completion of field inspections and tests, clean and paint metal surfaces exposed to weather and in manholes, including valves, strainers, traps, flow meters, pipe flanges, bolts, nuts, washers, pipe hangers, support, expansion joints, manhole drains, and miscellaneous metal. Do not paint piping prior to the application of field-applied insulation. Do not paint stainless steel or aluminum jackets. Apply paint to clean dry surfaces. Clean surfaces to remove dust, dirt, rust, oil, and grease. Provide surfaces with two coats of enamel paint applied to a total minimum dry film thickness of \(0.05 \text{ mm} \) \(2 \text{ mils}\). Apply the second coat of paint after the preceding coat is thoroughly dry. Color of finish coat shall be aluminum or light gray. Paint shall be rated for use on hot metal surfaces up to \(232 \text{ degrees C} \) \(450 \text{ degrees F}\) and for use on surfaces exposed to weather.

3.5 CONNECTIONS TO EXISTING SYSTEMS

Notify Contracting Officer in writing at least 15 days prior to date the connections are required. Obtain approval before interrupting service. Provide materials required to make connections into existing systems and perform excavating, backfilling, compacting, and other incidental labor as required.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASME INTERNATIONAL (ASME)

ASME B16.3 (2016) Malleable Iron Threaded Fittings, Classes 150 and 300

ASME B16.11 (2016) Forged Fittings, Socket-Welding and Threaded

ASME B16.21 (2016) Nonmetallic Flat Gaskets for Pipe Flanges

ASME B16.34 (2017) Valves - Flanged, Threaded and Welding End

ASME B31.1 (2016; Errata 2016) Power Piping

ASTM INTERNATIONAL (ASTM)

1.2 SYSTEM DESCRIPTION

Provide [new and modify existing] exterior aboveground steam and condensate piping system complete and ready for operation. Provide piping to and including the main steam pressure regulating valves, bypass valves, safety-relief valves, and high pressure traps within each building. Design pressure and temperature ratings of system components shall be for working pressure of 1034 kPa-gage 150 psig steam at 186 degrees C 366 degrees F and 862 kPa-gage 125 psig condensate at 121 degrees C 250 degrees F. [Provide [new and modify existing] exterior buried factory-prefabricated preinsulated steam and condensate piping under roads as specified in paragraph entitled "Buried Piping Under Roads."]

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.
The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Piping

Valves

Strainers

Pipe hangers and supports

Traps

Gages
Steam flow meters
Expansion joints
Manhole drainers
SD-07 Certificates
Certification of welder's qualifications
SD-10 Operation and Maintenance Data
Manhole drainers, Data Package 2; G[, [____]]
Steam flow meters, Data Package 2; G[, [____]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.4 QUALITY ASSURANCE

1.4.1 Certification of Welder's Qualifications

Submit prior to site welding. Certifications shall not be more than one year old.

PART 2 PRODUCTS

2.1 PIPING

Steam piping includes piping upstream of steam traps. Condensate piping includes piping downstream of steam traps.

2.1.1 Steam Pipe

a. ASTM A53/A53M, Type E (electric-resistance welded, Grade A or B) or Type S (seamless, Grade A or B); black steel. Provide Weight STD (Standard) for welding end connections. Provide Weight Class XS (Extra Strong) for threaded end connections.

b. ASTM A106/A106M, Grade A or B, black steel, Schedule No. 40 for pipe sizes through 250 mm 10 inches, and minimum pipe wall thickness of 9.50 mm 0.375 inch for pipe sizes 300 mm 12 inches and larger for welding end connections. Provide Schedule 80 for threaded end connections.

2.1.2 Condensate Pipe

a. ASTM A53/A53M, Type E (electric-resistance welded, Grade A or B) or Type S (seamless, Grade A or B); black steel, Weight Class XS (Extra Strong).

b. ASTM A106/A106M, Grade A or B, black steel, Schedule No. 80.

2.1.3 Buried Steel Piping to Cooling Well or Drain

Provide direct buried steel condensate pipe and fittings with exterior coal tar epoxy painting system.
2.2 FITTINGS

2.2.1 Threaded Fittings

ASME B16.11, or ASME B16.3, Class 150 for steam, Class 300 for condensate.

2.2.2 Socket Welding Fittings

ASME B16.11.

2.2.3 Buttwelding Fittings

ASME B16.9. Provide the same material and weight as the piping in which fittings are installed. Backing rings shall conform to ASME B31.1 and be compatible with materials being welded.

2.2.4 Eccentric Reducing Fittings

ASME B16.9. Provide the same material and weight as the piping in which fittings are installed. Provide for changes in horizontal steam piping sizes.

2.2.5 Flanges and Unions

2.2.5.1 Flanges

ASME B16.5, Class 150 or 300 as required.

2.2.5.2 Unions

ASME B16.39, Class 150 for steam, Class 250 for condensate.

2.2.6 Gaskets, Bolts, Nuts, and Washers

a. Gaskets: Provide spiral wound, non-asbestos gasket with centering ring per ASME B16.20. [ASME B16.21, composition ring 1.60 mm 0.0625 inch thick. Provide one piece factory cut ring gaskets for raised-face flanged joints, and full-face gaskets for flat-face flanged joints.]

b. Bolts: ASTM A193/A193M, Grade B7. Extend a minimum of two full threads beyond the nut with the bolts tightened to the required torque.

c. Nuts: ASTM A194/A194M, Grade 7, with Teflon coated threads.

d. Washers: Provide steel flat circular washers under bolt heads and nuts.

e. Electrically isolating (insulating) gaskets for flanges: Provide ASTM D229 electrical insulating material of 1000 ohms minimum resistance. Provide one piece factory cut insulating gaskets between flanges. Provide silicon-coated fiberglass insulating sleeves between the bolts and the holes in flanges; bolts may have reduced shanks of a diameter not less than the diameter at the root of threads. Provide 3.20 mm 0.125 inch thick high-strength insulating washers next to flanges and provide stainless steel flat circular washers over insulating washers and under bolt heads and nuts. Provide bolts 13 mm 0.5 inch longer than standard length to compensate for the thicker insulating gaskets and the washers under bolt heads and nuts in the horizontal position or not greater than 45 degrees above the horizontal position.
2.3 **VALVES**

Provide with stems in the horizontal position or not greater than 45 degrees above the horizontal position. Valves shall have flanged end connections, except sizes smaller than 65 mm 2.5 inches may have union end connections, or threaded end connections with a union on one side of the valve.

2.3.1 **Valves for Steam Service**

Valves upstream of steam traps shall be steel body for minimum working pressure of ASME Class 150.

2.3.1.1 **Gate Valves, Globe Valves, Angle Valves, and Check Valves**

ASME B16.34, steel body, minimum of ASME Class 150. Provide swing check valves.

2.3.1.2 **Steam Pressure Regulating Valves**

Steel body, minimum of ASME Class 150, except as modified herein. Valve seats and disc shall be of replaceable heat-treated stainless steel. Valves shall be single seated, seat tight under dead end conditions, and move to the closed position in the event of pressure failure of the operating (controlling) medium. Provide strainer in inlet from external operating (controlling) medium. Valves shall be controlled by pilot valve with strainer at inlet from external pressure sensing piping. Valves shall be internally or externally steam traced for freeze protection. Valves shall be piston operated type or spring loaded diaphragm operated type with stainless steel springs.

2.3.1.3 **Safety-Relief Valves**

Minimum of ASME Class 150, with test lever. Valves shall have steel or copper alloy body. Valves shall have flanged inlet and outlet connections or threaded connections attached to threaded ASME Class 150 flanges. Valves shall be ASME rated for capacity indicated.

2.3.2 **Valves for Condensate Service**

Valves downstream of steam traps shall be for minimum working pressures of ASME Class 125.

2.3.2.1 **Gate Valves**

MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-70.

2.3.2.2 **Globe and Angle Valves**

MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-85.

2.3.2.3 **Check Valves**

MSS SP-80, except sizes 65 mm 2.5 inches and larger shall conform to MSS SP-71. Provide swing check valves.
2.4 PIPING ACCESSORIES

2.4.1 Pipe Hangers and Supports

Provide MSS SP-58 and MSS SP-69, Type 43, of the adjustable type, except as specified or indicated otherwise. Tack-weld Type 39 pipe covering protection saddles to steel pipe for insulated piping. Provide steel support rods. The finish of rods, nuts, bolts, washers, hangers, and supports shall be hot-dip galvanized after fabrication. Rollers, bases, and saddles may be painted with two coats of aluminum or light gray paint rated for use on hot metal surfaces up to 232 degrees C 450 degrees F in lieu of hot-dip galvanized. Provide stainless steel axles for rollers. Miscellaneous metal shall conform to ASTM A36/A36M, hot-dip galvanized after fabrication.

2.4.2 Strainers

Construct of steel in accordance with ASME B16.5 for minimum of ASME Class 150. Provide stainless steel strainer element with perforations of 0.40 mm 0.016 inch for steam, 0.80 mm 0.031 inch for steam mixed with condensate, and 1.20 mm 0.047 inch for condensate (hot water). Provide blow-off outlet with pipe nipple, gate valve, and discharge pipe nipple.

2.4.3 Traps

Steel body, internals of stainless steel, minimum of ASME Class 150, and of the types indicated.

2.4.4 Gages

Provide single style pressure gage for steam with 115 mm 4.5 inch dial, brass or aluminum case, bronze tube, gage cock, pressure snubbers, and syphon. Provide scale range for the intended service.

2.4.5 Pipe Sleeves

Provide where piping passes entirely through walls and floors. Provide sleeves of sufficient length to pass through entire thickness of walls and floors. Provide 25 mm one inch minimum clearance between exterior of piping or pipe insulation, and interior of sleeve or core-drilled hole. Firmly pack space with mineral wool insulation. Seal space at both ends of sleeve or core-drilled hole with plastic waterproof cement which will dry to a firm but pliable mass, or provide mechanically adjustable segmented elastomeric seal. In fire walls and fire floors, seal both ends of sleeves or core-drilled holes with UL listed fill, void, or cavity material.

a. Sleeves in Masonry and Concrete Walls and Floors: Provide hot-dip galvanized steel, ductile-iron, or cast-iron sleeves. Core drilling of masonry and concrete may be provided in lieu of sleeves when cavities in the core-drilled hole are grouted smooth.

b. Sleeves in Other Than Masonry and Concrete Walls and Floors: Provide 26 gage galvanized steel sheet.

2.4.6 Escutcheon Plates

Provide split hinge type metal plates for piping entering walls and floors in exposed spaces. Provide polished stainless steel plates or chromium-plated copper alloy plates in finished spaces. Provide paint
finish on metal plates in unfinished spaces.

2.4.7 Electronic Steam Flow Meter

Meter shall be for minimum working pressure of ASME Class 150. Meter shall include an orifice plate, pressure transmitter, indicator, and totalizer. Provide meter for measuring steam flow in kg per second pounds per hour. Meter shall be for installation and operation in horizontal position.

2.4.7.1 Orifice Plate

Provide differential producing type orifice plate with circular hole for insertion into the steam piping between two ASME B16.5 Class 300 welding neck orifice flanges. Orifice plate shall be Type 304 stainless steel. Furnish a dimensional report and flow versus differential curve with accuracy of plus or minus one percent over a 5 to 1 flow range. Orifice flanges shall have at least two radially-drilled and tapped holes for metering and two jack screws.

2.4.7.2 Pressure Transmitter

Provide solid state electronic type differential pressure transmitter. Transmitter shall utilize Type 316 stainless steel dual opposed rupture-proof bellows converted to produce a 4 to 20 mA dc output. Transmitter shall have a flow range of zero to 0.40 kg per second 3000 pounds per hour of steam flow with accuracy of plus or minus 2 percent of the full scale over a 5 to 1 flow range. House transmitter in a weatherproof enclosure designed for wall mounting. Bellows body shall be rated for not less than 6994 kPa (gage) 1000 psig. Power requirements are 120 volts ac. Provide transmitter complete with condensate reservoirs, steel three-valve manifold for isolation and nulling, and blowdown valves.

2.4.7.3 Indicator

Provide electric indicator to continuously indicate steam flow by means of a 4 to 20 mA dc electrical input signal. Indicator shall have pivot and jewel suspension and a mirrored scale with uniform graduations over a steam flow range of zero to 0.40 kg per second 3000 pounds per hour.

2.4.7.4 Totalizer

Provide totalizer that linearizes a 4 to 20 mA dc electrical input signal into a digital signal scaled in kg pounds of steam flow, displays totalized steam flow on a six-digit nonresettable counter, and transmits each totalizer count to the output.

2.4.7.5 Output

An isolated (500 volts minimum) ac or dc switch closure rated at 50 volts dc or 40 volts RMS ac, one ampere minimum capacity. Duration of closure shall be not less than 0.04 second or more than 0.06 second.

2.4.7.6 Adjustments

Upon completion of the work, furnish the services of a competent technician regularly employed by the manufacturer of the flow meter to make the necessary adjustments to place the steam flow meter in operation and to conduct performance tests which demonstrate that the flow measuring equipment is functioning. Install the steam flow meter in accordance with
manufacturer's recommendations.

2.4.8 Steam Flow Meters

**************************************************************************

NOTE: Meters can have (a) six-dial counter, or (b) remote totalizer, or (c) pressure compensated six-dial counter, or (a) and (b). Meters cannot have (a) and (c), or (b) and (c).
**************************************************************************

Meter shall be for minimum working pressure of ASME Class 150 with steel pressure chambers or ASME Class 250 with cast-iron pressure chambers. Provide meter in horizontal pipe between two ASME B16.5 welding neck flanges. Provide rotary type meter for flow integration. Working parts shall be stainless steel. Steam flow shall cause rotation of a rotor assembly at a speed directly proportional to the rate of steam flow, as controlled by a damping liquid. The rotational speed of the rotor assembly shall be reduced by gearing in the damping liquid chamber. Final drive to the exterior counter shall be by driving magnets; stuffing box shall not be allowed. Counter shall be enclosed in a dust-tight cast-aluminum housing attached to, but easily removable from the meter. For steam pipe main sizes 100 mm 4 inches and smaller, provide meter directly in the steam piping. For steam pipe main sizes larger than 100 mm 4 inches, provide meter in shunt bypass piping with two ASME B16.5 Class 300 welding neck orifice flanges in the steam pipe main. In the shunt bypass piping, provide two flanged gate valves calibrated by the meter manufacturer. In the steam pipe main, provide 3.20 mm 0.125 inch thick stainless steel orifice plate sized to suit meter capacity between two ASME B16.5 Class 300 welding neck orifice flanges. [Provide six-dial counter with an electrical contactor to transmit signal to data terminal cabinet (DTC) for indicating steam flow in kg pounds.] [Provide remote totalizer for recording steam flow in kg pounds.] [Provide pressure compensated six-dial counter to automatically and continuously correct steam flow meter readings for steam pressure variations.]

2.4.9 Steam Meter-Strain Gage Target Flow Type

**************************************************************************

NOTE: Refer to UFC 3-430-09, "Exterior Mechanical Utility Distribution" for selection of steam flow meter type.
**************************************************************************

a. Operation: The steam meter shall have four interconnected strain gages attached to the sensing tube, two in the forward side of flow, two on the reverse side of the flow, producing a four-active arm, bridge circuit. At zero flow, the bridge circuit is balanced and produces zero output. Forces from the fluid are transferred from the target to the sensing tube producing strain on the sensing tube. The bridge circuit becomes unbalanced producing an output to a microprocessor sending unit. A mass flow computer is connected to the sending unit for visual display.

b. Valve Body: ANSI Class 150; Inline type body with flanged ends - 303/304 stainless steel.

c. Sensing Element: 316 Stainless Steel.

e. Sending Unit: Microprocessor design with 24-bit speed and accuracy, 4-20 mA output, programmable cutoff, two programmable open collector output hi/lo set points, RS-232 communications, open collector 0-1000hz square wave output.

   Accuracy: 0.02 percent of rate.
   Repeatability: 0.01 percent of rate.
   Power: 16-30vdc, 24vdc at 100mA maximum with current loop connected at 4.00maDC.
   Temperature: 0-60 degrees C 32-140 degrees F
   Enclosure: EXPLOSION PROOF TYPE WATERTIGHT HOUSING.

   Flow: Square wave digital pulse with plus or minus 0.057 percent accuracy.
   Temperature: 4-wire RTD: 100 ohm platinum to European alpha 3850 curve;
   Current Loop; 4-20 mA; Accuracy: plus or minus 0.1 percent at 25 degrees C 77 degrees F.
   Pressure: Current Loop: 4-20mA; Accuracy: plus or minus 0.1 percent at 25 degrees C 77 degrees F.
   Power: 120/240vac plus 10 percent to 15 percent. 50/60 Hz at .2amps.
   Temperature: 0-55 degrees C 32-131 degrees F.

2.4.10 Guided Slip Tube Expansion Joints

   Internally-externally guided type, injected semiplastic type packing, with service outlets. Joints shall be for minimum working pressure of ASME Class 150. Provide single or double slip tube type as indicated. Provide flanged or buttwelding end connections as indicated.

2.4.11 Flexible Ball Expansion Joints

   Provide chromium plated steel balls capable of 360-degree rotation plus 15-degree angular flex movement. Provide pressure molded composition gaskets designed for continuous operation temperature of 274 degrees C 525 degrees F. Joints shall be for minimum working pressure of ASME Class 150. Provide single or double bellows expansion joint as indicated.

2.4.12 Bellows Expansion Joints

   Type 304 stainless steel corrugated bellows, reinforced with rings, internal sleeves, and external protective covers. Provide limit stops to limit total movement in both directions. Cold set the joints to compensate for temperature at time of installation. Joints shall withstand 10,000 cycles over a 20 year period. Joints shall be for minimum working pressure of ASME Class 150. Provide single or double bellows expansion joint as indicated. Provide first pipe alignment guide no more than four pipe diameters from the expansion joint; provide second pipe alignment guide no more than 14 pipe diameters from the first guide. Provide flanged or buttwelding end connections as indicated.
2.5 POLES SUPPORTING ABOVEGROUND PIPING

2.5.1 Concrete Poles

Provide under this section as specified in Section 03 45 33 PRECAST STRUCTURAL CONCRETE. Accurately set the top fittings to grade by means of adjusting screws, and grout in place. Provide high-strength grout consisting of one part portland cement and two parts clean, sharp sand with minimal water to make a workable grout. Wet tops of poles before placing the grout. Prevent grout leaks around the bottom of the fittings which streak or disfigure the concrete. Discoloration or disfiguring of concrete will not be permitted.

2.5.2 Steel Pipe Poles

a. **ASTM A53/A53M**: Type E (electric-resistance welded, Grade A or B) or Type S (seamless, Grade A or B; hot-dip galvanized, Weight Class STD (Standard).

b. **ASTM A106/A106M**: Grade A or B, hot-dip galvanized, Schedule No. 40 for pipe sizes through 250 mm 10 inches, and minimum pipe wall thickness of 9.5 mm 0.375 inch for pipe sizes 300 mm 12 inches and larger.

2.5.3 Guy Wires, Fittings, and Hardware

**************************************************************************
NOTE: Use a minimum factor of safety of 3.0. Use 9.5 mm 3/8 inch minimum wire strand thickness.
**************************************************************************

b. Anchor Rods and Anchors: Provide thimble-eye, 32 mm 1.25 inch diameter steel rod with 250 mm 10 inch diameter screw anchor, hot-dip galvanized.

c. Turnbuckles: Provide open turnbuckles, forged steel body, with jaw and jaw end pulls, 9.50 mm 0.375 inch size, hot-dip galvanized.

d. Clamps: Provide hot-dip galvanized forged high carbon steel clamps capable of developing full strength of guy wire, and fitted with galvanized heat-treated bolts. Provide two clamps at each connection of guy wire.

2.5.4 Miscellaneous Metal

**ASTM A36/A36M**, standard mill finished structural shapes, hot-dip galvanized after fabrication.

2.5.5 Fastenings

Provide steel bolts and oversized nuts conforming to **ASTM A307**. Galvanize in accordance with **ASTM A153/A153M**. Provide nuts with an approved means for locking to ensure nuts remain tight under severe service, including vibrations. Drive bolts to a tight fit without injury to the threads. Bolts with injured threads will not be permitted. Drill holes 1.60 mm 1/16
inch larger than bolts; burning of holes will not be permitted. Tighten bolts to the required torque.

2.6 MANHOLE DRAINERS (EJECTORS)

Provide automatic type drainers to operate on 862 kPa (gage) 125 psig steam supply. The drainer shall operate when the water level rises sufficiently in the sump, the float shall rise and open the steam control valve to admit steam to the drainer, which in turn shall pump the water from the sump. When the water level is lowered by the pumping action, the float shall lower and close the steam valve to stop the pumping action until water again gathers in the sump. Provide each drainer with controls to accomplish the above sequence of operation. The automatic float-operated steam valve shall be designed to prevent dead centering under field conditions and to lengthen the life of the valve seat. The valve shall have a high grade, renewable composition disc and a stainless steel or hard, noncorrosive bronze renewable seat inserted in the valve body. The drainer shall be constructed of corrosion-resistant copper and bronze. Piping from manhole drainers shall be ASTM A53/A53M, Weight Class XS (Extra Strong), hot-dip galvanized steel pipe with ASME B16.11 or ASME B16.3, Class 300, hot-dip galvanized threaded fittings. Provide a steam pressure regulating valve assembly for manhole drainers for operation on steam system above 862 kPa (gage) 125 psig.

2.7 CONCRETE MANHOLES

Provide under this section as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE, except as modified herein. Concrete shall be of 30 MPa 4000 psi minimum 28 day compressive strength, air entrained admixture (133 grams per cubic meter 3.6 ounces per cubic yard), with water-reducing admixture (814 grams per cubic meter 22 ounces per cubic yard), reinforced with deformed steel bars. Construct manhole sides by one monolithic pour. Cast-iron steps with nonslip surfaces, and spaced 300 to 400 mm 12 to 16 inches apart on centers shall be firmly embedded in concrete walls for access to bottom of manholes. Provide top of manhole as indicated. [Steel grating covers for manholes shall be welded parallel bearing bars, with right angle cross members, zinc coated after fabrication; size as indicated.]

2.8 BURIED PIPING UNDER ROADS

Provide [new and modify existing] buried factory-prefabricated preinsulated steam and condensate piping in accordance with Section 33 63 13 EXTERIOR UNDERGROUND STEAM DISTRIBUTION SYSTEM.

2.8.1 Carrier Piping

2.8.1.1 Steam Piping

Provide steel piping.

2.8.1.2 Condensate Piping

Provide steel piping.

2.8.2 Piping Insulation for Carrier Piping

**************************************************************************

NOTE: The insulation thickness indicated is...
suitable for most geographical regions. However, if the project is located in a region where extreme annual temperatures occur, the design engineer should evaluate the insulation thickness based on an economical analysis, with the approval of the Mechanical Engineering Branch.

Products containing asbestos will not be permitted.

2.8.3 Cathodic Protection

Provide sacrificial anode type cathodic protection system for metal conduits.

2.8.4 Buried Warning and Identification Tape

Provide detectable aluminum foil plastic backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape shall be detectable by an electronic detection instrument. Provide tape in rolls, 80 mm 3 inches minimum width, color coded for the utility involved, with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall read CAUTION BURIED STEAM PIPING BELOW OR similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material.

PART 3 EXECUTION

3.1 INSTALLATION

Installation of exterior steam distribution system including equipment, materials, installation, workmanship, fabrication, assembly, erection, examination, inspection, and testing shall be in accordance with ASME B31.1, except as modified herein. Install piping straight and true to bear evenly on supports and sand bedding material. Install valves with stems horizontal or above. Provide flanges or unions at valves, traps, strainers, connections to equipment, and as indicated.

3.1.1 Cleaning of Piping

Keep the interior and ends of new piping and existing piping affected by the Contractor's operations, cleaned of water and foreign matter during installation by using plugs or other approved methods. When work is not in progress, securely close open ends of pipe and fittings to prevent entry of water and foreign matter. Inspect piping before placing into position.

3.1.2 Demolition

Remove materials so as not to damage materials which are to remain. Replace existing work damaged by the Contractor's operations with new work of the same construction.

3.2 PIPING

Test, inspect, and approve piping before burying, covering, or concealing. Provide fittings for changes in direction of piping and for connections.
Reducing branch connections in steel piping may be made with forged branch outlet reducing fittings for branches two or more pipe sizes smaller than mains. Branch outlet fittings shall be forged, flared for improved flow where attached to the run, reinforced against external strains, and designed to withstand full pipe bursting strength. Stab type connections will not be permitted. Jointing compound for pipe threads shall be Teflon pipe thread paste. Pipe nipples 150 mm 6 inches long and shorter shall be Schedule 80 steel pipe. Make changes in piping sizes through tapered reducing fittings; bushings will not be permitted. Condensate piping shall include drip, vent, relief, and gage connecting piping.

3.2.1 Fittings and End Connections

For sizes less than 25 mm one inch provide threaded fittings and end connections. For sizes 25 to 50 mm one to 2 inches provide threaded or socket-welding or buttwelding fittings and end connections; provide threaded connections for threaded valves, traps, strainers, and threaded connections to equipment. For sizes 65 mm 2.5 inches and larger provide buttwelding fittings and end connections; provide flanged connections for flanged valves, traps, strainers, and flanged connections to equipment.

3.2.2 Welding

ASME B31.1, metallic arc process, including qualification of welders.

3.2.3 Pipe Hangers and Supports

Provide additional hangers and supports for concentrated loads in piping between hangers and supports, such as for valves. Support steel piping as follows:

| MAXIMUM SPACING (METER) |
|-------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Pipe Size (mm)          | 25 and under    | 40              | 50              | 80              | 100             | 150             | 200             | 250             | 300             |
| Steel Piping            | 2.70            | 3.70            | 4.00            | 4.60            | 5.20            | 6.40            | 7.30            | 8.00            | 9.20            |

| MAXIMUM SPACING (FEET)  |
|-------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Pipe Size (inches)      | one and under   | 1.5             | 2               | 3               | 4               | 6               | 8               | 10              | 12              |
| Steel Piping            | 9               | 12              | 13              | 15              | 17              | 21              | 24              | 26              | 30              |

3.2.4 Buried Piping Under Roads

Installation including field joints, bedding, and initial backfill shall be in accordance with the Approved Brochure.
3.3 NAMEPLATES

Provide laminated plastic nameplates for equipment, gages, thermometers, and valves. Nameplates shall be melamine plastic, 3.20 mm 0.125 inch thick, black with white center core. Surface shall be matte finish. Corners shall be square. Accurately align lettering and engrave into the white core. Minimum size of nameplates shall be 25 by 65 mm one by 2.5 inches. Lettering shall be minimum of 6.40 mm 0.25 inch high normal block style. Key the nameplates to a chart and schedule for each system. Frame charts and schedules under glass, and locate where directed near each system. Furnish two copies of each chart and schedule.

3.4 FIELD QUALITY CONTROL

3.4.1 Inspections

Prior to initial operation, inspect piping system for compliance with drawings, specifications, and manufacturer's submittals.

3.4.2 Piping Tests

Before final acceptance of the work, test each system as in service to demonstrate compliance with contract requirements. Before insulation is applied, hydrostatically test each piping system at not less than 1551 kPa (gage) 225 psig in accordance with ASME B31.1, with no leakage or reduction in gage pressure for 2 hours. Flush and clean piping before placing in operation. Flush piping at a minimum velocity of 2.40 meters per second 8 fps. Correct defects in work provided by Contractor and repeat tests until work is in compliance with contract requirements. Furnish potable water, electricity, instruments, connecting devices, and personnel for the tests.

**************************************************************************

NOTE: On projects that provide modifications to existing piping systems, pneumatic pressure testing and hydraulic pressure testing of newly installed piping is much more difficult than the same testing on a complete new system. Therefore, by means of the following design techniques, provide for the Contractor a piping modification design that facilitates acceptance testing: piping design which includes flanges at appropriate locations for flanged blanks to be installed for testing; specifications which include requirements for how the modified piping shall be pressure tested; specifications which specify which pipe sections shall be pressure tested in the shop if absolutely necessary.

**************************************************************************

3.4.3 Buried Piping Under Roads

Installation including field joints, bedding, and initial backfill shall be in accordance with the Section 33 63 13 EXTERIOR UNDERGROUND STEAM DISTRIBUTION SYSTEM. Bury tape with the printed side up at a depth of 300 mm 12 inches below the top surface of earth or the top surface of the subgrade under pavements.
3.4.3.1 Conduit Coating

Test conduit coating of buried piping under roads prior to backfill in accordance with the approved brochure.

3.4.3.2 Cathodic Protection

Test cathodic protection of buried piping under roads to prove continuity of electrical connections prior to backfill.

3.5 FIELD PAINTING

After completion of field inspections and tests, clean and paint metal surfaces exposed to the weather and in manholes, including valves, strainers, traps, flow meters, pipe flanges, bolts, nuts, washers, pipe hangers, supports, expansion joints, and miscellaneous metal. Do not paint piping prior to the application of field-applied insulation. Do not paint stainless steel or aluminum jackets. Apply paint to clean dry surfaces. Clean surfaces to remove dust, dirt, rust, oil, and grease. Provide surfaces with two coats of enamel paint applied to a total minimum dry film thickness of \(0.05 \text{ mm} \ 2 \text{ mils}\). Apply the second coat of paint after the preceding coat is thoroughly dry. Color of finish coat shall be aluminum or light gray. Paint shall be rated for use on hot metal surfaces up to 232 degrees C 450 degrees F and for use on surfaces exposed to the weather.

3.6 CONNECTIONS TO EXISTING SYSTEMS

Notify the Contracting Officer in writing at least 15 days prior to the date the connections are required. Obtain approval before interrupting service. Provide materials required to make connections into existing systems and perform excavating, backfilling, compacting, and other incidental labor as required.

NOTE: This guide specification covers the requirements for overhead electrical work and utility poles.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification is for 0-35 kV Overhead Transmission and Distribution and does not cover all possible methods or requirements for providing overhead facilities. To do so would be to produce an involved, confusing document. This guide specification presents the usual methods and the most used alternatives. Different materials and methods, properly specified, indicated, and economically used will be acceptable when approved by cognizant authority.

NOTE: TO DOWNLOAD UFGS GRAPHICS

Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms

**************************************************************************
NOTE: The following information should be shown on the drawings:

1. Conductor sizes, types, and materials.

2. Guy strand type, size, and length.

3. Primary fused cutout; give voltage rating and state fusing (ampere rating) and "K" quick or "T" tardy required for coordination with existing upstream sectionalizing equipment.

4. Pole top switch. State voltage, current, and other operating characteristics. The applicable switch ratings are stated in IEEE C37.30.

5. Meter connections (can be determined from NEMA/ANSI C12.10 or similar source).

6. Anchor type, description, and dimensions suitable for the ultimate load and the specific soil at location.

7. Indicate ruling span (average span length plus 2/3 of the difference between the longest and the average span).

8. Sag table(s) for the specific conductor, the ruling span(s) and the loading zone.

9. The mechanical strength of crossarms, insulators, pins, guys and anchors must be engineered for each job and the dimensions, materials, and other descriptions covered by drawings. Strength requirements of IEEE C2 are minimum.

10. Avian protection on power lines as required by the Federal, State, and Local Land Management or Wildlife Conservation Agencies.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED REQUIREMENTS

Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section with additions and modifications specified herein.

1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, must be as defined in IEEE 100.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality,
with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-09 Manufacturer's Field Reports
NOTE: Use the following paragraph and subparagraphs regarding transformer submittals for NAVFAC projects. In the bracketed option, insert your appropriate NAVFAC Component organization and code. For other projects, submittal review must be performed by the designer of record. If submittal review by NAVFAC LANT is specifically desired, the responsible Government agency must coordinate with NAVFAC LANT, Code C144 during the design process. Add appropriate information in Section titled "Submittal Procedures" to coordinate with the special requirements.

[ Code [C144][____], NAVFAC [Atlantic] [____] will review and approve transformer submittals.] As an exception to this paragraph, transformers manufactured by ABB in Athens, GA; by Cooper Power Systems in Lumberton, MS; by ERMCO in Dyersburg, TN; or by Howard Industries in Laurel, MS need not meet the submittal requirements of this contract. Instead, the following must be submitted.

a. A certification, from the manufacturer stating, that the manufacturer will meet the technical requirements of this specification.

b. Provide transformer test schedule and routine and other tests required by submittal item "SD-09 Manufacturer's Field Reports."

c. Provide acceptance test reports received by submittal item "SD-06 Test Reports."

d. Provide operation and maintenance manuals required by submittal item "SD-10 Operation and Maintenance Data."

1.5 QUALITY ASSURANCE

1.5.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory except of NFPA 70 when more stringent requirements are specified or indicated, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship shall be in accordance with the mandatory and
advisory provisions of NFPA 70 and IEEE C2 unless more stringent requirements are specified or indicated.

1.5.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products must have been in satisfactory commercial or industrial use for 2-years prior to bid opening. The 2-year period must include applications of equipment and materials under similar circumstances and of similar size. The product must have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items shall be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.2.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.2.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site must not be used, unless specified otherwise.

1.5.3 Ground Resistance Test Reports

Submit the measured ground resistance of grounding system. When testing grounding electrodes and grounding systems, identify each grounding electrode and each grounding system for testing. Include the test method and test setup (i.e. pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

1.5.4 Wood Crossarm Inspection Report

Furnish an inspection report from an independent inspection agency, approved by the Contracting Officer, stating that offered products comply with applicable AWPA and RUS standards. The RUS approved Quality Mark "WQC" on each crossarm will be accepted, in lieu of inspection reports, as evidence of compliance with applicable AWPA treatment standards.

1.5.4.1 Field Test Plan

Provide a proposed field test plan [20] [30] [_____] days prior to testing the installed system. No field test must be performed until the test plan is approved. The test plan must consist of complete field test procedures including tests to be performed, test equipment required, and tolerance limits.

1.6 OPERATIONS AND MAINTENANCE DATA

Provide operation and maintenance manuals for systems in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA that provides basic data relating to the design, operation, and maintenance of the electrical distribution system.
1.6.1 Additions to Operations and Maintenance Data

In addition to requirements of Data Package 5, include the following in the operation and maintenance manuals provided:

a. Assembly and installation drawings
b. Prices for spare parts and supply list
c. Date of purchase

1.7 DELIVERY, STORAGE, AND HANDLING

Devices and equipment must be visually inspected by the Contractor when received and prior to acceptance from conveyance. Protect stored items from the environment in accordance with the manufacturer's published instructions. Replace damaged items. Store oil filled transformers and switches in accordance with the manufacturer's requirements. Store wood poles held in storage for more than 2 weeks in accordance with ATIS ANSI O5.1. Handle wood poles in accordance with ATIS ANSI O5.1, except that pointed tools capable of producing indentations more than 1 inch in depth must not be used. Nails and holes are not permitted in top of poles. Handle and store metal poles in accordance with the manufacturer's instructions.

1.8 WARRANTY

The equipment items must be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

**************************************************************************

NOTE: A 120-hour test will be specified in a noncorrosive environment and a 480-hour test will be specified in a corrosive environment.

**************************************************************************

Consider materials specified herein or shown on contract drawings which are identical to materials listed in RUS 202-1 as conforming to requirements. Provide equipment and component items, not hot-dip galvanized or porcelain enamel finished, with corrosion-resistant finishes which must withstand [120] [480] hours of exposure to the salt spray test specified in ASTM B117 without loss of paint or release of adhesion of the paint primer coat to the metal surface in excess of 1.6 mm 1/16 inch from the test mark. Provide the described test mark and test evaluation in accordance with ASTM D1654 with a rating of not less than 7 in accordance with TABLE 1, (procedure A). Coat cut edges or otherwise damaged surfaces of hot-dip galvanized sheet steel or mill galvanized sheet steel with a zinc rich paint conforming to the manufacturer's standard.

2.2 POLES

**************************************************************************

SECTION 33 71 01 Page 17
NOTE: Use "class" for wood poles and "strength" for concrete and steel poles. Follow local utility practice regarding grounding metallic items on poles, after coordination with local DPW/BCE. Specify clearances and climbing space in accordance with IEEE C2 or applicable state code.

**************************************************************************
Provide poles of lengths and [classes] [strengths] indicated.

2.2.1 Wood Poles

**************************************************************************

NOTE: For NAVFAC LANT projects, do not use lodgepole pine or Western Larch poles.

**************************************************************************
Wood poles machine trimmed by turning, [Douglas Fir] [Lodgepole Pine] [Western Larch] [Southern Yellow Pine] [_____] conforming to ATIS ANSI O5.1. Gain, bore and roof poles before treatment. Should additional gains be required subsequent to treatment, metal gain plates must be provided. Pressure treat poles with [pentachlorophenol,] [ammoniacal copper arsenate (ACA),] [chromated copper arsenate (CCA)], except that Douglas Fir and Western Larch poles must not be treated with CCA in accordance with AWPA C1 and AWPA C4. Ensure the quality of each pole with "WQC" (wood quality control) brand on each piece, or by an approved inspection agency report.

2.2.2 Steel Poles

Design steel poles to withstand the loads specified in IEEE C2 multiplied by the appropriate overload capacity factors, hot-dip galvanized in accordance with ASTM A123/A123M and not painted. Poles must have tapered tubular members, either round in cross-section or polygonal, and comply with strength calculations performed by a registered professional engineer. Submit calculations in accordance with the design data portion of paragraph SUBMITTALS. Provide certification, from the manufacturer, that the technical requirements of this specification must be met. Pole shafts must be one piece. Poles must be welded construction with no bolts, rivets, or other means of fastening except as specifically approved. Pole markings must be approximately 900 to 1270 mm 3 to 4 feet above grade and must include manufacturer, year of manufacture, top and bottom diameters, length, and a loading tree. Provide attachment requirements as indicated, including grounding provisions. Climbing facilities are not required. Bases must be of the anchor-bolt-mounted type.

2.2.3 Concrete Poles

**************************************************************************

NOTE: In areas where freezing temperatures occur, the minimum compressive strength given for concrete in spun poles should be increased in line with concrete design for such temperatures.

**************************************************************************

Design concrete poles to withstand the loads specified in IEEE C2 multiplied by the appropriate overload capacity factors. Poles must be reinforced or prestressed, either cast or spun. Spun poles must be manufactured by a centrifugal spinning process with concrete pumped into a polished round tapered metal mold. Concrete for spun poles must have a
compressive strength of at least 34.5 MPa 5000 psi at 28 days; steel wire must have an ultimate tensile strength of at least 827 MPa; 120,000 psi; and reinforcing bars must have an ultimate tensile strength of at least 276 MPa 40,000 psi. After the high speed spinning action is completed, a spun pole must be cured by a suitable wet steam process. Spun poles must have a water absorption of not greater than three percent to eliminate cracking and to prevent erosion. Concrete poles must have hollow shafts. Poles must have a hard, smooth, nonporous surface that is resistant to soil acids, road salts, and attacks of water and frost. Poles must not be installed for at least 15 days after manufacture. Provide fittings and brackets that conform to the concrete pole design. Poles must conform to strength calculations performed by a registered professional engineer and submitted in accordance with design data portion of paragraph SUBMITTALS. Provide certification, from the manufacturer, that the technical requirements of this specification must be met.

2.3 CROSSARMS AND BRACKETS

2.3.1 Wood Crossarms

Conform to RUS Bull 1728H-701. Pressure treat crossarms with pentachlorophenol, chromated copper arsenate (CCA), or ammoniacal copper arsenate (ACA). Treatment must conform to AWPA C25. Crossarms must be solid wood, distribution type, and a 6.4 mm 1/4 inch 45 degree chamfer on all top edges. Cross-sectional area minimum dimensions must be 108.0 mm 4-1/4 inches in height by 82.6 mm 3-1/4 inches in depth in accordance with IEEE C2 for Grade B construction. Crossarms must be 2.4 m 8 feet in length, except that 3.1 m 10 foot crossarms must be used for crossarm-mounted banked single-phase transformers or elsewhere as indicated. Crossarms must be machined, chamfered, trimmed, and bored for stud and bolt holes before pressure treatment. Factory drilling must be provided for pole and brace mounting, for four pin or four vertical line-post insulators, and for four suspension insulators, except where otherwise indicated or required. Drilling must provide required climbing space and wire clearances. Crossarms must be straight and free of twists to within 2.5 mm per 304.8 mm 1/10 inch per foot of length. Bend or twist must be in one direction only.

2.3.2 Crossarm Braces

Provide [flat steel] or [steel angle] as indicated. Provide braces with [965 mm span with 2440 mm crossarms] and [1520 mm span with 3050 mm crossarms] [38 inch span for 8 foot crossarms] and [60 inch span for 10 foot crossarms].

2.3.3 Armless Construction

Pole mounting brackets for line-post or pin insulators and eye bolts for suspension insulators must be as indicated. Brackets must be attached to poles with a minimum of two bolts. Brackets may be either provided integrally as part of an insulator or attached to an insulator with a suitable stud. Bracket mounting surface must be suitable for the shape of the pole. Brackets for wood poles must have wood gripping members. Horizontal offset brackets must have a 5-degree uplift angle. Pole top brackets must conform to IEEE C135.22, except for modifications necessary to provide support for a line-post insulator. Brackets must provide a strength exceeding that of the required insulator strength, but in no case less than a 12.5 kN 2800 pound cantilever strength.
2.4 HARDWARE

**************************************************************************
NOTE: In hot humid marine atmospheres, galvanized steel pole-line hardware may not be acceptable and only hot-dip galvanized malleable or ductile iron should be permitted. Local usage should be checked. Navy projects require hot-dip galvanized hardware only.
**************************************************************************

Hardware must be hot-dip galvanized in accordance with ASTM A153/A153M and ASTM A123/A123M.

**************************************************************************
NOTE: Do not use this paragraph for Navy projects. The pole line construction criteria for the Navy, including the listing of materials, is covered in the pole plates.
**************************************************************************

Zinc-coated hardware must comply with IEEE C135.1, IEEE C135.2, IEEE C135.22. Steel hardware must comply with ASTM A575 and ASTM A576. Pole-line hardware must be hot-dip galvanized[ steel.][ steel, except anchor rods of the copper-molten welded-to-steel type with nonferrous corrosion-resistant fittings must be used.] Install washers under boltheads and nuts on wood surfaces and elsewhere as required. Washers used on through-bolts and double-arming bolts must be approximately 57.2 mm square 2-1/4 inches square and 4.8 mm 3/16 inch thick. The diameter of holes in washers must be the correct standard size for the bolt on which a washer is used. Washers for use under heads of carriage-bolts must be of the proper size to fit over square shanks of bolts. Use eye bolts, bolt eyes, eyenuts, strain-load plates, lag screws, guy clamps, fasteners, hooks, shims, and clevises wherever required to support and to protect poles, brackets, crossarms, guy wires, and insulators.

2.5 INSULATORS

**************************************************************************
NOTE: Stipulate insulator class required for each application. The following table suggests insulator types from specific ANSI Standards for application under normal conditions. Number followed by diagonal slash indicates quantity of insulators when other than one. Environments with unusual contaminant conditions would require special treatment. Spool insulators for use with brackets, or devices to support the neutral-messenger of triplex or quadruplex, secondary or service cables should conform to ANSI C29.3 Class 53-2. Use the values in Table II for NAVFAC LANT projects.

When specifying or indicating post insulators, add the appropriate "L" or "S" designation indicating "L" long studs or "S" short. Example: "57-1L" would indicate an insulator for wood crossarms and "57-1S" would indicate an insulator for use on must members. When the engineer determines that station policy differs from these requirements, insulators which match the policy in effect at the station must be specified by ANSI reference and class. Insulator flashover values must be determined from Table 273-1, IEEE C2. In areas with severe lightning problems, transmission line corners and dead ends should be provided with special pressure-treated wood-guy insulators having arcing horns for lighting discharge. In addition to being used with underground terminals, use fiberglass guy strain insulators where other interference problems exist.

**************************************************************************

SECTION 33 71 01 Page 21
Provide wet-process porcelain insulators which are radio interference free.

[a. Line post type insulators: NEMA/ANSI C29.7, Class [____].

[b. Suspension insulators: ANSI C29.2 [4/52-4 for 34.5 kV on NAVSTA NORVA], Quantity per Phase, [____], Class [____].

[c. Spool insulators: ANSI C29.3, Class [____].

[d. Guy strain insulators: ANSI C29.4, Class [____], [except provide fiberglass type when used with underground terminal or when other interference problems exist].

[e. Pin insulators: ANSI C29.5, Class [____].

2.6 OVERHEAD CONDUCTORS, CONNECTORS AND SPLICES

**************************************************************************
NOTE: For NAVFAC LANT projects, do not use "aluminum conductor steel reinforced (ACSR)."
**************************************************************************

Conductors of bare [copper] [aluminum (AAC)] [aluminum alloy (AAAC)] [aluminum conductor steel reinforced (ACSR)] [aluminum conductor steel supported (ACSS)] of sizes and types indicated.[ Where aluminum conductors are connected to dissimilar metal, fittings conforming to UL 486A-486B must be used.]

2.6.1 Solid Copper

2.6.2 Aluminum (AAC)

ASTM B230/B230M and ASTM B231/B231M.

2.6.3 Aluminum Alloy (AAAC)

ASTM B398/B398M or ASTM B399/B399M.

2.6.4 Aluminum Conductor Steel Reinforced (ACSR)

2.6.5 Aluminum Conductor Steel Supported (ACSS)

ASTM B857, aluminum.

2.6.6 Connectors and Splices

Connectors and splices must be of copper alloys for copper conductors, aluminum alloys for aluminum-composition conductors, and a type designed to minimize galvanic corrosion for copper to aluminum-composition conductors. Aluminum-composition, aluminum-composition to copper, and copper-to-copper must comply with UL 486A-486B.
2.7 NEUTRAL-SUPPORTED SECONDARY AND SERVICE DROP CABLES

NOTE: The term "secondary," for our general purpose, means either bare or insulated conductors installed between poles and operated at the utilization voltage. Bare conductors should be utilized on long span, open wire design when a neutral-supported secondary cable is not appropriate due to weight. When using bare conductors for secondary applications use the above paragraph entitled "Overhead Conductors". "Services" are insulated conductors extending from a pole to the metering point or service entrance connection at the utilization point. Minimum conductor size for aluminum, aluminum alloy, ACSR, or ACSS must be No. 4 AWG and for copper, No. 6 AWG. For NAVFAC LANT projects, do not use ACSR.

[Service][Secondary] cables must be [aluminum] [copper], [triplex] [quadruplex] with cross-linked polyethylene insulation on the phase conductors. Neutral must be bare [ACSR] [ACSS] [aluminum alloy] [hard drawn copper] and must be the same size as the phase conductors unless otherwise indicated. Cables shall conform to [NEMA WC 70] [and] [ANSI/NEMA WC 71/ICEA S-96-659] [ASTM B857] for cross-linked polyethylene insulation.

2.8 GUY STRAND

[ASTM A475, [high-strength] [extra high-strength], Class A or B, galvanized strand steel cable][Class 30 [high-strength] [extra high-strength] copper-clad steel]. Guy strand must be [_____] mm inch in diameter with a minimum breaking strength of [_____] Newton pounds. Provide guy terminations designed for use with the particular strand and developing at least the ultimate breaking strength of the strand.

2.9 ROUND GUY MARKERS

Vinyl or PVC material, [white] [yellow] colored, 2440 mm 8 feet long and shatter resistant at sub-zero temperatures.

2.9.1 Guy Attachment

Thimble eye guy attachment.

2.10 ANCHORS AND ANCHOR RODS

NOTE: Complete guy-anchor assembly must provide strength conforming to IEEE C2 for the grade of construction of the line. Designated maximum holding power rating assumes proper installation in Class 5 soil (medium dense coarse sand and sandy gravels; stiff to very stiff and slays). When the anchor is installed in poorer soils, the holding power of the anchor must be derated by 25 percent in Class 6 soil, 50 percent in Class 7 soil. For Class 8 soil it is usually necessary to use power driven
screw anchors which can penetrate the poor soil into firmer soil. In areas of extremely high chemical activity of the soil, anchor rods and ground rods must be completely encased in concrete to point 100 mm 4 inches above finished grade. Anchors must be a special unit to be indicated.

Anchors must present holding area indicated on drawings as a minimum. Anchor rods must be triple thimble-eye, [19] [25] mm diameter by 2440 mm [3/4] [one] inch diameter by 8 feet long. Anchors and anchor rods must be hot dip galvanized.

2.10.1 Screw Anchors

Screw type [swamp] anchors having a manufacturer's rating [of not less than [_____] Newton pounds in loose to medium sand/clay soil, Class 6] [at least equal to rating indicated] and extra heavy pipe rods conforming to ASTM A53/A53M, Schedule 80, and couplings conforming to ASME B16.11, [fitting Class 6000.]

2.10.2 Plate Anchors

Minimum area of [_____] square mm inches and rated by manufacturer for [_____] Newton pounds or more in soils classified as medium dense coarse sand and sandy gravels; firm to stiff clays and silts.

2.10.3 Rock Anchors

Rock anchors having a manufacturer's rating of [102,310][160,130] Newtons [23,000][36,000] pounds.

2.11 GROUNDING AND BONDING

2.11.1 Driven Ground Rods

Provide cone pointed [copper-clad steel ground rods conforming to UL 467] [zinc-coated steel ground rods conforming to IEEE C135.30] [solid stainless steel ground rods] not less than 19 mm 3/4 inch in diameter by 3.1 m 10 feet in length. Sectional type rods may be used for rods 6.1 m 20 feet or longer.

2.11.2 Grounding Conductors

ASTM B3. Provide soft drawn copper wire ground conductors a minimum No. 4 AWG. Ground wire protectors must be PVC. Keep ground conductors straight and short. Minimize bends in all ground connections.
2.11.3 Grounding Connections

UL 467. Exothermic weld or compression connector.

2.12 SURGE ARRESTERS

**************************************************************************
NOTE: Rating of lightning (surge) arresters should be 125 percent of the nominal line-to-ground voltage of four-wire, multi-grounded neutral systems; 80 percent of the nominal line-to-line voltage for three-wire, solidly grounded neutral systems; or nominal line-to-line voltage for delta and ungrounded-wye systems. Distribution class arresters should normally be used. However, use intermediate class on the 34.5 kV system at Naval Base, Norfolk, VA.
**************************************************************************

IEEE C62.11, metal oxide, polymeric-housed, surge arresters arranged for [crossarm] [equipment] mounting. RMS voltage rating must be [3] [6] [9] [10] [12] [15] [27] [30] [36] kV. Arresters must be [Distribution] [Intermediate] [Station] class.

2.13 FUSED CUTOUTS

**************************************************************************
NOTE: For NAVFAC LANT projects, use "open type" cutouts with Type "K" fuses as indicated.

Provide IEEE C37.41 rated backup current limiting fuses in series with Type K (fast-acting) expulsion fuses on systems that are: greater than 15 kV; 15 kV and lower that have available fault currents equal to or greater than 7,000 asymmetrical amperes. Expulsion fuses and backup current limiting fuse must be properly coordinated with other protective devices on the system. Expulsion fuses will interrupt current in 0.01 second or greater. Backup current limiting fuse will interrupt current in less than 0.01 seconds. Existing systems must continue to use the expulsion fuse link type that represents the standard for that system.
**************************************************************************

[Open][Enclosed] type fused cutouts rated [100] [200] amperes and [_____] amperes symmetrical interrupting current at [(7.8] [15] kV ungrounded] [8.3/15 kV gnd Y] [15/26 kV gnd Y] [27/34.5 kV gnd Y], conforming to IEEE C37.42. [IEEE C37.41 rated backup current limiting fuses in series with Type K expulsion fuses. ]Type [K] [T] fuses conforming to IEEE C37.42 with ampere ratings [as indicated] [equal to 150 percent of the transformer full load rating]. Open link type fuse cutouts are not acceptable.[ Provide heavy duty open drop-out type, rated 15 kV, 200 Amp, 7,100 Amp I.C. (Sym.).]

2.14 CONDUIT RISERS AND CONDUCTORS

The riser shield must be PVC containing a PVC back plate and PVC extension shield or a rigid galvanized steel conduit, as indicated, and conforming to
UL 6. Provide conductors and terminations as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

2.15 TRANSFORMER (OVERHEAD-TYPE DISTRIBUTION)

**************************************************************************
NOTE: Use the following guidelines for specifying transformers.

1. Use IEEE C57.12.00, Figure 3 (a), voltage designations, such as 4160 V - 120/240 V.

2. Fully self-protected transformers must not be used.
**************************************************************************

b. Single phase, self-cooled, 65 degrees C continuous temperature rise, two winding, 60 Hertz.

c. Insulating liquid:

**************************************************************************
NOTE: Choose one of the following options. For the Navy, choose less-flammable transformer liquids for all projects unless there is a specific requirement to do otherwise.
**************************************************************************

[ Mineral oil: ASTM D3487, Type II, tested in accordance with ASTM D117. Provide identification of transformer as "non-PCB" and "Type II mineral oil" on the nameplate.

][ Less-flammable transformer liquids: NFPA 70 and FM APP GUIDE for less-flammable liquids having a fire point not less than 300 degrees C tested per ASTM D92 and a dielectric strength not less than 33 kV tested per ASTM D877/D877M. Provide identification of transformer as "non-PCB" and "manufacturer's name and type of fluid on the nameplate.

The fluid must be a biodegradable electrical insulating and cooling liquid classified by UL and approved by FM as "less flammable fluids. The fluid must meet the following fluid properties:

(1) Pour point: ASTM D97, less than -15 degrees C

(2) Aquatic biodegradation: EPA 712-C-98-075, 100 percent.

(3) Trout toxicity: OECD Test 203, zero mortality of EPA 821-R-02-012, pass.

] d. Ratings:

(1) kVA: [______].

(2) BIL: [95] [75] [60] kV.

(3) Primary voltage: [_____] kV.
(4) Secondary voltage: [_____] volts.
(5) Minimum Tested Impedance at 85 degrees C: [_____] percent.

[ e. Single-phase connections:
(1) Connect primary: [Phase-to-phase] [Phase-to-ground].
(2) Provide transformer with [_____] high voltage bushing(s).

[f. Three-phase connections:
(1) Connect primary: [Grounded wye] [Ungrounded wye] [Delta].
(2) Connect secondary: [Grounded wye] [Delta], for [_____] volt, three phase, [_____] wire service.
(3) Provide transformer with [_____] high voltage bushings.

] g. Taps:
(1) Provide four 2-1/2 percent full capacity taps, 2 above and 2 below rated primary voltage. Tap changer must have external handle.

**************************************************************************
NOTE: The "series-multiple voltage-changing switch" would be in the primary winding of the transformer and is for dual-voltage systems. It is normally used when a base is planning a voltage upgrade of its primary distribution system or when there are multiple systems on base and they would like the transformer to be interchangeable. Caution: If this option is indicated, the BIL level must be specified for the higher voltage and actual transformer losses would have to be coordinated with multiple manufacturers and be specified to obtain an energy efficient transformer.
**************************************************************************

[ h.Externally operated Series-Multiple Voltage-Changing Switch.

] i. Corrosion Protection:

**************************************************************************
NOTE: In hostile environments, the additional cost of stainless steel tanks and covers may be justified.
**************************************************************************

[Transformer tanks and covers must be corrosion resistant and must be fabricated of stainless steel conforming to ASTM A240/A240M, Type 304 or 304L. ]Paint coating system must comply with IEEE C57.12.28 regardless of tank and cover material. Finish coat must be light gray, ANSI color No. 70.

j. Show transformer kVA capacity using 65 mm 2 1/2 inch Arabic numerals placed near the low-voltage bushings.
2.15.1 Specified Transformer Efficiencies

**************************************************************************

NOTE: Single phase transformer losses and efficiency requirements have been modified into the table included within the specification and the previous Navy loss tables have been deleted.

10 CFR 431, Subpart K is a result of the Energy Policy and Conservation Act (EPACT) of 2005 and is the "minimum" industry standard for distribution transformers manufactured on or after January 1, 2016.

**************************************************************************

Provide single phase transformer efficiency calculations utilizing the actual no-load and load loss values obtained during the routine tests performed on the actual transformer(s) prepared for this project. Reference no-load losses (NLL) at 20 degrees C. Reference load losses (LL) at 55 degrees C and at 50 percent of the nameplate load. The transformer is not acceptable if the calculated transformer efficiency is less than the efficiency indicated in the "KVA / Efficiency" table below. The table is based on requirements contained within 10 CFR 431, Subpart K, for a liquid-immersed distribution transformer. Submit certification, including supporting calculations, from the manufacturer indicating conformance.

[2.16 GROUP-OPERATED LOAD INTERRUPTER SWITCHES]

2.16.1 Manually Operated Type (Switch Handle Operated)

Manually operated (switch handle operated) load interrupter switches must comply with IEEE C37.30.1 and must be of the outdoor, manually-operated, three-pole, single-throw type with either tilting or rotating insulators. Switches must be equipped with interrupters capable of interrupting currents equal to the switch's continuous current rating. Each switch must be preassembled for the indicated configuration and mounting. Moving contacts must be of the high-pressure, limited-area type, designed to ensure continuous surface contact. Switches must be fused or non-fused as indicated. Switches must be complete with necessary operating mechanisms, handles, and other items required for manual operation from the ground. Switch operating handles must be located approximately 1.1 meters 3 feet 6 inches above final grade. Insulation of switch operating mechanisms must include both insulated interphase rod sections and insulated vertical shafts. Provide each handle must be provided with a padlock arranged to lock the switch in both the open and the closed position.
[2.16.2 Remotely Operated Type (Stored-Energy Actuator)]

NOTE: SF6 switches are available for nominal voltages of 15 kV through 34.5 kV in 600 ampere continuous and load-break ratings. Delete SCADA equipment and remote telemetry when not required.

Remotely-operated, [air-insulated] [SF6 insulated] load interrupter switches must be rated in accordance with and comply with the requirements of IEEE C37.30.1 and must be of the outdoor, three-pole, [pole-mounted] [crossarm-mounted] type. Interrupter devices must be [air-insulated] [SF6-insulated, puffer-type] switches capable of interrupting currents equal to the switch continuous current ratings indicated. Switches must utilize an electric motor-charged, stored-energy (spring-driven) operator to simultaneously trip all phases. A switch-control unit must be provided [for push-button operation from the ground] [for push-button operation from the ground and remote switch actuation via telemetry]. The switch-control unit must be pad-lockable, tamper-resistant, in a NEMA ICS 6, Type [3R] [4] [4X] [4X-SS] enclosure, which is connected to the switch actuator by a shielded control cable. Control power for closing and tripping must be provided by a battery mounted in the control unit enclosure. The switch control unit must be provided with a separate 120 volt ac circuit for the battery powered. Power for charging the operator mechanism may be 120 volt ac or battery powered. If operator mechanism charging power is from a battery, capacity must be provided for a minimum of [__] [four] sequential opening and closing operation without battery charging. The switch control unit must be configured for supervisory, control, and data acquisition (SCADA) function, including local and remote operation. Provide voltage and current sensors, one set for each phase, for monitoring of both normal and fault conditions. Provide switches with visual indication of open switch contact for clearance and isolation purposes. Provide switch mechanisms with provisions for grounding of nonenergized metal parts. Provide the switch control unit with a switch operations.

[2.17 RECLOSER]

NOTE: Manufacturers information or catalog information is required to edit this paragraph.

IEC 62271-111, IEEE C37.60. Operating temperature range of minus 40 degree C to 55 degree C. Paint the reclosure tank Munsell 5BG7.0/0.4 sky gray (ANSI 70), with paint coating system complying with IEEE C57.12.31. The Munsell color notation is specified in ASTM D1535.

a. [Electronically] [Hydraulically] operated, in [air] [epoxy] [oil] insulating medium with [oil] [vacuum] interruption.

b. [Three-phase] [Single-phase].

c. [15.5kV] [27kV] [38kV] maximum design voltage. [2.4kV] [4.8kV] [8.32kV] [14.4kV] [24.9kV] [34.5kV] [_____] nominal operating voltage.

d. [100A] [200A] [400A] [600A] [800A] [1200A] [_____] continuous current.

e. [50] [60] hertz.
f.  [8kA] [10kA] [12kA] [16kA] [20kA] [_____] interrupting rating, symmetrical.

g.  [110] [125] [150] [170] kV BIL.

h.  [Form 6][Form 4D] recloser control.

][2.18  SECTIONALIZER

**************************************************************************
NOTE:  Manufacturers information or catalog information is required to edit this paragraph.
**************************************************************************

IEEE C37.63. Operating temperature range of minus 40 degree C to 55 degree C. Paint the reclosure tank Munsell 5BG7.0/0.4 sky gray (ANSI 70), with paint coating system complying with IEEE C57.12.31. The Munsell color notation is specified in ASTM D1535.

a.  [Electronically][Hydraulically] operated, oil-insulated.

b.  Three-phase.

c.  [15.5 kV] [27 kV] [38 kV] maximum design voltage.  [2.4 kV] [4.8 kV] [8.32 kV] [14.4 kV] [24.9 kV][_____] nominal operating voltage.

d.  200 A continuous current.  440 A interrupting loadbreak current.

e.  [50] [60] Hertz.

f.  9 kV maximum momentary and making current, asymmetrical.

g.  [110] [125] [150] kV BIL.

][2.19  METERING EQUIPMENT

**************************************************************************
NOTE:  "Metering Equipment" paragraph and its subparagraphs are for primary metering and should only be used when primary metering is required by the local utility company and specific metering requirements have been properly coordinated with the cognizant Activity.
**************************************************************************

Pole mounted metering equipment must include current transformers, potential transformers, watthour meter, [meter test switch block,] metering enclosure, wire, conduit and fittings.

2.19.1  Potential Transformers

Potential transformers must be rated for outdoor service fitted for crossarm mounting and secondary connection box for conduit connection. Voltage rating must be [2.4] [4.16] [7.2] [12.0] [12.47] [_____] kV to 120 volts ac, 60 Hz. Transformers must conform to the requirements of IEEE C57.13 BIL [45] [60] [75] [95] kV and accuracy Class 0.3 (min.) of [75 VA] [burden Y].
2.19.2 Current Transformers

Current transformers must be rated for outdoor service with crossarm mounting and secondary connection box for conduit connection. Voltage rating must be [2.4] [4.16] [7.2] [12.47] [12.0] [_____] kV. Current rating must be [_____] to 5 amperes. Transformers must conform to requirements of IEEE C57.13, BIL [45] [60] [75] [95] kV and accuracy Class 0.3 at [B2.0] [50 VA].

2.19.3 Watthour Meter

Provide meter with provisions for future pulse initiation.

a. Meters: NEMA/ANSI C12.10 and ANSI C12.1; when providing meter with electronic time-of-use register.
   (1) Form: [5A] [5S] [6A] [6S].
   (2) Element: [2] [2 1/2] [3].
   (3) Voltage: 120 volts.
   (4) Current: 2 1/2 amperes.
   (5) Frequency: 60 hertz.
   (6) Kilowatt hour register: 5 dial or 5 digit type.

b. Demand register:
   (1) Solid state type.
   (2) Meter reading multiplier:
      (a) Indicate multiplier on the meter face.
      (b) Provide multiplier in even hundreds.
   (3) Demand interval length: must be programmed for [15] [30] [60] minutes with rolling demand up to six subintervals per interval.

c. Mounting:
   (1) Provide meter with [matching socket per ANSI C12.7 with [manual] [automatic] current short-circulating device.][ "A" base type mounting].

2.19.4 Meter Test Block

Provide meter test block with [T] [10] pole group of open knife type switches designed for the isolation of metering devices at meter location by opening each circuit individually. Current switches must short circuit current supply before opening meter circuit. Switch handles of potential switches must be black. Switch handles of current switches must be red.

2.19.5 Metering Enclosure

Metering enclosure must be of galvanized steel, weatherproof construction with pole mounting bracket, and 19 mm 3/4 inch exterior plywood, full size
backboard and hinged door arranged for padlocking in closed position. Internal space must be adequate to house equipment and wiring but not smaller than 510 by 760 by 280 mm 20 by 30 by 11 inches deep. Paint metal manufacturer's standard finish.

2.20 CAPACITORS

IEEE 18. Operating temperature range of minus 40 degrees C to 46 degrees C. Provide capacitor tank fabricated of stainless steel conforming to ASTM A240/A240M, Type 409. Paint the capacitor tank Munsell 5BG7.0/0.4 sky gray (ANSI 70), with paint coating system complying with IEEE C57.12.31. The Munsell color notation is specified in ASTM D1535. Capacitor equipment must comply with IEEE 18 and must be of the three-phase, grounded-wye, outdoor type rated for continuous operation and automatically switched. Equipment must be suitable for mounting on a single pole. Polychlorinated biphenyl and tetrachloroethylene (perchloroethylene) must not be used as the dielectric. Equipment must be rated for the system voltage. The indicated kvar must be automatically switched by [single-step] [time switch] [current] [kilovar] [control] [multiple-step] [kilovar] [control providing the indicated number of steps and switching the indicated kvar]. Provide necessary transformers for sensing circuit variations and for low-voltage control. Provide oil-immersed switches for automatic switching of capacitors, and must be electrically separate from ungrounded capacitor enclosures and metal frames. Installations must include one primary fuse cutout and one surge arrester for each ungrounded phase conductor. Fuse link ratings must be in accordance with the manufacturer's recommendations. Capacitor equipment, except for low-voltage control and primary fuse cutouts, must be subassembled and coordinated by one manufacturer. Ship units, including metal pole-mounting supports and hardware, in complete sections ready for connection at the site. Low-voltage equipment must be socket or cabinet type, mounted on the pole approximately 1.2 m 4 feet above grade, must be connected with the necessary wiring in conduit to capacitor equipment, and must be provided with secondary arrester protection against switching surges when recommended by the manufacturer.

2.21 VOLTAGE REGULATOR

**************************************************************************
NOTE: Bypass arresters are normally standard equipment. Incoming line arresters may not be needed. Coordinate with the manufacturer.
**************************************************************************

Voltage regulators must comply with IEEE C57.15 and must be of the outdoor, self-cooled, 55/65 degrees C temperature rise, single-phase type. Windings and the load-tap-changing mechanism must be mineral-oil-immersed. When operating under load, a regulator must provide plus and minus 10 percent automatic voltage regulation in approximately 5/8 percent steps, with 16 steps above and 16 steps below rated voltage. Automatic control equipment must provide Class 1 accuracy. Bypass surge arresters must be suitable for [a grounded] [an ungrounded] system and for the associated regulator voltage.[ [Station][Intermediate] class surge arresters must be mounted next to each incoming line bushing on a regulator tank-mounted bracket and connected to a surge arrester ground pad-mounted on the regulator tank].

2.21.1 Ratings

Ratings at 60 Hz must be
2.21.2 Bypass and Isolation Switches

Switches must be of the outdoor, stickhook-operated, single-pole, single-throw, vertical-break type suitable for the indicated mounting. Switches must be of a type designed to provide bypass of a single-phase regulator circuit by an integral sequence which always occurs when each switch is opened or closed. Each opening sequence must initially bypass the single-phase regulator circuit, then open the input and output circuits, and finally interrupt the exciting current. Opening any single-phase regulator circuit must not be possible until after the bypass circuit is closed. Ratings at 60 Hz must be in accordance with IEEE C37.41 and as follows:

- Maximum voltage
- Nominal voltage class
- Basic Insulation Level (BIL)
- Momentary asymmetrical current in the closed position
- Momentary asymmetrical current in the bypass position
- Continuous and interrupting current

2.21.3 Miscellaneous

Standard accessories and components in accordance with IEEE C57.15 must be provided. Single-phase units must be provided with additional components and accessories required by IEEE C57.15 for three-phase units. Install regulator control approximately 1.5 m (5 feet) from ground on field side of pole. Control cable must be properly shielded or installed in suitable conduit.

2.22 ELECTRICAL TAPES

Tapes must be UL listed for electrical insulation and other purposes in wire and cable splices. Terminations, repairs and miscellaneous purposes, electrical tapes must comply with UL 510.

2.23 CAULKING COMPOUND

Compound for sealing of conduit risers must be of a puttylike consistency workable with hands at temperatures as low as 2 degrees C (35 degrees F), must not slump at a temperature of 150 degrees C (300 degrees F), and must not harden materially when exposed to air. Compound must readily caulking or adhere to clean surfaces of the materials with which it is designed to be used. Compound must have no injurious effects upon the workmen or upon the materials.
2.24 NAMEPLATES

2.24.1 Manufacturer's Nameplate

Each item of equipment must have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable. Equipment containing liquid-dielectrics must have the type of dielectric on the nameplate.

2.24.2 Field Fabricated Nameplates

ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings. Each nameplate inscription must identify the function and, when applicable, the position. Nameplates must be melamine plastic, 3 mm 0.125 inch thick, white with [black] [_____] center core. Surface must be matte finish. Corners must be square. Accurately align lettering and engrave into the core. Minimum size of nameplates must be 25 by 65 mm one by 2.5 inches. Lettering must be a minimum of 6.35 mm 0.25 inch high normal block style.

2.25 SOURCE QUALITY CONTROL

2.25.1 Transformer Test Schedule

The Government reserves the right to witness tests. Provide transformer test schedule for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

a. Test Instrument Calibration

(1) The manufacturer shall have a calibration program which assures that all applicable test instruments are maintained within rated accuracy.

(2) The accuracy shall be directly traceable to the National Institute of Standards and Technology.

(3) Instrument calibration frequency schedule must not exceed 12 months for both test floor instruments and leased specialty equipment.

(4) Dated calibration labels must be visible on all test equipment.

(5) Calibrating standard must be of higher accuracy than that of the instrument tested.

(6) Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

(a) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

(b) Identify the third party/laboratory calibrated instrument to
verify that calibrating standard is met.

2.25.2 Routine and Other Tests

IEEE C57.12.00 and IEEE C57.12.90. Routine and other tests must be performed by the manufacturer on [each of] the actual transformer(s) prepared for this project to ensure that the design performance is maintained in production. Submit test reports, by serial number and receive approval before delivery of equipment to the project site. Required tests must be as follows:

a. Polarity
b. Ratio
c. No-load losses (NLL) and excitation current
d. Load losses (LL) and impedance voltage
e. Dielectric
   (1) Impulse
   (2) Applied voltage
   (3) Induced voltage
f. Leak

PART 3 EXECUTION

3.1 INSTALLATION

**************************************************************************
NOTE: In areas where the applicable State code is more stringent, substitute it for IEEE C2 and make the required changes under paragraph REFERENCES. In California, use CALPUC G.O.95, State of California Public Utilities Commission.
**************************************************************************

Provide overhead pole line installation conforming to requirements of [_____] [IEEE C2] [CALPUC G.O. 95] for Grade [B] [C] construction of overhead lines in [light] [medium] [heavy] loading districts and NFPA 70 for overhead services. Provide material required to make connections into existing system and perform excavating, backfilling, and other incidental labor. Consider street, alleys, roads and drives "public." Pole configuration must be as indicated.

3.1.1 Overhead Service

Terminate overhead service conductors into buildings at service entrance fittings or weatherhead outside building. Installation and connection of service entrance equipment to overhead service conductor is included in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Nearby support bracket for overhead wires must be not less than [_____] meters feet above finished grade at building. Drip loops must be formed on conductors at entrances to buildings, cabinets, or conduits.
3.1.2 Tree Trimming

Where lines pass through trees, trees must be trimmed at least [4.5 meters 15 feet] [_____] clear on both sides horizontally and below for medium-voltage lines, and [1.5 meters 5 feet] [_____] clear on both sides horizontally and below for other lines. No branch must overhang horizontal clearances. Where trees are indicated to be removed to provide a clear right-of-way, clearing is specified in Section 31 11 00 CLEARING AND GRUBBING.

3.1.3 Wood Pole Installation

**************************************************************************
NOTE: Include the bracketed sentence for projects where poles will be set in tropical areas including tropical areas of the Pacific Ocean, that are infested by the Formosan termite, coptotermes formosanus shirake. Delete it in other projects. Coordinate termiticide treatment, both chemical and application quantity selected, with the installation pest management coordinator.
**************************************************************************

Provide pole holes at least as large at the top as at the bottom and large enough to provide 100 mm 4 inch clearance between the pole and side of the hole. Provide a 150 mm 6 inch band of soil around and down to the base of the pole treated with [_____] liters gallons of a termiticide solution. Treatment requirements are specified in Section 31 31 16.13 Chemical Termite Control.

3.1.3.1 Setting Depth of Pole

Pole setting depths must be as follows:

<table>
<thead>
<tr>
<th>Length of Pole (mm)</th>
<th>Setting in Soil (mm)</th>
<th>Setting in Solid Rock (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6095</td>

3.1.3.2 Setting in Soil, Sand, and Gravel

"Setting in Soil" depths, as specified in paragraph entitled "Setting Depth of Pole," apply where the following occurs:

a. Where pole holes are in soil, sand, or gravel or any combination of these;

b. Where soil layer over solid rock is more than $610 \text{ mm} = 2 \text{ feet}$ deep;

c. Where hole in solid rock is not substantially vertical; or

d. Where diameter of hole at surface of rock exceeds approximately twice the diameter of pole at same level. [At corners, dead ends and other points of extra strain, poles $12160 \text{ mm} = 40 \text{ feet}$ or more long must be set $150 \text{ mm} = 6 \text{ inches}$ deeper.]

3.1.3.3 Setting in Solid Rock

"Setting in Solid Rock," as specified in paragraph SETTING DEPTH OF POLE, applies where poles are to be set in solid rock and where hole is substantially vertical, approximately uniform in diameter and large enough to permit use of tamping bars the full depth of hole.

3.1.3.4 Setting With Soil Over Solid Rock

Where a layer of soil $610 \text{ mm} = 2 \text{ feet}$ or less in depth over solid rock exists, depth of hole must be depth of soil in addition to depth specified under "Setting in Solid Rock" in paragraph SETTING DEPTH OF POLE, provided, however, that such depth must not exceed depth specified under "Setting in Soil."

3.1.3.5 Setting on Sloping Ground

On sloping ground, always measure hole depth from low side of hole.

3.1.3.6 Backfill

Thoroughly tamp pole backfill for full depth of the hole and mound excess fill around the pole.

3.1.3.7 Setting Poles

Set poles so that alternate crossarm gains face in opposite directions, except at terminals and dead ends where gains of last two poles must be on side facing terminal or dead end. On unusually long spans, set poles so that crossarm comes on side of pole away from long span. Where pole top pins are used, they must be on opposite side of pole from gain, with flat side against pole.
3.1.3.8 Alignment of Poles

Set poles in alignment and plumb except at corners, terminals, angles, junctions, or other points of strain, where they must be set and raked against the strain. Set not less than 50 mm 2 inches for each 3050 mm 10 feet of pole length above grade, nor more than 100 mm 4 inches for each 3050 mm 10 feet of pole length after conductors are installed at required tension. When average ground run is level, consecutive poles must not vary more than 1525 mm 5 feet in height. When ground is uneven, poles differing in length must be kept to a minimum by locating poles to avoid the highest and lowest ground points. If it becomes necessary to shorten a pole, a piece must be sawed off the top. Holes must be dug large enough to permit the proper use of tampers to full depth of hole.

3.1.3.9 Pole Caps

**************************************************************************
NOTE: Pole caps are not necessary for ACA/CCA treated poles.
**************************************************************************

Provide plastic pole caps with 6.35 mm 1/4 inch sealing rings and four nailing tabs. Fill sealing area with either a bituminous, elastigum roof cement or an acceptable preservative paste to level of sealing ring to eliminate possibility of condensation. Place on pole top and nail each tab down with a 31.75 mm 1 1/4 inch nail.

3.1.4 Steel and Concrete Pole Setting

Poles must be mounted on cast-in-place or power-installed screw foundations. [Concrete poles must be embedded in accordance with the details indicated.] Provide conduit elbows for cable entrances into pole interiors.

3.1.4.1 Cast-In-Place Foundations

Concrete foundations, sized as indicated, must have anchor bolts accurately set in foundations using templates supplied by the pole manufacturer. Concrete work and grouting is specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. After the concrete has cured, pole anchor bases must be set on foundations and leveled by shimming between anchor bases and foundations or by setting anchor bases on leveling nuts and grouting. Poles must be set plumb. Anchor bolts must be the manufacturer's standard, and not less than necessary to meet the pole wind loading specified herein and other design requirements.

3.1.4.2 Power-Installed Screw Foundations

Power-installed screw foundations may be used if they have the required strength, mounting-bolt, and top plate dimensions. Screw foundations must be of at least 6.4 mm 1/4 inch thick structural steel conforming to ASTM A36/A36M and hot-dip galvanized in accordance with ASTM A123/A123M. Mark conduit slots in screw foundation shafts and top plates to indicate orientation. Design calculations indicating adequate strength must be approved before installation of screw foundation is permitted.

3.1.5 Anchors and Guys

Place anchors in line with strain. Indicate the length of the guy lead (distance from base of pole to the top of the anchor rod).
3.1.5.1 Setting Anchors

Set anchors in place with anchor rod aligned with, and pointing directly at, guy attachment on the pole with the anchor rod projecting 150 to 230 mm (6 to 9 inches) out of ground to prevent burial of rod eye.

3.1.5.2 Backfilling Near [Plate] Anchors

**************************************************************************
NOTE: If plate anchors are chosen, for NAVFAC LANT projects, include the bracketed option in the title of the paragraph and use the second bracketed sentence.
**************************************************************************

[ Backfill plate, expanding, concrete, or cone type anchors with tightly tamped coarse rock 610 mm (2 feet) immediately above anchor and then with tightly tamped earth filling remainder of hole. ]

[Backfill plate anchors with tightly tamped earth for full depth of hole.]

3.1.5.3 Screw Anchors

Install screw anchors by torquing with boring machine.

3.1.5.4 Swamp Anchors

Install swamp anchors by torquing with boring machine or wrenches, adding sections of pipe as required until anchor helix is fully engaged in firm soil.

3.1.5.5 Rock Anchors

Install rock anchors minimum depth 305 mm (12 inches) in solid rock.

3.1.5.6 Guy Installation

**************************************************************************
NOTE: Guy strand must be insulated or grounded in conformance with IEEE C2 or local practice.
**************************************************************************

A soil survey should be completed early in the design to properly select the type of anchor.

**************************************************************************
Provide guys where indicated, with loads and strengths as indicated, and wherever conductor tensions are not balanced, such as at angles, corners and dead-ends. Where single guy will not provide the required strength, provide two or more guys. Where guys are wrapped around poles, at least two guy hooks must be provided. Provide pole shims where guy tension exceeds 27,000 Newtons (6000 pounds). Provide guy clamps 152 mm (6 inches) in length with three 16 mm (5/8 inch) bolts, or offset-type guy clamps, or approved guy grips at each guy terminal. Securely clamp plastic guy marker to the guy or anchor at the bottom and top of marker. Complete anchor and guy installation, dead end to dead end, and tighten guy before wire stringing and sagging is begun on that line section.[ Provide strain insulators at a point on guy strand 2435 mm (8 feet) minimum from the ground and 1825 mm (6 feet) minimum from the surface of pole.][ Effectively ground
and bond guys to the system neutral.]

3.1.6 Hardware

Provide hardware with washer against wood and with nuts and lock nuts applied wrench tight. Provide locknuts on threaded hardware connections. Locknuts must be M-F style and not palnut style.

3.1.7 Grounding

**************************************************************************
NOTE: For Army projects, the designer will specify the grounding configuration and the number and type of electrodes required. See TM 5-811-1 for guidance. Coordinate with NFPA 70 and IEEE C2.

Delete the bracketed sentence for Army projects.
**************************************************************************

Unless otherwise indicated, grounding must conform to IEEE C2 and NFPA 70.[Pole grounding electrodes must have a resistance to ground not exceeding 25 ohms. When work in addition to that indicated or specified is directed in order to obtain specified ground resistance, provisions of the contract covering changes must apply.]

3.1.7.1 Grounding Electrode Installation

**************************************************************************
NOTE: Modify and/or delete paragraphs in accordance with project requirements.

The designer should investigate the soil resistivity during the preliminary design phase to determine the design required to ensure that the grounding values are obtained. For areas where the water table is low and/or the soil resistivity is high (such as volcanic soils, sand, or rock), delete the additional electrode provisions and provide a design to meet the site requirements.
**************************************************************************

Install grounding electrodes as follows:

a. Driven rod electrodes - Unless otherwise indicated, locate ground rods approximately 900 mm 3 feet out from base of the pole and drive into the earth until the tops of the rods are approximately 300 mm one foot below finished grade. Evenly spaced multiple rods at least 3 m 10 feet apart and connected together 600 mm 2 feet below grade with a minimum No. 6 bare copper conductor.

b. Plate electrodes - Install plate electrodes in accordance with the manufacturer's instructions and IEEE C2 and NFPA 70.

**************************************************************************
NOTE: Use the following paragraph for Army projects only.
**************************************************************************
[ c. Ground resistance - The maximum resistance of a [driven ground rod]
[plate electrode] must not exceed 25 ohms under normally dry conditions. Whenever the required ground resistance is not met, provide additional electrodes [interconnected with grounding conductors] [as indicated], to achieve the specified ground resistance. The additional electrodes will be [up to three, [2.4] [3] m [8] [10] feet rods spaced a minimum of 3 m 10 feet apart] [a single extension-type rod, [15.9] [19.1] mm [5/8] [3/4] inch diameter, up to 9.1 m 30 feet long, [driven perpendicular to grade] [coupled and driven with the first rod]]. In high ground resistance, UL listed chemically charged ground rods may be used. If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, notify the Contracting Officer immediately.

3.1.7.2 Grounding Electrode Conductors

**************************************************************************
NOTE: If grounding details are provided on the drawings, delete the bracketed information.
**************************************************************************

[On multi-grounded circuits, as defined in IEEE C2, provide a single continuous vertical grounding electrode conductor. Bond neutrals, surge arresters, and equipment grounding conductors to this conductor. For single-grounded or ungrounded systems, provide a grounding electrode conductor for the surge arrester and equipment grounding conductors and a separate grounding electrode conductor for the secondary neutrals. Staple grounding electrode conductors to wood poles at intervals not exceeding 600 mm 2 feet. On metal poles, a preformed galvanized steel strap, 15.9 mm 5/8 inch wide by 0.853 22 gauge minimum by length, secured by a preformed locking method standard with the manufacturer, must be used to support a grounding electrode conductor installation on the pole and spaced at intervals not exceeding 1.5 m 5 feet with one band not more than 75 mm 3 inches from each end of the vertical grounding electrode conductor. ]Size grounding electrode conductors as indicated. Connect secondary system neutral conductors directly to the transformer neutral bushings, then connected with a neutral bonding jumper between the transformer neutral bushing and the vertical grounding electrode conductor as indicated. Bends greater than 45 degrees in grounding electrode conductor are not permitted.

3.1.7.3 Grounding Electrode Connections

Make above grade grounding connections on pole lines by exothermic weld or by using a compression connector. Make below grade grounding connections by exothermic weld. Make exothermic welds strictly in accordance with manufacturer's written recommendations. Welds which have puffed up or which show convex surfaces indicating improper cleaning, are not acceptable. No mechanical connectors are required at exothermic weldments. Compression connectors must be type that uses a hydraulic compression tool to provide correct pressure. Provide tools and dies recommended by compression connector manufacturer. An embossing die code or similar method must provide visible indication that a connector has been fully compressed on ground wire.

3.1.7.4 Grounding and Grounded Connections

a. Where no primary or common neutral exists, bond surge arresters and frames of equipment operating at over 750 volts together and connected to a dedicated primary grounding electrode.
b. Where no primary or common neutral exists, bond transformer secondary neutral bushing, secondary neutral conductor, and frames of equipment operating at under 750 volts together and connected to a dedicated secondary grounding electrode.

c. When a primary or common neutral exists, the neutral must be connected to a grounding electrode. Transformer secondary neutral bushing and frames of equipment operating at under 750 volts must be bonded together and connected to a common neutral and to a common grounding electrode.

3.1.7.5 Protective Molding

Protect grounding conductors which are run on surface of wood poles by PVC molding extending from ground line throughout communication and transformer spaces.

3.1.8 CONDUCTOR INSTALLATION

3.1.8.1 Line Conductors

**************************************************************************
NOTE: Do not use bracketed sentence for Navy projects. Instead, sag and tension tables should be provided and values indicated on the drawings.
**************************************************************************

[Unless otherwise indicated, install conductors in compliance with IEEE C2 Grade B requirements and in accordance with revised manufacturer's approved tables of sags and tensions. ]Handle conductors with care necessary to prevent nicking, kinking, gouging, abrasions, sharp bends, cuts, flattening, or otherwise deforming or weakening conductor or any damage to insulation or impairing its conductivity. Remove damaged sections of conductor and splice conductor. Conductors must be paid out with the free end of conductors fixed and cable reels portable, except where terrain or obstructions make this method unfeasible. Bend radius for any insulated conductor must not be less than the applicable NEMA specification recommendation. Conductors must not be drawn over rough or rocky ground, nor around sharp bends. When installed by machine power, conductors must be drawn from a mounted reel through stringing sheaves in straight lines clear of obstructions. Initial sag and tension must be checked by the Contractor, in accordance with the manufacturer's approved sag and tension charts, within an elapsed time after installation as recommended by the manufacturer.

3.1.8.2 Connectors and Splices

Conductor splices, as installed, must exceed ultimate rated strength of conductor and must be of type recommended by conductor manufacturer. No splice must be permitted within 3050 mm 10 feet of a support. Connectors and splices must be mechanically and electrically secure under tension and must be of the nonbolted compression type. The tensile strength of any splice must be not less than the rated breaking strength of the conductor. Splice materials, sleeves, fittings, and connectors must be noncorrosive and must not adversely affect conductors. Aluminum-composition conductors must be wire brushed and an oxide inhibitor applied before making a compression connection. Connectors which are factory-filled with an inhibitor are acceptable. Inhibitors and compression tools must be of types recommended by the connector manufacturer. Primary line apparatus...
taps must be by means of hot line clamps attached to compression type bail clamps (stirrups). Low-voltage connectors for copper conductors must be of the solderless pressure type. Noninsulated connectors must be smoothly taped to provide a waterproof insulation equivalent to the original insulation, when installed on insulated conductors. On overhead connections of aluminum and copper, the aluminum must be installed above the copper.

3.1.8.3 Conductor-To-Insulator Attachments

Conductors must be attached to insulators by means of clamps, shoes or tie wires, in accordance with the type of insulator. For insulators requiring conductor tie-wire attachments, tie-wire sizes must be as specified in TABLE I.

<table>
<thead>
<tr>
<th>TABLE I - TIE-WIRE REQUIREMENTS</th>

<tr>
<td>AAC, AAAC, or ACSR (AWG)</td>
</tr>
<tr>
<td>Any size</td>
</tr>
</tbody>
</table>

3.1.8.4 Armor Rods

Provide armor rods for AAC, AAAC, and ACSR conductors. Armor rods must be installed at supports, except armor rods will not be required at primary dead-end assemblies if aluminum or aluminum-lined zinc-coated steel clamps are used. Lengths and methods of fastening armor rods must be in accordance with the manufacturer's recommendations. For span lengths of less than 61 m, 200 feet, flat aluminum armor rods may be used. Flat armor rods, not less than 762.0 micrometers by 6.4 mm 0.03 by 0.25 inch must be used on No. 1 AWG AAC and AAAC and smaller conductors and on No. 5 AWG ACSR and smaller conductors. On larger sizes, flat armor rods must be not less than 1.3 by 7.6 mm 0.05 by 0.30 inches. For span lengths of 61 m 200 feet or more, preformed round armor rods must be used.

3.1.8.5 Ties

Provide ties on pin insulators tight against conductor and insulator and ends turned down flat against conductor so that no wire ends project.

3.1.8.6 Low-Voltage Insulated Cables

Support low-voltage cables on clevis fittings using spool insulators. Provide dead-end clevis fittings and suspensions insulators where required for adequate strength. Dead-end construction must provide a strength exceeding the rated breaking strength of the neutral messenger. Provide
clevis attachments with not less than 15.9 mm 5/8 inch through-bolts. Secondary racks may be used when installed on wood poles and where the span length does not exceed 61 m 200 feet. Secondary racks must be two-, three-, or four-wire, complete with spool insulators. Racks must meet strength and deflection requirements for heavy-duty steel racks, and must be rounded and smooth to avoid damage to conductor insulation. Each insulator must be held in place with a 15.9 mm 5/8 inch button-head bolt equipped with a nonferrous cotter pin, or equivalent, at the bottom. Attach racks for dead-ending four No. 4/0 AWG or four larger conductors to poles with three 15.9 mm 5/8 inch through-bolts. Attach other secondary racks to poles with at least two 15.9 mm 5/8 inch through-bolts. Minimum vertical spacing between conductors must not be less than 200 mm 8 inches.

3.1.8.7 Reinstalling Conductors

**************************************************************************
NOTE: Sag tables are usually available from conductor manufacturers. For projects which entail considerable length of overhead line, sag tables for the particular line as designed must be indicated.
**************************************************************************

Existing conductors to be reinstalled or resagged must be strung to "final" sag table values indicated for the particular conductor type and size involved.

3.1.8.8 New Conductor Installation

**************************************************************************
NOTE: Sag tables are usually available from conductor manufacturers. For projects which entail considerable length of overhead line, sag tables for the particular line as designed should be indicated. Use "indicated" on NAVFAC LANT projects.
**************************************************************************

String new conductors to "initial" sag table values [indicated] [recommended by the manufacturer] for conductor type and size of conductor and ruling span indicated.

3.1.8.9 Fittings

Dead end fittings[, clamp or compression type,] must conform to written recommendations of conductor manufacturer and must develop full ultimate strength of conductor.

3.1.8.10 Aluminum Connections

Make aluminum connections to copper or other material using only splices, connectors, lugs, or fittings designed for that specific purpose. Keep a copy of manufacturer's instructions for applying these fittings at job site for use of the inspector.

3.1.9 Pole Mounted Metering Equipment

3.1.9.1 Primary Meters

Install primary metering transformers [as indicated] [according to manufacturer's drawings]. Make connections to metering circuits within
each transformer conduit connection box.

3.1.9.2 Installing Meter System

Metering enclosure must house kWh meter [and meter test block]. Secure the enclosure to pole at a height of 1825 mm 6 feet above grade to center of the enclosure. Ground enclosure.

a. Connect meter as indicated.

b. Connect meter test block between meter and metering transformers to isolate meter for removal, test or adjustment.

c. Indicate phase sequence and color code of potential and current leads. Mark wires which are connected to transformer terminals identified with polarity marks (dots) by a colored plastic tape around the wire at each end.

d. No splices are permissible in metering circuits. Train wire at sides and bottom of enclosure back board and secured by plastic wraps.

3.1.10 Pole Top Switch Installation

Install pole top switch strictly according to manufacturer's installation drawings and information.

3.1.10.1 Operating Handle

Locate approximately 1520 mm 5 feet above ground on field side of pole.

3.1.11 Recloser

Install recloser(s) strictly in accordance with manufacturer's instructions.

3.1.12 Sectionalizer

Install sectionalizer(s) strictly in accordance with manufacturer's instructions.

3.1.13 Risers

[Secure galvanized steel conduits on poles by two hole galvanized steel pipe straps spaced as indicated and within 910 mm 3 feet of any outlet or termination. Ground metallic conduits.] [Secure PVC riser shields on poles as indicated.]

3.2 TRANSFORMER INSTALLATION

**************************************************************************
NOTE: Specify phase sequence in accordance with the local practice.
**************************************************************************

Transformers must be carefully installed so as not to scratch finishes or damage bushings. Transformers must be installed in accordance with the manufacturer's instructions. After installation, surfaces must be inspected and scratches must be touched up with a finish provided by the transformer manufacturer for this purpose.
[3.3 CROSSARM MOUNTING]

**************************************************************************
NOTE: Do not use this paragraph and subparagraphs for Navy projects. The Navy provides this information on the drawings. Utilize Navy plates during design of Navy projects. Refer to "Instructions to view/print graphics" for access to Navy plates.
**************************************************************************

**************************************************************************
NOTE: Normally flat braces will be specified for 2.4 m 8 foot crossarms and angle braces for 3.1 m (10 foot) crossarms to agree with REA construction. An angle brace is also required on 2.4 m 8 foot arms where conductors have a breaking strength of more than 20.0 kN 4500 pounds. Extreme loading conditions may also warrant the extra cost of the stronger angle brace under other circumstances.

Metal crossarm braces will reduce the effective BIL rating of the pole. In high lightning areas specify fiberglass braces.

**************************************************************************

Bolt crossarms to poles with 15.9 mm 5/8 inch through-bolts with square washers at each end. Extend bolts not less than 3 mm 1/8 inch nor more than 50 mm 2 inches beyond nuts. On single crossarm construction, install the bolt head on the crossarm side of the pole. [Fiberglass] [Metal] [Wood] crossarm braces must be provided on crossarms. Flat braces may be provided for 2.4 m 8 foot crossarms and must be 6.4 by 31.8 mm 1/4 by 1-1/4 inches, not less than 700 mm 28 inches in length. Bolt flat braces to arms with 9.5 mm 3/8 inch carriage bolts with round or square washers between boltheads and crossarms, and secured to poles with 50.8 by 101.6 mm 1/2 by 4 inch lag screws after crossarms are leveled and aligned. Angle braces are required for 3.1 m 10 foot crossarms and must be 1.5 m 60 inch span by 457.2 mm 18 inch drop formed in one piece from 38.1 by 38.1 by 4.8 mm 1-1/2 by 1-1/2 by 3/16 inch angle. Bolt angle braces to crossarms with 50.8 mm 1/2 inch bolts with round or square washers between boltheads and crossarms, and secured to poles with 15.9 mm 5/8 inch through-bolts. Double crossarms must be securely held in position by means of 15.9 mm 5/8
inch double-arming bolts. Each double-arming bolt shall be equipped with four nuts and four square washers.

3.3.1 Line Arms and Buck Arms

Set line arms and buck arms at right angles to lines for straight runs and for angles 45 degrees and greater; and line arms must bisect angles of turns of less than 45 degrees. Use dead-end assemblies for turns where shown. Install buck arms, as shown on the pole plate(s), at corners and junction poles. Provide double crossarms at ends of joint use or conflict sections, at dead-ends, and at angles and corners to provide adequate vertical and longitudinal strength. Provide double crossarms at each line-crossing structure and where lines not attached to the same pole cross each other.

3.3.2 Equipment Arms

Set equipment arms parallel or at right angles to lines as required to provide climbing space. Locate equipment arms below line construction to provide necessary wire and equipment clearances.

3.4 FIELD APPLIED PAINTING

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Painting must be as specified in Section 09 90 00 PAINTS AND COATINGS.

3.5 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.6 FIELD QUALITY CONTROL

**************************************************************************

NOTE: Select types to suit project conditions and delete all others. Delete all paragraphs not applicable. Tests must be justified.
**************************************************************************

3.6.1 General

[Perform field testing in the presence of the Contracting Officer.] The Contractor must notify the Contracting Officer [_____] days prior to conducting tests. The Contractor must furnish materials, labor, and equipment necessary to conduct field tests. The Contractor must perform tests and inspections recommended by the manufacturer unless specifically waived by the Contracting Officer. The Contractor must maintain a written record of tests which includes date, test performed, personnel involved, devices tested, serial number and name of test equipment, and test results. Field reports will be signed and dated by the Contractor.

3.6.2 Safety

The Contractor must provide and use safety devices such as rubber gloves, protective barriers, and danger signs to protect and warn personnel in the test vicinity. The Contractor must replace any devices or equipment which
are damaged due to improper test procedures or handling.

3.6.3 Medium-Voltage Preassembled Cable Test

**************************************************************************

NOTE: If the installation is tapping a new feeder to an existing feeder using a "T" splice, modify the paragraph to indicate that when existing cable cannot be readily disconnected, the system should only be tested to the lower (after installation) voltage. Delete the test if no cable is installed in the project.

**************************************************************************

After installation, prior to connection to an existing system, and before the operating test, the medium-voltage preassembled cable system must be given a high potential test. Apply direct-current voltage on each phase conductor of the system by connecting conductors at one terminal and connecting grounds or metallic shieldings or sheaths of the cable at the other terminal for each test. Prior to the test, the cables must be isolated by opening applicable protective devices and disconnecting equipment. The method, voltage, length of time, and other characteristics of the test for initial installation must be in accordance with NEMA WC 74/ICEA S-93-639 for the particular type of cable installed, and must not exceed the recommendations of IEEE 404 for cable joints unless the cable and accessory manufacturers indicate higher voltages are acceptable for testing. Should any cable fail due to a weakness of conductor insulation or due to defects or injuries incidental to the installation or because of improper installation of cable, cable joints, terminations, or other connections, the Contractor must make necessary repairs or replace cables as directed. Repaired or replaced cables shall be retested.

3.6.4 Sag and Tension Test

The Contracting Officer must be given prior notice of the time schedule for stringing conductors or cables serving overhead medium-voltage circuits and reserves the right to witness the procedures used for ascertaining that initial stringing sags and tensions are in compliance with requirements for the applicable loading district and cable weight.

3.6.5 Low-Voltage Cable Test

**************************************************************************

NOTE: The insulation resistance test (dielectric test) value is based on the recommendation contained in IEEE 525. Delete the cable test if no low voltage cables are in the project.

**************************************************************************

For underground secondary or service laterals from overhead lines, the low-voltage cable, complete with splices, must be tested for insulation resistance after the cables are installed, in their final configuration, ready for connection to the equipment, and prior to energization. The test voltage must be 500 volts dc, applied for one minute between each conductor and ground and between all possible combinations of conductors in the same trench, duct, or cable, with other conductors in the same trench, duct, or conduit. The minimum value of insulation must be:

\[ R \text{ in megohms} = \frac{\text{rated voltage in kV} + 1}{304,800/\text{(length of cable in}}} \]
meters) R in megohms = (rated voltage in kV + 1) x 1000/(length of cable in feet)

Repair each cable failing this test or replace. The repaired cable must then be retested until failures have been eliminated.

3.6.6 Pre-Energization Services

Perform the following services on the equipment listed below. Perform these services subsequent to testing but prior to the initial energization. Inspect the equipment to ensure that installation is in compliance with the recommendations of the manufacturer and as shown on the detail drawings. Inspect terminations of conductors at major equipment to ensure the adequacy of connections. Inspect bare and insulated conductors between such terminations to detect possible damage during installation. If factory tests were not performed on completed assemblies, perform tests after the installation of completed assemblies. Inspect components for damage caused during installation or shipment and to ensure that packaging materials have been removed. Components capable of being both manually and electrically operated must be operated manually prior to the first electrical operation. Components capable of being calibrated, adjusted, and tested must be calibrated, adjusted, and tested in accordance with the instructions of the equipment manufacturer. Items for which such services must be provided, but are not limited to, are the following:

Capacitors.

Switches.

3.6.7 Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.6.7.1 Overhead-Type Distribution Transformers

a. Visual and mechanical inspection

(1) Compare equipment nameplate information with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method. Thermographic survey is not required.

(4) Perform specific inspections and mechanical tests as recommended by manufacturer.

(5) Verify correct equipment grounding.

b. Electrical tests

**************************************************************************

NOTE: Coordinate the option on series-multiple voltage-changing switch with the option in paragraph entitled "Transformers (Overhead-Type Distribution)"

SECTION 33 71 01 Page 50
[1] Insure that the series-multiple voltage-changing switch is in the correct position. Transformers are normally shipped in the series position.

] (2) Perform insulation-resistance tests.

(3) Perform continuity test.

(4) Set tap changer to provide a secondary voltage of [120/240] [120/208] [____].

3.6.7.2 Pole Top Interrupter Switch

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate information with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify appropriate equipment grounding.

(4) Perform mechanical operator tests in accordance with manufacturer's instructions.

(5) Verify correct blade alignment, blade penetration, travel stops, arc interrupter operation, and mechanical operation.

b. Electrical Tests

(1) Perform insulation-resistance tests.

(2) Perform dc over-potential tests.

(3) Perform contact-resistance tests across each switch blade.

3.6.7.3 Reclosers

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Inspect alignment and grounding.

(4) Perform mechanical operation and contact alignment tests on both the recloser and its operating mechanism in accordance with manufacturer's instructions.

(5) Verify tightness of accessible bolted electrical connections.

(6) Inspect for correct insulating liquid level.

b. Electrical Tests
(1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter.

(2) Perform a contact resistance test

(3) Sample insulating liquid. Test sample for:
   (a) Dielectric breakdown voltage
   (b) Color
   (c) Visual condition

(4) Test protective functions.

[5] Perform vacuum bottle integrity test (overpotential) across each vacuum bottle with the recloser in the open position in strict accordance with manufacturer's instructions.

]6 Perform overpotential tests.

(7) Determine time delay for each programmed reclosing interval.

(8) Verify lockout for unsuccessful reclosing.

(9) Determine reset time.

(10) Verify instantaneous overcurrent lockout.

][3.6.7.4 Sectionalizers

a. Visual and Mechanical inspection
   (1) Compare equipment nameplate data with approved shop drawings.
   (2) Inspect physical and mechanical condition.
   (3) Inspect alignment and grounding.
   (4) Perform mechanical operation and contact alignment tests on both the sectionalizer and its operating mechanism in accordance with manufacturer's instructions.
   (5) Verify tightness of accessible bolted electrical connections.
   (6) Inspect for correct insulating liquid level.

b. Electrical Tests
   (1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter.
   (2) Perform a contact resistance test.
   (3) Sample insulating liquid. Test sample for:
      (a) Dielectric breakdown voltage
(b) Color
(c) Visual condition
(4) Perform overpotential tests.
(5) Test sectionalizer counting function.
(6) Test sectionalizer lockout function.
(7) Test for reset timing on trip actuator.

3.6.7.5 Potential Transformers

a. Visual and Mechanical Inspection
   (1) Compare equipment nameplate data with specifications and approved shop drawings.
   (2) Verify correct connection.
   (3) Verify that adequate clearances exist between primary and secondary circuit wiring.
   (4) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method.
   (5) Verify that all required grounding and shorting connections provide good contact.
   (6) Verify correct fuse sizes.

b. Electrical Tests
   (1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter
   (2) Perform insulation-resistance tests.
   (3) Perform polarity tests.
   (4) Perform turns-ratio tests.

3.6.7.6 Current Transformers

a. Visual and Mechanical Inspection
   (1) Compare equipment nameplate data with specifications and approved shop drawings.
   (2) Inspect physical and mechanical condition.
   (3) Verify correct connection.
   (4) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method.
   (5) Verify that all required grounding and shorting connections provide good contact.
b. Electrical Tests

(1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter.

(2) Perform insulation-resistance tests.

(3) Perform polarity tests.

(4) Perform ratio-verification tests.

3.6.7.7 Metering

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify tightness of electrical connections.

b. Electrical Tests

(1) Verify accuracy of meters at 25 percent, 50 percent, 75 percent, and 100 percent of full scale.

(2) Calibrate watthour meters according to manufacturer's published data.

(3) Verify all instrument multipliers.

3.6.7.8 Grounding System

a. Visual and mechanical inspection

(1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical tests

(1) Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground resistance tester in accordance with manufacturer's instructions to test each ground or group of grounds. Use an instrument equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

(2) Submit the measured ground resistance of each ground rod and grounding system, indicating the location of the rod and grounding system. Include the test method and test setup (i.e. pin location) used to determine ground resistance and soil conditions at the time the measurements were made.
3.6.8 Devices Subject to Manual Operation

Each device subject to manual operation must be operated at least three times, demonstrating satisfactory operation each time.

3.6.9 Follow-Up Verification

Upon completion of acceptance checks and tests, the Contractor must show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for overhead electrical work and utility poles.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification does not cover all possible methods or requirements for providing overhead facilities. This guide specification presents the usual methods and the most used alternatives. Different materials and methods, properly specified, indicated, and economically used are acceptable when approved by cognizant authority.

NOTE: TO DOWNLOAD UFGS GRAPHICS

Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms
NOTE: Do not include list of tables, or tables themselves, in project specifications. Use table to obtain values required in Part 2 of the specification.

**************************************************************************

NOTE: Show the following information on the drawings:

1. Conductor sizes, types, and materials.

2. Guy strand type, size, and length.

3. Primary fused cutout; give voltage rating and state fusing (ampere rating) and "X" quick or "T" tardy required for coordination with existing upstream sectionalizing equipment.

4. Pole top switch. State voltage, current, and other operating characteristics.

5. Meter connections (can be determined from NEMA/ANSI C12.10 or similar source).

6. Anchor type, description, and dimensions suitable for the ultimate load and the specific soil at location.

7. Indicate ruling span (average span length plus 2/3 of the difference between the longest and the average span).

8. Sag table(s) for the specific conductor, the ruling span(s) and the loading zone.

9. Engineer the mechanical strength of crossarms, insulators, pins, guys and anchors. Show the dimensions, materials, and other descriptions covered by drawings. Strength requirements of IEEE C2 are minimum.

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in
1.3 ADMINISTRATIVE REQUIREMENTS

Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section with additions and modifications specified herein.

1.3.1 Pre-Installation Meetings

Within [30] [_____] calendar days after [date of award] [date of receipt by him of notice of award], submit for the approval of the Contracting Officer [six (6)] [_____] copies of specified drawings of all equipment to be furnished under this contract, together with weights and overall dimensions. Submit the following data and drawings:

a. Connection Diagrams
b. Fabrication Drawings
c. Installation Drawings

Submit certification from the manufacturer indicating conformance with the specified poles and transformer losses:

a. Concrete Poles
b. Steel Poles
c. Wood Poles
d. Wood Crossarms
e. Transformer Losses

Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA and as specified herein.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident
Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Submittal items not designated with a "G" are considered as being for information only for Army projects and for Contractor Quality Control approval for Navy projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

NOTE: Use the following paragraph and subparagraphs regarding transformer submittals for NAVFAC projects. In the bracketed option, insert your appropriate NAVFAC Component organization and code. For other projects, perform submittal review with the designer of record. If submittal review by NAVFAC LANT is specifically desired, ensure the responsible Government agency coordinates with NAVFAC LANT, Code CIEE during the design process. Add appropriate information in Section titled "Submittal Procedures" to coordinate with the special requirements.

[[Code [CIEE] [____], NAVFAC [Atlantic] [____] will review and approve transformer submittals.] As an exception to this paragraph, transformers manufactured by ABB in Athens, GA; by Cooper Power Systems in Lumberton, MS; by ERMCO in Dyersburg, TN; or by Howard Industries in Laurel, MS need not meet the submittal requirements of this contract. Instead, submit the following:

a. Provide certification, from the manufacturer, that the technical requirements of this specification are met.

b. Manufacturer is to conduct routine and other tests (paragraph ROUTINE AND OTHER TESTS, which [will] be witnessed by the Government paragraph TESTS, INSPECTIONS, AND VERIFICATIONS). Provide certified copies of
the tests.

c. Provide field test reports (paragraph FIELD QUALITY CONTROL).

1.5 MAINTENANCE MATERIAL SUBMITTALS

1.5.1 Additions to Operations and Maintenance Data

In addition to requirements of Data Package 5, include the following in the operation and maintenance manuals provided:

a. Assembly and installation drawings
b. Prices for spare parts and supply list
c. Date of purchase

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 and IEEE C2 unless more stringent requirements are specified or indicated.

1.6.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products that have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Provide a product that has been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are
required, provide items that are products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.6.2.1 Alternative Qualifications

Products having less than a 2-year field service record are acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.6.2.2 Material and Equipment Manufacturing Date

Do not use products manufactured more than 3 years prior to date of delivery to site, unless specified otherwise.

1.6.3 Ground Resistance Test Reports

Submit the measured ground resistance of grounding system. When testing grounding electrodes and grounding systems, identify each grounding electrode and each grounding system for testing. Include the test method and test setup (i.e. pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

1.6.4 Wood Crossarm Inspection Report

Furnish an inspection report from an independent inspection agency, approved by the Contracting Officer, stating that offered products comply with applicable AWPA and RUS standards. The RUS approved Quality Mark "WQC" on each crossarm is acceptable, in lieu of inspection reports, as evidence of compliance with applicable AWPA treatment standards.

1.6.4.1 Field Test Plan

Provide a proposed field test plan [20] [30] [_____] days prior to testing the installed system. Do not perform field test until the test plan is approved. Provide a test plan that consists of complete field test procedures including tests to be performed, test equipment required, and tolerance limits.

1.7 DELIVERY, STORAGE, AND HANDLING

Visually inspect devices and equipment when received and prior to acceptance from conveyance. Protect stored items from the environment in accordance with the manufacturer's published instructions. Replace damaged items. Store oil filled transformers and switches in accordance with the manufacturer's requirements. For wood poles held in storage more than 2 weeks, store in accordance with ATIS ANSI 05.1. Handle wood poles in accordance with ATIS ANSI 05.1, except do not use pointed tools capable of producing indentations more than an inch in depth. Nails and holes are not permitted in top of poles. Handle and store metal poles in accordance with the manufacturer's instructions.

1.8 WARRANTY

Support the equipment items by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.
PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Specify a 120-hour test in a noncorrosive
environment and specify a 480-hour test in a
corrosive environment.
**************************************************************************

Consider materials specified herein or shown on contract drawings which are
identical to materials listed in RUS 202-1 as conforming to requirements.
Provide equipment and component items, not hot-dip galvanized or porcelain
enamel finished, with corrosion-resistant finishes which withstand [120]
[480] hours of exposure to the salt spray test specified in ASTM B117
without loss of paint or release of adhesion of the paint primer coat to
the metal surface in excess of 1.6 mm 1/16 inch from the test mark.
Provide the described test mark and test evaluation in accordance with
ASTM D1654 with a rating of not less than 7 in accordance with TABLE 1,
(Procedure A). Coat cut edges or otherwise damaged surfaces of hot-dip
galvanized sheet steel or mill galvanized sheet steel with a zinc rich
paint conforming to the manufacturer's standard.

2.1.1 Design Requirements

Provide materials and equipment that are products of manufacturers
regularly engaged in the production of such products which are of equal
material, design and workmanship. Provide products that have been in
satisfactory commercial or industrial use for 2 years prior to bid
opening. The 2-year period includes applications of equipment and
materials under similar circumstances and of similar size. Provide a
product that has been on sale on the commercial market through
advertisements, manufacturers' catalogs, or brochures during the 2-year
period. Where two or more items of the same class of equipment are
required, provide items that are products of a single manufacturer;
however, the component parts of the item need not be the products of the
same manufacturer unless stated in this section.

2.2 EQUIPMENT

2.2.1 Hardware

**************************************************************************
NOTE: In hot humid marine atmospheres, galvanized
steel pole-line hardware is not acceptable. Permit
only hot-dip galvanized malleable or ductile iron.
Check local usage. Navy projects require hot-dip
galvanized hardware only.
**************************************************************************

Provide hot-dip galvanized hardware in accordance with ASTM A153/A153M and
ASTM A123/A123M.

**************************************************************************
NOTE: Do not use this paragraph for Navy projects.
The pole line construction criteria for the Navy,
including the listing of materials, is covered in
the pole plates.
**************************************************************************
Provide zinc-coated hardware that complies with IEEE C135.1, IEEE C135.2, NEMA C135.4, ANSI C135.14 IEEE C135.22. Provide steel hardware that complies with ASTM A575 and ASTM A576. Provide pole-line hardware that is hot-dip galvanized steel. [steel, except use anchor rods of the copper-molten welded-to-steel type with nonferrous corrosion-resistant fittings]. ++Install washers under boltheads and nuts on wood surfaces and elsewhere as required. Provide washers used on through-bolts and double-arming bolts that are approximately 57.2 mm square 2-1/4 inches square and 4.8 mm 3/16-inch thick. Make the diameter of holes in washers the correct standard size for the bolt on which a washer is used. Provide washers for use under heads of carriage-bolts, of the proper size to fit over square shanks of bolts. Use eye bolts, bolt eyes, eyenuts, strain-load plates, lag screws, guy clamps, fasteners, hooks, shims, and clevises wherever required to support and to protect poles, brackets, crossarms, guy wires, and insulators.]

2.2.1.1 Pins

Provide pins that are zinc-coated forged steel with lead-thread height to suit the insulator to be installed, but not less than 115 millimeter high by 16 millimeter diameter 4-1/2-inches high by 5/8-inch diameter. Provide shoulder that is not less than 50 millimeter 2-inch diameter and that is designed to distribute the load uniformly to the crossarm. Provide shank that is not less than 16 millimeter diameter by 145 millimeter length 5/8-inch diameter by 5-3/4-inch length, equipped with a 50 millimeter 2-inch square washer, nut, and locknut, and that projects not less than 3 millimeter 1/8-inch nor more than 50 millimeter 2-inches beyond the locknut. Use broad-based corner pins of drop-forged welded steel or malleable iron for turning small angles, as indicated.

2.2.1.2 Hot-Line Clamps

Make connections to overhead primary conductors with hot-line clamps of the screw type with concealed threads. Fill thread chamber with corrosion-resistant compound. Provide hot-line clamp tap conductor of bare soft-drawn seven-strand 5.2 millimeter diameter No. 4 copper, except that for the hot-line clamp tap conductor for lateral lines 6.5 millimeter diameter No. 2 and larger, provide bare soft-drawn copper of the same size and stranding as the lateral line.

Provide stirrups for hot-line clamp connections that are 100 by 100 millimeter 4 by 4 inches, and are constructed of bare hard-drawn copper the same size as the tap line but not less than No. 4.

2.2.1.3 Secondary Racks

Provide secondary racks that are the 2-, 3-, or 4-wire type as required and are furnished complete with spool insulators.

Provide racks that meet industry requirements for the strength and deflection of heavy-duty steel racks and that are either galvanized steel or aluminum alloy.

Provide top of insulator points that are rounded and smooth. Hold insulators in place with a 16 millimeter 5/8-inch buttonhead bolt equipped with a nonferrous cotter pin, or equivalent, at the bottom.
2.2.2 Guy Strand

[ASTM A475, [high-strength] [extra high-strength], Class A or B, galvanized strand cable] [Class 30 [high-strength] [extra high-strength] copper-clad steel]. Provide guy strand that is [_____] mm-inch in diameter with a minimum breaking strength of [_____] Newton pounds. Provide guy terminations designed for use with the particular strand and developing at least the ultimate breaking strength of the strand.

2.2.3 Round Guy Markers

Vinyl or PVC material, [white] [yellow] colored, 2440 mm 8-feet long and shatter resistant at sub-zero temperatures.

2.2.3.1 Guy Attachment

Thimble eye guy attachment.

2.2.4 Anchors and Anchor Rods

**************************************************************************

NOTE: Complete guy-anchor assembly provides strength conforming to IEEE C2 for the grade of construction of the line. In areas of extremely high chemical activity of the soil, completely encase anchor rods and ground rods in concrete to point 100 mm 4 inches above finished grade. Provide anchors that are a special unit to be indicated.

**************************************************************************

Provide anchors that present holding area indicated on drawings as a minimum. Provide anchor rods that are triple thimble-eye, [19] [25] mm diameter by 2440 mm [3/4] [one]-inch diameter by 8-feet long. Provide anchors and anchor rods that are hot dip galvanized.

2.2.4.1 Screw Anchors

**************************************************************************

NOTE: For NAVFAC Atlantic projects normally use screw type anchors. Provide Newton pound rating and leave out "[fitting Class 6000]."

**************************************************************************

Screw type [swamp] anchors having a manufacturer's rating [of not less than [_____] Newton pounds in loose to medium sand/clay soil, Class 6] [at least equal to rating indicated] and extra heavy pipe rods conforming to ASTM A53/A53M, Schedule 80, and couplings conforming to ASME B16.11, [fitting Class 6000.]

2.2.4.2 Plate Anchors

Minimum area of [_____] square mm inches and rated by manufacturer for [_____] Newton pounds or more in soils classified as medium dense coarse sand and sandy gravels; firm to stiff clays and silts.

2.2.4.3 Rock Anchors

Rock anchors having a manufacturer's rating of [102,310] [160,130] Newtons [23,000] [36,000] pounds.
2.2.5 Grounding and Bonding

2.2.5.1 Driven Ground Rods

**************************************************************************
NOTE: Use "copper-clad steel" ground rods for NAVFAC Atlantic projects.
**************************************************************************

Provide [copper-clad steel ground rods conforming to UL 467][zinc-coated steel ground rods conforming to IEEE C135.30][solid stainless steel ground rods] not less than 19 mm 3/4-inch in diameter by 3.1 m 10-feet in length. Sectional type rods are acceptable for rods 6.1 m 20-feet or longer.

2.2.5.2 Grounding Conductors

ASTM B8. Provide soft drawn copper wire ground conductors a minimum No. 4 AWG. Provide PVC ground wire protectors.

2.2.5.3 Grounding Connections

UL 467. Exothermic weld or compression connector.

2.2.6 Conduit Risers and Conductors

Provide PVC riser shield containing a PVC back plate and PVC extension shield or a rigid galvanized steel conduit, as indicated, and conforming to UL 6. Provide conductors and terminations as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

2.2.7 Group-Operated Load Interrupter Switches

2.2.7.1 Manually Operated Type (Switch Handle Operated)

Provide manually operated (switch handle operated) load interrupter switches that comply with IEEE C37.32 and are of the outdoor, manually-operated, three-pole, single-throw type with either tilting or rotating insulators. Provide switches that are equipped with interrupters capable of interrupting currents equal to the switch's continuous current rating. Provide preassembled switches for the indicated configuration and mounting. Provide high-pressure, limited-area type moving contacts, designed to ensure continuous surface contact. Provide fused or non-fused switches as indicated. Provide switches complete with necessary operating mechanisms, handles, and other items required for manual operation from the ground. Locate switch operating handles approximately 1.1 meters 42-inches above final grade. Provide insulation of switch operating mechanisms that includes both insulated interphase rod sections and insulated vertical shafts. Provide each handle with a padlock arranged to lock the switch in both the open and the closed position.

2.2.7.2 Remotely Operated Type (Stored-Energy Actuator)

**************************************************************************
NOTE: SF6 switches are available for nominal voltages of 15 kV through 34.5 kV in 600 ampere continuous and load-break ratings. Delete SCADA equipment and remote telemetry when not required.
**************************************************************************
Provide remotely-operated, [air-insulated] [SF6 insulated] load interrupter switches that are rated in accordance with and comply with the requirements of IEEE C37.32 and are of the outdoor, three-pole, [pole-mounted] [crossarm-mounted] type. Provide interrupter devices that are [air-insulated] [SF6-insulated, puffer-type] switches capable of interrupting currents equal to the switch continuous current ratings indicated. Provide switches that utilize an electric motor-charged, stored-energy (spring-driven) operator to simultaneously trip all phases. Provide a switch-control unit [for push-button operation from the ground] [for push-button operation from the ground and remote switch actuation via telemetry]. Provide a switch-control unit that is pad-lockable, tamper-resistant, in a NEMA ICS 6, Type [3R] [4] [4X] [4X-SS] enclosure, which is connected to the switch actuator by a shielded control cable. Provide control power for closing and tripping by a battery mounted in the control unit enclosure. Provide the switch control unit with a separate 120 volt ac circuit for the battery powered. Power for charging the operator mechanism is 120 volt ac or battery powered. If operator mechanism charging power is from a battery, provide capacity for a minimum of [_____] [four] sequential opening and closing operation without battery charging. Configure the switch control unit for supervisory, control, and data acquisition (SCADA) function, including local and remote operation. Provide voltage and current sensors, one set for each phase, for monitoring of both normal and fault conditions. Provide switches with visual indication of open switch contact for clearance and isolation purposes. Provide switch mechanisms with provisions for grounding of nonenergized metal parts. Provide the switch control unit with switch operations.

2.2.8 Recloser

IEC 62271-111. [Provide recloser controller that is [electronically] [hydraulically] operated and utilizes an [oil] [vacuum] operating medium.]

2.2.9 Sectionalizer

IEEE C37.63.

2.2.10 Metering Equipment

******************************************************************************
NOTE: "Metering Equipment" paragraph and its subparagraphs are for primary metering. Only use when primary metering is required by the local utility company and specific metering requirements have been properly coordinated with the cognizant EFD/EFA. Cover secondary metering in Sections 26 12 19.10 THREE-PHASE PAD-MOUNTED TRANSFORMERS, 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS, or 26 20 00 INTERIOR DISTRIBUTION SYSTEM as applicable.
******************************************************************************

Provide pole mounted metering equipment that includes current transformers, potential transformers, watthour meter, [meter test switch block,) metering enclosure, wire, conduit and fittings.

2.2.10.1 Potential Transformers

Provide potential transformers that are rated for outdoor service fitted for crossarm mounting and secondary connection box for conduit connection.
Provide [2.4] [4.16] [7.2] [12.0] [12.47] [_____] kV to 120 volts ac, 60 Hz voltage rating. Provide transformers that conform to the requirements of IEEE C57.13 BIL [45] [60] [75] [95] kV and accuracy Class 0.3 (min.) of [75 VA] [burden Y].

2.2.10.2 Current Transformers

Provide current transformers that are rated for outdoor service with crossarm mounting and secondary connection box for conduit connection. Provide [2.4] [4.16] [7.2] [12.47] [12.0] [_____] kV voltage rating. Provide [_____] to 5 amperes current rating. Provide transformers that conform to requirements of IEEE C57.13, BIL [45] [60] [75] [95] kV and accuracy Class 0.3 at [B2.0] [50 VA].

2.2.10.3 Watthour Meter

Provide meter with provisions for future pulse initiation.

a. Meters: NEMA/ANSI C12.10 and ANSI C12.1; when providing meter with electronic time-of-use register.

   (1) Form: [5A] [5S] [6A] [6S].

   (2) Element: [2] [2 1/2] [3].

   (3) Voltage: 120 volts.

   (4) Current: 2 1/2 amperes.

   (5) Frequency: 60 hertz.

   (6) Kilowatt hour register: 5 dial or 5 digit type.

b. Demand register:

   (1) Solid state type.

   (2) Meter reading multiplier:

   (a) Indicate multiplier on the meter face.

   (b) Provide multiplier in even hundreds.

   (3) Program demand interval length: for [15] [30] [60] minutes with rolling demand up to six subintervals per interval.

c. Mounting:

   (1) Provide a meter with [matching socket per ANSI C12.7 with [manual] [automatic] current short-circulating device.] ["A" base type mounting].

2.2.10.4 Meter Test Block

Provide meter test block with [T] [10] pole group of open knife type switches designed for the isolation of metering devices at meter location by opening each circuit individually. Provide current switches that short circuit current supply before opening meter circuit. Provide black switch handles of potential switches. Provide red switch handles of current
2.2.10.5 Metering Enclosure

Provide metering enclosure of galvanized steel, weatherproof construction with pole mounting bracket, and 19 mm 3/4-inch exterior plywood, full size backboard and hinged door arranged for padlocking in closed position. Provide adequate internal space to house equipment and wiring but not smaller than 510 by 760 by 280 mm 20 by 30 by 11-inches deep. Paint metal manufacturer's standard finish.

2.2.11 Capacitors

Provide capacitor equipment that complies with IEEE 18 and that is of the three-phase, grounded-wye, outdoor type rated for continuous operation and automatically switched. Provide equipment suitable for mounting on a single pole. Do not use polychlorinated biphenyl and tetrachloroethylene (perchloroethylene) as the dielectric. Provide equipment that is rated for the system voltage. Provide the indicated kvars that are automatically switched by [single-step] [time switch] [voltage] [current] [kilovar] [control] [multiple-step] [voltage] [kilovar] [control providing the indicated number of steps and switching the indicated kvar]. Provide necessary transformers for sensing circuit variations and for low-voltage control. Provide oil-immersed switches for automatic switching of capacitors, electrically separate from ungrounded capacitor enclosures and metal frames. Provide installations that include one primary fuse cutout and one surge arrester for each ungrounded phase conductor. Provide fuse link ratings in accordance with the manufacturer's recommendations. Provide capacitor equipment, except for low-voltage control and primary fuse cutouts, that is subassembled and coordinated by one manufacturer. Ship units, including metal pole-mounting supports and hardware, in complete sections ready for connection at the site. Provide low-voltage equipment that is socket or cabinet type, mounted on the pole approximately 1.2 m 4-feet above grade. Connect with the necessary wiring in conduit to capacitor equipment, provided with secondary arrester protection against switching surges when recommended by the manufacturer.

2.2.12 Voltage Regulator

**************************************************************************
NOTE: Bypass arresters are normally standard equipment. Coordinate with the manufacturer to determine if incoming line arresters are needed.
**************************************************************************

Provide voltage regulators that comply with IEEE C57.15 and are of the outdoor, self-cooled, 55/65 degrees C temperature rise, single-phase type. Provide windings and the load-tap-changing mechanism that are mineral-oil-immersed. When operating under load, provide a regulator with plus and minus 10 percent automatic voltage regulation in approximately 5/8 percent steps, with 16 steps above and 16 steps below rated voltage. Provide automatic control equipment with Class 1 accuracy. Provide bypass surge arresters suitable for [a grounded] [an ungrounded] system and for the associated regulator voltage. [Provide [station] [intermediate] class surge arresters that are mounted next to each incoming line bushing on a regulator tank-mounted bracket and connected to a surge arrester ground pad-mounted on the regulator tank].
2.2.12.1 Ratings

Provide the following ratings at 60 Hz:

- Maximum voltage: [___]
- Basic Insulation Level (BIL): [___]
- Current: [___]

2.2.12.2 Bypass and Isolation Switches

Provide switches of the outdoor, stickhook-operated, single-pole, single-throw, vertical-break type suitable for the indicated mounting. Provide switches of a type designed to provide bypass of a single-phase regulator circuit by an integral sequence which always occurs when each switch is opened or closed. Provide opening sequences that initially bypass the single-phase regulator circuit, then open the input and output circuits, and finally interrupt the exciting current. Make opening any single-phase regulator circuit not possible until after the bypass circuit is closed. Provide ratings at 60 Hz in accordance with IEEE C37.41 and as follows:

- Maximum voltage: [___]
- Nominal voltage class: [___]
- BIL: [___]
- Momentary asymmetrical current in the closed position: [___]
- Momentary asymmetrical current in the bypass position: [___]
- Continuous and interrupting current: [___]

2.2.12.3 Miscellaneous

Provide standard accessories and components in accordance with IEEE C57.15. Provide single-phase units with additional components and accessories required by IEEE C57.15 for three-phase units.

2.3 COMPONENTS

2.3.1 Poles

**************************************************************************

NOTE: Use "class" for wood poles and "strength" for concrete and steel poles. Follow local utility practice regarding grounding metallic items on poles, after coordination with local DPW/BCE. Specify clearances and climbing space in accordance with IEEE C2 or applicable state code.

**************************************************************************

Provide poles of lengths and [classes] [strengths] indicated.

2.3.1.1 Wood Poles

**************************************************************************
NOTE: For NAVFAC Atlantic projects, do not use lodgepole pine or Western Larch poles.

**************************************************************************

Wood poles machine trimmed by turning, [Douglas Fir] [Lodgepole Pine] [Western Larch] [Southern Yellow Pine] [_____] conforming to ATIS ANSI O5.1 and RUS Bull 345-67. Gain, bore and roof poles before treatment. If additional gains are required subsequent to treatment, provide metal gain plates. Pressure treat poles with [pentachlorophenol,] [ammoniacal copper arsenate (ACA),] [chromated copper arsenate (CCA)], except do not treat Douglas Fir and Western Larch poles with CCA in accordance with AWPA C1 and AWPA C4 as referenced in RUS Bull 345-67. Ensure the quality of each pole with "WQC" (wood quality control) brand on each piece, or by an approved inspection agency report.

a. Preservative

**************************************************************************

NOTE: Choose one of the following three types of preservatives, according to the environment.

**************************************************************************

For preservative used for humid, harsh environment, provide Chromated Copper Arsenate type (A)(B)(C) conforming to AWPA T1 and ASTM D1625.

Treat wood poles with waterborne preservatives conforming to AWPA T1.

b. Preservative Application

Apply preservative treatment using a pressure process conforming to and AWPA T1 for Southern Pine. Determine penetration of preservatives as specified in AWPA A3 and obtain complete sapwood penetration.

Before treatment, roof, gain and bore poles that are to be given a full-length preservative treatment. Plug unused holes in poles with treated wood-dowel pins. Treat field-cut gains or field-bored holes in poles with an approved preservative compound.

c. Storage

For poles stored for any reason more than 2 weeks, stack them on pressure treated or decay-resistant skids of such dimensions and so arranged as to support the poles without producing noticeable distortion. Stack poles in a manner that permits free circulation of air; with the bottom poles of the stacks at least 300 millimeter 1-foot above ground level or any vegetation growing thereon. No decayed or decaying wood is permitted to remain underneath stored poles.

d. Handling

Do not drag treated poles along the ground. Do not use pole tongs, cant hooks, and other pointed tools capable of producing indentations more than 25 millimeter 1 inch in depth, in handling the poles. Do not apply tools to the groundline section of any pole. Groundline section is that portion between 300 millimeter 1 foot above and 600 millimeter 2 feet below the ground line.
2.3.2 Steel Poles

Provide a steel pole design for withstanding the loads specified in IEEE C2 multiplied by the appropriate overload capacity factors, that are hot-dip galvanized in accordance with ASTM A123/A123M and that are not painted. Provide poles that have tapered tubular members, either round in cross-section or polygonal, and that comply with strength calculations performed by a registered professional engineer. Submit calculations in accordance with the design data portion of paragraph SUBMITTALS. Provide certification, from the manufacturer, that the technical requirements of this specification are met. Provide one piece pole shafts. Provide welded construction poles with no bolts, rivets, or other means of fastening except as specifically approved. Provide pole markings that are approximately 900 to 1270 mm (3 to 4 feet) above grade and that include manufacturer, year of manufacture, top and bottom diameters, length, and a loading tree. Provide attachment requirements as indicated, including grounding provisions. Climbing facilities are not required. Provide bases of the anchor-bolt-mounted type.

2.3.3 Concrete Poles

**************************************************************************
NOTE: In areas where freezing temperatures occur, increase the minimum compressive strength given for concrete in spun poles in line with concrete design for such temperatures.
**************************************************************************

Provide a concrete pole design for withstanding the loads specified in IEEE C2 multiplied by the appropriate overload capacity factors. Provide reinforced or prestressed, either cast or spun poles. Provide spun poles that are manufactured by a centrifugal spinning process with concrete pumped into a polished round tapered metal mold. Provide concrete for spun poles that has a compressive strength of at least 34.5 MPa (5000 psi) at 28 days; steel wire that has an ultimate tensile strength of at least 827 MPa; 120,000 psi; and reinforcing bars that have an ultimate tensile strength of at least 276 MPa 40,000 psi. After the high speed spinning action is completed, cure a spun pole by a suitable wet steam process. Provide spun poles that have a water absorption of not greater than three percent to eliminate cracking and to prevent erosion. Provide concrete poles that have hollow shafts. Provide poles that have a hard, smooth, nonporous surface that is resistant to soil acids, road salts, and attacks of water and frost. Do not install poles for at least 15 days after manufacture. Provide fittings and brackets that conform to the concrete pole design. Provide poles that conform to strength calculations performed by a registered professional engineer and submit in accordance with design data portion of paragraph SUBMITTALS. Provide certification, from the manufacturer, that the technical requirements of this specification are met.

2.3.4 Crossarms and Brackets

2.3.4.1 Wood Crossarms

Conform to RUS Bull 1728H-701. Pressure treat crossarms with pentachlorophenol, chromated copper arsenate (CCA), or ammoniacal copper arsenate (ACA). Provide treatment that conforms to AWPA C25. Provide solid wood, distribution type crossarms, with a 6.4 mm 1/4-inch 45 degree chamfer on all top edges. Provide cross-sectional area minimum dimensions of 108.0 mm 4-1/4 inches in height by 82.6 mm 3-1/4 inches in depth in
accordance with IEEE C2 for Grade B construction. Provide crossarms that are 2.4 m 8-feet in length, except use 3.1 m 10-foot crossarms for crossarm-mounted banked single-phase transformers or elsewhere as indicated. Provide crossarms that are machined, chamfered, trimmed, and bored for stud and bolt holes before pressure treatment. Provide factory drilling for pole and brace mounting, for four pin or four vertical line-post insulators, and for four suspension insulators, except where otherwise indicated or required. Provide required climbing space and wire clearances by drilling. Provide crossarms that are straight and free of twists to within 2.5 mm per 304.8 mm 1/10-inch per foot of length. Provide bend or twist that is in one direction only.

2.3.4.2 Crossarm Braces

Provide [flat steel] [or] [steel angle] as indicated. Provide braces with [965 mm span with 2440 mm crossarms] [and] [1520 mm span with 3050 mm crossarms] [38-inch span for 8-foot crossarms] [and] [60-inch span for 10-foot crossarms].

2.3.4.3 Armless Construction

Provide pole mounting brackets for line-post or pin insulators and eye bolts for suspension insulators as shown. Attach brackets to poles with a minimum of two bolts. Provide brackets either integrally as part of an insulator or attached to an insulator with a suitable stud. Provide bracket mounting surface suitable for the shape of the pole. Provide brackets for wood poles that have wood gripping members. Provide horizontal offset brackets that have a 5-degree uplift angle. Provide pole top brackets that conform to IEEE C135.22, except for modifications necessary to provide support for a line-post insulator. Provide brackets that have a strength exceeding that of the required insulator strength, but in no case less than a 12.5 kN 2800 pound cantilever strength.

2.3.5 Insulators

**************************************************************************
NOTE: Stipulate insulator class required for each application. The following table suggests insulator types from specific ANSI Standards for application under normal conditions. Number followed by diagonal slash indicates quantity of insulators when other than one. Environments with unusual contaminant conditions require special treatment. Provide spool insulators for use with brackets, or devices to support the neutral-messenger of triplex or quadruplex, secondary or service cables that conform to ANSI C29.3 Class 53-2. Use the values in Table II for NAVFAC Atlantic projects.

When specifying or indicating post insulators, add the appropriate "L" or "S" designation indicating "L" long studs or "S" short. Example: "57-1L" indicates an insulator for wood crossarms and "57-1S" indicates an insulator for use on steel members. When the engineer determines that station policy differs from these requirements, specify insulators which match the policy in effect at the station by ANSI reference and class. Determine insulator flashover values from Table 273-1, IEEE C2.

In areas with severe lightning problems, provide transmission line corners and dead ends with special pressure-treated wood-guy insulators having arcing horns for lighting discharge. In addition to being used with underground terminals, use fiberglass guy strain insulators where other interference problems exist.

Provide wet-process porcelain insulators which are radio interference free.

- a. Line post type insulators: NEMA/ANSI C29.7, Class [____].

- b. Suspension insulators: ANSI C29.2 [4/52-4 for 34.5 kV on NAVSTA NORVA], Quantity per Phase, [____], Class [____].

- c. Spool insulators: ANSI C29.3, Class [____].

- d. Guy strain insulators: ANSI C29.4, Class [____], [except provide fiberglass type when used with underground terminal or when other interference problems exist].

- e. Pin insulators: ANSI C29.5, Class [____].

#### 2.3.6 Neutral-Supported Secondary and Service Drop Cables

**NOTE:** The term "secondary," for this general purpose, means either bare or insulated conductors.
installed between poles and operated at the utilization voltage. Utilize bare conductors on long span, open wire design when a neutral-supported secondary cable is not appropriate due to weight. When using bare conductors for secondary applications use the above paragraph OVERHEAD CONDUCTORS. "Services" are insulated conductors extending from a pole to the metering point or service entrance connection at the utilization point. Minimum conductor size for aluminum, aluminum alloy, or ACSR is No. 4 AWG and for copper, No. 6 AWG. For LANTNAVFACENGCOM projects, do not use ACSR.

**************************************************************************
Provide [Service] [Secondary] cables of [aluminum] [copper], [triplex] [quadruplex] with cross-linked polyethylene insulation on the phase conductors. Provide bare [ACSR] [aluminum alloy] [hard drawn copper] that is the same size as the phase conductors unless otherwise indicated. Provide cables that conform to [NEMA WC 70][ and ][ ANSI/NEMA WC 71/ICEA S-96-659] for cross-linked polyethylene insulation.

2.3.7 Surge Arresters

**************************************************************************
NOTE: Rating of lightning (surge) arresters is 125 percent of the nominal line-to-ground voltage of four-wire, multi-grounded neutral systems; 80 percent of the nominal line-to-line voltage for three-wire, solidly grounded neutral systems; or nominal line-to-line voltage for delta and ungrounded-wye systems. Normally use distribution class arresters. However, use intermediate class on the 34.5 kV system at Naval Base, Norfolk, VA.

**************************************************************************

2.3.8 Fused Cutouts

**************************************************************************
NOTE: Include last bracketed sentence for NAS Pensacola projects. Delete it in all other projects. For NAVFAC Atlantic projects, use "open type" cutouts with Type "K" fuses as indicated.

**************************************************************************
[Open] [Enclosed] type fused cutouts rated [100] [200] amperes and [_____] amperes symmetrical interrupting current at [[7.8] [15] kV ungrounded] [8.3/15 kV gnd Y] [15/26 kV gnd Y] [27/34.5 kV gnd Y], conforming to IEEE C37.42. Type [K] [T] fuses conforming to IEEE C37.42 with ampere ratings [as indicated] [equal to 150 percent of the transformer full load rating]. Open link type fuse cutouts are not acceptable. [Provide heavy duty open drop-out type, rated 15 kV, 200 Amp, 7,100 Amp I.C. (Sym.).]
2.3.9 **Transformer** (Overhead-Type Distribution)

**********************************************************************************************************************************************
**NOTE:** Use the following guidelines for specifying transformers.

1. Use IEEE C57.12.00, Figure 3 (a), voltage designations, such as 4160 V - 120/240 V.

2. Select impedance value in accordance with technical note under paragraph SPECIFIED TRANSFORMER LOSSES.

3. Do not use fully self-protected transformers.
**********************************************************************************************************************************************

b. Single phase, self-cooled, 65 degrees C. continuous temperature rise, two winding, 60 Hertz.

c. Insulating liquid:

**********************************************************************************************************************************************
**NOTE:** Choose one of the following options. For NAVFAC Atlantic, choose less-flammable transformer liquids for all projects unless there is a specific requirement to do otherwise.
**********************************************************************************************************************************************

[ Mineral oil: ASTM D3487, Type II, tested in accordance with ASTM D117. Provide identification of transformer as "non-PCB" and "Type II mineral oil" on the nameplate.

][Less-flammable transformer liquids: NFPA 70 and FM APP GUIDE for less-flammable liquids having a fire point not less than 300 degrees C tested per ASTM D92 and a dielectric strength not less than 33 kV tested per ASTM D877. Provide identification of transformer as "non-PCB" and "manufacturer's name and type of fluid on the nameplate.

Provide fluid that is a biodegradable electrical insulating and cooling liquid classified by UL and approved by FM as "less flammable fluids. Provide fluid that meets the following fluid properties:

(1) Pour point: ASTM D97, less than -15 degrees C

(2) Aquatic biodegradation: EPA 712-C-98-075, 100 percent.

(3) Trout toxicity: OECD Test 203, zero mortality of EPA 600/4-90/027F, pass.

] d. Ratings:

(1) kVA: [______].

(2) BIL: [95] [75] [60] kV.

(3) Primary voltage: [______] kV.
(4) Secondary voltage: [_____] volts.

(5) Minimum Tested Impedance at 85 degrees C: [_____] percent.

[ e. Single-phase connections:

(1) Connect primary: [Phase-to-phase] [Phase-to-ground].

(2) Provide transformer with [_____] high voltage bushing(s).

][f. Three-phase connections:

(1) Connect primary: [Grounded wye] [Ungrounded wye] [Delta].

(2) Connect secondary: [Grounded wye] [Delta], for [_____] volt, three phase, [_____] wire service.

(3) Provide transformer with [_____] high voltage bushings.

] g. Taps:

(1) Provide four 2 1/2 percent full capacity taps, two above and two below rated primary voltage. Provide tap changer that has an external handle.

**************************************************************************
NOTE: The "series-multiple voltage-changing switch" is in the primary winding of the transformer and is for dual-voltage systems. It is normally used when a base is planning a voltage upgrade of its primary distribution system or when there are multiple systems on base and they want the transformer to be interchangeable. Caution: If this option is indicated, specify the BIL level for the higher voltage and coordinate actual transformer losses with multiple manufacturers and specify to obtain an energy efficient transformer.
**************************************************************************

[ h. Externally operated Series-Multiple Voltage-Changing Switch.

] i. Corrosion Protection:

**************************************************************************
NOTE: In hostile environments, the additional cost of stainless steel tanks and covers is justified.
**************************************************************************

(1) [Provide transformer tanks and covers that are corrosion resistant and are fabricated of stainless steel conforming to ASTM A167, Type 304 or 304L.] Provide paint coating system that complies with IEEE C57.12.28 regardless of tank and cover material. Provide light gray, ANSI color No. 70 finish coat.

j. Show transformer kVA capacity using 65 mm 2-1/2-inch Arabic numerals placed near the low-voltage bushings.
2.3.9.1 Specified Transformer Losses

**************************************************************************
NOTE: This paragraph is for use on Navy Projects only. Steps to specifying transformer losses.

1. Print Tables OH-1, OH-2, OH-3, and EC-1 or EC-2 as applicable (directions included at the front of this specification).

2. Obtain energy cost for the specific activity from the cognizant EFD or PWC. Base energy costs on the cost of energy without the demand charge factors scaled in. Use Table EC-1 for energy costs at the NAVFAC Atlantic activities indicated.

3. Use Tables OH-1, OH-2, and OH-3 to specify losses and impedances for transformers based on energy cost range, and transformer primary and secondary voltages.

4. Perform fault current calculations to verify that distribution equipment is coordinated with impedance specified.
**************************************************************************

Provide no-load losses (NLL) in watts at 20 degrees C, and load losses (LL) in watts at 85 degrees C, as follows:

<table>
<thead>
<tr>
<th>NAME</th>
<th>KVA</th>
<th>&quot;NLL&quot;</th>
<th>&quot;LL&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>[T1]</td>
<td>[___]</td>
<td>[___]</td>
<td>[___]</td>
</tr>
<tr>
<td>[T2]</td>
<td>[___]</td>
<td>[___]</td>
<td>[___]</td>
</tr>
</tbody>
</table>

Use the values for the specified losses for comparison with the losses determined during the routine tests. If the routine test values exceed the specified values by more than the tolerances allowed by Table 19 in IEEE C57.12.00, the transformer is unacceptable.

2.3.10 Nameplates

2.3.10.1 Manufacturer's Nameplate

Provide each item of equipment with a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent is not acceptable. Provide equipment containing liquid-dielectrics with the type of dielectric on the nameplate.

2.3.10.2 Field Fabricated Nameplates

ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings. Identify the function and, when applicable, the position with each nameplate inscription. Provide melamine plastic, 3 mm 0.125-inch thick nameplates, white with [black] [___] center core. Provide matte finish surface. Provide square corners. Accurately align lettering and
UFGS

engrave into the core. Minimum size of nameplates is 25 by 65 mm 1 by 2.5-inches. Minimum size of lettering is 6.35 mm 0.25 inch high normal block style.

2.4 MATERIALS

2.4.1 Overhead Conductors, Connectors and Splices

**************************************************************************
NOTE: For NAVFAC Atlantic projects, do not use "aluminum conductor steel reinforced (ACSR)."
**************************************************************************

Provide bare [copper] [aluminum (AAC)] [aluminum alloy (AAAC)] [aluminum conductor steel reinforced (ACSR)] Conductors of sizes and types indicated. [Where aluminum conductors are connected to dissimilar metal, use fittings conforming to UL 486A-486B.]

2.4.1.1 Solid Copper

2.4.1.2 Aluminum (AAC)

ASTM B230/B230M and ASTM B231/B231M.

2.4.1.3 Aluminum Alloy (AAAC)

ASTM B398/B398M or ASTM B399/B399M.

2.4.1.4 Aluminum Conductor Steel Reinforced (ACSR)

2.4.1.5 Connectors and Splices

Provide connectors and splices of copper alloys for copper conductors, aluminum alloys for aluminum-composition conductors, and a type designed to minimize galvanic corrosion for copper to aluminum-composition conductors. Provide aluminum-composition, aluminum-composition to copper, and copper-to-copper that complies with UL 486A-486B.

2.4.2 Electrical Tapes

Provide UL listed tapes for electrical insulation and other purposes in wire and cable splices. Provide terminations, repairs and miscellaneous purposes, electrical tapes that comply with UL 510.

2.4.3 Caulking Compound

Provide compound for sealing of conduit risers that is of a puttylike consistency workable with hands at temperatures as low as 2 degrees C 35 degrees F, that does not slump at a temperature of 150 degrees C 300 degrees F, and that does not harden materially when exposed to air. Provide compound that readily caulsks or adheres to clean surfaces of the materials with which it is designed to be used. Provide compound that has no injurious effects upon the workmen or upon the materials.
2.5 TESTS, INSPECTIONS, AND VERIFICATIONS

2.5.1 Transformer Test Schedule

The Government reserves the right to witness tests. Provide transformer test schedule for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

a. Test Instrument Calibration
   (1) Provide a manufacturer that has a calibration program which assures that all applicable test instruments are maintained within rated accuracy.
   (2) Provide an accuracy that is directly traceable to the National Institute of Standards and Technology.
   (3) Provide instrument calibration frequency schedule that does not exceed 12 months for both test floor instruments and leased specialty equipment.
   (4) Provide visible dated calibration labels on all test equipment.
   (5) Provide calibrating standard of higher accuracy than that of the instrument tested.
   (6) Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:
      (a) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.
      (b) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

2.5.2 Routine and Other Tests

IEEE C57.12.00 and IEEE C57.12.90. Perform routine and other tests by the manufacturer on [each of] the actual transformer(s) prepared for this project to ensure that the design performance is maintained in production. Submit test reports, by serial number and receive approval before delivery of equipment to the project site. Provide required tests as follows:

a. Polarity
b. Ratio
c. No-load losses (NLL) and excitation current
d. Load losses (LL) and impedance voltage
e. Dielectric
   (1) Impulse
PART 3   EXECUTION

3.1 INSTALLATION

**************************************************************************
NOTE: In areas where the applicable State code is more stringent, substitute it for IEEE C2 and make the required changes under paragraph REFERENCES. In California, use CALPUC G.O.95, State of California Public Utilities Commission.
**************************************************************************

Provide overhead pole line installation conforming to requirements of [_____] [IEEE C2] [CALPUC G.O. 95] for Grade [B] [C] construction of overhead lines in [light] [medium] [heavy] loading districts and NFPA 70 for overhead services. Provide material required to make connections into existing system and perform excavating, backfilling, and other incidental labor. Consider street, alleys, roads and drives "public." Provide pole configuration as indicated.

3.1.1 Overhead Service

Terminate overhead service conductors into buildings at service entrance fittings or weatherhead outside building. Installation and connection of service entrance equipment to overhead service conductor is included in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide nearby support bracket for overhead wires that is not less than [_____] meters feet above finished grade at building. Provide drip loops that are formed on conductors at entrances to buildings, cabinets, or conduits.

3.1.2 Tree Trimming

Where lines pass through trees, trim trees at least[ 4.5 meters 15 feet ][_____] clear on both sides horizontally and below for medium-voltage lines, and[ 1.5 meters 5-feet][_____] clear on both sides horizontally and below for other lines. Do not allow a branch to overhang horizontal clearances. Where trees are indicated to be removed to provide a clear right-of-way, clearing is specified in Section 31 11 00 CLEARING AND GRUBBING.

3.1.3 Wood Pole Installation

**************************************************************************
NOTE: Include the bracketed sentence for projects where poles are set in tropical areas of the Pacific Ocean, that are infested by the Formosan termite, coptotermes formosanus shirake. Delete it in other projects. For NAVFAC Pacific projects, contact Code 18, Environmental Division, for latest guidance on termite treatment methods.
**************************************************************************
Provide pole holes at least as large at the top as at the bottom and large enough to provide 100 mm 4-inch clearance between the pole and side of the hole. [Provide a 150 mm 6-inch band of soil around and down to the base of the pole treated with 7.5 to 11.4 liters 2 to 3 gallons of a one percent dursban TC termiticide solution.]

### 3.1.3.1 Setting Depth of Pole

Provide pole setting depths as follows:

<table>
<thead>
<tr>
<th>Length of Pole (mm)</th>
<th>Setting in Soil (mm)</th>
<th>Setting in Solid Rock (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6095</td>

3.1.3.2 Setting in Soil, Sand, and Gravel

"Setting in Soil" depths, as specified in paragraph SETTING DEPTH OF POLE, apply where the following occurs:

a. Where pole holes are in soil, sand, or gravel or any combination of these;

b. Where soil layer over solid rock is more than 610 mm 2-feet deep;

c. Where hole in solid rock is not substantially vertical; or

d. Where diameter of hole at surface of rock exceeds twice the diameter of pole at same level. [At corners, dead ends and other points of extra strain, set poles that are 12160 mm 40 feet or more long 150 mm 6 inches deeper.]

3.1.3.3 Setting in Solid Rock

"Setting in Solid Rock," as specified in paragraph SETTING DEPTH OF POLE applies where poles are to be set in solid rock and where hole is substantially vertical, approximately uniform in diameter and large enough to permit use of tamping bars the full depth of hole.
3.1.3.4 Setting with Soil Over Solid Rock

Where a layer of soil 610 mm 2-feet or less in depth over solid rock exists, make depth of hole the depth of soil in addition to depth specified under "Setting in Solid Rock" in paragraph SETTING DEPTH OF POLE provided, however, that such depth does not exceed depth specified under "Setting in Soil."

3.1.3.5 Setting on Sloping Ground

On sloping ground, always measure hole depth from low side of hole.

3.1.3.6 Backfill

Thoroughly tamp pole backfill for full depth of the hole and mound excess fill around the pole.

3.1.3.7 Setting Poles

Set poles so that alternate crossarm gains face in opposite directions, except at terminals and dead ends where gains of last two poles are on side facing terminal or dead end. On unusually long spans, set poles so that crossarm comes on side of pole away from long span. Where pole top pins are used, place on opposite side of pole from gain, with flat side against pole.

3.1.3.8 Alignment of Poles

Set poles in alignment and plumb except at corners, terminals, angles, junctions, or other points of strain, set and rake them against the strain. Set not less than 50 mm 2 inches for each 3050 mm 10 feet of pole length above grade, nor more than 100 mm 4 inches for each 3050 mm 10 feet of pole length after conductors are installed at required tension. When average ground run is level, vary consecutive poles by not more than 1525 mm 5 feet in height. When ground is uneven, keep poles differing in length to a minimum by locating poles to avoid the highest and lowest ground points. If it becomes necessary to shorten a pole, saw a piece off the top. Dig holes large enough to permit the proper use of tampers to full depth of hole.

3.1.3.9 Pole Caps

**************************************************************************
NOTE: Pole caps are not necessary for ACA/CCA treated poles.
**************************************************************************

Provide plastic pole caps with 6.35 mm 1/4-inch sealing rings and four nailing tabs. Fill sealing area with either a bituminous, elastigum roof cement or an acceptable preservative paste to level of sealing ring to eliminate possibility of condensation. Place on pole top and nail each tab down with a 31.75 mm 1-1/4-inch nail.

3.1.3.10 Marking

Mark each pole in accordance with the requirements of ATIS ANSI 05.1. Locate marking on the face of the pole approximately 3 meter 10-feet from the butt on the pole. Mark on the face of the pole at other locations standard with the pole manufacturer, where approved by the Contracting
Number poles as indicated. Number poles not having numbers indicated as directed by the Contracting Officer. Provide pole numbers that consist of aluminum numerals and characters not less than 65 millimeter 2-1/2-inches high fastened to the pole with aluminum nails. Locate numerals to provide maximum visibility from the road or patrol route.

3.1.4 Steel and Concrete Pole Setting

Mount poles on cast-in-place or power-installed screw foundations. [Embed concrete poles in accordance with the details shown.] Provide conduit elbows for cable entrances into pole interiors.

3.1.4.1 Cast-In-Place Foundations

Provide concrete foundations, sized as indicated, with anchor bolts accurately set in foundations using templates supplied by the pole manufacturer. Concrete work and grouting is specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. After the concrete has cured, set pole anchor bases on foundations and level by shimming between anchor bases and foundations or by setting anchor bases on leveling nuts and grouting. Set poles plumb. Provide the manufacturer's standard anchor bolts, and not less than necessary to meet the pole wind loading specified herein and other design requirements.

3.1.4.2 Power-Installed Screw Foundations

Use power-installed screw foundations if they have the required strength, mounting-bolt, and top plate dimensions. Provide at least 6.4 mm 1/4 inch thick structural steel screw foundations conforming to ASTM A36/A36M and hot-dip galvanized in accordance with ASTM A123/A123M. Mark conduit slots in screw foundation shafts and top plates to indicate orientation. Design calculations indicating adequate strength require approval before installation of screw foundation is permitted. Submit calculations in accordance with the design data portion of paragraph SUBMITTALS.

3.1.5 Anchors and Guys

Place anchors in line with strain. Provide indicated length of the guy lead (distance from base of pole to the top of the anchor rod).

3.1.5.1 Setting Anchors

Set anchors in place with anchor rod aligned with, and pointing directly at, guy attachment on the pole with the anchor rod projecting 150 to 230 mm 6 to 9 inches out of ground to prevent burial of rod eye.

3.1.5.2 Backfilling Near [Plate] Anchors

**************************************************************************
NOTE: If plate anchors are chosen, for NAVFAC Atlantic projects, include the bracketed option in the title of the paragraph and use the second bracketed sentence.
**************************************************************************

[ Backfill plate, expanding, concrete, or cone type anchors with tightly tamped coarse rock 610 mm 2 feet immediately above anchor and then with
tightly tamped earth filling remainder of hole.

][Backfill plate anchors with tightly tamped earth for full depth of hole.

3.1.5.3 Screw Anchors

Install screw anchors by torquing with boring machine.

3.1.5.4 Swamp Anchors

Install swamp anchors by torquing with boring machine or wrenches, adding sections of pipe as required until anchor helix is fully engaged in firm soil.

3.1.5.5 Rock Anchors

Install rock anchors minimum depth $305 \text{ mm} \ 12\text{-inches}$ in solid rock.

3.1.5.6 Guy Installation

**************************************************************************

NOTE: Insulate or ground guy strand in conformance with IEEE C2 or local practice.

Complete a soil survey early in the design to properly select the type of anchor.

**************************************************************************

Install guys where indicated, with loads and strengths as indicated, and wherever conductor tensions are not balanced, such as at angles, corners and dead-ends. Where a single guy does not provide the required strength, provide two or more guys. Where guys are wrapped around poles, provide at least two guy hooks. Provide pole shims where guy tension exceeds 27,000 Newtons 6000 pounds. Provide guy clamps $152 \text{ mm} \ 6\text{-inches}$ in length with three $16 \text{ mm} \ 5/8\text{-inch}$ bolts, or offset-type guy clamps, or approved guy grips at each guy terminal. Securely clamp plastic guy marker to the guy or anchor at the bottom and top of marker. Complete anchor and guy installation, dead end to dead end, and tighten guy before wire stringing and sagging is begun on that line section.[ Provide strain insulators at a point on guy strand $2435 \text{ mm} \ 8\text{-feet}$ minimum from the ground and $1825 \text{ mm} \ 6\text{-feet}$ minimum from the surface of pole.][ Effectively ground and bond guys to the system neutral.]

3.1.6 Hardware

Install hardware with washer against wood and with nuts and lock nuts applied wrench tight. Provide locknuts on threaded hardware connections. Provide M-F style locknuts and not palnut style.

3.1.7 Grounding

**************************************************************************

NOTE: For ARMY or NASA projects, specify the grounding configuration and the number and type of electrodes required. See TM 5-811-1 for guidance. Coordinate with NFPA 70 and IEEE C2.

Delete the bracketed sentence for ARMY projects.

**************************************************************************
Unless otherwise indicated, install grounding that conforms to IEEE C2 and NFPA 70. [Provide pole grounding electrodes with a resistance to ground not exceeding 25 ohms. When work in addition to that indicated or specified is directed in order to obtain specified ground resistance, apply provisions of the contract covering changes.]

3.1.7.1 Grounding Electrode Installation

**************************************************************************
NOTE: Modify and/or delete paragraphs in accordance with project requirements.

Investigate the soil resistively during the preliminary design phase to determine the design required to ensure that the grounding values are obtained. For areas where the water table is low and/or the soil resistively is high (such as volcanic soils, sand, or rock), delete the additional electrode provisions and provide a design to meet the site requirements.
**************************************************************************

Install grounding electrodes as follows:

a. Driven rod electrodes - Unless otherwise indicated, locate ground rods approximately 900 mm 3-feet out from base of the pole and drive into the earth until the tops of the rods are approximately 300 mm 1-foot below finished grade. Evenly space multiple rods at least 3 m 10-feet apart and connect together 600 mm 2-feet below grade with a minimum No. 6 bare copper conductor.

b. Plate electrodes - Install plate electrodes in accordance with the manufacturer's instructions and IEEE C2 and NFPA 70.

**************************************************************************
NOTE: Do not use the following paragraph for Navy projects.
**************************************************************************

c. Ground resistance - Provide a [driven ground rod][plate electrode] with a maximum resistance that does not exceed 25 ohms under normally dry conditions. Whenever the required ground resistance is not met, provide additional electrodes [interconnected with grounding conductors][as indicated], to achieve the specified ground resistance. The additional electrodes are [up to three, [2.4] [3] m [8] [10] feet rods spaced a minimum of 3 m 10 feet apart][a single extension-type rod, [15.9] [19.1] mm [5/8] [3/4] inch diameter, up to 9.1 m 30 feet long, [driven perpendicular to grade] [coupled and driven with the first rod]]. In high ground resistance, use of UL listed chemically charged ground rods is allowed. If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, notify the Contracting Officer immediately.

]3.1.7.2 Grounding Electrode Conductors

**************************************************************************
NOTE: If grounding details are provided on the drawings, delete the bracketed information.
[On multi-grounded circuits, as defined in IEEE C2, provide a single continuous vertical grounding electrode conductor. Bond neutrals, surge arresters, and equipment grounding conductors to this conductor. For single-grounded or ungrounded systems, provide a grounding electrode conductor for the surge arrester and equipment grounding conductors and a separate grounding electrode conductor for the secondary neutrals. Staple grounding electrode conductors to wood poles at intervals not exceeding 600 mm 2-feet. On metal poles, use a preformed galvanized steel strap, 15.9 mm 5/8-inch wide by 0.853 (22 gauge) 22 gauge minimum by length, secured by a preformed locking method standard with the manufacturer, to support a grounding electrode conductor installation on the pole and space at intervals not exceeding 1.5 m 5-feet with one band not more than 75 mm 3-inches from each end of the vertical grounding electrode conductor.]

Size grounding electrode conductors as indicated. Connect secondary system neutral conductors directly to the transformer neutral bushings, then connect with a neutral bonding jumper between the transformer neutral bushing and the vertical grounding electrode conductor as indicated. Bends greater than 45 degrees in grounding electrode conductor are not permitted.

3.1.7.3 Grounding Electrode Connections

Make above grade grounding connections on pole lines by exothermic weld or by using a compression connector. Make below grade grounding connections by exothermic weld. Make exothermic welds strictly in accordance with manufacturer's written recommendations. Welds which have puffed up or which show convex surfaces indicating improper cleaning, are not acceptable. No mechanical connectors are required at exothermic weldments. Provide compression connectors that are the type that uses a hydraulic compression tool to provide correct pressure. Provide tools and dies recommended by compression connector manufacturer. Provide an embossing die code or similar method as visible indication that a connector has been fully compressed on ground wire.

3.1.7.4 Grounding and Grounded Connections

a. Where no primary or common neutral exists, bond together surge arresters and frames of equipment operating at over 750 volts and connect to a dedicated primary grounding electrode.

b. Where no primary or common neutral exists, transformer secondary neutral bushing, secondary neutral conductor, and bond together frames of equipment operating at under 750 volts and connect to a dedicated secondary grounding electrode.

c. When a primary or common neutral exists, connect all grounding and grounded conductors to a common grounding electrode.

3.1.7.5 Protective Molding

Protect grounding conductors which are run on surface of wood poles by PVC molding extending from ground line throughout communication and transformer spaces.
3.1.8 Conductor Installation

3.1.8.1 Line Conductors

**************************************************************************
NOTE: Do not use bracketed sentence for Navy projects. Instead, provide sag and tension tables and values indicated on the drawings.**************************************************************************

[Unless otherwise indicated, install conductors in accordance with manufacturer's approved tables of sags and tensions. ]Handle conductors with care necessary to prevent nicking, kinking, gouging, abrasions, sharp bends, cuts, flattening, or otherwise deforming or weakening conductor or any damage to insulation or impairing its conductivity. Remove damaged sections of conductor and splice conductor. Provide conductors that are paid out with the free end of conductors fixed and cable reels portable, except where terrain or obstructions make this method unfeasible. Make the bend radius for any insulated conductor not less than the applicable NEMA specification recommendation. Do not draw conductors over rough or rocky ground, nor around sharp bends. When installed by machine power, provide conductors that are drawn from a mounted reel through stringing sheaves in straight lines clear of obstructions. Check the initial sag and tension, in accordance with the manufacturer's approved sag and tension charts, within an elapsed time after installation as recommended by the manufacturer.

3.1.8.2 Connectors and Splices

Provide conductor splices, as installed, that exceed ultimate rated strength of conductor and are of the type recommended by conductor manufacturer. No splices are permitted within 3050 mm 10-feet of a support. Provide connectors and splices that are mechanically and electrically secure under tension and are of the nonbolted compression type. Make splices have a tensile strength of not less than the rated breaking strength of the conductor. Provide splice materials, sleeves, fittings, and connectors that are noncorrosive and that do not adversely affect conductors. Wire brush and apply an oxide inhibitor to aluminum-composition conductors before making a compression connection. Connectors which are factory-filled with an inhibitor are acceptable. Provide types of inhibitors and compression tools recommended by the connector manufacturer. Provide primary line apparatus taps by means of hot line clamps attached to compression type bail clamps (stirrups). Provide solderless pressure type low-voltage connectors for copper conductors. Smoothly tape noninsulated connectors to provide a waterproof insulation equivalent to the original insulation, when installed on insulated conductors. On overhead connections of aluminum and copper, install the aluminum above the copper.

3.1.8.3 Conductor-To-Insulator Attachments

Attach conductors to insulators by means of clamps, shoes or tie wires, in accordance with the type of insulator. For insulators requiring conductor tie-wire attachments, provide tie-wire sizes as specified in TABLE I.
TABLE I
TIE-WIRE REQUIREMENTS

3.1.8.4 Armor Rods

Provide armor rods for AAC, AAAC, and ACSR conductors. Install armor rods at supports, except armor rods are not required at primary dead-end assemblies if aluminum or aluminum-lined zinc-coated steel clamps are used. Provide lengths and methods of fastening armor rods in accordance with the manufacturer’s recommendations. For span lengths of less than 61 m, 200-feet, use of flat aluminum armor rods is allowed. Use flat armor rods, not less than 762.0 micrometers by 6.4 mm 0.03 by 0.25 inch on No. 1 AWG AAC and AAAC and smaller conductors and on No. 5 AWG ACSR and smaller conductors. On larger sizes, provide flat armor rods that are not less than 1.3 by 7.6 mm. 0.05 by 0.30 inches. For span lengths of 61 m 200-feet or more, use preformed round armor rods.

3.1.8.5 Ties

Provide ties on pin insulators tight against conductor and insulator and ends turned down flat against conductor so that no wire ends project.

3.1.8.6 Low-Voltage Insulated Cables

Support low-voltage cables on clevis fittings using spool insulators. Provide dead-end clevis fittings and suspensions insulators where required for adequate strength. Provide dead-end construction that has a strength exceeding the rated breaking strength of the neutral messenger. Provide clevis attachments with not less than 15.9 mm 5/8-inch through-bolts. Use secondary racks when installed on wood poles and where the span length does not exceed 61 m 200-feet. Provide two-, three-, or four-wire secondary racks, complete with spool insulators. Provide racks that meet strength and deflection requirements for heavy-duty steel racks, and are rounded and smooth to avoid damage to conductor insulation. Hold each insulator in place with a 15.9 mm 5/8-inch button-head bolt equipped with a nonferrous cotter pin, or equivalent, at the bottom. Provide racks for dead-ending four No. 4/0 AWG or four larger conductors that are attached to poles with three 15.9 mm 5/8-inch through-bolts. Attach other secondary racks to poles with at least two 15.9 mm 5/8-inch through-bolts. Provide minimum vertical spacing between conductors of not less than 200 mm 8-inches.
3.1.8.7 Reinstalling Conductors

**************************************************************************
NOTE: Sag tables are usually available from conductor manufacturers. For projects which entail considerable length of overhead line, indicate sag tables for the particular line as designed.
**************************************************************************

String existing conductors to be reinstall or resagged to "final" sag table values indicated for the particular conductor type and size involved.

3.1.8.8 New Conductor Installation

**************************************************************************
NOTE: Sag tables are usually available from conductor manufacturers. For projects which entail considerable length of overhead line, indicate sag tables for the particular line as designed. Use "indicated" on NAVFAC Atlantic projects.
**************************************************************************

String new conductors to "initial" sag table values [indicated] [recommended by the manufacturer] for conductor type and size of conductor and ruling span indicated.

3.1.8.9 Fittings

Provide dead end fittings[, clamp or compression type,] that conform to written recommendations of conductor manufacturer and that develop full ultimate strength of conductor.

3.1.8.10 Aluminum Connections

Make aluminum connections to copper or other material using only splices, connectors, lugs, or fittings designed for that specific purpose. Keep a copy of manufacturer's instructions for applying these fittings at job site for use of the inspector.

3.1.9 Pole Mounted Metering Equipment

3.1.9.1 Primary Meters

Install primary metering transformers [as indicated] [according to manufacturer's drawings]. Make connections to metering circuits within each transformer conduit connection box.

3.1.9.2 Installing Meter System

Provide metering enclosure that houses kWh meter [and meter test block]. Secure the enclosure to pole at a height of 1825 mm 6-feet above grade to center of the enclosure. Ground enclosure.

a. Connect meter as indicated.

b. Connect meter test block between meter and metering transformers to isolate meter for removal, test or adjustment.
c. Provide identical phase sequence and color code of potential and current leads. Mark wires which are connected to transformer terminals identified with polarity marks (dots) by a colored plastic tape around the wire at each end.

d. No splices are permissible in metering circuits. Provide wire that is trained at sides and bottom of enclosure back board and secured by plastic wraps.

3.1.10 Pole Top Switch Installation

Install pole top switch strictly according to manufacturer's installation drawings and information.

3.1.10.1 Operating Handle

Locate approximately 1520 mm 5 feet above ground on field side of pole.

3.1.11 Recloser

Install recloser(s) strictly in accordance with manufacturer's instructions.

3.1.12 Sectionalizer

Install sectionalizer(s) strictly in accordance with manufacturer's instructions.

3.1.13 Risers

[Secure galvanized steel conduits on poles by two hole galvanized steel pipe straps spaced as indicated and within 910 mm 3-feet of any outlet or termination. Ground metallic conduits.] [Secure PVC riser shields on poles as indicated.]

3.1.14 Transformer Installation

**********************************************************
NOTE: Specify phase sequence in accordance with the local practice.
**********************************************************

Carefully install transformers so as not to scratch finishes or damage bushings. Install transformers in accordance with the manufacturer's instructions. After installation, inspect surfaces and touch up scratches with a finish provided by the transformer manufacturer for this purpose.

3.1.15 Crossarm Mounting

**********************************************************
NOTE: Do not use this paragraph and subparagraphs for Navy projects. The Navy provides this information on the drawings. Utilize Navy plates during design of Navy projects. Refer to "Instructions to view/print graphics" for access to Navy plates.
**********************************************************

**********************************************************
NOTE: Normally specify flat braces for 2.4 m 8 foot
crossarms and angle braces for 3.1 m 10 foot crossarms to agree with REA construction. An angle brace is also required on 2.4 m 8 foot arms where conductors have a breaking strength of more than 20.0 kN 4500 pounds. Extreme loading conditions also warrants the extra cost of the stronger angle brace under other circumstances.

Provide metal crossarm braces to reduce the effective BIL rating of the pole. In high lightning areas specify fiberglass braces.

**************************************************************************

Bolt crossarms to poles with 15.9 mm 5/8-inch through-bolts with square washers at each end. Extend bolts not less than 3 mm 1/8-inch nor more than 50 mm 2-inches beyond nuts. On single crossarm construction, install the bolt head on the crossarm side of the pole. Provide [fiberglass] [metal] [wood] crossarm braces on crossarms. Provide flat braces for 2.4 m 8-foot crossarms 6.4 by 31.8 mm, 1/4 by 1-1/4-inches, not less than 700 mm 28-inches in length. Bolt flat braces to arms with 9.5 mm 3/8-inch carriage bolts with round or square washers between boltheads and crossarms, and secure to poles with 50.8 by 101.6 mm 1/2 by 4-inch lag screws after crossarms are leveled and aligned. Angle braces are required for 3.1 m 10-foot crossarms. Provide angle braces that are 1.5 m 60-inch span by 457.2 mm 18-inch drop formed in one piece from 38.1 by 38.1 by 4.8 mm 1-1/2 by 1-1/2 by 3/16-inch angle. Bolt angle braces to crossarms with 50.8 mm 1/2-inch bolts with round or square washers between boltheads and crossarms, and secure to poles with 15.9 mm 5/8-inch through-bolts. Securely hold double crossarms in position by means of 15.9 mm 5/8-inch double-arming bolts. Equip each double-arming bolt with four nuts and four square washers.

3.1.15.1 Line Arms and Buck Arms

Provide line arms and buck arms that are set at right angles to lines for straight runs and for angles 45 degrees and greater; and line arms that bisect angles of turns of less than 45 degrees. Use dead-end assemblies for turns where shown. Install buck arms, as shown, at corners and junction poles. Provide double crossarms at ends of joint use or conflict sections, at dead-ends, and at angles and corners to provide adequate vertical and longitudinal strength. Provide double crossarms at each line-crossing structure and where lines not attached to the same pole cross each other.
3.1.15.2 Equipment Arms

Set equipment arms parallel or at right angles to lines as required to provide climbing space. Locate equipment arms below line construction to provide necessary wire and equipment clearances.

3.1.16 Field Applied Painting

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Provide painting as specified in Section 09 90 00 PAINTS AND COATINGS.

3.1.17 Field Fabricated Nameplate Mounting

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.2 FIELD QUALITY CONTROL

**************************************************************************
NOTE: Select types to suit project conditions and delete all others. Delete all paragraphs not applicable. Provide justification for all tests.
**************************************************************************

3.2.1 General

[Perform field testing in the presence of the Contracting Officer. ]Notify the Contracting Officer [_____] days prior to conducting tests. Furnish materials, labor, and equipment necessary to conduct field tests. Perform tests and inspections recommended by the manufacturer unless specifically waived by the Contracting Officer. Maintain a written record of tests which includes date, test performed, personnel involved, devices tested, serial number and name of test equipment, and test results. Sign and date field reports.

3.2.2 Safety

Provide and use safety devices such as rubber gloves, protective barriers, and danger signs to protect and warn personnel in the test vicinity. Replace any devices or equipment which are damaged due to improper test procedures or handling.

3.2.3 Medium-Voltage Preassembled Cable Test

**************************************************************************
NOTE: If the installation is tapping a new feeder to an existing feeder using a "T" splice, modify the paragraph to indicate that when existing cable cannot be readily disconnected, only test the system to the lower (after installation) voltage. Delete the test if no cable is installed in the project.
**************************************************************************

After installation, prior to connection to an existing system, and before the operating test, give the medium-voltage preassembled cable system a high potential test. Apply direct-current voltage on each phase conductor of the system by connecting conductors at one terminal and connecting
grounds or metallic shieldings or sheaths of the cable at the other terminal for each test. Prior to the test, isolate the cables by opening applicable protective devices and disconnecting equipment. Provide the method, voltage, length of time, and other characteristics of the test for initial installation in accordance with NEMA WC 74/ICEA S-93-639 for the particular type of cable installed, and do not exceed the recommendations of IEEE 404 for cable joints unless the cable and accessory manufacturers indicate higher voltages are acceptable for testing. For any cable that fails due to a weakness of conductor insulation or due to defects or injuries incidental to the installation or because of improper installation of cable, cable joints, terminations, or other connections, make necessary repairs or replace cables as directed. Retest repaired or replaced cables.

3.2.4 Sag and Tension Test

Give the Contracting Officer prior notice of the time schedule for stringing conductors or cables serving overhead medium-voltage circuits. The Contracting Officer reserves the right to witness the procedures used for ascertaining that initial stringing sags and tensions are in compliance with requirements for the applicable loading district and cable weight.

3.2.5 Low-Voltage Cable Test

**************************************************************************
NOTE: The insulation resistance test (dielectric test) value is based on the recommendation contained in IEEE Std 525. Delete the cable test if no low voltage cables are in the project.
**************************************************************************

For underground secondary or service laterals from overhead lines, provide the low-voltage cable, complete with splices, that is tested for insulation resistance after the cables are installed, in their final configuration, ready for connection to the equipment, and prior to energization. The 500 volts dc test voltage, applied for one minute between each conductor and ground and between all possible combinations of conductors in the same trench, duct, or cable, with other conductors in the same trench, duct, or conduit. Provide insulation with a minimum value of:

- \[ R \text{ in megohms} = \frac{(\text{rated voltage in kV} + 1) \times 304,800}{\text{length of cable in meters}} \]
- \[ R \text{ in megohms} = \frac{(\text{rated voltage in kV} + 1) \times 1000}{\text{length of cable in feet}} \]

Repair or replace each cable failing this test. Retest the repaired cable then until failures have been eliminated.

3.2.6 Pre-Energization Services

Perform the following services on the equipment listed below. Perform these services subsequent to testing but prior to the initial energization. Inspect the equipment to assure that installation is in compliance with the recommendations of the manufacturer and as shown on the detail drawings. Inspect terminations of conductors at major equipment to ensure the adequacy of connections. Inspect bare and insulated conductors between such terminations to detect possible damage during installation. If factory tests were not performed on completed assemblies, perform tests after the installation of completed assemblies. Inspect components for damage caused during installation or shipment and to ensure that packaging materials have been removed. Provide components capable of being both
manually and electrically operated that are operated manually prior to the first electrical operation. Provide components capable of being calibrated, adjusted, and tested and calibrate, adjust and test in accordance with the instructions of the equipment manufacturer. Items for which such services are provided, but are not limited to, are the following:

a. Capacitors

b. Switches

3.2.7 Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.2.7.1 Overhead-Type Distribution Transformers

a. Visual and mechanical inspection

  (1) Compare equipment nameplate information with specifications and approved shop drawings.

  (2) Inspect physical and mechanical condition.

  (3) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method. Thermographic survey is not required.

  (4) Perform specific inspections and mechanical tests as recommended by manufacturer.

  (5) Verify correct equipment grounding.

b. Electrical tests

**************************************************************************
NOTE: Coordinate the option on series-multiple voltage-changing switch with the option in paragraph OVERHEAD-TYPE DISTRIBUTION TRANSFORMERS herein.
**************************************************************************

[ (1) Insure that the series-multiple voltage-changing switch is in the correct position. Transformers are normally shipped in the series position.

] (2) Perform insulation-resistance tests.

(3) Perform continuity test.

(4) Set tap changer to provide a secondary voltage of [120/240] [120/208] [____].

3.2.7.2 Pole Top Interrupter Switch

a. Visual and Mechanical Inspection

  (1) Compare equipment nameplate information with specifications and approved shop drawings.
(2) Inspect physical and mechanical condition.

(3) Verify appropriate equipment grounding.

(4) Perform mechanical operator tests in accordance with manufacturer's instructions.

(5) Verify correct blade alignment, blade penetration, travel stops, arc interrupter operation, and mechanical operation.

b. Electrical Tests

(1) Perform insulation-resistance tests.

(2) Perform dc over-potential tests.

(3) Perform contact-resistance tests across each switch blade.

[3.2.7.3 Reclosers

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Inspect alignment and grounding.

(4) Perform mechanical operation and contact alignment tests on both the recloser and its operating mechanism in accordance with manufacturer's instructions.

(5) Verify tightness of accessible bolted electrical connections.

(6) Inspect for correct insulating liquid level.

b. Electrical Tests

(1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter.

(2) Perform a contact resistance test.

(3) Sample insulating liquid. Test sample for:

(a) Dielectric breakdown voltage

(b) Color

(c) Visual condition

(4) Test protective functions.

(5) Perform vacuum bottle integrity test (overpotential) across each vacuum bottle with the recloser in the open position in strict accordance with manufacturer's instructions.
(6) Perform overpotential tests.

(7) Determine time delay for each programmed reclosing interval.

(8) Verify lockout for unsuccessful reclosing.

(9) Determine reset time.

(10) Verify instantaneous overcurrent lockout.

3.2.7.4 Sectionalizers

a. Visual and Mechanical inspection

(1) Compare equipment nameplate data with approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Inspect alignment and grounding.

(4) Perform mechanical operation and contact alignment tests on both the sectionalizer and its operating mechanism in accordance with manufacturer's instructions.

(5) Verify tightness of accessible bolted electrical connections.

(6) Inspect for correct insulating liquid level.

b. Electrical Tests

(1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter.

(2) Perform a contact resistance test.

(3) Sample insulating liquid. Test sample for:

   (a) Dielectric breakdown voltage

   (b) Color

   (c) Visual condition

(4) Perform overpotential tests.

(5) Test sectionalizer counting function.

(6) Test sectionalizer lockout function.

(7) Test for reset timing on trip actuator.

3.2.7.5 Potential Transformers

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Verify correct connection.
(3) Verify that adequate clearances exist between primary and secondary circuit wiring.

(4) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method.

(5) Verify that all required grounding and shorting connections provide good contact.

(6) Verify correct fuse sizes.

b. Electrical Tests

(1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter.

(2) Perform insulation-resistance tests.

(3) Perform polarity tests.

(4) Perform turns-ratio tests.

} [3.2.7.6 Current Transformers

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify correct connection.

(4) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method.

(5) Verify that all required grounding and shorting connections provide good contact.

b. Electrical Tests

(1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter.

(2) Perform insulation-resistance tests.

(3) Perform polarity tests.

(4) Perform ratio-verification tests.

} [3.2.7.7 Metering

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.
(3) Verify tightness of electrical connections.

b. Electrical Tests

(1) Verify accuracy of meters at 25 percent, 50 percent, 75 percent, and 100 percent of full scale.

(2) Calibrate watthour meters according to manufacturer's published data.

(3) Verify all instrument multipliers.

3.2.7.8 Grounding System

a. Visual and mechanical inspection

   (1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical tests

   (1) Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground testing megger in accordance with manufacturer's instructions to test each ground or group of grounds. Provide an instrument that is equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

3.2.8 Devices Subject to Manual Operation

Operate each device subject to manual operation at least three times, demonstrating satisfactory operation each time.

3.2.9 Follow-Up Verification

Upon completion of acceptance checks and tests, show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. As an exception to requirements stated elsewhere in the contract, give the Contracting Officer 5 working days advance notice of the dates and times of checking and testing.

   2.14.3 Manhole Frames and Covers
   2.14.4 Handhole Frames and Covers
   2.14.5 Frames and Covers for Airfield Facilities
   2.14.6 Ductile Iron Frames and Covers for Airfield Facilities
   2.14.7 Brick for Manhole Collar
   2.14.8 Composite/Fiberglass Handholes and Covers

2.15 CABLE SUPPORTS (RACKS, ARMS, AND INSULATORS)
   2.15.1 Cable Rack Stanchions
   2.15.2 Rack Arms
   2.15.3 Insulators

2.16 CABLE TAGS IN MANHOLES
   2.16.1 Polyethylene Cable Tags

2.17 MEDIUM VOLTAGE ABOVE GROUND CABLE TERMINATING CABINETS

2.18 LOW VOLTAGE ABOVE GROUND TERMINATION PEDESTAL

2.19 PROTECTIVE DEVICES AND COORDINATION

2.20 SOURCE QUALITY CONTROL
   2.20.1 Arc-Proofing Test for Cable Fireproofing Tape
2.20.2 Medium Voltage Cable Qualification and Production Tests

PART 3 EXECUTION

3.1 INSTALLATION
3.2 CABLE INSPECTION
3.3 CABLE INSTALLATION PLAN AND PROCEDURE
3.4 UNDERGROUND FEEDERS SUPPLYING BUILDINGS
3.5 UNDERGROUND STRUCTURE CONSTRUCTION
  3.5.1 Cast-In-Place Concrete Structures
  3.5.2 Precast Concrete Construction
  3.5.3 Pulling-In Irons
  3.5.4 Cable Racks, Arms and Insulators
  3.5.5 Field Painting
3.6 DIRECT BURIAL CABLE SYSTEM
  3.6.1 Trenching
  3.6.2 Cable Installation
  3.6.3 Splicing
  3.6.4 Bends
  3.6.5 Horizontal Slack
  3.6.6 Identification Slabs[ or Markers]
3.7 UNDERGROUND CONDUIT AND DUCT SYSTEMS
  3.7.1 Requirements
  3.7.2 Treatment
  3.7.3 Conduit Cleaning
  3.7.4 Jacking and Drilling Under Roads and Structures
  3.7.5 Galvanized Conduit Concrete Penetrations
  3.7.6 Multiple Conduits
  3.7.7 Conduit Plugs and Pull Rope
  3.7.8 Conduit and Duct Without Concrete Encasement
    3.7.8.1 Encasement Under Roads and Structures
    3.7.8.2 Directional Boring
  3.7.9 Duct Encased in Concrete
    3.7.9.1 Connections to Manholes
    3.7.9.2 Connections to Existing Underground Structures
    3.7.9.3 Connections to Existing Concrete Pads
    3.7.9.4 Connections to Existing Ducts
    3.7.9.5 Partially Completed Duct Banks
    3.7.9.6 Removal of Ducts
  3.7.10 Duct Sealing
3.8 CABLE PULLING
  3.8.1 Cable Lubricants
3.9 CABLES IN UNDERGROUND STRUCTURES
  3.9.1 Cable Tag Installation
3.10 CONDUCTORS INSTALLED IN PARALLEL
3.11 LOW VOLTAGE CABLE SPlicing AND TERMINATING
  3.11.1 Terminating Aluminum Conductors
3.12 MEDIUM VOLTAGE CABLE TERMINATIONS
3.13 MEDIUM VOLTAGE CABLE JOINTS
  3.13.1 Joints in Shielded Cables
  3.13.2 Joints in Armored Cables
3.14 CABLE END CAPS
3.15 LIVE END CAPS
3.16 FIREPROOFING OF CABLES IN UNDERGROUND STRUCTURES
  3.16.1 Fireproofing Tape
  3.16.2 Tape-Wrap
3.17 GROUNDING SYSTEMS
  3.17.1 Grounding Electrodes
  3.17.2 Grounding Connections
3.17.3 Grounding Conductors
3.17.4 Ground Cable Crossing Expansion Joints
3.17.5 Manhole Grounding
3.17.6 Fence Grounding
3.17.7 Metal Splice Case Grounding

3.18 EXCAVATING, BACKFILLING, AND COMPACTING
3.18.1 Reconditioning of Surfaces
  3.18.1.1 Unpaved Surfaces
  3.18.1.2 Paving Repairs

3.19 CAST-IN-PLACE CONCRETE
3.19.1 Concrete Slabs (Pads) for Equipment
3.19.2 Sealing

3.20 FIELD QUALITY CONTROL
3.20.1 Performance of Field Acceptance Checks and Tests
  3.20.1.1 Medium Voltage Cables
  3.20.1.2 Low Voltage Cables, 600-Volt
  3.20.1.3 Grounding System
3.20.2 Follow-Up Verification

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for underground electrical work.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification does not cover all possible methods or requirements for providing underground facilities. To do so would be to produce an involved, confusing document. This guide specification presents the usual methods and the most used alternatives. Different materials and methods, properly specified, indicated, and economically used will be acceptable when approved by cognizant authority.
Note: This section uses the following manhole / handhole sketches.

NOTE: TO DOWNLOAD UFGS GRAPHICS

Go to

LIST OF SKETCHES

Sketches are available in metric (SI) and U.S. Customary (IP) system dimensions. Sketch titles and style numbers are unchanged for both types.

The metric values indicated are a conversion of the IP system dimensions.

Do not include list of sketches, or sketches themselves, in project specifications. Use manhole / handhole sketches as details on drawings whenever possible. If special features are required for a project, do not modify sketches, but indicate these changes on notes below the sketch. The "UG" style numbers and dates should remain on the drawing details.

NOTE: The following information must be shown on the project drawings:

1. Where specification identifies type, size, color, finish, or other definitive information to be "as indicated," include the information on the drawings.

2. Location of ducts, and cables.

3. Types of wire and cable; number and sizes of conductors.
4. Ground rods and ground rings.

5. Locations of faulted circuit indicators, when used.

6. Special conditions, including live end caps and ductbank reinforcing, as required.

PART 1   GENERAL
1.1 REFERENCES
**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

### 1.2 SYSTEM DESCRIPTION

**************************************************************************  
NOTE: Do not use this paragraph for Navy projects.

For Army projects, select the features and fill in blanks with selections appropriate for the design condition and in accordance with guidance contained in UFC 3-550-01, "Exterior Electrical Power Distribution".

See UFC 3-550-01 for guidance regarding service conditions. Retain or add the required conditions.

Provide seismic requirements, if a Government designer is the Engineer of Record, and show on the drawings. Delete the inappropriate bracketed phrase. Pertinent portions of UFC 3-310-04, "Seismic Design for Buildings" and Sections 13 48 00 [SEISMIC] BRACING FOR MISCELLANEOUS EQUIPMENT and 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT properly edited, must be included in the contract documents.

**************************************************************************

Items provided under this section must be specifically suitable for the following service conditions. Seismic details must [conform to UFC 3-310-04, "Seismic Design for Buildings" and Sections 13 48 00 [SEISMIC] BRACING FOR MISCELLANEOUS EQUIPMENT and 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT] [be as indicated].

a. Fungus Control [_____]
b. Altitude [_____] m feet.

c. Ambient Temperature [_____] degrees C F.

d. Frequency [_____] 

e. Ventilation [_____]

f. Seismic Parameters [_____]

g. Humidity Control [_____]

h. Corrosive Areas [_____]

i. [_____]

1.3 RELATED REQUIREMENTS

**************************************************************************
NOTE: Include Section 26 08 00 APPARATUS INSPECTION
AND TESTING on all projects involving medium voltage
and grounding systems.
**************************************************************************

Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section,
with the additions and modifications specified herein.

1.4 DEFINITIONS

a. Unless otherwise specified or indicated, electrical and electronics
terms used in these specifications, and on the drawings, are as defined
in IEEE Stds Dictionary.

b. In the text of this section, the words conduit and duct are used
interchangeably and have the same meaning.

c. In the text of this section, "medium voltage cable splices," and
"medium voltage cable joints" are used interchangeably and have the
same meaning.

**************************************************************************
NOTE: For Navy projects, areas subject to aircraft
loading are generally defined as follows:

1. For fixed wing aircraft facilities:
   a) On or within 61 m 200 feet of runway sideline
   b) On or within 15 m 50 feet of taxiway or apron
      sideline
   c) Within Type 1 clear zone area as defined by UFC
      3-260-01, "Airfield and Heliport Planning and
      Design".

2. For rotary wing aircraft facilities:
   On landing surfaces, primary surfaces, or within
   areas defined as "paved and unpaved shoulders" in
   UFC 3-260-01, "Airfield and Heliport Planning and
   Design".
**************************************************************************
[ d. Underground structures subject to aircraft loading are indicated on the drawings.

] 1.5 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

[ Aluminum conductors; G[, [_____]]]
Submit modified drawings and engineering calculations associated with design changes required for use of aluminum conductors.

Precast underground structures; G[, [_____]]

SD-03 Product Data

***************************************************************
NOTE: Submittals are required for each kind, voltage, or type used on the project.
***************************************************************

Medium voltage cable; G[, [_____]]
Medium voltage cable joints; G[, [_____]]
Medium voltage cable terminations; G[, [_____]]

Live end caps; G[, [_____]]

Precast concrete structures; G[, [_____]]

Sealing Material

Pulling-In Irons

Manhole frames and covers; G[, [_____]]
Handhole frames and covers; G[, [_____]]

Frames and Covers for Airfield Facilities; G[, [_____]]

Ductile Iron Frames and Covers for Airfield Facilities; G[, [_____]]

Composite/fiberglass handholes; G[, [_____]]

Cable supports (racks, arms and insulators); G[, [_____]]

***************************************************************
NOTE: For Navy projects, do not use protective device coordination studies.
***************************************************************

Protective Devices and Coordination Study; G[, [_____]]

The study must be submitted with protective device equipment submittals. No time extension or similar contract modifications will be granted for work arising out of the requirements for this study. Approval of protective devices proposed must be based on recommendations of this study. The Government must not be held responsible for any changes to equipment, device ratings, settings, or additional labor for installation of equipment or devices ordered or procured prior to approval of the study.

SD-06 Test Reports

Medium voltage cable qualification and production tests; G[, [_____]]
Field Acceptance Checks and Tests; G[, [____]]

Arc-proofing test for cable fireproofing tape; G[, [____]]

**************************************************************************

NOTE: Use Cable Installation only when pulling cable between manholes; do not use for pulling from pole riser to manhole only.

**************************************************************************

Cable Installation Plan and Procedure; G[, [____]]

Six copies of the information described below in 215.9 by 279.4 mm 8-1/2 by 11 inch binders having a minimum of three rings from which material may readily be removed and replaced, including a separate section for each cable pull. Separate sections by heavy plastic dividers with tabs, with all data sheets signed and dated by the person supervising the pull.

Site layout drawing with cable pulls numerically identified.

A list of equipment used, with calibration certifications. The manufacturer and quantity of lubricant used on pull.

The cable manufacturer and type of cable.

The dates of cable pulls, time of day, and ambient temperature.

The length of cable pull and calculated cable pulling tensions.

The actual cable pulling tensions encountered during pull.

SD-07 Certificates

Cable splicer/terminator; G[, [____]]

Cable Installer Qualifications; G[, [____]]

Directional Boring Certificate of Conformance; G[, [____]]

1.6 QUALITY ASSURANCE

1.6.1 Precast Underground Structures

Submittal required for each type used. Provide calculations and drawings for precast manholes and handholes bearing the seal of a registered professional engineer including:

Material description (i.e., f'c and Fy)

Manufacturer's printed assembly and installation instructions

Design calculations

Reinforcing shop drawings in accordance with ACI SP-66
e. Plans and elevations showing opening and pulling-in iron locations and details

[1.6.2 Certificate of Competency for Cable Splicer/Terminator

**************************************************************************
NOTE: Delete this paragraph if there is no medium voltage work required for the project. For CONUS projects, select the first bracketed paragraph. For OCONUS projects, select the second bracketed paragraph.
**************************************************************************

[ The cable splicer/terminator must have a certification from the National Cable Splicing Certification Board (NCSCB) in the field of splicing and terminating shielded medium voltage (5 kV to 35 kV) power cable using pre-manufactured kits (pre-molded, heat-shrink, cold shrink). Submit "Proof of Certification" for approval, for the individuals that will be performing cable splicer and termination work, 30 days before splices or terminations are to be made.

] [Certification of the qualification of the cable splicer/terminator shall be submitted, for approval, 30 days before splices or terminations are to be made in medium voltage (5 kV to 35 kV) cables. The certification shall include the training, and experience of the individual on the specific type and classification of cable to be provided under this contract. The certification shall indicate that the individual has had three or more years recent experience splicing and terminating medium voltage cables. The certification shall also list a minimum of three splices/terminations that have been in operation for more than one year. In addition, the individual may be required to perform a dummy or practice splice/termination in the presence of the Contracting Officer, before being approved as a qualified cable splicer. If that additional requirement is imposed, the Contractor shall provide short sections of the approved types of cables along with the approved type of splice/termination kit, and detailed manufacturer's instructions for the cable to be spliced. The Contracting Officer reserves the right to require additional proof of competency or to reject the individual and call for certification of an alternate cable splicer.

]1.6.3 Cable Installer Qualifications

Provide at least one onsite person in a supervisory position with a documentable level of competency and experience to supervise all cable pulling operations. Provide a resume showing the cable installers' experience in the last three years, including a list of references complete with points of contact, addresses and telephone numbers. Cable installer must demonstrate experience with a minimum of three medium voltage cable installations. The Contracting Officer reserves the right to require additional proof of competency or to reject the individual and call for an alternate qualified cable installer.

[1.6.4 Directional Boring Certificate of Conformance

**************************************************************************
NOTE: Delete this paragraph if there is no directional boring work required for the project.
**************************************************************************
Provide certification of compliance with the registered Professional Engineer’s design requirements for each directional bore, including: HDPE conduit size and type, bend radius, elevation changes, vertical and horizontal path deviations, conductor size and type and any conductor derating due to depth of conduit. Record location and depth of all directional-bore installed HDPE conduits using Global Positioning System (GPS) recording means with "resource grade" accuracy.

1.6.5 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship must be in accordance with the mandatory and advisory provisions of IEEE C2 and NFPA 70 unless more stringent requirements are specified or indicated.

1.6.6 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products must have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period must include applications of equipment and materials under similar circumstances and of similar size. The product must have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.6.6.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.6.6.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site are not acceptable, unless specified otherwise.

PART 2 PRODUCTS

2.1 CONDUIT, DUCTS, AND FITTINGS

2.1.1 Rigid Metal Conduit

UL 6.

2.1.1.1 Rigid Metallic Conduit, PVC Coated

NEMA RN 1, Type A40, except that hardness must be nominal 85 Shore A durometer, dielectric strength must be minimum 15.75 kV per mm 400 volts per mil at 60 Hz, and tensile strength must be minimum 25 MPa 3500 psi.
2.1.2 Intermediate Metal Conduit

UL 1242.

2.1.2.1 Intermediate Metal Conduit, PVC Coated

NEMA RN 1, Type A40, except that hardness must be nominal 85 Shore A durometer, dielectric strength must be minimum 15.75 kV per mm 400 volts per mil at 60 Hz, and tensile strength must be minimum 25 MPa 3500 psi.

2.1.3 Plastic Conduit for Direct Burial and Riser Applications

**************************************************************************
NOTE: Specify EPC-40-PVC or EPC-80-PVC for direct-burial and riser applications.
**************************************************************************

UL 651 and NEMA TC 2, [ EPC-40] [ or] [ EPC-80] [ as indicated].

2.1.4 Plastic Duct for Concrete Encasement

**************************************************************************
NOTE: Choose EB-35 where conduit deformity is a concern. Choose EPC-40 where required by the activity. Include "as indicated" when drawings designate different applications, such as, Type EB for primary distribution and Type EPC for secondary distribution to avoid transitions for risers..
**************************************************************************

Provide[[ Type EB-20] [ Type EB-35] per UL 651, ASTM F512, and NEMA TC 6 & 8 ] [ or][ Type EPC-40 per UL 651 and NEMA TC 2][, as indicated].

2.1.5 High Density Polyethylene (HDPE) Electrical Conduit for Directional Boring

**************************************************************************
NOTE: Delete this paragraph if there is no directional boring work required for the project.
**************************************************************************

Smoothwall, approved/listed for directional boring, minimum Schedule 80, ASTM F2160, NEMA TC 7.

2.1.6 Innerduct

Provide corrugated [or solid wall] polyethylene (PE) or PVC innerducts, or fabric-mesh innerducts, with pullwire. Size as indicated.

2.1.7 Duct Sealant

UL 94, Class HBF. Provide high-expansion urethane foam duct sealant that expands and hardens to form a closed, chemically and water resistant, rigid structure. Sealant must be compatible with common cable and wire jackets and capable of adhering to metals, plastics and concrete. Sealant must be capable of curing in temperature ranges of 2 degrees C to 35 degrees C 35 degrees F to 95 degrees F. Cured sealant must withstand temperature ranges of -29 degrees C to 93 degrees C -20 degrees F to 200 degrees F without loss of function.
2.1.8 Fittings

2.1.8.1 Metal Fittings

UL 514B.

2.1.8.2 PVC Conduit Fittings

**************************************************************************
NOTE: Choose UL listed fittings for most applications and where conduit is required to comply with NFPA 70.
**************************************************************************

[UL 514B, UL 651][NEMA TC 3].

2.1.8.3 PVC Duct Fittings

NEMA TC 9.

[2.1.8.4 Outlet Boxes for Steel Conduit

Outlet boxes for use with rigid or flexible steel conduit must be cast-metal cadmium or zinc-coated if of ferrous metal with gasketed closures and must conform to UL 514A.

]2.2 LOW VOLTAGE INSULATED CONDUCTORS AND CABLES

**************************************************************************
NOTE: In most cases NFPA 70 requires listed conductors and cable. Choose bracketed item for NEMA WC 70 only when compliance with NFPA 70 is not required.
**************************************************************************

Insulated conductors must be rated 600 volts and conform to the requirements of NFPA 70, including listing requirements[, or in accordance with NEMA WC 70]. Wires and cables manufactured more than [24][12] months prior to date of delivery to the site are not acceptable. Service entrance conductors must conform to UL 854, type USE.

2.2.1 Conductor Types

**************************************************************************
NOTE: Allow aluminum conductors for new underground lines.
**************************************************************************

Cable and duct sizes indicated are for copper conductors and THHN/THWN unless otherwise noted. Conductors No. 10 AWG and smaller must be solid. Conductors No. 8 AWG and larger must be stranded. Conductors No. 6 AWG and smaller must be copper. Conductors No. 4 AWG and larger may be either copper or aluminum, at the Contractor's option. Do not substitute aluminum for copper if the equivalent aluminum conductor size would exceed 500 kcmil. When the Contractor chooses to use aluminum for conductors No. 4 AWG and larger, the Contractor must: increase the conductor size to have the same ampacity as the copper size indicated; increase the conduit and pull box sizes to accommodate the larger size aluminum conductors in
accordance with NFPA 70; ensure that the pulling tension rating of the aluminum conductor is sufficient; relocate equipment, modify equipment terminations, resize equipment, and resolve to the satisfaction of the Contracting Officer problems that are direct results of the use of aluminum conductors in lieu of copper.[ All conductors must be copper.]

2.2.2 Conductor Material

**************************************************************************
NOTE: For project applications which require a different insulation than those listed below, reference a Government or industry standard that the cable or conductor must meet. For projects which require multiple types of insulations, indicate the type for each cable on the project drawings. Refer to UFC 3-550-01, "Exterior Electrical Power Distribution" for further guidance.
**************************************************************************

Unless specified or indicated otherwise or required by NFPA 70, wires in conduit, other than service entrance, must be 600-volt, Type THWN/THHN conforming to UL 83 or Type XHHW or RHW conforming to UL 44. Copper conductors must be annealed copper complying with ASTM B3 and ASTM B8. Aluminum conductors must be Type AA-8000 aluminum conductors complying with ASTM B800 and ASTM B801, and must be of an aluminum alloy listed or labeled by UL as "component aluminum-wire stock (conductor material). Type 1350 is not acceptable. Intermixing of copper and aluminum conductors in the same raceway is not permitted.

2.2.3 Jackets

Multiconductor cables must have an overall PVC outer jacket.

2.2.4 Direct Buried

Single-conductor [and multi-conductor ]cables must be of a type identified for direct burial.

2.2.5 In Duct

**************************************************************************
NOTE: For Army and Air Force projects only, coilable plastic duct may be used as an alternative to direct burial where extra physical protection is required.
**************************************************************************

Cables must be single-conductor cable. [ Cables in factory-installed, coilable-plastic-duct assemblies must conform to NEMA TC 7.]

2.2.6 Cable Marking

Insulated conductors must have the date of manufacture and other identification imprinted on the outer surface of each cable at regular intervals throughout the cable length.

Identify each cable by means of a fiber, laminated plastic, or non-ferrous metal tags, or approved equal, in each manhole, handhole, junction box, and each terminal. Each tag must contain the following information; cable
Conductors must be color coded. Provide conductor identification within each enclosure where a tap, splice, or termination is made. Conductor identification must be by color-coded insulated conductors, plastic-coated self-sticking printed markers, colored nylon cable ties and plates, heat shrink type sleeves, or colored electrical tape. Control circuit terminations must be properly identified. Color must be green for grounding conductors and white for neutrals; except where neutrals of more than one system are installed in same raceway or box, other neutrals must be white with a different colored (not green) stripe for each. Color of ungrounded conductors in different voltage systems must be as follows:

a. 208/120 volt, three-phase
   (1) Phase A - black
   (2) Phase B - red
   (3) Phase C - blue

b. 480/277 volt, three-phase
   (1) Phase A - brown
   (2) Phase B - orange
   (3) Phase C - yellow

c. 120/240 volt, single phase: Black and red

[ d. On three-phase, four-wire delta system, high leg must be orange, as required by NFPA 70.]

2.4.1 Heat Shrinkable Splice

Provide heat shrinkable splice insulation by means of a thermoplastic adhesive sealant material applied in accordance with the manufacturer's written instructions.
2.4.2 Cold Shrink Rubber Splice

Provide a cold-shrink rubber splice which consists of EPDM rubber tube which has been factory stretched onto a spiraled core which is removed during splice installation. The installation must not require heat or flame, or any additional materials such as covering or adhesive. It must be designed for use with inline compression type connectors, or indoor, outdoor, direct-burial or submerged locations.

2.5 MEDIUM VOLTAGE CABLE

Cable (conductor) sizes are designated by American Wire Gauge (AWG) and Thousand Circular Mils (Kcmil). Conductor and conduit sizes indicated are for copper conductors unless otherwise noted. Insulated conductors must have the date of manufacture and other identification imprinted on the outer surface of each cable at regular intervals throughout cable length. Wires and cables manufactured more than [24][12] months prior to date of delivery to the site are not acceptable. Provide single conductor type cables unless otherwise indicated.

2.5.1 Cable Configuration

**************************************************************************
NOTE: For Navy projects, use type MV only and delete requirements for concentric neutrals throughout.
**************************************************************************

**************************************************************************
NOTE: For Army and Air Force projects:

The two most commonly produced/specifed medium voltage cables are Type MV (as described in UL 1072) and underground distribution ("UD/URD"), commonly used by electrical utilities. Type MV is a type designation recognized by NFPA 70 because it is UL listed. "UD/URD" is not a recognized type designation because it is utilized primarily by electrical utilities, who are not governed by NFPA 70 and for whom a UL listed cable adds unnecessary expense. Both type MV and "UD/URD" can be specified for use in duct or direct buried. In addition to the standard MV-90, NFPA 70 also lists an MV-105 temperature rating. However, MV-105 is not available from all manufacturers. Provide MV-105, only if needed.

Use either Type MV or "UD/URD" in ducts, keeping in mind that the concentric neutral affects bending radius and pulling tensions, therefore limiting the maximum pull and distance between manholes. Use "UD" for direct buried applications.

Choose 133 percent insulation level on 5 kV, 15 kV and 25 kV rated cables.
**************************************************************************

Provide [Type MV cable, conforming to NEMA WC 74/ICEA S-93-639 and UL 1072] [concentric neutral underground distribution cable conforming to
ICEA S-94-649] metallic armored cables, consisting of three-conductor, multi-conductor cables, with insulation and shielding, as specified, using [a galvanized steel][an aluminum] interlocked tape armor and thermoplastic jacket. Provide cables manufactured for use in [duct] or [direct burial] applications [as indicated]. Cable must be rated [5 kV][15 kV][25 kV][28 kV][35 kV] [as indicated] with [100][133] percent insulation level.

### 2.5.2 Conductor Material

**NOTE:** Provide aluminum conductors for new underground circuits and extensions of existing circuits. Select Type AA-8000 for type MV cable. Select 1350 for "UD/URD" cable. This includes all new medium voltage systems designs that do not require interface (splicing copper to aluminum in underground structures) with existing copper infrastructure. Refer to UFC 3-550-01, "Exterior Electrical Power Distribution" paragraph entitled "Underground Electrical Systems" for additional guidance.

**NOTE:** A concentric compressed conductor has a diameter that is 3 percent less than a regular concentric conductor. A compact conductor has a diameter that is 10 percent less than a regular concentric conductor. Edit to specify compact conductors where necessary to limit duct fill (i.e. where new conductors are installed in existing ducts).

Provide concentric-lay-stranded, Class B[ compact round] conductors. Provide [aluminum alloy Type AA-8000 aluminum conductors complying with ASTM B800 and ASTM B801][ aluminum alloy 1350 cables, 3/4 hard minimum complying with ASTM B609/B609M and ASTM B231/B231M for regular concentric and compressed stranding or ASTM B400/B400M for compacted stranding][ soft drawn copper cables complying with ASTM B3 and ASTM B8 for regular concentric and compressed stranding or ASTM B4096 for compact stranding].

### 2.5.3 Insulation

**NOTE:** For projects which require multiple types of insulations, or special types of cables, such as submarine cable, indicate the type for each cable on the project drawings. Choose XLP or tree retardant XLP for "UD or URD" cable and either XLP or EPR for Type MV cable.

Choose AEIC CS8, except for concentric neutral cable only, choose ICEA S-94-649.

Provide [ethylene-propylene-rubber (EPR) insulation conforming to the requirements of ANSI/NEMA WC 71/ICEA S-96-659] and [AEIC CS8][ICEA S-94-649][tree-retardant cross-linked thermosetting polyethylene (XLP) insulation]
conforming to the requirements of NEMA WC 74/ICEA S-93-639 and [AEIC CS8][ICEA S-94-649].

2.5.4 Shielding

******************************************************************************
NOTE: Choose tape shielding unless wire shielding is allowed or required by the Activity.
******************************************************************************

Cables rated for 2 kV and above must have a semiconducting conductor shield, a semiconducting insulation shield, and an overall copper[ tape][or] wire shield for each phase.

2.5.5 Neutrals

******************************************************************************
NOTE: Use first bracketed sentence for type MV cable and second bracketed sentence for type UD/URD cable.
******************************************************************************

In second bracketed sentence, select full ampacity concentric neutral for single-phase applications and one-third ampacity for three-phase applications.

Include the last bracketed sentence where high impedance grounded neutral systems are employed.

******************************************************************************
[ Neutral conductors must be [copper][aluminum], employing the same insulation and jacket materials as phase conductors, except that a 600-volt insulation rating is acceptable.][Concentric neutrals conductors must be copper, having a combined ampacity [equal to][1/3 of] the phase conductor ampacity rating.][ For high impedance grounded neutral systems, the neutral conductors from the neutral point of the transformer or generator to the connection point at the impedance must utilize [copper][aluminum] conductors, employing the same insulation level and construction as the phase conductors.

]2.5.6 Jackets

******************************************************************************
NOTE: PVC is acceptable for duct applications. Polyethylene (LLDPE) is exceptional for direct burial and in duct applications where there is significant amounts of water. There are many other types of jacket materials available (neoprene, hypalon, thermoplastic CPE) for special environments involving exposure to sunlight, petroleum products, and corrosive chemicals. Consult local cable representatives to specify the appropriate jacket for the application.
******************************************************************************

Choose the last bracketed sentence when PVC is specified.

******************************************************************************
Provide cables with a [PVC][_____] jacket.[ Direct buried cables must be rated for direct burial.][ Provide type UD cables with an overall jacket.]
[ Provide PVC jackets with a separator that prevents contact with underlying semiconducting insulating shield.]

2.6 MEDIUM VOLTAGE CABLE TERMINATIONS

******************************************************************************
NOTE: Specification sections for equipment, such as pad-mounted transformers, SF-6 switches, and unit substations, contain paragraphs for terminations, and have not been updated to coordinate with this specification section. When this paragraph is used only for that equipment, specify terminations either in that section or in this section, and delete paragraph from the other section.
******************************************************************************

******************************************************************************
NOTE: Provide indoor terminator/outdoor terminations with skirts. By including skirts for "indoor" and "within equipment" locations, tracking resistance is significantly improved. Provision of skirts for indoor terminations automatically makes them IEEE 48 Class 1.
******************************************************************************

IEEE 48 Class 1; of the molded elastomer, prestretched elastomer, or heat-shrinkable elastomer. Acceptable elastomers are track-resistant silicone rubber or track-resistant ethylene propylene compounds, such as ethylene propylene rubber or ethylene propylene diene monomer. Separable insulated connectors may be used for apparatus terminations, when such apparatus is provided with suitable bushings. Terminations, where required, must be provided with mounting brackets suitable for the intended installation and with grounding provisions for the cable shielding, metallic sheath, or armor. Terminations must be provided in a kit, including: skirts, stress control terminator, ground clamp, connectors, lugs, and complete instructions for assembly and installation. Terminations must be the product of one manufacturer, suitable for the type, diameter, insulation class and level, and materials of the cable terminated. Do not use separate parts of copper or copper alloy in contact with aluminum alloy parts in the construction or installation of the terminator.

2.6.1 Cold-Shrink Type

Terminator must be a one-piece design, utilizing the manufacturer's latest technology, where high-dielectric constant (capacitive) stress control is integrated within a skirted insulator made of silicone rubber. Termination must not require heat or flame for installation. Termination kit must contain all necessary materials (except for the lugs). Termination must be designed for installation in low or highly contaminated indoor and outdoor locations and must resist ultraviolet rays and oxidative decomposition.

2.6.2 Heat Shrinkable Type

Terminator must consist of a uniform cross section heat shrinkable polymeric construction stress relief tubing and environmentally sealed outer covering that is nontracking, resists heavy atmospheric contaminants, ultra violet rays and oxidative decomposition. Provide heat shrinkable sheds or skirts of the same material. Termination must be designed for
installation in low or highly contaminated indoor or outdoor locations.

[2.6.3 Separable Insulated Connector Type

**************************************************************************

NOTE: Coordinate the connector ratings required with the equipment specification for transformers and switches.

Separable connectors must not be used in manholes.

**************************************************************************

IEEE 386. Provide connector with steel reinforced hook-stick eye, grounding eye, test point, and arc-quenching contact material. Provide connectors of the loadbreak or deadbreak type as indicated, of suitable construction for the application and the type of cable connected, and that include cable shield adaptors. Provide external clamping points and test points. Separable connectors must not be used in manholes/handholes.

[ a. 200 Ampere loadbreak connector ratings: Voltage: [15 kV, 95 kV BIL][25 kV, 125 kV BIL][35 kV, 150 kV BIL]. Short time rating: 10,000 rms symmetrical amperes.
]

**************************************************************************

NOTE: For Navy projects, provide 200 ampere bushing interface on all 600 ampere connectors.

**************************************************************************

[b. 600 Ampere deadbreak connector ratings: Voltage: [15 kV, 95 kV BIL][25 kV, 125 kV BIL][35 kV, 150 kV BIL]. Short time rating: 25,000 rms symmetrical amperes. Connectors must have 200 ampere bushing interface[ for surge arresters][ as indicated].]

**************************************************************************

NOTE: Include the following paragraph only when the activity requires additional grounding elbows and feed-thru inserts.

**************************************************************************

[c. Provide[ [one][_____] set[s] of three grounding elbows][ and][ [one][_____] set[s] of three feed-thru inserts]. Deliver [grounding elbows][ and ][feed-thru inserts] to the Contracting Officer.
]

**************************************************************************

NOTE: Include the following paragraph only when the activity requires faulted circuit indicators.

**************************************************************************

[d. Install one set of faulted circuit indicators on the test points of each set of separable insulated connectors. Faulted circuit indicators must comply with IEEE 495. Indicators must be self powered; with automatic trip with mechanical flag indication upon overcurrent followed by loss of system voltage, and automatic reset upon restoration of system voltage. Indicators must be compact, sealed corrosion resistant construction with provision for hotstick installation and operation.

SECTION 33 71 02 Page 27
2.7 MEDIUM VOLTAGE CABLE JOINTS

Provide joints (splices) in accordance with IEEE 404 suitable for the rated voltage, insulation level, insulation type, and construction of the cable. Joints must be certified by the manufacturer for waterproof, submersible applications. Upon request, supply manufacturer’s design qualification test report in accordance with IEEE 404. Connectors for joint must be tin-plated electrolytic copper, having ends tapered and having center stops to equalize cable insertion.

2.7.1 Heat-Shrinkable Joint

Consists of a uniform cross-section heat-shrinkable polymeric construction with a linear stress relief system, a high dielectric strength insulating material, and an integrally bonded outer conductor layer for shielding. Replace original cable jacket with a heavy-wall heat-shrinkable sleeve with hot-melt adhesive coating.

2.7.2 Cold-Shrink Rubber-Type Joint

Joint must be of a cold shrink design that does not require any heat source for its installation. Splice insulation and jacket must be of a one-piece factory formed cold shrink sleeve made of black EPDM rubber. Splice must be packaged three splices per kit, including complete installation instructions.

2.8 TELECOMMUNICATIONS CABELING

Provide telecommunications cabling in accordance with Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP).

2.9 LIVE END CAPS

******************************************************************************
NOTE: Live end caps are only required when cable is required to remain unterminated, but energized. Live end cap locations must be indicated on the drawings.
******************************************************************************

Provide live end caps using a "kit" including a heat-shrinkable tube and a high dielectric strength, polymeric plug overlapping the conductor. End cap must conform to applicable portions of IEEE 48.

2.10 TAPE

2.10.1 Insulating Tape

UL 510, plastic insulating tape, capable of performing in a continuous temperature environment of 80 degrees C.

2.10.2 Buried Warning and Identification Tape

******************************************************************************
NOTE: For Navy projects, use Section 31 23 00.00 20, EXCAVATION AND FILL.
******************************************************************************

Provide detectable tape in accordance with Section [31 23 00.00 20]
EXCAVATION AND FILL] [31 00 00 EARTHWORK].

2.10.3 Fireproofing Tape

******************************************************************************
NOTE: Provide the following paragraph where medium voltage cable (2200 volts or greater) is installed in manholes, handholes and vaults.
******************************************************************************

Provide tape composed of a flexible, conformable, unsupported intumescent elastomer. Tape must be not less than 0.762 mm .030 inch thick, noncorrosive to cable sheath, self-extinguishing, noncombustible, adhesive-free, and must not deteriorate when subjected to oil, water, gases, salt water, sewage, and fungus.

2.11 PULL ROPE

Plastic or flat pull line (bull line) having a minimum tensile strength of 890 N 200 pounds.

2.12 GROUNDING AND BONDING

2.12.1 Driven Ground Rods

******************************************************************************
NOTE: Provide solid copper ground rods when soil conditions are corrosive.
******************************************************************************

Provide [copper-clad steel ground rods conforming to UL 467][solid copper ground rods conforming to UL 467][solid stainless steel ground rods] not less than [ 19 mm 3/4 inch] in diameter by [ 3.1 m 10 feet] in length. Sectional type rods may be used for rods 20 feet or longer.

2.12.2 Grounding Conductors

Stranded-bare copper conductors must conform to ASTM B8, Class B, soft-drawn unless otherwise indicated. Solid-bare copper conductors must conform to ASTM B1 for sizes No. 8 and smaller. Insulated conductors must be of the same material as phase conductors and green color-coded, except that conductors must be rated no more than 600 volts. Aluminum is not acceptable.

2.13 CAST-IN-PLACE CONCRETE

******************************************************************************
NOTE: Use the first bracketed paragraph when project includes a concrete section in Division 3; otherwise, the second bracketed paragraph may be used. Coordinate requirements with Section 03 30 00 CAST-IN-PLACE CONCRETE.
******************************************************************************

Provide concrete in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. In addition, provide concrete for encasement of underground ducts with 20 MPa 3000 psi minimum 28-day compressive strength. Concrete associated with electrical work for other than encasement of underground ducts must be 30 MPa 4000 psi minimum 28-day compressive strength unless
specified otherwise.

2.14 UNDERGROUND STRUCTURES

**************************************************************************
NOTE: Edit this paragraph to comply with project requirements concerning the type of structure or duct, strength of concrete, concrete mix, metal accessories, and excavating and grading. Indicate special reinforcing where required, particularly with duct banks of non-rectangular cross-section. Contact local telephone company, where applicable, concerning the size of all signal manholes and the number and type of signal duct required. Determine availability since aircraft or H20 highway loadings may not be available in precast.

For Navy projects only, see standard sketches UG-1 through UG-7, covering manholes and handholes located at http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms. Include the required sketches on the project drawings.
**************************************************************************

Provide precast concrete underground structures or standard type cast-in-place manhole types as indicated, conforming to ASTM C857 and ASTM C478M ASTM C478. Top, walls, and bottom must consist of reinforced concrete. Walls and bottom must be of monolithic concrete construction. Locate duct entrances and windows near the corners of structures to facilitate cable racking. Covers must fit the frames without undue play. Form steel and iron to shape and size with sharp lines and angles. Castings must be free from warp and blow holes that may impair strength or appearance. Exposed metal must have a smooth finish and sharp lines and arises. Provide necessary lugs, rabbets, and brackets. Set pulling-in irons and other built-in items in place before depositing concrete. Install a pulling-in iron in the wall opposite each duct line entrance. Cable racks, including rack arms and insulators, must be adequate to accommodate the cable.

2.14.1 Cast-In-Place Concrete Structures

**************************************************************************
NOTE: Edit bracketed items at designer's discretion and as required where aircraft loading is in project.
**************************************************************************

Concrete must conform to Section 03 30 00 CAST-IN-PLACE CONCRETE.[ Construct walls on a footing of cast-in-place concrete except that precast concrete base sections may be used for precast concrete manhole risers.][ Concrete block must conform to ASTM C139 and Section 04 20 00, MASONRY.][ Concrete block is not allowed in areas subject to aircraft loading.]

2.14.2 Precast Concrete Structures, Risers and Tops

Precast concrete underground structures may be provided in lieu of cast-in-place subject to the requirements specified below. Precast units must be the product of a manufacturer regularly engaged in the manufacture of precast concrete products, including precast manholes.
2.14.2.1 General

Precast concrete structures must have the same accessories and facilities as required for cast-in-place structures. Likewise, precast structures must have plan area and clear heights not less than those of cast-in-place structures. Concrete materials and methods of construction must be the same as for cast-in-place concrete construction, as modified herein. Slope in floor may be omitted provided precast sections are poured in reinforced steel forms. Concrete for precast work must have a 28-day compressive strength of not less than 30 MPa (4000 psi). Structures may be precast to the design and details indicated for cast-in-place construction, precast monolithically and placed as a unit, or structures may be assembled sections, designed and produced by the manufacturer in accordance with the requirements specified. Structures must be identified with the manufacturer's name embedded in or otherwise permanently attached to an interior wall face.

2.14.2.2 Design for Precast Structures

ACI 318M. In the absence of detailed on-site soil information, design for the following soil parameters/site conditions:

a. Angle of Internal Friction (phi) = 0.523 rad (30 degrees)

b. Unit Weight of Soil (Dry) = 1760 kg/m³ (110 pcf), (Saturated) = 2080 kg/m³ (130 pcf)

c. Coefficient of Lateral Earth Pressure (Ka) = 0.33

d. Ground Water Level = 915 mm (3 feet) below ground elevation

**************************************************************************

NOTE: Specify H20 highway loading for most locations. Revise as required if loading in excess of H20 highway loading is required.

Indicate structures subject to aircraft loading on the drawings. Also show structure design requirements on the drawings. Decks and covers subject to aircraft loadings must be designed for loadings per FAA AC-150/5320-6 except as follows:

a. Covers must be designed for 45,000 kg (100,000 lb) wheel loads with 1.72 MPa (250 psi) tire pressure.

b. For spans of less than 0.6 m (2 feet) in the least direction, a uniform live load of 2.24 Mpa (325 psi) must be used.

c. For spans of 0.6 m (2 feet) or greater in the least direction, the design must be based on the number of wheels which will fit the span. Wheel loads of 34,000 kg (75,000 pounds) each must be used.

**************************************************************************

e. Vertical design loads must include full dead, superimposed dead, and live loads including a 30 percent magnification factor for impact. Live loads must consider all types and magnitudes of vehicular...
(automotive, industrial, or aircraft) traffic to be encountered. The minimum design vertical load must be for H20 highway loading per AASHTO HB-17.

f. Horizontal design loads must include full geostatic and hydrostatic pressures for the soil parameters, water table, and depth of installation to be encountered. Also, horizontal loads imposed by adjacent structure foundations, and horizontal load components of vertical design loads, including impact, must be considered, along with a pulling-in iron design load of 26,700 N 6000 pounds.

g. Each structural component must be designed for the load combination and positioning resulting in the maximum shear and moment for that particular component.

h. Design must also consider the live loads induced in the handling, installation, and backfilling of the manholes. Provide lifting devices to ensure structural integrity during handling and installation.

2.14.2.3 Construction

Structure top, bottom, and wall must be of a uniform thickness of not less than 150 mm 6 inches. Thin-walled knock-out panels for designed or future duct bank entrances are not permitted. Provide quantity, size, and location of duct bank entrance windows as directed, and cast completely open by the precaster. Size of windows must exceed the nominal duct bank envelope dimensions by at least 305 mm 12 inches vertically and horizontally to preclude in-field window modifications made necessary by duct bank misalignment. However, the sides of precast windows must be a minimum of 150 mm 6 inches from the inside surface of adjacent walls, floors, or ceilings. Form the perimeter of precast window openings to have a keyed or inward flared surface to provide a positive interlock with the mating duct bank envelope. Provide welded wire fabric reinforcing through window openings for in-field cutting and flaring into duct bank envelopes. Provide additional reinforcing steel comprised of at least two No. 4 bars around window openings. Provide drain sumps a minimum of 305 mm 12 inches in diameter and 100 mm 4 inches deep for precast structures.

2.14.2.4 Joints

Provide tongue-and-groove joints on mating edges of precast components. Shiplap joints are not allowed. Design joints to firmly interlock adjoining components and to provide waterproof junctions and adequate shear transfer. Seal joints watertight using preformed plastic strip conforming to ASTM C990M ASTM C990. Install sealing material in strict accordance with the sealant manufacturer's printed instructions. Provide waterproofing at conduit/duct entrances into structures, and where access frame meets the top slab, provide continuous grout seal.

2.14.3 Manhole Frames and Covers

**************************************************************************
NOTE: CID A-A-60005 is used below as a requirement for manhole frames and covers. Although this document has been withdrawn by GSA, it is still used as a requirement because manufacturers still use it as a design guide.
**************************************************************************
Provide cast iron frames and covers for manholes conforming to CID A-A-60005. Cast the words "ELECTRIC" or "TELECOMMUNICATIONS" in the top face of power and telecommunications manhole covers, respectively.

2.14.4 **Handhole Frames and Covers**

Frames and covers of steel must be welded by qualified welders in accordance with standard commercial practice. Steel covers must be rolled-steel floor plate having an approved antislip surface. Hinges must be of [stainless steel with bronze hinge pin] [wrought steel], 125 by 125 mm 5 by 5 inches by approximately 4.75 mm 3/16 inch thick, without screw holes, and must be for full surface application by fillet welding. Hinges must have nonremovable pins and five knuckles. The surfaces of plates under hinges must be true after the removal of raised antislip surface, by grinding or other approved method.

2.14.5 **Frames and Covers for Airfield Facilities**

**************************************************************************
NOTE: Use this paragraph for structures subject to aircraft loading.
**************************************************************************

Fabricate frames and covers for airfield use of standard commercial grade steel welded by qualified welders in accordance with AWS D1.1/D1.1M. Covers must be of rolled steel floor plate having an approved anti-slip surface. Steel frames and covers must be hot dipped galvanized after fabrication.

2.14.6 **Ductile Iron Frames and Covers for Airfield Facilities**

**************************************************************************
NOTE: As an option, the designer may also allow the use of this paragraph for structures subject to aircraft loading.
**************************************************************************

At the contractor's option, ductile iron covers and frames designed for a minimum proof load of 45,000 kg 100,000 pounds may be provided in lieu of the steel frames and covers indicated. Covers must be of the same material as the frames (i.e. ductile iron frame with ductile iron cover, galvanized steel frame with galvanized steel cover). Perform proof loading in accordance with CID A-A-60005 and ASTM A48/A48M. Proof loads must be physically stamped into the cover. Provide the Contracting Officer copies of previous proof load test results performed on the same frames and covers as proposed for this contract. Modify the top of the structure to accept the ductile iron structure in lieu of the steel structure indicated. The finished structure must be level and non-rocking, with the top flush with the surrounding pavement.

2.14.7 **Brick for Manhole Collar**

Provide sewer and manhole brick conforming to ASTM C32, Grade MS.

2.14.8 **Composite/Fiberglass Handholes and Covers**

ANSI/SCTE 77. Provide handholes and covers of polymer concrete, reinforced with heavy weave fiberglass with a design load (Tier rating) appropriate for or greater than the intended use. All covers are required to have the
Tier level rating embossed on the surface and this rating must not exceed the design load of the box.

2.15 CABLE SUPPORTS (RACKS, ARMS, AND INSULATORS)

The metal portion of racks and arms must be zinc-coated after fabrication.

2.15.1 Cable Rack Stanchions

The wall bracket or stanchion must be 100 mm 4 inches by approximately 38 mm by 4.76 mm 1-1/2 inch by 3/16 inch channel steel, or 100 mm 4 inches by approximately 25 mm 1 inch glass-reinforced nylon with recessed bolt mounting holes, 1220 mm 48 inches long (minimum) in manholes. Slots for mounting cable rack arms must be spaced at 200 mm 8 inch intervals.

2.15.2 Rack Arms

Cable rack arms must be steel or malleable iron or glass reinforced nylon and must be of the removable type. Rack arm length must be a minimum of 200 mm 8 inches and a maximum of 305 mm 12 inches.

2.15.3 Insulators

Insulators for metal rack arms must be dry-process glazed porcelain. Insulators are not required for nylon arms.

2.16 CABLE TAGS IN MANHOLES

**************************************************************************
NOTE: Verify cable labeling requirements with the local Activity.
**************************************************************************

Provide tags for each power cable located in manholes. The tags must be polyethylene. Do not provide handwritten letters. The first position on the power cable tag must denote the voltage. The second through sixth positions on the tag must identify the circuit. The next to last position must denote the phase of the circuit and include the Greek "phi" symbol. The last position must denote the cable size. As an example, a tag could have the following designation: "11.5 NAS 1-8(Phase A)500," denoting that the tagged cable is on the 11.5kV system circuit number NAS 1-8, underground, Phase A, sized at 500 kcmil.

2.16.1 Polyethylene Cable Tags

Provide tags of polyethylene that have an average tensile strength of 22.4 MPa 3250 pounds per square inch; and that are 2 millimeter 0.08 inch thick (minimum), non-corrosive non-conductive; resistive to acids, alkalis, organic solvents, and salt water; and distortion resistant to 77 degrees C 170 degrees F. Provide 1.3 mm 0.05 inch (minimum) thick black polyethylene tag holder. Provide a one-piece nylon, self-locking tie at each end of the cable tag. Ties must have a minimum loop tensile strength of 778.75 N 175 pounds. The cable tags must have black block letters, numbers, and symbols 25 mm one inch high on a yellow background. Letters, numbers, and symbols must not fall off or change positions regardless of the cable tags' orientation.
2.17 MEDIUM VOLTAGE ABOVE GROUND CABLE TERMINATING CABINETS

**************************************************************************
NOTE: Cable terminating cabinets may be used for above ground applications only. They may be utilized in place of manholes for cable splicing where the local water table does not allow for manhole drainage, or in limited applications where it is desirable to provide a dead-break circuit sectionalizing point for circuit isolation. Loadbreak connectors are not available for applications above 200 A.
**************************************************************************

Cable terminating cabinets must be hook-stick operable, deadfront construction conforming to the requirements of IEEE C37.20.3, Category A. Provide cabinets with [200 A. loadbreak junctions and elbow-type separable loadbreak connectors, cable parking stands, and grounding lugs][600 A. dead-break junctions and elbow-type separable dead-break connectors, cable parking stands, and grounding lugs]. Provide cable terminating equipment in conformance with IEEE 386.

Ratings at 60 Hz must be:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nominal voltage (kV)</td>
<td>[_____]</td>
</tr>
<tr>
<td>Rated maximum voltage (kV)</td>
<td>[(15)[25][35]]</td>
</tr>
<tr>
<td>Rated continuous current (A)</td>
<td>[(200)[600]]</td>
</tr>
<tr>
<td>One-second short-time current-carrying capacity (kA)</td>
<td>[_____]</td>
</tr>
<tr>
<td>BIL (kV)</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

2.18 LOW VOLTAGE ABOVE GROUND TERMINATION PEDESTAL

Provide copolymer polypropylene, low voltage above ground termination pedestal manufactured through an injection molding process. Pedestals must resist fertilizers, salt air environments and ultra-violet radiation. Pedestal top must be imprinted with a "WARNING" and "ELECTRIC" identification. Pedestal must contain [three][four] lay-in six port connectors. Connectors must be NEMA C119.4, Class "A", dual rated for aluminum or copper, and capable of terminating conductors ranging from 10 AWG to 500 kcmil. Protect each connector with a clear, hard lexan (plastic) cover. Pedestal must be provided with rust-free material and stainless steel hardware. Pedestal must be lockable.

2.19 PROTECTIVE DEVICES AND COORDINATION

**************************************************************************
NOTE: Do not use on Navy Projects. Per UFC 3-501-01, "Electrical Engineering", the designer of record is responsible for providing a design stage and a final coordination study based on as built conditions.
**************************************************************************
For the Army and Air Force, the designer is responsible for specifying the requirement for fuses, circuit breakers, protective relays, or other protective devices associated with the project and depicting them on the drawings. Select and specify the protective devices to protect electrical power system conductors or equipment against sustained overloads, in-rush conditions, electrical faults, or other abnormal power system or equipment operating conditions, in accordance with IEEE 242, and IEEE 141. Utilize section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION and coordinate the incorporation of the protective device requirements identified in the other equipment specification sections.

******************************************************************************

Provide protective devices and coordination as specified in Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

2.20 SOURCE QUALITY CONTROL

2.20.1 Arc-Proofing Test for Cable Fireproofing Tape

Manufacturer must test one sample assembly consisting of a straight lead tube 305 mm 12 inches long with a 65.5 mm 2 1/2 inch outside diameter, and a 3.175 mm 1/8 inch thick wall, and covered with one-half lap layer of arc and fireproofing tape per manufacturer's instructions. The arc and fireproofing tape must withstand extreme temperature of a high-current fault arc 13,000 degrees K for 70 cycles as determined by using an argon directed plasma jet capable of constantly producing and maintaining an arc temperature of 13,000 degrees K. Temperature (13,000 degrees K) of the ignited arc between the cathode and anode must be obtained from a dc power source of 305 (plus or minus 5) amperes and 20 (plus or minus 1) volts. The arc must be directed toward the sample assembly accurately positioned 5 (plus or minus 1) millimeters downstream in the plasma from the anode orifice by fixed flow rate of argon gas (0.18 g per second). Each sample assembly must be tested at three unrelated points. Start time for tests must be taken from recorded peak current when the specimen is exposed to the full test temperature. Surface heat on the specimen prior to that time must be minimal. The end point is established when the plasma or conductive arc penetrates the protective tape and strikes the lead tube. Submittals for arc-proofing tape must indicate that the test has been performed and passed by the manufacturer.

2.20.2 Medium Voltage Cable Qualification and Production Tests

Results of AEIC CS8 qualification and production tests as applicable for each type of medium voltage cable.

PART 3 EXECUTION

3.1 INSTALLATION

******************************************************************************

NOTE: Soil treatment for termite control must conform to Section 31 31 16.13 CHEMICAL TERMITE CONTROL, except that application to direct burial
cable installation must be as specified. In lieu of 
soil poisoning, cable in direct-buried EPC-40-PVC 
conduit can be a more economical and practical way 
of protecting cable from termites.

**************************************************************************

NOTE: CALPUC publication applies only to State of 
California Public Utilities Commission CALPUC 
G.0.128, "Construction of Underground Electric 
Supply and Communication System" for underground 
electrical work. For other states, delete this 
publication and insert other publications which 
govern underground electrical work for that state. 
Revise reference paragraph to include deletion or 
adoption of state publication.

**************************************************************************

Install equipment and devices in accordance with the manufacturer's 
published instructions and with the requirements and recommendations of 
NFPA 70 and IEEE C2[ and CALPUC G.0.128] as applicable. In addition to 
these requirements, install telecommunications in accordance with TIA-758 
and RUS Bull 1751F-644.

3.2 CABLE INSPECTION

Inspect each cable reel for correct storage positions, signs of physical 
damage, and broken end seals prior to installation. If end seal is broken, 
remove moisture from cable prior to installation in accordance with the 
cable manufacturer's recommendations.

3.3 CABLE INSTALLATION PLAN AND PROCEDURE

**************************************************************************

NOTE: Use this paragraph when pulling cable between 
manholes. Do not use this paragraph when only 
installing between poles and manholes

Choose checklist for small electrical distribution 
jobs, and calculations for large jobs.

**************************************************************************

Obtain from the manufacturer an installation manual or set of instructions 
which addresses such aspects as cable construction, insulation type, cable 
diameter, bending radius, cable temperature limits for installation, 
lubricants, coefficient of friction, conduit cleaning, storage procedures, 
moisture seals, testing for and purging moisture, maximum allowable pulling 
tension, and maximum allowable sidewall bearing pressure. [Prepare a 
checklist of significant requirements] [Perform pulling calculations and 
prepare a pulling plan] and submit along with the manufacturer's 
instructions in accordance with SUBMITTALS. Install cable strictly in 
accordance with the cable manufacturer's recommendations and the approved 
installation plan.

[Calculations and pulling plan must include:

a. Site layout drawing with cable pulls identified in numeric order of 
expected pulling sequence and direction of cable pull.
b. List of cable installation equipment.

c. Lubricant manufacturer's application instructions.

d. Procedure for resealing cable ends to prevent moisture from entering cable.

e. Cable pulling tension calculations of all cable pulls.

f. Cable percentage conduit fill.

g. Cable sidewall bearing pressure.

h. Cable minimum bend radius and minimum diameter of pulling wheels used.

i. Cable jam ratio.

j. Maximum allowable pulling tension on each different type and size of conductor.

k. Maximum allowable pulling tension on pulling device.

3.4 UNDERGROUND FEEDERS SUPPLYING BUILDINGS

**************************************************************************
NOTE: For Navy only, choose PVC.
**************************************************************************

Terminate underground feeders supplying building at a point 1525 mm 5 feet outside the building and projections thereof, except that conductors must be continuous to the terminating point indicated. Coordinate connections of the feeders to the service entrance equipment with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide [PVC, Type EPC-40][IMC][RGS] conduit from the supply equipment to a point 1525 mm 5 feet outside the building and projections thereof. Protect ends of underground conduit with plastic plugs until connections are made.

Encase the underground portion of the conduit in a concrete envelope and bury as specified for underground duct with concrete encasement.

3.5 UNDERGROUND STRUCTURE CONSTRUCTION

**************************************************************************
NOTE: Edit this paragraph to comply with project requirements concerning the type of structure, strength of concrete, concrete mix, metal accessories, and excavating and grading. Indicate special reinforcing where required. Contact local telephone company, where applicable, concerning the size of all signal manholes and the number and type of signal duct required. Determine availability since H2O or aircraft loadings may not be available in precast.

For Navy projects, see standard sketches UG-1 through UG-7 covering manholes and handholes. Include the required sketches on the project drawings.

**************************************************************************
Provide standard type cast-in-place construction as specified herein and as
indicated, or precast construction as specified herein. Horizontal
concrete surfaces of floors must have a smooth trowel finish. Cure
cement by applying two coats of white pigmented membrane forming-curing
compound in strict accordance with the manufacturer's printed instructions,
except that precast concrete may be steam cured. Curing compound must
conform to ASTM C309. Locate duct entrances and windows in the center of
end walls (shorter) and near the corners of sidewalls (longer) to
facilitate cable racking and splicing. Covers for underground structures
must fit the frames without undue play. Steel and iron must be formed to
shape and size with sharp lines and angles. Castings must be free from
warp and blow holes that may impair strength or appearance. Exposed metal
must have a smooth finish and sharp lines and arises. Provide necessary
lugs, rabbets, and brackets. Set pulling-in irons and other built-in items
in place before depositing concrete. Manhole locations, as indicated, are
approximate. Coordinate exact manhole locations with other utilities and
finished grading and paving.

3.5.1 Cast-In-Place Concrete Structures

[Construct walls on a footing of cast-in-place concrete except that precast
cement base sections may be used for precast concret manhole
risers.][Provide concrete block conforming to ASTM C139 and Section 04 20 00
MASONRY.][Concrete block is not allowed in areas subject to aircraft
loading.]

3.5.2 Precast Concrete Construction

Set commercial precast structures on 150 mm 6 inches of level, 90 percent
compacted granular fill, 19 mm to 25 mm 3/4 inch to 1 inch size, extending
305 mm 12 inches beyond the structure on each side. Compact granular fill
by a minimum of four passes with a plate type vibrator. Installation must
additionally conform to the manufacturer's instructions.

3.5.3 Pulling-In Irons

Provide steel bars bent as indicated, and cast in the walls and floors.
Alternatively, pipe sleeves may be precast into the walls and floors where
required to accept U-bolts or other types of pulling-in devices possessing
the strengths and clearances stated herein. The final installation of
pulling-in devices must be made permanent. Cover and seal exterior
projections of thru-wall type pulling-in devices with an appropriate
protective coating. In the floor the irons must be a minimum of 150 mm 6
inches from the edge of the sump, and in the walls the irons must be
located within 150 mm 6 inches of the projected center of the duct bank
pattern or precast window in the opposite wall. However, the pulling-in
iron must not be located within 150 mm 6 inches of an adjacent interior
surface, or duct or precast window located within the same wall as the
iron. If a pulling-in iron cannot be located directly opposite the
Corresponding duct bank or precast window due to this clearance limitation,
locate the iron directly above or below the projected center of the duct
bank pattern or precast window the minimum distance required to preserve the
150 mm 6 inch clearance previously stated. In the case of directly
opposing precast windows, pulling-in irons consisting of a 915 mm 3 foot
length of No. 5 reinforcing bar, formed into a hairpin, may be
cast-in-place within the precast windows simultaneously with the end of the
corresponding duct bank envelope. Irons installed in this manner must be
positioned directly in line with, or when not possible, directly above or
below the projected center of the duct bank pattern entering the opposite wall, while maintaining a minimum clear distance of 75 mm 3 inches from any edge of the cast-in-place duct bank envelope or any individual duct. Pulling-in irons must have a clear projection into the structure of approximately 100 mm 4 inches and must be designed to withstand a minimum pulling-in load of 26,700 N 6000 pounds. Irons must be hot-dipped galvanized after fabrication.

3.5.4 Cable Racks, Arms and Insulators

Cable racks, arms and insulators must be sufficient to accommodate the cables. Space racks in power manholes not more than 915 mm 3 feet apart, and provide each manhole wall with a minimum of two racks. Space racks in signal manholes not more than 420 mm 16 1/2 inches apart with the end rack being no further than 305 mm 12 inches from the adjacent wall. Methods of anchoring cable racks must be as follows:

a. Provide a 15 mm diameter by 125 mm 5/8 inch diameter by 5 inch long anchor bolt with 75 mm 3 inch foot cast in structure wall with 50 mm 2 inch protrusion of threaded portion of bolt into structure. Provide 15 mm 5/8 inch steel square head nut on each anchor bolt. Coat threads of anchor bolts with suitable coating immediately prior to installing nuts.

b. Provide concrete channel insert with a minimum load rating of 1192 kg per meter 800 pounds per foot. Insert channel must be steel of the same length as "vertical rack channel;" channel insert must be cast flush in structure wall. Provide 15 mm 5/8 inch steel nuts in channel insert to receive 15 mm diameter by 75 mm 5/8 inch diameter by 3 inch long steel, square head anchor bolts.

c. Provide concrete "spot insert" at each anchor bolt location, cast flush in structure wall. Each insert must have minimum 365 kg 800 pound load rating. Provide 15 mm diameter by 75 mm 5/8 inch diameter by 3 inch long steel, square head anchor bolt at each anchor point. Coat threads of anchor bolts with suitable coating immediately prior to installing bolts.

3.5.5 Field Painting

**************************************************************************

NOTE: Edit to match products contained in Part 2. Choose cast-iron for most applications. Ductile iron or steel may be required for areas subject to heavy loading such as airfields or industrial areas.

**************************************************************************

Cast-iron frames and covers not buried in concrete or masonry must be cleaned of mortar, rust, grease, dirt and other deleterious materials, and given a coat of bituminous paint.

[3.6 DIRECT BURIAL CABLE SYSTEM

**************************************************************************

NOTE: Refer to UFC 3-550-01, "Exterior Electrical Power Distribution", for guidance on when direct buried wiring may be permitted.

**************************************************************************

Cables must be buried directly in the earth below the frostline [as
indicated] to the requirements of NFPA 70 and IEEE C2, whichever is more stringent).

3.6.1 Trenching

Excavate trenches for direct-burial cables to provide a minimum cable cover of 610 mm 24 inches below finished grade for power conductors operated at 600 volts or less, and 765 mm 30 inches below finished grade for over 600 volts in accordance with IEEE C2. When rock is encountered, remove to a depth of at least 75 mm 3 inches below the cable and fill the space with sand or clean earth free from particles larger than 6 mm 1/4 inch. Bottoms of trenches must be smooth and free of stones and sharp objects. Where materials in bottoms of trenches are other than sand, a 75 mm 3 inch layer of sand must be laid first and compacted to approximate densities of surrounding firm soil. Trenches must be not less than [150][200] mm [6][8] inches wide, and must be in straight lines between cable markers. [Cable plows must not be used.] Bends in trenches must have a radius [of not less than 915 mm 36 inches][consistent with the cable manufacturer's published minimum cable bending radius for the cable installed].

3.6.2 Cable Installation

**************************************************************************
NOTE: Where soil is known to be rocky, provide selected backfill for cable protection. Specify bend radius in accordance with NFPA 70.
**************************************************************************

Unreel cables along the sides of or in trenches and carefully place on sand or earth bottoms. Pulling cables into direct-burial trenches from a fixed reel position is not permitted, except as required to pull cables through conduits under paving or railroad tracks.

Where two or more cables are laid parallel in the same trench, space cables laterally at not less than 75 mm 3 inches apart, except that communication cable must be separated from power cable by a minimum distance of 305 mm 12 inches.

Where direct-burial cables cross under roads or other paving exceeding 1.5 m 5 feet in width, such cables must be installed in[ concrete-encased] ducts. Where direct-burial cables cross under railroad tracks, such cables must be installed in [reinforced concrete-encased ducts][ducts installed through rigid galvanized steel sleeves]. Ducts must extend at least 1.5 m 5 feet beyond each edge of any paving and at least 1.5 m 5 feet beyond each side of any railroad tracks. Cables may be pulled into duct from a fixed reel where suitable rollers are provided in the trench. Where direct burial cable transitions to duct-enclosed cable, direct-burial cables must be centered in duct entrances, and a waterproof nonhardening mastic compound must be used to facilitate such centering. If paving or railroad tracks are in place where cables are to be installed, coated rigid steel conduits driven under the paving or railroad tracks may be used in lieu of concrete-encased ducts. Prevent damage to conduit coatings by providing ferrous pipe jackets or by predrilling. Where cuts are made in any paving, the paving and subbase must be restored to their original condition. Where cable is placed in duct(e.g. under paved areas, roads, or railroads), slope ducts to drain.
3.6.3 Splicing

**************************************************************************
NOTE: Direct earth burial cables generally require direct burial splices. Observe marker slab requirements previously covered in this specification. Direct burial splices are allowable for NAVFAC projects only, do not specify for Army and Air Force Projects. For Army and Air Force projects, use the second bracketed option.
**************************************************************************

Provide cables in one piece without splices between connections except where the distance exceeds the lengths in which cables are manufactured. Where splices are required, provide splices designed and rated for direct burial. Where splices are required, install splices only in maintenance manholes/handholes or cabinets/pedestals.

3.6.4 Bends

Bends in cables must have an inner radius not less than those specified in NFPA 70 for the type of cable, or manufacturer's recommendation.

3.6.5 Horizontal Slack

Leave approximately 915 mm 3 feet of horizontal slack in the ground on each end of cable runs, on each side of connection boxes, and at points where connections are brought above ground. Where cable is brought above ground, leave additional slack to make necessary connections. Enclose splices in lead-sheathed or armored cables in split-type cast-iron splice boxes; after completion of the connection, fill with insulating filler compound and tightly clamp the box.

3.6.6 Identification Slabs (or Markers)

Provide a slab at each change of direction of cable, over the ends of ducts or conduits which are installed under paved areas and roadways[, over the ends of ducts or conduits stubbed out for future use][, and over each splice]. Identification slabs must be of concrete, approximately 500 mm square by 150 mm 20 inches square by 6 inches thick and must be set flat in the ground so that top surface projects not less than 20 mm 3/4 inch, nor more than 30 mm 1 1/4 inches above ground. Concrete must have a compressive strength of not less than 20 MPa 3000 psi and have a smooth troweled finish on exposed surface. Inscribe an identifying legend such as "electric cable," "telephone cable," "splice," or other applicable designation on the top surface of the slab before concrete hardens. Inscribe circuit identification symbols on slabs as indicated. Letters or figures must be approximately 50 mm 2 inches high and grooves must be approximately 6 mm 1/4 inch in width and depth. Install slabs so that the side nearest the inscription on top must include an arrow indicating the side nearest the cable. Provide color, type and depth of warning tape as specified in Section [31 23 00.00 20 EXCAVATION AND FILL][31 00 00 EARTHWORK].

3.7 UNDERGROUND CONDUIT AND DUCT SYSTEMS

3.7.1 Requirements

**************************************************************************
NOTE: Indicate direct buried conduit and concrete
Run conduit in straight lines except where a change of direction is necessary. Provide numbers and sizes of ducts as indicated. Provide a 4/0 AWG bare copper grounding conductor [below][above] medium-voltage distribution duct banks. Bond bare copper grounding conductor to ground rings (loops) in all manholes and to ground rings (loops) at all equipment slabs (pads). Route grounding conductor into manholes with the duct bank (sleeving is not required). Ducts must have a continuous slope downward toward underground structures and away from buildings, laid with a minimum slope of [75 mm][100 mm] per 30 m [3][4] inches per 100 feet. Depending on the contour of the finished grade, the high-point may be at a terminal, a manhole, a handhole, or between manholes or handholes. Provide ducts with end bells whenever duct lines terminate in structures.

Perform changes in ductbank direction as follows:

a. Short-radius manufactured 90-degree duct bends may be used only for pole or equipment risers, unless specifically indicated as acceptable.

b. The minimum manufactured bend radius must be 450 mm 18 inches for ducts of less than 80 mm 3 inch diameter, and 900 mm 36 inches for ducts 80 mm 3 inches or greater in diameter.

c. As an exception to the bend radius required above, provide field manufactured longsweep bends having a minimum radius of 7.6 m 25 feet for a change of direction of more than 5 degrees, either horizontally or vertically, using a combination of curved and straight sections. Maximum manufactured curved sections: 30 degrees.

3.7.2 Treatment

Ducts must be kept clean of concrete, dirt, or foreign substances during construction. Field cuts requiring tapers must be made with proper tools and match factory tapers. A coupling recommended by the duct manufacturer must be used whenever an existing duct is connected to a duct of different material or shape. Ducts must be stored to avoid warping and deterioration with ends sufficiently plugged to prevent entry of any water or solid substances. Ducts must be thoroughly cleaned before being laid. Plastic ducts must be stored on a flat surface and protected from the direct rays of the sun.

3.7.3 Conduit Cleaning

As each conduit run is completed, for conduit sizes 75 mm 3 inches and larger, draw a flexible testing mandrel approximately 305 mm 12 inches long with a diameter less than the inside diameter of the conduit through the conduit. After which, draw a stiff bristle brush through until conduit is clear of particles of earth, sand and gravel; then immediately install conduit plugs. For conduit sizes less than 75 mm 3 inches, draw a stiff bristle brush through until conduit is clear of particles of earth, sand and gravel; then immediately install conduit plugs.
3.7.4 Jacking and Drilling Under Roads and Structures

Conduits to be installed under existing paved areas which are not to be disturbed, and under roads and railroad tracks, must be zinc-coated, rigid steel, jacked into place. Where ducts are jacked under existing pavement, rigid steel conduit must be installed because of its strength. To protect the corrosion-resistant conduit coating, predrilling or installing conduit inside a larger iron pipe sleeve (jack-and-sleeve) is required. For crossings of existing railroads and airfield pavements greater than 15 m 50 feet in length, the predrilling method or the jack-and-sleeve method will be used. Separators or spacing blocks must be made of steel, concrete, plastic, or a combination of these materials placed not farther apart than 1.2 m 4 feet on centers. [Hydraulic jet method must not be used.]

[3.7.5 Galvanized Conduit Concrete Penetrations

Galvanized conduits which penetrate concrete (slabs, pavement, and walls) in wet locations must be PVC coated and must extend from at least 50 mm 2 inches within the concrete to the first coupling or fitting outside the concrete (minimum of 150 mm 6 inches from penetration).

]3.7.6 Multiple Conduits

Separate multiple conduits by a minimum distance of 75 mm 3 inches[, except that light and power conduits must be separated from control, signal, and telephone conduits by a minimum distance of [300] mm [12] inches]. Stagger the joints of the conduits by rows (horizontally) and layers (vertically) to strengthen the conduit assembly. Provide plastic duct spacers that interlock vertically and horizontally. Spacer assembly must consist of base spacers, intermediate spacers, ties, and locking device on top to provide a completely enclosed and locked-in conduit assembly. Install spacers per manufacturer's instructions, but provide a minimum of two spacer assemblies per 3050 mm 10 feet of conduit assembly.

3.7.7 Conduit Plugs and Pull Rope

New conduit indicated as being unused or empty must be provided with plugs on each end. Plugs must contain a weephole or screen to allow water drainage. Provide a plastic pull rope having 915 mm 3 feet of slack at each end of unused or empty conduits.

3.7.8 Conduit and Duct Without Concrete Encasement

Depths to top of the conduit must be not less than 610 mm 24 inches below finished grade. Provide not less than 75 mm 3 inches clearance from the conduit to each side of the trench. Grade bottom of trench smooth; where rock, soft spots, or sharp-edged materials are encountered, excavate the bottom for an additional 75 mm 3 inches, fill and tamp level with original bottom with sand or earth free from particles, that would be retained on a 6.25 mm 1/4 inch sieve. The first 150 mm 6 inch layer of backfill cover must be sand compacted as previously specified. The rest of the excavation must be backfilled and compacted in 75 to 150 mm 3 to 6 inch layers. Provide color, type and depth of warning tape as specified in Section [31 23 00.00 20 EXCAVATION AND FILL][31 00 00 EARTHWORK].

3.7.8.1 Encasement Under Roads and Structures

Under roads, paved areas, and railroad tracks, install conduits in concrete
encasement of rectangular cross-section providing a minimum of 75 mm 3 inch concrete cover around ducts. Concrete encasement must extend at least 1525 mm 5 feet beyond the edges of paved areas and roads, and 3660 mm 12 feet beyond the rails on each side of railroad tracks. Depths to top of the concrete envelope must be not less than 610 mm 24 inches below finished grade[, and under railroad tracks not less than 1270 mm 50 inches below the top of the rails].

[3.7.8.2 Directional Boring]

HDPE conduits must be installed below the frostline and as specified herein.

[For distribution voltages greater than 1000 volts and less than 34,500 volts, depths to the top of the conduit must not be less than 1220 mm 48 inches in pavement-covered areas and not less than 3050 mm 120 inches in non-pavement-covered areas.][ For distribution voltages less than 1000 volts, depths to the top of the conduit must not be less than 1220 mm 48 inches in pavement- or non-pavement-covered areas.][ For branch circuit wiring less than 600 volts, depths to the top of the conduit must not be less than 610 mm 24 inches in pavement- or non-pavement-covered areas.]

]3.7.9 Duct Encased in Concrete

**************************************************************************

NOTE: Edit this paragraph to comply with project requirements concerning type of structure or duct, strength of concrete, concrete mix, metal accessories, and excavating and grading. Indicate special reinforcing where required, particularly with duct banks of non-rectangular cross-section, and for ductbanks under road crossings, railroad crossings and airfield paving crossings. Reinforcing should extend at least 1.5 m 5 feet beyond the edge of pavement or railroad tracks.

Medium voltage cables and campus distribution cables of telecommunications backbone distribution system must be in duct encased in concrete, unless otherwise required by local Activity. Contact local telephone company, where applicable, concerning size of signal manholes and number and type of signal duct required.

**************************************************************************

**************************************************************************

NOTE: Provide steel reinforcing per the following table:
<table>
<thead>
<tr>
<th>COVER</th>
<th>UNREINFORCED</th>
<th>REINFORCED*</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;450 mm 18 in and &lt;1220 mm 48 in</td>
<td>Undeveloped areas.</td>
<td>Transition from good to poor soil conditions where differential settlement is anticipated.</td>
</tr>
<tr>
<td>&gt;610 mm 24 in and &lt;1220 mm 48 in</td>
<td>Roads/paved areas for light to moderate traffic loads.</td>
<td>Other roads/paved areas (i.e. supporting trucks, cranes, ultra-heavy loads.)</td>
</tr>
<tr>
<td>&gt;1220 mm 48 in</td>
<td>All ductbanks (except as noted).</td>
<td>Under railroad tracks. Transition from good to poor soil conditions where differential settlement is anticipated.</td>

</tbody>
</table>

* Use minimum reinforcement of 4 #13 #4 w/ #10 #3 ties at 915 mm 3 feet o/c for ductbanks 760 mm 30 inches or less wide.
* Use minimum reinforcement of 6 #13 #4 w/ #10 #3 ties at 915 mm 3 feet o/c for ductbanks greater than 760 mm 30 inches wide.
* Consult with structural or geotechnical engineer for assistance.

Construct underground duct lines of individual conduits encased in concrete. Depths to top of the concrete envelope must be not less than 450 mm 18 inches below finished grade[, except under roads and pavement, concrete envelope must be not less than 610 mm 24 inches below finished grade][, and under railroad tracks not less than 1270 mm 50 inches below the top of the rails]. Do not mix different kinds of conduit in any one duct bank. Concrete encasement surrounding the bank must be rectangular in cross-section and must provide at least 75 mm 3 inches of concrete cover for ducts. Separate conduits by a minimum concrete thickness of 75 mm 3 inches. Before pouring concrete, anchor duct bank assemblies to prevent the assemblies from floating during concrete pouring. Anchoring must be done by driving reinforcing rods adjacent to duct spacer assemblies and attaching the rods to the spacer assembly.[ Provide steel reinforcing in the concrete envelope as indicated.][ Provide color, type and depth of warning tape as specified in Section [31 00 00 EARTHWORK][31 23 00.00 20 EXCAVATION AND FILL.]]
3.7.9.1 Connections to Manholes

Duct bank envelopes connecting to underground structures must be flared to have enlarged cross-section at the manhole entrance to provide additional shear strength. Dimensions of the flared cross-section must be larger than the corresponding manhole opening dimensions by no less than 300 mm 12 inches in each direction. Perimeter of the duct bank opening in the underground structure must be flared toward the inside or keyed to provide a positive interlock between the duct bank and the wall of the structure. Use vibrators when this portion of the encasement is poured to assure a seal between the envelope and the wall of the structure.

3.7.9.2 Connections to Existing Underground Structures

For duct bank connections to existing structures, break the structure wall out to the dimensions required and preserve steel in the structure wall. Cut steel and [extend into][bend out to tie into the reinforcing of] the duct bank envelope. Chip the perimeter surface of the duct bank opening to form a key or flared surface, providing a positive connection with the duct bank envelope.

3.7.9.3 Connections to Existing Concrete Pads

**************************************************************************
NOTE: Choose second bracketed option where existing concrete is reinforced.
**************************************************************************

For duct bank connections to concrete pads, break an opening in the pad out to the dimensions required and preserve steel in pad. Cut the steel and [extend into][bend out to tie into the reinforcing of] the duct bank envelope. Chip out the opening in the pad to form a key for the duct bank envelope.

3.7.9.4 Connections to Existing Ducts

Where connections to existing duct banks are indicated, excavate the banks to the maximum depth necessary. Cut off the banks and remove loose concrete from the conduits before new concrete-encased ducts are installed. Provide a reinforced concrete collar, poured monolithically with the new duct bank, to take the shear at the joint of the duct banks.[ Remove existing cables which constitute interference with the work.][ Abandon in place those no longer used ducts and cables which do not interfere with the work.]

3.7.9.5 Partially Completed Duct Banks

During construction wherever a construction joint is necessary in a duct bank, prevent debris such as mud, and, and dirt from entering ducts by providing suitable conduit plugs. Fit concrete envelope of a partially completed duct bank with reinforcing steel extending a minimum of 610 mm 2 feet back into the envelope and a minimum of 610 mm 2 feet beyond the end of the envelope. Provide one No. 4 bar in each corner, 75 mm 3 inches from the edge of the envelope. Secure corner bars with two No. 3 ties, spaced approximately 305 mm one foot apart. Restrain reinforcing assembly from moving during concrete pouring.
3.7.9.6 Removal of Ducts

Where duct lines are removed from existing underground structures, close the openings to waterproof the structure. Chip out the wall opening to provide a key for the new section of wall.

3.7.10 Duct Sealing

Seal all electrical penetrations for radon mitigation, maintaining integrity of the vapor barrier, and to prevent infiltration of air, insects, and vermin.

3.8 CABLE PULLING

******************************************************************************
NOTE: For Navy projects, choose bracketed item for tape shielding and coordinate with Part 2 PRODUCTS.
******************************************************************************

[Test existing duct lines with a mandrel and thoroughly swab out to remove foreign material before pulling cables. ]Pull cables down grade with the feed-in point at the manhole or buildings of the highest elevation. Use flexible cable feeds to convey cables through manhole opening and into duct runs. Do not exceed the specified cable bending radii when installing cable under any conditions, including turnups into switches, transformers, switchgear, switchboards, and other enclosures. Cable with[ tape][ or][ wire] shield must have a bending radius not less than 12 times the overall diameter of the completed cable. If basket-grip type cable-pulling devices are used to pull cable in place, cut off the section of cable under the grip before splicing and terminating.

3.8.1 Cable Lubricants

Use lubricants that are specifically recommended by the cable manufacturer for assisting in pulling jacketed cables.

3.9 CABLES IN UNDERGROUND STRUCTURES

Do not install cables utilizing the shortest path between penetrations, but route along those walls providing the longest route and the maximum spare cable lengths. Form cables to closely parallel walls, not to interfere with duct entrances, and support on brackets and cable insulators. Support cable splices in underground structures by racks on each side of the splice. Locate splices to prevent cyclic bending in the spliced sheath. Install cables at middle and bottom of cable racks, leaving top space open for future cables, except as otherwise indicated for existing installations. Provide one spare three-insulator rack arm for each cable rack in each underground structure.

3.9.1 Cable Tag Installation

******************************************************************************
NOTE: On contracts where existing cables are recircuited special attention should be given to changing existing cable identification tags in each manhole to reflect new circuit numbers.
******************************************************************************

Install cable tags in each manhole as specified, including each splice.
Tag wire and cable provided by this contract. Install cable tags over the fireproofing, if any, and locate the tags so that they are clearly visible without disturbing any cabling or wiring in the manholes.

3.10 CONDUCTORS INSTALLED IN PARALLEL

Conductors must be grouped such that each conduit of a parallel run contains 1 Phase A conductor, 1 Phase B conductor, 1 Phase C conductor, and 1 neutral conductor.

3.11 LOW VOLTAGE CABLE SPlicing AND TERMINATING

Make terminations and splices with materials and methods as indicated or specified herein and as designated by the written instructions of the manufacturer. Do not allow the cables to be moved until after the splicing material has completely set. Make splices in underground distribution systems only in accessible locations such as manholes, handholes, or aboveground termination pedestals.

3.11.1 Terminating Aluminum Conductors

a. Use particular care in making up joints and terminations. Remove surface oxides by cleaning with a wire brush or emery cloth. Apply joint compound to conductors, and use UL-listed solid aluminum connectors for connecting aluminum conductors. When connecting aluminum to copper conductors, use connectors specifically designed for this purpose.

b. Terminate aluminum conductors to copper bus either by: (1) in line splicing a copper pigtail to the aluminum conductor (copper pigtail must have a ampacity at least that of the aluminum conductor); or (2) using a circumferential compression type, aluminum bodied terminal lug UL listed for AL/CU and steel Belleville spring washers, flat washers, bolts, and nuts. Belleville spring washers must be cadmium-plated hardened steel. Install the Belleville spring washers with the crown up toward the nut or bolt head, with the concave side of the Belleville bearing on a heavy-duty, wide series flat washer of larger diameter than the Belleville. Tighten nuts sufficient to flatten Belleville and leave in that position. Lubricate hardware with joint compound prior to making connection. Wire brush and apply joint compound to conductor prior to inserting in lug.

c. Terminate aluminum conductors to aluminum bus by using all-aluminum nuts, bolts, washers, and lugs. Wire brush and apply inhibiting compound to conductor prior to inserting in lug. Lubricate hardware with joint compound prior to making connection; if bus contact surface is unplated, scratch-brush and coat with joint compound (without grit).

3.12 MEDIUM VOLTAGE CABLE TERMINATIONS

Make terminations in accordance with the written instruction of the termination kit manufacturer.

3.13 MEDIUM VOLTAGE CABLE JOINTS

Provide power cable joints (splices) suitable for continuous immersion in water. Make joints only in accessible locations in manholes or handholes by using materials and methods in accordance with the written instructions of the joint kit manufacturer.
3.13.1 Joints in Shielded Cables

Cover the joined area with metallic tape, or material like the original cable shield and connect it to the cable shield on each side of the splice. Provide a bare copper ground connection brought out in a watertight manner and grounded to the manhole grounding loop as part of the splice installation. Ground conductors, connections, and rods must be as specified elsewhere in this section. Wire must be trained to the sides of the enclosure to prevent interference with the working area.

[3.13.2 Joints in Armored Cables]

Armored cable joints must be enclosed in compound-filled, cast-iron or alloy splice boxes equipped with stuffing boxes and armor clamps of a suitable type and size for the cable being installed.

3.14 CABLE END CAPS

Cable ends must be sealed at all times with coated heat shrinkable end caps. Cables ends must be sealed when the cable is delivered to the job site, while the cable is stored and during installation of the cable. The caps must remain in place until the cable is spliced or terminated. Sealing compounds and tape are not acceptable substitutes for heat shrinkable end caps. Cable which is not sealed in the specified manner at all times will be rejected.

3.15 LIVE END CAPS

**************************************************************************
NOTE: Live end caps are only required when cable is required to remain unterminated, but energized. Live end cap locations must be indicated on the drawings.
**************************************************************************

Provide live end caps for single conductor medium voltage cables where indicated.

3.16 FIREPROOFING OF CABLES IN UNDERGROUND STRUCTURES

Fireproof (arc proof) wire and cables which will carry current at 2200 volts or more in underground structures.

3.16.1 Fireproofing Tape

Tightly wrap strips of fireproofing tape around each cable spirally in half-lapped wrapping. Install tape in accordance with manufacturer's instructions.

3.16.2 Tape-Wrap

Tape-wrap metallic-sheathed or metallic armored cables without a nonmetallic protective covering over the sheath or armor prior to application of fireproofing. Wrap must be in the form of two tightly applied half-lapped layers of a pressure-sensitive 0.254 mm 10 mil thick plastic tape, and must extend not less than 25 mm one inch into the duct. Even out irregularities of the cable, such as at splices, with insulation putty before applying tape.
3.17 GROUNDING SYSTEMS

*********************************************************
NOTE: Determine the grounding requirements for each project. Show all necessary ground rods and ground rings on the drawings.
*********************************************************

NFPA 70 and IEEE C2, except provide grounding systems with a resistance to solid earth ground not exceeding [25]\[_____] ohms.

3.17.1 Grounding Electrodes

*********************************************************
NOTE: Investigate the soil resistivity during the preliminary design phase to determine the design required to ensure that the grounding values are obtained. For areas where the water table is low or the soil resistivity is high (such as volcanic soils, sand, or rock), delete the additional electrode provisions and provide a design to meet the site requirements.
*********************************************************

Provide cone pointed driven ground rods driven full depth plus [150 mm 6 inches] [300 mm 12 inches], installed to provide an earth ground of the appropriate value for the particular equipment being grounded. If the specified ground resistance is not met, an additional ground rod must be provided in accordance with the requirements of NFPA 70 (placed not less than 6 feet from the first rod). Should the resultant (combined) resistance exceed the specified resistance, measured not less than 48 hours after rainfall, notify the Contracting Officer immediately.

3.17.2 Grounding Connections

Make grounding connections which are buried or otherwise normally inaccessible, by exothermic weld or compression connector.

a. Make exothermic welds strictly in accordance with the weld manufacturer's written recommendations. Welds which are "puffed up" or which show convex surfaces indicating improper cleaning are not acceptable. Mechanical connectors are not required at exothermic welds.

b. Make compression connections using a hydraulic compression tool to provide the correct circumferential pressure. Tools and dies must be as recommended by the manufacturer. An embossing die code or other standard method must provide visible indication that a connector has been adequately compressed on the ground wire.

3.17.3 Grounding Conductors

Provide bare grounding conductors, except where installed in conduit with associated phase conductors. Ground cable sheaths, cable shields, conduit, and equipment with No. 6 AWG. Ground other noncurrent-carrying metal parts and equipment frames of metal-enclosed equipment. Ground metallic frames and covers of handholes and pull boxes with a braided, copper ground strap with equivalent ampacity of No. 6 AWG. Provide direct connections to the grounding conductor with 600 v insulated, full-size conductor for each
grounded neutral of each feeder circuit, which is spliced within the manhole.]

3.17.4 Ground Cable Crossing Expansion Joints

Protect ground cables crossing expansion joints or similar separations in structures and pavements by use of approved devices or methods of installation which provide the necessary slack in the cable across the joint to permit movement. Use stranded or other approved flexible copper cable across such separations.

3.17.5 Manhole Grounding

Loop a 4/0 AWG grounding conductor around the interior perimeter, approximately 305 mm 12 inches above finished floor. Secure the conductor to the manhole walls at intervals not exceeding 914 mm 36 inches. Connect the conductor to the manhole grounding electrode with 4/0 AWG conductor. Connect all incoming 4/0 grounding conductors to the ground loop adjacent to the point of entry into the manhole. Bond the ground loop to all cable shields, metal cable racks, and other metal equipment with a minimum 6 AWG conductor.

3.17.6 Fence Grounding

**************************************************************************
NOTE: Use this paragraph only when fence is required to be grounded in accordance with IEEE C2, NFPA 70, or other requirements.
**************************************************************************

[Provide grounding for fences as indicated.] Drive ground rods until the top is 305 mm 12 inches below grade. Attach a No. 4 AWG copper conductor, by exothermic weld to the ground rods and extend underground to the immediate vicinity of fence post. Lace the conductor vertically into 305 mm 12 inches of fence mesh and fasten by two approved bronze compression fittings, one to bond wire to post and the other to bond wire to fence. Each gate section must be bonded to its gatepost by a 3 by 25 mm 1/8 by one inch flexible braided copper strap and ground post clamps. Clamps must be of the anti-electrolysis type.

3.17.7 Metal Splice Case Grounding

Metal splice cases for medium-voltage direct-burial cable must be grounded by connection to a driven ground rod located within 600 mm 2 feet of each splice box using a grounding electrode conductor having a current-carrying capacity of at least 20 percent of the individual phase conductors in the associated splice box, but not less than No. 6 AWG.

3.18 EXCAVATING, BACKFILLING, AND COMPACTING

Provide in accordance with NFPA 70 and Section [31 23 00.00 20 EXCAVATION AND FILL] [31 00 00 EARTHWORK].

3.18.1 Reconditioning of Surfaces

3.18.1.1 Unpaved Surfaces

Restore to their original elevation and condition unpaved surfaces
disturbed during installation of duct [or direct burial cable]. Preserve sod and topsoil removed during excavation and reinstall after backfilling is completed. Replace sod that is damaged by sod of quality equal to that removed. When the surface is disturbed in a newly seeded area, re-seed the restored surface with the same quantity and formula of seed as that used in the original seeding, and provide topsoiling, fertilizing, liming, seeding, sodding, sprigging, or mulching.[ Provide work in accordance with Section 32 92 19 SEEDING and Section 32 93 00 EXTERIOR PLANTS.]

3.18.1.2 Paving Repairs

**************************************************************************
NOTE: Where paving repairs are a very minor part of project, the first bracketed paragraph may be used; otherwise, use the second bracketed paragraph and include other sections as needed (also include necessary cutting and patching details on the drawings.)
**************************************************************************

**************************************************************************
NOTE: Insert appropriate Section number and title in the blank below.
**************************************************************************

Where trenches, pits, or other excavations are made in existing roadways and other areas of pavement where surface treatment of any kind exists [, restore such surface treatment or pavement the same thickness and in the same kind as previously existed, except as otherwise specified, and to match and tie into the adjacent and surrounding existing surfaces.][ Make repairs as specified in Section [32 13 13.06 PORTLAND CEMENT CONCRETE PAVEMENT FOR ROADS AND SITE FACILITIES][_____] .]

3.19 CAST-IN-PLACE CONCRETE

Provide concrete in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.19.1 Concrete Slabs (Pads) for Equipment

Unless otherwise indicated, the slab must be at least 200 mm 8 inches thick, reinforced with a 152 mm by 152 mm - MW19 by MW19 (6 by 6 - W2.9 by W2.9) 6 by 6 - W2.9 by W2.9 mesh, placed uniformly 100 mm 4 inches from the top of the slab. Slab must be placed on a 150 mm 6 inch thick, well-compacted gravel base. Top of concrete slab must be approximately 100 mm 4 inches above finished grade with gradual slope for drainage. Edges above grade must have 15 mm 1/2 inch chamfer. Slab must be of adequate size to project at least 200 mm 8 inches beyond the equipment.

Stub up conduits, with bushings, 50 mm 2 inches into cable wells in the concrete pad. Coordinate dimensions of cable wells with transformer cable training areas.

[3.19.2 Sealing

**************************************************************************
NOTE: Require sealing of holes (windows) in the concrete pad if rodent intrusion is a problem.
**************************************************************************
When the installation is complete, seal all conduit and other entries into the equipment enclosure with an approved sealing compound. Seals must be of sufficient strength and durability to protect all energized live parts of the equipment from rodents, insects, or other foreign matter.

3.20 FIELD QUALITY CONTROL

3.20.1 Performance of Field Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations, and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.20.1.1 Medium Voltage Cables

Perform tests after installation of cable, splices, and terminators and before terminating to equipment or splicing to existing circuits.

a. Visual and Mechanical Inspection

(1) Inspect exposed cable sections for physical damage.

(2) Verify that cable is supplied and connected in accordance with contract plans and specifications.

(3) Inspect for proper shield grounding, cable support, and cable termination.

(4) Verify that cable bends are not less than ICEA or manufacturer's minimum allowable bending radius.

(5) Inspect for proper fireproofing.

(6) Visually inspect jacket and insulation condition.

(7) Inspect for proper phase identification and arrangement.

b. Electrical Tests

(1) Perform a shield continuity test on each power cable by ohmmeter method. Record ohmic value, resistance values in excess of 10 ohms per 1000 feet of cable must be investigated and justified.

(2) Perform acceptance test on new cables before the new cables are connected to existing cables and placed into service, including terminations and joints. Perform maintenance test on complete cable system after the new cables are connected to existing cables and placed into service, including existing cable, terminations, and joints. Tests must be very low frequency (VLF) alternating voltage withstand tests in accordance with IEEE 400.2. VLF test frequency must be 0.05 Hz minimum for a duration of 60 minutes using a sinusoidal waveform. Test voltages must be as follows:

<table>
<thead>
<tr>
<th>CABLE RATING</th>
<th>AC TEST VOLTAGE for ACCEPTANCE TESTING</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 kV</td>
<td>10 kV rms (peak)</td>
</tr>
</tbody>
</table>
### CABLE RATING AC TEST VOLTAGE for ACCEPTANCE TESTING

3.20.1.2 Low Voltage Cables, 600-Volt

Perform tests after installation of cable, splices and terminations and before terminating to equipment or splicing to existing circuits.

**a. Visual and Mechanical Inspection**

1. Inspect exposed cable sections for physical damage.
2. Verify that cable is supplied and connected in accordance with contract plans and specifications.
4. Inspect compression-applied connectors for correct cable match and indentation.
5. Visually inspect jacket and insulation condition.
6. Inspect for proper phase identification and arrangement.

**b. Electrical Tests**

1. Perform insulation resistance tests on wiring No. 6 AWG and larger diameter using instrument which applies voltage of approximately 1000 volts dc for one minute.
2. Perform continuity tests to insure correct cable connection.

3.20.1.3 Grounding System

**a. Visual and mechanical inspection**
Inspect ground system for compliance with contract plans and specifications.

b. Electrical tests

Perform ground-impedance measurements utilizing the fall-of-potential method in accordance with IEEE 81. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground resistance tester in accordance with manufacturer's instructions to test each ground or group of grounds. The instrument must be equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test. Provide site diagram indicating location of test probes with associated distances, and provide a plot of resistance vs. distance.

3.20.2 Follow-Up Verification

Upon completion of acceptance checks and tests, show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. As an exception to requirements stated elsewhere in the contract, the Contracting Officer must be given 5 working days advance notice of the dates and times of checking and testing.

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Pre-Installation Meeting

Within [30] [_____] calendar days after [date of award] [date of receipt by him of notice of award], submit for the approval of the Contracting Officer [six] [_____] copies of specified drawings of all equipment to be furnished under this contract, together with weights and overall dimensions.

1.3 SUBMITTALS

********************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, use a code of up to three characters within the submittal tags following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable
requirements in accordance with Section 01 33 29
SUSTAINABILITY REPORTING. Locate the "S" submittal
under the SD number that best describes the
submittal item.

Choose the first bracketed item for Navy, Air Force
and NASA projects, or choose the second bracketed
item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation;
submittals not having a "G" designation are [for Contractor Quality Control
approval.][for information only. When used, a designation following the
"G" designation identifies the office that reviews the submittal for the
Government.] Submittals with an "S" are for inclusion in the
Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY
REPORTING. Submit the following in accordance with Section 01 33 00
SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

  Transformer Test Schedule[; G[, [___]]]

SD-02 Shop Drawings

  Connection Diagrams[; G[, [___]]]
  Fabrication Drawings[; G[, [___]]]
  Installation Drawings[; G[, [___]]]
  Equipment Foundation Drawings[; G[, [___]]]

SD-03 Product Data

  Power Transformers[; G[, [___]]]
  Manufacturer's Instructions[; G[, [___]]]

SD-06 Test Reports

  Factory Test Reports[; G[, [___]]]
  Acceptance Tests[; G[, [___]]]

SD-07 Certificates

  Certificates of Compliance[; G[, [___]]]

SD-11 Closeout Submittals

  Final Test Reports[; G[, [___]]]
  Operation And Maintenance Manuals[; G[, [___]]]
  Warranty[; G[, [___]]]
1.4 QUALITY CONTROL

1.4.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Ensure equipment, materials, installation, and workmanship are in accordance with the mandatory and advisory provisions of NFPA 70, IEEE C2 unless more stringent requirements are specified or indicated.

1.4.2 Qualifications

Provide materials and equipment that are products of manufacturers regularly engaged in the production of oil filled transformers and their component parts and equipment which are of equal material, design and workmanship. Provide products that are of the latest standard design for outdoor service which have been in satisfactory commercial or industrial use for 2 years with no less than 150 units manufactured prior to bid opening. Ensure the 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Ensure the product has been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer.

1.4.3 Certificates of Compliance

Submit certificates of compliance of previous tests on similar units under actual conditions for temperature rise, bushing tests, and short-circuit tests in lieu of factory tests on actual units furnished is acceptable upon approval.

1.5 DELIVERY, STORAGE, AND HANDLING

Do not ship transformer to the site until all factory tests and their results are approved by the Contracting Officer and the equipment is inspected and approved by the Contracting Officer unless he has given the manufacturer a written waiver.

Do not use products manufactured more than one year prior to date of delivery to site, unless specified otherwise.

**************************************************************************
NOTE: The following Government testing requirements are specific to the site, project, and Government Agency. Coordinate requirements with Government Representatives.
**************************************************************************

After the transformer arrives on site and prior to installation, the Government will perform an insulation power factor test and take an oil sample for a dielectric test, dissolved gas analysis, water-in-oil (Karl Fischer) test, oil acidity test, and PCB content determination. Test results will be used as baseline for future maintenance and compared to factory test results to ensure compliance with all requirements.
1.6 MAINTENANCE MATERIAL SUBMITTALS

In addition to requirements of Section 01 78 00, Data Package 5, include the following information on the actual Power Transformers provided:

a. An instruction manual with pertinent items and information highlighted
b. An outline drawing, front, top, and side views
c. Routine and field acceptance test reports
d. Automatic load-tap changing equipment and accessories
e. Fuse curves for all fuses
f. Actual nameplate diagram
g. Date of purchase

1.7 WARRANTY

Provide three (3) copies of the warranty to the Contracting Officer. Ensure the equipment items are supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************

NOTE: Utility Class Power Transformers are highly specialized and expensive pieces of equipment with long-lead procurement times. Product specifications in this section are high-level and require designer to coordinate with the Government Agency procuring the equipment and the entity performing maintenance and operations on the system supplied by the equipment.

**************************************************************************

2.1.1 Design Requirements

Provide station power transformers with primary connections to [overhead] [underground] high-voltage incoming lines and [bus connected secondary] [secondary connections to underground cables] [secondary connections to underground distribution lines] that are two-winding, three-phase, 60-hertz (Hz), oil-immersed, 55/65-degree C rise above a 30 degrees Fahrenheit average ambient, [self-cooled Class OA] [forced-air-cooled Class OA/FA] [forced-air-oil-cooled Class OA/FA/FOA] outdoor type conforming to IEEE C57.12.00 and IEEE C57.12.80.

Submit complete design and manufacturer's catalog data on power transformers including transformer tanks, bushings, enclosures, cores, coils, automatic load-tap changing equipment and accessories. Ensure power transformers and all equipment and accessories meet or exceed specified material and performance requirements and reference standards.
Submit manufacturer's instructions for the power transformers including special provisions required to install equipment components and system packages. Provide special notices that detail impedances, hazards and safety precautions.

Submit connection diagrams for power transformers, cores, coils and automatic load-tap changing equipment. Provide connection diagrams that indicate the relations and connections of the following items by showing the general physical layout of all controls, the interconnection of one system (or portion of system) with another, and internal tubing, wiring, and other devices.

Submit fabrication drawings for power transformers, transformer tanks, bushings, enclosures, cores, coils, automatic load-tap changing equipment and accessories. Provide fabrication drawings that consist of manufacturers original fabrication and assembly details to be performed at the factory for the project.

Submit engineered Equipment Foundation Drawings for power transformers that includes plan dimensions of foundations and relative elevations, equipment weight and operating loads, horizontal and vertical loads, horizontal and vertical clearances for installation, and size and location of anchor bolts. Ensure submitted drawings are signed and sealed by a licensed professional engineer[ in the State of [____]].

2.1.2 Performance Requirements

2.1.2.1 Impedance

Provide percent impedance voltage at the self-cooled rating in accordance with IEEE C57.12.10.

2.1.2.2 Short-Circuit Withstand

Provide transformers capable of withstanding, without injury, the mechanical and thermal stresses caused by short circuits on the external terminals of the low-voltage windings in accordance with IEEE C57.12.00.

2.1.2.3 Voltage Ratings

Provide primary voltage section that is rated for connection to [69,000] [115,000] [138,000] [230,000] [_____] volt, three-phase, 60 Hz power distribution systems.

Provide secondary voltage section that is [13,800] [13,200] [12,470] [_____] volt, three-phase, 60-Hz, for connection to solidly grounded power distribution systems.

2.1.2.4 Insulation Class

Insulate transformer primary windings for [69,000] [115,000] [138,000] [230,000] [_____] volts for connection to [69,000] [115,000] [138,000] [230,000] [_____] volt, three-phase, 60-Hz, power transmission systems.

2.1.2.5 Basic Impulse Insulation Levels

Provide basic impulse insulation levels (BILs) of the incoming and transforming sections of the transformer in accordance with IEEE C37.121.
2.2  FABRICATION

2.2.1 Painting

**************************************************************************
NOTE: For all outdoor applications and all indoor applications in a harsh environment refer to Section 09 96 00 HIGH-PERFORMANCE COATINGS. High performance coatings are specified for all outdoor applications because ultraviolet radiation breaks down most standard coatings, causing a phenomena known as chalking, which is the first stage of the corrosion process. For additional information contact The Coatings Industry Alliance, specific suppliers such as Keeler and Long and PPG, and NACE International (NACE).
**************************************************************************

After fabrication, clean and paint all exposed ferrous metal surfaces of the transformer and component equipment. Provide the transformer with the standard finish by the manufacturer when used for most indoor installations. For harsh indoor environments (any area subjected to chemical and/or abrasive action), and all outdoor installations, refer to Section 09 96 00 HIGH-PERFORMANCE COATINGS.

2.3 COMPONENTS

Provide transformers that include a core and coil assembly enclosed in a sealed airtight and oiltight tank, with accessories and auxiliary equipment as indicated and specified.

2.3.1 Tank

Provide transformer tank with walls, bottom, and cover fabricated from hot-rolled steel plate with cooling tubes or radiators vertically mounted to the side walls of the tank.

Provide transformer tank that is welded construction with rectangular base designed for rolling in the direction of the centerline of the bushing segments.

Provide lifting, moving, and jacking facilities conforming to IEEE C57.12.10.

Provide transformer base that is designed to provide natural draft ventilation under the transformer tank when the transformer is placed on a flat concrete foundation. Undercoat the bottom of the transformer tank with a heavy rubberized protective sealing material at least 0.8 millimeter 1/32 inch thick.
Weld cooling tubes into headers which in turn are welded into the transformer tank wall.

Provide a sealed-tank oil-preservation system that seals the interior of the transformer from the atmosphere throughout temperatures ranging to 100 degrees C. Provide constant gas and oil volume with internal gas pressure not exceeding 69 kilopascal positive or 55 kilopascal negative. 10 pounds per square inch, gage (psig) positive or 8-psig negative. Make provision for the relief of excessive internal pressure in the transformer tank, by the installation of a pressure relief valve.

Provide a completely assembled transformer that is designed to withstand, without permanent deformation, a pressure 25 percent greater than the maximum operating pressure of the sealed-tank oil-preservation system.

Provide spare mounting gaskets for all bushings, terminal chambers, handholes, and the gasket between the relief cover and flange on the pressure relief valve.

2.3.2 Bushings

Terminate primary windings of the transformer in cover-mounted high-voltage bushings. Terminate secondary windings of the transformer in sidewall bushings enclosed with throats or flanges that are an integral part of the transformer and terminal chambers for electrical connections to the underground distribution system. Provide same insulation class of bushings as the insulation class of the windings to which they are connected. Provide electrical characteristics of transformer bushings in accordance with IEEE C57.12.00. Provide dimensions of transformer bushings in accordance with IEEE C57.19.00.

2.3.3 Cores

Provide cores that are built up with laminated, nonaging, high-permeability, grain-oriented, cold-rolled, silicon sheet steel. Ensure laminations are coated with an insulating film or finish to minimize eddy-current losses. Ensure sheet steel conforms to ASTM A345.

2.3.4 Coils

Provide high- and low-voltage coil sections that consist of insulated copper conductors wound around the core. Provide coil sections that are [concentric] [rectangular] to counteract forces incurred under short-circuit conditions. Provide coil sections with oil ducts to dissipate the heat generated in the windings. Provide coil sections that are electrically connected together and to the respective terminal bushings of the transformer. Ensure copper conductors in the high- and low-voltage coil sections conform to ASTM B48, Type B for applications involving edgewise bending.

Provide primary winding of the transformer that is equipped with four 2.5 percent full-capacity taps, two above and two below normal voltage, brought out to an externally operated manual tap changer. Provide tap changer handles capable of being padlocked in each tap position and is operable when the transformer is deenergized.
2.3.5 Cooling Provisions

Provide radiators that are detachable all-welded [mild steel] [hot-dipped galvanized steel] construction, with top and bottom connections to the transformer tank wall. Provide tank wall top and bottom connections to radiators that are equipped with valves that permit removal of radiator without draining oil from the transformer tank.

Provide transformer that is equipped with automatically controlled fans to provide forced-air-cooled transformer ratings in accordance with IEEE C57.12.10. Provide equipment that includes a thermally operated control device, manually operated bypass switch, motor-driven fans, and electrical conduit and wire connections.

Make provision for future installation of automatically controlled motor-driven fans to give forced-air-cooled transformer ratings conforming to IEEE C57.12.10. Provide necessary mechanical arrangements for a thermally operated control device to be mounted in a well for top liquid-temperature control as described in IEEE C57.12.00. Make provision for the future mounting of control cabinets, conduit, and fans.

NOTE: When fans are to be provided, select from one of the two following paragraphs.

Provide a thermally operated control device that consists of a top oil temperature relay with a thermal element mounted in a well responsive to the top liquid-level temperature of the transformer.

Provide thermally operated control device that consists of a hot-spot temperature relay with thermal element mounted in a well and a bushing type current transformer. Add energy from the current transformer to the top oil temperature of the transformer to indicate the simulated hot-spot condition in one phase of the transformer winding.

Provide well that conforms to IEEE C57.12.00. Connect manually operated bypass switch in parallel with the automatic control contacts and enclose in a weatherproof cabinet located on the side of the transformer at a height not greater than 1500 millimeter 60-inches above the concrete foundation. Provide fan motors that are [230] [120] -volt, single-phase, 60-hertz, without centrifugal switch and are [individually fused] [thermally] protected.

2.3.6 Automatic Load-Tap Changing Equipment

NOTE: Delete the following paragraphs if automatic load-tap changers are not applicable to the project.

Provide transformer that is equipped with three-phase automatic load-tap changing equipment that provides 10 percent voltage adjustment in 16 equal steps above and below rated secondary voltage in accordance with IEEE C57.12.10.

Provide load-tap changing equipment that consists of an arcing tap switch or tap selector and arcing switch, a motor-driving mechanism, position indicator, and automatic control devices contained in weatherproof
enclosures mounted on the sidewalls of the transformer tank.

Locate arcing tap switch or tap selector and arcing switch in one or more oil-immersed welded steel plate compartments. Compartments have removable, bolted, external access covers, drain and sampling valve, filling plug, and magnetic liquid-level gage. Make provision for the escape of gas generated by the arcing contacts. Isolate oil in the arcing switch compartment from the oil within the transformer tank.

Provide a motor-drive mechanism that is equipped with a [230] [120]-volt, single-phase, 60-hertz motor and [hand crank] [hand wheel] for automatic and manual operation of the driving mechanism. Provide mechanically operated electric limit switches to prevent overtravel beyond the maximum lower and raise positions.

House automatic control devices in a weatherproof sheet metal cabinet with breather and hinged doors to provide access to the control devices. Make provisions for padlocks.

Provide automatic control devices that include a voltage-regulating relay, time delay, manual/automatic selector switch, line-drop compensator, paralleling switch, current transformers, reactance reversal control switch, operation counter, current and potential test terminals, lampholder and switch, heater and switch, convenience outlet, and protective devices in accordance with IEEE C57.12.10, Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

Make provision for the accurate alignment, positioning, and locking of arcing contacts in each tap position. When the load-tap changing equipment is on a tap position at or above rated secondary voltage, provide a transformer that is capable of supplying its rated kVA.

2.3.7 Insulating Liquid

Ensure insulating oil conforms to ASTM D3487 Type II with inhibitor. Provide dielectric strength of transformer oils, when shipped, that is not less than 28 kV when measured in accordance with ASTM D117. Ensure the Neutralization Number is not greater than .03 gm KOH/ml when measured in accordance with ASTM D974. Provide emulsified water that does not exceed 25 ppm at 20 degrees C when measured in accordance with ASTM D1533. Provide power factor that does not exceed 0.5 percent at 20 degrees C when measured in accordance with ASTM D924. Provide identification of transformer as "non-PCB" and "Type II mineral oil" on the nameplate.

Provide less-flammable oil conforming to NFPA 70 and FM APP GUIDE. Provide a non-propagating high fire point transformer insulating liquid having a fire point not less than 300 degrees C when tested per ASTM D92. Ensure liquid has a dielectric strength not less than 33 kilovolts when tested in accordance with ASTM D877 and NFPA 70. Provide identification of the transformer as "non-PCB" and "manufacturer's name and type of fluid" on the nameplate.

Provide a fluid that is a biodegradable electrical insulating and cooling liquid classified by UL and approved by FM as "less flammable". Ensure the fluid meets the following requirements:

a. Pour point: ASTM D97, less than -15 degree C
b. Aquatic biodegradation: EPA 712-C-98-075, 100 percent

c. Trout toxicity: OECD Test 203, zero mortality of EPA 600/4-90/027F, pass

2.4 ACCESSORIES

Provide transformer accessories that include a liquid-level indicator, liquid-temperature indicator, pressure/vacuum gage, drain and filter valves, ground pads, and identification plate. Ensure transformer accessories and their locations conform to IEEE C57.12.10.

Locate the nitrogen fill valve above the transformers liquid level.

2.4.1 Space Heaters

**************************************************************************

NOTE: Include paragraphs SPACE HEATERS and EXTERNAL VOLTAGE SOURCE for outdoor transformers that utilize stress cones for terminating medium voltage power cables. Include space heaters in secondary compartment at the request of maintenance and operations personnel. Space heaters prevent moisture build-up in ventilated compartments.

Wattage supplied by heaters is one-fourth of heater nameplate rating when 240-volt heaters are operated at 120-volts.

**************************************************************************

Equip primary [and secondary] cable termination compartment with externally energized space heaters. Ensure heaters generate approximately 40 watts per square meter 4 watts per square foot at the outer surface area. Provide heaters that have a power density that does not exceed 4 watts per 645 square millimeter square inch of heater element surface. Provide heaters that are rated at 240-volts for connection to 120-volts. Locate heaters at the lowest portion of each space to be heated. Cover terminals. Use thermostats to regulate the temperature.

Provide installed and operable heaters at the time of shipment so that the heaters can be operated immediately upon arrival at the site, during storage, or before installation. Provide connection locations that are marked prominently on drawings and shipping covers and that have temporary leads for storage operation. Ensure leads are easily accessible without having to remove shipping protection.

2.4.2 External Voltage Source

Group together all externally powered wiring to the switch as much as possible and connect to a terminal block which is marked with a laminated plastic nameplate having 5 millimeter 3/16-inch high white letters on a red background as follows:

DANGER - EXTERNAL VOLTAGE SOURCE

Provide externally powered wiring that includes unit space heaters [, temperature alarm devices] [, fans] [, _____] [, and] [instrumentation circuits].
2.4.3 Miscellaneous

Include the following transformer accessories, a liquid-level indicator, liquid-temperature indicator, pressure/vacuum gage, drain and filter valves, ground pads, and identification plate. Provide transformer accessories and their locations that conform to IEEE C57.12.10.

Transformer kilovolt-ampere (kVA) ratings are continuous and are based on temperature-rise tests. Do not exceed temperature limits when the transformer is delivering rated kVA output at rated secondary voltage in accordance with IEEE C57.12.00.

2.5 FACTORY TESTING

Conduct factory testing and submit Factory Test Reports in accordance with IEEE C57.12.90, IEEE 62, ASTM D3612, and IEEE C57.12.00, Table 16. Ensure at a minimum all tests included in "Design Tests" and Routine and Other Tests" paragraphs are completed. Maximum acceptable insulation power factor is 0.5 percent for mineral oil insulated transformers.

2.5.1 Transformer Test Schedule

The Government [reserves the right to][will] witness tests. Provide transformer test schedule for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

a. Test Instrument Calibration

(1) The manufacturer has a calibration program which assures that all applicable test instruments are maintained within rated accuracy.

(2) The accuracy is directly traceable to the National Institute of Standards and Technology.

(3) Instrument calibration frequency schedule does not exceed 12 months for both test floor instruments and leased specialty equipment.

(4) Dated calibration labels are visible on all test equipment.

(5) Calibrating standard is of higher accuracy than that of the instrument tested.

(6) Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

   (a) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

   (b) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.
2.5.2  Design Tests

IEEE C57.12.00, and IEEE C57.12.90. Section 5.1.2 in IEEE C57.12.80 states that "design tests are made only on representative apparatus of basically the same design." Submit factory test reports (complete with test data, explanations, formulas, and results), in the same submittal package as the catalog data and drawings for each of the specified transformers. Perform design tests prior to the award of this contract.

a. Submit test reports certified and signed by a registered professional engineer.

b. Temperature rise: "Basically the same design" for the temperature rise test means a power transformer with the same coil construction, the same kVA, the same cooling type, the same temperature rise rating, and the same insulating liquid as the transformer specified.

c. Lightning impulse: "Basically the same design" for the lightning impulse dielectric test means a power transformer with the same BIL, the same coil construction, and a tap changer. Design lightning impulse tests includes the primary windings only of that transformer.

(1) IEEE C57.12.90, paragraph 10.3 LIGHTNING IMPULSE TEST PROCEDURES and IEEE C57.98.

(2) State test voltage levels.

(3) Provide photographs of oscilloscope display waveforms or plots of digitized waveforms with test report.

d. Lifting and moving devices: "Basically the same design" requirement for the lifting and moving devices test means a test report confirming that the lifting device being used is capable of handling the weight of the specified transformer in accordance with IEEE C57.12.34.

e. Pressure: "Basically the same design" for the pressure test means a power transformer with a tank volume within 30 percent of the tank volume of the transformer specified.

f. Short circuit: "Basically the same design" for the short circuit test means a power transformer with the same kVA as the transformer specified.

2.5.3  Routine and Other Tests

IEEE C57.12.00. Routine and other tests are performed by the manufacturer on [each of ] the actual transformer(s) prepared for this project to ensure that the design performance is maintained in production. Submit test reports, by serial number and receive approval before delivery of equipment to the project site. Required tests and testing sequence are as follows:

a. Insulation-resistance tests of the windings

b. Turns ratio tests

c. Polarity and phase rotation tests

d. No-load losses (NLL) and excitation current at rated voltage
e. Load losses (LL) and impedance voltage at rated current
f. Insulation power factor tests
g. Dielectric
   (1) Impulse
   (2) Applied voltage
   (3) Induced voltage
h. Insulating liquid power factor tests
i. Insulating liquid acidity tests
j. Water-in-oil (Karl Fischer) tests
k. Leak
l. Dissolved gas analysis (DGA)
m. Sound tests
n. Bushing tests

PART 3 EXECUTION

3.1 INSTALLATION

Install transformers as indicated and in accordance with the manufacturer's recommendations. Ground transformer tanks.

Provide installation drawings for the power transformer. Include complete details of equipment layout and design on the drawings.

3.2 FIELD QUALITY CONTROL

3.2.1 Acceptance Tests

Retain the services of the manufacturer's service representative to perform initial start-up, commissioning, and acceptance testing. Manufacturer's service representative certification is required on all tests and reports submitted.

Disconnect primary winding of the transformer from the power supply, and ground the secondary windings of the transformer, before conducting insulation and high-voltage tests on primary windings.

Disconnect secondary winding of the transformer from the secondary feeder cables, and disconnect the primary winding of the transformer from the power supply and ground, before conducting insulation and high-voltage tests on secondary windings.

Give windings of the transformer an insulation-resistance test with a 5,000-volt insulation-resistance test set.

Apply tests for not less than 5 minutes and until 3 equal consecutive readings, 1 minute apart, are obtained. Record readings every 30 seconds.
during the first 2 minutes and every minute thereafter. Minimum acceptable resistance is 100 megohms.

 Upon satisfactory completion of the insulation resistance tests, give the transformer windings an insulation power factor test and an excitation test. Maximum acceptable power factor is 0.5 percent. Excitation results vary due to the amount of iron and copper in the windings and are used for baselines only.

 Conduct a turns ratio test on the transformer. Provide readings within 1/2 percent of each other.

 Upon satisfactory completion of the above electrical tests, give the transformer the following oil tests: Power factor, neutralization number, Karl Fischer, Dissolved gas analysis, and dielectric. Provide results as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power Factor</td>
<td>less than .5 percent at 20 degrees C</td>
</tr>
<tr>
<td>Karl Fischer</td>
<td>less than 25 ppm at 20 degrees C</td>
</tr>
<tr>
<td>Neutralization Number</td>
<td>less than .03 gm KOH/ml</td>
</tr>
<tr>
<td>Dielectric</td>
<td>greater than 33kV</td>
</tr>
<tr>
<td>Dissolved Gas Combustibles</td>
<td>less than 1000 ppm total</td>
</tr>
</tbody>
</table>

Final acceptance depends upon the satisfactory performance of the equipment under test. Do not energize transformer until recorded test data has been approved by the Contracting Officer.

3.3 CLOSEOUT ACTIVITIES

3.3.1 Test Reports

Submit final test reports to the Contracting Officer containing the results of all checks and tests, neatly cataloged and bound, to the Contracting Officer before Final Acceptance.

3.3.2 Maintenance

No less than [30] [_____] days prior to final testing and inspection, submit Operation and Maintenance Manuals to the Contracting Officer for the following equipment:

a. Power transformers

b. Automatic load-tap changing equipment

c. Space heaters]

NOTE: This guide specification covers the requirements for switchgear and switchboards of special design or configuration. For primary-unit substations, use Section 26 11 16 SECONDARY UNIT SUBSTATIONS; for motor control centers, use Section 26 24 19.00 40 MOTOR CONTROL CENTERS; for power panelboards, use Section 26 24 16.00 40 PANELBOARDS. Show switchgear/switchboard elevation, dimensions, devices, instruments, and installation on drawings.

Adhere to UPC_1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: If Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS is not included in the project specification, insert applicable requirements therefrom, and delete the following paragraph.

Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS applies to work specified in this section.
1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text are automatically deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NFPA 70 (2017; ERTA 1-2 2017; TIA 17-1; TIA 17-2; TIA 17-3; TIA 17-4; TIA 17-5; TIA 17-6; TIA 17-7; TIA 17-8; TIA 17-9; TIA 17-10;
1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, use a code of up to three characters within the submittal tags following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that reviews the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00.
SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Switchgear Assemblies; G[, [___]]

SD-02 Shop Drawings

Switchgear Assemblies; G[, [___]]
Buses; G[, [___]]

1.3 MAINTENANCE MATERIAL SUBMITTALS

Submit manufacturer's instructions for the switchgear assemblies including special provisions required to install equipment components and system packages. Provide special notices that detail impedances, hazards, safety precautions, and installation instructions.

1.4 QUALITY CONTROL

1.4.1 Manufacturer Qualifications

Provide material and equipment under this specification that is the standard catalog product of a manufacturer regularly engaged in the manufacture of switchgear assemblies and their component parts and equipment. Provide equipment that is of the latest standard design for [indoor] [outdoor] service and that has been in repetitive manufacture for at least [50] [_____] units.

1.4.2 Engineer Qualifications

Perform electrical power system's circuit loading requirements and analyses by a professional electrical engineer registered with the National Society of Professional Engineers (NSPE). Select a professional engineer who has conducted electrical coordination studies and tests for not less than five projects of comparable size and complexity. Perform work by or under the direct supervision of the registered professional electrical engineer.

Submit certificates to verify the qualifications of the Registered Professional Electrical Engineer.

1.4.2.1 Engineering Services

Select an electrical engineer holding a valid state license as a Professional Engineer in the jurisdiction where the project is being constructed, and who specializes in relays and coordinating systems associated with electric-power apparatus for the manufacturer of the equipment, to coordinate all circuit-interrupting devices before the substation is energized. Duties and responsibilities of the engineer
include the following work.

a. Preliminary Survey and System Coordination Study

Review necessary short-circuit calculations to determine the minimum and maximum values of short-circuit current for faults anywhere in the system. Review values of fault current to be expected at each protective device shown on the one-line diagrams.

Prepare one-line diagrams that indicate by means of single lines and simplified symbols the course and component devices of an electric circuit or system of circuits and their electrical characteristics.

Inspect equipment and determine the intended function of each circuit-interrupting device and the manner in which it is connected to provide a properly coordinated electrical power system under normal load and fault conditions.

Check and compare wiring diagrams furnished by the manufacturer with actual connections of the equipment to verify that each device is properly connected to perform its intended function.

b. Time/Current Curves and Settings

Plot time/current curves on a single sheet of graph paper or electronic format for those devices that are to operate selectively in series with each other using a common current scale, with current ratings at the lowest-voltage level. Plot curves progressively as each circuit is studied, starting with the device farthest from the source. Make each curve on the graph include tolerance band and show degree of coordination with each successive device. Coordinate adjustable and nonadjustable protective devices to operate on the minimum current that permits distinguishing between fault and load current in a minimum amount of time.

Select time and current settings for the adjustable devices that operate in sequence with the nonadjustable devices to isolate a fault with a minimum of disturbance to the unfaulted portion of the system.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Submit switchgear assemblies that conform to IEEE C37.20.1.

Submit equipment and performance data for electrical equipment consisting of the following:

a. One-line diagram of electrical equipment and system.

b. Short-circuit calculations and a table of short-circuit fault currents at critical points in the electrical system.

c. Spare Parts Data

d. Time/current coordination curves on 270 by 380 millimeter 10 1/2 by 15 inch translucent tracing paper for each relay device.

e. Table of recommended relay settings.
Submit **equipment foundation data** for switchgear assemblies that includes plan dimensions of foundations and relative elevations, equipment weight and operating loads, horizontal and vertical loads, horizontal and vertical clearances for installation, and size and location of anchor bolts.

### 2.1.1 Design Requirements

Submit connection diagrams indicating the relations and connections of the following items: switchgear assemblies, buses, switchgear components, automatic/manual transfer switch, and space heaters. Show the general physical layout of all controls, the interconnection of one system (or portion of system) with another, and internal tubing, wiring, and other devices.

Submit fabrication drawings consisting of fabrication and assembly details to be performed in the factory for the following items: switchgear assemblies, buses, switchgear components, automatic/manual transfer switch, enclosures, and space heaters.

### 2.2 FABRICATION

#### 2.2.1 Switchgear and Auxiliary Compartments

**************************************************************************

**NOTE:** Ability to remove access covers is required for maintenance activities. In addition, access may be required to inspect this device while circuits are energized (for example, using infrared imaging). Minimum distances to energized circuits is specified in OSHA Standards Part 1910.333 (Electrical - Safety-Related work practices). OSHA Standards are available on the internet.

**************************************************************************

Stationary mount switchgear assemblies and auxiliary equipment in self-supporting, self-contained, sheet metal enclosures with front-hinged doors and hinged rear covers. Join sheet metal compartments together to form a continuous structure. Provide sheet metal barriers, enclosures, and external covers and doors that are constructed from cold-rolled carbon-steel sheets of commercial quality not less than [1.9] [_____] millimeter [14] [____]-gage, with stretcher-level flatness in accordance with ASTM A1008/A1008M.

Provide unit sheet metal that encloses one or more vertically mounted power circuit breakers or auxiliary equipment in individual sheet metal compartments and a full height rear compartment. Provide housing that is approximately 2300 millimeter 90-inches high with individual ventilated [front] [rear]-hinged panels and bolted top and rear covers. Provide rear compartment that contains the main bus, main bus-tap connections, cable connections, and instrument transformers.

#### 2.2.2 Compartment Details

Completely wire compartments with cable terminals, cable clamps, control bus, control power switch, and terminal blocks. Provide terminal blocks that are readily accessible for the external connections of metal-clad switchgear.

Run low-voltage wiring for controls and accessories to terminal blocks.
having numbered points, as indicated, to identify circuits. Run low-voltage wiring in conduit or wiring raceways to isolate the wiring from high-voltage circuits. Identify wiring connections.

Identify each compartment of the switchgear assembly by an identification plate engraved with circuit and function designations.

Provide removable elements of the same type and rating in the switchgear assembly that are physically and electrically interchangeable in corresponding compartments. Provide front-hinged panel that is suitable for mounting instruments, relays, control switches, and indicating lamps.

Provide barriers between a sectionalized bus with bus sectionalizing breakers in a compartment that are sheet steel not less than \[3.1\] \text{ millimeter} [11] \text{ gage}. Provide other covers, barriers, panels, and doors that are not less than \[1.9\] \text{ millimeter} [14] \text{ gage}.

Reinforce each compartment with structural members and weld together. Ground welds to a smooth flat surface before painting.

2.2.3 Buses

Completely bus switchgear assemblies utilizing electrical grade, high conductivity, solid copper bus bar having a rectangular cross section. Uniformly position and phase sequence, riser and bus tap connections in accordance with \textit{IEEE C37.20.1}. Support and brace buses to withstand both electrically and mechanically the short circuit current ratings.

Silverplate termination and connection points by an electroplating process for all bus bar used in the switchgear. Silver coating methods that do not use the flow of electrical current as part of the process are not acceptable. After plating, do not sand or otherwise abrade the contact surface, but clean it with a soft cloth immediately prior to final assembly.

Make all bus bar connections using silicon bronze bolts with wide flat silicon bronze washers under the bolt head and nut. Tighten and check these connections by use of a calibrated torque wrench. Other connection designs are allowed with the written agreement of the Contracting Officer.

[ Provide main bus that is readily accessible for connection of future switchgear assemblies at either end. Provide main and auxiliary control drawout type connections that are silver-to-silver contact, positive pressure, self-aligning, with enclosure-to-enclosure stationary mechanism when breaker is in drawout position.

] Provide voltage rating and insulation level of switchgear assemblies as specified and that conform to \textit{IEEE C37.20.1}.

Provide temperature limits for buses and bus-tap connections in switchgear assemblies that are in accordance with \textit{IEEE C37.20.1}.

Provide a continuous rigid copper ground bus that extends throughout the entire assembly and that grounds the stationary structure and equipment. Provide ground bus that is capable of carrying the rated short circuit current of the protective devices in the switchgear assembly for a minimum period of one second.

Completely wire compartments with cable terminals, cable clamps, control bus, control power switch, and terminal blocks. Provide terminal blocks
that are readily accessible for the external connections of metal-clad switchgear.

Run low-voltage wiring for controls and accessories to terminal blocks having numbered points, as indicated, to identify circuits. Run low-voltage wiring in conduit or wiring raceways to isolate the wiring from high-voltage circuits. Identify wiring connections.

Identify each compartment of the switchgear assembly by an identification plate engraved with circuit and function designations.

**************************************************************************
NOTE: Delete the following paragraphs when the switchgear units are not bus connected.
**************************************************************************

Provide metal-enclosed bus of non-segregated group phase construction that includes rigid insulated conductors and supports in a grounded metal enclosure with associated ventilation and space-heater enclosures, condensation barriers, expansion and connection joints, and fittings in accordance with IEEE C37.20.1.

Completely bus enclosures with an insulated solid rigid copper bus bar of rectangular cross section. Uniformly position and phase sequence bar and connections within the enclosure for adaptation to metal-clad switchgear assemblies and power transformers, in accordance with IEEE C37.20.1.

Support and brace bus bar to withstand short-circuit stresses with momentary current ratings, in accordance with IEEE C37.20.1. Silverplate and bolt together contact surfaces of all bus connections to ensure maximum conductivity. Provide voltage and current ratings that conform to IEEE C37.20.1.

Provide insulating supports that consist of track-resistant, flame-retardant IEEE Class 130 electrical insulating materials. Provide voltage rating and insulation level that conform to IEEE C37.20.1.

Provide sheet metal weatherproof enclosures that are constructed from carbon steel sheets of commercial quality, not less than [1.9] [_____] millimeter [14] [_____] gage. Reinforce each section with structural members and bolt together. Structurally support complete assembly as indicated.

2.2.4 Automatic/Manual Transfer Switch

Make provision for the automatic transfer of load on loss of voltage, low voltage, single phasing, reverse phase rotation of either source, and the automatic transfer of load upon restoration of normal service without a service interruption. Under normal operation, close both main secondary breakers with the main bus tie breaker open and the automatic/manual transfer control switch in the automatic position, and energize and load each source of supply.

Electrically operate main and bus tie breakers with remote pushbutton controls electrically interlocked so that only two of the three breakers close by operation of the respective breaker-closing mechanisms when the automatic/manual transfer control switch is in the manual position.

Ensure main secondary breaker compartments include undervoltage and
phase-sequence relays with adjustable time-delay between 30 and 200 cycles.

Provide auxiliary relays that automatically open the proper main secondary breaker and close the main bus tie breaker under fault conditions. Include provisions for the automatic reclosing of the main secondary breakers before opening the main bus tie breaker when normal service is restored.

Provide lockout relays that prevent automatic transfer of load from undervoltage caused by overload or transient conditions. Provide lockout relay controls that are connected into the closing circuit of the main tie breaker to prevent operation under lockout conditions and that are the hand-reset type.

Provide main bus tie breaker compartment that includes an automatic/manual transfer switch which disconnects the automatic transfer features when in the manual position. Provide main secondary and bus tie breakers that are manually inoperable when the automatic/manual transfer control switch is in the automatic position.

Provide a bypass switch to permit manual momentary paralleling of the two sources of supply in restoring normal service without interruption.

Provide main secondary and bus tie breakers that are manually operable when the automatic/manual transfer control switch is in the manual position.

Provide a contactor for the automatic transfer of control power. Provide control power transformers that capable of furnishing power through the selective contactor for the bus tie breaker, feeder breakers, compartment heaters, interior lighting, utility outlets, battery chargers, and other miscellaneous equipment.

Supply secondary switchgear assembly or assemblies from two separate sources, with each source normally carrying load as indicated. Under normal operation, close both main secondary breakers with the main bus tie breaker open. Do not operate two sources of supply in parallel.

2.2.5 Switchgear Assemblies

Provide general arrangement of the number of compartments and each compartment's components as shown.

[ Provide bus sectionalizing switchgear compartments that include a metal-enclosed low-voltage power circuit breaker.

][Provide secondary feeder switchgear compartments that include the following equipment:

[ a. Metal-enclosed low-voltage power circuit breaker

][b. Provisions for terminating cables of the metal-enclosed bus

][Provide auxiliary station power compartments that include the following:

[ a. Control-power transformer and primary fuses

][b. Circuit overload protection

][c. Potential transformers for relaying purposes
Provide auxiliary metering compartments that include the following:

- Current transformers
- Ammeters and ammeter switches
- Potential transformers
- Voltmeters and voltmeter switches
- Watt-hour meters
- Reverse current directional relays
- Lamp ground detectors
- Cooling fans

Provide auxiliary bus sectionalizing compartments that include a contactor for automatic transfer of control power and auxiliary devices.

Provide switchgear compartments for future use that are fully equipped to receive the removable element with complete bus connections, disconnecting devices, rails, and cell interlocks.

Provide filler compartments incidental to the switchgear assembly that are empty compartments with hinged cover plates.

Provide main and feeder power circuit breakers that are suitable for fully rated [nonselective] [selective] trip systems in accordance with IEEE C37.121.

### 2.2.6 Weatherproof Construction

Provide switchgear assemblies for outdoor applications that are weatherproof NEMA Type 3R enclosures, with ventilated [front] [and rear]-hinged doors, base, and roof sections. Provide flanged access doors that close against rubber or similar gasketing material. Provide ventilated openings with filtered covers and screened vents for protection against the weather and insects. Equip doors with latch, stops, and door-locking mechanism.

Provide roof section that is unit construction with removable sloping cover and overhanging roof drip edge. Provide base section that is unit construction and that supports metal-enclosed switchgear [150] [_____] millimeter [six] [_____]-inches above the concrete foundation.

Provide switchgear enclosures that include a removable steel floor plate which is drilled for conduit and cable during installation. Undercoat floor and roof of the switchgear with a heavy rubberized protective sealing material at least [0.79] [_____] millimeter [1/32] [_____]-inch thick.

Equip each enclosure subject to an outside or humid environment with
thermostatically controlled electric space heaters and cooling fans to minimize condensation. Make provisions for terminating incoming and outgoing underground cables.

2.2.7 Painting

**************************************************************************
NOTE: For all outdoor applications and all indoor applications in a harsh environment refer to Section 09 96 00 HIGH-PERFORMANCE COATINGS. High performance coatings are specified for all outdoor applications because ultraviolet radiation breaks down most standard coatings, causing a phenomena known as chalking, which is the first stage of the corrosion process. For additional information contact The Coatings Industry Alliance, specific suppliers such as Keeler and Long and PPG, and NACE International (NACE).
**************************************************************************

After fabrication, prepare and paint exposed ferrous-metal surfaces of switchgear assemblies and component equipment. Provide standard finish by the manufacturer on assemblies and component equipment when used for most indoor installations. For harsh indoor environments (any area subjected to chemical and/or abrasive action), and all outdoor installations, refer to Section 09 96 00 HIGH-PERFORMANCE COATINGS.

2.3 SWITCHGEAR COMPONENTS

2.3.1 Air Interrupter Switches

Provide the manually group-operated three-pole, gang-operated, stationary type air interrupter switches in accordance with IEEE C37.121 and IEEE C37.20.1, that carry the rated current continuously.

Provide stored energy type quick-make/quick-break operating mechanism with positive action for fault closing and load-interrupting capability. Provide a handle speed that is independent of operation.

Provide the stored energy type operator, designed for easy inspection with a basic impulse level (BIL) of [95 at 14.4 kilovolts] [110 at 35 kilovolts]. Mechanically interlock access door with a switch mechanism. Provide [2.7] [_____] millimeter [12] [_____]-gage minimum sheet steel switch enclosure. Provide switch gear to switch connections that prevent ground transmission to switch.

[Make provision for terminating underground cables and for bus connections to the primary of the transformer transition box. Use flexible connections between primary potheads and the interrupter switch with adequate bracing provided for short circuit stresses.

Provide switch that has provisions for padlocking in the open and closed positions. Clearly and permanently mark open and closed switch positions on the outside of the enclosure. Provide a mechanical indicator that shows the switch position.

Provide switch with provision to add electrical operation with auxiliary contacts, and is a [two-position, single-throw] [duplex dual feeders] [selector] type.
[ Equip interrupter switchgear with three current-limiting [CLE type] [RBA boric acid] power fuses capable of interrupting the available short circuit current with the switch carrying full load rated current. Provide a mechanical interlock to prevent access to the power fuses when the interrupter switch is closed.

2.3.2 Power Circuit Breakers

Provide air circuit breakers of the [manually] [electrically] operated type as indicated, conforming to Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

2.3.3 Molded-Case Circuit Breakers

Provide molded-case circuit breakers that conform to Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

2.3.4 Instruments and Instrument Transformers

Provide indicating instruments, protective relays, current and potential transformers, instrument transfer switches, and control-power transformers that conform to the applicable requirements of Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

2.3.5 Control-Power Circuit Overcurrent Protection

Provide branch-circuit breakers that provide circuit overload protection to compartment heater, lights, convenience outlets, transformer fans, and other devices.

2.3.6 Automatic/Manual Transfer Switch

Provide the rotary snap-action type automatic/manual transfer switch with silver-plated contacts. Provide a manually operated two-position transfer switch device designed to interrupt the automatic transfer and close-back features of the system when the transfer switch is in the manual position. Ensure switch permits the transfer of all load to a particular switchgear assembly without a service interruption when the transfer switch is in the automatic position.

2.3.7 Control-Power Circuit Contactor

Provide a contactor for automatic transfer of control-power that is designed for 120/240-volt, single-phase, 60-Hz service with current rating. Provide contactor that is the open type, two-pole, double-throw with solid neutral connections and that automatically transfers its load circuits to the alternate power supply upon loss of power in the normal supply. Provide a device that is electrically operated and mechanically held and that obtains its operating current from the source to which the load is transferred. Provide contactors for automatic transfer of control power that is suitable for installation in metal-clad switchgear.

2.3.8 Service and Maintenance Devices

Include the following service and maintenance devices as a part of the
substations:

a. A manual handle for operating the air and power circuit breaker isolating mechanism

b. Removable manual maintenance closing devices for air and power circuit breakers

c. Transfer trucks for air and power circuit breakers

d. Facilities for operating air and power circuit breakers in the test or removed position

e. Facilities for withdrawing air and power circuit breakers for inspection or maintenance

f. Test plugs and cable for meters and relays

2.3.9 Protective Relays and Devices

Provide protective relays and devices that comply with Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

2.3.10 Space Heaters

**************************************************************************

NOTE: Include the following paragraphs for outdoor switchgear assemblies and indoor assemblies which are in humid environments. Provide space heaters to prevent moisture build-up in ventilated compartments.

Wattage supplied by heaters is one-fourth of heater nameplate rating when 240-volt heaters are operated at 120 volts.

**************************************************************************

Equip each section of the switchgear assembly with externally energized space heaters providing approximately 40 watts per square meter 4 watts per square foot of outer surface area. Provide heaters that have a power density that does not exceed 4 watts per 650 square millimeter per square inch of heater element surface. Provide heaters rated at 240 volts for connection to 120 volts. Locate heaters at the lowest portion of each space to be heated. Cover terminals. Use thermostats to regulate the temperature.

Provide heaters that are installed and operable at the time of shipment so that the heaters can be operated immediately upon arrival at the site, during storage, or before installation. Provide connection locations that are marked prominently on drawings and shipping covers and that have temporary leads for storage operation. Make leads easily accessible without having to remove shipping protection.

2.3.11 External Voltage Source

Group together all externally powered wiring to the switch as much as possible and connected to a terminal block which is marked with a laminated plastic nameplate having 5 millimeter 3/16-inch high white letters on a red background as follows:
DANGER - EXTERNAL VOLTAGE SOURCE

Provide externally powered wiring that includes 120-volt unit space heaters.

2.4 FACTORY TESTING

Make factory tests on transformers and switchgear assemblies in accordance with the applicable provisions of the referenced standards.

Perform tests on transformers that include resistance measurements of windings, ratio tests, polarity and phase-rotation tests, no-load loss at rated voltage, excitation current at rated voltage, impedance voltage and load-loss at rated current, insulation power factor tests, and dielectric tests. Conduct tests in accordance with IEEE C57.12.90.

Perform tests on switchgear assemblies that include mechanical operational tests, electrical operation and control-wiring tests, relaying and metering circuit performance tests, and dielectric tests. Conduct tests in accordance with IEEE 4.

PART 3 EXECUTION

3.1 INSTALLATION

Submit installation drawings for the switchgear assemblies. Provide drawings that include complete details of equipment layout and design.

Make installation conform to IEEE C2 and NFPA 70.

Electrically and mechanically connect complete assembly together at the site from coordinated subassemblies shipped in complete sections from the manufacturer. Provide installation that is carefully aligned, leveled, and secured to the foundation and that conforms to the manufacturer's recommendations.

Install noncurrent carrying parts and enclosures of the switchgear; bonded together and grounded to the ground grid with a maximum resistance to ground of 20 ohms. Exothermically weld inaccessible ground connections in accordance with UL 467. The minimum size of ground conductor is 11.7 millimeter diameter 4/0 AWG.

*****************************************************************************

NOTE: The following applies to high-voltage switchgear only.

*****************************************************************************

Provide switchgear with an earth ground resistance pad as shown on the drawings. Provide a switchgear resistance to ground that does not exceed the following values:

- 5,000 kVA and above  3 ohms
- 5,000 kVA and below  5 ohms

For switchgear assemblies separated for shipping, carefully join assemblies to present a neat appearance. Tighten main and ground bus joints to manufacturer's recommended torque values. Handle assemblies with lifting devices.
3.2 FIELD TESTING

Subject main bus of switchgear assemblies to insulation resistance and high-voltage, 60-hertz withstand tests after installation is completed and ready for operation. Perform electrical current and voltage tests in accordance with referenced standards in this section.

Provide test equipment, labor, and technical assistance to perform the electrical acceptance tests as herein specified.

Disconnect incoming section main bus from the power supply and primary feeder cables, and ground the switchgear enclosure before the insulation and high-voltage tests are conducted.

Disconnect outgoing section main bus from the secondary feeder cables and from the power supply and primary feeder cables. Ground the switchgear enclosure before conducting insulation and high-voltage tests.

Conduct an insulation-resistance test on the main bus of the incoming section with a [5,000] [2,500]-volt insulation-resistance test set.

Conduct an insulation-resistance test on the main bus of the outgoing section with a [1,000] [2,500] [500]-volt insulation-resistance test set.

Apply test for not less than five minutes and until three equal consecutive readings, one minute apart, are obtained. Record readings every 30 seconds during the first two minutes and every minute thereafter. Minimum acceptable resistance reading is 100 megohms.

Upon satisfactory completion of the insulation-resistance test, subject the main bus to a high-voltage (hi-pot) withstand test. Provide test voltage that is equal to [100 percent for 60 Hz] [75 percent for dc] of the values shown in IEEE C37.20.1 for metal-clad switchgear and metal-enclosed low-voltage power-circuit-breaker switchgear. Apply test for one minute.

Upon satisfactory completion of the high-voltage withstand test, give the main bus a second insulation-resistance test as before. Results of the second test are required to be within five percent of the first test and indicate no evidence of permanent injury by the high-potential test.

Subject weatherproof enclosure and switchgear assembly to a weatherproof test conducted at the site in the presence of the Contracting Officer in accordance with IEEE C37.20.1.

Provide tests on switchgear assemblies that include electrical and mechanical operational tests, control-wiring tests, relaying and metering circuit performance tests, and dielectric tests. Conduct tests in accordance with IEEE 4.

Final acceptance depends upon the satisfactory performance of the equipment under test. Provide final test data to the Contracting Officer. Provide data with a cover letter/sheet clearly marked with the System name, Date, and the words "Final Test Data - Forward to the Systems Engineer/Condition Monitoring Office/Predictive Testing Group for inclusion in the Maintenance Database."
3.3 SYSTEM STARTUP

3.3.1 Relay Settings And Tests

Properly coordinate circuit-interrupting devices before the switchgear assemblies are energized. Thoroughly inspect and adjust relays at the site in the presence of and at the discretion of the Contracting Officer.

3.3.2 Preliminary Inspection

Conduct preliminary inspection of electrical equipment. Make relay settings and tests only after the preliminary survey and system coordination survey have been completed. Provide preliminary inspection, relay settings, and tests as follows:

a. Inspect equipment for damage or maladjustment caused by shipment or installation. Remove wedges, ties, blocks, and other packing material installed by manufacturer to prevent damage in shipment.

b. Verify protective relays, auxiliary relays, trip coils, trip circuit seal-in and target coils, fuses, and instrument transformers to be of the proper type and range.

c. Perform electrical continuity tests on current, potential, and control circuits.

d. Perform Ratio and polarity tests on current and potential transformers.

e. Perform insulation tests on relays, wiring, instrument-transformer secondary windings, and instruments.

Remove each adjustable relay from its case and calibrate separately as an instrument, using a variable alternating-current source and an accurate timing device. Verify with this procedure that the relay has not been damaged in shipment and that it performs in accordance with previously prepared time-current coordination curves at specified current tap and time dial settings.

With the relay disconnected and the main current transformer effectively open, apply a current test to the remainder of the secondary circuit to detect any open or short-circuit connections.

Reinstall and connect relays into their current-transformer secondary and control circuits.

Report any defects in electrical equipment, protective devices, wiring, or other conditions that prevent complete coordination and the successful operation of equipment to the Contracting Officer before proceeding with the work.

After the installation has been thoroughly tested and certified to be in satisfactory condition, with relays calibrated and adjusted to the proper current tap and time dial setting, request permission to energize the equipment at system voltage for final testing.

3.3.3 Energizing Switchgear Assemblies

**************************************************************************

NOTE: When required by the project, replace the
following paragraphs with the statement "Switchgear assemblies will be energized by Government personnel."

**************************************************************************

Do not energize switchgear assembly until it is completely installed, tested, approved by the Contracting Officer, and ready for operation. Conduct site testing and obtain approval from the Contracting Officer.

Using ammeter, voltmeter, and wattmeter or phase-angle meter, measure and compare the values and polarities of voltage and current with those expected in the various relay circuits. Inspect and note positions of directional elements and the voltage relays.

After inspection and satisfactory tests have been completed on all active relay circuits under a no-load condition, give each relay an operational test with diverted load currents or simulated ground faults.

Prepare a report with records of connections, electrical constants, settings, test values, operating performance, and failures or weaknesses found on test.

Perform tests and procedures for testing in accordance with the manufacturer's recommendations, as approved by the Contracting Officer. Provide final test reports to the Contracting Officer. Provide reports with a cover letter/sheet clearly marked with the System name, Date, and the words "Final Test Reports - Forward to the Systems Engineer/Condition Monitoring Office/Predictive Testing Group for inclusion in the Maintenance Database."

NOTE: This guide specification covers the requirements for the requirements for 5k through 38 kV, 600A load-break sulphur hexafluoride (SF6) gas and solid dielectric switches. Refer to 26 13 01 PAD-MOUNTED DEAD-FRONT AIR INSULATED SWITCHGEAR if air-insulated switches are to be used. On drawings, indicate subsurface, vault, pad-mount, indoor, metal-enclosed, or pole mounted type; the number of switched ways; separable connections; and single-side, double-side, floor, wall, ceiling, or other type installation.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: If Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES, and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES are not included in the project specification, insert applicable requirements therefrom and delete the following paragraph.
Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES, and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES apply to work specified in this section.

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text are automatically deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D1535 (2014; R 2018) Standard Practice for Specifying Color by the Munsell System

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE 386 (2016) Separable Insulated Connector Systems for Power Distribution Systems Rated 2.5 kV through 35 kV

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, use a code of up to three characters within the submittal tags following the "G"
Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that reviews the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Assembly Drawings; G[, [___]]

SD-03 Product Data
   Medium Voltage Switches; G[, [___]]

SD-06 Test Reports
   Factory Test Report; G[, [___]]
   Acceptance Test Report; G[, [___]]

SD-10 Operation and Maintenance Data
   Medium Voltage Switches

1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer.
materials, installation, and workmanship are in accordance with the mandatory and advisory provisions of NFPA 70, IEEE C2 unless more stringent requirements are specified or indicated.

1.3.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products which have been in satisfactory commercial or industrial use for 2 years prior to bid opening. Ensure the 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Ensure the product has been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer.

Ensure products manufactured more than 3 years prior to date of delivery to site not be used, unless specified otherwise.

1.3.3 Delivery, Storage, and Handling

Handle and store medium voltage switches in accordance with manufacturer's recommendations. Ensure switches are shipped preassembled from the manufacturer.

1.3.4 Predictive Testing and Inspection Technology Requirements

*****************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all NASA assets and systems identified as Critical, Configured, or Mission Essential. If the system is non-critical, non-configured, and not mission essential, use sound engineering discretion to assess the value of adding these additional test and acceptance requirements. See Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information regarding cost feasibility of PT&I.
*****************************************************************************

This section contains systems and equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with RCBEA GUIDE to ensure building equipment and systems have been installed properly and contain no identifiable defects that shorten the design life of a system and its components. Satisfactory completion of all acceptance requirements is required to obtain Government approval and acceptance of the work.

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.
PART 2   PRODUCTS

2.1   EQUIPMENT

Provide [manually][automatically] operated, load-interrupting type medium voltage switches for use on a 3-phase, [3][4]-wire system and with ratings as follows:

**************************************************************************
NOTE: Ratings shown below are typical minimums manufacturer minimums. Refer to basis of design manufacturer's product data for the system being designed when selecting switch and ratings.
**************************************************************************

a. [15][ ] kV Maximum Design Voltage
b. [110][ ] kV Basic Impulse Level (BIL)
c. [600][ ] A Minimum Continuous Current
d. [600][ ] A Minimum Load Break Current
e. [12.5][ ] kA Symmetrical Fault Interrupter Rating
f. [20][ ] kA Asymmetrical Fault Interrupter Rating

Submit product data for medium voltage switches including manufacturer's assembly drawings detailing switch construction, configuration, and mounting and installation.

Provide switches with suitable attachments to permit closing and opening under full rated load current, without damage. Ensure switches are equipped with a visible break option that allows direct viewing or indication of the switch contacts in the open and closed positions.

**************************************************************************
NOTE: Coordinate cable termination requirements of medium voltage switches with 26 05 13.00 40 MEDIUM-VOLTAGE CABLES.
**************************************************************************

Provide cable and cable terminations in accordance with Section 26 05 13.00 40 MEDIUM-VOLTAGE CABLES. Equip switches with [600][200] ampere bushing wells and bushing well inserts to accept load break elbows, as indicated.

Provide fittings, lifting eyes, insulators, and other required accessories with the switch as necessary for transportation and installation of the equipment.

Provide all corrosion-resistant metal operating parts of switch assemblies.

2.1.1   Solid Dielectric Switches

Provide [indoor][outdoor] rated switch with switched and protected ways as indicated and rated for the required continuous load and interrupting current. Ensure switch is designed for [front[ and]] [rear] access to operators, bushings, and terminations. Provide switch enclosures.
constructed in accordance with [IEEE C57.12.28][IEEE C57.12.29] equipped with ground bus capable of carrying the rated fault current for one second for each way. Ensure enclosure is equipped with hinged access doors equipped with penta head locking bolts and provisions for padlocking.

Provide switch of dead-front design with stainless steel operating mechanism housing equipped with a viewing window for verification of vacuum interrupter contact position with indicator position labeling visible from viewing window. Ensure each switched way is equipped with a two position switch for "Open" position, "Closed" position, and has provisions for grounding.

Provide solid dielectric modules coated with a semi-conductive layer of epoxy tested to IEEE 592. Ensure modules are fully sealed and tested to prevent ingress of moisture and designed to interrupt all load and fault currents within the vacuum bottle. Provide fault interrupter assembly consisting of switch mechanism consisting of three individual vacuum bottle assemblies mechanically linked to a single spring-assisted operating mechanism. Ensure manual opening and closing of each way is via an operating handle.

Provide stainless steel three line diagram and nameplates installed on switch. Ensure nameplates indicate the manufacturer's name, catalog number, model number, date of manufacture, and serial number.

2.1.2 Sulfur Hexafluoride (SF6) Switches

Provide [indoor][outdoor] rated switch with switched and protected ways as indicated and rated for the required continuous load and interrupting current. Ensure switch is designed for [front[ and]][rear] access to operators, bushings, and terminations. Provide switch enclosures constructed in accordance with [IEEE C57.12.28][IEEE C57.12.29] equipped with ground bus capable of carrying the rated fault current for one second for each way. Ensure enclosure is equipped with hinged access doors equipped with penta head locking bolts and provisions for padlocking.

Provide switch with contacts and cable entrance terminations contained in a single welded, [mild steel][304 stainless steel] tank. Ensure switch is factory filled with SF6 gas conforming to ASTM D2472 to a nominal 69 kpa 10 psig positive pressure at 24 degrees C 75 degrees F. Paint switch tank using a corrosion resistant-epoxy paint. Ensure switch is equipped with [temperature compensated] SF6 gas pressure gauge and fill valve.[ Equip switch with low pressure warning device and dry contact for remote notification if SF6 pressure falls below manufacturer recommended levels.]

Provide switch of dead-front design with stainless steel operating mechanism housing equipped with a viewing window for verification of vacuum interrupter contact position with indicator position labeling visible from viewing window. Ensure each switched way is equipped with a two position switch for "Open" position, "Closed" position, and has provisions for grounding.

Provide solid dielectric modules coated with a semi-conductive layer of epoxy tested to IEEE 592. Ensure modules are fully sealed and tested to prevent ingress of moisture and designed to interrupt all load and fault currents within the vacuum bottle. Provide fault interrupter assembly consisting of switch mechanism consisting of three individual vacuum bottle assemblies mechanically linked to a single spring-assisted operating
mechanism. Ensure manual opening and closing of each way is via an operating handle.

Provide stainless steel three line diagram and nameplates installed on switch. Ensure nameplates indicate the manufacturer's name, catalog number, model number, date of manufacture, and serial number.

Provide provisions for padlocking each handle in any position.

2.2 COMPONENTS

Provide fuses located in a separate compartment on the outgoing feeders as indicated and per Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

**************************************************************************

NOTE: Space heaters are seldom required with SF6 and solid dielectric switches. Choose the following paragraphs only when metal enclosed switch/fuse modules are used and where moisture could condense on components in air-filled compartments.

Wattage supplied by heaters is 1/4 of the heater nameplate rating when 240-volt heaters are operated at 120 volts.

**************************************************************************

2.2.1 Factory Finish

**************************************************************************

NOTE: For all outdoor applications and all indoor applications in a harsh environment refer to Section 09 96 00 HIGH-PERFORMANCE COATINGS or IEEE C57.12.29. High performance coatings are specified for all outdoor applications because ultraviolet radiation breaks down most standard coatings, causing a phenomena known as chalking, which is the first stage of the corrosion process. For additional information contact The Coatings Industry Alliance, specific suppliers such as Keeler and Long and PPG, and NACE International (NACE).

**************************************************************************

Provide switches with the manufacturer's standard paint finish when used for most indoor installations.

For harsh indoor environments (any area subjected to chemical and/or abrasive action), and all outdoor installations, refer to [Section 09 96 00 HIGH-PERFORMANCE COATINGS][09 90 00 PAINTS AND COATINGS].

Paint [switchgear tank and support frame][enclosure including base] ASTM D1535 Munsell 7Gy3.29/1.5 green. Comply with [IEEE C57.12.28][IEEE C57.12.29] for the paint coating system regardless of equipment material.

2.2.2 Pad-Mounting Provisions

**************************************************************************
NOTE: Choose the following paragraphs when pad-mounted switches are used. Subsurface switches do not require frames since they mount directly to the floor, walls, or ceiling.

Provide mounting frames that are of angle-iron construction, for all [pad] -mounted switches and are hot-dipped galvanized after fabrication in accordance with [ASTM A123/A123M] [ASTM A153/A153M].

2.2.3 Cable Entrances

2.2.4 Space Heaters

Permanently mark connection diagrams for heater connections on detail drawings and shipping covers.

Equip ventilated cable termination compartment and the fuse compartment on outdoor switches with externally energized space heaters to provide approximately [40][ ] watts/square meter [4][ ] watts/square foot of outer surface area. Provide heaters that have a power density that does not exceed [4][ ] watts per 645 square millimeter [4][ ] watts per square inch of heater element surface. Provide heaters that are rated at [240][ ] volts for connection at [120][ ] volts. Locate heaters at the lowest portion of each space to be heated. Cover terminals. Use thermostats to regulate the temperature.

Provide installed and operable heaters at the time of shipment so that the heaters can be operated immediately on arrival at the site, during storage, or before installation. Mark connection locations prominently on drawings and shipping covers with temporary leads for storage operation easily accessible without removal of shipping protection.

2.2.5 Interrupter Control

Provide an electronic control to monitor load and fault current on all three phases of the interrupter. Ensure the current transformers are encapsulated within the [solid dielectric modules][switch tank] to provide control power and current sensing. Ensure no external power source is required for overcurrent protection.

Ensure the controller provides multiple Time Current Characteristic (TCC) curves and all settings may be inputted via the controller's display or via a computer. Ensure the controller allows for multiple TCC curve modification options, including Instantaneous Trip, Inrush Restraint, Phase Time Delay and a Phase Imbalance (Ground Fault) setting.[ Provide a controller that includes a Sequence of Events Recorder (SER) which records the last 16 causes of trip.]

Mount controller in a separate NEMA 4X, stainless steel junction box.[ Provide 2, Form C (Single Pole, Double Throw) auxiliary contacts on all ways wired to separate terminal strips in controller junction box].

Provide manufacturer's programming kit for controller.
2.3 TESTS, INSPECTIONS, AND VERIFICATIONS

2.3.1 Factory Test Report

Submit factory test report which include results of design and production tests performed according to IEEE C37.74 to ensure that design performance is maintained in production. Tests are to include but are not limited to:

a. Mechanical operation check.

b. AC hi-potential tested one minute phase-to-phase, phase-to-ground and across the open contacts.

c. Circuit resistance testing.

d. Leak test to insure the integrity of all seals and gaskets.

e. Primary current injection test to test CTs, trip mechanism, and electronic control.

f. X-ray inspection and a partial discharge test of solid dielectric modules to ensure void-free construction.

g. SF6 leak tests to ensure that the completed switch assembly has a leak rate less than 0.0000001 cubic centimeters per second by a helium mass spectrometer test.

PART 3 EXECUTION

3.1 INSTALLATION

Install switches in accordance with the manufacturer's instructions. Include in the installation all necessary hardware, insulators, and connections to line wire or bus. Ensure installation is in accordance with IEEE C2 and NFPA 70.

3.1.1 Grounding

Solidly bond tanks, mounting frames, and operating mechanisms to the station ground counterpoise in accordance with IEEE C37.74 and Section 28 05 26.00 40 GROUNDING AND BONDING FOR ELECTRONIC SAFETY AND SECURITY.

Identify incoming line position with a warning tag that states "CAUTION: INCOMING LINE, DO NOT GROUND."

3.2 FIELD QUALITY CONTROL

3.2.1 Acceptance Testing

**************************************************************************
NOTE: If the specified system is identified as critical, configured, or mission essential, use Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS to establish predictive and acceptance testing criteria, above and beyond that listed below.
**************************************************************************

Perform PT&I tests and provide submittals as specified in Section
01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

Perform acceptance testing in accordance with the manufacturer's recommendations, NFPA 70B, and NETA ATS. Submit acceptance test report documenting result.

[3.2.2 Coordination

Program settings into medium voltage switch controllers in accordance with the final, Government approved coordination study.

]3.3 CLOSEOUT ACTIVITIES

Submit operation and maintenance manuals for medium voltage switches.

1.2 SUBMITTALS

******************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the
Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Fabrication Drawings; G[, [___]]
Installation Drawings; G[, [___]]

SD-03 Product Data

Distribution Fuse Cutouts; G[, [___]]

SD-07 Certificates

Testing Certificates

SD-08 Manufacturer's Instructions

Fuse Cutouts

Manufacturer's Installation Instructions

PART 2   PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Show the following information the drawings:

1. Conductor sizes, types, and materials.

2. Primary fused cutout; give voltage rating and state fusing (ampere rating) and "X" quick or "T" tardy required for coordination with existing upstream sectionalizing equipment.
**************************************************************************

Submit fabrication drawings for fuse cutouts consisting of fabrication and assembly details to be performed in the factory.

Submit equipment and performance data for distribution fuse cutouts including life, testing certificates verifying conformance to referenced standards, system functional flows, safety features, and mechanical automated details.

2.2 EQUIPMENT

2.2.1 Standards

Ensure distribution fuse cutouts conform to the following standards:

a. IEEE C37.40

b. IEEE C37.41

c. IEEE C37.42
2.2.2  Fuse Cutouts

Submit manufacturer's instructions for fuse cutouts, including special provisions required to install equipment components and system packages. Include special notices detailing impedances, hazards, and safety precautions.

Ensure that distribution fuse cutouts are self-contained, enclosed, dropout type, or open type when required for higher voltage or interrupting rating. Install loadbreak cutouts only if specifically indicated.

Ensure the interrupting capacity is sufficient to break the maximum system fault current to which the cutout will be subjected. The minimum interrupting capacity is 16,000 amperes (A) root mean square (rms) asymmetric.

Provide that heavy-duty or extra-heavy-duty classification cutouts. Ensure cutouts installed on three-phase, 13.2 kilovolt (kV) or 13.8 kV systems that are rated at 15 kV. The installation of cutouts rated at 7.8 kV on these systems is not allowed.

Provide fuse links with a continuous rating equal to approximately 150 percent of the full-load line current when used for transformer protection, and approximately [100][110][_____] percent of the conductor-rated capacity when used for circuit protection. Ensure that the 15 kV cutout has a wet withstand, 10-second voltage rating of 37 kV, with a 95 kV basic impulse level (BIL). Provide a continuous current rating of 100 A unless otherwise indicated. Provide fuse disconnects rated not less than 100 amperes, having attachments to permit manual operation of the disconnect under load without external arcing.

Where indicated, combine lightning arresters and fuse cutouts.

PART 3  EXECUTION

3.1  INSTALLATION

Install distribution fuse cutouts in accordance with installation drawings and with the manufacturer's installation instructions.

NOTE: This guide specification covers exterior telecommunications Outside Plant consisting of the campus distributor, outside copper and fiber optic (FO) cable media, and associated hardware necessary to support communications systems at facility installations including permanently constructed buildings. This specification covers outside plant (OSP) campus fiber optic and copper cable media for supporting information technology transfer systems to include voice, data, video, imaging, security, and audio systems used by various facilities. This guide specification is to be used in the preparation of project construction specifications.

Coordinate with Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM and ensure that copper cable and fiber optic cable interconnecting components and patch cord assemblies mechanically intermate.

Use Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION and Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

For Navy projects use UFC 3-580-10, "Navy And Marine Corps Intranet (NMCI) Standard Construction Processes" for design guidance related to telecommunications infrastructure. Confirm specific system requirements with the using Activity.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are
Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This section will be used in conjunction with any other guide specifications required by the design. Show following information on project drawings:

1. Where specification identifies type, size, color, finish, or other definitive information to be "as indicated" the engineer shall show the information on the drawings.

2. Location and dimensions of manholes, handholes, ducts, and location and size of cables.

3. Types of wire and cable; number and sizes of conductors and conduits.

4. Special conditions.

5. Include tensioning and sag data on drawings in tabular form for aerial cable installation.

Provide a minimum of 12 single-mode fibers per fiber optic cable. Coordinate with activity and Base Communications Office (BCO) to determine fiber optic cabling requirements. Provide fiber optic cabling to piers in accordance with UFC 4-150-02, "Design: Dockside Utilities for Ship Service" for Navy projects only.

PART 1   GENERAL

1.1  REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically
be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: Choose Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM if it is used on the project. Choose Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION, and Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
**************************************************************************

1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in this specification shall be as defined in TIA-568-C.1, TIA-568-C.2, TIA-568-C.3, TIA-569, TIA-606, and IEEE 100 and herein.

1.3.1 Campus Distributor (CD)
A distributor from which the campus backbone cabling emanates. (International expression for main cross-connect - (MC).)

1.3.2 Entrance Facility (EF) (Telecommunications)
An entrance to the building for both private and public network service cables (including antennae) including the entrance point at the building wall and continuing to the entrance room or space.

1.3.3 Entrance Room (ER) (Telecommunications)
A centralized space for telecommunications equipment that serves the occupants of a building. Equipment housed therein is considered distinct from a telecommunications room because of the nature of its complexity.

1.3.4 Building Distributor (BD)
A distributor in which the building backbone cables terminate and at which connections to the campus backbone cables may be made. (International expression for intermediate cross-connect - (IC).)
1.3.5 Pathway

A physical infrastructure utilized for the placement and routing of telecommunications cable.

1.4 SYSTEM DESCRIPTION

**************************************************************************

For Army projects only: For MCA projects, telephone switch upgrades and line cards are procured and installed using funds provided by ISEC outside of the construction contract. Other types of projects, such as Army Reserve, DoD and work for others, may require that the switch upgrade and line cards be added to this section to be procured and installed as part of the construction contract. Choose the last bracketed sentences for Navy and Marine Corps projects only.

**************************************************************************

The telecommunications outside plant consists of cable, conduit, manholes, poles, etc. required to provide signal paths from the closest point of presence to the new facility, including free standing frames or backboards, interconnecting hardware, terminating cables, lightning and surge protection modules at the entrance facility. The work consists of providing, testing and making operational cabling, interconnecting hardware and lightning and surge protection necessary to form a complete outside plant telecommunications system for continuous use. [The telecommunications contractor must coordinate with the NMCI contractor concerning layout and configuration of the EF telecommunications and OSP. The telecommunications contractor may be required to coordinate work effort for access to the EF telecommunications and OSP with the NMCI contractor.]

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for...
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for information only.] [for Contractor Quality Control approval.] When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Telecommunications Outside Plant; G[, [____]]

Telecommunications Entrance Facility Drawings; G[, [____]]

In addition to Section 01 33 00 SUBMITTAL PROCEDURES, provide shop drawings in accordance with paragraph SHOP DRAWINGS.

SD-03 Product Data

Wire and cable; G[, [____]]

Cable splices, and connectors; G[, [____]]

Closures; G[, [____]]

Building protector assemblies; G[, [____]]

Protector modules; G[, [____]]

Cross-connect terminal cabinets; G[, [____]]

**************************************************************************

NOTE: Delete submittal for spare parts on Navy projects. Spare parts requirements are provided in Section 01 78 23 OPERATION AND MAINTENANCE DATA on Navy projects.

[Spare Parts; G[, [____]]]

Submittals shall include the manufacturer's name, trade name,
place of manufacture, and catalog model or number. Submittals shall also include applicable federal, military, industry, and technical society publication references. Should manufacturer's data require supplemental information for clarification, the supplemental information shall be submitted as specified in paragraph REGULATORY REQUIREMENTS and as required for certificates in Section 01 33 00 SUBMITTAL PROCEDURES.

SD-06 Test Reports

Pre-installation tests; G[, [____]]

Acceptance tests; G[, [____]]

Outside Plant Test Plan; G[, [____]]

SD-07 Certificates

Telecommunications Contractor Qualifications; G[, [____]]

Key Personnel Qualifications; G[, [____]]

Minimum Manufacturer's Qualifications; G[, [____]]

SD-08 Manufacturer's Instructions

Building protector assembly installation; G[, [____]]

Cable tensions; G[, [____]]

Fiber Optic Splices; G[, [____]]

Submit instructions prior to installation.

SD-09 Manufacturer's Field Reports

Factory Reel Test Data; G[, [____]]

SD-10 Operation and Maintenance Data

Telecommunications outside plant (OSP), Data Package 5; G[, [____]]

Commercial off-the-shelf manuals shall be provided for operation, installation, configuration, and maintenance of products provided as a part of the telecommunications outside plant (OSP). Submit operations and maintenance data in accordance with Section 01 78 23, OPERATION AND MAINTENANCE DATA and as specified herein not later than[ 2][____] months prior to the date of beneficial occupancy. In addition to requirements of Data package 5, include the requirements of paragraphs TELECOMMUNICATIONS OUTSIDE PLANT SHOP DRAWINGS and TELECOMMUNICATIONS ENTRANCE FACILITY DRAWINGS.

SD-11 Closeout Submittals

Record Documentation; G[, [____]]

In addition to other requirements, provide in accordance with paragraph RECORD DOCUMENTATION.
1.6 QUALITY ASSURANCE

1.6.1 Shop Drawings

Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Wiring diagrams shall identify circuit terminals and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Drawings shall indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Submittals shall include the nameplate data, size, and capacity. Submittals shall also include applicable federal, military, industry, and technical society publication references.

1.6.1.1 Telecommunications Outside Plant Shop Drawings

**************************************************************************
NOTE: Coordinate drawings with Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM, if used, to ensure activity responsible for telecommunications system maintenance and administration maintains a single complete and accurate set of drawings for the entire telecommunications system.

Choose bracketed option for RCDD approved drawings on Navy projects where multiple splices in the outside cable plant are required or when more than one telecommunications manhole and associated ductbanks are required. Choose the last bracketed sentence for facilities that currently have telecommunications outside plant drawings that require updating as a result of project installation.
**************************************************************************

Provide Outside Plant Design in accordance with TIA-758, RUS Bull 1751F-630 for aerial system design, and RUS Bull 1751F-643 for underground system design. Provide T0 shop drawings that show the physical and logical connections from the perspective of an entire campus, such as actual building locations, exterior pathways and campus backbone cabling on plan view drawings, major system nodes, and related connections on the logical system drawings in accordance with TIA-606. Drawings shall include wiring and schematic diagrams for fiber optic and copper cabling and splices, copper conductor gauge and pair count, fiber pair count and type, pathway duct and innerduct arrangement, associated construction materials, and any details required to demonstrate that cable system has been coordinated and will properly support the switching and transmission system identified in specification and drawings. [ Provide Registered Communications Distribution Designer (RCDD) approved drawings of the telecommunications outside plant.][ Update existing telecommunication Outside Plant T0 drawings to include information modified, deleted or added as a result of this installation in accordance with TIA-606.] The telecommunications outside plant (OSP) shop drawings shall be included in the operation and maintenance manuals.
1.6.1.2 Telecommunications Entrance Facility Drawings

******************************************************************************
NOTE: Choose the last bracketed sentence when Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLELING SYSTEMS is included in the specifications.
******************************************************************************

[Provide T3 drawings for EF Telecommunications in accordance with TIA-606 that include telecommunications entrance facility plan views, pathway layout (cable tray, racks, ladder-racks, etc.), mechanical/electrical layout, and[ cabinet][, rack][, backboard][ and] wall elevations. Drawings shall show layout of applicable equipment including incoming cable stub or connector blocks, building protector assembly, outgoing cable connector blocks, patch panels and equipment spaces and cabinet/racks. Drawings shall include a complete list of equipment and material, equipment rack details, proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearance for maintenance and operation. Drawings may also be an enlargement of a congested area of T1 or T2 drawings.] [Provide T3 drawings for EF Telecommunications as specified in the paragraph TELECOMMUNICATIONS SPACE DRAWINGS of Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLELING SYSTEMS.] The telecommunications entrance facility shop drawings shall be included in the operation and maintenance manuals.

1.6.2 Telecommunications Qualifications

Work under this section shall be performed by and the equipment shall be provided by the approved telecommunications contractor and key personnel. Qualifications shall be provided for: the telecommunications system contractor, the telecommunications system installer, the supervisor (if different from the installer), and the cable splicing and terminating personnel. A minimum of 30 days prior to installation, submit documentation of the experience of the telecommunications contractor and of the key personnel.

1.6.2.1 Telecommunications Contractor Qualifications

The telecommunications contractor shall be a firm which is regularly and professionally engaged in the business of the applications, installation, and testing of the specified telecommunications systems and equipment. The telecommunications contractor shall demonstrate experience in providing successful telecommunications systems that include outside plant and broadband cabling within the past 3 years. Submit documentation for a minimum of three and a maximum of five successful telecommunication system installations for the telecommunications contractor. Each of the key personnel shall demonstrate experience in providing successful telecommunications systems in accordance with TIA-758 within the past 3 years.

1.6.2.2 Key Personnel Qualifications

Provide key personnel who are regularly and professionally engaged in the business of the application, installation and testing of the specified telecommunications systems and equipment. There may be one key person or more key persons proposed for this solicitation depending upon how many of the key roles each has successfully provided. Each of the key personnel shall demonstrate experience in providing successful telecommunications systems within the past 3 years.
Cable splicing and terminating personnel assigned to the installation of this system or any of its components shall have training in the proper techniques and have a minimum of 3 years experience in splicing and terminating the specified cables. Modular splices shall be performed by factory certified personnel or under direct supervision of factory trained personnel for products used.

Supervisors and installers assigned to the installation of this system or any of its components shall have factory or factory approved certification from each equipment manufacturer indicating that they are qualified to install and test the provided products.

Submit documentation for a minimum of three and a maximum of five successful telecommunication system installations for each of the key personnel. Documentation for each key person shall include at least two successful system installations provided that are equivalent in system size and in construction complexity to the telecommunications system proposed for this solicitation. Include specific experience in installing and testing telecommunications outside plant systems, including broadband cabling, and provide the names and locations of at least two project installations successfully completed using optical fiber and copper telecommunications cabling systems. All of the existing telecommunications system installations offered by the key persons as successful experience shall have been in successful full-time service for at least 18 months prior to the issuance date for this solicitation. Provide the name and role of the key person, the title, location, and completed installation date of the referenced project, the referenced project owner point of contact information including name, organization, title, and telephone number, and generally, the referenced project description including system size and construction complexity.

Indicate that all key persons are currently employed by the telecommunications contractor, or have a commitment to the telecommunications contractor to work on this project. All key persons shall be employed by the telecommunications contractor at the date of issuance of this solicitation, or if not, have a commitment to the telecommunications contractor to work on this project by the date that the bid was due to the Contracting Officer.

Note that only the key personnel approved by the Contracting Officer in the successful proposal shall do work on this solicitation's telecommunications system. Key personnel shall function in the same roles in this contract, as they functioned in the offered successful experience. Any substitutions for the telecommunications contractor's key personnel requires approval from The Contracting Officer.

1.6.2.3 Minimum Manufacturer's Qualifications

Cabling, equipment and hardware manufacturers shall have a minimum of [3][_____] years experience in the manufacturing, assembly, and factory testing of components which comply with TIA-568-C.1, TIA-568-C.2 and TIA-568-C.3. In addition, cabling manufacturers shall have a minimum of [3][_____] years experience in the manufacturing and factory testing of cabling which comply with ICEA S-87-640, ICEA S-98-688, and ICEA S-99-689.

1.6.3 Outside Plant Test Plan

Prepare and provide a complete and detailed test plan for field tests of...
the outside plant including a complete list of test equipment for the copper conductor][ and][ optical fiber] cables, components, and accessories for approval by the Contracting Officer. Include a cut-over plan with procedures and schedules for relocation of facility station numbers without interrupting service to any active location. Submit the plan at least[ 30][_____] days prior to tests for Contracting Officer approval. Provide outside plant testing and performance measurement criteria in accordance with TIA-568-C.1 and RUS Bull 1753P-201. Include procedures for certification, validation, and testing that includes fiber optic link performance criteria.

1.6.4 Standard Products

**************************************************************************

NOTE: Choose 2 years and 6000 hours for Navy projects and 1 year and 3000 hours for Army projects.

**************************************************************************

Provide materials and equipment that are standard products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship and shall be the manufacturer's latest standard design that has been in satisfactory commercial or industrial use for at least[ 2][ 1] year[s] prior to bid opening. The[ 2][ 1]-year period shall include applications of equipment and materials under similar circumstances and of similar size. The product shall have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the[ 2][ 1]-year period. Products supplied shall be specifically designed and manufactured for use with outside plant telecommunications systems. Where two or more items of the same class of equipment are required, these items shall be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.6.4.1 Alternative Qualifications

Products having less than a[ 2][ 1]-year field service record will be acceptable if a certified record of satisfactory field operation for not less than[ 6000][ 3000] hours, exclusive of the manufacturers' factory or laboratory tests, is provided.

1.6.4.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site shall not be used, unless specified otherwise.

1.6.5 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship shall be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.6.5.1 Independent Testing Organization Certificate

In lieu of the label or listing, submit a certificate from an independent
testing organization, competent to perform testing, and approved by the Contracting Officer. The certificate shall state that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

1.7 DELIVERY, STORAGE, AND HANDLING

Ship cable on reels in [152][305][_____] meter ([500][1000][_____] feet) [500][1000][_____] feet length with a minimum overage of 10 percent. Radius of the reel drum shall not be smaller than the minimum bend radius of the cable. Wind cable on the reel so that unwinding can be done without kinking the cable. Two meters of cable at both ends of the cable shall be accessible for testing. Attach permanent label on each reel showing length, cable identification number, cable size, cable type, and date of manufacture. Provide water resistant label and the indelible writing on the labels. Apply end seals to each end of the cables to prevent moisture from entering the cable. Reels with cable shall be suitable for outside storage conditions when temperature ranges from minus 40 degrees C to plus 65 degrees C, with relative humidity from 0 to 100 percent. Equipment, other than cable, delivered and placed in storage shall be stored with protection from weather, humidity and temperature variation, dirt and dust, or other contaminants in accordance with manufacturer's requirements.

1.8 MAINTENANCE

1.8.1 Record Documentation

**************************************************************************
NOTE: Coordinate record documentation with Section 27 10 00, BUILDING TELECOMMUNICATIONS CABLELING SYSTEM and choose the second bracketed paragraph if Section 27 10 00 is used on the project. TIA-606 describes the necessary data fields and reports for hard copy, spreadsheet and electronic media as well as cable management software requirements. Check with activity to determine if cable management software is currently employed at the activity and ensure contractor is required to provide necessary data input to update the existing system with information associated with project installation.
**************************************************************************

Provide the activity responsible for telecommunications system maintenance and administration a single complete and accurate set of record documentation for the entire telecommunications system with respect to this project.

[ Provide T5 drawings including documentation on cables and termination hardware in accordance with TIA-606. T5 drawings shall include schedules to show information for cut-overs and cable plant management, patch panel layouts, cross-connect information and connecting terminal layout as a minimum. T5 drawings shall be provided[ in hard copy format][ on electronic media using Windows based computer cable management software.][ A licensed copy of the cable management software including documentation, shall be provided.][ Update existing record documentation to reflect campus distribution T0 drawings and T3 drawing schedule information modified, deleted or added as a result of this installation.] Provide the following T5 drawing documentation as a minimum:
a. Cables - A record of installed cable shall be provided in accordance with TIA-606. The cable records shall [include only the required data fields] [include the required data fields for each cable and complete end-to-end circuit report for each complete circuit from the assigned outlet to the entry facility] in accordance with TIA-606. Include manufacture date of cable with submittal.

b. Termination Hardware - Provide a record of installed patch panels, cross-connect points, campus distributor and terminating block arrangements and type in accordance with TIA-606. Documentation shall include [only] the required data fields [as a minimum] in accordance with TIA-606.

][Provide record documentation as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING SYSTEM.

][1.8.2 Spare Parts

**************************************************************************

NOTE: Do not use this paragraph for Navy projects.
**************************************************************************

In addition to the requirements of Section 01 78 23 OPERATION AND MAINTENANCE DATA, provide a complete list of parts and supplies, with current unit prices and source of supply, and a list of spare parts recommended for stocking. Spare parts shall be provided no later than the start of field testing.

]1.9 WARRANTY

The equipment items shall be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

Products supplied shall be specifically designed and manufactured for use with outside plant telecommunications systems.

2.2 TELECOMMUNICATIONS ENTRANCE FACILITY

**************************************************************************

NOTE: The EF Telecommunications consists of the telecommunications service entrance to the building, including the entrance through the building wall, and continuing to the ER Telecommunications (if required). The EF Telecommunications contains the backbone pathways and campus distributor that link the building distributors (BD)s in the main terminal space and to other buildings in campus situations. Antenna entrances, if used, also constitute part of the EF Telecommunications.

The EF Telecommunications may contain both the CD and BD for the building. Facilities with few telecommunications requirements may house all
telecommunications cabling and equipment required for that facility in the EF Telecommunications. Coordinate this section with Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLELING SYSTEM and provider of building telecommunications cabling system when Section 27 10 00 is used on a project. Other than building protector assemblies and modules, components for telecommunications spaces are specified in Section 27 10 00. If Section 27 10 00 is not used, copy the required components from Section 27 10 00 and paste them under this paragraph. Edit the component requirements as necessary.

2.2.1 Building Protector Assemblies

NOTE: Interbuilding backbone cables shall be terminated on protected entrance terminals and in a housing (when so directed) using current industry standard practice. Certain types of terminals are mounted on the outside walls of buildings. Outside terminal should be the exception and not the norm, and should only be installed on small buildings (e.g., storage sheds, small warehouses, guard gates, etc.). Copper cable termination components are specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLELING SYSTEM. If the project does not include Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLELING SYSTEM copy connector blocks or patch panel information and paste information into this section under this paragraph heading and edit as necessary.

Provide self-contained[ 5 pin][ screw type] unit supplied with a field cable stub factory connected to protector socket blocks to terminate and accept protector modules for [_____] pairs of outside cable. Building protector assembly shall have interconnecting hardware for connection to interior cabling at full capacity. Provide manufacturers instructions for building protector assembly installation. Provide copper cable interconnecting hardware as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLELING SYSTEM.

2.2.2 Protector Modules

NOTE: Protector modules are not required for interbuilding cable runs of 42.7 m (140 feet) or less, directly buried or in underground conduit, where a continuous metallic cable shield or a continuous metallic conduit containing the cable is bonded to each building grounding electrode system.

Solid-state surge protectors provide protection for sensitive equipment because it incorporates a fast semiconductor switch with operating voltage nearly independent of transient rise time. Otherwise, use
heavy duty gas tube protection modules unless area lightning damage probability is very high. Select the type of protector module required depending on their performance in categories of impulse life, maximum surge impulse and 60 Hz current carrying capacity.

**************************************************************************

Provide in accordance with UL 497[ three][ two]-electrode gas tube or solid state type[ 5 pin][ screw type] rated for the application. Provide gas tube protection modules in accordance with RUS Bull 345-83 and shall be[ heavy duty, A>10kA, B>400, C>65A][ maximum duty, A>20kA, B>1000, C>200A] where A is the maximum single impulse discharge current, B is the impulse life and C is the AC discharge current in accordance with ANSI C62.61. The gas modules shall shunt high voltage to ground, fail short, and be equipped with an external spark gap and heat coils in accordance with UL 497. Provide the number of surge protection modules equal to the number of pairs of exterior cable of the building protector assembly.

2.2.3 Fiber Optic Terminations

**************************************************************************

NOTE: Fiber Optic termination components are specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING SYSTEM. If the project does not include Section 27 10 00 copy enclosure type connectors and adapters and paste information into this section under this paragraph heading and edit as necessary.

**************************************************************************

Provide fiber optic cable terminations as specified in 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING SYSTEM.

2.3 CLOSURES

2.3.1 Copper Conductor Closures

2.3.1.1 Aerial Cable Closures

**************************************************************************

NOTE: Design of aerial plant should be in accordance with RUS Bull 1751F-630, Design of Aerial Plant. Indicate sizes on drawings.

**************************************************************************

Provide cable closure assembly consisting of a frame with clamps, a lift-off polyethylene cover, cable nozzles, and drop wire rings. Closure shall be suitable for use on Figure 8 cables. Close shall be free breathing and suitable for housing[ straight-through type][ branch type][ of the type indicated] splices of non-pressurized communications cables and shall be sized as indicated. The closure shall be constructed with ultraviolet resistant PVC.

2.3.1.2 Underground Cable Closures

**************************************************************************

NOTE: Indicate sizes on drawings.
a. Aboveground: Provide aboveground closures constructed of [not less than 14 gauge steel][ultraviolet resistant PVC] and acceptable for [pole][stake] mounting in accordance with RUS 1755.910. Closures shall be sized and contain a marker as indicated. Covers shall be secured to prevent unauthorized entry.

b. Direct burial: Provide buried closure suitable for enclosing a straight, butt, and branch splice in a container into which can be poured an encapsulating compound. Closure shall have adequate strength to protect the splice and maintain cable shield electrical continuity in the buried environment. Encapsulating compound shall be reenterable and shall not alter the chemical stability of the closure. Provide filled splice cases in accordance with RUS Bull 345-72.

c. In vault or manhole: Provide underground closure suitable to house a straight, butt, and branch splice in a protective housing into which can be poured an encapsulating compound. Closure shall be of suitable thermoplastic, thermoset, or stainless steel material supplying structural strength necessary to pass the mechanical and electrical requirements in a vault or manhole environment. Encapsulating compound shall be reenterable and shall not alter the chemical stability of the closure. Provide filled splice cases in accordance with RUS Bull 345-72.

2.3.2 Fiber Optic Closures

2.3.2.1 Aerial

Provide aerial closure that is free breathing and suitable for housing splice organizer of non-pressurized cables. Closure shall be constructed from heavy PVC with ultraviolet resistance.

2.3.2.2 Direct Burial

Provide buried closure suitable to house splice organizer in protective housing into which can be poured an encapsulating compound. Closure shall have adequate strength to protect the splice and maintain cable shield electrical continuity, when metallic, in buried environment. Encapsulating compound shall be reenterable and shall not alter chemical stability of the closure.

2.3.2.3 In Vault or Manhole

Provide underground closure suitable to house splice organizer in a protective housing into which can be poured an encapsulating compound. Closure shall be of thermoplastic, thermoset, or stainless steel material supplying structural strength necessary to pass the mechanical and electrical requirements in a vault or manhole environment. Encapsulating compound shall be reenterable and shall not alter the chemical stability of the closure.

2.4 PAD MOUNTED CROSS-CONNECT TERMINAL CABINETS

**************************************************************************
NOTE: Indicate size on the drawings.
**************************************************************************

Provide in accordance with RUS 1755.910 and the following:
a. Constructed of 14 gauge steel or [____].

b. Equipped with a double set of hinged doors with closed-cell foam weatherstripping. Doors shall be locked and contain a marker as indicated.

c. Equipped with spool spindle bracket, mounting frames, binding post log,[ and] jumpering instruction label[, and load coil mounting provisions].

d. Complete with cross connect modules to terminate number of pairs as indicated.

e. Sized as indicated.

2.5 CABLE SPLICES, AND CONNECTORS

2.5.1 Copper Cable Splices

*NOTE: Multipair splices are insulation displacement (IDC) type splices.*

Provide[ multipair,[ foldback][ in-line]] [single pair, [ in-line][ butt][ box tap]] splices of a moisture resistant, [two][ three][____]-wire [insulation displacement] connector held rigidly in place to assure maximum continuity in accordance with RUS Bull 1753F-401. Cables greater than 25 pairs shall be spliced using multipair splicing connectors, which accommodate 25 pairs of conductors at a time. Provide correct connector size to accommodate the cable gauge of the supplied cable.

[2.5.2 Copper Cable Splice Connector

Provide splice connectors with a polycarbonate body and cap and a tin-plated brass contact element. Connector shall accommodate 22 to 26 AWG solid wire with a maximum insulation diameter of 1.65 mm 0.065 inch. Fill connector with sealant grease to make a moisture resistant connection, in accordance with RUS Bull 1753F-401.

[2.5.3 Fiber Optic Cable Splices

Provide fiber optic cable splices and splicing materials for[ fusion][ mechanical] methods at locations shown on the construction drawings. The splice insertion loss shall be 0.3 dB maximum when measured in accordance with TIA-455-78-B using an Optical Time Domain Reflectometer (OTDR). Splices shall be designed for a return loss of 40.0 db max for single mode fiber when tested in accordance with TIA-455-107. Physically protect each fiber optic splice by a splice kit specially designed for the splice.

[2.5.4 Fiber Optic Splice Organizer

Provide splice organizer suitable for housing fiber optic splices in a neat and orderly fashion. Splice organizer shall allow for a minimum of 1 m 3 feet of fiber for each fiber within the cable to be neatly stored without kinks or twists. Splice organizer shall accommodate individual strain relief for each splice and allow for future maintenance or modification, without damage to the cable or splices. Provide splice organizer hardware, such as splice trays, protective glass shelves, and shield bond connectors.
2.5.5 Shield Connectors

Provide connectors with a stable, low-impedance electrical connection between the cable shield and the bonding conductor in accordance with RUS Bull 345-65.

2.6 CONDUIT

******************************************************************************
NOTE: Use Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
******************************************************************************

Provide conduit as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

2.7 PLASTIC INSULATING TAPE

UL 510.

2.8 WIRE AND CABLE

******************************************************************************
NOTE: For Army projects follow guidelines set forth in USAISEC Technical Guide for Installation Information Infrastructure Architecture (I3A) or The Army Common User Information Transport Network (CUITN). Army ECB 2007-22 is available electronically at . Interbuilding backbone cabling is the cable (optical fiber and copper) media between the campus distributors of multiple buildings within a base complex (campus environment). Interbuilding backbone cable plant terminates in the telecommunications entrance facility, the first terminating point in a building. Cable may be direct buried, aerial, or underground (in conduit and ducts). The preferred method is underground with the cable terminating in the telecommunications entrance facility.
******************************************************************************

2.8.1 Copper Conductor Cable

Solid copper conductors, covered with an extruded solid insulating compound. Insulated conductors shall be twisted into pairs which are then stranded or oscillated to form a cylindrical core. For special high frequency applications, the cable core shall be separated into compartments. Cable shall be completed by the application of a suitable core wrapping material, a corrugated copper or plastic coated aluminum shield, and an overall extruded jacket. Telecommunications contractor shall verify distances between splice points prior to ordering cable in specific cut lengths. Gauge of conductor shall determine the range of numbers of pairs specified; 19 gauge (6 to 400 pairs), 22 gauge (6 to 1200 pairs), 24 gauge (6 to 2100 pairs), and 26 gauge (6 to 3000 pairs). Copper conductor shall conform to the following:
2.8.1.1 Underground

**************************************************************************
NOTE: For WESTNAVFACENGCOM projects, delete this paragraph.
**************************************************************************

Use RUS 1755.390 for filled cable and RUS 1755.890 for filled cable with expanded insulation.

**************************************************************************
Provide filled cable meeting the requirements of ICEA S-99-689 and [RUS 1755.390][ RUS 1755.890].

2.8.1.2 Aerial

Provide filled cable meeting the requirements of [ICEA S-99-689][ICEA S-98-688], and RUS 1755.390 except that it shall be suitable for aerial installation and shall be Figure 8 distribution wire with 26,700 N 6,000 pound Class A galvanized steel or 26,700 N 6,000 pound aluminum-clad steel strand.

2.8.1.3 Screen

Provide screen-compartmental core cable filled cable meeting the requirements of ICEA S-99-689 and RUS 1755.390.

2.8.2 Fiber Optic Cable

**************************************************************************
NOTE: Single-mode fiber optic cable is recommended for all fiber optic cable runs. Designer should identify whether multimode will be used. Multimode fiber system may be installed only if an existing communication network is being extended. If multimode fiber is used, single-mode fiber should also be placed for future use. Designer will indicate on the drawings the number of optical fibers required.
**************************************************************************

Provide[ single-mode, 8/125-um, 0.10 aperture 1310 nm fiber optic cable in accordance with TIA-492AAAA][ single-mode, 8/125-um, 0.10 aperture 1550 nm fiber optic cable in accordance with TIA-492E000][ and ][ multimode 62.5/125-um, 0.275 aperture fiber optic cable in accordance with TIA-492AAAA][ multimode 50/125-um, 0.275 aperture fiber optic cable in accordance with TIA-492AAAB], TIA-472D000, and ICEA S-87-640 including any special requirements made necessary by a specialized design. Provide[ 12][ ____] optical fibers[ as indicated]. Fiber optic cable shall be specifically designed for outside use with loose buffer construction. Provide fiber optic color code in accordance with TIA/EIA-598

2.8.2.1 Strength Members

Provide[ central][ non-central],[ non-metallic][ metallic] strength members with sufficient tensile strength for installation and residual rated loads to meet the applicable performance requirements in accordance with ICEA S-87-640. The strength member is included to serve as a cable core foundation to reduce strain on the fibers, and shall not serve as a pulling strength member.
2.8.2.2 Shielding or Other Metallic Covering

**************************************************************************
NOTE: Delete this paragraph if no additional physical protection is required or if aerial cable is specified. Designer must select the shield or metallic covering material required. Bare aluminum, coated aluminum, copper, copper alloy and copper and steel laminate are used as shielding tapes. Copper and stainless steel, coated stainless steel and bare low carbon steel are use for cable armoring. The copper alloy or stainless steel should be used for rodent protection. If additional physical protection is required use the dual aluminum and steel tape shield. Dual tape construction is normally used for armor protection of cables.
**************************************************************************

Provide[ copper, copper alloy or copper and steel laminate][ copper and stainless steel, coated stainless steel or bare low carbon steel][ bare aluminum or coated aluminum],[ single][ dual] tape covering or shield in accordance with ICEA S-87-640.

2.8.2.3 Performance Requirements

Provide fiber optic cable with optical and mechanical performance requirements in accordance with ICEA S-87-640.

2.8.3 Grounding and Bonding Conductors

Provide grounding and bonding conductors in accordance with RUS 1755.200, TIA-607, IEEE C2, and NFPA 70. Solid bare copper wire meeting the requirements of ASTM B1 for sizes No. 8 AWG and smaller and stranded bare copper wire meeting the requirements of ASTM B8, for sizes No. 6 AWG and larger. Insulated conductors shall have 600-volt, Type TW insulation meeting the requirements of UL 83.

2.9 T-SPAN LINE TREATMENT REPEATERS

Provide as indicated. Repeaters shall be pedestal mounted with non-pressurized housings, sized as indicated and shall meet the requirements of RUS Bull 345-50.

2.10 POLES AND HARDWARE

Provide poles and hardware as specified in Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION.

2.11 CABLE TAGS IN MANHOLES, HANDHOLES, AND VAULTS

**************************************************************************
NOTE: Designer must coordinate with the base communications office and use the current base standard for labeling, if one exists and choose the as indicated bracketed option. Show the labeling scheme on the drawings that the telecommunications contractor is required to follow. If no labeling standard exists provide labeling for cable tags in

SECTION 33 82 00 Page 25
accordance with TIA-606 and choose the bracketed option for TIA-606 labeling.

Provide tags for each telecommunications cable or wire located in manholes, handholes, and vaults. Cable tags shall be [stainless steel] [or] [polyethylene] and labeled [as indicated] [in accordance with TIA-606]. Handwritten labeling is unacceptable.

2.11.1 Stainless Steel

Provide stainless steel, cable tags 41.25 mm 1 5/8 inches in diameter 1.58 mm 1/16 inch thick minimum, and circular in shape. Tags shall be die stamped with numbers, letters, and symbols not less than 6.35 mm 0.25 inch high and approximately 0.38 mm 0.015 inch deep in normal block style.

2.11.2 Polyethylene Cable Tags

Provide tags of polyethylene that have an average tensile strength of 22.4 MPa 3250 pounds per square inch; and that are two millimeter 0.08 inch thick (minimum), non-corrosive non-conductive; resistive to acids, alkalis, organic solvents, and salt water; and distortion resistant to 77 degrees C 170 degrees F. Provide 1.3 mm 0.05 inch (minimum) thick black polyethylene tag holder. Provide a one-piece nylon, self-locking tie at each end of the cable tag. Ties shall have a minimum loop tensile strength of 778.75 N 175 pounds. The cable tags shall have black block letters, numbers, and symbols 25 mm one inch high on a yellow background. Letters, numbers, and symbols shall not fall off or change positions regardless of the cable tags' orientation.

2.12 BURIED WARNING AND IDENTIFICATION TAPE

Provide fiber optic media marking and protection in accordance with TIA-590. Provide color, type and depth of tape as specified in paragraph BURIED WARNING AND IDENTIFICATION TAPE in Section 31 00 00 EARTHWORK.

2.13 GROUNDING BRAID

Provide grounding braid that provides low electrical impedance connections for dependable shield bonding in accordance with RUS 1755.200. Braid shall be made from flat tin-plated copper.

2.14 MANUFACTURER’S NAMEPLATE

Each item of equipment shall have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.15 FIELD FABRICATED NAMEPLATES

Provide laminated plastic nameplates in accordance with ASTM D709 for each patch panel, protector assembly, rack, cabinet and other equipment or as
indicated on the drawings. Each nameplate inscription shall identify the function and, when applicable, the position. Nameplates shall be melamine plastic, 3 mm 0.125 inch thick, white with black center core. Surface shall be matte finish. Corners shall be square. Accurately align lettering and engrave into the core. Minimum size of nameplates shall be 25 by 65 mm one by 2.5 inches. Lettering shall be a minimum of 6.35 mm 0.25 inch high normal block style.

2.16 TESTS, INSPECTIONS, AND VERIFICATIONS

2.16.1 Factory Reel Test Data

Test 100 percent OTDR test of FO media at the factory in accordance with TIA-568-C.1 and TIA-568-C.3. Use TIA-526-7 for single mode fiber and TIA-526-14 Method B for multi mode fiber measurements. Calibrate OTDR to show anomalies of 0.2 dB minimum. Enhanced performance filled OSP copper cables, referred to as Broadband Outside Plant (BBOSP), shall meet the requirements of ICEA S-99-689. Enhanced performance air core OSP copper cables shall meet the requirements of ICEA S-98-688. Submit test reports, including manufacture date for each cable reel and receive approval before delivery of cable to the project site.

PART 3 EXECUTION

3.1 INSTALLATION

Install all system components and appurtenances in accordance with manufacturer's instructions IEEE C2, NFPA 70, and as indicated. Provide all necessary interconnections, services, and adjustments required for a complete and operable telecommunications system.

3.1.1 Contractor Damage

Promptly repair indicated utility lines or systems damaged during site preparation and construction. Damages to lines or systems not indicated, which are caused by Contractor operations, shall be treated as "Changes" under the terms of the Contract Clauses. When Contractor is advised in writing of the location of a nonindicated line or system, such notice shall provide that portion of the line or system with "indicated" status in determining liability for damages. In every event, immediately notify the Contracting Officer of damage.

3.1.2 Cable Inspection and Repair

Handle cable and wire provided in the construction of this project with care. Inspect cable reels for cuts, nicks or other damage. Damaged cable shall be replaced or repaired to the satisfaction of the Contracting Officer. Reel wraps shall remain intact on the reel until the cable is ready for placement.

3.1.3 Direct Burial System

********************************************************************************
NOTE: Indicate minimum radius allowed. Buried warning tape requirements are specified in paragraph BURIED WARNING AND IDENTIFICATION TAPE in Section 31 00 00 EARTHWORK.
********************************************************************************

SECTION 33 82 00 Page 27
Installation shall be in accordance with RUS Bull 1751F-640. Under railroad tracks, paved areas, and roadways install cable in conduit encased in concrete. Slope ducts to drain. Excavate trenches by hand or mechanical trenching equipment. Provide a minimum cable cover of \( 610 \text{ mm} \) 24 inches below finished grade. Trenches shall be not less than \( 155 \text{ mm} \) 6 inches wide and in straight lines between cable markers. Do not use cable plows. Bends in trenches shall have a radius of not less than \( [915][_____] \text{ mm} \) 36 inches. Where two or more cables are laid parallel in the same trench, space laterally at least \( 78 \text{ mm} \) 3 inches apart. When rock is encountered, remove it to a depth of at least \( 78 \text{ mm} \) 3 inches below the cable and fill the space with sand or clean earth free from particles larger than \( 6 \text{ mm} \) 1/4 inch. Do not unreel and pull cables into the trench from one end. Cable may be unreeled on grade and lifted into position. Provide color, type and depth of warning tape as specified in paragraph BURIED WARNING AND IDENTIFICATION TAPE in Section 31 00 00 EARTHWORK.

### 3.1.3.1 Cable Placement

a. Separate cables crossing other cables or metal piping from the other cables or pipe by not less than \( [78][_____] \text{ mm} \) 3 inches of well tamped earth. Do not install circuits for communications under or above traffic signal loops.

b. Cables shall be in one piece without splices between connections except where the distance exceeds the lengths in which the cable is furnished.

c. Avoid bends in cables of small radii and twists that might cause damage. Do not bend cable and wire in a radius less than 10 times the outside diameter of the cable or wire.

d. Leave a horizontal slack of approximately \( 915 \text{ mm} \) 3 feet in the ground on each end of cable runs, on each side of connection boxes, and at points where connections are brought aboveground. Where cable is brought aboveground, leave additional slack to make necessary connections.

### 3.1.3.2 Identification Slabs [Markers]

Provide a marker at each change of direction of the cable, over the ends of ducts or conduits which are installed under paved areas and roadways and over each splice. Identification markers shall be of concrete, approximately \( 508 \text{ mm} \) 20 inches square by \( 155 \text{ mm} \) 6 inches thick.

### 3.1.3.3 Backfill for Rocky Soil

When placing cable in a trench in rocky soil, the cable shall be cushioned by a fill of sand or selected soil at least \( 53 \text{ mm} \) 2 inches thick on the floor of the trench before placing the cable or wire. The backfill for at least \( 103 \text{ mm} \) 4 inches above the wire or cable shall be free from stones, rocks, or other hard or sharp materials which might damage the cable or wire. If the buried cable is placed less than \( 610 \text{ mm} \) 24 inches in depth[, a protective cover of[ metal][ concrete] shall be used].

### 3.1.4 Cable Protection

**************************************************************************
NOTE: Use Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
**************************************************************************
Provide direct burial cable protection in accordance with NFPA 70 and as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Galvanized conduits which penetrate concrete (slabs, pavement, and walls) shall be PVC coated and shall extend from the first coupling or fitting outside either side of the concrete minimum of 155 mm per 305 mm 6 inches per 12 inches burial depth beyond the edge of the surface where cable protection is required; all conduits shall be sealed on each end. Where additional protection is required, cable may be placed in galvanized iron pipe (GIP) sized on a maximum fill of 40 percent of cross-sectional area, or in concrete encased 103 mm 4 inches PVC pipe. Conduit may be installed by jacking or trenching. Trenches shall be backfilled with earth and mechanically tamped at 155 mm 6 inches lift so that the earth is restored to the same density, grade and vegetation as adjacent undisturbed material.

3.1.4.1 Cable End Caps

Cable ends shall be sealed at all times with coated heat shrinkable end caps. Cables ends shall be sealed when the cable is delivered to the job site, while the cable is stored and during installation of the cable. The caps shall remain in place until the cable is spliced or terminated. Sealing compounds and tape are not acceptable substitutes for heat shrinkable end caps. Cable which is not sealed in the specified manner at all times will be rejected.

3.1.5 Underground Duct

**************************************************************************
NOTE: Use Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
**************************************************************************

Provide underground duct and connections to existing manholes, handholes, concrete pads, and existing ducts as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION with any additional requirements as specified herein.

3.1.6 Reconditioning of Surfaces

**************************************************************************
NOTE: Use Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
**************************************************************************

Provide reconditioning of surfaces as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

3.1.7 Penetrations

Caulk and seal cable access penetrations in walls, ceilings and other parts of the building. Seal openings around electrical penetrations through fire resistance-rated wall, partitions, floors, or ceilings in accordance with Section 07 84 00 FIRESTOPPING.

3.1.8 Cable Pulling

Test duct lines with a mandrel and swab out to remove foreign material before the pulling of cables. Avoid damage to cables in setting up pulling apparatus or in placing tools or hardware. Do not step on cables when
entering or leaving the manhole. Do not place cables in ducts other than those shown without prior written approval of the Contracting Officer. Roll cable reels in the direction indicated by the arrows painted on the reel flanges. Set up cable reels on the same side of the manhole as the conduit section in which the cable is to be placed. Level the reel and bring into proper alignment with the conduit section so that the cable pays off from the top of the reel in a long smooth bend into the duct without twisting. Under no circumstances shall the cable be paid off from the bottom of a reel. Check the equipment set up prior to beginning the cable pulling to avoid an interruption once pulling has started. Use a cable feeder guide of suitable dimensions between cable reel and face of duct to protect cable and guide cable into the duct as it is paid off the reel. As cable is paid off the reel, lubricate and inspect cable for sheath defects. When defects are noticed, stop pulling operations and notify the Contracting Officer to determine required corrective action. Cable pulling shall also be stopped when reel binds or does not pay off freely. Rectify cause of binding before resuming pulling operations. Provide cable lubricants recommended by the cable manufacturer. Avoid bends in cables of small radii and twists that might cause damage. Do not bend cable and wire in a radius less than 10 times the outside diameter of the cable or wire.

3.1.8.1 Cable Tensions

Obtain from the cable manufacturer and provide to the Contracting Officer, the maximum allowable pulling tension. This tension shall not be exceeded.

3.1.8.2 Pulling Eyes

Equip cables 32 mm 1.25 inches in diameter and larger with cable manufacturer's factory installed pulling-in eyes. Provide cables with diameter smaller than 32 mm 1.25 inches with heat shrinkable type end caps or seals on cable ends when using cable pulling grips. Rings to prevent grip from slipping shall not be beaten into the cable sheath. Use a swivel of 19 mm 3/4 inch links between pulling-in eyes or grips and pulling strand.

3.1.8.3 Installation of Cables in Manholes, Handholes, and Vaults

Do not install cables utilizing the shortest route, but route along those walls providing the longest route and the maximum spare cable lengths. Form cables to closely parallel walls, not to interfere with duct entrances, and support cables on brackets and cable insulators at a maximum of 1220 mm 4 feet. In existing manholes, handholes, and vaults where new ducts are to be terminated, or where new cables are to be installed, modify the existing installation of cables, cable supports, and grounding as required with cables arranged and supported as specified for new cables. Identify each cable with corrosion-resistant embossed metal tags.

3.1.9 Aerial Cable Installation

******************************************************************************
NOTE: Include tensioning and sag data on drawings in tabular form.
******************************************************************************

Pole installation shall be as specified in Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION. Where physical obstructions make it necessary to pull distribution wire along the line from a stationary reel, use cable stringing blocks to support wire during placing and tensioning operations. Do not place ladders, cable coils, and other equipment on or
against the distribution wire. Wire shall be sagged in accordance with the data shown. Protect cable installed outside of building less than 2.5 meters 8 feet above finished grade against physical damage.

3.1.9.1 Figure 8 Distribution Wire

Perform spiraling of the wire within 24 hours of the tensioning operation. Perform spiraling operations at alternate poles with the approximate length of the spiral being 4575 mm 15 feet. Do not remove insulation from support members except at bonding and grounding points and at points where ends of support members are terminated in splicing and dead-end devices. Ground support wire at poles to the pole ground.

3.1.9.2 Suspension Strand

******************************************************************************
NOTE: Include tensioning and sag data on drawings in tabular form.
******************************************************************************

Place suspension strand as indicated. Tension in accordance with the data indicated. When tensioning strand, loosen cable suspension clamps enough to allow free movement of the strand. Place suspension strand on the road side of the pole line. In tangent construction, point the lip of the suspension strand clamp toward the pole. At angles in the line, point the suspension strand clamp lip away from the load. In level construction place the suspension strand clamp in such a manner that it will hold the strand below the through-bolt. At points where there is an up-pull on the strand, place clamp so that it will support strand above the through-bolt. Make suspension strand electrically continuous throughout its entire length, bond to other bare cables suspension strands and connect to pole ground at each pole.

3.1.9.3 Aerial Cable

Keep cable ends sealed at all times using cable end caps. Take cable from reel only as it is placed. During placing operations, do not bend cables in a radius less than 10 times the outside diameter of cable. Place temporary supports sufficiently close together and properly tension the cable where necessary to prevent excessive bending. In those instances where spiraling of cabling is involved, accomplish mounting of enclosures for purposes of loading, splicing, and distribution after the spiraling operation has been completed.

3.1.10 Cable Splicing

3.1.10.1 Copper Conductor Splices

Perform splicing in accordance with requirements of RUS Bull 1753F-401 except that direct buried splices and twisted and soldered splices are not allowed. Exception does not apply for pairs assigned for carrier application.

3.1.10.2 Fiber Optic Splices

Fiber optic splicing shall be in accordance with manufacturer's recommendation and shall exhibit an insertion loss[ not greater than 0.2 dB for fusion splices][ not greater than 0.4 db for mechanical splices].
3.1.11 Surge Protection

All cables and conductors, except fiber optic cable, which serve as communication lines through off-premise lines, shall have surge protection installed at each end which meet the requirements of RUS Bull 1751F-815.

3.1.12 Grounding

**************************************************************************

NOTE: Designer should verify the existence of grounding facilities. It is essential that all grounding facilities, new and existing, conform with IEEE C2, NFPA 70, MIL-HDBK-419, and MIL-STD-188-124.

**************************************************************************

Provide grounding and bonding in accordance with RUS 1755.200, TIA-607, IEEE C2, and NFPA 70. Ground exposed noncurrent carrying metallic parts of telephone equipment, cable sheaths, cable splices, and terminals.

3.1.12.1 Telecommunications Master Ground Bar (TMGB)

The TMGB is the hub of the basic telecommunications grounding system providing a common point of connection for ground from outside cable, CD, and equipment. Establish a TMGB for connection point for cable stub shields to connector blocks and CD protector assemblies as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.1.12.2 Incoming Cable Shields

Shields shall not be bonded across the splice to the cable stubs. Ground shields of incoming cables in the EF Telecommunications to the TMGB.

3.1.12.3 Campus Distributor Grounding

a. Protection assemblies: Mount CD protector assemblies directly on the telecommunications backboard in the telecommunications [rack] [cabinet]]. Connect assemblies mounted on each vertical frame with No. 6 AWG copper conductor to provide a low resistance path to TMGB.

b. TMGB connection: Connect TMGB to TGB with copper conductor with a total resistance of less than 0.01 ohms.

3.1.13 Cut-Over

All necessary transfers and cut-overs, shall be accomplished by the telecommunications contractor.

3.2 LABELING

3.2.1 Labels

**************************************************************************

NOTE: Provide labeling in accordance with TIA-606 using a mechanical device for printing.

**************************************************************************

Provide labeling for new cabling and termination hardware located within the facility in accordance with TIA-606. Handwritten labeling is
 unacceptable. Stenciled lettering for cable and termination hardware shall be provided using [thermal ink transfer process] [laser printer] [______].

3.2.2 Cable Tag Installation

**************************************************************************
NOTE: Verify cable labeling requirements with the local Activity. Label in accordance with TIA-606 for activities without current labeling standards. Choose appropriate cable labeling requirements based on verification results.
**************************************************************************

Install cable tags for each telecommunications cable or wire located in manholes, handholes, and vaults including each splice.[Tag only new wire and cable provided by this contract.][Tag new wire and cable provided under this contract and existing wire and cable which are indicated to have splices and terminations provided by this contract.] The labeling of telecommunications cable tag identifiers shall be [as indicated][in accordance with TIA-606]. [Tag legend shall be as indicated.] Do not provide handwritten letters. Install cable tags so that they are clearly visible without disturbing any cabling or wiring in the manholes, handholes, and vaults.

3.2.3 Termination Hardware

Label patch panels, distribution panels, connector blocks and protection modules using color coded labels with identifiers in accordance with TIA-606.

3.3 FIELD APPLIED PAINTING

**************************************************************************
NOTE: Select the second bracketed sentence if Section 09 90 00 PAINTS AND COATINGS is used on the project and delete the subparagraphs for CLEANING, PRIMING, and FINISH COAT.
**************************************************************************

[Provide ferrous metallic enclosure finishes in accordance with the following procedures. Ensure that surfaces are dry and clean when the coating is applied. Coat joints and crevices. Prior to assembly, paint surfaces which will be concealed or inaccessible after assembly. Apply primer and finish coat in accordance with the manufacturer's recommendations.][Provide ferrous metallic enclosure finishes as specified in Section 09 90 00 PAINTS AND COATINGS.]

[3.3.1 Cleaning

Clean surfaces in accordance with SSPC SP 6/NACE No.3.

][3.3.2 Priming

Prime with a two component polyamide epoxy primer which has a bisphenol-A base, a minimum of 60 percent solids by volume, and an ability to build up a minimum dry film thickness on a vertical surface of 0.127 mm 5.0 mils. Apply in two coats to a total dry film thickness of 0.127 to 0.2 mm 5 to 8 mils.
3.3.3 Finish Coat

Finish with a two component urethane consisting of saturated polyester polyol resin mixed with aliphatic isocyanate which has a minimum of 50 percent solids by volume. Apply to a minimum dry film thickness of 0.05 to 0.076 mm (2 to 3 mils). Color shall be the manufacturer's standard.

3.4 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.5 FIELD QUALITY CONTROL

Provide the Contracting Officer[10][_____] working days notice prior to[each][_____] test. Provide labor, equipment, and incidentals required for testing. Correct defective material and workmanship disclosed as the results of the tests. Furnish a signed copy of the test results to the Contracting Officer within 3 working days after the tests for each segment of construction are completed. Perform testing as construction progresses and do not wait until all construction is complete before starting field tests.

3.5.1 Pre-Installation Tests

Perform the following tests on cable at the job site before it is removed from the cable reel. For cables with factory installed pulling eyes, these tests shall be performed at the factory and certified test results shall accompany the cable.

3.5.1.1 Cable Capacitance

Perform capacitance tests on at least 10 percent of the pairs within a cable to determine if cable capacitance is within the limits specified.

3.5.1.2 Loop Resistance

Perform DC-loop resistance on at least 10 percent of the pairs within a cable to determine if DC-loop resistance is within the manufacturer's calculated resistance.

3.5.1.3 Pre-Installation Test Results

Provide results of pre-installation tests to the Contracting Officer at least[5][_____] working days before installation is to start. Results shall indicate reel number of the cable, manufacturer, size of cable, pairs tested, and recorded readings. When pre-installation tests indicate that cable does not meet specifications, remove cable from the job site.

3.5.2 Acceptance Tests

**********************************************************************************************
NOTE: Designer should delete tests that are not required.
**********************************************************************************************

Perform acceptance testing in accordance with RUS Bull 1753F-201 and as further specified in this section. Provide personnel, equipment,
instrumentation, and supplies necessary to perform required testing. Notification of any planned testing shall be given to the Contracting Officer at least 14 days prior to any test unless specified otherwise. Testing shall not proceed until after the Contractor has received written Contracting Officer's approval of the test plans as specified. Test plans shall define the tests required to ensure that the system meets technical, operational, and performance specifications. The test plans shall define milestones for the tests, equipment, personnel, facilities, and supplies required. The test plans shall identify the capabilities and functions to be tested. Provide test reports in booklet form showing all field tests performed, upon completion and testing of the installed system. Measurements shall be tabulated on a pair by pair or strand by strand basis.

3.5.2.1 Copper Conductor Cable

Perform the following acceptance tests in accordance with TIA-758:

a. Wire map (pin to pin continuity)
b. Continuity to remote end
c. Crossed pairs
d. Reversed pairs
e. Split pairs
f. Shorts between two or more conductors

3.5.2.2 Fiber Optic Cable

**************************************************************************
NOTE: The OTDR works on the principal of the amount of light that is reflected back to the source and therefore gives an estimated loss value. Typically, the OTDR can be used for locating problems causing high attenuation. It should be noted, however, that the distances needed for accurate OTDR readings must exceed 100 m 328 ft. To overcome the long tail on the trace due to the initial reflection at the OTDR connector, a "dead-zone fiber" with a length exceeding the displayed pulse duration may be used between the OTDR connector and the specimen. (Numerically, pulse length in meters corresponds to approximately one-tenth the pulse duration in ns.) To avoid the tail, the dead-zone fiber length may be up to 20 times the pulse length, depending upon characteristics of the individual OTDR. Recommend a 20 meter 66 feet jumper minimum, for testing fiber optic cabling using the OTDR, however on long cabling runs this length may be inadequate to overcome the dead-zone and potentially skew test results. Select 850 or 1300 nanometer light source for multimode fiber and 1310 or 1550 nanometer light source for single-mode fiber.
**************************************************************************

Test fiber optic cable in accordance with TIA/EIA-455 and as further
specified in this section. Two optical tests shall be performed on all optical fibers: Optical Time Domain Reflectometry (OTDR) Test, and Attenuation Test. In addition, a Bandwidth Test shall be performed on all multimode optical fibers. These tests shall be performed on the completed end-to-end spans which include the near-end pre-connectorized single fiber cable assembly, outside plant as specified, and the far-end pre-connectorized single fiber cable assembly.

a. OTDR Test: The OTDR test shall be used to determine the adequacy of the cable installations by showing any irregularities, such as discontinuities, micro-bendings or improper splices for the cable span under test. Hard copy fiber signature records shall be obtained from the OTDR for each fiber in each span and shall be included in the test results. The OTDR test shall be measured in both directions. A reference length of fiber, \( \text{[ } 20\text{]}\text{[ } ____\text{]} \text{ m} \text{[ } 66\text{]}\text{[ } ____\text{]} \text{ feet} \text{ minimum, used as the delay line shall be placed before the new end connector and after the far end patch panel connectors for inspection of connector signature. Conduct OTDR test and provide calculation or interpretation of results in accordance with TIA-526-7 for single-mode fiber and TIA-526-14 for multimode fiber. Splice losses shall not exceed 0.3 db.} \)

b. Attenuation Test: End-to-end attenuation measurements shall be made on all fibers, in both directions, using an \( \text{[ } 850\text{]}\text{[ } 1300\text{]}\text{[ } 1310\text{]}\text{[ } 1550\text{]} \text{ nanometer light source at one end and the optical power meter on the other end to verify that the cable system attenuation requirements are met in accordance with TIA-455-46A for multimode} \text{[ and]} \text{[ TIA-526-7 for single-mode] fiber optic cables. The measurement method shall be in accordance with TIA-455-78-B. Attenuation losses shall not exceed 0.5 db/km at 1310 nm and 1550 nm for single-mode fiber. Attenuation losses shall not exceed 5.0 db/km at 850 nm and 1.5 db/km at 1300 nm for multimode fiber.} \)

c. Bandwidth Test: The end-to-end bandwidth of all multimode fiber span links shall be measured by the frequency domain method. The bandwidth shall be measured in both directions on all fibers. The bandwidth measurements shall be in accordance with TIA/EIA-455-204.

3.5.3 Soil Density Tests

******************************************************************************
NOTE: Choose one of the following options.
******************************************************************************

[ a. Determine soil-density relationships for compaction of backfill material in accordance with ASTM D1557, Method D.]

[b. Determine soil-density relationships as specified for soil tests in Section 31 00 00 EARTHWORK.]

PART 3 EXECUTION

3.1 REMOVAL, SALVAGE, AND DISPOSITION OF MATERIALS
   3.1.1 Materials To Be Salvaged
   3.1.2 Methods and Procedures
   3.1.3 Inventory of Track Materials
3.1.4 Inspection and Reconditioning of Used Track Materials
3.1.4.1 Cleaning By Hand or Mechanical Means
3.1.4.2 Visual Examination of Rails
3.1.4.3 Visual Examination of Joint Bars
3.1.4.4 Visual Examination of Gage Rods
3.1.4.5 Visual Examination of Tie Plates and Rail Anchors
3.1.4.6 Gage Rods
3.1.4.7 Grade Crossing Materials
3.1.5 Transport and Stack Excess and Salvaged Materials
3.1.5.1 Material Not Used In Track Repair
3.1.5.2 Stacking of Rails
3.1.5.3 Stacking of Joint Bars, Gage Rods, and Tie Plates
3.1.5.4 Containers
3.1.5.5 Stacking of Special Trackwork Materials
3.1.6 Material to be Scrapped

3.2 Placement of Ballast [and Subballast]
3.2.1 Subballast
3.2.1.1 Subballast Placement
3.2.1.2 Subballast Compaction
3.2.2 Ballast
3.2.2.1 Ballast Placement
3.2.2.2 Ballast Distribution
3.2.2.3 Ballast Below Ties

3.3 Track Construction and Out-of-Face Relay
3.3.1 Roadbed Preparation
3.3.2 Geotextile for Track Construction
3.3.3 Unloading the Materials
3.3.4 Ties
3.3.5 Tie Plates
3.3.6 Rail
3.3.6.1 Laying Rail
3.3.6.2 Joints
3.3.6.3 Expansion Allowance
3.3.6.4 Cutting Rail
3.3.6.5 Matching Rails
3.3.6.6 Rail Replacement
3.3.6.7 Out-of-Face Rail Relay
3.3.6.8 Spot Rail Replacement
3.3.6.8.1 Replacement Rail
3.3.6.8.2 Spot Rail Replacement Resulting in Joint Staggers
3.3.7 Joint Bars
3.3.8 Spiking
3.3.8.1 Spiking Procedures
3.3.8.2 Number of Spikes
3.3.9 Tie Plugs
3.3.10 Rail Anchor Placement
3.3.11 Inner Guard Rails
3.3.12 Derails
3.3.13 Superelevation
3.3.14 Preliminary Surfacing
3.3.14.1 Lifts
3.3.14.2 Tamping
3.3.14.3 Replacement of Ties
3.3.14.4 Track Off The Ends of Open Deck Bridges
3.3.14.5 Runoff of Track Raises
3.3.14.6 Horizontal Realignment
3.3.15 Final Surfacing
3.3.15.1 Final Tamping
3.3.15.2 Final Alignment
3.3.15.3 Final Dressing
3.3.15.4 Surplus Ballast
3.3.16 Cleanup
3.3.16.1 Shoulder Removal and Reconstruction
3.3.16.2 Spoil Materials
3.3.17 Final Adjustments
3.3.18 Tolerances for Finished Track
3.3.18.1 Gage
3.3.18.2 Alignment
3.3.18.3 Track Surface
3.3.18.4 Guard Face Gage
3.3.18.5 Guard Check Gage

3.4 TURNOUTS AND TRACK CROSSINGS
3.4.1 Turnout Reconstruction
3.4.1.1 Install Salvaged Turnouts
3.4.1.2 Salvage and Install Turnouts
3.4.1.3 Turnout Removal and Salvaged or Scrapped
3.4.1.4 Trackbed
3.4.1.5 Replacement Turnout
3.4.1.6 Matching
3.4.1.7 Placing of Ballast
3.4.1.8 Existing Switch Stand
3.4.1.9 Rail Anchors
3.4.2 Turnout Repair
3.4.2.1 Switch Ties
3.4.2.2 Bolt Tightening
3.4.2.3 Rebuild Switch Points and Protectors, Frogs, and Guard Rails
3.4.2.4 Regage Closure Rails

3.5 HIGHWAY CROSSINGS
3.5.1 Subgrade
3.5.2 Geotextile Installation
3.5.2.1 Preparation
3.5.2.2 Placement
3.5.2.3 Placement of Cover Material
3.5.2.4 Equipment Operations on the Cover Material
3.5.2.5 Minimum Ballast Depth
3.5.2.6 Tamping Operations
3.5.2.7 Double Layers
3.5.3 Ballast Placement and Surfacing
3.5.4 Ties
3.5.5 Tie Plates, Spikes, and Anchors
3.5.6 Rail
3.5.7 Lining and Surfacing
3.5.8 Crossing Surface
3.5.8.1 Type 1 Aggregate Crossings
3.5.8.2 Type 1A Aggregate with Timber Flangeway Guards Crossings
3.5.8.3 Type 2 Timber Plank Crossings
3.5.8.4 Type 3a Asphalt Crossings
3.5.8.5 Type 3b Asphalt With Timber Flangeway Header Crossings
3.5.8.6 Type 4a Cast-in-place Concrete Crossings
3.5.8.7 Type 4b Prefabricated Concrete Panel Crossings
3.5.8.8 Type 5 Full Depth Rubber Crossings
3.5.9 Signs and Signals
3.5.9.1 Location and Positioning of Signs
3.5.9.2 Traffic Control
3.5.10 Crossing Flangeways
3.5.10.1 Flangeway Filler
3.5.10.2 Clean Grade Crossing Flangeways
3.5.11 As-Built Drawings
3.6 BONDING AND GROUNDING TRACK
   3.6.1 Rail Joint Bond
   3.6.2 Rail Cross-Bond and Ground
   3.6.3 Inspection of Rail Bond and Ground
   3.6.4 Rail Bonds At Signalized Grade Crossings
   3.6.5 Existing Bonds
   3.6.6 Removal of Defective Bonds

3.7 INSTALLATION OF MISCELLANEOUS TRACK MATERIALS
   3.7.1 Tie Plates
   3.7.2 Insulated Joints
   3.7.3 Bumping Posts, Cushion Head, and Wheelstops
   3.7.4 Inner Guard Rails
   3.7.5 Gage Rods
   3.7.6 Installation of Joint Bars

3.8 BRIDGE REPAIR
   3.8.1 State and Local Government Permits
   3.8.2 Work Hours
   3.8.3 Schedule of Bridge Repair Work
   3.8.4 Timber Pile Repair
   3.8.5 Timber Pile Replacement
   3.8.6 Bridge Tie Replacement Open-Deck Bridges
   3.8.7 Rivet Replacement

3.9 ELECTRIC ARC WELDING
   3.9.1 Welding Supervision
   3.9.2 Weather Conditions
   3.9.3 Welding Manganese Frogs and Crossings
      3.9.3.1 Manganese Overheating
      3.9.3.2 Slotting
   3.9.4 Welding Switch Points
   3.9.5 Welding Switch Point Protectors
      3.9.5.1 In Track
      3.9.5.2 Out of Track
   3.9.6 Welding Engine Burns
      3.9.6.1 Depth and Length Limitations
      3.9.6.2 Ambient Limitations
      3.9.6.3 Number of Welds
      3.9.6.4 Welding Procedure
   3.9.7 Welding Rail Joints

3.10 THERMITE WELDING PROCEDURES
   3.10.1 End Preparation
      3.10.1.1 Cleaning
      3.10.1.2 Gap and Alignment
   3.10.2 Surface Misalignment Tolerance
   3.10.3 Gage Misalignment Tolerance
   3.10.4 Thermite Welding
      3.10.4.1 Thermite Weld Preheating
      3.10.4.2 Thermite Weld Cooling
   3.10.5 Weld Finishing and Tolerances
   3.10.6 Weld Quality
   3.10.7 Weld Numbering

3.11 TRACK REPAIR
   3.11.1 Cutting and Drilling of Rail
   3.11.2 Rail Joints
      3.11.2.1 Used Bolt Assemblies
      3.11.2.2 Joint Repair
      3.11.2.3 Cleaning of Finishing Area
      3.11.2.4 Rail Ends
      3.11.2.5 Joint Gap
   3.11.3 Spiking
3.11.4 Spot Tie Replacement
  3.11.4.1 Paint Markings and Tie Inspection
  3.11.4.2 Additional Tie Work
  3.11.4.3 Old Spikes, Rail Anchors, tags and Tie Plates
  3.11.4.4 Humped Track
  3.11.4.5 Minimal Humping
  3.11.4.6 Fouled or Muddy Ballast
  3.11.4.7 Insertion of New Ties
  3.11.4.8 Positioning of Tie Plates
  3.11.4.9 Re-spacing of existing ties
  3.11.4.10 Track Gage
    3.11.4.10.1 Tangent Track
    3.11.4.10.2 Curved Track
  3.11.5 Joint Respiking
    3.11.5.1 Substitution of Tie Plates
    3.11.5.2 Respiked Joints
  3.11.6 Regaging
  3.12 SAMPLING AND TESTING
  3.12.1 Ballast [and Subballast] Samples
  3.12.2 Ballast [and Subballast] Tests
    3.12.2.1 Sieve Analyses
    3.12.2.2 Bulk Specific Gravity and Absorption
    3.12.2.3 Percentage of Clay Lumps and Friable Particles
    3.12.2.4 Degradation Resistance
    3.12.2.5 Soundness Test
    3.12.2.6 Percentage of Flat or Elongated Particles
  3.12.3 Tie Inspection
  3.12.4 Examination of Geotextile
  3.13 INSPECTION AND FIELD TESTING
  3.13.1 Track
  3.13.2 Welded Joints - Visual Inspection
  3.13.3 Electric Arc Welding Inspection
  3.13.4 Thermit Weld Joints Testing
  3.13.5 Electric Arc Weld Testing
  3.13.6 Inspection of Geotextile
  3.13.7 Testing Relay Rail
    3.13.7.1 Testing for Wear
    3.13.7.2 Testing for Defects

UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated July 2019

SECTION 34 11 00

RAILROAD TRACK AND ACCESSORIES
04/08

NOTE: This guide specification covers the requirements for new railroads after the roadbed has been prepared, and railroad rehabilitation.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: This section will be used only for railroad construction after the roadbed has been prepared. Sections 31 11 00 CLEARING AND GRUBBING and 31 00 00 EARTHWORK will be used for specifying roadbed preparation. CAUTION: Coordination of this section with other sections of the specifications and with the project drawings is required.

The following information should be shown on the drawings:

a. Location of various sizes of rail if required.

b. Approximate location of compromise joints.
c. Locations of accessories such as welded joints, rail anchors, guard rails, gage rods, bonded and grounded track, etc.

d. Locations of items of equipment such as derails and car bumpers.

e. Location of turnouts, including dimensions from point of switch and center of last switch tie. Also type of switch stand and quantity and location of switch ties.

f. Track section with all needed dimensions.

g. Superelevation locations and amounts.

h. Highway grade crossing location, type, and details (cross-sections) as required. Standard details for each type of crossing are available on CADD through the PCASE program.

1.1 UNIT PRICES

NOTE: When lump sum payment is desired in the Invitation for Bids for work covered under this section the UNIT PRICES paragraphs will be deleted and subsequent paragraphs renumbered.

Each bid item will be measured by the unit listed in the Bid Schedule. Materials must be actually used or installed in the completed work. No measurement will be made for wasted materials or materials used for the convenience of the Contractor. The quantities thus determined will be paid for at their respective unit prices as shown in the Unit Price Schedule. This payment will constitute full compensation for furnishing materials, equipment, and labor and incidentals necessary to complete the work required, and for removing and properly disposing of replaced materials. Any required work or materials, such as lubricants and creosote, which are not listed on the Unit Price Schedule, shall be considered subsidiary to the items listed, and their cost shall be included in the costs for the listed items. Bid items are self-explanatory except as described below.

1.1.1 Rail

NOTE: Use the following paragraph for new track construction. Use paragraphs Out-of-Face Rail Replacement and Spot Rail Replacement below for rehabilitation work.

Rail will be paid for on a unit price per linear meter ft of rail weight shown in the Unit Price Schedule. Stock rails and closure rails will be included for payment in the turnout unit price. The rails in road crossings will be included for payment for rail. Payment [will] [will not] include such items as [furnishing the rail,] [cutting and drilling the rail,] [installing the rail,] [and] [delivering the old rail removed from
track to the designated storage area].

1.1.1.1 Out-of-Face Rail Replacement

Measurement will be by the linear meter of 30.5 m ft of 100 ft or more of contiguous replacement rail acceptably installed. Payment will be at the contract unit price per linear meter ft for "Out-of-Face Rail Replacement".

1.1.1.2 Spot Rail Replacement

Measurement will be by the linear meter of less than 30.5 m ft of less than 100 ft of contiguous replacement rail acceptably installed. Existing rails which are adjusted in the track during spot rail replacement will not be measured for payment. Existing rails which must be transposed or exchanged during spot rail replacement, as determined by the Contracting Officer, [will] [will not] be measured for payment. Payment will be at the contract unit price per linear meter ft for "Spot Rail Replacement".

1.1.2 Joint Bars

**************************************************************************
NOTE: List joint bars required.
**************************************************************************

Joint bars will be paid for at the unit price per pair under "Furnish Joint Bars" for the following items: [______].

1.1.3 Compromise Joints

Compromise joints will be paid for at the contract unit price per joint for "Furnish Compromise Joint".

1.1.4 Turnouts

1.1.4.1 New Turnouts

Turnout construction will be measured and paid for at the contract unit price for "Furnish and Install New Turnouts". Each turnout shall include the complete switch, switch stand, connecting rod, switch rods, attachments, switch points, slide plates, rail braces, frog, fillers, joint bars and track bolts for the switch and frog, switch ties, and all other required items, including rail, rail anchors, standard tie plates, and spikes. Ballast will be paid for at the unit price for ballast. The pay limit for turnout construction begins at the center of the No. "0" tie at the front of the turnout to the last long switch tie of the rear of the turnout.

1.1.4.2 Turnout Repair

The following are turnout and track crossing unit price pay items:

1.1.4.2.1 "Switch Repair"

(1) "Replace Switch Stand" - Each
(2) "Replace Switch Points" - Each
(3) "Install or Replace Heel Fillers" - Each
(4) "Install or Replace Heel Filler Bolt Assembly" - Each
(5) "Install or Replace Switch Plates" - Each
(6) "Install or Replace Switch Braces" - Each
(7) "Remove and Respike Braces and Plates" - Each
(8) "Adjust Adjustable Braces" - Each
(9) "Install or Replace Switch Rods and Clips" - Each
(10) "Replace Connecting Rod" - Each
(11) "Grind and Dress Switch Point and Adjacent Stockrail" - Each
(12) "Clean, Adjust, and Lubricate Switch" - Each
(13) "Rebuild Switch Point Protector" - Each
(14) "Rebuild Switch Point" - Each
(15) "Paint Switch Stand"

1.1.4.2.2 "Frog Repair"

(1) "Replace Frog" - Each
(2) "Install or Replace Frog Plates or Hook Plates" - Each
(3) "Rebuild Frog" - Each
(4) "Grind and Dress Frog, Install or Replace Frog Bolt Assembly" - Each

1.1.4.2.3 "Guard Rail Repair"

(1) "Replace Guard Rail" - Each
(2) "Install or Replace Guard Rail Plates" - Each
(3) "Install or Replace Guard Rail Bolt Assembly" - Each
(4) "Install or Replace Guard Rail Fillers" - Each
(5) "Install or Replace Clamp Assembly including Fillers and Wedges" - Each
(6) "Tighten all Bolts in Turnouts" - Each

1.1.5 Track Crossing

Track crossings will be paid for at the contract unit price for "Furnish and Install Track Crossing".

1.1.6 Crossties and Switch Ties

**************************************************************************
NOTE: If only one of the AREMA Manual standard crosstie grades listed below is to be used, list only the specified grade and delete the other grade.
**************************************************************************

Crossties will be measured for each defective crosstie removed and for each new crosstie acceptably furnished and installed as indicated. Switch ties will be measured for each length of defective switch tie removed and for each length of new switch tie acceptably furnished and installed as indicated. Defective crossties and switch ties removed become the property of the Contractor. Crossties will be paid for at the contract unit price for each type listed below:

"152 by 203 mm 6 by 8 in Grade Crosstie"
"178 by 229 mm 7 by 9 in Grade Crosstie"

Switch ties will be paid for at the contract unit price each for the length of switch tie listed below:

"2.74 m 9 ft 0 in Switch Tie"
"3.05 m 10 ft 0 in Switch Tie"
"3.35 m 11 ft 0 in Switch Tie"
"3.66 m 12 ft 0 in Switch Tie"
1.1.7 Geotextiles

Geotextile quantities will be paid for at the unit price as shown on the Unit Price Schedule. Payment for material used in laps, seams, or extra lengths such as anchorage and for associated equipment such as securing pins along with the associated materials, equipment, labor, and operations is included in the contract unit price for "geotextile" and shall not be paid for separately. For payment purposes, installed geotextile will be measured in place to the nearest square meter or square yard of placement area. Only material must be actually used or installed in the completed work will be paid for.

1.1.8 Ballast, Out-of-Face Surface and Aligning

Ballast shall be measured based upon certified scale tickets for railcars or other delivery vehicles. Payment for ballast material will be made at the contract unit price per net metric ton or ton of each gradation acceptably furnished and placed in track for "Furnish and Place Ballast." Copies of waybills and delivery tickets shall be submitted during the progress of work. Before the final statement is allowed, file certified waybills and delivery tickets for ballast actually used. Out-of-Face Surface and Aligning will be measured by the unit track-meter or track-ft for each track-meter or track-ft of raise of each type or fraction thereof, acceptably performed. Payment will be at the contract unit price per track meter or ft for each item given below:

"Out-of-Face Surface and Aligning - skin Lift"
"Out-of-Face Surface and Aligning - 51 mm 2 in Raise"
"Out-of-Face Surface and Aligning - 102 mm 4 in Raise"
"Out-of-Face Surface and Aligning - 152 mm 6 in Raise"
"Out-of-Face Surface and Aligning - [_____] mm [_____] in Raise"

1.1.9 Subballast

Subballast shall be measured based upon certified scale tickets. Payment for subballast material will be made at the contract unit price per net metric ton or ton of each gradation acceptably furnished and placed and compacted on the track bed for "Furnish, Place, and Compact Subballast." Copies of waybills and delivery tickets shall be submitted during the progress of work. Before the final statement is allowed, file certified waybills and delivery tickets for subballast actually used.
1.1.10 Bridge Work

**************************************************************************
NOTES: Remove this paragraph when Bridge Work is not required in the contract. This paragraph should be edited to include payment for the items shown if they are not paid for separately under the Bidding Schedule.

Open deck bridge repair would not be track construction. Repair would require bridge tie renewals and wood guard rail renewals as separate items.
**************************************************************************

The following items relating to bridge repair will be measured separately for payment and are described under other sections of these specifications.

<table>
<thead>
<tr>
<th>ITEM DESCRIPTION</th>
<th>UNIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timber Pile Repair</td>
<td>Linear m feet</td>
</tr>
<tr>
<td>Timber Pile Replacement</td>
<td>Linear m feet</td>
</tr>
<tr>
<td>Shotcrete Repair</td>
<td>Square m feet</td>
</tr>
<tr>
<td>Bridge Tie Replacement (Open-deck)</td>
<td>Each</td>
</tr>
<tr>
<td>Rivet Replacement</td>
<td>Each</td>
</tr>
<tr>
<td>Gabion and Gabion Mattress</td>
<td>Cubic m yard</td>
</tr>
</tbody>
</table>

All other work relating to bridge repairs will not be measured but will be paid for under the contract lump sum prices listed below for work at the following locations: [______].

1.1.10.1 Lump Sum Payment

Payment for each lump sum shall be full compensation for all material, labor, equipment, and incidentals necessary to complete the work as shown on the drawings and as specified herein. Lump sum payment will be exclusive of those items specifically covered by the unit prices referenced above. The lump sum payment items include, but are not limited to, permitting, traffic maintenance, demolition, excavation, excavation supports, backfill, clearing, grubbing, protection of utilities and signals, timber repairs, temporary supports, jacking bridges, concrete construction, ballast retaining walls, pipe, end walls, removal and reinstallation of existing track, surface preparation, and painting.

1.1.10.2 Track over Ballasted-deck Bridges

Repair of track over ballasted-deck bridges will be measured and paid for at the contract unit price for the applicable repair item. Removal of track over ballasted-deck bridges which are to be repaired is considered incidental to the bridge repair. Reconstruction of track over open deck bridges will be measured per track m ft and paid for at the contract unit price for TRACK CONSTRUCTION AND OUT-OF-FACE RELAY.
1.1.11  Track Spikes

Measurement will be by the unit keg for each keg of spikes acceptably furnished. Payment will be at the contract unit price per keg under "Furnished Track Spikes". Payment [will] [will not] be made for installation incidental to tie replacement or rail relay.

1.1.12  Track Bolt Assemblies

**************************************************************************
NOTE: List required bolt sizes.
**************************************************************************

Track bolt assemblies shall include bolt, spring washer (nutlock and nut). Measurement will be for each bolt furnished of the following sizes: [____]. Payment will be at the contract unit price per each "Furnished Track Bolt Assembly". Payment [will] [will not] be made for installation incidental to rail joint repair or rail relay.

1.1.13  Tie Plates

**************************************************************************
NOTE: List tie plate sizes required.
**************************************************************************

Measurement will be for each tie plate acceptably furnished of the following size: [____]. Payment will be at the contract unit price per each under "Furnish Tie Plates". Payment [will] [will not] be made for installation incidental to tie replacement or rail relay.

1.1.14  Rail Anchors

**************************************************************************
NOTE: List rail weight and section for which anchors are required.
**************************************************************************

Measurement will be for each anchor of the following weight [____] and section [____] acceptably furnished and installed. Payment will be at the contract unit price for "Furnish and Install Rail Anchors".

1.1.15  Insulated Joints

**************************************************************************
NOTE: List rail weight and section for which insulated joints are required.
**************************************************************************

Insulated joints will be measured for each insulated joint acceptably furnished and installed and will be paid for at the contract unit price for "Furnished and Installed Insulated Joints". Insulated joints will be required for the following rail weight [____] and section [____].

1.1.16  New Bumpers

**************************************************************************
NOTE: List type of bumpers required.
**************************************************************************
New bumpers of [_____] type will be measured for each bumper acceptably furnished and installed. Payment for furnishing and installing new bumpers will be at the contract unit price per each under "Furnish and Install New Bumpers".

1.1.17 New Wheelstops

**************************************************************************
NOTE: List type of wheelstops required.
**************************************************************************

New wheelstops of [_____] type will be measured by the unit pair for each pair of wheelstops acceptably furnished and installed. Payment for furnishing and installing new wheelstops will be at the contract unit price for each pair for "Furnish and Install New Wheelstops".

1.1.18 Salvaged Bumpers and Wheelstops

Salvage of existing track bumpers and wheelstops will be measured and paid for each bumper or pair of wheel stops salvaged.

1.1.19 Install Bumpers

Installation of salvaged bumpers will be measured for each bumper under "Install Track Bumper".

1.1.20 Install Wheelstops

Installation of salvaged wheelstops will be measured for each pair of wheelstops acceptably installed and will be paid for at the contract unit price for "Install Wheelstops".

1.1.21 Cushion Head for Bumper

Payment for furnishing and installing cushion head will be at the contract unit price per each new cushion bumper head.

1.1.22 Fastenings

Payment for fastenings used in the installation or reinstallation of bumping post, wheelstops, or cushion head for bumpers are considered incidental and included in the installation pay item for each.

1.1.23 Inner Guard Rail

Inner guard rail will be measured by the linear m ft of rail acceptably furnished and installed and will be paid for at the contract unit price for furnished and installed "Inner Guard Rail". Each rail of dual guard rail installations will be measured separately. The other track materials (OTM, i.e., joint bars, bolt assemblies, tie plates and spikes) will be included with the guard rail.

1.1.24 Adjusted gage Rods

Readjusting existing gage rods, as designated by the Contracting Officer, will be measured for each and be paid for at the contract unit price per each under "Adjust gage Rods".
1.1.25 New gage Rods

New gage rods will be measured for each gage rod acceptably furnished and installed and will be paid for at the contract unit price for "Furnish and Install gage Rods".

1.1.26 Salvaged gage Rods

Removal and salvage of existing gage rods will be measured and paid for at the contract unit price for each under "Salvage gage Rod".

1.1.27 Installed Salvaged gage Rods

Installation of salvaged gage rods will be measured for each gauge rod acceptably installed and will be paid for at the contract unit price for each under "Install Salvaged gage Rods".

1.1.28 New Derails

New derails will be measured and paid for at the contract unit price per each new derail acceptably furnished and installed under the bid item "Furnish and Install New Derail".

1.1.29 Installed Derails

Installation of salvaged derails will be measured for each derail acceptably installed and will be paid for at the contract unit price for each under "Install Derail".

1.1.30 Rail Welding

1.1.30.1 Rail Welding Thermite

Thermite rail welding to eliminate joints will be measured for payment based upon the number of rails welded and accepted by the Contracting Officer. Payment will be made for costs associated with rail welding of Government furnished and Contractor furnished rails. No payment will be made for replacement welds found unacceptable by ultrasonic testing.

1.1.30.2 Rail Welding Electric Arc

Electric Arc rail welding of [rebuilt rail ends] [engine burns] [____] will be measured for payment based upon the number of rails welded and accepted by the Contracting Officer. Payment will be made for costs associated with rail welding of Government furnished and Contractor furnished rails. No payment will be made for replacement rails or replacement welds found unacceptable by ultrasonic testing.

1.1.31 Rail Joint Gap Adjustment

Measurement will be by the unit for each rail gap acceptably adjusted by replacing rail. Rail gaps which are created by rail adjusting (pulling or bumping) operations will not be measured for payment. Payment will be at the contract unit price per each under "Spot Rail Replacement".

1.1.32 Rail Joint Repair

Measurement will be by the unit for each joint acceptably repaired (disassembly, cleaning, inspection, repairing any rail end mismatch, and
reassembly with new bolt assemblies). Joints which are repaired coincident with adjacent other repair work, such as spot rail replacement, will not be measured for payment. Payment will be at the contract unit price per each under "Rail Joint Repair".

1.1.33 Respiking

Measurement will be by the unit for each 90.7 kg 200 pound keg utilized in track respiking. Respiking of joints located in a rail which is being shifted as part of a regaging operation will not be measured for payment. Spiking of ties installed under this contract will not be measured for payment. Respiking of ties in areas of "Rail Joint Repair" will not be measured for payment. Payment will be made at the contract unit price per tie under "Respiking".

1.1.34 Rail Cropping

Measurement will be by the unit for each rail end acceptably cropped and redrilled. Payment will be at the contract unit price for "Rail Cropping".

1.1.35 Tighten Bolts

Measurement will be made by the track km mile of bolts tightened, or removing and installing bolts that cannot be tightened, or replacing bolts that are missing. Payment will be made at the contract unit price for km mile or portion thereof under "Tighten Bolts".

1.1.36 Bolt Assembly Replacement

Measurement will be by the unit for each bolt assembly acceptably replaced. Payment will be at the contract unit price for "Bolt Assembly Replacement".

1.1.37 Track Construction

Track construction is defined as the initial construction of track or total reconstruction of track from the subgrade up. The pay item "Track Construction" includes all plant, equipment, and labor necessary to install rail, ties, and track materials and construct the track in accordance with this specification. Track materials shall be furnished under their respective pay items in the contract Unit Price Schedule. Track construction will be measured and paid for by the track m ft for construction acceptably performed at the contract unit price for "Track Construction".

a. Reconstruction of track through grade crossings and between points 6 meters 20 ft beyond the outside limits of the crossing surface as shown will be considered to be track construction.

b. Track relocation or realignment of existing track by more than 1 meter 3 ft when associated with the relocation of turnouts or other work will be measured and paid for as "Track Construction".

c. Minor shifting of existing track associated with the replacement of turnouts, or any shifting less than 1 meter 3 ft is considered to be minor work incidental to related lining and surfacing work.

d. Where track construction abuts a turnout, the pay limit for construction of various items will be the center of the No. "0" tie in
front of the turnout and the last long switch tie at the rear of the turnout and shall not include turnout.

e. Rail, ties, and other track materials for use in track construction will be included for measurement and payment under the respective contract unit prices for furnishing that material. Ballast and subballast will be measured and paid for at the contract unit prices for "Furnish and Install Ballast" and "Furnish, Place, and Compact Subballast". Costs for surfacing and alignment will be included in the contract unit price for "Track Construction".

1.1.38 Track Removal and Salvage

Removal of track will be measured by the \text{track-meter} track-ft, acceptably removed, and materials salvaged, inspected, inventoried, marked, stacked, and transported to designated storage sites. Track removal and salvage will be paid at the contract unit price per track meter ft under "Track Removal and Salvage".

1.1.39 Track Removal and Scrap

Track removal and scrap will be measured by the track \text{meter ft} of track acceptably removed and all of the scrap materials removed from the installation. Track removal and scrap will be paid for at the contract unit price per track meter ft of "Track Removed and Scraped".

1.1.40 Turnout Removal and Salvage

Turnout removal and salvage consist of removing all turnout materials, including switch ties. Limits of the turnout removal and salvage will be from the switch point to the last long switch tie. Also, included is the transportation of the materials to the designated storage site. The removal and salvage will be measured for each turnout removed and turnout material salvaged.

1.1.41 Straight Rail Turnout

**************************************************************************
NOTE: Straight rail turnout is performed when a turnout is removed, but one track is to remain in service.**************************************************************************

Straight rail turnout consists of installing crossties in place of switch ties and replacing the previously removed switch and frog with rail and other track materials. The straight rail turnout will be measured for each turnout removed.

1.1.42 Rail Bonds

Rail bonds will be measured for each bond acceptably furnished and installed and will be paid for at the contract unit price for each of the following:

a. "Furnish and Install Railhead Bonds"
b. "Furnish and Install Duplex Web Bonds"
1.1.43 Rail Grounds

Rail grounds, including grounding rods, connecting cables, and hardware will be measured by the unit for each rail ground assembly acceptably furnished and installed and will be paid for at the contract unit price for each "Ground Assembly" furnished and installed.

1.1.44 Removal of Existing Crossing Surfaces

Removal and disposal of existing crossing surfaces and adjacent pavements will be measured by the square meter yard of surface or pavement acceptably removed and will be paid for at the contract unit price for "Pavement Removal". Removal of aggregate crossings will not be measured for payment as this work is considered incidental to "Track Construction".

1.1.45 Salvage of Grade Crossing Panel

Salvage of existing grade crossing panels and other materials will be measured by the track meter ft of crossing surface acceptably salvaged and will be paid for at the contract unit price per track m ft under "Grade Crossing Panel Salvage".

1.1.46 Track Removal and Track Construction Through Crossings

Track removal through crossings will be measured by the track meter ft and paid for as "Track Removal". Track construction using existing rail through crossings will be measured and paid for at the contract unit prices as specified in the appropriate sections of this specification. Track construction furnishing rail and other track material will be measured and paid for at the unit prices as specified in the appropriate sections of this specification.

1.1.47 Grade Crossing Surface Installation

**************************************************************************
NOTE: Throughout this section, delete crossing types not applicable to the work by coordinating with the project standard drawings and cross sections. Designer should add a separate bid item for signs if required.
**************************************************************************

Grade crossing surface installation will be measured by the track meter ft of crossing surface acceptably installed and paid for at the contract unit prices for the items listed below:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GRAVEL: (SEMI-PERMANENT)</td>
</tr>
<tr>
<td>1A</td>
<td>GRAVEL: WITH TIMBER HEADERS</td>
</tr>
<tr>
<td>2</td>
<td>TIMBER: FULL DEPTH</td>
</tr>
<tr>
<td>2A</td>
<td>TIMBER: FULL DEPTH, PREFABRICATED TIMBER SECTIONAL</td>
</tr>
<tr>
<td>TYPE</td>

</tr>
<tr>
<td>4A</td>
<td>CONCRETE: PRECAST CROSSING PANELS/SYSTEMS</td>
</tr>
<tr>
<td>5</td>
<td>RUBBER (ELASTOMERIC)</td>
</tr>
</tbody>
</table>

1.1.48 Subdrains

Subdrains acceptably installed will be measured and paid for by the linear meter ft at the contract unit price for "Grade Crossing Subdrains".

1.1.49 Conduit

**************************************************************************
NOTE: Delete this paragraph if grade crossing conduit is not required for automatic crossing protection warning devices. Installation should be considered if future crossing signal installation is anticipated.
**************************************************************************

PVC cable conduit of 100 mm 4 in diameter acceptably installed will be measured and paid for by the linear m ft at the contract unit price for "Grade Crossing Conduit".

1.1.50 Cleaning Flangeways

Cleaning the gage side flangeways in grade crossings shall be considered incidental work.

1.1.51 Ultrasonic Testing of Rail

Ultrasonic testing will be measured by the track meter ft and will be paid for as "Ultrasonic Testing".

1.1.52 Electric Arc Welding

Electric arc welding will be measured and paid for by the item, rebuilt in the track or in the shop and installed in the track. Items to be included are as follows:

a. "Switch point", each.
b. "Frog", each.
c. "Batter rail end", each.
d. "Guard rail", each.
e. "Engine burn", each.
f. "Railroad crossing", each.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the

SECTION 34 11 00 Page 25
District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Track Construction

Perform track construction under the direction of qualified and competent supervisory personnel experienced in railroad construction.
1.4.2 Welding

Perform welding under the direct supervision of an experienced welding supervisor or foreman.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Materials and Samples

Submit a complete schedule of the materials proposed for installation within 60 days of receipt of notice to proceed, and before installation of the materials; the schedule shall include a list of equipment proposed for the work. The Contracting Officer will notify the Contractor of the materials approved or disapproved. Disapproved materials that have already been delivered to the project site, shall be promptly segregated from the approved materials and removed from the premises. If materials are disapproved, acceptable replacement materials shall be provided at no additional cost to the Government. Submit performance data for components or products proposed as an equivalent to those specified. The Contracting Officer's written approval is required for any such equivalent type component or product proposed to be used. Initial approval by the Contracting Officer will not prevent the removal and replacement of materials that are materially defective or materials not meeting this specification that are discovered during construction and/or routine quality control/quality assurance operations. Submit manufacturer's certificates of conformance for the following materials:

a. Rail.
b. Tie plates.
c. Track bolts, nuts, and spring washers.
d. Joint bars.
e. Rail anchors.
f. Track spikes.
g. Turnouts.
h. Rail welding process.
i. Premanufactured car bumpers.
j. Premanufactured road crossings and/or crossing surfaces.

1.5.2 Geotextiles

Ship and store geotextiles in their original ultraviolet resistant cover until the day of installation. Protect geotextiles from vandalism, temperatures greater than 60 degrees C 140 degrees F, dirt, dust, mud, debris, moisture, sunlight, and ultraviolet rays. Geotextiles delivered to the project site shall be clearly labeled on the material cover to show the manufacturer's name, brand name, fabric type, location and date manufactured, lot identification, width, and length. Submit independent testing laboratory's certified test reports for geotextiles, including necessary analysis and interpretation. These reports shall provide results of the laboratory testing performed on samples of the geotextile material delivered to the jobsite. Test reports shall be submitted at least [5] _____ working days prior to the installation of the geotextile.

1.6 PROJECT/SITE CONDITIONS

1.6.1 Temporary Work

Provide, during construction, suitable roads and crossings with all necessary lights, signs, drainage, and other appurtenances required for
safe public and local travel. Erect and maintain suitable temporary fences where required to prevent trespass upon work or damage to adjoining property. Drainage shall be maintained, and the accumulation of water that might affect the stability of the roadbed will not be permitted.

1.6.2 Traffic Control

Traffic control devices shall comply with MUTCD. Suitable warning signs shall be placed near the beginning of the work site and well ahead of the work site for alerting approaching traffic from both directions. Small markers shall be placed along newly painted lines or freshly placed raised markers to control traffic and prevent damage to newly painted surfaces or displacement of raised pavement markers. Painting equipment shall be marked with large warning signs indicating slow-moving painting equipment in operation.

1.6.3 Welding

Welding shall not be performed in rain, snow, or other inclement weather without adequately protecting the weld from the elements.

1.6.4 License Agreement

**************************************************************************
NOTE: The Designer should assess the need to include this paragraph and its subparagraphs in the project specifications. Delete if not applicable.
**************************************************************************

The work under this contract is being accomplished under a license agreement between the [_____] RAIL CORPORATION (hereinafter referred to as the Railroad Company) and the UNITED STATES OF AMERICA executed on [______].

1.6.4.1 Provisions and Requirements

The following provisions and requirements are made a part of this contract in order for the UNITED STATES OF AMERICA to perform its obligations under the License agreement:

a. Perform the work in conformance with the standards of care and practice appropriate to the nature of the work.

b. Allow the Railroad Company to view and inspect the work at any time.

c. Do not enter the Railroad Company's premises until specifically authorized by the Contracting Officer. Notify the Contracting Officer at least 7 days prior to the planned date for entering the premises of the Railroad Company.

d. Take any safety precautions that the Railroad Company deems necessary. No equipment, unless being utilized to perform work on the railroad track, shall be located within 3.5 m 12 ft of the centerline of the nearest railroad track. Such equipment allowed within 3.5 m 12 ft of the centerline of the nearest railroad track shall be attended at all times.

e. Furnish evidence of Workmen's Compensation coverage for both itself and for all subContractors.
f. Maintain at all times during any construction, maintenance, or removal work, the following insurance coverages:

(1) Contractor's Public Liability and Property Damage Liability Insurance, including automobile coverage, with a combined single limit of $2,000,000 per occurrence;

(2) For each subcontractor, Contractor's Protective Public Liability and Property Damage Liability Insurance, including automobile coverage, with a combined single limit of $2,000,000 per occurrence;

(3) Railroad Protective Public Liability and Property Damage Liability Insurance with a combined single limit of $2,000,000 per occurrence.

1.6.4.2 Insurance Policy Requirements

The Railroad Protective Liability policy shall name the [_____] Rail Corporation, [_____] Corporation, and [_____] as the named insureds and shall include an endorsement in the form appearing in the Standard Provisions of the contract documents. Furnish to the Railroad Company, the Railroad Protective Liability policy and the certificates evidencing the other insurance coverage required in this section. Each policy and/or certificate shall provide that cancellation of the insurance cannot be accomplished unless at least ten (10) days notice is given to the Railroad Company.

PART 2 PRODUCTS

2.1 BALLAST

******************************************************************************

NOTE: No. 5 ballast should only be used around turnouts and other areas requiring a smooth walking surface. Depth of ballast will be indicated on the drawings.

A wide choice of materials may be used for ballast, depending on economics and availability. Prepared ballast is preferred since production can be controlled. The use of unprepared ballast for heavy-duty track will increase maintenance requirements. The inapplicable types of ballast will be deleted, and brackets will be removed. The size number will be indicated in this paragraph. Normally, prepared ballast will be used conforming to sizes of gradations established by AREMA Manual. Ballast, crushed stone and slag numbers 4, 4A, or 5 are acceptable. Size numbers 4 and 4A are typically mainline ballast materials. Size number 5 is typically used on yard and house tracks. Any or all of these sizes can be specified, with a Contractor's option. The depth and other details of the ballast section will be shown on the contract drawings.

Blast furnace slag should be considered a last choice or limited to areas with low rainfall and moisture and obtained from a source that is known to
have provided good performing ballast in recent years. Most slag ballast tend to cement together over time or otherwise disintegrate more rapidly than better quality crushed rock. Water seems to accelerate this process. (This behavior is much like some poorer quality limestones.) Thus, unless its performance is already well known, using slag for ballast is much riskier than using crushed rock.

**************************************************************************
Submit samples of the ballast [and subballast] material for testing. Submit samples a minimum of [30] [60] [90] [_____] days prior to the installation of the material. Samples shall be obtained from the quarry, supplier, or other source that will be used to provide the ballast [and subballast] materials for this project using the methods described in ASTM D75/D75M. [One representative sample of not less than 90.6 kg 200 lbs of ballast material shall be submitted for each 9070 MT 10,000 ton of ballast to be installed.] [One representative sample of not less than 90.6 kg 200 lbs of subballast material shall be submitted for each 9070 MT 10,000 ton of subballast to be installed.] Prepared ballast shall be crushed stone, [crushed air-cooled blast-furnace slag,] [ or ] [crushed steel furnace slag] Size No. [4,] [ 4A,] [ or ] [5] conforming to Chapter 1, Part 2, of AREMA Eng Man for quality, soundness and gradation. In the portion retained on each sieve specified, the crushed gravel shall contain at least 90 percent by weight of crushed pieces having two or more freshly fractured faces with the area of each face being at least equal to 75 percent of the smallest midsectional area of the plane. When two fractures are contiguous, the angle between planes of the fractures shall be at least 30 degrees in order to count as two fractured faces. Flat and elongated particle dimension ratio used in ASTM D4791 shall be 1:3. Submit certificates of Compliance for the ballast [and] [subballast] materials to be installed in this project. Ballast materials shall meet the property requirements shown in TABLE I.

2.2 SUBBALLAST

NOTE: Subballast should be used in frost areas where the ballast thickness requirement exceeds 250 mm (10 inches). Where subballast is necessary, indicate the kind of subballast to be used; the depth and other details of subballast section will be shown on the contract drawings. In some cases, the subballast material may be substituted for the lower portion of the ballast layer. The subballast is often constructed as a filter layer between the ballast and subgrade. Gradation of subballast generally ranges from the largest subgrade particles to the smaller or middle ballast particle sizes. Where practical, subballast should be placed in layers and thoroughly compacted to form a stable foundation for the ballast. AREMA Manual has a procedure for selecting gradation based on gradation of ballast and subgrade.

Subballast shall consist of aggregate-soil materials conforming to an ASTM D1241 Type I, Gradation [A] [B] [C] [D] mixture.

2.3 GEOTEXTILE

NOTE: Requirements for geotextile will be deleted unless a thorough investigation indicates that geotextile is necessary. Where geotextile is necessary, subballast is recommended and the following information should be shown on the drawings:

a. Locations for geotextile installation.

b. Locations for drainage work, including subdrains to provide drainage for the geotextile.

c. Typical cross-section through track showing rail, tie, ballast, subballast, geotextile, and subgrade with dimensions.

d. Locations for disposal of spoil materials.

Numerical values listed in TABLE II, except AOS,
represent Minimum Average Roll Values (MARV) and are the value in the weaker principal direction as defined in AASHTO M 288.

Color should be grey or tinted to prevent "snow blindness" of personnel during installation.

The permeability of the geotextile should be at least five times greater than the permeability of the subgrade soil, but not less than the specified value. The pressure used to measure the nominal thickness (necessary to calculate the permeability) in ASTM D1777 should be based on the pressure expected to be placed on the geotextile in the installation.

Most railroad applications use overlap as a method of joining separate pieces of geotextile.

See UFC 3-230-01 for additional information on subsurface drainage and filtration criteria.

The minimum depth of ballast for the track section being constructed/reconstructed is to be specified. However, where geotextiles are used in the track structure, the minimum depth of ballast/subballast between the tie and the geotextile of 300 mm 12 in. should be enforced to avoid severe damage to the geotextile.

Submit geotextile samples for testing. Submit samples a minimum of [30] [60] [90] [_____] days prior to the beginning of installation of the geotextiles. One sample shall be provided for each 20 units (rolls, panels, etc.) of geotextile to be used in the contract. All samples shall be from the same production lot as will be supplied for the contract. Samples shall be identified by the manufacturer's name, brand name, lot designation, and project name. The minimum size of sample submitted for testing shall be the full width of the geotextile by [1.7] [9] [_____] m [5] [30] [_____] ft.

2.3.1 Physical Property Requirements

The geotextile shall be a nonwoven, pervious sheet of polymeric material and shall consist of long-chain synthetic polymers composed of at least 95 percent by weight polyolefins, polyesters, or polyamides. The use of woven slit film geotextiles (i.e. geotextiles made from yarns of a flat, tape-like character) will not be allowed. The geotextile shall contain stabilizers and/or inhibitors as necessary to make the filaments resistant to deterioration from ultraviolet light and heat exposure, particularly prior to placement and coverage. The fibers shall be formed into a network which will be dimensionally stable. The edges of the geotextile shall be finished in a way to prevent the outer fibers from being pulled away from the geotextile. The geotextile shall exceed the applicability property requirements stated in TABLE II.
### TABLE II - PROPERTY REQUIREMENTS-GEOTEXTILE

</tr>
</tbody>
</table>

*These property requirements are Minimum Average Roll Values in the weaker principal direction.

**Geotextile selection shall not be limited by the minimum weight shown. Selection shall be based on the other property requirements listed. Heavier geotextiles have shown greater resistance to abrasion.

### 2.3.2 Dimensional Requirements

Each roll of geotextile shall match the roadbed width and be at least 3.6 m 12 ft.

### 2.4 JOINT BARS

**NOTE: Lone toe joint bars are not recommended for high used tracks.**

Joint bars shall be of the size, shape, and punching pattern to fit the rail being joined.

#### 2.4.1 New Joint Bars

New joint bars shall be used with new rail, and shall be of the "toeless" and "head free design" to match rail section. New joint bars shall conform to the requirements of "Specifications For High-Carbon Steel Joint Bars" or "Specifications For Quenched Carbon-Steel Joint Bars and Forged Compromise Joint Bars" found in Chapter 4, Part 2 of AREMA Eng Man for the joint bar and assemblies recommended in Chapter 4, Part 1 of AREMA Eng Man.

#### 2.4.2 Used Joint Bars

Used joint bars in good condition shall be used with relay rail only. The type of joint bar shall be "toeless" type. The used "long toe" type of joint bar shall not be employed where, because of the tie plate punching pattern, the spike slots are used to spike the rail to alignment at the joints. Used joint bars shall be straight, free from cracks, breaks, and other visual defects. Excessive rust, dirt, and other foreign materials on the joint bars are not permitted. Used joint bars shall be of the proper
size to make good contact with the underside of the rail head and the top
of the rail base on the rails being joined. Joint bars shall have
alternating round and oval bolt holes. Bolt holes shall not show excessive
wear that would prevent use of the oval neck track bolt normally used with
that joint bar. Joint bars that have been flame-gouged, flame cut, or
otherwise altered shall be considered scrap and shall not be used.

2.4.3 Compromise Joint Bars

Compromise joint bars shall be of the size, shape, and punching pattern to
fit the rail sizes and sections being joined. Only factory designed and
constructed (forged or cast) compromise joint bars shall be used to join
rails of different sizes.

2.4.3.1 New Compromise Joint Bars

Compromise joint bars shall conform to the requirements of "Specifications
For Quenched Carbon-Steel Joint Bars and Forged Compromise Joint Bars"
found in Chapter 4, Part 2 of AREMA Eng Man.

2.4.3.2 Used Compromise Joint Bars

Requirements for joint bars in paragraph Used Joint Bars shall also apply
to used compromise joint bars.

2.5 GREASE

Grease for lubricating moving parts in turnouts and other trackwork shall
have the following typical characteristics:

<table>
<thead>
<tr>
<th>Calcium Soap, percent</th>
<th>9.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solid Additive (Graphite), percent</td>
<td>11.5</td>
</tr>
<tr>
<td>Penetration, ASTM D217 at 25 degrees C 77 degrees F worked</td>
<td>340</td>
</tr>
<tr>
<td>Dropping Point ASTM D566 at 25 degrees C 77 degrees F</td>
<td>101/214</td>
</tr>
<tr>
<td>Oil Viscosity, square mm/record at 40 degrees C cSt at 104 degrees F</td>
<td>81.8</td>
</tr>
<tr>
<td>ASTM D445 SUS at 38 degrees C 100 degrees F</td>
<td>379</td>
</tr>
</tbody>
</table>

Other types of grease or lubricating oil (like SoyTrak) may be used
provided that the grease or oil has been used successfully by local
commercial railroads and has the approval of the Contracting Officer.

2.6 OIL FOR CORROSION PROTECTION

Oil for protecting rail and other track materials from corrosion, except
joints, shall conform to the following general specification:

| Asphalt, 100 penetration minimum 45 percent | ASTM D402/D402M |
| Flash point, minimum 55 degrees C 130 degrees F | ASTM D1310 |
2.7 **RAIL**

Submit manufacturer's data on new rail including: rail weight, rail section, drilling, rail length, date rolled, and the name of the mill where the rail was rolled. Include chemical analysis for Industrial Grade Rail. For relay rail the required information shall include weight, section, lengths, and the name of the supplier. Provide the maximum allowable vertical wear on the rail head and the maximum allowable horizontal wear on the side of the rail. The design of the joint bars and compromise joint bars proposed to be furnished with each rail section shall also be provided.

### 2.7.1 New Jointed Rail

**NOTES:** Designer will indicate the desired rail weight and section. Rail weights/sections recommended for new rail purchases include: 115 RE, 132 RE, 133 RE, and 136 RE.

The designer will insert the rail section and the drilling pattern for each rail section required. Recommended rail drillings and joint bar punchings are found in Chapter 4, Part 1 of AREMA Manual. An example specification for 57 kg 115 lbs rail and a 6-hole joint bar would be:

<table>
<thead>
<tr>
<th>RAIL</th>
<th>DRILLING</th>
</tr>
</thead>
<tbody>
<tr>
<td>115RE</td>
<td>89-152-152 mm (3-1/2, 6, 6 inch)</td>
</tr>
</tbody>
</table>

**2.7.1.1 General Requirements**

New jointed rail shall comply with the following:

2.7.1.1.1 Rail Lengths

New rail shall be a [_____] kg/m lbs/yd section or heavier and shall conform to the specifications in Chapter 4, Parts 1 and 2 of AREMA Eng Man that were in effect at the time of its manufacture. New rail shall be provided in [11.9][24.4] m [39][80] ft lengths.

2.7.1.1.2 Rail Drilling

New rail shall be provided with the rail ends drilled. Drilling shall be uniform and to the patterns specified.

<table>
<thead>
<tr>
<th>RAIL</th>
<th>DRILLING</th>
</tr>
</thead>
<tbody>
<tr>
<td>[____]</td>
<td>[____]</td>
</tr>
</tbody>
</table>
2.7.1.2 New Industrial Grade Rail

All steel shall be produced in an electric furnace and be continuous cast, free of hydrogen. All injurious hot marks, or surface imperfections shall be culled out and eliminated. Rail shall control cooled to AREMA specifications. Rail shall be rolled in accordance with the general physical dimensional requirements of AREMA design but shall meet the Section tolerances and Chemical Composition listed below.

### SECTION TOLERANCES

<td>Flat Bottom Hole</td>
</tr>
<tr>
<td>Base</td>
<td>3.2 mm X 12.7 mm0.13 x 0.50 inch Slot</td>
<td></td>
</tr>
</tbody>
</table>

2.7.1.2.2 Straightness

Straighten rail for line in a press or roller straightener. End straightness must meet the following guidelines:
### 2.7.2 Used Jointed Rail

**NOTES:** Due to the ever-changing markets for used rail, it may be beneficial to allow the Contractor the option to provide an acceptable rail section for relay. Hence, the list of acceptable rail sections, acceptable rail weights, and sections should be chosen for compatibility with the existing rail and to minimize the number of different rail weights and sections on the installation. Delete unacceptable weights/sections from the list. Normally, rail less than 115 lbs should not be purchased for DOD track.

The designer will insert the rail section and the drilling pattern for each rail section required. To the greatest extent practical, the specified drillings should match the drilling pattern in the existing rail that is to remain in track. Recommended rail drillings and joint bar punchings are found in Chapter 4, Part 1 of AREMA Manual. An example specification for 57 kg 115 lbs rail and a 6-hole joint bar would be:

<table>
<thead>
<tr>
<th>RAIL</th>
<th>DRILLING</th>
</tr>
</thead>
<tbody>
<tr>
<td>115RE</td>
<td>89-152-152 mm 3-1/2, 6, 6 inch</td>
</tr>
</tbody>
</table>

### 2.7.2.1 Relief Rail

Used rail for spot rail replacement of defective rails (relief rail) shall be the same weight, section, drilling, and length as the rail being replaced. Relief rail shall meet the requirements specified for relay rail.

### 2.7.2.2 Relay Rail

**NOTE:** Relay rail is typically available in nominal lengths of 10 and 12 meters 33 and 39 ft. Relay rail can be justified if the construction cost is substantially below that of new rail.

A comparison of the usable metal in the heads of a new 57 kg/m 115-lbs RE rail and a 57 kg/m 115-lbs relay rail shows that the relay rail has about 32 percent less usable metal. Based on construction cost, the rail constitutes about 47 percent of the total track above roadbed; therefore, for economy,
track constructed with 57 kg/m 115-lbs relay rail should cost at least 15 percent (33 percent times 0.47 equals about 15 percent) less than track constructed with new 57 kg/m 115-lbs rail. Other conditions can be evaluated in a similar manner.

Specifying relay rail that meets AREMA is not adequate for military track. AREMA permits excessive end batter because rail ends are intended to be cropped off before welding. All relay rail should have ultrasonic inspection after it is installed. For Army projects the default values in Table IV are the maximum values. For Navy projects, the maximum wear shall be 5 mm 3/16 inch for the top and 3 mm 1/8 inch for the side.

FORSOM projects require the used of 115RE, 132RE, 133RE or 136RE rail sections.

Relay rail shall be control cooled. [Used rail for out of face replacement and new construction shall be 45 kg/m 90 lb/yard or heavier and shall have the same section and drilling pattern for each rail weight. Acceptable rail weights and sections are: [90 ARA-A,] [100 ARA-B,] [112 AREA,] [115 AREA,] [130 AREA,] [132 AREA,] [133 AREA,] [136 AREA,] [_____] [All relay rail provided shall be the same section.] Relay rail shall not be cut into jointed rail from continuous welded rail.

2.7.2.2.1 Rail Drilling
Relay rail shall be provided with the rail ends drilled. Drilling shall be uniform and to the patterns specified.

<table>
<thead>
<tr>
<th>RAIL</th>
<th>DRILLING</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

2.7.2.2.2 Length
Relay rail shall be standard [10.1] [11.9] m [33] [39] ft lengths. Not more than 10 percent of the lot may be shorts. No rail shorter than 8.2 m 27 ft will be accepted.

2.7.2.2.3 Maximum Allowable Wear
For each rail, the average top wear shall meet the requirements on Table IV, except rail in turnouts which shall conform to paragraph Maximum Wear Used Rails Installed in Turnouts. Side wear shall be measured 16 mm 5/8 in below the original top of rail.
### TABLE IV. ALLOWABLE WEAR LIMITS FOR RELAY RAIL

<table>
<thead>
<tr>
<th>Nominal Rail Weight, kg/m lbs/yds</th>
<th>Maximum Allowable Wear, mm inch</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Top</td>
</tr>
<tr>
<td>57.0 or less than 115</td>
<td>3.21/8</td>
</tr>
<tr>
<td>Greater than 57.0115 or Greater</td>
<td>6.41/4</td>
</tr>
</tbody>
</table>

#### 2.7.2.2.4 Condition and Appearance

Relay rail shall be free from obvious defects and clean in appearance. Rail that has severe pitting and corrosion or has been flame-gouged, or spike nipped will not be accepted. Rail shall be straight from line and surface and free from any kinks or bends. Rail bases shall be solid and free from visual defects such as plate wear, spike notching, pitting, and flame-gouging. All existing bond wires shall be removed from relay rail by shear cutting old cables immediately adjacent to the weld or pin. Bond wire heads shall be completely removed from the gage side.

#### 2.7.2.2.4.1 Maximum Allowable Lip

Lip or overflow shall not exceed 3 mm 1/8 inch on either side of the rail head.

#### 2.7.2.2.4.2 Engine Burns

Engine burns shall not be greater than 13 mm 1/2 inch diameter and 0.8 mm 1/32 inch deep. A maximum of 6 engine burns is allowed per rail and engine burns shall not affect more than 25 percent of the total order.

#### 2.7.2.2.4.3 End Batter and Chipping

Rail end batter shall not exceed a maximum of 3 mm 1/8 inch when measured 13 mm 1/2 inch from the rail end with a 460 mm 18 inch straightedge laid only on the rail being measured. Chipped or broken rail ends will not be accepted.

#### 2.7.2.2.4.4 Running Surface Damage

Running surface damage shall not exceed 6 mm 1/4 inch long by 13 mm 1/2 inch wide, and shall be not greater than 1.5 mm 1/32 inch deep. Flat spots are not permitted on the rail head.

#### 2.7.2.2.4.5 Defects Not Permitted

Relay rail having any of the following defects shall not be accepted: bolt hole cracks or breaks, broken base, breaks, crushed head, detail fracture, engine burn fracture, head-web separation, piped rail, horizontal split head, vertical split head, torch cut rail ends, torch cut bolt holes, and compound or transverse fissures. The presence of any of these defects in the rail render that rail as scrap.

#### 2.7.3 Welded Rail

**************************************************************************

SECTION 34 11 00 Page 40
NOTE: While the use of continuously welded rail and concrete ties may be beneficial in some situations, the cost effectiveness for general use for DOD track has not been proven at this time. A thorough life-cycle cost analysis should be performed prior to specifying these materials.

******************************************************************************

New rail shall be, [_____] kg/m lbs, [_____] section and shall conform to Chapter 4, Part 2 of AREMA Eng Man. Relay rail shall conform to TABLE IV, [_____] kg/m lbs. Relay rail that is to be welded shall meet the criteria specified in Chapter 4, Part 2 of AREMA Eng Man for welded rail. Mingling of new and relay rail will not be permitted.

2.8 TIE PLATES

2.8.1 General

Tie plates shall be of the dimensions and punching pattern (A or B) to fit the rail. New tie plates conforming to Chapter 5, Part 1 of AREMA Eng Man shall be used with new rail. Used tie plates in good condition may be used with relay rail and shall be the dimensions as originally specified by AREMA Eng Man. The used tie plates shall not be smaller than 190.5 by 254 mm 7-1/2 by 10 inch for use with relay rail having nominal weights less than 49.6 kg/m 100 lbs/yd, or not smaller than 190.5 by 279 mm 7-1/2 by 11 inch double-shoulder for use with relay rail having nominal weights of 49.6 kg/m 100 lbs/yd and greater. Both flat and canted plates will be required to match the existing tie plates that are in track. Canted tie plates shall be used in all new rail and relay out-of-face rail replacements.

2.8.2 Used Tie Plates

Used tie plates shall be free from excessive rust, pitting, mechanical damage, and dirt and other foreign materials. Cracked or broken plates shall be considered as scrap and shall not be used. Shoulders on the tie plates shall project a minimum of 6 mm 1/4 inch above the plane of the rail seat. The thickness of the tie plate shall be at least 13 mm 1/2 inch when measured anywhere in the rail seat area. Spike holes shall be square and not corroded, worn, or mechanically enlarged.

2.9 WOOD TIES

******************************************************************************

NOTE: Because of differences in treatability of the many species of wood used to manufacture railroad ties, installations should limit the number of acceptable species to those most commonly used in their geographic area. Red Oak, White Oak, and Southern Pine will provide good service in the eastern states while Douglas Fir will generally be more available in the western states. Southern Pine should not be used as mainline ties or as switch ties. Gum and pine ties are not recommended for use in areas having high humidity, such as the southeastern states. If unsure about the most appropriate species of wood for timber ties in the job geographic area, the engineering department of the local commercial railroad should be consulted.
The size and form of the crossties will be inserted in this paragraph using the following guidance.

a. For main lines, access tracks, or other tracks where the movement may be classified as heavy or the desired speed is in excess of 64.4 km/hr (40 miles per hour), crossties will be not less than 178 mm (7 in.) thick by 229 mm (9 in.) wide. The length of crossties will be 2.591 m (8 ft 6 in.) or 2.743 m (9 ft).

b. For yard or body, industrial, storage, siding, and running tracks, and for access tracks where the movement is not classified as heavy, crossties not less than 152 mm (6 in.) thick by 203 mm (8 in.) wide can be used. The length of crossties will either be 2.438 m (8 ft) or 2.591 m (8 ft 6 in.).

c. For road crossings, ties 178 mm (7 in.) thick by 229 mm (9 in.) wide and 2.743 m (9 ft) long will be required, unless the manufacturer recommends a different length.

d. If locally available, oak is preferred for switch ties. A bill of material for switch ties should be provided on the drawings for each proposed type of turnout. AREMA PORTFOLIO SET, Plan 912 contains bills of switch ties for various size turnouts and crossovers.

Other local species may be listed if used by railroads in the area.

Submit name of the tie manufacturer, Rail Tie Association membership, the wood species proposed, the quantities of ties for each specie proposed, and product data for the ties to be furnished, including the type of seasoning to be utilized, prior to ordering the ties. All ties shall be new. Species shall be Ash, Beech, Red and White Oak, [Gum,] [Spruces] [_____] [Pine,] [Douglas Fir,] [and] [other Fir].

a. Switch ties shall be Ash or Oak. Conditioning and seasoning shall conform to the requirements of AWPA U1 for the individual wood species. Ties shall be well seasoned. Prior to preservative treatment, wood ties shall be dried to the oven dry moisture content, or less, as specified in paragraph 3.14 of AWPA U1. The wood may be air dried, vapor dried, or boultonized.

b. Ties which are to be dried by artificial means shall be conditioned and treated as soon as possible after sawing, but no more than 30 days later. The temperature used for boultonizing shall be as high as possible but in no case less than 94 degrees C (200 degrees F). Vapor dried ties shall be transferred from drying cylinders to treatment cylinders as quickly as possible to avoid loss of heat from the seasoned ties. Ties shall be pressure treated in accordance with Chapter 30, Part 3 of AREMA Eng Man by the empty cell process with a 60/40 creosote/coal tar solution (Grade C) in accordance with AWPA P2 to a minimum retention of 128 kg/cu m (8 lbs/cu ft) of wood.

c. Bridge ties shall be treated in accordance with paragraph BRIDGE TIES.
Record treatment as specified in AWPA M2. Treated ties shall be permanently marked or branded by the producer in accordance with AWPA M6. Ties shall be produced by a member of the Railway Tie Association. All ties, except Southern, Red, and Ponderosa Pine, shall be incised on all four sides in the pattern specified in AREMA Eng Man, Chapter 30, Part 3, prior to treatment.

d. Splits shall not be longer than 100 mm 4 inch and not wider than 5 mm 1/4 in at either end. Splits longer than 100 mm 4 inch but not longer than the width of the face in which the split appears, will be acceptable if specified anti-splitting devices are installed with the splits compressed. Any required adzing and drilling for spikes shall be performed prior to treatment.

e. Notify the Contracting Officer at least 15 days prior to the shipment of any treated ties or timbers from the manufacturer's plant, to provide the Government the opportunity to inspect the materials before shipment. When inspections of onsite materials result in product rejection, promptly segregate and remove rejected material from the premises. The Government may also charge the Contractor any additional cost of inspection or test when prior rejection makes reinspection or retesting necessary.

f. Submit certified [test] [and] [inspection] reports for crossties and switch ties subsequent to treatment, a minimum of seven calendar days prior to any ties being installed in track. [Test] [and] [inspection] reports shall contain the information required by Part 7 of AWPA M2. Submit certificates of compliance prior to any ties being installed in track.

2.9.1 Crossies

Wood crossties shall conform to Chapter 30, Part 3 of AREMA Eng Man.

2.9.1.1 Except at Road Crossings

Wood ties shall be sawed and shall be not less than [_____] mm inch thick and [_____] mm inch wide. The length shall be [2.44] [2.6] [2.75] m [8.0] [8.5] [9.0] ft.

2.9.1.2 At Road Crossings

Wood ties shall be sawed and shall not be less than 178 mm thick and 229 mm wide 7 inch thick and 9 inch wide. The length shall be 2.75 m 9 ft, unless recommended otherwise by the manufacturer of crossing surface materials.

2.9.2 Switch Ties

Switch ties shall conform to Chapter 30, Part 3 of AREMA Eng Man and shall be sawed 178 mm 7 inch thick and 229 mm 9 inch wide. The length and quantities shall be as shown.

2.9.3 Bridge Ties

**************************************************************************
NOTE: Delete this paragraph and paragraphs Ballasted-Deck Bridge Ties and Open-Deck Bridge Ties if bridge work is not included in the contract.**************************************************************************
The method for treatment of bridge ties shall be in accordance with AWPA U1. The treatment standards shall be based on the type of deck on the bridge. Any drilling of bolt holes shall be performed prior to treatment. The ties shall be sawed to dimensions and furnished in the quantities indicated on the contract drawings. Field verify all dimensions and quantities prior to furnishing timber bridge ties.

2.9.3.1 Ballasted-Deck Bridge Ties

Ties for use in track over ballasted deck bridges shall be standard crossties.

2.9.3.2 Open-Deck Bridge Ties

Bridge ties for open-deck bridges shall be sized on two sides and of adequate size to distribute the track load to all stress-carrying stringers. Preservative treatment shall be in accordance with AWPA U1 for above-ground exposure.

2.9.4 Tie Plugs

Tie plugs shall fit holes from which spikes are drawn. The plugs shall comply and be treated in accordance with Chapter 30, Part 3 Section 3.1.5 of AREMA Eng Man.

2.9.5 Anti-splitting Devices

Crossties and switch ties shall be equipped on each end with gang nail end plates anti-splitting devices of the type specified, regardless of whether or not the wood has shown any tendency to split. Products used shall conform to Chapter 30, Part 3 Sections 3.1.6 and 3.1.7 of AREMA Eng Man.

2.10 BRIDGE TIMBERS

**************************************************************************
NOTE: Delete this paragraph if bridge work is not included in the contract.
**************************************************************************

Bridge timbers include all structural members such as stringers, caps, and posts. Timbers shall be incised on two sides. Creosote preservative treatment shall be in accordance with AWPA U1 for above-ground exposure and shall have fire-retardant coating for creosoted wood in accordance with AREMA Eng Man, Chapter 7 Section 1.11.

2.11 BRIDGE LUMBER

**************************************************************************
NOTE: Delete this paragraph if bridge work is not included in the contract.
**************************************************************************

Lumber used in decks and bracing above the waterline shall be treated for above-ground exposure. Lumber used in retaining walls, fender systems, and bracing below the high waterline shall be treated for soil contact exposure. Preservative treatment shall be in accordance with AREMA Eng Man, Chapter 73.
2.12 BRIDGE PILES

**************************************************************************
NOTE: Delete this paragraph if bridge work is not included in the contract.
**************************************************************************
Preservative treatment of piles shall conform to AREMA Eng Man, Chapter 7, Part 1, Section 1.9 for piles. Piles used as friction or end-bearing piles shall be a First-Class pile in accordance with AREMA Eng Man, Chapter 7, Part 1, Section 1.9.4. Second-class piles can be used in retaining walls, dolphins, and fender systems supports.

2.13 ENGINEERED POLYMER COMPOSITE TIES

**************************************************************************
NOTE: Engineered polymer composite ties, also commonly known as plastic ties, are a relatively new technology compared to the more conventional sawn wood and concrete ties. Engineered polymer composite ties are inherently resistant to moisture, rot, and insects and may be preferred for certain locations. Besides out-of-face applications, engineered polymer composite ties can be used for maintenance (intermingled) replacement of deteriorated wood crossties.

Recommended size requirements for engineered polymer composite ties follow the same basic guidance as in the NOTE for paragraph WOOD TIES above pertaining to wood tie sizes.

Engineered composite ties are designed to use the same tie spacing and ballast structure as wood ties. The ties can be installed using conventional hardware and installation equipment. Specific installation details, such as which fasteners work best, size of pre-drill holes, etc., should be based on the manufacturer's recommendations.

For increased lateral and longitudinal track stability, engineered polymer composite ties can be manufactured with specially designed surface patterns to create a mechanical interlock between the tie and the ballast. Individual manufacturers have different proprietary designs to provide a range of lateral track stability. Experience has shown that this interlock (track stability) can be achieved with little or no train traffic commonly needed upon replacement of wood ties.

**************************************************************************
Submit name of the tie manufacturer, dimensions, and the pre-drill size as recommended by the tie manufacturer for the type and size fastening system being used. Engineered polymer composite ties shall conform to Chapter 30, Part 5 of AREMA Eng Man. The ties shall incorporate a surface pattern to provide a minimum single tie lateral push result of 11.1 kN 2,500 lbf after no more than 100,000 gross tons of accumulated traffic. Submit certified test reports for crossties and switch ties, a minimum of seven calendar
days prior to any ties being installed in track. Test reports shall document compliance of the ties to the performance criteria in Chapter 30, Part 5 of AREMA Eng Man. Submit certificates of compliance prior to any ties being installed in track.

2.13.1 Crossties

2.13.1.1 Except at Road Crossings

Engineered polymer composite crossties, except at road crossings, shall be not less than [_____] mm inch thick and [_____] mm inch wide. The length shall be [2.44] [2.6] [2.75] m [8.0] [8.5] [9.0] ft.

2.13.1.2 At Road Crossings

Engineered polymer composite crossties at road crossings shall not be less than 178 mm thick and 229 mm wide 7 inch thick and 9 inch wide. The length shall be 2.75 m 9 ft, unless recommended otherwise by the manufacturer of the crossing surface materials.

2.13.2 Switch Ties

Switch ties shall conform to Chapter 30, Part 5 of AREMA Eng Man and shall be 178 mm 7 inch thick and 229 mm 9 inch wide. The length and quantities shall be as shown.

2.13.3 Ballasted-Deck Bridge Ties

Engineered composite ties for use in track over ballasted deck bridges shall be standard crossties.

2.13.4 Tie Plugs

Tie plugging may be utilized in engineered polymer composite ties in similar fashion as they are used in sawn wood ties. Polymer-based plugging compounds (e.g., polyurethane) are recommended.

2.14 STEEL TIES

**************************************************************************
NOTE: AREMA has a lighter weight steel tie section than specified below that can be used for yard tracks subject to light loads. Section minimum properties shall be changed to:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length</td>
<td>2540 mm 100 inch</td>
</tr>
<tr>
<td>Width</td>
<td>260 mm 10.2 inch</td>
</tr>
<tr>
<td>Thickness</td>
<td>10 mm 0.4 inch</td>
</tr>
<tr>
<td>Section Depth</td>
<td>97 mm 3.8 inch</td>
</tr>
<tr>
<td>Moment of Inertia</td>
<td>316 cm⁴ 7.6 in⁴</td>
</tr>
</tbody>
</table>
**************************************************************************
chemical analysis of the steel. Steel ties shall conform to Chapter 30 of AREMA Eng Man. Steel ties shall be constructed with hook-in shoulders of a 178 mm 7 inch minimum spade. Ties shall be design and furnished with elastic type rail fixation system for Pandrol E clips or safelock, or an approved equal. Ties shall have a brand rolled into the material indicating the section and manufacturer. Steel ties shall have the following minimum section:

<table>
<thead>
<tr>
<th>Steel Ties</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Length</td>
<td>2590 mm 102 inch</td>
</tr>
<tr>
<td>Width</td>
<td>300 mm 11.8 inch</td>
</tr>
<tr>
<td>Thickness</td>
<td>10 mm 0.4 inch</td>
</tr>
<tr>
<td>Section Depth</td>
<td>118 mm 4.6 inch</td>
</tr>
<tr>
<td>Moment of Inertia</td>
<td>610 cm$^4$ 14.6 in$^4$</td>
</tr>
</tbody>
</table>

Ties shall be manufactured from steel free of injurious segregation with a minimum tensile strength of 312 MPa 45,000 psi. Steel shall have the chemical composition conforming to ASTM A242/A242M or ASTM A992/A992M.

### 2.15 CONCRETE TIES

**************************************************************************
NOTE: Delete if concrete ties are not required.
Concrete ties may be preferred for certain locations.
**************************************************************************

Submit name of the tie manufacturer, dimensions, type of fixation and the chemical analysis of the concrete mix. Concrete ties and fastening system shall comply with the material and strength requirements specified in Chapter 30 of AREMA Eng Man for [monoblock] [reinforced two-block] [prestressed two-block] ties. Concrete ties shall be a minimum of [2.44 m 8 ft] [_____] in length, width of [____], and height of [____]. Concrete ties shall have a factored design positive bending moment of [_____] kN-m Inch-kips at center of seat. Concrete shall be furnished with dual durometer rubber pads, which have 50 to 60 shore A durometer on the bottom surface and 75 to 85 Shore A durometer reinforced rubber on the top surface. Submit certified test reports for ties and fastening system, a minimum of seven calendar days prior to any ties being installed in track. Test reports shall document the testing required by Chapter 30 of AREMA Eng Man.

### 2.16 TURNOUTS AND TRACK CROSSINGS

**************************************************************************
NOTE: Detailed information on frogs may be found in AREMA PORTFOLIO SET. Self-guarded frogs, in accordance with AREMA Track Work Plan No. 641 and Notes, may be specified in place of rigid-bolted frogs except: (1) for tracks where the design speed exceeds 48.3 km/hr 30 miles per hour, or (2) for track installations outside the United States. Spring rail frogs shall not be used on military track. The type of switch lamp required will be
indicated on the drawings. The type or types required will be retained in the contract specification and those not required will be deleted. Those lamps with reflector units only are preferred and will be specified where possible. Those lamps with reflectors and daylight disks will be used only at important crossovers or turnouts from main running tracks. Illuminated switch lamps will not be specified except for special main track movements, or as required by the serving railroad or by special regulations.

The component parts of the turnouts to be furnished shall be the products of manufacturers regularly engaged in the manufacture of such products, and shall essentially duplicate items that have been in satisfactory use at least 2 years prior to bid opening. The parts need not all be made by the same manufacturer, but each turnout shall be the product of a single firm. Switch assemblies, stands, frogs, and guardrails assemblies shall conform to the requirements of AREMA Eng Man.

2.16.1 Rail and Joint Bars

NOTE: The rail weight and section to be used in each turnout and track crossing constructed, reconstructed, or having steel replaced will be shown on the Contract Drawings and/or listed in this paragraph along with the turnout or crossing identification number and turnout size number. Example:

<table>
<thead>
<tr>
<th>TURNOUT TRACK OR CROSSING ID</th>
<th>SIZE OR CROSSING ANGLE</th>
<th>RAIL</th>
<th>DRILLING</th>
</tr>
</thead>
<tbody>
<tr>
<td>T51</td>
<td>No. 8</td>
<td>90RA</td>
<td>72-138 mm 2-11/16-5-1/2 inch</td>
</tr>
</tbody>
</table>

Designer may want new rail in turnouts to match new switch points.

Rail, joint bars, and miscellaneous track materials used in turnout and track crossing construction shall be furnished and installed as part of the complete turnout or crossing. Rail and miscellaneous track materials used in turnout and track crossing construction shall be the weight and section [shown on the contract drawings] [as listed:
2.16.2 Maximum Wear Used Rails Installed in Turnouts

[The average top (vertical) wear shall be 3 mm 1/8 in or less. Gage side head wear shall not exceed 3 mm 1/8 inch] [All rail installed in turnouts shall be new].

2.16.3 Frogs, Switches, Guardrails and Appurtenances

Frogs, switches, guardrails and appurtenances shall be materials suitable for use in heavy tonnage main track. Used turnout materials shall have been fully reconditioned and shall be within plus or minus 3 mm 1/8 inch of the original specification for that turnout design. Materials used in the turnout shall be of the same weight and section. Materials shall be in good condition and free from excessive rust, dirt, and other foreign materials. The rail weight and section shall be as specified.

2.16.3.1 Switches

******************************************************************************
NOTE: List length, type, and quantity of switch points and size, type, and quantity of other turnout materials required for turnout repairs in the drawings schedule. If new switch points are required, edit the following paragraphs accordingly. Switch point Detail 5000 can also be used. Designer may want new rail in turnouts to match new switch points. The Navy recommends the use of manganese tipped switch points on the side opposite the turnout side of the switch.
******************************************************************************

Switches for new turnout construction or complete turnout replacement shall be 5029 mm 16 feet and 6 inches reinforced straight split switches with graduated risers generally conforming to AREMA Eng Man, Plan Number 112. Switch materials used to replace defective materials shall be as indicated.

a. Switch points shall be new. Switch point detail shall be AREMA Eng Man, Plan No. 221, Detail 4000 or 6100. [One switch point in each turnout shall be manganese tipped in accordance with AREMA Eng Man, Plan No. 220-52-E-82, installed on the side opposite the turnout side of the switch (example the right switch point shall be manganese tipped on a left hand turnout).]

b. Switch rods and connecting rods shall be new.

c. Gage plates, switch plates, slide plates, and heel plates shall either be new or used and in good condition and not worn or corroded. Rail braces shall be either rigid or adjustable. For a given turnout all rail braces shall be of the same design.
d. Heel blocks shall be either cast or forged steel and be either new or used and in good condition. New heel block bolt assemblies shall be provided and shall be heat treated. The heel joint bars shall be either new or used in good condition and manufactured for the purpose. If floating heel blocks are used, special no. 5 double shoulder plates shall be used to maintain 160 mm 6.25 inch heel spread.

2.16.3.2 Frogs

Frogs shall be [bolted rail] [railbound manganese] [solid manganese self-guarded] in the sizes indicated.

a. Frogs shall be [new] [remanufactured]. Cracked or broken used frog castings shall not be used. Cracked or broken frog castings that have been repaired by welding are not acceptable and shall not be used. Remanufactured frogs shall meet the following wear requirements:

(1) Frog points shall be in good condition and not be worn, chipped, or broken.

(2) Maximum allowable wear on used or reconditioned frogs shall be:

<table>
<thead>
<tr>
<th>Wear Surface</th>
<th>Allowable Wear</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frog Point</td>
<td>3 mm 1/8 in</td>
</tr>
<tr>
<td>Top Surface</td>
<td>3 mm 1/8 in</td>
</tr>
<tr>
<td>Raised Guarding Face (Self-Guarded)</td>
<td>3 mm 1/8 in</td>
</tr>
<tr>
<td>All Wear Surfaces</td>
<td>3 mm 1/8 in</td>
</tr>
</tbody>
</table>

(3) Minimum flangeway depth for used frogs shall be 45 mm 1-3/4 inch. Minimum flangeway width shall be 48 mm 1-7/8 inch.

b. Frog bolts, nuts, lock washers, and headlocks shall all be new.

2.16.3.3 New or Replacement Guard Rails

New or replacement guard rails shall be a minimum of 4.6 m 15 ft in length and shall be new or used in good condition. Guard rails shall be of any of the following designs: Tee rail in accordance with AREMA Eng Man, Plan No. 504, solid manganese steel in accordance with AREMA Eng Man, Plan No. 510, or an acceptable hook flange design. For used guard rails the guard face shall be smooth and not worn more than 3 mm 1/8 inch from its new condition. Guard rails bolted to the running rails shall be equipped with fillers. When fillers are installed or repaired new bolt assemblies shall be used. All bolts, nuts, and associated hardware shall be new. Clamped guard rails shall be equipped with block wedges, filler wedges, and cotter keys. Guard rail plates shall be new or acceptable replacements. Single-shoulder tie plates used with guard rails shall be installed with the shoulder on the inside flush against the base of the guard rail.

2.16.3.4 Hook Plates

Hook plates shall be new or acceptable used material and shall be of the designs and lengths indicated on AREMA Eng Man, Plan Nos. 112 and 241.
2.16.3.5 Switch Stands

**************************************************************************
NOTE: The type and manufacturer of switch stand should be the same as presently used at the jobsite or serving railroad. Mixing positive-action and automatic-action switch stands on the same military base is not recommended. Examples of acceptable types of stands are Racor models 22 and 36D, or Bethlehem Steel models 51A and 53. Other specialty designs, like a rotary wheel switch stand, may be also required.
**************************************************************************

2.16.3.5.1 New or Replacement Switch Stands

New or replacement switch stands shall conform to AREMA Eng Man, Plan 251-64 and shall be new or fully reconditioned, low-stand type with model number [Bethlehem Steel model 51A][____]. Switch stand shall be [automatic-action][semi-automatic action (spring)][positive-action (rigid)] with [adjustment from the top with shims through a moveable cover][spring connecting rods][adjustable connecting rods][____].

2.16.3.5.2 Existing Switch Stands

Existing switch stands, staffs and targets, where not designated for replacement, shall be reconditioned by cleaning to bare metal and then painted with one coat of metal primer.[ The interior portion of the stands, including mechanisms, shall be cleaned and re-lubricated.] The switch stand staff shall be painted with two coats of black enamel paint. Switch targets shall be similarly prepared and painted with two coats of red or white enamel paint to indicate switch position in accordance with normal railroad practice.

2.16.3.5.3 Switch Lamps

Each stand shall be equipped with one of the following switch lamps as indicated on the project plans:

2.16.3.5.3.1 Reflecting Type

Approved reflecting switch lamps fitted with standard commercial-type double red and white reflecting lenses but without day signal targets.

2.16.3.5.3.2 Reflecting Type with Daylight Disk

Approved reflecting switch lamps fitted with standard commercial-type double red and white reflecting lenses, and with day signal targets.

2.16.3.5.3.3 Illuminated Type

Approved illuminated lamps with primary battery, battery housing, and cable.

2.16.4 Track Crossings

Track crossings shall be new and shall be fabricated in accordance with AREMA Eng Man, Plan No. [____]. Rail weight and section shall be [____]. Tie layout shall be in accordance with AREMA Eng Man, Plan No. [____].
2.16.5 Rail Braces

Rail braces shall be either the fixed or adjustable type and shall be of standard manufacture.

2.17 GRADE CROSSINGS

Recyclable materials used in Grade Crossings shall conform to EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING.

2.17.1 Crossing Material or Surface

**************************************************************************
NOTES: Coordinate this paragraph with the drawings showing the typical railroad crossing cross-section and details.

Where suitable local materials meeting state specifications for a granular highway base course material are available, those materials may be substituted for the ASTM D1241 material specified below. Ballast or subballast materials may also be used for semi-permanent aggregate crossings.
**************************************************************************

Within 30 days of the Notice to Proceed, submit the brand name of the premanufactured crossing material or crossing surface material proposed for use along with manufacturer's literature concerning the product; and for built-in-place crossings, the type of materials to be used along with manufacturer's literature. Submit detailed installation procedure for the premanufactured crossing material or crossing surface material proposed for use within 30 days of the notice to proceed. Roadway width shall be as indicated in the contract drawings. Crossing material or surface shall comply with the following:

a. A semi-permanent aggregate crossing shall be constructed of compacted crushed aggregate placed between the rails and as short approaches to the track. The aggregate shall be a crushed gravel or crushed stone material conforming to the requirements of [ballast] [subballast] [ASTM D1241, Type I, Gradations A or B].

b. A permanent aggregate crossing shall be constructed of compacted crushed aggregate placed in the track between bond timbers header as indicated. The crushed aggregate shall be [ballast] [subballast] [a crushed aggregate material conforming to the requirements of ASTM D1241, Type I, Gradations A or B].

c. Full-depth timber crossings shall be [constructed-in-place] [prefabricated]. Timber road crossing materials shall be [oak] [acceptable hardwood]. Seasoning and treatment shall conform to the requirements of AWPA U1 and paragraph WOOD TIES.

d. Bituminous paving materials for full-depth asphaltic cement concrete (bituminous) crossing with bond timbers flangeway headers shall conform to the applicable State of [_____] Highway Specification for a [_____] type mix design. Bond timbers shall be [oak] [acceptable hardwood]. Seasoning and treatment shall conform to AWPA U1 and paragraph WOOD TIES.
e. Concrete pavement materials for full-depth, cast-in-place concrete crossings shall conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

f. Premanufactured, precast concrete panels for grade crossings shall be constructed of reinforced concrete having a minimum 28-day compressive strength of 34.5 MPa 5,000 psi. Each panel shall be manufactured to meet HS20-44 loading in accordance with AASHTO HB-17, with 30 percent impact increment. Loading shall be based on single axle loads of 14,500 kg 32,000 lbs. Precast crossing panels shall be the product of a company regularly engaged in the manufacture of such panels, and whose products have been successfully used in the commercial railroad industry for at least 2 years.

g. Panels for premanufactured elastomeric crossing systems shall be full depth. Elastomeric systems with or without steel composition grade crossing panels shall be the product of a company regularly engaged in the manufacture of such products, and whose products have been successfully used in the commercial railroad industry for at least 2 years.

2.17.2 Rail

**************************************************************************
NOTE: The use of 57 kg/m 115-lbs rail as the minimum through crossings and for 6 m 20 ft on either side of the crossing is recommended. The use of welded joints or long (24.4 m (78 feet) rail for the crossing area is also recommended to eliminate any joints in the crossing area. The use of 178 mm by 229 mm by 2.74 m 7 inches by 9 inches. by 9 feet long ties is recommended throughout the crossing area. Although 2.59 m 8-1/2 feet ties are acceptable, they are the minimum length that should be used in the crossing.
**************************************************************************

Rail within the road crossing and for at least 6 m 20 ft on either side of the crossing shall be [_____] [115RE] as specified in paragraph Rail and Joint Bars.

2.17.3 Ties

Ties within the road crossing and for at least 6 m 20 ft on either side of the crossing shall be hardwood or polymer composite and shall be as specified in paragraphs Crossties and Switch Ties.

2.17.4 Track Materials

For premanufactured crossing surfaces or systems, tie plates, spikes or other rail fasteners, rail anchors, and other track materials shall conform to the manufacturer's recommendations. Unless specified by the crossing manufacturer, track materials shall be as specified in paragraph MISCELLANEOUS TRACK MATERIALS.

2.17.5 Threaded Fasteners and Screw Spikes

**************************************************************************
NOTE: Screw spikes having an ultimate tensile strength of 483 MPa 70,000 psi are commercially available.

Threaded fasteners for use in grade crossings shall be of the sizes and lengths specified by the grade crossing manufacturer or as indicated for built-in-place crossings. Screw spikes shall have a minimum ultimate tensile strength of 414 MPa 60,000 psi and shall be galvanized for corrosion protection.

2.17.6 Pipe for Subdrains

Pipe for subdrains shall be [152] [203] [_____] mm [6] [8] [_____] inch diameter corrugated, perforated [polyethylene complying with ASTM F667/F667M] [bituminous coated galvanized corrugated steel].

2.17.7 Cable Conduit

Cable conduit under grade crossings shall be 102 mm 4 inch diameter PVC pipe conforming to UL 651, and shall be a minimum of Schedule 80.

2.18 MISCELLANEOUS TRACK MATERIALS

Submit manufacturer's data for all track materials to be furnished. Miscellaneous track materials shall be as follows:

2.18.1 Spikes

2.18.1.1 Track Spikes

Track spikes shall be new and shall conform to Chapter 5, Part 2 of AREMA Eng Man. Track spikes size 152 by 16 mm 6 by 5/8 inch shall be used with 49.6 kg/m 100 lbs or heavier rail. Track spikes 140 by 14 mm 5-1/2 by 9/16 inch shall be used with 44.6 kg/m 90 lb and under rail.

2.18.1.2 Bridge Spikes

[Minimum 19 mm 3/4 in diameter washer head screw spikes that allow a minimum of 127 mm 5 inch penetration into the stringers shall be used to connect the bridge ties to the stringers on an open-deck bridge, in accordance with AREMA Eng Man, Chapter 7, Part 7.]

2.18.2 Bolts, Nuts, and Spring Washers

New track bolts, nuts, and spring washers shall be used throughout the project for both new and relay rail.[ Bolts shall be used in both steel and timber bridge connections.]

2.18.2.1 Bolts and Nuts

The various rail, joint bars, and rail drillings require various lengths and diameters of bolt assemblies. Determine the number of bolt assemblies of each size required. All bolt diameters shall be the largest possible for a given rail drilling and joint bar punching. Track bolts and nuts shall conform to Chapter 4, Part 2 of AREMA Eng Man. Track bolts shall be long enough to leave at least two threads exposed after the nut is tightened.[ Steel bridge connections shall use ASTM A325M ASTM A325 or ASTM A490M ASTM A490 bolts. Timber bridge connections shall use hot dip
galvanized steel bolts, minimum 19 mm 3/4 in diameter with lengths as required.)

2.18.2.2 Spring Washers

Spring washers and nuts shall be sized to ensure that the spring washer develops its full reactive force and does not jam into the joint bar hole. Spring washers shall be of the size to fit the bolt and nut used and shall conform to Chapter 4, Part 2 and Section M12 of AREMA Eng Man.

2.18.3 Rail Anchors

******************************************************************************
NOTE: The number and position of rail anchors will be shown on the drawings and will be based on amount of traffic, character of traffic, and local conditions. When required, anchors will be placed in accordance with AREMA recommendations for "Light Density Lines" in Chapter 5 of AREMA Manual. This recommendation calls for 16 anchors per 11.9 meters 39-ft length of track, that is 8 anchors to resist movement in each direction. Where heavy traffic, steep grades or other factors result in rail creeping additional anchors may be specified.
******************************************************************************

Where special tools are required to install or remove anchors, furnish a minimum of one tool for each 5,000 anchors, or fraction thereof, not to exceed 5 tools per job.

2.18.3.1 New Installation

Rail anchors for new installations shall be [new] [repinched]. Sizes shall conform to the various sizes of rail on the project and conform to "Specifications for Rail Anchors" in Chapter 5, Part 7 of AREMA Eng Man. Anchors may be either drive-on or spring type.

2.18.3.2 Salvaged Rail Anchors

Rail anchors salvaged from the track being removed shall become the property of the Contractor and shall be removed from the site. No used anchors shall be reinstalled unless they have been repinched.

2.18.3.3 Rail Clips and Fasteners

Provide single tight fit clips with fillers as necessary to fit rail section furnished. Clip or fastener design shall anchor rail against longitudinal movement.

2.18.4 Insulated Joints

Insulated joints shall conform to applicable portions of Chapter 4, Part 2 of AREMA Eng Man. Conventional continuous insulated joints with fibre insulation shall not be used. Unless otherwise directed by the Contracting Officer, insulated joints shall be for the following rail sections, rail drilling, and number of joints:
2.18.5 Bumping Posts, Cushion Heads and Wheelstops

Bumping posts, cushion heads, and wheelstops shall be new and shall be of a standard design that has been in use by commercial railroad industry for at least 5 years. Bumping posts, cushion heads, and wheelstops shall be manufactured by a company regularly engaged in the manufacture of these products.

2.18.5.1 Bumping Posts

Bumping posts shall be of all-steel construction, shall bolt firmly onto the rail, and shall be of a type designed for general service. Bumping posts shall have tension with $3800 \text{ mm}^2$ 6 sq inch cross-sectional area and compression members with a moment of inertia not less than $15 \times 10^6 \text{ mm}^4$ 37 inch$^4$ of A36 steel. Bumping post shall be capable of withstanding a yield load of $2450 \text{ kN} 550,000 \text{ pounds}$.

2.18.5.2 Cushion Heads

Cushion heads shall be of all steel construction, shall firmly bolt, attach, or clamp onto the bumper or end dock (platform or ramp). Cushion heads shall resist $356 \text{ kN} 80,000 \text{ lbs}$ of compression.

2.18.5.3 Wheelstops

Wheelstops shall be of all-steel construction, shall firmly bolt or clamp onto the rail, and shall be of a type designed for general service.

2.18.6 Used Bumping Posts and Wheelstops

Do not furnish used bumping posts and wheelstops. Used bumping posts and wheelstops [shall be salvaged from existing tracks which are removed or rebuilt under this Contract] [will be provided by the Government]. New fastening materials shall be used to install or reinstall used bumping posts or wheelstops. Furnish new fastening materials conforming to the applicable sections of this specification.

2.18.7 Inner Guard Rail

Inner guard rail shall be Class IV or better used rails as indicated in Part 2, Chapter 4, "Inspection Classification of Second Hand Rail for Welding", of AREMA Eng Man. Rail shall be $36 \text{ kg/m} 80 \text{ lbs/yd}$ or greater. All rails used at any one inner guard rail location shall be the same weight and section. Joint bars shall match the rail provided and shall be in good condition.

2.18.8 Gage Rods

2.18.8.1 New Gage Rods

New gage rods shall be the double-clamp style manufactured in conformance with "Specifications for Special Trackwork" of AREMA Eng Man. The double
clamp style gage rods shall be threaded on both ends and shall be equipped with four malleable steel casting clamps to rigidly hold both sides of the base of both rails.

2.18.8.2 Used Gage Rods

Do not furnish used gage rods. Used gage rods [will be provided by the Government] [shall be salvaged from existing track]. Salvaged gage rods shall be cleaned and inspected prior to reinstallation. Bent or broken gage rods shall be scrapped.

2.18.9 Derails

**************************************************************************

NOTE: Derails may be either a hinged type, a sliding type, or a switch point derail. The contract drawings should indicate the required location, type, size, and direction. Sliding type derails are typically installed with a derail stand and operating mechanism for throwing the derail. A split switch derail is to be installed where absolute protection is required. If a switch point derail is to be installed, the project plans will show the layout of the switch point derail and this paragraph will be modified accordingly.

**************************************************************************

2.18.9.1 New Derails

New derails shall be of a standard design that has been in use by the commercial railroad industry for at least 5 years. Derails shall be of all-steel construction and shall be designed to be permanently spiked to a crosstie. Derails shall be either one-way or two-way as indicated. Derails shall be either sliding type or hinged type as indicated. When the type of derail indicated requires a derail stand, connecting rod, and operating mechanism for proper operation, the derail and all necessary components shall be provided as a unit. The locations, sizes, and directions of the derails shall be as indicated on the contract drawings.

2.18.9.2 Used Derails

Do not furnish used derails. Used derails [will be provided by the Government] [shall be salvaged from existing tracks that are removed or rebuilt under this Contract]. New track spikes and other fastening materials shall be used to install or reinstall the used derails. Furnish new fastening materials conforming to the applicable sections of this specification and AREMA Eng Man.

2.19 SALVAGED MATERIALS

2.19.1 Dunnage

Pallets, sills, and other material used for packaging and stacking salvaged track items shall be clean, free of decay or other defect, and sufficiently sturdy for the service intended.

2.19.2 Marking Paint

Marking paint shall be a good quality oil-based spray marking paint or a
2.19.3 Salvaging Rail

Salvage rail as directed; the Government will make available salvaged rail to the Contractor subject to the following:

a. Nondefective and reclaimable rails salvaged from existing tracks may be used to execute spot rail replacement work at other locations of the project, subject to review and approval of the materials by the Contracting Officer.

b. Reclaimable defective rails may be used to construct inner guard rails provided all defects can be cropped off. Detailed inspection shall be made of such rails to ensure that rails which contain critical defects such as transverse defects, head-web separations, vertical split heads, pipe, split webs, etc., are not incorporated in the work. Loose rails located along the right-of-way shall be inspected and used as directed.

2.19.4 Joint Bars

Nondefective joint bars salvaged from existing tracks may be used to execute spot replacement work at other locations of the project, subject to review and approval of the material by the Contracting Officer.

2.19.5 Tie Plates

Tie plates salvaged from existing tracks, which are not either broken, cracked, or severely corroded or worn, may be used to execute the work subject to review and approval of the material by the Contracting Officer.

2.20 RAIL BONDING AND GROUNDING

2.20.1 Rail Bonds

**************************************************************************

NOTES: Designer will select the length of web bonds based on the joint bar size; 600 mm 24 in. joint bars require 854 mm 34 in. bond wires, and 900 mm 36 in. joint bars require 1154 mm 46 in. bond wires.

Double bonding is required for crossing signals only (installation of both rail head and web bonds).

If only static electricity bonding/grounding (without signals or lightning protection) is required, the size of cables may be reduced. If local experience indicates drive in tight connections performs satisfactorily, 12 mm drive in tight from American Steel drive socket terminal # 34100 type CPN or approved equal can be used.

**************************************************************************

Rail bonds shall be exothermic type ("Cadweld") bonds applied to the field side of the rail head[, or [1154] mm [46] inch bonds welded to the rail web]. The bond cables shall be flexible bare copper stranded 1/0 AWG cables with preformed ends. Bond cables shall be flexible bare copper stranded cables with preformed ends and shall conform to applicable requirements of AREMA Eng Man Vol. 3.
2.20.2 Grounding Rods

Grounding rods shall be [19 mm 3/4 in diameter copper clad steel rods] [25 mm 1 inch diameter zinc-coated steel rods]. The minimum length of ground rods shall be 2.5 m 8 ft.

2.20.3 Ground Connection Cables

Connections between the grounding system or ground rods and rails shall be made with a bare flexible copper stranded 2/0 AWG cable.

2.20.4 Electrical Connecting Hardware

Electrical connecting hardware shall be bronze pressure bar type materials having no rotating parts coming in direct contact with conductors.

2.21 WELDING

2.21.1 Rail Welding Kits

Kits for thermite type rail welds shall be approved by the Contracting Officer before use. Provide welding kits for all rail sections used and no differentiation will be made between Contractor-furnished and Government-furnished rail sections for measurement and payment purposes.

2.21.2 Electrodes

Provide AWS low-hydrogen, high tensile 140-16 (extrapolation) or 25-20 electrode, Grade 310-16 and 310-15 stainless steel rod welding electrodes. Provide electrodes of the smallest practical diameter worked at the lowest compatible current. Coating on low-hydrogen type electrodes shall be thoroughly dry when the electrode is provided. Use electrodes taken from hermetically sealed packages within one hour of the time the package is opened. Electrodes not used within this one-hour period and electrodes taken from non-hermetically sealed packages shall be dried for at least one hour between 371 and 427 degrees C 700 and 800 degrees F. Electrodes so dried may be stored at temperatures between 107 and 205 degrees C 225 and 400 degrees F until used, or, if not stored and not used within one hour after this drying is completed, shall be re-dried before use. Do not use electrodes which have been wet.

PART 3 EXECUTION

3.1 REMOVAL, SALVAGE, AND DISPOSITION OF MATERIALS

**************************************************************************
NOTE: Delete paragraphs which are not applicable to the salvaged materials.
**************************************************************************

Tracks and segments of track shall not be dismantled until approved to do so by the Contracting Officer. Salvage the following materials for later use by the Government. Some of these items will be used in the repair of tracks as indicated.

3.1.1 Materials To Be Salvaged

**************************************************************************
Materials to be salvaged for later use by the Government are:

a. [____].

b. [____].

Other materials shall become the property of the Contractor and shall be removed from the project.

3.1.2 Methods and Procedures

The Contractor may use any methods to dismantle the track, provided proper measures are taken to ensure the safety of the laborers and the general public, and no damage is caused to track components to be salvaged or other tracks and structures which are indicated to remain. Methods of removal of existing tracks shall not cause damage to adjacent sidewalks or paved roadways. Damage to these facilities caused by the Contractor shall be restored at Contractor's expense.

3.1.3 Inventory of Track Materials

Keep a detailed inventory of excess and salvaged track materials stockpiled for the Government. Detailed inventory shall be recorded in appropriate format and furnished to the Contracting Officer.

3.1.4 Inspection and Reconditioning of Used Track Materials

Salvaged track materials shall be cleaned and inspected for defects to determine their suitability for further use.

3.1.4.1 Cleaning By Hand or Mechanical Means

Rail, joint bars, gage rods, tie plates, rail anchors, and other materials shall be cleaned by hand or mechanical means to remove all adhering dirt and heavy rusting so that the bare steel can be examined.

3.1.4.2 Visual Examination of Rails

Rails shall be visually examined for evidence of defects such as those illustrated on Form 402-A found in Chapter 4 Part 3 of AREMA Eng Man. Such defects shall be brought to the attention of the Contracting Officer who will be the final judge as to the serviceability of the rail. Rails having bolt hole cracks or end batter under paragraph TRACK REPAIR that can be reconditioned for use by cropping and redrilling shall be marked at the location of the defect with yellow paint. Rails with other defects or which cannot be reconditioned shall be rejected as scrap and shall be marked with bright red paint and stacked separately.

3.1.4.3 Visual Examination of Joint Bars

Existing joint bars and compromise joint bars which are removed and no longer required at that location due to rail replacement or other work may be cleaned and reused at other locations, subject to review and approval of the Contracting Officer. Joint bars and compromise joints that are not reused shall be salvaged or scrapped. Joint bars shall be visually examined.
examined for defects and wear. Joint bars with bolt hole or spike slot cracks shall be scrapped. Bars which do not fit tightly against the rail or bars in which the bolt holes are excessively corroded or worn shall be scrapped. The Contracting Officer will be the final judge of the serviceability of joint bars. Scrapped bars shall be marked with bright red paint and stacked separately.

3.1.4.4 Visual Examination of Gage Rods

Gage rods shall be visually examined for bends, cracks, or breaks. Bent, cracked, or broken gage rods shall be considered as scrap, marked with bright red paint and stacked separately.

3.1.4.5 Visual Examination of Tie Plates and Rail Anchors

Tie plates and rail anchors shall be visually examined for cracks, breaks, excessive wear, and excessive corrosion. Track material with these defects shall be considered scrap, marked with bright red paint and stacked separately.

3.1.4.6 Gage Rods

Gage rods which exist in tangent track and in curved track with a curvature of 10 degrees or less shall be removed and salvaged. Salvaged gage rods that have been inspected and cleaned shall be reused to the maximum extent possible.

3.1.4.7 Grade Crossing Materials

Existing premanufactured grade crossing panels, rail and other track materials shall be salvaged as indicated, or as designated by the Contracting Officer. All salvaged materials shall remain the property of the Government, and shall be reinstalled as indicated or shall be transported to the military installation storage yard. Grade crossing materials to be salvaged shall be removed, cleaned as required for proper reinstallation, marked or labeled as necessary for proper reinstallation, and transported to the reinstallation location or to the storage yard.

3.1.5 Transport and Stack Excess and Salvaged Materials

3.1.5.1 Material Not Used in Track Repair

Excess and salvaged materials which are not used in track repair work shall be stacked at a site on the military installation designated by the Contracting Officer.

3.1.5.2 Stacking of Rails

Rails shall be stacked on approved sills a minimum of 152 mm 6 inch above the ground. Rails shall be stacked with the heads up and with the ends even. Each layer shall be separated by at least three 50 by 100 mm 2 by 4 inch wood strips evenly spaced along the length of the rail. Rail shall be grouped by weight, section, drilling, condition, length, and amount of wear. The weight, section, drilling, and length shall be marked on one of the rails near the mid-height of the stack. These markings shall be painted neatly near one end of the rail.
3.1.5.3 Stacking of Joint Bars, Gage Rods, and Tie Plates

Joint bars, gage rods, and tie plates shall be sorted by section, punching and condition and shall be stacked on pallets. Each pallet stack shall be steel banded for forklift handling. The maximum weight on any pallet shall be 680 kg 1,500 lbs. Compromise joint bars shall be wired together in pairs and stacked on pallets, separate from other bars.

3.1.5.4 Containers

Rail anchors shall be sorted by type and size and placed in kegs, steel drums, or other approved containers. Containers shall be labeled with the rail weight and section.

3.1.5.5 Stacking of Special Trackwork Materials

Special trackwork materials shall be palletized and stacked as directed by the Contracting Officer. The rail weight, rail section, and length shall be marked on each switch point. The weight, section, and frog number shall be marked on the side of each frog casting. Other switch materials salvaged shall be placed in steel drums and labeled as to rail weight, section, length of points, and turnout size.

3.1.6 Material to be Scrapped

************************************************************************************
NOTE: Remove or edit above paragraphs and retain this paragraph when materials are to be scrapped.
************************************************************************************

[All material] [_____] shall be scrapped and shall become the property of the Contractor.

3.2 PLACEMENT OF BALLAST [AND SUBBALLAST]

Place ballast [and subballast] to the lines and grades indicated. The average thickness shall be within 6 mm 0.25 inch of the thickness indicated. Subgrade must conform to the requirements of Section 310000 EARTHWORK. Do not place ballast [and subballast] on soft, muddy, or frozen areas. Where the prepared subgrade (roadbed) is soft, muddy, rutted, exhibits severe depressions, or is otherwise damaged, the ballast [and subballast] shall not be placed until the damaged subgrade has been repaired and the area has been approved by the Contracting Officer.

3.2.1 Subballast

************************************************************************************
NOTE: Remove these paragraphs when subballast is not required.
************************************************************************************

3.2.1.1 Subballast Placement

Subballast shall be placed in [two] uniform horizontal lifts of not more than 152 mm 6 inch for the full width of the cross-section to the total depth indicated. Each subballast layer shall be shaped to a section conforming to the subballast section shown on the drawings and shall be thoroughly compacted.
3.2.1.2 Subballast Compaction

Each subballast lift shall be compacted using approved compaction equipment. The roller weights, vibration frequencies (where applicable), tire pressures (where applicable), and number of passes shall be sufficient to obtain in-place densities across the full width of the subballast and throughout the entire depth of the layer of not less than 95 percent of the ASTM D1557 laboratory maximum dry density for the subballast material. Prior to placement of subsequent subballast layers the top of the previous layer shall be scarified to a depth of approximately 50 mm 2 inch to insure proper bond of the layers. Density shall be field measured in accordance with ASTM D1556/D1556M (base plate, as shown in the drawing shall be used) or ASTM D6938. The calibration curves shall be checked and adjusted, if necessary, using only the sand cone method as described in paragraph Calibration, of the ASTM publication. Tests performed in accordance with ASTM D6938 result in a wet unit weight of soil and ASTM D6938 shall be used to determine the moisture content of the soil. The calibration curves furnished with the moisture gages shall also be checked along with density calibration checks as described in ASTM D6938. The calibration checks of both the density and moisture gages shall be made by the prepared containers of material method, as described in paragraph Calibration, in ASTM D6938, on each different type of material to be tested at the beginning of a job and at intervals as directed. One field density test shall be taken for each 1000 square meters yards of each layer of material placed in each area.

3.2.2 Ballast

3.2.2.1 Ballast Placement

******************************************************************************
NOTE: Show detail of ballast section on the drawings.
******************************************************************************

Number 5 AREMA ballast shall be placed in the tracks where indicated; 50 mm 2 inch of Number 5 ballast shall be used near turnouts and for 10 m 30 feet each side of the switch stand to provide a smooth walking surface for railroad employees. All other areas shall require size AREMA Number [4] [4A] ballast.

3.2.2.2 Ballast Distribution

******************************************************************************
NOTE: For projects where large amounts of track are being ballasted, ballast distribution from railcars is beneficial. The provision of a Government locomotive and crew to move ballast cars for the Contractor may result in a lower unit cost for ballast distribution. If the installation has a locomotive available for use, insert the point of contact and telephone number for arranging use of the locomotive. Examples would be "... Rail Movements Branch, Directorate of Logistics, extension 1234 at least 4 hours ..." If no locomotive is available indicate that Government locomotive is not available and the Contractor shall provide equipment to unload ballast in paragraph LOCOMOTIVE.

SECTION 34 11 00  Page 63
Ballast shall not be distributed until the [subgrade] [subballast] has been approved by the Contracting Officer. No payment will be made for ballast which is distributed without the Contracting Officer's approval.

a. Distribute ballast distribution to the depth indicated, from either trucks or railroad cars. [If available, the Government will furnish a locomotive for unloading ballast along the track if a carload or more is used. Arrangements for use of the locomotive shall be made by contacting [_____] at least [_____] hours in advance of the time the locomotive is needed.] [A government locomotive is not available for unloading ballast.]

b. Prevent forming of ruts that would impair proper roadway drainage when distributing ballast from trucks and off track equipment. Level any ruts formed greater than \[25 \text{ mm} \] and grade to drain.

c. Unload ballast as close as possible to the point of use so that unnecessary handling is prevented. Excess ballast shall be picked up and redistributed at the Contractor's expense. If additional ballast is required for dressing, it shall be added at no increase in unit price.

d. Ballast cars shall not be released until they have been inspected. Ballast cars may be weighed by the Government before and after dumping the ballast at no cost to the Contractor.

3.2.2.3 Ballast Below Ties

For new construction, the last \[100 \text{ mm} \] ballast below the tie, the shoulder ballast and the ballast in the tie cribs shall be placed subsequent to the rail and tie installation. For surfacing existing track, the ballast shall be placed subsequent to rail and tie replacements.

3.3 TRACK CONSTRUCTION AND OUT-OF-FACE RELAY

Track construction not covered specifically herein shall be in accordance with AREMA recommendations and recommended practices.

3.3.1 Roadbed Preparation

**************************************************************************

NOTE: If the roadbed will require any major amount of preparation, such as compaction or provisions for drainage not covered by other sections of the specifications, this paragraph will be either revised or augmented to cover the work required, or Section 31 00 00 EARTHWORK will be added. If no roadbed preparation is required, delete this paragraph. If geotextiles are used, the "road crossing" tailoring option should be on to get the reference paragraph requirements for geotextiles.

**************************************************************************

Clearing and grubbing, grading, excavation, embankment preparation, and subgrade preparation shall be performed in accordance with Section [______]. Roadbed surface, grade, and drainage shall be approved prior to any distribution of construction material. Where the subgrade or roadbed
is damaged during distribution of materials, ruts and depressions shall be filled and compacted and the roadbed surface reapproved prior to track construction.

3.3.2 Geotextile for Track Construction

**************************************************************************
NOTE: Delete this paragraph if geotextile is not required.
**************************************************************************

Geotextile shall be installed between the subgrade and the ballast as shown. Installation shall be in accordance with subparagraph Geotextile Installation under paragraph Highway Crossings.

3.3.3 Unloading the Materials

The use of picks in the handling of ties will not be permitted. Rails shall be unloaded from cars with an approved derrick or crane and placed with the head up without dropping and with sufficient support under the base. Rails of proper length shall be distributed as necessary for road crossings, switches, joint spacing, and other special conditions.

3.3.4 Ties

**************************************************************************
NOTE: The center to center spacing will be inserted in the blank space in this paragraph in accordance with the following:
**************************************************************************

a. For main lines, access tracks, or other tracks where the movement may be classified as heavy or the desired speed is in excess of 32 km/hr 20 miles per hour, 480 to 560 mm 19.5 in. spacing will be used.

b. For body tracks in yards, sidings, running tracks, and access tracks, where the train speed is less than 32 km/hr 20 miles per hour and train movement is not classified as heavy, a 530 mm 21 in. spacing will be used.

**************************************************************************

Standard center-to-center spacing of crossties shall be [50][53] mm [19.5][21] inch. Switch ties and bridge ties shall be spaced as indicated on the drawings. Ties shall be laid perpendicular to the center line of the track with the grain up (heartwood side down) for wood ties. The best ties shall be used at the rail joints. The ends of ties on one side of the track shall be parallel to the rail and the center of the tie shall be on the approximate center line of the track. The ends shall be aligned on the inside of curves and shall continue on that side until reaching a curve in the opposite direction. On double tracks, the ties shall be aligned on the outside ends. The top surface of ties shall provide full bearing for the tie plates. Adzing of wood ties shall be restricted to that necessary to provide a sound true bearing for the tie plate. Adzing in excess of 5 mm 0.2 inch will not be permitted. Where adzing is necessary, the cut surface of the wood tie shall be completely saturated with creosote or other approved preservatives.
3.3.5 Tie Plates

**************************************************************************

NOTE: For track rehabilitation where the track does not currently have tie plates, plates should be installed on each new tie installed. As defective ties are replaced, tie plates are installed with the new ties and with time the entire track has plates.

**************************************************************************

Tracks shall be fully tie-plated. Tie plates shall be free of dirt and other foreign material when installed. Tie plates shall be placed so that the rails will have full bearing on the plate, and the plate will have full bearing on the tie. Tie plates shall be set at right angles to the rail with the outside shoulder against the base of the rail, and centered on the tie. Canted tie plates shall be installed to cant the rail inward.

3.3.6 Rail

The base of the rail and the surface of the tie and tie plate shall be free of dirt and other foreign materials prior to laying rail.

3.3.6.1 Laying Rail

Rail shall be laid without bumping or striking, to standard gage (1.435 m 4 ft 8-1/2 inch between points 16 mm 5/8 inch below the top of the rail) on tangents and on curves up to 12 degrees. For curves 12 degrees and greater, the gage shall be widened 3.2 mm 1/8 in for each increment of 2 degrees to a maximum of 1.448 m 4 ft 9 inch, in accordance with TABLE V. The track shall be gaged at every third tie as spikes are being driven.

a. Lay jointed rails, one at a time, with space allowance for expansion being provided between rail ends in accordance with TABLE VI.

b. Gaps between rail ends in insulated joints shall only be sufficient to permit insertion of standard end posts.

c. Use a standard rail thermometer to determine the rail temperature. The thermometer shall be laid close to the web on the side of the rail base which is shaded from the sun's rays in advance of the laying operation and left there long enough to accurately record the temperature. The Contractor quality control representative shall see that rail

SECTION 34 11 00 Page 66
temperature is checked frequently and that proper rail expansion shims are used. All thermometers shall be calibrated against the Contracting Officer's rail thermometer which will have been accurately calibrated and will be considered as the standard.

d. Except through turnouts and at insulated joints, the staggering of the joints on one side shall not vary more than [460] [500] mm [18] [20] inch in either direction from the center of the opposite rail.

e. Rails less than 10 m 33 ft in length shall not be used in out-of-face rail relay. However, rails not less than 4 m 13 ft long may be used for final connections to existing rails to prevent joints from occurring at prohibited locations or to provide the specified joint stagger in curves.

f. Rail joints shall not occur in or within 6 m 20 ft of a road crossing, alongside of or within 1.5 m 5 ft of the end of any switch or turnout guard rail, or the end of any open deck bridge.

3.3.6.2 Joints

The joints in opposite rails shall be staggered one-half the rail length but not less than 3.5 m 12 ft apart, except closer joints may be required at turnouts and insulated joints. Rail less than 4 m 13 ft in length shall not be installed in track. No joint shall be less than 2 m 6 ft from the ends of open-deck bridges, or less than 1 m 3 ft from switch points. No joint shall be installed within 6 m 20 ft of a road crossing, outer perimeter of any structure, or any location which restricts access to the joint. Where joints are required in these areas, the joints shall be welded.

3.3.6.3 Expansion Allowance

Allowance for expansion shall be provided at rail joints by using rail-expansion metal shims. Shims shall be removed to within 12 rails of the laying. Shims shall be of the thickness shown in TABLE VI. The temperature of the rail shall be determined by use of a thermometer placed on the rail base on the side away from the sun. Typical rail gap gages are as shown.

3.3.6.4 Cutting Rail

Only rail saws or track chisels shall be used to cut rail. New holes shall be drilled using a standard template. Holes shall not be burned in rail. Holes cut with a torch will not be accepted. When drilling of rail is necessary, all chips and burrs shall be removed before applying joints.

3.3.6.5 Matching Rails

NOTE: Remove this paragraph when relay rail is not used.

Where relay rail is used, matching adjacent rails shall not cause lipped or uneven joints. Any mismatched rail ends shall be welded to provide proper match. Rail end mismatch shall not exceed 3 mm 1/8 in on gage or tread portions of rail.

3.3.6.6 Rail Replacement

The following procedures apply to rail replacement work:

a. Spot rail replacement is defined as replacement of 30 m 100 ft or less of contiguous rails, usually with rails of the same section. Installation of relief rail in place of defective rail is considered spot rail replacement. Replacement of more than 30 m 100 ft of contiguous rails shall be considered to be out-of-face rail relay.

b. If spikes are withdrawn, the holes shall be plugged with treated tie plugs of proper size to fit the hole, prior to replacement of rail. If spikes are withdrawn and spikes are to be redriven in existing spike holes, the holes shall be plugged with treated tie plugs prior to redriving the spike. Tie plugs shall not be installed in prebored holes unless spikes have been driven and withdrawn.

c. All ties shall be spiked with new spikes in accordance with paragraph Spot Tie Replacement.

d. Ensure that rail ends at joints are not lipped or uneven. Tread portion (vertical) or gage side (horizontal) rail end mismatch shall be no greater than 2 mm 1/16 inch. Rail end mismatch greater than 2 mm
1/16 inch shall be corrected by welding and grinding on the smaller rail. Grinding the larger rail is not permitted unless approved by the Contracting Officer. Welded transitions shall be made at a rate of 1 to 80.

e. Rails removed from track will be designated by the Contracting Officer as relay (for use on project), reclaimer (to be salvaged and stockpiled), or scrap. Joint bars removed from track will be designated as relay, reclaimer, or scrap. Mark scrap materials as scrap using bright red paint, transport them off the military installation or to the military installation temporary scrapyard. Relay materials required to complete other repair work of this contract shall be transported to the location of need. Reclaimer materials shall be classified and inventoried and stacked at the military installation storage site, all as indicated for salvage materials in paragraph Removal, Salvage, and Disposition of Materials.

f. Metal rail expansion shims shall be used when laying rail. Wood sticks or other material shall not be used as shims. Provide a sufficient supply of each shim available to permit rail laying to progress without delay.

3.3.6.7 Out-of-Face Rail Relay

Replace existing rail with the designated new or used rail between designated limits in a continuous operation. It is expected that replacement of one rail of a given track will be completed prior to replacement of the opposite rail. Used rail shall be laid [with previous gage side wear facing out, unless required to match existing wear patterns] [as directed by the Contracting Officer].

3.3.6.8 Spot Rail Replacement

Spot rail replacements shall be made where necessary to replace existing defective rails or to compensate for rail joint gap adjustments.

3.3.6.8.1 Replacement Rail

Replacement rail shall be of equal length or longer than the rail it replaces. The minimum length of rail used shall be 4 m 13 ft.

3.3.6.8.2 Spot Rail Replacement Resulting in Joint Staggers

Unless otherwise approved by the Contracting Officer on a case by case basis, spot rail replacement shall not result in joint staggers less than 1.33 m 4 ft.

3.3.7 Joint Bars

**************************************************************************

NOTE: The location of compromise joints will be shown on the drawings. Where compromise joints are required, the portion of this paragraph in brackets will be retained. If compromise joints are not required, the portion of this paragraph in brackets will be deleted.

AREMA Manual recommends an initial bolt tension of between 89,000 and 133,000 N 20,000 and 30,000 lbs
per bolt in order to overcome the surface roughness and provide proper seating for the joint bars. After application of traffic, tension in the bolt is lost relatively rapidly and may lose from 22,000 to 44,000 N 5,000 to 10,000 lbs per bolt in the first month. Therefore, retightening of all track bolts after some period of time is necessary. Bolt tension recommended for subsequent tightening is within the range of 67,000 to 111,000 N 15,000 to 25,000 lbs per bolt. The torque required to develop the specified tension in a bolt is approximately as follows:

<table>
<thead>
<tr>
<th>BOLT DIAMETER</th>

<tr>
<td>291-1/8</td>
<td>544400</td>
</tr>
</tbody>
</table>

*For well oiled bolts with clean threads.

Joint bars shall be clean. Rail joints shall be installed so that bars are not cocked between the base and head of the rail. Bars shall be properly seated in the rail and the full number of correct-size bolts, nuts, and spring washers installed. Bolts shall be placed with nuts alternately on inside and outside of rail. A corrosion resistant lubricant shall be applied to the bolt threads prior to application of nuts. Bolts shall be tightened to torque of approximately [_____] N-m ft-lbs, beginning at the center of the joint and working both ways to the ends of the joint. After the track has been in service [, but before acceptance of the work,] all bolts shall be checked and retightened to a torque of approximately [_____] N-m ft-lbs. [Rail of different sections shall be connected by properly fitting compromise joint bars. The mismatch for compromise joints for either tread surface or on the gage side shall not exceed 3 mm 1/8 inch]. Defective joint bars designated on the contract drawings, discovered by the Contractor during track repair operations, or as identified by the Contracting Officer shall be replaced with acceptable joint bars.

3.3.8 Spiking

3.3.8.1 Spiking Procedures

Rail shall be spiked promptly after being laid. Spikes shall be started and driven vertically and square with the rail. Engineered polymer composite ties shall be pre-drilled in accordance with manufacturer's recommendations for size and depth. Spikes shall be driven to allow approximately 3 to 5 mm 1/8 to 3/16 inch space between the underside of the spike and the top of the rail base. Spikes shall not be overdriven, or straightened while being driven. Spikes shall not be installed through the
slots in skirted-type, slotted joint bars (angle bars). Spikes shall not be driven against the ends of joint bars.

3.3.8.2 Number of Spikes

Four rail-holding spikes shall be used on each tie on tangents and curves less than 4 degrees. Spikes on the gage side of the running rail shall be placed directly across from each other and the spikes on the field side of the running rail shall be placed directly across from each other. Spikes on the gage side shall be offset longitudinally from the field spike and all four spikes shall be rail-holding spikes next to the base of the rail. This pattern shall be held consistent. On curves 4 degrees or greater, but not more than 36 degrees, six spikes shall be used on each tie with the spikes located as follows: One rail-holding spike on the field side and two rail-holding spikes on the gage side for both rails. [Curves 36 degrees and greater shall be spiked with eight spikes per tie, located as follows: One rail-holding spike and one plate-holding spike on the field side and two rail-holding spikes on the gage side for both rails.] Eight rail-holding spikes shall be used on each tie through road crossings.

3.3.9 Tie Plugs

If spikes are withdrawn from wood ties, the holes shall be swabbed with creosote and plugged with creosoted tie plugs of proper size to fit the hole. If spikes are withdrawn and spikes are to be reinserted in existing spike holes, the holes shall be swabbed with creosote and plugged with creosoted tie plugs prior to redriving the spike. Tie plugs shall not be installed in prebored holes unless spikes have been driven and withdrawn.

3.3.10 Rail Anchor Placement

**************************************************************************
NOTE: Coordinate this paragraph with paragraph Rail Anchors in PART 2.
**************************************************************************

Rail anchors shall be located as indicated on the project plans. Where the use of rail anchors is indicated, apply a minimum of [_____] anchors per 11.9 m 39 ft of rail in the pattern indicated on the project drawings. The rail anchors shall be spaced approximately uniformly along the rail length. Rail anchors shall be installed to the gage side of the rail against the same tie face on opposite rails. Rail anchors shall grip the base of the rail firmly and shall have full bearing against the face of the tie. Rail anchors shall not be moved by driving them along the rail. Rail anchors shall not be applied to track on an open-deck bridge. Where anchors are used on track approaching an open deck bridge, every third tie shall be box anchored for at least four rail lengths, off each end of the bridge. Rail shall be anchored immediately after spiking and before rail has experienced a large temperature change.

3.3.11 Inner Guard Rails

Guard rails shall be installed on bridges and trestles as indicated. Guard rails shall be approximately 280 mm 11 inch from the gage side of track rails and shall extend a minimum of 15 m 50 ft beyond the structure. The ends shall be curved inward and beveled. Guard rails shall be fully bolted. Guard rails shall not be higher than the running rail and shall not be more than 25 mm 1 inch lower than the running rail. Each guard rail shall be spiked with two spikes to each tie but shall not be tie-plated.
Unfit track rail in short lengths may be used for guardrails.

3.3.12 Derails

Derails shall be properly installed where indicated. Derailed equipment shall not foult other tracks. Installation shall be in accordance with the manufacturer's instructions. Where no specific installation instructions are available for salvaged derails, reinstallation shall be in accordance with good track construction practice to ensure proper performance of their intended function.

3.3.13 Superelevation

**************************************************************************

NOTE: Superelevation on military railroad track should not exceed 100 mm 4 inches. Superelevation for each curve will be shown on the drawings.

**************************************************************************

Curves shall be superelevated as shown on the drawings unless otherwise directed by the Contracting Officer. Superelevation shall be obtained by raising the outside rail of the curve. The inside rail shall be maintained at grade. The maximum superelevation will be [___] mm inch. Full superelevation shall be carried throughout each curve, unless otherwise directed or shown on the drawings. Superelevation runoff shall be at a uniform rate, and shall extend at least the full length of the spirals. The normal rate of superelevation runoff will be 13 mm per 9.4 m 1/2 inch per 31 ft; however, this may be increased to 25 mm in 9.4 m 1 inch in 31 ft with the prior approval of the Contracting Officer.

3.3.14 Preliminary Surfacing

The preliminary alignment and surfacing gangs shall follow the unloading of the ballast. Rail renewal, tie renewal, bolt tightening, and ballast placement shall be complete prior to commencement of surfacing and alignment work.

3.3.14.1 Lifts

a. The track, after being aligned, shall be brought to grade and surface in lifts not exceeding 100 mm 4 in each. After each lift, the ballast shall be tamped. When using jacks, they shall be placed close enough together to prevent undue bending of rail or stress of rail and joint. Both rails shall be raised at one time and as uniformly as possible, except where superelevation is required. The track shall be so lifted that after a period of not less that 5 train operations (70 metric ton ballast car) after the last lift, it will be necessary to give the track a final lift of between 25 and 50 mm 1 and 2 inch to bring it to grade.

b. In areas where major track resurfacing is not required, perform a "skin lift" tamping operation to ensure that the ties are adequately tamped, the ballast section is adequately compacted and dressed, and to correct minor deficiencies in surface and alignment. The rise in skin lift areas shall be 25 mm 1 in or less and usually will not require that additional ballast be placed.

c. A 50 mm2 inch rise shall provide an average 50 mm2 inch raise in the track being surfaced.
d. A 100 mm 4 in rise shall provide an average 100 mm 4 inch raise in the track being surfaced, and shall be made in at least two lifts not to exceed 50 mm 2 inches per lift.

e. A 150 mm 6 inch raise shall provide an average 150 mm 6 inch raise in the track being surfaced, and shall be made in at least 2 lifts. The initial lift shall not exceed 100 mm 4 inch with the final lift not to exceed 70 mm 2-1/2 inch.

3.3.14.2 Tamping

Raising and tamping of track shall be performed with an automatic, vibratory, squeeze type power tamper with 16 tamping heads, capable of raising both rails simultaneously and maintaining cross-level. The equipment to be used for surfacing operations is subject to approval by the Contracting Officer. Every tie in the track shall receive two or more full insertions of the tamping heads. Ballast shall be power-tamped under both sides of ties from each end to a point [300 mm 12 inches inside each rail for 2.4 m 8-ft ties,] [380 mm 15 inches inside each rail for 2.6 m 8 feet-6 inch ties,] [and] [460 mm 18 inches inside each rail for 2.7 m 9 ft ties]. The center shall be filled with ballast, but tamping will not be permitted in the center of the tie between the above stated limits. Both ends of the ties shall be tamped simultaneously and tamping inside and outside of the rail shall be done at the same time. Tamping tools shall not be used with more than 35 percent wear and shall be worked opposite each other on the same tie. Ballast under switch ties and road crossing ties shall be tamped the entire length of each tie. All ties shall be tamped to provide solid bearing against the base of the rail after the track or turnout is raised to grade at final surfacing. All down ties shall be brought up to the base of rail and shall be machine tamped. The resultant track surface and alignment shall be uniform and smooth. Tamping of track in snow or frozen ballast conditions will not be permitted.

3.3.14.3 Replacement of Ties

After tamping has been completed and the jacks removed, all ties pulled loose shall be replaced to their proper position, respiked and retamped to provide full bearing against the rail.

3.3.14.4 Track Off The Ends of Open Deck Bridges

Track off the ends of open deck bridges shall maintain the same grade as the track on the bridge for a minimum of 8 m 25 ft beyond the bridge abutment and then transition smoothly to meet established track grades.

3.3.14.5 Runoff of Track Raises

The runoff at the end of a rise shall not exceed 13 mm in 9.4 m 0.5 inches in 31 ft of track unless otherwise approved by the Contracting Officer.

3.3.14.6 Horizontal Realignment

Horizontal realignment of curved track shall be established using manual or mechanical means as described in the AREMA Eng Man Chapter 5, Part 3 Section 3.2, "String Lining of Curves by the Chord Method".
3.3.15 Final Surfacing

After preliminary surfacing has been completed, grade and line stakes shall be checked and the track brought to grade and alignment.

3.3.15.1 Final Tamping

Track shall be brought to grade and the ballast retamped in the manner described for preliminary surfacing, except that the tamping distance inside the rail shall be decreased from 300 to 250 mm for 2.4 m ties, 380 to 330 mm for 2.6 ties, and 460 to 410 mm for 2.7 ties. 12 to 10 inch for 8 ft. ties, 15 to 13 inch for 8 ft 6 inch ties, and 18 to 16 inch for 9 ft ties.

3.3.15.2 Final Alignment

The track shall be given a final aligning conforming to the established track centers.

3.3.15.3 Final Dressing

After the final alignment the ballast shall be dressed to the section indicated. After final dressing ballast shall not cover the tops of the ties. The portion of the subgrade outside the ballast line shall be left with a full, even surface and the shoulder of the subgrade shall be properly dressed to the indicated section to provide proper drainage away from the track.

3.3.15.4 Surplus Ballast

Surplus ballast remaining after final surfacing and dressing of the ballast section shall be distributed or otherwise disposed of as directed by the Contracting Officer.

3.3.16 Cleanup

Upon completion of the work, [remove all rubbish, waste, and discarded materials generated by the work from the project area] [dispose of rubbish, waste, and discarded materials in an approved manner as directed by the Contracting Officer]. Areas where the Contractor has worked, including but not limited to, project areas, material storage sites, and borrow or disposal areas shall be left in a clean, well-graded, and well-drained condition.

3.3.16.1 Shoulder Removal and Reconstruction

Where track construction or rehabilitation operations result in deposition of materials along the track shoulders that would impede the free drainage of the geotextile and track structure, remove the material. Where [undercutting] [ploughing] operations leave fouled shoulder materials that impede free drainage of the geotextile and the track structure, the shoulder material shall be removed, and the ballast shoulders shall be reconstructed using the materials and dimensions as indicated. Areas where shoulder removal and reconstruction are required [are] [are not] indicated on the drawings.

3.3.16.2 Spoil Materials

Spoil materials removed from the track shall be disposed of [as indicated] [off site at the Contractor's expense]. Spoil materials shall not be
placed on the shoulders, in ditches, in drains, or in other areas where they would impede the flow of water away from the track.

3.3.17 Final Adjustments

Sixty calendar days after the track has been accepted and put into operation, perform, at no cost to the Government, necessary resurfacing adjustments to leave the track in alignment and on grade.

3.3.18 Tolerances for Finished Track

Completed track shall meet the following tolerances. Track not meeting the tolerances specified below shall be repaired to meet these requirements, at no additional cost to the Government.

3.3.18.1 Gage

Track gage shall be within plus 6 mm 1/4 inch or minus 3 mm 1/8 inch of standard gage.

3.3.18.2 Alignment

******************************************************************************
NOTE: The alignment and track surface tolerances for out-of-face surfacing of secondary track (less than 16 km/hour 10 MPH) may be doubled from the values given below if alignment is not critical. Horizontal alignment and profile drawings are recommended.
******************************************************************************

Alignment shall be measured as the deviation of the mid-offset of a 18.9 m 62 ft line, with the ends of the line at points on the gage side of the line rail, 16 mm 5/8 inch below the top of the railhead. Either rail may be used as the line rail on tangent track; however, the same rail shall be used for the entire length of the tangent. The outside rail in a curve is always the line rail. Alignment on tangents shall not deviate from uniformity more than 13 mm 1/2 inch. Alignment on curves shall not deviate from uniformity more than 10 mm 3/8 inch.

3.3.18.3 Track Surface

Track surface shall meet the following requirements:

a. The runoff at the end of a raise shall not exceed 13 mm 1/2 inch in any 9.4 m 31 ft of rail.

b. The deviation from design profile on either rail at the mid-ordinate of a 18.9 m 62 ft chord shall not exceed 13 mm 1/2 in.

c. Deviation from design elevations on spirals shall not exceed 13 mm 1/2 inch.

d. Deviation from zero cross level at any point on tangent or from designated superelevation on curves or spirals shall not exceed 13 mm 1/2 in.

e. The difference in cross level between any two points less than 18.9 m 62 ft apart on tangents, and on curves between spirals shall not exceed
3.3.18.4 Guard Face Gage

Guard face gage is the distance between the guard lines measured across the track at right angles to the gage line, and is measured at the point of frog on both sides of the turnout. The design value for guard face gage is 1340 mm (52-3/4 inch). Guard face gage shall be within plus or minus 3 mm (1/8 inch) of the design value.

3.3.18.5 Guard Check Gage

Guard check gage is the distance between the gage line of a frog and the guard line of its guard rail, or guarding face, measured across the track at right angles to the gage line. The design value for guard check gage is 1388 mm (54-5/8 inch). Guard check gage shall be within plus or minus 3 mm (1/8 inch) of the design value.

3.4 TURNOUTS AND TRACK CROSSINGS

Turnouts and crossovers shall be located as indicated on the drawings. Switch, frog and guardrail assemblies shall be complete. Stock rails shall be accurately bent. Changes in rail weight or section will not be permitted within the limits of the switch ties. Headblocks shall be at right angles to the main track and shall be securely spiked in place. Except where directed otherwise, switch stands shall be installed so that when the switch is set for the normal position, the connecting rod keeps the points closed with a pulling force. Switches shall be properly adjusted. Switch components and slide plates shall be lubricated.

3.4.1 Turnout Reconstruction

**************************************************************************
NOTE: List the turnout identification numbers and/or other identifying information, such as location or milepost on the drawings. Indicate the appropriate work required on each turnout.
**************************************************************************

3.4.1.1 Install Salvaged Turnouts

Turnouts shall be reconstructed using Government materials, except switch ties which are furnished and installed. This work includes transporting the turnout from the Government stockpile to the installation site and reconstruction of the turnout.

3.4.1.2 Salvage and Install Turnouts

Turnouts shall be salvaged (removed) and installed. This work consists of removal of the turnout, transporting to the installation site all turnout materials except the switch ties, and reconstructing the turnout using new switch ties.

3.4.1.3 Turnout Removal and Salvaged or Scrapped

Materials from turnouts that are removed from the track and that are not to be reinstalled, shall be either salvaged or scrapped as indicated on the drawings.
3.4.1.4 Trackbed

The trackbed shall be prepared by excavating and wasting existing ballast or subgrade materials and establishing a firm top of subgrade as indicated on the contract drawings. ([Subballast shall be placed as indicated and compacted.] [Geotextile shall be placed to the limits indicated.])

3.4.1.5 Replacement Turnout

The replacement turnout shall be constructed at the location indicated on the contract drawings. Replacement turnouts shall be located so that the point of frog remains at the same location as the original turnout point of frog. Dimensions, details, and configuration of each turnout shall be as indicated on AREMA Eng Man, Plans Nos. 910 and 911. Switch ties shall be placed as indicated on AREMA Eng Man, Plans Nos. 112 and 912, except that even meter foot increments in length of switch ties may at Contractor's option be substituted for 150 mm 6 inch increments in length of switch ties. The end of a switch tie shall not be within 355 mm 14 inch of a spike. Connecting tracks shall be shifted to their new alignments as shown on the contract drawings and all tracks connected to the replacement turnout. Tracks shall be placed within 30 mm 0.1 ft of design alignment prior to ballasting work.

3.4.1.6 Matching

**************************************************************************
NOTE: Allow at least 50 mm 2 in. of clearance between moving parts of the switch and the top of the ballast. One hundred mm Four inches is the minimum clearance in Northern climates, where snow and ice accumulation and heaving occur. Select the appropriate clearance for the project location.
**************************************************************************

Switch points/stock rails, rail joints, frog castings, and other parts of the turnout that must fit together shall fit properly and be of the proper match. Both rail ends at all rail joints throughout the turnout and at the joints at the frog shall be matched on both the top (tread portion) and on the gage side of the rail. Rail end welding and grinding [are] [are not] acceptable methods to achieve a good match.

3.4.1.7 Placing of Ballast

Ballast shall be placed as required and the turnout brought to proper grade in a minimum of three lifts. The initial lift shall not exceed 100 mm 4 inch. The final lift shall not exceed 50 mm 2 inch and all tracks shall be brought into final alignment at that time. Tamping, ballast dressing requirements, and alignment tolerances shall be as indicated in paragraph TRACK CONSTRUCTION AND OUT-OF-FACE RELAY. Ballast level in cribs beneath the connecting rod, switch point rails, and switch rods shall be at least 100 mm 4 inch below any steel.

3.4.1.8 Existing Switch Stand

The existing switch stand, or a replacement stand if specified, shall be installed and the switch operating mechanisms adjusted so that the switch operates smoothly and without excessive force being required. All switch plates and connection points in the switch rod shall be lubricated with a switch lubricant, which does not allow sand or debris to adhere to the
3.4.1.9 Rail Anchors

All switch ties shall be box-anchored to the extent possible. Ties shall be anchored only when box-anchors can be applied to every rail on the tie.

3.4.2 Turnout Repair

**************************************************************************
NOTE: Designer will list the turnout identification numbers and/or other identifying information, such as location or milepost, along with the requirements in a schedule on the drawings.
**************************************************************************

Turnouts which will remain in their existing location but require repairs shall be indicated in the "Schedule of Turnout Repairs" on the contract drawings and repaired as specified below.

3.4.2.1 Switch Ties

Defective switch ties shall be removed and replaced. Existing nondefective switch ties shall remain in place. Replacement switch ties shall be installed at a uniform spacing, but not greater than 530 mm 21 inch center to center. The end of a switch tie shall not be within 36 mm 14 inch of a spike. Switch ties shall not be interlaced, where one tie penetrates the crib area of another tie.

3.4.2.2 Bolt Tightening

All bolts in all turnouts within the project area shall be tightened. Any bolt that cannot be tightened shall be replaced with a bolt assembly of the proper diameter and length.

3.4.2.3 Rebuild Switch Points and Protectors, Frogs, and Guard Rails

Switchpoints, frogs, guard rails, or switch point protectors shall be rebuilt as specified in paragraph ELECTRIC ARC WELDING.

3.4.2.4 Regage Closure Rails

Track shall be regaged from heel of switch to the toe of frog. Regaging shall be performed as specified in paragraph TRACK CONSTRUCTION AND OUT-OF-FACE RELAY.

3.5 HIGHWAY CROSSINGS

**************************************************************************
NOTE: Subdrains are recommended on all highway crossings. Drawings should show location of outfall pipe. Density requirements can be deleted if a separate specification section is provided for subgrade preparation.
**************************************************************************

Highway and other grade crossings within the project shall be constructed as indicated on the contract drawings.
3.5.1 Subgrade

[For new construction, the subgrade in the crossing area and for 6 m 20 ft beyond each end of the crossing shall be bladed to a level surface and compacted to at least 90 percent CE55 maximum dry density for cohesive materials or 95 percent CE55 maximum dry density for cohesionless materials.] [For track rehabilitation, old contaminated ballast and subballast shall be excavated a minimum 300 mm 12 inch below the design elevation of the bottom of the tie, 300 mm 12 inch beyond the ends of the ties, and for at least 6 m 20 ft beyond each end of the crossing. The subgrade shall be bladed to a level surface.] Drainage areas shall be cleaned and sloped away from the crossing in both directions along the track and the roadway. [Surface ditches][Subdrains] shall be installed as indicated.

3.5.2 Geotextile Installation

**************************************************************************
NOTE: Coordinate these paragraphs with paragraph GEOTEXTILE. Delete these paragraphs if geotextile is not required.
**************************************************************************

The width of the geotextile should cover the entire width of the roadbed with no longitudinal seams or overlaps. Where mechanized geotextile laying equipment will be used to place the geotextile, the maximum diameter of the geotextile rolls should not exceed the capability of the equipment to be used on the project.

Prior to the placement of the cover material (ballast or subballast), the geotextile may be anchored in several ways, i.e., pins, small ballast piles, ballast bags, etc. If fixing of the geotextile is critical and adverse conditions exist, e.g., steep slopes or high winds, the specification can detail anchoring requirements, e.g., pin length and spacing. Care should be taken to prevent or quickly release any tension caused by anchoring and placement of the geotextile cover materials. Excessive tension can cause bridging of irregularities beneath the geotextile and increase the potential for puncture.

If there is reason to suspect movement which will reduce overlap, provision should be made in the specification to remove cover materials at selected areas in order to determine if required overlap is being maintained after cover placement.

**************************************************************************
Geotextile shall be placed between the subgrade and the ballast section in the crossing area and for 6 m 20 ft beyond each end of the crossing.

3.5.2.1 Preparation

Surfaces on which geotextiles will be placed shall be prepared in accordance with the applicable portions of this specification and shall be free of irregularities such as sags, cavings, erosion, or vegetation. Any
irregularities shall be corrected to ensure continuous, intimate contact of the geotextile with the whole surface. Any loose material or debris shall be removed prior to geotextile placement.

3.5.2.2 Placement

**************************************************************************
NOTE: Delete paragraph "b." if a protective sand layer is not specified.
**************************************************************************

a. When geotextile is to be installed in an existing track following removal of the ballast by undercutting or ploughing, special care shall be taken to remove as many of the large ballast particles that remain on the roadbed surface as possible.

b. A protective sand layer 50 mm 2 inch thick [or subballast] shall be placed on top of the geotextile after it has been installed.

c. The geotextile shall be carefully placed on the prepared surface with the long dimension parallel to the prepared surface. The geotextile shall be placed free of wrinkles, folds, creases, and tension. The geotextile shall be held in place by pins, small aggregate piles or ballast bags, until it is completely covered. The geotextile shall be covered immediately after placement in track. The maximum exposure time for the geotextile, from removal of the protective shipping cover to placement of the ballast/subballast cover materials which prevent exposure to sunlight, shall be 2 consecutive days.

d. The minimum overlap of geotextile splicing seams shall be 900 mm 36 inch. If several geotextile units are placed with the required overlap prior to the placement of the [ballast][subballast], the overlap distance of each overlap shall be checked as placement of [ballast][subballast] approaches the overlap. Ensure that the required overlap exists when the geotextile is covered.

e. The geotextile shall remain free of any contamination such as mud, dust, sediment, debris, etc., that will impair its function. Contamination shall be removed without damage to the geotextile or to the prepared surface at the Contractor's expense. If the geotextile is damaged, its function impaired by the cleaning efforts, or if it cannot be properly cleaned, repair the prepared surface, if necessary, and replace the damaged or impaired geotextile with geotextile meeting requirements of this specification. Equipment shall not operate in direct contact with the geotextile. Surface drainage, as much as possible, shall be directed away from the geotextile installation area to prevent accumulation of mud, debris, and sediment.

3.5.2.3 Placement of Cover Material

Placement of [ballast][subballast] cover material in contact with the geotextile shall be performed ensuring intimate contact of the geotextile with the prepared surface and with the cover material. The placement shall be performed without damage to the geotextile including tears, punctures, or abrasion.

3.5.2.4 Equipment Operations on the Cover Material

A minimum depth of 200 mm 8 inch of cover material shall be placed over the
geotextile before equipment is allowed to operate on the covered geotextile. Equipment operations on the covered geotextile shall be limited to those necessary for track construction and equipment turning will not be allowed on the covered geotextile.

3.5.2.5 Minimum Ballast Depth

The minimum depth of ballast between the bottom of the tie and the top of the geotextile shall be 300 mm 12 inch.

3.5.2.6 Tamping Operations

Tamping of ballast materials shall be performed by setting the tamping force and insertion depth to the minimum necessary to adequately tamp the track. The tamper operator shall monitor the depth of tamping and limit the depth to prevent detrimental effects of the tamper feet on the geotextile.

3.5.2.7 Double Layers

Double layers of geotextile will not be allowed, except for splicing overlaps at seams.

3.5.3 Ballast Placement and Surfacing

Ballast shall be placed and tamped as specified in paragraph TRACK CONSTRUCTION AND OUT-OF-FACE RELAY except that in crossings, the ballast between the ties shall be thoroughly compacted with a vibratory compactor, or other approved means, after each raise. The ballast shall be tamped for the entire length of the crossties for highway crossings. The track shall receive final alignment and surfacing prior to placement of the crossing surface. Final surfacing shall bring the track to the final grade and alignment as indicated on the contract drawings. Where the crossing involves two or more tracks, the top of the rail for all tracks shall form a plane with the adjacent roadway surface. The top of rail elevation shall be 50 to 100 mm 2 to 4 inches above surrounding pavement elevation, with a smooth transition of pavement. The ballast in the cribs and on the shoulders shall be compacted using a vibratory plate compactor or other approved means.

3.5.4 Ties

[Hardwood][Concrete][Polymer Composite] ties shall be used. Spacing shall be a minimum of 500 mm 20 inches center to center. For premanufactured grade crossings, ties shall conform to the manufacturer’s recommendations for the type of grade crossing surface materials being used.

3.5.5 Tie Plates, Spikes, and Anchors

All ties within the crossing and for 6 m 20 ft beyond each end of the crossing shall be fully tie plated, and spiked with 4 rail-holding spikes per tie plate. [Each tie within the crossing shall be fully box anchored.] [Rubber tie pads shall be installed between the tie and tie plate on all ties within the crossing area and for 6 m 20 ft beyond each end of the crossing.]

3.5.6 Rail

Rail within the crossing area and for 6 m 20 ft beyond each end of the
crossing shall be, at a minimum, [57][_____] kg/m [115][_____] lbs/yd. Rail [shall] [shall not] be protected from corrosion by application of an approved rust inhibitor. Bolted joints will not be permitted in any Type 2, Type 3, Type 4, or Type 5 crossing or within 6 m 20 ft of either edge of the crossing surface. Bolted joints will be eliminated by either field welding the joints to form continuous rail throughout this area or by using 24.4 m 78 ft rail lengths.

3.5.7 Lining and Surfacing

Rail shall be spiked to line and the track mechanically tamped and surfaced to the grade and alignment of the existing track and roadway. Where the crossing involves two or more tracks, the top of rails for all tracks shall be brought to the same plane.

3.5.8 Crossing Surface

**************************************************************************
NOTE: Provide Typical Railroad Crossing cross section and details on the drawings.
**************************************************************************

The surface of the highway shall be [in the same plane as][not greater than 6 mm 1/4 inch higher than] the top of the rails for a distance of 600 mm 2 ft outside of the rails for either single or multiple-track crossings. A smooth transition shall be made between the crossing surface and the adjoining pavement.

3.5.8.1 Type 1 Aggregate Crossings

Type 1 crossings shall be constructed by placing the aggregate material between the rails and outside of the rails to form an approach ramp as indicated in the contract drawings.

3.5.8.2 Type 1A Aggregate with Timber Flangeway Guards Crossings

The bond timber headers shall be installed with the edge of the timber solid against the edges of the tie plates prior to placement of the aggregate. Headers shall fasten to the ties as indicated using the appropriate size and length fasteners. After installation of the bond timber, the aggregate shall be placed in the track and on the outside approaches and compacted.

3.5.8.3 Type 2 Timber Plank Crossings

Type 2 Type 2 crossings shall be installed as shown or in accordance with the manufacturer's instructions for prefabricated timber crossing units. The surface of the crossing timbers shall form a smooth plane with the top of the rails and the adjacent roadway surface. Crossing timbers shall be attached to the ties as indicated in the contract drawings using the appropriate size and length fasteners, unless otherwise specified by the manufacturer's instructions.

3.5.8.4 Type 3a Asphalt Crossings

Type 3a crossings are full-depth asphalt crossings as shown in the contract drawings. The asphalt shall be placed in lifts not to exceed 50 mm 2 inch thick and shall be compacted with approved compaction equipment. General requirements for asphalt placement are specified in [_____] State Highway...
3.5.8.5 Type 3b Asphalt With Timber Flangeway Header Crossings

Type 3b crossings are full-depth asphalt crossings as shown in the contract drawings. The asphalt shall be placed in lifts not to exceed 50 mm 2 inch thick and shall be compacted with approved compaction equipment. General requirements for asphalt placement are specified in [_____] State Highway Specifications. The flangeway timbers shall be installed prior to the placement of the asphalt pavement. The timbers shall be installed with the dappled edge of the timber solid against the ends of the tie plates. Flangeway timbers shall fasten to the ties as indicated in the contract drawings using the appropriate size and length fasteners.

3.5.8.6 Type 4a Cast-in-place Concrete Crossings

Type 4 crossings shall be constructed as shown in the contract drawings using the materials specified herein. Concrete forming, reinforcement, and placement shall conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.5.8.7 Type 4b Prefabricated Concrete Panel Crossings

Type 4A crossings and crossing materials shall be installed in accordance with the crossing manufacturer's instructions. Tie spacings and track materials used in the crossing shall be in accordance with the installation instructions and manufacturer's recommendations.

3.5.8.8 Type 5 Full Depth Rubber Crossings

Type 5 crossings and crossing materials shall be installed in accordance with the crossing manufacturer's printed instructions. Tie spacings and track materials used in the crossing shall be in accordance with the installation instructions and manufacturer's recommendations.

3.5.9 Signs and Signals

The type and location of railroad-highway crossing warning signs and signals shall conform to the requirements of MUTCD, Part VIII.

3.5.9.1 Location and Positioning of Signs

Signs for both highway and railroad track installation shall be located and erected as shown. Unless otherwise shown, signs shall be erected so that sign face is vertical and at a deflection angle of 87 degrees from the center of the highway lane or track which the sign serves and facing the direction of travel. Where lanes or tracks are on curves, sign faces shall be on a deflection angle of 87 degrees to the tangent to the curve. Signs shall be erected so that specular reflection is minimized or eliminated. After installation is completed, the signs will be inspected during the day and at night by the Contracting Officer. If specular reflection is apparent on any sign, its positioning shall be adjusted to eliminate or minimize this condition. This adjustment and any subsequent adjustments shall be at no additional cost to the Government.

3.5.9.2 Traffic Control

During installation of highway signs, provide for the safe and expeditious movement of traffic through the work area. Provide schedule of lane
closures, work zone safety and traffic control, and related items.

3.5.10 Crossing Flangeways

Upon completion of the grade crossing installation, the flangeways through the crossing shall be a minimum of 50 mm 2 inch deep and between 65 and 75 mm 2-1/2 and 3 inches wide. Ensure that adequate flangeways are provided prior to installation of the final crossing surface.

3.5.10.1 Flangeway Filler

Except for Type I crossings all open crossing flangeways shall be filled with [asphaltic concrete and compacted as indicated on the drawings] [preformed rubber filler].

3.5.10.2 Clean Grade Crossing Flangeways

Where grade crossing flangeways are obstructed (filled in), remove foreign material to provide a minimum 50 mm 2 inch depth and 65 mm 2-1/2 inch width flangeways on the gage side of the rails.

3.5.11 As-Built Drawings

Submit one set of reproducible originals of the final as-built drawings for each automatic crossing protection installation prior to final acceptance by the Contracting Officer. The materials and methods used to produce these drawings shall meet the requirements of this specification and shall result in drawings which are easy to revise without damage to the drawing.

3.6 BONDING AND GROUNDING TRACK

**************************************************************************
NOTE: Whenever rail facilities are required for unloading fuel, ammunition, other flammable or explosive materials, or if the track is located adjacent to electrical equipment, the rails and related track materials capable of conducting electrical current must be bonded, grounded and insulated from the remaining track. See UFC 4-860-01FA for details on which track must be bonded and grounded.
**************************************************************************

Track shall be bonded and grounded as indicated. Where track is designated for bonding and grounding, the rails shall be bonded electrically continuous and effectively grounded. Connections shall be made by exothermite welds in accordance with the manufacturer's instructions.

3.6.1 Rail Joint Bond

Rail joints on both rails of designated track shall be bonded using an exothermic type bond. The bond shall be applied to the field side of the rail [head] [web] unless otherwise approved by the Contracting Officer. Track to be bonded and grounded shall be electrically insulated from the remaining track using one of the specified insulated joints.

3.6.2 Rail Cross-Bond and Ground

Rail cross-bond and ground shall be installed using an exothermic type
bond. The cross-bond shall be applied to the [rail head][rail web]. One cross-bond and ground shall be [installed at 30.5 m 100 ft intervals along the designated tracks.][provided for each section of bonded and grounded track.] Connections between grounding system or ground rods and rails shall be made with bare stranded copper cable, installed at least 300 mm 12 inch below the bottom of the ties. Ground rods shall be driven vertically full-length. The top of the ground rod shall be located at the toe of the ballast slope and shall be a minimum of 300 mm 12 inch below the top of the subgrade. Maximum resistance to ground from any grounded rail or structure shall not exceed 25 ohms. Make any corrections needed to reduce the resistance to below 25 ohms at no cost to the Government.

3.6.3 Inspection of Rail Bond and Ground

Loose, damaged, or missing rail bond wires, cross bond wires, ground connections, and ground rods shall be visually inspected. If there is a signal failure, bonding can be tested for current loss in the joints using a volt meter. Defective items shall be marked for repair.

3.6.4 Rail Bonds At Signalized Grade Crossings

Bolted rail joints within the approach circuits to signalized highway grade crossings shall be double-bonded using both a rail head bond and a web bond. Rail head and web bonds shall be installed in the locations indicated where the existing rail bonds are missing, broken, or otherwise ineffective.

3.6.5 Existing Bonds

Protect existing rail bonds[, cross-bonds][, ground connections, and grounding rods] from damage. Except for bonds attached to rails which are designated to be replaced in this contract, replacement of bonds damaged or destroyed by the Contractor's operation shall be replaced at no cost to the Government.

3.6.6 Removal of Defective Bonds

Rail head pin-type and welded-type bonds shall be removed by shear cutting old cables immediately adjacent to the weld or pin. Rail web type pin bonds shall be removed by knocking the old pin out with a drift. Flames or torches shall not be used to remove defective bonds.

3.7 INSTALLATION OF MISCELLANEOUS TRACK MATERIALS

3.7.1 Tie Plates

Tie plates shall be furnished to the work sites as required. Excess tie plates, remaining at the conclusion of the contract, shall be delivered to the military installation storage site and stacked where directed by the Contracting Officer.

3.7.2 Insulated Joints

Insulated joints shall be installed where indicated and in accordance with the manufacturer's installation instructions.

3.7.3 Bumping Posts, Cushion Head, and Wheelstops

Bumping posts, cushion head, and wheelstops shall be
[removed,][installed,][ or ][reinstalled][____]. Installation shall be in accordance with the manufacturer's instructions. Where no specific installation instructions are available for salvaged bumping posts and wheelstops, reinstallation shall be in accordance with good track construction practice to ensure proper performance.

3.7.4 Inner Guard Rails

Inner guard rails shall be installed as detailed in the contract drawings. Each rail shall be spiked to alternate crossties throughout the full length using two spikes per rail per tie; tie plates are not required. Guard rails shall be installed using acceptable joint bars of the proper size to fit the rails being joined. Each joint shall be bolted with at least two bolts and one fully tightened bolt per rail.

3.7.5 Gage Rods

One gage rod shall be installed in the crib immediately ahead of the switch point of all turnouts. Two gage rods shall be installed on the curved closure rail, one ahead of the joint, and one ahead of the toe of the frog in all turnouts.

3.7.6 Installation of Joint Bars

**************************************************************************

NOTE: For low traffic volume tracks that are equipped with six hole angle bars, the bars may be installed by placing bolts in only the four center holes. Modify paragraph as needed if six hole bars are used, and designate locations for four bolt use.
**************************************************************************

Joint bars shall be installed with their full number of bolt assemblies unless otherwise noted. Bars shall be properly seated on the rail and the bolts tightened beginning at the center of the joint and working toward the ends of the bars, alternating between rails. Bolts used shall be of the proper diameter and length for the rail and joint bars at the joint. The use of extra washers to shim out track bolt nuts is prohibited. Bolts with nuts shall be placed alternately on inside and outside of rail.

3.8 BRIDGE REPAIR

Submit shop drawings necessary for the construction and erection of the railroad bridge work. Provide shop drawings made from measurements taken at the site wherever possible or from established measurements, when actual measurements are not available. The Contractor is responsible for the accuracy of the established measurements, the information furnished to the subContractors for the preparation of their Shop Drawings, and the checking of all Shop Drawings. Drawings shall bear the stamp of a Professional Engineer. Bridge repair shall be as follows:

3.8.1 State and Local Government Permits

Obtain necessary permits from state and local governments for work over public roads. Prepare traffic maintenance and detour plans; submit them for approval to the appropriate authorities; erect and maintain signs, barricades, lighting, and other traffic control devices in accordance with MUTCD; pay for police details; and stage the work to provide for the continued safe public use of the roadways beneath the bridges.
3.8.2 Work Hours

The Contractor may be required by local or state authorities to work at night or on split shifts to avoid peak traffic hours at bridges [____]. No additional compensation will be made for any costs associated with meeting such requirements.

3.8.3 Schedule of Bridge Repair Work

The work of this project shall be scheduled to minimize the duration of interruptions to rail service. Bridge repair work shall be scheduled so that to the maximum practical extent, bridges on the same line are taken out of service and repaired simultaneously.

3.8.4 Timber Pile Repair

A timber pile can be spliced or shimmed to repair areas of deterioration or to compensate for settlement of the pile. Any spliced pile shall achieve a bearing adequate for its design loading. No more than 50 percent of the piles in a single bent shall be spliced, and no more than 25 percent of the piles in the entire substructure shall be spliced or shimmed.

3.8.5 Timber Pile Replacement

Any pile shall be replaced when it does not achieve adequate bearing, the pile has greater than 50 percent deterioration, or replacement is more economical. [Replacement pile shall be driven along side existing piles] [A two pile support pier shall be constructed under the bridge cap to carry the load of the deteriorated pile].

3.8.6 Bridge Tie Replacement Open-Deck Bridges

Where spot replacement of bridge ties is required, the existing tie shall be removed without permanently disturbing the track surface. New bridge ties shall be of the proper wood species, structural grade, and size for the intended application. Shimming of bridge ties will not be permitted.

3.8.7 Rivet Replacement

Where replacement is required, rivets shall be replaced with high-strength bolts as specified in Section 05 12 00 STRUCTURAL STEEL.

3.9 ELECTRIC ARC WELDING

**************************************************************************
NOTE: An electric flash butt mobile rail welder should be used on large projects.
**************************************************************************

Welding to repair or rebuild frogs, switch point, guard rails, switch point protectors and rails (engine burns, battered ends, etc.) shall be done in accordance with AREMA Eng Man, Chapter 5, Part 5,Section 5.10 and AWS D1.1/D1.1M. Submit a detailed specification covering the step-by-step procedures to be employed in making the electric arc welds. A complete description of each of the following items as applicable and any other essential characteristics shall be included in the procedure specifications.

a. Type, size, and capacity of electric welding machine (250 amp minimum),
grinder and other equipment. Also, type and size of material (welding rod or wire).

b. The method to be used to remove defective and excess metal prior to welding (arcair or grinding).

c. The method to be used to prevent warping.

d. The method used for preheating, including time and temperature.

e. The method of applying metal buildup and slag removal.

f. The method of securing original contour of items welded.

g. Quality control procedures to be followed.

h. Welding materials (rod or wire), name and manufacturer of materials (low carbon steel) for welding rail, rail frogs, guard rails, switch point protectors, and switch points without manganese inserts and materials (manganese alloy) for welding manganese frogs, RBM frogs, manganese switch point inserts and manganese railroad crossing inserts or castings.

3.9.1 Welding Supervision

Electric arc welding shall be performed under the direct supervision of an experienced welding supervisor or foreman and by a certified welder.

3.9.2 Weather Conditions

Welding shall not be performed in rain, snow, or other inclement weather without adequate protection of the welding from the elements.

3.9.3 Welding Manganese Frogs and Crossings

**************************************************************************
NOTE: Edit these paragraphs as needed to match the project requirements.
**************************************************************************

Bolts shall be tightened, spikes driven down and ties tamped under crossing and frogs for level surface, when welding manganese frogs and crossings. Chips and cracks shall be ground out with grinding machine or gouged out with arcair gouging device even if crack goes through the entire casting. When gouging device is used, no finished grinding of cracks or chips is required. If cracks are gouged out to bottom of casting, reinforcement strap shall be [placed underneath the hole.] [welded to the bottom of the hole in casting with the wire feed machine, allowing the frog or crossing to be welded back to level surface using the skip method.]

3.9.3.1 Manganese Overheating

Welder shall ensure that manganese is not overheated in this process. If manganese shows signs of overheating, casting shall be air cooled and then welding process continued, repeating the process as many times as necessary to prevent manganese from overheating. Flange carbons [shall] [shall not] be used to keep welding metal out of flangeways. Welded surface shall be built slightly higher than normal surface of casting so when ground, it will have sufficient weld metal to grind to a level surface. A 600 mm 24
inch straightedge shall be used to check this work. Edges of flangeways and sides of points shall be ground in a roll manner, using a frog and crossing flangeway gage as a guide.

3.9.3.2 Slotting

Manganese frogs and crossings shall be slotted with a 5 mm 3/16 inch slotting wheel. Connecting rail joints to frog shall also be welded, ground, and slotted in like manner. The grinding and slotting process shall be repeated approximately 6 weeks from the time the frog is put back in service and thereafter when overflow appears on points and flangeways.

3.9.4 Welding Switch Points

**************************************************************************
NOTE: Field welding of switch points is not recommended. Qualifications of welder are very important for this type of work.
**************************************************************************

Overflow of stock rail shall be ground off of ball of rail on both sides and switch point ground to where cracks and chips are ground out. All grease and rust shall be ground off of point as far back as point is to be welded. Switch point shall be adjusted tight against stock rail and check gage. If gage just ahead of switch point is tight, it shall be opened to where gage reads 6 mm 1/4 inch open. The following shall be done before starting to weld: 1) Open switch point and place rail flange carbon between switch point and stock rail. 2) Pull switch tight against carbon and hold with spike; another rail carbon can be placed just on top of reinforcement binding strap on point to use as guide for first welding pass; carbon can then be removed or left in place. 3) Grind switch point with surface grinder or utility grinder. 4) Apply graphite or oil to switch points and plates to prevent rusting and to make switch throw easier. 5) Check with proper authority to ensure ample time to complete welding, grinding and cooling before traffic is due. Switch point shall be ground welded complete without chipping weld slag.

3.9.5 Welding Switch Point Protectors

3.9.5.1 In Track

The following operations shall be performed: 1) Check with proper authority to ensure ample time to complete welding, grinding and cooling before traffic is due. 2) Use a steel ruler to determine the amount of weld needed on manganese switch point protectors; measure the top of the protector any place where there is no wear. 3) Grind out the work hardened surface and any cracks or chips. 4) Weld the protector with the semi-automatic wire feed machine slightly wider than the width of a new switch point protector; run a string bead along the bottom of the wear surface on the protector guard; leaving flux on this bead continue with string bead until protector is built back to size without overheating the protector. If signs of overheating appear, use intermittent welding procedure. 5) Grind back the protector to the correct width. 6) Use roll method on top inside corner of protector.

3.9.5.2 Out of Track

The following operations shall be performed: 1) Use a steel tape to determine the amount of weld needed on manganese switch point protectors;
measure the top of the protector any place where there is no wear. 2) Ground out the work hardened surface and any cracks or chips. 3) Weld the protector with the semi-automatic wire feed machine to just a little wider than the width of a new switch point protector; the protector can be laid on its side and three flat beads run on wear surface of the protector guard; ground back to the size of a new protector. 4) Use intermittent method and skip welding to keep protector from overheating. 5) Use the roll method on inside corner of running wear surface of guard.

3.9.6 Welding Engine Burns

The damaged steel of the rail shall be removed by grinding or arcair to get below the burn area into sound metal. Sufficient amount of metal shall be removed to eliminate all shatter cracks.

3.9.6.1 Depth and Length Limitations

Engine burns requiring welds greater than 10 mm 3/8 inch in depth below the top of the rail head shall not be repaired by welding and grinding. While grinding out the damaged metal, the operation shall be stopped when it is discovered that the necessary weld will go too deep into the rail head. The ground out portion shall be welded and joint bars shall be applied at the weld location with the rail undrilled at the middle bolt holes, centering the joint bars under the engine burn. The supervisor of maintenance shall be immediately notified so that the rail can be removed from track. These failed rails shall be disposed of in accordance with current instructions. Engine burns which would require a weld longer than 200 mm 8 inch shall not be welded.

3.9.6.2 Ambient Limitations

Welding and grinding engine burns shall be avoided when the air temperature is below 0 degrees C 32 degrees F. When welding is necessary below 0 degrees C 32 degrees F, the heated area shall be protected by covering with insulating material to retard cooling. Engine burns shall not be welded during rain or heavy snow.

3.9.6.3 Number of Welds

Determine the maximum number of burns in a 12 m 39 ft rail, or equivalent, that can be economically welded. Unless otherwise directed, when a rail has more than 8 burns needing repair, the rail shall be replaced.

3.9.6.4 Welding Procedure

The burn shall be welded with semi-automatic wire feed machine. The skip method shall be used in this process because no preheating or post heating is needed. If engine burns are found in groups close together, ten to fifteen burns shall be ground out at a time, welding one pass at a time on each of the burns. The process shall be repeated until all of the burns are completed to a surface just higher than the normal ball of the rail. The burn shall then be cooled until hand can be placed on it. Welds shall be ground to a level surface with cup wheel attachment grinder.

3.9.7 Welding Rail Joints

**************************************************************************
NOTE: Remove this paragraph when not required.
**************************************************************************
Bolts in the joint bars shall be tightened and the joint pulled to a level surface. Joint bars shall be checked for wear and replaced if they are badly worn. Six hole bars shall be used if available. A straightedge shall be placed across the joint to determine the amount of batter. The straightedge shall be a minimum of 450 mm 18 inch in length. A rail joint with less than 3 mm 0.012 inch of batter shall not be welded. If batter is 3 mm 0.012 inch or more, the rail joint shall be built up. If rail cracks or chipped out places are present in rail ends, they shall be melted out with acetylene torch, gouged out with arcar or ground out with grinder. If cracks or chips extend below ball, rail shall be replaced. If horizontal crack in ball of rail extends more than 200 mm 8 inch rail shall be replaced. Rail ends shall be preheated to approximately 93 degrees C 200 degrees F before welding. Starting 40 mm 1-1/2 inches from the end, the rail shall be built back as follows: A strip shall be welded 25 mm 1 inch into bead; the rail ends shall be ground to a level surface with surface grinder or cup wheel attachment; and rail joint shall be cross slotted with 5 mm 3/16 inch grinding stone to keep rail ends from overlapping and chipping out.

3.10 THERMITE WELDING PROCEDURES

Submit a detailed statement covering the step-by-step procedures to be employed in making the welds, including a complete description of each of the following items, as applicable, and any other essential characteristics included in the welding procedures:

a. The manufacturer's trade name for the welding process.

b. The method used for cutting and cleaning the rail ends. Flame cutting of rail ends will not be allowed.

c. The minimum and maximum spacing between rail ends.

d. The method used for maintaining the rails in alignment during welding.

e. The method used for preheating, including time and temperature.

f. The tapping procedure, including the minimum time required to cool the weld under the mold insulation.

g. The method used, including a description of special tools and equipment, for removing the upset metal and finishing the weld to the final contour.

h. Quality control procedures to be followed.

i. The contractual agreements with any subcontractor employed by the Contractor in doing the work.

Thermite welding procedures shall be performed by a technician certified to meet ANSI/ASNT CP-189, level II or III qualifications and comply with the following paragraphs:

3.10.1 End Preparation

Rails to be welded shall meet the requirements Section 2.2, "Specifications for Fabrication of Continuous Welded Rail" given in Chapter 4, Part 2 of AREMA Eng Man. The rail ends shall be aligned in accordance with paragraph
GAP AND ALIGNMENT. Rail ends shall show no steel defects, dents, or porosity before welding. Bolt holes shall not be made in, or permitted to remain in, the ends of the rail to be welded. One handling hole may be made in each end of welded string. Rail ends containing such holes shall be cut off during track construction. Rail which must be cut for any reason shall be cut square and clean by means of approved rail saws or abrasive cutting wheels in accordance with Chapter 5 of AREMA Eng Man, Section 10.3, "Recommended Practice For Use of Abrasive Wheels".

3.10.1.1 Cleaning

The rails to be welded shall be cleaned of grease, oil, dirt, loose scale, and moisture to a minimum of **150 mm 6 inch** back from the rail ends, including the railhead surface. Cleaning shall be accomplished by use of a wire brush, to completely remove dirt and loose oxide and by use of oxygen-acetylene torch to remove grease, oil and moisture. A power grinder with an abrasive wheel shall be used to remove scale rust, burrs, lipped metal and mill brands which would interfere with the fit of the mold, for **50 mm 2 inch** on each side of the ends.

3.10.1.2 Gap and Alignment

The minimum and maximum spacing between rail ends shall be as specified by the rail welding kit manufacturer and the approved welding procedures.

a. The ends of the rails to be welded shall be properly gapped and aligned to produce a weld which shall conform to the alignment tolerances below. Alignment of rail shall be done on the head of the rail. The rail gap and alignment shall be held without change during the complete welding cycle.

b. Vertical alignment shall provide for a flat running surface. Any difference of height of the rails shall be in the base.

c. Horizontal alignment shall be done so that any difference in the width of heads of rails shall occur on the field side. Horizontal offsets shall not exceed **1 mm 0.04 in** in the head and/or **3 mm 0.12 inch** in the base.

3.10.2 Surface Misalignment Tolerance

Combined vertical offset and crown camber shall not exceed **3 mm/m 0.04 inch/feet** at 315 degrees C 600 degrees F or less. Combined vertical offset and dip camber shall not exceed **1 mm/m 0.01 inch/feet** at 315 degrees C 600 degrees F or less.

3.10.3 Gage Misalignment Tolerance

Combined horizontal offset and horizontal kink camber shall not exceed **3 mm/m 0.04 inch/feet** at 315 degrees C 600 degrees F or less.

3.10.4 Thermite Welding

Welding shall be done in accordance with Chapter 4, Part 2, Section 2.5 of AREMA Eng Man, articles "Thermite Welding - Rail Joints" and Section 2.2 "Specification for Fabrication of Continuous Welded Rail", except as modified by these specifications. All welds shall be visually inspected at the time of welding.
3.10.4.1 Thermite Weld Preheating

The rail ends shall be preheated prior to welding to a sufficient temperature and for sufficient time as indicated in the approved welding procedures to ensure full fusion of the weld metal to the rail ends without cracking of the rail or weld.

3.10.4.2 Thermite Weld Cooling

The molds shall be left in place after tapping for sufficient time to permit complete solidification of the molten metal and proper slow cooling to prevent cracking and provide a complete weld with proper hardness and ductility.

3.10.5 Weld Finishing and Tolerances

Welded joints in the finished track shall be brought to a true surface and alignment by means of a proper grinding or planing machine (shear). Finish grinding shall be performed with an approved grinder operated by a skilled workman grinding evenly and leaving the joints in a smooth and satisfactory condition. Finishing shall eliminate all cracks. The completed weld shall be finished by mechanically controlled grinding in conformance with the following requirements:

a. A finishing deviation of not more than plus or minus 1 mm 0.01 in of the parent section of the rail head surface will be allowed. The gage side of the rail head shall be finished to plus or minus 1 mm 0.01 in of the parent section.

b. Welds produced by welding kits which are specially designed to produce reinforced welds need not be ground in the finishing area except as necessary to remove fins, burrs, cracks, etc.

3.10.6 Weld Quality

Each completed weld shall have full penetration and complete fusion and be entirely free of cracks or fissures. Welds shall meet the acceptance criteria given in AWS D1.1/D1.1M.

3.10.7 Weld Numbering

Semi-permanently mark a sequential weld number on the rail immediately adjacent to the weld, using a quality lead paint marker at the time the weld is made. Welds shall be numbered sequentially in the order in which they are made. The Contracting Officer will provide the initial weld number. Defective welds which are replaced shall be assigned a new sequential number by adding a letter to the defective weld number (e.g., defective weld 347 would be replaced by 347A).

3.11 TRACK REPAIR

3.11.1 Cutting and Drilling of Rail

Use only rail saws and abrasive cutting wheels for this operation. Other methods for cutting rail will not be acceptable. Cuts shall be square and clean. When given the option of cutting existing rail or new rail being installed, the existing rail shall be cut. When new holes are necessary, they shall be drilled. Holes shall not be punched, slotted, or burned with a torch. Holes shall be of the size and located as shown on the contract.
drawings. Drilled bolt holes shall be peened or ground to remove sharp edges.

3.11.2 Rail Joints

In areas which do not require out-of-face rail replacement, tighten all track bolts. Defective track bolts, nuts and lock washers ("bolt assemblies"), and those that cannot be tightened shall be replaced. This work shall include both spot replacement of assemblies at locations to be determined by the Contracting Officer ("Spot Bolt Assembly Replacement") and out-of-face replacement of all bolt assemblies within a rail joint ("Joint Repair").

3.11.2.1 Used Bolt Assemblies

Used bolt assemblies removed from rail joints shall become the Contractor's property and shall not be reincorporated in the work. Existing bolt assemblies designated to be replaced shall be removed by methods which shall not damage joint bars or rails.

3.11.2.2 Joint Repair

**************************************************************************
NOTE: List locations where out-of-face joint repairs are required on the drawings.
**************************************************************************

Replacement of defective joint bars and correction of rail-end mismatch, as designated or directed by the Contracting Officer, shall be defined as joint repair work. At designated joint repair locations, both joint bars shall be removed from the rails and the rail ends inspected for damage or defects.

3.11.2.3 Cleaning of Finishing Area

The finishing area shall be cleaned of mill scale, rust, and dirt by wire brushing, compressed air, solvents, or a combination of these or other methods.

3.11.2.4 Rail Ends

The clean rail ends shall be jointly examined by the Contractor and the Contracting Officer for the presence of any rail defects that would make the rail unsuitable for further use at the location. If a rail is determined to have an end defect, either crop or replace the rail.

3.11.2.5 Joint Gap

Where pull-aparts have occurred, whether currently gapped or not, or where the rail joint gap exceeds 19 mm 3/4 inch, the joint gap shall be adjusted to the rail joint gap specified in TABLE VI. Rail joint gap adjustment work shall be performed in conjunction with spot rail replacement work and bolt renewal work.

3.11.3 Spiking

The proper gage, as indicated in this section, shall be verified immediately prior to spiking.
3.11.4 Spot Tie Replacement

Replace defective ties as marked in the field and as directed by the Contracting Officer.

3.11.4.1 Paint Markings and Tie Inspection

Paint markings may exist on the existing rails and crossties. Such markings do not necessarily indicate work within the scope of the contract. Participate in a walk-through tie inspection with the Contracting Officer prior to commencement of tie replacement work. The scope of the tie replacement work will be determined at that time and relevant paint markings made or touched up as required.

3.11.4.2 Additional Tie Work

In areas where existing ballast inhibits tie inspection, additional ties may be required beyond those marked. The scope of such additional tie work will be identified by the Contracting Officer as adjacent work progresses.

3.11.4.3 Old Spikes, Rail Anchors, tags and Tie Plates

Old spikes shall be pulled and scrapped. Rail anchors shall be removed, sorted, and salvaged. Tie plates shall be removed, inspected and classified as either relay or scrap. Scrap tie plates shall be marked scrap and shall not be reinstalled in the track. Acceptable relay tie plates may be reused at that location or at other locations as required. Old stationing tags will be removed and replace on the new tie.

3.11.4.4 Humped Track

Where the track will not be surfaced, in order to prevent permanent distortion ("Humping") of the line and surface of the track when performing spot tie replacement, the tie cribs and ends shall be excavated, the old ties removed, and the new ties installed without jacking the rails. Humped track shall be resurfaced at the Contractor's expense.

3.11.4.5 Minimal Humping

For spot or out-of-face tie replacement, where the track will be surfaced and aligned under this Contract, a minimal amount of humping will be allowed, provided the surfacing tolerances can be met.

3.11.4.6 Fouled or Muddy Ballast

Fouled or muddy ballast, as identified by the Contracting Officer, shall be excavated and wasted outside of the track area where it will not interfere with drainage of the track.

3.11.4.7 Insertion of New Ties

New wood ties shall be inserted in track with the heartwood down, square to the line of the rails. Engineered polymer composite ties shall be inserted with the flat (tie plate) surface up, square to the line of the rails.

a. Ties shall be inserted so that the average tie spacing in any one rail length does not exceed 530 mm 21 in and so that the maximum spacing between any two ties does not exceed 610 mm 24 in and the maximum spacing is not less than 460 mm 18 in.
b. Crosstie position at joints shall result in a "suspended joint" arrangement unless otherwise directed by the Contracting Officer.

3.11.4.8 Positioning of Tie Plates

Tie plates shall be positioned on the tie so that the shoulder has full bearing against the base of the rail. The plate shall be centered on the tie width, except that the plate shall be positioned up to 13 mm 1/2 in off-center if necessary to avoid spiking into an existing tie split. Ensure that all tie plates in a given stretch of track are either canted or flat. Canted and flat tie plates shall not be mixed within a given stretch of track.

3.11.4.9 Re-spacing of existing ties

Re-spacing of ties is required to straighten slewed ties or to correct uneven tie spacing. Crib and shoulder ballast shall be removed as required to facilitate sliding crossties to their final position or to insert new ties. Spike mauls or sledges shall not be used to slide ties. Rail anchors and ballast shall be installed immediately after ties are re-spaced.

3.11.4.10 Track Gage

Track gage shall be set at the time of spiking.

3.11.4.10.1 Tangent Track

For track rehabilitation or spot rail replacement on tangent, the track shall be regaged if the existing gage is less than 1420 mm 56 in or is equal to or greater than 1460 mm 57-1/2 in. These sections of track shall be regaged to conform with the gage of the adjacent track, but the gage after regaging shall be between 1430 and 1450 mm 56-1/4 and 57 in.

3.11.4.10.2 Curved Track

Curved track shall be gaged as shown in TABLE V.

3.11.5 Joint Respiking

Many joints in track will be found with nonstandard spiking patterns and other deficiencies. These include joints with no tie plates, plates which are positioned so that it is not possible to spike through the plate on both sides of the joint, spikes driven against the ends of skirted joint bars, and similar deficiencies. Respike such joints in accordance with the following.

3.11.5.1 Substitution of Tie Plates

When tie plates are available which will permit spiking through the tie plate at the edge of the joint bar skirts on both sides of the rail, they shall be substituted for existing plates.

3.11.5.2 Respiked Joints

All joints which are respiked shall have existing spike holes plugged.
3.11.6 Regaging

Where the existing track gage is less than 1420 mm 56 in or is equal to or greater than 1460 mm 57-1/2 in, or as designated by the Contracting Officer, the track shall be regaged. These sections of track shall be regaged to conform with the gage of the adjacent track; the track gage after regaging shall be between 1430 and 1450 mm 56-1/4 and 57 in.

3.12 SAMPLING AND TESTING

Sampling and testing is the responsibility of the Contractor. Submit one certified copy of Test Reports for each test performed on the ballast [and subballast] within 2 working days of the test completion. Sampling and testing shall be performed by an approved commercial testing laboratory, or by the Contractor, subject to approval. If the Contractor elects to establish testing facilities, approval of such facilities shall be based on compliance with ASTM D3740. Work requiring testing will not be permitted until the Contractor's facilities have been inspected and approved. The first inspection of the facilities will be at the expense of the Government and any subsequent inspections required because of failure of the first inspection shall be at the expense of the Contractor. Such costs will be deducted from the total amount due the Contractor.

3.12.1 Ballast [and Subballast] Samples

Periodic sampling and testing of ballast [and subballast] material shall be performed to ensure continued compliance with this specification. During construction, one representative sample of the ballast [and subballast] material shall be taken from each 1818 metric tons 2,000 tons of ballast [and subballast] delivered to determine the material gradation. For each 9090 metric tons 10,000 tons or a fraction thereof of ballast delivered, an additional amount of material shall be obtained in order to perform the quality and soundness tests specified. Samples for material gradation, quality, and soundness tests shall be taken in conformance with ASTM D75/D75M. Test samples shall be reduced from field samples in conformance with ASTM C702/C702M. Sample sizes shall be sufficient to provide the minimum sample sizes required by the designated test procedures. If any individual sample fails to meet the gradation requirement, placement shall be halted and immediate corrective action shall be taken to restore the specified gradation. If any individual sample fails to meet the specified quality and soundness requirements, placement shall be halted and immediate corrective action shall be taken to restore the specified quality.

3.12.2 Ballast [and Subballast] Tests

3.12.2.1 Sieve Analyses

Sieve analyses shall be made in conformance with ASTM C117 and ASTM C136/C136M. Sieves shall conform to ASTM E11.

3.12.2.2 Bulk Specific Gravity and Absorption

Bulk specific gravity and absorption tests shall be made in conformance with ASTM C127.

3.12.2.3 Percentage of Clay Lumps and Friable Particles

The percentage of clay lumps and friable particles shall be determined in...
3.12.2.4 Degradation Resistance

Resistance to degradation of materials shall be determined in conformance with ASTM C131/C131M and ASTM C535. Materials with gradations having 100 percent passing the 25 mm 1 in sieve, shall be tested in conformance with ASTM C131/C131M. Materials having gradations with particles larger than 25 mm 1 in shall be tested in conformance with ASTM C535.

3.12.2.5 Soundness Test

Soundness tests shall be made in conformance with ASTM C88.

3.12.2.6 Percentage of Flat or Elongated Particles

The percentage of flat or elongated particles shall be determined in conformance with ASTM D4791.

3.12.3 Tie Inspection

The Contractor is responsible for the quality of the treated ties. Each tie shall be permanently marked or branded by the producer in accordance with AWPA M6. Each treated wood tie shall be inspected, in accordance with AWPA M2, for conformance with the specified AWPA standards. The 100 percent inspection shall be performed by an independent inspection agency approved by the Contracting Officer. Inspection shall be made at the wood treatment site. The agency's report of inspection shall accompany delivery of the ties. Core and check preservative treatment once per 1000 ties delivered to the construction site.

3.12.4 Examination of Geotextile

**************************************************************************
NOTE: The amount of geotextile being installed and the criticalness of the installation determine the size and scope of the geotextile testing and quality control/quality assurance program. Small jobs with minor importance may not warrant extensive preconstruction testing of the geotextile, and the manufacturer's Certificate of Compliance may be adequate for assuring that the physical properties are met. However, for large projects and critical installations, regardless of size, a complete regimen of preconstruction and quality control testing should be specified.
**************************************************************************

[Sample the geotextile upon delivery to the project site. Sampling procedures used shall be those detailed in ASTM D4759 and ASTM D4354 with the number of sample units selected from TABLE II of ASTM D4354. An independent testing laboratory shall perform the index property tests specified in TABLE II on each of the sample units and determine conformance with the minimum requirements of TABLE II. Conformance shall be determined in accordance with ASTM D4759.] [Geotextile seams expected to perform a reinforcement function shall be tested in accordance with ASTM D4595.] The Contracting Officer may examine any geotextiles for defects, damage, or nonconformance prior to installation. Any geotextile not meeting the minimum property requirements of paragraph GEOTEXTILE, or geotextile that
is determined to be damaged or defective shall be removed from the site and shall be replaced with additional geotextile meeting the requirements of this specification at no additional cost to the Government.

3.13 INSPECTION AND FIELD TESTING

Perform quality control inspection and field testing.

3.13.1 Track

Inspection shall be performed to ensure that all the requirements of these specifications are met. Bolted joints shall be inspected for loose bolts and for smooth transitions between rails of different sections. Rail, tie plates, and ties shall be checked to ensure that the rail is properly seated and has full bearing on the tie plate and tie. Upon completion of construction, measurements of track gage, cross level, and alignment shall be taken and recorded at least once every [30] [60] [_____] m [100] [200] [_____] feet of track centerline length. A copy of these measurements shall be provided to the Contracting Officer.

3.13.2 Welded Joints - Visual Inspection

Quality control inspection and field testing shall be performed by a technician certified to meet ANSI/ASNT CP-189 level II or III qualifications with a minimum of one year experience in testing rail for defects. Each welded joint shall be inspected in the presence of the Contracting Officer after removal of the mold and grinding of excess metal. Pay particular attention to surface cracking, slag inclusion, gas pockets, and lack of fusion. Correct or replace, at no extra cost to the Government, any weld found defective. The method of correction shall be as approved by the Contracting Officer.

3.13.3 Electric Arc Welding Inspection

Electric arc welds shall be inspected to determine that the item welded conforms to the desired contour and contains no visible cracks or voids.

3.13.4 Thermite Weld Joints Testing

Each thermite weld joint shall be [ultrasonically tested] [dye tested] following the visual inspection. The method of inspection and acceptance shall be in accordance with AWS D1.1/D1.1M. Correct or replace defective welds, at no additional cost to the Government. The method of correction shall be as approved by the Contracting Officer. Ultrasonic testing [shall] [will] be performed by the [Contractor] [Government] after the rail has been installed in track. The testing will determine whether or not each weld meets the criteria of paragraphs Gap and Alignment, Weld Finishing and Tolerances, and Weld Quality. Welds made in the track which the Contracting Officer determines to be unacceptable shall be cut out of the rail and replaced by a section of new rail and two new welds. Saw cuts shall be made at least 150 mm 6 in from the centerline of the faulty weld. Replacement welds and replacement rails shall be at the sole expense of the Contractor. Replacement welds shall be renumbered as indicated. Replacement welds made in track [shall] [will] be ultrasonically tested.

3.13.5 Electric Arc Weld Testing

The welds shall be visually inspected and the contours checked after completion and later tested by the ultrasonic method. The [Government
will] [Contractor shall] have the welds tested by the ultrasonic method. The testing will determine whether or not each weld meets the quality criteria. Defective welds will be removed and the item rewelded at the Contractors expense.

3.13.6 Inspection of Geotextile

At the direction of the Contracting Officer, remove the cover material from the geotextile at 3 locations per km mile so that the geotextile may be inspected for damage. At each location, the cover material shall be removed to expose a 1.2 by 1.2 m 4 by 4 feet section of the geotextile. If punctures, tears, improper installation, other impairment or damage are found within this section, additional sections shall be excavated to determine the extent of the damage. Damaged geotextile shall be repaired or replaced and recovered with ballast/subballast at the Contractor's expense.

3.13.7 Testing Relay Rail

3.13.7.1 Testing for Wear

Each relay rail shall be checked for wear by the Contractor's quality control representative in the presence of the Contracting Officer after the material is delivered to the construction site. Monitor the installation of track for defects in rail and joint bars being installed. Rail and joint bars that are found to be defective shall not be installed in track.

3.13.7.2 Testing for Defects

Upon completion of the track construction, have the rail tested by ultrasonic methods. Ultrasonic testing shall be done by a Contractor normally engaged in this type of testing with a minimum of 5 years of experience. Submit results of the ultrasonic rail testing. Results shall list defects and rail stationing. Schedule a rail testing machine and notify the Contracting Officer of the type of machine and schedule. Contractor furnished rails which are found to have any detectable defect at that time shall be removed and replaced at no additional cost to the Government. Contractor furnished joint bars and compromise joint bars that are found to be cracked or broken shall be removed and replaced at no additional cost to the Government. Submit Data package 1 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

NOTE: This guide specification covers the requirements for welding of crane rail and railroad rail by a thermite process.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Show the following information on the project drawings:

1. Location of welds.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WELDING SOCIETY (AWS)

U.S. DEPARTMENT OF DEFENSE (DOD)

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
  Welding Procedure
  Cold Weather Welding Procedures
  Wet Weather Welding Procedures

SD-06 Test Reports
  Ultrasonic Tests
  Hardness Tests
  Weld Correction Method

SD-07 Certificates
  Operator Qualification

SD-08 Manufacturer's Instructions
  Thermite Kit

SD-11 Closeout Submittals
  Joint Records
1.3 QUALITY ASSURANCE

**************************************************************************

NOTE: Thermite welding processes and kits have been developed by the following companies. There may be other processes available. This Guide Specification has been prepared with the processes of these manufacturers in mind. If another manufacturer's product is available in the vicinity of the activity at which the work is to be performed, modify this Guide Specification as necessary.

1. Orgo-Thermit Inc., 3500 Colonial Drive North, Manchester, NJ 08759, Telephone: (732) 657-5781

2. Railtech Boutet, Inc., 25 Interstate Drive, P.O. Box 69, Napoleon, OH 43545, Telephone: (419) 592-5050

3. ESCO Equipment Service Co., 117 Garlisch Dr., Elk Grove Village, IL 60007, Telephone: (847) 758-9860

**************************************************************************

Use only qualified procedures and personnel. Procedures and personnel previously qualified in accordance with this specification are not required to be requalified, provided qualifications have not lapsed and qualification records are available.

1.3.1 Operator Qualification

Notify the Contracting Officer in writing one week prior to making qualification welds. Qualify operators by welding one acceptable rail joint in accordance with a qualified procedure. This qualification may be accomplished either prior to production welding or on the first joints to be welded at the work site. If welding operator qualification is conducted at the work site, perform no further welding until the qualification weldments have been accepted by visual inspection and ultrasonic tests. Obtain written approval of the acceptability of the welded joint from the Contracting Officer prior to continuing with welding. Welding operator's qualifications are effective from the test date and will remain in effect for a period of one year.

1.3.2 Acceptable Welds

Welds that meet the visual inspection and ultrasonic test requirements of MIL-STD-1699 are considered acceptable. Welds selected for testing for Brinell Hardness must meet the requirements of ASTM E10 and paragraph HARDNESS TESTS.

1.3.3 Procedure Qualification

1.3.3.1 Written Procedure

Prepare for the welding process to be used. The procedure must include any particulars of the process deemed pertinent to the successful completion of the welds.
1.3.3.2 Manufacturer's Procedure

No separate qualification is necessary for various rail weights, although in order to be qualified for a specific rail weight or cross section, the procedure must include fit-up requirements and other features unique to the rail weight or cross section of the rails to be welded.

1.3.3.3 Welding Procedure Qualification

a. Submit welding procedure qualification records acceptable to the Contracting Officer as proof of previous qualification under this specification.

b. Welding procedure not previously qualified under this specification may be qualified by providing four consecutive acceptable welded rail joints. An acceptable weld is defined as a weld which has been visually inspected and ultrasonically tested and has been found acceptable in accordance with MIL-STD-1699 and ASTM E10. This qualification may be accomplished either by shop fabrication of the joints or on the first four joints welded at the work site. If procedure qualification is accomplished at the work site, perform no further welding until the qualification weldments have been accepted by visual inspection and ultrasonic tests. Obtain written approval of the acceptability of the four welded joints from the Contracting Officer prior to continuing with welding.

c. Ambient temperature: Welding procedures are considered qualified for use at an ambient temperature of 10 degrees C 50 degrees F and above regardless of ambient temperature during welding of qualification assemblies. Do not conduct welding below 10 degrees C 50 degrees F without a specifically qualified procedure. Procedures qualified for use at ambient temperatures less than 10 degrees C 50 degrees F must be qualified by welding test assemblies in accordance with the procedure qualification requirements of this specification at the desired minimum ambient temperature plus or minus one degree C 5 degrees F. Procedures thus qualified are considered acceptable for use at the minimum qualified ambient temperature and above. Submit cold weather welding procedures.

d. Wet weather welding: Perform welding only during dry weather. No welding will normally be permitted on wet, showery and inclement days. However, if means are provided to protect the work and work area, welding may be performed during other than dry weather, if approved by the Contracting Officer. Submit wet weather welding procedures.

e. Confined space welding: Welding in confined spaces must comply with AWS D1.1/D1.1M to assure adequate ventilation for personnel safety.

1.3.4 Required Data

Submit thermit kit manufacturer's instructions and recommendations covering rail end preheat treatment, thermit ignition, mold removal, and finishing.

1.3.5 Welding Procedure

Submit a report of the following information:

a. Thermit kit manufacturer's name and kit size or designation
b. Thermite kit batch numbers and manufacturing date

c. Welding procedure designation (name, number)

d. Size of rail section being joined and type of rail

e. Test assembly identification number

f. Results of nondestructive testing of qualifications assemblies

g. Date of qualification (test date)

1.3.6 Required Qualification Welds

Submit operator qualification welding results in accordance with paragraph OPERATOR QUALIFICATION. Submit procedure qualification welding results in accordance with paragraph WELDING PROCEDURE QUALIFICATIONS. Include results of ultrasonic test and hardness tests. Welders certification or procedure qualification may be substituted, pursuant to paragraph QUALITY ASSURANCE.

1.4 DELIVERY AND STORAGE

Deliver materials in the manufacturer's original unbroken packages or containers plainly labeled with the manufacturer's name and brand.

1.4.1 Receipt Inspection of All Thermite Weld Kits

Perform visual inspection of the weld kit package for freedom from damage and record the thermite weld mix batch number and manufacturing date. Do not use kits which have been manufactured more than 2 years before the date of use or show signs of having been wet.

1.4.2 Material Control

Store materials in the original package and keep dry at all times until used.

PART 2 PRODUCTS

2.1 MATERIALS

Provide in kit form including preformed mold, thermite powder, wicking cord, luting material, and all necessary materials and accessories needed to provide one welded rail joint per kit. Molds must be factory-made, moisture free, and of nonhygroscopic material.

PART 3 EXECUTION

3.1 SEQUENCE OF OPERATION

Perform work in strict accordance with the qualified procedure.

3.1.1 Rail Preparation

Cut rails which are battered, cracked or notched, or which contain bolt holes so that these irregularities are removed. Rail surface must be free of grease, dirt, loose oxide, and moisture on the face of and for
approximately 125 mm 5 inches from the joint to be welded. Clean rail ends by grinding or wire brushing. Use a torch to remove grease, oil, or moisture in accordance with procedures in thermite manufacturer's instructions. Rail cutting, when necessary, must be by the saw-cut method. Remove all burrs, rolled-over edges, and loose oxide before applying the mold. No flame cutting of rails is permitted. If the space between the mold and the rail is unusually large on used or relayer rails, fill this gap with a piece of wicking cord before luting or packing.

3.1.2 Rail Alignment

Separate rail ends as recommended by the welding process manufacturer. Align rails as to both surface and gage, and raise the rails at the joint to compensate for the greater thermal contraction that occurs in the rail head during cooling relative to the web and base regions. Measure the amount of joint elevation with a 900 mm 36 inch long straightedge centered at the joint. The correct elevation is obtained when 2 mm 1/16 inch separates the top of the rail head and bottom surface of the straightedge at both ends.

3.1.3 Placing of Molds

Attach the molds to the rails, centered over the joint, and seal the molds to the rail with luting material according to the welding kit manufacturer's instructions. Handle the luting material, a mixture of clay and sand, so that none is introduced into the weld chamber. Align so that the centerline of the mold coincides with the centerline of the gap. Install the tapping plug or discs in the crucible and pour in the prescribed amount of thermite mixture.

3.1.4 Preheating Rail Ends

Preheat the rail ends in accordance with the manufacturer's instructions and recommendations.

3.1.5 Ignition of Thermite

Follow manufacturer's instructions and recommendations regarding the ignition of the thermite.

3.1.6 Mold Removal

Follow manufacturer's instructions regarding mold removal.

3.1.7 Finishing

Follow manufacturer's instructions and recommendations. No finishing is required on the web and base of rail. Perform final grinding when the weld and rail have cooled to ambient temperature. Do not use a cutting torch to remove excess weld metal.

3.1.8 Joint Records

Submit a record of the date and location of each weld made. The record must also include the rail type, size, thermite kit manufacturer's name, and thermite weld portion batch number. Also, provide a record of the nondestructive test date and acceptance date.
3.2 INSPECTION AND TESTING

3.2.1 Visual Inspection

Inspect each welded joint after removal of the mold and grinding or removal of excess metal. Pay particular attention to surface cracking, lack of fusion and other surface irregularities. Correct or replace all defective welds at no additional cost to the Government. Submit the weld correction method for approval by the Contracting Officer.

3.2.2 Nondestructive Inspection

Inspect each welded joint by ultrasonic tests using the method of inspection and acceptance as prescribed in MIL-STD-1699. Correct or replace all defective welds at no additional cost to the Government. The method of correction must be approved by the Contracting Officer. Inspect all repairs to defective welds using the method of inspection and acceptance as prescribed in MIL-STD-1699. Submit test reports showing compliance with MIL-STD-1699.

3.2.3 Hardness Tests

Perform Brinell hardness test in accordance with ASTM E10 and ASTM E110. The Brinell Hardness Number (BHN) of the weld and for the rail for a distance of 150 mm 6 inches on each side of the joint must be greater than 250. In the heat-affected zone (a distance not greater than 25 mm one inch to each side of the joint) the BHN may be up to 20 points lower except for the top of the rail, which must not be less than 250. Check hardness on at least 10 percent of all welds. Perform tests on randomly selected welds or as directed by the Contracting Officer. Submit test reports showing welds meet hardness requirements of this paragraph.

-- End of Section Table of Contents --
NOTE: This specification covers the requirements for the design of an access control point control system.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The design of an ACP must be fully engineered to ensure compliance with the Army Standards for ACPs, the Office of the Provost Marshal General's Criteria for ACPs, and the Standard Definitive Design for ACPs. Using these standards and criteria, the designer must prepare an ACP project specific design including the drawings as indicated herein. The project specific drawings along with this edited performance specification must be included in the procurement documents for the Access Control Point Control System.

Drawings must identify the following: active and passive vehicle barrier locations, over-speed and wrong way detection zones, Closed Circuit Television...
(CCTV) camera coverage areas, Intrusion Detection Sensor locations, traffic signal and warning beacon locations, actuated gate arm locations, and incidental construction. Also, include active barrier control panels and control schematics.

ACP Standard Definitive Design Standard Drawing E1.03 can be used for required control panels, and appropriate drawing among drawings E1.04 through E1.06 can be used for the control schematic. However, if changes to the control panels from drawing E1.03 are made, the designer is responsible for changing the control schematic (drawing E1.04, 5, or 6) to provide the security and safety measures required in the Army Standard for ACPs.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SYSTEM DESCRIPTION

Furnish and install a complete and functional ACPCS for the Access Control Point including active vehicle barriers, active vehicle barrier controls, traffic signals, traffic signal controls, traffic warning signals, traffic signs and pavement markings, actuated traffic arms, vehicle over speed and wrong-way detectors, vehicle presence detectors, building intrusion detectors, duress alarms, Alarm Display, Alarm Panel(s), Sequence of Events Recorder, CCTV system, data transmission, and all interconnecting conduit and wiring. Provide a Health and Safety Plan in accordance with EM 385-1-1.

1.3.1 Design Strategy

The primary objective of the ACP is to prevent an unauthorized vehicle from entering the Installation. The overall design strategy to meet this objective is to detect the vehicle as early in its attack as possible and to delay the threat vehicle a sufficient amount of time to allow ACP guards time to deploy the active vehicle barriers before the threat vehicle enters the Installation.

1.3.1.1 Detection

ACP guards in the Gatehouse, Guard Booths, and Overwatch Position (if provided) are the primary means of detecting a threat vehicle. The ACP design includes technology to aid guards in detecting possible threat vehicles. Detection technology includes over speed detection of a threat vehicle attempting to run the gate and wrong-way detection of a threat vehicle attempting to enter the Installation in the outbound lanes. Assessment technology includes CCTV.
1.3.1.2 Deploy the Barrier

Once ACP guards detect a threat vehicle, they will initiate the Emergency Fast Operate (EFO) command on their respective control panel. The EFO command will start a sequence to close all active vehicle barriers in the barriers' emergency fast operate mode. The active barrier close sequence will include safety features to ensure that innocent vehicles obtain sufficient warning of barrier deployment such that they can either clear the barrier before it deploys or stop safely in front of it.

1.3.1.3 Delay

The ACP design includes features to delay the threat vehicle to allow guards time to deploy the active vehicle barriers. Delay features take into consideration the point in the ACP where the threat vehicle is detected, the speed of the threat vehicle at the point of detection, the maximum acceleration rate of the threat vehicle, and any ACP features that will limit the acceleration of the threat vehicle or require it to slow down, e.g., turns, chicanes, serpentines, etc. Delay features are included in the overall ACP design and are not part of this specification.

1.3.2 Over-speed and Wrong-Way Sensors

Overspeed and wrong-way detectors are used to detect a potential threat vehicle attempting to gain unauthorized entry to Installation. In order to maximize the effectiveness of overspeed and wrong-way detectors, the speed limit in all inbound and outbound lanes of the ACP shall be no greater than 40 km/hr [25 mph] except in the inbound lanes from the ID Check Point to 75m [250 feet] in front of the ID Check Point, where it shall be no more than 24 km/hr [15 mph].

**************************************************************************

NOTE: Choose on of the following three over speed sensor paragraphs in accordance with the ACP design.
**************************************************************************

[1.3.2.1 Point Over Speed

Over speed detectors shall be installed to detect any vehicle traveling over the posted ACP speed limit at a point or points in the approach zone. Sensors can be induction loops, radar, lidar, video motion, or other technologies capable of detecting the speed of vehicles as they enter the ACP. Sensor ranges and settings are shown on the drawings.

[1.3.2.2 Continuous Over Speed Detection - One Zone

**************************************************************************

NOTE: See Appendix D of the SDC for method to determine over speed settings and range.
**************************************************************************

Over speed detectors shall be installed to detect a vehicle traveling over the posted ACP speed limit in any of the inbound lanes anywhere between the ID Check Point and a specified distance ahead of the ID Check Point. Over speed detectors shall be mounted from the canopy roof, from trusses spanning over the entry lanes, from light poles, or from other locations that provide unobstructed view of the detection area. Speed detectors shall be forward or reverse looking. Sensors shall use radar, lidar, video motion, or other technologies capable of detecting a speeding vehicle over
a continuous range. Sensor ranges and settings are shown on the drawings.

1.3.2.3 Continuous Over Speed Detection - Two Zones

**************************************************************************
NOTE: See Appendix D of the SDC for method to determine over speed settings and range.
**************************************************************************

Two sets of over speed detectors shall be installed. The first set shall cover a zone (Zone 1) between 2 points in front of the ID Check Area. The Second Set shall cover a zone (Zone 2) from the end of Zone 1 to the ID Check Area. Over speed detectors shall be mounted from the canopy roof, from trusses spanning over the entry lanes, from light poles, or from other locations that provide unobstructed view of the detection area. Speed detectors shall be forward or reverse looking. Sensors shall use radar, lidar, video motion, or other technologies capable of detecting vehicle speeds over a continuous range in the zones described above. Sensor ranges and settings are shown on the drawings.

1.3.2.4 Wrong Way Detection

Wrong way detectors shall be installed to detect vehicles traveling the wrong way in the outbound lanes. As a minimum, wrong way detectors shall be installed at the ACP entrance and at each turn-around in the ACP. Sensors shall be induction loops, radar, lidar, video motion, or other technologies capable of detecting a vehicle traveling the wrong way.

1.3.3 Active Vehicle Barrier Safety System

**************************************************************************
NOTE: Select one of the following barrier safety systems. Include the appropriate Appendix, at the end of this specification, in the Performance Specifications.
**************************************************************************

The [Signs and Signals][Presence Detection][Normally Deployed] Safety System, as approved by the Surface Development and Distribution Command (SDDC), shall be installed and programmed to ensure the safety of innocent motorists. See Appendix A for the required features and operational sequences of this safety system.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.
**************************************************************************

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.
For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

Choose the bracketed Government approval only when needed. Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [Information Only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29, SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

1.5 QUALITY ASSURANCE

1.5.1 Project Manager Qualifications

Designate a Project Manager for all work under this specification. The Project Manager shall provide technical and managerial leadership to all contractor personnel and subcontractors during the design, manufacturer, and installation phases of this specification. The Project Manager shall be the primary point of contact for the Government for this specification. The Project Manager shall have a minimum of 5 years of experience in the design, manufacture, and installation of similar systems.

1.5.2 Installation Superintendent Qualifications

Designate an Installation Superintendent responsible for onsite installation team direction and leadership. The Superintendent shall provide first line supervision of tradesmen and subcontractors. The Superintendent shall be responsible for job planning and shall coordinate the work with trades, subcontractors, vendors, and site personnel. The Superintendent shall be responsible for scheduling materials, equipment, and labor to maintain the flow of work commensurate with the task schedule. The Superintendent shall administer and execute the provisions of the Accident Prevention Plan. The Superintendent shall have a minimum of 5 years of experience in the installation, operation, and testing of similar systems.

1.5.3 QC Representative Qualifications

Provide a Quality Control Representative responsible for establishing, executing and reporting on the Government approved Contractor Quality Control Plan as required in the Group I Technical Data Package. Quality Control Representative shall report independently to the Project Manager on matters of quality control. The Quality Control Representative shall have a minimum of 5 years experience in performing quality control duties.

1.5.4 Technical Specialists Qualifications

Provide the services of technical specialists for the Active Vehicle Barriers, the Traffic Controller Unit subsystem, and the CCTV subsystem. Submit names and qualifications for each of the technical specialists involved. The technical specialists shall have a minimum of 5 years of experience in the installation, operation, and testing of all components, software, and interconnecting wiring of their particular equipment/subsystem. In addition, the technical specialist for the Traffic Controller Unit subsystem shall have valid International Municipal Signals Association (IMSA) certifications for Traffic Signals and Work Zone Safety. Submit the names and qualifications (including proof of IMSA certifications for the Traffic Controller Unit subsystem technical specialist) of the candidate technical specialists to the Contracting Officer for approval. Each technical specialist shall be present in the factory during manufacture and assembly of the subsystem, during Factory
Tests of the subsystem, during subsystem installation in the field, and shall serve as the Contractor's Commissioning Specialist for their designated equipment/subsystem for the commissioning tests as specified.

1.5.5 Line Supervision

1.5.5.1 General

All signal and Data Transmission System (DTS) lines shall be supervised by the system. The system shall supervise the signal lines by monitoring the circuit for changes or disturbances in the signal and for conditions as described in UL 1076 for line security equipment. The system shall initiate an alarm in response to a current change of 5 to 10 percent or greater. The system shall also initiate an alarm in response to opening, closing, shorting, or grounding of the signal and DTS lines.

1.5.5.2 Data Transmission System (DTS)

**************************************************************************
NOTE: Include Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM in the project specification for the appropriate Data Transmission required at the project site
**************************************************************************

Provide DTS as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLE SYSTEM.

1.6 DELIVERY OF TECHNICAL DATA AND COMPUTER SOFTWARE

**************************************************************************
NOTE: The acquisition of technical data, databases, and computer software items that are identified herein will be accomplished in accordance with the Federal Acquisition Regulation (FAR) and the Defense Acquisition Regulation Supplement (DFARS).

Those regulations, as well as the specific Service implementation thereof, should also be consulted to ensure that a delivery of critical items of technical data is not inadvertently lost. Specifically, DFARS 52.227-7013 Rights in Technical Data - Noncommercial Items as well as any requisite software licensing agreements will be made a part of the CONTRACT CLAUSES or SPECIAL CONTRACT REQUIREMENTS of the contract. In addition, the appropriate DD FORM 1423 Contract Data Requirements List, will be filled out for each distinct deliverable data item and made a part of the contract. Where Necessary, DD FORM 1664, Data Item Description, shall be used to explain and more fully identify the data items listed on the DD FORM 1423.

It is to be noted that all of these clauses and forms are required to assure the delivery of data in question and that such data is obtained with the requisite rights to use by the Government. Include with the request for proposals a completed DD FORM 1423, Contract Data Requirements List. This form is
essential to obtain delivery of all documentation. Each deliverable will be clearly specified, both description and quantity being required. Include a payment schedule in the SPECIAL CONTRACT REQUIREMENTS of the request for proposals. This payment schedule will define payment milestones and percentages at specific times during the contract period.

The designer must show all salient features of the ACPCS on the drawings. Also, show any work required in restricted or hazardous locations and include the type of hazard, class, and group.

**************************************************************************

All items of computer software and technical data (including technical data which relates to computer software), which is specifically identified in this specification shall be delivered in accordance with the CONTRACT CLAUSES, SPECIAL CONTRACT REQUIREMENTS, and in accordance with the Contract Data Requirements List (CDRL), DD FORM 1423, which is attached to and thereby made a part of this contract. All data delivered shall be identified by reference to the particular specification paragraph against which it is furnished.

1.6.1 Group I Technical Data Package

Submit Group 1 Technical Data Package 30 days after receipt of the Notice to Proceed. The data package includes system descriptions, analyses, calculations used in sizing equipment specified, manufacturer's data for all equipment and end devices provided under these specifications. Descriptions and calculations shall show how the equipment will operate as a system to meet the performance of this specification. The software data package consists of descriptions of the operation and capability of all subsystem software. Key control plan for all Contractor provided enclosures requiring locks and all keyed control switches. The key control plan shall include the following: 1) Procedures that will be used to log and positively control all keys during installation. 2) A listing of all keys and where they are used. 3) A listing of all persons allowed access to the keys. Quality Control Plan for approval. The QC Plan shall describe all Contractor and subcontractor activities during design, manufacture, and installation of the ACPCS. The QC Plan shall include all Contractor and subcontractor technical data reviews, inspections, certifications, and approvals and the QC documentation procedures. Certifications from the manufacturers of the following equipment shall be submitted with the data package: Active Vehicle Barrier, Traffic Controller Unit, Traffic Arm, Warning Signal, Annunciator, Sequence of Events Recorder, Alarm Panels, CCTV system, and all sensors including over speed, wrong-way, vehicle presence, intrusion detection, and tamper. The data package shall include the following:

a. Functional System Block Diagram, identifying all major equipment, interconnecting wire types and quantities, approximate distances, and communications protocols.

b. Block and Wiring Diagrams of each subsystem.

c. Drawing showing layout and dimensions of the Gatehouse Control Console with the Alarm Display, CCTV monitor and controls, and the barrier Master Control Panel.
d. Drawing showing equipment layout in the Gatehouse including the Gatehouse Control Console, UPS, and other hardware intended to be located in the Gatehouse.

e. Drawing showing equipment layout around the active vehicle barriers including the active vehicle barriers, active vehicle barrier control box(es), vehicle presence detectors, Stop Lines, Traffic Signals, Wig-Wag warning signals (if applicable), and Traffic Arms (if applicable).

f. Device wiring and installation drawings.

g. Point to point wiring diagram of complete interconnected system including database listing of wire numbers, to and from designations, and wire characteristics.

h. Details of connections to power sources, including power supplies and grounding.

i. Details of surge protection device installation.

j. Intrusion Detection System block diagram and sensor layout.

k. Over speed, wrong-way, and vehicle presence detector locations and sensor detection patterns.

l. Traffic signals and traffic signal supports.

m. Communications speeds and protocol descriptions.

o. Alarm response time.

q. Start-up operations including system and database backup operations.

r. Expansion capability and method of implementation.

s. Sample copy of sequence of events report.

u. Design calculations for traffic signal supports.

1.6.2 Group II Technical Data Package

Submit Group II Technical Data Package within 60 days of Notice to Proceed. Prepare and submit a report of "Current Site Conditions" to the Government documenting site conditions that significantly differ from the design drawings or conditions that affect performance of the system to be installed. Provide specification sheets, or written functional requirements to support the findings, and a cost estimate to correct those site changes or conditions. Do not perform any field work until the "Current Site Conditions" report is approved by the Government. Do not correct any deficiencies identified in the report without written permission from the Government.
1.6.3 Group III Technical Data Package

Submit Test Plan for the Factory Acceptance Test, Test Plan for Contractor Field Test, Factory Acceptance Test Report, and Contractor Field Test Report. Test Plans, a minimum of 30 days before the scheduled start of all factory acceptance tests and 15 days before the scheduled start of the Contractor Field Tests. Submit the Factory Acceptance Test Report and Contractor Field Test Report no more than 1 week after the completion of each test.

1.6.4 Group IV Technical Data Package

Submit Group IV Technical Data Package 30 days prior to the start of the Performance Verification Test. Submit the Performance Verification Test Report no more than 1 week after the test. Submit the Commissioning Report no more than 2 weeks after completion of the Endurance Test. The data package shall contain an Operator's Manual fully explaining all procedures and instructions for the operation of the system, including:

a. Color print of the graphical user interface (GUI) screens on 216 x 292 mm 8-1/2 by 11 inch paper.

b. ACP Processing and Control database on 216 by 292 mm 8-1/2 by 11 inch paper.

c. Control diagrams and programming flow charts showing complete control details of the active vehicle barriers, traffic signals, and over speed and wrong way annunciation system.

d. Computers and peripherals.

e. User enrollment.

f. System start-up and shutdown procedures.

g. Use of system and application software.

h. Recovery and restart procedures.

i. Use of report generator and generation of reports.

j. Data entry.

k. Operator commands.

l. Alarm and system messages and printing formats.

m. System entry requirements.

n. Test Plan for the Performance Verification Test.

o. Test Plan for the Endurance Test.

q. Commissioning Report.
1.6.4.1 Active Vehicle Barrier Controls

Describe operation of barrier control modes, barrier control switches, barrier normal and emergency operation, traffic signals, warning beacons, vehicle presence detectors, and actuated traffic arms. Include descriptions of security strategy for defeating a threat vehicle and the SDDC approved barrier safety system for protecting innocent vehicles from barrier operations.

1.6.4.2 Over-speed and Wrong-way detection

Include descriptions of the security strategy for detecting potential threat vehicles, the coverage and operation of the sensors, and the man machine interfaces for over-speed and wrong way alarms.

1.6.4.3 Traffic Control Plan for the Maintenance of Traffic During Construction

Provide a Traffic Control Plan for maintenance of traffic during construction per Section 08C of EM 385-1-1.

1.6.4.4 Traffic Control Plan During Active Vehicle Barrier Maintenance

Describe plans for taking one or more active barriers out of service for maintenance or testing purposes, while other barriers at the ACP remain in service. As a minimum, include requirements for traffic signal indications and for temporary passive barriers and signage, e.g., Type 3 passive barriers, per MUTCD. Include both short term (less than an hour) and long term plans.

1.6.4.5 Application Software

Where an application software installed on a computer (computers) is involved, provide the default (manufacturer's standard) software installation package on optical disc. Provide also, on optical disc separate from the default software, the complete image of the installed software, with all custom changes and configuration data specific for the installed system. The software image shall be the same as that of the system used when it is put in operation before the final acceptance tests, and a subsequent one that is used for the final (30-day) acceptance tests, after all pending corrections and adjustments have been implemented.

1.6.4.6 Software Manual

The software manual shall describe the functions of all software and shall include all other information necessary to enable proper loading, testing, and operation. The manual shall include:

a. Definition of terms and functions.

b. Use of system and application software.

c. Procedures for system initialization, start-up and shutdown.

d. Alarm reports.

e. Reports generation.

f. Database format and date entry requirements.
g. Directory of all disk files.

h. Description of all communication protocols, including data formats, command characters, and a sample of each type of data transfer.

i. Interface definition.

1.6.4.7 Hardware Manual

The hardware manual shall describe all equipment furnished including:

a. General description and specifications.

b. Installation and checkout procedures.

c. Equipment electrical schematics and layout drawings.

d. System schematics and layout drawings.

e. Alignment and calibration procedures.

f. Manufacturer's repair parts list indicating sources of supply.

g. Interface definition.

1.6.4.8 Functional Design Manual

The functional design manual shall identify the operational requirements for the system and explain the theory of operation, design philosophy, and specific functions. A description of hardware and software functions, interfaces, and requirements shall be included for all system operating modes.

1.6.4.9 Maintenance Manual

The maintenance manual shall include descriptions of maintenance for all equipment including inspection, periodic prevention maintenance (include specific time intervals for each recommended preventative maintenance tasks), fault diagnosis, and repair or replacement of defective components.

1.6.4.10 Training Documentation

Lesson plans and training manuals for the training phases, including type of training to be provided, and a list of reference material, shall be delivered for Government approval.

1.6.4.11 Data Entry

Enter all data needed to make the system operational. Deliver the data to the Government on data entry forms, utilizing data from the contract documents, Contractor's field surveys, and other pertinent information in the Contractor's possession required for complete installation of the database. Identify and request from the Government, any additional data needed to provide a complete and operational ACPCS. The completed forms shall be delivered to the Government for review and approval at least 30 days prior to the Contractor's scheduled need dates. When the ACPCS database is to be populated in whole or in part from an existing or Government furnished electronic database, demonstrate the field mapping
scheme to correctly input the data.

1.6.5 **Group V Technical Data Package**

**************************************************************************
NOTE: The designer will specify the correct number of manuals on DD FORM 1423. Unless the installation has a specific requirement, specify two copies of all manuals, except the Operator’s Manual, which should be specified to be six copies.
**************************************************************************

Provide the Group V Technical Data Package within 30 days after completing the Endurance Test. The data package shall include:

1.6.5.1 **Group IV Manuals**

Submit finalized Group IV Manuals, as specified in Group IV Technical Data Package, bound in hardback, loose-leaf binders. The draft copy used during site testing shall be updated with any changes required prior to final delivery of the manuals. Each manual's contents shall be identified on the cover. Each manual shall include names, addresses, and telephone numbers of each subcontractor installing equipment and systems, and the nearest service representative for each item of equipment. The manuals shall have a table of contents and tab sheets. Tab sheets shall be placed at the beginning of each chapter or section and at the beginning of each appendix. The final copies delivered after completion of the endurance test shall include modifications made during installation, checkout, and acceptance. The number of copies of each manual to be delivered shall be as specified on DD FORM 1423.

1.6.5.2 **Final System Drawings**

Maintain a separate set of drawings (including site, civil, electrical, mechanical, structural, and architectural plans, elevations, and details), elementary diagrams, wiring diagrams, control diagrams, and programming flow charts of the system to be used for final system drawings. This set shall be accurately kept up-to-date with all changes and additions to the ACPCS and shall be delivered to the Government with the final endurance test report. In addition to being complete and accurate, this set of drawings shall be kept neat and shall not be used for installation purposes. Final drawings submitted with the endurance test report shall be finished drawings on optical disc in [Microstation Version 8] [AutoCAD 2006] [or more recent] [_____] format.

1.7 **WARRANTY**

**************************************************************************
NOTE: The maintenance and service to be provided during first year's warranty period will be included as a separate bid item, and must be funded with O & M funds. The designer will coordinate funding requirements with the installation.
**************************************************************************

Provide all labor, equipment, and materials required to maintain the entire system in an operational state as specified, for a period of two years after formal written acceptance of the system to include scheduled and nonscheduled adjustments.
1.8 MAINTENANCE AND SERVICE

1.8.1 Description of Work

The adjustment and repair of the system includes all vehicle barriers, traffic arms, traffic signals, warning signals, computer equipment, CCTV system components, sequence of events recorder, software updates, communications transmission equipment and DTS, local processors, over speed and wrong-way sensors, vehicle presence detection sensors, IDS sensors, facility interface, and support equipment. All repair, calibration, and other work shall be provided and performed in accordance with the manufacturer's documentation and instruction. Responsibility shall be limited to Contractor installed equipment.

1.8.2 Service Personnel

Service personnel shall be certified in the maintenance and repair of the specific type of equipment installed and qualified to accomplish work promptly and satisfactorily. The Government shall be advised in writing of the name of the designated service representative, and of any change in personnel.

1.8.3 Schedule of Work

Perform two minor inspections at 6 month intervals (or more often if required by the manufacturer), and two major inspections offset equally between the minor inspections to effect quarterly inspection of alternating magnitude.

1.8.3.1 Minor Inspections

Minor inspections shall include visual checks and operational tests of active vehicle barriers (cleaning pit if necessary), traffic arms, traffic signals, console equipment, peripheral equipment, local processors, sensors, and electrical and mechanical controls.

1.8.3.2 Major Inspections

Major inspections shall include work described under paragraph Minor Inspections and the following work:

a. Clean interior and exterior surfaces of all system equipment and local processors, including workstation monitors, keyboards, and console equipment.

b. Perform diagnostics on all equipment.

c. Check, walk test, and calibrate each sensor.

d. Run all system software diagnostics and correct all diagnosed problems.

e. Resolve any previous outstanding problems.

f. Purge and compress data bases.

g. Review network configuration.
1.8.3.3 Scheduled Work

Scheduled work shall be performed during regular working hours, Monday through Friday, excluding federal holidays.

1.8.4 Emergency Service

******************************************************************************
NOTE: In some cases the designer may determine a less rapid response time is acceptable when weighed against the cost of the service. The designer must insert a time based upon input from the user.
******************************************************************************

The Government will initiate service calls to the Contractor when the system is not functioning properly. Qualified personnel shall be available to provide service to the complete system. The Government shall be furnished with a telephone number where the service supervisor can be reached at all times. Service personnel shall be at site within [2] [4] [_____] hours after receiving a request for service. The system shall be restored to proper operating condition within 8 hours after service personnel arrive onsite and obtain access to the system.

1.8.5 Operation

Performance verification test procedures shall be used after all scheduled maintenance and repair activities to verify proper component and system operation.

1.8.6 Records and Logs

Maintain records and logs of each performed task and organize cumulative records for each component and for the complete system chronologically resulting in a continuous log to be maintained for all devices. The log shall contain all initial settings. Complete logs shall be kept and shall be available for inspection onsite, demonstrating that planned and systematic adjustments and repairs have been accomplished for the system.

1.8.7 Work Requests

Record separately each service call request, as received. The form shall include the serial number identifying the component involved, its location, date and time the call was received, specific nature of trouble, names of service personnel assigned to the task, instructions describing what has to be done, the amount and nature of the material to be used, the time and date work started, and the time and date of completion. Deliver a record of the work performed within 5 days after work is accomplished.

1.8.8 System Modifications

Make any recommendations for system modification in writing to the Government. System modifications shall not be made without prior approval of the Government. Any modifications made to the system shall result in the updating of the operation and maintenance manuals as well as any other documentation affected.

1.8.9 Software

Provide a description of all software updates to the Government, who will
then decide whether or not they are appropriate for implementation. After notification by the Government, implement the designated software updates and verify operation in the system. These updates shall be accomplished in a timely manner, fully coordinated with system operators, and shall be incorporated into the operation and maintenance manuals, and software documentation. Make a system image file prior to implementing any software update so the system can be restored to its original state if the update adversely affects system performance.

PART 2   PRODUCTS

2.1   MATERIALS

2.1.1   Materials and Equipment

Units of equipment that perform identical, specified functions shall be products of a single manufacturer. All material and equipment shall be new and currently in production. Each major component of equipment shall have the manufacturer's model and serial number in a conspicuous place.

2.1.2   Field Enclosures

2.1.2.1   Interior Sensors

Sensors to be used in an interior environment shall have a housing that provides protection against dust, falling dirt, and dripping non-corrosive liquids.

2.1.2.2   Exterior Sensors

Sensors to be used in an exterior environment shall have a housing that provides protection against windblown dust, rain and splashing water, and hose directed water. Sensors shall be undamaged by the formation of ice on the enclosure.

2.1.2.3   Interior Electronics

Systems electronics to be used in an interior environment shall be housed in enclosures which meet the requirements of NEMA 250, Type 12.

2.1.2.4   Exterior Electronics

Systems electronics to be used in an exterior environment shall be housed in enclosures which meet the requirements of NEMA 250, Type 4X.

2.1.2.5   Corrosion Resistant

System electronics to be used in a corrosive environment as defined in NEMA 250 shall be housed in non-metallic non-corrosive enclosures which meet the requirements of NEMA 250, Type 4X.

2.1.3   Nameplates

Nameplates shall be provided for major components of the system. Nameplates shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a corrosion resistant plate secured to the item of equipment. Nameplates will not be required for devices smaller than 25 by 75 mm1 by 3 inch.
2.1.4 Tamper Switches

Equipment enclosures for the AVBCS, RSM, CCTV, and the active vehicle barrier shall have hinged doors or removable covers. The doors or covers shall be provided with cover operated, corrosion-resistant tamper switches, arranged to initiate an alarm signal when the door or cover is moved. The enclosure and the tamper switch shall function together and shall not allow direct line of sight to any internal components before the switch activates. Tamper switches shall be inaccessible until the switch is activated; have mounting hardware concealed so that the location of the switch cannot be observed from the exterior of the enclosure; be connected to circuits which are under electrical supervision at all times, irrespective of the protection mode in which the circuit is operating; shall be spring-loaded and held in the closed position by the door or cover; and shall be wired so that the circuit is broken when the door or cover is disturbed.

2.1.5 Locks and Key-Lock Switches

**************************************************************************
NOTE: Either round key or conventional key type locks are acceptable for use in the system. Selection should be based on hardware availability at the time of design and the requirements for matching locks currently in use at the site. If the locks do not have to be matched to locks in use, and the designer has no preference, all brackets may be removed.
**************************************************************************

2.1.5.1 Locks

Locks shall be provided on system enclosures for maintenance purposes. Locks shall be UL listed, [round-key type with 3 dual, 1 mushroom, 3 plain pin tumblers] or [conventional key type lock having a combination of 5 cylinder pin and 5-point 3 position side bar]. Keys shall be stamped "U.S. GOVT. DO NOT DUP". The locks shall be arranged so that the key can only be withdrawn when in the locked position. Maintenance locks shall be keyed alike and only 2 keys shall be furnished for all of these locks. These keys shall be controlled in accordance with the key control plan as specified in paragraph Key Control Plan.

2.1.5.2 Key-Lock-Operated Switches

Key-lock-operated switches required to be installed on system components shall be UL listed, [round-key type, with 3 dual, 1 mushroom, and 3 plain pin tumblers] or [conventional key type lock having a combination of 5 cylinder pin and 5-point 3 position side bar]. Keys shall be stamped "U.S. GOVT. DO NOT DUP". Key-lock-operated switches shall be 2 or 3 position, with the key removable in specified positions. All key-lock-operated switches shall be keyed differently and only 2 keys shall be furnished for each key-lock-operated-switch. Keys shall be removable in the positions described in these specifications or as shown on the drawings. Keys shall be controlled in accordance with the key control plan as specified in paragraph Key Control Plan.

2.1.5.3 Construction Locks

A set of temporary locks shall be used during installation and
construction. The final set of locks installed and delivered to the Government shall not include any of the temporary locks.

2.1.6 System Components

System components shall be designed for continuous operation. Electronic components shall be solid state type, mounted on printed circuit boards conforming to UL 796. Printed circuit board connectors shall be plug-in, quick-disconnect type. Power dissipating components shall incorporate safety margins of not less than 25 percent with respect to dissipation ratings, maximum voltages, and current carrying capacity. Control relays and similar switching devices shall be solid state type or sealed electro-mechanical.

2.1.6.1 Modularity

Equipment shall be designed for increase of system capability by installation of modular components. System components shall be designed to facilitate maintenance through replacement of modular subassemblies and parts.

2.1.6.2 Maintainability

Components shall be designed to be maintained using commercially available tools and equipment. Components shall be arranged and assembled so they are accessible to maintenance personnel. There shall be no degradation in tamper protection, structural integrity, EMI/RFI attenuation, or line supervision after maintenance when it is performed in accordance with manufacturer's instructions.

2.1.6.3 Interchangeability

The system shall be constructed with off-the-shelf components which are physically, electrically and functionally interchangeable with equivalent components as complete items. Replacement of equivalent components shall not require modification of either the new component or of other components with which the replacement items are used. Custom designed or one-of-a-kind items shall not be used without explicit approval from the Contracting Officer. Interchangeable components or modules shall not require trial and error matching in order to meet integrated system requirements, system accuracy, or restore complete system functionality.

2.1.6.4 Product Safety

System components shall conform to applicable rules and requirements of NFPA 70. System components shall be equipped with instruction plates including warnings and cautions describing physical safety and any special or important procedures to be followed in operating and servicing system equipment.

2.1.7 Controls and Designations

Controls and designations shall be as specified in NEMA ICS 1, Special Test Equipment. Provide all special test equipment, special hardware, software, tools, and programming or initialization equipment needed to start or maintain any part of the system and its components. Special test equipment is defined as any test equipment not normally used in an electronics maintenance facility.
2.1.8 System Integration

The ACPCS shall be supplied as an integrated system, and shall include all sub systems specified hereafter. Hardware and software integration shall be required for the ACPCS to function as one integrated system. The Contractor is responsible for all integration and appetencies required for the system to behave as one system. Supply of separate sub systems without integration is not acceptable. The extent and nature of integration shall be extensively documented and demonstrated in the Group 1 Technical Data Package.

2.1.9 Environmental Conditions

2.1.9.1 Interior Conditions

Equipment installed in environmentally protected interior areas shall meet performance requirements specified for the following ambient conditions:

2.1.9.1.1 Temperature

0 to 50 degrees C 32 to 120 degrees F. Components installed in unheated security protected areas shall meet performance requirements for temperatures as low as -17 degrees C zero degrees F

2.1.9.1.2 Pressure

Sea level to 4,573 m 15,000 feet above sea level

2.1.9.1.3 Relative Humidity

5 to 95 percent

2.1.9.1.4 Fungus

System components located in fungus growth inductive environments shall be completely treated for fungus resistance. Treating materials containing a mercury bearing fungicide shall not be used. Treating materials shall not increase the flammability of the material or surface being treated. Treating materials shall cause no skin irritation or other injury to personnel handling it during fabrication, transportation, operation, or maintenance of the equipment, or during use of the finished items when used for the purpose intended.

2.1.9.1.5 Acoustical Noise

Components shall be suitable for use in high noise areas above 100 dB, such as boiler rooms, power plants, and foundries without adversely affecting their performance.

2.1.9.2 Exterior Conditions

Exterior Conditions Components mounted in locations exposed to weather shall be housed in corrosion-resistant enclosures with appropriate environmental protection. Component performance shall not degrade because of improper housing design. Components in enclosures shall meet performance requirements when exposed to the following ambient conditions:
2.1.9.2.1 Temperature

-32 to 60 degrees C -25 to 140 degrees F

2.1.9.2.2 Pressure

Sea level to 4,573 m 15,000 feet above sea level

2.1.9.2.3 Solar Radiation

Six hours of solar radiation at dry bulb temperature of 60 degrees C 120 degrees F including 4 hours of solar radiation at 0.00112 watts per square mm 104 watts psf.

2.1.9.2.4 Sand and Dust

Wind driven for up to [9.6] [_____] km/hour [6] [_____] mph

2.1.9.2.5 Rain

50 mm 2 inches per hour and 125 mm 5 inches per hour cyclic with wind plus one period of 300 mm 12 inches per hour

2.1.9.2.6 Humidity

5 to 95 percent

2.1.9.2.7 Fungus

Warm, humid atmosphere conducive to the growth of heterotrophic plants

2.1.9.2.8 Salt Fog

Salt atmosphere with 5 percent salinity

2.1.9.2.9 Snow

Snow loading of 234 kg/square m 48 pounds psf per hour; blowing snow of 22.5 kg/square m 4.6 psf per hour

2.1.9.2.10 Ice Accretion

Up to 13 mm 1/2 inch of radial ice

2.1.9.2.11 Wind

Up to 80 km/h 50 mph with gusts to 106 km/h 66 mph, except that fence sensors shall detect intrusions up to 56 km/h 35 mph.

2.1.9.2.12 Acoustical Noise

Components shall be suitable for use in high noise areas above 110 dB, such as flight lines, run up pads, and generator sites without adversely affecting their performance.
2.2 ACTIVE VEHICLE BARRIER CONTROL SYSTEM (AVBCS)

2.2.1 General Requirements

**************************************************************************
NOTE: Check for approved version of the Advanced Traffic Controller Standard.
**************************************************************************

The AVBCS shall collect alarm, status, and control switch inputs at the ACP and provide control signals to the Active Vehicle Barriers, Traffic Signals, Traffic Arms, and Warning Beacons. The AVBCS shall provide alarm, status, and control information to the Gatehouse Control Console, each Guard Booth Control Panel, the Overwatch Position Control Panel, the Local Control Panel at each AVB, the CCTV subsystem for controlling camera presets, and to the Installation's Central Security Monitoring System (CSMS) for annunciating alarms at both the CSMS alarm monitoring point and a CSMS provided annunciation panel at the Gatehouse.

2.2.2 AVBCS Processor

The AVBCS processor shall be a Traffic Controller Unit (TCU) with a real time operating system and mappable inputs and outputs (I/O). The AVBCS TCU shall conform to the requirements of the Advanced Transportation Controller (ATC) Standard (Ballot Copy for the Joint Committee on the ATC for Joint Adoption by AASHTO, ITE, and NEMA, ITE ATC 5201 dated 26 June 2006) or the NEMA TS-1, NEMA TS-2-Type 1, or NEMA TS-2-Type 2 Standard TCUs. The AVBCS TCU shall be housed in a NEMA TS-1 or NEMA TS-2-Type 2 cabinet with terminal block connections for external wiring. A single AVBCS TCU shall be capable of managing 4 AVBs and their associated traffic and warning signals simultaneously.

2.2.3 Timing Requirements

a. The processing and update time for the total number of required input and output points shall be 1 millisecond or less. Compliance of this requirement shall be specifically supported with manufacturer's documentation during the shop-drawing approval phase, demonstrated during the FAT at the supplier's premise, and demonstrated during acceptance testing on site after completion of the installation.

b. The AVBCS real time clock shall be synchronized within 1 second of the correct time at least once per day automatically (without operator intervention and without requiring system shutdown) using a nationally recognized clock reference, e.g., NIST, WWV, GPS, etc.

c. The AVBCS shall annunciate or record alarms, status changes, and guard control actions in no more than 100 milliseconds after the condition occurs (e.g., alarm, status point, or switch contact closure).

d. The AVBCS shall provide date and time (with 1 second resolution) stamps for all discrete alarm and status changes.

2.2.4 Conflict Monitor

The AVBCS TCU shall be equipped with a conflict monitor. Upon detection of a conflict, the conflict monitor shall instruct the AVBCS to go into a fail safe mode where all barrier controls are locked out and all traffic signals change to Flashing Red.
2.2.5 Configuration

The AVBCS shall be configured to alert ACP guards of unauthorized entry attempts through the ACP and unauthorized entry attempts into secured ACP facilities, to provide video surveillance of selected ACP areas, and to provide video assessment for alarm activations. The AVBCS shall include a gatehouse control console (GCC), control panels for each guard booth and the overwatch position, local control panel for each AVB, alarm panels for the ID Check area, facility IDS sensors, duress alarms, over speed detectors, wrong-way detectors, CCTV system, communications and processing equipment, data transmission systems (DTS), and tamper detection as described below. The AVBCS shall provide alarm and status information and CCTV video images to the Installation's Central Security Monitoring Station (CSMS) through local interface points at the ACP. The AVBCS shall provide totally automatic communication of status changes, commands, field initiated interrupts and any other communications required for proper system operation. System communication between the AVBCS and all external devices shall not require operator initiation or response. System communication shall return to normal operation after any partial or total network interruption such as power loss or transient upset. The AVBCS shall automatically annunciate communication failures to the operator with identification of the communication link that has experienced a partial or total failure. See Drawing 1 for configuration of AVBCS components and communication paths.

2.2.6 Communications

Means and format for the communication between the AVBCS TCU and other CPU's and PLCs used shall be IEEE 802.3 parallel based Ethernet communication or EIA232 or EIA485 serial. Provide media and format converter system as applicable. The TCU and all other CPUs and PLCs for this project shall be purchased close to the time of installation. Coordination with the Government is essential in completing the system integration in a timely manner such that the latest technology is installed.

2.3 TRAFFIC CONTROLLER UNIT (TCU) PROCESSING AND CONTROL SOFTWARE

The software must provide the communication, programming and control capabilities necessary to support all specified points and functions, plus a minimum expansion of 50 percent of the current number of points, complete with their point database. The TCU shall be online at all times and shall perform all required functions as specified. The software shall consist of one or more standard software modules. Where multiple modules are used, the modules shall be capable of sharing data and operating together seamlessly. The system shall support multiple user operations with multiple tasks for each user and shall support operation and management of all peripheral devices. All configuration modifications shall be capable of being made on-line, while the system is operating. It shall be possible to upgrade the software to newer versions using an automatic mechanism provided by the software manufacturer. The software shall provide complete user documentation online, including examples of how to operate the various modules within the software. The TCU software shall be "off-the-shelf" standard software products of a company (companies) specializing in such products, supplemented by custom-developed software codes for integrating the different sub systems and implement the required functionalities. Provide documentation of all implemented software, including the custom-developed software codes after formal system acceptance, but prior to the endurance tests. The Government reserves the right of use for the
provided software for future enhancements and additions to the installed system.

2.3.1 Load and Adjust Software

Load software required for an operational control and processing system, including databases, operational parameters, and system, command, and application programs. Adjust, tune, debug, and commission all software and parameters for controlled systems to assure proper operation in accordance with the sequences of operation and database tables.

2.3.2 Display Information

The TCU shall display information necessary to support all requirements specified, including: guard control commands; alarm notification; status point changes; and report generation.

2.3.3 TCU Utility Programming

All utility programs shall be object oriented with a mouse driven or touch screen graphical user interface (GUI). The graphical user interface shall include a set of desktop utilities including the following: file management, shell tool, calculator, text editor, and icon library. Program elements shall be able to be combined into a custom template which can then be used as a standard function. Program checkout and debug facilities shall include display of dynamic and/or simulated system variables and points on the programming screens. The user shall be able to fix or force values of variables to enable program checkout during debugging. The programming shall allow for the use of a portable tester for loading files directly into the TCU and uploading and downloading control programs and database information.

2.3.4 Command Software

The software shall provide for defining and selecting I/O, parameters, and all other functions associated with operation. The operator commands shall be usable from keyboards with individual operator passwords as specified.

2.3.5 Command Input and Errors

Command menus shall utilize full words and acronyms selected to allow programmers/technicians to use the TCU without extensive training or data processing backgrounds. The TCU shall prompt the programmer/technician. The TCU shall supervise programmer/technician inputs to ensure they are correct for proper execution. Programmer/technician input assistance shall be provided whenever a command cannot be executed because of input errors.

2.3.6 Special Functions

The TCU must support the following special functions by using a mouse, in addition to all other commands specified:

2.3.6.1 Help

Produce a display of all commands available to the operator. The help command, followed by a specific command, shall produce context sensitive listing with a short explanation of the purpose, use, and system reaction to that command.
2.3.6.2 Start/Enable
Manually start equipment and enable monitoring and control of points.

2.3.6.3 Stop/Disable
Manually stop equipment and disable monitoring and control components.

2.3.6.4 Dynamic Displays
Provide real time status of functions, timers, and I/O.

2.3.6.5 Auto/Override
Override automatic operation of a point or return a point to automatic operation.

2.3.6.6 Print Report
Allow the operator to print reports.

2.3.7 System Access Control
A minimum of 20 passwords shall be usable with the control system software. The TCU shall maintain a log of programmers/technicians logged onto the system. Each password shall be definable as to the functions that the programmer/technician can perform.

2.3.8 Alarms
The software shall notify a programmer/technician of the occurrence of an alarm condition. The TCU alarm history shall be stored and shall be recallable by the programmer/technician using the report generator. Alarm messages shall take precedence over other functions. A minimum of the most recent 1000 alarms shall be directly available at the TCU. Digital alarms shall be subject to immediate reporting, within the alarm response time.

2.3.9 Report Generator
Software shall be provided to generate and format standard and custom reports for displaying and storing on disk. Reports shall use database values and parameters, values calculated using the real time static database or historical data base; with the reports subsequently stored on removable media. Dynamic operation of the system shall not be interrupted to generate a report. The report shall contain the time and date when the report was printed.

2.3.10 Periodic Automatic Report
The system shall allow for specifying, modifying, or inhibiting the report to be generated, the time the initial report is to be generated, the time interval between reports, end of period, and the output peripheral. The system (through the Request Report Mode) shall allow for the operator to request, at any time, an immediate display of any report.

2.3.11 ACP Processing and Control Database
The database shall be stored on disk and in non-volatile RAM. The static database shall be downloadable to backup devices.
2.3.12 Database Definition Process

Software shall be provided to define and modify each point in the database using operator commands. The definition shall include all physical parameters and constraints associated with each point. Each database item shall be callable for display or printing, including EEPROM, ROM and RAM resident data. Each point shall be defined and entered into database by the Contractor.

2.3.13 Historical Data Storage and Retrieval

A historical data storage and retrieval function shall be provided to collect and store dynamic data. This function shall be in addition to other data storage requirements. The function shall have the capability to collect and store alarm status changes, point values, events and operator commands, and system responses. This function shall have the capability to retain historical data on non-volatile RAM for pre-specified time periods, up to forty-five days using last day roll over, for short-term analysis, and then output the data to the utility software for long-term retention. The operator shall also be able to selectively recall short-term data stored on non volatile RAM. Retrieval of the contents of any selected historical data file through utility programs shall be available using the data retrieval and report generation program. The output of the report generation program shall be capable of being viewed on the screen, transferred to removable media, or stored.

2.3.14 Security Management

The software shall support a user based security system. When enabled, the security system shall allow for the creation of users with certain rights and/or privileges. When user based security is enabled, an audit trail shall be generated in the system which shall tag every programmer/technician logon with user identification (ID). The following functions shall be supported within the security management application:

a. Define users.

b. Define groups which users may belong to.

c. Define user and/or group rights/privileges.

2.4 GATEHOUSE CONTROL CONSOLE (GCC)

**************************************************************************
NOTE: Coordinate with Installation and select two means of communications between Gatehouse, each Guard Booth, the Overwatch Position, Search Area, VCC, and the CSMS. Include requirements for the selected communications systems at the Gatehouse in the Gatehouse Control Console
**************************************************************************

Provide a GCC with all necessary displays and controls to allow the operator to view real-time ACP alarms, discrete point status changes, and CCTV video images and to control ACP equipment including the Active Vehicle Barriers. The GCC shall be mounted in the gatehouse in a manner to allow a Gatehouse guard to easily use the controls and monitor the displays while, at the same time, oversee ACP operations. The GCC shall include the following:
2.4.1 Alarm Display

See paragraph ALARM DISPLAY IN THE GCC for description and requirements.

2.4.2 Overspeed and Wrong Way Annunciation Panels

Provide a back lit annunciation window for displaying OVERSPEED alarms and a back lit annunciation window for displaying WRONG WAY alarms. Provide volume adjustable sound indication for each alarm. Alarm display and sound indication shall occur in no less than 100 milliseconds after the sensor detects the overspeed or wrong way condition.

2.4.3 CCTV Monitor and Controls

Provide CCTV system monitors and controls. See paragraph CCTV SYSTEM for requirements.

2.4.4 Active Vehicle Barrier Controls

Provide Active Vehicle Barrier Master Control Panel, as indicated.

2.5 ALARM DISPLAY IN THE GCC

**************************************************************************

NOTE: Reference Appendix B. Some alarms listed in Appendix B must annunciate on both the Annunciation Panel in the GCC and on the Installation's Central Security Monitoring System (CSMS). Coordinate with the Installation's Director of Emergency Services (DES) and/or Director of Public Works (DPW) to determine the optimum method of interfacing the AVBCS with the CSMS and include the requirements for the AVBCS here. Also ensure the DES/DPW initiates appropriate requirements for the CSMS. Revise Standard Drawing E1.08 to reflect the AVBCS/CSMS interface requirements.

**************************************************************************

Provide an Annunciation Panel in the GCC for displaying alarms identified in Appendix B for annunciation at the Gatehouse. [____].

2.6 SEQUENCE OF EVENTS RECORDER

All alarms and events listed in Appendix B shall be collected by the AVBCS TCU and stored with the following data: identification of the alarm/event, date and time to the nearest second of occurrence, date and time of acknowledgement (alarm points only), date and time of reset (alarm points only), and an alarm/event message. Events may have multiple messages to describe all possible states, e.g., AVB #1 in EFO mode, AVB #1 in Test mode, or AVB #1 in Local mode. Provide means and user-initiated procedure to export the stored alarms and events to a removable storage device for printing in a standard Windows application such as Excel Spreadsheet. All alarms and status changes shall be received and stored in the TCU database with the appropriate time tags in no more than 100 milliseconds after the condition occurs (e.g., alarm/status point contact closure).

2.7 ALARM PANELS AT THE GUARD BOOTHS

One or more Alarm Panels consisting of back-lit OVER SPEED and WRONG WAY
messages shall be mounted outside of but near the Guard Booths. Alarm Panels shall include an audible alarm. The number and location of Alarm Panels shall be such as to allow any ACP guard either sitting in a Guard Booth or standing along side a Guard Booth at the ID Check position to see and hear at least one panel. The audible alarm shall be loud enough to be heard over ambient traffic noise. Overspeed and wrong-way alarms shall clear automatically 3 seconds (adjustable) after the alarm condition ends with no action required by guard. Overspeed and wrong-way alarms shall be recorded on the Alarm and Events Recorder.

2.8 GUARD BOOTH AND OVERWATCH POSITION CONTROL PANELS

Provide a Control Panel for each Guard Booth and the Overwatch Position. Control Panels shall include the EFO control switch, indicating lights, and back lit alarm windows for OVER SPEED, WRONG WAY, and DURESS (Overwatch Position only) alarms (see Standard Drawing E1.03). Control Panels shall include a volume adjustable audible alarm. The audible alarm shall be loud enough to be heard over ambient traffic noise. Alarm acknowledgement and clearing of a DURESS alarm shall be from the Gatehouse alarm controls, except a control switch at the Overwatch Position shall be provided to silence the audible alarm. Overspeed and wrong-way alarms shall clear automatically 3 seconds (adjustable) after the alarm condition ends. For an Overwatch Position without a permanent building, the Control Panel shall be portable with a cord for plugging into a companion receptacle in the Overwatch Position junction box.

2.9 CCTV SYSTEM

**************************************************************************
NOTE: Edit Section 28 10 05 ELECTRONIC SECURITY SYSTEMS (ESS) to include appropriate project features of the CCTV System.
**************************************************************************

Coordinate with Installation to determine storage requirements for digital CCTV images and to determine communications requirements.

**************************************************************************
Provide a CCTV System to monitor designated areas of the ACP, present critical CCTV images to the ACP guards, and record and store ACP images for future evaluation by security personnel. The CCTV system shall meet the requirements listed in Section 28 10 05 ELECTRONIC SECURITY SYSTEMS (ESS), and the following:

a. The CCTV system shall provide Video Surveillance of the ACP areas shown on the drawings. The CCTV system shall also provide Video Assessment of IDS, Tamper, Duress, Overspeed, and Wrong-way alarms. For Video Surveillance, the cameras and CCTV system shall operate full time to monitor the required ACP areas. For Video Assessment, the appropriate camera or cameras shall automatically focus on the alarmed area and the CCTV system shall automatically bring the camera image to one of the guard's monitors when an alarm is activated.

b. CCTV monitoring and controls shall be included in the GCC to provide monitoring and display control of live CCTV images from any ACP camera. The CCTV subsystem shall also provide controls to display and view recorded video imagery.

c. The CCTV system shall provide digital video recording of all ACP video
imagery cameras 24 hours per day, seven days per week. The CCTV system shall be capable of storing up to seven days of video information of all connected CCTV cameras.

d. Provide an interface with the CSMS to allow the CSMS to monitor live CCTV images from any ACP camera or recorded images from the digital video recorder.

2.10 UNINTERRUPTIBLE POWER SUPPLIES (UPS)

Provide UPS in the event of loss of normal electrical power for the following functions:

a. Primary communications system.

b. Security Monitoring subsystem including CCTV, GCC, Alarm Panels, and all sensors for duress, IDS, over speed, wrong-way, tamper, etc.

c. AVBCS subsystem including all controls for active barriers, traffic signals, gate arms, and warning signals.

d. Active barrier activation systems for one complete operation cycle (open to close and close to open).

e. Lighting. One luminaire for each ID Check Lane located near the guard position and one luminaire for each CCTV camera required at the Active Vehicle Barrier.

UPS shall be capable of carrying required loads for a minimum of 10 minutes. Submit calculations for all proposed UPS systems identifying all connected loads plus 50 percent spare capacity and submit in accordance with Group I Technical Data Package.

2.11 OVER SPEED, WRONG-WAY, AND VEHICLE PRESENCE DETECTORS

2.11.1 Photoelectric Type

Photoelectric sensors shall meet the requirements listed below. Photoelectric sensors shall be used for vehicle presence detection [and over-height detection] as shown on the drawings.

a. Photoelectric detectors shall consist of separate transmitter and receiver units. Detector design or arrangement requiring reflector is not acceptable.

b. Light beam: laser or infrared, modulated and synchronized between the transmitter-receiver pair to minimize cross talk with adjacent detectors or other light sources. Where laser is used, the light source shall be rated laser Class II or lower as per 21 CFR 1040 10.

c. Provide shield cones for beam path to minimize and isolate interference from other light sources outside the detector aim cone and from other adjacent light sources.

d. The photoelectric detector set, including the mounting post shall be of robust design to withstand mechanical abuse such as plowed snow from roadway snow removal operations.

e. Provide Transient Voltage Surge Suppression (TVSS) for the power and
sensor wire terminations. Ground the TVSS with minimum 10AWG insulated ground wire of high strand-count to the closest ground termination point.

f. Provide matching cable connector as required

g. Detector shall have a range of minimum **1.8 m 6 feet** to no less than **19.5 m 65 feet**.

h. Detector tuning shall be automatic, with temperature compensation.
i. Detector shall have user selectable sensitivity settings.
j. Detector response time shall be 15 milliseconds or less.
k. Detector output shall be a dry form C contact set, rated a minimum of 0.25 A at 24 Volts dc.
l. Detector enclosure rating shall be NEMA 4X or better.
m. Detector shall be capable of operating in a humidity range of 0 to 95 percent and a temperature range of **-40 to +77 degrees C -40 to +170 degrees F.**
n. Detector shall be capable of operating from 120V/60Hz power, or be provided with appropriate power module/assembly and appurtenance, which are suitable for operation with 120V/60Hz.

2.11.2 Induction Loops

Induction loops may be used for vehicle presence detection, wrong-way detection, and point over-speed detection. Induction loops shall be capable of detecting passenger vehicles, motorcycles, and high bed trucks. Tests for all three types of vehicles shall be conducted on each installed loop during the Performance Verification Test.

a. Tuning: automatic, with temperature compensation.
b. Loop input: to withstand minimum 2000V, both normal and common modes.
c. Loop Sensing frequency: minimum four user selectable frequencies to minimize cross talk with adjacent loops.
d. Sensitivity: user selectable, minimum 12 ranges, 20 to 2500 micro henries with a Q factor of minimum 5.
e. Diagnostic: provide diagnostics and related indication for short and open loop circuit.
f. Detector output: dry form C contact set, rated a minimum of 0.25 A at 24 Volts dc.
g. Operating humidity: 0 to 95 percent.
h. Operating temperature: **-40 to 77 degrees C -40 to 170 degrees F.**
i. Vibration: **NEMA TS-2 -2.1.9 or better.**
j. Shock: **NEMA TS-2 -2.1.10 or better.**
k. User selectable operation modes: presence, pulse on entrance, pulse on exit - factory set on presence mode.

l. User selectable operation: Fail Safe or Fail Secure - factory set at Fail Safe.

m. User selectable sensitivity boost feature, which boosts sensitivity after a presence detection and holds the increased sensitivity until the detection drops out, at which time sensor sensitivity returns to the original setting.

n. Power requirement: 120V/60Hz, or be provided with appropriate power module/assembly and appurtenance, which is suitable for operation with 120V/60Hz.

o. Loop Wire.
   (1) Provide number of inductive loops as per manufacturer's recommendations based on loop size and distance between loop and loop amplifier.
   (2) Ensure that the loop slots in which the loop wire is laid are free from debris, sharp objects, and are completely dry. Clean out slots with compressed air before installing loop wire.
   (3) Install loop wire in layers. Install backer rods over top wire at a minimum of 300 mm (1 foot) spacing to ensure uniform placement of wire in the slot. Fill the loop slots with sealant per recommendation of the loop wire manufacturer.
   (4) Use 16AWG stranded cable with Cross Linked Polyethylene insulation installed in a PVC sleeve. Loop wire extending from the loop to the loop amplifier shall be twisted with a minimum twist pitch of 18 per m (6 per foot).
   (5) Check conductor resistance to ground with "megger" of 500V or higher. Remove and replace the whole installation if ground resistance of less than 10 mega-Ohms is measured.
   (6) Provide TVSS (Transient Voltage Surge Suppressor) for both loop-wire terminations at or near the loop detector module. Ground the TVSS with minimum 10AWG insulated ground wire of high strand-count to the closest ground termination point.
   (7) Loops shall be capable of detecting motorcycles, passenger vehicles, and high bed trucks with the same sensitivity setting.

2.11.3 Radar

**************************************************************************
NOTE: Select either Point or Continuous over speed detection as required
**************************************************************************

Radar detection sensors may be used for vehicle over speed detection.[ POINT OVER SPEED DETECTION. The detector unit shall be capable of detecting the speed of one or more vehicles at a point in the ACP Approach Zone and closing an alarm contact if the vehicle speed is over a preset
Continuous Over speed Detection. The detector unit shall be capable of continuously detecting the speed of vehicles within preset zones as they approach the ID Check Area of the ACP. The Sensor shall close an alarm contact when the speed of any vehicle anywhere within the zone is above a preset value. See drawings for required detection zones and detector speed settings. For radar sensors which sense speed at multiple discrete points in the direction of travel instead of continuously, the distance between discrete points shall not be more than 5 m 15 feet.

Radar detection sensors shall meet the requirements listed below.

a. The detector unit shall have an operating temperature range of -40 to +77 degrees C -40 to +170 degrees F and a relative humidity range of 5 to 95 percent, non-condensing. The detector unit shall be equipped with means for automatic temperature compensation as is necessary to overcome adverse effects of temperature and humidity swings in the specified range.

b. The detector unit shall be resistant to vibration in accordance with NEMA TS-1, IEC 60068-2-30 (test Fc), or approved equivalent. The detector unit shall be resistant to shock in accordance with NEMA TS-1, IEC 60068-2-27 (test Ea), or approved equivalent.

c. The detector unit shall withstand voltage surge of minimum 1kV (rise time = 1.2 microsecond, hold = 50 microsecond) applied in differential mode to all lines, power and output, as defined by IEC 61000-4-5 standard.

d. The detector unit shall not emit a noise at levels exceeding 55 dBA when measured at a distance of 1 meter 3 feet away from its surface.

e. Each detector unit shall transmit on a frequency band of 10.525 GHz +/-25 MHz or another approved spectral band. The detector shall comply with the limits for a Class A digital device pursuant to Part 15 of the FCC rules or the appropriate Spectrum Management Authority. The detector unit shall not interfere with any known equipment. Transmitter power shall not exceed 10 mili-watts.

f. The detector unit shall detect vehicle speed with 95 percent accuracy or greater independent of the vehicle's direction of travel through the detection zone.

g. The field of view of the detector unit shall cover an area defined by an oval shaped beam with a beam height and width of 15 degrees minimum and a range of 3 to 70 m 10 to 200 feet minimum.

h. The enclosure rating of the detector unit shall be NEMA 3R or better. The overall detector dimensions shall not exceed the nominal envelop of 200 by 254 by 150 mm 8 by 10 by 6-inch.

i. The power requirement of the detector unit shall be 120V/60Hz, or be provided with appropriate power module/assembly and appurtenance, which is suitable for operation with 120V/60Hz.

j. The detector unit output upon detection of a vehicle speed over the adjustable preset value shall be a dry form C contact set, rated a minimum of 0.25 A at 24 Volts dc.

k. The detector unit shall have a blind zone of not more than 3 m 10 feet in front of the unit.
1. The detector unit may be applied in either Side-fired or Forward-looking configuration.

m. Detector units may be mounted on existing ACP structures or utility poles if suitable for this purpose. When existing structures and utility poles are not suitable, provide mounting trusses or poles for mounting detector units. The support structure and the mounted detector units shall deflect less than 13 mm 0.5 inch at exposure to 160 km/h 100 mph winds with a gust factor of 1.3.

n. Set all detector unit parameters and adjust detectors to provide required zone coverages.

2.11.4 Video Detection

Video detectors may be used for vehicle presence, over speed, and wrong-way detection. Detection shall be derived from video image signals received from a CCTV video camera. The video vehicle detector set shall include the camera, hardware, software, and appurtenances required to perform the detection functions required on the drawings. The Video analytics system shall produce warning annunciation via alarm contacts when the required detection criteria are met. Refer to Section 28 10 05 ELECTRONIC SECURITY SYSTEMS (ESS) for requirement on the related video camera and video signal transmission system. Video detectors shall meet the requirements listed below.

a. The detector unit shall have an operating temperature range of -40 to +77 degrees C -40 to +170 degrees F and a relative humidity range of 5 to 95 percent, non-condensing.

b. The detector unit shall be resistant to vibration in accordance with NEMA TS-1, IEC 60068-2-30 (test Fc), or approved equivalent. The detector unit shall be resistant to shock in accordance with NEMA TS-1, IEC 60068-2-27 (test Ea), or approved equivalent.

c. The detector unit when used for continuous speed detection shall sense speed at multiple discrete points in the direction of travel. In order to adequately simulate continuous speed detection, the distance between discrete points shall not be more than 5 m 15 feet.

d. The detector unit when used for speed detection shall detect vehicle speed with a 95 percent accuracy or greater, independent of the vehicle's direction of travel through the detection zone. The detector unit when used for presence or wrong-way detection shall identify the required condition with a 95 percent accuracy or greater.

e. The enclosure rating of the detector unit shall be NEMA 3R or better.

f. The power requirement of the detector unit shall be 120V/60Hz, or be provided with appropriate power module/assembly and appurtenance, which are suitable for operation with 120V/60Hz. The detector unit output upon detection shall be a dry form C contact set rated a minimum of 0.25 A at 24 Volts dc.

g. The detector unit may be applied in either Side-fired or Forward-looking configuration.

h. Detector units may be mounted on existing ACP structures or utility
poles if suitable for this purpose. [When existing structures and utility poles are not suitable, provide mounting trusses or poles for mounting detector units. The support structure and the mounted detector units shall deflect less than 13 mm 0.5 inch at exposure to 160 km/h 100 mph winds with a gust factor of 1.3.]

i. Set all detector unit parameters and adjust detectors to provide required zone coverages.

2.12 BALANCED MAGNETIC SWITCH (BMS)

**************************************************************************
NOTE: Determine the type, number, and locations of BMS's and show them on the drawings.
**************************************************************************

Provide BMS detectors as shown on the drawings. The BMS shall detect a 6 mm 1/4 inch of separating relative movement between the magnet and the switch housing. Upon detecting such movement, the BMS shall activate and generate an alarm. BMS detectors shall meet the following requirements:

2.12.1 BMS Subassemblies

The BMS shall consist of a switch assembly and an actuating magnet assembly. The switch mechanism shall be of the balanced magnetic type or triple-biased reeds to provide detection of tamper attempts. The switches shall provide supervision and pry tamper capability. Each switch shall be provided with an overcurrent protective device, rated to limit current to 80 percent of the switch capacity. Switches shall be rated for a minimum lifetime of 1,000,000 operations. The magnet assembly shall house the actuating magnet.

2.12.2 Housing

The housings of surface mounted switches and magnets shall be made of nonferrous metal and shall be weatherproof. The housings of recess mounted switches and magnets shall be made of nonferrous metal or plastic.

2.12.3 Remote Test

A remote test capability shall be provided. The remote test shall be initiated when commanded by the alarm annunciation system. The remote test shall activate the sensor's switch mechanism causing an alarm signal to be transmitted to the alarm annunciation system. The remote test shall simulate the movement of the actuating magnet relative to the switch subassembly.

2.12.4 Access/Secure

The BMS and all access/secure equipment for ACP facilities shall be provided by the contractor and wired to the local interface point at the ACP for the Installation's CSMS as shown on the drawings.

2.13 DURESS ALARMS

**************************************************************************
NOTE: Determine the type, number, and locations of duress alarms and show them on the drawings. Edit out the appropriate subparagraphs below for the
Duress alarm switches shall provide the means for an individual to covertly notify the alarm annunciation system that a duress situation exists. Provide the number and type(s) of the following Duress Alarms as required on the drawings:

2.13.1 Foot-rail

Foot-rail duress alarms shall be designed to be foot activated and floor mounted. No visible or audible alarm or noise shall emanate from the switch when activated. The switch housing shall shroud the activating lever to prevent accidental activation. Switches shall be rated for a minimum lifetime of 50,000 operations.

2.13.2 Push-button

Latching push-button duress alarm switches shall be designed to be activated by depressing a push-button located on the duress switch housing. No visible or audible alarm or noise shall emanate from the switch. The switch housing shall shroud the activating button to prevent accidental activation. Switches shall be rated for a minimum lifetime of 50,000 operations.

2.13.3 Wireless

Wireless duress alarm switches shall consist of portable alarm transmitters and permanently installed receivers. The transmitter shall be activated by depressing a push-button located on the housing. An alarm signal shall be transmitted to one or more receivers located within a protected zone. The receivers shall, in-turn, transmit an alarm signal to the alarm annunciation system. No visible or audible alarm or noise shall emanate from the transmitter or receiver when activated. The transmitter housing shall shroud the activating button to prevent accidental activation. The transmitter shall be designed to be unobtrusive and still be activated in a covert manner. Switches shall be rated for a minimum lifetime of 50,000 operations and have a range of at least 45 m 150 feet. Wireless switches shall be fully supervised, such that the transmitter automatically transmits (checks in) to the receiver on a regular basis to test the system for low battery, tamper, and inactive status.

2.14 ACTUATED TRAFFIC ARMS

NOTE: Traffic arms are required in each inbound lane at the ID Check Area for all Safety Systems. Traffic arms are also required in front of all active vehicle barriers in the Presence Detection Safety System. Edit the following paragraphs as necessary.

Traffic arms in the ID Check Area shall be controlled by control switches in the Guard Booths. Traffic arms at the active vehicle barriers shall be controlled by the Traffic Controller Unit - see drawings for control logic. The housing for the traffic arm controller shall be weather proof and constructed of stainless steel not less than 14 gauge, carbon steel not less than 3 mm 1/8 inch thick, or cast steel not less than 6 mm 1/4 inch.
UFGS thick. All seams, joints, and supports shall be electric bead welded. Access to the motor compartment shall be provided with a removable cover secured in a weather proof manner with a lock.

2.14.1 Traffic Arm Assembly

The traffic arm drive assembly shall be directly linked to the gear motor by a heavy duty connecting rod. The traffic arm travel shall not exceed 4 seconds for raising or lowering. Override stops shall be provided to limit the gate arm travel in vertical or horizontal position and shall operate through 90 degrees. The assembly shall be capable of a minimum of 500 duty cycles per hour. A motor of at least 1/3 HP shall be used to power the system. The traffic arm assembly shall consist of a hollow aluminum assembly, wood, steel or fiberglass material with a length of 2.74 m 9 feet. Provide a spare arm for each traffic arm assembly. The traffic arm shall be covered with retroreflective red and white sheeting. See MUTCD for proper orientation of sheeting. Each traffic arm shall be equipped with an obstruction detector that will automatically reverse the traffic arm motor when an obstruction is detected.

2.14.2 Presence Detection Safety System Only

The traffic arm shall have a minimum of three red warning lights a minimum of 100 mm 4 inch in diameter evenly spaced on the arm. Provide interlocks and appurtenances to [illuminate][flash] the lights when the arm is deployed.

2.15 TRAFFIC SIGNALS

Provide traffic signals with light emitting diode (LED) signal modules as shown on the drawings. The term "LED signal module" in this text shall refer to an array of LEDs and lens that are capable of providing a circular signal indication as specified herein and shown on the drawings. All LED signal modules shall conform to the Equipment Standards of the Institute of Transportation Engineers (ITE), chapter 2a. The arrangement and size of signal indications for each LED signal module shall be as shown on the drawings and shall be in conformance with MUTCD.

2.16 WARNING BEACONS

The warning beacon shall include two alternately flashing signal sections. Each signal section shall have a standard traffic signal face with a flashing CIRCULAR YELLOW signal indication. Signal sections shall be mounted horizontally on the warning beacon. The visible diameter of each signal section shall not be less than 200 mm 8 inch. When illuminated, the beacon shall be clearly visible, to all drivers it faces, for a distance of at least 1.6 km 1 mile under normal atmospheric conditions unless otherwise physically obstructed. The yellow lens colors shall be in accordance with the requirements of MUTCD. All flashing contacts shall be equipped with filters for suppression of radio interference. Beacons shall be flashed at a rate of not less than 50 nor more than 60 times per minute. The illuminated period of each flash shall be 1/2 of the total cycle for each signal section. Operation should be programmable and permit continuous non-flashing operation through a supervisory signal from the Traffic Controller Unit (TCU). Provide day-light sensor and an automatic dimming system to reduce the brilliance of the beacon.
2.17 TRAFFIC SIGNAL SUPPORTS

The design and installation of all traffic control supports shall be in accordance with AASHTO LTS and applicable local and state standard specifications. Traffic signal supports consist of tubular members, mast arms, pole shaft, base plates, anchor bolts assemblies, foundations as well as associated connections and appurtenances. Loading evaluations shall be consistent with local and state guidelines. Ice and wind loads shall be determined based on the geographic location of the installation in accordance with AASHTO guidelines. Group loading analysis shall be consistent with local and state guideline and section 1.2.6 of AASHTO LTS. Allowable stress shall be consistent with local and state guideline and section 1.4 of AASHTO LTS. Fatigue calculations shall be consistent with local and state guideline and section 1.9.6 of AASHTO LTS. It is the Contractor's responsibility to conduct soil borings for foundation design; otherwise, conservative soils assumptions shall be used in calculating foundation requirements. If local and state guidelines provide foundations designs for design conditions, these guidelines may be used provided all loading and design conditions fall within guideline parameters. Before forming and placing concrete, each foundation excavation shall be inspected and evaluated for the actual soil conditions encountered. Do not proceed with the work until the excavation is inspected and evaluated. If necessary, revise the foundation design based on the soil conditions encountered. Before submitting the revised design for approval, obtain the signature and seal of a Professional Engineer registered in the State. Foundation locations may be changed to avoid underground obstructions (see Group II Technical Data Package). All design calculations as well as shop drawings shall be submitted to the government for review and acceptance prior to installation (see Group I Technical Data Package).

2.18 ACTIVE VEHICLE BARRIERS

******************************************************************************
NOTE: Edit Section 34 71 13.19 ACTIVE VEHICLE BARRIERS and include it in the procurement documents for the ACPCS.
******************************************************************************

Furnish and install active vehicle barriers in accordance with Section 34 71 13.19 ACTIVE VEHICLE BARRIERS.

2.19 SIGNS AND PAVEMENT MARKINGS

All signs and pavement markings shall be installed in accordance with MUTCD per Joint Regulation (DA AR 55-80/OPNAVINST 11210.2, AFMAN 32-1017/MCO 11210.2D/DLAR 4500.19) of the Department of Defense (DoD) Transportation Engineering Program. In states with supplements to the Manual on Uniform Traffic Control Devices (MUTCD), signs and pavement markings shall also be in accordance with those supplements. Signs and pavement markings shall meet retroreflectivity requirements as defined by FHWA and/or as contained in the MUTCD section 2A.8 and 2A.9. State and local retroreflectivity requirements shall also be satisfied. A minimum sign sheeting of MUTCD (Section 6F.63) Type III sign sheeting shall be used for regulatory and warning signs. All sign posts shall be of breakaway design as set forth in AASHTO RSDG-4 or as required by the local/State DOT. A signing and pavement marking plan shall be submitted to the government for review and comment and is subject to review and comment by SDDCTEA (see Group I Technical Data Package).
2.20 WIRE AND CABLE

Provide all wire, cable, and conduit connecting all Contractor furnished and, where indicated on the drawings, Government furnished equipment. Wiring shall be in accordance with NFPA 70. The wiring shall be [fiber optic][ or ][copper] cable in accordance with the manufacturers' requirements. Copper signaling line circuits and initiating device circuit field wiring shall be No. [18][20][_____] AWG size conductors at a minimum. Wire size shall be sufficient to prevent voltage drop problems. Circuits operating at 24 VDC shall not operate at less than 21.6 volts. Circuits operating at any other voltage shall not have a voltage drop exceeding 5 percent of nominal voltage.

2.20.1 Above Ground Sensor Wiring

Sensor wiring shall be 20 AWG minimum, twisted and shielded, 2, 3, 4, or 6 pairs to match hardware. Multi-conductor wire shall have an outer jacket of PVC.

2.20.2 Direct Burial Sensor Wiring

Sensor wiring shall be 20 AWG minimum, twisted and shielded, 2, 3, 4, or 6 pairs to match hardware. The construction of the direct burial cable shall be as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM.

2.20.3 Cable Construction

All cable components shall withstand the environment in which the cable is installed for a minimum of 20 years.

2.21 POWER LINE SURGE PROTECTION

Equipment connected to alternating current circuits shall be protected from power line surges. Equipment protection shall withstand surge test waveforms described in IEEE C62.41.1 and IEEE C62.41.2. Fuses shall not be used for surge protection.

2.21.1 Sensor Device Wiring and Communication Circuit Surge Protection

Inputs shall be protected against surges induced on device wiring. Outputs shall be protected against surges induced on control and device wiring installed outdoors and as shown. Communications equipment shall be protected against surges induced on any communications circuit. Cables and conductors, except fiber optics, which serve as communications circuits between systems shall have surge protection circuits installed at each end. Protection shall be furnished at equipment, and additional triple electrode gas surge protectors rated for the application on each wireline circuit shall be installed within 1 meter 3 feet of the building cable entrance. Fuses shall not be used for surge protection. The inputs and outputs shall be tested in both normal mode and common mode using the following two waveforms:

a. A 10 microsecond rise time by 1000 microsecond pulse width waveform with a peak voltage of 1500 Volts and a peak current of 60 amperes.

b. An 8 microsecond rise time by 20 microsecond pulse width waveform with a peak voltage of 1000 Volts and a peak current of 500 amperes.
2.21.2 Power Line Conditioners

A power line conditioner shall be furnished for equipment in each subsystem. The power line conditioners shall be of the Ferro-resonant design, with no moving parts and no tap switching, while electrically isolating the secondary from the power line side. The power line conditioners shall be sized for 125 percent of the actual connected kVA load. Characteristics of the power line conditioners shall be as follows:

a. At 85 percent load, the output voltage shall not deviate by more than plus or minus 1 percent of nominal when the input voltage fluctuates between minus 20 percent to plus 10 percent of nominal.

b. During load changes of zero to full load, the output voltage shall not deviate by more than plus or minus 3 percent of nominal. Full correction of load switching disturbances shall be accomplished within 5 cycles, and 95 percent correction shall be accomplished within 2 cycles of the onset of the disturbance.

c. Total harmonic distortion shall not exceed 3.5 percent at full load.

2.22 FACTORY ACCEPTANCE TEST

2.22.1 General

Provide personnel, equipment, instrumentation, and supplies necessary to perform a Factory Acceptance Test of the complete Active Vehicle Barrier Control System. The Factory Acceptance Test shall demonstrate the required barrier, traffic signal, and warning beacons controls. The test shall also demonstrate the required alarm annunciation, CCTV controls, and sequence of events recording. The test set-up must include the Traffic Controller Unit; the Gatehouse Control Console with all control panels, control switches, and CCTV monitors; and all Alarm Panels. The IDS, tamper, duress, overspeed, and wrong-way sensors; the active vehicle barrier open, close, and emergency close actuating devices; the active vehicle barrier open and close position switches; the VPDs; the traffic signals; and the warning beacons may all be simulated.

2.22.2 Test Plan

In accordance with the Group III Technical Data Package, submit a Test Plan including a schedule, test procedures, equipment catalog cuts, one line diagrams showing interconnections of all subsystem components, and diagrams showing control logic for the barriers, traffic signals, warning beacons, and alarm and status points to the Contracting Officer 30 days prior to the proposed test start date of the Factory Acceptance Test.

2.22.3 Test

Upon Test Plan approval by the Contracting Officer, assemble the test system and perform the Factory Acceptance Test. The Factory Acceptance Test shall demonstrate that the subsystems comply with the requirement specified herein. The Factory Acceptance Test shall be conducted during regular daytime working hours on weekdays. The Contracting Officer reserves the right to witness all or a portion of the Factory Acceptance Test.
2.22.4 Test Report

Within seven days of successful completion of the Factory Acceptance Test, submit a Test Report to the Contracting Officer documenting the results of the test. The Test Report shall include the results of all test procedures showing all commands, stimuli, and responses to demonstrate compliance with the contract requirements. The Test Report shall also include a certification from Technical Specialists from the active vehicle barrier, the Traffic Controller Unit, and the CCTV subsystems that their subsystem meets the contract requirements. The Contracting Officer will notify the Contractor within 7 days of receipt of the Test Report whether the Test Report is approved. If disapproved, the Contracting Officer will note the specific procedures that are disapproved; retest those procedures. Do not ship equipment to the field until the Test Report is approved by the Contracting Officer.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify that site conditions are in agreement with the contract drawings. In accordance with Group II Technical Data Package, prepare a report describing any differences in site conditions or conditions that will affect performance of the system to the Contracting Officer. Do not take any corrective action without written permission from the Contracting Officer.

3.2 INSTALLATION

3.2.1 Oversight

The Contractor designated Technical Specialist from the AVBCS shall oversee installation.

3.2.2 Installation Schedule

Before beginning any site work, provide a schedule of all installation and testing activities. The project activities in the proposed schedule shall be arranged in chronological order. All installation and testing activities, specifically those requiring ACP outages, shall be coordinated with the Contracting Officer. No site work shall be done without an approved schedule by the Contracting Officer.

3.2.3 Wiring

Furnish and install all cables and conduits for all wiring interconnecting contractor furnished, and where indicated, Government furnished equipment. Install all wiring per Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

3.2.4 Grounding

Provide adequate grounding system for the following: Traffic Signal supports, Warning Signal supports, AVBCS enclosure, Active Vehicle Barrier frames, Active Vehicle Barrier control enclosure, and supports for over speed and wrong-way detectors. Test installed ground rods as specified in IEEE 142. Provide a ground wire from Active Vehicle Barrier frame to the Active Vehicle Barrier control enclosure.
3.2.5 Enclosure Penetrations

Enclosure penetrations shall be from the bottom unless the system design requires penetrations from other directions. Penetrations of interior enclosures involving transitions of conduit from interior to exterior, and penetrations on exterior enclosures shall be sealed with rubber silicone sealant to preclude the entry of water. The conduit riser shall terminate in a hot-dipped galvanized metal cable terminator. The terminator shall be filled with an approved sealant as recommended by the cable manufacturer and in a manner that does not damage the cable.

3.2.6 Cold Galvanizing

Field welds and/or brazing on factory galvanized boxes, enclosures, conduits, etc., shall be coated with a cold galvanized paint containing at least 95 percent zinc by weight.

3.2.7 Other Requirements

Install the system in accordance with the standards for safety included in NFPA 70 and the appropriate installation instructions from the manufacturers of the equipment. Components within the system shall be configured with appropriate service points to pinpoint system trouble in less than 20 minutes.

3.2.8 Incidental Infrastructure

******************************************************************************
NOTE: Provide drawing showing all contract requirements for incidental infrastructure, e.g., shoulders, curbing, shoulder to curb transitions, guardrail, and other passive barriers. Passive barriers must transition towards active barriers in accordance with Standard Drawing C9.02. Gaps and offsets between active and passive barriers must prevent a threat vehicle from traveling between barriers. Active vehicle barriers must be installed in a curbed section. If no curbing exists, a shoulder to curb transition of 10:1 must be introduced prior to and after the active vehicle barrier. All appurtenances must have lateral offset no less than 600 mm 2 feet as noted on Standard Drawing C9.02 except in the absence of curbing or where speeds exceed 64 km/h 40 mph, in which case offsets and clearances must be compliant with AASHTO RSDG-4. All passive barriers not identified as crashworthy per NCHRP 350 and AASHTO RSDG-4 must be located outside of the clear zone as defined by AASHTO RSDG-4.
******************************************************************************

Provide all incidental construction as indicated. Incidental construction shall be designed and constructed in accordance with local/state DOT requirements, AASHTO GDHS-5, AASHTO RSDG-4, NCHRP 350, and the MUTCD.

3.3 CONTRACTOR FIELD TEST

In accordance with Group III Technical Data Package, the Contractor's Commissioning Team shall submit a Test Plan including a test schedule.
Calibrate and test all equipment, verify communications links between all subsystem components and between subsystems, place the integrated system in service, and test the integrated system using the approved test procedures for the Performance Verification Test. Deliver a report certifying that the installed complete system has been calibrated, tested, and is ready to begin performance verification testing. The report shall also include certifications from the Technical Specialists of the Active Vehicle Barrier, Traffic Controller Unit, and CCTV equipment/subsystems that the equipment/subsystems have been installed and tested and that they meet the requirements of the specifications.

3.4 COMMISSIONING

3.4.1 General

Commissioning shall consist of successfully completing a Performance Verification Test, the training of Installation security and maintenance personnel, and successfully completing an Endurance Test as described below. Commissioning shall begin only after the Contracting Officer approves the Test Report from the Contractor Field Test and all materials in the Group IV Technical Data Package.

3.4.2 Commissioning Team Leader

Designate a Commissioning Team Leader to be responsible for scheduling all tests, coordinating attendance of all required Commissioning Team members, conducting the tests, and preparing appropriate Test Reports and the final Commissioning Report.

3.4.3 Commissioning Team

The Commissioning Team shall consist of the Commissioning Team Leader; the Technical Specialists from the Active Vehicle Barrier supplier, the Traffic Controller Unit subsystem, and the CCTV subsystem; a representative of the design agent; a Contracting Officer’s representative; a representative from the installation; a representative of the Electronic Security Systems Center; and a representative of the USACE Protective Design Center. The programmer of the Traffic Controller Unit shall also be present during commissioning tests if he/she is not the Traffic Controller Unit Technical Specialist.

3.4.4 Training

3.4.4.1 General Requirements

**************************************************************************
NOTE: Coordinate the training requirements with the Installation and designate the number of persons to be trained.
**************************************************************************

Conduct training courses for designated personnel in the operation and maintenance of the ACPCS. The training shall be oriented to the specific system being installed. Training manuals shall be delivered for each trainee with 2 additional copies delivered for archiving at the project site. The manuals shall include an agenda, defined objectives for each lesson, and a detailed description of the subject matter for each lesson. Furnish audio-visual equipment and other training materials and supplies. Where the Contractor presents portions of the course by audio-visual
material, copies of the audio-visual material shall be delivered to the Government either as a part of the printed training manuals or on the same media as that used during the training sessions. A training day is defined as 8 hours of classroom instruction, including two 15-minute breaks and excluding lunchtime, Monday through Friday, during the daytime shift in effect at the training facility. For guidance in planning the operator training for the guards, assume that guards will have a high school education or equivalent and are familiar with Access Control Points operations. For maintenance training, assume mechanical and electrical maintenance personnel typically employed at military installations. Approval of the planned training schedule shall be obtained from the Government at least 30 days prior to the training.

3.4.4.2 Guard’s Training

The Guard Training Course shall be taught at the project site for a period of up to eight hours during or after the Contractor's field testing, but before commencing the performance verification test. A maximum of [12] personnel shall attend the course. No part of the training given during this course will be counted toward completion of the performance verification test. The course shall include instruction on the specific hardware configuration of the installed system and specific instructions for operating the installed system. Upon completion of this course, each student shall be able to operate the ACPCS including the following:

a. Operate the active vehicle barriers in both the Test, Local and EFO modes.

b. Understand the differences between the normal and EFO operation of the barriers.

c. Understand when to use Test, Local and EFO modes for each barrier.

d. Understand all requirements for putting a barrier in either the Test or Local modes including required actions in the roadway ahead of the barrier and actions at the barrier.

e. Understand the active vehicle barrier safety scheme including operation of all Vehicle Presence Detectors, Traffic Signals, signs, and warning signals.

f. Understand operation of the Traffic Signal including all signal indications for various operational modes and barrier positions.

g. Reconfigure barriers after an EFO activation.

h. Understand the operation and coverage of all over speed and wrong-way sensors.

i. Monitor, acknowledge, and reset alarms.

j. Monitor and control CCTV system

3.4.4.3 Maintenance Personnel Training

The Maintenance Personnel Training Course shall be taught at the project site for a period of up to eight hours during or after the Contractor's field testing, but before commencing the performance verification test. A maximum of [12] personnel shall attend the course. The course
shall include the following:

a. Instruction on each equipment and its configuration in the installed system.

b. Trouble shooting and diagnostic procedures.

c. Component repair and replacement procedures.

d. Emphasis on the importance of periodic testing and preventative maintenance. Provide a list of periodic preventative maintenance tasks for the active vehicle barriers and other critical equipment.

e. Calibration procedures.

f. Review of system drawings to identify device locations, communications, topology, and flow.

3.4.4.4 System Manager Training

[_____] System managers shall be trained for a minimum of 8 hours in addition to the Guard and Maintenance Personnel described above. System Manager Training shall provide training for trainers, such that, system managers will be able to train new guards and maintenance personnel in the future. System Manager Training shall also include the following:

a. Enrollment/deactivation process including the assignment of operator passwords.

b. Change database configuration.

c. Modify graphics, if provided.

d. Print reports, e.g., Sequence of Events reports.

e. Any other functions necessary to manage the system.

3.4.5 Performance Verification Test (PVT)

3.4.5.1 Test Plan

In accordance with the Group IV Technical Data Package, the Contractor's Commissioning Team Leader shall submit a Test Plan including a schedule, test procedures, equipment catalog cuts, one line diagrams showing interconnections of all subsystem components, and diagrams showing control logic for the barriers, traffic signals, warning beacons, and alarm and status points to the Contracting Officer 30 days prior to the proposed start date of the Performance Verification Test. For each test in the PVT, the test procedures shall clearly indicate which Commissioning Team members must witness and certify the test. Coordinate PVT tests with the testing requirements for the Active Vehicle Barriers in Section 34 71 13.19 ACTIVE VEHICLE BARRIERS.

3.4.5.2 Test Equipment

Have the following equipment available for all PVT tests:

a. A minimum of 4 hand held radios/walkie-talkies.
b. Safety vests for all participants.
c. Stop watch.
d. Flash lights.
e. Multi-meter.

3.4.5.3 Test

Per approved test procedures and under the direction of the Contractor's Commissioning Team Leader, the Commissioning Team shall perform a Performance Verification Test of the installed Access Control Point Control System. The PVT shall demonstrate that the system complies with the requirements specified herein. Where possible, the PVT shall be conducted during regular daytime working hours on weekdays. At the successful completion of each test in the PVT, appropriate Commissioning Team Members shall sign the completed test procedure to certify that the test was successful.

3.4.5.4 Test Report

Within seven (7) days of successful completion of the PVT, the Contractor's Commissioning Team Leader shall submit a Test Report to the Contracting Officer documenting the results of the test. The Test Report shall include the results of all test procedures showing all commands, stimuli, and responses to demonstrate compliance with the contract requirements. The Test Report shall also include a certification from each Commissioning Team member that the tests were successful. The Contracting Officer will notify the Contractor, within 7 days of receipt of the Test Report, whether the Test Report is approved. If disapproved, the Contracting Officer will note the specific procedures that are disapproved; retest those procedures. Do not start the Endurance Test until the PVT Test Report is approved by the Contracting Officer.

3.4.5.5 Opposite Season Test

**************************************************************************
NOTE: If temperature lows at the site dip to below freezing in the winter time, specify an opposite season test. If the initial pvt test is done in the winter, specify an opposite season test in the summer. If the initial pvt is done in the spring, summer, or fall; specify an opposite season test in the winter.
**************************************************************************

Coordinate with the Commissioning Team to conduct an opposite season PVT in the [summer] [winter] months. All PVT tests and test reports required for the initial PVT shall be required for the opposite season PVT.

3.4.6 Endurance Test

3.4.6.1 General

In accordance with the Group IV Technical Data Package, the Contractor's Commissioning Team Leader shall submit a Test Plan including a schedule, test description, list of personnel required to conduct the test, and a list of all data to collect and observances to be made in order to
demonstrate system reliability and operability of the completed Access Control Point Control System. The Endurance Test shall be conducted in phases as specified. The Endurance Test shall not be started until the Contractor notifies the Contracting Officer, in writing, that training as specified has been completed and that the correction of all outstanding deficiencies has been satisfactorily completed. The Contracting Officer may terminate the testing at any time the system fails to perform as specified. Upon termination of testing by the Contracting Officer or by the Contractor, commence an assessment period as described for Phase II below.

3.4.6.2 Phase I Testing

The test shall be conducted 24 hours per day for 15 consecutive calendar days, including holidays, and the system shall operate as specified. Make no repairs during this phase of testing unless authorized by the Contracting Officer in writing. If the system experiences no failures during Phase I testing, the Contractor may proceed directly to Phase III testing after receipt of written permission from the Contracting Officer.

3.4.6.3 Phase II Assessment

After the conclusion of Phase I, identify all failures, determine causes of all failures, repair all failures, and deliver a written report to the Contracting Officer. The report shall explain in detail the nature of each failure, corrective action taken, results of tests performed, and shall recommend the point at which testing should be resumed. After delivering the written report, convene a test review meeting at the jobsite to present the results and recommendations to the Contracting Officer. The meeting shall not be scheduled earlier than 5 business days after receipt of the report by the Contracting Officer. As a part of this test review meeting, demonstrate that all failures have been corrected by performing appropriate portions of the performance verification test. Based on the Contractor's report and the test review meeting, the Contracting Officer will determine the restart date, or may require that Phase I be repeated. If the retest is completed without any failures, proceed directly to Phase III testing after receipt of written permission from the Contracting Officer.

3.4.6.4 Phase III Testing

The test shall be conducted 24 hours per day for 15 consecutive calendar days, including holidays, and the system shall operate as specified. Make no repairs during this phase of testing unless authorized by the Contracting Officer in writing.

3.4.6.5 Phase IV Assessment

After the conclusion of Phase III, identify all failures, determine causes of failures, repair failures, and deliver a written report to the Contracting Officer. The report shall explain in detail the nature of each failure, corrective action taken, results of tests performed, and shall recommend the point at which testing should be resumed. After delivering the written report, convene a test review meeting at the jobsite to present the results and recommendations to the Contracting Officer. The meeting shall not be scheduled earlier than 5 business days after receipt of the report by the Contracting Officer. As a part of this test review meeting, demonstrate that all failures have been corrected by repeating appropriate portions of the performance verification test. Based on the Contractor's report and the test review meeting, the Contracting Officer will determine
the restart date, and may require that Phase III be repeated. Do not commence any required retesting until after receipt of written notification by Contracting Officer. After the conclusion of any retesting which the Contracting Officer may require, the Phase IV assessment shall be repeated as if Phase III had just been completed.

3.4.7 Commissioning Report

Upon successful completion of the Endurance Test, the Contractor's Commissioning Team Leader shall prepare a Commissioning Report documenting that the Contractor has successfully completed the PVT and Endurance Test and recommending that the completed system be accepted. The Commissioning Report shall include signatures of the Commissioning Team.

3.5 APPENDICES

**************************************************************************
NOTE: There are three possible Appendix A, of which the Designer must choose one.
**************************************************************************
APPENDIX A
Normally Deployed Active Barrier Safety System

[NOTE TO DESIGNER.
1. Include drawings showing the control switches and control logic for this scheme. Use Drawing E1.07 in the Standard Design or provide a new drawing if the control switches on Drawing E1.07 are modified. If the controls are modified from Drawing E1.07 and the control sequences described below, provide narrative descriptions of the controls in the same detail as provided below.
2. Include drawings showing locations of all required features including Gatehouse, Guard Booths, active vehicle barriers, stop lines, traffic signals, vehicle presence detectors, signs, and pavement markings.]

1 NORMALLY DEPLOYED SYSTEM FEATURES. Provide the following features for the Barrier Normally Closed Safety System:

1.1 One or more sets of Active Vehicle Barriers in the inbound and outbound lane or lanes. Each set of barriers will consist of an initial and final barrier(s) separated by a selected distance to form an entrapment area, in which either the initial barrier(s) or final barrier(s) is always closed.

1.2 Passive barrier on a raised island separating the inbound entrapment area from the outbound entrapment area to prevent vehicle crossover.

1.3 Passive barriers along the ACP corridor to contain vehicles within the corridor.

1.4 One three-light Traffic Signal located on each side of each active vehicle barrier (or roadway if there is more than one barrier across the roadway) as shown on the Drawings. The three lights in each Traffic Signal shall be Red-Yellow-Green top to bottom.

1.5 A 2 foot wide stop line placed 10 feet in front of each barrier(s) as a driver normally approaches the barrier(s).

1.6 Vehicle presence detectors located immediately before and immediately after each barrier. Presence detectors can be induction loops, video motion sensors, or other suitable technologies capable of sensing vehicle presence.

1.7 One Master Control Panel and one Guard Booth Control panel for each Guard Booth along with all control switches and indicating lights as shown on the Drawings. The Master Control Panel will normally be located in the Gatehouse for use by the lead ACP guard.

1.8 [NOTE TO DESIGNER. If actuated traffic arm(s) is not required, delete this paragraph. See Standard Definitive Design drawings for Barrier Normally Closed schemes with and without actuated traffic arms.] An Actuated Traffic Arm for each inbound lane in the ID Check Area. ATAs shall be installed near the Guard Booths as shown on the Drawings. An ATA Control Panel with Open and Close control switches for the ATA shall be provided and mounted on the back wall of the Guard Booth below the back window.

2 BARRIER CONTROL SWITCHES.

2.1.1 Per the Drawings, the active vehicle barrier control system shall have one Control Power On/Off switch, one key operated 3 position Manual - Auto - Local mode selector switch for the Inbound Barriers, one key operated 3...
APPENDIX A

Normally Deployed Active Barrier Safety System

position Manual - Auto - Local mode selector switch for the Outbound Barriers, one Inbound Fill switch, one Inbound Release switch, one Outbound Fill switch, one Outbound Release switch, and one set of Open and Close switches for each barrier. Keys for the inbound and outbound mode switches shall be unique and shall be removable in the Local positions only. Also per the Drawings, the Guard Booth Control Panels shall have one Inbound Fill switch, one Inbound Release switch, one Outbound Fill switch, and one Outbound Release switch. In the Barrier Normally Closed Safety Scheme, at least one barrier is closed in both the inbound and outbound lanes, therefore, the EFO function (and associated controls) is not required.

2.1.2 In the Manual mode of the Inbound Barriers' mode selector switch, the Close and Open switches on the Master Control Panel shall be activated for the inbound barriers, but the Fill and Release switches on the Master and Guard Booth Control Panels shall be deactivated for inbound barriers. In the Auto mode of the Inbound Barriers' mode selector switch, the Close and Open switches on the Master Control Panel shall be deactivated for the inbound barriers and the Fill and Release switches on the Master and Guard Booth Panels shall be activated for the inbound barriers. In the Local position of the inbound barriers' Manual - Auto - Local selector switch, the Close and Open switches on the Master Control Panel shall be deactivated and the Fill and Release switches on the Master and Guard Booth Control Panels shall also be deactivated for the inbound barriers. Inbound barriers can only be operated by controls located locally at the barriers. The above requirements also apply to the control switches and control logic for the outbound barriers.

2.1.3 Under normal operations, the Inbound Barriers and Outbound Barriers Manual - Auto - Local mode selector switches on the Master Control Panel will be in the Auto positions. Barriers in the inbound or outbound lane(s) can be individually operated by placing the appropriate Inbound or Outbound Mode switch to the Manual mode. Once in the Manual mode, individual barriers can be opened and closed from the Open and Close switches on the Master Control Panel. The Local position of each barrier's Manual - Auto-Local selector switch can be used when maintenance needs to be performed on a barrier. Maintenance personnel would place the Inbound or Outbound Manual - Auto - Local mode switch in the Local position and then remove and retain the key, thus locking out all control of those barriers from the Master and Guard Booth Control Panels. Maintenance personnel would also have to block and mark the lane ahead of the barriers and also lock and tag out certain equipment at the barriers per the barrier manufacturer's recommendations for the type of maintenance to be performed.

3 TRAFFIC SIGNAL AND BARRIER CONTROLS.

3.1 BARRIER LAYOUT AND DESIGNATIONS. Each inbound and outbound lane shall have 2 barriers per lane arranged in a sally port to entrap a vehicle or vehicles between them. The space between barriers shall be long enough for the longest vehicle anticipated for the ACP. The space may be made longer to accommodate multiple vehicles in a platooning type arrangement. Per the Drawings, the initial barrier from the perspective of innocent motorists is designated A, and the final barrier is designated B for inbound lanes. The initial barrier, again from the perspective of the innocent motorists, is designated C, and the final barrier is designated D for outbound lanes.

3.2 AUTO MODE OF OPERATION.
APPENDIX A

Normally Deployed Active Barrier Safety System

3.2.1 Initially with no vehicles present in the inbound lanes and the Inbound Barriers' Manual - Auto - Local mode selector switch in the Auto mode, Barrier A is open and Barrier B is closed. Incoming vehicles are checked at the ID Check point and if cleared are allowed to pass over Barrier A and proceed to the Stop Line for Barrier B. The guard at either the Gatehouse or the Guard Booth will then activate the Inbound Release switch. Upon activation of the Inbound Release switch, the Traffic Signal for Barrier A shall go from Green to Yellow for three seconds and then to Red. After an additional second of Red, Barrier A's close circuit shall be energized to close the barrier. After Barrier A is fully closed, Barrier B's open circuit shall be energized to open Barrier B. When Barrier B is fully open, its Traffic Signal shall change from Red to Green to allow the vehicle or vehicles to proceed onto the Installation.

3.2.2 When the vehicle or vehicles between Barriers A and B have passed over Barrier B, the guard will activate the Inbound Fill switch. Upon activation of the Inbound Fill switch, the Traffic Signal for Barrier B shall change from Green to Yellow for 3 seconds and then to Red. After an additional 1 second at Red, Barrier B's close circuit will be energized to close Barrier B. After Barrier B is fully closed, the open circuit for Barrier A shall be energized to open Barrier A. After Barrier A is fully open, its Traffic Signal shall change from Red to Green.

3.2.3 The same controls apply to Barriers C and D in the outbound lanes and control switches Outbound Release and Outbound Fill.

3.2.4 The close circuit for all barriers shall be supervised by the Vehicle Presence Detectors (VPD's) in front of and behind the barrier, such that if either VPD detects a vehicle, the barrier close circuit shall be suppressed.

3.2.5 A red indicating light adjacent to each Fill switch shall light when the lane barriers are in the Fill position, i.e., the initial barrier is open and the final barrier is closed. Similarly, a red indicating light adjacent to each Release switch shall light when the lane barriers are in the Release position, i.e., the initial barrier is closed and the final barrier is open. The Fill and Release indicator lights shall only light when the barriers' mode switch is in the Auto position.

3.3 MANUAL MODE OF OPERATION. When the Inbound Barriers Manual - Auto - Local mode switch is placed in the Manual mode, the inbound barriers shall be controlled from the individual barrier Open and Close switches on the Master Control Panel. Initiation of a Close command to an open barrier shall cause that barrier's Traffic Signal to change from Green to Yellow for 3 seconds and then to Red. After an additional one second of Red, the barrier's close circuit shall be energized through the VPD's immediately in front of and behind the barrier. If the VPD's are clear, the barrier shall close. Initiation of an Open commend to a closed barrier shall energize the open circuit for the barrier and open the barrier. After the barrier is fully open, the Traffic Signal shall change from Red to Green. In the Manual mode, both initial and final barriers in a given entrapment area can be opened. Situations requiring this configuration include passing a vehicle that is longer than the entrapment area. In such situations, guards must provide compensatory security measures to defeat a threat while both barriers are open.

3.4 LOCAL MODE OF OPERATION. When the barrier's Manual - Auto - Local mode switch is placed in the Local position and the barrier is open, the Traffic
APPENDIX A

Normally Deployed Active Barrier Safety System

Signal for that barrier shall change from Green to Yellow for 3 seconds and then to Red. If the barrier is closed when its Manual - Auto - Local mode switch is placed in the Local position, the Traffic Signal will already be Red and shall stay Red as long as the selector switch is in the Maintenance position. When the barrier's Manual - Auto - Local mode switch is returned to the Manual or Auto positions, the Traffic signal shall stay Red if the barrier is closed or shall change to Green if the Barrier is open.

3.5 OUTBOUND ENTRAPMENT AREA: A VPD located immediately in front of the final barrier's STOP line shall detect a vehicle's presence in the entrapment area. If the final barrier is closed, a signal shall be sent to the guard in the Gatehouse notifying him/her of the vehicle's presence. The signal shall cause a short audible noise to alert the guard and shall turn on a Red indicating light until the final barrier is open.
APPENDIX A
Presence Detection Active Barrier Safety System

[NOTE TO DESIGNER. Include a drawing showing the control switches and control logic for this scheme. Use Drawings E1.03 and either E1.05 (no queue preemption) or E1.06 (queue preemption) in the Standard Design or provide new drawings if the control switches and controls on Drawing E1.03, E1.05, or E1.06 are modified. If the controls are modified from Drawings E1.03, E1.05, or E10.6, the following control sequences must also be modified.]

1 PRESENCE DETECTION SAFETY SCHEME FEATURES. Provide the following features for the Presence Detection Safety Scheme:

1.1 One Active Vehicle Barrier at the end of the Response Zone in each inbound and each outbound lane.

1.2 Dual phenomenology vehicle presence detectors (VPDs) located in front of the Stop Line (detectors 1a and 1b), between the Stop Line and the barrier (detectors 2a and 2b), and immediately after the barrier (detectors 3a and 3b). Presence detectors can be induction loops, IR Break Beams, video motion sensors, or other suitable technologies capable of sensing vehicle presence.

1.3 Passive barriers on raised islands between each inbound and each outbound lane. Passive barriers and islands shall extend from just ahead of the range of VPDs 1a and 1b to just beyond the trailing edge of the range of VPDs 3a and 3b. See Drawings.

1.4 Passive barrier on a raised median island between the inner most inbound and outbound lanes. Passive barrier and median island shall extend from the end of the last Turn-around to either the trailing edge of range of the inbound VPDs 3a and 3b or the leading edge of the outbound VPDs 1a and 1b, whichever is further. See Drawings.

1.5 A three light Traffic Signal at each inbound and outbound lane. The three lights in each Traffic Signal shall be Red-Yellow-Green top to bottom. The Traffic Signal shall be located 3.5 feet behind the front edge of the Stop Line as a driver normally approaches the barriers.

1.6 A 2 foot wide Stop Line placed 24 feet in front of the active vehicle barrier as a driver normally approaches the barrier.

1.7 Actuated Traffic Arm 11.5 feet beyond the front edge of the Stop Line. Provide an Auto-Test selector switch and Open and Close switches for the ATA in the Barrier Control Cabinet. In the Auto mode of the selector switch, the ATA control shall mimic the adjacent active vehicle barrier. In the Test mode of the selector switch, the ATA shall be controlled by the Open and Close switches.

1.8 Vehicle presence detection systems to detect queues on any inbound or outbound lanes in front of the barrier(s). VPDs shall be a minimum of 117 feet in front of the front edge of the Stop Line and shall cover an area the width of the lane(s) by 50 feet long. Multiple loops may be used to achieve the 50 foot required length.

1.9 One Master Control Panel, one Guard Booth Control panel for each Guard Booth, one Overwatch Position Control Panel, and a Local Control Panel for each barrier along with all control switches and indicating lights as shown.
APPENDIX A

Presence Detection Active Barrier Safety System

on the Drawings. The Master Control Panel will normally be located in the Gatehouse for use by the ACP guards. Each Local Control Panel for an individual barrier shall be located locally at or near its respective barrier.

1.10 Actuated Traffic Arm for each inbound lane in the ID Check Area. ATAs shall be installed near the Guard Booths as shown on the Drawings. An ATA Control Panel with Open and Close control switches for the ATA shall be provided and mounted on the back wall of the Guard Booth below the back window.

2 BARRIER CONTROL SWITCHES.

2.1 Per the Drawings, the Master Control Panel shall have a Control Power On/Off switch and each barrier shall have a 3 position mode selector switch and Open and Close switches. Also per the Drawings, the Master Control Panel and the Guard Booth and Overwatch Position Control Panels shall have EFO switches. Each barrier shall also have a 2 position mode selector switch and Open and Close switches on a Local Control Panel located at or near the barrier.

2.2 The modes on each barrier's mode selector on the Master Control Panel shall be Local - EFO - Test. Each switch shall be operable by a key unique for that switch only, which shall be removable in all modes. The modes of each barrier's mode selector switch on the Local Control Panel shall be Off-Local. Each switch shall be operable by the same key that operates the mode selector switch for that barrier on the Master Control Panel. The key will be removable in the "Off" position only of the Off-Local mode selector switch.

2.3 Operating Modes.

2.3.1 EFO Operation. Under normal operations, all barriers' mode selector switches on the Master Control Panel will be in the EFO position with the key removed and accessible only by the lead ACP guard. With the barrier's mode selector switch in the EFO position, EFO shall be enabled for that barrier, but the Open and Close switches for that barrier on the Master Control Panel and the Open and Close switches on that barrier's Local Control Panel shall be disabled.

2.3.2 Test Operation. An individual barrier can be test operated by installing the proper lane markings and passive barriers ahead of the active barrier and then placing its mode selector switch in the Test position. With the barrier's mode selector switch in the Test position, that barrier's Open and Close switches on the Master Control Panel shall be enabled, but the Open and Close switches on that barrier's Local Control Panel shall be disabled and all EFO switches shall be disabled for that barrier only.

2.3.3 Local Operation. The Local mode can be used when maintenance personnel need to perform maintenance on the barrier. Maintenance personnel would obtain the mode selector switch key from the lead ACP guard, place the barrier's mode selector switch on the Master Control Panel in the Local position, and then remove the key. With the barrier's mode selector switch on the Master Control Panel in the Local position, that barrier's Open and Close switches on the Master Control Panel shall be disabled and all EFO switches shall be disabled for that barrier only. The maintenance person would then insert the key into the Off-Local mode selector switch on the barrier's Local Control Panel and turn the key to the "Local" position, which shall enable
APPENDIX A

Presence Detection Active Barrier Safety System

the Open and Close switches on the barrier's Local Control Panel. Maintenance personnel would also have to block and mark the lane ahead of the barrier and also lock and tag out certain equipment at the barrier per the barrier manufacturer's recommendations for the type of maintenance to be performed.

3 TRAFFIC SIGNAL AND BARRIER CONTROLS.

3.1 EFO MODE OF OPERATION. In the EFO mode of operation with the barrier open and no vehicles on VPD 1a or 1b, the Traffic Signal shall be Red. If a vehicle is detected by either VPD 1a or 1b, there shall be a one second delay and then the Traffic Signal shall change from Red to Green to allow the vehicle to pass over the barrier. Once the vehicle is detected by either VPD 2a or 2b, the Traffic Signal shall change from Green back to Red. This operation is similar to Lane Metering on freeway entrances. If a vehicle is detected by VPD 2a, 2b, 3a, or 3b at the instant a guard activates the barrier Emergency Fast Operate (EFO) command, the barrier "Close" circuit shall be suppressed until VPD's 2a, 2b, 3a, and 3b are all clear. Also, if a guard activates the Emergency Fast Operate (EFO) command and the Traffic Signal is Green, the Traffic Signal shall change from Green to Red and the barrier "Close" circuit shall be suppressed until the vehicle is detected by either VPD 2a or 2b. If the vehicle is detected by VPD 2a or 2b, the suppression will continue until VPD's 2a, 2b, 3a, and 3b are all clear as described above. If neither of these conditions exist at the time that a barrier Emergency Fast Operate (EFO) command is activated, the barrier "Close" Circuit shall not be suppressed and the barrier shall immediately close in its emergency fast mode (2 seconds or less). See typical control schematics on the Drawings.

3.2 [NOTE TO DESIGNER: Delete paragraphs 3.2 and 3.3 if Queue Operation is not required.] QUEUE OPERATION. If vehicles back up behind the Stop Line during periods of heavy traffic such that the queue VPD detects a vehicle continuously for 30 seconds, the Traffic Signal shall go from Lane Metering operation to Queue operation. In the Queue operation, the Traffic Signal shall change to Flashing Yellow and vehicles will be allowed to pass over the barrier without stopping at the Stop Line. The Queue operation shall end immediately when the Queue VPD does not detect a vehicle. When the Queue operation ends, the Traffic signal shall change from Flashing Yellow to Solid Yellow and then to Red and resume Lane Metering operation. The distance between the Queue VPD and the Stop Line is such that the last vehicle leaving the Queue VPD will see the Traffic Signal change to Solid Yellow and Red in time to have to stop at the Stop Line. Since this operation relies on the vehicles in the queue to stop a threat vehicle, the last vehicle in the queue must stop at the Stop Line.

3.3 EFO DURING QUEUE OPERATION. If an EFO command is activated from any of the Control Panels during Queue operation, the Traffic Signal shall go from Flashing Yellow to Solid Yellow for 4 seconds and then to Solid Red. After an additional 1 second of Solid Red, the barrier close circuit shall be energized, provided that there are no vehicles detected on VPD's 2a, 2b, 3a, or 3b. If a vehicle is detected on any of these VPD's, the barrier close circuit will be suppressed until all VPD's are clear.

3.4 EFO RESET. After an EFO activation, guards will close all inbound and outbound lanes. Guards will then activate the EFO Reset switch on the Master Control Panel to reset EFO, place each barrier's mode switch to the Test position, open each barrier using the Open switches on the Master
APPENDIX A

Presence Detection Active Barrier Safety System

Control Panel, and then place each barrier's mode switch to the EFO position. Guards could then reopen the ACP.

3.5 TEST AND LOCAL MODES OF OPERATION. When a barrier's mode switch is placed in either the Local or Test modes, the traffic signal for that barrier, if not already red, shall go from Green to Yellow for 3 seconds and then to Red. As noted above, before a barrier's mode switch is placed in either the Local or Test positions, the operator must ensure that the lane that the barrier is in is properly blocked and marked.

3.6 RETURN TO EFO MODE. When the barrier's mode switch is placed in the EFO mode and the barrier is open, the barrier's Traffic Signal shall revert back to the RED/GREEN lane metering operation. If a barrier's mode switch is placed in the EFO mode and the barrier is closed, the barrier's Traffic Signal shall stay Red and an alarm shall be generated on the ACP TROUBLE window on the Gatehouse Control Panel.
APPENDIX A
Signs and Signals Active Barrier Safety System

[NOTE TO DESIGNER. Include a drawing showing the control switches and control logic for this safety scheme. Use Drawings E1.03 and E1.04 in the Standard Design or provide a new drawing if the control switches and controls on Drawings E1.03 and E1.04 are modified. If the controls are modified from Drawings E1.03 and E1.04, care must be taken to ensure compliance with the security and safety criteria in the Army Standard Design. The control sequences described below will also need to be modified.]

1 SIGNS AND SIGNALS SAFETY SCHEME FEATURES. Provide the following features for the Signs and Signals Safety System:

1.1 Active Vehicle Barriers in all inbound and outbound lanes.

1.2 A three light Traffic Signal over each inbound and outbound active barrier. The three lights in each Traffic Signal shall be Red-Yellow-Green top to bottom. The Traffic Signal shall be located up to 10 feet behind the active barriers as a driver normally approaches the barriers.

1.3 A 2 foot wide stop line placed 40 feet in front of the traffic signal as a driver normally approaches the barriers.

1.4 Double solid white lines between inbound lanes approaching the barriers to prohibit lane changes in front of the barriers.

1.5 Double solid yellow lines between adjacent inbound and outbound lanes.

1.6 Vehicle Presence Detectors (VPDs) located immediately before and immediately after each barrier. VPDs can be induction loops, video motion sensors, or other suitable technologies capable of sensing vehicle presence.

1.7 Warning Sign and Beacon with alternating yellow flashing lights located 150 feet in front of the barriers.

1.8 One Master Control Panel, one Guard Booth Control panel for each Guard Booth, one Overwatch Position Control Panel, and a Local Control Panel at each barrier along with all control switches and indicating lights as shown on the Drawings. The Master Control Panel will normally be located in the Gatehouse for use by the ACP guards. Each Local Control Panel for an individual barrier shall be located locally at its respective barrier power unit.

1.9 Actuated Traffic Arm for each inbound lane in the ID Check Area. ATAs shall be installed near the Guard Booths as shown on the Drawings. An ATA Control Panel with Open and Close control switches for the ATA shall be provided and mounted on the back wall of the Guard Booth below the back window.

2 BARRIER CONTROL SWITCHES.

2.1 Per the Drawings, the Master Control Panel shall have one Control Power On/Off switch and each barrier shall have a 3 position mode selector switch and Open and Close switches. Also per the Drawings, the Master Control Panel and the Guard Booth and Overwatch Position Control Panels shall have EFO switches. Each barrier shall also have a 2 position mode selector switch and Open and Close switches on a Local Control Panel located at or near the
APPENDIX A

Signs and Signals Active Barrier Safety System

2.2 The modes on each barrier's mode selector on the Master Control Panel shall be Local - EFO - Test. Each switch shall be operable by a key unique for that switch only, which shall be removable in all modes. The modes of each barrier's mode selector switch on the Local Control Panel shall be Off-Local. Each switch shall be operable by the same key that operates the mode selector switch for that barrier on the Master Control Panel. The key will be removable in the "Off" position only of the Off-Local mode selector switch.

2.3 Operating Modes.

2.3.1 EFO Operation. Under normal operations, all barriers' mode selector switches on the Master Control Panel will be in the EFO position with the key removed and accessible only by the lead ACP guard. With the barrier's mode selector switch in the EFO position, EFO shall be enabled for that barrier, but the Open and Close switches for that barrier on the Master Control Panel and the Open and Close switches on that barrier's Local Control Panel shall be disabled.

2.3.2 Test Operation. An individual barrier can be test operated by installing the proper lane markings and passive barriers ahead of the active barrier and then placing its mode selector switch in the Test position. With the barrier's mode selector switch in the Test position, that barrier's Open and Close switches on the Master Control Panel shall be enabled, but the Open and Close switches on that barrier's Local Control Panel shall be disabled and all EFO switches shall be disabled for that barrier only.

2.3.3 Local Operation. The Local mode can be used when maintenance personnel need to perform maintenance on the barrier. Maintenance personnel would obtain the mode selector switch key from the lead ACP guard, place the barrier's mode selector switch on the Master Control Panel in the Local position, and then remove the key. With the barrier's mode selector switch on the Master Control Panel in the Local position, that barrier's Open and Close switches on the Master Control Panel shall be disabled and all EFO switches shall be disabled for that barrier only. The maintenance person would then insert the key into the Off-Local mode selector switch on the barrier's Local Control Panel and turn the key to the "Local" position, which shall enable the Open and Close switches on the barrier's Local Control Panel. Maintenance personnel would also have to block and mark the lane ahead of the barrier and also lock and tag out certain equipment at the barrier per the barrier manufacturer's recommendations for the type of maintenance to be performed.

3 TRAFFIC SIGNAL AND BARRIER CONTROLS.

3.1 EFO MODE OF OPERATION. In the EFO mode of operation with the barrier open, the Traffic Signal shall be Green. Upon activation of an EFO command at any of the Control Panels, barrier emergency closure shall be delayed 4 seconds. During this 4 seconds, the Traffic Signal shall change from Green to Yellow for 3 seconds and then to Red. After an additional one second at Red, the barrier's emergency close circuit shall be energized to close the barrier in its emergency fast mode (2 seconds or less) provided that the VPDs immediately in front of and behind the barrier are clear. If either VPD detects a vehicle, the barrier shall not close.
APPENDIX A

Signs and Signals Active Barrier Safety System

3.2  EFO RESET. After an EFO activation, guards will close all inbound and outbound lanes. Guards will then activate the EFO Reset switch on the Master Control Panel to reset EFO, place each barrier's mode switch to the Test position, open each barrier using the Open switches on the Master Control Panel, and then place each barrier's mode switch to the EFO position. Guards could then reopen the ACP.

3.3  TEST AND LOCAL MODES OF OPERATION. When a barrier's mode switch is placed in either the Local or Test modes, the traffic signal for that barrier shall go from Green to Yellow for 3 seconds and then to Red. As noted above, before a barrier's mode switch is placed in either the Local or Test positions, the operator must ensure that the lane that the barrier is in is properly blocked and marked.

3.4  RETURN TO EFO MODE. When the barrier's mode switch is placed in the EFO mode and the barrier is open, the barrier's Traffic Signal shall change from Red to Green. If a barrier's mode switch is placed in the EFO mode and the barrier is closed, the barrier's Traffic Signal shall stay Red and an alarm shall be generated on the ACP TROUBLE window on the Gatehouse Control Panel.

NOTE: This guide specification covers the requirements for roadside barriers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

ASTM INTERNATIONAL (ASTM)

ASTM A615/A615M (2016) Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement

ASTM A706/A706M (2016) Standard Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement

ASTM A1035/A1035M (2016a) Standard Specification for Deformed and Plain, Low-carbon, Chromium, Steel Bars for Concrete Reinforcement

ASTM F3125/F3125M (2015a) Standard Specification for High Strength Structural Bolts, Steel and Alloy Steel, Heat Treated, 120 ksi (830 MPa) and 150 ksi (1040 MPa) Minimum Tensile Strength, Inch and Metric Dimensions

U.S. FEDERAL HIGHWAY ADMINISTRATION (FHWA)

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

FHWA Acceptance Letter

SD-08 Manufacturer's Instructions

End Anchorage
Submit at least 14 days prior to installation.

Crash Cushion
Submit at least 14 days prior to installation.

PART 2 PRODUCTS

2.1 GUARDRAIL POSTS

Guardrail posts must be either wood or steel and of the dimensions indicated. Unless otherwise indicated, use only one type of post throughout the project.

2.1.1 Sawn Wood Posts and Offset Blocks

**************************************************************************
NOTE: Include reference to applicable State DOT specification for wood posts and offset blocks.
**************************************************************************

Except as otherwise specified herein, provide wood posts and offset blocks as specified in [______]. Posts and offset blocks must be of stress grade and capable of resisting a working stress of 11 MPa 1600 psi on the extreme fibers when subjected to bending. Posts and blocks must be double end trimmed with the mounting bolt hole in each being drilled 2 mm 1/16 inch oversize and within 13 mm 1/2 inch of the specified location on either side of the post or block. All wood posts and offset blocks must be rough, free of wane, squarecut, and fully sawn to the dimensions indicated. Drill post bolt holes before preservative treatment is applied. Unless otherwise approved, use only one preservative on the project.

2.1.2 Steel Posts

Fabricate "H" beam sections from steel conforming to either ASTM A36/A36M, ASTM A588/A588M or ASTM A242/A242M and conforming to the size, weight and dimensions indicated. Use bolts must be of the diameters indicated. Bolts used with galvanized ASTM A36/A36M steel must conform to ASTM A307. ASTM F3125/F3125M, Type 3 bolts may be used with ASTM A588/A588M or ASTM A242/A242M steel without galvanizing. Galvanize bolts, posts, and all necessary hardware fabricated from ASTM A36/A36M steel in accordance with ASTM A123/A123M.

2.1.3 Polymer and Polymer Composite Offset Blocks

Provide polymer and polymer composite offset blocks certified by the Federal Highway Administration (FHWA) to meet the requirements of either NCHRP 350 or AASHTO MASH. Submit a copy of the FHWA Acceptance Letter.

2.2 W-BEAM GUARDRAIL

Provide galvanized steel beam guard rail elements and fittings of the indicated design and details. The finished steel beam elements must be Class A (base metal nominal thickness 2.67 mm 0.105 inch and conform to the requirements of AASHTO M 180. Galvanizing of steel beam elements must be Type 1 (zinc coated 550 grams per square meter 1.80 ounces per square foot, minimum single spot) and must conform to the requirements of AASHTO M 180.
2.3 "W' BEAM END SECTION

Provide "W" beam end sections of the same or greater thickness of metal and the same type as the beam to which it is attached.

2.4 GUARDRAIL HARDWARE

All fittings (bolts, nuts, washers, etc.) for guardrail must conform to the requirements of **AASHTO M 180**.

2.5 TERMINAL FOR W-BEAM GUARDRAIL

**************************************************************************
NOTE: Guardrail terminals must meet the crashworthiness criteria of NCHRP 350 or the Manual for Assessing Safety of Hardware (MASH). FHWA acceptance letters for various end treatments are available on the FHWA Safety Program webpage.

TL-1, TL-2 and TL-3 are conducted at speeds of 50 km/h, 70 km/h, and 100 km/h respectively. The tests conducted depend on whether the terminal is a gating or nongating device. A gating device is one designed to allow controlled penetration of the vehicle when impacted between the end and the beginning of the length of need of the device. A nongating device is designed to contain and redirect a vehicle when impacted downstream from the end of the device.

**************************************************************************

Provide a [flared] [Eccentric Loader Terminal (ELT)] [Modified Eccentric Loader Terminal (SRT)] [Flared Energy-Absorbing Terminal (FLEAT)] [Slotted Rail Terminal (SRT-350)] [tangent] [Extruder Terminal (ET-Plus)] [Sequential Kinking Terminal (SKT-350)] terminal for w-beam guardrail. Provide terminal certified by the Federal Highway Administration (FHWA) to meet the requirements for Test Level [2] [3] of NCHRP 350 or AASHTO MASH. Submit a copy of the FHWA Acceptance Letter.
2.6 CABLE BARRIER

**************************************************************************
NOTE: See the AASHTO "Roadside Design Guide" and NCHRP Report 711 "Guidance for the Selection, Use, and Maintenance of Cable Barrier Systems" for information on cable barrier systems.
**************************************************************************

2.6.1 Cable

Provide 19 mm 3/4 inch, Type I, Class A coating in accordance with AASHTO M 30.

2.6.2 Cable Splices, Ends, Fittings

Design cable splices and ends capable of developing the full breaking strength of the cable (110 kN) (25,000 lbs). Cable ends must be cast steel or malleable iron. Cable wedges must be malleable iron and not be galvanized. Conform cast steel fittings to ASTM A27/A27M, grade 485-250 70-36. Conform malleable iron fittings to ASTM A47/A47M. Galvanize cable splices, ends, and fittings in accordance with ASTM A123/A123M.

2.6.3 Compensating Device

Provide compensating devices with a spring rate of 78.8 newtons 450 lbs plus or minus 8.8 newtons 50 lbs per millimeter inch and a minimum total available travel of 150 mm 6 inches. Galvanize all parts in accordance with ASTM A153/A153M.

2.6.4 Hook Bolts

Provide hook bolts conforming to ASTM A307 Grade A with a tensile strength of 400 MPa 60 ksi and a yield strength of 240 MPa 36 ksi. Provide corrosion-resistant bolts manufactured from ASTM F3125/F3125M Type 3 material, with a tensile strength of 660 MPa 92 ksi and a yield strength of 410 MPa 60 ksi. Hook bolts must develop an ultimate pull open strength, applied in a direction normal to the longitudinal axis of the post, from 2 to 4.5 kN 500 to 1000 pounds. Use galvanized nuts conforming to ASTM A563M Class 5 ASTM A563 Grade A. Use corrosion-resistant nuts conforming to ASTM A563M Grade 8S3 ASTM A563 Grade C3. Finish galvanized bolts and nuts according to ASTM A153/A153M for Class C or ASTM B695 for Class 50. If galvanized, overlap the threads as specified in ASTM A563MASTM A563.

2.6.5 Steel Posts

**************************************************************************
NOTE: Cable guardrail designs typically include either structural steel I beam posts or flanged channel steel posts.
**************************************************************************

2.6.5.1 Structural Steel Posts

Provide structural steel posts and anchor plates conforming to ASTM A36/A36M. Galvanize in accordance with ASTM A123/A123M.
2.6.5.2 Flanged Channel Posts

Fabricate flanged channel posts from rerolled rail steel bars conforming to ASTM A499, Grade 415 60 except that the minimum yield strength must be 480 Mpa 70,000 psi. The post must meet the chemical properties of ASTM A1 for rails 44.56 kg/m 30 pounds per foot and heavier.

2.6.6 Anchor Assembly

******************************************************************************
NOTE: Cable is typically anchored to a concrete foundation with steel rods or hook or J bolts.
******************************************************************************

Provide steel cable anchor brackets conforming to ASTM A709/A709M Grade 250 36 or ASTM A36/A36M. Provide anchor posts and anchor post plates conforming to ASTM A36/A36M. Galvanize cable anchor brackets[, anchor posts, and anchor post plates] after fabrication in accordance with ASTM A123/A123M. Provide steel [rods] [hook or J bolts] conforming to ASTM A449 or ASTM A568/A568M and galvanize the top 150 mm 6 inches in accordance with ASTM A123/A123M. Provide hex nuts conforming to ASTM A563M.

2.6.7 Concrete

ASTM C94/C94M, using 19 mm 3/4 inch maximum aggregate, and having minimum compressive strength of 28 Mpa 4000 psi at 28 days. Reinforcing steel must be deformed bars conforming to ASTM A615/A615M, ASTM A706/A706M, or ASTM A1035/A1035M grade 280 40.

2.7 CRASH CUSHION

Provide redirective, non-gating, bi-directional type crash cushion as indicated. Crash cushion must be certified by the Federal Highway Administration (FHWA) to meet the requirements for Test Level [2][3] of NCHRP 350 or AASHTO MASH. Submit a copy of the FHWA Acceptance Letter.

2.8 RETROREFLECTIVE SHEETING

Provide retroreflective sheeting conforming to ASTM D4956, Type III, IV, V, VII, VIII, IX or XI. All retroreflective sheeting must have a precoated adhesive which will permanently adhere to the metal surface.

PART 3 EXECUTION

3.1 POSTS

Posts may be placed by driving or by setting in excavated holes. Post holes for guardrail posts must be round and at least 100 mm 4 inches larger, in diameter, than the greater dimensions (not the diagonal) of the posts, and must be backfilled around the posts with material removed or other suitable soil, placed in lifts not exceeding 100 mm 4 inches, each lift thoroughly tamped. When placed by driving, drive the posts plumb, to the depth and in the position indicated. Remove posts which are broomed, split or damaged in any other way and replace with a sound post. Carry on driving operations in such manner that nearby structures, shoulders, or pavements are not damaged. Cuts and abrasions in preservative-treated posts and blocks must have the newly exposed surfaces treated with at least three applications of the same type of preservative with which the material
UFGS

was originally treated. Each application must be reasonably dry before the succeeding coat is applied. At the time a timber post is installed, any seasoning check which extends the full length of the piece cannot exceed 6 mm 1/4 inch in width. Adjust posts used for vertical transition in length so that a minimum of 1550 mm 60 inches will be buried. Where guardrail cross buried structures and 1550 mm 60 inches of bury is not obtainable, install the guardrail post as deep as possible and with a 610 mm 24 inch diameter concrete encasement for the full depth of bury.

3.2 GUARDRAIL BEAM ELEMENTS

Place and fasten the beam elements, fittings, and other parts of the guardrail as indicated. Erect the elements to produce a smooth, even rail, closely conforming to a line and grade parallel to the pavement. Bolt the beam elements to each post, and make splices by lapping in the direction of traffic. Splice only at posts. Where the rail is on a curve, the beams at the splice must make contact throughout the area of the splice, forming a continuous beam before erection. On curves of 45 m 150 foot radius or less, install shop bent beam elements, bent to the radius indicated. Tighten all bolts in the finished rail.

3.3 GUARDRAIL DELINEATOR REFLECTOR TABS

**************************************************************************
NOTE: This paragraph is applicable for metal guardrail delineator tabs with retroreflective sheeting. Delete paragraph if other types of delineators are used.
**************************************************************************

Clean, degrease and etch the face of metal tabs using methods recommended by the retroreflective sheeting manufacturer. After cleaning and degreasing, apply retroreflective sheeting material to the metal tabs as recommended by the manufacturer. Perform shearing, cutting and punching prior to preparing the blanks for application of reflective material.

3.4 GUARDRAIL END ANCHORAGE

Install flared and non-flared end anchorages in accordance with the manufacturer's instructions. Submit a copy of the manufacturer's end anchorage installation instructions prior to installation.

3.5 THREE CABLE GUARDRAIL

3.5.1 Posts

Set all posts plumb and firm and spaced as indicated. Posts may be power driven or set by hand. Protect the top of steel posts by a suitable driving cap if power driven.

3.5.2 Cable Splices, Compensating Devices and Turnbuckle Cable End Assemblies

Stagger cable splices. Provide a minimum of 6 m 20 feet between any pair. Provide a minimum of 30 m 100 feet between cable splices on the same cable. For length of cable runs up to 305 m 1000 feet, use a compensating device on one end and a turnbuckle on the other end of each individual cable. For length of cable runs from 305 m 1000 feet to 610 m 2000 feet, use a compensating device on the ends of each individual cable. For length
of cable runs over 610 m 2000 feet, start a new stretch by interlacing at the last parallel post.

3.5.3 Pretension of Cable

Install and tension the cable barrier as follows:

a. Properly seat the spring in the compensator device and permanently mark the unloaded spring position on the compensator rod.

b. Install spring end assemblies at one end of the barrier and secure to the anchor.

c. With cable strung through the hook bolts, introduce tension into the cable at the opposite end of the barrier to compress the installed springs approximately 90 mm 3.5 inches.

d. Clamp this tension in the cable while the end assemblies are installed at the second anchor.

e. Remove the slack between the clamp point and the second anchor by taking up the turnbuckle. If springs are also used at this end, compress them approximately 90 mm 3.5 inches.

**************************************************************************

NOTE: The cable barrier detail drawing should include a table indicating the required spring compression from the unloaded position for various temperatures.

**************************************************************************

f. After two weeks at this setting, reset the spring compression as indicated based on the temperature at the time of adjustment.

3.6 CRASH CUSHION

Assemble and install crash cushions as indicated and in accordance with the manufacturer's instructions. Submit a copy of crash cushion manufacturer's installation instructions.

U.S. DEPARTMENT OF STATE (SD)

SD-STD-02.01 (2003; Rev A) Specification For Vehicle Crash Test of Perimeter Barriers and Gates

U.S. FEDERAL HIGHWAY ADMINISTRATION (FHWA)

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

29 CFR 1910 Occupational Safety and Health Standards
1.2 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Performance levels are based on the following:

1. The Department of State (DoS) publication SD-SDT-02.01 Specification for Vehicle Crash Testing of Perimeter Barriers and Gates (April 1985) in which:

<table>
<thead>
<tr>
<th>Condition Designation</th>
<th>Vehicle Weight</th>
<th>Impact Speed</th>
<th>Kinetic Energy</th>
</tr>
</thead>
<tbody>
<tr>
<td>K4</td>
<td>15,000 kg</td>
<td>48 km/h</td>
<td>610 kJ 450,000</td>
</tr>
<tr>
<td></td>
<td>15,000 lb</td>
<td>30 mph</td>
<td>610 kJ 450,000 ft-lb</td>
</tr>
<tr>
<td>K8</td>
<td>15,000 kg</td>
<td>65 km/h</td>
<td>1084 kJ 800,000</td>
</tr>
<tr>
<td></td>
<td>15,000 lb</td>
<td>40 mph</td>
<td>1084 kJ 800,000 ft-lb</td>
</tr>
<tr>
<td>K12</td>
<td>15,000 kg</td>
<td>80 km/h</td>
<td>1695 kJ 1,250,000</td>
</tr>
<tr>
<td></td>
<td>15,000 lb</td>
<td>50 mph</td>
<td>1695 kJ 1,250,000 ft-lb</td>
</tr>
</tbody>
</table>

Performance Levels are:

(a) L 3.0 Vehicle and cargo are to be stopped although vehicle partial penetration and/or barrier deflection of up to 1 m 3 feet permitted.

(b) L 2.0 Vehicle and cargo are to be stopped although vehicle partial penetration and/or barrier deflection of up to 6 m 20 feet is permitted.

(c) L 1.0 Vehicle is disabled and does not travel more than 15 m 50 feet after impact.

2. Prior to 2001, the Department of the Navy had its own test standard for Vehicle-Crash-Resistant Barrier Requirements. Since then, the Navy has discontinued referencing its standard and now references the DOS specification for certified vehicle barriers. This guide specification still recognizes barriers originally certified under the Navy standard. These barriers are identified as such in their respective paragraph of PART 2 PRODUCTS. The Department of the Navy publication Operational Requirement No. 098-09-88: Operational Requirements for Secure Structures Ashore (Locks and Barriers, 1986) in which:
Vehicle-Crash-Resistant Barrier Requirements are:

<table>
<thead>
<tr>
<th>Security Level</th>
<th>Vehicle Weight</th>
<th>Impact Speed</th>
<th>Kinetic Energy</th>
</tr>
</thead>
<tbody>
<tr>
<td>HIGH</td>
<td>4535 kg 10,000 lb</td>
<td>80 km/h 50 mph</td>
<td>1133 kJ 836,000 ft-lb</td>
</tr>
<tr>
<td>LOW</td>
<td>4535 kg 10,000 lb</td>
<td>24 km/h 15 mph</td>
<td>102 kJ 75,000 ft-lb</td>
</tr>
</tbody>
</table>

Performance Levels are:

(a) For the high security level, vehicle penetration from 0 to 3 m 0 to 10 feet is permitted.

(b) For the low security level, vehicle penetration from 15 to 30 m 50 to 100 feet is permitted.

3. Because kinetic energy is a function of the square of the velocity, the vehicle's speed has more significance than its weight. Therefore, limiting a vehicle's speed reduces the kinetic energy the barrier must resist resulting in a lower barrier cost. Vehicle barrier requirements are within the chart combinations below:

<table>
<thead>
<tr>
<th>VEHICLE BARRIER TESTED COMBINATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>VEHICLE WEIGHT (kg) (lb)</td>
</tr>
<tr>
<td>-------------------------</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>6000 15,000</td>
</tr>
<tr>
<td>4536 10,000</td>
</tr>
<tr>
<td>4536 10,000</td>
</tr>
</tbody>
</table>

**************************************************************************

Submit a complete list of equipment, materials, including industrial standards used and how they apply to the applicable component and
manufacturer's descriptive data and technical literature, catalog cuts, and installation instructions. Furnish information necessary to document a minimum 1-year successful field operation performance history for each type of vehicle barrier installed. **Barrier systems** used shall be listed in either the Department of State (DoS) certified or Department of Defense (DoD) approved anti-ram vehicle barrier lists. Barrier widths shall be 'as certified/approved' on these lists. Alternatively, if a barrier system's width is between the widths of two listed barrier systems that are identical except for their widths, then that barrier system is also acceptable. Exceptions and acceptable widths will only be taken from the DoD anti-ram vehicle barrier list. The design and structural materials of the vehicle barrier furnished shall be the same as those used in the crash tested barrier. Crash test must have been performed and data compiled by an approved independent testing agency in accordance with either **ASTM F2656/F2656M** or **SD-STD-02.01**. Barriers tested and certified on the previous Department of State standard, **SD-STD-02.01** and listed on the DoD approved anti-ram vehicle barrier list are also acceptable. Submit Data Package 4 in accordance with Section **01 78 23** OPERATION AND MAINTENANCE DATA.

### 1.3 SUBMITTALS

********************************************************************************

**NOTE:** Review submittal description (SD) definitions in Section **01 33 00** SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section **01 33 29** SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force
and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [Information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
- Installation; G[, [_____]]
- Equipment; G[, [_____]]
- Electrical Work; G[, [_____]]

SD-03 Product Data
- Barrier Systems
- Spare Parts

SD-06 Test Reports
- Field Testing

SD-10 Operation and Maintenance Data
- Barrier Systems; G[, [_____]]
- Operating and Maintenance Instructions; G[, [_____]]

1.4 DELIVERY, STORAGE, AND HANDLING

Protect components placed in storage from the weather, humidity, and temperature variation, dirt and dust, or other contaminants. Store structural materials on sleepers or pallets and protect them from rust and objectionable materials such as dirt, grease, or oil.

1.5 EXTRA MATERIALS

Submit spare parts data for each different item of material and equipment used, after approval of the detail drawings. Include in the data a complete list of parts and supplies, with current unit prices and source of supply. Provide a manufacturer's standard recommended spare parts package, with current unit prices and source of supply complete with detailed manuals on parts replacement, with each barrier to facilitate 1 year of normal operation. Give particular consideration to system components which are not readily available from local or commercial sources and which are critical to the operation of the system.

PART 2 PRODUCTS

**************************************************************************
Note: Hydraulic operated barrier systems shall contain synthetic biodegradable hydraulic fluid. The fluid shall be International Organization for Standardization (ISO) Grade 32 for cooler climates or ISO Grade 46 for temperate zones. Barriers for tropical or desert areas require a heavier grade, verify grade requirements with local suppliers. Based on barrier cycling and climate data, decide if a hydraulic fluid heater is required.

Edit these paragraphs according to the barriers chosen.

**************************************************************************
2.1 RETRACTABLE BARRIERS
**************************************************************************

NOTE: Coordinate with paragraph SYSTEM DESCRIPTION.

Based on the threat vehicle, state the height and width of retractable vehicle barrier required. The maximum tested width of approved barriers to date has not exceeded 3.66 m 144 inches. A minimum height of 711 mm 28 inches is required. Consult manufacturer's literature for barrier heights.

The table below shows typical performance levels as a function of barrier height.

<table>
<thead>
<tr>
<th>Height Above Road Surface, mm inch</th>
<th>Average Barrier Height, mm inch</th>
<th>Typical Performance Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>787-1016 31-40</td>
<td>914 36</td>
<td>L3.0, K12</td>
</tr>
<tr>

There are no known barriers capable of supporting loads larger than those indicated here and which will meet all other requirements found within this guide specification. These load limits are adequate for normal commercial truck traffic but will not support the Army's Heavy Equipment Transporter (HET) or similar vehicle. Overall design consideration must include providing alternate access for these vehicles if they have a valid reason for entering the secured area.

Federal and/or state EPA regulations may require that an oil/water separator be installed in the pit drainage system to ensure capture of any hydraulic fluid that may leak out of the system. If pit/vault type construction is required provisions will be made for drainage and connection to storm drainage system, or if no storm drain exists, a self-priming submersible sump pump of adequate capacity will be specified.
When in the raised position, the total retractable barrier heights shall be no less than [_____] mm inches above the roadway surface and shall be [_____] mm inches wide. When in the lowered position, the retractable barrier shall extend no more than 16 mm 5/8 inch above the roadway surface. Retractable barriers in the lowered position shall be capable of supporting a 142 kN 32,000 pound axle load or a 71 kN 16,000 pound wheel load. Design for this load shall be in accordance with AASHTO HB-17.

2.1.1 Powered Retractable Barrier

The retractable barrier shall be capable of [_____] complete up/down cycles per hour. The retractable barrier motion shall be instantly reversible and shall be capable of raising the barrier from the lowered position to the raised position within 8 seconds during normal use, and within 2 seconds during an emergency. Also, the barrier shall be capable of being lowered from the raised position to the lowered position in not more than 3 seconds. [Retractable barrier shall withstand a [_____] kg pound vehicle at impact speed of [_____] km/hour mph with maximum barrier deflection or vehicle penetration of [_____] m feet].

2.1.1.1 Failure Modes of Operation

The system shall be designed to remain in the last commanded position in the event of hydraulic, electrical, or mechanical failure. A manual pump, or other system, shall be included for operation of hydraulic barriers without power.

2.1.1.2 Electric Motors

Unless otherwise indicated, electric motors shall have [drip-proof] [totally enclosed] [totally enclosed fan cooled] enclosures. All couplings, motor shafts, gears, and other moving parts shall be fully guarded in accordance with 29 CFR 1910 Subpart O. Guards shall be removable without disassembling the guarded unit. For multiple barriers operated from a single hydraulic unit it is highly recommended that the electric motor be 3-phase.

2.1.1.3 System

The system shall be designed to maintain the barriers in the raised position, without inspection, for periods of time of up to 1 week. If a hydraulic system is used, it shall be equipped with pressure relief valves to prevent overpressure. The system shall not require continuous running of the motor to stay in the raised position, excluding the use of manual pinning to do so.

2.1.1.4 Hydraulic Power Unit

*NOTE: Based on manufacturer's system layout the*
The hydraulic platform unit should be located above ground. The unit should be placed on a reinforced concrete pad in a prefabricated weatherproof metal enclosure. Based on EPA requirements, provide a containment area; i.e., depressed floor or catch pan, to ensure capture of the total amount of hydraulic fluid within the hydraulic power unit. Access door or doors shall be provided to meet the maintenance requirements of the unit. The physical location of the unit should be on the protected side of the area.

The hydraulic oil viscosity must remain within its operating range, even after barrier non-use. If ambient temperature drops below \(-7\) degrees C \(20\) degrees F then hydraulic power unit shall be equipped with proper hydraulic oil, hydraulic oil heater, insulated and heated hydraulic lines, and underground hydraulic oil lines in pipes. If ambient temperature exceeds \(38\) degrees C \(100\) degrees F then the manufacturer must supply efficient cooling and proper hydraulic oil for oil viscosity to remain within its operating range, even at constant heaviest use rate. If ambient temperature range requires the oil to be changed, the manufacturer must supply information on type of oil to be used and instructions for changing. Fill in the high and low air temperature of the area where the barrier will be installed.

******************************************************************************

The hydraulic power unit shall contain synthetic biodegradable hydraulic fluid which maintains its viscosity operating range, even at constant heaviest use rate, for an ambient temperature range of \([-7\) to plus 66 degrees C \(20\) to 150 degrees F\]. A hydraulic fluid heater shall be provided so that the viscosity remains within its operating range if ambient temperatures below \(-7\) degrees C \(20\) degrees F are expected. Buried hydraulic lines for the connection of the hydraulic power unit to the barrier shall be flexible or carbon steel pipe, or a combination of flexible and carbon steel pipe. Flexible and rigid hydraulic line working pressures shall exceed the maximum system relief pressure. [PVC pipe and fittings for burial of hydraulic lines shall be in accordance with ASTM D3034 Type PS 46 with minimum pipe stiffness of 46.]

2.1.1.4.1 Flexible Hydraulic Lines

In accordance with SAE J517

2.1.1.4.2 Rigid Hydraulic Lines

Seamless carbon steel pipe in accordance with ASTM A106/A106M

2.1.1.5 Hydraulic Power Unit Enclosure

Provide a NEMA Type 3R enclosure as specified in NEMA 250 to enclose the hydraulic power unit. The enclosure shall be designed for easy removal of the hydraulic power unit and other accessories without complete removal of the enclosure. An access door with hinges and an inside and outside operable/lockable (exterior) door latch shall be provided. Equipment
within the enclosure shall be placed and configured so that all periodic maintenance can be performed through the access door without removal of the equipment. The enclosure shall be equipped with weatherproof louver vents appropriately sized and located to dissipate internal heat generation.

2.1.2 Manual Retractable Barriers

The manual barrier shall be capable of being raised and lowered by manual means such as levers or hydraulics requiring a maximum 267 N 60 pounds of force. The manual mechanism shall contain a locking pin which accepts a padlock for securing the barrier when it is in the "UP" position. Retractable barrier shall withstand a [_____] kg pound vehicle at impact speed of [_____] km/hour mph, with maximum barrier deflection or vehicle penetration of [_____] m feet. Barrier should be capable of being locked in the down position.

2.2 NAMEPLATES

Nameplate data shall be permanently attached to each vehicle barrier. The data shall be legibly marked on corrosion-resistant metal plates and shall consist of at least the following:

a. Manufacturer's name.

b. Model number.

c. Serial number.

d. Date of manufacture.

2.3 RETRACTABLE BOLLARDS

******************************************************************************
NOTE: Coordinate with paragraph SYSTEM DESCRIPTION and paragraph RETRACTABLE BARRIERS.
******************************************************************************

The total bollard height when in the raised position shall be no less than 750 mm 30 inches above the roadway surface and shall have an outside diameter of no less than 200 mm 8 inches. A bollard system shall consist of a minimum of 3 bollards spaced no more than 915 mm 36 inches from centerline to centerline of bollards across a 3.0 m 10 foot roadway. Bollards in the lowered position shall be capable of supporting a 71 kN 16,000 pound wheel load each. Design for this load shall be in accordance with AASHTO HB-17. Retractable bollards shall withstand a [_____] kg pound vehicle at impact speed of [_____] km/hour mph with maximum bollard deflection or vehicle penetration of [_____] m feet.

2.3.1 Powered Retractable Bollards

******************************************************************************
NOTE: Based on peak hourly volumes, fill in number of cycles per hour that the barrier will be required to function (maximum 300 complete up/down cycles per hour).
******************************************************************************

The retractable bollard shall be capable of [_____] complete up/down cycles per hour. Bollards shall be capable of being raised or lowered within a 3
Failure Modes of Operation

2.3.1.1 Failure Modes of Operation

The system shall be designed to prevent lowering of the barrier in the event of hydraulic, electrical, or mechanical failure. A manual pump, or other system, shall be included for operation of hydraulic and/or mechanical barriers without power.

2.3.1.2 Electric Motors

Unless otherwise indicated, electric motors shall have [drip-proof] [totally enclosed] enclosures. For multiple barriers being operated from a hydraulic power unit it is highly recommended that the electric motor be 3-phase.

2.3.1.3 System

The system shall be designed to maintain the barriers in the raised position, without inspection, for period of time of up to 1 week. If a hydraulic system is used, it shall be equipped with pressure relief valves to prevent overpressure.

2.3.1.4 Hydraulic Power Unit

NOTE: Retain and edit or delete paragraph based on type of operator chosen.

The hydraulic power unit shall contain synthetic biodegradable hydraulic fluid which maintains its viscosity operating range, even at constant heaviest use rate, for an ambient temperature range of [minus 7 to plus 66 degrees C 20 to 150 degrees F] [[_____] to [_____]]. A hydraulic fluid heater shall be provided so that the viscosity remains within its operating range, if ambient temperatures below minus 7 degrees C 20 degrees F are expected. Buried hydraulic lines for the connection of the hydraulic power unit to the barrier shall be flexible or carbon steel pipe, or a combination of flexible and carbon steel pipe. Flexible and rigid hydraulic line working pressures shall exceed the maximum system relief pressure. [PVC pipe and fittings for burial of hydraulic lines shall be in accordance with ASTM D3034 Type PS 46 with minimum pipe stiffness of 46.]

2.3.1.4.1 Flexible Hydraulic Lines

In accordance with SAE J517

2.3.1.4.2 Rigid Hydraulic Lines

Seamless carbon steel pipe in accordance with ASTM A106/A106M

2.3.1.5 Hydraulic Power Unit Enclosure

A NEMA Type 3R enclosure as specified in NEMA 250 shall be provided to enclose the hydraulic power unit. The enclosure shall be designed for easy removal of the hydraulic power unit and other accessories without complete removal of the enclosure. An access door with hinges and an inside and outside operable/lockable (exterior) door latch shall be provided.
Equipment within the enclosure shall be placed and configured so that all periodic maintenance can be performed through the access door without removal of the equipment. The enclosure shall be equipped with weatherproof louver vents appropriately sized and located to dissipate internal heat generation.

2.3.2 Manual Retractable Bollards

Manual bollards shall be capable of being raised and lowered utilizing a recessed handle on the top surface of the bollard or a manual hydraulic pump, either requiring a maximum 267 N 60 pounds of force. A mechanism, that is lockable, shall be provided to secure the bollard in either the full "UP" or full "DOWN" position.

2.4 CRASH GATE

The crash gate shall consist of steel buttresses anchored into the ground and an above grade assembly consisting of a heavy steel structure or a combination of heavy steel and structural aluminum capable of being opened and closed. The height of the gate shall be a minimum of [2.1] [_____] m [84] [_____] inches from the road surface to the top of the gate frame. The length shall close and protect a minimum [3.0] [_____] m [120] [_____] inch clear opening. The maximum clear opening between the gate frame and end posts, between the bottom of the gate and finished grade, and between any grill work shall be 75 mm 3 inches.

2.4.1 Powered Crash Gate

The gate movement shall be controlled by [an electro-mechanical gate operator] [a hydraulic gate operator] consisting of an operator unit with required control circuits and operator station. The control and operating voltage shall be 24 vac (nominal) or, as an option 24 vdc. A remote control master station shall be capable of driving the gate at [_____] m per second fpm [_____] degrees per second for a swing gate. Unless otherwise indicated, motors shall have [drip-proof] [totally enclosed] enclosures. Crash gate shall withstand a 6804 kg 15,000 pound vehicle at impact speed of [48] [64] [80] km/hour [30] [40] [50] mph, with maximum barrier deflection or vehicle penetration of [_____]m feet.

2.4.1.1 Failure Mode of Operation

The system shall be designed to prevent opening of the crash gate in the event of electrical or mechanical failure. A disconnect system for the gate drive shall be provided to allow manual operation of the barrier in the event of a power outage.

2.4.1.2 Hydraulic Power Unit

**************************************************************************
NOTE: Retain and edit or delete paragraph based on type of operator chosen. Coordinate with PART 2 PRODUCTS.
**************************************************************************

The hydraulic power unit shall contain synthetic biodegradable hydraulic fluid which maintains its viscosity within its operating range, even at constant heaviest use rate, for an ambient temperature range of [minus 7 to plus 66 degrees C 20 to 150 degrees F] [_____] to [_____]]. A hydraulic fluid heater shall be provided so that the viscosity remains within its
operating range if ambient temperatures below minus 7 degrees C 20 degrees F are expected. Buried hydraulic lines for the connection of the hydraulic power unit to the barrier shall be flexible or carbon steel pipe, or a combination of flexible and carbon steel. Flexible and rigid hydraulic line working pressures shall exceed the maximum system relief pressure. [PVC pipe and fittings for burial of hydraulic lines shall be in accordance with ASTM D3034 Type PS 46 with minimum pipe stiffness of 46.]

2.4.1.2.1 Flexible Hydraulic Lines

In accordance with SAE J517

2.4.1.2.2 Rigid Hydraulic Lines

Seamless carbon steel pipe in accordance with ASTM A106/A106M

2.4.1.3 Hydraulic Power Unit Enclosure

A NEMA Type 3R enclosure as specified in NEMA 250 shall be provided to enclose the hydraulic power unit. The enclosure shall be designed for easy removal of the hydraulic power unit and other accessories without complete removal of the enclosure. An access door with hinges and an inside and outside operable/lockable (exterior) door latch shall be provided. Equipment within the enclosure shall be placed and configured so that all periodic maintenance can performed through the access door without removal of the equipment. The enclosure shall be equipped with weatherproof louver vents appropriately sized and located to dissipate internal heat generation.

2.4.2 Manual Crash Gate

The manual crash gate shall be capable of being hinged from either side. Hinge points of both buttresses shall each contain a locking pin with padlock acceptance for securing the crash gate in the closed position. The crash gate shall withstand a [4535 kg 10,000 pound vehicle at impact speed of 80 km/hour 50 mph, with maximum gate deflection or vehicle penetration of 3 m 10 feet] [6804 kg 15,000 pound vehicle traveling at impact speed of [48] [64] [80] km/hour [30] [40] [50] mph, with a maximum gate deflection or vehicle penetration of up to 1 m 3 feet].

2.5 CRASH BEAM

******************************************************************************
NOTE: Edit the paragraph for the crash barrier requirements. Department of State impact condition of a 6804 kg 15,000 pound vehicle traveling at 48 km/hour 30 mph, 64 km/hour 40 mph, or 80 km/hour 50 mph with penetration of less than 6 m 20 feet. Or Department of the Navy impact condition of a 4535 kg 10,000 pound traveling at 24 km/hour 15 mph, with penetration of less than 3 m 10 feet.
******************************************************************************

The crash beam shall be an above-grade assembly that, in the "DOWN" position, shall present a visible obstacle to approaching vehicles. The height of the barrier shall be a minimum of 750 mm 30 inches as measured from the roadway surface to the centerline of the crash beam. The crash beam shall be capable of blocking a minimum road width of [3.0] [_____] m [120] [_____] inches. The crash beam end shall contain a locking pin with padlock acceptance for securing the crash beam when it is in the "DOWN"
position. Crash beam shall withstand a [6804 kg 15,000 pound] vehicle traveling at [48][64][80] km/hour [30][40][50] mph, with maximum vehicle penetration of [6 m 20 feet] [4535 kg 10,000 pound] vehicle at impact speed of [24 km/hour 15 mph], with a maximum vehicle penetration of [3 m 10 feet].

2.5.1 Powered Crash Beam

The crash beam shall be operated by means of a hydraulic power system. The crash beam shall be capable of being raised or lowered within an 8 to 15 second time range.

2.5.1.1 Failure Mode of Operation

A disconnect system for the crash beam shall be provided to allow manual operation of the barrier in the event of an electrical or mechanical failure.

2.5.1.2 Hydraulic Power Unit

******************************************************************************
NOTE: Retain and edit or delete paragraph based on type of operator chosen.
******************************************************************************

The hydraulic power unit shall contain synthetic biodegradable hydraulic fluid which maintains its viscosity operating range, even at constant heaviest use rate, for an ambient temperature range of [minus 7 to plus 66 degrees C 20 to 150 degrees F] [[_____] to [_____]]. A hydraulic fluid heater shall be provided so that the viscosity remains within its operating range if ambient temperatures below minus 7 degrees C 20 degrees F are expected. Buried hydraulic lines for the connection of the hydraulic power unit to the barrier shall be flexible or carbon steel pipe or a combination of flexible and carbon steel pipe. Flexible and rigid hydraulic line working pressures shall exceed the maximum system relief pressure. [PVC pipe and fittings for burial of hydraulic lines shall be in accordance with ASTM D3034 Type PS 46 with minimum pipe stiffness of 46.]

2.5.1.2.1 Flexible Hydraulic Lines

In accordance with SAE J517

2.5.1.2.2 Rigid Hydraulic Lines

Seamless carbon steel pipe in accordance with ASTM A106/A106M

2.5.1.3 Hydraulic Power Unit Enclosure

A NEMA Type 3R enclosure as specified in NEMA 250 shall be provided to enclose the hydraulic power unit. The enclosure shall be designed for easy removal of the hydraulic power unit components and other accessories without complete removal of the enclosure. An access door with hinges and an inside and outside operable/lockable exterior door latch shall be provided. Equipment within the enclosure shall be placed and configured so that all periodic maintenance can be performed through the access door without removal of the equipment. The enclosure shall be equipped with weatherproof louver vents appropriately sized and located to dissipate internal heat generation.
2.5.2 Manual Crash Beam

The crash beam shall be manually raised and lowered with the aid of a counterbalanced end requiring approximately 267 N 60 pounds of force.

2.6 PORTABLE RETRACTABLE BARRIER

The portable retractable barrier shall be transportable and capable of manual and/or electro-mechanical operation. When in the raised position, the total barrier heights shall be no less than [_____] mm inches above the roadway surface and shall be [_____] mm inches wide. The barrier shall be equipped with entrance/exit ramps when the barrier extends more than 16 mm 5/8 inch above the roadway surface. Retractable barriers in the lowered position shall be capable of supporting a 142 kN 32,000 pound axle load or a 71 kN 16,000 pound wheel load. Design for this load shall be accordance with AASHTO HB-17.

2.6.1 Powered Portable Retractable Barrier

**************************************************************************
NOTE: Based on peak hourly volumes, fill in number of cycles per hour that the barrier will be required to function (maximum 300 complete up/down cycles per hour).
**************************************************************************

The portable retractable barrier shall be capable of [_____] complete up/down cycles per hour. The retractable barrier motion shall be instantly reversible and shall be capable of raising the barrier from the lowered position within 8 seconds during normal use, and within 2 seconds during an emergency. Also, the barrier shall be capable of being closed from the raised position to the lowered position in not more than 3 seconds. [Retractable barrier shall withstand a [_____] kg pound vehicle at impact speed of [_____] km/hour mph with maximum barrier deflection or vehicle penetration of [_____] m feet.] Portable retractable barrier, when impacted by a [_____] kg pound vehicle at impact speed of [_____] km/hour mph shall disable the vehicle and allow it to travel no more than 15.2 m 50 feet after impact. Portable power assisted retractable barriers shall be equipped with on and off ramps for smooth transition between surfaces when the barrier extends more than 16 mm 5/8 inch above the roadway surface.

2.6.1.1 Failure Modes of Operation

The system shall be designed to prevent lowering of the barrier in the event of hydraulic, electric, or mechanical failure. A manual pump shall be included for operation of hydraulic and/or mechanical barriers without power.

2.6.1.2 Electric Motors

Unless otherwise indicated, electric motors shall have [drip-proof] [totally enclosed] enclosures.

2.6.1.3 System

The system shall be designed to maintain the barriers in the raised position, without inspection, for periods of time of up to 1 week. If a hydraulic system is used, it shall be equipped with pressure relief valves.
to prevent overpressure.

2.6.1.4 Hydraulic Power Unit

The hydraulic power unit shall contain synthetic biodegradable hydraulic fluid which maintains its viscosity operating range, even at constant heaviest use rate, for an ambient temperature range of minus 7 to plus 66 degrees C 20 to 150 degrees F. A hydraulic fluid heater shall be provided so that the viscosity remains within its operating range if ambient temperatures below minus 7 degrees C 20 degrees F are expected. Flexible hydraulic lines shall be used for the connection of the hydraulic power unit to the barrier. Flexible hydraulic line working pressures shall exceed the maximum system relief pressure; flexible hydraulic lines shall be in accordance with SAE J517.

2.6.2 Manual Retractable Portable Barriers

The manual barrier shall be capable of being raised and lowered by manual means such as levers or hydraulics requiring a maximum 267 N 60 pounds of force. The manual mechanism shall contain a locking pin which accepts a padlock for securing the barrier when it is in the "UP" position and shall also be capable of being locked in the "DOWN" position. Retractable barrier shall withstand a [_____] kg pound vehicle at impact speed of [_____] km/hour mph, with maximum barrier deflection or vehicle penetration of [_____] m feet.

2.7 PORTABLE CRASH BEAM

The portable crash beam shall be an above-grade assembly that, in the "DOWN" position, shall present a visible obstacle to approaching vehicles. The height of the barrier shall be a minimum of 750 mm 30 inches as measured from the roadway surface to the centerline of the crash beam. The crash beam shall be capable of blocking a minimum road width of [3.0] [_____] m [120] [_____] inches. The crash beam end shall contain a locking pin with padlock acceptance for securing the crash beam when it is in the "DOWN" position. Crash beam shall withstand a 6804 kg 15,000 pound vehicle traveling at 48 km/hour 30 mph, with maximum vehicle penetration and/or barrier deflection of 6 m 20 feet.

2.7.1 Powered Portable Crash Beam

The portable crash beam shall be operated by means of a hydraulic power system. The crash beam shall be capable of being raised or lowered within an 8 to 15 second time range.

2.7.1.1 Failure Mode of Operation

A disconnect system for the portable crash beam shall be provided to allow manual operation of the barrier in the event of an electrical or mechanical failure.

2.7.1.2 Hydraulic Power Unit

*******************************************************************************
NOTE: Retain and edit or delete paragraph based on type of operator chosen.
*******************************************************************************

The hydraulic power unit shall contain synthetic biodegradable hydraulic fluid which maintains its viscosity operating range, even at constant heaviest use rate, for an ambient temperature range of minus 7 to plus 66 degrees C 20 to 150 degrees F. A hydraulic fluid heater shall be provided so that the viscosity remains within its operating range if ambient temperatures below minus 7 degrees C 20 degrees F are expected. Flexible hydraulic lines shall be used for the connection of the hydraulic power unit to the barrier. Flexible hydraulic line working pressures shall exceed the maximum system relief pressure; flexible hydraulic lines shall be in accordance with SAE J517.
fluid which maintains its viscosity operating range, even at constant heaviest use rate, for an ambient temperature range of \([\text{minus 7 to plus 66 degrees C}}, \text{20 to 150 degrees F}\] \([\text{[_____] to [______]}]\). A hydraulic fluid heater shall be provided so that the viscosity remains within its operating range if ambient temperatures below \text{minus 7 degrees C}, \text{20 degrees F} are expected. Flexible hydraulic lines shall be used for the connection of the hydraulic power unit to the barrier. Flexible hydraulic line working pressures shall exceed the maximum system relief pressure; flexible hydraulic lines shall be in accordance with \text{SAE J517}.

2.7.1.3 Hydraulic Power Unit Enclosure

A weather resistant enclosure shall be provided to enclose the hydraulic power unit. The enclosure shall be designed for easy removal of the hydraulic power unit components and other accessories without complete removal of the enclosure. An access door with hinges and an inside and outside operable lockable (exterior) door latch shall be provided. Equipment within the enclosure shall be placed and configured so that all periodic maintenance can be performed through the access door without removal of the equipment. The enclosure shall be equipped with weatherproof louver vents appropriately sized and located to dissipate internal heat generation.

2.7.2 Manual Portable Crash Beam

The crash beam shall be manually operated by means of a counter balanced system requiring approximately \text{267 N 60 pounds} of force.

2.8 ELECTRICAL WORK

******************************************************************************

\text{NOTE: Designer will check with the user if a standby power source is required. If one is required, provide the appropriate guide specification.}

******************************************************************************

Submit detail drawings containing complete wiring and schematic diagrams, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Motors, manual or automatic motor control equipment [except where installed in motor control centers] and protective or signal devices required for the operation specified herein shall be provided in accordance with Section \text{26 20 00 INTERIOR DISTRIBUTION SYSTEM}. All field wiring for loop detectors, communication lines, and power circuits shall have surge protection. Any wiring required for the operation specified herein, but not shown on the electrical plans, shall be provided under this section in accordance with Sections \text{[26 20 00 INTERIOR DISTRIBUTION SYSTEM]} [and \text{33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION}].

2.9 CONTROL PANEL

******************************************************************************

\text{NOTE: Delete reference to remote control panel if it is not applicable. Add to end of paragraph if signal light logic is required: "Logic shall be provided to coordinate the barricade and the traffic light."}

******************************************************************************
A control panel and control circuit shall be provided to interface between all barrier control stations and the power unit. A control panel shall be provided for the inbound lanes and a separate one for the outbound lanes where the barriers are located. The control station is defined as the main control panel [and the remote control panel] as shown. The control circuit shall contain all relays, timers, and other devices or an industrial programmable controller programmed as necessary for the barrier operation. The control panel shall allow direct interface with auxiliary equipment such as card readers, remote switches, loop detectors, infrared sensors, and [sliding] [swinging] gate limit switches. Loop controllers shall not cause an automatic barrier raise following power loss or restoration. The enclosure shall be as indicated on the drawings. All device interconnect lines shall be run to terminal strips.

2.9.1 Voltage

The control circuit shall operate from a [120] [_____] volt [60] [50] Hz supply. The control circuit voltage shall be [12] [24] [_____] [ac] [dc] for all external control panels.

2.9.2 Main Control Panel

A main control panel shall be supplied to control barrier function. This panel shall have a key-lockable main switch with main power "ON" and panel "ON" lights. Buttons to raise and lower each [barrier] [set of barriers] shall be provided. Barrier "UP" and "DOWN" indicator lights shall be included for each [barrier] [set of barriers]. An emergency fast operate circuit (EFO) shall be operated from a push button larger than the normal controls and have a flip safety cover installed over the push button or toggle switch. The EFO shall also be furnished with an EFO-active light and reset button. [The main control panel shall have a key lockable switch to arm or disable the remote control panel. An indicator light shall show if the remote control panel is enabled.]

2.9.3 Remote Control Panel

**************************************************************************
NOTE: A remote control panel will be required at the entry control point where the barriers are located if a main control panel is required at the main security command center.
**************************************************************************

A remote control panel, one panel for the inbound lane(s) and a separate panel for the outbound lane(s), shall have a panel "ON" light that is lit when enabled by a key lockable switch on the main control panel. Buttons to raise and lower each barrier shall be provided. Barrier "UP" and "DOWN" indicator lights shall be included for each barrier. The EFO shall be operated from a push button larger than the normal controls and have a flip safety cover installed over the push button or toggle switch. Activation of either EFO will operate all barriers. The EFO shall be interconnected with an EFO-active light. When the remote control panel EFO is pushed, operation of the barrier will not be possible from this panel until reset at the main control panel.
2.10 MISCELLANEOUS EQUIPMENT

2.10.1 Safety Equipment

2.10.1.1 Barrier Systems Sensors

**************************************************************************
NOTE: Safety equipment identified in items "b." and "c." below, and subparagraphs "Warning Annunciators" and "Vehicle Barrier Vertical Arm Gate (Traffic Arm)" are required at installation access control points. If active vehicle barriers are used for other applications, edit the subparagraphs below accordingly.
**************************************************************************

The sensors must be compatible with the barrier controller and function as part of a complete barrier control system. The barrier system sensors shall consist of the following:

2.10.1.1.1 Suppression Loops

Two inductive loops whose outputs shall be used to prevent barriers raising when a vehicle is within a prescribed distance of the barrier. The output of the loops shall override all barrier rise signals until one second after a vehicle clears the suppression loop.

2.10.1.1.2 Speed Loops

Two inductive loops whose output is used to signal the barrier controller of a vehicle approaching at a speed greater than the posted speed (11.2 m/sec 25 mph or less (recommended)). The speed loops shall cause the barrier control panel to annunciate a warning sound alerting the guard to make a decision as to whether the barrier should be raised or not.

2.10.1.1.3 Wrong Way Loops

Two inductive loops whose output is used to signal the barrier control panel to annunciate a warning sound if a vehicle is attempting to enter the facility through the exit lane. The warning sound will alert the guard to make a decision as to whether the barrier should be raised or not.

2.10.1.2 Traffic Lights

**************************************************************************
NOTE: Designer must verify that vehicles using a gate with a barrier will be able to see the barrier position or the traffic lights. Semi-trucks may require a painted stop line or a traffic arm versus a higher mounted traffic light to ensure the lights or barrier can be seen by all vehicles.
**************************************************************************

Red/yellow 200 mm 8 inch traffic lights shall be supplied for each entrance and exit to alert motorists of the barrier position. Traffic lights are not required for manual barriers. The yellow flashing light shall indicate that the barrier is fully open. All other positions shall cause the light to show red. Brackets shall be supplied to allow the light to be mounted a minimum 1.4 m 4.5 feet above the roadway pavement on a 90 mm 3.5 inch
outside diameter metal post [or mounted directly on the crash gate].

2.10.2 Warning Annunciator

Provide a warning annunciator built into the barrier control panel that produces a pulsing audible sound when the speed loop detects a vehicle entering the facility with excess speed. Provide a warning annunciator built into the barrier control panel that produces a continuous sound whenever a wrong way loop detects a vehicle entering from the exit. The warning annunciator shall sound until a warning annunciator silence reset button is pressed.

2.10.3 Heater

**************************************************************************
NOTE: Retain or delete paragraph based on climatic conditions.
**************************************************************************

A waterproof barrier heater with a thermostat control and NEMA 4 junction box connection point shall be provided for de-icing and snow melting. The heater shall provide barrier operation to an ambient temperature of \( -40 \) degrees C or \( -40 \) degrees F. For retractable bollards, a 250-watt heater shall be provided for each bollard.

2.10.4 Signage

**************************************************************************
NOTE: Load limit signs based on allowable single axle loads for highways of \( 80 \) kN 18,000 pounds and maximum tandem axle loads of \( 142 \) kN 32,000 pounds are required for subsurface vehicle barriers, except bollards, at entry control points (ECPs). Signage shall conform to MUTCD.
**************************************************************************

Signage shall read "Axle Weight Limit 9 Tons" and shall conform to MUTCD sign (R12.2).

2.10.5 Vertical Arm Gates (Traffic Arms)

**************************************************************************
NOTE: Edit the traffic arm location based on design requirements.
**************************************************************************

Vertical arm gates shall have an opening and closing time of less than or equal to 5 seconds. The gates shall be capable of 500 duty cycles per hour as a minimum. Gate shall operate the arm through 90 degrees. Gate operators shall be supplied with single phase 120 volt motors. [Each entry lane shall be provided with a vertical arm gate.] Each gate shall be capable of being operated from a remote open-close push button station [in each guard booth and the gatehouse for the respective entry lane]. Gates shall have a hand-crank, or other means, which will allow manual operation during power failures. Gate arms shall be constructed out of wood, steel, fiberglass, or aluminum, as specified by the manufacturer for the given lengths as shown on the drawings. Gate arms shall be covered with \( 406 \) mm 16 inch wide reflectorized red and white sheeting. Each gate shall be furnished with a spare gate arm. Gate operator cabinets shall be
constructed of galvanized steel, or aluminum and shall be painted manufacturers standard color as approved. Each gate operator shall be provided with an obstruction detector that will automatically reverse the gate motor when an obstruction is detected. The obstruction detector shall be any of the following 3 types: An electronic loop vehicle detector buried in the road, a photocell electric eye mounted on the gate operator, or a safety strip mounted on the lower edge of the arm. The detector system shall be automatically deactivated when the arm reaches the fully lowered position. Slab size and anchorage for gate operator shall be in accordance with manufacturer requirements.

2.10.6 Vehicle Barrier Vertical Arm Gate (Traffic Arm)

A traffic arm, as a separate piece of equipment, will be included with each non-portable active vehicle barrier as part of the barrier safety operating system. This traffic arm shall automatically deploy (close) when the emergency up button is activated and open when the vehicle barrier is reset. This traffic arm will not be equipped with an automatic obstruction detector.

2.11 FINISH

Surfaces shall be painted in accordance with requirements of Section 09 90 00 PAINTS AND COATINGS. The roadway plate shall have a nonskid surface painted white with reflective red [100] [150] mm [4] [6] inch wide red reflective stripes 100 mm 4 inches apart. The barrier front shall be painted white and have [100] [150] mm [4] [6] inch wide reflective red stripes 100 mm 4 inches apart. The diagonal striping should point down and outward from the center of the device. Bollards shall be painted white with [50] [75] mm [2] [3] inch wide reflective red diagonal stripes. The barrier crash gate shall be painted as specified by purchaser and the crash beam shall be painted white with 75 mm 3 inch wide reflective red diagonal stripes.

2.12 CONCRETE

The concrete shall conform to Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.13 WELDING

Welding shall be in accordance with AWS D1.1/D1.1M.

2.14 PAVEMENT

**************************************************************************
NOTE: Edit this paragraph to provide the specification Sections required, depending on the type of the existing pavement to be matched.
**************************************************************************

After placement of the vehicle barrier, the pavement sections shall be replaced to match the section and depth of the surrounding pavement. Pavement shall be warped to match the elevations of existing pavement. Positive surface drainage, away from the vehicle barrier, shall be provided by pavement slope.
PART 3   EXECUTION

3.1 INSTALLATION

Perform installation in accordance with manufacturers instructions and in the presence of a representative of the manufacturer. Manufacturer's representative shall be experienced in the installation, adjustment, and operation of the equipment provided. The representative shall also be present during adjustment and testing of the equipment. Show on the Drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including foundation and clearances for maintenance and operation. Include with the Detail drawings a copy of the Department of State certificate of barrier performance. If the active vehicle barrier is crash rated and/or certified, then the barrier system shall be installed in an 'as-tested' condition. Additional site investigation and construction will be required in order to accomplish this; except when a site specific crash test was performed where the exact site requirements were utilized in the crash test.

3.2 HYDRAULIC LINES

Place buried hydraulic lines in polyvinyl chloride (PVC) sleeves. Provide positive drainage from the hydraulic power unit to the barrier for drainage of condensation within the PVC sleeve.

3.3 PIT DRAINAGE

**************************************************************************
NOTE: Edit this paragraph for drainage requirements. If soil characteristic and/or climate dictates another solution, then this should be considered and edited into this paragraph. Provide self-priming sump pump with capacity and power requirements if one is required. Delete this paragraph if pit/vault type construction is not required. Federal and/or State requirements may require an oil/water separator be installed in the pit drainage to ensure capture of any hydraulic fluid that may leak out of the system.
**************************************************************************

Provide a drain connection [and oil/water separator] in each barrier that requires pit/vault type construction. Provide hookups between the storm drains. [The self-priming sump pump shall have the capacity to remove [_____] cubic meters per second gallons per minute.]

3.4 ELECTRICAL

All control power wiring requiring compression terminals shall use ring-style terminals. Terminals and compression tools shall conform to UL 486A-486B. Roundhead screws and lockwashers shall be used to provide vibration-resistant connections. Connections between any printed circuit cards and the chassis shall be made with screw connections or other locking means to prevent shock or vibration separation of the card from its chassis. The electrical power supply breaker for the hydraulic power unit shall be capable of being locked in the power on and power off positions.
3.5 MANUFACTURER'S SERVICES

**************************************************************************
NOTE: Delete this paragraph if a manufacturer's representative is not required in the project.
**************************************************************************

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment supplied. The representative shall supervise the installation, adjustment, and testing of the equipment.

3.6 FIELD TRAINING

**************************************************************************
NOTE: For electrical/hydraulic option, select 8 hour requirement. For the manual option, select the 1-hour requirement.
**************************************************************************

Provide a field training course for designated operating staff members. Training shall be provided for a total period of not less than [8 hours] [1 hour] of normal working time and shall start after the system is functionally complete but prior to final acceptance tests. Field training shall cover all of the items contained in the operating and maintenance instructions. Submit [6] [_____] copies of operation and maintenance manuals, a minimum of 2 weeks prior to field training. One complete set prior to performance testing and the remainder upon acceptance. Manuals shall be approved prior to acceptance. Operation manuals shall outline the step-by-step procedures required for system startup, operation, and shutdown. The manuals shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Maintenance manuals shall include routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The manuals shall include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. The manuals shall also include synthetic biodegradable hydraulic oil types to be used for ambient temperature ranges of minus 34 degrees C minus 30 degrees F to plus 66 degrees C 150 degrees F to cover winter operation, summer operation, and ambient temperature ranges in between.

3.7 FIELD TESTING

**************************************************************************
NOTE: Edit paragraph accordingly for hydraulic or manual vehicle barrier.
**************************************************************************

Submit test reports in booklet form showing all field tests, including component adjustments and demonstration of compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate with each test report the final position of controls. Upon completion of construction, perform a field test for each vehicle barrier. The test shall include raising and lowering the barrier, both electrically and manually, through its complete range of operation. Each vehicle barrier shall then be continuously cycled for not less than 30 minutes to test for heat build-up in the hydraulic system. Notify the Contracting Officer at least 7 days prior to the beginning of the field test. Furnish
all equipment and make all necessary corrections and adjustments prior to tests witnessed by the Contracting Officer. Any conditions that interfere with the proper operation of the barrier disclosed by the test shall be corrected at no additional cost to the Government. Adjustments and repairs shall be done by the Contractor under the direction of the Contracting Officer. After adjustments are made to assure correct functioning of components, applicable tests shall be completed.

-- End of Section Table of Contents --
NOTE: This guide specification covers requirements for mooring and static grounding points for Army and Air Force aircraft.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The items specified will provide ground points with a resistance of no more than 10,000 ohms to ground if the resistance of the surrounding soil or rock is less than 2,000,000 ohm-centimeters. In high resistivity soils, over 2,000,000 ohm-centimeters, 3 meter 10 foot or sectional rods may be used to obtain the required resistivity to ground; however, where rock is encountered, additional rods, a counterpoise, or ground grid may be necessary. Resistance to ground for static electricity dissipation may be as much as 1,000,000 ohms. Static grounds are not designed for aircraft lightning protection or for equipment grounding.
Grounding devices installed in hangar floors are intended to serve for airplane static and equipment grounding. The resistance to ground for each device will be no more than 25 ohms. This requirement should not be a problem since the rods will be bonded to the facility ground. The resistance to ground of grounding rods installed in all other areas should be no more than 10,000 ohms.

Coordination with grounding requirements listed in other sections should be done to avoid duplication.

It is recommended that this specification, and other contract requirements for mooring and grounding points, be coordinated with UFC 3-575-01, Design of US Army Airfield Aircraft Mooring and Grounding Points for Rotary Wing Aircraft.

The mooring points in this specification are applicable to Army rotary wing aircraft only.

1.1 REFERENCES

**NOTE:** This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**AMERICAN WELDING SOCIETY (AWS)**

AWS D1.4/D1.4M (2011) Structural Welding Code - Reinforcing Steel

**ASTM INTERNATIONAL (ASTM)**

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that
the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   As-Built Drawings; G[, [_____]]

SD-06 Test Reports
   Concrete; G[, [_____]]
   Tests

SD-07 Certificates
   Mooring Devices
   Grounding Rods
   Grounding Connectors
   Copper Conductors
   Reinforcing Steel

1.3 AS-BUILT DRAWINGS

Submit AS-Built Drawings that provide current factual information, including deviations from and amendments to the drawings and changes in the work, concealed and visible.

PART 2 PRODUCTS

2.1 METALS

Do not use combination of materials that forms an electrolytic couple, which accelerates corrosion in the presence of moisture, unless moisture is permanently excluded from the junction of such metals.
2.2 **MOORING DEVICES**

Mooring devices shall be cast in ductile iron 80-55-06 conforming to ASTM A436, unless otherwise indicated. The device shall be as shown in the contract drawings. Submit certificates of compliance on the devices stating that the mooring devices meet the specified requirements.

2.3 **GROUNDING RODS**

Grounding rods, unless otherwise indicated, shall conform to UL 467 and shall be made of copper-clad steel. The rods shall be not less than 19 mm 3/4 inch in diameter and not less than 3 m 10 feet long. The copper cladding shall conform to the applicable requirements of ASTM B371/B371M, Copper Alloy UNS No's. c 69400, c 69430, c 69440 or c 69450. The copper cladding shall be not less than 0.25 mm 0.010 inches thick at any point and shall comply with adherence requirements and the banding requirements of UL 467. Submit certificates of compliance stating that the grounding rods meet the specified requirements. Rods shall be provided with a closed eye or shepherd's hook bend having an inside diameter of not less than 32 mm 1-1/4 inches. [The rods shall be pointed unless used for flexible pavement.] [For flexible pavement, the rods shall have 19 mm 3/4 inch American standard rolled threads for attachment of a bottom anchor and shall be equipped with a screw-type bottom having a wing diameter of not less than 152 mm 6 inches.]

2.4 **COPPER CONDUCTORS**

Copper conductors shall be bare number 4 AWG copper wire conforming to ASTM B8. Submit certificates of compliance stating that the copper conductors meet the specified requirements.

2.5 **GROUNDING CONNECTORS**

Grounding connectors shall comply with UL 467 for the required application. Submit certificates of compliance stating that the grounding connectors meet the specified requirements.

2.6 **CONCRETE**

**************************************************************************

**NOTE:** ASTM C94 is set up to use Type I cement. If other types of cement are required due to site conditions, the designer should specify the proper cement type. A 28-day 40 MPa 6000 psi compressive strength concrete is required for mooring point installation in drilled piers and in cored existing pavements. New rigid pavement 150 mm 6 inches or greater in thickness with a minimum 90-day flexural strength of 3.5 MPa 500 psi should be adequate for cast-in-place mooring point installation. Remove this paragraph if concrete is not required.

If concrete is specified in another section, delete this paragraph.

**************************************************************************

Submit complete concrete mix design including all cement, aggregate, and concrete tests and compliance certificates. Concrete shall be in accordance with [Section 32 13 14.13 CONCRETE PAVING FOR AIRFIELDS AND
OTHER HEAVY DUTY PAVEMENTS [ASTM C94/C94M]. The concrete shall be air entrained and have a minimum compressive strength of 40 MPa 6000 psi. The concrete shall have the following properties: Nominal maximum aggregate size of 25 mm 1 inch, air content of 6 percent, and a maximum slump of [100 mm 4 inches for drilled piers] [and] [50 mm 2 inches for all other applications].

2.7 REINFORCING STEEL

Reinforcing steel shall conform to ASTM A615/A615M Grade 40 or 60 for #4 tie bars and Grade 60 for #6 vertical bars. Steel shall be welded into cages in accordance with AWS D1.4/D1.4M and inserted securely in the piers, in position and alignment, as shown, prior to concrete placement. Submit certificates of compliance stating that the reinforcing steel meets the specified requirements.

PART 3 EXECUTION

**************************************************************************
NOTE: Types of mooring or grounding point installations not needed should be edited out.
**************************************************************************

3.1 MOORING POINTS IN NEW RIGID PAVEMENTS OR CONCRETE PADS

Install the mooring device within plus or minus 50 mm 2 inches of the location shown on the contract drawings. The top of the mooring device shall be set within 6 mm 1/4 inch of the plan pavement surface elevation, but not higher than the pavement surface. Install the mooring device prior to placement of the concrete pavement. Place concrete and reinforcement in accordance with Section [03 30 00 CAST-IN-PLACE CONCRETE][03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE]. Hand finishing of the concrete around the mooring devices shall be kept to a minimum.

3.2 MOORING POINTS IN EXISTING RIGID PAVEMENTS

**************************************************************************
NOTE: Existing rigid pavement must be equal to or greater than 150 mm 6 inches thick and in good condition, with very few cracked slabs. This is required to provide adequate mass to resist the horizontal component of the mooring point load.
**************************************************************************

Install the mooring points, unless otherwise indicated, in 305 plus or minus 13 mm 1/2 inch diameter holes cored through the pavement. The core holes shall be drilled within plus or minus 38 mm 1-1/2 inches of the location shown in the contract drawings. The mooring device and attached grounding rod shall be installed within plus or minus 13 mm 1/2 inch of the center of the core hole. The top of the mooring device shall be installed within 6 mm 1/4 inch of the surrounding pavement surfaces, but not higher.

3.2.1 Coring Requirements

Core the holes using rotary, non-percussion drilling techniques. The sides of the core hole shall be perpendicular to the pavement surface. Once the pavement is cored, the base course shall be excavated as shown in the drawings. The sides of the core hole shall be cleaned of latex and
roughened by sand blasting. Place the concrete around the mooring device in two or more lifts. The first lift shall be placed to within 125 mm 5 inches of the pavement surface and thoroughly consolidated by spud vibrators. The second lift shall be placed and also consolidated by internal vibration. The surface of the concrete shall be finished and textured to match the adjacent pavement surface and elevation. White pigmented curing compound meeting the requirements of COE CRD-C 300 shall be uniformly applied at a coverage of not more than 4.5 square m/L 200 square feet per gallon.

3.2.2 Cleanup

Control all operations to minimize the amount of dust, dirt, debris and laitance in the work area. Clean all dirt, dust, debris, or laitance from coring or concreting operations, from the pavement surfaces prior to final acceptance.

3.3 MOORING POINTS INSTALLED IN DRILLED PIERS

Coordinate excavation of piers so that reinforcing steel and concrete placement is a continuous operation performed the same day that the excavation is completed. Excavations shall not be left open overnight. Place concrete within 3 hours after approval of the completed pier excavation. Pier drilling equipment shall have the minimum torque capacity and downward force capacity for the contract site conditions.

3.3.1 Government Inspection

The Contracting Officer will inspect each drilled pier excavation. Concrete shall not be placed until the excavation has been approved. Furnish the Contracting Officer all necessary equipment required for proper inspection of drilled pier excavations.

3.3.2 Installation Procedures

Excavate piers to the depths and dimensions shown. Piers shall be core drilled through pavements. Bottoms of piers shall be cleaned of loose or soft material and leveled. Excavated material shall be disposed of in accordance with Section 31 00 00 EARTHWORK. Perform the following:

a. The surrounding base courses, subgrade, and soil shall be adequately and securely protected against cave-ins, displacement of the surrounding earth, and retention of ground water by means of temporary steel casings. Casings shall have outside diameters not less than the indicated shaft sizes and shall be a minimum of 6 mm 1/4-inch thick. Withdraw steel casings as the concrete is being placed, maintaining sufficient head of concrete within the casing to prevent extraneous material from falling in from the sides and mixing with the concrete. Casings may be jerked upward a maximum of 100 mm 4 inches to break the bottom seal; but, thereafter, shall be removed with a smooth, continuous motion.

b. The inside of steel casings shall be thoroughly cleaned and oiled before reuse.

c. Water that flows into the excavations shall be continuously removed and all water shall be removed from the excavation bottom, to the extent possible, prior to concrete placement. The maximum permissible depth of water shall be 50 mm 2 inches. In the event of a severe water
condition that makes it impossible or impractical to dewater the excavation, concrete shall be placed using underwater tremie after water movement has stabilized.

d. Continuously place concrete, ensuring against segregation and dislodging of excavation sidewalls; concrete shall completely fill the shaft. Concrete shall be placed by pumping or drop chutes in dry holes and by tremie or pumping in wet holes. The discharge shall be kept a minimum of \(305 \text{ mm} = 1 \text{ ft}\) below the fresh concrete surface during placement. Concrete placement shall not be interrupted in any pier for more than 30 minutes. The upper \(1.5 \text{ m} = 5 \text{ ft}\) of the concrete pier shall be vibrated.

e. Correct any pier out of center or plumb beyond the specified tolerance, as necessary for compliance; bear any cost of correction. Cross sections of shafts shall not be less than design dimensions. Piers shall be installed with top location deviating a maximum of \(50 \text{ mm} = 2 \text{ inches}\) from centerline locations.

f. Install the mooring device within plus or minus \(25 \text{ mm} = 1 \text{ inch}\) of the center of the drilled pier. The top of the mooring device shall be within \(6 \text{ mm} = 1/4 \text{ inch}\) of the top of the pier, but not higher.

g. Replace, at no additional cost to the Government, piers found out of tolerance.

h. Provide protection around top of the excavation to prevent debris from being dislodged into the excavation and concrete.

3.4 GROUNDING POINTS

Locate the grounding points as shown on the contract drawings to within plus or minus \(50 \text{ mm} = 2 \text{ inches}\).

3.4.1 Pavement Recess

The top of the grounding rod shall be set at or not more than \(6 \text{ mm} = 1/4 \text{ inch}\) below the pavement surface grade. A recess \(70 \text{ mm} = 2-3/4 \text{ inches}\) wide, and not more than \(150 \text{ mm} = 6 \text{ inches}\) long, with a smooth rounded edge shall be provided in the pavement around the grounding point anchor eye to permit the entrance of lines into the eye and to allow for attachment of the grounding cable. The depth of the recess shall be no deeper than the bottom of the opening of the grounding point eye.

3.4.2 Installation

3.4.2.1 Existing Rigid Pavement

Install grounding rods in holes cored through the rigid pavement using rotary, non-percussion drilling techniques. The core holes shall have a minimum diameter of \(150 \text{ mm} = 6 \text{ inches}\). The grounding rod shall be installed by pushing or driving the rod through the pavement base courses and subgrade. The installation technique chosen shall not damage the grounding rod or the pavement. Installation shall be completed by placing concrete around the grounding rod in two lifts with each lift consolidated with spud vibrators.
3.4.2.2 New Rigid Pavement

Install the grounding rod by pushing or driving the rod through the pavement base courses and subgrade prior to concrete placement. The installation technique chosen shall not damage the grounding rod. Hand finishing around the rod shall be kept to a minimum.

3.4.2.3 Flexible Pavement

Install grounding rods in portland cement concrete blockouts measuring 1.2 by 1.2 m 4 by 4 foot in plan dimensions. The thickness and reinforcing details are shown on the contract drawings. Install the grounding rod by pushing or driving the rod through the pavement base courses and subgrade prior to concrete placement. The installation technique chosen shall not damage the grounding rod. Hand finishing around the rod shall be kept to a minimum.

3.4.3 Interconnection

Grounding rods within aircraft hangars shall be electrically interconnected to the hangar electrical grounding system with not less than a number 4 AWG bare copper conductor. Grounding rods installed at fueling hydrant outlets shall be electrically interconnected with the fuel piping with not less than a number 4 AWG bare copper conductor.

3.5 TESTS

Submit an independent testing agency's certified reports of inspections and tests, including analysis and interpretation of test results. Each report shall be properly identified. Describe Test methods and standards used. Measure resistance to ground tests as specified in NFPA 407. Submit test results to the Contracting Officer. Report to the Contracting Officer, immediately, any ground rods that have more than 10,000 ohms of resistance.

3.4.8.1 Sidebar Tests
3.4.8.2 Pin Tests

3.5 GEAR CERTIFICATION

3.6 CHAIN CERTIFICATION

3.7 HOISTING DRUM AND SHEAVE CERTIFICATION

3.8 HOISTING MACHINERY AND DRUM SHOP LOAD TEST

3.9 POCKET WHEEL [SPROCKET] SHOP LOAD TEST
NOTE: This guide specification covers the requirements for mechanical power systems to operate gates, culvert valves, and other mechanisms at navigational locks and dams, flood control dams, and other civil works structures.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.
for various configurations of linkages, pins, shafts, etc. For self-lubricated bearing systems, see UFGS 35 05 40.17 SELF-LUBRICATED BEARING MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY.

Ensure products used in this section comply with Federal procurement preference under Section 9002 of the Farm Security and Rural Investment Act of 2002. See Section 01 33 29 SUSTAINABILITY REPORTING for requirements associated with EPA designated products.

1.2 SUBMITTALS

*****************************************************************************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control
System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only.] When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-01 Preconstruction Submittals**

**Purchase Agreements**

Purchase agreements, delivery dates and monthly progress reports shall comply with the requirements of paragraph, CRITICAL PATH COMPONENTS/SYSTEMS.

**Shop Test Information; G[, [____]]**

Contractor shall provide proposed shop test procedures, test rig details, final shop test procedures, and data sheets.

**Shop Load Test Rig and Location; G[, [____]]**

Provide details of the Contractor designed test rig and its location for the shop load test for approval.

**Installation and Alignment Procedure; G[, [____]]**
Provide detailed [manufacturer's] [Contractor developed] instructions concerning the installation and alignment procedures for the equipment to be furnished. Items include [gear reducers,] [bearings,] [shafts,] [brakes,] [motors,] [couplings,] [pocket wheels,] [sprockets,] [hoisting chains,] [_____] and [limit switches].

**Gate Support Method; G[, [_____]]**

Provide detailed information on the method proposed to support the [tainter] gate during the work delineated in this section. The support method, engineering computations, and support drawings shall be designed and certified by a licensed professional engineer.

**Measuring Tension Procedure; G[, [_____]]**

Provide details for the procedure used to measure wire rope, [chain] tension during installation.

**Gate Position Settings on Limit Switches**

Immediately prior to commencement of work on each gate, record the gate position settings.

**Equipment Protection Plan; G[, [_____]]**

Provide detailed information on the method proposed to protect the existing equipment from such operations as power washing, abrasive blast cleaning, welding, placement of concrete, and painting.

**Materials List; G[, [_____]]**

Submit materials list for fabricated items at the time of submittal of detail drawings.

**Commissioning; G[, [_____]]**

**[Field Tensioning and] Operating Test Procedure; G[, [_____]]**

**Pre-Functional Checklist**

Contractor developed checklist for checks, recordings, measurements and verifications to be performed prior to start up. Acceptance shall be required by signature for all parties.

**Functional Checklist**

Contractor developed checklist for checks, recordings, measurements and verifications to be performed after start up. Acceptance shall be required by signature for all parties.

**SD-02 Shop Drawings**

**Detail Drawings; G[, [_____]]**

Detailed shop drawings for pocket wheels, [sprockets,] gears, shafts, bushings, hoisting chains, limit switches, supports, and
all ship fabricated metal items, shall be submitted and approved prior to fabrication.

**Materials Orders**

Submit copies of purchase orders, mill orders, shop orders and work orders for materials prior to the use of the materials in the work.

**Shipping Bills**

Shipping Bills with the delivery of finished pieces to the site.

**Reducer Shafts; G[, [____]]**

**Key Fit and Shaft Bores**

SD-03 Product Data

Manufacturer's Literature and Equipment Data; G[, [____]]

Provide catalog cuts and material data for the proposed equipment that clearly indicates compliance with the requirements of these specifications and the drawings. AGMA ratings for gear quality of all gears and gear reducers shall be submitted.

Provide the names of the manufacturers of all machinery and other equipment which it contemplates incorporating into the work, together with performance capacities and other pertinent information pertaining to the equipment.

**Electric motors**

SD-05 Design Data

Contractor Designed Gearing; G[, [____]]

Gearbox Lubrication System; G[, [____]]

Contractor Designed Sheaves; G[, [____]]

Lubricating Oil for Speed Reducers

SD-06 Test Reports

[Sector] [Bull] [Spoked] [____] Type Gears

Electric Motors

Final Operating Test; G[, [____]]

Final [Field Tensioning and] Operating Test; G[, [____]]

Round Link Chain Tensioning

Submit proposed operating test procedures, final field operating test procedures, and data sheets.

**Startup and Acceptance Test**
Magnetic Particle Examination

Provide test reports for non-destructive tests performed on the gears, pocket wheels, hoisting chains, repair links and all fabricated welded components.

Tooth Contact Patterns

Inspection Log

Shop Assembly and Tests

Final Alignment Test Report

SD-07 Certificates

Equipment Manufacturer's and Fabricator's Qualifications

Provide evidence and years of experience for each of the equipment manufacturers and fabricators. Identify any certifications, standards, and/or professional organizations the manufacturers comply with or are members of.

Qualification of Welders and Welding Operators

Submit certifications for welders and welding operators prior to commencing fabrication.

Equipment Warranty

Provide manufacturer's standard warranty or guarantee for equipment, e.g., speed reducers. Identify any warranties that extend beyond a 1-year period.

Erecting Engineer Installation and Operation

Submit erecting engineer installation and operation certificates at the conclusion of installation and startup for each specified major equipment or subassemblies.

Nondestructive Examination Certification

Gear Certification

Drum Geometry for Synchronous Drums

Commissioning Document

SD-08 Manufacturer's Instructions

Cleaning of Corrosion-Resisting Steel; G[, [_____]]

SD-10 Operation and Maintenance Data

Operations and Maintenance (O&M) Manual; G[, [_____]]

Provide six copies of operation and maintenance manuals (in accordance with paragraph OPERATIONS AND MAINTENANCE MANUALS and
1.3 QUALITY ASSURANCE

1.3.1 Manufacturer and Assembler

Manufacturing and assembly of the [miter gate] [dam gate] [and] [tainter] [valve], [_____] machinery units shall be performed by a Contractor and fabrication company that has been normally and regularly engaged in assembly, and manufacture of heavy machinery over the preceding [10] [_____] years. Changes to the dimensions shown on the drawings [and in the Bill of Materials] for the Gate and Valve Machinery (including structural supports) requires written approval from the Contracting Officer. Submit Equipment Manufacturer's and Fabricator's Qualifications showing evidence and years of experience for each of the equipment manufacturers and fabricators. Identify any certifications, standards, and/or professional organizations the manufacturers comply with or are members of.

1.3.2 Erecting Engineer Services

**************************************************************************
NOTE: This paragraph covers services of erecting engineers. The designer should incorporate the use of on-site erecting engineers from the equipment manufacturer when a particularly complex equipment is being installed as part of the project and/or on-site training for project personnel is desired.
**************************************************************************

Provide the services of one or more erecting engineers onsite during the installation and startup of each defined major piece of equipment and subassembly. The erecting engineer(s) are responsible to technically supervise and provide instruction for the equipment to be installed and operated. [The major pieces of equipment and subassemblies requiring engineering services is defined as follows:]

[ a. [Miter Gate Machinery]]
[ b. [Dam gate Machinery]]
[ c. [Culvert Valve Machinery]]

Upon completion of the work and at a time designated, provide the services of one or more erecting engineers for training Government personnel in accordance with the requirements of paragraph FIELD TRAINING.

1.4 DELIVERY, STORAGE, AND HANDLING

1.4.1 Critical Path Components/Systems

**************************************************************************
NOTE: Many custom and catalog selected items require long lead times that may affect the construction schedule. If this is the case, use the following paragraph.
**************************************************************************

Many of the components required for the electrical and mechanical equipment at a [Lock] [and] [Dam] have long delivery times. A large percentage of the electrical and mechanical work must be accomplished only during
To ensure that all work required during this time period is accomplished, present to the Contracting Officer, within [120] [_____] calendar days after receiving notice to proceed, written copies of finalized purchase agreements with component manufacturers (NOT SUPPLIERS) for the components and systems noted below.

</tbody>
</table>

Include a confirmed delivery date and point of contact at the particular manufacturer in the purchase agreements. Require the manufacturer to furnish a monthly report (submit to the Contracting Officer on the 10th of each month) of progress on the particular component/system and any delays in the previously specified delivery date. Include both written and photographic updates to track and monitor the current status of the equipment to be furnished in the progress reports. The reporting requirements specified herein are included in the requirements of Section 01 32 01.00 10 PROJECT SCHEDULE.

1.4.2 Delivery, Storage and Handling of Equipment

NOTE: This paragraph covers storage of equipment when delivered to the jobsite and storage of spares. Major pieces of equipment and subassemblies
that require Government inspection prior to shipment
shall be identified by the designer.

Protect equipment and components from corrosion, deformation, and other
types of damage. Store items in enclosed and secured areas free from
contact with soil. Provide moisture proof weather protection for all
equipment stored in outdoor locations. Transport, handle and store all
equipment in accordance with the manufacturer's written instructions.
Remove and replace damaged items with new items. [Do not prepare the major
pieces of lock and dam operating equipment and subassemblies for
shipment until they have been inspected and accepted for shipment at origin
by the Contracting Officer or his authorized representative, unless
inspection has been waived in writing.] Ship each subassembly completely
assembled. Submit the shipping bills with the delivery of finished pieces
to the site. The major pieces of equipment and subassemblies for this
contract are defined to include the following:

[a. Miter Gate Machinery]
b. Dam Gate Machinery]
c. Culvert Valve Machinery]

1.4.2.1 Packaging

Provide equipment and subassemblies with adequate protective pads,
supports, and blocking. Securely restrain equipment and subassemblies to
prevent distortion or damage to the painted surfaces in transit. Any loss
or damage during shipment, including damage to the painted surfaces, is the
responsibility of the Contractor. Replace or repair lost or damaged items
without cost to the Government. Coat all parts with a rust preventative,
wrap in heavy-duty plastic, and securely contain in wooden crates. Clearly
mark each crate with its contents (including contract number and Corps mark
number) on the outside, with a non-ferrous metal tag, engraved with the
contents, and secured to the crate with non-ferrous screws. Provide a
means for inspection of the crate's contents without destroying the crate.
Pack all accessories and spare parts separately in containers plainly
marked "ACCESSORIES ONLY," or "SPARE PARTS ONLY." Package each spare part
or spare part assembly in a durable treated wooden crate with metallic,
plastic or suitable outer shell for weathertight protection and with
provisions for handling and long-term storage (60 months). Provide and
deliver to the site the component and assembly spare parts as delineated on
the drawings. Place a separate packing list, listing the contents of each
crate, in a moisture-proof envelope securely fastened to the outside of the
crate. Standard commercial packaging in accordance with ASTM D3951 is
acceptable except where a different method or standard of packaging is
specified.

1.4.2.2 Shipping, Preservation, and Storage

Provide all packing, crating, etc., necessary to ensure safe shipment of
equipment. The crates shall become the property of the Government unless
specifically waived. Fill or protect the equipment with the necessary
fluids, coatings, and/or preservatives to maintain in a stable condition
without corrosion, deterioration, or degradation for an extended period of
storage of up to [12] [_____] months. Protect stored equipment from the
weather, humidity, temperature variation, dirt and dust, or other
contaminants.
PART 2   PRODUCTS

2.1   EQUIPMENT

**************************************************************************
NOTE: This guide specification covers operating machinery for lock gates, filling/emptying valves and dam gate operating equipment. It can be revised as needed to accommodate any type of gate or culvert valve.
**************************************************************************

2.1.1 Machinery

Furnish equipment under this specification consisting of [four] [_____] [_____] type gate operating machinery units [and [four] [_____] type filling/emptying valve operating machinery units; [two] [_____] upper gate and valve units and [two] [_____] lower gate and valve units [and spares]]. Furnish complete units including base supports, geared drives, brakes, motors, shafts, bearings, [wire rope,] [chain,] [pocket wheels,] [sprockets,] [engineered chain,] electrical equipment, controls, covers, guards, [portable] filtering unit and other necessary items to provide a complete and operable system.

2.1.2 Electrical Equipment

Conform electrical equipment, including limit switches, motor starters, conduit, conductors, controls, [slack cable safety devices,], to the requirements of [Section 35 20 20 ELECTRICAL EQUIPMENT FOR GATE HOIST][ and ][Section 40 95 00 PROCESS CONTROL].

2.1.3 Nameplate

Provide an engraved or raised [metallic] [_____] nameplate that is mechanically attached to each piece of equipment. Include the manufacturer's name, model designation, serial number, unit rating, application factor, reduction ratio's, and any other applicable information on the nameplate.

2.1.4 Equipment Submittal Data

Submit Equipment Data and Detail Drawings including equipment dimensional drawings, assembly drawings, catalog cuts, and material data and shop drawings showing arrangement, construction details and ratings for factory built [miter gate] [tainter valve] [miter gate and tainter valve] machinery; test rig assembly details; proposed and final shop test procedures and data sheets; proposed and final field [cable tensioning and] operating test procedures and data sheets, for approval. Provide all details of fabrication and assembly to include shipping and long term storage instructions. Shop drawings lacking this information will be rejected. Approval of the material submitted in no way relieves the Contractor from the responsibility of complying with the requirements of the specifications as to the suitability and quality of materials and workmanship and the adequacy of capacity, operating speed and other essential characteristics of the [gate][valve][gate and valve] drives. Submit drawings, catalogs, and design data necessary to clearly show the details of any changes proposed in conformity with the requirements of this specification. Equipment, materials, and articles of construction installed or used without such approval will be at the risk of subsequent rejection.

SECTION 35 01 41.00 10   Page 18
Submit a **materials list** for fabricated items at the time as the detail drawings submittal.

Submit copies of all **materials orders** including purchase orders, mill orders, shop orders and work orders for materials prior to using the materials in the work.

Submit Manufacturer's Literature and Equipment Data for approval. Include the names of the manufacturers of all machinery and other equipment contemplated for incorporation into the work, performance capacities and other pertinent information about the equipment. As a minimum, include the following Manufacturer's Literature and Equipment Data:

### 2.2 DESIGN CRITERIA

***************

NOTE: Edit all or portions of this paragraph depending upon type of contract documents to be prepared. At a minimum the designer shall provide the anticipated operating loads and required operating conditions to be satisfied for equipment manufacturers to best select and size equipment components to match the anticipated operating conditions. The designer should review EM 1110-2-2610 Mechanical and Electrical Design for Lock and Dam Operating Equipment for specific guidance and design criteria related to the type of lock gate and filling/emptying valve configuration

***************
to be specified for the project. The designer should be aware that modifications and or deviations away from EM design criteria may require separate documentation, design analysis, and written USACE-HQ approval.

******************************************************************************

Provide equipment and machinery to meet the anticipated operating conditions as specified by the following design criteria.

<table>
<thead>
<tr>
<th>COMPONENT DESIGN CRITERIA</th>
</tr>
</thead>
<tbody>
<tr>
<td>ITEM</td>
</tr>
<tr>
<td>LOAD (kN) (Kips)</td>
</tr>
</tbody>
</table>

******************************************************************************

NOTE: Delete the following paragraph for Corps of Engineers designed projects and include only for non-Corps designed machinery where the AE, Contractor or Equipment Manufacturer are the responsible Designer of Record for calculating the equipment operating loads. The Corps must be aware in the review of such designs any modifications and or deviations away from EM design criteria may require separate documentation, design analysis, and written USACE-HQ approval.

******************************************************************************

[Design equipment in strict accordance with the requirements of EM 1110-2-2610 Mechanical and Electrical Design for Lock and Dam Operating Equipment unless otherwise specified within. Equipment shall be designed for the normal loads using factors of safety applicable to the type of service and the particular part with a minimum factor of safety of 5 based on the ultimate strength of the material. Include all anticipated loads in the design. Loads include, but are not limited to, the loads imposed by the dead weight, hydraulic forces, buoyancy forces, ice, and seal friction. In addition, design each part or component, including speed reducers[ (excluding wire rope)], for a unit stress not in excess of 75
percent of the yield strength of the material under loads resulting from the locked rotor torque of the electric motor. Design components that might fail in buckling compression for a minimum factor of safety of 3.0, using the Euler or J.B. Johnson formulas. Apply the factor of safety to the maximum load on the member and the critical buckling load. Model the end fixity coefficient for pin-end conditions. [Both the normal loads and loads resulting from the locked rotor torque of the electric motor shall be considered for miter gate machinery.] [Both the normal loads and loads resulting from the locked rotor torque of the electric motor shall be considered as divided [70/30] between the two drums of a hoist for [tainter valve] machinery.] [Both the normal loads and loads resulting from the locked rotor torque of the electric motor shall be considered for [gate][filling/emptying valve] operating equipment.] [For loads divided between the components of the operating equipment they shall be considered for design purposes to have a [____/____] split in load distribution.] Allowances for shock and impact will not be required unless specifically identified. Submit for approval all equipment modification design calculations.

2.3 OPERATION SEQUENCES

2.3.1 [Lock Gate] [Hoisting Machinery] Operation

**************************************************************************
NOTE: The designer should coordinate with electrical design engineers to develop the required sequence of operation and provide the requirements on the drawings. The necessary control equipment and devices should be specified in UFGS Section 40 95 00 PROCESS CONTROL and Section 35 20 20 ELECTRICAL EQUIPMENT FOR GATE HOIST.
**************************************************************************

The equipment sequence of operation, interlocks and electrical controls are as indicated. [Conform equipment and hardware with the requirements of Section 35 20 20 ELECTRICAL EQUIPMENT FOR GATE HOIST and Section 40 95 00 PROCESS CONTROL.]

2.3.1.1 Sequence of Operation

**************************************************************************
NOTE: The designer should include or edit the paragraphs below to describe the anticipated sequence of operation for the equipment specified.
**************************************************************************

2.3.1.1.1 [Lock] Gate Opening

b. Motor and brake are energized (brake is released).

d. Motor [shifts] [ramps] to high speed mode and runs at full speed mode until the [lock] gate is [95] [____] percent open.

f. Gate position is device proven to be at end of travel.

g. Motor and brake are de-energized (brake is engaged).

2.3.1.1.2 [Lock] Gate Closing

The sequence for closing the gate is identical to that for opening, except the gate moves in the opposite direction to the closed position.

2.3.1.2 Design Considerations

Normal operations of the [lock][dam] [gates][valves] for the purpose of design consist of the [lock][dam] [gates][valves] operating through [3] [_____] complete cycles per hour with [2] [_____] starts and [2] [_____] stops per cycle. A cycle is defined as moving the [lock][dam] [gate][valve] from the fully closed position to the fully opened position and back to the fully closed position.

2.4 SPEED REDUCERS

2.4.1 [Miter Gate Speed Reducers] [Gate Hoist Speed Reducer] [Tainter Valve Speed Reducer]

2.4.1.1 General

The speed reducer is a [single] [double] [triple] [quadruple] reduction, [right angle,] [parallel shaft,] [spiral bevel/helical gear] [helical gear] [right angle worm gear] type, entirely self contained in an oil tight, steel housing designed to maintain shafts and bearings in accurate alignment. Provide the gear ratio as indicated plus or minus [1.5] [_____] percent. [The [vertical] [horizontal] output shaft must be [single] [double] extended and [be coupled to the pinion shaft] [have the pinion mounted on the output shaft]]. Provide a [vertical up] [horizontal] output shaft for position feedback with the gear reducer. The shaft must be [19 mm 3/4 inches in diameter and extend to provide a [direct coupled][gear reduced coupling][non-contact coupling] to drive a [rotary cam limit switch][angular displacement transducer][non-contact transducer]]. [Reducers with dual output working shafts must be designed to accommodate a split percentage torque distribution between the output shafts based upon the loads produced by the motor and in accordance with the design criteria specified in paragraph DESIGN CRITERIA.][ The input shaft must be [_____] mm inches in diameter.] Design, rate and manufacture the speed reducers in accordance with ANSI/AGMA 6113 AGMA 6013 with all components meeting the requirements of ANSI/AGMA 6001. The gearing must be rated in accordance with ANSI/AGMA 2003 and ANSI/AGMA 2001. In all cases where these standards or this specification are in conflict with one another the more conservative design standard takes precedence.

2.4.1.2 Reducer Housing

*************************************************************************************************************************************************

NOTE: Gearboxes exposed to the environment should be fitted with filtering ports or a self-contained filter system so that the oil can be filtered to remove moisture.
The reducer housing must be heavy duty cast steel or welded steel construction and have dowel pins at all parting seams for accurate gear and bearing alignment. Split the reducer housing to facilitate disassembly for maintenance and repair. The reducer housing must be of the dry well type design for the vertical down output shaft. Design the dry well such that the speed reducer can be completely filled with oil while in storage and the oil can be drained out of the dry well when the speed reducer is to be put into service. Design the base thickness and width with adequate rigidity and stiffness to not contribute additional stress on the mounting bolts. All surfaces must be smooth and flat and easy to clean. Provide the upper and lower housings with large, rugged lifting lugs.

Provide a machined steel bracket for mounting the [rotary cam limit switch][angular displacement transducer] and mount as indicated. Provide all required oil drains, fill ports, breathers, heater ports, filtering ports, and inspection covers in the housing. Provide a main oil drain at the lowest point possible on the reducer housing. Fit the main oil drain with a 25 mm 1-inch stainless steel ball valve with a pressure-temperature rating of 13.8 MPa [2000 psig at 38 degrees C 100 degrees F]. Plug the valve on the open end. Housing must include 25 mm 1-inch filter ports with 25 mm 1-inch stainless steel ball valve to be connected to the portable filtering unit where specified, otherwise cap the ends. Also provide the lower bearings with drainable deepwell bearing end caps as indicated. Locate drain and fill plugs for speed reducers so as to be readily accessible on the completed units and provide with extension piping where required.

Manifold and pipe the drains to a single point with a shutoff valve and threaded cap on the exterior of the housing so that it is easily accessible. The design of the reducer housing should minimize potential for water intrusion as the reducers will be continuously exposed to all weather conditions. This includes raising the upper bearing caps on top of the housing to prevent standing water from seeping into the enclosure. Internally raise lower bearings within the housing to prevent bearings from being the lowest point in the housings. Top side inspection covers are not acceptable. Provide side inspection access covers. All dimensions indicated must remain as shown as a minimum for proper machinery alignment, as well as interchangeability with other reducers within the [_____] District.

2.4.2 Gearing

NOTE: The designer should coordinate with the gearbox manufacturer to determine the heat treatment and hardening method best suited to satisfy the operational conditions for the gearbox.

Provide [spur] [helical] gearing made from high strength alloy steel that is hardened by [flame][induction][carburizing] with subsequent quenching and tempering to produce a [through][case] hardened gear. Grind the gears after gear cutting to achieve a minimum ANSI/AGMA Quality [11] [_____] in accordance with AGMA 2015/915-1. [Integrally cut the [helical] pinions on the pinion shaft.][Make spiral bevel gears from high strength alloy steel with case hardened teeth, crown lapped for quality and smooth operation.]

2.4.3 Reducer Shafts

Make shafts from high-strength alloy steel in accordance with
ASTM A668/A668M and of sufficient size and as indicated to insure rigid alignment. All keyways must have fillet radii. Provide keys for all shafts. Design shafts in accordance with the requirements of ANSI/AGMA 6001. All shafts must have standard keyways and keys in accordance with ASME B17.1, Class II. Submit all fabricated dimensions of the keyways and keys.

2.4.4 Shaft Bearings

The shaft bearings must be high capacity antifriction roller bearings suitable for both radial and thrust loads. All bearings must have a minimum L-10 bearing life of [75,000] [_____] hours based on the largest full load motor kW horsepower provided by the specified motor.

2.4.5 Gearbox Lubrication System

**************************************************************************
NOTE: A pressure or combination system generally is specified for right angle gearboxes that might have gearing above the oil line or a gearbox with slow moving gearing. If a splash type system is used, delete the requirement for the pump.
**************************************************************************

The lubrication system must be a [splash] [pressure] [combination pressure/splash] type system using a [synthetic] [petroleum based] hydro-carbon lubricant conforming to the requirements of ANSI/AGMA 9005. The pressure lubricating system consists of an electric motor driven lubricating gear pump and piping assembly which lubricates the upper bearings and gear meshes not submerged in oil. The pump must be a positive displacement [internal][external] gear type, cast iron construction. Equip the pump with an overpressure relief valve. [Internally][Externally] mount the pump on the gear box and provide with the proper seals to operate under the stated conditions. The gear reducer manufacturer must design the lubrication system. Install external and internal piping as required to provide adequate lubrication to the gear meshes and bearings. Define, document and submit the pressure losses, total flow rate, and expected flow rate to each component and/or gear mesh. Mount a flow switch, pressure switch, and pressure gauge on the pump outlet.] Design the lubrication system to function properly at both nameplate speed ratings using the specified lubricating oil. All gears and lower bearings [with the exception of the lower bearing of the vertical (down) output shaft] must be oil lubricated. All upper bearings must be oil and/or grease lubricated. Provide all required oil slingers, dams, and passages.[ House the lower vertical output shaft bearing in the dry well and grease lubricate.] Provide grease lines and lubrication fittings for all grease lubricated bearings and mounted on the reducer housing such that the bearings can be easily identified and lubricated from the side of the reducer housing. Equip the reducer with a sight gauge and dipstick in order to observe and measure the oil level. Also, fit the speed reducer with an oil sample valve arrangement. The valve must be a 6 mm [1/4-inch] stainless steel ball valve with a pressure-temperature rating of 13.8 MPa [2000 psig at 38 degrees C 100 degrees F] and be fitted with a plug on the open end. Locate the oil sample port on the reducer housing such that an oil sample can be drawn (through the sample valve) from a point that is approximate 1/2 of the operating oil level in the reducer.

2.4.6 Seals

Provide spring loaded grease-purged dual lip seals for all shaft
extensions. Design and size all seals to withstand the pressure head developed when the speed reducer is completely filled with oil (storage condition) without leaking.

2.4.7 Heater

**************************************************************************
NOTE: Designers should use caution when specifying heaters for use. Careful consideration should be given to attempt to select a lubricant with the characteristics and viscosity range that is suitable for the anticipated operating conditions vs. randomly specifying heaters for use in the system. Damage and premature degradation of lubricants can result from high temperatures or excessive heating. The designer shall consult with the gearbox manufacturer to best access the lubrication requirements and need for auxiliary heating.
**************************************************************************

2.4.8 Breather

**************************************************************************
NOTE: Standard breather may be provided. However, to help prevent water contamination, a hygroscopic breather is recommended for gearboxes exposed to the environment.
**************************************************************************

Provide all reducers with a hygroscopic breather with threaded fittings for installation to prevent problems caused by moisture and particulate matter contamination in the reducer when it breathes in and out due to temperature fluctuations. The breather must filter particles down to 3 µm in size. The hygroscopic agent must change color signifying when the unit requires replacement, i.e., when the desiccant is saturated with moisture. Air flow stoppage through the breather under freezing conditions is not allowed.

2.4.9 Lubrication

**Lubricating oil for speed reducers** must have good resistance to foaming under normal operating conditions and be noncorrosive to speed reducer components. Provide the oil in accordance with the gearbox manufacturer's requirements unless otherwise specified herein. Submit lubricant characteristics, physical properties and product data. Provide lubricant in compliance with ANSI/AGMA 9005 and be [AGMA 5EP][______]. Provide lubricant suitable for infrequent intermittent duty operation of the speed reducers with an ambient temperature range from minus 23 degrees C to plus 43 degrees C minus 10 degrees F to plus 110 degrees F. Lubricate couplings and bearings in accordance with the manufacturer's instructions.

2.4.10 Portable Filtering Unit

**************************************************************************
NOTE: Portable oil filtering unit may be desired if
the gearbox unit will be exposed to the weather. Moisture can collect in the unit and become suspended in the oil. The liquid water that has separated can be drained off but the oil must be filtered to remove water still in solution. Heaters can be provided to heat the oil. However, they are not energy efficient, can damage the oil, and may not completely prevent moisture intrusion. The designer may also elect to design a heated kidney loop filtration system which is integral to the gearbox for critical applications requiring continuous filtration during gearbox operation.

**************************************************************************

Provide [one] portable filtering unit for use with the specified gear reducers.

a. The portable filtering unit must be [1.1][_____] kW [1.5][_____] horsepower, 110-120 volt, [1,140][_____] RPM high efficiency, positive displacement, rotary internal gear type pump with a mechanical seal. Provide a pump capable of delivering [0.5][_____]L/s [8][_____] gallons per minute flow rate. The pump must be self-priming and designed to handle liquids of 35 SSu to 1000 SSu viscosity, while able to develop 625 mm 25 inches of mercury vacuum at zero MPa psi. Equip the filtering unit with an ON/OFF switch, High/Low pressure switch, two interchangeable filter housings, one set of hose assemblies on a portable rolling cart frame.

b. Equip the one set of filter element with replaceable [5][_____] µm micron filter cartridges. The portable filtering unit separates water from the oil by coalescing and gravity separation. The water sinks to the bottom and accumulates until it is periodically bled off. The coalescing chamber must be able to handle dissimilar liquids with a specific gravity difference of 0.09 and greater, leaving the effluent with less than 10 ppm of the discontinuous phase. The coalescing element has an indefinite life, with replacement required only when it becomes plugged with solid particles. Provide a multiple element filter with a non-channeling seal. A non-channeling seal has the flow of oil carrying the contaminants into the depths of the filter media with no flow restriction from surface loading. Each element removes water from wet oils. The multiple element filter consists of four or six sections in one housing that all work at the same time. Design the filters so that water and contaminants are absorbed in the filter element. The capacity of the filter element should be approximately 4 L 1 gallon of water. A coalescing chamber is not necessary for the portable filtration system.

c. Provide the portable filtering unit secured on a dolly or wheeled cart with all the necessary fittings, hoses, and pipe to connect the unit to the reducer using standard hand tools.

2.5 BEARINGS

2.5.1 Pillow Block Bearing Assemblies

The pillow block bearing assemblies include the bearings, housings, seals and hardware. Housings must be [one piece][split] type, with [stainless steel] [painted cast iron] [painted cast steel] [_____] machined base housing with a [through drilled][tapped], [two bolt][four bolt] base.
Split housings must have dowels or steps to provide alignment accuracy.
Except as otherwise specified, shaft bearings must be high capacity antifriction [spherical][tapered] self-aligning roller bearings suitable for both radial and thrust loads with pressure lubrication fittings. Use the manufacturer's ratings for loads and speeds in determining the bearing capacity. Service and installation factors shall be in accordance with the bearing manufacturer's recommendations. The bearings shall be capable of withstanding the total resultant normal loads and axial loads as specified below.

<table>
<thead>
<tr>
<th>Bearing Mark/ID No</th>
<th>Normal Load (Kg) (Lbs)</th>
<th>Axial Load (Kg) (Lbs)</th>

<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Provide [floating][fixed] type bearing as indicated. Provide end caps on open ended shafts. All cap bolts must be SAE Grade [8] [_____]. Provide locking rings, set screws, lock nuts, spacers, and the necessary sleeves to center and secure the bearings within the housing. All bearings must have a minimum L-10 bearing life of [75,000] [_____] hours as defined by ISO 281 or JSA JIS B 1519 based on the largest full load motor kW horsepower provided by the specified motor. Design the bearing and housing for [grease][oil] lubrication and equip with [labyrinth] [_____] type shaft seals made of materials suitable for the working conditions and lubricant to be used to exclude foreign matter and retain lubrication without leakage under both static and dynamic operating conditions.

2.5.2 Sleeve Type Plain Pillow block Bearing Assemblies

[Provide [one piece][split] type bearing pillow block, [stainless steel][painted cast iron][painted cast steel][_____] machined base housing with a [through drilled][tapped], [two bolt][four bolt] base. [Split housings must have dowels or steps to provide alignment accuracy.]

The sleeve type plain bearings must be a bronze alloy material suitable for the installation and conform to the requirements of ASTM B271/B271M or ASTM B584, Alloy [C93200][_____]. The sleeve type plain bearings must be [press-fit][epoxied][_____] into the bearing housing bore.[ Use [retaining sets screws][locking pins][keys][machine screws] to secure the plain sleeve bearings.]

Provide machined grease and oil grooves in the interior of the bearing unless otherwise shown. Break all edges of the grease grooves to provide a minimum [1.6][_____] mm [1/16][_____] inch fillet radius.

2.5.3 Self-Lubricated Bearings

Conform self-lubricated and composite type bearings to the requirements of Section 35 05 40.17 SELF-LUBRICATED MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY.

2.6 SHAFTS

**************************************************************************
NOTE: For shafts to be designed by the Contractor the designer may select the following paragraph.
**************************************************************************
Calculate and design shafts to satisfy the requirements of Corps of Engineers' guidance specified in EM 1110-2-2610. Design shafts at minimum to provide a factor of safety of 5 when maximum load condition stresses are compared to the ultimate strength of the material and the stresses produced by the maximum torque of the motor do not exceed 75 percent of the material yield strength. Equations used for design must meet the requirements of the ASME shafting code. Apply a combined shock-and-fatigue factor of 1.25. Limit the maximum shaft bending moment shaft deflection to 0.83 mm/m 0.01 in/ft of length at the maximum rated load. The torsional shaft deflection must not exceed 0.26 deg/m 0.08 deg/ft of shaft length.

2.7 SHAFT COUPLINGS

Shaft couplings shall be of the [flexible disk] [elastomeric] [chain] [gear] [grid] [jaw] type of machined [steel] [stainless steel] construction and capable of transmitting the applied design torques.

2.7.1 General

Provide couplings capable of the [vertical] [or] [horizontal] installation and design for [non-reversing] [reversing] loads and a maximum [3000] [_____] RPM operating speed. The couplings must be capable of handling a maximum torque of [_____] Nm inch-pounds. Design couplings to compensate for angular, parallel and axial misalignment. Couplings must have a general service factor of [1.0] [_____] applied to their selection and design based upon the anticipated application and expected service.] Couplings must be of sufficient capacity to develop the full strength of the shafting which they connect and must be pressed and keyed thereon. All hub bores must meet the dimensional and tolerance specifications in accordance with AGMA 9002 unless otherwise indicated. The key fit must be in accordance with ASME B17.1, Class II. Submit the fabricated dimensions of the key fit and shaft bores. Equip couplings with lube plugs; enclose and seal with an elastomeric O-ring to retain the lubricant. Couplings must be oiltight under both static and dynamic operating conditions. Use SAE grade 8 bolts unless specifically used for shear applications by the manufacturer to achieve published shear strengths. Minimize misalignment for gear couplings by not exceeding the manufacturer's recommendations for installation limits pertaining to gap-hub separation, angular alignment, and parallel offset alignment measurements.

2.7.1.1 Flexible Disk Couplings

Use high strength stainless steel flexible disks to transmit torque and have no moving parts of backlash. Lubrication of the coupling is not required. The coupling must be of the [close coupled] [floating shaft] design. Dynamically balance the coupling in accordance with AGMA standards to achieve a AGMA [7] [_____] balance class.

2.7.1.2 Elastomeric Couplings

Provide [one-piece] [two-piece] [through bolt inserts] molded [EPDM] [Neoprene] [Urethane] sleeves to transmit torque with keyed metal flanges secured with set screws. The elastomeric coupling must have a service factor of [1.0] [_____] .

2.7.1.3 Chain Couplings

Provide hardened teeth sprocket hubs with a connecting ANSI Standard Double
Width Roller Chain to transmit torque. Secure hubs to the shaft by means of keys/keyways. Furnish a sealed coupling cover of [die-cast aluminum] [stamped steel] material to retain lubricant. The covers must be rounded edge design with recessed and threaded lubricant plugs to fill and retain lubricant.

2.7.1.4 Gear Type Couplings

Flanged with exposed bolt, double engagement, made of forged steel. Couplings must transmit torque by means of external gears on hubs engaging in internal gears on the coupling sleeves. Machine gears in accordance with AGMA 9002 and AGMA 908.

2.7.1.5 Grid Type Couplings

Keyed shaft hubs with slotted faces to connect each coupling half through an interlocking tapered high tensile metal alloy grid. The grid must be fully enclosed in a sealed [horizontally] [vertically] split cover to retain the lubricant. The covers must be rounded edge design with recessed and threaded lubricant plugs to fill and retain lubricant.

2.7.1.6 Jaw Type Couplings

Keyed shaft [stainless steel][sintered iron] hubs of the fail-safe spider design. Furnish set screws to secure the hubs. Make coupling insert material of [bronze][Buna-N][Urethane][_____] to transmit torque.

2.7.2 Torque Limiting Couplings

******************************************************************************
NOTE: Torque limiting couplings prevent motor over-torque which could result in damage to the equipment.
******************************************************************************

Install a [mechanical friction ] [ball-detent] [_____] type torque limiting coupling limit applied torque of the electric motor for equipment protection. The torque limiting coupling must slip if the machinery torque exceeds [_____] N-m inch-pounds. The coupling must continue to slip until the torque drops below this level. The coupling must be of the flexible type design with bored and keyed steel hubs[ and a steel grid which fits into the periphery of the coupling hubs].[ Provide friction linings of the segmental type design and are easily replaced without removing connected equipment.][ Hardened steel balls that are spring loaded in machined detents control the slip setting of the coupling.] Control the torque slip range by a spring type mechanism which can be adjusted by means of tightening or loosening bolts or adjustment nut. The torque slip must have an adjustment range of plus or minus [20] [_____] percent of the specified load. Equip the spring mechanism with machined spacers of a specific length determined by the required slip setting. Preset the coupling slip setting at the factory. Equip the coupling with self lubricated bearings to permit free rotation when slipping. The coupling must have elastomeric seals that are both water and dust tight and have a fitting that allows grease lubrication. [Break in mechanical friction torque limiting couplings after assembly to the motor shafts. This consists of operating the couplings at a pre-determined number of revolutions at 100 percent slip and then re-setting the spring compression distance as described in the manufacturer's installation instructions.]
2.8 ELECTRIC MOTORS

**************************************************************************
NOTE: The designer should coordinate with the respective electrical or mechanical designers to ensure motors are not being specified elsewhere in the contract documents and that all motor requirements are satisfied.
**************************************************************************

Motor must be Horizontal shaft, squirrel cage induction, high slip, high torque, [dual horsepower rated], [two winding,] [two speed,] [460] [_____] volt, 3 phase, 60 Hertz type motor controlled by [across the line magnetic starter] [Variable Frequency Drive]. The motor must be rated for continuous duty and conform to the applicable requirements of NEMA MG 1. The motor must be rated at a minimum of 8 percent and maximum of 13 percent slip for [both high and low speed] windings. The enclosure must be totally enclosed, fan cooled, and weatherproof type. Provide the motors with a removable stainless steel drain. Remove the drain as specified by the motor manufacturer. [Motor installation is in an exterior location subjected to the weather elements.] Speed/torque characteristics must be as described herein. Provide conduit box for incoming power with two [38] [_____] mm [1-1/2] [_____] inch diameter holes for installation of watertight fittings on the power cord. Provide conduit box for heater power with two [19] [_____] mm [3/4] [_____] inch diameter holes for installation of watertight fitting on the heater power cord. Locate conduit boxes on the side of the motor as indicated. Seal the motor shaft with a labyrinth type seal where the shaft penetrates the front and back of the motor.

2.8.1 Ratings

The [gate][_____] motors must be rated at [ / ] [_____] kW [20/6.25] [_____] horsepower at [745/230] [_____] RPM (high/low speed) based on [900/300] [_____] RPM synchronous speeds. The 100 percent full load speed values proposed for the new motor shall not be less than [740] [_____] RPM and not more than [775] [_____] RPM for high speed and not less than [230] [_____] RPM and not more than [260] [_____] RPM for low speed at the specified horsepower values. Locked rotor torque must be in a range from 200 to 300 percent of full load motor torque for high speed and from 250 to 300 percent of full load motor torque for low speed. [The motor must have no breakdown torque.] It is preferred to optimize characteristics at full load conditions and allow locked rotor torque to be in the previously specified range if there are design trade-off's between full load torque and locked rotor torque values.

2.8.2 Construction

Motor frame size must be a minimum of a NEMA [445TS] [_____] for the [gates][_____.] Temperature rise must be no greater than [80] [_____] degrees C [176] [_____] degrees F. Provide an internal heater of the strip type as part of the motor. The heater must have a minimum capacity of [90] [_____] W and have separate leads terminating in a separate conduit box. Heater power supply must be 120 volt, 60 Hertz, single phase. Use Class F insulation throughout the motor. Impregnate motor windings with the insulating compound by the vacuum/pressure impregnating method. Repeat the procedure until all voids in the winding are completely filled with the insulating material. Motor bearings must be the antifriction type and incorporate a suitable method for lubrication. Bearing ratings must meet
or exceed a L-10 life of 30,000 hours at full radial load. Provide the motor with a visible nameplate indicating motor horsepower, voltage, phase, hertz, RPM, full load amps, frame size, manufacturer's name and model number, service factor, and serial number. Submit motor performance data at the time the motors are submitted. The data includes: percent efficiency, percent amperes, percent power factor, and percent slip plotted against 0 to maximum allowable motor overload above 100 percent for both high and low speed windings; and torque (N-m) (ft-lb.) and amperes plotted against 0-100 percent synchronous speed for both high and low speed windings.

2.8.3 Electric Motor Factory Tests

Factory test all motors to ensure that they are free from electrical and mechanical defects. Perform tests in compliance with IEEE 112 and NEMA MG 1. Document test results in accordance with the guidance indicated in IEEE 112 and NEMA MG 1. Testing includes the following. Additionally, perform all tests normally conducted by the manufacturer as part of its quality control program, but not specified herein.

2.8.3.1 No Load Test

For each winding (high and low speed); at no load and rated frequency and 100 percent rated voltage; record the current, voltage, frequency, kilowatt input, and RPM.

2.8.3.2 Locked Rotor Test

For each winding (high and low speed); with the motor blocked and at rated test frequency and 50 percent rated voltage; record the voltage, current, frequency, and kilowatt input. Repeat for 100 percent rated voltage.

2.8.3.3 High Potential Test

For each winding (high and low speed): Record voltage and duration.

2.8.3.4 Stator Winding Resistance Test

For each winding (high and low speed): Record resistance in ohms between the stator winding terminals. Record the temperature in degrees C.

2.9 BRAKES

**************************************************************************
NOTE: Brakes can be either AC or DC type. If electrohydraulic AC Thruster brakes are specified, delete paragraph RELEASE MAGNETS AND RECTIFIER below. If AC solenoid or DC magnet operated brakes are specified, delete paragraph ELECTROHYDRAULIC ACTUATOR.
**************************************************************************

Provide brakes that are self-adjusting, shoe type, spring set, [released by a sealed electrohydraulic AC thruster actuator] [with DC magnet operated release][with AC-rectified solenoid release] and are completely enclosed in a water-tight and dust-tight enclosing case arranged for floor mounting. The brake must be [alternating current] [direct current] type rated for [120] [240] [460]-volts, [1] [3]-phase, 60 Hertz. The brake must have an operating torque rating of [271] [_____] N-m [200] [_____] foot-pounds with
a [250] mm [10] inch wheel bored for mounting on the brake shaft. Base the torque rating on open construction continuous duty. The brake must be self-adjusting such that compensation for shoe wear is automatic. Provide a manually operated hand release, [external][internal] to the brake enclosure. The brake torque field setting cannot be less than [125] [150] percent of the full load torque of the motor when referred to the shaft on which the brake wheel is mounted.

2.9.1 Electrohydraulic Actuator

Consists of an electric motor that drives an impeller inside a fluid filled, heavy-duty, cast [aluminum][_____] housing. The rotation of the impeller must develop hydraulic pressure to extend a cylinder which releases the brake by overcoming the main spring. Provide an adjustable valve to allow setting the brake timing. Completely enclose the actuator in the housing. The fluid must be suitable for operation in temperatures to [minus] [plus] [4] [_____] degrees C [40] [_____] degrees F.

2.9.2 Release Magnets and Rectifier

Provide releasing magnets of the [AC][ or ][DC] shunt type and of standard stock design. Supply direct current by means of a self-contained rectifier unit of proper rating and suitable for operation on [120] [240] [460]-volt, [1] [3]-phase, 60-hertz, alternating current electrical power. The complete unit (brake and rectifier) must be suitable for connection to the power circuit of the motor with which the brake is used so that the brake will set or release when the motor is de-energized or energized, respectively. The rating of the rectifier and the brake releasing magnet must be in accordance with the brake rating requirements specified and be sufficient to release and hold the brake in the released position with 85 percent of rated voltage impressed on the incoming terminals of the rectifier. The brake must operate satisfactorily at up to 110 percent of rated voltage. Provide a forcing contactor for operation of the DC operated magnet.

2.9.3 Enclosing Case

Provide a NEMA Type 4 enclosing case with watertight grease pressure lubricated shaft seals of a standard manufacturer. Hold the cover in place by heavy hinge bolts and wing nuts. Provide enclosing case for 115 volt AC space heaters. Space heaters total capacity must be a minimum of [62] [_____] watts. Heaters are provided by the brake manufacturer. provide a bottom mounted drain and breather unit on the enclosure to allow condensate water to drain, but prevent outside water from entering the enclosure. Provide the enclosure with a shaft seal for each shaft penetration through the enclosure.

2.9.4 Mechanical Construction

Except for brake wheels, shoes, and electrical parts, no cast iron is allowed in brake construction. All pins, fittings and other miscellaneous small metal parts must be of corrosion-resisting metal. Fit bearings with bronze or other approved bushings to prevent any binding of moving parts. Antifriction bearings of corrosion-resisting construction may be used. Provide means for lubrication shall be provided for all bearings, unless bearings are of an self or pre-lubricated type. Provide and attach a nameplate of corrosion resisting material to a part of the brake which ordinarily will not be replaced. The nameplate must indicate all necessary information required by this specification. Provide a manual release.
mechanism to allow removal of wheel or permit lining replacement without readjusting torque setting. Magnet coil must be epoxy coated.

2.10 GUARDS AND COVERS

Provide safety guards or covers where necessary to protect the operators from accidental contact with moving parts. Provide openings in guards and covers as necessary to provide access to parts requiring lubrication or regular maintenance.

2.11 STRUCTURAL BASES AND SUPPORTS

For specific requirements for welded structural steel bases, frames, and supports see Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.12 OPEN [SPUR] [HELICAL] GEARS

**************************************************************************
NOTE: The designer should coordinate with the gear manufacturer to determine the heat treatment and hardening method best suited to satisfy the operational conditions for the gears.
**************************************************************************

2.12.1 Gearing

Make all [spur] [helical] gearing from high strength alloy steel that is hardened by [flame][induction][carburizing] with subsequent quenching and tempering to produce a [through][case] hardened gear. Grind the gears after gear cutting to achieve a minimum ANSI/AGMA Quality [11] [_____] in accordance with AGMA 2015/915-1.[ Integrate cut the [helical] pinions on the pinion shaft.] Make spiral bevel gears from high strength alloy steel with case hardened teeth, crown lapped for quality and smooth operation. Make keys of [ASTM A108, UNS G10180 (ASTM A1018/A1018M),] [_____] keystone. Certified material test results for the drive pinion and drive pinion shaft are required.

The overall dimensions and configurations of new [open] [spur] gears and mating shafts must be as indicated. All gears must be manufactured to achieve a AGMA gear quality of [6][_____] or better and be supplied as match marked sets. Factory test all gears in accordance with the TESTING paragraphs of this specification. [Spur] [Helical] gear teeth must be of the involute form. Cut pinion gears from solid steel and fabricate from [ASTM A148/A148M Grade 80-40 steel] [ASTM A291/A291M forged steel, Grade [7][_____] Class [H][_____] [______]]. The Brinell Hardness must be a minimum 50 (BHN) greater than the Brinell Hardness of the mating gears. Harden the gear teeth as specified to measure at any point on the tooth face within [360] [_____] to [400] [_____] BHN after finishing. The ends of the pinion teeth must be end relieved to prevent end loading. Crown the gear teeth as indicated.

2.12.1.1 Pinion "Drive" Gear

Pinion "drive" gear must have a pitch diameter of [_____] mm inches. Teeth profile must be standard 20-degree full depth involute with a diametral pitch of [0.75] [______]. Teeth width must be [_____] mm inches. Accurately machine cut teeth to American Gear Manufacturer Association (AGMA) tolerance of No. 6 or better quality. Machine the inside rim of the gear as indicated and drill to match the mounted [shaft] [motor] [______].
Verify machining dimensions to assure proper mounting. Manufacture gears from steel meeting the requirements as stated above. Scribe the pitch line, and two indexing lines offset 3 mm 1/8-inch to each side, on the top of the gear teeth of all mated gears to aid in installation alignment.

2.12.1.2 [Sector][Bull][Spoked][_____] Type Gears

Gears have through hardened teeth and are of fabricated or cast construction. The overall dimensions and configurations of the [sector][_____] gear must be as indicated. Make the rim of the [sector][_____] gear of [ASTM A290/A290M forged steel, Grade [3][], Class E[____]] [______]. The material of the spokes, hub and other parts of the [sector][_____] gear are determined based on design requirements. Conform cast hubs, spokes and arms to the requirements of [ASTM A148/A148M, Grade 90-60][_______]. Submit certified material test results for the gears and shafts. [Overhung gears on shafts and speed reducers are not be acceptable.]

2.12.2 Contractor Designed Gearing

Contractor designed gearing must be engineered, designed, and manufactured by a reputable gear manufacturer who has prior experience in designing and supplying the specified size gearing. Submit the manufacturer's required calculations and shop drawings for the design and fabrication of the identified gearing prior to the start of shop fabrication. Design the [spur] [helical] gears in accordance with ANSI/AGMA 2001 with life factors CL and KL equal to unity and reliability factors CR and KR equal to 1.00 or greater. The reduction set number used in the design calculations cannot be greater than 3. The normal strength kW horsepower rating of the [spur] [helical] gears cannot exceed 1/2 of the peak strength kW horsepower rating as determined by ANSI/AGMA 2001. Durability rating of gears must be as determined by ANSI/AGMA 2001 and based on a service factor of 1. The pinion must have a generated tooth form as indicated.

2.13 PINTLE BUSHING

**************************************************************************
NOTE: The following paragraphs are included if the pintles are not specified with the lock gates. Choose the first paragraph if the pintle bushing is a greased bronze design. Choose the second paragraph if a self-lubricated pintle bushing is to be furnished and designed by the Government or a self-lubricating bearing manufacturer. Self-lubricated pintle bushings must have performance criteria provided to allow the manufacturer to design and fabricate the pintle and bushing. Additional paragraphs may be required for gate and shoe pintle components that are not included in this guide specification due to the wide variance in designs requirements. Recommendations for material selection of pintle bushing sockets, pintle shoes and pintle bases can be found in ERDC/CERL TR-02-7, Advanced Materials Selection Guide for Lock, Dam, and Hydroelectric Plant Components.
**************************************************************************

[ Provide a grease lubricated alloy bronze pintle bushing to the dimensions and tolerances indicated. For the bushing material use either stainless
steel conforming to \([\text{ASTM A564/A564M, Type 630, UNS S17400]}\) or aluminum bronze alloy and conform to the requirements of \([\text{ASTM B148}}\) or \([\text{ASTM B271/B271M, [C95400]}}\). [Pattern cast and machine the bushing] [Machine the bushing from a solid piece of material] to acquire the shape and surface finishes indicated. [Provide a surface finish of\([16]\) \(\mu\text{m micro-inches}\) or better on the running bearing surface.] [Press fit] [Mechanically secure] the bushing into the gate as indicated without distortion or altering the fit with the mating pintle ball.]

[Provide a greaseless self-lubricated pintle bushing [to the dimensions and tolerances indicated] [designed by the self-lubricating bearing manufacturer to meet the requirements provided for bearing performance]. [Conform the self-lubricated bearing composite material and bearing design to the requirements of Section 35 05 40.17 SELF-LUBRICATED BEARING MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY.] Provide [one piece] [two piece] pintle bushing [and hinge ball bushings] manufactured by [Tenmat Inc.], [Kamatics Corp.] [or [_____]]. Bushing bearing surfaces for fabric reinforced polymers similar to [Tenmat T814] [_____] must have a minimum thickness of \(2 \text{ mm} 1/12 \text{ inch} (0.083 \text{ inch})\). Sprayed polymer coatings similar to [Karon V] [_____] must have a minimum thickness of \(0.5 \text{ mm} 2/100 \text{ inch} (0.020 \text{ inch})\). The bushing substrate material must meet the requirements of \([\text{ASTM B148, Alloy C95400}}\].]

[Provide a debris seal of the dimensions and materials as indicated with the pintle bushing. Mate the bushing bearing surface with the pintle ball through metrology methods and the use of a calibrated scanning probe coordinate measuring machine that meets the requirements of \([\text{ISO 10360-2,}}\] [by [lapping] mating components], via [_____] to achieve the indicated tolerances and [compare] [test] with contact [measurements] [dye] [tape] [_____] to confirm uniform bearing contact. Test the contact area between the mating components, witnessed by the Government, to achieve a bearing contact area of \([85][_____]\) percent or better to be acceptable. Perform nondestructive examination testing of pintle bushings, balls and fabricated pintle components in accordance with the requirements of paragraph NONDESTRUCTIVE EXAMINATION.]

[The maximum static bearing pressure for the pintle bushing must not exceed \([17][_____]\) MPa [2500][_____] psi when a normal load of [_____] N pounds is applied at an angle of [_____] degrees from horizontal or [34][_____] MPa [5000][_____] psi during dynamic operation. Pintle bushings will operate submerged [and hinge] bushing will normally be dry but may be exposed to rain water.]

2.14 PINTLE BALL

Fabricate pintle ball(s) from steel castings conforming to \([\text{ASTM A487/A487M, Grade 13 Modified (Nickel 3.25-3.75)}]\) \([\text{ASTM A743/A743M, Grade CF8, UNS J92600}}]\) \([\text{ASTM A744/A744M, Grade CF8, UNS J92600}}]\), \([\text{ASTM A27/A27M, Grade 70-36, Class 2, [_____]}}\) or age-hardened stainless steel forgings in accordance with \([\text{ASTM A473, Type 303, condition A, UNS S30300}}]\) \([\text{ASTM A705/A705M, UNS S17400, Type 630, minimum hardness 40 Rc]}\) [_____] Machine pintle ball(s) to meet the dimensions, surface finish and tolerances as indicated. Any casting patterns developed became property of the Government and must be packaged for long term storage with the pertinent part identification provided on the exterior packaging. [Free float] [Press fit] [Mechanically secure] the pintle ball into the pintle casting as indicated without distortion or altering the fit with the mating pintle bushing. Furnish removable lifting eyes with the pintle ball for lifting. Mate the pintle ball bearing surface with the pintle bushing.
through metrology methods and the use of a calibrated scanning probe coordinate measuring machine that meets the requirements of ISO 10360-2, [by [lapping] mating components], via [_____] to achieve the indicated tolerances and [compared] [tested] with contact [measurements] [dye] [tape] [_____] to confirm uniform bearing contact. Test the contact area between the mating components, witnessed by the Government, to achieve a bearing contact area of [85]% percent or better to be acceptable. [The maximum static bearing pressure for the pintle ball must not exceed [17][_____] MPa [2500][_____] psi when a normal load of [_____] N pounds is applied at an angle of [_____] degrees from horizontal or [34][_____] MPa [5000][_____] psi during dynamic operation.]

2.15 PINTLE SHOE

Fabricate pintle shoes from steel castings conforming to [ASTM A27/A27M, Grade 70-36, (UNS J03501)] [______]. Machine pintle shoes to meet the dimensions, surface finish and tolerances indicated. Any casting patterns developed become property of the Government and must be packaged for long term storage with the pertinent part identification provided on the exterior packaging.

2.16 PINTLE BASE

Fabricate pintle bases from steel castings conforming to [ASTM A27/A27M, Grade 60-30, (UNS J03000)] [______]. Machine pintle bases to meet the dimensions, surface finish and tolerances indicated. Any casting patterns developed become property of the Government and must be packaged for long term storage with the pertinent part identification provided on the exterior packaging.

2.17 ENGINEERED CHAIN

**************************************************************************
NOTE: This and following five Articles can be retained and edited or deleted as needed depending on the gate hoist equipment specified.
**************************************************************************

2.17.1 Corrosion-Resisting Steel Flats and Rounds

Conform corrosion-resisting steel flats and rounds [ASTM A564/A564M, [Type 630][______], minimum charpy-V notch impact value of [20][_____] Nm [15 foot-pounds][_____] at -18 degrees C 0 degrees F; or [ASTM A564/A564M, Type XM-25, Condition H1050], age-hardened heat treatment condition, hot-finished or cold-finished, Class C, minimum charpy-V notch impact value of [20][_____] Nm [15 foot-pounds][_____] at -18 degrees C 0 degrees F.][ Furnish ASTM A564/A564M, Type 630 material to provide a minimum yield strength of 1000 MPa 145,000 psi, minimum Brinell Hardness of [331][_____] unless otherwise indicated.][ Furnish ASTM A564/A564M, Type XM-25, H1050 material to provide a minimum yield strength of 930[_____] MPa [135,000] [_____] psi, minimum Brinell Hardness of [321][_____] unless otherwise indicated.]

2.17.2 Nickel-Aluminum Bronze Flats and Corrosion-Resisting Steel Rounds

Conform Nickel-Aluminum bronze flats to [ASTM B505/B505M, UNS C95500HT][______] to provide a minimum yield strength of [427][_____] MPa [62,000][_____] psi and rounds to [ASTM A564/A564M, Type 630][______], minimum charpy-V notch impact value of [20][_____] Nm [15 foot-pounds][_____] at
-18 degrees C 0 degrees F.

2.17.3 Pins

Fabricate normal and long pins from [ASTM A564/A564M, Type XM-25, Condition H1050] stainless steel. The material must be certified by the steel manufacturer to provide a minimum yield strength of [930][_____] MPa [135,000][_____] psi in accordance with ASTM A564/A564M. Heat treat at the mill that supplies the alloy in accordance with the relevant ASTM heat treatment instructions.

2.17.4 Retaining Rings

Provide retaining rings of [multiple-turn][_____] stainless construction. Provide retaining rings with offset permanently set into the design of the ring spiral to provide parallel flat sides that mate parallel against the groove wall. Provide retaining rings similar in design to [Smalley, model WST-400-S02 series][_____] . Provide a minimum of [667][_____] kN [150,000][_____] pounds thrust shear strength capacity with the retaining rings when installed in the recommended groove detail. Size the retaining rings to match the pin groove details as indicated unless otherwise approved.

2.17.5 Hardness

Hardness for material as indicated.

2.18 ROUND LINK CHAIN

2.18.1 Calibrated Hoisting Chain

Furnish [two][four][_____] lengths of calibrated hoisting chain, as indicated, for each [tainter][_____] gate hoist. Chain must be [34 mm x 126 mm][_____] mm x [_____] mm [1.3 inches x 5 inches][_____] inches x [_____] inches] [ASTM A322, UNS G8620, Grade 2 alloy steel][_____] round link type manufactured to DIN 22252. Machine weld the links, and grind the welds to comply with the dimensions indicated. After welding, heat treat the chain to yield a minimum case hardness of [340][_____] BHN. Machine fit the chain to the tolerances set forth in DIN 22252. After heat treating, proof test each link of chain to [1080][_____] kN [242,800][_____] pounds. After proof testing, visually inspect the chain for permanent deformation cracks and deformed links. After proof testing and visual inspection, immersion coat the chain with a corrosion resisting coating of [TECTYL 846, Class I][MIL-PRF-16173E, Grade 4, Class I]. Tensile test a sample of finished chain to destruction to determine its breaking strength. The breaking strength must not be less than [1450][_____] kN [326,000][_____] pounds. [Make one 7.5 m 25-foot long test chain, of the above specification, available to the manufacturer of the pocket wheels specified in the paragraph FINISHED PRODUCT.]

2.18.2 Hoisting Chain/Gate Attachments

Provide each length of hoisting chain with accessory parts to connect the chain to the gate. Manufacture the accessory parts in accordance with requirements indicated.

2.18.3 Hoisting Chain Repair Links

Furnish repair links in conformance with the specification for connecting
chain links as set forth in DIN 22258-1, for the hoisting chains, in the quantity listed. Forge the repair links from high-alloy steel and design to permit installation by mechanical means to replace a damaged link in any of the hoisting chains. Dimension the repair links to be compatible with the [pocket wheels] [hoisting drum] [____]. The connector links must be capable of developing the full [1450][_____] kN [326,000][_____] pounds minimum breaking strength of the hoisting chain. Inspect each repair link by non-destructive methods during manufacture to ensure freedom from cracks and other flaws which would impair strength and durability. Finish coat the same as applied to the hoisting chain.

2.19 POCKET WHEEL [SPROCKET]

2.19.1 Ring Forging

Provide the pocket wheel or chain sprocket that is a ring forging of alloy steel conforming to [ASTM A290/A290M, Class K][____], [or ] [ASTM A322] cast steel having the following mechanical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>

</table>

2.19.2 Machining and Heat Treatment

Rough machine the forging prior to heat treatment for mechanical properties. Rough machining prior to heat treatment may include definition of the chain pocket recesses, provided that the product form at that stage is not susceptible to cracking during heat treatment, and provided that specified dimensional accuracy requirements can be met thereafter by final machining or grinding.

2.19.3 Testing

Perform nondestructive examination of each pocket wheel in accordance with the requirements of paragraph NONDESTRUCTIVE EXAMINATION.

2.19.4 Finished Product

Finish-machine each pocket wheel [sprocket] within the dimensional tolerances indicated. Dimensionally verify the pocket wheel [sprocket] metrology methods and the use of a calibrated scanning probe coordinate measuring machine that meets the requirements of ISO 10360-2. The machine tools and the machining methods and procedures used by the manufacturer must be such that the specified calibrated hoisting chain functions properly in engagement with each pocket wheel [sprocket]. Use a test length of calibrated chain, as specified in the paragraph HOISTING CHAIN, to test-fit each pocket wheel after its final machining.
2.20 HOIST DRUMS

**************************************************************************
NOTE: If wire rope hoists are specified, use the following section for fabricated drums.
**************************************************************************

[For specific requirements comply with Section 05 50 15 CIVIL WORKS FABRICATIONS.]

The hoist drum must be a [centrifugally spun steel casting conforming to ASTM A148/A148M, GR90-60 spun cast steel][machined weldment of ASTM A829/A829M, Grade 4140 or 4340 material, condition [_____]][____], as indicated. Each drum must have full end diaphragms to transfer the supported load to the operating shaft. Stress relieve the entire drum after welding and before finish machining. Heat treat the drum spool face through [flame hardening][_____] to achieve a surface hardness of [375-400][_____] BHN after final machining. The hoist drums must be of the through shaft type design and [keyed][welded][_____] to the drum shaft.[Fabricate multi drum assemblies to be synchronous right and left drum units.] Size the drum as indicated.[Weld the drum flange to the drum and fabricate of [ASTM A36/A36M steel][_____]]. Fabricate the drum shaft from [ASTM A29/A29M, Grade 1045 cold finished steel][ASTM A473, UNS S4140 or S4340 material] with a minimum yield and tensile strength of 345 MPa and 483 MPa 50,000 psi and 70,000 psi, respectively[_____] MPa psi.]

2.21 GROOVED CHAIN DRUM (FOR ROUND LINK CHAIN)

2.21.1 General

Integrally weld the chain drum and shaft together by rib and diaphragm plates. The drum shell must be cast steel, conforming to [ASTM A27/A27M, Grade 60-30, Class 1][______]. The shaft must be a steel forging conforming to [ASTM A668/A668M, Class D] [______], with carbon content limited to 0.35 percent. Plates must be ASTM A36/A36M material. The chain anchor block must be a steel forging conforming to ASTM A668/A668M, Class B, with carbon content of 0.35 percent maximum.

2.21.2 Machining and Welding

Machine the component parts for welding assembly as indicated. Conform all welding, including preheat and interpass temperature control, with AWS D1.1/D1.1M. Stress relieve the weldment after completion of welding, and prior to final machining of the shaft to suit the bearings and machining the shell for mounting the [drum gear][______].

2.21.3 Testing

Nondestructively examine grooved chain drums in accordance with the requirements in paragraph NONDESTRUCTIVE EXAMINATION. Conform all welding acceptance criteria with the requirements of AWS D1.1/D1.1M.

2.21.4 Finished Product

In the finished product the shaft must be concentric with the drum shell and together with all other dimensions must be within the tolerances indicated. The location of the chain anchor block with respect to the [drum gear][______] machined shoulder, and the handing (R.H. or L.H.) of the chain groove in the drum shell must be in accordance with the requirements.
2.21.5 Dimension Test

The first chain drum manufactured must be dimensionally match tested with the chain to verify the following:

a. Dimensionally verify the grooved chain drum through metrology methods and the use of a calibrated scanning probe coordinate measuring machine that meets the requirements of ISO 10360-2.

b. Clearance of U-bolt to the bottom of the chain groove when inserted into the chain anchor.

c. Clearance, if any, from first chain link to the chain anchor when first link is positioned so that its center bears on the drum.

d. Number of threads left over the nuts of the U-bolt when the first link is positioned as described in b. above.

e. Number of revolutions of the chain drum to take up [11.6 m] [38 feet-0 inch] [_____] of chain. Provide chain tension (approximately 9 kN 2000 lbs) during the wrapping and measurement to keep it wound tightly on the drum. Measure from W.P. beginning of groove as indicated.

f. Verify chain feeds smoothly onto drum.

g. Clearance between adjacent wraps of chain.

h. Clearance from the chain anchor to the adjacent wrap of chain.

i. Minimum shoulder distance from edge of groove to point where chain link bears on chain drum when chain is displaced to one side of the groove.

k. Maximum "off centeredness" of horizontally oriented links. (to nearest 6 mm 1/4 inch) the distance from the center of the link point where it bears on the drum. Link must be at least 2 links into the wrap from where the chain leaves the drum.

2.22 WIRE ROPE AND END TERMINATIONS

Comply with Section 35 01 70.13 WIRE ROPE FOR GATE OPERATING DEVICES for the hoisting wire rope and end terminations.

2.23 SHEAVES

Provide sheaves of heavy duty [cast], [forged], [rolled], or [welded] steel construction[ that are a standard product design regularly offered by a sheave manufacturing company].[ The sheave manufacturer must have been regularly engaged in the production of wire rope sheaves and have a minimum of 5 years experience producing sheaves of similar size to those specified.] Provide sheave shall of a through shaft design and assemble with new bearings onto the shaft as indicated. Fit the interference fit between the sheave(s) and bearings in accordance with the bearing manufacturer's recommendations to prevent slipping between the components.
Dimensions the sheaves and material for sheaves as indicated. Accurately machine sheave grooves for the wire rope diameter provided, smoothly finished, and free of surface defects. Flame harden the groove contact area to a minimum [50] [_____] Rockwell C for a depth of [1.5][_____] mm [0.060] [_____] inch minimum with a minimum contact arc of 150 degrees. Design sheave(s) for a minimum radial design load of [2292][_____] kN [515.2][_____] KIPS. Provide sheaves with [roller] [bronze] bearings as indicated. [If casting is the fabrication method, produce casting pattern for the wire rope sheave that becomes the property of the Government upon completion of the contract. If heavy duty fabricated steel weldment is selected as the fabrication method, provide all engineering and design of the sheaves to satisfy the requirements specified herein and submit calculations and shop drawings.]

**************************************************************************
NOTE: For sheaves to be designed by the Contractor the designer may select the following paragraph.
**************************************************************************

Conform Contractor designed sheaves to the requirements of EM 1110-2-2610 unless otherwise specified herein. Design the sheaves for the normal operating conditions with sufficient safety factors so that the maximum unit stresses do not exceed 75 percent of the yield points of the materials of construction based on the maximum hoisted load. Engineer, design, fabricate, and assemble the sheave units. Design the sheave assembly in accordance with the Crane Manufacturers Association of America (CMAA) standards and in accordance with ANSI standards and OSHA'S interpretation of their regulations for drums/sheaves for mill type cranes. Prepare and submit all required calculations and shop drawings for the design and fabrication of the hoisting sheave assembly to the Contracting Officer for approval prior to the start of shop fabrication.]

2.24 PAINTING

**************************************************************************
NOTE: The designer should consult with the manufacturer if considering painting the interior of any enclosures such as gearboxes, cabinets, etc. to select the most appropriate paint coating system for the environment.
**************************************************************************

Paint all exposed ferrous surfaces in accordance with Section 09 90 00 PAINTS AND COATINGS[ or as noted]. Paint equipment and components not otherwise specified by Section 09 90 00 PAINTS AND COATINGS with the manufacturer's standard coating system. Standards coatings must be compatible with the lubrication and environmental conditions specified or recommended. Touch up all damaged painted surfaces after installation. Paint must at a minimum provide for zinc chromate primer, 2 coats of varnish, and gray enamel to result in a minimum dry film thickness of [0.062][_____] mm [2.5][_____] mils. Painting of nonferrous metals and corrosion resisting steel will not be required unless otherwise specified.

2.25 SHOP ASSEMBLY AND TESTS

**************************************************************************
NOTE: Shop tests are necessary to ensure proper assembly.
**************************************************************************
2.25.1 General

a. Each machinery unit consisting of the [motor,] [brake,] [reducer,] [wire rope drums], [wire rope,] [chain,] [couplings,] [and bearings] must be completely assembled [on its structural steel base (machinery base as indicated)] [with its respective mating component] in the shop and tested [without the [sector] [bull] gear and pinion assembly,] in the presence the Contracting Officer. [The [sector] [bull] gear, pinions, shaft, and bearings must be completely assembled, shimmed, and aligned in the shop on the pinion support base.] Notify the Contracting Officer at least [10] [_____] calendar days before testing of each machinery unit. This notification includes information on how many units will be tested and the estimated time frame involved with each test.

b. The witnessing of a particular test may be waived by the Contracting Officer; however, the approved commissioning shop test procedures, notification, and documentation must still be performed as required by these specifications. Once informed that Government personnel will witness the test(s), notify the Contracting Officer that a particular test is scheduled as planned a minimum of 48 hours prior to the test(s). Perform all necessary preparations and preliminary testing prior to issuing the 48 hour notification.

c. Commence testing upon the arrival of Government personnel at the scheduled location and time. Design and furnish a test rig and facilities (within the continental United States) suitable for performing the tests. Submit details of the test rig and its location. Address in the submittal aspects including adequacy of rig strength, including, but not limited to, foundations; access to the test rig; availability of suitable power and cranes; how the work will be protected; how the test measurements will be made; and how test results can be verified. Clean all bearing surfaces and lubrication lines and lubricate reducer bearings, couplings, and gears before tests are begun. Fill all speed reducers with the specified lubricating oil; transfer of lubricating oil from one unit to another is not allowed. Electrically connect and operate the motors, brakes, and controls at rated voltage. Test and ship the [motor,] [speed reducer,] [and brake machinery] components to the job-site fully assembled on the structural steel base (machinery base as indicated).

d. [The [sector] [bull] gear and pinion assembly must be properly match marked and disassembled prior to shipment.] Machinery that is not tested or arrives on site without the machinery base installed will be rejected. Reimburse the Government for all travel, lodging and per diem costs incurred for any Government witness tests that fail to meet the contract specifications or performance requirements and result in the factory testing being terminated, postponed or rescheduled to correct the deficiencies.

2.25.2 Alignment

Conform alignment of interconnecting shafts to the installation requirements of the coupling and gear manufacturers in accordance with standard AGMA practices. Accurately align each machinery or structural unit by the use of stainless steel shims or other approved methods so that no binding in any moving parts or distortion of any member occurs before it is fastened in place. The alignment of all parts with respect to each
other must be true within the respective manufacturer's tolerances required. Set machines true to the elevations indicated.

2.25.3 Anti-Seize Lubricant

Assemble threaded portions of the assemblies using an anti-seize lubricant that prevents galling of parts and corrosion, allows for easy disassembly of parts, and reduces friction unless otherwise noted or specified. Anti-seize lubricant must be a standard product designed for the intended use.

2.25.4 Acceptance

All readings taken from the equipment, components or assemblies are required to be within the specified limits. Failure of any part to meet these contract requirements is cause for rejection of the entire quantity until action is taken to correct defects and prevent recurrence and such actions have been approved by the Contracting Officer. Retesting is subject to the same random sampling and testing procedures as the original lots.

2.25.5 Gages

Make gages available to the Government at the fabrication site for use in checking critical dimensions. Gages are steel tape, vernier, micrometer, Gar S22 Surface Finish Comparator, etc.

PART 3 EXECUTION

3.1 STRUCTURAL FABRICATION

3.1.1 General

Fabricate components and assemblies in compliance with the requirements of Section 05 50 15, CIVIL WORKS FABRICATIONS unless otherwise specified herein. Where specification requirements are similarly covered in both sections the specification section, apply the more stringent requirements.

3.1.2 Material

Material must be straight before being laid off or worked. If straightening is necessary, straighten by methods that do not impair or alter the metal. Sharp kinks, bends, or overcuts of material are cause for rejection of the material. Material with welds will not be accepted except where welding is specified, indicated, or otherwise approved. Flame cutting of material is not allowed. Shearing must be accurately done and all portions of the work neatly finished. Corners must be square and true unless otherwise indicated.

3.1.3 Dimensional Tolerances for Structural Work

Measure dimensions with an approved calibrated steel tape, vernier caliper, micrometer of approximately the same temperature as the material being measured at the time of measurement. Dimensions must comply with the dimensional tolerance specified in ASTM A484/A484M.
3.2 MACHINE WORK

3.2.1 Finished Surfaces

a. Surface finishes indicated or specified herein, must be in accordance with ASME B46.1. Determine compliance with specified surface by sense of feel and by visual inspection of the work compared to Roughness Comparison Specimens in accordance with the provisions of ASME B46.1. Values of roughness width and waviness height are not specified but must be consistent with the general type of finish specified by roughness height. Flaws such as scratches, ridges, holes, peaks, cracks, or checks which will make the part unsuitable for the intended use are cause for rejection.

b. Where the finish is not indicated or specified, the type of finish is that which is most suitable for the particular surface and provides the class of fit required. Maximum surface roughness of any surface is 3.175 µm 250 micro-inch. Indicate surfaces to be machine finished by symbols which conform to ASME B46.1.

3.2.2 Unfinished Surfaces

In so far as practicable, lay out all work to secure proper matching of adjoining unfinished surfaces. Where there is a large discrepancy between adjoining unfinished surfaces, chip and grind smooth or machine to secure proper alignment. Unfinished surfaces must be true to the lines and dimensions indicated and must be chipped or ground free of all projections and rough spots. Fill depressions or holes not affecting the strength or usefulness of the parts in a manner approved by the Contracting Officer.

3.2.3 Pin Holes

Pin holes must be bored true to gages, smooth, straight, and at right angles to the axis of the member. Perform the boring after the member is securely fastened in position.

3.3 FIELD QUALITY ASSURANCE

Perform all specified quality control inspections and tests. Implement and maintain an inspection log to include copies of all descriptive data for all specified inspections and tests. Make the inspection log available immediately to the Government's inspector upon request. Submit a complete copy of the inspection log to the Government at the end of specified inspections and tests. The Government reserves the right to witness any and all specified quality control (QC) procedures. Provide the Government with one-week advance notice of QC procedure scheduling to allow time for witness coordination. Fully test replacements for all rejected parts as specified herein for the original lots.

3.4 NONDESTRUCTIVE EXAMINATION

3.4.1 NDT Agency Requirements

Conduct NDT examinations [using a testing agency adequately equipped and competent to perform such services][or][using suitable equipment and qualified personnel]. [In either case, provide] [Provide] written approval of the examination procedures and perform the examination tests in the presence of the Contracting Officer. Persons performing the NDT examination must be qualified for the specific procedure used in accordance
with ASNT SNT-TC-1A. Submit nondestructive examination certification of qualified persons, procedures and equipment performing or used for nondestructive testing.

3.4.2 Nondestructive Testing (NDT) for Flaws

For all components to be furnished ultrasonically scan a quantity representing approximately 5 percent of the total supplied quantity for internal defects as specified. Select components, specified below, require (100 percent) of the quantities furnished to be NDT examined to satisfy the specific requirements herein. The minimum quantities and requirements for testing are shown in TABLE 2, below. Lots from which examined specimen parts are selected must consist of at least 25 percent of the total quantity of each type part to be furnished. A lot is the completed components of a given type available at the inspection site. The Contracting Officer will select parts to be examined at random. Notify the Government one week prior to when the lots are available for specimen selection. Flawed specimens (excessive inclusion size, out-of-tolerance dimension or hardness, or excessive surface roughness) are subject to rejection.

3.4.3 Quality Assurance Measurements

Conduct inspections to supplement the Quality Control NDT in the presence of the Contracting Officer. This testing is to verify that dimensions, hardness and finish are within required tolerances. Perform this testing of the chain components at the fabrication site.

Quantities subject to this testing are specified in Table 2. Parts to be examined will be selected at random by the Contracting Officer. Lots from which inspected parts are selected consist of at least 25 percent of the total quantity of each type part to be furnished. A lot is the completed components of a given type available at the inspection site. Notify the Government one week prior to when the lots are available for specimen selection and inspection. More than one testing date may be required.

TABLE 2 Notes:

a. OD = Outside Diameter, ID = Inside Diameter, BHN = Brinell Hardness
b. Take two measurements per parameter per specimen.

c. Test specimen quantities shown are at least 5 percent of the total quantity furnished.

d. Measure inside diameters of both bores and take one measurement per bore. Measure pitch tolerance derived from sidebar inside diameter edge to edge measurements. Take two hardness readings per specimen. Take two width measurements per specimen.

e. Measure inside and outside diameter of each selected Bearing (three measurements per bore and three measurements per OD).

3.4.4 Pintle Component Nondestructive Testing Examination

All Pintle bushings, balls and fabricated pintle components must have ANSI/ASNT CP-189, ASNT SNT-TC-1A, AIA/NAS NAS410 qualified personnel perform radiographic NDT testing in accordance with the guidelines, practices and applicable testing standards set forth in ASTM E94/E94M, ASTM E1742/E1742M, ASTM E1030/E1030M, and ASTM E1032. Also test the pintle components by magnetic particle NDT methods in accordance with supplementary requirement S3.1 of ASTM A290/A290M. Other NDT methods are subject to Government approval. Radiographic acceptance criteria for welds satisfies the minimum severity level requirements for a Grade I condition as defined by ASTM E1955.

**************************************************************************
NOTE: In some situations where castings are specified severity level requirements in accordance with reference radiographs as outlined by ASTM E390 may not be appropriate for defining acceptance criteria. In those situations the designer may consider the use of the following paragraph.
**************************************************************************

[ Any cracks found are unacceptable and reason for immediate rejection. Evaluate all relevant indications greater than 1.5 mm 1/16 inch in length present on radiographic films against the specified acceptance criteria. Where the length of each indication (li) within an area of interest and along a continuous straight line oriented in the direction of interest are measured. If the distance between two indications is smaller in length than the length of the smaller indication then both indications must be added and treated as a single indication to include the distance of both indications as well as the distance between the indications. The total indication length is obtained as the sum of all indication lengths on a straight line within the area of interest. The maximum total indication length (lim) on any such single straight line is used to assess acceptance of the casting being evaluated.]

**************************************************************************
NOTE: The designer must specify a feature length (Lf) and the maximum indication fraction limit acceptance level, where Level I F=0.1, Level II F=0.2, Level III F=0.3, Level IV F=0.4, Level V F=0.5.
**************************************************************************
This maximum total indication length \((\text{lim})\) is divided by the feature length \((\text{Lf})\), where \((\text{Lf})\) equals \([\_]\) mm inches, to calculate the indication fraction \(F\) \((F = \text{lim} / \text{Lf})\). The value of indication fraction \(F\) must be acceptable for values less than a \([\text{Level I } F=0.1] [\_]\). Provide \([7][\_]\) day advance notice of the NDT testing and perform all testing in the presence of the Contracting Officer. If testing and certification is not performed in the presence of the Contracting Officer, the Government reserves the right to perform independent quality verification and the acceptable total indication length \((\text{lim})\) for the acceptable indication fraction Level will be increased by \(1.5\) mm \(\frac{1}{16}\) inch for the calculation to account for reproducibility in the evaluation. The manufacturer must certify in writing that the inspection was performed in accordance with the requirements specified and found to meet or exceed the requirements of the specified inspection level.]

3.4.5 Gear Nondestructive Testing Examination

Perform magnetic particle and liquid dye penetrant examination after fabrication of all gears. Conduct the testing in accordance with the requirements set forth in **ASTM E709** and **ASTM E165/E165M**, respectively. Gears found to have unacceptable relevant indications are cause for rejection of the gear component.

3.4.5.1 Gear Teeth (Magnetic Particle or Dye Penetrant)

The gear teeth are defined as \([\text{all material}]\) \([\text{beyond a radius of } [\_]\) mm \([\_]\) feet \([\_]\) inches]. Only indications with major dimensions greater than \(1.5\) mm \(\frac{1}{16}\)-inch are considered relevant. The following relevant indications are unacceptable:

a. Any linear indications greater than \([4.8][\_]\) mm \([\frac{3}{16}][\_]\)-inch (a linear indication is defined as having length three times its width)

b. Rounded indications with dimensions greater than \([4.8][\_]\) mm \([\frac{3}{16}][\_]\)-inch

c. Four or more relevant indications in a line separated by \([1.5][\_]\) mm \([\frac{1}{16}][\_]\)-inch or less, edge to edge

d. Ten or more relevant indications in any \(3870\) square mm \(6\) square inches of surface with the major dimension of this area not to exceed \(150\) mm \(6\) inches when taken in the most unfavorable orientation relative to the indications being evaluated

3.4.5.2 Gear Spokes and Hub (Dye Penetrant)

The gear spokes and hub are defined as all material inside a radius of \([\_]\) mm inches. Only indications with major dimensions greater than \([6][\_]\) mm \([\frac{1}{4}][\_]\)-inch are considered relevant. The following relevant indications are unacceptable:

a. Any linear indications greater than \([13][\_]\) mm \([\frac{1}{2}][\_]\)-inch (a linear indication is defined as having length three times its width)

b. Rounded indications with dimensions greater than \([6][\_]\) mm \([\frac{1}{4}][\_]\)-inch

c. Four or more relevant indications in a line separated by \([3][\_]\) mm \([\frac{1}{8}][\_]\)-inch or less, edge to edge
d. Ten or more relevant indications in any 3870 square mm 6 square inches of surface with the major dimension of this area not to exceed 150 mm 6 inches when taken in the most unfavorable orientation relative to the indications being evaluated

3.4.6 Pocket Wheel Nondestructive Testing Examination

3.4.6.1 Ultrasonic Examination

Perform ultrasonic examination of all pocket wheels in accordance with supplementary requirement [S3.2 of ASTM A290/A290M] [____], after preliminary machining of plain surfaces of the ring prior to heat treatment. In the straight-beam method of examination, use the back-reflection method of tuning in accordance with [ASTM A388/A388M] [____]. In addition to the reportable conditions of ASTM A388/A388M [____], record indications exceeding the resultant back-reflection. Unless all injurious defects are to be completely removed by final machining, a forging is unacceptable when one or more reflections are present producing indications accompanied by a complete loss of back-reflection, not attributable to nor associated with the geometric configuration. For this purpose, a back-reflection of less than 5 percent of full screen height is considered complete loss of back-reflection. In the angle-beam method of examination, cut calibration notches into the inside diameter and outside diameter surfaces in accordance with ASTM A388/A388M [____]. A forging that contains a discontinuity which results in an indication exceeding the amplitude of the reference line is subject to rejection. Report of the ultrasonic test in compliance with ASTM A388/A388M [____]. Additional non-destructive examination or trepanning may be employed to resolve questions of interpretation of ultrasonic indications.

3.4.6.2 Magnetic Particle Examination

Perform magnetic particle examination on all pocket wheels in accordance with supplementary requirement [S3.1 of ASTM A290/A290M] [____], after heat treatment and after the chain pocket recesses are fully contoured, but not necessarily finally machined. Only indications with major dimensions greater than 1.5 mm 1/16-inch are considered relevant. The following relevant indications are unacceptable:

a. Any linear indications greater than [5] [____] mm [3/16] [____]-inch (a linear indication is defined as having length three times its width)

c. Four or more relevant indications in a line separated by [1.5] [____] mm [1/16] [____]-inch or less, edge to edge

d. Ten or more relevant indications in any 3870 square mm 6 square inches of surface with the major dimension of this area not to exceed 150 mm 6 inches when taken in the most unfavorable orientation relative to the indications being evaluated

3.4.7 Hoisting Drum Nondestructive Testing Examination

Perform nondestructive testing on all chain and wire rope hoisting drums. After stress relief, test the surfaces of all completed welds including
adjacent heat-affected zones and face of drum grooves/sockets using a liquid dye penetrant method for the presence of flaws. Alternate methods of non-destructive testing which would be equal to or more effective than the liquid dye penetrant method may be used if approved by the Contracting Officer.

3.4.8 Engineered Chain Nondestructive Testing Examination

3.4.8.1 Sidebar Tests

Test sidebars in the machined and hardened state. Ultrasonically examine sidebars in accordance with ASTM A578/A578M and ASTM E114. Specimens with inclusion (defect) size greater than 5 mm 0.20 inch in any direction are unacceptable.

3.4.8.2 Pin Tests

Test pins in the machined and hardened state. Tested pins must have ends finished to 3 µm 125 micro-inches or smoother to allow axial direction ultrasound scans. Ultrasonically examine pins in accordance with ASTM A578/A578M and ASTM E114. Specimens with inclusion (defect) size greater than 5 mm 0.20 inch in any direction are unacceptable.

3.5 GEAR CERTIFICATION

Prepare certified profile (involute) charts and certified tooth alignment (lead) charts for all gears fabricated to meet the American Gear Manufacturer's Association AGMA gear quality as specified for each gear to be fabricated. Satisfy a minimum contact ratio of 1.5 or higher. These charts must be accurate to within +/-0.0125 mm 0.0005 inches and drawn directly by metrology methods and the use of a calibrated probe coordinate measuring machine that meets the requirements of ISO 10360-2. Submit these charts for both faces of all driven gear and drive pinion gear teeth arrangements. The tooth alignment charts must span the entire face width of the tooth at the pitch line and indicate the tooth centerline. The profile charts must indicate the theoretical involute line and span from base circle to tooth tip at the tooth centerline. Label scales on all charts. Charts must be traceable to the specific teeth from which they are measured.

3.6 CHAIN CERTIFICATION

The finished length of chains and assemblies shall not vary more than a [6][_____] mm [1/4][_____] -inch from the length of its respective mate. Measure length with the chains under a nominal load to eliminate slack between links. Chains must be straight and aligned when under load without visible twists, kinks, bends or runout. Attach a taut string line at each end of the chain under nominal load to visually inspect for straightness. The string line must not deviate away from the chain surface by more than [13][_____] mm [1/2][_____] inch at any point along the entire length of chain. Match and match mark chains in pairs with an indelible dye. In addition, match mark chain pins and link bars with metal stamped alpha-numeric characters.

3.7 HOisting DRUM AND SHEAVE CERTIFICATION

All wire rope hoisting drums and sheaves must have the grooves verified for size and contour with a groove gage (nominal size plus full oversize percentage). The grooves must meet the contact area and groove dimension.
limitations established within the Wire Rope Users Guide. All wire rope grooves and running surfaces must be unpainted.

Multi-drum assemblies that are connected to the same driven machinery must have drum geometry for synchronous drums certified by metrology methods and the use of a calibrated probe coordinate measuring machine that meets the requirements of ISO 10360-2. Certify the dimensional data for each drum and submit the results. [Multi-drum assemblies that are connected to the same driven machinery must be shop tested and measured to demonstrate the ability to reeve equal lengths of wire rope on each commonly driven wire rope drum. The testing measurements must be by direct measurement of wire rope length and wire rope tension when an interconnected tension load is applied to the wire ropes and drums. Continuously monitor the tension in each wire rope during the testing. Wind drums with sufficient length of pre-stretched wire rope to fill all drum grooves or a single layer of wire rope wound on grooveless drums. The drums are considered synchronous and equal when the tension in each wire rope does not deviate more than [5][_____] percent from the initial wire rope tension measured at the initiation of the testing].

3.8  HOISTING MACHINERY AND DRUM SHOP LOAD TEST

The test procedure applies to all units and include raising and lowering a [_____] kg pound test load ([_____] kg pounds on each drum) vertically through a distance of [_____] mm feet. Suspend the load from the actual service hoisting wire ropes. The wire rope drums must make [_____] revolutions to raise and the same to lower the load, and this shall be done three times in succession at high and low speeds without significant interruption. Inspect the wire rope drums to ensure proper reeving of the wire rope. Demonstrate the brakes to hold the test load statically and upon receiving a stop travel command in each direction of travel. Any brake hand release specified must have its operation demonstrated by gradually allowing the suspended load to begin movement and catching the load upon release of the handle. Submit shop test information to include the proposed shop test procedures, test rig details, final shop test procedures, and test result data sheets.

3.9  POCKET WHEEL [SPROCKET] SHOP LOAD TEST

a. Submit shop test information to include the proposed shop test procedures, test rig details, final shop test procedures, and test result data sheets. Conduct a load test for each complete [tainter][_____] gate assembly of [two][_____] pocket wheels [sprockets], [four][_____] chains, gate connection assemblies, sprocket shaft gears, shafts, chain guards, and bearings, prior to installation of any hoist on the [service bridge][______]. Prior to any load tests being performed all submittals for materials and components must have been approved by the Contracting Officer. Perform the assembly and load test. The load test will be witnessed by the Contracting Officer, unless otherwise waived. Provide [7][_____] working days notice before the testing. Design and furnish a test rig and facilities suitable for performing the assembly and testing. Submit Shop Load Test Rig and Location details of the test rig and its location for evaluation. The evaluation will address aspects including adequacy of rig strength including, but not limited to, foundations; access to the test rig; availability of suitable cranes; how the work will be protected, how the test measurements will be made, and how test results, including test load, can be verified.]
[a][b]. The load test consists of raising and lowering a test load vertically through a distance of \[3\] m or \[10\] feet using the actual equipment furnished for this contract. The test rig must, as a minimum, incorporate the use of the pocket wheel, shaft, chain, and gate connection assemblies. Alternate configurations of the test rig that simulates raising and lowering of the test load will be considered. Load one end of the chain and leave one end slack. Ensure that the chain extending from the test load passes over the top of the pocket wheel in the same direction as in the final installation. The total test load on \[four\] chains must be \[965\] kN or \[217,000\] pounds. Connect the load to the actual hoisting chains of the hoist that will be installed in the field. During the test, the pocket wheels must make \[1.5\] revolutions to raise and the same to lower the test load, and this must be done \[three\] times in succession without significant interruption. The chain must enter, ride in, and exit the pocket wheel without binding or slipping.

[b][c]. Prior to any operation of the assembly, inspect for proper orientation and straight alignment. Prior to disassembly, match mark mating parts of the hoist in accordance with a system of numbering approved by the Contracting Officer.

3.10 WELDING

Unless otherwise specified, conform welding to the provisions of AWS D1.1/D1.1M, Sections 1 through 8 and Section 10. Welders and welding operators must pass the qualification tests as prescribed by AWS D1.1/D1.1M, Section 5 before being assigned to production work. Submit certifications showing qualification of welders and welding operators prior to commencing fabrication.

3.11 MISCELLANEOUS PROVISIONS

3.11.1 Cleaning of Corrosion-Resisting Steel

After fabrication, remove oil, paint, and other foreign substances from corrosion-resisting steel surfaces. Clean by vapor degreasing or by the use of cleaners of the alkaline, emulsion, or solvent type. After the surfaces have been cleaned, final rinse with clean water followed by a 24 hour period during which the surfaces are intermittently wet with clean water and then allowed to dry for the purpose of inspecting the clean surfaces. Visually inspect the surfaces for evidence of paint, oil, grease, welding slag, heat treatment scale, iron rust, or other forms of contamination. If evidence of foreign substance exists, clean the surface in accordance with the applicable provisions of ASTM A380/A380M. Submit the proposed method of treatment. After treatment visually reinspect the surfaces. Brushes used to remove foreign substances must have only stainless steel or nonmetallic bristles. Remove any contamination occurring subsequent to the initial cleaning by one or more of the methods indicated above.

3.11.2 Protection of Finished Work

Submit an equipment protection plan with detailed information on the method(s) proposed to protect the existing equipment from such operations as power washing, abrasive blast cleaning, welding, placement of concrete, and painting. Thoroughly clean machined surfaces of foreign matter. Protect all finished surfaces by suitable means. Unassembled pins and bolts must be oiled and wrapped with moisture-resistant paper or protected
by other approved means.

3.11.3 Lubrication

Lubricate all the components of the equipment requiring lubrication using only the lubricants [specified] [which have been provided by the Government]. Provide and lubricate the components and assemblies, in their entirety, after assembly with a [food grade][_____] lubricant which meets the following minimum characteristics:

<table>
<thead>
<tr>
<th>ISO Grade</th>
<th>Four Ball Wear Test (ASTM D4172)</th>
<th>Falex EP (ASTM D3233)</th>

<td>100 pounds force</td>
</tr>
</tbody>
</table>

3.12 FIELD ERECTION AND TESTS

3.12.1 General

Perform field erection and field tests. Install the machinery under supervision of the erecting engineer under the provisions of paragraph ERECTING ENGINEER. Submit the installation and alignment procedure and install in with the approved procedure. The procedure must include consideration of all the other work that is obligated to be performed at the site [Lock] [and] [Dam]; and also the operating regime for the [Lock] [and ][Dam] gates which the Government will enforce, as described and specified in the SPECIAL CLAUSES. Base the procedure on a proper sequence of construction that will complete the work with safety, efficiency, and in full accordance with these specifications. Submit for approval anyGate Support Method to be used. Include detailed information on the method proposed to support the [tainter] gate during the work delineated in this section. The support method, engineering computations, and support drawings shall be designed and certified by a licensed professional engineer.

3.12.2 General Test Procedure

The Contractor shall submit the commissioning, pre-functional and functional checklist test procedures, with a blank test results data sheet for each, prior to the commencement of any tests. Complete all Pre-Functional checklists prior to performing Functional operational tests. The testing must comply with the requirements herein and as specified below. The test procedure must consist of operating the units with no load at high speed in both directions for [15][_____] minutes and at low speed in both directions for [10][_____] minutes.[ VFD controlled equipment must be ramped in speed from low to high and high to low for normal operation sequencing.] Inspect each piece of equipment for smooth operation and proper alignment and check all necessary clearances to ensure vibration, binding, or excessive heat does not occur in any moving part. During the test, provide readings of motor current, RPM, voltage, and bearing temperature. Stop the test immediately if there is any undue noise, vibration, or heat developed in any of the equipment. After correction of alignment and/or all other causes for the interruption of the test, reinspect the unit and resume testing when permitted by the Contracting Officer. Submit final operating test results for each unit.
3.12.3 Crane Availability

The Government's existing cranes will not be available for use in installation of the machinery.

3.12.4 Schedule

Schedule and coordinate operations with the Contracting Officer for the Government's installation and removal of the bulkheads for the [tainter] gates.

3.12.5 Wire Rope Tensioning

Submit the [Field Tensioning and] Operating Test Procedure, with a blank test results data sheet, prior to the commencement of any field tests. Submit details for the measuring tension procedure used to measure wire rope, [chain] tension during installation. Base the wire rope field tensioning procedure on the following steps. Upon connection of the wire rope to the [valves] gates, equalize the tension in the cables by the use of a hydraulic power pack or hydraulic ram to apply an equal horizontal force (perpendicular to the cable axis) on each cable and measuring the cable deflections at the point of force application. Apply the forces to the cables at a common elevation when the cables are under load. Make adjustments to the cables (to equalize cable tensions) at the [valve drum][adjustable cable connection][____]. Equal tensioning will be considered achieved when the deflections of the [two][____] cables are within 5 percent of each other. Measured deflections must be greater than 63 mm 2-1/2 inches at the time they are considered equal. After final tensioning, the [cable end socket][welded][mechanically secured] to the drum as indicated. After the units have been installed [and the field tensioning tests are complete], operate each complete [gate] [and valve] unit [____] cycles, as indicated, to demonstrate to the satisfaction of the Contracting Officer that the requirements of the specifications have been met and that the performance of the equipment is satisfactory for the purpose intended. During the test, provide readings of motor RPM, current, and voltage to the Contracting Officer as data to enable estimation of the motor kW horsepower developed. Submit final [field tensioning and] operating test results for each unit.

3.12.6 Round Link Chain Tensioning

Install hoisting chains such to obtain equal tension in the chains when hoisting the gate. With proper precaution observed to restrain uncontrolled movement of the chains, the cross shaft couplings may be disengaged and rotated to perform gross chain tension adjustment. Use the gate connection and turnbuckle for final adjustment. The installation procedure must define the method to be used. Measure chain tensions using a linear dynamometer, strain gauges with instrumentation, or other approved direct load indicating device. Submit the procedure for measuring the chain tensions. Perform chain tensioning with the gate raised above the sill. Each chain assembly at each [pocket wheel] [sprocket] must be tensioned within 5 percent of the mean tension for that [pocket wheel] [sprocket]. The total load supported by any [pocket wheel] [sprocket] must not be less than [48] [____] percent nor more than [52] [____] percent of the total load on the two [pocket wheels] [sprockets] connected to the same gate. Repeat adjustments until the chain assemblies are within these
specified limits.

3.12.7 Limit Switch and Position Indication Settings

Immediately prior to commencement of work on each gate, record the gate position settings. Submit the Gate Position Settings on Limit Switches. Refer to the [pre-recorded] limit switch and position indication requirements as specified [in paragraphs above] [Section 35 20 20 ELECTRICAL EQUIPMENT FOR GATE HOIST]. Following a thorough check of alignment, clearances, and readiness to operate, operate the machinery with due care to set the travel limits and confirm control or monitoring functions. The settings of the limit switch and control points must conform to the indicated requirements.

3.12.8 Open Spur Gear Alignment

Install spur gears, shafts and bearings to meet the specified backlash and gear tooth contact area requirements. Measure the gear backlash in unloaded conditions with one of the mating gears secured and the other gear manually rotated to obtain the backlash measurements. Use dial indicators to collect backlash measurements. Align the gears to achieve a backlash of between 0.63 to 0.89 mm 0.025 and 0.035 inch. Check alignment of mating gear sets in both the unloaded and at rated load conditions. Check four teeth at 90 degree intervals on each gear set for each condition. The gears are considered aligned when there is a minimum of at least 75 percent tooth contact across the pinion or driven gear tooth face, whichever is larger, at rated load. The contact pattern is considered the area indicating a consistent length and depth of the tooth pattern (i.e. a rectangle). Edge loaded patterns or irregular and discontinuous patterns are not acceptable. Submit the calculations of the percentage of tooth contact patterns for each condition. Record unloaded contact patterns using a tooth marking grease or compound and transfer to contact tape. Overlay the contact tape with the lifted contact pattern onto paper with the entire gear tooth profile shown. Measure loaded condition contact patterns using machinist's layout lacquer similar to (DYKEM) or some other similar use "bluing" dye to verify alignment requirements are met. Submit a Final Alignment Test Report which includes the results of the backlash measurements and the tooth contact patterns with calculations of the tooth contact percentages. Clean the driven gear and pinion and coat with [a dry film][the specified] lubricant after alignment and prior to any operational testing of the equipment. [The dry film lubricant must be [Sprayon S0000201][_____] heavy duty open gear and wire rope lubricant or similar product.] After performing successful initial no load gear alignment and prior to full load operational testing, secure the bearing supports with [tapered alignment pins] [fitted bolts] [bearing chocks] [shear blocks]. Verify band check final fastener torques before exposed metal surfaces are coated as required by the contract.

3.13 ERECTING ENGINEER

Furnish the services of one or more competent erecting engineers from the equipment manufacturer/fabricator to supervise and direct the erection and installation of this equipment.

a. The erecting engineer(s) must be present for all shop erection, inspections, tests, installation and operation of all equipment at the project site.

b. The erecting engineer has responsibility for the equipment meeting all
c. The erecting engineer must verify the fit and alignment of mating components prior to erecting in the field and be present during final connection and all commissioning and field testing for contract compliance. The erecting engineer must keep records of all measurements taken during installation and testing.

d. Upon completion of the installation, commissioning and startup for each specified major equipment or subassemblies, each erecting engineer must submit a **erecting engineer installation and operation certification** approving the installation and operation of the equipment.

### 3.14 FIELD TRAINING

Provide field training conducted by the erecting engineer for operating staff after each system is functionally complete but prior to final acceptance. The training must be given for a period of not less than [8][_____] hours. The training must cover all pieces of equipment and include items contained in the operation and maintenance manuals. Do not conduct training until operation and maintenance manuals have been approved. Provide a one week advance notice of the scheduled training date to the Government. Digitally record all training conducted and provide two DVD copies of the training to the Government. The recording must be compatible with common DVD players in the United States.

### 3.15 STARTUP AND ACCEPTANCE TEST

Submit the **pre-functional checklist** for approval that includes checks, recordings, measurements and verifications to be performed prior to start up. Acceptance shall be required by signature for all parties. Following the completion of installation, checkout, adjustment, and setting the limit switches, controls, interlocks, perform a startup and acceptance test on each machinery unit. Perform the startup and acceptance test in accordance with the approved commissioning **Functional checklist**, record and submit the results on test result forms of the procedure. Include a demonstration of proper functioning of the limit switches, controls, interlocks in the acceptance test. For acceptance, the machinery unit(s) must be successfully operated through a minimum of three complete cycles to satisfy the Contracting Officer that the requirements of the contract have been met and that the performance of the equipment is satisfactory for the purpose intended.

Upon successful completion of the field tests, the [miter gate] [and] [[tainter] valve] [_______] machinery, accessory items and equipment will be examined by the Contracting Officer, Erecting Engineer, Contractor, Project Personnel, and if found to comply with the contract it will be accepted by signature of all parties in a prepared **commissioning document**. Signatures and Acceptance will not occur until all found deficiencies have been corrected. submit copies of the signed commissioning document to the Contracting Officer.

### 3.16 Equipment Warranty

Submit manufacturer's standard warranty or guarantee for equipment, e.g., speed reducers. Identify any warranties that extend beyond a 1-year period.
3.17 OPERATIONS AND MAINTENANCE DATA

**************************************************************************
NOTE: Collective O&M Manuals are usually compiled from the individual O&M manuals for each piece of equipment. Designers should incorporate UFGS 01 78 23 OPERATION AND MAINTENANCE DATA into the specifications when comprehensive and outlined data packages are to be furnished to the customer. Use the first bracketed paragraph if UFGS 01 78 23 OPERATION AND MAINTENANCE DATA is included in the specifications.
**************************************************************************

For specifications on the furnishing, installation, operations and maintenance instructions, refer to Section 01 78 23 OPERATION AND MAINTENANCE DATA. Unless otherwise specified, all operation and maintenance manuals must be comprehensive to the electro-mechanical operating system with independent sections for each unique piece of equipment. Operation and Maintenance manuals are to comply with the requirements of Data Package 3 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

Unless otherwise specified, all operation and maintenance manuals must be comprehensive to the electro-mechanical operating system with independent sections for each unique piece of equipment. Include six copies of the following bound information.

a. Safety precautions
b. Operator prestart
c. Startup, shutdown, and post-shutdown procedures
d. Normal operations
e. Emergency operations
f. Environmental conditions
g. Lubrication data
h. Preventive maintenance plan and schedule
i. Cleaning recommendations
j. Troubleshooting guides and diagnostic techniques
k. Wiring diagrams and control diagrams
l. Maintenance and repair procedures
m. Removal and replacement instructions
n. Spare parts and supply list
o. Product submittal data
p. O&M submittal data
q. Parts identification
r. Warranty information
s. Testing equipment and special tool information
t. Testing and performance data…
u. Contractor information

Submit six copies of the OPERATIONS AND MAINTENANCE (O&M) MANUAL [in accordance with paragraph OPERATIONS AND MAINTENANCE MANUALS and in compliance with Data Package 3 in Section 01 78 23 OPERATION AND MAINTENANCE DATA.]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for supplying and installing wire rope (new or replacement) needed by gate operating devices (i.e. spillway gates, tainter gates, etc.).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification is based on the assumption that a single Contractor will be responsible for supply and installation of the wire rope. Please refer to US Army Corps of Engineers Engineer Manual 1110-2-3200 Wire Rope Selection Criteria for Gate-Operating Devices (http://www.publications.usace.army.mil/Portals/76/Publications/EngineerManuals) prior to editing this section. It is recommended that the designer talk with wire rope manufacturers to get their consensus that the proposed wire rope type can be manufactured and used successfully.

If a specification is needed only for supply of wire
rope, or for installation of wire rope, there are example specifications included in the appendices of US Army Corps of Engineers Engineer Manual 1110-2-3200 Wire Rope Selection Criteria for Gate-Operating Devices (http://www.publications.usace.army.mil/Portals/76/Publications/EngineerManuals). It is also assumed the wire rope is for replacement for a gate operating device. Paragraphs written in regard to removal of existing wire rope, and cleaning drums and sheaves would need to be deleted if the application is for a new installation.

Ensure products used in this section comply with Federal procurement preference under Section 9002 of the Farm Security and Rural Investment Act of 2002. See Section 01 33 29 SUSTAINABILITY REPORTING for requirements associated with EPA designated products.

**************************************************************************

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

U.S. ARMY CORPS OF ENGINEERS (USACE)

EM 385-1-1 (2014) Safety and Health Requirements
1.2 SYSTEM DESCRIPTION

1.2.1 Wire Rope Work Plan

The work required in accordance with this specification is of a complicated nature, requiring technical expertise and planning. Submit a work plan, which will indicate how the existing wire rope will be removed and how the new wire rope will be installed, without damaging either existing equipment or the new wire rope. The approved work plan must submitted and approved before any work can be performed. Include the following in the plan:

- Removal plan for old wire rope.
- Un-reeling and installation plans for new wire rope.
- Plan for tensioning wire ropes.
- Schedule for delivery.
- Schedule for installation.
- Lubrication method.
- Field tensioning method.

1.2.2 Wire Rope Safety Plan

The work area, conditions of work area(s), and type of work required can create considerable potential for accidents. Submit a safety plan indicating how accidents will be prevented. Include in the safety plan details of how the wire rope will be handled and installed to minimize the risk to personnel. Perform work in accordance with EM 385-1-1. Include the safety provisions of this section in the safety plan required by [Section [_____] SPECIAL CONTRACT REQUIREMENTS] [Section 01 35 26 GOVERNMENT SAFETY REQUIREMENTS] [____].

1.2.3 Tools, Equipment and Expertise

**************************************************************************
NOTE: The last sentence may or may not be needed, or consider propane powered equipment.
**************************************************************************

The work may take place [over water] in areas with limited ventilation. [Only electric or air powered tools and equipment will be allowed within those areas (no internal combustion engines will be allowed).]

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.
**************************************************************************
The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-01 Preconstruction Submittals**

- Wire Rope Work Plan; G[, [_____]]
- Wire Rope Safety Plan; G[, [_____]]
- Manufacturer's Qualifications; G[, [_____]]
- Supervisor's Qualifications; G[, [_____]]

**SD-02 Shop Drawings**

- End Terminations; G[, [_____]]

**SD-03 Product Data**
Lubrication; G[, [____]]
Pre-Stretching; G[, [____]]
End Termination Attachment Method; G[, [____]]

SD-06 Test Reports
Tension Testing; G[, [____]]
Attaching and Proof Loading Terminations; G[, [____]]
Wire Strength and Ductility; G[, [____]]
Pre-Forming; G[, [____]]
Stress Relief "(Wrapping Test)"; G[, [____]]
Zinc Coating; G[, [____]]
End Terminations; G[, [____]]

SD-07 Certificates
Warranty
Type of Wire Rope; G[, [____]]
Tension Testing Equipment; G[, [____]]

1.4 SUPERVISOR’S QUALIFICATIONS

Submit the supervisor's experience in the installation of wire rope. The supervisor must have performed work similar to that required in this contract on at least three separate occasions. The supervisor must be on site at all times when wire rope is being delivered, stored, un-reeeled, during testing, installation, and after installation testing. Submit the Contractor's Installation Supervisor's experience record before work at the site may begin.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

[The work and storage areas are as indicated [on Drawing _____]] [or as directed by the Contracting Officer]. Wind the wire ropes on spools in the same direction as they were bent during manufacturing. Cover the [coils] [spools] for protection from rain, snow, and/or road spatter during shipping.

1.5.2 Inspection on Delivery

**************************************************************************
NOTE: Consider altering or deleting this paragraph to reduce cost if the wire rope can be inspected completely, while being installed.
**************************************************************************
Upon delivery to the work or storage area, inspect the wire [ropes] [ropes and sockets] in the presence of the Contracting Officer. Inspect the wire rope for dings, kinks or other damage. [Unreel the wire ropes from spool to spool to allow complete inspection of the wire ropes over their entire length. Perform the unreeling/reeling operation, and furnish extra spools or any other equipment required.] Upon completion of the inspection, furnish the Contracting Officer with a written report of the results.

1.5.3 Storage

After delivery, store the wire ropes in well ventilated enclosures in the storage area and protect from the elements.

1.6 ENVIRONMENT PRECAUTIONS

Take special care to prevent any materials of any type falling into or contaminating waters surrounding the work site. Immediately notify the Contracting Officer if materials fall into or contaminate waters.

1.7 WARRANTY

**************************************************************************
NOTE: Designer should contact wire rope manufacturers to determine the extent of manufacturer's warranties available. Warranties may vary with type of rope and application.
**************************************************************************

Submit signed copies or the manufacturer's warranty of a [1][_____] year[s] warranty for all materials and services provided under this section.

PART 2 PRODUCTS

2.1 WIRE ROPE[ AND SOCKETS]

Provide wire rope [and sockets] which are the standard product of a manufacturer regularly engaged in the manufacture of wire rope, and that essentially duplicate products having been in satisfactory use for at least 5 years prior to [bid opening] [proposal evaluation]. Submit manufacturer's qualifications statement.

2.1.1 Quantity

Furnish [_____] wire ropes [with end terminations (sockets) [at both ends]]. Each wire rope must be [of the length indicated on Drawing No. [_____], and within the tolerance also indicated on that drawing.] [[_____] meters feet in length.] Wind the wire rope on reels in lengths such that [_____] sections, each with a length of [_____] meters feet available for use, as splicing will not be allowed.

2.1.2 Type of Wire Rope

**************************************************************************
**************************************************************************
The wire rope must be of the following type:

2.1.2.1 Strand Configuration

[6x19 Seale] [7x19 Seale] [6x26 Warrington Seale] [6X37 Warrington Seale] [_______]; [Flattened strand]

2.1.2.2 Lay

******************************************************************************
NOTE: The advantages of lang lay wire rope are discussed in more detail in EM 1110-2-3200. In many Army Corp of Engineers applications existing regular lay wire rope would best be replaced by lang lay wire rope.
******************************************************************************

[Right, lang] [Left, lang] [Right, regular] [Left, regular]

2.1.2.3 Diameter

[_____] mm inch, with a tolerance of minus and plus 5 percent

2.1.2.4 Finish

[Galvanized] [Plain]

2.1.2.5 Minimum Breaking Strength

[_____] kN [pounds] [tons]

2.1.2.6 Material

******************************************************************************
NOTE: Stainless steel wire ropes tends to abrade on itself when wrapped on disk-layered drums. Some manufacturers are questioning the wisdom of making regular lay stainless steel wire rope with flattened strands, as the cold-working tends to be excessive and weaken the rope. Stress relieving to alleviate the cold working can be difficult and inconsistent with the stainless steels. Stainless steel should not be used in saltwater applications because of susceptibility to crevice corrosion. If they are used, they must be inspected regularly.
******************************************************************************

[Extra improved plow steel] [AISI 302 stainless] [AISI 304 stainless] [______]

2.1.2.7 Core Type

******************************************************************************
NOTE: It is not recommended that fiber core be used for a gate lifting device.
******************************************************************************

Independent wire rope core
2.1.2.8 Pre-Formed

**************************************************************************
NOTE: There is no reason not to preform.
**************************************************************************

[Yes] [No]

2.1.3 Pre-Stretching

**************************************************************************
NOTE: In the following paragraphs the manufacturer is tasked with some testing. This is intentional, as personnel who are familiar with the required procedures should perform these tasks.

Pre-stretching is highly recommended for installations with multi-rope drums, because initial stretch in the wire ropes tends to be uneven. Pre-stretching will likely result a more equal tension between the ropes. It is also recommended for other wire rope so that final length after use will be closer to length at the time of installation.
**************************************************************************

Submit Pre-Stretching Procedure. Pre-stretch the [wire rope.] [wire ropes before attaching their end terminations.] This is done by subjecting them to three cycles at 40 percent of its nominal strength. Hold the 40 percent loads for 5 minutes with 5 percent loads for 5 minutes between cycles. A method of dynamic pre-stretching may be proposed.

2.1.4 Wire Strength and Ductility

Perform testing in accordance with FS RR-W-410 to verify wire strength and ductility. Submit test results.

2.1.5 Pre-forming

Provide pre-formed wire rope, and perform testing in accordance with FS RR-W-410 to verify pre-forming. Submit test results.

2.1.6 Stress Relief "(Wrapping Test)"

Stress relieve the wire rope, and perform testing in accordance with FS RR-W-410 to verify stress relief. Submit test results.

2.1.7 Weld Distribution

Wire joints in any strand must not be closer than 450 mm 18 inches in any strand.

2.1.8 Galvanizing

**************************************************************************
NOTE: Wire rope woven from galvanized wires will have much better resistance to corrosion than un-galvanized wire rope woven from bare carbon steel. It will also have better resistance to corrosion than wire rope woven from drawn galvanized

SECTION 35 01 70.13  Page 10
wire. However, it will also have a significantly lower strength. If full strength is required, then use wire rope woven from plain carbon steel or from drawn galvanized wire depending on how important corrosion resistance is. If full strength is not required, but high corrosion resistance is required, use wire ropes woven from galvanized wire and perform the zinc coat test to verify the zinc thickness. See FS RR-W-410 for information on the rate of zinc coating. Of course stainless steel wire rope would not be galvanized, and this entire paragraph would be deleted.

**************************************************************************
[The wire rope must be woven from drawn galvanized wire. That is, the wires galvanized prior to their last drawing operation. The wire rope must have the same accepted industry standards for nominal strength as it would, had it not been galvanized.] [The wire ropes must be woven from galvanized wire. Zinc must be applied at a rate of [_____] grams per square meter ounces per square foot of wire surface. The manufacturer must perform testing in accordance with FS RR-W-410 to verify the zinc coating has been applied at the required rate. Submit test results.]

2.1.9 Strand Pitch Length

Not be less than 4-1/2 times the nominal rope diameter.

2.1.10 Core Strand Wires

The number of wires in the core strand must be equal to or greater than the number of wires in the other strands. Use the same material as the wires in the other strands, or use a material with a lower tensile strength.

2.1.11 End Terminations

**************************************************************************

NOTE: EM 1110-2-3200 discusses materials and coatings, and attachment methods for sockets. Note that the wire rope industry usually recommends replacing sockets when replacing wire rope. Sockets are usually selected from a catalog, however they can be custom fabricated. Spelter sockets are the Army Corp of Engineers standard for end terminations. Swaged sockets can be specified but are not suitable for lang lay rope. Both types should develop 100 percent of the wire rope strength. Molten zinc should not be used with stainless steel spelter sockets. Molten zinc or epoxy resin spelter sockets should not be used with stainless steel wire rope in saltwater applications due to susceptibility to crevice corrosion. If they are used, they must be inspected regularly. Swaged sockets can be used in saltwater applications.

**************************************************************************

Submit shop [fabrication] drawings, as specified. [The wire rope end terminations must be [an open] [a closed] spelter socket type with poured zinc or epoxy resin. Spelter sockets must be [forged] [cast alloy] [galvanized steel] [stainless steel] [swaged type of carbon steel suitable
for cold forming]. [Provide fabricated wire rope end terminations as indicated [on Drawing No. [____]], and cast from [steel conforming to ASTM A148/A148M, Grade 105-85] [stainless steel conforming to ASTM A351/A351M CF8M] [____]. Secure the wire rope in fabricated sockets with poured zinc or epoxy resin.]

2.1.12 Tension Testing

Submit rope tension test report. Perform a tension test to verify the wire rope meets the accepted industry standards for nominal strength. Test two rope samples to failure to be sure the expected performance level has been met. Perform the test using suitable tension testing equipment and by qualified personnel. Submit certification of rope tension testing device. Cut the rope samples to no less than 1 meter 3 feet of length. The test will not be considered valid if the failure occurs less than 50 mm 2 inches from either socket or holding mechanism. Relative speed between the machine heads must not exceed 25 mm 1 inch per minute.

[2.1.13 Attaching and Proof Loading Terminations

**************************************************************************
NOTE: EM1110-2-3200 suggests that pre-stretching the wire rope and proof loading the terminations might be accomplished simultaneously. However, for multi-rope drums the wire rope would need to be pre-stretched first to be sure they are closer to their final correct length before attaching the terminations. If the sockets must be attached in the field delete this paragraph.
**************************************************************************

The manufacturer must attach the end terminations after pre-stretching the wire rope. The end termination attachment method must be as indicated on Drawing No. [____]. After their attachment, proof load the wire ropes at 40 percent of nominal strength of the rope. Measure the length of the wire ropes to the nearest 0.25 mm 0.01 inch at a load of [____]. Submit proof load of terminations test report and measured rope lengths.

]2.2 LUBRICATION

**************************************************************************
NOTE: All frequently used wire rope should be lubricated, however, if operation is infrequent, it may be best to specify that it not be lubricated. Explained in EM 1110-2-3200, some cases where the wire rope is rarely operated, the presence of a heavy lubricant will increase corrosion on wire ropes. Carbon steel wire ropes in saltwater applications should have a durable protective lubricant coating.

If the end user has their own lubrication product, they may provide the lubricant.
**************************************************************************

Submit manufacturer's literature for factory and field lubricant. The field and factory lubricants must be compatible. [Lubricate the wire ropes at the manufacturing facility. Apply the lubricant with equipment capable of forcing the lubricant between the rope wires, including the center
PART 3 EXECUTION

3.1 REMOVAL OF EXISTING WIRE ROPE

After its removal, the existing removed wire rope becomes the Contractor's property. Remove from the site following all federal, state, and local laws and regulations.

3.2 EXAMINATION

It is highly recommended that bidders visit the site before submitting bids. Drawings and verbal descriptions cannot fully describe the effort required to satisfactorily complete the contract work. [A pre-bid site visit, between the dates of [_____] and [_____] can be arranged by contacting [_____] at telephone number [______].] [See Section [_____] for site visit arrangements.]

3.2.1 QA Inspections

Up to two representatives of the Contracting Officer will be present to witness the various manufacturing processes for the wire rope. At a minimum, a site visit will be made to witness the tension test, and the wire rope will be inspected upon delivery. Inspection during removal of the existing wire rope and installation of the new wire rope will be ongoing.

3.2.2 Verify Dimensions

After becoming familiar with the details of the work, verify dimensions in the field, and immediately advise the Contracting Officer of any discrepancies before performing any work.

3.3 ATTACHING SOCKETS

******************************************************************************
NOTE: Delete this paragraph if the sockets are to be attached at the wire rope factory.
******************************************************************************

Attach the end terminations to the wire rope [as indicated] [in accordance with Drawing No. [______]] and the recommendations of WRTB.

3.4 CLEAN DRUMS AND SHEAVES

Clean all drum and sheave grooves with a power wire brush, and inspect them for wear, abrasion, corrosion or other roughness and verify their dimensions are suitable for the new wire rope. Immediately advise the Contracting Officer of any problems.

3.5 LUBRICATION

Lubricate the wire ropes after they are installed, but before break-in/testing. Submit the proposed method in the work plan.
3.6 UN-REELING AND INSTALLING WIRE ROPE

**************************************************************************
NOTE: EM1110-2-3200 suggests at least two and preferably three dead wraps of the rope on the drum.
**************************************************************************

Attach the wire rope(s) to spools or pulleys as [indicated] [shown on Drawing No. [_____]]. Wind the wire rope under adequate tension and guide the each end of the rope(s) to its proper location. Wind the wire rope in the same direction it was bent during its manufacture. Ensure that no twists or loops occur. Do not install wire rope damaged during installation by kinking, and remove from the site. Submit the proposed method of un-reeling and installing in the work plan.

3.7 FIELD TENSIONING [SINGLE LINE] [MULTI-LINE] HOISTS

Adjust the wire rope tension of [single line][multi-line] hoists to ensure that they share load equally. Submit the proposed field tensioning method in the work plan. [For each multi-line hoist rope drum, final tension values for each rope must be no more than plus or minus 5 percent from the average of the individual rope tension values. For two multi-line hoists on a gate, the total wire rope load on each hoist is computed by summing the measured tension values for all wire ropes on a hoist.] The total wire rope load on each hoist must be within a range less than or equal to 0.5 percent of the average of the two total wire rope loads. Measure and adjust wire rope tensions while keeping the gate properly positioned and aligned[ in the slot]. After "break-in/testing" test the ropes to determine if they share load equally, and if not, re-tension.

3.8 BREAK-IN/TESTING

After installation is complete, run the gate-operating device through [one] [two] [three] [four] [_____] complete cycles, fully open to fully closed.

3.9 ORDERLY WORK AREA/SITE CLEANUP

Maintain neat and orderly storage and work areas. The Contract will not be considered complete until all the tools, equipment and property have been removed from the site, and the storage and work areas have been restored. Remove all dirt, debris, litter etc. from project and dispose of in a proper manner.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for hydraulic power systems to operate gates and other mechanisms at civil works structures. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Ensure products used in this section comply with Federal procurement preference under Section 9002 of the Farm Security and Rural Investment Act of 2002. Refer to Section 01 33 29 SUSTAINABILITY REPORTING for requirements associated with EPA designated products.

1.1 SUMMARY

The work covered by this section consists of detailed requirements for the [design,] fabrication, shop assembly, testing, delivery, and installation of the hydraulic power systems for operation of the [intake gates] [slide gates] [control gates] [Tainter gates] [miter gates] [butterfly valves]
[hoisting equipment] [_____] as specified and as shown.

[1.2 PRODUCTS INSTALLED BUT NOT SUPPLIED]

**************************************************************************
NOTE: List all property which will be furnished to the Contractor for installation. Delete materials and equipment which are purchased by supply Contract by the Government to be furnished to the Contractor from other portions of this specification.
**************************************************************************

Pursuant to Contract Clause GOVERNMENT-FURNISHED PROPERTY (SHORT FORM), the Government will furnish to the Contractor the following property, if required, to be incorporated or installed in the work. Such property will be furnished at the project site for delivery acceptance. Install or incorporate all such property into the work. Verify the quantity and condition of such Government-furnished property when delivered, acknowledge receipt thereof in writing and in case of damage to or shortage of such property, report within 24 hours, in writing, such damage or shortage.

[1.3 MEASUREMENT AND PAYMENT]

**************************************************************************
NOTE: If Section 01 22 00.00 10 MEASUREMENT AND PAYMENT is included in the project specifications, move this paragraph and its subparagraphs from this section and insert in Section 01 22 00.00 10.
**************************************************************************

1.3.1 Payment

Payment will be made for costs associated with the hydraulic power system(s) as specified.

1.3.2 Unit of Measure

Unit of measure: Job

1.4 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile.
references in the publish print process.

1.5 DESIGN AND PERFORMANCE REQUIREMENTS

**************************************************************************
NOTE: Include this paragraph in the specifications when the Contractor is required to furnish the detailed design of the system.

List all items for which the Contractor must furnish design computations. If Contractor designed, also provide a reference to have the Contractor follow requirements in USACE EM 1110-2-2610 for hydraulic power systems.

**************************************************************************

The Contract drawings indicate the general arrangement of the hydraulic power system for operation of the [intake gates] [slide gates] [control gates] [Tainter gates] [miter gates] [butterfly valves] [hoisting equipment] [_____], clearances necessitated by the structure or other equipment, maximum overall dimensions, and other pertinent features. Furnish the detailed design in accordance with the following design criteria. Furnish the detailed design in accordance with ISO 4413, and the following design criteria. Identify design and dimensional changes necessary to satisfy the principal design parameters identified in the paragraph "Design Parameters" as variations in the submittals. Dimensions submitted that differ from those indicated and not otherwise constrained by the Design Parameters and physical limitations of installation are subject to approval. Also submit design computations for all extension of design items.

1.5.1 Design Parameters

**************************************************************************
NOTE: List all design parameters or criteria required by the Contractor to design the hydraulic power system. Possible design criteria to consider are:

a. Maximum system pressure.
b. Working system pressure.
c. Rated raising or retracting force.
d. Rated lowering or extending force.
e. Maximum raising or retracting time.
f. Maximum lowering or extending time.
g. Hoist stroke.
h. Critical or limiting dimensions.
i. Operating temperature range.

j. Duty cycles.

k. Accumulator performance characteristics.

l. Corrosivity category

m. Any other unusual features.

The principal design parameters for the hydraulic power system are as follows and were developed at the minimum operating temperature and utilizing the hydraulic fluid as specified:

1.5.2 Allowable Stresses

1.5.2.1 Structural Items

Design structural items associated with the hydraulic power system, such as support beams, to withstand the maximum force exerted by the hydraulic cylinder plus any dead loads with a factor of safety of 2 based on the yield strength of the materials involved.

1.5.2.2 Hydraulic Cylinders

Design all hydraulic cylinders to withstand a maximum operating pressure of 21[___] MPa 3000[___] psi with a factor of safety of 5 based on the ultimate strength of the material or 2 based on the yield strength of the material. Apply a factor of safety of 3 to the compression load when designing the hydraulic cylinders to resist buckling. End fixity coefficients for determining the effective buckling length for each hydraulic cylinder are [1.0] [___].

1.5.2.3 Stress Concentration Factors

Use stress concentration factors where applicable. Reduction of allowable stresses to compensate for repeated cycles of loading is not required.

1.5.3 Corrosivity Environment Category

Design hydraulic cylinders, cylinder rods and components to meet the corrosivity category [____] in accordance with ISO 9223 to meet anticipated atmospheric environment the cylinders and piston rods will be operating within.

NOTE: Select a Corrosivity Category (C1-C5, or CX) to meet the measured corrosion rates of 1 year tests conducted in the actual intended environment for the hydraulic cylinder in accordance with ISO 9223 and
ISO 9226 OR to meet the anticipated atmospheric environment in accordance with the Table 1 furnished below. The hydraulic cylinder manufacturer may already have test data which can be requested in a shop drawing submittal. It is important to work with the cylinder manufacturer on the selected corrosivity category. The corrosivity category impacts the selection of the piston rod and the type of rod coating and rod material. Submerged cylinders and piston rods should be selected for CX Extreme category. In environments with expected "CX category" classification, it is recommended that the atmospheric corrosivity classification be verified from one-year or three year corrosion loss analysis such as salt water droplet corrosion test to ensure correct classification if possible or from existing test data. Collection and analysis of water quality data in advance of the installation may also be beneficial for environments subject to immersion. When crossover between categories occurs the designer should select the category with the more severe environment. Additional factors that may influence the selected corrosivity category include salt spray, humidity, airborne pollutants, waterborne pollutants, anticipated cylinder rod retraction operation, frequency of immersion, frequency of movement, time spent extended, presence of sheltering, and inspection/maintenance accessibility.

**************************************************************************

Table 1: Description of Corrosivity Categories

<table>
<thead>
<tr>
<th>Corrosivity Category</th>
<th>Typical Environments - Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>INDOOR</td>
</tr>
<tr>
<td>C1</td>
<td>Heated spaces with low relative humidity and insignificant pollution, e.g. offices, schools, museums.</td>
</tr>
<tr>
<td>Very Low</td>
<td>Dry or cold zone, atmospheric environment with very low pollution and time of wetness, e.g. certain deserts, Central Arctic/Antarctica.</td>
</tr>
<tr>
<td>C2</td>
<td>Unheated spaces with varying temperatures and relative humidity. Low frequency of condensation and low pollution, e.g. storage, sport halls.</td>
</tr>
<tr>
<td>Low</td>
<td>Temperate zone, atmospheric environment with low pollution (SO2 &lt; 5 micro grams/cubic meter), e.g. rural areas, small towns.</td>
</tr>
<tr>
<td></td>
<td>Dry or cold zone, atmospheric environment with short time of wetness, e.g. deserts, subarctic areas.</td>
</tr>
<tr>
<td>Corrosivity Category</td>
<td>Typical Environments - Examples</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td><strong>C3</strong> Medium</td>
<td>Indoor: Spaces with moderate frequency of condensation and moderate pollution from production process, e.g. food-processing plants, laundries, breweries, dairies.</td>
</tr>
<tr>
<td></td>
<td>Outdoor: Temperate zone, atmospheric environment with medium pollution (SO₂: 5 micro grams/cubic meter to 30 micro grams/cubic meter) or some effect of chlorides, e.g. urban areas, coastal areas with low deposition of chlorides.</td>
</tr>
<tr>
<td><strong>C4</strong> High</td>
<td>Indoor: Spaces with high frequency of condensation and high pollution from production process, e.g. industrial processing plants, swimming pools.</td>
</tr>
<tr>
<td></td>
<td>Outdoor: Spaces with high frequency of condensation and high pollution from production process, e.g. industrial processing plants, swimming pools. Temperate zone, atmospheric environment with high pollution (SO₂: 30 micro grams/cubic meter to 90 micro grams/cubic meter) or substantial effect of chlorides, e.g. polluted urban areas, industrial areas, coastal areas without spray of salt water or, exposure to strong effect of de-icing salts.</td>
</tr>
<tr>
<td><strong>C5</strong> Very High</td>
<td>Indoor: Spaces with very high frequency of condensation and/or with high pollution from production process, e.g. mines, caverns for industrial purposes, unventilated sheds in subtropical and tropical zones.</td>
</tr>
<tr>
<td></td>
<td>Outdoor: Temperate and subtropical zone, atmospheric environment with very high pollution (SO₂: 90 micro grams/cubic meter to 250 micro grams/cubic meter) and/or significant effect of chlorides, e.g. industrial areas, coastal areas, sheltered positions on coastline.</td>
</tr>
</tbody>
</table>
### Corrosivity Category

<table>
<thead>
<tr>
<th>Indoor</th>
<th>Outdoor</th>
</tr>
</thead>
<tbody>
<tr>
<td>CX Extreme</td>
<td>Subtropical and tropical zone (very high time of wetness), atmospheric environment with very high SO2 pollution (higher than 250 micro grams/cubic meter) including accompanying and production factors and/or strong effect of chlorides, e.g. extreme industrial areas, coastal and offshore areas, occasional contact with salt spray.</td>
</tr>
<tr>
<td>Spaces with almost permanent condensation or extensive periods of exposure to extreme humidity effects and/or with high pollution from production process, e.g. unventilated sheds in humid tropical zones with penetration of outdoor pollution including airborne chlorides and corrosion-stimulating particulate matter. Submerged cylinders and piston rods.</td>
<td>NOTE: Water Quality Sampling may be required in advance of the design project to collect sufficient data to assess pollution levels for determination of Corrosivity Category. Applications with frequent submergence for extended periods (&gt; 24 hours).</td>
</tr>
</tbody>
</table>

### 1.5.4 Connections

#### 1.5.4.1 Pinned Connections

Design pinned hydraulic cylinder connections for field assembly [as manufacture designed] [as shown].

#### 1.5.4.2 Shop Connections

Design shop connections for assembly by means of welding or by bolting.

#### 1.5.4.3 Welded Connections

******************************************************************************************

NOTE: If the need exists for more stringent requirements for weldments, delete this first bracketed paragraph and use the second paragraph. The designer should also consider whether a U-Stamp per ASME BPVC SEC VIII code is necessary since custom produced hydraulic cylinders are generally exempt. Note specifically in paragraph below the exemption of the U-stamp requirement. All other requirements of the ASME BPVSC SEC VIII code should

SECTION 35 05 40.14 10  Page 17
still be enforced.

**************************************************************************

[ Design welded connections in accordance with AWS D1.1/D1.1M except that provisions for repeated stress is not required. Weld hydraulic cylinders in accordance with ASME BPVC SEC VIII D1, [ISO 15614-1]. Weld piping in accordance with ASME B31.1. Qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. [U-stamp requirements per ASME BPVC are waived.] Notify the Contracting Officer within 24 hours in advance of tests and perform the tests at the work site if practicable. Apply the welder's or welding operator's assigned symbol near each weld made as a permanent record. Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators.]

[ Welding and nondestructive testing procedures for piping are specified in Section 40 05 13.96 WELDING PROCESS PIPING.]

1.5.4.4 Structural Bolted Connections

Make structural bolted connections carrying primary loads with ASTM F3125/F3125M, Grade [A325][A490] bolts [or ISO equivalent standards as approved].

1.6 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29.
SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-10 Operation and Maintenance Data
1.7 SCHEMATIC DRAWINGS AND DATA

1.7.1 Shop Drawings

Include fabrication, shop assembly, delivery, and field installation drawings in the detailed shop drawings. Detail any component part of fabricated items omitted on the shop drawings. If departures from the Contract drawings are deemed necessary by the Contractor, submit details of such departures, including changes in related portions of the project and reasons, with the shop drawings. Provide fabrication and assembly drawings to 1:8 or 1-1/2 inch = 1 foot-0 inch or larger scale.

1.7.2 Fabrication Drawings and Assembly Details

Provide fabrication drawings for all mechanical and structural parts and components, except those of standard design and manufacture. Include in fabrication drawings complete detailing, materials of construction, tolerances, machined surface finishes, connections, and weld details with annotation to differentiate shop welds from field welds. Provide detailed drawings of the manifolds including required drilled passages. Provide details and dimensions of the hydraulic cylinder and piston rod as applicable. Provide details of the cylinder rod measuring system as applicable [magneto resistive system] [magnetorestrictive system]. Provide details of the proposed coating system for the cylinder rod to meet the required corrosivity category and provide data for any coating system.

1.7.3 Hydraulic Power Unit Drawings

Provide drawings for hydraulic power units showing general arrangement of components and outline dimensions of unit. Identify all components on the drawings and provide sufficient information to determine whether the components proposed conform to the specifications.

1.7.4 Manifold Drawings

Provide fabrication drawings for all manifolds showing general arrangements outline dimensions, and drilling dimensions. Identify all components on the drawings and provide sufficient information to determine whether the components proposed conform to the specifications. Identify all port configurations and connections.

1.7.5 Piping Drawings

Provide piping drawings showing the complete hydraulic system in schematic format identifying all items of equipment incorporated in the system. Include details of all pipe supports including those for manifolds and on the hydraulic power unit.

1.7.6 Electrical Drawings

Provide electrical drawings of all electrical equipment. On electrical drawings include complete schematic diagrams and connection diagrams. On connection diagrams show electrical connections (by lines) for each conductor between terminal points. Identify terminal points.
1.7.7 Shop Assembly Drawings

Provide shop assembly drawings with details for connecting the adjoining fabricated components in the shop to ensure satisfactory field installation.

1.7.8 Hydraulic Schematic

Provide a complete hydraulic schematic in accordance with ISO 1219-1 and ISO 1219-2. Show all hydraulic components including valves and pumps on the schematic, and indicate all setpoint and size parameters for each component.

1.7.9 Product Data

Include performance data and curves for pumps, motors and valves. Provide catalog cuts and outline dimensions for the pumps, motors, filters, heaters, thermostats, float switches, pressure transducer, switches, breathers, and all valves, valve controls and other accessories.

1.7.10 Delivery Drawings

Provide delivery [drawings][details][sketches] with descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damage.

1.7.11 Shop Assembly and Testing Procedures and Results

Provide procedures for shop testing and operating test for all testing outlined in paragraphs "SHOP ASSEMBLY AND TESTING" and "FIELD TESTS AND INSPECTIONS." Submit operational test reports for all required shop testing and testing of equipment after installation. Provide records of all adjustments and final settings for all hydraulic components in the system. This includes pump flow rates, operating times, relief settings, counterbalance valve adjustments, operating pressures at both the hydraulic power units and cylinder manifolds, flow level adjustments, filter differential switch settings, and other parameters as outlined in paragraph "Test Reports."

1.7.12 Field Installation Procedures

Provide field installation [drawings][sketches][manuals] with a detailed description of the field installation procedures. Include the location and method of support of installation and handling equipment, the provisions to be taken to protect concrete and other work during installation, the method of maintaining components in correct alignment, and the methods for installing other appurtenant items. Include dates and schedule of work. Submit methods and procedures to accelerate the sequence of work.

1.7.13 Design and Performance Requirements

Provide design computations for all items which are designed by the Contractor. [Include computerized simulations of the complete and proposed hydraulic system.]

1.7.14 Cleaning and Flushing Procedures and Results

Submit detailed procedure for the cleaning and flushing of hydraulic cylinders, piping, and power unit as outlined in paragraph "CLEANING AND FLUSHING," not less than 30 calendar days before start of operations.
Provide test reports of the results of the flushing and of the oil used to fill the system.

1.7.15  Erecting Engineer Qualifications

Provide a resume for the on-site erecting engineer with details on experience and background in similar installations.

1.8  DELIVERY, STORAGE, AND HANDLING

1.8.1  Packaging

Do not prepare the hydraulic power systems for shipment until they have been inspected and accepted for shipment at origin by the Contracting Officer, unless inspection has been waived in writing. Ship each hydraulic power system or subassembly completely assembled as feasible. [Any separate delivery of components must be coordinated by the Contractor and noted in a submittal.] The subassemblies are defined as the following:

a. Hydraulic cylinders. Each hydraulic cylinder subassembly consists of the hydraulic cylinder, [trunnion,] [cardanic ring,] [pillow block bearings,] [bushings,] [cylinder support platform,] [manifold,] and [piping].

b. Hydraulic power units.

c. Piping assemblies.

d. Control consoles.

Provide all subassemblies and spare equipment and parts with adequate protective pads, supports, and blocking, and securely restrained to prevent distortion or damage to the painted surfaces in transit. Any loss or damage during shipment, including damage to the painted surfaces, will be the Contractor's responsibility; replace or repair without any cost to the Government. Pack all accessories and spare parts separately in containers plainly marked "ACCESSORIES ONLY" or "SPARE PARTS ONLY." Place a packing list, listing the contents of each container, in a moisture-proof envelope and securely fasten to the outside of the container. Standard commercial packaging in accordance with ASTM D3951 will be acceptable except where a different method or standard of packaging is specified.

1.8.2  Shipping, Preservation, and Storage

**************************************************************************

NOTE: For very long cylinders, deflection of the rod during shipment may cause damage to the rod and/or bore of the cylinder. It is best to avoid the use of internal rod support blocks. One solution to this problem is to extend the rod a short distance, provide a bracket so that the rod cannot be retracted, and then pressurize the underside of the piston so that the rod is in tension. Also, shipping the cylinder filled with oil may help dampen the movement of the rod.

**************************************************************************

Packing, crating, cradles, and other packing materials necessary to ensure safe shipment are the responsibility of the Contractor and become the
property of the Government upon delivery of the equipment. The hydraulic cylinders to be [filled with the specified hydraulic fluid, and to account for expansion and contraction of the oil during shipping and storage by installation of a bladder type accumulator to the rod end bleed port.][drained and purged with nitrogen.] Then securely cap remaining ports with blank flanges to prevent the entrance of foreign matter. [Make provisions with external shipping devices to prevent damage to the cylinder and piston rod resulting from the rod flexing up and down in the cylinder during transport. Submit a proposal for controlling movement of the piston rod for approval.] [Provide internal rod supports to prevent the rod from deflecting and damaging the rod and cylinder bore during handling and shipping.] Adequately protect machined surfaces from corrosion and physical damage. Protect equipment delivered and placed in storage from the weather, humidity, temperature variation, dirt and dust, or other contaminants. [Furnish spare cylinders with a portable pump, hose and connections to stroke the cylinder in and out a short distance during storage to lubricate seals and prevent damage.]

1.9 WARRANTY

**************************************************************************
NOTE: Consider adding minimum warranty claim response times based on the criticality of the system. For example, failures resulting in delays to navigation or the inoperability of systems integral to flood protection equipment should require faster response times.
**************************************************************************

Guarantee all equipment for a period of 2 years from the date of acceptance. Guarantee replacement parts for 2 years from date of replacement. Provide warranty against defective materials, design, and workmanship. In cases where the equipment manufacturer's advertised minimum guarantee is in excess of 2 years, it remains in force for its full period. Upon receipt of notice from the Government of failure of any of the parts during the warranty period, provide new replacement parts promptly at no additional cost to the Government.

1.10 QUALITY CONTROL

Establish and maintain quality control for operations to assure compliance with Contract requirements and maintain records of quality control for all materials, fabricated parts, equipment, and construction operations. In addition, establish and maintain surveillance for quality control over sub-contractors, suppliers, or manufacturers. The quality control must include a minimum of two shop inspections during manufacture and assembly of the hydraulic cylinder assemblies power units and manifolds. The quality control includes, but is not limited to, the following:

a. Materials and workmanship.

b. Manufacture and installation of the piping, hydraulic cylinder assemblies power units and manifolds, complete.

c. Cleaning and flushing.

d. Shop assembly and tests.

e. Field erection and tests.
f. Damage and defects.

Submit a copy of these records and tests, as well as the records of corrective action taken, to the Government.

PART 2 PRODUCTS

2.1 MATERIALS AND MECHANICAL EQUIPMENT

**************************************************************************
NOTE: The contents of the following paragraphs are dependent on design requirements which may necessitate revision or expansion to cover different conditions and standards.
**************************************************************************

2.1.1 General

Provide materials and mechanical equipment in accordance with the requirements as indicated or specified, and if not specified, furnish materials and mechanical equipment of the best commercial grade quality suited to the intended use and as approved. All electric motors, hydraulic pumps, hydraulic cylinders, valves and similar items and/or accessories, of the same type and size, to be the products of the same manufacturer, unless otherwise approved. Permanently display the manufacturer's name, address, and catalog number on a nameplate securely attached to each major item of equipment.

Submit data specifications [product manuals] and assembly drawings showing sizes, ratings, parts and material lists, overall dimensions, and mounting dimensions with the product data.

2.1.2 Standard Products

Where items are referred to hereinafter as "similar and equal to" a particular manufacturer's product, such references have been made merely as a convenient method of indicating the type of material or equipment required, with no intention of asserting superiority thereof. The standard product of any reputable manufacturer regularly engaged in the commercial production for at least 2 years prior to this solicitation of the type and quality of material or equipment referred to will not be excluded on the basis of minor differences, provided essential requirements of the specifications relative to materials, capacity, and performance are met. Furnish performance capacities and other pertinent information concerning the manufacturer's "equal to" standard products intended for incorporation in the work. "Equal to" standard products installed or used without such approval are at the risk of subsequent rejection.

2.1.3 Hydraulic Cylinders (Standard Design)

**************************************************************************
NOTE: Use this Alternate 1 when hydraulic cylinders of standard design and manufacture are required and available as standard catalogue items. These are typically tie rod type cylinders and will generally be available as standard catalogue items. Cylinder parts and components are generally standardized.
**************************************************************************
Provide one of the hydraulic cylinder types listed in ISO 5598 as specified or indicated, of tie rod design, [square head standard construction]. Cylinders shall be standard catalogue items with manufacturer supplied measuring system and rod coating systems. The pressure rating of the cylinder is not to be less than the maximum system pressure indicated. Provide evidence that each cylinder was hydrostatically tested by the manufacturer to [ASME BPVC SEC VIII D1 requirements] [200% of working load][150% working load] for the severest service rating and that dynamic seals are suitable for both frequent and infrequent operation and are capable of not less than [manufacturer defined and rated number of operations] [500,000 cycles of operation] in systems properly maintained. Provide the bore, stroke, rod diameter, and mounting style of the cylinder as indicated. Provide the hydraulic cylinder with [adjustable] [nonadjustable] cushions on [the cap end only] [the rod end only] [both ends]. [Cushions to have free reverse flow check valves.] Provide the cylinder with double end rods where indicated and [SAE straight thread O-ring][SAE 4 bolt hydraulic flanges] [_____] piping ports.

2.1.3.1 Cylinder Tubes

Machine the cylinder tube from ASTM A519/A519M, Grade 1018 [or materials meeting ISO standard equivalent as approved], heavy wall seamless steel tubing and hone the bore to a surface finish compatible with the seals being used so as to result in zero net leakage past the seals.

2.1.3.2 Cylinder Heads and Caps

Fabricate the cylinder head and cap from [ASTM A576, Grade 1018, steel bar stock][ASTM A516/A516M, Grade 60 plate][or materials meeting ISO equivalent standards as approved] and machine finish on all surfaces. Equip the cylinder head with a rod seal and external dirt wiper, [ice scraper,] and a rod bushing piloted into the head to ensure concentricity. [Rod bushings to be removable without the use of special tools and without removing the tie rods or cylinder head.] Attach the cylinder tube to the head and cap by tie rods [bolts] having a minimum yield strength of 690 MPa or 100,000 psi. Removable attachments to have the cylinder tube end seals arranged to seal with pressure and be designed to prevent shearing and extrusion and to provide axial metal backup.

2.1.3.3 Pistons

Precision fit the piston to the cylinder body bore. Provide the piston of [fine-grained cast iron][____], designed with suitable method for locking piston to the rod and equipped with [zero net leakage cup-type seals][bronze-filled polytetrafluoroethylene seals with phenolic wear rings][contractor furnished design]. The design will be to protect the piston rings from blow-out and oversqueezing.

2.1.3.4 Piston Rods (Standard Design)

Make of [medium carbon steel with a yield strength of 620 to 690 MPa or 90,000 to 100,000 psi for rods 16 through 100 mm or 5/8 through 4 inches in diameter][620 to 760 MPa or 90,000 to 110,000 psi high tensile strength steel using ASTM A108, Type C 1045, for rods 16 to 63 mm or 5/8 to 2 1/2 inches in diameter, and ASTM A108, Type CR 4140, for rods 75 to 250 mm or 3 to 10 inches in diameter][materials and coatings as recommended by the manufacturer to meet the specified design requirements for operation, strength, durability, corrosivity and operating environment]. [Provide the
rod case hardened to 50-54 Rockwell C, polished to a 0.25 micrometer or 10 microinch Ra surface finish or better, and nickel and hard-chrome plated to 75 micrometer or 0.003 inch minimum thickness. [Provide rod coating system per manufacturer standard design and standard surface finish to meet required corrosivity rating.]

2.1.4 Hydraulic Cylinders (Custom Design by Manufacturer)

**************************************************************************
NOTES: Use this Alternate 2 when the hydraulic cylinders are to be custom designed by the manufacturer specifically for this project in accordance with the design parameters.

Telescopic hydraulic cylinders may be used only for special retrofit applications where regular single or double acting cylinders cannot be used.

Unless the designer needs to make the choices because of unique criteria situations, the selection of materials and configurations should remain as Contractor's options. Mill type cylinders are preferable over tie rod cylinders and should be specified and utilized. Mill type cylinders generally are rated for the higher pressures than the other designs. The cylinder heads generally are mounted with bolts or cap screws.

**************************************************************************

Utilize mill type cylinders. Provide cylinder of [single][double] acting[, telescopic] type designed and manufactured [to be used under water and] to meet the criteria as stated in paragraph "Design Parameters."[ Design cylinders and integrated appurtenances including position sensing systems to be submerged [and operate] under [_____] meters [_____] feet of water for up to [_____] days per year.][ Telescopic cylinders may be either single or double wall as necessary to provide the best operating characteristics.] Provide cylinder measuring systems as approved. Material for the hydraulic cylinder to be a high strength carbon or alloy steel. Stress relief heat treat cylinder tubes which have been welded and [radiograph all welds including those on the end mounts][radiograph designated welds as indicated]. Material for the piston rod to be a high strength [carbon or alloy steel with chrome plating per ASTM B650][stainless steel with chrome plating per ASTM B177/B177M and ASTM B254][manufacturer standard thermal sprayed system with nickel chromium based alloy on stainless steel substrate][laser clad metal alloy on carbon steel or stainless steel substrates][____.][Nickel plate the exterior of the extending rods and tubes on a telescopic cylinder.][The nickel plating to be a minimum of 75 micrometers or 0.003 inch thick and a [high][mid] phosphorous, electroless nickel process designed for corrosion protection.][Fabricate rings, bearings, packing, packing rings, retaining rings, seals, wiper-scrapers, and any other fabricated items from sufficiently qualified materials as recommended and approved to provide net zero leakage. Where a cylinder head is used as a positive-position stop, the stop head to incorporate an adjustable cushion, or an external deceleration control provided to minimize detrimental mechanical impact. [End mounts [for pinned connections] as indicated.][Provide bronze bushings in accordance with ASTM B505/B505M, Alloy [C92200], in the pin holes.][Fabricate connection pins from ASTM A564/A564M, Type 630, Condition H-1150, stainless steel.][Mount the hydraulic cylinder as
indicated.

Drill, tap, and surface ports to receive [SAE Code 61 flanges] in the positions indicated or as otherwise approved. Locate the manifold and pipe supports, as indicated, to be an integral part of the machinery. Provide both ends of all the cylinders with convenient bleed ports. Tap each cylinder port to receive the 7/16-20-SAE bleed valves. Provide diagnostic connectors rated at least 31 MPa 4500 psi and consisting of a stainless steel body with internal ball check and spring, male SAE O-ring connection and protective cap as bleed valves. Integrated position indication systems mounted to the cylinders to be designed for minimal leakage and equipped with a pressureless leakage monitoring port collection system. [Cylinders to have ports on both sides and provisions for mounting piping in either left or right hand configuration so that the cylinders for both positions are interchangeable.]

2.1.5 Hydraulic Cylinders (USACE Custom Design)

**************************************************************************

NOTE: Use this Alternate 3 when the hydraulic cylinders have been designed or by the Corps of Engineers or have specific and unique requirements and they are detailed on the contract drawings. Mill type cylinders to be utilized in accordance with EM 1110-2-2610. Mill type cylinders generally are rated for the higher pressures than the other designs. The cylinder heads generally are mounted with bolts or cap screws. Most main operating systems to be designed for this type of cylinder.

Position sensing systems are a critical feature and are either integral with the cylinder or external to the cylinder and sense either the cylinder or the gate or valve directly. An advantage of a position sensing system connected to the gate (not the cylinder) is the gate position is known if the actuator becomes disconnected or damaged. Systems integral with the cylinder can be provided by the manufacturer and require no external mechanisms or linkages.

Integral systems include the magneto resistive systems. Notches are etched or machined into the base material of the cylinder rod and a surface coating is applied over this. These systems, however, only work with carbon steel rods and non-magnetic coatings. Located in the rod seal gland housing is a sensor, which is positioned to receive signals from the etched or machined notch embedded below the polished surface. Signal pulses are counted and computed to provide an output positioning signal.

Magnetostrictive systems require drilling the cylinder rod from the piston end for a sensor rod. This system provides an absolute indication of position but is limited in stroke because of the length of the unsupported rod in the cylinder when extended.

**************************************************************************
Utilize mill type cylinders. The hydraulic cylinder to be of the [single][double] acting type designed and manufactured [to be used under water and] to meet the criteria stated in paragraph "Design Parameters." [Design cylinders and integrated appurtenances including position sensing systems to be submerged [and operate] under [_____] meters[_____] feet of water for up to [_____] days per year.]

Position indication shall be of the [magnetoresistive type][magnetostrictive type].

The interior of the finished cylinder to be honed to the dimensions, tolerances and finish shown. The finished wall thickness not to be less than that shown. Weld flanges to the cylinder parallel with each other and perpendicular to the cylinder center line. Tolerances are as shown. Stress relief heat treat the cylinder after completion of all welding. [Radiograph all welds including those on the end mounts.][Radiograph designated welds as indicated.] The assembled cylinder to be of such straightness that the piston and rod move smoothly without any indication of binding or tight spots. Surface finishes as indicated. Provide steel cylinder material in accordance with one of the following Options:

a. Option A: Rolled steel plate in accordance with ASTM A516/A516M, Grade 70 or equivalent material as approved, and welded flanges in accordance with ASTM A181/A181M, Class 70 or equivalent material as approved.

b. Option B: Provide centrifugal cast steel shell in accordance with ASTM A216/A216M, Grade WWC or equivalent material as approved, and welded flanges in accordance with ASTM A181/A181M, Class 70 or equivalent material as approved, or cast from ASTM A216/A216M, Grade WWC steel or equivalent material as approved.

c. Option C: The shell and flanges a solid trepanned forging in accordance with ASTM A266/A266M, Class 1 or equivalent material as approved.

2.1.5.1 Piston Rods (USACE Design)

**********************************************************************************************************************

NOTE: Choose one or more options depending on the unique requirements and life-cycle costs of the project. Carbon steel piston rods with chrome plating is noted but should be avoided if possible due to potential corrosion of the piston rod especially in high corrosivity environments.

The designer needs to reference and select the appropriate corrosivity category in Table 1 for the piston rod.

The designer should be aware that cylinder rod ends specified with carbon steel substrates have an increased likelihood of corrosion between the mating surfaces/threads of the cylinder rod and connected components. The cylinder rod ends are typically machined threads for adjustability and are not protected by the specified rod coating system. Standard o-ring type seal designs may not be enough to withstand environmental conditions. Designers should provide provisions in the design to seal,
protect or coat mating surfaces to minimize the chance of seizing and corrosion for future maintenance and serviceability.

Fabricate the piston rods with the type of construction as specified. If the piston rods are composed of two or more pieces, radiograph the welds.

[Carbon steel piston rods with chrome [nickel plus chrome] plating: Fabricate ASTM A108, Type C 1045 or Type CR 4140 or equivalent material as approved. Case harden to 50-54 Rockwell C. The chrome plating thickness to be a minimum of 76 micrometers or 0.003 inch. Plating in accordance with ASTM B177/B177M or ASTM B650 [ASTM B546].]

[Stainless steel piston rods with chrome plating: Fabricate with ASTM A564/A564M or ASTM A705/A705M, Type 630 or Type XM-12 or equivalent material as approved. The chrome plating thickness to be a minimum of 76 micrometers or 0.003 inch. Plating in accordance with ASTM B177/B177M and ASTM B254.]

[Carbon steel piston rods with welded overlay: Fabricate with ASTM A108, Type C 1045 or Type CR 4140 or equivalent material as approved. The coating material to be certified and formulated to consist of a metal alloy to meet corrosivity category and designed and applied by the cylinder manufacturer and submitted for approval. The minimum coating thickness to be [600 micrometers] or [0.0236 inches][400 micrometers][300 micrometers].]

[Carbon steel piston rods with high velocity oxygen fuel (HVOF) coating: Fabricate with ASTM A108, Type C 1045 or Type CR 4140 or equivalent material as approved. Case harden to 50-54 Rockwell C. Apply thermal sprayed coatings with HVOF method and have the applied material composition certified and submitted for approval. HVOF application per ASTM E1920 and ASTM C633 [manufacturer standard application process] and submitted for approval. Applied coating materials to consist of Nickel-Chromium based alloys as approved applied in multiple layers to achieve a total coating thickness greater or equal to [250 micrometers] or [0.0089 inches] for the first layer and not less than [440 micrometers] or [0.0173 inches] for two layers.]

[The final rod surface to have a roughness height of not more than [0.20] micrometers or [8] microinches Ra.]

[Quantify the final rod surface roughness using the Rpk-Rk-Rvk in accordance with ISO 13565. Other parameters such as Ra, Rz or Rmax value can only be used indicative. Roughness to be determined by Cylinder manufacturer and Seal manufacturer for the intended cylinder operating environment as specified.]

Submit certified test reports for both the rod material and performance requirements as specified.

All rod coatings to meet or exceed the minimum test criterion as stated in the following tables (Tables 2,3,4).

**************************************************************************
NOTE: ASTM G48 testing is not a suitable test for porous coatings, e.g. hard chromium, thermal sprayed.

2.1.5.2 Pistons

Provide in cast iron in accordance with ASTM A536, Grade 80-55-06 or 10-50-05 or equivalent material as approved.

**************************************************************************

NOTE: The designer may allow the cylinder manufacturer to recommend and provide the seals, o-rings and bearing materials per their recommendations and coordination with the seal, o-ring and bearing suppliers and compatibility requirements for the selected hydraulic fluids or the designer may specify the requirements of the seals, o-rings and bearing materials using the tables below

**************************************************************************

2.1.5.3 Seals, O-rings and Bearing Materials

Design and provide seals, O-rings, and bearing materials to be compatible with the specified hydraulic fluid. Each material in use with the hydraulic cylinder to be tested to verify the chemical resistance and hydraulic fluid compatibility. Conduct testing in accordance with ISO 1817 to measure changes in hardness, tensile strength, and elongation to satisfy the requirements of [the cylinder and seal manufacturers][Table 5][Table 6]. Submit for Government approval seals, O-rings and bearing materials.

[Table 5: Allowable deviations in seal material properties after ISO 1817 testing.]

2.1.5.3.1 Piston Wear Rings

Provide [composite] [cast iron] piston wear rings with a compressive and tensile strength of not less than 165 MPa or 24,000 psi and an embedability capability to prevent scoring of the cylinder.

2.1.5.3.2 O-Ring Seals

Use O-ring seals of [Buna N][Viton] and designed for [____] kPa psi service.

2.1.5.3.3 Rod Wiper/Scraper

**************************************************************************
NOTE: Use option for metal scraper ring for environment subject to ice or other materials adhering to the rod.
**************************************************************************

Provide a [high-strength polyurethane scraper ring][spring reinforced brass scraper ring] which will withstand the impact and the abrasion of materials adhering to the piston rod and have a minimum tear resistance of 120 N/mm or 685.2 pounds per inch. Split and retain the scrapers with split, bolted retainer to facilitate replacement without removal of the rod end clevis.
2.1.5.3.4 [Piston and] Piston Rod Seals

Provide low leakage V-ring, nonadjustable gland type [piston and] piston rod seals, designed for [_____] kPa[_____] psi service. [Provide bronze-filled polytetrafluoroethylene piston seals.]

2.1.5.4 Rod Seal Gland and Locking Device Flange

Fabricate the rod seal gland and locking device flange from bronze in accordance with ASTM B505/B505M, Alloy No. C95400 or C93200. The ice scraper, attached to the gland, bronze-filled polytetrafluoroethylene in accordance with ASTM B584, Alloy No. C86300.

**************************************************************************
NOTE: The designer should work with the cylinder manufacturer to determine if a mechanical cylinder rod locking device can be provided for gate lifting applications. These are mechanical locking devices as opposed to valves in the hydraulic circuit for holding the load in place. These should be designed by the cylinder manufacturer and submitted for approval.
**************************************************************************

2.1.5.5 [Hoist Locking Device]

Fabricate the hoist locking device from stainless steel in accordance with ASTM A564/A564M or ASTM A705/A705M, Type 630 or XM-12, Condition H-1150.

2.1.6 Hydraulic Power Unit

Provide a self-contained hydraulic power unit. Design the packaged unit to operate the hydraulic cylinders in accordance with the criteria stated in paragraph "Design Parameters." Design the power unit to meet the space limitations shown and configure essentially as indicated. The structure of the unit both internally and externally will be adequate for the unit to be free standing and capable of being lifted or moved without structural damage. Securely attach all components including piping, motors, pumps, and manifolds to the power unit in a manner to be free of damaging vibration during operation. Design and provide each unit with forklift tubes and lifting eyes to facilitate lifting or moving the unit, including the reservoir when full of oil.

2.1.7 Oil Reservoirs

**************************************************************************
NOTE: Remove requirement for painting if reservoir is to be stainless steel. The design and sizing of the hydraulic reservoir is a critical feature. The designer should utilize EM 1110-2-2610 for sizing the reservoir or allow the manufacturer to determine the final size.
**************************************************************************

Size the oil reservoir [as indicated] [to meet the space limitations indicated] [in accordance with the manufacturer requirements as approved]. Fabricate the reservoir of [steel] [stainless steel] with welded joints and conform to the requirements as shown. Fabricate the reservoirs in accordance with ISO 4413. Provide a bolt-on mounting base along side of
the reservoir which supports the motor-driven hydraulic pumps, associated valves and accessories for design loads and speeds. The bottom of the reservoir to have a minimum clearance from the floor of not less than 0.3 m or 12 inches. Shape and slope the reservoir bottom to facilitate emptying and cleaning. A foot valve or check suction lines to provide flooded inlets to the pumps. Provide each side of the reservoir with a cleanout opening of not less than 0.26 square meters or 400 square inches clearance with a bolted, gasketed cover. Provide each reservoir with a drain with shut-off valve; a magnetic trap; low oil float level switches; and other appurtenances as indicated and as specified herein. Equip the reservoir with a fluid level indicator and filler with built-in strainer. Provide a baffle between the intake and return lines to facilitate the separation of air and foreign matter from the hydraulic fluid. The connection between the two chambers of the reservoir to connect high enough from the bottom to form a settling chamber. Bring both the intake and return pipes down to a distance of 1-1/2 pipe diameters above the tank bottom. Clean interior surfaces of the reservoir down to bright metal and coated with an epoxy-based urethane finish or an approved alternate that is compatible with oil and water. Finish the welded joints of the reservoir smooth and free from irregularities. Do not grind welds to an extent that weakens the reservoir. Until final installation of the hydraulic equipment, seal all openings with plastic closures. The capacity of each reservoir not to be less than [__] liters [_____] gallons. Anchor the reservoirs to the concrete by suitable anchor bolts. Furnish all piping, fittings, hose, manifold blocks, fasteners and appurtenances required to connect equipment to the reservoir. After painting, insulate the exterior of the reservoir with a polystyrene, polyurethane, or foamglass type insulation. The insulation to be compatible with oil and not retain moisture. The insulation thickness to be 50 mm or 2 inches on all surfaces other than the top.]

2.1.7.1 Reservoir Heater

******************************************************************************
NOTE: Proper selection of the hydraulic fluid may eliminate the need for a reservoir heater.
******************************************************************************

Provide the reservoir with one or more screw plug type immersion heaters with a watt density not to exceed 17 kW/square meter or 11 watts per square inch and a [built-in][remote] thermostat set to maintain the hydraulic oil at 5 degrees C or 40 degrees F. Fabricate the heater sheath and screw plug from stainless steel. Total heating output to be [___] watts] at [_____] volts AC. Supply the heater with a watertight, stainless steel, NEMA 4X terminal housing as a minimum. Provide a weatherproof junction box with a single phase, [120][___] volt, control transformer for the thermostat and high temperature circuit. Install the heater in a location on the reservoir vessel to maintain complete submergence of the heating element during all operating level fluctuations within the reservoir.

2.1.7.1.1 Heater Switch

Provide a thermostat to sense the oil temperature in the tank and close its contacts when the temperature drops below [10] [_____] degrees C [50] [_____] degrees F as indicated. Provide a bulb and capillary type thermostat and provided with a protective well which extends into the tank. The temperature adjustment range to be 10 degrees to 38 degrees C or 50 degrees to 100 degrees F with plus or minus 1 degree C or 2 degrees F.
differential switch. Fit the switch with an external calibrated adjustment knob. The thermostat to be rated for 15 amperes at 120 volts. Provide weatherproof junction box.

2.1.7.1.2 High Temperature Switch

Provide a thermostat to sense the oil temperature in the tank and close its contacts when the temperature exceeds $50^\circ C$ $[122]^\circ F$ as indicated. The thermostat to be of the bulb and capillary type and provided with a protective well which extends into the tank. The temperature adjustment range to be $10$ to $149^\circ C$ or $50$ to $300^\circ F$ with $\pm 1^\circ C$ or plus or minus $2^\circ F$ differential switch. Fit the switch with an external calibrated adjustment knob. The thermostat to be rated for 15 amperes at 120 volts. Provide weatherproof junction box.

2.1.7.2 Magnetic Separators

Provide the manufacturer’s standard magnetic separator in the reservoir. The magnetic separator consists of a high-strength permanent magnet arranged for rigid mounting with the poles of the magnet exposed to the fluid in the reservoir. The magnet to be [combined in the construction of the fill strainer] mounted on a removable rod assembly installed through the top of the reservoir] [incorporated in the bottom drain plug]. [The drain plug type installation to incorporate an automatic valve arranged to permit removal of the magnetic separator for inspection without loss of fluid from the reservoir.] [The drain plug type installation to include provisions for automatic chip detection without removal of the plug.]

2.1.7.3 Low Level Float Switches

Provide each power unit with two float switches. Provide flanged switches and install inside a 125 mm or 5-inch nominal diameter pipe to eliminate surge effects. The thermostat mercury type switches to have a narrow differential and be rated for 13 amperes at 120 volts. Set switches to close when oil level rises above or drops below those recommended by the manufacturer and observed during operational tests. Provide a NEMA 4X junction box.

**************************************************************************
NOTE: If a flow meter is necessary, the designer should select an electronic flow meter or visual flow meter. The detailed design should be provided by the hydraulic power system manufacturer and fabricator.
**************************************************************************

2.1.7.4 Electronic Flow Meter

The flow meter to accurately measure the volumetric flow rate of fluids in the hydraulic system. The unit to be capable of directly measuring flow and constructed to be compatible with the hydraulic operating system. Convert the flow rate into a 4 to 20 mA signal. The mounting to be in-line with threaded connections and the unit capable of measuring flow rates up to $4.7 L/s$ $[75] gpm$ with an accuracy of less than or equal to 2 percent of the measured value.
2.1.7.5 Visual Flow Meter

Provide an in-line flow meter with a spring loaded variable area annular orifice metering disk for measuring hydraulic fluid flow with a minimum pressure rating of 21 MPa or 3000 psi. Provide visual indication of the flow rate in the range of [0.32 to 3.2 L/s] [_____] [5 to 50 gpm] [_____] The viewing window to be graduated to the flow range and of sealed glass construction.

2.1.7.6 Air Breather

**************************************************************************
NOTE: Where space allows, flexible reservoir breathers are the preferred method of preventing or controlling the introduction of outside air into the reservoir. Delete either of two paragraphs which are not needed.
**************************************************************************

Provide the reservoir with an air breather which removes dirt and moisture from the incoming air. The incoming air to first pass through a desiccant bed to remove the moisture, and then pass through a filter to eliminate the solid contaminants before entering the reservoir. Outgoing air to pass directly to the atmosphere through a check valve. The breather to also provide visual indication of the desiccant and filter condition.

2.1.7.7 Flexible Reservoir Breathers

Provide each hydraulic power unit with flexible reservoir breather units to eliminate the introduction of outside air into the reservoir during normal operation of the system and to accommodate expansion and contraction of the air inside the reservoir. The breather units to be of sufficient capacity to accommodate the differential volume of the reservoir. The flexible reservoir breathers to have a bladder compatible with the system hydraulic fluid. Equip the reservoir breathers with pressure vacuum breakers. The shell to be free standing and of rugged construction made of steel, fiberglass or other material as approved. Construct and mount the breather in a manner to facilitate bladder replacement. Provide piping to the breather with adequate pipe unions and screwed fittings to facilitate repair or replacement of the vent bladder. Install, securely attach and support the units as shown on the hydraulic power unit.

2.1.7.7.1 Pressure Relief and Emergency Venting

Provide a pressure relief system consisting of inline check valves and breathers in the breather piping, as indicated, to prevent collapse or "oil canning" of the tank. The check valve in-line with the breather to be removable to permit venting the reservoir during setup. Direct the air in the tank to the flexible breather during normal operations. The breathers to be of the threaded type with steel shell and nylon strainer and guard and rated for [127][_____] cubic meters per hour [75][_____] cubic foot per minute. The inline free flow check valves to be the threaded type with a 13.8 kPa or 2 psi cracking pressure.

2.1.7.8 Oil Level Gauge

Provide an oil level gauge with an indicating length of not less than 300 mm 12 inches on each unit and position to give a visual indication of the oil level in the tank including the "low level", "add oil", "nor. min. level", 
and "max. level" marks. After the system is operational and all tests complete, permanently mark the levels on the tank in a manner approved by the Contracting Officer.

2.1.8 Pumps

**************************************************************************

NOTE: Only use the submerged pump option where space is restricted so that the pump cannot be mounted on the exterior of the reservoir with the pump suction flooded.

If the designer elects to select the particular type of pump to be used, consider the following factors: displacement, pressure rating, prime-mover speed, rated pump life, initial cost, mountings available, serviceability, porting connections, availability, compatibility, product history, efficiencies, and size and weight. Fixed displacement pumps are usually lower in cost, on a component basis. However, weigh the lower initial cost of the pump against the cost of the control components needed to make the system work. Variable displacement pumps, conversely, are generally higher in cost, but less control equipment may be needed to achieve the same result. The reduced control costs may more than offset the higher initial pump cost. As a general rule, gear pumps are usually least costly, vane pumps intermediate, and piston pumps most costly. However, on the basis of cost per watt (horsepower), there is no clear-cut rule. Evaluate each application individually.

**************************************************************************

Provide [submersible,] electric motor-driven, [variable] [fixed] displacement, [gear] [vane] [piston] type pump[s] for the hydraulic system [with constant wattage horsepower control to regulate flow rate and pressure] [rated to deliver a nominal [_____] L/s at [_____] kPa [_____] gpm at [_____] psi] while operating with the specified oil in the specified temperature range. Maximum rotating speed will be 1800 rpm. Safety guard exposed rotating parts. Mount the pumps [in] [on] the reservoir in a manner similar to that indicated so that the pump suction is flooded. Operate the pumps on [_____] volts, 60 Hz, three phase power. The pumps to be rated for continuous operation at a discharge pressure equal to or greater than the system design pressure. The rated discharge capacity of each pump not to be less than indicated when the pump is operated at the design input speed and discharge pressure.

2.1.8.1 Gear Pumps

Provide [fixed] [variable] [or] [_____] type gear pumps. Covers and center section to be [high strength aluminum alloy die castings] [steel] [cast iron]. Thrust and wear plates of [heavy-duty bronze coated steel] [bronze] [or] [______]. Use manufacturer's [standard] [or] [_____] shaft seals for rotary pumps. Seals and wear plates and other wearing parts to be replaceable and suitable for the application, duty, and temperatures involved.
2.1.8.2 Vane Pumps

2.1.8.2.1 Fixed Displacement Vane Pumps

Provide hydraulically balanced types with housing of [high tensile strength ductile iron] [cast iron] [____], vanes of [heat treated high-speed tool steel] [____], and shaft and rotor of [case hardened steel] [____]. Shaft to ride in bearings at both ends. Cam ring of [high carbon chromium steel] [____]. Provide double vane pumps when indicated. Use [Buna N] [fluoroelastomer] [____] seals.

2.1.8.2.2 Variable Displacement Vane Pumps

Incorporate means for varying the pump displacement from zero to the maximum rated quantity while the pump is operating against the system pressure indicated. Materials as specified for fixed vane pumps. Arrange pumps for adjustment of discharge volume by [mechanical] [electric] [hydro] [pneumatic] means. Control the pump displacement by [integral automatic pressure compensation] [adjustment screw] control. Provide the pump casing with a tapped outlet for connection of an external drain line. Pump ports to be [NPT] [tapped NPTF] [tapped for straight pipe threads] [drilled and faced for flange connections] [socket weld].

2.1.8.3 Piston Pumps

Provide [cylinder block in-line type which reverses flow direction and controls flow rate by means of external valve bank] [axial fixed] [axial variable] [or] [____] piston pumps. [Axial variable type to be capable of providing reversed flow with constant direction of input shaft rotation.] [Axial variable type to be suitable for control of displacement [and direction of flow] by [manual] [mechanical] [hydraulic] [electric] [pneumatic] devices.] [Provide manually adjustable maximum and minimum limits of displacement in each direction of flow.]

2.1.9 Accumulators

Provide bladder type suitable for charging with nitrogen. [Provide the indicated number of accumulators with the fluid capacity not less than [____] [L] [gallons]]. [Provide a tee with a [____]L gallon accumulator in the pressure line at each cylinder.] Design the accumulators in accordance with ASME BPVC SEC VIII D1 for a rated working pressure of not less than [____] kPa psi. [Accumulators should be stamped and certified per ASME standards.] Equip accumulators with a safety device to release excessive pressure before the burst pressure is reached. Arrange accumulators so that pressures can be checked and bladders can be easily changed without the removal of other components. Provide a ball type shutoff valve for each accumulator.

2.1.10 Filters

**************************************************************************
NOTE: Use duplex filters only if continuous operation is necessary without shutting down the system for replacement of the filter element.

To ensure maximum reliability of the system and reduce repairs to or replacement of the system components, specify the filtration level for the system by the Beta ratio, the ratio of the number of
particles in a certain size range upstream of the filter to the number of particles in that size range downstream of the filter. This will however increase initial costs and filter maintenance.

Locate the filter[s] in the return line to the reservoir [and in the pump discharge line] [in the indicated location]. Provide the [spin-on type with a bypass and an indicator to show the condition of the filter element] [duplex type with a differential pressure device to indicate the need for filter element service]. Provide filter housing and cover of steel or cast iron construction. Bolt the cover to the main housing. Locate filters so that they can be changed without removal of hydraulic system components. Shutoff valves to be easily accessible. Equip the filter with a relief valve which protects the filter against excessive pressures. Equip the filter unit with a gauge or gauges indicating the pressure loss or a cartridge replacement indicator. Equip the filter unit with a pressure switch to signal excessive pressure loss across the filter. Each filter to have a minimum capacity of [_____] L/s [_____] gpm at a pressure drop not exceeding 69 kPa or 10 psi when filtering hydraulic fluid having a viscosity of 389 SSU at 38 degrees C or 100 degrees F. The filter cartridges will not remove additives from the hydraulic fluid. [The filter element to have a rating of [_____] µm absolute [10 µm absolute unless a smaller mesh is recommended by the manufacturer of the component with the highest cleanliness requirement]]. [The filter element to have a minimum silt control rating as approved and Beta rating of 200 [ ] at 400 kPa or 60 psi differential pressure in accordance with [ISO 16889].] The filter to be rated for use with hydraulic oil and the pressure drop not to exceed 40 kPa or 6 psi in the clean condition. [The return filter to be pressure rated for 1400 kPa or 200 psi and a flow rate of [_____] L/s gpm.] [The discharge line filter to be pressure rated for [_____] kPa psi and a flow rate of [_____] L/s gpm.] [Determine the pressure and flow rating of the filters to be compatible with the design of the power units.]

2.1.11 Gauges

2.1.11.1 Pressure Gauges

NOTE: Panel mounted pressure gauges and other sensors and or valves connected to the manifolds are recommended to avoid loose connections or items that can be bumped or disturbed. Avoid stem mountings.

Provide in accordance with ASME B40.100, with a black enameled metal case, a 115 mm or 4-1/2 inch dial, and a stainless steel Bourdon tube. The scale range of the gauge to be approximately 150 percent of the maximum pressure of the line in which installed. Provide safety type gauges with solid fronts and blowout backs. Provide each gauge with a pressure snubber. [Mount gauge as indicated.] [Panel mount the pressure gauges and make them readable from the front of the power unit after opening the doors of the enclosure.] Provide bottom tap gauges and gauge lines in horizontal pressure lines.

2.1.11.2 Thermometer

Provide a direct indicating thermometer to indicate fluid temperature in the reservoir. Do not use Mercury in thermometers. [Provide a bimetallic
thermometer [mounted directly on the reservoir] [and panel mounted as for the pressure gauges].} [Provide a remote reading, capillary tube-and-bulb type thermometer, panel mounted.] Provide a minimum 75 mm or 3 inch dial with black markings on a white background, with scale range of minus 5 to plus 115 degrees C or 20 to 240 degrees F. Provide a corrosion resistant case and stem, and stainless steel wetted components. Provide thermometer wells of the separable socket type for each thermometer with a direct type bulb.

2.1.12 Manifolds

Provide pre-drilled manifold blocks for connection of control valve assemblies. Construct each manifold block of ductile iron, ASTM A536 or equal. Machine ports and passages smooth and free of burrs and sharp edges. Arrange manifold block interconnecting passages and valving so as to provide the system connections and functions as indicated. Manifold block interconnecting passages and valving to be of ample proportions to minimize internal pressure losses. Machine surfaces and recesses where valving and other components are installed to the specifications of the applicable valve or component manufacturer. Make provisions for attaching the hydraulic piping to the manifolds by the use of flanges as specified in paragraph "Pipe Fittings" and as indicated. The manifold in accordance with the valve manufacturers' recommendations to provide for installation of valves, flanges, and accessories. Make hydraulic interconnections between the manifold and piping with 4 bolt flanges. Design the manifold for a minimum pressure rating of not less than [_____] kPa [_____] psi at 66 degrees C or 150 degrees F except as specified. [Locate components on the manifold in positions as indicated. All components as specified by their model numbers and mounted to the manifold in accordance with mounting details indicated and in the manufacturer's catalogues.] [Supply manifolds with manifold enclosures rated for submergence to [_____] m [_____] feet.] [The manifolds and all attached valves, equipment, and electrical devices to be rated for submergence to [_____] m [_____] feet.] [Provide test ports as shown on the schematics and fitted with diagnostic connectors with stainless steel quick coupling nipple and accessory stainless steel metal dust cap.]

2.1.13 Valves

Provide a minimum pressure rating of [_____] kPa psi unless stated otherwise. Where possible, manifold mount valves. Manifold mounted valves to be either cartridge type or subplate mounted. Provide socket-welded piping connections on non-manifold mounted valves 25mm or 1-inch or larger. Provide valves less than 25 mm or 1 inch with SAE straight thread ends and [Buna N] [Viton] O-rings with tube fittings. Valves to be specifically designed and rated for hydraulic system applications.

2.1.13.1 Shut-Off Valves

Provide in-line mounted, stainless steel, lever operated, ball type. Shut-off valves at piping manifolds of each cylinder at the upstream and downstream locations for the main supply and return lines to be [_____] mm [_____]-inch line size, rated for a working pressure of [21][_____] MPa [3000][_____] psi, with socket-welded ends, double acting ball type. Shut-off valves for all other lines to be ball type, match the line size, and have a maximum allowable working pressure of [21][_____] MPa [3000][_____] psi. The valve ends to have socket-weld pipe connections and drilled to receive SAE Code [61][_____] flanges. Provide a removable operating lever for each valve. Valves to be specifically designed and
rated for hydraulic system applications. Provide with stainless steel valve trim including handles. The valves to have replaceable seats and be repairable without disturbing the welded connections.

2.1.13.2 Needle Valves

Supply needle valves of stainless steel construction and designed for fine flow regulation. Use [Buna N] [Viton] stem sealing O-rings.

2.1.13.3 Manual Control Valves

2.1.13.3.1 Flow

Flow control valves to be [subplate mounted for socket-welded piping] [line mounted] [manifold mounted cartridge valves]. The valves to be pressure-compensating, free flowing in one direction, and adjustable. The valves to be capable of being locked in position to prevent an unintentional adjustment. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].[*]

2.1.13.3.2 Manual Four-Way Directional Control Valves

The rotary shear seal type, open or closed center, and detent or spring centered as indicated. The valve to be three position, [subplate mounted with socket-welded piping connections] [line mounted]. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].[*]

2.1.13.4 Solenoid Operated Control Valves

Solenoids to be rated for continuous operation without damage or malfunction. Solenoids to operate the valves within a 10 percent fluctuation range. All moving parts and windings of the solenoids to be totally enclosed to prevent entrance of dirt and moisture. Pilot fluid supply to be internally supplied and externally drained from the power circuit. Vent both end cap chambers as necessary to achieve spring centering. [Equip the valve with manual [push detent][lever] weather protected overrides.]

2.1.13.4.1 Pilot-Operated, Solenoid-Controlled Four-Way Directional

Pilot-operated, solenoid-controlled four-way directional control valves to be [two][three] position and [open][closed] centered as indicated. Provide pilot operated valves with [a single] [two] solenoid[s], subplate mounted with [socket-welded piping] [tubing] connections. The valve's amplifier to be of the same manufacturer as the throttle valve. Provide a power supply for the valve and amplifier with an input of 120 volts AC. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].

2.1.13.4.2 Solenoid Operated Proportional Throttle Valve

Hydraulically control the rate of oil flow into the manifold by an electrohydraulic proportional throttle valve with electrical feedback setting. The throttle valve's amplifier to be of the same manufacturer as the throttle valve. Provide a power supply for the throttle valve and
amplifier with an input of 120 volts AC. The flow rating to be [a minimum of [_____] L/s gpm] determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters].

2.1.13.5 Pressure Relief Valves

Provide adjustable pressure relief valves with a body designed for a set pressure of [_____] kPa psi. Relief pressure to be adjustable between [_____] kPa psi and [_____] kPa psi. [The valve to have the capacity to pass [_____] L/s gpm.][Determine the flow capacity in accordance with the design criteria stated in paragraph "Design Parameters]." Provide balanced piston type relief valves. Valve bodies to be of close grain alloy cast iron, cast steel or forged steel. Valve pistons to be hardened, alloy steel. Finish grind valve pistons to provide an interchangeable fit. Valve springs to be alloy steel or music wire. All relief valves to be field adjustable within the specified relief pressure adjustment range with a [key-lockable] adjustment handle. Final factory settings as indicated, unless otherwise approved in writing by the Contracting Officer. [Provide manifold mounted type valves.]

2.1.13.6 Unloading Valves

******************************************************************************
NOTE: Unloading valves provide free passage through a low pressure area when a signal is applied to a pilot connection. An unloading valve is normally located in the pump discharge line so that the pump can unload to the tank at a preset pressure. In a typical application, unloading valves may be arranged to accept a signal from an accumulator. At a predetermined pressure value, when the accumulator is charged to the preferred level, the pump unloads to the tank.
******************************************************************************

Provide adjustable unloading valves designed for [_____] kPa psi service. Set the pressure as shown and determine the flow capacity so that the valve operates without cavitating.

2.1.13.7 Supply Spring Loaded Check Valves

Provide supply spring loaded check valves of stainless steel construction, the ball or poppet type with a body designed for high shock and [_____] kPa psi service.

2.1.13.8 Return Spring Loaded Check Valves

Construct the return spring loaded check valves of stainless steel, the ball or poppet type with a body designed for [_____] kPa psi service. Cracking pressure to be [_____] kPa psi.

2.1.13.9 Bleeder Valves

Provide 6 mm or 1/4 inch, stainless steel construction, wrench operated bleeder valves.

2.1.13.10 Pressure Snubbers

Provide stainless steel pressure snubbers for all pressure gauges and
pressure switches to protect against shock and provide more stable instrument operation.

2.1.13.11 Counterbalance Valve

**************************************************************************

NOTE: For hydraulic cylinders with attached flexible hoses, a counterbalance valve should be installed directly on the cylinder so that the lower hose is not subjected to a static load.
**************************************************************************

Install in the oil line to the bottom side of the hoist piston as indicated to balance the load being held by the cylinder. The valve to be directly operated, internally drained, and adjustable for operating over a pressure range of [_____] to [_____] kPa psi. Design the valve for a system operating pressure of [_____] kPa psi. Provide the valve capacity rating of not less than [_____] L/s gpm. Permit unrestrained flow to the underside of the hoist piston and retain pressure in the hoist cylinder in the amount of the valve's pressure adjustment. [Each valve to be remote pilot operated with a check valve.] [Each valve to have an adjustable flow control valve in the pilot pressure line.] The counterbalance valve to be factory set in accordance with the settings as indicated.

2.1.14 Piping

**************************************************************************

NOTE: Tubing is recommended for indoor and or protected environments where damage due to flooding, ice, debris, vibration or personnel traffic is not likely to occur. Use caution when specifying tubing applications in larger diameters as the available working pressures of the tubing may be lower than anticipated operating pressures of the hydraulic system.

Recommend providing an Engineering Consideration for In Field Personnel to have QA performed on the installation, assembly and testing of any threaded piping connections specified to ensure a leak free design.

**************************************************************************

Design piping, tubing, and hose for a working pressure of [_____] kPa psi. [Use pipe when a 25 mm or 1 inch or larger diameter is required. Use tubing when less than 25 mm or 1 inch diameter is required.] [Provide external cylinder piping as indicated.] Weld pipe as indicated. Provide power piping equal or exceeding the requirements of ASME B31.1, and subsequent addenda unless otherwise specified or indicated.

2.1.14.1 Pipe

Use seamless [steel conforming to in accordance with ASTM A106/A106M, Grade B] [stainless steel in accordance with ASME B36.19M and ASTM A312/A312M, Grade TP304]. Supply carbon steel pipe in the pickled and oiled condition. The piping weight class to be Schedule 80 [_40_].
2.1.14.2 Pipe Fittings

Use socket welding type pipe fittings in accordance with ASME B16.11 and made of [steel in accordance with ASTM A234/A234M, Grade WPB] [stainless steel in accordance with ASTM A182/A182M, Grade F304]. Provide pressure class [_____] kg pounds. Flanges in accordance with ASTM A182/A182M with the grade suitable for the pipe to which attached. Also conform threaded fittings to the above, but use only where absolutely necessary for the application.

2.1.14.3 Pipe and Tube Hangers and Supports

Locate all pipe support devices at intervals no greater than 2 m or 6 feet between centerlines of adjacent supports, except as modified as specified. Install support devices on both sides of a bend within four nominal pipe or tube diameters of the bend location. Furnish all supports, hangers, sleeves and brackets complete with compatible mounting hardware and appurtenances. Conventional pipe hangers and support in accordance with MSS SP-58 type as required. Provide stainless steel pipe supports and hangers. Provide special hangers and anchors as indicated. Construct tube supports of stainless steel hardware with polypropylene support halves. Provide each tube support with all mounting hardware required to connect with the appropriate anchorage system.

2.1.14.4 Sleeves and Wall Brackets

Fabricate sleeves and wall brackets of stainless steel as indicated.

2.1.14.5 Pipe Penetration Seals

Provide modular mechanical type pipe penetration seals, consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and opening. Assemble links to form a continuous rubber belt around the pipe with a pressure plate under each bolthead and nut. Tightening of the bolts to cause the rubber sealing elements to expand and provide a watertight seal.

2.1.14.6 Unions

Provide O-ring type unions, made of stainless steel with socket-welding ends. The Contractor may, as an option, substitute four bolt split flanges with [Buna N] [Viton] O-rings for the unions.

2.1.14.7 Hydraulic Tubing

Stainless steel tubing used for hydraulic circuits in accordance with ASTM A269/A269M for Grade TP 304, Seamless. Select the wall thickness to provide a safety factor of 6 based on the manufacturer's ratings for burst strength in relation to the maximum working pressure.

2.1.14.8 Tube Fittings

Provide flareless type with SAE straight threads and [Buna N] [Viton] O-ring seals. Each fitting to hold the tubing with a chucking action and to provide a firm flat grip on the tubing without penetration of the tubing wall. Fittings not to twist the tubing during assembly. Provide a leak-proof seal at the rated working pressure of the tubing. Each fitting connection to be capable of no less than 30 connect - disconnect - reconnect cycles without galling, leakage or any other damage. Provide all
tube fittings without special adaptors or custom-designed assemblies. Provide Type 304 stainless steel fittings and in accordance with SAE J514.

2.1.14.9 Hose

**************************************************************************
NOTE: Carbon steel hose fittings can be evaluated by the designer for use depending on the application. Any applications that are submerged should utilize stainless steel fittings.
**************************************************************************

All flexible hoses to have an inside diameter to match the line size to which it is to be connected to. A minimum working pressure of the hose to be rated not lower than the system operating pressure indicated with a factor of safety of 4. Provide hose in accordance with SAE J517, 100R9. The hose used for general industrial use in hydraulic systems provided with petroleum base hydraulic fluids. Provide a synthetic rubber tube with four spiral wire reinforcements and a synthetic rubber cover. Each end of the hose to have a straight split stainless steel flange fitting in accordance with SAE J518-1, Code [61]_[__]. Design fittings specifically for use with the hose selected and as recommended by the hose manufacturer. Install the fittings using the internal skive crimp method. Make fittings of [stainless steel][carbon steel] and of the reusable type. Fit the hose with a nylon sleeve to protect and prevent abrasion of the hose cover. Maintain minimum bending radii. Install hoses with uniform and neat routing such that they are not-overlaying one another and are without kinks, sharp bends, binding, or rubbing throughout the entire motion of the hydraulic actuator. Protect the finished surfaces prior to installation of the flanges.

2.1.15 Bolts, Nuts, and Washers

2.1.15.1 Carbon Steel Bolts and Nuts

Provide in accordance with ASTM A354, Grade BC, with ASTM A194/A194M, Grade 2H nuts. Make structural bolted connections carrying primary loads with ASTM F3125/F3125M, Grade [325][490] bolts.

2.1.15.2 Stainless Steel Bolts and Nuts

Provide in accordance with ASTM A193/A193M, Grade B8, with ASTM A194/A194M, Grade 8 nuts.

2.1.15.3 Flat Washers

Provide in accordance with ASTM F844.

2.1.16 Hydraulic Fluid (Petroleum Based)

**************************************************************************
NOTE: Specify the hydraulic fluid by brand name only if it is necessary for the fluid to be compatible with the fluid in an existing hydraulic system.
**************************************************************************

Mineral oil hydraulic fluids are the most common within USACE and will work for a majority of applications. They are refined with the addition of
additives, which range from anti-wear (AW), rust and oxidation inhibitors (RO), anti-foaming, and viscosity index (VI) improvers. These fluids offer a lower cost alternative to synthetics and can be very comparable in performance when certain additive packages are included.

Viscosity should be determined by the pump type. ISO Grade 32 and 46 and 68 are the most common. Not having the correct viscosity for the application will dramatically reduce the average life of the pump and system, thereby directly reducing its reliability and production. When selecting the appropriate viscosity grade, look for the optimum viscosity required by the pump. This can be determined by collecting data from the pump original equipment manufacturer, actual operating temperature of the pump, and the lubricant properties referenced to the ISO grading system at 40 and 100 °C (104 and 212 °F).

NOTE: A minimum requirement of the Kinematic Viscosity at 40°C = 22 mm²/s (1 mm²/s = 1 cSt = 0.01 St). Lower values, for example 15 mm²/s at 40°C, can be allowed but special seals (similar to low friction seals) are advised. Chevron seals or U-cup seals at 15 mm²/s at 40°C can give friction problems and high wear. Of course, this is also depending on the viscosity index. The absolute minimum viscosity at maximum operation temperature should be no lower than 10 mm²/s.

The designer needs to carefully consider any applications of EA hydraulic fluid to insure proper system performance. Types of EA fluids generally considered to have acceptable properties in the variety of conditions found on civil works projects include synthetic esters and polyglycols (PAG's). Biobased fluids can also be considered, depending on the application, but the designer needs to carefully consider their performance. Some polyalphaolefins (PAOs) can also be considered EA fluids. Grade of filter to introduce hydraulic into the system through depends on the final target cleanliness of the system and the cleanliness requirements of individual components.

 Use the hydraulic fluid during shop testing, [to fill the cylinders before shipment,] flush the system after installation, and to fill the complete hydraulic system to be [[___] Petroleum Corporation's [___] hydraulic oil which has a high viscosity index, low pour point, and antifoam properties,] [an all-weather type hydraulic oil which has a high viscosity index, low pour point, rust and oxidation inhibitors, and antifoam properties]. The oil to have an ISO viscosity grade of [___] and a pour point of minus [___] degrees C degrees F. [Formulate the oil to separate quickly from water to prevent formation of emulsions.] [Provide hydraulic fluid certified by the manufacturer as fire resistant in accordance with NFLPA T2.13.1.] Filter fresh hydraulic fluid through a 10 µm filter before
it is added to the system. Introduce clean and fresh hydraulic fluid [5] µm filter before it is added to the system. Provide letters of assurance from the hose, pump, valve, and cylinder manufacturers that the oil provided is satisfactory for use in their equipment in this application. Supply all oil and furnish two [210] L containers to the Government for a reserve supply.

2.1.17 Hydraulic Fluid (Environmentally Acceptable)

**************************************************************************

NOTE: The designer should reference EM 1110-2-1424 for further discussion on EA hydraulic fluid. ISO 15380 identifies four categories of biodegradable hydraulic oil: These four categories of EA hydraulic fluids include:

* Synthetic Esters (SE) - ISO Classification HEES
* Polyglycols (particularly Polyalkylene Glycols (PAG)) - ISO Classification HEPG
* Triglycerides (vegetable oils and biobased oils) - ISO Classification HETG
* Polyalphaolefins (PAO) and related hydrocarbon products - ISO Classification HEPR.

USACE has also adopted a two-tiered approach for selecting EA fluids. Tier 1 is more stringent from an environmental perspective but the selection of fluids may be less available. Tier 2 is less stringent environmentally and more fluids may be available to meet Tier 2 requirements. USACE would prefer a Tier 1 fluid if available and it meets the performance requirements of the system.

A Tier 1 USACE EAL is one that conforms to a strict interpretation of the United States Environmental Protection Agency (USEPA) definition and will either:
* Be a product labeled by European Eco-label, and/or Ospar (other product labeling could be considered by an Environmental Officer), or
* Be a product classified as USEPA VGP document Appendix A compliant,

A Tier 2 USACE EAL is a product that does not meet the criteria of a Tier 1 EAL, but:
* It is labeled by one or more of the following: Blue Angel, Nordic Swan, or Swedish Standard and/or,
* It contains a manufacturer's statement that it meets one or more of the test criteria (bioaccumulation, toxicity, and biodegradability) in accordance with USEPA 800-R11-002 definition or USEPA VGP document Appendix A definition, with appropriate test data to confirm the other criteria, and/or
Use nontoxic and biodegradable hydraulic fluid during shop testing, [to fill the cylinders before shipment,] flush the system after installation, and to fill the complete hydraulic system. Biodegradability is defined as 60 percent or more of the fluid carbon is converted to CO2 in 28 days, using test method in accordance with ASTM D5864. Nontoxicity is defined as concentrations greater than 1000 ppm of the fluid are necessary to kill 50 percent of the test organisms in 96 hours using test method EPA 560/6-82-002. Provide [synthetic ester] [poly glycol] type hydraulic fluid. The fluid to have a high viscosity index, low pour point, oxidation inhibitors, and antifoam properties. The oil to have an ISO viscosity grade of [____], a viscosity index of [____], and a pour point of minus [____] degrees C degrees F. [Formulate the oil to separate quickly from water to prevent formation of emulsions.] [Provide hydraulic fluid certified by the manufacturer as fire resistant in accordance with NFLPA T2.13.1.]

Introduce clean and fresh hydraulic fluid through a [10] [_____] µm filter before it is added to the system. Provide letters of assurance from the hose, pump, valve and cylinder manufacturers that the oil provided is satisfactory for use in their equipment in this application.[ Supply all oil plus furnish [two] [_____] [210] [_____] L [55][_____] gallon containers to the Government for a reserve supply.]

2.2 ELECTRICAL EQUIPMENT

**************************************************************************

NOTE: The contents of the following paragraphs are dependent on design requirements which may necessitate revision or expansion to cover different conditions and standards.

**************************************************************************

Provide electrical equipment for the hydraulic power systems as indicated and as specified. Other electrical materials and equipment required for the installation of the hydraulic power systems is specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Furnish standard catalog item electrical equipment under regular manufacture with preexisting catalog ratings equal to or better than the requirements of the Contract drawings and specifications. Accompany request for approval of equipment other than as specified or as indicated by technical and descriptive data and specifications sufficient for the Contracting Officer to determine its adequacy. Unless otherwise specified or indicated, electrical materials and equipment to meet the standards, specifications, and tests referenced.

Submit data specifications and assembly drawings showing sizes, ratings, parts and material lists, overall dimensions, and mounting dimensions with the product data.

2.2.1 Conduit, Duct, and Accessories

[_____]Threads on the following equipment to be American Standard. No metric threads will be accepted.
2.2.1.1 [Plastic Coated] Rigid Metal Conduit

Hot-dip galvanize the conduit, including the threads, in accordance with ANSI C80.1 and UL 6. [The plastic coating to be factory applied by the same manufacturer who produces the hot-dip galvanized conduit. The plastic coating to have a minimum thickness of 1 mm or 0.040 inch for the full length of the pipe except for the threads and a tensile strength of 24.1 MPa or 3500 psi. Furnish a coupling loose with each length of the conduit. The bond between metal and plastic to be equal to or greater than the tensile strength of the plastic coating. The coated conduit in accordance with NEMA RN 1, Type A.]

2.2.1.2 Conduit Fittings

Provide galvanized, high test, gray iron castings. [The fittings to be plastic coated in the same manner as outlined above for the conduit.] Furnish gaskets for all covers.

2.2.1.3 Conduit and Cabinet Supports

Support conduit and cabinets as required by IEEE C57.12.70. The supports to be galvanized [and plastic coated in the same manner as outlined above for the conduit].

**************************************************************************
NOTE: The designer should consider the use of "Subsea" junction boxes, pin connectors and instrumentation components where flooding or submergence is likely to occur. All potential water ingress points of connection must be considered for possible failure risk of the operating system.
**************************************************************************

2.2.2 Cabinets and Boxes

Provide watertight, [galvanized] [stainless] steel, NEMA 4X housings sized as required. The cabinet and box hubs to be consistent with the NEMA 4X rating of the box. Mount cabinets and boxes such that the NEMA 4X rating is not compromised. Match threads on the hubs with the threads on the conduit [_____] and to be American Standard. Metric threads will not be accepted. The cabinets and boxes in accordance with UL 50.

2.2.3 Pump Motors

**************************************************************************
NOTE: Where motor starters are provided in motor control centers, delete the reference to motor starters.
**************************************************************************

Provide in accordance with NEMA MG 1, except as specified, and designed to withstand full voltage starting. Provide a totally enclosed frame, fan cooled construction for the pump. Provide a stainless steel drain-breather similar and equal to Crouse-Hinds type "ECD Universal" and locate so that any water present can be drained from inside the motor. [Encapsulate the motors windings.] [Provide motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motors specified.] Provide manual or automatic control and protective or
signal devices required for the operation, and any control wiring required for controls and devices but not shown on the electrical drawings.

2.2.3.1 Rating

The motors to operate on [___] volts, 60 Hz, 3 phase power and sized to operate the pumps specified in paragraph "Pumps." Design the motor to operate continuously without exceeding the temperature rise permitted by the applicable NEMA standards for the class of insulation and frame construction used.

2.2.3.2 Winding Insulation

Provide winding insulation of either class F or H [with special moisture, fungus, and oil-proof treatment]. Provide winding insulation of the type designed and constructed to withstand the severe moisture conditions and the wide range in ambient temperature to which the motors will be subjected.

2.2.3.3 Winding Heaters

Install heater[s] in the motor frame or end bells or wrapped around the winding end turns. The heater to automatically turn on when the motor is not running. The heater to be capable of withstanding the same temperature extremes as the motor. Provide heaters that when energized the temperature of the motor winding will be held approximately 10 degrees C or 18 degrees F above ambient. Design them for [___] volts AC continuous operation. The heaters to withstand 10 percent overvoltage continuously. Terminals of the heaters, including the leads, to be watertight. Terminate the leads in the motor lead terminal box.

2.2.3.4 Terminal Leads

Extend the motor leads outside the frame, have insulation equivalent to that of the motor winding, and terminate in a two-piece, four-position, watertight, [galvanized] [stainless] steel, NEMA 4X, terminal box secured rigidly to the motor frame. Position and seal the leads where they pass through the frame with a water-resistant seal of a synthetic rubber material or else with a synthetic rubber gasket. Thread conduit entrances to the terminal box.

2.2.4 Control Components

**************************************************************************

NOTES: Where it is desired to control, coordinate, and program components of a hydraulic fluid power system to achieve synchronization of cylinders or components or to achieve a sequence of operations in several modes, tailor system requirements and specifications for the job.

a. The programmed controller is used in modern fluid power systems where a series of operations is to be performed in a sequential order on each cycle. It can be programmed to cause a number of hydraulic cylinders or motors to follow a sequential order of operations, extending and retracting, starting and stopping, during each cycle.

b. The controller can be programmable, consisting
of a console plugged into a Central Processing Unit (CPU), or a specialized microcomputer system that can be custom programmed to control a wide variety of electronic and electrohydraulic systems and components, and has the capability to interface with other controls and transducers.

c. The designer should consider the use of "Subsea" rated components where there is a possible risk of flooding or submergence.

Other types of position measurement and control equipment may be used instead of the electronic limit switch and transducer combination indicated. Many other methods of position measurement are available including some which are entirely mechanical. Select the best type for the application.

**************************************************************************

2.2.4.1 Control Devices and Wiring

Provide manual or automatic control protective or signal devices required for the specified operation and all control wiring for these controls and devices whether indicated or not. Electrical control devices to have a minimum current and voltage ratings in accordance with NEMA ICS 2 contact rating designation A 300, as applicable, unless larger ratings are indicated or are required. Provide control devices with the number and arrangement of contacts required to perform the specified control functions. Provide devices with or installed in NEMA 4X enclosures.

2.2.4.2 Pressure Switches

Provide a minimum pressure rating of [_____] kPa psi with set point operating as shown. Enclose the switches in watertight, [galvanized] [stainless] steel, NEMA 4X housings. Provide the switches with a normally open, normally closed contact having a minimum rating of 5 amps, 125/250 volts AC.

2.2.4.3 Pressure Transducers

Install pressure transducer as indicated to permit measurement and remote reading of the pressure in the system. Provide a transducer of the bonded strain gauge design with a pressure range of 0-21 MPa 0-3000 psi. The electrical output to be 4-20 mA with an accuracy of plus or minus 1 percent. The transducer to have a shielded electrical conductor cable of sufficient length to extend to the terminal strip in the junction box. Provide stainless steel housing construction with SAE hydraulic connections. Equip the pressure transducer with two adjustable setpoint switches that are integral to the unit to provide protection control. Alternatively, provide standard 4-20mA pressure transducers as approved.

2.2.4.4 Flow Detection Switches

Provide thermal dispersion type flow detection switches with no moving parts and temperature sensors utilized to monitor flow or "no-flow" condition and be field adjustable with SPDT relays to detect flow in the range of [0-3.2][_____] L/s [0-50][_____] gpm. Provide with powder coated steel or aluminum housing, splash-proof construction. Make the sensors of
stainless steel construction. Operating temperature to be -29 to 177 degrees C or -20 to 350 degrees F and the operating pressure 0-28 MPa or 0-4,000 psig. Use either threaded or flanged connections. Electrical requirements are 120V, 60Hz, 4 watts. The relay output to be SPDT 3 amps resistive. Electronics associated with the sensor may be either integrally mounted of weather-proof construction or remotely located within NEMA 4 rated junction box at the cylinder manifold or located within the machinery rooms with extended cabling.

2.2.4.5 Electronic Limit Switches

Provide solid-state, thumbwheel, programmable limits with a count/revolution range of 0000 to 3599; four decades of limit programming; set point switch function selection; initial power supply that provides four AC power levels (plus 5 V, plus 15 V, plus 24 V) from standard 120 or 240 VAC sources; and outputs for read-outs on two [digital] [analog] displays (one remote digital read-out in the control room and one at the hydraulic power unit). The operating temperature range of the electronic limit switches to be [0] [minus 20] degrees C [32] [minus 4] degrees F to plus 65 degrees C or 150 degrees F. Locate and mount the limit switches as indicated.

2.2.4.6 Transducer (Electromagnetic Position Sensor)

Provide a single turn, heavy duty, and enclosed in a water-resistant NEMA 13 enclosure with an operating range of minus 20 degrees C or 4 degrees F to plus 85 degrees C or 185 degrees F.

2.2.4.7 Remote Read-Out [Digital] [Analog] Display

Provide a remote [digital] [analog] display which is to be connected to the BCD output from the limit switch.

2.2.4.8 Manual Switches

Manually operated switches, including push-button switches, selector switches, and key-operated switches, heavy-duty, oil-tight type in accordance with NEMA ICS 1. Switches to be the [momentary contact type with standard operators] [maintained contact type with [mushroom head] [illuminated button] [latching button]].

2.2.4.9 Relays

Relays used in control circuits to be industrial magnetic control relays in accordance with NEMA ICS 2 contact rating designation A 300, except where other ratings are indicated. Apply relays in control circuits in such a manner that proper control functions is obtained regardless of whether the contacts are overlapping or non-overlapping.

2.2.4.10 Indicating Lights

Indicating light assemblies to be the switchboard type, insulated for 120 volt AC service, with appropriate colored caps as indicated and integrally mounted resistors for 120 volt AC service. Make color caps of a material which will not be softened by the heat from the lamp. Lamps to be replaceable from the front of the panel. Furnish any special tools required for lamp replacement. The indicating light assemblies to be the same product line as compatible push buttons and switches.
2.2.5 Control Consoles and Valve and Gauge Panels

2.2.5.1 Control Console Construction

The control console to include a basic frame with metal panels fully custom fabricated or may consist of custom modules using standardized components where available to meet the dimensional and functional characteristics shown and specified. Construct the console of steel in accordance with NEMA ICS 6. Steel sheet in accordance with ASTM A659/A659M. Secure removable panels in place using captive, spring-loaded, self-locking spring nuts and hardened sheet metal screws. Use stainless steel screws and nuts. Secure access panels with spring-loaded, quarter-turn fasteners with studs held captive in the removable panel. Equip the console with adequate louvered panels to ventilate the interior and dissipate the heat generated within the console. Provide special equipment supports and guides as required to support the equipment and other components within the console. [Finish the interior and exterior surfaces with one coat of primer and two coats of the manufacturer's standard baked-on white enamel finish.]

2.2.5.2 Valve and Gauge Panel Construction

Construct valve and gauge panels of stainless steel plate thick enough to provide rigid support for the valves and other components mounted thereon. Terminate all piping with bulkhead type connections in a position convenient for the connection of external lines. [Primer and finish to be the manufacturer's standard coating.]

**************************************************************************
NOTE: For accumulators and other pressure vessels ASME stamps and certification are often necessary.
**************************************************************************

2.2.5.3 Nameplates and Instruction Plates

Provide nameplates for each device on the control console, valve panels, and gauge panels and submit for approval. Nameplates to clearly indicate the function of each device and, in the case of manually operated controls, indicate the condition established for each position of the control. Instruction plates to clearly indicate the proper procedures and sequences of operations to activate the system, to operate the system, and to secure the system after completion of operation. Machine engrave [print] lettering on nameplates on [steel plate] [plastic laminate with white characters on a black background]. Mount instruction plates on a rigid backing and covered with clear, rigid plastic sheeting. Mount instruction plates in a location easily visible to an operator stationed at the console or panel.

2.2.5.4 Security Provisions

Construct and install control consoles to prevent unauthorized or accidental operation of the system. [The main power control switch mounted on the control console to be a key-operated type with provision for removal of the key only when the switch is in the "OFF" position.] [Provide the control console with a hinged cover with a key-operated lock arranged to automatically lock the cover in the closed position.]

2.2.5.5 Weather Protection

Control consoles and valve and gauge panels exposed to the weather or
subjected to water or dirt in the atmosphere to be NEMA Type 4 for exterior nonhazardous applications. Enclosures to have hinged and latched covers. Hinges to be the separable type to permit complete removal of the cover for maintenance. Construct hinges and latches of stainless steel.

2.3 SHOP ASSEMBLY AND TESTING

Completely shop assemble and test each hydraulic power system using temporary piping and wiring to determine the correctness of fabrication and the matching of component parts to ensure acceptable operation after field erection. Include all [cardanic rings, trunnions, bushings, pins, clevis, cylinder support base, pillow block bearings, cylinders, and bearings]. Perform shop tests in the presence of the Contracting Officer, unless otherwise authorized in writing. Upon satisfactory completion of the shop assembly and testing, preliminary acceptance will be made by the Contracting Officer.

[2.3.1 Cylinder Tests

**************************************************************************

NOTE: This paragraph does not apply for cylinders of standard manufacture and design.
**************************************************************************

Fill each cylinder with the specified hydraulic fluid filtered through a [10 micron][8 micron] filter, taking care to exclude all air. Clean and flush per requirements in Paragraph "Cleaning and Flushing." Then hydrostatically test each cylinder in each direction at [_____] kPa psi for a minimum of [1][_____] hour[s] [per ASME BPVSC code standards]. [With the rod and piston fully retracted, and the pressure applied to the lower side of the piston, observe the upper end for leakage past the piston.] [With the telescopic cylinder fully retracted and under pressure, check the cylinder for leakage past the seals.] Any leakage past the seals is cause for rejection. Then extend the [cylinder rod and piston] [telescopic cylinder] and observe for smooth, even travel. Any operational problems or source of leakage to the outside of the cylinder is cause for rejection.

]2.3.2 Hydraulic Power Units

Test each motor-driven oil pump of the hydraulic power unit in the shop as directed. Include a hydrostatic pressure test at [21][_____] MPa [3000] [_____] psi. (The temperature of oil during test not to be more than [21][_____] degrees C [70] [_____] degrees F.) Also test each pump by operating at approximately [14][_____] MPa [2000] [_____] psi operating pressure and [2.3][_____] L/s [36] [_____] gpm capacity for a period of 30 minutes. Hydrostatically or pneumatically test the __tank at [21][_____] kPa [3] [_____] psi for 30 minutes. Valves and operators to undergo a functional test and the pumps tested to verify flow and pressure ratings. Correct defects detected by the tests. Furnish oil for shop tests.

2.4 MANUFACTURER PREPARATION BEFORE SHIPMENT

2.4.1 Flushing Hydraulic Cylinders

Clean, flush, and fill hydraulic cylinders with specified oil, filtered through a 10 µm filter, taking precautions to exclude all air, before leaving the manufacturing facility. Clean and flush per Paragraph "Cleaning and Flushing." Submit oil for use in the system for approval. Make suitable provisions to allow for expansion and contraction of the hydraulic
2.4.2 Flushing Hydraulic Power Unit

After cleaning and prior to shipment, flush each hydraulic power unit and manifold. Manifolds not to be installed until cleaned and flushed. Fill the hydraulic tank with hydraulic fluid as specified and actuate the oil filtration system with a 10 µm element in the filter. Circulate the fluid and change filters as become clogged. After flushing of the fluid in the tank is complete, install a by-pass loop with filter on the pressure and tank lines of the unit and the run pumps alternately until the returning oil meets the requirement for system cleanliness.

2.5 PAINTING

Shop prime and coat all exposed exterior surfaces of assemblies and equipment except stainless steel, synthetic rubber, and plastic, as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES unless the equipment is given a standard factory finish as specified. Insofar as is practicable, apply the complete coating system to individual components and items before assembly to ensure complete coverage and maximum protection against corrosion. Paint shop assembled equipment prior to any storage or shipment. Do not paint aluminum, stainless steel, non-ferrous surfaces, or machined surfaces requiring field assembly, except as approved. Paint standard manufactured equipment, such as motors, pumps, hydraulic cylinders, valves, in accordance with the manufacturer's standard practice for high humidity service, subject to approval. Repair chips, scratches, and other damage to shop-applied painted surfaces in the field.

**************************************************************************
NOTE: The designer shall identify and list all special tool requirements as needed for operation and maintenance of the operating system and any spare equipment requiring periodic cycling. Items to consider may include such items as; filtering carts, portable HPU, diagnostic pressure gauges, cylinder disassembly/tightening tools, spanner wrenches, oil monitoring/analysis or testing
**************************************************************************

2.6 SPECIAL TOOLS

Provide all special tools necessary for the proper operation, maintenance, assembly and disassembly of the machinery in a location and in a manner as directed. Special tools include those indicated and the following:

<table>
<thead>
<tr>
<th>Tool 1</th>
<th>Tool 2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
2.7 SPARE PARTS

**************************************************************************

NOTE: It is suggested that for critical systems that the minimum spare parts called for include a spare hydraulic pump and a spare of all hydraulic valves, including control valves, relief valves, counterbalance valves, and cartridge valves.

**************************************************************************

Furnish the following spare parts with the hydraulic system. Also furnish any additional spare parts recommended by the manufacturers if not otherwise included in the listing.

PART 3 EXECUTION

3.1 EXAMINATION

After visiting the site and becoming thoroughly familiar with all details of the work and working conditions, verify dimensions in the field, and then advise the Contracting Officer of any discrepancies prior to performing any work. The Contractor is specifically responsible for the coordination and proper relation of the contracted work to the structure and work of all trades.

3.2 INSTALLATION

Install the equipment specified and as shown to complete the hydraulic power systems for operation of the [intake gates][slide gates][control gates][Tainter gates][miter gates][butterfly valves][hoisting equipment][____]. Install hydraulic components in accordance with the manufacturer's written instructions and under the direction of the erection engineer or manufacturer's representative. Install complete units or assemblies without disassembly. Provide necessary supports for all appurtenances, pumps, motors, and other equipment or components as indicated. Anchor floor-mounted equipment to concrete pads by anchor bolts or expansion anchors as shown. Installation in accordance with Section 05 50 14 STRUCTURAL METAL FABRICATIONS and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.
3.3  POWER PIPING

The general arrangement of the hydraulic piping is as indicated. Any changes to the arrangement necessary to facilitate the installation and proper functioning of the system may be made subject to the approval of the Contracting Officer. Arrange the piping such as to close and open the miter gates, and to raise and lower the Tainter valves, when the valve spools are positioned as indicated.

3.3.1  Piping Installation

Install the system complete including all necessary valves, fittings, and pipe accessories. All joints to be tight and successfully pass the test as specified. Submit details of pipe supports and anchors not indicated. Adequately support all lines at intervals not greater than 3 m or 10 feet or as otherwise indicated. Install hangers and supports using machine bolts and masonry anchors caulked in drilled holes in the masonry or by using machine bolts and expansion shields. Ream and remove burrs from all cut ends of pipe. Remove metal particles from the reaming operations and thoroughly clean ends of pipe before proceeding with the work. Tightly plug all piping at all times except when work is being performed on a pipe. Clean the pipe sleeves, recesses and trenches of all debris and thoroughly wash with a high pressure stream of water before any piping is installed. Drilling, chipping, or grinding of concrete in close proximity of any piping being installed is not permitted. Repeat washing out of the sleeves, recesses and trenches from time to time as necessary. Store valves in a clean, dry place and protect against moisture. Do not install valves in the system prior to 4 months before the system is to be filled with hydraulic oil. Install pipes passing through masonry in pipe sleeves as indicated. Mitering of joints for elbows and notching of straight runs of pipe for tees is not permitted.

3.3.2  Piping Vents and Drains

Install plugged vent connections with high pressure globe or needle valves at all high points of piping. Provide plugged drain connections with valves in accessible locations at all low points of piping. Threads on valves and pipe plugs for vents and drains to be SAE Straight Thread with O-ring seals. Provide pipe plugs and other miscellaneous fittings required for the installation of the vents and drains of the same material as the pipe on which they are installed.

3.3.3  Mounting Support for Manifolds

Bolt the manifolds to a mounting base in such a manner that they can be removed by unbolting from flanges and mounting base and can be adapted for a left hand or right hand orientation of the cylinder mounted piping. Locate manifold and cylinder piping supports on the hydraulic power units or hydraulic cylinders as indicted and as recommended by the cylinder manufacturer to facilitate both left hand and right hand installations. All bolts and hardware used in the supports to be a minimum of 10 mm 3/8-inch. Provide all items in stainless steel [galvanized steel][painted steel].

3.3.4  Identification of Piping and Valves

Identify all pipe, tubing, valves, fittings, as required, and hydraulic power equipment, located within the trenches, machine rooms, and machinery recesses. Use No. 20 gauge brass tags for tagging, with the proper
identification symbol stamped into the metal. Use piping symbols as indicated and stamp with 19 mm or 3/4-inch high lettering. Attach tags to piping and valving by means of No. 12 gauge copper wire. Install pipe markers at intervals of no greater than 5 m or 15 feet, except as approved.

a. Provide a numerical identification tag on each valve, coded such that no other valve in a connected hydraulic power system has the same number. Provide each power circuit valve with an additional tag, which indicates the valve's function.

b. Provide manifold-mounted valves with port identification markings on a part of the valve body that remains in view after mounting.

c. Identify all other valves at the port location, on the connecting piping.

d. Identify manifold assemblies with a tag indicating the manifold's function and the identity of the machine operated.

e. Identify all ball, bleed, and globe valves with a "normally closed" or "normally open" legend.

f. Identify all gauge mounts and pressure transducer mounts with numerical tags, as well as any working or instruction tags required for safe operation.

g. Provide a warning tag and an instruction tag, or tags as required, at each return filter assembly to indicate the safe, approved procedures for cartridge replacement and by-pass operation.

3.4 CLEANING AND FLUSHING

**************************************************************************

NOTES: The allowable limit of contamination in this paragraph is subject to the specific project design requirements which may necessitate revision or expansion to cover varying standards of acceptance. The amount and sizes of particles which any given component can tolerate is a function of the clearances between moving parts, the frequency and speed of operation, and the materials of construction. Tolerances range from low pressure gear pumps which may give satisfactory performance with dirt levels typically found in new fluid (ISO 4406) to servo control valves which require oil much cleaner (ISO 4406 16/14/11). General guidelines are as follows:

<table>
<thead>
<tr>
<th>SYSTEM TYPE</th>
<th>CODE LEVEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low pressure - manual control</td>
<td>20/18/15 or better</td>
</tr>
<tr>
<td>Low to medium pressure - electrohydraulic controls</td>
<td>19/17/14 or better</td>
</tr>
<tr>
<td>Systems with servo or proportional control valves</td>
<td>17/15/12</td>
</tr>
<tr>
<td>High pressure-servo controlled</td>
<td>16/14/11 or better</td>
</tr>
</tbody>
</table>
Hydraulic fluid power equipment is rated according to maximum pressure. Generally low pressure is 0 to 4.1 MPa (0 to 600 psi), medium pressure to 20.7 MPa (3000 psi), and high pressure to 34.5 MPa (5000 psi).

Results of microscopic automatic particle counter particle count in accordance with ISO 4406 Higher code levels indicate higher particle counts per millimeter.

ISO 4406 is an internationally recognized standard that expresses the level of particulate contamination of a lubricating fluid. This is the preferred standard for particle counting and should be used in testing lubricants. ISO 4406 is a cleanliness rating system that is based on a number of contamination particles in a 1-milliliter (ml) fluid sample. Once the number and size of the particles are determined, the points are plotted on a standardized chart of ISO range numbers to convert the particle counts into an ISO 4406 rating. The ISO 4406 rating provides three range numbers that are separated by a slash, such as 16/14/12. All three values for applicable range numbers can be determined through the use of the ISO 4406 standardized chart based on the actual number of particles counted within the 1-ml sample for each size category. The first number in the ISO 4406 standard represents the number of particles present measuring greater than 4 micron, the second represents particles greater than 6 micron and the third represents those greater than 14 micron. As the range number increases by one value, the number of particles in a sample of oil will double. On the range code, each number is double the range below.

For example, an oil with a code of 19/17/14 should contain twice as many particles in each size category as the code of 17/15/12. For critical components, particle counting and testing should be repeated to confirm the ISO rating.

Filter manufacturing firms can be the source of information regarding determination of contamination levels and analysis and have available portable kits for more general detection of contamination.

**************************************************************************

During assembly, securely cover all openings to avoid the entrance of abrasives, dirt, metal chips, and other foreign materials into the hydraulic system through open ends of piping, tubing, and ports of the components. Use the same hydraulic fluid for flushing as approved for final filling. Include a detailed description of the equipment, materials, hydraulic fluid, temperatures, and duration of each phase of the flushing in the procedures. Clean the system of particles so that the contamination level is below [_____] in accordance with ISO 4406. Take three 500 milliliter samples at approved locations in accordance with ISO 4021. Perform particle counting on each sample in accordance with ISO 11500 or ISO 4407 by an approved independent test laboratory. Water content of each
sample to be below 200 ppm. Reclean if any sample does not comply with the permissible contamination limits, and reinspect. When flushing is completed, drain the system and then fill with the specified hydraulic fluid introduced through a 10 micron filter.

3.4.1 Flushing Piping

Flush all hydraulic piping before installation of the hydraulic power unit, cylinders, and manifolds. Install by-pass loops of piping in place of cylinders, manifolds and the power units. Circulate hydraulic fluid through each and every pipe unit until returning oil meets the requirement for system cleanliness. Sequence flushing so that all piping is flushed in both directions. The flow capacity of the flushing system to produce a minimum velocity of 4.6 meters per second or 15 feet per second in all piping. Provide means to verify the flow during the flushing operation.

3.4.2 Flushing Manifolds and Hoses

After cleaning and prior to installation, flush each valve manifold, pipe manifold, and hose by circulating hydraulic fluid through all ports until the returning fluid meets the requirement for system cleanliness.

3.5 FILLING AND BLEEDING THE SYSTEM

With all hydraulic equipment installed and all cleaning and flushing complete filling of the system may begin. The cleanliness of the oil used to fill the system in accordance with the requirements for system cleanliness. Open the by-pass ball valves at the cylinders. Fill each hydraulic power unit and pump oil into the system through a 10 µm filter and keep adding oil as long as the level continues to drop. Cease pumping when the oil level no longer drops. Install by-pass piping and repeat the procedure to fill the drain/siphon line. Take care to expel as much air as possible from the piping and cylinders during the initial filling. Utilize piping vents and drains as much as possible to expel air from the system. Each power circuit pipe for the [Tainter valves] [and] [miter gate] to have this procedure performed to fill the respective piping. Actuate cylinders by shifting spool on the four-way valve back and forth and bleeding air from ports provided on cylinders. Continue procedure for all hydraulic power units until all cylinders have been bled. Ball valves in tank lines may be closed during bleeding to prevent introduction of air into tank lines. After all the cylinders for the machinery have been filled and bled of air, fill the hydraulic power unit tanks with oil. The oil level with the [miter gate] open and all [Tainter valves] closed to be above the "low level" shut-off. The system, once filled, to be bled of air, operated, and periodically bled during the first week of operation to remove any air entrained in the system.

3.6 ERECTION ENGINEER

Obtain the services of an experienced erection engineer who is regularly employed by the hydraulic cylinder/power unit manufacturer to supervise the installation, start-up, adjustment and operation, and testing of the equipment provided. The erection engineer to furnish a signed statement stating that the final installation and start-up of the hydraulic power system has been inspected, witnessed, and complies fully with the manufacturer's warranty requirements. Following completion of the work the erecting engineer to instruct the Contracting Officer in the operation and maintenance of the system. These field instructions to cover all items contained in the bound instructions. Do not conduct instruction until
Operation and Maintenance Manuals are approved.

3.7 FIELD TESTS AND INSPECTIONS

3.7.1 Field Testing

Submit procedures for field testing and proposed testing program, at least 30 calendar days prior to the first scheduled test, to ensure agreement as to personnel required and scope of the testing program. Notify the Contracting Officer at least 14 calendar days before any field testing is to be conducted. Conduct testing in the presence of the Contracting Officer unless waived in writing. Submit a certified field test report. Conduct testing under the direction of the erection engineer or manufacturer's representative.

3.7.2 Pipe Pressure Test

Subject pressure piping to a test pressure of 21 MPa or 3000 psi and 7 MPa or 1000 psi for all other piping. Subject the head end of the cylinder and manifold to a test pressure of 21 MPa or 3000 psi. Maintain the test pressures in the piping and cylinder for a minimum of 4 hours. Isolate or remove any equipment that might be damaged by this pressure to prevent damage. Make tests using the hydraulic oil specified. Under these tests there will be no leakage in the system. Carefully examine welded, flanged, flared, and threaded connections and wipe for leakage, also inspect lines for evidence of deflection caused by inadequate anchorage. No leakage or deflection is allowed. During the tests, take care to avoid subjecting equipment to pressure in excess of their capacities. Correct any defects or damage to any part of the hydraulic system and conduct retest.

3.7.3 Final Acceptance Tests

*****************************************************************************************************************************************

NOTE: It is recommended that the designer develop pre-functional and functional checklists for the Contractor to perform all testing requirements and have all concerned parties, including the customer, present to witness and sign-off on the completion of the checklists.

*****************************************************************************************************************************************

In preparation for the final acceptance tests, and after completion of the installation and proof tests, operate the hydraulic power system to prove acceptability. Conduct preliminary tests at minimum pressures and velocities until initial adjustments have been proven safe for normal operation. Constantly monitor details of all operations for signs of impending trouble and make corrections as necessary to prevent damage to the equipment. At such time as the Contracting Officer may direct, conduct the following complete acceptance tests on the hydraulic power system for approval. Immediately correct any deficiency or maladjustment disclosed by the tests and repeat the test until satisfactory results are obtained. No subsequent tests will be permitted until all preceding tests have been completed satisfactorily. Upon completion of the final acceptance tests, furnish a written statement that the hydraulic power system has been field tested and meets all operational requirements.

3.7.3.1 Initial Start-Up

Inspect the hydraulic reservoir to ensure that the fluid is at the proper
level. Inspect and adjust the accumulator precharge pressure to the specified value. Test start the hydraulic pumps using [both] the controls at the control console [and the remote controls]. Inspect the [pump] [pumps] for proper operation and discharge pressure. Read and record the discharge pressure of [the] [each] pump. Adjust the pressure relief [valve] [valves] to limit the system pressure to the specified value. Adjust the unloading [valve] [valves] to unload the pumps to the reservoir when the accumulator has been charged to the specified pressure or if the control valves are not actuated. Inspect the hydraulic lines and components which are under pressure for evidence of leakage.

3.7.3.2 Combined System Tests

After final assembly and installation of the machinery, equipment and piping, and prior to [flooding the lock] [____], operate each assembly of operating machinery individually as nearly as practicable under its normal operating conditions for a minimum of [5] [____] open/close cycles; and demonstrate that each assembly is in proper working order and free from defects of materials, workmanship or alignment. Upon satisfactory completion of the individual tests, and before final acceptance of the work, conduct, in the presence of the Contracting Officer, over-all testing through a minimum of [10] [____] additional [locking operations with the lock flooded] [operating cycles], to demonstrate that all machinery has been properly installed and that [lock] [____] operation can be effected without interruption. During each test operation, inspect the hydraulic lines and components for evidence of leakage. Read and record the pressure in the supply and return lines for each direction of operation. Inspect response of components to operation of applicable controls to confirm that all connections have been made properly. Check flow control valves and adjust as required to conform to indicated operating time requirements. Inspect and adjust sequence valves as required to obtain the indicated sequence of operation. Adjust chokes in pilot circuits of pilot-operated valves to obtain smooth, shock-free operation. Adjust relief valves and counterbalance valves to the proper pressures as indicated, unless otherwise directed by the Contracting Officer. [Adjust proportional control valves for the proper flows to achieve desired cylinder operating speeds as directed by the Contracting Officer.] Operating tests to cover a period of not less than [4] [____] hours, and conduct all tests at such times as the Contracting Officer may direct. After installation and testing of the hydraulic system has been completed, install a complete set of new and unused filter cartridges.

3.7.3.3 Test Reports

**************************************************************************
NOTE: Edit the following data to be reported as required.
**************************************************************************

Prepare and complete test reports showing in detail the results of the shop and field tests. Include in the test reports detailed tabulation showing values of pressures, flow rates, and all adjustments recorded during the final tests, and adjustment and calibration of the entire system. During each test run, record the following data and observations:

a. Control operation

b. Voltages
c. Currents

d. Pressures

e. Speeds and Times

f. Flow Control Valve Settings

g. Alignment and Operating Clearances

h. Excessive Vibration, by Component

i. Temperature of Motors and Hydraulic Fluid

j. Pertinent observations regarding such events as unusual sounds, malfunctions or difficulties encountered, and adjustments required.

k. Hydraulic oil testing results

3.8 CLEAN-UP

Keep the work areas clean during installation of the hydraulic system and appurtenances. Upon completion of the installation of the hydraulic system and appurtenances, remove debris and surplus materials resulting from the work.

3.9 OPERATION AND MAINTENANCE

Submit Operation and Maintenance manuals as data packages in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Supplemental requirements are as described in this paragraph. Furnish [_____] complete sets of instructions containing the manufacturer's operation and maintenance instructions for each piece of equipment to the Contracting Officer. Permanently bind each set with a hard cover. Furnish one complete set prior to field testing and furnish the remaining sets before the contract is completed. Inscribe the following identification on the covers: "OPERATING AND MAINTENANCE INSTRUCTIONS," title of the project, location of the project, the name of the Contractor, and the contract number. Place a flysheet before instructions covering each subject. The instruction sheets size to be 210 by 297 mm 8 1/2 by 11 inches, with large sheets of drawings folded in. The instructions include, but are not be limited to, the following:

a. A cross-section drawing of the hydraulic cylinder with parts list.

b. Detailed fabrication drawings for all custom fabricated components of the hydraulic cylinders.

c. A system layout drawing showing the piping, valves, and controls.

d. A system hydraulic schematic.

e. Manifold fabrication drawings with dimensions and locations of pre-drilled passages and cavities.

f. Electrical wiring and control diagrams.

g. Operating and maintenance instructions.
h. Manufacturer's bulletins, catalog cuts, and descriptive data.

i. A written control sequence describing startup, operation, and shutdown. Uniquely identify the control sequence and list the individual components of the hydraulic system. Each component to have a narrative description as to the function, purpose, and limits of adjustment (if any) and method of adjustment for that component.

Provide the Operation and Maintenance (O&M) Manual with all information which may be needed or useful for operation, maintenance, repair, dismantling or assembling, and for identification of parts for ordering replacements. The manual is subject to approval. Provide a recommended spare parts list.

-- End of Section Table of Contents --
NOTE: This guide specification covers self-lubricated bearing materials for waterway and marine construction. These bearing materials are used for lock and dam applications ranging from critical bearing applications to light duty and electro-galvanic isolating applications. This section has been developed for USACE Civil Works projects.

In accordance with ER 10-1-53, the USACE Hydroelectric Design Center (HDC) in Portland OR is designated as the Mandatory Center of Expertise (MCX) for hydropower engineering and design. HDC's policy is to use self-lubricating materials in hydroturbine applications. For applications involving turbines, consult HDC (Phone: 503-808-4250).

Sections have also been included on self-lubricated bearings used for product lubricated vertical shaft pumps. Product lubricated pump bearings are used for applications that require minimizing or eliminating the exposure to petroleum lubricants to be in compliance with environmental, biological, or other applicable regulations.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be
submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

**********************************************************************
NOTE: Use this guide specification in conjunction with EM 1110-2-1424
LUBRICANTS AND HYDRAULIC FLUIDS and EM 1110-2-2610 Mechanical and
Electrical Design for Lock and Dam Operating Equipment.

Users of this specification should understand that successful
performance of self-lubricated materials relies on factors that are not
covered under the scope of this specification. These factors include but
are not limited to accurate estimation of applied loads, adequate
alignment of self-lubricated parts including their housings and running
surfaces, and adequate stiffness of housings and running surfaces to match
the loading assumptions made.

Designers need to be aware that self-lubricated parts and materials have
many differences in properties and behavior from traditional metallic
supplied-lubricant bearings. Successful design of self-lubricated bearing
systems relies on designers that understand these differences as well
as acceptable design practices for self-lubricated materials. Designers
unfamiliar with self-lubricated components, at a minimum, should
have their designs and assumptions thoroughly checked by qualified
individuals familiar with self-lubricated material systems.

It is common for minor design details, such as final
tolerances and fits, to be left for the construction
contractor to determine. However, construction
contractors typically are not qualified to perform
the complete design for self-lubricated bearing
systems. As discussed above successful design of
self-lubricated bearing systems requires detailed
knowledge of both the application and self-lubricated
materials. Using construction contractors to fully
perform the design of self-lubricated bearing systems is not recommended.

Designers are responsible to consult self-lubricated material manufacturers
to verify that the products being used are appropriate for the application.
Self-lubricated material manufacturers should also be consulted to verify the use of other appropriate
design details such as bearing wall thicknesses, installation fits, running surface clearance fits, edge
chamfers, etc.

Consider including self-lubricated material fabricator qualifications and self-lubricated
material installation plans as evaluation criteria used to select a contractor.
Include in drawings a complete design indicating the character of the work to be performed and giving the dimensions, quantity, location, assembly details, and installation details of each bearing component, housing, and associated running surfaces.

Information has been included in this specification for product lubricated pump bearings. This information has been included as many of the materials used to construct these bearings are the same as the materials covered in this specification for other lock and dam applications. This specification assumes the pump manufacturer will be responsible to select the appropriate product lubricated bearings. The information in this specification has been limited to the list of parameters that need to be specified to allow the pump manufacturer to select appropriate bearings. Product lubricated information in this specification should be copied to the applicable pump specification for use.

********************************************************************************

1.1 SUMMARY

This section specifies fabrication, handling, cleaning, and installation requirements for self-lubricated materials and associated running surfaces.

1.2 REFERENCES

********************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

********************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

Hot-Rolled and Cold-Finished Age-Hardening Stainless Steel Bars and Shapes

ASTM D149 (2009; R 2013) Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies

ASTM D1002 (2010) Apparent Shear Strength of Single-Lap-Joint Adhesively Bonded Metal Specimens by Tension Loading (Metal-to-Metal)

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.
For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
Assembly and Installation Plan; G[, [_____]]

SD-02 Shop Drawings
Self-lubricated Component Shop Drawings; G[, [_____]]
Show the complete dimensions, fabrication tolerances, and material callouts.
Self-Lubricated Component Field Installation Drawings; G[, [_____]]
Show the installation and assembly details including alignment tolerances.

SD-03 Product Data
Self-Lubricated Material Product Data; G[, [_____]]
Bonding Adhesive Product Data; G[, [_____]]

SECTION 35 05 40.17 Page 7
1.4 MANUFACTURER’S QUALIFICATIONS AND WARRANTY

Self-lubricated material manufacturer[s] [is] [are] required to have a minimum of [10][_____] years experience in manufacturing self-lubricated materials.

Submit a Manufacturer's Experience Record which details the number of years the manufacturer has been fabricating self-lubricated materials[ and a description of at least 5 previous, separate, similar installations within the last [5] [10] [_____] years].

1.5 HANDLING

Handle self-lubricated components and their associated running surfaces in a manner that does not cause damage or affect the surface finish of the components. Perform lifting, and maneuvering of self-lubricated components and their running surfaces with fabric straps or other non-marring rigging. Do not allow self-lubricated materials and their mating surfaces to come into direct contact with chains, shackles, hooks, or wire ropes. Damage to self-lubricated components or their mating surfaces including scratches, nicks, chips, or marring is grounds for rejection of the components.

1.6 WARRANTY

Provide a warranty from the self-lubricated material manufacturer protecting products against defects in material and workmanship for a minimum of [5] [_____] years. Submit the Self-Lubricated Material Manufacturer's Warranty.
marine applications. However, if a material containing graphite meets the minimum dielectric strength requirement then it may be ok for the application. Make sure selection of language for graphite and dielectric strength requirements are consistent.

Dielectric strength is an important property of self-lubricated materials. Supplied lubricant metallic bearings rely on the lubricant to prevent galvanic and other types of corrosion, as they can jeopardize the performance of a bearing. The Dielectric strength of self-lubricated materials should be adequate to prevent galvanic corrosion.

Excessive water absorption can affect the running clearances and fits of self-lubricated materials. Avoid excessive water absorption for successful performance.

The operating temperature range requirement is based on what would likely be seen in a typical lock and dam application. This range is commonly achievable for self lubricated materials.

The requirement below, for self-lubrication to be continuous and without measurable gaps for the full self-lubricated surface in contact with the mating running surface is especially important for applications that only have small ranges of movement.

**************************************************************************
Submit Self-Lubricated Material Product Data showing the material[s] selected for use are in compliance with the requirements of this specification. Self-lubricated materials must meet the following requirements:

a. Thermoset polymer approved for use in submerged and marine environments by the material manufacturer.

[ b. Self-lubricated materials cannot contain graphite.]

[b] [c]. Surfaces of the self-lubricated materials that come into contact with bearing running surfaces must have a minimum dielectric strength of 50V/mm as tested in accordance with ASTM D149.

[c] [d]. Have a water absorption of less than [0.1][0.2][0.3] percent increase in weight for long term immersion as tested in accordance with ASTM D570.

[d] [e]. Have an operating range of [-34] [_____] to [93] [_____] degrees C [-30] [_____] to [200] [_____] degrees F.

[ e] [f]. Continuous and without measurable gaps for the full self-lubricated material surface[s] that come into contact with the mating running surface.]
2.1.1 Fabric Reinforced Polymer Self-Lubricated Materials

In addition to the general self-lubricated material requirements above fabric reinforced polymer self-lubricated materials must have the following features and properties:

a. Base materials must be isophthalic polyester, orthophthalic polyester, vinylester, or epoxy resin.

b. Polyester reinforcement, or a combination of polyester and polytetrafluoroethylene (PTFE) sheet fabric or fiber strand.

c. A minimum dynamic bearing pressure of 69 MPa 10,000 psi applied in a direction perpendicular to the fabric layers as rated by the self-lubricated material manufacturer.

d. A minimum compressive yield strength of 103 MPa 15,000 psi as tested in accordance with ASTM D695 with the load applied perpendicular to the fabric layers.

e. A minimum in-plane shear strength of 69 MPa 10,000 psi as tested in accordance with ASTM D3846.

2.1.2 Sprayed Polymer Coating Self-Lubricated Materials

**************************************************************************
NOTE: Coating thickness and backer material selection vary with each application. Consult self-lubricated material manufacturers for the best selections.
**************************************************************************

In addition to the general self-lubricated material requirements above sprayed homogeneous coatings must have the following features and properties:

a. A minimum of [0.38] [0.51] [0.64] mm [0.015] [0.020] [0.025] inches thick after final machining.

b. A minimum dynamic bearing pressure of 69 MPa 10,000 psi, as rated by the self-lubricated material manufacturer.

c. A minimum compressive strength at failure of 241 MPa 35,000 psi as tested by the material manufacturer.

d. Secure sprayed polymer coatings to the backer material using only the adhesive bond of the polymer material. Do not use keys, keeper plates, and other mechanical methods to secure the sprayed coating to the backer material.

e. Sprayed polymer coating backer material must be [copper nickel alloy in accordance with ASTM B929, UNS C72900] [stainless steel in accordance with ASTM A564/A564M, UNS S17400, Type 630, Condition [H1025] [H1075] [H1100]] [glass fiber reinforced composite].

2.1.3 Extruded Homogeneous Polymer Self-Lubricated Materials

In addition to the general self-lubricated material requirements above
extruded homogeneous self-lubricated materials must have the following features and properties:

a. A minimum dynamic bearing pressure of 69 MPa 10,000 psi, as rated by the self-lubricated material manufacturer.

b. A minimum compressive yield strength of 138 MPa 20,000 psi as tested in accordance with ASTM D695.

### 2.1.4 Plugged Bronze Self-Lubricated Materials

**NOTE:** Plugged bronze style self-lubricated materials are often not a good choice for lock and dam applications. This is due to the fact that they can cause galvanic corrosion if a supplied lubricant is not used. These types of materials are also not ideal for applications with small ranges of movement as the plugs providing the lubrication are intermittently spaced and may not provide full lubrication of the running surface especially for applications that have small ranges of movement.

Spec requirements for dielectric strength to be a minimum of 50V/mm and for self-lubrication to be continuous and without measurable gaps for the full self-lubricated material surface that come into contact with the mating running surface exclude the use of plugged bronze materials. Select the appropriate spec language to provide consistent requirements.

Plugged bronze self-lubricated materials are not acceptable as they do not meet dielectric strength requirements and do not provide continuous self-lubrication without measurable gaps.

a. Base material must be bronze.

b. Plug materials must be self-lubricating polymer containing polytetrafluoroethylene (PTFE)

c. A minimum dynamic bearing pressure of 69 MPa 10,000 psi, as rated by the self-lubricated material manufacturer.

d. A minimum compressive yield strength of 103 MPa 15,000 psi, as rated by the self-lubricated material manufacturer.

### 2.2 SELF-LUBRICATING BEARING MATERIAL

#### 2.2.1 Allowable Materials

The self-lubricating bushings and bearing plate provided for each application location specified in paragraph 2.2.2 shall be selected from the following list of approved materials:

[ a. Triboglide 15M+, ACM Composite Bearings Americas, 1137 Ashland Court, Coburg, ON, K9A5S2, CANADA. Contact: Tom Carew, 289-252-1713, Tom.carw@acmbearings.co.uk]
2.2.2 Qualified FCB Material

**************************************************************************
NOTE: For an updated list of material performance scores contact the USACE Hydroelectric Design Center (HDC) (Phone: 503-808-4250).
**************************************************************************

The following list of materials meet FCB requirements:

[ a. CIP Hydro, Columbia Industrial Products, 29538 Airport Rd. Unit A, Eugene, OR 97402. Contact Person: Jessica Leamen, 541-607-3655, jessica@cipcomposites.com]
[ b. TXM-M, Trelleborg Sealing Solutions (previous name - ORKOT Engineering Plastics), 901 Phoenix Lake Ave., Streamwood, IL 60107. Contact person: Tom Zozokos, 630-233-7957, tom.zozokos@trelleborg.com]

[ c. D-Glide FT, Drie-D Americas, 25 Elgin St., Grimsby, ONT. Contact Person: Frank Trivieri, 905-309-9558, trivieri@drie-d.com]

[ d. All True Hydro 2069-ATHB, All True Designs, 4660 Main St., Building C, Suite 450, Springfield, OR 97478. Contact Person: Andy Standerfer, 541-357-5263, andys@alltruedesigns.com]

[ e. Karon V - bronze backed, Kamatics Corporation, Post Office Box 3, Bloomfield, CT, 06002. Contact person: Yarrow Banko, 206-420-1840, yarrow.banko@kaman.com]

[ f. Karon V - composite, Kamatics Corporation, Post Office Box 3, Bloomfield, CT, 06002. Contact person: Yarrow Banko, 206-420-1840, yarrow.banko@kaman.com]

[ g. HPF, Glacier Garlock Bearings, P.O. Box 189, 700 Mid Atlantic Parkway, Thorofare, NJ 08086. Contact: 856-848-3200, usa@ggbearings.com]

[ h. HPM, Glacier Garlock Bearings, P.O. Box 189, 700 Mid Atlantic Parkway, Thorofare, NJ 08086. Contact: 856-848-3200, usa@ggbearings.com]

[ i. Devatex 522, Federal Mogul Corporation, 26555 Northwestern Highway, Southfield, MI 48003. Contact Person: Jim Rober, 248-794-7801, jim.rober@federalmogul.com]

[ j. C417, Trelleborg Sealing Solutions (previous name - ORKOT Engineering Plastics), 901 Phoenix Lake Ave., Streamwood, IL 60107. Contact person: Tom Zozokos, 630-233-7957, tom.zozokos@trelleborg.com]

Submit [FCB Material Certifications](#) from the material manufacturer stating that the chemical formulations, manufacturing processes and overall structure of the materials supplied are identical to those of the bearings that meet the FCB material qualifications above.

2.3 SELF-LUBRICATED MATERIAL BONDING ADHESIVE

**************************************************************************
NOTE: Remove this section if a bonding installation method is not being used.
**************************************************************************

Self-lubricated material bonding adhesives must meet the following requirements. Submit [Bonding Adhesive Product Data](#) showing that the minimum requirements listed are met.

**************************************************************************
NOTE: Designers should be aware that the strength properties of the bonding adhesive may be the limiting factor for the design of self-lubricated bearing systems. The strength properties of the adhesive should be accounted for when designing for a specific factor of safety.
**************************************************************************
a. Approved by the adhesive manufacturer for use in submerged and marine environments.

b. Approved by the adhesive manufacturer for use with the materials to which it will be applied.

c. After reaching full cure, a minimum compressive strength of 52 MPa 7,500 psi as tested in accordance with ASTM D695.

d. After reaching full cure, a minimum tensile lap shear strength of 28 MPa 4,000 psi as tested in accordance with ASTM D1002.

e. Approved for service in the temperature range of -34 to 93 degrees C -30 to 200 degrees F.

2.4 SELF-LUBRICATED MATERIAL MATING RUNNING SURFACES

**************************************************************************
NOTE: Successful operation of self-lubricated components requires a specific running surface hardness and surface finish values. These critical requirements can often be overlooked by contractors and sub-contractors that are not familiar with self-lubricated materials. This section is intended to help highlight the importance of these requirements to contractors.
**************************************************************************

The surface finish and hardness of the mating component of a self-lubricated material has a large effect on the successful operation of that self-lubricated material. Running surfaces typically need to be fabricated with a Rockwell hardness number between 30 and 40 on the Rockwell C scale (HRC 30 - HRC 40) in accordance with ASTM E18. Self-lubricated materials in applications with infrequent service typically require no rougher than a 0.8 µm 32 micro-inches surface finish. Surface finishes, typically no rougher than 0.4 µm 16 micro-inches are required for application that have frequent service. Verify that the surface finish and hardness requirements [indicated][specified] for self-lubricated material running surfaces are in compliance with the self-lubricated material manufacturer's recommendations. If the [indicated][specified] running surface requirements are outside of the self-lubricated material manufacturer's recommendations [notify the Government by submitting a Request for Information] [submit a variance request on the shop drawings].

2.5 Seals

**************************************************************************
NOTE: The use of physical seals for self-lubricated bushings/bearings is an important consideration for designers. Factors that should be considered when making this decision include the potential for debris or contaminants to enter the bushing/bearing, the bushing/bearing's natural tendency to evacuate debris or contaminants, and the abrasion resistance characteristics of the chosen material construction(s).

Testing for debris or contamination tolerance is essentially an abrasion resistance assessment of the
material. In general, fabric reinforced polymers have a moderate to high tolerance for abrasion resistance. Sprayed coatings are harder which give them a better tolerance for abrasion resistance. Extruded homogeneous materials are softer and have a lower tolerance for abrasion resistance.

There are many acceptable materials and configurations that can be used for physical seals. The material choices presented here have been used in self-lubricated material bushing/bearing designs and are provided here as sample seal materials for consideration.

Elastomeric o-rings are commonly used for static joint seals. These are designed to be compressed with the assembly of the joint to provide positive contact to exclude debris, and other contaminants. Low friction polymers are commonly used for dynamic joint seals. PTFE is a very common selection because of its low friction and chemically resistive properties. A bent metal spring or compressed o-ring is typically used to provide positive contact when the joint is assembled. These types of seals are commonly available as off-the-shelf parts from seal manufacturers.

**************************************************************************

Provide seals for the [_____] [bearing] [bushing] meeting the following requirements.

2.5.1 Static Seals

Static seals must be synthetic ethylene propylene elastomeric o-rings meeting the following material requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>65 to 75</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>Tensile Strength</td>
<td>10 MPa 1450 psi (minimum)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>150 percent minimum</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6 MPa 900 psi (minimum)</td>
<td>ASTM D412</td>
</tr>
</tbody>
</table>

2.5.2 Dynamic Seals

Dynamic seals must be [molded PTFE] [_____] with energizing springs fabricated from stainless steel or elastomeric o-rings. PTFE must be carbon filled and meet the following material requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>

**C.6 Centering Wires**

**************************************************************************

**NOTE:** Remove this section if a bonding installation method is not being used.

**************************************************************************

Wires used to center the [bushing] [bearing] during bonding must be 300 series stainless steel and meet the requirements of ASTM A580/A580M condition A.

**[C.7 PRODUCT LUBRICATED PUMP BEARINGS]**

**************************************************************************

**NOTE:** If used, this section should be copied into an applicable pump specification. If pump bearings are not being used remove this section.

**************************************************************************

Submerged pump bearing must be product lubricated and meet the following requirements:

a. Fabricated from an elastomeric material or polymer composite material and not require petroleum lubricants for operation.

b. Operate in water that may contain [sand] [silt] [vegetative trash].

b. Does not require service or replacement for 50,000 [_____] operating hours.

**[C.8 TEST FITTING]**

Test the fit of self-lubricated components with their mating surfaces prior to transporting components on site.

### PART 3 EXECUTION

#### 3.1 FABRICATION

Fabricate self-lubricated components and their running surfaces from the materials, dimensions/tolerances, and qualities indicated.

#### 3.2 ALIGNMENT REQUIREMENTS

**************************************************************************

**NOTE:** Self-lubricated components are susceptible to damage caused by edge loading. The test procedure outlined in CERL Technical Report 99/104, Greaseless Bushings for Hydropower Applications tests the edge.
loading properties of materials with a tapered test sleeve. The slope of the tapered test sleeve is 0.229 degrees (0.004°/1.000°). Actual installations should be held to much tighter alignment requirements than this procedure tests for. Define required alignment of self-lubricated components in accordance with an applicable code such as ASME Y14.5 - Dimensioning and Tolerancing.

Use this paragraph to define alignment requirements of self-lubricated components and mating parts. These requirements could also be shown on drawings. Use an applicable dimensioning and tolerancing code such as ASME Y14.5 to define alignment requirements.

**************************************************************************

[_____.  ]Submit Alignment QC Report showing the results of the field measurements taken to verify the required alignment of installed components.

3.3 INSTALLATION PLAN

Submit an Assembly and Installation Plan showing the proposed method to assemble and install the self-lubricated components. Include pre-assembly fabrication dimensions, a description of the [interference fitting procedure][bonding procedure][mechanical fastening procedure including installation torques], post-assembly dimensions, installation procedure,[seal installation procedure including any methods to temporarily support the seals during assembly,] method to measure and confirm the alignment requirements.

3.4 INTERFERENCE FITTING OF SELF-LUBRICATED MATERIALS

3.4.1 Preparation of Interference Fit Surfaces

Remove coatings from bushing/bearing housing surfaces prior to interference fitting. Remove coatings including paint, galvanizing, and anodizing from the interference fit surfaces prior to assembling the joint. Clean interference fit surfaces of the bushing/bearing and housing of oil, grease, cutting fluids, or other substances prior to assembling the interference fit.

3.4.2 Press-Fitting

Do not use hammer blows or other impact type loading to press fit self-lubricated components. Use a method to press fit self-lubricated components that provides a smooth and constant force such as a hydraulic or other style of press. Protect components from damage during the press fitting process.

3.4.3 Shrink-Fitting

Perform shrink fitting by lowering the temperature of the inner component to a point where the outer diameter shrinks adequately to avoid interference with the outside part. Use a method to lower the temperature of self-lubricated materials that is approved by the self-lubricated material manufacturer. Ensure shrink-fit components are fully seated prior to allowing the parts to return to ambient temperature.
3.5 MECHANICAL FASTENING OF SELF-LUBRICATED COMPONENTS

Install self-lubricated components in accordance with the approved Assembly and Installation Plan. Use [300 series stainless steel fasteners] [_____] to install self-lubricated components unless otherwise noted. Install fasteners [with a thread locker and] to a torque value that does not damage or distort the self-lubricated materials. Determine the amount of wear that is expected for the service life of the self-lubricated material. Install fasteners so that no part of the fastener extends beyond the fully worn running surface of the self-lubricated material.

[3.6 BONDING SELF-LUBRICATED MATERIALS]

**************************************************************************
NOTE: Remove this section if a bonding installation method is not being used on the self-lubricated components.
**************************************************************************

3.6.1 Protection of Work

Perform bonding of self-lubricated materials in a controlled environment. Perform bonding in a temperature controlled building that allows protection from the elements. [Exceptions to this requirement may be allowed, at the discretion of the Contracting Officer, for cases where the size of components prevents feasible transportation to an offsite location.] In cases where outdoor installation of self-lubricated materials is necessary, protect the bonded surfaces and work area from the weather.

3.6.2 Preparation of Bonding Surfaces

Prepare surfaces to be bonded, including degreasing and abrading, in accordance with the bonding adhesive manufacturer's recommendations. Prepare the bond joint so that the adhesive bonds only to the parent materials of each component. Remove surface coatings such as paint, galvanizing, and anodizing from the surfaces to be bonded using an approved method prior to applying the adhesive. Clean surfaces to be bonded of oil, grease, cutting fluids, and substances that may affect the quality of the bonded joint. Only clean self-lubricated materials with cleaners that are approved for use by the self-lubricated material manufacturer.

3.6.3 Bonding

Mix and apply the bonding adhesive in accordance with the adhesive manufacturer's recommendations. Unless the adhesive manufacturer recommends otherwise, apply the adhesive evenly and completely across both bond surfaces prior to assembling the joint. Use a bonding procedure that prevents adhesive from coming into contact with the running surfaces of the self-lubricated materials. Prior to starting the bonding process, have a solvent or other cleaner approved by the self-lubricated material manufacturer on-hand and accessible. Quickly and completely clean off adhesive that ends up on self-lubricated material running surfaces during the bonding process.

3.6.3.1 Maintaining Dimensions of Bushings/Bearings During Bonding

While unsupported, self-lubricated materials have a tendency to slightly sag under their own weight creating an out-of-round condition. Prior to bonding bushings or bearings in place, check the diameter of the running
surface of the bushings/bearings to verify they are within the dimension requirements shown. If the diameter is out of the required dimension, provide and use jigs or other devices, which do not harm the material, to maintain the required dimensions during bonding. Assemble bushings and bearings with the axis in a vertical orientation where feasible to minimize the possibility of bearing sag and non-conforming radial tolerances.

3.6.3.2 Bushing/Bearing Centering Wires

Use centering wires for situations that require assembly of bushings/bearings axis in a horizontal orientation. Place centering wires in the clearance between bushing/bearing outer diameter and housing inner diameter. Use centering wires that have a diameter equal to the radial clearance between bushing/bearing and housing. Use a minimum of eight wires evenly spaced around the circumference of the bushing/bearing. After the adhesive is fully cured cut centering wires flush with the surfaces of the bushing/bearing and file any sharp edges smooth.

3.6.3.3 Flanged Bushings/Bearings

Unless indicated otherwise, bond flanges of bushing/bearing to their associated housings.

3.6.4 Curing of Bonding Adhesive

Do not load self-lubricated materials until the bonding adhesive has fully cured. Follow the adhesive manufacturer's recommendations to achieve full cure of the adhesive.

[3.6.5 Accelerating Cure of Bonding Adhesives

******************************************************************************************
NOTE: The amount of time to reach full cure for many bonding adhesives can be reduced at increased temperatures. This is a common practice for many adhesives but should be performed with an awareness of the issues identified in the specification language below. Remove the section below if accelerated curing is not being used.
******************************************************************************************

Perform accelerated curing of bonding adhesives by increasing the temperature of the components to a maximum temperature that does not harm the self-lubricated materials or other components. Many self-lubricated materials cannot be heated past approximately 100 degree F without post curing and potentially shrinking or distorting the material. Consult the self-lubricated material manufacturer for the maximum temperature that can be used for accelerating the cure of the bonding adhesive. Perform heating of components in a manner that brings the entire bonded joint up to the desired cure temperature. Consider heat sinks in the components that may increase the amount of time that is required to heat the bond joint up to the desired temperature. Do not use open flame to heat or pre-heat components for bonding.

]3.7 VERIFYING DIMENSIONS AFTER ASSEMBLY

******************************************************************************************
NOTE: The inner and outer diameter of self-lubricated bushings can change significantly

SECTION 35 05 40.17  Page 19
after interference fitting. Consult the self-lubricated material manufacturer for pre-interference fit dimensions to achieve the desired post-interference fit dimensions. Manufacturer's can typically accurately predict the pre-interference fit dimensions required. However, sometimes post-interference fit machining is required to meet final dimensions.

Some self-lubricated materials are fabricated with a layer of premium grade material applied only at the running surface of the part. This is a common practice and can be used to significantly reduce material costs. If this practice is used an adequate thickness of premium grade material needs to be provided to allow post-interference fit machining.

**************************************************************************

After [shop assembly] [field installation], measure self-lubricated components to verify contract required dimensions are met. If assembly dimensions are not met, machine or hone the self-lubricated materials to achieve the required dimensions. Perform machining and honing of self-lubricated components in accordance with the self-lubricated material manufacturer's recommendations. Some self-lubricated materials are fabricated with a layer of premium grade material applied only at the running surface of the part. Provide enough premium grade material at running surfaces to allow for post-assembly machining. Submit a Post-Assembly QC Report detailing the measured dimensions after assembly and showing compliance with the approved Assembly and Installation Plan.

3.8 ASSEMBLY OF MATING COMPONENTS

3.8.1 Cleaning

Prior to final installation, clean self-lubricated materials and their running surfaces of oil, dirt, and debris using a method recommended by the self-lubricated material manufacturer.

[3.8.2 Seal Installation

**************************************************************************

NOTE: Delete this section if physical seals are not used.

**************************************************************************

Install seals in accordance with the approved Assembly and Installation Plan. [Temporary support of seals for assembly/installation may be performed with cyanoacrylate adhesive applied in small amounts at several locations equally spaced around seal grooves.]

]3.8.3 Final Installation

Do not force components together in a manner that causes binding of the running surfaces of the components. Do not use lubricants to assemble self-lubricated components unless otherwise specified.
3.9 ACCEPTANCE TESTING

Following the completion of installation, checkout, adjustment, [[and setting the] [limit switches], [controls], [interlocks],[] perform acceptance testing on each self-lubricated bearing system. Develop an acceptance test report form to record the acceptance testing results. For acceptance, operate the [gate] [bearing system] through [three][_____] complete cycles to satisfy the Contracting Officer that the requirements of the contract have been met and that the performance of the bearing system is satisfactory for the purpose intended.

Upon successful completion of the field tests, the bearing system and [related components] [accessory items and equipment] will be examined by the [Contracting Officer] [Project Personnel], and if found to comply with the contract it will be accepted by signature by all parties. Signatures and Acceptance will not occur until all found deficiencies have been corrected. Submit the Acceptance Test Report documenting the testing performed, findings of the testing, and correction of issues.

3.10 OPERATION AND MAINTENANCE MANUALS

[In addition to the requirements of Section 01 78 00 CLOSEOUT SUBMITTALS, include] [Provide] legible copies of the following information in the Operation and Maintenance Manuals. All information must be the most current and approved copy, reflecting any changes made during the construction process:

a. Self-lubricated Component Shop Drawings.

b. Self-Lubricated Component Field Installation Drawings.

[d] [e]. Self-Lubricated Material Manufacturer's Warranty.

[e] [f]. FCB Material Certifications.

[f] [g]. Post-Assembly QC Report

[g] [h]. Alignment QC Report

[h] [i]. Acceptance Test Report

3.11 TRAINING

Provide field training conducted by the [self-lubricated material manufacturer] [erection engineer] for operating staff after each system is functionally complete but prior to final acceptance. The training must be given for a period of not less than [four][_____] hours. Cover all pieces of equipment and include the items contained in the operation and maintenance manuals. Do not perform training until operation and maintenance manuals have been approved. Provide [four weeks] [_____] advance notice of the scheduled training. [Record video and audio of training conducted and provide two CD-ROM copies of the training. Provide MPEG-2 or MPEG-1 format to be compatible with common DVD players in the United States.]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for fabricating, assembling, delivering, and installing stoplogs. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 LUMP SUM PRICES

NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.

1.1.1 Stoplogs Payment

Payment shall constitute full compensation for furnishing all plant, labor,
materials and equipment and performing all operations necessary for installing the stoplogs as specified.

1.1.2 Unit of Measure

Unit of measure: lump sum.

1.2 REFERENCES

******************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A320/A320M (2017b) Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service

Structural Bolts, Steel, Heat Treated, 830 MPa Minimum Tensile Strength (Metric)

ASTM A490M (2014a) Standard Specification for High-Strength Steel Bolts, Classes 10.9 and 10.9.3, for Structural Steel Joints (Metric)

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detail Drawings; G[, [_____]]

SD-03 Product Data

Sequencing and Scheduling; G[, [_____]]
Welding

Materials

Identification System

SD-06 Test Reports

Tests, Inspections, and Verifications

1.4 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.5 DELIVERY, STORAGE, AND HANDLING

Delivery, handling and storage of materials and fabricated items shall conform to the requirements specified [herein and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Rubber seals shall be kept free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.5.2 Identification System

Submit an Identification System which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract.

[1.6 SEQUENCING AND SCHEDULING

**************************************************************************

NOTE: The name of the appropriate railroad company or roadway agency should be inserted as indicated.
**************************************************************************

Before the work is commenced, submit the approved sequencing and scheduling plan which illustrates that work affecting [railroads] [roadways] has been coordinated with [____]. The plan shall include schedules, lists of labor or materials to be provided to the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities. The plan shall clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed.
2.1 MATERIALS

Materials orders, materials lists and materials shipping bills shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel[, structural aluminum,] and other metal materials sections and standard articles shall be as shown and as specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to [ASTM A36/A36M][ASTM A242/A242M][ASTM A529/A529M][ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M].

2.1.1.2 Structural Aluminum

Structural aluminum shall conform to [ASTM B221M ASTM B221,] [ASTM B308/B308M[,] [Alloy 6061, Temper T6].]

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION and ZINC FILLER.
**************************************************************************

2.1.2.1 General Requirements

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa, 2,500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.2 MPa, 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>

<td>TEST VALUE</td>
<td>TEST METHOD SPECIFICATION</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees plus/minus 2 degrees C for 22 plus/minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as W1 (W1 is defined in ASTM D471). The immersion temperature shall be 70 degrees plus/minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.2.2  [Fabrication]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa2,000 psi (min.)</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

2.2  MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform to the requirements specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1  Bolts, Nuts and Washers

[High-strength bolts, nuts, and washers shall conform to [ASTM A325M ASTM A325,] Type [______]. [hot-dip galvanized] or [ASTM A490M ASTM A490,] Type [______].] [Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [______]] [Austenitic Steel, Grade [______], Class [______]].] Bolts 13 mm 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2  Screws

Screws shall be of the type indicated.
2.2.3  [Clips and Clip Bolts for [Aluminum] [Steel] Panels

Clips and clip bolts for [aluminum] [steel] panels shall be approved standard manufactured stock items.]

2.3   FABRICATION

2.3.1  Detail Drawings

Detail drawings of stoplogs and appurtenant shop fabricated items, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.1.1  Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.3.1.2  Shop Assembly Drawings

Show on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.3.1.3  Delivery Drawings

Show on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.3.1.4  Field Installation Drawings

Show on the field installation drawings a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; and methods for installing appurtenant items.

2.3.2  Structural Fabrication

Structural fabrication shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.3  Welding

Submit schedules of welding procedures for structural steel [and welding processes for aluminum]. Welding shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4  Bolted Connections

Bolted connections shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5  Machine Work

Machine work shall conform to the requirements specified in Section 05 50 14
2.3.6 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Zinc coating of hardware items shall conform to ASTM A153/A153M.]

2.3.7 Fabrications

2.3.7.1 Stoplogs [and Posts]

**************************************************************************

NOTE: Stoplogs and posts shall be fabricated of structural steel or aluminum. Where aluminum is specified, include the requirements for aluminum stoplogs and posts to be furnished by the Contractor, or aluminum materials and extrusion dies for fabricating stoplogs and posts to be furnished by the Government to the Contractor for fabricating aluminum stoplogs and posts if such is the practice in the Command.

**************************************************************************

[Stoplogs [and posts] shall be fabricated of [structural steel conforming to [ASTM A36/A36M] [ASTM A242/A242M] [ASTM A529/A529M] [ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M]] [extruded aluminum conforming to [ASTM B221M ASTM B221,] [ASTM B308/B308M,] [Alloy 6061, Temper T6].] [Steel items shall be galvanized where indicated.] [Stoplogs [and posts] shall be fabricated with the aluminum materials and extrusion dies provided to the Contractor by the Contracting Officer. Furnish all other materials and equipment as required for fabrication.]

2.3.7.2 Stoplog Guides [and Post Pockets]

Stoplog guides [and post pockets] shall be fabricated of structural steel conforming to [ASTM A36/A36M] [ASTM A242/A242M] [ASTM A529/A529M] [ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M].

2.3.7.3 Miscellaneous Embedded Metals

Corner protection angles, frames, base plates, and other embedded metal items required for complete installation shall conform to the details shown.

2.3.8 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and machine-finished after splicing.
2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

2.4.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Submit certified test reports for material tests, with all materials delivered to the site.

2.4.2 [Testing of Rubber Seals]

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUOROCARBON FILM</th>
<th>MACHINE METHOD AT 50 MM² INCHES PER MINUTE</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.762 mm 0.030 inch</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
</tr>
<tr>
<td>1.524 mm 0.060 inch</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
</tr>
</tbody>
</table>

Failure of any specimen to meet the requirements of the test used will be cause for rejection of the piece from which the test specimen was taken.

PART 3 EXECUTION

3.1 INSTALLATION

Installation shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.1.1 Embedded Metals

Corner protection angles, frames, base plates, and other embedded metal items required for complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour.

3.1.2 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate[s], a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.
3.1.3 Painting

Exposed parts of stoplogs and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, rubber seals, and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.2 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.3 ACCEPTANCE TRIAL OPERATION

After completion of installation, the Contracting Officer will examine the stoplog installation for final acceptance. The individual components of the stoplog installation will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will be required to place the stoplogs [and posts] in the guides [and post pockets] a sufficient number of times to demonstrate that the stoplogs fit properly and seat uniformly. Required repairs or replacements to correct defects, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected.

-- End of Section Table of Contents --
NOTE: This guide specification covers design-build gates and stop logs or boards made from fiber reinforced polymer (FRP) composite materials for use in low-head water control structures and weirs. Structures covered by this specification are to have a maximum static hydraulic head of 6.1 meters (20 feet), accounting for overflow, a maximum height of 3.7 meters (12 feet) and a maximum width of 3.7 meters (12 feet). This guide specification is not applicable if catastrophic failure of the water control structure would create a life safety risk as per ER 1110-2-1156. This specification covers the performance requirements for composite gates and stop logs or boards as well as appurtenant components such as seals, guide frames, anchors and fasteners.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

Units of work normally included should be FRP items which require specific fabrication to meet the desired project requirements.
NOTE: The scope section may be edited by the User as needed. However, the maximum design head and maximum width must not be increased.

1.1 SCOPE

This guide specification covers low-head FRP water control structures, such as gates, valves or stoplogs, and any appurtenant features defined in the Contract Drawings that have a maximum static hydraulic head of 6.1 meters 20 feet, accounting for overflow, a maximum height of 3.7 meters 12 feet and a maximum width of 3.7 meters 12 feet.

1.2 UNIT PRICES

Payment must constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for fabricating and installing the [Stoplogs] [Vertical Lift Gate] [_____] as specified.

1.2.1 Unit of Measure

Unit of measure: lump sum.

1.3 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN COMPOSITES MANUFACTURER'S ASSOCIATION (ACMA)

AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE)

AMERICAN WATER WORKS ASSOCIATION (AWWA)

AWWA C563 (2014) Fabricated Composite Slide Gates

ASME INTERNATIONAL (ASME)

ASME B18.22M (1981; R 2017) Metric Plain Washers

ASTM INTERNATIONAL (ASTM)

ASTM A320/A320M (2017b) Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service

ASTM F844 (2007a; R 2013) Washers, Steel, Plain (Flat), Unhardened for General Use

1.4 DEFINITIONS

1.4.1 Design Head

The maximum differential head that will actually be applied to the gate (from AWWA C563).

1.4.2 Failure Critical Member

Any member for which failure would cause collapse, partial collapse or loss of functionality of the structure.

1.4.3 Fracture Critical Member

A steel member (or component thereof) that is in tension and whose failure would result in collapse or partial collapse of the structure.

1.4.4 FRP Composites

A Fiber Reinforced Polymer (FRP) member composed of fibers and resin systems, including fillers and additives. These members are manufactured via pultrusion, filament winding, vacuum infusion, hand lay-up or other methods and may contain foam or wooden cores, metal frame members, other previously produced FRP composites or other materials. This includes structural shapes, sandwich panels, boards, or other members made of FRP.

1.4.5 Low-Head Water Control Structure

A gate, valve or stoplog structure with a maximum design head of 6.1 meters 20 feet, a maximum height of 3.7 meters 12 feet, and a maximum width of 3.7 meters 12 feet.

1.4.6 Stoplog

Horizontal members placed on top of each other fitting into a frame, groove or channel on each side channel in the water control structure.
Vertical Lift Gate
A gate that opens upward to allow water to flow under the gate. Vertical lift gates may also be referred to as sluice gates or slide gates.

Weir Dam
A dam to control water level by flowing water over the top of the structure; may include a control mechanism made of stoplogs or movable gates.

SEQUENCING AND SCHEDULING
Before the work is commenced, submit the approved sequencing and scheduling plan which illustrates that work affecting [railroads] [roadways] [utilities] [appurtenances] has been coordinated with [______]. The plan must include schedules, lists of labor or materials to be provided to the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities. The plan must clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] [appurtenances] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed or approved.

SUBMITTALS
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal.
under the SD number that best describes the submittal item.

Additional submittal requirements may be added by the User as needed.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-01 Preconstruction Submittals**

  Contractor, Manufacturer, and Engineer Qualifications; G[, [____]]

  Sequencing and Scheduling Plan; G[, [____]]

  Quality Control Plan

**SD-02 Shop Drawings**

  Detail Drawings; G[, [____]]

**SD-03 Product Data**

  [Slide Gate][Stop Log] Technical Data Sheet; G[, [____]]

  Materials variances G[, [____]]

**SD-05 Design Data**

  Design Documentation; G[, [____]]

**SD-06 Test Reports**

  Test Reports; G[, [____]]

  Include test reports to verify all material properties used in design following ASTM or other specification bodies where possible.

**SD-07 Certificates**

  Date and type of manufacture including constituent materials; G[, [____]]

  FRP Composites ; G[, [____]]

  Certification of State Product Approval; G[, [____]]

  Anchorage System; G[, [____]]
Proof of Certification; G[, [____]]

Provide proof of certification from a minimum of two quality assurance programs for its facilities or products (ISO, UL, DNV, ABS, USCG, AARR).

SD-08 Manufacturer's Instructions
Shipping, Handling, Storage, Installation Procedures; G[, [____]]

SD-09 Manufacturer's Field Reports
Certification of Installation; G[, [____]]
Field Leakage Test; G[, [____]]

SD-10 Operation and Maintenance Data
Care and Maintenance Instructions; G[, [____]]

SD-11 Closeout Submittals
Warranty ; G[, [____]]
Operation and Maintenance Manual; G[, [____]]
Data Book; G[, [____]]

1.7 MAINTENANCE MATERIAL SUBMITTALS

1.7.1 Spare Parts

**************************************************************************
NOTE: Include a list of all spare parts required.
This information should be provided on the contract drawings.
**************************************************************************

[____]

1.8 QUALITY CONTROL

1.8.1 General

The Contractor is responsible for quality control and must establish and maintain an effective quality control system [in accordance with Contract Clauses 52.236-6 SUPERINTENDENCE BY THE CONTRACTOR and 52.236-5 MATERIAL AND WORKMANSHIP and with SECTION H, SPECIAL CONTRACT REQUIREMENTS]. The quality control system must consist of plans, procedures, and organization necessary to produce an end product which complies with the requirements of this contract. The system must cover all design, fabrication, painting, and delivery operations. The Contractor must submit a written Contractor quality control plan for approval.

1.8.2 Regulatory Requirements

**************************************************************************
NOTE: Include all regulatory information.
**************************************************************************
1.8.3 Contractor, Manufacturer, and Engineer Qualifications

Provide documentation from manufacturer having a minimum of [five] years' experience in the manufacture of similar products and systems. Additionally, if requested, provide a record of at least [five] previous, separate, similar successful installations in the last [five] years. Submit Manufacturer's catalog data to include two copies of specifications, load tables, dimension diagrams, and anchor details for the following low-head water control structures and components.

Provide documentation from Engineer of Record having a minimum of [five] years' experience in the design of similar products and systems and copy of current license. Additionally, if requested, provide a record of at least [five] previous, separate, similar successful installations in the last [five] years.

[Ensure Manufacturer is certified to the ISO 9001 standard.]
[Submit Proof of Certification from a minimum of two quality assurance programs for its facilities or products (UL, DNV, ABS, USCG, AARR)]

1.9 DELIVERY, STORAGE, AND HANDLING

1.9.1 General

Submit recommendations for shipping, handling, storage, installation procedures, and care and maintenance instructions. Deliver manufactured materials in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Ensure all related adhesives, resins and their catalysts and hardeners are crated or boxed separately, and noted as such to facilitate their movement to a dry indoor storage facility under controlled temperature and humidity.

1.9.2 Handling and Storage

Handle all materials to prevent abrasion, cracking, chipping, twisting, other deformations, and other types of damage. Store adhesives, resins and their catalysts in dry indoor storage facilities following MDS requirements.

1.10 PROJECT/SITE CONDITIONS

1.10.1 Design Parameters

**************************************************************************

[_____]
all inclusive nor will all be necessary in all situations. User to edit this section as appropriate to include all relevant site conditions for the project and should be included with the scope of work or contract drawing documents.

**************************************************************************

NOTE: Provide information on the following items:
type of water control structure; height and width of opening; design head (including operating head); bearing conditions (embedded metals condition and layout); type of actuator preferred to operate gate; type of frame (conventional, self-contained thrust reaction) and installation (surface mounted, in-channel wall mounted, embedded in wall, etc.); frequency of operation; debris and ice loads; corrosive, acidic or alkaline water conditions; operational limits (lifting, handling, etc.); and other items listed in AWWA C563.

**************************************************************************

[_____] 1.11 WARRANTY

**************************************************************************

NOTE: Designated appurtenances of the gate assembly may be guaranteed for a minimum period of 1 year from the date of acceptance thereof, either for beneficial use or final acceptance, whichever is earlier, against defective materials and workmanship. Such guarantees will require the Contractor to furnish and install new replacement parts immediately upon receipt of notice from the Government of the failure of any part of the guaranteed items during the warranty period. These warranty requirements will be covered in the CONTRACT CLAUSES and this paragraph should be deleted from this section of the specifications.

**************************************************************************

Furnish manufacturer's no-dollar-limit warranty for the FRP composite low-head water control structure or components. The warranty period is to be no less than [1] [5] [10] [15] [20] years from the date of acceptance of the work and be issued directly to the Government. The warranty must provide that, if within the warranty period, the composite low-head water control structure or components show evidence of deterioration resulting from defective materials and/or workmanship, correcting of any defects is the responsibility of the manufacturer. Repairs that become necessary because of defective materials and workmanship while the composite low-head water control structure or components are under warranty are to be performed within [32] [_____] hours after notification, unless additional time is approved by the Contracting Officer. Failure to perform repairs within [32] [_____] hours of notification will constitute grounds for having emergency repairs performed by others and will not void the warranty.
PART 2   PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************

NOTE: This section should be modified to account for the specific type of water control structure. The materials listed are suggestions showing most commonly used for such structures. Unsuitable materials for a particular application can be removed. Specify similar metals or provide dielectric insulators as necessary.

**************************************************************************

Provide [vertical lift gate] [stop logs] [_____] composed of fiber reinforced polymer composites [and embedded metal frame] in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions as specified on the contract drawings and specifications.

Provide reinforcement in the form of glass or carbon fibers, mats, or fabrics to meet the design requirements and dimensions as specified. Select the reinforcement format for failure critical FRP components according to the mechanical requirements of the application and the geometry/shape of the part. Confirm selected reinforcements are compatible with selected resin matrix system to ensure proper adhesion/load transfer and long-term performance of the component in its intended physical-chemical environment of use. Ensure all surfaces of FRP composite items and fabrications are smooth, resin-rich, free of voids, and without dry spots, cracks, and un-reinforced areas as per quality requirements herein. Ensure all reinforcing fibers are completely covered during manufacturing with resin to a depth of 0.25 to 0.51 mm 0.01 to 0.02 inches to protect against their exposure to wear, water immersion, or weathering. Seal over fasteners that penetrate the FRP skin, end cuts, and penetrations in a way that prevents delamination and water ingress. Use mechanical fasteners or mechanical plus adhesive for built up FRP members connected in tension after manufacturing. Provide documentation showing core materials are resistant to decay and attack by fungus and bacteria.

Embedded frames made of [FRP] [galvanized steel] [T-_____] stainless steel] [aluminum] may be used to provide added stiffness to meet the specified requirements, but must be submitted to the Contracting Officer or their approved representative for approval and have a minimum of 1/4 inch thick FRP on each side. [Metal frames made of [galvanized steel][T-_____] stainless steel] [aluminum] must meet ASME/ASTM standards, be fully encapsulated in the FRP structure, and design submittals must account for the potential for the FRP to delaminate from the frame][Metal frames must be detailed to prevent galvanic corrosion if carbon is used in FRP]. Specification section [_____] must be referenced when embedded metals are used in conjunction with the composite structure. Provide anchored guide frames made of [carbon steel] [T-_____] stainless steel] [FRP] [aluminum] [or approved material] that attach into the sidewalls of the water control structure. [Galvanize or epoxy coat carbon steel frames as per AWWA C563.] Provide anchors which match the frame material and provide dielectric insulators to secure the guide frame into the surrounding water control structure. As necessary, coat anchors to inhibit corrosion.
2.1.1 Design Requirements

**************************************************************************

NOTE: A factor of safety of 5 is suggested based on the typical response of FRP composites under sustained loads. This can be adjusted based on the site conditions of the structure and the associated risks. The design life is the same as HSS, but it should be noted that FRP composites do not have the performance data needed to calibrate design codes. Thus, the determination of the parameters that affect the design life would be based on the judgment of the designer of record.

**************************************************************************

The water control structure must be designed in accordance with this specification to achieve the objectives of constructability, safety, serviceability, with due regard to issues of inspectability, and economy. The structural system must be proportioned and detailed to ensure the development of significant and visible inelastic deformations at the strength and extreme event limit states before failure. Load-path redundant structures should be used unless there are compelling reasons to not do so.

Submit design documentation showing the water control structure is capable of meeting a factor of safety of [5] [_____] defined as the ratio of ultimate stress to the working or allowable stress using allowable stress design prior to commencement of work. Maximum sustained stress cannot exceed one-fifth of failure stress and account for creep and the effects of water adsorption. Design life should be assumed to be [100] [_____] years assuming routine inspection and maintenance. All design computations are to be stamped by a registered professional engineer who will be identified as the Engineer of Record. All design computations must also be initialed by an additional registered professional engineer who will be identified in the design documents as having provided design quality control. See paragraph 3.5.2 "Data Book" for additional requirements.

2.1.1.1 Mechanical Anchorage

Mechanical anchorage system to be designed to meet the load requirements as outlined in ASCE 7 and paragraph 1.10.1 Design Parameters. Anchorage calculations are stamped by a Registered Professional Engineer. Expansion anchors are not permitted.

2.1.2 Performance Requirements

**************************************************************************

NOTE: Delete columns as appropriate based on gate type. Leakage requirements should only be included for instances where leakage is considered a critical issue. Leakage tests can be performed in the shop or in the field, though testing may not be practical based on the size and head on the gate.

**************************************************************************

Submit documentation including [Slide Gate][Stop Log] Technical Data Sheet showing the full gate system is capable of meeting the following
performance requirements prior to commencement of work.

<table>
<thead>
<tr>
<th>Test</th>
<th>Vertical Lift Gates</th>
<th>Stoplogs</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Leakage (AWWA C563)]</td>
<td>[Less than 1.3 lpm/m 0.1 gpm/ft of seating perimeter]</td>
<td>[Less than 0.62 lpm/m 0.05 gpm/ft of seating perimeter]</td>
</tr>
<tr>
<td>Gate Deflection</td>
<td>Less than 1/720 of the gate width at maximum head water</td>
<td>Less than 1/360 of the gate width, max of 6.4 mm 1/4 inch at maximum head water</td>
</tr>
<tr>
<td>Yoke Deflection</td>
<td>Less than 1/360 of the gate width, max 6.4 mm 1/4 inch at maximum head water</td>
<td>[not applicable]</td>
</tr>
</tbody>
</table>

2.2 MANUFACTURED UNITS

Miscellaneous materials and standard articles must conform to the respective standards or specifications below when that type of material is furnished. Where material requirements are not specified, materials furnished must be suitable for the intended use and are subject to approval. Submit date and type of manufacture including constituent materials. Submit materials variances for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1 Bolts, Nuts and Washers

Provide bolts, nuts, and washers of the material, grade, type, class, style and finish indiced or best suited for the intended use.

2.2.1.1 Bolts

Where the use of high strength bolts is required, the materials, workmanship, and installation must conform to the applicable provisions of ASTM F3125/F3125M and RCSC S348. Bolts for low-temperature applications must conform to ASTM A320/A320M. Bolts for non-high strength applications must conform to the applicable provisions of ASTM A307, Grade A.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1.2 Nuts

All nuts to be used with high strength bolts must conform to ASTM A563 and ASME B18.2.2

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1.3 Washers

All nuts must be equipped with washers. Washers to be used with high strength bolts must conform to ASTM F436/F436M. Plain washers must conform
to ASME B18.22M or ASME B18.21.1, Type B as applicable. Lock washers must conform to ASME B18.21.1.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2 Anchorage

**************************************************************************
NOTE: For most jobs, ASTM F1554 248 MPa 36 ksi anchor bolts are used. If high tensile loads are anticipated, the designer should consider the use of 379 MPa 55 ksi or 724 MPa 105 ksi ASTM F1554 anchor bolts. If stainless steel is considered, the designer should select from material in ASTM A193/A193M.
**************************************************************************

2.2.2.1 Anchor Rods

ASTM F1554 [Stainless steel Gr 36 [55] [105], Class 1A [2A]. ASTM A193/A193M.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2.2 Anchor Nuts

ASTM A563, Grade A, hex style. [Stainless steel ASTM A193/A193M.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2.3 Anchor Washers

ASTM F844. [Stainless steel [Type 304] [Type 316] conforming to ASTM A276/A276M.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2.4 Anchor Plate Washers

ASTM A36/A36M [Stainless steel [Type 304] [Type 316] conforming to ASTM A276/A276M.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2.5 [Sleeve Anchors] [Adhesive Anchors]

Provide [_____] mm [_____] inch diameter [sleeve anchors] [adhesive anchors]. Minimum concrete embedment must be [_____] mm [_____] in.
Design values listed must be as tested according to ASTM E488/E488M.

b. Minimum [ultimate][allowable] shear value: [_____] kN [_____] lb.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.3 EQUIPMENT

[Provide [manual] [powered] actuators to lift the gate as per AWWA C563].
[Provide lifting beams and storage racks for stop logs.]

2.4 MATERIALS

Miscellaneous materials and standard articles must conform to the respective standards or specifications below when that type of material is furnished. Where material requirements are not specified, materials furnished must be suitable for the intended use and are subject to approval. Submit materials variances for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.1 FRP Composites

**************************************************************************
NOTE: A wide range of strength properties for FRP composites are possible and depend on the fiber volume fraction, resin type, cross section, and manufacturing method. There is no need to specify a minimum design strength, as the manufacturer must design the low-head water control structure to meet the specified requirement. A manufacturer could use a weak material in bulk, or smaller quantities of a much stronger material. The key for the government is to ensure that the strength of the supplied FRP composite meets or exceeds the design values.

For reference, pultruded FRP composite structural shapes often have tensile, compressive and flexural strength design values at ultimate around 207 Mpa 30 ksi and tensile modulus around 17.2 Kpa 2.5 Msi in the lengthwise direction. Pultruded plates range from one half to two thirds of these values. FRP rods and bars are often two to three times stronger than structural shapes in tension and flexural. Properties of honeycomb members, sandwich panels and other shapes made via process other than pultrusion can vary significantly.

**************************************************************************
Submit documentation showing FRP composites meet the material properties used in the design as per the applicable [ASTM] [_____] test requirements. [Submit samples to permit verification testing for FRP composites made via hand-layup].

Submit documentation showing that FRP composites show no evidence of damage including breaks, cracks, blistering, delamination, exposure of fibers, or
combination thereof, after being subjected to ASTM D4329 or ASTM G154 for a minimum of 720 hours.

Allowable visual defects of FRP Composite members must meet conditions as per ASTM D4385 for pultruded members, Level II of ASTM D2563 for laminates or a similar appropriate specification for other types of FRP composites. Dimensional tolerances for pultruded components must meet ASTM D3917.

2.4.2 Structural Steel

**************************************************************************
NOTE: If structural steel is not permitted to be used, omit this section.
**************************************************************************

Use non-fracture critical steel members conforming to ASTM A36/A36M or ASTM A992/A992M.

Use fracture critical steel members conforming to ASTM A709/A709M, Grade 50 (F) for temperature Zone 2 or ASTM A992/A992M, Grade 50 with a minimum average Charpy V-Notch (CVN) impact test value of 34 N-m 25 ft-lbs when tested at 4.4 degrees Celsius 40 degrees Fahrenheit.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.3 Stainless Steel

**************************************************************************
NOTE: If stainless steel is not permitted to be used, omit this section.
**************************************************************************

Use stainless steel bars and shapes conforming to ASTM A276/A276M, UNS [S20910,] [S30400,] [S40500,] [S31600,] [_____] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S17400,] [S45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.4 Aluminum

**************************************************************************
NOTE: If aluminum is not permitted to be used, omit this section.
**************************************************************************

Use aluminum bars and shapes conforming to [ASTM B209][ASTM B308/B308M ][_____].

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.
2.4.5 Rubber Seals

NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION OF RUBBER SEALS AND TESTING OF RUBBER SEALS.

Use [fluorocarbon (Teflon) clad rubber seals of the mold type only] [compounded of natural rubber, synthetic polyisoprene, or a blend of both, and must contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers]. Submit documentation showing the seals meet the following requirements prior to commencing work:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent</td>
<td>6.2 MPa 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent of tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test must be performed with distilled water. The washed specimen must be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees 158 degrees F plus or minus 4 degrees F for 22 hours plus or minus 1/4 hour. The specimen must then be removed, allowed to cool to room temperature in air, and weighed. The weight must be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature must be 70 degrees C plus or minus 1 degree 158 degrees F plus or minus 2 degrees F and the duration of immersion is to be 166 hours.

Rubber seals must have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film must be [0.726 mm] [0.030 inch] thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and must have the following physical properties:

| Tensile strength                     | 13.8 MPa 2,000 psi (min.) |
| Elongation                           | 250 percent (min.)       |

The outside surface of the bonded film must be flush with the surface of the rubber seal and be free of adhering or bonded rubber. Strips and corner seals must be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the bulb.
the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film must be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

Submit variances of these suggested materials and test methods for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.6 Ultrahigh Molecular Weight Polyethylene (UHMWPE)

**************************************************************************
NOTE: If UHMWPE is not permitted to be used, omit this section.
**************************************************************************

If used, ultrahigh molecular weight polyethylene (UHMWPE) must conform to the following physical properties:

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>TEST VALUE (+/- 10 percent)</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specific gravity</td>
<td>0.93 g/cm³ 0.034 lbs/in³</td>
<td>ASTM D792</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>27.6 Mpa 4,000 psi</td>
<td>ASTM D638</td>
</tr>
<tr>
<td>Durometer</td>
<td>D68 (minimum)</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>Coefficient of friction</td>
<td>0.20 (maximum)</td>
<td>ASTM D1894</td>
</tr>
</tbody>
</table>

If the UHMWPE material is to be exposed to sunlight, the material must be stabilized for ultraviolet radiation via 2.5 percent carbon black or other equivalent stabilizer. The fabricated form must be from virgin resin. The virgin resin must be a homopolymer of ethylene and have an intrinsic viscosity (IV) between 22.0 and 28.0 dl/g per ASTM D4020.

2.5 FABRICATION

Follow the ACMA Code for pultruded FRP composites.

2.5.1 Drawings and Specifications

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the specified requirements [_____] days prior to starting fabrication. The structure design is communicated to the Government through the required submittals designated in these specifications. All information necessary to fabricate the structure as intended in the design is depicted in these documents. Denote failure critical members on all drawings with the abbreviation FC. Denote fracture critical members on all drawings with the abbreviation FCM. The notation of FC and FCM on the drawings provides critical information to the Government for the structural response of the structure. Drawings must not be reproductions of the Government furnished contract drawings.

2.5.2 Fabrication Drawings

Fabrication drawings must show complete details of materials, dimensions, tolerances, connections.
2.5.3 Fabrication Tolerances

Measure dimensions by an approved measuring system. Submit the measuring system for approval with the work plan (i.e. calibrated steel tape of approximately the same temperature as the material being measured). The overall dimensions of an assembled structural unit must be within the tolerances indicated on the drawings or as specified for the item of work. Where tolerances are not specified in other section of these specifications or shown, a variation of $0.8 \text{ mm} \ 1/32\text{-inch}$ is permissible in the overall length of component members with both ends milled and component members without milled ends must not deviate from the dimensions shown by not more than $1.6 \text{ mm} \ 1/16\text{-inch}$ for members $3.7 \text{ meters} \ 12 \text{ feet}$ or less in length.

2.5.4 Delivery Drawings

Delivery drawings must provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.6 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified material test reports with all material delivered to the site. Tests, inspections, and verifications for materials and fabricated items must conform to the requirements specified.

2.6.1 General

Tests, inspections, and verifications for materials must conform to the specified requirements. Submit certified test reports for material tests, with all materials delivered to the site.

2.6.2 Inspection

**************************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************************

Inspect shop assembled components for accurate fit and compliance with dimensional tolerances. Sealing, guiding, and connecting surfaces must be inspected to determine if their planes are true, parallel, and in uniform contact with opposing surfaces.

2.6.3 Operation Tests Prior to Installation

**************************************************************************
NOTE: This paragraph is only applicable to slide gates.
**************************************************************************

The operation of the shop-assembled gate assembly must be tested by opening and closing the gate several times by use of the operating machinery. The force used to operate the gate must be the minimum required to open and close the gate. Since the sill of the unembedded gate frame is not fully supported during the operation tests, special precaution must be taken to prevent the application of excessive force on the gate leaf and frame when the gate is closed. The operation of the lifting beam must be tested by engaging and disengaging the lifting beam several times. Adjustments must be made as required until operations are satisfactory as
determined by the Contracting Officer or their approved representative.]

**************************************************************************

NOTE: The shop hydrostatic leakage test outlined below may not be practical due to the size or head requirements of the gate. This test should only be required if gate leakage is considered a critical issue.

**************************************************************************

[The gate assembly must be tested hydrostatically prior to installation by applying a hydrostatic pressure of [_____] Mpa [_____] psi, measured at the sill of the gate frame, to the upstream side of the gate leaf in the closed position. Under hydrostatic testing, the gate seals must prevent water leakage meeting paragraph 2.1.2.]

PART 3 EXECUTION

3.1 EXAMINATION

Gate will be inspected when delivered to site. When Government inspections result in product rejection, promptly segregate and remove rejected material from the premises. The Government may also charge an additional cost of inspection or testing when prior rejection makes re-inspection or retesting necessary.

3.2 PREPARATION

3.2.1 Protection

Protect the surrounding water control structure to prevent damage during the installation of the gate. Install temporary water control structures if replacing an existing gate to ensure water control is maintained.

3.3 INSTALLATION

Installation must conform to the requirements specified. Gate and appurtenant items must be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication must be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Submit certification of installation. Submit Certification of State Product Approval.

3.4 FIELD QUALITY CONTROL

3.4.1 Tests

**************************************************************************

NOTE: The field leakage test outlined below may not be practical due to the size or head requirements of the gate. This test should only be required if gate leakage is a critical issue. Consideration should be given to the ability to apply head to the gate in the field.

**************************************************************************

[Conduct a field leakage test including [operating the gate] [removing and replacing stoplogs] to ensure the as-built gate meets the requirements of.
3.5 CLOSEOUT ACTIVITIES

3.5.1 Demonstration and Training

Demonstrate gate operation and provide training for [USACE] [owner] [_____] employees for a maximum [8] [_____] hours.

Provide an operation and maintenance manual to [USACE] [owner] [_____].

3.5.2 Data Book

Compile and maintain a "Data Book" throughout the duration of the contract. The "Data Book" consists of copies of all Requests for Information (RFI's) with Government responses, Material Orders, Mill Certification Reports and Certification Letter's. Use tabs to separate each specific item identified above and a Table of Contents to identify which tab corresponds to which item. The in-progress "Data Book" must be available to the Government to review during shop inspections of the project.

When final revisions have been completed, prepare a "Certificate of Conformance" on their company letterhead certifying that: 1) all materials and workmanship included in the project were detailed, designed, manufactured, tested, inspected and documented as specified in the contract requirements; and 2) the requirements of applicable codes, standards, specifications and drawings have been complied with and that all required quality assurance documentation verify conformance to the contract documents have been submitted, signed by the Contractor's Quality Control System Manager and Engineer of Record.

Submit a draft copy of Final "Data Book" for review and approval within fifteen (15) calendar days following the completion of fabrication activities. Within thirty (30) calendar days of receipt of the Final "Data Book", the Government will return one copy annotated with any necessary corrections. Within fourteen (14) calendar days the Contractor must revise the "Data Book" accordingly at no extra cost and submit the Final Copy of the Final "Data Book" including the "Certificate of Conformance" to the Government. Approval and acceptance of the Final "Data Book" is required before final payment to the Contractor.

3.6 WARRANTY

**************************************************************************
NOTE: For USACE projects, delete the first two subparagraphs and utilize the tailored option.
**************************************************************************

3.6.1 Manufacturer's Warranty

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.6.2 Contractor's Warranty for Installation

Submit contractor's warranty for installation to the Contracting Officer prior to final commissioning and acceptance.
3.6.3 Contractor's Five (5) Year No Penal Sum Warranty
## CONTRACTOR'S FIVE (5) YEAR NO PENAL SUM WARRANTY FOR COMPOSITE LOW-HEAD WATER CONTROL STRUCTURE

The composite low head water control structure or component installed on the above named structure is warranted by [_____] for a period of [5][10][20] [_____] years against workmanship and material deficiencies, wind damage and structural failure within project specified design loads[, and leakage exceeding paragraph 2.1.2]. The composite low-head water control structure and components covered under this warranty includes, but is not limited to, the following:

Framing and structural members, opening mechanisms including motors, storage racks, accessories, trim, miscellaneous closure items, connectors, components, and fasteners, and other system components and assemblies installed to enable operation of the composite low-head water control structure, and items specified in other sections of these specifications that become part of the composite low-head water control structure.

All material and workmanship deficiencies, system deterioration caused by exposure to the elements and/or inadequate resistance to specified service design loads and water leaks must be repaired as approved by the contracting officer.

All material deficiencies, structural failure, and leakage associated with the composite low-head water control structure covered under this warranty must be repaired as approved by the contracting officer.

This warranty covers the entire cost of repair or replacement, including all material, labor, and related markups. The above referenced warranty commenced on the date of final acceptance on [_____] and will remain in effect for stated duration from this date.

Signed, dated, and notarized (by company president)

(Company President)                                    (Date)

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of miter gates and appurtenant items as specified and shown. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

PART 1   GENERAL

1.1   UNIT PRICES

**NOTE:** If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.

Select Alternate 1 (one pay item) or Alternate 2 (two pay items). Delete all paragraphs of Alternate not selected.
1.1.1 Furnishing and Installing Miter Gates

NOTE: Alternate 1.

1.1.1.1 Payment

Payment will be made for costs associated with furnishing and installing miter gates and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of miter gates and appurtenant items including gate leaves, diagonals, strut connections, miter guides, miter latches, recess latch strikes, quoin and miter contact blocks, gudgeon top anchorages, pintle assemblies, [walkways,] [bridgeways,] gudgeon embedded anchorages, wall quoins, sill assemblies, seal assemblies, recess latches, bumpers, fenders, and all other items necessary for complete installation.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Furnishing Miter Gates

NOTE: Alternate 2.

1.1.2.1 Payment

Payment will be made for costs associated with furnishing miter gates and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of miter gates and appurtenant items including gate leaves, diagonals, strut connections, miter guides, miter latches, recess latch strikes, quoin and miter contact blocks, gudgeon top anchorages, pintle assemblies, [walkways,] [bridgeways,] gudgeon embedded anchorages, wall quoins, sill assemblies, seal assemblies, recess latches, bumpers, fenders, and other items necessary for complete installation.

1.1.2.2 Unit of Measure

Unit of Measure: lump sum.

1.1.3 Installing Miter Gates

NOTE: Alternate 2.

1.1.3.1 Payment

Payment will be made for costs associated with the installation of miter gates and appurtenant items, which includes full compensation for the complete installation and testing of miter gates and appurtenant items.
1.1.3.2 Unit of Measure

Unit of measure: lump sum.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WELDING SOCIETY (AWS)

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.
The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
- Detail Drawings: G[, [_____]]
- Diagonals Prestressing: G[, [_____]]
- Gudgeon Embedded Anchorage: G[, [_____]]

SD-03 Product Data
- Materials
- Diagonals Prestressing
- Gudgeon Embedded Anchorage
- Welding

SD-04 Samples
- Materials: G[, [_____]]

SD-06 Test Reports
- Tests, Inspections, and Verifications

SD-07 Certificates
- Epoxy Filler

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
1.4.2 [Safety Provisions for Zinc Filler]

The following special safety provisions are required for heating and placing zinc filler:

a. Workers shall wear protective clothing including hard hats with fine wire mesh screen, goggles, leather sleeves, chaps, apron, and leather gloves.

b. Workers shall wear air-line respirators certified by National Institute for Occupational Safety and Health (NIOSH) or Mine Safety and Health Administration (MSHA). In enclosed spaces, both local exhaust ventilation and air-line respirators are required. Local exhaust ventilation shall consist of movable hoods placed close to the work to remove fumes at the source.

c. Ladles, equipment, and material shall be pre-heated before being used so that they will be moisture-free.

d. Heating devices and ladles shall be placed on a level, firm foundation, and protected against traffic, accidental tipping, or similar hazard.

e. Hot zinc shall not be carried up or down ladders.

f. Buckets or vessels used for handling and transporting hot zinc shall be substantially constructed and shall not be filled higher than 100 mm (4 inches) from the top.

1.4.3 Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.3.1 Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

1.4.3.2 Shop Assembly Drawings

Show on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

1.4.3.3 Delivery Drawings

Show on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

1.4.3.4 Field Installation Drawings

Show on the field installation drawings a detailed description of the field installation procedures. Include in the description the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of
maintaining components in correct alignment; plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler; [procedures and equipment used for heating and placing of the zinc filler;] and methods for installing other appurtenant items.

1.5 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items in accordance with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Do not distort rubber seals during handling.

1.5.2 [Epoxy Filler

Deliver epoxy filler from the manufacturer just prior to use in the work to insure receipt of recently manufactured material and store under cover, out of direct sunlight, at a temperature between 20 to 30 degrees C 65 to 85 degrees F.]

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract. Materials orders, materials lists and materials shipping bills shall conform with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Submit approved samples prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum bronze and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to ASTM A36/A36M.
2.1.1.2 Structural Steel Plates

Structural steel plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade 50].

2.1.1.3 Steel Pipe

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.4 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.5 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A167, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION and ZINC FILLER.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers.

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa2,500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>

<td>Test Method Specification</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-------------------------------------</td>
<td>----------------------------</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as Muplicitscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree and the duration of immersion shall be 166 hours.

2.1.2.2  [Fabrication]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

- Tensile strength 13.8 MPa2,000 psi (min.)
- Elongation 250 percent (min.)

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

2.1.3  [Epoxy Filler]

Epoxy filler shall be an approved epoxy resin formulation equal to "Nordback," a product of Nordberg Mfg. Co., or an approved equal, with a specific gravity of 1.70 to 1.75, minimum compressive strength after 72 hours at 20 degrees C 70 degrees F of 114 MPa 16,500 psi, and maximum shrinkage of 0.15 percent. Submit Manufacturer's certificate for epoxy filler stating that it meets or exceeds the specified physical properties; material shall be delivered to the site.

2.1.4  [Zinc Filler]

ASTM B6.

2.1.5  [Bumpers and Fenders]

[Bumpers and fenders shall be "Rubbumper," a product of Missouri Dry Dock & Repair Co., or an approved equal.] [Timber bumpers and fenders shall conform to [west coast fir] [or] [southern yellow pine], structural grade, dressed surfacing, pressure treated with creosote conforming to AWPA P3 in accordance with AWPA U1. Bumpers and fenders shall be cut, beveled, or bored as required before being pressure treated.]
2.1.6 Asphalt Saturated Preformed Filler Strips
    ASTM D1751.

2.1.7 Asphalt Cement
    ASTM D3019.

2.1.8 Asphalt Mastic
    SSPC PS 9.01.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490M ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Perritic Steel, Grade [____]] [Austenitic Steel, Grade [____], Class [____]]. Bolts M16 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated on the drawings.

2.3 FABRICATION

2.3.1 Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown on the drawings. Splices shall occur only where shown or approved. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of [cathodic protection system devices and other] appurtenances as required.

2.3.2 Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination.
**************************************************************************
Welding shall conform with the requirements of AWS D1.1/D1.1M, AWS D1.2/D1.2M, the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.3.3 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6 Fabrications

2.3.6.1 Gate Leaf

Gate leaf shall be of welded structural steel fabrication consisting of horizontal girders, [vertical beams,] [vertical girders,] intercostals, diaphragms, quoin post, gudgeon pin hood, operating strut connections, skin plate, and adjustable diagonals. Gate leaf shall be shop-fabricated. Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved by the Contracting Officer and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of the gate leaf shall not vary from the nominal dimension or differ from the mating gate leaf by more than 6 mm 1/4 inch. The surfaces of framing elements to which skin plates are to be welded shall not vary from a true plane by more than 5 mm 3/16 inch. The outside surfaces of skin plates welded to framing members shall not vary from a true plane by more than 5 mm. 3/16 inch. Splices in skin plates shall be located only where shown or approved. [In addition to welds specifically indicated on the drawings for nondestructive testing, [____] percent of the welds in the girders, gudgeon pin hood, verticals and skin plate of the gate leaf shall receive nondestructive testing. The location of these additional welds for testing shall be as directed by the Contracting Officer.] Gate leaf shall be provided complete with quoin and miter contact [blocks] [posts], miter guide assembly, pintle assembly, gudgeon anchorage, seal assembly, and other appurtenant components as required for complete installation, specified herein and shown.
2.3.6.2 Wall Quoin

Wall quoin shall consist of a welded structural steel frame with adjustable stainless steel base anchors and adjustable stainless steel quoin contact [block] [post].

2.3.6.3 Quoin and Miter Contact [Blocks] [Posts]

Quoin and miter contact [blocks] [posts] shall be of stainless steel bars conforming to ASTM A276/A276M or ASTM A564/A564M. Splices in contact [blocks] [posts] shall be made by an offset method so that there will not be a continuous joint across the [block] [post]. [Splices in gate leaf contact [block] [post] shall occur only at the centerlines of horizontal girders.] Splice locations shall match those of the opposing [block] [post]. Contact faces of contact [blocks] [posts] shall be milled at splices to assure watertight joints. Contact [blocks] [posts] shall be provided with adjusting bolts as shown.

2.3.6.4 Pintle Assembly

Pintle assembly shall consist of pintle socket, pintle, and pintle base as shown. Pintle socket shall be of cast nickel-alloy steel. Pintle socket shall be press-fitted with an aluminum bronze bushing with bearing surfaces finished truly hemispherical. Pintle shall be of [cast alloy] [forged alloy] steel with bearing surfaces of corrosion-resisting steel. Pintle ball shall receive a 0.4 micrometer 16 microinch finish and shall be fitted into the bushing by scraping until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. The pintle ball shall be match-marked with the bushing when fitted and so erected in the field. Pintle base shall be of cast steel. Bolt holes for attaching pintle socket to gate leaf shall be drilled and reamed after the pintle socket is assembled with gate leaf. Pintle socket shall be connected to the bottom of the lower girder web of the gate leaf with stainless steel bolts.

2.3.6.5 Gudgeon Anchorage

Gudgeon anchorage shall consist of gudgeon pin barrel, gudgeon anchorage links, gudgeon pin, and gudgeon embedded anchorage. Gudgeon pin barrel shall be of welded [structural steel plates] [forged alloy steel plates conforming to ASTM A668/A668M] and shall be fitted with a bronze bushing. Gudgeon anchorage links and gudgeon pin shall be of forged alloy steel conforming to ASTM A668/A668M. Gudgeon anchorage links shall be pin connected to the gudgeon embedded anchorage and shall have a threaded section for adjustment of the gate leaf. The threaded section shall have right and left threads, a hexagonal sleeve nut with 13 mm1/2 inch threads, and a jam nut with standard threads at each end of the sleeve nut. The gudgeon embedded anchorage shall consist of a structural steel frame with end-restrained anchor bolts conforming to [ASTM A325M. ASTM A325.] [ASTM A490M. ASTM A490M.]

2.3.6.6 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals
shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and machine-finished after splicing.

2.3.6.7 Appurtenant Items

Sill assemblies, latches, bumpers fenders, seal plates and shapes, and other appurtenant items shall conform to details specified and shown.

2.3.7 Shop Assembly

Shop assembly requirements for miter gates and appurtenant items shall be as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Miter gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved by the Contracting Officer, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise approved by the Contracting Officer. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.4.1 General

Tests, Inspections, and Verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.2 Testing of Rubber Seals

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:
### THICKNESS OF FLUOROCARBON FILM

<table>
<thead>

#### PART 3 EXECUTION

#### 3.1 INSTALLATION

Installation shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Miter gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

##### 3.1.1 Embedded Metals

Sill assemblies, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

##### 3.1.2 Pintle Assembly

Base anchors for the pintle assembly shall be embedded in first-pour concrete. The pintle assembly base plate shall be attached to base anchors, adjusted to the exact elevation and center-to-center distance shown, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete. The concrete shall be allowed to set 72 hours and must reach a minimum compressive strength of [_____] MPa psi before loading is applied. [The space in the floating pintle base not occupied by the pintle shoe shall be filled completely with sponge rubber before the gate leaf is set in place.]

##### 3.1.3 Gudgeon Embedded Anchorage

Submit approved gudgeon embedded anchorage prestressing plan prior to initiating the anchorage operations. Gudgeon embedded anchorage prestressing record prior to completion of the contract. The gudgeon embedded anchorage, except for anchor bolts and horizontal anchor arms, shall be covered with asphalt saturated preformed strips applied with asphalt cement prior to being embedded in concrete. Anchor bolts shall be coated with asphalt mastic. The gudgeon embedded anchorage shall be aligned, leveled, and blocked rigidly in place to prevent displacement before concrete is placed. Concrete shall be placed in a manner not to damage the preformed strips. Anchor bolts shall be prestressed after the concrete has attained the specified strength in accordance with contract...
drawings and approved field installation drawings. A record of the gudgeon embedded anchorage prestressing operations shall be compiled and submitted immediately after completion of the prestressing operations.

3.1.4 Wall Quoin

Base anchors for the wall quoin shall be embedded in first-pour concrete. The wall quoin shall be attached to base anchors prior to setting the gate leaf in place. After the gate leaf is set in place, the wall quoin shall be plumbed and adjusted in relation to the gate leaf quoin so as to provide for continuous contact between the sealing surfaces of the wall and gate leaf quoin contact [blocks] [posts] over the full height of the gate leaf. This adjustment shall be made almost entirely by moving the wall quoin so that the gap for the [epoxy] [zinc] filler behind the gate leaf quoin contact [block] [post] remains near the nominal dimension. After final adjustments have been made, the wall quoin shall be anchored firmly and the second-pour concrete shall be placed in the blockout.

3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the field as required for installation. The pintle ball shall be coated with grease prior to setting the gate leaf in place. Pintle grease pipes shall be tapped into pintle bushing in correct register with bushing grease grooves. Grease pipes shall be flushed prior to connecting to bearings. All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the miter ends of the gate leaf due to compression of blocking or other causes. After the gate leaf has been set in place and the components of gudgeon anchorage are connected to the gate leaf, the gate leaf shall be plumbed and brought into correct position by adjusting the sleeve nuts of the diagonals and the gudgeon anchorage links.

3.1.6 Diagonals

Gate leaf diagonals shall be attached to the gate leaf after the leaf is set in place. **Diagonals prestressing** shall be performed before the final adjustment of the quoin and miter contact [blocks] [post] are made. Prestressing of diagonals shall be as specified, shown, and as approved on the prestressing plan developed by the Contractor. Submit approved diagonal prestressing plan prior to initiating the prestressing operations. Submit diagonal prestressing records immediately after completion of the prestressing operations. The plan for prestressing the diagonals shall describe the method of prestressing, including the materials, connections, rigging, anchorages, and stress measuring equipment. Compile a record of the prestressing operations consisting of the information indicated in the following table:

<table>
<thead>
<tr>
<th>STRESS DATA TABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gate Leaf Location:</td>
</tr>
<tr>
<td>--------------------</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>Diagonal</td>
</tr>
<tr>
<td>[___]</td>
</tr>
</tbody>
</table>
1. Initial strain gage readings shall be made after slack is removed.

2. Final strain gage readings shall be made after prestressing is complete.

3. \( E \) is the total elongation over the full length of the diagonal, computed from the strain gage readings.

4. \( D \) is the prestress deflection of the leaf as shown on the drawings.

5. \( d \) is the field deflection of the leaf measured after completion of the prestress operation; it is the deflection when final strain gage readings are taken.

3.1.7 Gate Leaf Quoin and Miter Contact [Blocks] [Posts]

After the wall quoin has been adjusted and concreted in place and final adjustments made to the gudgeon anchorage links, gate leaf quoin and miter contact [blocks] [posts] shall be adjusted to provide continuous contact over the full height of the gate leaf in the mitered position. After the gate leaf diagonals are prestressed and final adjustments of gate leaf quoin and miter contact [blocks] [posts] have been made with the gate leaf in the mitered position, the gate leaf shall be swung out of miter and [epoxy] [zinc] filler poured behind the quoin and miter contact [blocks] [posts]. Prior to pouring of the filler, the surfaces to receive the filler shall be cleaned free of dirt, rust, and other foreign materials. The adjusting and holding bolts shall be coated with grease or other bond breaker to prevent adherence of the filler.

3.1.7.1 Placing [Epoxy] [Zinc] Filler

[A field test to determine the indentation hardness of the epoxy filler compound shall be conducted prior to placement. The field test procedures are as follows:

a. Cast a 50 mm 2 inch cube sample of mixed epoxy filler compound in a mold and cure at room temperature (20 to 25 degrees C 70 to 80 degrees F) for 24 plus or minus 8 hours.

b. Remove from mold and cut sample to expose interior surface.

c. Sand exposed interior surfaces to remove saw marks and provide a smooth surface.

d. Using a Type D Durometer conforming to ASTM D2240, measure the hardness across the exposed interior surface, taking a minimum of three readings on each half of the sample. Care must be taken during the durometer reading to insure the spring loaded pin used to penetrate the surface is not in a depressed surface caused by either residual saw marks or an exposed air bubble. The average reading should be at least 85, with no individual reading below 82. If the durometer readings fall below the required minimum values, the material will be rejected.
The manufacturer's instructions for placing the epoxy filler shall be followed explicitly. Special precautions must be taken to prevent leakage of the filler during placement. The complete masses of the metals whose surface areas are to receive the epoxy filler should have a temperature of 15 to 30 degrees C 60 to 90 degrees F. The epoxy filler shall be kept free from moisture or other foreign materials during mixing and placement and for at least 48 hours after placement.

[Immediately preceding the pouring of the zinc filler, the adjacent metal components shall be pre-heated to a temperature of 100 to 150 degrees C 212 to 300 degrees F by an approved method which does not buckle the metal components. The zinc filler shall then be poured at a temperature which will insure that it will completely fill all interstices. Pouring temperature of zinc filler shall be maintained between 430 and 480 degrees C 810 and 900 degrees F to minimize volatilization and oxidation of the zinc.]

3.1.7.2 Adjusting Contact [Blocks] [Posts]

After the [epoxy has set] [zinc has cooled], quoin and miter contact [blocks] [posts] shall be drawn up against the filler by tightening of the adjusting bolts. After the contact [blocks] [posts] are adjusted, the gate leaves shall swing into the mitered position without interference of the quoin contact [blocks] [posts] and the gate leaf quoin contact [block] [post] shall make tight contact with the wall quoin contact [block] [post].

3.1.8 Miter Guide

Miter guide shall be installed after the contact [blocks] [posts] have been properly set. The guide bracket and roller bracket shall be mounted on gate leaves with leaves in the mitered position. The roller shall be centered accurately in the saddle of the contact [blocks] [posts] and shall be in full contact with the [blocks] [posts]. Adjustment of the miter guide shall be accomplished by adjusting the guide bracket and roller bracket so that the gap behind the contact [blocks] [posts] for the [epoxy] [zinc] filler is kept at the nominal dimension. Proper adjustment of the brackets should allow either gate leaf to be mitered or opened without moving the other leaf. After final adjustments have been made, bolt holes shall be drilled in the brackets and gate leaves, brackets shall be bolted securely in place, and [epoxy] [zinc] filler shall be placed behind the contact [blocks] [posts].

3.1.9 Painting

Exposed parts of gates and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.10 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate(s), a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.
3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section 26 42 19.10 CATHODIC PROTECTION SYSTEMS FOR LOCK MITER GATES.

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skin Plate Watertightness Test

**************************************************************************

NOTE: Skin plate watertightness tests should not be required when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.

**************************************************************************

After the gate leaf diagonals are prestressed but prior to painting and mounting of seals, skin plate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 400 kPa 60 psi at the nozzle, to one face of the skin plate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.]

3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.3 SUBMITTALS

******************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.
The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
1.4.2  **Detail Drawings**

Provide detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.2.1  **Fabrication Drawings**

Provide fabrication drawings showing complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

1.4.2.2  **Shop Assembly Drawings**

Provide shop assembly drawings showing details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

1.4.2.3  **Delivery Drawings**

Provide delivery drawings showing descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

1.4.2.4  **Field Installation Drawings**

Provide field installation drawings showing a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing hinge bracket anchors, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing pintle and hinge assemblies, including checking and maintaining alignments during concreting; and methods for installing other appurtenant items.

1.5  **DELIVERY, STORAGE, AND HANDLING**

Provide delivery, handling, and storage of materials and fabricated items as described below.

1.5.1  **Materials and Fabricated Items**

Delivery, handling, and storage of materials and fabricated items shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.

1.5.2  **Rubber Seals**

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the
rubber. Rubber seals shall not be distorted during handling.

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract; and materials orders, materials lists, and materials shipping bills in conformance with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum-bronze, and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel Shapes

ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

[ASTM A36/A36M,] [ASTM A572/A572M, Grade 50,] [or] [ASTM A588/A588M, Grade 50].

2.1.1.3 Steel Pipe

[ASTM A53/A53M, Type S, Grade B, seamless, black, normal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.] [ASTM A501/A501M, seamless, outside diameter and nominal wall thickness as shown.]

2.1.1.4 Steel Castings

ASTM A27/A27M, Grade [____], Class [____]; or ASTM A148/A148M, Grade [____].

2.1.1.5 Steel Forgings

ASTM A668/A668M, Class [____], carbon content not exceeding 0.35 percent, and chemical composition which results in satisfactory weldability.

2.1.1.6 High-Strength Steel Bar

ASTM A722/A722M, Type [____], and complying with all supplementary requirements.

2.1.1.7 Stainless Steel Bars and Shapes

ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.
2.1.1.8 Stainless Steel Plate, Sheet, and Strip

ASTM A167, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.9 Bronze Castings

ASTM B22/B22M, Copper Alloy UNS No. C91300.

2.1.1.10 Aluminum-Bronze Castings

ASTM A148/A148M, Copper Alloy UNS No. [______].

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers.

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.2 MPa900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus one (1) degree and the duration of immersion shall be 166 hours.
2.1.2.2  [Fabrication

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa, 2,000 psi (min.)</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

2.1.3  Bumpers and Fenders

[Bumpers and fenders shall be "Rubbumper," a product of Missouri Dry Dock & Repair Co., or an approved equal.] Timber bumpers and fenders shall conform to [west coast fir] [or] [southern yellow pine], structural grade, dressed surfacing, pressure treated with creosote conforming to [AWPA P3] in accordance with AWPA U1. Bumpers and fenders shall be cut, beveled, or bored as required before being pressure treated.

2.1.4  Asphalt Mastic

SSPC PS 9.01.

2.2  MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown and specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1  Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490M ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [____]] [Austenitic Steel, Grade [____]], Class [____]. Bolts M16 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2  Screws

Screws shall be of the type indicated on the drawings.
2.3 FABRICATION

2.3.1 Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown. Splices shall occur only where shown or approved. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of appurtenances as required.

2.3.2 Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination.
**************************************************************************

Welding shall conform with [AWS D1.1/D1.1M, AWS D1.2/D1.2M,] the requirements specified, and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval of the Contracting Officer, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.3.3 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6 Fabrications

Submit approved samples, prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full
size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded. Fabrications shall conform to the following requirements.

2.3.6.1 Gate Leaf

Gate leaf shall be of welded fabrication except for bolted appurtenances. Gate leaf shall consist of a pintle socket, pipe column, and hinge pin housing integrally framed with horizontal and vertical trusses supporting vertical ribs faced with a continuous skin plate. Pintle socket shall be of cast steel conforming to ASTM A27/A27M. Pintle socket shall be press-fitted with bronze bushing conforming ASTM B22/B22M. Bearing surfaces of the bronze bushing shall have a truly hemispherical 0.4 micrometer 16 microinch finish. Pipe column shall conform to [ASTM A53/A53M] [ASTM A501/A501M]. Hinge pin housing shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. Trusses and vertical ribs shall be of structural steel conforming to ASTM A36/A36M. Skin plate shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50,] [ASTM A588/A588M, Grade 50]. Gate leaf shall be shop-fabricated. Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of the gate leaf shall not vary from the nominal dimension or differ from the mating gate leaf by more than 6 mm 1/4 inch. The surfaces of the vertical ribs to which skin plates are to be welded shall not vary from a true plane by more than 5 mm 3/16 inch. The outside surfaces of skin plates welded to the vertical ribs shall not vary from a true plane by more than 5 mm 3/16 inch. Splices in skin plates shall be located only where shown or approved. [In addition to welds specifically indicated on the drawings for nondestructive testing, [_____] percent of the welds in the [hinge pin housing] [joints between trusses and pintle socket] [joints between trusses and hinge pin housing] [joints between vertical webs and skin plate] [and] skin plate shall receive nondestructive testing. The location of these additional welds for testing shall be as directed by the Contracting Officer.] Gate leaf shall be provided complete with pintle assembly, hinge assembly, seal assembly, and other appurtenant components as required for complete installation as specified and shown.

2.3.6.2 Hinge Assembly

Hinge assembly shall consist of hinge bracket support anchor frame, hinge bracket support, hinge bracket, and hinge pin. Hinge bracket support anchor frame shall be a welded structural steel frame with high strength anchor bolts conforming to ASTM A722/A722M for prestressed anchorage of the hinge bracket support. Hinge bracket support and hinge bracket shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. The hinge pin barrel section of the hinge bracket shall be fitted with [a stainless steel collar conforming to ASTM A564/A564M and] [a bronze bushing conforming with ASTM B22/B22M] [an aluminum bronze bushing conforming to ASTM B148]. Hinge pin shall be of [forged steel conforming to ASTM A668/A668M] [stainless steel conforming to [ASTM A276/A276M] [ASTM A564/A564M]]. [In addition to welds specifically indicated on the drawings for nondestructive testing, [_____] percent of the welds in the hinge assembly components shall receive nondestructive testing. The location of these additional welds for testing shall be directed by the Contracting Officer.] [Welded hinge assembly components shall be
stress-relieved by heat-treating after all welding is completed. Stress-relieving shall be performed prior to machining.]

2.3.6.3 Pintle Assembly

Pintle assembly shall consist of pintle base anchor frame, pintle base, pintle socket seal retainer ring assembly, pintle, and pintle socket which shall be an integral component of the gate leaf. Pintle base anchor frame shall be a welded structural steel frame [with high strength anchor bolts conforming to ASTM A722/A722M for prestressed anchorage of the pintle base]. Pintle base shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. Pintle shall be of [cast alloy steel] [forged alloy steel with bearing surfaces of corrosion-resisting steel deposited in weld passes to a thickness of not less than 3 mm 1/8 inch and machined the required shape]. The pintle ball shall receive a 0.4 micrometer 16 microinch finish and shall be fitted into the bushing of the pintle socket by scraping the bushing until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. The pintle ball shall be match-marked with the bushing when fitted and so erected in the field.

2.3.6.4 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and shall be machine-finished after splicing.

2.3.6.5 Appurtenant Items

Seal plates, seal shapes, pintle socket seal retainer ring assembly, bumpers, fenders, [walkways,] [bridgeways,] and other appurtenant items shall conform to details specified and shown.

2.3.7 Shop Assembly

Shop assembly requirements for sector gates and appurtenant items shall be as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Sector gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matching of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. Shop assembly and disassembly work shall be performed in the presence of the Contracting
2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests, with all materials delivered to the site.

2.4.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

[2.4.2 Testing of Rubber Seals]

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUOROCARBON FILM</th>
<th>MACHINE METHOD AT 50 MM² INCHES PER MINUTE</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.524 mm0.030 inch 13.6 kg per 25 mm30 pounds per inch width</td>
<td>13.6 kg per 25 mm30 pounds per inch width</td>
<td></td>
</tr>
<tr>
<td>0.726 mm0.060 inch 13.6 kg per 25 mm30 pounds per inch width</td>
<td>13.6 kg per 25 mm30 pounds per inch width</td>
<td></td>
</tr>
</tbody>
</table>

3.1 INSTALLATION

Perform installation in conformance with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Sector gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Seal shapes, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded
anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 Hinge Assembly Embedded Anchorages

Submit record of the prestressing of hinge bracket anchors immediately after completion of the prestressing operations. The hinge assembly embedded anchorages consisting of the hinge bracket support anchor frame and attached hinge bracket support anchor bolts shall be aligned accurately, leveled, and blocked rigidly in place to prevent displacement before concrete is placed. Hinge bracket support anchor bolts shall be coated with asphalt mastic prior to the placement of first-pour concrete. Hinge bracket support shall be connected to anchor bolts and embedded in second-pour concrete. Anchor bolts shall be prestressed as shown on contract drawings and approved field installation drawings after the concrete has attained the specified strength. A record of the prestressing operations shall be compiled and submitted.

3.1.3 Pintle Base Anchor Frame and Pintle Base

**************************************************************************
NOTE: Design options provided in this paragraph consist of the pintle base bearing directly on an anchor frame embedded in second-pour concrete and anchored with bolts embedded in first-pour concrete, the pintle base bearing directly on second-pour concrete and anchored with bolts attached to an anchor frame embedded in first-pour concrete, and the prestressing of pintle base anchor bolts when attached to an anchor frame embedded in first-pour concrete.
**************************************************************************

[Anchor bolts for the pintle base anchor frame shall be embedded in first-pour concrete. Submit record of the prestressing of the pintle base anchors immediately after the prestressing operations are completed. Pintle base anchor frame shall be attached to the anchor bolts, aligned, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete. Pintle base shall be bolted to the pintle base anchor frame.] [Pintle base anchor frame shall be embedded in first-pour concrete. Pintle base shall be attached to the pintle base anchor bolts extending from the embedded anchor frame, aligned, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete.] [Pintle base anchor bolts shall be prestressed as shown on contract drawings and approved field installation drawings. A record of the prestressing operations shall be compiled and submitted.] Concrete pours shall be allowed to set for 72 hours and must attain the specified before any loading is applied.

3.1.4 Pintle

Surfaces of the pintle base shall be cleaned thoroughly prior to installing the pintle. The pintle shaft shall be set in the pintle base and secured by lock-bolting.

3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the
field as required for installation. Pintle socket seal retainer ring assembly shall be attached to the pintle socket and the pintle ball shall be coated with grease prior to setting the gate leaf in place. Pintle grease pipes shall be tapped into pintle bushing in correct register with bushing grease grooves. Grease pipes shall be flushed prior to connecting to bearings. All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the sector gate leaf due to compression of blocking or other causes.

3.1.6 Hinge Bracket and Hinge Pin

Hinge bracket shall be attached to the hinge bracket support after the gate leaf has been set in place. Hinge pin shall be inserted to connect the hinge pin barrel of the hinge bracket to the hinge pin housing of the gate leaf. Hinge bracket shall be adjusted so that the center of the hinge pin is in vertical alignment with the center of the pintle and each gate leaf swings without interference and any point on the moving gate leaf remain in a plane throughout the range of movement.

3.1.7 Painting

Exposed parts of gates and appurtenances, except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.8 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gates, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section 26 42 19.10 CATHODIC PROTECTION FOR LOCK MITER GATE.

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skinplate Watertightness Test

**************************************************************************
NOTE: Skinplate watertightness tests should be deleted when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.
**************************************************************************

After the gate leaves are installed but prior to painting and mounting of seals, skinplate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 400 kPa 60 psi at the
nozzle, to one face of the skinplate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.]

3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

NOTE: This guide specification covers the requirements for fabrication, assembly, delivery, and installation of tainter gates, anchorage assemblies, and appurtenant items. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

1.1  UNIT PRICES

NOTE: Delete paragraph UNIT PRICES and incorporate appropriately edited paragraphs from below into Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES.

1.1.1  Alternate 1

a. "Furnishing Tainter Gates and Appurtenant Items"

   (1) Payment will be made for costs associated with furnishing tainter gates and appurtenant items, which includes full
compensation for materials, fabrication, shop assembly, and
delivery of tainter gates, including gates, trunnions, trunnion
yokes, trunnion pins, and appurtenant items, including cable
attachment brackets, seal assemblies, side seal plates, dogging
brackets, sill beams, stop beams, and other items necessary for
complete installation.

(2) Unit of measure: lump sum.

b. "Furnishing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for costs associated with furnishing
tainter gate anchorage assemblies, which includes full
compensation for materials, fabrication, and delivery of tainter
gate anchorage assemblies, including tainter gate trunnion girders
and prestressing assemblies for anchoring trunnion girders to
piers [and trunnion yokes to trunnion girders, and other items
necessary for complete installation].

(2) Unit of measure: lump sum

c. "Installing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for cost associated with the complete
installation of tainter gates anchorage assemblies.

(2) Unit of measure: lump sum.

1.1.2 Alternate 2

a. "Furnishing and Installing Tainter Gates and Appurtenant Items"

(1) Payment will be made for costs associated with furnishing and
installing tainter gates and appurtenant items, which includes full
compensation for materials, fabrication, shop assembly,
delivery, and installation of tainter gates, including gates,
trunnions, trunnion yokes, trunnion pins, and appurtenant items,
including cable attachment brackets, seal assemblies, side seal
plates, dogging brackets, sill beams, stop beams, and other items
necessary for complete installation.

(2) Unit of measure: lump sum.

b. "Furnishing and Installing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for costs associated with furnishing and
installing tainter gate anchorage assemblies, which includes full
compensation for materials, fabrication, delivery, and
installation of tainter gate anchorage assemblies, including tainter
gate trunnion girders and prestressing assemblies for
anchoring trunnion girders to piers [and trunnion yokes to
trunnion girders, and other items necessary for complete
installation].

(2) Unit of measure: lump sum.

1.1.3 Alternate 3

"Furnishing and Installing Tainter Gates, Appurtenant Items, and
Tainter Gate Anchorage Assemblies"

(1) Payment will be made for costs associated with furnishing and installing tainter gates, appurtenant items, and tainter gate anchorage assemblies, which includes full compensation for materials, fabrication, shop assembly, delivery, and installation of tainter gates, including gates, trunnions, trunnion yokes, trunnion pins; appurtenant items, including cable attachment brackets, seal assemblies, side seal plates, dogging brackets, sill beams, and stop beams; and tainter gate anchorage assemblies, including tainter gate trunnion girders and prestressing assemblies for anchoring trunnion girders to piers [and trunnion yokes to trunnion girders, and other items necessary for complete installation].

(2) Unit of measure: lump sum.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

***********************************************************************************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control
System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders and Welding Operators

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.2 Certification of Prestressing Technicians

Submit certificates, for prestressing technicians who will use the proposed system in the work, 30 days prior to the start of prestressing operations certifying by name that the technicians are trained and skilled in the use of the proposed system.

1.4.3 Manufactured Units and Fabricated Items

Samples of manufactured units and shop fabricated shall be full-size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is identified and its location recorded.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Perform delivery, handling, and storage of materials and fabricated items in conformance with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Do not allow prestressing steel materials to come in contact with the earth. Protective wrappings and coverings shall not be removed until immediately prior to use in the work. Each prestressing tendon shall be closely inspected prior to use in the work. Tendons with nicks, pits, bends or damaged threaded ends shall not be used in the work.

1.5.2 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 21 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

PART 2 PRODUCTS

2.1 MATERIALS

System of identification which shows the disposition of specific lots of
approved materials and fabricated items in the work, before completion of the contract. Provide materials orders, materials lists, and materials shipping bills conforming with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum-bronze, and other metal materials used for fabrication shall conform to the requirements shown on the drawings and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel Shapes

ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

[ASTM A36/A36M,] [ASTM A572/A572M, Grade 50,] [or] [ASTM A588/A588M, Grade 50].

2.1.1.3 Steel Pipe

[ASTM A53/A53M, Type S, Grade B, seamless, black, normal size and weight class or outside diameter and nominal wall thickness as shown on the drawings, [plain] [threaded] [threaded and coupled] ends.] [ASTM A501/A501M, seamless, outside diameter and nominal wall thickness as shown on the drawings.]

2.1.1.4 Steel Castings

ASTM A27/A27M, Grade [_____], Class [_____]; or ASTM A148/A148M, Grade [_____].

2.1.1.5 Steel Forgings

ASTM A668/A668M, Class [______], carbon content not exceeding 0.35 per cent, and chemical composition which results in satisfactory weldability.

2.1.1.6 Stainless Steel Bars and Shapes

ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.7 Stainless Steel Plate, Sheet, and Strip

ASTM A167, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.8 Bronze Castings

ASTM B22/B22M, Copper Alloy UNS No. C91300.

2.1.1.9 Aluminum-Bronze Castings

ASTM B148, Copper Alloy UNS No. [______].
2.1.10  Prestressing Steel Bar Tendons

ASTM A722/A722M, Type [____], including Supplementary Requirements, except the degree of bending for bend tests shall be 180 degrees. Certified manufacturing records and test reports for tendons shall be provided, identified with specific lots, and approved prior to use of tendons in the work. Manufacturing records for tendons shall include mixing casting, cooling, rolling, cold-stressing to 80 percent of the minimum ultimate strength, and stress-relieving. Test reports shall include chemical analyses, mechanical properties testing and stress-strain curves, mechanical coupling demonstration, and product analyses of finished tendons representing each heat.

2.1.11  Steel Bars for Concrete Reinforcement

Steel bars for concrete reinforcement other than steel bar prestressing tendons shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.1.12  Anchorages and Couplers

Submit certificates for anchorages and couplers 30 days prior to the start of prestressing operations. Anchorages and couplers for prestressing tendons shall be of metal of proven corrosion resistance and compatibility with tendons and shall be tested by an approved method and certified to be capable of developing the minimum ultimate strength of tendons without excessive slip. Anchorages shall be plate, bar, or other positive connecting type which allows complete placement and consolidation of concrete around and within its confines and exerts uniform bearing on the concrete. Couplers shall be provided with housing or enclosures which are long enough to permit the necessary movements and fittings which allow complete grouting of all components.

2.1.13  Ducts

Ducts for encasing prestressing tendons shall be of the type [shown on the drawings] [approved by the Contracting Officer]. Ducts shall retain shape under the weight of concrete and shall not permit the entrance of cement paste from concrete.

2.1.2  Concrete

As specified in Section 03 30 00 CAST-IN-PLACE CONCRETE [and Section 03 45 33 PRECAST[ PRESTRESSED] STRUCTURAL CONCRETE].

2.1.3  Asphalt Mastic

Asphalt Mastic shall conform to [____].

2.1.4  Premolded Expansion Joint Sheets

As specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.1.5  Gaskets for Seal Assemblies

Rubber gasket sheets for seal assemblies shall have nominal Shore A durometer value of [40][55][80] with dimensions as shown on the drawings.
2.1.6 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION below.
**************************************************************************

2.1.6.1 General

Rubber seals shall be compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>1.38 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.21 MPa 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees C for 22 hours plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as W1 (W1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.6.2 [Fabrication]

Rubber seals shall have a fluoro-carbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be 0.762 [0.030 inch] thick Huntington Abrasion Resistant fluoro-carbon Film No. 4508, or equal, and shall have the following physical properties:

| Tensile strength              | 13.8 MPa 2,000 psi (min.) |
| Elongation                    | 250 percent (min.)        |

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish.
lengths shown on the drawings and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluoro-carbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.1.7 Cement for Grout

ASTM C150/C150M, Type I or II.

2.1.8 Grout Admixture

Submit manufacturer's description of grout admixture, for approval, 30 days prior to the use of the material in the work. Grout admixture shall be a shrinkage compensating type which produces 2 percent maximum and 10 percent maximum unconfined expansion of the grout when tested in accordance with ASTM C940, shall not contain chlorides, fluorides, or nitrates and may be dispensed in solid or liquid form. Complete manufacturer's description of the grout admixture shall be submitted for approval.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown on the drawings and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, Ferritic Steel, Grade [____] [Austenitic Steel, Grade [____], Class [____]]. Bolts 13-mm 1/2-inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated on the drawings.

2.3 GROUT

Grout shall be a mixture of Portland cement specified in paragraph CEMENT FOR GROUT, shrinkage compensating admixture specified in paragraph GROUT ADMIXTURE, and potable water. Final mix proportions shall be based on test results of sample mixtures. The water content of grout shall be the minimum necessary for proper placement but the water-cement ratio shall not exceed 0.50 by weight. The fluidity of grout shall be determined in accordance with ASTM C939/C939M. The efflux time of a grout sample immediately after mixing shall not be less than 11 seconds. The minimum 7-day compressive strength of 50-mm 2-inch grout cubes molded, cured and tested in accordance with ASTM C109/C109M shall be 17.2 MPa 2500 psi.
2.4 FABRICATION

2.4.1 Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.1.1 Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, machined surface finishes, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.4.1.2 Shop Assembly Drawings

Provide on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.4.1.3 Delivery Drawings

Provide on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.4.1.4 Field Installation Drawings

Provide on the field installation drawings a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for installation of prestressing assemblies, including proposed stressing sequences and stressing calculations for anchorage assemblies.

2.4.2 Structural Fabrication

Structural fabrication shall conform with the requirements shown on the drawings and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown on the drawings. Dimensional tolerances shall be as specified and shown on the drawings. Splices shall occur only where shown on the drawings or approved by the Contracting Officer. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of appurtenances as required.

2.4.3 Welding

******************************************************************************
NOTE: List applicable welds requiring radiographic examination.
******************************************************************************

SECTION 35 20 16.46 Page 15
Welding shall conform with the requirements [of AWS D1.1/D1.1M, AWS D1.2/D1.2M,] specified herein, and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval of the Contracting Officer, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown on the drawings. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.4.4 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.5 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.6 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.7 Fabrications

Submit samples for approval prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded.

2.4.7.1 Gates

Gates shall be of welded fabrication except for bolted appurtenances as shown on the drawings. Structural steel framing members shall be of structural steel conforming to ASTM A36/A36M. Skin plate shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50,] [ASTM A588/A588M, Grade 50]. Gates shall be shop-fabricated. Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved by the Contracting Officer and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of gates shall not vary from the nominal dimension by more than 6 mm 1/4 inch. The surfaces of framing elements which support skin plates shall be in true alignment within 5 mm 3/16 inch so that skin plates will be in full bearing on all contact surfaces before being welded. The outside faces of skin plates after being welded to framing elements shall not vary from the surface established on the drawings by more than 5 mm 3/16 inch. Splices in skin plates shall be located only where shown on the drawings. Trunnions shall be an integral part of the gate framing and shall be stress-relieved by heat treatment.
after welding. The machining of trunnion hubs and bushings shall be performed after welding of the hubs is completed. The classification of fit between trunnion hubs and bushings shall be as shown on the drawings. Dowel holes and grease holes shall be drilled in bushings after installation in trunnion hubs. Gates shall be provided with seal assemblies and other appurtenant items as shown on the drawings.

2.4.7.2 Trunnion Pins

Trunnion pins shall be of [[cast steel conforming to [ASTM A27/A27M] [ASTM A148/A148M]] [alloy steel forging conforming to [ASTM A668/A668M] clad with corrosion resisting steel [weldment] [shrink-on sleeve] as shown on the drawings. The clad surface shall be machined after completion of all welding. The thickness of the cladding after final machining shall be not less than 25 mm 1 inch thick] [corrosion resisting steel as shown on the drawing]].

2.4.7.3 Trunnion Yokes

Trunnion yokes shall be provided complete with adjusting plates and bolts and thrust washers. Yokes shall be stress-relieved by heat treatment and machined to the class to fit shown on drawings after fabrication welding is completed.

2.4.7.4 Prestressing Anchorage Assemblies

Submit prestressing records immediately after the work is completed. Furnish descriptions of the proposed method for installing the prestressing assemblies, for approval, 30 days prior to the start of prestressing operations. Prestressing assemblies shall consist of prestressing tendons, anchorages, ducts, grout and other appurtenances as required and shown on the drawings.

   a. Prestressing tendons shall be as specified in paragraph PRESTRESSING STEEL BAR TENDONS.

   b. Anchorages shall be as specified in paragraph ANCHORAGES AND COUPLERS.

   c. Ducts shall be as specified in paragraph DUCTS.

   d. Grout shall be as specified in paragraph GROUT.

2.4.7.5 Trunnion Girders

Trunnion girders shall be [[cast-in-place] [precast] concrete girders of the 28-day compressive strength shown on the drawings and post-tensioned with prestressing anchorage assemblies. The ducts of the anchorage assemblies shall be cast in the girders in the positions and alignments shown on the drawings. The installation of prestressing assemblies shall be as specified in paragraph PRESTRESSING ANCHORAGE ASSEMBLIES. Reinforcement steel, premolded expansion joint sheets, blockouts and other components of the girders shall be as specified and indicated on the drawings] [structural steel as shown on the drawings].

2.4.7.6 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the
full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown on the drawings. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown on the drawings and shall be machine-finished after splicing.

2.4.7.7 Appurtenant Items

Cable attachment brackets, dogging brackets, side seal plates, sill beams, stop beams and other appurtenant items shall conform to the requirements specified and shown on the drawings. The sealing surfaces of side seal plates and sill beams shall be flush, straight, and free from offsets, warps, twists or other distortions.

2.4.8 Shop Assembly

Shop assembly requirements for tainter gates, anchorage assemblies and appurtenant items shall be as shown on the drawings and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates shall be assembled completely in the shop to assure satisfactory field installation. Adjoining components and appurtenant items shall be fitted and bolted together to facilitate field connections. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions permit. Rubber seals shall be fitted and drilled to match the seal retainers on the gates, match-marked and removed for shipment. Drilled slots for attaching seals shall allow a minimum adjustment of plus/minus 10 mm 3/8 inch. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise waived in writing by the Contracting Officer. The presence of the Contracting Officer during assembly or disassembly will not relieve the Contractor of any responsibility under this contract.

2.5 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.5.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.5.2 Testing of Rubber Seals

**************************************************************************
NOTE: If fluoro-carbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluoro-carbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight
method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluoro-carbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUORO-CARBON FILM</th>
<th>MACHINE METHOD AT 50 mm2 INCHES PER MINUTE</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.762 mm 0.030 in.</td>
<td>5.25 N per mm 30 lbs per inch width</td>
<td>5.25 N per mm 30 lbs per inch width</td>
</tr>
<tr>
<td>1.524 mm 0.060 in.</td>
<td>5.25 N per mm 30 lbs per inch width</td>
<td>5.25 N per mm 30 lbs per inch width</td>
</tr>
</tbody>
</table>

PART 3 EXECUTION

3.1 INSTALLATION

Perform installation conforming with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Seal shapes, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 Trunnion Girders

Trunnion girders shall be anchored to concrete piers as specified and shown on the drawings. [The installation, post-tensioning and grouting of prestressing assemblies for anchoring trunnion girders shall conform to the requirements specified in paragraph PRESTRESSING ASSEMBLIES.]

3.1.3 Trunnion Yokes

Trunnion yokes shall be installed and adjusted in strict accordance with the procedure shown on the drawings. [The final alignment of trunnion yokes shall be performed after the prestressing tendons of the anchoring prestressing assemblies have been post-tensioned partially as specified in paragraph POST-TENSIONING.] Special precautions shall be exercised to align the trunnion yokes so that the center lines of trunnion pins at the opposite ends of each gate are concentrically located on the established horizontal line. The eccentricity of the actual centerline of each trunnion pin with respect to the established horizontal line shall not be more than 0.8 mm 1/32 inch. The horizontal distance between trunnion yokes...
shall not vary more than 3 mm 1/8 inch from the established dimension. [Second-pour, high-strength concrete fills shall be placed between the bases of trunnion yokes and trunnion girders [and concrete non-shrink grout fills shall be placed between the yokes of trunnion yokes and the abutting faces of concrete piers] after the successful completion of the trial operation specified in paragraph TRIAL OPERATIONS and the final alignment of trunnion yokes.] [Complete tensioning of the prestressing tendons shall be performed after the concrete fills have attained the minimum [strengths] [strength]. The installation, post tensioning and grouting of prestressing assemblies for anchoring trunnion yokes to trunnion girders shall conform to the requirements specified in paragraph PRESTRESSING ASSEMBLIES.]

3.1.4 Gates

**************************************************************************
NOTE: The water-tightness tests on the skinplates should be deleted when complete or spot radiographic or ultrasonic examination of the skinplates is required by the specifications.
**************************************************************************

The trunnion lubrication system lines shall be purged, filled with grease and connected to each trunnion assembly prior to installing gates. The bearing surfaces of trunnion pins and bushings shall be cleaned and coated with grease prior to installing the trunnion pins. Gates shall be assembled in the field in strict conformity with shop match markings. Controlling dimensions and alignments shall be checked and corrected as required before starting field welding. Welding shall be done in a manner such that distortion of gates is prevented. Erection bolts, lugs and ties shall be removed after welding is completed. Holes and depressions shall be filled with weld metal and surface projections shall be removed by grinding. [Skinplate welds shall be tested for water-tightness after the gates are installed but prior to painting and mounting of seals by coating one face of the skinplate with soapsuds and applying air pressure with a hose using a minimum air pressure of 414 kPa 60 psi at the nozzle to the opposite face.] Disclosed leaks shall be sealed with light welds.

3.1.5 Prestressing Assemblies

The proposed method and equipment for installing prestressing anchorage assemblies, including riggings, tensioning jacks, gages, dynamometers and load cells or other devices for measuring stress loads, shall provide for the accurate installation of the assemblies and shall be selected by the Contractor and submitted for approval.

3.1.5.1 Ducts

Ducts shall be accurately placed, aligned and adequately supported at close intervals to limit sag and deviation from established lines when tendons are inserted and concrete is placed. Ducts shall have grout openings at both ends and grout vents as required. Connections and other joints in ducts shall be watertight. Openings shall be adequately protected to prevent the entry of water, concrete or debris. Ducts shall not have blockages, dents or other defects which could cause increased friction between tendons and ducts or restrict grout flow.

3.1.5.2 Steel Bar Prestressing Tendons

Steel bar prestressing tendons shall be inspected before being placed in
ducts to assure that they are not bent, nicked, scored or have damaged threaded ends. Tendons should not be placed in ducts until all welding has been completed on templates, supports or other items near or in contact with the tendons.

3.1.5.3 Anchorages

Anchorages for steel bar prestressing tendons shall be set in a plan normal to the axis of the tendon so that uniform bearing on the concrete is assured and shall be positively connected to tendons. Ends of tendons shall extend beyond anchorages to accommodate testing. End extensions shall be removed after tests are completed and approved.

3.1.5.4 Post-Tensioning

Complete records of the prestressing operation shall be compiled and submitted as required in paragraph GROUT RECORDS. Tensioning of the steel bar prestressing tendons shall be as specified and shown on the drawings. Tendons shall be tensioned a minimum of [_____] days after the casting of concrete piers [and girders]. Tensioning shall not be started until tests on concrete cylinders made and cured under the same conditions as the piers [and girders] indicate that the concrete has attained the required minimum strength. The tensioning operation shall be conducted in a manner so that the load being applied and the elongation of the tendon may be measured at all times. Elongation measurements shall be accurate to 0.25 mm 0.01 inch. Jack gage readings shall be accurate to the nearest 500 kPa 100 psi. If the stress in a tendon determined by gage pressure differ from the stress determined by elongation measurement in excess of 5 percent the cause of the difference shall be determined and corrected before proceeding with the tensioning operation. [Longitudinal tendons in concrete trunnion girders shall be tensioned prior to the placement of the second-pour, high-strength concrete fills for the sections of piers adjacent to the face of trunnion girders.] [The transverse tendons which anchor trunnion girders to piers shall be tensioned after the second-pour concrete fills for the piers have attained the minimum required strength.] [The transverse tendons which anchor trunnion yokes to trunnion girders shall be partially tensioned prior to the trial operation of tainter gates as specified below in paragraph TRIAL OPERATIONS and prior to the final adjustment of trunnion yokes as specified and shown on the drawings. Complete tensioning of these tendons shall not be performed until after the trunnion yokes have been adjusted and the second-pour, high-strength concrete fills between the base of trunnion yokes and the trunnion girders [and the concrete grout fills between the yokes of trunnion yokes and the piers] have attained the required minimum [strength] [strengths].] Exposed ends of prestressing components shall be protected from damage during the tensioning operations; take the safety measures necessary to prevent accidents caused by failure of prestressing components.

3.1.5.5 Verification of Prestressing Forces

Individual prestressing tendons selected by the Contracting Officer shall be tested to verify the sustentation of prestress forces by being subjected to a force equal to the design force between 7 and 14 days after the complete tensioning of all tendons. Tendons which sustain the applied force without being unseated will be considered to be satisfactory. The number of tendons tested shall not exceed 10 percent of all tendons unless a tested tendon is unable to sustain the required test force. If a tested tendon is unable to sustain the required test force all tendons shall be tested and retensioned if required to the initial prestress. Retensioned
3.1.5.6 Grouting

Prestressing assemblies shall be grouted immediately after complete tensioning of prestressing tendons and verification of prestressing forces. Grout shall conform to the requirements specified in paragraph GROUT. Grouting equipment shall provide continuous mechanical mixing and placing of grout, measure grout mix volume and measure volume of grout placed within 2500 cubic mm 0.1 cubic foot. Grout pump shall be a positive displacement type and have the capacity to develop a pressure of 1.38 MPa 200 psi. Stand-by water flushing equipment shall be provided for flushing out ducts partially grouted and stopped due to blockage or equipment breakdown. Ducts for prestressing tendons shall be flushed free of water, dirt or any other foreign substance and shall be blown out with compressed air until no water comes through just prior to grouting. Ducts shall be pressure grouted at a minimum pressure of 690 kPa 100 psi immediately after post-tensioning has been completed. Grouting shall continue until all air within the duct has been displaced with grout. Once the grouting of a system of prestressing tendons and ducts has been started the grouting operation shall be continuous until that system has been completely grouted. Grout placement records shall be compiled.

3.1.6 Appurtenant Items

Side seal plates, sill beams, stop beams and other items to be embedded in second-pour concrete shall be attached to anchors, aligned, leveled and rigidly blocked to prevent displacement during the placement of concrete. Side seal plates shall be aligned in planes normal to the axis of rotation of the gates and shall be checked before being embedded in concrete to ensure that they do not vary more than 2.5 mm 3/32-inch from the established alignment in an arc length of 3.6 m 12 feet. Welded field splices in exposed metals shall be ground smooth to assure proper sealing. Metal supports for rubber seals shall be continuous and free of waves, winds and distortions. Rubber seals shall be installed after the [skinplate water-tightness test and] gate painting operations have been completed. Seals shall be adjusted after installation so that they are slightly compressed in the closed, unwatered condition to prevent excessive depression and wear in the closed, watered condition. [The heating system for seals shall be installed as shown on the drawings and specified in Section [_____] CREST-GATE-SEAL.]

3.1.7 Trial Operations

Gates shall be trial operated after the complete installation of gates and appurtenant items. Trial operations shall be performed and approved prior to placing the second-pour, high-strength concrete fills around embedded appurtenant items [and between trunnion yokes and trunnion girders and prior to the complete tensioning of the prestressing tendons anchoring the trunnion yokes]. Hoist lifting cables shall be adjusted and trunnion bushings shall be lubricated through the permanent lubrication fittings with an approved, extreme-pressure lubricant before operating the gates. Gates shall move smoothly and without binding or lateral sway when raised and lowered through the complete range of travel. Defects disclosed from trial operations shall be corrected and trial operations repeated by the Contractor at no cost to the Government. Trial operations shall be repeated after complete tensioning and grouting of all prestressing assemblies.
3.1.8 Second-Pour, High-Strength Concrete [and Concrete Grout] Fills

**************************************************************************
NOTE: The zones and strengths of high-strength concrete and concrete grout should be shown on the drawings.
**************************************************************************

The second-pour, high-strength concrete fills for the sections of piers adjacent to the face of trunnion girders [and the space between the base of trunnion yokes and trunnion girders] [and the concrete grout fills between the yokes of trunnion yokes and the piers] shall be as shown on the drawings and as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.1.9 Painting

Exposed parts of gates and appurtenances, except machined surfaces, stainless steel surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.10 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gates, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section [26 42 17.00 10 CATHODIC PROTECTION SYSTEM (IMPressed CURRENT)] [26 42 19.10 CATHODIC PROTECTION SYSTEMS (IMPressed CURRENT) FOR LOCK MITER GATES].

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skinplate Watertightness Test]

**************************************************************************
NOTE: Skinplate watertightness tests should be deleted when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.
**************************************************************************

After the gate leaves are installed but prior to painting and mounting of seals, skinplate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 414 kPa 60 psi at the nozzle, to one face of the skinplate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.]
3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of vertical lift slide gate, vertical lift wheel gate, and vertical lift tractor gate and appurtenant items. This section was originally developed for USACE Civil Works projects.

Adhere to **UPC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard** when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

**PART 1  GENERAL**

1.1 **LUMP SUM PRICES**

NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.

Select Alternate 1 (one pay item) or Alternate 2 (two pay items). Delete all paragraphs of Alternate
not selected.

1.1.1 Furnish & Install Gate & Appurtenances

NOTE: Alternate 1, Vertical Lift Slide Gate.

1.1.1.1 Payment

Payment will be made for costs associated with furnishing and installing vertical lift slide gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift slide gate and appurtenant items including gate leaf, stem, stem guides, leaf nuts, leaf nut wrench, seal collars, frame, [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate] for supporting operating machinery, [lock assembly,] [leaf springs,] [air vent liner,] and other appurtenances necessary for complete installation.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Furnish Gate & Appurtenances

NOTE: Alternate 2, Vertical Lift Slide Gate.

1.1.2.1 Payment

Payment will be made for costs associated with furnishing vertical lift slide gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery, of vertical lift slide gate and appurtenant items including gate leaf, stem, stem guides, leaf nuts, leaf nut wrench, seal collars, frame, [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate] for supporting operating machinery, [lock assembly,] [leaf springs,] [air vent liner,] and other appurtenances necessary for complete installation.

1.1.2.2 Unit of Measure

Unit of Measure: lump sum.

1.1.3 Install Gate & Appurtenances

NOTE: Alternate 2, Vertical Lift Slide Gate.

1.1.3.1 Payment

Payment will be made for costs associated with installing vertical lift slide gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift slide gate and appurtenant items.
1.1.3.2 Unit of Measure

Unit of measure: lump sum.

1.1.4 Furnish & Install Wheel Gate & Appurtenances

**************************************************************************
NOTE: Alternate 1, Vertical Lift Wheel Gate.
**************************************************************************

1.1.4.1 Payment

Payment will be made for costs associated with furnishing and installing vertical lift wheel gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift wheel gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.4.2 Unit of Measure

Unit of measure: lump sum.

1.1.5 Furnish Wheel Gate & Appurtenances

**************************************************************************
NOTE: Alternate 2, Vertical Lift Wheel Gate.
**************************************************************************

1.1.5.1 Payment

Payment will be made for costs associated with furnishing vertical lift wheel gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of vertical lift wheel gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.5.2 Unit of Measure

Unit of measure: lump sum.

1.1.6 Install Wheel Gate & Appurtenances

**************************************************************************
NOTE: Alternate 2, Vertical Lift Wheel Gate.
**************************************************************************

1.1.6.1 Payment

Payment will be made for costs associated with installing vertical lift wheel gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift wheel gate and appurtenant items.

1.1.6.2 Unit of Measure

Unit of measure: lump sum.
1.1.7 Furnish & Install Tractor Gate & Appurtenances

**************************************************************************
NOTE: Alternate 1, Vertical Lift Tractor Gate.
**************************************************************************

1.1.7.1 Payment

Payment will be made for costs associated with furnishing and installing vertical lift tractor gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift tractor gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.7.2 Unit of Measure

Unit of measure: lump sum.

1.1.8 Furnish Tractor Gate & Appurtenances

**************************************************************************
NOTE: Alternate 2, Vertical Lift Tractor Gate.
**************************************************************************

1.1.8.1 Payment

Payment will be made for costs associated with furnishing vertical lift tractor gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of vertical lift tractor gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.8.2 Unit of Measure

Unit of Measure: lump sum.

1.1.9 Install Tractor Gate & Appurtenances

**************************************************************************
NOTE: Alternate 2, Vertical Lift Tractor Gate.
**************************************************************************

1.1.9.1 Payment

Payment will be made for costs associated with installing vertical lift tractor gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift tractor gate and appurtenant items.

1.1.9.2 Unit of Measure

Unit of measure: lump sum.
1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A320/A320M (2017b) Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service

ASTM A490M (2014a) Standard Specification for High-Strength Steel Bolts, Classes 10.9 and 10.9.3, for Structural Steel Joints (Metric)

U.S. GENERAL SERVICES ADMINISTRATION (GSA)

FS RR-W-410 (Rev H) Wire Rope and Strand

1.3 SUBMITTALS

****************************************************************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Acceptance Trial Operation and Test

1.4 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Perform delivery, handling, and storage of materials and fabricated items conforming to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Unload materials and equipment delivered to the site by the Contracting Officer. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing. If delivered items are damaged or a shortage is determined, notify of such in writing within 24 hours after delivery.

1.5.2 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.6 WARRANTY

**************************************************************************
NOTE: Designated appurtenances of the gate assembly may be guaranteed for a minimum period of 1 year from the date of acceptance thereof, either for beneficial use or final acceptance, whichever is earlier, against defective materials and workmanship. Such guarantees will require the Contractor to furnish and install new replacement parts immediately upon receipt of notice from the Government of the failure of any part of the guaranteed items during the warranty period. These warranty requirements will be covered in the CONTRACT CLAUSES and this paragraph should be deleted from this section of the specifications.
**************************************************************************

[____]

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work before completion of the contract. Furnish materials orders, material lists and
material shipping bills conforming with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, monel, [babbit,] steel forgings, steel castings, stainless steel, bronze, aluminum bronze, brass and other metal materials used for fabrication shall conform to the requirements as shown and as specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

Structural steel plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade [_____]].

2.1.1.3 Steel Pipe

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.4 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.5 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,] [S 41008]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.2 Rubber Seals

******************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION OF RUBBER SEALS AND TESTING OF RUBBER SEALS.
******************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only] [compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers].

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:
<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent</td>
<td>6.2 MPa900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent of tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 hours plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree and the duration of immersion shall be 166 hours.

2.1.2.2 Fabrication of Rubber Seals

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be \(0.726\) \(0.030\) inches thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Tensile strength</th>
<th>13.8 MPa2,000 psi (min.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements as shown and as specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

[High-strength bolts, nuts, and washers shall conform to ASTM A325M]
ASTM A325, Type [_____] or ASTM A490M
ASTM A490, Type [_____] (Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] [_____] or ASTM A320/A320M, [Ferritic Steel, Grade [_____] [Austenitic Steel, Grade [_____] Class [_____]].) Bolts 13 mm 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws
Screws shall be of the type indicated.

2.2.3 Sheaves
Sheaves shall be of cast steel conforming to ASTM A27/A27M, sized for the wire rope used.

2.2.4 Wire Rope
Wire rope shall conform to FS RR-W-410, Type [_____] Class [_____] Construction [_____] (wire size,) [strand seizing] as indicated.

2.2.5 Wheels
Wheels shall be short hub or long hub, rigid type, heavy duty steel casters fabricated with steel castings conforming to ASTM A148/A148M. Wheels shall be of the size and load capacity shown. Wheel shall be provided with lubrication fittings, roller bearings, and removable axle or shaft. Wheel treads shall be machined-finished as shown. Unless otherwise specified or shown, shafts for wheels shall be stainless steel conforming to ASTM A276/A276M, UNS S 30400.

2.3 FABRICATION

2.3.1 Detail Drawings
Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.1.1 Fabrication Drawings
Fabrication drawings shall show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.3.1.2 Shop Assembly Drawings
Shop assembly drawings shall provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.3.1.3 Delivery Drawings
Delivery drawings shall provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.
2.3.1.4 Field Installation Drawings

**************************************************************************
NOTE: If zinc filler is not specified, delete requirements for procedures and equipment for it.
**************************************************************************

Field installation drawings shall provide a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler; procedures and equipment used for heating and placing of the zinc filler; and methods for installing other appurtenant items.

2.3.2 Structural Fabrication

**************************************************************************
NOTE: Delete reference to cathodic protection if not required for project.
**************************************************************************

Structural fabrication shall conform to the requirements as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Dimensional tolerances shall be as specified and as shown. Splices shall occur only where shown. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of cathodic protection system devices and other appurtenances as required.

2.3.2.1 Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination. Delete reference to stress-relieving if not applicable for the project.
**************************************************************************

Submit schedules of welding procedures for structural steel conforming with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated and as follows: [______]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise situated where radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests. Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed...
prior to the attachment of miscellaneous appurtenances.

2.3.2.2 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.2.3 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.2.4 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.3 Slide Gate Leaf

Slide gate leaf shall be of single-component structural fabrication. Slide gate shall be shop fabricated and shall be provided complete with gate stem, stem guides, leaf nut, leaf nut spanner wrench, bar seals, seal collars, [lock assembly,] [leaf springs,] and other appurtenant items as required for installation. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than 1/16 inch to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than 2 mm 1/16 inch. Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than 2 mm 1/16 inch. Gate leaf shall be stress-relieved prior to the attachment of bar seals. Surfaces where bar seals are attached shall be accurately machined to provide uniform bearing for the full contact dimensions. Top and side bar seals shall be firmly butted together at the corners. The ends of side bar seals shall be flush with the bottom seating surface of the gate leaf. Final machining of bar seals shall be performed after they are attached to the gate leaf. The bottom seat of the gate leaf shall be machined for a tight fit with the gate frame sill.

2.3.4 Slide Gate Frame and Bonnet

**************************************************************************
NOTE: Edit this paragraph to fit the project.
**************************************************************************

Slide gate frame and bonnet shall be shop fabricated. Guiding and seal surfaces of slide gate frame and bonnet shall be in a true vertical plane and shall be machined finished. Unmachined surfaces exposed to water flow shall match at joints between component parts, shall not depart from true planes shown by more than 2 mm 1/16 inch and shall be free of offsets or irregularities greater than 2 mm 1/16 inch. Allowable offsets or irregularities less than 2 mm 1/16 inch shall be ground to a bevel of not greater than one on twenty-four. The bottom seat of the gate leaf shall be machined for a tight fit with the gate frame sill. Gate frame and bonnet shall be stress relieved prior to the attachment of bar seals. Surfaces where bar seals are attached shall be accurately machined to provide uniform bearing for the full contact dimensions. Top, side, and invert bar seals shall be firmly butted together at the corners. Final machining of
bar seals shall be performed after they are attached to the gate frame and bonnet. Babbit shall be poured in the gate frame sill and peened before machining the frame. When machining the gate frame sill, the tool travel shall be parallel to the long dimension of the babbit.

2.3.5 Slide Gate Bonnet Cover, Pedestal and Base Plate

**************************************************************************
NOTE: Edit this paragraph to fit the project.
**************************************************************************

The flanges of the bonnet cover, pedestal and base plate for the supporting the operating machinery for the slide gate shall be accurately machined and drilled to match mating flanges and provide the required true alignment. Unmachined oil-contacting surfaces of bonnet cover and pedestal shall be coated with alkyd resin as specified for the unmachined oil-contacting surfaces of hydraulic cylinder heads. Base plate dimensions may be altered to fit the operating machinery furnished, provided the basic configuration, plate thickness, and number and sizes of fasteners are equal to that shown and the altered dimensions are approved.

2.3.6 Wheel Gate Leaf

**************************************************************************
NOTE: Delete first sentence if not applicable for the project.
**************************************************************************

Wheel gate leaf shall be of single-component structural fabrication. Wheel gate leaf shall be shop fabricated and shall be provided complete with lifting brackets, wheel assemblies, seal assemblies, [guide shoes,] [plates,] [dogging brackets,] and other appurtenant items as required for installation and proper operation. Check the design center of gravity of the gate leaf prior to fabrication and notify the Contracting Officer if an unreasonable amount of counter-weighting is required to attain the center of gravity as designed. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than 2 mm 1/16 inch to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than 2 mm 1/16 inch. Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than 2 mm 1/16 inch. Gate leaf shall be stress relieved prior to the attachment of seal assemblies and other appurtenant items.

2.3.6.1 Wheel Gate Leaf Lifting Brackets

Fabrication details of wheel gate leaf lifting brackets shall be closely coordinated with the details of the [lifting sling] [lifting hoist] [engaging and disengaging mechanism of the lifting beam assembly] to assure proper operation.

2.3.6.2 Wheel Gate Leaf Wheel Assembly

Wheel assemblies shall be products of a manufacturer regularly engaged in the manufacture of such products. Each wheel assembly shall be provided complete with wheel, shaft, roller bearing, lock washer, lock nut, bearing cover, seal housing, grease seal, seal retainer, shaft lock plate, lubrication fittings, fasteners, and other accessories as required for
complete and proper installation. Wheel diameter and thickness shall not be changed from that shown. The dimensions and tolerances of other components may be changed as required for compatibility with the manufacturer's product.

2.3.6.3 Wheel Gate Leaf Seal Assembly

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and machine finished after splicing.

2.3.7 Wheel Gate Frame and Guides

**************************************************************************
NOTE: Delete last sentence if not applicable to the project.
**************************************************************************

Exposed unmachined surfaces of wheel gate frame and guides shall match at joints between component parts, shall not depart from true planes shown by more than 2 mm 1/16 inch, and shall be free of offsets or irregularities greater than 2 mm 1/16 inch. Allowable offsets or irregularities less than 2 mm 1/16 inch shall be ground to a bevel of not greater than one on twenty-four. Surfaces of frames and guides to receive seal bars and wheel track bars shall be accurately machined to provide uniform bearing for the full contact dimensions. Seal bars shall be firmly butted together at corners. Bearing surfaces of wheel track bars and sealing surfaces of seal bars shall be machined to the tolerances shown to provide uniform bearing and sealing at all points of contact. Final machining of seal bars and wheel track bars shall be performed after they are attached to the gate frame and guides. Anchor bolt holes for gate frame and guides shall be accurately located using Government-furnished templates which provide the installation location of anchor bolts.

2.3.8 Wheel Gate Lifting Sling

Wheel gate lifting sling shall be of wire rope with thimble and socket fittings attached to the wire rope in a manner that develops the full strength of the wire rope.

2.3.9 Wheel Gate Lifting Beam Assembly

Wheel gate lifting beam assembly shall be fabricated as shown for automatic engaging and disengaging with the lifting brackets of the gate leaf. The lifting beam shall be stress relieved prior to final machining and attachment of the roller and counterweight assemblies.
2.3.10 Tractor Gate Leaf

**************************************************************************
NOTE: Delete first sentence if not applicable for the project.
**************************************************************************

Tractor gate leaf shall be of single-component structural fabrication. Tractor gate leaf shall be shop fabricated and shall be provided complete with roller train assemblies, lifting brackets, seal assemblies, guide shoes, [plates,] dogging brackets, [pier guides,] [pier ties,] and other appurtenant items as required for installation and proper operation. Check the design center of gravity of the gate leaf prior to fabrication and give notification if an unreasonable amount of counterweighting is required to attain the center of gravity as designed. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than \(2 \text{ mm} \ 1/16 \text{ inch}\) to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than \(2 \text{ mm}1/16 \text{ inch}\). Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than \(2 \text{ mm} \ 1/16 \text{ inch}\). Gate leaf shall be stress relieved prior to the attachment of seal assemblies and other appurtenant items.

2.3.10.1 Tractor Gate Leaf Lifting Brackets

Fabrication details of tractor gate leaf lifting brackets shall be closely coordinated with the details of the [lifting sling] [lifting hoist] [engaging and disengaging mechanism of the lifting beam assembly] to assure proper operation.

2.3.10.2 Tractor Gate Leaf Roller Train Assemblies

Roller train assemblies shall consist of roller guides, track plates, roller train, and roller train cover. Roller guides shall be adjustable and removable without dismantling the roller train. Turned bolts, jack screws, shims for mounting and adjusting roller guides, and cap screws for attaching track plates shall be provided as shown. Track plates shall be attached to the gate leaf so that the side faces of the track plates are parallel to a vertical plane within \(2 \text{ mm} \ 1/16 \text{ inch}\). The track surfaces of track plates shall be machined finished to a plane parallel to a common plane within \(2 \text{ mm} \ 1/16 \text{ inch}\) after being attached to the gate leaf. Roller train shall be provided complete with pins, link bars, retaining rings, and other appurtenances as shown and as required for proper installation and operation.

2.3.10.3 Tractor Gate Leaf Guide Shoes

Guide shoes shall be attached to the gate leaf for drilling and reaming for bolting. Guide shoes shall be accurately located on the gate leaf in a true vertical plane with each other in the upstream-downstream direction. Lines passing through face of guide shoes on each side of leaf shall be parallel within \(2 \text{ mm} \ 1/16 \text{ inch}\).

2.3.10.4 Tractor Gate Leaf Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper
installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. Vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field spliced only where shown and machine finished after splicing.

2.3.11 Tractor Gate Frame and Guides

******************************************************************************
NOTE: Delete last sentence if not applicable for the project.
******************************************************************************

Exposed unmachined surfaces of tractor gate frame and guides shall match at joints between component parts, shall not depart from true plane shown by more than 2 mm 1/16 inch, and shall be free of offsets or irregularities greater than 2 mm 1/16 in. Allowable offsets or irregularities less than 2 mm 1/16 inch shall be ground to a bevel of not greater than one on twenty-four. Surfaces of frames and guides to receive roller track plates and seal plates shall be accurately machined to provide uniform bearing for the full contact dimensions. Seal plates shall be firmly butted together at corners. Roller bearing surfaces of track plates and sealing surfaces of seal plates shall be machined to the tolerances shown to provide uniform bearing and sealing at all points of contact. Final machining of track plates and seal plates shall be performed after they are attached to the gate frame and guides. Anchor bolt holes for gate frame and guides shall be accurately located using Government furnished templates which provide the installation location of anchor bolts.

2.3.12 Tractor Gate Lifting Sling

Tractor gate lifting sling shall be of wire rope with thimble and socket fittings attached to the wire rope in a manner that develops the full strength of the wire rope.

2.3.13 Tractor Gate Lifting Beam Assembly

Tractor gate lifting beam assembly shall be fabricated as shown for automatic engaging and disengaging with the lifting brackets of the gate leaf. The lifting beam shall be stress relieved prior to final machining and attachment of the roller and counterweight assemblies.

2.3.14 Appurtenant Items

The fabrication requirements for [air vents,] [air vent liner,] [conduit liner,] [dogging devices,] [pier tie anchors,] [gate leaf pier guides,] and other appurtenant items shall conform to the details shown.

2.3.15 Shop Assembly

Shop assembly requirements for gate, gate frame and appurtenant items shall be as shown and as specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gate, frame, guides, and appurtenant items shall be assembled completely in the shop to assure satisfactory field
installation. The matchmarking of unassembled components shall be carefully preserved until the components are assembled. Adequate support shall be provided during assembly to maintain components within 2 mm 1/16 inch of actual installation planes. Mating surfaces and machined surfaces shall be coated with a rust preventive coating until assembled. Other connecting surfaces which are not required to be disassembled for shipment shall be thinly coated with an approved rust preventive coating before being joined. Adjoining components shall be fitted and bolted together to facilitate field connections. Shop assembled components shall be delivered assembled, if practically permitted by shipping and field installation conditions. Assembled components shall be shop welded in their final positions as much as delivery and field installation conditions allow. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise approved. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.3.15.1 Gate Leaf

**********************************************************************************************
NOTE: This paragraph must be edited to fit the project.
**********************************************************************************************

Shop assembly of the gate leaf shall be in the [vertical position] [and] [horizontal position with the skin side of the gate leaf facing down]. Shop assembly shall include the attachment of all accessories to the gate leaf. The [wheel gate leaf] [and] [tractor gate leaf] shall be lifted by the lifting brackets and inspected for balance about the center of gravity after being shop assembled. If the gate leaf is out of plumb by more than 6 mm 1/4 inch in the total length in a vertical plane in the upstream-downstream direction, or by more than 2 mm 1/16 inch in the total width in a vertical plane perpendicular to the vertical plane in the upstream-downstream direction, it shall be balanced by counterweighting or some other method as approved at the Contractor's expense.

2.3.15.2 Wheel Assemblies

The gate leaf shall be supported in the horizontal position for adjusting wheel assemblies so that the wheels of the attached wheel assemblies are free to rotate to allow the proper adjustment. Attached wheel assemblies shall be adjusted so that the wheels remain perpendicular to the gate leaf and the contact surfaces of the wheels on each side of the gate leaf are in a single plane within 0.127 mm 0.005 inch when rotated 360 degrees. The final adjustment of wheel assemblies shall be made after the gate leaf is assembled with the gate frame and guides in the horizontal position. The top of each wheel shall be tapped to insure that the weight of the wheel assembly has caused the shaft to bear firmly on the supporting framing of the gate leaf. Wheel assemblies shall then be adjusted so that the tolerance on the distance between the plane through the downstream faces of the wheels and the plane through the downstream machined surfaces of the side bar supports for the seal assemblies shall not exceed 1 mm/32 inch. After wheel assemblies have been adjusted, they shall be locked in position by drilling the lock plate, support plate, and shaft and installing cap screws as shown. Wheel assemblies shall be lubricated after being locked in position with a lubricant that is suitable for underwater operation, equal to the lubricant recommended by the manufacturer of the wheel roller bearings, and as approved. Additional lubricant shall be applied at regular intervals until final acceptance of the work.
2.3.15.3 Roller Train Assemblies

Roller trains shall be mounted on the track plates with the gate leaf in the vertical position. Roller guides shall be adjusted so that the roller trains are in alignment and can traverse freely without binding and with a maximum sag of 19 mm \(\frac{3}{4}\) inch at the bottom. After the roller trains are mounted, the gate leaf shall be maintained in a vertical position unless the roller trains are securely restrained from sagging.

2.3.15.4 Guide Shoes

Guide shoes shall be drilled and reamed for bolting to the gate leaf while attached to the gate leaf. Guide shoes shall be accurately located on the gate leaf in a true plane with each other in the upstream-downstream direction and parallel to the plane established by the downstream machined surfaces of the side bar supports for the seal assemblies. Shims shall be provided as required.

2.3.15.5 Seal Assemblies

Seal assemblies shall be attached to the gate leaf during shop assembly and removed for shipment. The rubber seals of the assemblies shall be accurately fitted, drilled to match the seal retainers, match marked, and removed for shipment.

2.3.15.6 Lifting Beam Assembly

The lifting beam assembly shall be completely shop assembled in the sequence and manner shown. The balance of the completed assembly shall be checked by lifting the assembly by the pick-up pin. If the lifting beam is out of true horizontal by more than 10 mm \(\frac{3}{8}\) inch, counterweighting or some other method approved shall be used to balance the assembly at the Contractor's expense.

2.3.15.7 Dogging Devices

Dogging devices shall be completely shop assembled. Pin holes shall be drilled in base plates and dogs with these components in assembly.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified material test reports with all material delivered to the site. Tests, inspections, and verifications for materials and fabricated items shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.1 Testing of Rubber Seals

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm \(\frac{1}{4}\) inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

SECTION 35 20 16.53 Page 22

</tbody>
</table>

2.4.2 Inspection

Shop assembled components shall be inspected for accurate fit and compliance with dimensional tolerances. Sealing, guiding, and connecting surfaces shall be inspected to determine if their planes are true, parallel, and in uniform contact with opposing surfaces. With the gate leaf closed and uniformly blocked in the sealing position, gate leaf [wheels,] [rollers,] [bar seals,] [and] [rubber seals] shall be inspected to determine if they are in continuous contact with [track] [and] [seal plates]. [Compression of rubber seals shall not vary by more than 1 mm1/32 inch.] [It shall not be possible to insert a feeler gauge of greater than 0.076 [0.127] mm [0.003] [0.005] inch thickness at any point between bar seals and seal plates.]

2.4.3 Operation Tests

**************************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************************

The operation of the shop-assembled gate assembly shall be tested by opening and closing the gate several times by use of the operating machinery. The force used to operate the gate shall be the minimum required to open and close the gate. Since the sill of the unembedded gate frame is not fully supported during the operation tests, special precaution shall be taken to prevent the application of excessive force on the gate leaf and frame when the gate is closed. The operation of the lifting beam shall be tested by engaging and disengaging the lifting beam several times. Adjustments shall be made as required until operations are satisfactory. The gate assembly shall be tested hydrostatically by applying a hydrostatic pressure of [_____] kPa psi, measured at the sill of the gate frame, to the upstream side of the gate leaf in the closed position. For conducting the hydrostatic testing, the gate frame shall be bulkheaded or restrained by some other method as approved. Under hydrostatic testing, the gate seals shall be sufficiently tight to prevent water leakage.

PART 3 EXECUTION

3.1 INSTALLATION

Installation shall conform with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gate and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field welded shall be in correct alignment before welding is commenced.
3.1.1 Embedded Metals

Frames, bases, and other embedded metal items shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Shims, jackbolts, or other supports required to align and hold components rigidly in place until embedment concrete has attained the specified strength shall be provided. Anchors shall be installed as shown. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour.

3.1.2 Gate Frame and Guides

**************************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************************

Gate frame and guides shall be connected to embedded anchors, aligned, and rigidly blocked in place prior to the placement of second-pour concrete. The sealing surfaces of the slide gate frame seal bars shall serve as the reference plane for the installation alignment. Alignment shall be to two theoretical control planes described as control plane "A" and control plane "B". Control plane "A" is a vertical plane that is normal to the water passageway and is located at the sealing surface of the gate frame seal bars. Control plane "B" is a vertical plane that is parallel to the water passageway and is located at the centerline of the water passageway. The gate frame shall be aligned to within $0.381 \text{ mm} \ 0.015 \text{ inch}$ of control planes "A" and "B". A taut piano wire and an electric micrometer or some other approved method shall be used to measure the vertical alignment tolerances. The alignment of [wheel gate] [and] [roller gate] frame and guides shall be such that planes through the bearing surfaces of track plates and the sealing surfaces of seal plates shall be within $2 \text{ mm} \ 1/16 \text{ inch}$ of the alignment shown. Gate frame and guides shall be tested for proper alignment and clearances prior to being embedded in concrete by lowering and raising the gate leaf through the full operating range.

3.1.3 Gate Leaf

**************************************************************************
NOTE: Delete reference to rubber seals if not applicable for the project.
**************************************************************************

Gate leaf shall be completely assembled, including the attachment of all components and accessories, prior to being placed in the gate frame. All necessary precautions shall be taken to avoid distortion of the gate leaf and attached components during installation. Rubber seals shall be fastened securely to metal retainers. Before operating the gate, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.1.4 Operating Machinery

**************************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************************
Operating machinery for the gate assembly and supporting components, including [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate], shall be positioned and aligned to the installed location of the gate frame and guides and anchored in place. The location of the slide gate stem shall be projected to and scribed on the sill of the installed gate frame to serve as a reference point for the alignment of operating machinery and supporting components. Operating machinery and components shall be aligned to within 0.762 mm 0.030 inch of the reference point. Prior to being embedded in concrete, an alignment template shall be bolted to the [bonnet,] [bonnet cover,] marked, and drilled to match the exact center point of the gate stem.

3.1.5 Concrete and Concrete Grout Placement

The embedment of the gate frame and other components in concrete shall be performed in an approved manner to fill all voids, secure anchorage, prevent seepage, and provide uniform finish surfaces. After embedment concrete has cured for at least 7 days, any voids around embedded components shall be filled by pumping concrete grout around the components. After the pumped grout has cured for at least 7 days, hammer blows to the components shall be used to detect any remaining voids. Where remaining voids are located, 25 mm 1 inch diameter grout holes shall be drilled in the components and the voids shall be filled by pressure grouting through the grout holes. Grout holes in the components shall be plugged by welding and shall be ground flush.

3.1.6 Painting

Exposed parts of the gate and appurtenance components, except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces, shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.2 OPERATING MACHINERY

Operating machinery shall conform to Section [______].

3.3 ACCEPTANCE TRIAL OPERATION AND TEST

After the gate assembly has been installed, including operating machinery, the Contracting Officer will examine the complete system for final acceptance. Operation and test results shall be furnished to the Contracting Officer. The assembly will be examined first to determine whether or not the workmanship conforms to the specification requirements. Operate the gate throughout its full operating range a sufficient number of times to demonstrate proper operation. [The gate shall be operated from the remote control vault and the control panel in the control tower.] [Operation of hydraulic cylinders by use of compressed air will not be permitted.] The initial operation of the gate assembly shall be conducted in the dry. [With the gate leaf in the seated position and uniformly blocked so that the [wheels] [rollers] are in uniform contact with the track plates, the rubber seals shall be checked to ensure that they are...
uniformly compressed against the seal plates.) [The gate lock assembly shall be tested by destructing one set of lock pins. This shall be accomplished by inserting one set of pins in the lock position, permitting the weight of the gate leaf to rest on the pins, and using the hydraulic pressure system to break the pins by applying pressure to the top of the hydraulic cylinder. The pressure shall be adjusted at the pressure reducing valve to its lowest setting and gradually increased until the pins fail. The pressure reading at failure of the lock pins shall be recorded in the operation and test report. After completion of the test, broken pins shall be replaced by new ones.] The second trial operation and testing of the gate assembly shall be conducted with the reservoir normal operating pool hydrostatic pressure. The workmanship in the fabrication and installation of the gate assembly shall be such that the gate leaf shall form a watertight barrier when lowered to the seated position. Adjustments shall be made to the operation and control apparatus until all components function as required. The [lifting beam assembly,] [lifting sling,] [dogging devices,] and other appurtenances will be inspected to assure proper operation. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no additional cost to the Government. The trial operation and testing shall be repeated after defects are corrected.

3.4 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing all plant, equipment, labor, and materials (except materials specified to be furnished by the government) for fabricating, assembling, delivering, and installing closure gates in accordance with these specifications and applicable drawings. This section was originally developed for USACE Civil Works projects.

Adhere to **UPC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](##).

**PART 1   GENERAL**

1.1   UNIT PRICES

**NOTE:** If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.
1.1.1 Closure Gates

1.1.1.1 Payment

Payment will constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for the installing of closure gates as specified.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.3 SUBMITTALS

**************************************************************************

SECTION 35 20 16.59  Page 7
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Detail Drawings; G[, [_____]]

Epoxy Filler

1.4 QUALITY ASSURANCE

The following special safety provisions are required for heating and placing zinc filler:

a. Workers shall wear protective clothing including hard hats with fine wire mesh screen, goggles, leather sleeves, chaps, apron, and leather gloves.

b. Workers shall wear air-line respirators certified by NIOSH or MSHA. In enclosed spaces, both local exhaust ventilation and air-line respirators are required. Local exhaust ventilation shall consist of movable hoods placed close to the work to remove fumes at the source.

c. Ladles, equipment, and material shall be pre-heated before being used so that they will be moisture-free.

d. Heating devices and ladles shall be placed on a level, firm foundation, and protected against traffic, accidental tipping, or similar hazard.

e. Hot zinc shall not be carried up or down ladders.

f. Buckets or vessels used for handling and transporting hot zinc shall be substantially constructed and shall not be filled higher than 100 mm 4 inches from the top.

1.5 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.6 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Unload materials and equipment delivered to the site by the Contracting Officer. Verify the condition and quantity
of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.

1.6.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.6.2 [Epoxy Filler]

Epoxy filler shall be delivered from the manufacturer just prior to use in the work to insure receipt of recently manufactured material and shall be stored under cover, out of direct sunlight, at a temperature between 20 to 30 degrees C 65 to 85 degrees F].

1.7 [SEQUENCING AND SCHEDULING]

**************************************************************************
NOTE: The name of the appropriate railroad company or roadway agency should be inserted as indicated.
**************************************************************************

Submit a sequencing and scheduling plan, approved before the work is commenced, which illustrates that work affecting [railroads] [roadways] has been coordinated with [______]. Include in the plan schedules, lists of labor or materials to be provided the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities as specified in Section SPECIAL CONDITIONS. The protection plan shall clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed. Refer to Section SPECIAL CONDITIONS for other requirements such as warning signs, flagmen, permits, and debris removal.

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work before completion of the contract. Furnish materials orders, materials lists and materials shipping bills conforming with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, [aluminum alloy,] and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shapes shall conform to ASTM A36/A36M. Structural steel
plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade [_____]].

2.1.1.2 [Steel Pipe]

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.3 [Self-Lubricating Bearings]

Self-lubricating bearings shall conform to ASTM B823, Type II. The bearings shall be impregnated with a turbine grade lubricant containing oxidation and rust inhibitors and a polar anti-wear additive.

2.1.1.4 [Bronze Castings]

Bronze castings shall conform to ASTM B22/B22M, Copper Alloy UNS No. C91300 [and ASTM B148].

2.1.1.5 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.6 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,] [S 41008]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.7 [High-Strength Steel Bar]

High-strength steel bar shall conform to ASTM A722/A722M, Type I or II, and all supplementary requirements.

2.1.2 Rubber Seals

2.1.2.1 General

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION OF SEALS.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only and shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:
<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modules</td>
<td>6.2 MPa900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs.)</td>
<td>80 percent of tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees C for 22 plus or minus 1/4 hours. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M1 (M1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.2.2 [Fabrication of Seals]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following minimum physical properties:

<table>
<thead>
<tr>
<th></th>
<th>13.8 MPa2,000 psi</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td></td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.1.3 [Epoxy Filler]

Submit manufacturer's certificate for epoxy filler with the material delivered to the site. Epoxy filler shall be an approved epoxy resin formulation equal to "Nordback Backing For Locks and Dams," a product of Fel-Pro Chemical Products LP, 6120 East 58th Ave., Commerce City, CO 80022, Phone 1-800-992-9799, or an approved equal, with a specific gravity of 1.70 to 1.75, minimum compressive strength after 72 hours at 20 degrees C 70
degrees F of 114 MPa, 16,500 psi, and maximum shrinkage of 0.15 percent. The manufacturer must certify that the material meets or exceeds the specified physical properties.]

2.1.4 [Zinc Filler

Zinc filler shall conform to ASTM B6.]

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490M ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [____]] [Austenitic Steel, Grade [____]], Class [____].] Bolts 13 mm 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated.

2.2.3 Shackles and Turnbuckles

Shackles and turnbuckles shall be of forged steel conforming to ASTM A668/A668M, zinc coated. Turnbuckles shall be end-threaded right and left hand and shall be of the size shown.

2.2.4 Screw Jacks

Screw jacks shall have a [____] ton (metric) (2000 lb) rated capacity and shall conform to the details shown.

2.2.5 [Hoists

Hoists shall be of [____] ton (metric) (2000 lb) capacity, with [____] m foot lift, link type chain and safety latch hook. Hoists shall be of light weight design, weighing not over [____] kg lb and requiring not more than [____] kg lb lever pull to lift the full-rated load.]

2.2.6 Winches

Winches shall be [____] ton (metric) (2000 lb) marine winches with [____] mm inch drum and adjustable handle. Each winch shall be equipped with [____] mm foot of [____] mm inch diameter wire cable suitable for exterior exposure.

2.2.7 Sheaves

Sheaves shall be of cast steel conforming to ASTM A27/A27M, sized for the wire rope used.
2.2.8 [Rails]

Rails shall conform to ASTM A1, [No. 1] [No. 2], weighing [_____] kg/m. lb/yd. Rail stops shall be as recommended by rail manufacturer for [_____] kg/m 1b/yd rails and for the wheel diameters indicated.]

2.2.9 Wire Rope

Wire rope shall conform to FS RR-W-410, Type [_____] , Class [_____] , Construction [_____] , [wire size,] [strand seizing] as shown.

2.2.10 [Wheels]

Wheels shall be short hub or long hub, rigid type, heavy duty steel casters fabricated from steel castings conforming to ASTM A148/A148M. Wheel shall be of the size and load capacity shown and shall be provided with lubrication fittings, roller bearings and removable axle. Wheel treads shall be machined-finished to conform with the indicated rail. Unless otherwise specified or shown, axles for wheels shall be of stainless steel bars conforming to ASTM A276/A276M, UNS S30400.]

2.2.11 [Bridge Planks]

Bridge planks shall be of steel conforming to ASTM A1011/A1011M, Grade 33. Bridge planks shall have a minimum thickness and minimum section modulus as shown.

2.2.12 Chains and Attachments

Chains and attachments shall conform to FS RR-C-271, Type [_____] , Grade [_____] , Class [_____] , Style [_____] , Size [_____] , Finish [_____] .

2.2.13 Padlocks and Hasps

Padlocks shall conform to CID A-A-1928, Type [I][II]. Padlocks shall be keyed alike and provided with two keys. Hasps shall be of wrought steel and sized to accommodate padlocks.

2.2.14 [Elastomeric Bearing Pads]

Elastomeric bearing pads shall conform to the requirements of AASHTO HB-17, Chapter 25, and shall be reinforced with steel plates.]

2.3 FABRICATION

2.3.1 Detail Drawings

Submit detail drawings as specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS, of closure gates and appurtenant items, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings.

2.3.1.1 Fabrication Drawings

Fabrication drawings shall show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.
2.3.1.2 Shop Assembly Drawings

Shop assembly drawings shall provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.3.1.3 Delivery Drawings

Delivery drawings shall provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.3.1.4 Field Installation Drawings

Field installation drawings shall provide a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; [plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment;] [methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler;] [procedures and equipment used for heating and placing of the zinc filler;] [method for installing hinge anchor plates, including checking and maintaining alignments of the plates during concreting and placement of epoxy filler;] and methods for installing other appurtenant items.

2.3.2 Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown. Splices shall occur only where shown. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation.

2.3.3 Welding

******************************************************************************
NOTE: List applicable welds requiring radiographic examination.
******************************************************************************

Submit schedules of welding procedures for structural steel conforming with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be [in accordance with AWS D1.1/D1.1M[,][ and] AWS D1.2/D1.2M][, and] of the type shown and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated and as follows: [______]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests.
Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.

2.3.4 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.7 Fabrications

Submit samples approved prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded. Fabrications shall conform to the following requirements.

2.3.7.1 Gate Leaf

Gate leaf shall be of welded structural steel fabrication. Gate leaf shall be provided complete with quoin and miter contact blocks, miter guide assembly, elastomeric bearing pads, hinge assemblies, pintle assembly, wheel assemblies, trolley assembly, tie-down assembly, gate hooks, seal assemblies, and other appurtenant components as specified and shown. Proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of gate leaf shall not vary from the nominal dimension or differ from mating gate leaf by more than 6 mm. 1/4 inch. The surfaces of framing elements to which skin plates, bridge planks are to be welded shall not vary from a true plane by more than 6 mm.1/4 inch. Splices in skin plates, bridge planks shall be located only where shown. In addition to welds specifically indicated for nondestructive testing, _____ percent of the welds in the girders, verticals and skin plate, bridge planks of the gate leaf shall receive nondestructive testing. The location of these additional welds for testing shall be as directed.

2.3.7.2 Wall Quoin

Wall quoin shall consist of a welded structural steel frame with adjustable base anchors and adjustable quoin contact block post.

2.3.7.3 Quoin and Miter Contact Blocks Posts

Quoin and miter contact blocks posts shall be of stainless steel bars
conforming to ASTM A276/A276M or ASTM A564/A564M. Splices in the contact [block] [post] shall be made by an offset method so that there will not be a continuous joint across the [block] [post]. Contact faces of the contact [block] [post] shall be milled at splices to assure watertight joints. [Splices in the gate leaf contact [block] [post] shall occur only at the centerlines of horizontal girders.] Contact [blocks] [posts] shall be provided with adjusting bolts as shown.]
end of the cross pin shall not exceed [_____] m. [_____] ft [_____] in.
Trolleys shall be designed for continuous outdoor service and shall be
painted with the manufacturers standard paint system for outdoor operation.]

2.3.7.7 [Trolley Gate Overhead Support Beam

Trolley gate overhead support beam shall conform to the details shown.
Post-tensioned anchorage for support beam shall consist of ASTM A722/A722M,
Type [_____] [_____] high-strength steel bars and prestressing system as
specified in Section 03 23 00 STRESSED TENDON REINFORCING.]

2.3.7.8 [Rolling Gate Wheel Assembly

Rolling gate wheel assembly shall be provided complete with cast steel
wheels as specified herein and fittings, couplings and hoses for
lubrication of wheels.  Fittings shall be 6 mm 1/4 inch threaded-pipe
fitting.  Couplings shall be 6 mm 1/4 inch stainless steel half coupling.
Hoses shall be 6 mm 1/4 inch inside diameter, double-braided stainless
steel flexible hoses.  Couplings and hoses shall have a pressure rating of
21 MPa. 3,000 psi.]

2.3.7.9 [Rolling Gate Stabilizing Trolley Assembly

Stabilizing support for trolley wheels shall be of structural steel
conforming to ASTM A36/A36M.  Trolley wheels shall be of steel fabrication
and rated for the minimum load shown.  Trolley wheels shall be
single-flanged and the wheel treads shall be machined-finished to conform
with the guiding gate girder.  Trolley wheels shall be mounted on
weather-protected roller bearings and a removable axle and shall be
provided with lubrication fittings.]

2.3.7.10 Seal Assembly

Seal assembly shall consist of rubber seals, steel retainer and spacer
bars, [retractable support,] and fasteners.  Rubber seals shall be
continuous over the full length.  Seals shall be accurately fitted and
drilled for proper installation.  Bolt holes shall be drilled in the rubber
seals by using prepared templates or the retainer bars as templates.
Splices in seals shall be fully molded, develop a minimum tensile strength
of 50 percent of the unspliced seal, and occur only at locations shown.
All vulcanizing of splices shall be done in the shop.  The vulcanized
splices between molded corners and straight lengths shall be located as
close to the corners as practicable.  Splices shall be on a 45 degree bevel
related to the "thickness" of the seal.  The surfaces of finished splices
shall be smooth and free of irregularities.  Steel retainer bars shall be
field-spliced only where shown and machine-finished after splicing.  [The
retractable support shall be provided complete with hinge and operating
winch.]

2.3.7.11 Miscellaneous Embedded Metals

Wall armor, shear anchors, protection and seal plates and shapes, and other
miscellaneous embedded metals shall be of structural steel or
corrosion-resisting steel conforming with the details specified herein and
shown.

2.3.8 Shop Assembly

Shop assembly requirements for gates and appurtenant items shall be as
shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. [The trolley gate shall be suspended in the shop to verify its center of gravity location. If the trolley gate is more than 3 mm 1/8 inch out-of-plumb in the suspended position, it shall be balanced by means as directed.] Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless waived in writing. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.4.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

[2.4.2 Testing of Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>Thickness of Fluorocarbon Film</th>
<th>Machine Method at 50 mm 2 inches per minute</th>
<th>Deadweight Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.726 mm 0.060 inch</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>

</tbody>
</table>

]PART 3   EXECUTION

3.1 INSTALLATION

Installation shall conform with the requirements specified herein and in
Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Before assembly and installation, all bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant. All components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Corner protection angles, sill angles, seal plates, frames, pedestals, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 [Lower Hinge Assembly]

Base anchors for the lower hinge assembly shall be embedded in the first pour concrete. Base plate shall be attached to base anchors, set to the final position, and epoxy fill shall be placed in the void behind the base plates and allowed to reach the strength as shown and the approved field installation drawings. After the gate leaf is set in place, the hinge assembly shall be adjusted to provide for continuous contact between the sealing surfaces over the full height and length of the gate leaf. Allowances shall be made for the seals which shall not be attached until painting operations are completed. Second pour concrete shall be placed after final adjustments are completed.

3.1.3 [Pintle Assembly]

Base anchors for the pintle assembly shall be embedded in first pour concrete. The pintle assembly base plate shall be attached to base anchors, adjusted to the exact elevation and center-to-center distance as shown, leveled, blocked rigidly to prevent displacement, and embedded in second pour concrete. The concrete shall be allowed to set 72 hours and must reach a minimum compressive strength of [_____] MPa psi before loading is applied.

3.1.4 [Wall Quoin]

Base anchors for the wall quoin shall be embedded in first pour concrete. The wall quoin shall be attached to base anchors prior to setting the gate leaf in place. After the gate leaf is set in place, the wall quoin shall be plumbed and adjusted in relation to the gate leaf quoin so as to provide for continuous contact between the sealing surfaces of the wall and gate leaf quoin contact [blocks] [posts] over the full height of the gate leaf. This adjustment shall be made almost entirely by moving the wall quoin so that the gap for the [epoxy] [zinc] filler behind the gate leaf quoin contact [block] [post] remains near the nominal dimension. After final adjustments have been made, the wall quoin shall be anchored firmly and the second pour concrete shall be placed in the blockout.]
3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the field as required for installation. [[Lower hinge assembly bearings] [Pintle ball] shall be coated with grease prior to setting the gate leaf in place.] [Grease pipes shall be flushed prior to connecting to bearing.] All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the ends of the gate leaf due to compression of blocking or other causes. After the gate leaf has been set in place and the top hinge assembly installed, the gate leaf shall be plumbed and brought into correct position.

3.1.6 Diagonals

Gate leaf diagonals shall be attached to the gate leaf after the leaf is set in place. Submit diagonal prestressing records immediately after completion of the prestressing operations. Diagonals shall be prestressed before the final adjustment of the [quoin and miter contact [blocks] [post]] [hinge assemblies] are made. **Diagonal prestressing** shall be as specified herein and as shown and the prestressing plan developed by the Contractor. The plan for prestressing the diagonals shall describe the method of prestressing including the materials, connections, rigging, anchorages, and stress measuring equipment. Compile a record of the prestressing operations consisting of the information indicated in the following table:

<table>
<thead>
<tr>
<th>STRESS DATA TABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Gate Leaf Location:</strong></td>
</tr>
<tr>
<td><strong>Diagonal</strong></td>
</tr>
<tr>
<td>Initial</td>
</tr>
</tbody>
</table>

1. Initial strain gage readings shall be made after slack is removed.
2. Final strain gage readings shall be made after prestressing is complete.
3. E is the total elongation over the full length of the diagonal, computed from the strain gage readings.
4. D is the prestress deflection of the leaf as shown.
5. d is the field deflection of the leaf measured after completion of the prestress operation; it is the deflection when final strain gage readings are taken.

3.1.7 [Top Hinge Assembly]

After the gate leaf has been set in place, the top hinge assembly shall be installed and adjusted so that the center of the hinge pin is in vertical alignment with the center of the [pintle] [bottom hinge assembly pin]. When the top hinge pin is inserted, the gate leaf shall swing horizontally throughout its range of movement. [Any required final adjustments to the top hinge assembly shall be made after the gate leaf diagonals have been
The second pour concrete shall be made after final adjustments are completed.

3.1.8 [Gate Leaf Quoin and Miter Contact [Blocks] [Posts]

After the wall quoin has been adjusted and concreted in place and final adjustments made to the top hinge assembly, gate leaf quoin and miter contact [blocks] [posts] shall be adjusted to provide continuous contact over the full height of the gate leaf in the mitered position. After the gate leaf diagonals are prestressed and final adjustments of gate leaf quoin and miter contact [blocks] [posts] have been made with the gate leaf in the mitered position, the gate leaf shall be swung out of miter and [epoxy] [zinc] filler poured behind the quoin and miter contact [blocks] [posts]. Prior to pouring of the filler, the surfaces to receive the filler shall be cleaned free of dirt, rust, and other foreign materials. The adjusting and holding bolts shall be coated with grease or other bond breaker to prevent adherence of the filler.

3.1.8.1 Placing [Epoxy] [Zinc] Filler

[Epoxy Filler: The manufacturer's instructions for placing the epoxy filler shall be followed explicitly. Special precautions must be taken to prevent leakage of the filler during placement. The complete masses of the metals whose surface areas are to receive the epoxy filler should have a temperature of 15 to 30 degrees C. 60 to 90 degrees F. The epoxy filler shall be kept free from moisture or other foreign materials during mixing and placement and for at least 48 hours after placement. A field test to determine the indentation hardness of the epoxy filler compound shall be conducted prior to placement. The field test procedures are as follows:

a. Cast a 50 mm 2 inch cube sample of mixed epoxy filler compound in a mold and cure at room temperature 20 to 25 degrees C 70 to 80 degrees F for 24 plus or minus 8 hours.

b. Remove from mold and cut sample to expose interior surface.

c. Sand exposed interior surfaces to remove saw marks and provide a smooth surface.

d. Using a Type D Durometer conforming to ASTM D2240, measure the hardness across the exposed interior surface, taking a minimum of three readings on each half of the sample. Care must be taken during the durometer reading to insure the spring loaded pin used to penetrate the surface is not in a depressed surface caused by either residual saw marks or an exposed air bubble. The average reading should be at least 85, with no individual reading below 82. If the durometer readings fall below the required minimum values, the material will be rejected.]

[Zinc Filler: Immediately preceding the pouring of the zinc filler, the adjacent metal components shall be pre-heated to a temperature of 100 to 150 degrees C 212 to 300 degrees F by an approved method which does not buckle the metal components. The zinc filler shall then be poured at a temperature which will insure that it will completely fill all interstices. Pouring temperature of zinc filler shall be maintained between 430 and 480 degrees C 810 and 900 degrees F to minimize volatilization and oxidation of the zinc.]
3.1.8.2 [Adjusting Contact [Blocks] [Posts]

After the [epoxy has set] [zinc has cooled], quoin and miter contact [blocks] [posts] shall be drawn up against the filler by tightening of the adjusting bolts. After the contact [blocks] [posts] are adjusted, the gate leaves shall swing into the mitered position without interference of the quoin contact [blocks] [posts] and the gate leaf quoin contact [block] [post] shall make tight contact with the wall quoin contact [block] [post].

3.1.9 [Anchorage of Overhead Support Beam

Submit record of the post-tensioning operation for the trolley gate overhead beam anchors, immediately after the anchorage is completed, set in place and post-tensioned anchored as shown and as specified in Section 03 23 00 STRESSED TENDON REINFORCING.]

3.1.10 [Rolling Gate Stabilizing Trolley Assemblies

Rolling gate stabilizing trolley assemblies shall be installed after the gate is set in place and properly adjusted. Assemblies shall be placed on the top girder of the gate leaf, attached to anchors embedded in the top of the supporting concrete wall, shimmed as required, and secured in place.

3.1.11 Painting

Exposed parts of gates and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.12 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate[s], a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.3 ACCEPTANCE TRIAL OPERATION

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, shall be made at no additional cost to the Government. Repeat the trial operation after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

-- End of Section Table of Contents --
NOTE: This guide specification covers the technical requirements for hoist applications using a squirrel-type induction motor commonly used for control gates for outlet works; penstock gates, crest gates, spillway tainter gates, and other similar applications. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](http://example.com).

**PART 1  GENERAL**

NOTE: This specification is to be used as a section of a supply specification for the procurement of hoisting equipment, or, with only minor modification, it may be used as a section in a general contract specification.

The specification is general and covers all types and ratings of hoist applications used by the Corps of Engineers on Civil Works structures where a squirrel cage induction-type hoist motor is used. The specification must be accompanied by a drawing.
or drawings showing the schematic wiring diagram of the control system for the particular application, along with a description of the scheme of operation and illustrations showing the several items of electrical equipment.

In adapting this specification to any project, the form and phraseology will be changed as necessary to properly specify the work contemplated. When technical deviations from this specification are considered necessary and the specification is not submitted to Headquarters, US Army Corps of Engineers (HQUSACE), for review, prior approval of (HQUSACE) will be obtained. Instructions for the preparation and submission of specifications for approval are included in ER 1110-2-1200.

The electrical equipment requirements contained herein are based upon experience and information gained from similar equipment now in service and are considered the most suitable for use on hydraulic structures.

**************************************************************************

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASME INTERNATIONAL (ASME)

ASME B1.1 (2003; R 2018) Unified Inch Screw Threads (UN and UNR Thread Form)

ASTM INTERNATIONAL (ASTM)

1.2 SYSTEM DESCRIPTION

All equipment furnished under these specifications will be subjected to [severe moisture] [moderately moist] conditions, [shall operate over a temperature range of [_____] to [_____] degrees C F,] and shall be designed to render it resistant to corrosion. The general requirements to be followed are specified below; any additional special treatment or requirement considered necessary for any individual item is specified under the respective item.
1.2.1 Fastenings and Fittings

Where practicable, all screws, bolts, nuts, pins, studs, springs, washers, and such other miscellaneous fastenings and fittings shall be of an approved corrosion-resisting material or shall be treated in an approved manner to render them resistant to corrosion.

1.2.2 Corrosion-Resisting Materials

Corrosion-resisting steel, copper, brass, bronze, copper-nickel, and nickel-copper alloys are acceptable corrosion-resisting materials. However, contact between dissimilar metals should be avoided as much as practicable, except where one of the dissimilar metals is steel or in the case of wiring and connections.

1.2.3 Corrosion-Resisting Treatments

Hot-dip galvanizing shall be in accordance with ASTM A123/A123M or ASTM A153/A153M as applicable. Other corrosion-resisting treatments may be used if approved by the Contracting Officer.

1.2.4 Frames, Enclosing Cases, and Housings

All surfaces of the enclosing cases or housings of controllers, brakes, limit switches, control stations, and other similar equipment, if other than plastic or stainless steel construction, shall be cleaned of rust, grease, mill scale, and dirt and then treated with an approved iron and zinc phosphate solution followed by rinsing with a chromic acid solution, bonderizing, or equivalent process. Immediately after rinsing and drying, the inside and outside surfaces shall be given one coat of a zinc molybdate primer and cured as required. For items of cast construction, the iron and zinc phosphate treatment may be omitted.

1.2.5 Finish Painting

**************************************************************************
NOTE: If severely moist conditions exist, a separate paint system should be specified using Civil Works Guide Specification UFGS Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, system 21, epoxy finish or equivalent. When such painting is specified, care must be taken to specify a paint that will adhere to and not be injurious to the protective painting provided under these specifications.
**************************************************************************

A minimum of two coats of paint shall be applied to all equipment in accordance with the manufacturer's standard process for the conditions specified.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.
**************************************************************************
The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
  Controller
  Limit Switch
  Hoist Motor
  Control Station[s]
  Brake Enclosing Case

SD-03 Product Data
  Hoist Motor
PART 2   PRODUCTS

2.1   HOIST MOTOR

Submit [6] [_____] copies of motor characteristics, curves or tabulated data (tested or calculated), indicating the speed, power factor, efficiency, current and kilowatt input, all plotted or tabulated against torque or percent of rated motor load.

a. Submit [6] [_____] copies of calculations to determine the required horsepower rating of each motor.

2.1.1  Motor Type

**************************************************************************

NOTE: When a single-speed motor or two single-speed motors in lieu of a two-speed motor is acceptable for the application, the designer will specify NEMA MG 1 standard design letter. The torque requirements listed in paragraph MOTOR LIMITS must be met, and the designer will verify that the design specified is sufficient. Design "C" and "B" have a 5 percent or less slip limit and are used where load inertia is lower. Design "D" has a 5 percent or greater slip and must be used where inertia is high. Designs "B," "C," and "D" provide
progressively higher torques and get progressively more expensive. Design "B" will generally apply to motors from 745 to 2240 W 1 to 3 hp, design "C" to motors between 2.24 to 11 kW 3 and 15 hp, and design "D" for motors larger than 11 kW 15 hp. This a general guide according to NEMA minimum standards and may vary with manufacturer's specific equipment.

At reduced cost, dripproof encapsulated construction may be used in protected locations. Consult manufacturer's data for information on application of this type motor to specific environmental conditions.

Provide a motor of the horizontal-shaft, squirrel-cage induction type [two-speed, two-winding, constant [torque] [horsepower]] [NEMA design [B] [C] [D]], designed for full-voltage starting, [of water-proof, totally enclosed, fan-cooled or nonventilated frame construction],[dripproof, encapsulated frame construction] and shall conform to the applicable requirements of NEMA MG 1.

2.1.2 Motor Rating

NOTE: For a two-speed motor, use single-voltage rating. Specify load conditions when Contractor designed. (Second Option) This specification covers three-phase motors which are suitable for most applications and shall be used whenever possible. When utility three-phase power is unavailable and forces use of single-phase motors, this specification may be modified accordingly. Generally, single-phase motors used for this application should be below 19 kW 25 horsepower. The torque limits should be carefully evaluated, and the testing requirements should be changed. Please consult Engineering Manual (EM) 1110-2-2703 for further guidance.

2.1.3 Motor Torque

NOTE: The torque values are those required by design guidance given in EM-1110-2-2702 and EM-1110-2-2703. The gate design must be coordinated with the requirements of these documents to ensure that torque limits are met. Reducing the upper
limit or raising the lower limit will result in significant cost increase and should be avoided wherever possible.

2.1.3.1 Motor Limits

The torque limits for each individual winding shall be as follows:

a. **Upper Limit:** The upper limit of the torque between locked-rotor and breakdown shall be not more than 280 percent of the rated full-load torque of the motor.

b. **Lower Limit:** The lower limit of the torque between locked-rotor and breakdown shall be as high as possible consistent with good design but not less than 150 percent of the rated full-load torque of the motor.

c. When the characteristics of a motor or the winding of a motor results in a speed torque curve without a definite value of breakdown torque, the limitations on the minimum value of torque shall apply between locked-rotor and 75 percent of synchronous speed.

2.1.3.2 (Single-Speed Motor Limits)

NOTE: Permit the use of two single-speed motors in lieu of a single two-speed motor where space is not a concern, and a two-speed motor cannot meet the specifications requirements.

Two single-speed motors may be used in lieu of a two-speed motor, providing the synchronous speed of the high-speed motor is not more than 1,800 rpm's and the low-speed motor will conform to the 50 percent over-speed requirements of the high-speed motor.

2.1.4 Frames and Shafts

NOTE: Shafts of stainless steel may be specified in lieu of manufacturer's standard treatment where extremely corrosive atmospheres exist. The use of stainless steel will change the motor design and increase the shaft diameter at a significant cost. Manufacturer's should be consulted before specifying stainless steel in a given application.

Size and dimensions of frames shall conform to NEMA MG 1 and shaft extension shall be as required. Eye bolts shall be provided on all motors. Each motor shall be provided with a drain-breather which shall be so located to prevent accumulation of water inside the motor. Frames shall have corrosion prevention in accordance with the requirements of paragraph CORROSION PREVENTION AND FINISH PAINTING. Exposed portions of shafts shall be treated with manufacturer's standard primer and two coats of moisture proof varnish in accordance with the manufacturer's recommendation.
2.1.5 Windings and Insulation

NOTE: Select insulation class based on NEMA temperature requirements as follows:

<table>
<thead>
<tr>
<th>CLASS</th>
<th>LIMITING TEMPERATURE (in degrees Celsius)</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>130</td>
</tr>
<tr>
<td>F</td>
<td>155</td>
</tr>
<tr>
<td>H</td>
<td>180</td>
</tr>
</tbody>
</table>

Selection of insulation class should be left to the Contractor when he is also responsible for motor design, but in no case should it be less than Class B. Class F is typical.

Designer will provide ambient temperature values where possible.

Insulation shall be Class [B] [F] [H] [B or better as required for design conditions] with special moisture, [fungus], and oil proof treatment. Motors shall be designed and constructed to withstand the environmental conditions specified. The following specifications describe the minimum requirements for acceptable insulation and are not intended to restrict or prohibit the use of materials or methods which will give equal or better performance.

2.1.5.1 Insulated Windings

Insulated windings, unless otherwise approved, shall be completely assembled in the motor core before impregnating with the insulating compound. Insulating compound shall be 100 percent solid. Impregnation of the windings with the insulating compound shall be by vacuum impregnation method followed by baking. The procedure shall be repeated as often as necessary to fill in and seal over the interstices of the winding, but in no case shall the number of dips and bakes be less than two dips and bakes when the vacuum method of impregnation is used.

2.1.5.2 Magnet Wire

The magnet wire shall have an insulation or combination of insulations with an insulation thickness not less than that required for the environment specified and the temperature rating as required by the hot-spot temperature of the motor.

2.1.6 Winding Heaters

NOTE: Delete this paragraph and the requirement for "Winding Heaters," if dripproof encapsulated motor is used. Additionally, the designer should consider elimination of winding heaters if possible in other situations, i.e. where the probability of
condensation is low. In the past, heaters have been a maintenance problem and have been disconnected by project personnel.

A heater or heaters shall be installed in the motor frame or end bells or wrapped around the winding end turns. Heaters shall meet the requirements of paragraph HEATERS-GENERAL. Heaters installed around the winding end turns shall consist of the required turns of heating cable wrapped around the end turns and secured in place before the motor windings are impregnated.

2.1.7 Bearings and Lubrication

NOTE: The use of sealed bearings should be limited to special applications. Sealed bearings do not require as much maintenance but reduce the overall life of the motor.

The motors shall be provided with antifriction bearings, and the design of the housing and method of assembly shall permit ready removal of the end brackets and prevent escape of lubricant and entrance of foreign materials. Bearings shall be fitted with bronze or other approved bushings to prevent any binding of moving parts. Approved antifriction bearings of corrosion resisting construction may be used. Bearings shall be of an approved prelubricated type requiring no addition or change of lubrication for a period of at least 5 years; shall have fitted openings located on the top and bottom of the bearing housing. The openings shall be readily accessible for applying and draining the lubricant. Pressure lubrication fittings may be used provided the housings are properly vented to prevent damage to the seals. When the brake housing or other equipment is to be assembled adjacent to or bolted to the motor end bell, suitable filler and drain pipe extensions, with the ends properly fitted and easily accessible, shall be provided. For those applications where the brake wheel is mounted on a shaft extension on the front end of the motor, the bearing housing, or a suitable flange, shall be furnished to provide a suitable surface and connecting means to allow the fastening of the brake enclosure to the bearing housing (see paragraph BRAKE ENCLOSING CASE).

2.1.8 Terminal Leads

Terminals leads shall extend outside the frame; shall have insulation equivalent to that of the motor winding; shall be terminated in a two-piece, watertight terminal box secured rigidly to the motor frame; and shall be suitably identified. Leads shall be positioned and sealed where they pass through the frame with a water-resistant seal of a synthetic rubber material or a synthetic rubber gasket. Terminal box shall have threaded conduit entrances on a minimum of four sides.

2.1.9 Machine Work

Machine work shall be accurate, of high quality, and in conformity with approved standard practice. Threads shall be in accordance with ASME B1.1. Thread fittings shall be Class 2. Threads on all body-bound bolts shall be chased a sufficient length so that when the nut is tightened there will be approximately one and one-half full threads under the nut. All bolts and cap screws shall be provided with lock washers.
2.1.10 Designation and Markings

Motor nameplates of a suitable corrosion-resisting material shall be attached to the frame of each motor and shall indicate clearly the motor NEMA temperature and insulation class, continuous amperage rating, voltage rating, operating frequency, rated RPM, horsepower rating, nominal efficiency, NEMA locked rotor code letter and serial number. In addition, the nameplate shall show a lead connection diagram. Identification or serial numbers shall be die stamped on the frame.

2.2 BRAKE

Submit [6] [_____] copies of detailed descriptive data covering the brake, with necessary cuts, photographs, and drawings to indicate clearly the construction of the brake and the materials used. Releasing device specifications and characteristics, including input current minimum voltage required for brake release.

2.2.1 Brake Type

The brakes shall be of the shoe type, spring set, with AC or DC magnet operated release and shall be completely enclosed in a watertight and dusttight enclosing case arranged for [floor mounting] [motor mounting].

2.2.2 Brake Rating

**************************************************************************
NOTE: Delete paragraph b. if constant torque two-speed motor or a single-speed motor is specified.
**************************************************************************

a. The brake shall have a torque rating not less than 150 percent of the full load torque of the motor when referred to the shaft on which the brake wheel is mounted, efficiency of speed reducer not being considered. The torque rating shall be based on open construction, [1-hour] [continuous] duty.

b. [The brake shall have a torque rating of [_____] pound-feet as shown on the plans, or if the design is changed as permitted by [____], the brake shall have a torque rating not less than 150 percent of the full-load torque of the motor when referred to the shaft on which the brake wheel is mounted, efficiency of speed reducer not being considered.] [For a two-speed motor, the rating shall be computed from the full-load torque of the low-speed winding of the motor.]

2.2.3 Adjustment

Means shall be provided for varying torque required for holding. Additionally, the brake shall have means of adjusting the position of the shoes to compensate for wear, unless the design is such that compensation for shoe wear is automatic.

2.2.4 Release

2.2.4.1 Releasing Magnets and Rectifier

**************************************************************************
NOTE: Coordinate voltage requirements with
