NOTE: Select and include in Part 1 of this Section and later in Part 3 those building enclosure tests required to verify envelope performance as appropriate to the project complexity, OPR, environmental requirements and geographic location. Tests should be selected through consultation between the BECxP and Design Team. ASTM E2813 provides a list of options for building enclosure tests that might be included. Note that all testing listed in ASTM E2813 is not required; thus, the text below states to follow ASTM E2947 except where it references ASTM E2813.

****

Conduct building enclosure commissioning in accordance with ASHRAE 202 and ASTM E2947 in addition to the requirements herein. Follow ASTM E2947 except where it references ASTM E2813. Commissioning must document in sufficient detail compliance of the building envelope with the design intent as defined in the Contract documents.

3.1 MEETINGS

Attend all meetings in accordance with Section 01 91 00.15 BUILDING COMMISSIONING.

Provide timely updates on construction schedule changes so Commissioning Provider has scheduling information needed to execute commissioning process efficiently. Notify Contracting Officer of anticipated construction delays to commissioning activities not yet performed or not yet scheduled.

3.2 DESIGN PHASE COORDINATION MEETING

****

NOTE: This Article is tailored for inclusion in DESIGN-BUILD projects only. This Article also includes tailoring for ARMY and NAVY. Select which

design submittal will include the design phase commissioning coordination meeting. Also, select or insert which Government representatives need to be invited to the meeting.
****

Participate in a design phase commissioning coordination meeting led by the CxC prior to the [35] [50] percent design submittal for systems to be commissioned. The purpose of the meeting is to discuss the commissioning process, including project Contract requirements, lines of communication, roles and responsibilities, schedules, documentation requirements, and to develop a Preliminary BECx Plan.

The Quality Control team, Designer of Record, and the Government Acceptance Testing Representatives and other Government team members must attend this meeting. Invite the User and[a Directorate of Public Works Representative][a Reserve Support Command Representative][ ][a Public Works Division Representative][ ] to attend this meeting. Meeting may be conducted by teleconferencing.

3.3 PRELIMINARY BECx PLAN

****
NOTE: The Article contains tailoring options for DESIGN-BUILD and DESIGN-BID-BUILD projects.
****

Submit the Preliminary BECx Plan no later than 14 calendar days after the Design Commissioning Coordination Commissioning Kickoff Meeting. Submit the Preliminary BECx Plan for inclusion in the Design Phase Interim Construction Phase Commissioning Plan as identified in Section 01 91 00.15 BUILDING COMMISSIONING. Coordinate the development of this plan with the commissioning plans required in Section 01 91 00.15 BUILDING COMMISSIONING. Outline the commissioning process, commissioning team members and responsibilities, lines of communication, inspections, and documentation requirements for BECx. Identify the Commissioning Standards chosen for the project. Establish appropriate and quantifiable enclosure related performance metrics, test standards, and test methodology in accordance with referenced standards for inclusion in the Contract documents. Provide a list of team members for systems to be commissioned with contact information, a list of tests as required to complete the scope of all commissioning and a copy of the project schedule as required by Section 01 32 17.00 20 COST-LOADED NETWORK ANALYSIS SCHEDULE 01 32 01.00 10 PROJECT SCHEDULE for inclusion in the Preliminary BECx Plan.

The Preliminary BECx Plan must include, at a minimum, the following:

1. Required performance of commissioned equipment, systems, and assemblies, and results of FPT and verification.

2. Summary of compliance of the building and its components, assemblies, controls, and systems with requirements.

3. Issues and resolution logs, including itemization of deficiencies found during verification, testing, and commissioning that have not been corrected at the time of report preparation.

4. Deferred tests that cannot be performed at the time of report preparation.

5. Documentation of the training of operation personnel and building occupants on commissioned systems, and a plan for the completion of any deferred trainings not completed at the time of report preparation.

6. A plan for the completion of commissioning and training, including climatic and other conditions required for performance of the deferred tests.

[3.4 DESIGN REVIEW

****

NOTE: For Navy, the Design Review is a bracketed selection; select the Design Review paragraph if a design review is required after contract award. For Army tailoring, the paragraph is not bracketed. The commissioning design review report is required for Army managed projects and may be required by applicable Sustainability third Party Certification guidelines. This Article contains tailoring options for ARMY, NAVY, KTR HIRED COMMISSIONING PROVIDER and GOVERNMENT HIRED COMMISSIONING PROVIDER. Choose bracketed language regarding the Owner's Project Requirements Document for projects that require one (refer to specifier note regarding OPR in paragraph DEFINITIONS for further information). Select the design submittal on which the design review will occur; depending on the size and complexity of the project, review of multiple design submittals can be included.

NOTE: When a KTR hired commissioning provider is used for a DESIGN-BID-BUILD project, the first opportunity for the BECxP to review the project is early in construction. Leveraging the BECxP's experience in review of the design to identify any remaining problems allows early correction, where correction is necessary. This can allow major problems to be addressed with minimal time and cost growth during construction. The Government, in coordination with designers, must review the Design Review Report to determine if any design changes are necessary. Changes to the construction contract are still at the sole discretion of the Contracting Officer.

****

The BECxP must review enclosure-related design documents. The review must occur prior to the [50 percent][PRE-FINAL][FINAL] design submittal. The design review must include verifying that the design for the systems to be commissioned are prepared in accordance with the Contract documents

Provide a Design Review Report identifying discrepancies or deficiencies that would prevent the systems to be commissioned from operating or performing in accordance with the design requirements or being safely maintained. Submit the building enclosure-related Design Review Report for inclusion in the overall project Design Review Report as identified in Section 01 91 00.15 BUILDING COMMISSIONING. Report must include individual list of each deficiency and corresponding corrective action necessary for proper system performance. [Identify any discrepancies between the design and the Owner's Project Requirements Document. The Owner's Project Requirements Document is provided for commissioning review purposes only and does not form a part of the contract documents for this project.] Submit the Design Review Report no later than [14][__] calendar days after approval of the Commissioning Firm and Commissioning Specialists after completing the review of the design. The Contracting Officer, Construction Manager, the Contractor's Project Manager, the BECxP, and the Designers of Record for the associated systems must meet, discuss, and resolve any outstanding items contained in the report no later than 14 calendar days after submission of the report. The BECxP must verify that their review comments have been adequately addressed in subsequent design submittals.

The BECxP is responsible for reviewing the design and preparing a Design Review Report identifying discrepancies or deficiencies that would prevent the systems to be commissioned from operating or performing in accordance with the design requirements or being safely maintained. The Contracting Officer, the CxC, the BECxP, and the Designers of Record for the associated systems must meet, discuss, and resolve any outstanding items contained in the report no later than 14 calendar days after submission of the report. The BECxP must verify that the review comments have been adequately addressed in subsequent design submittals.

Give particular attention to the continuity of the air barrier, vapor and moisture control within enclosure assembly, acoustic control of the enclosure assemblies to meet required Outdoor Indoor Transmission Class (OITC) values, flashing, thermal bridges, and resistance to water penetration or ponding.

]3.5 FINAL BECx PLAN

****

NOTE: This Article includes tailoring for ARMY and NAVY projects.

****

Submit the Final BECx Plan for inclusion in the Interim Construction Phase Commissioning Plan as identified in Section 01 91 00.15 BUILDING COMMISSIONING. Outline the commissioning process, commissioning team members and responsibilities, lines of communication, and documentation requirements for BECx. Identify the Commissioning Standards chosen for the project. Identify enclosure related inspections, performance metrics, test standards, and test methodologies in accordance with referenced standards for inclusion in the commissioning process.

Provide a list of team members for systems to be commissioned with contact information, a list of tests as required by this Section as well as 07 27 10 BUILDING AIR BARRIER SYSTEM, and a copy of the project schedule as required by Section 01 32 17.00 20 COST-LOADED NETWORK ANALYSIS SCHEDULE 01 32 01.00 10 PROJECT SCHEDULE for inclusion in the Final BECx Plan. Final BECx plan must be submitted with the Interim Construction Phase Commissioning Plan, and must be updated and included with the Final Construction Phase Commissioning Plan as identified in Section 01 91 00.15 BUILDING COMMISSIONING.

3.6 CONSTRUCTION SUBMITTAL REVIEWS

****

NOTE: This Article contains tailoring options for

KTR HIRED COMMISSIONING PROVIDER, GOVT HIRED COMMISSIONING PROVIDER, and DESIGN BUILD.
****

Coordinate construction submittal document reviews for commissioned systems and assemblies with the CxC and BECxP. The commissioning submittal review does not replace the designer of record (DoR) or Government submittal review, in accordance with Section 01 33 00 SUBMITTAL PROCEDURES.

The BECxP must identify construction submittals to be provided by the Contractor for the commissioned systems, and coordinate with the CxC. The BECxP must evaluate construction submittals related to BECx for compliance with the Contract documents. The BECxP is responsible for identifying construction submittals to be provided by the Contractor for the commissioned systems and coordinating with the CxC. The BECxP is responsible for evaluating construction submittals related to BECx for compliance with the Contract documents. The DoR must consider the BECxP's comments and provide direction to the Contractor as necessary. Provide a copy of final DoR submittal reviews with comment responses to the BECxP. Include a copy of the submittal document review transmittal and response in the Commissioning Report.

3.7 TEMPLATE BUILDING ENVELOPE INSPECTION CHECKLISTS

****
NOTE: This Article contains tailoring options for KTR HIRED COMMISSIONING PROVIDER, and GOVT HIRED COMMISSIONING PROVIDER.
****

The Building Enclosure Commissioning Specialist must develop the Template Building Envelope Inspection Checklists to verify the building materials and construction maintain the required air tightness of the building envelope system.

Use the Template Building Envelope Inspection Checklists prepared by the CxC to verify the building materials and construction maintain the required air tightness of the building envelope system.

The Building Envelope Compliance Documentation Form from ASHRAE 90.1 - IP User's Manual may be used as an example. The submitted checklist is not required to match the format of the form; however, the checklist must contain the same level of detail as shown on the mandatory provisions of the sample form.

3.8 BUILDING ENVELOPE INSPECTION AND TESTING

****
NOTE: This Article contains tailoring options for KTR HIRED COMMISSIONING PROVIDER and GOVT HIRED COMMISSIONING PROVIDER.

Edit the frequency of site visits based on the size and complexity of the project. Monthly inspections at a minimum are recommended as air barrier construction progresses; also take into account the complexity of the project (such as lab or medical facility vs. a storage building). Keep in mind it is best to inspect during initial construction

installation of key envelope elements; subpar conditions are difficult to correct in later stages of construction.

Whole building envelope air tightness testing is required for projects as outlined in the Editor's Note for the Part 3 section BUILDING ENVELOPE AIR TIGHTNESS REQUIREMENT; include the last bracketed sentence when the project requires air tightness testing.
****

Demonstrate that all system components have been installed, that each building enclosure component operates, and that the systems operate and perform in accordance with Contract documents and the Owner's Project Requirements. Provide all materials, services, and labor required to perform the Building Envelope Inspections.

Document building envelope inspections by the commissioning team using the approved Template Building Envelope Inspection Checklists. Indicate commissioning team member inspection and validation of each Building Envelope Inspection Checklist item by initials at the time they are inspected and found to be in conformance with Contract requirements. Inspect checklist items before they become hidden as construction progresses. Submit the initialed and completed Building Envelope Inspection Checklists no later than 14 calendar days after completion of inspection of all checklist items. The BECxP must conduct inspections at initial installation of each building envelope component and a minimum of [monthly][_____] site visits to the site to observe construction of the building envelope in-progress, each time reviewing the in-progress checklists to ensure that the commissioning team is inspecting the building envelope as required. Coordinate inspection requirements with Section 07 27 10 BUILDING AIR BARRIER SYSTEM and other Division 7 Specifications. [The BECxP must witness the building envelope pressure tests and diagnostic tests specified in this Section; review the resulting reports; and provide recommendations for correction of any deficiencies or further testing.]

Participate in periodic building envelope inspections with the commissioning specialists using the approved Template Building Envelope Inspection Checklists to observe and document construction of the building envelope in-progress. Coordinate inspection requirements with Section 07 27 10 BUILDING AIR BARRIER SYSTEM and other Division 7 Specifications. Complete the checklists and indicate inspection and validation of each Building Envelope Inspection Checklist item by initials at the time they are inspected. Notify the Commissioning Specialist and Contracting Officer at least 21 calendar days before checklist items are concealed to ensure inspection items can be observed before construction progresses. Submit the initialed and Completed Building Envelope Inspection Checklists no later than 14 calendar days after completion of inspection of all checklist items. [Notify the BECx at least 21 calendar days prior to the building envelope pressure tests and diagnostic tests specified in this Section.]

[3.8.1 Additional Building Enclosure Testing

****
NOTE: Select and include those building enclosure tests required to verify envelope performance as appropriate to the project complexity, OPR, environmental requirements and geographic location.

Tests should be selected through consultation between the BECxP and Design Team. ASTM E2813 provides a list of options for building enclosure tests that might be included. Some options include:

Adhesion tests on liquid-applied or adhered waterproofing and air/weather barrier such as ASTM D4541, Test Method for Pull-off Strength Coatings Using Portable Adhesion Testers.

Air leakage testing of fenestration or opaque walls using a site-built test chamber to provide different pressures such as ASTM E783, Test Method for Field Measurement of Air Leakage through Installed Exterior Windows and Doors.

Small scale tests of waterproofing or air weather barriers such as the bubble test described in ASTM E1186, Practices for Air Leakage Site Detection in Building Envelopes and Air Barrier Systems.

Water penetration tests of fenestration with a site-built test chamber (same chamber as ASTM E783) per ASTM E1105, Test Method for Field Determination of Water Penetration of Installed Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform or Cyclic Static Air Pressure Difference.

Water penetration testing using a hose with a calibrated nozzle such as AAMA 501.2, Quality Assurance and Diagnostic Water Leakage Field Check of Installed Storefronts, Curtainwall, and Sloped Glazing Systems.

Adhesion and cohesion testing of sealants according to ASTM C1193, Guide for Use of Joint Sealants: Field-Applied Sealant Joint Hand Pull Tab.

****

[a. Conduct adhesion tests on liquid-applied and adhered waterproofing and air/weather barrier in accordance with ASTM D4541.

][b. Conduct air leakage testing of fenestration in accordance with ASTM E783.

][c. Conduct small scale bubble tests of waterproofing and air/weather barriers in accordance with ASTM E1186.

][d. Conduct water penetration tests of fenestration in accordance with ASTM E1105.

][e. Conduct water penetration tests of installed storefronts, curtainwall, and sloped glazing systems in accordance with AAMA 501.2.

][f. Conduct adhesion and cohesion tests of sealants in accordance with ASTM C1193.

][g. [_____]

]]3.9 BUILDING ENCLOSURE AIR BARRIER PRESSURE TESTING

3.9.1 Pressure Test Agency

Employ an independent agency to conduct the pressure test on the building envelope in accordance with ASTM E779 and this specification section. The test agency is to be an independent third-party subcontractor, not an affiliated or subsidiary of the prime Contractor, subcontractors, or A/E firm. The agency is to be regularly engaged in pressure testing of commercial/industrial building envelopes. If using blower door or trailer-mounted fans, the lead test technician must have at least two years of experience in using such equipment in building envelope pressurization tests. Formal training using pressure test equipment is highly recommended. Technicians using the building's air handling system for pressure testing are to have tested at least five commercial/industrial buildings within the past two years with each building having over 4645 square meters 50,000 square feet of floor area. Submit the name, address, and floor areas of each of these five buildings for approval.

3.9.1.1 Field Work

The lead pressure test technician and thermographer are to be present at the project site while testing is performed and is to be responsible for conducting, supervising, and managing of their respective test work. Management includes health and safety of test agency employees.

3.9.1.2 Reporting Work

The lead pressure test technician is to prepare, sign, and date the test agenda, equipment list, and submit a certified Air Leakage Test Report. The thermographer is to prepare, sign, and date the test agenda, equipment list, and submit a certified Thermographic Investigation Report. The Contractor is to prepare a final report that identifies improvements that were made to the envelope to reduce air leaks [, mitigate thermal bridging][, eliminate moisture migration,][, repair insulation voids] discovered during diagnostic tests. The Verification & Testing (V&T) providers must certify completion of required verification and FPT and include a plan for the completion of any deferred FPT, including climatic and other conditions required for performance of the deferred tests; include the results of the FPT and verification activities in the completed verification and FPT (functional performance testing) documentation. Jointly submit all reports.

3.9.2 Envelope Surface Area Calculation

****

NOTE: The design architect is responsible for defining the air barrier boundary (all 6 sides), showing the boundaries on the drawings, calculating the air barrier envelope surface area, and showing the calculation result on the drawings.

****

The architectural air barrier boundary includes the floor, walls, and ceiling. After construction of the air barrier envelope is complete, field measure the envelope to ensure the physical measurements match the design drawings and the air barrier envelope surface area calculations are generated. If the calculation result is not within 10 percent of the defined air barrier boundary calculation result as indicated, submit the envelope surface area calculation and results for review. [If the air barrier was defined during design but the air barrier envelope surface area was not calculated, calculate it during construction and submit the envelope surface area calculations and result for review.]

3.9.3 Preparing The Building Envelope For The Pressure Test

3.9.3.1 Testing During Construction

The pressure test cannot be conducted until all components of the air barrier system have been installed. After all sealing as described herein has been completed, inspect the envelope to ensure it has been adequately prepared. During the pressure test, stop all ongoing construction within and neighboring the envelope which may impact the test or the air barrier integrity. The pressure test may be conducted before finishes that are not part of the air barrier envelope have been installed. For example, if suspended ceiling tile, interior gypsum board or cladding systems are not part of the air barrier the test can be conducted before they are installed. Recommend testing prior to installing the finished ceilings and interior wall finishes within the envelope and immediately surrounding it. The absence of finishes allows for inspection and diagnostic testing of the roof/wall interface and for implementation of repairs to the air barrier, if necessary to comply with the maximum allowed leakage.

3.9.3.2 Sealing the Air Barrier Envelope

****

NOTE: The design drawings are to detail architectural treatments necessary to provide a complete air barrier including sealing all interfaces in the air barrier envelope.

****

The Contractor is to seal all penetrations through the air barrier. Unavoidable penetrations due to electrical boxes or conduit, plumbing, and other assemblies that are not air-tight are to be made so by sealing the assembly and the interface between the assembly and the air barrier or by extending the air barrier over the assembly. Support the air barrier to withstand the maximum positive and negative air pressure to be placed on the building without displacement or damage, and transfer the load to the structure. Durably construct the air barrier to last the anticipated service life of the assembly and to withstand the maximum positive and negative pressures placed on it during pressure testing. Do not install lighting fixtures that are equipped with ventilation holes through the air barrier.

3.9.3.3 Sealing Plumbing

Prime all plumbing traps located within the envelope full of water.

3.9.3.4 Close and Lock Doors

Close and lock all doors and windows in the envelope perimeter. For doors not equipped with latching hardware, temporarily secure them in the closed position. Secure the doors in such a way that they remain fully closed even when the maximum anticipated differential air pressure produced during the test acts on them. Provide signage stating not to open the door and the time and duration of the test.

3.9.3.5 Hold Excluded Building Areas at the Outdoor Pressure Level

Keep building areas immediately surrounding but excluded from the test envelope at the outdoor pressure level during the pressure test. Maintain these areas at the outdoor pressure level by propping exterior doors open, opening windows and de-energizing all air moving devices in or serving these areas.

3.9.3.6 Maintain an Even Pressure within the Envelope

Ensure the pressure differences within the envelope are minimized by opening all internal air pathways including propping open all interior doors. Distribute test fans throughout the envelope as necessary to ensure the internal pressures are uniform (within 10 percent of the average differential pressure). Ideally, do not install suspended ceilings until after all pressure tests have been completed. If, however the envelope includes finished suspended ceiling spaces, temporarily remove approximately 5 percent of all ceiling tiles or a minimum of 1 tile from each isolated suspended ceiling space, whichever comprises the greatest surface area. Temporarily remove additional ceiling tiles during testing to allow for inspection and diagnostic testing of the ceiling/wall interface. An alternative to removing ceiling tiles is to measure the differential pressure between each isolated suspended ceiling space and the outdoors when the area below the suspended ceiling is maintained at a differential pressure of 75 Pa with respect to the outdoors. If the suspended ceiling differential pressure measurement is within ten percent of the 75 Pa pressure below the suspended ceiling no ceiling tiles need to be removed.

3.9.3.7 Maintain Access to Mechanical and Electrical Rooms

Maintain access to mechanical rooms and electrical rooms associated with the envelope to allow for de-energizing ventilation equipment and resetting circuit breakers tripped by blower door equipment, if used.

3.9.3.8 Minimize Potential for Blowing Dust and Debris

Because high velocity air will be blown into and out of the envelope during the test, debris, including dust and litter, may become airborne. Airborne debris may become trapped or entangled in test equipment, thereby skewing test results. Ensure areas within and surrounding the envelope are free of dust, litter and construction materials that are easily airborne. If pressurizing existing, occupied areas, provide adequate notice to building occupants of blowing dust and debris, and general disruption of normal activities during the test.

3.9.3.9 De-energize Air Moving Devices

De-energize all air moving devices serving the envelope to keep air within the envelope as still as reasonably achievable. De-energize all fans that deliver air to, exhaust air from, or recirculate air within the envelope. Also, de-energize all fans serving areas adjacent to but excluded from the envelope.

[3.9.3.10 Installing Blower Door Equipment in a Door Opening

****

NOTE: Delete this paragraph if blower door equipment will not be used for the pressure test.

****

Where blower door fans are used, before installing blower door equipment, select a door opening that does not restrict air flow into and out of the envelope and has at least 1.5 m 5 feet clear distance in front of and behind the door opening. Disconnect the door actuator and secure the door open to prevent it from being drawn into the fan-by-fan pressure. Avoid installing blower door equipment on the windward side of the building.

]3.9.4 Building Envelope Air Tightness Requirement

****

NOTE: UFC 3-101-01 imposes air tightness requirements for all buildings but requires only inspection (and not air tightness leak testing) for the specific building types. See UFC 3-101-01 for building types which require only inspections.

Seal existing buildings undergoing major renovations, especially the ones located in cold or hot and humid climates, to the same standard as newly constructed ones. The air barrier boundaries of the conditioned portion may not necessarily follow the exterior boundary of the building; it may only be a part of the whole. For additional guidance, see Air Leakage Test Protocol for Building Envelope at the following site: (https://www.wbdg.org/FFC/ARMYCOE/usace_airleakagetestprotocol.pdf).

The Architectural Plus HVAC test should be applied in the specifications of a Contract when the building is designed such that the HVAC system may operate intermittently and when dampers will be utilized to prevent air leakage out of the conditioned space through the HVAC system. The Architectural Plus HVAC test may be applied to residential projects with intermittent HVAC system operation or a project in which there is a need to verify mechanical dampers in the HVAC system for leakage performance.

****

For each building envelope, perform the Architectural Only test and if noted below, the Architectural Plus HVAC System test. The purpose of the pressure (air leakage) test is to determine final compliance with the airtightness requirement by demonstrating the performance of the continuous air barrier. An effective air barrier envelope minimizes infiltration and exfiltration through unintended air paths (leaks). The tests may be performed in any desired order.

3.9.4.1 Architectural Only Test

The test envelope is the architectural air barrier boundary as defined on the Contract drawings. This boundary includes connecting walls, roof and floor which comprise a complete, whole, and continuous three-dimensional envelope. Perform both a positive pressure test and a negative pressure test on this envelope, unless otherwise directed.

3.9.4.1.1 Test Goal

****

NOTE: Edit and include Section 07 27 10, BUILDING AIR BARRIER SYSTEM. The paragraph of Section 07 27 10 titled "Air Barrier Envelope Surface Area

and Leakage Requirements" includes the allowable leakage rate. These rates are different depending on if the test is Architectural Only or Architectural Plus HVAC System.

****

Input data from the test into the Air Leakage Rate by Fan Pressurization spreadsheet as described in paragraph CALCULATION PROGRAM via the Air Leakage Test Form. Compare output from the spreadsheet against the maximum allowable leakage defined in Section 07 27 10 BUILDING AIR BARRIER SYSTEM. The envelope passes the test if the leakage rate, as calculated using the spreadsheet, is equal to or lower than the Architectural Only leakage rate goal.

3.9.4.1.2 Preparing the Envelope for the Pressure Test - Seal All Openings through the Air Barrier

Temporarily close all perimeter windows, roof hatches and doors in the envelope perimeter except for those doors that are to remain open to accommodate blower door or trailer mounted fan test equipment installation. Seal, or isolate all other intentional openings, pathways, and fenestrations through the architectural envelope prior to pressure testing. Follow the Recommended Test Envelope Conditions identified in ASTM E1827, Table 1, for the Closed Envelope condition. These openings may include boiler flues, fuel-burning water heater flues, fuel-burning kitchen equipment, clothes dryer vents, fireplaces, wall or ceiling grilles, diffusers, and other similar openings. Before sealing flues, close their associated fuel valves and verify the associated pilot lights are extinguished. Prime all plumbing traps located within the envelope full of water. In lieu of applying tape or plastic, typical temporary sealing materials include tape and sheet plastic or a self-adhesive grille wrap. Use and apply tape and plastic in a manner that does not deface or remove paint or mar the finish of permanent surfaces. Be especially aware of residue that remains from tape applied to stainless steel surfaces such as kitchen hoods or rollup doors. For painted surfaces, use tape types that do not remove finish paint when the tape is removed. If paint is removed from the finished surface, repaint to match existing surfaces. Secure dampers closed either manually or by using the building's HVAC system controls. Use the table below for further guidance in building preparation.

Building Component	Envelope Condition
Air handling units, duct fans	As found (open) or temporarily sealed as necessary
Clothes dryer	Off
Clothes dryer vents	Temporarily sealed
Dampers - intake, exhaust	Physically closed or closed using control power or temporarily sealed
Diffusers, registers, grilles within the envelope	Temporarily sealed
Doors, personnel type, at the envelope perimeter	Secured closed
Doors, personnel type, within the envelope	Secured (propped) open

Building Component	Envelope Condition
Doors, roll-up type, at the envelope perimeter	Closed (no additional sealing)
Exhaust hoods	Closed* and temporarily sealed
Fireplace hearth	Temporarily sealed *
Kitchen hoods	Temporarily sealed *
Pilot light and associated fuel valve	Extinguished and closed, respectively
Vented combustion appliance	Temporarily sealed *
Vented combustion appliance exhaust flue	Off
Windows	Secured closed
* If the building component has an associated manual or automatic damper, consider securing the damper closed in lieu of temporarily sealing.	

[3.9.4.2 Architectural Plus HVAC System Test

****

NOTE: The Architectural Plus HVAC System test should be applied in the specifications of a Contract when the building is designed such that the HVAC system may operate intermittently and when dampers will be used to prevent air leakage out of the conditioned space through the HVAC system. The Architectural Plus HVAC System test may be applied to residential projects with intermittent HVAC system operation or a project in which there is a need to verify mechanical dampers in the HVAC system for leakage performance. Include or remove this paragraph as required.

****

This test envelope includes the architectural air barrier boundary as defined on the Contract drawings plus all HVAC supply, return and exhaust systems that penetrate and terminate within said architectural air barrier boundary and that extends outward from said boundary. All associated ductwork, intake and exhaust dampers, and air moving devices, including air handling units and fans, are included in this test envelope even if they are physically located outside of the architectural air barrier boundary. The boundary extends to and includes the low leakage intake and exhaust dampers. Perform both a positive pressure test and a negative pressure test on this envelope, unless otherwise indicated.

3.9.4.2.1 Test Goal

****

NOTE: Edit and include Section 07 27 10, BUILDING AIR BARRIER SYSTEM. The paragraph of Section 07 27 10 titled "Air Barrier Envelope Surface Area and Leakage Requirements" includes the allowable

leakage rate. These rates are different depending on if the test is Architectural Only or Architectural Plus HVAC System.
****

Data from the test is to be input into the Air Leakage Rate by Fan Pressurization spreadsheet as described in paragraph CALCULATION PROGRAM via the Air Leakage Test Form. If both positive and negative pressure tests were performed, both data sets are to be input in the spreadsheet. Compare output from the spreadsheet against the leakage rate goal. The envelope passes the test if the leakage rate, as calculated using the spreadsheet, is equal to or lower than the Architectural Plus HVAC System leakage rate goal.

3.9.4.2.2 Preparing the Building for the Pressure Test

In preparation for this test, de-energize all air moving devices within this envelope by putting their controls in the Unoccupied mode. This allows the building's HVAC controls to close all associated motorized intake, exhaust, and relief dampers. Make no other changes to the HVAC systems. Temporarily sealing diffusers, grilles, registers, kitchen hoods, exhaust hoods, fans, air handling units and all other HVAC system elements with tape or plastic sheeting or any other means is not allowed. If the envelope includes a fireplace hearth do not seal it with tape and plastic. Use the table below for further guidance in building preparation.

Building Component	Envelope Condition
Air handling units, duct fans	As found (open)
Clothes dryer	Off
Clothes dryer vents	As found (no preparation)
Dampers - intake, exhaust	As found (no preparation)
Diffusers, registers, grilles within the envelope	As found (open)
Doors, personnel type, at the envelope perimeter	Secured closed
Doors, personnel type, within the envelope	Secured (propped) open
Doors, roll-up type, at the envelope perimeter	Closed (no preparation)
Exhaust hoods	Closed
Fireplace hearth	As found (open)
Kitchen hoods	As found (open)
Pilot light and associated fuel valve	Extinguished and closed, respectively
Vented combustion appliance	Off
Vented combustion appliance exhaust flue	As found (open)

Building Component	Envelope Condition
Windows	Secured closed

]3.9.5 Conducting The Pressure Test

Notify the Contracting Officer at least ten(10) working days before conducting the pressure tests to provide the Government the opportunity to witness the tests and to monitor weather forecasts for conditions favorable for testing. Do not pressure test until verifying that the continuous air barrier is in place and installed without failures in accordance with installation instructions. During the pressure test periodically inspect temporarily sealed items to ensure they are still sealed. Seals on temporarily sealed items tend to release more readily at higher pressures. Test data obtained after temporarily sealed items become unsealed cannot be used as input into the calculation program. Follow the Envelope Pressure Test Procedures in the paragraphs below. Submit detailed pressure test procedures indicating the test apparatus, the test methods and procedures, and the analysis methods to be employed for the building envelope pressure (air tightness) test. Submit these procedures not later than 60 days after Notice to Proceed.

3.9.5.1 Extend Pneumatic Tubes and Establish a Reference Differential Pressure

Confirm the various zones within the envelope have a relatively uniform interior pressure distribution by establishing a representative differential pressure between the envelope and the outdoors with blower door or trailer-mounted fans operating. The number of indoor pressure difference measurements (pneumatic hoses) required depends on the number of interior zones separated by bottle necks that could create significant pressure drops (e.g., doorways and stairwells). Extend at least four pneumatic hoses (differential pressure monitoring ports) to locations within the envelope that are physically opposite of each other. In multiple story buildings, especially those over three stories, extend hoses to multiple floors. Locate the hose ends away from the effects of air discharge from blower test equipment. Select one of the four (or more) interior hoses, one judged by the test agency to be the most unaffected by air velocity produced by blower test equipment, to serve as the interior reference pressure port. Extend at least one additional pneumatic hose to the outdoors (outdoor pressure port). To the end of this hose manifold at least four hoses together and terminate each hose on a different side of the building. With the envelope sealed and the blowers energized, measure the differential pressure using the interior reference pressure port and the four outdoor pressure ports. Then measure and record the differential pressure by individually using each of the remaining three interior hoses. Ensure each reading is within plus or minus 10 percent of the reference reading. Thus, at an average 75 Pa maximum pressure difference across the envelope, the difference between the highest and lowest interior pressure difference measurements should be 15 Pa or less. If this condition cannot be met, attempt to create additional air pathways within the envelope to minimize pressure differences within the envelope. If necessary, move the interior hose ends. See step 2.13 of the Air Leakage Test Form in Appendix A.

3.9.5.2 Bias Pressure Readings

With the fan pressurization equipment de-energized and the envelope sealed, obtain the differential pressure between the outdoors and the envelope. Record 12 bias pressure readings before the pressure test and 12 bias pressure readings after the pressure test. Each reading is the average of ten or more 1-second measurements. Include positive and negative signs for each reading. To help dampen bias pressures that significantly contribute to test pressure, reduce temperature differences between indoor and outdoor air. Temperature differences can be reduced by operating test fan equipment for a few minutes to replace most of the indoor air with outdoor air.

3.9.5.3 Testing in Both Positive and Negative Directions

****

NOTE: The preferred way to dampen bias pressure due to wind is to test the building envelope in both the pressurization and depressurization directions and average the results. Bias pressures are nonlinear and cannot be adequately allowed for by merely subtracting the bias from the pressure reading. Testing in both directions more effectively dampens bias pressures thus tolerating the occurrence of larger bias pressures during a test, up to 30 percent of the lowest test pressure. Allow single direction testing only if testing in both directions cannot logistically be performed.

****

The preferred method for testing a building envelope is to test in both the pressurized and depressurized directions. Testing in one direction is only allowed if opposite direction testing cannot logistically be performed due to test equipment limitations or restrictions. After obtaining the pre-test bias differential pressure readings, conduct the pressure test. Record the envelope pressures (in units of Pascals) from one interior pneumatic hose (monitoring port) and the outdoor pneumatic hose(s), averaged or manifolded, with corresponding flows (in units of L/s cfm) for each fan. Record the flow rates at least 10 to 12 positive and 10 to 12 negative building pressure readings. If conducting both positive and negative pressure tests the lowest allowable test pressure is 40 Pa and the highest test pressure is 85 Pa. Keep at least 25 Pa difference between the lowest and highest test pressure readings. Include the 75 Pa pressure value between the lowest and highest readings. The 10 to 12 readings in each direction are to be roughly evenly spaced along the range of pressures and flows. After testing is complete de-energize the equipment used to provide pressurization and obtain an additional 10 to 12 post-test bias pressure readings. None of the bias pressure readings are allowed to exceed 30 percent of the minimum test pressure. If these limits are exceeded the test fails and must be repeated.

[3.9.5.4 Single Direction Testing

****

NOTE: Allowing testing in only one direction, acknowledges that very large buildings may require truck or trailer mounted blower equipment that logistically will not easily allow testing in both

positive and negative directions. Because bias pressures will have a greater impact on single-direction tests, the maximum allowable bias pressure under these circumstances is 10 percent of the lowest test pressure. At these generally higher pressures, the effects due to bias pressure is somewhat masked by the higher test pressure range. Because building envelopes are often leakier when measured in one direction than the other, testing in only one direction is considered less accurate than testing in both directions. Assume for example, that the bias pressure in a 12 m40 foot high building envelope where the temperature is -18 degrees C 0 degrees F outside and 20 degrees C 68 degrees F inside and with negligible wind is 10.5 Pa. This bias pressure can typically be assumed to be 5.25 Pa at the top of the building envelope and -5.25 Pa at the bottom of the building envelope.

****

After obtaining the 12 aforementioned bias pressure readings, conduct the [positive][negative] pressure test. Obtain flow rates at 10 to 12 roughly evenly spaced pressure readings over a pressure range of 50 to 85 Pa. After the data is recorded, de-energize the blower equipment and obtain an additional 10 to 12 bias pressure readings. None of the bias pressure readings may exceed 10 percent of the minimum test pressure. If these limits are exceeded the test fails.

]3.9.5.5 Using a Building's Own Air Handling System to Pressure Test an Envelope

****

NOTE: Very few US standards exist that adequately address the special requirements for pressurizing an envelope using the building's own air handling system. However, ASTM E779 attempts to address this topic. Canadian General Standards Board reference CAN/CGSB-149.15, "Determination of the Overall Envelope Airtightness of Buildings by Fan Pressurization Method Using the Building's Air Handling Systems" may help the designer better understand this test method. Using the building's air handling system is a less preferred test method due to the difficulty obtaining accurate readings and should only be used if a door blower fan is not feasible.

****

3.9.5.5.1 Test Setup

Temporarily seal the envelope in a manner similar to that for testing with blower door or trailer-mounted fans. To positively pressurize the envelope, de-energize all ventilation equipment and close all associated dampers, except those outside air intake dampers associated with supply fans that will be used to pressurize the building envelope. Fully open these dampers. For the negative pressure test, de-energize all ventilation equipment except for those fans that will be used to de-pressurize the envelope. All dampers associated with de-energized fans are to be closed and all exhaust dampers associated with fans used to de-pressurize the envelope will be fully opened.

3.9.5.5.2 Measuring Airflows

When using the building's own air handling system to pressure test the envelope, air flows can generally be measured using one of the following methods:

a. [When testing using the building's own air handling system, ensure flow readings obtained by anemometer comply with ASTM D3464.]Pitot tube or hot wire anemometer traverse in accordance with ASTM D3464.

b. Pressure compensated shrouds (especially recommended for rooftop exhaust fans)

c. Tracer gas methods for measuring airflows in ducts in accordance with ASTM E2029. Do not use tracer gas decay, constant injection, and constant concentration methods for estimating the total ventilation rate of the envelope.

3.9.5.5.3 Outdoor Air Flow Measuring Stations

Air flow stations may be used to measure outdoor airflows if one of the above methods is used to check accuracy of at least one air flow reading for each station or if the design of the HVAC system specifically placed outdoor air flow stations in locations that will yield accurate results. Field verify the accuracy of readings at the air flow measuring stations before obtaining pressure test readings.

3.9.5.6 Pressure Testing - Special Cases

[3.9.5.6.1 Pressure Testing a Tall or Large Building Envelope

****

NOTE: Use this method only if the entire envelope cannot be pressure tested using the methods previously described. Note that if this method of pressure testing is used, the Architectural Plus HVAC test cannot be performed.

****

Pressure testing the envelope of a tall or large building may be unworkable and unrealistic using blower door or trailer-mounted equipment. In this case, the test agency may define and pressure test separate zones or floors within the envelope and sum the leakage all of the zones to create an overall envelope leakage rate. Using this method, the test agency is to comply with the requirements of ASHRAE RP-935.

]3.9.5.6.2 Pressure Testing a Multiple Isolated Zoned Building

****

NOTE: Some buildings may consist of multiple zones that do not share a common air plenum and cannot easily be modified to do so. Typically, these buildings are dormitories, apartment buildings, hotels and offices wherein occupants enter and leave each zone via a separate, exclusive, exterior door. Walls and floors isolate each zone such that no discernable air pathway between zones exists. In

this case, testing cannot be performed on the entire building envelope; rather, several representative air barrier zones within the building are to be individually pressure tested.

****

Pressure test each exterior corner zone plus at least an additional 20 percent (as measured by floor area) of remaining zones. The Contracting Officer is responsible for selecting which of these additional zones to test. If all zones pass the pressure test it is assumed that all untested zones also pass and no further testing is required. If, however, any zone fails to pass the test's leakage requirements, re-seal, and re-test until it passes in accordance with paragraph FAILED PRESSURE TEST. Test an additional 20 percent of previously untested zones. If all tested zones pass, no further testing is needed. If any zone in this group fails the test re-seal and re-test the zone until it passes. Continue this process until all the tested zones pass. When testing a zone, the doors to all adjacent zones that share a common surface with the tested zone are to have their doors opened to the outdoors. The resulting leakage from the test zoned is that through all six surfaces (4 walls, roof, and floor, for a rectangular shaped zone).

3.9.5.6.3 Pressure Testing a Building Addition

****

NOTE: UFC 3-101-01 indicates that pressure testing a new building addition is not required if the interface between new and existing surfaces cannot be (or are not) adequately sealed for testing. An accurate pressure test can still be performed on the building addition using the method described in this paragraph. If a pressure test is performed on the addition, the surface area calculation should only include those surfaces equipped with an air barrier and not the interface (common) surfaces.

****

If the existing building is occupied, coordinate the pressure test with building representatives. In preparation of the test, de-energize the air handling system serving that portion of the existing building that shares surfaces with the new building addition. Pressure testing a new building addition may also require pressurizing that part of the existing building that shares surfaces in common with the new building addition. If an air barrier is applied to the common surfaces separating the existing building from the new addition, prior to the test prop open a sufficient quantity of doors and windows to keep the existing building at the same pressure as the outdoors. If an air barrier is not applied to the common surfaces separating the existing building from the new addition, pressurize that part of the existing building that shares surfaces in common with the building addition to the same level as the as the addition using separate test pressurization equipment.

3.9.5.7 Failed Pressure Test

If the pressure test fails to meet the established criteria, use diagnostic test methods described in paragraph LOCATING LEAKS BY DIAGNOSTIC TESTING to discover the leak locations. Provide additional permanent sealing measures to reduce or eliminate leak sources discovered during diagnostic testing. Retest (perform another pressure test) after sealing has been completed.

Repeat this sequence of documenting test results in the test report, performing diagnostic tests, documenting recommendations for additional sealing measures in the test report, sealing leak locations per recommendations, and re-testing as necessary until the building envelope passes the pressure test and is in compliance with the performance requirements.

3.9.5.8 Air Leakage Test Report

****

NOTE: Edit and include Section 07 27 10, BUILDING AIR BARRIER SYSTEM. The paragraph of Section 07 27 10 titled "Air Barrier Envelope Surface Area and Leakage Requirements" includes the allowable leakage rate. These rates are different depending on if the test is Architectural Only or Architectural Plus HVAC System.

****

Report volumetric flow rates and corresponding differential pressures in liters per second (L/s) cubic feet per minute (cfm) and Pascals (Pa), respectively, on the Air Leakage Test Form sample form found in Appendix A. Populate the accompanying spreadsheet file titled Pressure Test Data Analysis with information obtained during the test. The spreadsheet uses equations found in ASTM E779 as a basis for calculating the envelope leakage rate. Other similar leakage rate calculation programs cannot be used or submitted for review. Submit a printout of the data input and output in the report. Should any air tightness (pressure) test fail, the pressure test report is to include data and results from all previous failed tests along with the final successful test data and results. Indicate if the resulting leakage rate did or did not meet the goal leakage requirement. Identify and document deficiencies in the building construction upon failure of a test to meet the specified maximum leakage rate.

Test reports on leakage tests performed using fan pressurization must meet ASTM E779 requirements; reports on tests performed utilizing blower door testing must meet ASTM E1827 requirements. Include the Test Agency Qualification Sheet, Air Leakage Test Form and Air Leakage Test Results Form in the written report. Document every test set-up condition with diagrams and photos to ensure the tests can be made repeatable. Document all pneumatic hose termination locations. Record in detail how the building envelope was prepared for the tests. Also describe in detail which building items were temporarily sealed. Include photos of test equipment and sealing measures in the report. Include an electronic (pdf) version of all test reports on a CD. If the building envelope fails to meet the leakage rate goal, provide recommendations to further seal the envelope and document these recommendations in the test report.

3.9.6 Locating Leaks By Diagnostic Testing

Use diagnostic test methods described herein to discover obvious leaks through the envelope. Perform diagnostic tests on the building envelope regardless of the envelope meeting or failing to meet the designated leakage rate goal. Use diagnostic test methods in accordance with ASTM E1186 and in conjunction with pressurization equipment, as necessary. Use the thermography diagnostic test to establish a baseline for envelope leakage. Apply additional diagnostic tests (find, feel, fog or other tests) as necessary to further define leak locations and pathways discovered using thermography or to find additional leaks not readily detected by thermography. Using a variety of diagnostic tests may help locate leaks that would otherwise go undetected if only a single diagnostic test were used. Pay special attention to locating leaks at interfaces where there is a change in materials or a change in direction of like materials. These interfaces, at a minimum, include roof/wall, wall/wall, floor/wall, wall/window, wall/door, wall/louver, roof mounted equipment/roof curb interfaces and all utility penetrations (such as ducts, pipes, and conduit) through the envelope's architecture. Also use diagnostic tests to check for leakage between the air duct and duct damper, when the damper, under normal control power, is placed in the closed position.

3.9.6.1 Sealing and Re-Testing

Should leaks be discovered during diagnostic tests, thoroughly document the exact leak locations on a floor plan so that sealing can be later applied, if required or as directed. If the envelope passes the leakage test, use the diagnostic test procedure described above to identify obvious leakage locations. Seal the leaks at the discretion of the COR based on the magnitude, location, potential for liquid moisture penetration or retention, potential for condensation, presence of daylight through an architectural surface or if the leakage location could potentially cause rapid deterioration or mold growth of, or in the building envelope materials and assemblies. Apply sealing measures after diagnostic testing is complete and all pressurization blowers are off. To verify that the applied sealing measures are effective, re-test for leaks using the same diagnostic methods that discovered the leak. Reseal and retest until the envelope meets the leakage rate goal and all obvious leaks through the envelope are sealed.

3.9.6.2 Find Test

Use visual observation to locate daylight or artificial light streaming from the opposite side of the envelope. Observe all interfaces identified above.

3.9.6.3 Feel Test

Use the building's air handling system or blower door equipment to negatively pressurize the building envelope, to at least 25 Pa but no greater than 85 Pa, with respect to the outdoors. The larger the pressure difference, the easier discovering leaks by feeling them becomes. While inside the envelope, hand feel roof/wall, wall/wall, and floor/wall interfaces and utility penetrations (such as ducts, pipes and conduit) for leaks and note the leak locations on a floor plan. The "Feel" test may also be used to check for leaks between the ductwork and ductwork damper. To do this, positively pressurize the envelope and check for air movement from the envelope exterior.

3.9.6.4 Infrared Thermography Test

****

NOTE: Generally, thermography can only be performed if there is a sufficiently significant temperature difference, a minimum of 5 degrees C 9 degrees F per ASTM E1186 between the indoors and outdoors. Pressurizing and depressurizing the envelope while performing thermography can help exaggerate leaks, thereby making them more noticeable.

****

Coordinate thermography examination with the pressure test agency and the test agency's pressurization equipment. The pressure test agency is to allow adequate time for the thermographer to perform a complete thermographic examination, as described hereinafter, of the envelope interior and exterior, including readings of the roof.

3.9.6.4.1 Thermography Test Methods

Before thermographic testing, remove furniture, construction equipment, and all other obstructions both inside and outside the building as necessary to gain a clear field of view. In the Thermographic Investigation Report, document all areas where obstructions remain. For exterior thermal examination of the envelope, including readings of the roof, verify that no direct solar radiation has heated the envelope surfaces to be examined for a period of approximately 3 hours for frame construction and for approximately 8 hours for masonry veneer construction. Conduct exterior investigations after sunset, before sunrise, or on an overcast day when the influence of solar radiation can be determined to be minimal. Limit exterior examinations to times when the influence of solar radiation is minimal, such as after sunset or before sunrise or during an overcast day. Conduct thermal imaging tests only when wind speeds are less than 8 mph at the time of analysis and at the end of analysis. Document any variations in wind during the test. Document all variations of test conditions in the Thermographic Investigation Report. Test only when exterior surfaces are dry. Monitor and document ongoing test parameters, such as the temperatures inside and outside the air barrier envelope, wind speed, and differential pressure.

3.9.6.4.1.1 Thermography Testing of the Air Barrier

Test the building envelope in accordance with ISO 6781, and ASTM E1186. Perform a complete thermographic inspection consisting of the full inspection of the interior and exterior of the complete air barrier envelope, to include readings of the roof. Document envelope areas that are inaccessible for testing. Use infrared thermography technology in concert with standard pressurization methods (blower doors, trailer mounted fans or the building's own air handling systems) to locate leaks through the air barrier. Adjust the HVAC system, if possible, to create or enhance the temperature difference between the envelope interior and exterior. The minimum allowable temperature difference is 5 degree C 9 degrees F. Maintain this temperature difference for at least 3 hours prior to the test. Use pressurization methods to establish a minimum of +20 Pa pressure difference with respect to the outdoors while using an infrared camera to view the envelope from outdoors. When viewing with the camera from inside the envelope, keep the envelope at a pressure differential of -20 Pa with respect to the outdoors using pressure testing equipment or the building's own air handling system.

3.9.6.4.2 Thermography Test Results

Document the location of all leaks, anomalies, and unusual thermal features on a floor plan or elevation view and catalog them with a visible light picture for locating the defect for correction. The thermographer is to recommend corrective actions to eliminate the leaks, anomalies, and unusual thermal features. Where leaks are found perform corrective sealing as necessary to achieve the whole envelope air leakage rate specified. After sealing, again use thermography in concert with standard pressurization methods to verify that the air leakage has been reduced. After these leaks have been permanently sealed, note all actions taken on the drawings or in the Thermographic Investigation Report. Submit the drawings for approval as part of the Thermographic Investigation Report. Also include thermographic photos that show where leaks were discovered. Include thermograms using an imaging palette that clearly shows the observed thermal patterns indicating air leakage. The Contracting Officer's Representative is to witness all testing.

3.9.6.5 Fog Test

****

NOTE: A fog generator is an electrical device that heats a water-based fluid and converts it into a safe, breathable and relatively buoyant fog. This fog can be issued towards a building interface from a distance of 6 m 20 feet or greater. Consumer grade fog generators are commonly used for parties or during the Halloween season.

****

Before using a theatrical fog generator, disable all building smoke detectors as they may alarm when fog is issued. Coordinate fog tests and the disabling of all smoke detectors with the Contracting Officer's representative and the local fire department as necessary. Use pressure test equipment or the buildings own air handling system to positively pressurize the building envelope to at least 25 Pa but not greater than 85 Pa over the outdoors. Using a theatrical fog generator within the envelope, direct fog at suspected leakage points such as at building interfaces. Test the following interfaces: roof/wall, wall/wall, floor/wall, wall/window, roof/mounted mechanical equipment. From the vantage point immediately outside the envelope and opposite that of the interface being tested, observe the effect as the fog is issued. Detection may also be further enhanced by using a scented fog liquid or a fog liquid that produces a colored fog. Look for fog and smell for associated odor percolating through the interface. Also use smoke puffers and smoke sticks as necessary to locate leaks at these and other interface locations. If the Architectural Plus HVAC System pressure test will be/was performed introduce fog into ductwork to check for leakage between ductwork and associated dampers. After fog testing has ended, reactivate the building smoke detectors, and notify the Contracting Officer and local fire department that the test has ended. After sealing has been completed retest these areas using fog. Seal additional leaks that are found. (Note that theatrical fog may release quantities of the water vapor, glycol, mineral oil, or other media that could damage electronics and interior finishes or cause allergic reactions. Small scale smoke trace could be used as an alternative. See "Effects of Theatrical Smokes and Fogs on Respiratory Health in the Entertainment Industry" at www.nih.gov.)

3.9.6.6 Diagnostic Test Report

Once the diagnostic tests have been completed and the leakage locations identified and sealed, document these procedures, locations, and recommendations in the diagnostic test report. Submit plan and profile drawings that thoroughly identify leak locations. Describe in detail all leak locations so that the seal-up crew knows where to apply sealing measures. After sealing measures have been applied, describe the methods used along with applicable photos of the final sealed condition.

3.9.6.6.1 Thermographic Investigation Report

Submit a report of each thermographic investigation identifying the thermal discontinuities in the thermal control layer. Indicate in the final report locations to which improvements for both the air control layer and the thermal control layer were made to reduce air leaks and correct discontinuities in the thermal control layer. Include in the report some selected radiometric images of suspected failure points in the air barrier envelope that indicate before and after conditions.[Devote a chapter(s) of the Thermographic Investigation Report to identifying suspected points of thermal bridging, moisture migration through roofs and walls, and insulation voids.] Indicate in the final report improvements that were made to the envelope to reduce air leaks. Include the following items in the report:

a. Brief description of the building construction

b. Types of interior and exterior surface materials used in the building.

c. Geographical orientation of the building with a description of the exterior surroundings including other buildings, vegetation, landscaping, and surface water drainage.

d. Camera brand, model and serial number, and most recent calibration date; optional lenses with serial numbers (if applicable)

e. Thermographer's and Government Inspector's names

f. Date and time of tests

g. Air temperature and humidity inside the air barrier envelope

h. Outdoor air temperature and humidity

i. General information for the last 12 hours on the solar radiation conditions in the geographic area where the test is being performed.

j. Ambient conditions such as precipitation and wind direction and speed occurring with the last 24 hours, as applicable. Refer to specific requirements in each section of each thermographic inspection type for requirements in each specific area.

k. Documentation of those portions of the building envelope which were not within test conditions when the scan was performed, and which portions were obstructed by adjacent structures, interior furnishings, intervening cavities, or reflective surfaces.

l. Other relevant information, which may have influenced test results.

m. Drawings, sketches, floor plans and photographs detailing the locations in the buildings where thermograms were taken detailing possible irregularities in the components being tested.

n. Thermal images taken during the inspection with their relative locations and written or voiced recorded explanations of the anomaly listed along with visual and reference images.

o. An identification of the aspects or components of the building being examined.

p. Explanations for the type and the extent of each construction defect observed during the inspection.

q. Any results from additional measurements and investigations. Identify additional equipment used and support with type, model number, serial number, and date of most recent calibrated.

3.9.6.6.2 Fog Test Report

Document all turbulent air flow and dead air spaces within the envelope. Report fog behavior as it exits from or is entrained within the building. Include a floor plan in the report that documents the locations where fog passed through the envelope.

3.9.7 Calculation Program

To calculate the envelope leakage rate and other required outputs, input the data obtained during the pressure tests as documented in the Air Leakage Test Form (Appendix A) into the Air Leakage Rate by Fan Pressurization Excel spreadsheet. This spreadsheet can be found at the following web site: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-

3.9.8 After Completion Of The Pressure And Diagnostic Test

After all pressure and diagnostic testing has been completed unseal all temporarily sealed items. Unless otherwise directed by the Contracting Officer, return all dampers, doors, and windows to their pre-test condition. Remove tape and plastic from all temporarily sealed openings, being careful not to deface painted surfaces. If paint is removed from finished surfaces, repaint to match existing surfaces. Unless otherwise directed by the Contracting Officer's representative, return fuel (gas) valves to their pre-test position and relight pilot lights. Return all fans and air handling units to pre-test conditions. Restore smoke/fire detectors to operating condition.

3.9.9 Repair And Protection

Repair and protection are the Contractor's responsibility, regardless of the assignment of responsibility for testing, inspection, and similar services. Upon completion of inspection, testing, or sample taking and similar services, repair damaged construction and restore substrates and finishes, protect construction exposed by or for quality control service activities, and protect repaired construction.

3.10 TRAINING

****

NOTE: This Article contains tailoring options for KTR HIRED COMMISSIONING PROVIDER, and GOVT HIRED COMMISSIONING PROVIDER.

****

The Building Enclosure Commissioning Specialist must review the training plan required by Section 01 78 00 OPERATION AND MAINTENANCE DATA and identify any deficiencies to the Contracting Officer's Representative and the Contractor's Quality Control Personnel.

The Commissioning Provider is responsible for overseeing and approving the training plan required by Section 01 78 00 OPERATION AND MAINTENANCE DATA and identifying any deficiencies to the Contracting Officer's Representative and the Contractor's Quality Control Personnel.

Coordinate, schedule, and document training of all commissioned systems as required by Section 01 91 00.15 BUILDING COMMISSIONING paragraph titled "Training Plan".

3.11 FINAL BECx REPORT

The BECx must provide a final BECx report that includes information generated by the BECx process including: BECx meeting minutes, design reports, test reports, the final OPR, BoD, final BECx Plan, issue and resolution log, site observations, as-built drawings (provided by the Contractor), submittals, record of training, and recommended preventive maintenance actions and intervals.

The BECxP must ensure the Final BECx Report is submitted as a portion of the Final Commissioning Report for the project, as defined in Section 01 91 00.15 BUILDING COMMISSIONING. Submit report within 14 calendar days of completion of all commissioning efforts.

3.12 APPENDICES

****

PART 1 GENERAL

1.1 UNIT PRICES

****

NOTE: If Section 01 20 00 **PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below**

should be inserted into Section 01 20 00.
****

Make all measurements for payment by or in the presence of the Contracting Officer. Preserve all holes in good condition until final measurement and until the records and samples have been examined and accepted. Payment will be made only for drilling and pressure testing those holes or for excavating those test pits that are included in the SCHEDULE OF DRILLING, SAMPLING, AND TESTING, or are directed by the Contracting Officer to be so drilled or excavated. Payment will not be made for any hole or testing for which satisfactory records (and samples), as determined by the Contracting Officer, are not furnished.

1.1.1 Mobilization and Demobilization

1.1.1.1 Payment

Payment will be made for costs associated with mobilization and demobilization. Sixty percent of the Mobilization and Demobilization lump sum price will be paid following completion of moving onto the site, including complete assembly in working order, of all equipment necessary to perform the required drilling, sampling, pressure-testing and test pit excavation operations. The remaining 40 percent of the contract lump sum price will be paid after all site restoration is completed and all equipment has been removed from the site. No separate payment will be made for moves between holes or test pits.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Auger Boring and Sampling of Drill Holes

1.1.2.1 Payment

Payment will be made for costs associated with Auger Boring and Sampling, [_____] mm inch Diameter Drill Holes.

1.1.2.2 Measurement

Auger Boring and Sampling, [_____] mm inch Diameter Drill Holes will be measured for payment to the nearest 300 mm linear foot, based upon the linear meters feet of holes that were actually drilled through overburden with augers in accordance with the specifications. Measurements will be made from the original ground surface.

1.1.2.3 Unit of Measure

Unit of measure: linear meter foot.

1.1.3 Drive Sample Boring and Sampling

1.1.3.1 Payment

Payment will be made for costs associated with Drive Sample Boring and Sampling, - [_____] mm inch Diameter Samples.

1.1.3.2 Measurement

Drilling for drive sample boring and sampling will be measured for payment to the nearest 300 mm linear foot, based upon the linear meters feet of holes that were actually drilled by drive-sample-boring methods in accordance with the specifications. Measurements will be made from the original ground surface.

1.1.3.3 Unit of Measure

Unit of measure: linear m foot.

1.1.4 Undisturbed Sample Boring and Sampling

1.1.4.1 Payment

Payment will be made for costs associated with Undisturbed Sample Boring and Sampling, [_____] mm inch Diameter Samples.

1.1.4.2 Measurement

Drilling for undisturbed sample boring and sampling will be measured for payment to the nearest 300 mm foot, based upon the linear meters feet of holes that were actually drilled by undisturbed sampling methods in accordance with the specifications. Measurements will be made from the original ground surface.

1.1.4.3 Unit of Measurement

Unit of measure: linear m foot.

1.1.5 Core Hole Overburden Drilling, Without Sampling

1.1.5.1 Payment

Payment will be made for costs associated with Core Hole Overburden Drilling, Without Sampling, [_____] mm inch Diameter Drill Holes, [Vertical] [Inclined].

1.1.5.2 Measurement

Core hole drilling through overburden in order to permit core drilling of rock for [vertical] [inclined] holes where sampling of overburden is not required will be measured for payment to the nearest 300 mm foot, based upon the linear meters feet of hole actually drilled and cased in accordance with these specifications.

1.1.5.3 Unit of Measure

Unit of measure: linear m foot.

1.1.6 Core Drilling, [Vertical] [Inclined] Holes

1.1.6.1 Payment

Payment will be made for costs associated with Core Drilling [Vertical] [Inclined] Holes for [_____] mm inch Diameter Cores.

1.1.6.2 Measurement

Core Drilling [Vertical] [Inclined] Holes for [_____] mm inch Diameter Cores will be measured for payment to the nearest 300 mm foot, based upon the linear meters feet of hole actually drilled in rock in accordance with the specifications.

1.1.6.3 Unit of Measure

Unit of measure: linear m foot.

1.1.7 Pressure Testing (Hydraulic)

1.1.7.1 Payment

Payment will be made for costs associated with Pressure Testing (Hydraulic).

1.1.7.2 Measurement

Pressure Testing (Hydraulic) will be measured for payment based upon the number of hours that pressure testing (hydraulic) was actually performed at the direction of the Contracting Officer and in accordance with the specifications or as otherwise required. Pressure testing (hydraulic) will be measured from the time the pressure testing is begun at the direction of the Contracting Officer to the time of completion of the test as determined by the Contracting Officer. Time spent in placing packer elements in the holes, raising or lowering the packer elements from one lift to another, or removing the packer elements from the holes and time spent in preparation for testing will not be included.

1.1.7.3 Unit of Measure

Unit of measure: hour.

1.1.8 Test Pit Excavation

1.1.8.1 Payment

****

NOTE: Delete the first bracketed option below if the payment paragraphs are inserted in Section 01 20 00 PRICE AND PAYMENT PROCEDURES; otherwise delete the second bracketed option.

****

Payment will be made for costs associated with excavating test pits in accordance with [this section] [Section 01 20 00 PRICE AND PAYMENT PROCEDURES].

1.1.8.2 Measurement

Test Pit Excavation will be measured for payment based upon the contract unit price for each test pit excavated[, which includes the cost of all shoring materials].

1.1.8.3 Unit of Measure

Unit of measure: each.

1.1.9 Test Pit Undisturbed Sample

1.1.9.1 Payment

****

NOTE: Delete the first bracketed option below if the payment paragraphs are inserted in Section 01 20 00 PRICE AND PAYMENT PROCEDURES; otherwise delete the second bracketed option.

****

Payment will be made for costs associated with undisturbed sampling in a test pit in accordance with [this section] [Section 01 20 00 PRICE AND PAYMENT PROCEDURES].

1.1.9.2 Measurement

Test Pit Undisturbed Sample will be measured for payment based upon the contract unit price for each sample obtained.

1.1.9.3 Unit of Measure

Unit of measure: each.

1.1.10 Material for Shoring/Lining Pit Excavation

1.1.10.1 Payment

Payments will be made for costs associated with Shoring/Lining Test Pit Excavations at the contract unit price for each test pit excavation.

1.1.10.2 Measurement

Material used for shoring/lining test pit excavations will be measured for payment based upon the amount of material actually used as directed by the Contracting Officer for shoring/lining the excavations. Material salvaged and re-used at the direction of the Contracting Officer will be paid for at the rate of 30 percent of the contract unit price.

1.1.10.3 Unit of Measure

Unit of measure: each.

1.1.11 Casing Left in Drill Holes

1.1.11.1 Payment

Payment will be made for costs associated with Casing Left in Drill Holes, [_____] mm inch Diameter.

1.1.11.2 Measurement

Casing Left in Drill Holes will be measured for payment to the nearest 300 mm foot, based upon the linear meters feet of casing actually left in the drill holes at the direction of the Contracting Officer.

1.1.11.3 Unit of Measure

Unit of measure: linear m foot.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM D1452/D1452M	(2016) Standard Practice for Soil Exploration and Sampling by Auger Borings
ASTM D1586/D1586M	(2018) Standard Test Method for Standard Penetration Test (SPT) and Split-Barrel Sampling of Soils
ASTM D1587/D1587M	(2015) Thin-Walled Tube Sampling of Soils for Geotechnical Purposes
ASTM D2113	(2014) Rock Core Drilling and Sampling of Rock for Site Investigation
ASTM D2487	(2017; E 2020) Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)
ASTM D2488	(2017; E 2018) Standard Practice for Description and Identification of Soils (Visual-Manual Procedure)

U.S. ARMY CORPS OF ENGINEERS (USACE)

EM 1110-1-1906	(1996) Engineering and Design -- Soil Sampling

1.3 SYSTEM DESCRIPTION

Provide the data to determine the type, nature, and characteristics of subsurface materials and the extent and conditions of the various materials as they exist to the depths and at the locations specified. This is to be accomplished by means of [auger borings], [drive sample borings] [undisturbed sample borings] [core drilling] [pressure testing] [test pits] [_____].

1.3.1 Auger Borings and Sampling

An auger boring is any boring made in unconsolidated soils with a conventional manually or power-driven earth auger for the purpose of obtaining samples of subsurface materials. Perform auger boring and sampling in accordance with [Chapter [_____], EM 1110-1-1906] [ASTM D1452/D1452M], [as directed by the Contracting Officer].

1.3.2 Drive Sample Borings and Sampling

A drive sample boring is a boring made through unconsolidated or partly consolidated sediments or decomposed rock by means of a mechanically driven sampler. The purpose of these borings is to obtain knowledge of the composition, the thickness, the depth, the sequence, the structure, and the pertinent physical properties of foundation or borrow materials. Perform drive sample boring and sampling in accordance with [Chapter [_____] of EM 1110-1-1906] [ASTM D1587/D1587M] [as directed by the Contracting Officer]. Perform standard penetration tests (SPT) in accordance with [Appendix [_____] of EM 1110-1-1906] [ASTM D1586/D1586M].

1.3.3 Undisturbed Sample Borings and Sampling

An undisturbed sample boring is a boring made to obtain soil samples which, when tested, will show properties as close to the in situ (in place) properties as any sample which can be obtained. Accomplish all undisturbed sampling in accordance with [Chapter [_____] of EM 1110-1-1906] [ASTM D1587/D1587M] [as directed by the Contracting Officer].

1.3.4 Core Drilling

****

NOTE: See TABLE 1 COMMON CORE DIAMETERS.

****

Provide core drilling consisting with a [_____] mm inch Diameter. Core Drilling of cores must be [by any approved standard and accepted method of rotary rock core drilling that will provide continuous and complete rock cores of the required diameter from any subsurface interval of bedrock specified for investigation] [performed in accordance with ASTM D2113]. Provide equally good recovery of cores from both hard and soft rocks.

1.3.5 Pressure Testing (Hydraulic)

Hydraulic pressure testing is the process of forcing water under pressure into subsurface rock formations through pre-drilled holes for the purpose of determining the subsurface leakage conditions and possible grouting requirements.

1.3.6 Test Pit Excavation and Sampling

A test pit is any excavation in soil, hardpan, decomposed rock, or other unconsolidated or partially consolidated overburden materials which has an open cross-sectional area large enough to permit efficient excavation and shoring/lining, engineering and geological inspection and photographing of the subsurface soils and manual undisturbed sampling from within the test pit. Excavate, dewater (if necessary), shore/line and protect all test pits from surface water drainage in accordance with all applicable Federal, State, local, Corps of Engineers, and OSHA safety regulations.

1.3.7 Sequencing and Scheduling

1.3.7.1 Schedule of Drilling, Sampling, and Testing

Prior to starting work, submit a plan for drilling, sampling, testing, and safety which includes, but is not limited to, the proposed method of drilling and sampling including a description of the equipment and sampling tools that will be used, a listing of any subContractors to include a description of how the subContractors will be used and a description of all methods and procedures that will be utilized to insure a safe operation and to protect the environment. Do not perform any work until this plan has been approved and no deviation from the approved plan will be permitted without prior approval by the Contracting Officer. The schedule of Drilling, Sampling, and Testing is [indicated.] [listed in the following schedule:]

SCHEDULE OF DRILLING, SAMPLING AND TESTING				
[HOLE NO.][PIT NO.]	METHOD	DEPTH (METERS) (FEET)	VERTICAL OR INCLINED	SPECIAL INSTRUCTIONS

1.3.7.2 Order of Work

****
NOTE: Select appropriate alternative.
****

[The order in which the work is to be accomplished will be determined in the field by the Contracting Officer.] [Commence operations on [Hole No. [_____]] [Test Pit No. [_____]] [_____] and proceed so as to complete [Holes] [Test Pit] [Nos. [_____], [_____], and [_____]] before starting [Hole] [Test Pit] Nos. [_____] and [_____].]

[1.3.7.2.1 Numerical Sequence

It is intended that the [drilling] [test pit excavating] [_____] be accomplished in the numerical sequence indicated in the [SCHEDULE OF DRILLING, SAMPLING, AND TESTING shown on the drawings] [listed in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING]; however, the Contracting Officer may vary the order whenever and in whatever manner is deemed best for accomplishing the work.

1.3.7.2.2 Reporter

Provide a qualified, licensed Geologist experienced in subsurface exploration for each drill unit to oversee all drilling, sampling, and field testing operations. This individual is responsible for the preparation of a separate log and/or report for each boring, pressure test, or test pit. This individual is also responsible for the preparation of all soil and rock samples for delivery to the designated point.

1.3.7.2.3 Government Oversight

The presence of a Government representative or the keeping of separate drilling records by the Contracting Officer does not relieve the Contractor of the responsibility for the work specified in this specification.

]1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Drilling Log; G, [_____]

SD-03 Product Data

Permits, Certifications, and Licenses
Schedule of Drilling, Sampling, and Testing; G, [_____]

1.5 QUALITY ASSURANCE

Comply with all Federal, State and local laws, regulations and ordinances relating to the performance of this work. Procure all required permits, certifications and licenses required by Federal, State, and local law for the execution of this work. Submit copies of all permits, certifications, and licenses prior to starting work. Include a statement of the prior experience, in the type of work described in these specifications, of the person or persons designated to perform the work specified herein.

1.6 DELIVERY, STORAGE, AND HANDLING

****

NOTE: Insert delivery address for samples.

****

1.6.1 General

The Contractor is solely responsible for preserving all samples in good condition. Keep samples from freezing and undue exposure to the weather. Keep all descriptive labels and designations on sample jars, tubes, and boxes clean and legible until final delivery of samples to, and acceptance by, the Contracting Officer. Except as otherwise specified, deliver samples to [_____]. Deliver samples within the time limits specified for each type of investigation or in accordance with schedules prepared by the Contracting Officer.

1.6.2 Undisturbed Samples

Take every precaution to avoid damage to samples as a result of careless handling and undue delay in shipping. Ship samples in containers approved by the Contracting Officer. Provide durable containers to protect the samples from any damage during shipment. Pack the sample tubes in vermiculite or other equal material approved by the Contracting Officer to protect the samples against vibration. Avoid exposing sealed and crated samples to precipitation, direct sunlight, freezing and temperatures in excess of 38 degrees C 100 degrees F. Replace frozen, as well as partially frozen, samples. In general, undisturbed samples are not allowed to remain on the site of sampling for more than one week before shipment. Store and ship samples with the tube in a [horizontal] [vertical] position in order to prevent consolidation and segregation or change of water content.

1.7 PROJECT/SITE CONDITIONS

1.7.1 Environmental Requirements

****

NOTE: Select appropriate alternative.

****

[Comply with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.] [In order to prevent and to provide for abatement and control of any environmental pollution arising from Contractor activities in the performance of this contract, the Contractor and its subContractors must comply with all applicable Federal, State, and local laws, regulations, and ordinances concerning environmental pollution control and abatement.

a. The Contractor is responsible for keeping informed of all updates and changes in all applicable laws, regulations, and ordinances.

b. Do not pollute lakes, ditches, rivers, springs, canals, waterways, groundwaters, or reservoirs with drill fluids, fuels, oils, bitumens, calcium chloride, insecticides, herbicides, or other materials that may be harmful to the environment or a detriment to outdoor recreation.]

1.7.2 Field Measurements

The approximate locations of [drill holes] [test pits] [_____] are shown on the attached drawings. The actual locations will be established in the field by the Contracting Officer prior to the start of work. The elevations of the established locations will also be provided by the Contracting Officer prior to the start of work. Provide access to the locations as necessary for the prosecution of the work. Since no separate payment will be made for access construction, include all costs associated with this in the cost of [drilling] [excavating].

PART 2 PRODUCTS

2.1 CONTAINERS

Furnish jars, tubes, and boxes that meet the following requirements. All such containers will become the property of the Government and the cost thereof will be included in the contract price for the applicable item for which payment is provided.

2.1.1 Sample Jars

Provide sample jars that are [0.5 L 1 pint] [1.0 L 1 quart] capacity, wide-mouth [over 57 mm 2-1/4 inches in diameter] [glass] [plastic] jars with moisture-tight screw tops.

2.1.2 Shipping Boxes

Provide [corrugated cardboard] [wooden] boxes that have the capacity to hold no more than 12 sample jars and the strength to contain and protect the jars and their contents under ordinary handling and environmental conditions.

2.1.3 Tubes and Crates

Ship undisturbed samples in thin walled Shelby tubes packed in crates.

2.1.4 Core Boxes

Use longitudinally partitioned, hinged top, wooden core boxes constructed of plywood and dressed lumber or other approved materials in general accordance with the arrangement and dimensions shown in FIGURE 1 for all rock cores. Use as many core boxes as required to box all core. Furnish core boxes completely equipped with all necessary partitions, hinges, and a hasp for holding down the cover. Also provide wood spacers made of surfaced lumber (not plywood) and having dimensions that are 3 mm 1/8 inch less than the inside dimensions of the individual core box troughs and no less than 19 mm 3/4 inch thick for blocking the core in the boxes and for providing a marking space to identify core runs and pull depths/elevations. The quantities of these blocks that are required are: ten blocks per core box for 75 mm 3 inch or smaller core, five blocks per core box for 100 mm 4 inch and PQ core, and three blocks per core box for 150 mm 6 inch core. The box should have the following capacities:

Box Capacities	
150-mm6-inch core	single row of core
100-mm4-inch or PQ core	2 rows of core
75-mm3-inch or smaller core	3 or 4 rows of core

Provide core box with a maximum length of 1.2 m 4 feet for 75 mm 3 inch or smaller core and dimensioned so that a box will hold 3.6 to 4.9 m 12 to 16 feet of core. The maximum length of a core box for core that is larger than 75 mm 3 inches must be 1.5 m 5 feet.

2.2 LABELS

2.2.1 Sample Jar Labels

Affix a printed or type-written, fade resistant and waterproof label to the outside of each jar containing the following information:

PROJECT	(such as Table Rock Dam)	LOCATION	(such as Borrow Area B)
HOLE NO.		STATION	
JAR NO.		of	______ JARS
TOP ELEVATION OF		DEPTH OF SAMPLE	
DESCRIPTION OF MATERIAL	(such as moist, silty, medium sand)		

2.2.2 Shipping Box Labels

Identify each box of jar samples with weatherproof and wear-proof labels indicating the following:

PROJECT	[_____]
LOCATION	

JAR SAMPLES FROM HOLE OR HOLES	

2.2.3 Core Box Labels

Identify core boxes with stenciled labels containing the following information:

PROJECT	[_____]
HOLE NO.	
BOX NO.	
TOTAL NUMBER OF BOXES FOR THE HOLE	

2.3 EQUIPMENT AND SUPPLIES

2.3.1 Auger Boring and Sampling

Furnish the equipment for making auger borings including, but not limited to, standard continuous flight augers and/or standard cup-type earth augers, similar or equal to the Iwan Auger and not less than 100 mm 4 inches in diameter unless otherwise approved. Equip augers with all the accessories necessary for boring and sampling of overburden materials to the depths and diameters specified or shown on the drawings.

2.3.2 Drive Sample Boring and Sampling

Furnish equipment for making drive sample borings including, but not limited to, standard [50 mm 2-inch OD] [[_____] mm inch OD] [split barrel] [solid barrel] drive samplers and power-driven drilling machinery of a type or types approved by the Contracting Officer, complete with a [_____] kN drive-hammer drive-hammer of [_____]-pound weight and all other accessories for taking samples of all types of soils or decomposed rock at the locations and to the depths indicated [in the SCHEDULE OF DRILLING, SAMPLING, AND TESTING shown on the drawings] [in the schedule in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING]. Provide hardened steel drive shoe for the split barrel samplers and replace or repair when it becomes dented or distorted. Include all casing, drill stem, drill bits, drill fluid and additives, pumps, and power necessary to accomplish the required boring and sampling.

2.3.3 Undisturbed Sample Boring and Sampling

Furnish equipment for making undisturbed sample borings including, but not limited to, power-driven drilling machinery of an approved type or types complete with the special devices and accessories enumerated and described hereinafter. Provide hydraulic feed type drilling machinery. Include all samplers, casing, drill stem, drill bits, drill fluid and additives, pumps, and power necessary to accomplish the required boring and sampling. Provide drill casing, if used, of such minimum inside diameter as to allow use of the selected sampler.

2.3.3.1 Sands and Cohesive Soils

The sampling device used to sample fine to medium grain sands and cohesive soils must be a fixed or stationary piston type that uses a [75-mm 3-inch]

[125-mm 5-inch] diameter thin wall Shelby tube. [Subject to the approval of the Contracting Officer, floating or free piston and non-piston type samplers may be used provided adequate means, such as check valve or vacuum system, are provided to prevent loss of samples.]

2.3.3.2 Stiff and Dense Soils

Provide sampling device for obtaining samples of stiff and dense soils similar or equal to a Denison double tube, swivel head core barrel, or a Pitcher sampler and approved by the Contracting Officer prior to use.

2.3.4 Core Drilling

****

NOTE: See TABLE 1 COMMON CORE DIAMETERS.

****

Provide core drilling consisting of a [_____] mm inch Diameter Core. Furnish equipment for core drilling including core-drilling machinery of a type or types approved by the Contracting Officer, complete with all the accessories needed to take continuous rock cores of a diameter consistent with bit size to the depths specified. Use, as a minimum, a standard ball-bearing, swivel-head, double-tube core barrel, or equivalent. Capacity of the core barrel exceeding 3.2 m 10.5 feet of core is not acceptable. Include all casing, drill rods, core barrels, coring bits, piping, pumps, water, tools, and power required for drilling and all boxes and containers required for core samples. Selection of the type of bit is at the Contractor's discretion provided that the selected bit produces high quality rock core (see paragraph SUPPLEMENTAL [BORINGS] [PITS]).[Provide drilling equipment capable of drilling inclined as well as vertical core holes as specified.]

2.3.5 Pressure Testing (Hydraulic)

Furnish pressure testing equipment including, but not limited to, the following: water pump with a minimum capacity of 3.15 L/second 50 gpm that is capable of delivering a constant discharge pressure of [_____] kPa psi, double expander packers with rubber expansion elements set [1.5] [3] [_____] m [5] [10] [_____] feet apart with piping so arranged that water may be admitted either below the bottom packer element or between the two packer elements, a pressure relief valve, a pressure gage capable of measuring water pressures to the nearest [_____] kPa psi and water meter capable of measuring flows to the nearest [_____] 0.1 L/second gpm. Include all accessory valves, gages, surge tanks, stopcocks, plugs, expanders, potable water for testing, standby pumps, fuels, pipes, pressure hose, and tools necessary for maintaining uninterrupted tests for each boring to be tested. Configure the pressure test equipment such that the pressure gage is located at the top of the hole, a by-pass water line and valve are located between the pump and the gage, a flow meter is located between the by-pass and the pressure gage, and a valve is located in the line between the flow meter and the pressure gage. All equipment and supplies used for pressure testing must be approved by the Contracting Officer prior to use.

2.3.6 Test Pit Excavation and Sampling

Selection of the test pit excavation, shoring/lining and dewatering (if necessary) methods and equipment is at the Contractor's discretion but must be approved by the Contracting Officer. When the number of test pits to be excavated is large, and when adaptable mechanical trenching equipment is available, the Contracting Officer may require that such mechanical excavating equipment be used to expedite completion of the pits. Supplies for obtaining undisturbed samples include, but are not be limited to, split metal cylinders and/or metal or wooden boxes of acceptable sizes and types. Provide cylinders with minimum inside dimensions of [_____] mm inches in diameter by [_____] mm inches in length. Provide wooden boxes that are cubic in shape with a minimum inside dimension of [_____] mm inches. Accessories include, but are not be limited to, a small sample trimming shovel or spade, hatchet, trimming knife, [_____] wax and facilities for melting and brushing same, trowels, labels, and boxes for shipping samples. Also furnish all materials required for shoring/lining to comply with all applicable safety regulations. The Contracting Officer may require the Contractor to salvage and re-use this shoring/lining material in successive test pits.

PART 3 EXECUTION

3.1 MOBILIZATION AND DEMOBILIZATION

****

NOTE: Delete this paragraph if Mobilization and Demobilization is not a separate payment item.

****

3.1.1 Mobilization

Mobilization consists of the delivery to the site of all plant, equipment, materials and supplies to be furnished by the Contractor, the complete assembly in satisfactory working order of all such plant and equipment at the jobsite and the satisfactory storage at the site of all such materials and supplies.

3.1.2 Demobilization

Demobilization consists of the removal from the site of all plant, equipment, materials and supplies after completion of the work and also includes, at the direction of the Contracting Officer, the cleanup and removal of all scrap, waste backfill material, waste drilling fluid, soil contaminated with engine/hydraulic oil, backfilling all sumps or excavations resulting from the operations and, in general, returning the site as close to its original condition as possible.

3.2 IDENTIFYING SAMPLES

Provide sample jars, shipping boxes, and labels that comply with PART 2, paragraphs SAMPLE JARS, SHIPPING BOXES, and LABELS, respectively. [In addition, place a moisture proof label containing the project name, hole number and sample number inside the jar or write this information using a waterproof pen or scribe on the jar lid.] Take all precautions required to insure that the shipping boxes are not subjected to rough handling or damaging environmental conditions [, and complies with paragraph CARE AND DELIVERY OF SAMPLES]. [Enclose a copy of the boring log for the portion of the boring that the samples came from in the shipping box.]

3.3 AUGER BORING AND SAMPLING

Label samples in accordance with paragraph IDENTIFYING SAMPLES. Obtain samples for each change of overburden material and at maximum vertical intervals of [0.3] [1] [1.5] [_____] m [1] [3] [5] [_____] feet [as directed by the Contracting Officer]. In order to retain the natural moisture content of the material to the fullest extent possible, provide samples of sufficient volume to completely fill the sample jars and place the samples in the sample jars as soon as possible after they are taken from the hole. Label all sample jars. In general, no sample is allowed to remain on the site of boring for more than 1 week after being taken from the boring and placed in a jar.

3.4 DRIVE SAMPLE BORING AND SAMPLING

Label samples in accordance with paragraph IDENTIFYING SAMPLES. Case drive sample borings drilled through overburden materials to permit obtaining drive samples of the size or sizes specified or as directed. Take samples continuously or at maximum vertical intervals of [1] [1.5] [_____] m [3] [5] [_____] feet or at a change in materials [in accordance with instructions contained in the SCHEDULE OF DRILLING, SAMPLING, AND TESTING] [as shown on the drawings] or as otherwise directed by the Contracting Officer. Drive the sampler with the force of the [620 140] [_____] N pound drive hammer under a free fall of [_____] mm inches. To minimize the compacting effect of casing driving when casing is used to stabilize a boring, keep the bottom of the casing as high above the soil sampling zone as conditions permit. If hollow stem auger is used as a casing and/or to advance the boring, a plug assembly must be used to keep soil from entering the inside of the auger. Above the water table, obtain samples from a dry hole. Below the water table, maintain water within the hole at or above the groundwater level. Where information on the natural water content of soils above the water table is not needed and when approved by the Contacting Officer, boreholes may be drilled without casing by using a suitable drilling fluid to prevent collapse of sidewalls. When a drilling fluid is used, perform soil sampling by such means that will prevent inclusion of drilling fluid in the samples. Place the samples in sample jars as soon as possible after they are taken from the hole and, when possible, the volume of the sample must be large enough to completely fill the sample jar in order that the natural moisture content of the material may be retained to the fullest extent possible. Label all samples. No sample is permitted to remain at the site of boring for more than one week after being taken from the hole.

3.5 UNDISTURBED SAMPLE BORING AND SAMPLING

In general, label undisturbed samples in conformance to paragraph IDENTIFYING SAMPLES. Take particular care to indicate the top and bottom of each sample tube. Label tubes and crates for undisturbed samples "DO NOT JAR OR VIBRATE" and "HANDLE, HAUL, AND SHIP IN A [HORIZONTAL] [VERTICAL] POSITION".

3.5.1 Procedure

The procedure for Undisturbed Sample Boring and Sampling is outlined in paragraph DRIVE SAMPLE BORING AND SAMPLING, except that the sampling device must be advanced downward by one continuous, smooth drive using the drill rig's hydraulic feed system. Read and record the hydraulic down pressure at 150 mm 6 inch intervals during each sample drive. Advance the sampling device for stiff and dense soils by continuous rotation of the outer cutting barrel in conjunction with use of drill fluid circulation. Driving of any undisturbed sampling device by means such as a drop hammer will not be permitted.

3.5.2 Sealing

3.5.2.1 Alternate 1

Retain the soil sample obtained in a thin wall Shelby tube in the tube and sealed on both ends with a mechanically expandable O-ring sealing disk of the appropriate size.

3.5.2.2 Alternate 2

Extrude the soil sample obtained in a thin wall Shelby tube from the tube in the field as soon as the tube is removed from the boring by a method approved by the Contracting Officer. Immediately wrap the extruded soil sample in [aluminum foil] [thin plastic wrap] and placed in the center of a [metal bottomed, waxed cardboard] [plastic] tube that has a diameter of at least 25 mm 1 inch larger than the diameter of the soil sample, is at least 25 mm 1-inch longer than the length of the soil sample, and has at least 13 mm 1/2-inch of congealed [50/50 mixture of paraffin and microcrystalline wax] [microcrystalline wax] in the bottom. Fill the annular space between the soil sample and the tube with [a 50/50 mixture of paraffin and microcrystalline wax] [microcrystalline wax] to a distance of at least 13 mm 1/2-inch above the top of the soil sample.

3.5.2.3 Alternate 3

Clean both ends of the soil sample tube/liner obtained with a Denison barrel, or its equivalent, to remove all drill fluid contaminated and/or disturbed soil or to a minimum distance of 50 mm 2 inches from the ends of the tube/liner. Place any material removed that is not contaminated with drill fluid in a sample jar and label in accordance with paragraph IDENTIFYING SAMPLES. Seal the cleaned out ends of the sample liner tube with [a 50/50 mixture of paraffin and microcrystalline wax] [microcrystalline wax]. Insert a metal or wooden disk, having a diameter just slightly smaller than the inside diameter of the liner tube into the wax to a distance of 6 mm 1/4-inch from the end of the soil sample. Position the wax plugs flush with the ends of the tube and place a final seal consisting of a metal cap or tape over the ends of the tube.

3.6 CORE HOLE OVERBURDEN DRILLING

[Where samples of overburden materials are required in connection with core drilling, drill and sample the soil overburden in accordance with the applicable provisions for the type of samples required.] [Where sampling of the overburden materials is not required, the Contractor may utilize any method and equipment for drilling and, if required, casing through the overburden that will not affect the quality of the core drilling from the rock surface downward in accordance with these specifications. The method chosen must be approved by the Contracting Officer prior to starting any overburden drilling.]

3.7 CORE DRILLING

****

NOTE: See TABLE 1 COMMON CORE DIAMETERS.

****

Provide core drilling consisting of a [_____] mm inch Diameter Core

3.7.1 Procedure

Drill all holes [vertically] [at the inclined angles [indicated in the SCHEDULE OF DRILLING, SAMPLING, AND TESTING shown on the drawings] [listed in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING]] to the bottom elevations or depths specified unless indicated in the schedule of borings or directed to be drilled otherwise. Off-setting of borings from the locations specified in the Plan of Borings or as shown on the drawings, will not be permitted without prior approval. Casing through the overburden may be required. Seal this casing in the rock at the elevation where rock is encountered prior to commencement of rock coring. Operate the drills at required speeds and down pressures to control drill fluid pressures and quantities to insure maximum core quality and recovery in whatever kind of rock is encountered. Where soft or broken rock is encountered, reduce the length of runs to 1.5 m 5 feet or less in order to reduce and/or keep core loss and core disturbance to the minimum. Failure to comply with the foregoing procedures will constitute justification for the Contracting Officer to require redrilling, at the Contractor's expense, of any boring from which the core recovery is unsatisfactory. Exercise particular care in recording zones of water loss, cavities, rod jerks, rough drilling and other unusual and non-ordinary coring experiences that, supplementing the core record, will throw light on the nature and the extent of any fracturing or abnormalities.

3.7.2 Arrangement of Core

Provide core boxes in compliance with PART 2, paragraph CORE BOXES. Arrange all cores neatly in the partitioned boxes in the same sequence in which they occurred before removal from the hole. Facing the open box with the hinged cover above and the open box below, arrange cores in descending sequence beginning at the left end of the trough nearest the hinges and continuing in the other troughs from left to right. Place the highest part of the core in box 1, and place the lower portions of the core in the other boxes in consecutive order.

3.7.3 Preservation of Core

Wrap representative samples of core (not less than [_____] percent of the total core drilled) in [aluminum foil] [thin plastic wrap] [cheese cloth] and then seal by applying [paraffin wax] [microcrystalline wax] [50/50 mixture of paraffin and microcrystalline wax] to the outside of the wrapping material prior to placing the core in the core box. Accomplish this sealing process as soon as possible after the core is removed from the core barrel. A minimum length of core that is preserved from each boring less than 2.5 times the core diameter is not acceptable. Mark and place spacer blocks in the core box to show where samples have been removed.

3.7.4 Labeling, Marking and Packing Core

Place stenciled labels for core boxes complying with paragraph CORE BOX LABELS on the inside and outside of the top cover in addition to each end. In addition, mark the depths (or elevations) of each core run/pull with a black waterproof pen on the spacer blocks that are placed between core pulls. When a box is full, fill the space between the core and the trough sides with finely ground vermiculite or other packing material approved by the Contracting Officer.

3.7.5 Disposition of Core

While onsite, protect the filled core boxes from direct sunlight, precipitation, and freezing by some form of Contracting Officer approved shelter that allows ventilation to the boxes. Upon completion of core drilling and sampling operations, [store core boxes containing cores in an area provided by the Contracting Officer near the site of drilling] [ship or deliver core boxes containing cores to [provide address]].

3.8 PRESSURE TESTING (HYDRAULIC)

[Pressure-test each hole in [1.5] [3] [_____] m [5] [10] [_____] foot sections commencing at the top of bedrock and progressing downward to the bottom of the hole or to such depths as determined by the Contracting Officer below which testing of the hole is not necessary.] [Pressure test the bottom [1.5] [3] [_____] m [5] [10] [_____] foot section of hole immediately after it is cored. After a [_____] m foot section is cored, the coring equipment will be removed from the section and a single rubber expansion packer placed at the top of the section (bottom of the previously tested section) and the section pressure tested. After the pressure test is completed, remove the packer assembly and the next [_____] m foot section cored and then pressure tested. Continue this procedure to the bottom of the hole or to depths determined by the Contracting Officer.] Where core data from the test holes indicate only isolated zones that are open or fractured, pressure testing may be limited by the Contracting Officer to these zones only. Determine water pressure employed for each lift in the field and do not exceed 22.6 kPa per meter of depth one pound per square inch per foot of depth to the upper expander. Pressure greater than [_____] kPa psi is not acceptable. The pressure test will be divided into two phases; the first phase will be a flow test followed by the second phase, which is a duration test. In performing the first phase, water is pumped slowly at first, and the flow then gradually increased to the point where the predetermined maximum pressure is maintained, by adjusting the valve on the by-pass line. Hold the allowable pressure for 1 minute before any readings are taken. Measure the volume of flow into the test section for a period of 5 minutes without varying the pressure no more than 34.5 kPa 5 psi. After this 5-minute test, start the second phase by closing the valve located between the flow meter and the pressure gage. The drop in pressure is then read for a period of 5 minutes at [15] [30] [_____]-second intervals. In some situations, such as in a very tight formation, the Contracting Officer may eliminate phase one of the test. The Contractor may be required to make check tests at its own expense if the testing equipment or its assembly and arrangement are found to be faulty during or after the testing of any holes. Record all gage and meter readings made during a pressure test on a suitable form approved by the Contracting Officer. A sample form is shown in FIGURE 2 - PRESSURE TEST DATA FORM.

3.9 TEST PIT EXCAVATION AND SAMPLING

3.9.1 Excavation

Excavate the test pits in the order scheduled in [the SCHEDULE OF DRILLING, SAMPLING, AND TESTING shown on the drawings] [paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING], and excavate to depths and dimensions indicated [in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING] [on the drawings]. Become thoroughly familiar with work site and with all available subsurface data, particularly groundwater conditions, before excavating pits. Regardless of the method of excavation employed, excavate [, dewater] and shore/line the pits in conformance with all applicable safety regulations.

3.9.2 Sampling

Obtain soil samples from each pit [at the depths/elevations indicated in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING] [at depths of [_____] m feet, [_____] m feet, and [_____] m feet,] [at depths determined by the Contracting Officer]. Obtain a total of [_____] samples from each test pit. In obtaining samples from test pits, preserve the undisturbed in situ (in place) natural physical and structural characteristics of the sampled materials insofar as possible both while samples are being taken and during shipment to the point of testing. In cohesive and partially cohesive soils this may be accomplished by isolating the soil column or cube to be sampled by gently trenching around it and knife-trimming it to the required dimensions of the split cylinder or box. Apply a thin coating of melted [50/50 mixture of paraffin and microcrystalline][microcrystalline] wax quickly but gently to the sample with a paint brush to seal it against loss of moisture. Remove the top and bottom from the metal or wooden sample container and place over the wax coated sample such that the sample is centered within the container and the top of the container sides are at least 25 mm 1 inch above the top of the sample. Fill the spaces between the sample and the side walls of the container with melted [_____] wax. After this wax has congealed, fill the space between the top of the sample container sides and the top of the sample with [_____] wax. After this wax has congealed, trim so that when the top of the sample container is installed there is no void between the container top and the wax. After the container top is installed, cut off the soil column or cube few hundred mm inches below the container, invert and remove the sample and container from the pit and trim the sample at the base so that the bottom of the sample is at least 25 mm 1 inch below the bottom of the container. Fill this space with [_____] wax and, after the wax has congealed, trim it so that when the bottom of the container is installed, there is no void between the wax and the bottom of the container. Where overburden materials to be sampled are only partially cohesive, it is best not to expose the entire soil column before waxing. By exposing and waxing small sections at a time, the sample will be subjected to less disturbance. Where natural moisture content is an important factor, do not delay taking the sample in order to retain the natural moisture content of the material to the fullest extent.

3.9.3 Disposition of Samples

Pack samples in vermiculite or a packing material approved by the Contracting Officer and shipp in sturdy wooden boxes of strength and construction sufficient to guarantee against damage during shipment. Boxes should be no larger than is required for shipping two such samples. Mark all sample boxes FRAGILE-HANDLE WITH CARE and identify by labels, similar to those as specified in paragraph IDENTIFYING SAMPLES, attached to the outside of each box. Take extreme care to indicate the top and bottom of each sample. Avoid exposing sealed and crated samples to precipitation and extremes of temperature. Replace frozen, as well as partially frozen, undisturbed samples. Do not hold these samples at the site for a period in excess of one week. Prior to shipment, check each sealed and boxed sample for correct labeling.

3.10 SUPPLEMENTAL [BORINGS] [PITS]

[Borings] [Pits] that are abandoned or from which [unsatisfactory samples or cores are obtained] [less than [_____] percent total core recovery has been obtained, exclusive of open or filled cavities] will be supplemented by other [borings] [pits] adjacent to the original in order that satisfactory samples or the required information will be obtained. Actual locations of any supplemental [borings] [pits] will be established by the Contracting Officer. Penetration to the depth where the original was abandoned or to the depths where unsatisfactory samples were obtained may be made by any method selected by the Contractor that in the opinion of the Contracting Officer will permit satisfactory completion and sampling below the elevation where the last satisfactory sample was obtained in the abandoned or satisfactory sampling in the reaches where satisfactory samples were not obtained in the original [borings] [pits]. No payment will be made for supplemental [borings] [pits] that are required to be [drilled] [excavated] to replace [borings] [pits] that were abandoned or from which satisfactory samples were not obtained because of mechanical failure of drilling and sampling equipment, negligence on the part of the Contractor, or other preventable cause for which the Contractor is responsible except that payment will be made for acceptable portions of these supplementary [borings] [pits] below the depths or outside the reaches for which payment was made for the original [borings] [pits].

3.11 BACKFILLING

3.11.1 Drill Holes

Unless otherwise noted in these specifications or directed by the Contracting Officer, backfill and abandon all drill holes in accordance with all Federal, State, and local laws, regulations and ordinances. Preserve all holes in good condition until final measurement and until the records and samples have been accepted. As a minimum, grout all holes from the bottom of the hole to within 600 mm 2 feet of the ground surface using a grout mixture of 23 to 30 liters six to eight gallons of water per sack (42.6 kg) (94 pounds) of portland cement. Pump all grout through a [tremie] [_____] pipe that is inserted to the bottom of the boring to insure that the grout fills the full extent of the hole. Backfill the remaining ungrouted top 600 mm 2 feet of the hole with local soil and tamp. Perform all backfilling operations in the presence of the Contracting Officer and, if required by regulation, Federal, State, and local officials. No separate payment will be made for backfilling drill holes. Include the cost of this work in the drilling costs.

3.11.2 Test Pits

Backfill all test pits with local soil compacted to original densities as directed by the Contracting Officer. No separate payment will be made for backfilling test pits. Include the cost of this work in the test pit excavation costs.

3.12 RECORDS

Submit complete, legible copies of DRILLING LOG, ENG FORM 1836 and 1836A, and records to the Contracting Officer [upon completion of the work or at such other time or times as directed] [within [_____] days after a [hole] [test pit] is completed]. Keep accurate driller's logs (DRILLING LOG, ENG FORM 1836, and 1836-A will be provided by the Contacting Officer) and records of all work accomplished under this contract and deliver complete, legible copies of these logs and records to the Contracting Officer [upon completion of the work or at such other time or times as directed] [within [_____] days after a [hole] [test pit] is completed]. Record all such records during the actual performance of the work and preserve in good condition and order until they are delivered and accepted. The Contracting Officer has the right to examine and review all such records at any time prior to their delivery and has the right to request changes to the record keeping procedure. Include the following information on the logs or in the records for each [hole] [test pit]:

a. [Hole] [Test Pit] number or designation and elevation of top of [hole] [test pit].

b. Driller's name and Geologist's name.

c. Make, size, and manufacturer's model designation of [drilling,] [sampling,] [pressure testing,] [and] [test-pit excavating] equipment.

d. Type of [drilling,] [sampling,] [and] [pressure testing] operation by depth.

e. Hole diameter.

f. Dates and time by depths when [test-pit excavation,] [drilling,] [sampling,] [and] [pressure testing] operations were performed.

g. Time required for [drilling each run] [and] [pressure testing each interval tested].

h. Drill action, rotation speed, hydraulic pressure, water pressure, tool drops, and any other unusual and non-ordinary experience which could indicate the subsurface conditions encountered.

i. Depths [at which samples or cores were recovered or attempts made to sample or core including top and bottom depth of each run] [and] [of each interval pressure tested].

j. Classification or description by depths of the materials [sampled,] [cored,] [or] [penetrated] using the Unified Soil Classification System (ASTM D2487) and including a description of moisture conditions, consistency and other appropriate descriptive information described in paragraph SUPPLEMENTAL [BORINGS] [PITS] of ASTM D2488. Make this classification or description immediately after the samples or cores are retrieved.

k. Classification and description by depths of rock materials [sampled] [or] [cored] including rock type, composition, texture, presence and orientation of bedding, floiation, or fractures, presence of vugs or other interstices, and the RQD for each cored interval.

l. Indication of penetration resistance such as [drive-hammer blows given in blows per foot for driving sample spoons and casing] [and] [the pressure in kPa psi applied to push thin-wall or piston-type samplers].

m. Force Weight of drive hammer.

n. Percentage of sample or core recovered per run.

o. Depth at which groundwater is encountered initially and when stabilized.

p. Depths at which drill water is lost and regained and amounts.

q. Depths at which the color of the drill water return changes.

r. Type and weight of drill fluid.

s. Depth of bottom of hole.

t. Pressures employed in pressure testing.

u.

****

NOTE: This guide specification covers the requirements for demolition, deconstructon, dismantling, reconditioning and disposal of existing building materials, equipment and utilities as a part of new construction or renovation work.

The requirements for demolition and deconstruction activities must be coordinated with Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL. Disposal of demolition waste or recycling of deconstructed materials must be properly planned and managed in the Construction Waste Management Plan.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: Where premises are occupied, certain spaces

may exist where activities cannot be interrupted or disturbed during normal working hours. To prevent disputes or possible contract claims resulting from restriction of demolition or removal work in such spaces, provisions for scheduling of the work must be specified in the contract documents. Restrictions for scheduling of demolition or removal work in areas adjacent to or in occupied spaces should reflect the requirements resulting from the consultation with occupants of the affected spaces. These provisions are necessary to alert prospective bidders about the spaces where business is not to be interrupted or disturbed during construction.

Delete requirements if inapplicable.

Where suspect deck conditions are encountered during design investigation, identify and include appropriate repair and safety provisions in the design documents to draw attention to the suspect areas and the need for additional safety precautions.

Include "Notification of Demolition and Renovation" form for Hawaii only.

****

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 PROJECT DESCRIPTION

****

NOTE: Make a determination as to whether any material of a hazardous nature, as classified in the National Emissions Standards, OSHA, or EPA regulations, will result from the work described. If such material is determined likely, specify precautions and standards to be complied with. Since the Contractor performs the work, the Contractor will be the one responsible for complying with all necessary regulations.

Protect personnel from possible airborne contaminants, such as asbestos fibers, dried fecal matter (bird droppings) and metal dusts.

For Navy projects: Contact an industrial hygienist at (1) A Navy Regional Medical Center, (2) A Navy Environmental and Preventive Medicine Unit, or (3) the Navy Environmental Health Center for assistance. Disposal of materials must not endanger or pollute the environment. Obtain assistance from the environmental branch of the Engineering Field Division of the Naval Facilities Engineering Systems Command or from the Naval Facilities Engineering Service Center, Norfolk, Virginia.

Non-friable materials containing asbestos, such as cement-asbestos siding and roofing and vinyl-asbestos flooring materials, normally do not require special handling and disposal procedures unless such materials are sawn, ground, sanded, drilled, pulverized, or handled in such a manner that will cause dust and airborne asbestos fiber to be released. Thus the removal of non-friable asbestos will not normally require the use of Section 02 82 00 ASBESTOS REMEDIATION. If the project contains non-friable asbestos that is considered to be hazardous due to material condition (broken down or excessively old and decayed) or demolition or deconstruction procedures to be used, then specify the non-friable asbestos to be removed in accordance with Section 02 82 00.

For "NAVFAC SE" projects use "project site" in Guantanamo Bay, Cuba; for all other projects use "station daily."

Deconstruction is the process of taking apart a facility with the primary goal of preserving the value of all useful building materials, so that they may be reused or recycled. It should be considered when adaptive reuse of a building is not an option, and may be used in conjunction with demolition. Deconstruction minimizes demolition landfill materials and reduces material costs for the converted facility. Diverting demolition waste from the landfill contributes to meeting Federal requirements for waste diversion. Coordinate with Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL.

****

1.2.1 Definitions

1.2.1.1 Demolition

Demolition is the process of tearing apart and removing any feature of a facility together with any related handling and disposal operations.

1.2.1.2 Deconstruction

Deconstruction is the process of taking apart a facility with the primary goal of preserving the value of all useful building materials.

1.2.1.3 Demolition Plan

Demolition Plan is the planned steps and processes for managing demolition activities and identifying the required sequencing activities and disposal mechanisms.

1.2.1.4 Deconstruction Plan

Deconstruction Plan is the planned steps and processes for dismantling all or portions of a structure or assembly, to include managing sequencing activities, storage, re-installation activities, salvage and disposal mechanisms.

1.2.2 Demolition/Deconstruction Plan

****

NOTE: Either a Demolition Plan or a Deconstruction Plan is required. A project requiring both demolition and deconstruction work will name the plan according to the majority of the work being performed, and the plan will include requirements for both types of work.

****

Prepare a [Demolition Plan] [Deconstruction Plan] and submit proposed [salvage,] [demolition,] [deconstruction,] and removal procedures for approval before work is started. Include in the plan procedures for careful removal and disposition of materials specified to be salvaged, coordination with other work in progress[, a disconnection schedule of [utility services,] [and] [airfield lighting,] a detailed description of methods and equipment to be used for each operation and of the sequence of operations]. Identify components and materials to be salvaged for reuse or recycling with reference to paragraph Existing Facilities to be Removed. Append tracking forms for all removed materials indicating type, quantities, condition, destination, and end use. Coordinate with Waste Management Plan in accordance with Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL.[Include statements affirming Contractor inspection of the existing roof deck and its suitability to perform as a safe working platform or if inspection reveals a safety hazard to workers, state provisions for securing the safety of the workers throughout the performance of the work.] Provide procedures for safe conduct of the work in accordance with EM 385-1-1. Plan must be approved by [Structural PE] [Contracting Officer] prior to work beginning.

1.2.3 General Requirements

Do not begin demolition or deconstruction until authorization is received from the Contracting Officer. The work of this section is to be performed in a manner that maximizes the value derived from the salvage and recycling of materials. [Remove rubbish and debris from the [station daily] [project site]; do not allow accumulations [inside or outside the building[s]] [on airfield pavements].] [The work includes [demolition,] [deconstruction], salvage of identified items and materials, and removal of resulting rubbish and debris. Remove rubbish and debris from Government property daily, unless otherwise directed. Store materials that cannot be removed daily in areas specified by the Contracting Officer.] In the interest of occupational safety and health, perform the work in accordance with EM 385-1-1, Section 17, Demolition, and other applicable Sections.

1.3 ITEMS TO REMAIN IN PLACE

Comply with FAR 52.236-9 to protect existing vegetation, structures, equipment, utilities, and improvements. Coordinate the work of this section with all other work indicated. Construct and maintain shoring, bracing, and supports as required. Ensure that structural elements are not overloaded. Increase structural supports or add new supports as may be required as a result of any cutting, removal, deconstruction, or demolition work performed under this contract. Do not overload [structural elements] [pavements to remain]. Provide new supports and reinforcement for existing construction weakened by demolition, deconstruction, or removal work. Repairs, reinforcement, or structural replacement require approval by the Contracting Officer prior to performing such work.

1.3.1 Existing Construction Limits and Protection

Do not disturb existing construction beyond the extent indicated or necessary for installation of new construction. Provide temporary shoring and bracing for support of building components to prevent settlement or other movement. Provide protective measures to control accumulation and migration of dust and dirt in all work areas. Remove [snow,]dust, dirt, and debris from work areas daily.

1.3.2 Weather Protection

For portions of the building to remain, protect building interior and materials and equipment from the weather at all times. Where removal of existing roofing is necessary to accomplish work, have materials and workmen ready to provide adequate and temporary covering of exposed areas.

1.3.3 Trees

Protect trees within the project site which might be damaged during demolition or deconstruction, and which are indicated to be left in place, by a 1.8 m 6 foot high fence. Erect and secure fence a minimum of 1.5 m 5 feet from the trunk of individual trees or follow the outer perimeter of branches or clumps of trees. Replace any tree designated to remain that is damaged during the work under this contract with like-kind or as approved by the Contracting Officer.

1.3.4 Utility Service

****

NOTE: Delete the first bracketed sentence when the Government will disconnect and seal utilities. Delete the second bracketed sentence when the Contractor will disconnect and seal utilities.

****

Maintain existing utilities indicated to stay in service and protect against damage during demolition and deconstruction operations. Prior to start of work, [utilities serving each area of alteration or removal will be shut off by the [Government] [utility provider] and disconnected and sealed by the Contractor] [the [Government] [utility provider] will disconnect and seal utilities serving each area of alteration or removal upon written request from the Contractor].

1.3.5 Facilities

Protect electrical and mechanical services and utilities. Where removal of existing utilities and pavement is specified or indicated, provide approved barricades, temporary covering of exposed areas, and temporary services or connections for electrical and mechanical utilities. Floors, roofs, walls, columns, pilasters, and other structural components that are designed and constructed to stand without lateral support or shoring, and are determined to be in stable condition, must remain standing without additional bracing, shoring, or lateral support until demolished or deconstructed, unless directed otherwise by the Contracting Officer. Ensure that no elements determined to be unstable are left unsupported and place and secure bracing, shoring, or lateral supports as may be required as a result of any cutting, removal, deconstruction, or demolition work performed under this contract.

1.4 BURNING

The use of burning at the project site for the disposal of refuse and debris [will not be permitted] [will be permitted in the area located [_____] and between the hours of [_____] and [_____]]. Where burning is permitted, adhere to federal, state, and local regulations.

1.5 AVAILABILITY OF WORK AREAS

Areas in which the work is to be accomplished will be available [at contract award.] [in accordance with the following schedule:

Schedule	
Area	Date
[_____]	[_____]

]

1.6 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Demolition Plan; G, [_____]

Deconstruction Plan; G, [_____]

Existing Conditions

SD-07 Certificates

Notification; G, [_____]

Notification of Demolition and Renovation Form

SD-11 Closeout Submittals

Receipts

1.7 QUALITY ASSURANCE

Submit timely notification of [demolition] [deconstruction] [and] [renovation] projects to Federal, State, regional, and local authorities in accordance with 40 CFR 61, Subpart M. Notify the [Regional Office of the United States Environmental Protection Agency (USEPA)] [State's environmental protection agency] [local air pollution control district/agency] and the Contracting Officer in writing 10 working days prior to the commencement of work in accordance with 40 CFR 61, Subpart M. Comply with federal, state, and local hauling and disposal regulations. In addition to the requirements of the "Contract Clauses," conform to the safety requirements contained in ASSP A10.6. Comply with the Environmental Protection Agency requirements specified. Use of explosives [will] [will not] be permitted.

1.7.1 Hawaii Requirements

****

NOTE: Use the following for Hawaii projects only. "Notification of Demolition and Renovation" form is required for all demolition and deconstruction involving "load-supporting" structures and/or asbestos work. Use the first bracket for "demolition" and/or "deconstruction" work that does not involve asbestos, or "demolition" and/or "deconstruction" work where the combined amount of RACM to be stripped, removed, dislodged, cut, drilled, or similarly disturbed is less than 80 linear meters 260 linear feet on pipes or less than 15 square meters 160 square feet on other facility components. Use the second bracket for "demolition" and/or "deconstruction" and/or "renovation" work when the amount of RACM is greater than those stated above.

"Demolition" means the wrecking or taking out of any "load-supporting structural member" of a facility together with any related handling operations or the intentional burning of any facility. "Deconstruction" means the disassembly of buildings to recover materials. "Renovation" means altering a facility or one or more facility components in any way, including the stripping or removal of RACM from a facility component. "Regulated asbestos-containing material" (RACM) means:

1. Friable asbestos material;

2. Category I nonfriable ACM that has become friable;

3. Category I nonfriable ACM that will be or has been subjected to sanding, grinding, cutting, or abrading, or;

4. Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition, deconstruction, or renovation operations regulated by this subpart.

The designer will complete paragraphs III.A, V, VI, VII, and ensure the quantity of asbestos indicated reflects what is shown on the drawings.

****

Complete and submit Notification of Demolition and Renovation form to Federal and State authorities and Contracting Officer, postmarked or delivered at least ten working days prior to commencement of work, in accordance with 40 CFR 61, Subpart M. [Complete paragraphs I, II, III.B, III.C (if applicable), IX, and XVI of form.] [Complete paragraphs I, II, III.B, III.C (if applicable), VIII, and IX thru XIX of form.] Copy of form is attached at end of this section.

1.7.2 Dust[and Debris] Control

Prevent the spread of dust [and debris] [to occupied portions of the building] [on airfield pavements] and avoid the creation of a nuisance [or hazard] in the surrounding area. Do not use water if it results in hazardous or objectionable conditions such as, but not limited to, ice, flooding, or pollution. [Vacuum and dust the work area [daily] [_____].] [Sweep pavements as often as necessary to control the spread of debris that may result in foreign object damage potential to aircraft.]

1.8 PROTECTION

****

NOTE: Delete requirements if inapplicable. For aircraft safety, Air Force ETL 11-29: Use of Light Emitting Diode (LED) Fixtures on Air Force Installations and Enduring/Contingency Locations, dated 22 Dec 2011, does NOT allow use of LED fixtures for Obstruction Lighting. For work on airfield, coordinate with the Airfield manager the construction phasing plan and operational safety on the airfield during construction per UFC 3-260-01, Section 14.

****

1.8.1 Traffic Control Signs

a. Where [pedestrian and driver] [aircraft] safety is endangered in the area of removal work, use traffic barricades with flashing lights. [Anchor barricades in a manner to prevent displacement by wind, jet or prop blast.] Notify the Contracting Officer prior to beginning such work.

[Provide a minimum of 2 FAA type L-810 steady burning red obstruction lights on temporary structures (including cranes) over 30 m 100 feet, but less than 60 m 200 ft, above ground level. The use of LED based obstruction lights are not permitted. For temporary structures (including cranes) over 60 m 200 ft above ground level provide obstruction lighting in accordance with FAA AC 70/7460-1. Perform light construction and installation in compliance with FAA AC 70/7460-1. Lights must be operational during periods of reduced visibility, darkness, and as directed by the Contracting Officer. Maintain the temporary services during the period of construction and remove only after permanent services have been installed and tested and are in operation.]

1.8.2 Protection of Personnel

Before, during and after the [demolition][and][deconstruction] work continuously evaluate the condition of the [site specific features] [structure] [_____] being [demolished] [and] [deconstructed] and take immediate action to protect all personnel working in and around the project site. No area, section, or component of floors, roofs, walls, columns, pilasters, or other structural element will be allowed to be left standing without sufficient bracing, shoring, or lateral support to prevent collapse or failure while workmen remove debris or perform other work in the immediate area.

1.9 FOREIGN OBJECT DAMAGE (FOD)

****

NOTE: Delete requirements if inapplicable.

Some large scale apron, hangar, or other type projects to be constructed adjacent to areas with operational aircraft may require temporary barricades or debris fences installed in place prior to the start of work. The station's air operations and public works departments must be contacted by the designer to determine project requirements. If fences or other type barricades are required, they must be designed and located to suit the project

****

Aircraft and aircraft engines are subject to FOD from debris and waste material lying on airfield pavements. Remove all such materials that may appear on operational aircraft pavements due to the Contractor's operations. If necessary, the Contracting Officer may require the Contractor to install a temporary barricade at the Contractor's expense to control the spread of FOD potential debris. Provide a barricade consisting of a fence covered with a fabric designed to stop the spread of debris. Anchor the fence and fabric to prevent displacement by winds or jet/prop blasts. Remove barricade when no longer required.

1.10 RELOCATIONS

Perform the removal and reinstallation of relocated items as indicated with workmen skilled in the trades involved. Repair or replace items to be relocated which are damaged by the Contractor with new undamaged items as approved by the Contracting Officer.

1.11 EXISTING CONDITIONS

Before beginning any demolition or deconstruction work, survey the site and examine the drawings and specifications to determine the extent of the work. Record existing conditions in the presence of the Contracting Officer [or the Contracting Officer's Representative] [and a representative from the non-federal sponsor] showing the condition of structures and other facilities adjacent to areas of alteration or removal. Photographs or electronic images with a minimum resolution of 3072 x 2304 pixels, capable of a print resolution of 300 dpi, will be acceptable as a record of existing conditions. Include in the record the elevation of the top of foundation walls, finish floor elevations, possible conflicting electrical conduits, plumbing lines, alarms systems, the location and extent of existing cracks and other damage and description of surface conditions that exist prior to starting work. It is the Contractor's responsibility to verify and document all required outages which will be required during the course of work, and to note these outages on the record document. Submit survey results to the Contracting Officer [or the Contracting Officer's Representative].

PART 2 PRODUCTS

2.1 FILL MATERIAL

a. Comply with excavating, backfilling, and compacting procedures for soils used as backfill material to fill basements, voids, depressions or excavations resulting from demolition or deconstruction of structures. Provide fill material consisting of waste products from demolition or deconstruction until all waste appropriate for this purpose is consumed.

[b. Provide fill material conforming to the definition of satisfactory soil material as defined in [ASTM D2487] [AASHTO M 145, Soil Classification Groups A-1, A-2-4, A-2-5 and A-3]. In addition, fill material must be free from roots and other organic matter, trash, debris, frozen materials, and stones larger than 50 mm 2 inches in any dimension.

c. Proposed fill material must be sampled and tested by an approved soil testing laboratory, as follows:

Soil classification	AASHTO M 145
Moisture-density relations	AASHTO T 180, Method B or D

]

PART 3 EXECUTION

3.1 EXISTING FACILITIES TO BE REMOVED

****

NOTE: Thoughtful and considered disassembly as opposed to standard demolition will produce more usable "reusables" and will help prevent damage to items scheduled to remain.

Suggested uses for salvaged materials are as follows.
1. Whole buildings can be sold, leased, or donated and either moved or dismantled.
2. Separate asphalt roofing materials for milling

and recycling.
3. Salvage whole bricks for reuse, keeping exterior bricks separate. Salvage remaining masonry to be crushed and used as landscape cover, sub-base material, or fill.
4. Salvage precast concrete panels as whole units for use as erosion control or landscape features. Salvage whole concrete blocks for reuse. Salvage concrete block pieces to be crushed and used as sub-base material or fill. Crush and grade remaining concrete for use as riprap, aggregate, sub-base material, or fill.
5. Chipped or shredded wood can be used onsite as ground cover, mulch, compost, pulp, or process fuel.
6. Crushed porcelain may be used for fill.
7. Wood cleared from the site can be chipped or shredded for use as ground cover, mulch, compost, pulp, or process fuel.
8. Salvage clean, unpainted, non-biocide-treated gypsum board to be ground up and used as soil amendment or recycled.

****

Inspect and evaluate existing structures onsite for reuse. Disassemble existing construction scheduled to be removed for reuse. Dismantled and removed materials are to be separated, set aside, and prepared as specified, and stored or delivered to a collection point for reuse, remanufacture, recycling, or other disposal, as specified. Designate materials for reuse onsite whenever possible.

3.1.1   Structures

****

NOTE: Where necessary, add additional requirements relating to specific types of existing construction such as masonry, concrete, and other special requirements for removal work. It is very difficult to specify particular removal criteria in a guide specification or even a project specification. It may be more advantageous to show the work on the drawings.

****

a. Remove existing structures indicated to be removed to [grade] [top of foundation walls] [[_____] meters feet below grade]. Remove interior walls, other than retaining walls and partitions, to [_____] m feet below grade or to top of concrete slab on ground. Break up basement slabs to permit drainage. Remove sidewalks, curbs, gutters and street light bases as indicated.

b. [Demolish] [Deconstruct] structures in a systematic manner from the top of the structure to the ground. Complete demolition work above each tier or floor before the supporting members on the lower level are disturbed. [Demolish] [Deconstruct] concrete and masonry walls in small sections. Remove structural framing members and lower to ground by means of derricks, platforms hoists, or other suitable methods as approved by the Contracting Officer.

c. Locate demolition and deconstruction equipment throughout the structure and remove materials so as to not impose excessive loads to supporting walls, floors, or framing.

d. [Building, or the remaining portions thereof, not exceeding 25 m 80 feet in height may be demolished by the mechanical method of demolition.]

3.1.2 Utilities and Related Equipment

3.1.2.1 General Requirements

Do not interrupt existing utilities serving occupied or used facilities, except when authorized in writing by the Contracting Officer. Do not interrupt existing utilities serving facilities occupied and used by the Government except when approved in writing and then only after temporary utility services have been approved and provided. Do not begin demolition or deconstruction work until all utility disconnections have been made. Shut off and cap utilities for future use, as indicated.

3.1.2.2 Disconnecting Existing Utilities

****

NOTE: Where the materials, meters, or related equipment to be affected in the area of demolition or deconstruction are the property of the local utility companies and not of the Government, the specifier must contact them, determine the disposition of the existing utilities, and modify the requirements herein as needed.

****

Remove existing utilities [, as indicated] [uncovered by work] and terminate in a manner conforming to the nationally recognized code covering the specific utility and approved by the Contracting Officer. When utility lines are encountered but are not indicated on the drawings, notify the Contracting Officer prior to further work in that area. Remove meters and related equipment and deliver to a location [on the station] in accordance with instructions of the Contracting Officer.

3.1.3 Chain Link Fencing

Remove chain link fencing, gates and other related salvaged items scheduled for removal and transport to designated areas. Remove gates as whole units. Cut chain link fabric to [_____] 7 m 25 foot lengths and store in rolls off the ground.

3.1.4 Paving and Slabs

****

NOTE: Delete requirements if inapplicable.

****

[Remove [ground] [scarified] [sawcut] concrete and asphaltic concrete paving and slabs [including aggregate base] [as indicated] to a depth of [_____] mm inches below [existing adjacent] [new finish] grade. [Demolition of concrete pavement on airfields and other heavy duty pavements will follow methods in Section 32 13 14.13 CONCRETE PAVING FOR AIRFIELDS AND OTHER HEAVY DUTY PAVEMENTS.][Provide neat sawcuts at limits of pavement removal as indicated.]] Move, grind and store pavement and slabs designated to be recycled and utilized in this project as directed by the Contracting Officer. Remove pavement and slabs not to be used in this project from the [installation] [project site] at Contractor's expense.

3.1.5 Roofing

****

NOTE: Delete requirements if inapplicable.

Where suspect deck conditions are encountered during design investigation, identify and include appropriate repair and safety provisions in the design documents to draw attention to the suspect areas and the need for additional safety precautions.

****

[Remove existing roof system and associated components in their entirety down to existing roof deck.] [Remove [built-up] [single-ply] roofing to effect the connections with new flashing or roofing.] [Remove gravel surfacing from existing roofing felts for a minimum distance of 450 mm 18 inches back from the cut. Remove gravel without damaging felts.] [Salvage asphalt roofing materials.] [Cut existing [felts] [membrane] [and insulation] along straight lines.] [Remove roofing system [and insulation] without damaging the roof deck.] Sequence work to minimize building exposure between demolition or deconstruction and new roof materials installation.

3.1.5.1 Temporary Roofing

Install temporary roofing and flashing as necessary to maintain a watertight condition throughout the course of the work. Remove temporary work prior to installation of permanent roof system materials unless approved otherwise by the Contracting Officer. [The existing [deck] [and support structure] is deteriorated where indicated, such that ability to support foot traffic and construction loads is unknown. Make provisions for worker safety during demolition, deconstruction, and installation of new materials as described in paragraphs entitled "Statements" and "Regulatory and Safety Requirements."]

3.1.5.2 Reroofing

When removing the existing roofing system from the roof deck, remove only as much roofing as can be recovered by the end of the work day, unless approved otherwise by the Contracting Officer. Do not attempt to open the roof covering system in threatening weather. Reseal all openings prior to suspension of work the same day.

3.1.6 Masonry

Sawcut and remove masonry so as to prevent damage to surfaces to remain[, to removed materials being salvaged] [and to facilitate the installation of new work]. Where new masonry adjoins existing, abut or tie the new work into the existing construction as [indicated] [specified for the new work]. Provide square, straight edges and corners where existing masonry adjoins new work and other locations.[Salvage masonry removed in whole blocks and store for reuse.] [Masonry removed in pieces must be crushed[for use as aggregate]].

3.1.7 Concrete

Saw concrete along straight lines to a depth of a minimum 50 mm 2 inch. Make each cut in walls perpendicular to the face and in alignment with the cut in the opposite face. Break out the remainder of the concrete provided that the broken area is concealed in the finished work, and the remaining concrete is sound. At locations where the broken face cannot be concealed, grind smooth or saw cut entirely through the concrete. [Salvage removed concrete.] [Sawcuts in existing [concrete sidewalk] [roads] [concrete pads] [parking areas] must be at the nearest existing expansion joint or weakened plane joint and at full depth.]

3.1.8 Structural Steel

****

NOTE: Delete structural steel and miscellaneous metals only if it is determined that there are no existing metals or structural steel to be recycled or salvaged.

****

Dismantle structural steel at field connections and in a manner that will prevent bending or damage. Salvage for [reuse] [recycle] structural steel, steel joists, girders, angles, plates, columns and shapes. [Do not use flame-cutting torches] [Flame-cutting torches are permitted when other methods of dismantling are not practical]. Transport steel joists and girders as whole units and not dismantled. Transport structural steel shapes to a designated [storage area] [recycling facility] [area as directed by the Contracting Officer], stacked according to size, type of member and length, and stored off the ground, protected from the weather.

3.1.9 Miscellaneous Metal

Salvage shop-fabricated items such as access doors and frames, steel gratings, metal ladders, wire mesh partitions, metal railings, metal windows and similar items as whole units. Salvage light-gage and cold-formed metal framing, such as steel studs, steel trusses, metal gutters, roofing and siding, metal toilet partitions, toilet accessories and similar items. [Scrap metal is the Contractor's property.] Recycle scrap metal as part of demolition and deconstruction operations. Provide separate containers to collect scrap metal and transport to a scrap metal collection or recycling facility, in accordance with the Waste Management Plan.

3.1.10 Carpentry

Salvage for [reuse] [recycle] lumber, millwork items, and finished boards, and sort by type and size. [[Chip or shred and]recycle salvaged wood unfit for reuse, except stained, painted, or treated wood.] [Salvage] [Remove] windows, doors, frames, and cabinets, and similar items as whole units, complete with trim and accessories. [Do not remove hardware attached to units, except for door closers.] [Salvage hardware attached to units for reuse.] Brace the open end of door frames to prevent damage.

3.1.11 Carpet

Remove existing carpet for reclamation in accordance with manufacturer recommendations and as follows. Remove used carpet in large pieces, roll tightly, and pack neatly in a container. Remove adhesive according to recommendations of the Carpet and Rug Institute (CRI). Provide adhesive removal solvents in compliance with CRI 104/CRI 105. Recycle removed carpet cushion.

3.1.12 Acoustic Ceiling Tile

Remove, neatly stack, and recycle acoustic ceiling tiles. Recycling may be available with manufacturer. Otherwise, give priority to a local recycling organization. Recycling is not required if the tiles contain or may have been exposed to asbestos material.

3.1.13 Airfield Lighting

Remove existing airfield lighting as indicated and terminate in a manner satisfactory to the Contracting Officer. Remove [edge lights], [associated transformers] [and] [_____] as indicated and [deliver to a location on the station in accordance with instructions of the Contracting Officer] [dispose of off station] [_____].

3.1.14 Patching

Where removals leave holes and damaged surfaces exposed in the finished work, patch and repair these holes and damaged surfaces to match adjacent finished surfaces, using on-site materials when available. Where new work is to be applied to existing surfaces, perform removals and patching in a manner to produce surfaces suitable for receiving new work. Make finished surfaces of patched area flush with the adjacent existing surface and match the existing adjacent surface as closely as possible to texture and finish. Provide patching as specified and indicated, and include the following:

a. Concrete and Masonry: Completely fill holes and depressions, [caused by previous physical damage or] left as a result of removals in existing masonry walls to remain, with an approved masonry patching material, applied in accordance with the manufacturer's printed instructions.

b. Where existing partitions have been removed leaving damaged or missing resilient tile flooring, patch to match the existing floor tile.

c. Patch acoustic lay-in ceiling where partitions have been removed. Make the transition between the different ceiling heights by continuing the higher ceiling level over to the first runner on the lower ceiling and closing the vertical opening with a painted sheet metal strip.

3.1.15 Air Conditioning Equipment

****

NOTE: Delete requirements if inapplicable.

Quantify by weight the amount and type of refrigerant to be recovered and indicate on plans.

Directives from the Secretary of the Navy prohibit sale or transfer of Class I ODS materials outside of the Navy without prior approval from the Chief of Naval Operations or the Commandant of the Marine Corps.

****

[Remove air conditioning, refrigeration, and other equipment containing refrigerants without releasing chlorofluorocarbon refrigerants to the atmosphere in accordance with the Clean Air Act Amendment of 1990.] [Recover all refrigerants prior to removing air conditioning, refrigeration, and other equipment containing refrigerants and dispose of in accordance with the paragraph entitled "Disposal of Ozone Depleting Substance (ODS)."] [Turn in salvaged Class I ODS refrigerants as specified in paragraph, "Salvaged Materials and Equipment."]

3.1.16 Cylinders and Canisters

Remove all fire suppression system cylinders and canisters and dispose of in accordance with the paragraph entitled "Disposal of Ozone Depleting Substance (ODS)."

3.1.17 Locksets on Swinging Doors

****

NOTE: Use this paragraph when project includes removal and disposal of hinged or pivoted swinging doors. (This is a security measure.)

****

Remove all locksets from all swinging doors indicated to be removed and disposed of. Deliver the locksets and related items to a designated location for receipt by the Contracting Officer after removal.

3.1.18 Mechanical Equipment and Fixtures

****

NOTE: Delete, revise, or add to the text to cover the project requirements. Materials and equipment scheduled for salvage should be noted on the drawings.

****

Disconnect mechanical hardware at the nearest connection to existing services to remain, unless otherwise noted. Disconnect mechanical equipment and fixtures at fittings. Remove service valves attached to the unit. Salvage each item of equipment and fixtures as a whole unit; listed, indexed, tagged, and stored. Salvage each unit with its normal operating auxiliary equipment. Transport salvaged equipment and fixtures, including motors and machines, to a designated [on station] storage area as directed by the Contracting Officer. Do not remove equipment until approved. Do not offer low-efficiency equipment for reuse[; provide to recycling service for disassembly and recycling of parts].

3.1.18.1 Preparation for Storage

Remove water, dirt, dust, and foreign matter from units; drain tanks, piping and fixtures; if previously used to store flammable, explosive, or other dangerous liquids, steam clean interiors. Seal openings with caps, plates, or plugs. Secure motors attached by flexible connections to the unit. Change lubricating systems with the proper oil or grease.

3.1.18.2 Piping

Disconnect piping at unions, flanges and valves, and fittings as required to reduce the pipe into straight lengths for practical storage. Store salvaged piping according to size and type. If the piping that remains can become pressurized due to upstream valve failure, attach end caps, blind flanges, or other types of plugs or fittings with a pressure gage and bleed valve to the open end of the pipe to ensure positive leak control. Carefully dismantle piping that previously contained gas, gasoline, oil, or other dangerous fluids, with precautions taken to prevent injury to persons and property. Store piping outdoors until all fumes and residues are removed. Box prefabricated supports, hangers, plates, valves, and specialty items according to size and type. Wrap sprinkler heads individually in plastic bags before boxing. Classify piping not designated for salvage, or not reusable, as scrap metal.

3.1.18.3 Ducts

Classify removed duct work as scrap metal.

3.1.18.4 Fixtures, Motors and Machines

Remove and salvage fixtures, motors and machines associated with plumbing, heating, air conditioning, refrigeration, and other mechanical system installations. Salvage, box and store auxiliary units and accessories with the main motor and machines. Tag salvaged items for identification, storage, and protection from damage. Classify [non-porcelain]broken, damaged, or otherwise unserviceable units and not caused to be broken, damaged, or otherwise unserviceable as debris to be disposed of by the Contractor. [Salvage and crush porcelain plumbing fixtures unsuitable for reuse.]

3.1.19 Electrical Equipment and Fixtures

Salvage motors, motor controllers, and operating and control equipment that are attached to the driven equipment. Salvage wiring systems and components. Box loose items and tag for identification. Disconnect primary, secondary, control, communication, and signal circuits at the point of attachment to their distribution system.

3.1.19.1 Fixtures

Remove and salvage electrical fixtures. Salvage unprotected glassware from the fixture and salvage separately. Salvage incandescent, mercury-vapor, and fluorescent lamps and fluorescent ballasts manufactured prior to 1978, boxed and tagged for identification, and protected from breakage.

3.1.19.2 Electrical Devices

Remove and salvage switches, switchgear, transformers, conductors including wire and nonmetallic sheathed and flexible armored cable, regulators, meters, instruments, plates, circuit breakers, panelboards, outlet boxes, and similar items. Box and tag these items for identification according to type and size.

3.1.19.3 Wiring Ducts or Troughs

Remove and salvage wiring ducts or troughs. Dismantle plug-in ducts and wiring troughs into unit lengths. Remove plug-in or disconnecting devices from the busway and store separately.

3.1.19.4 Conduit and Miscellaneous Items

Salvage conduit except where embedded in concrete or masonry. Consider corroded, bent, or damaged conduit as scrap metal. Sort straight and undamaged lengths of conduit according to size and type. Classify supports, knobs, tubes, cleats, and straps as debris to be removed and disposed.

3.1.20 Elevators and Hoists

Remove elevators, hoists, and similar conveying equipment and salvage as whole units, to the most practical extent. Remove and prepare items for salvage without damage to any of the various parts. Salvage and store rails for structural steel with the equipment as an integral part of the unit.

3.1.21 Items With Unique/Regulated Disposal Requirements

****

NOTE: Batteries and materials with lead based finishes are examples of items with unique or regulated disposal requirements.

****

Remove and dispose of items with unique or regulated disposal requirements in the manner dictated by law or in the most environmentally responsible manner.

3.2 CONCURRENT EARTH-MOVING OPERATIONS

****

NOTE: Caution must be taken to prevent uncovered holes and other such hazards. If work is to be under a separate contract and subsequent filling is not required under the separate contract, arrangements must be made to have the filling done under this contract.

****

Do not begin excavation, filling, and other earth-moving operations that are sequential to demolition or deconstruction work in areas occupied by structures to be demolished or deconstructed until all demolition and deconstruction in the area has been completed and debris removed. Fill holes, open basements and other hazardous openings.

3.3 DISPOSITION OF MATERIAL

****

NOTE: This article entitled "Disposition of Material" and the paragraphs that follow are for all projects except as noted.

****

3.3.1 Title to Materials

****

NOTE: To minimize the possibility of contested ownership of materials or equipment in structures to be demolished or deconstructed, the following letter

should be sent to the station sufficiently in advance of the date on which action is required, and the response thereto incorporated in either the project specifications or bidding documents. The Government will prepare this letter. For project prepared by an A/E, the A/E must notify the Government the need for this correspondence.

From: (Appropriate EDF Activity)

To: Commanding Officer, (Station)

Subj: Contract (Number) - [_____]:
(Including [Demolition] [and] [Deconstruction] of [(_____)]

1. This activity is preparing the documents preliminary to advertising the subject contract for bids. A portion of this contract will be concerned with the ownership of the materials in the structure(s) and the contents of the building(s) to be [demolished] [and] [deconstructed]. It is normal practice to specify that the structures, and all equipment or other material inside the structures at the time the contract is advertised for bids, become the property of the Contractor.

2. Accordingly, it is requested that this activity be advised of the existence of any material or equipment within the limits of the contract which is to remain the property of the Government. A negative reply is requested. If there is any material or equipment in this category, it is requested that action be initiated to remove it from the limits of the contract. If prompt removal is impractical, it will be necessary for the station to make a complete inventory of, and tag or mark, each item which is to remain the property of the Government. A copy of the inventory, a description of the tag or mark used, and the desired disposition of the item must be forwarded to this activity for inclusion in the specification or bidding documents.

3. In the past, this activity has experienced considerable difficulty where a building evacuated prior to demolition or deconstruction is then used to store other material or equipment temporarily and the items were in storage during the bid advertising period. Upon award of the contract, the Contractor claimed the material and either removed it or claimed and was awarded compensation for it. Therefore, it is requested that the structure(s) to be demolished or deconstructed which are included in this contract not be used for temporary storage during the bid advertising period.

4. It is requested that the reply to this letter be sent to this activity not later than [60] [_____] days after the date of this letter. Failure to do

so may result in unnecessary cost to the Government in claims.

5. Insert name of contract and identify buildings(s) to be included under contract. Further revise as necessary to suit conditions.

****

Except for salvaged items specified in related Sections, and for materials or equipment scheduled for salvage, all materials and equipment removed and not reused or salvaged, become the property of the Contractor and must be removed from Government property. Materials approved for storage by the Contracting Officer must be removed before completion of the contract. Title to materials resulting from demolition and deconstruction, and materials and equipment to be removed, is vested in the Contractor upon approval by the Contracting Officer. The Government will not be responsible for the condition or loss of, or damage to, such property after contract award. Showing for sale or selling materials and equipment on site is prohibited.

3.3.2 Reuse of Materials and Equipment

****

NOTE: Delete if inapplicable, or edit to suit individual requirements. Items to be salvaged must be described in adequate detail to establish the limits of the items involved. Requirements for preparation and disposition will be as required to meet job conditions.

****

Remove and store materials and equipment [listed [in the [Demolition] [Deconstruction] Plan] [_____]] [indicated [_____]] to be reused or relocated to prevent damage, and reinstall as the work progresses. Coordinate the re-use of materials and equipment with the re-use requirements in accordance with Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL. Capture re-use of materials in the diversion calculations for the project.

3.3.3 Salvaged Materials and Equipment

****

NOTE: Delete if inapplicable, or edit to suit individual requirements. Describe items to be salvaged in adequate detail to establish the limits of the items involved. Requirements for preparation and disposition will be as required to meet job conditions.

****

Remove materials and equipment that are [listed [in the [Demolition] [Deconstruction] Plan][_____]] [indicated [_____]] [and] [specified [_____]] to be removed by the Contractor and that are to remain the property of the Government, and deliver to a storage site [, as directed within [_____] km miles of the work site].

a. Salvage items and material to the maximum extent possible.

b. Store all materials salvaged for the Contractor as approved by the

Contracting Officer and remove from Government property before completion of the contract. Coordinate the salvaged materials with tracking requirements in accordance with Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL. Capture salvaged materials in the diversion calculations for the project.

c. Remove salvaged items to remain the property of the Government in a manner to prevent damage, and packed or crated to protect the items from damage while in storage or during shipment. Items damaged during removal or storage must be repaired or replaced to match existing items. Properly identify the contents of containers. Deliver the following items reserved as property of the Government to the areas designated: [_____].

d. Remove the following items reserved as property of the using service prior to commencement of work under this contract: [_____].

e. Remove historical items in a manner to prevent damage. Deliver the following historical items to the Government for disposition: Corner stones, contents of corner stones, and document boxes wherever located on the site.

****

NOTE: For Class I ODS materials, use the first bracketed statement if the Contractor is to remove the material. Use the second bracketed statement if a Public Works Center or other Navy activity is to remove the Class I ODS materials. Edit statements for the project as necessary.

****

f. [Remove and capture all Class I ODS refrigerants in accordance with the Clean Air Act Amendment of 1990, and turn in to the Navy [as directed by the Commanding Officer.] [by shipping the refrigerant container to the Defense Logistics Agency at the following address:

(1) Defense Depot Richmond VA (DDRV)
(2) SW0400
(3) Cylinder Operations
(4) 00 Jefferson Davis Highway
(5) Richmond, VA 23297-5900]]

g. [The Government will remove and capture Class I ODS refrigerants. To view the web site for ODS, link to: https://www.osd.mil/denix/Public/News/DLA/ODS/sect1.html]

3.3.4 Debris Disposal in the San Diego Area

****

NOTE: This paragraph is for appropriate NAVFAC SW projects only.

****

Landfill coupons, that permit waste disposal at the Miramar Landfill free of charge, are available from the Contracting Officer. The coupons will be issued only upon the submission of a written request, by the prime contractor to the ROICC, which must identify the nature of the waste and the number of coupons requested. The landfill coupons issued under this contract are to be used only for the disposal of waste generated by this contract. If the prime contractor, one of its subcontractors, or one of its waste haulers is found to be misusing the landfill coupons by disposing of waste not generated under this contract, all rights under the contract to use landfill coupons are forfeited, from the date of misuse forward. All unused coupons will be returned to the Contracting Officer and no additional coupons will be issued for the duration of the contract. The Contracting Officer's refusal to issue landfill coupons, because of prior misuse, is not a change to the contract and no adjustment of the contract price will be made.

3.3.5 Disposal of Ozone Depleting Substance (ODS)

Class I and Class II ODS are defined in Section, 602(a) and (b), of The Clean Air Act. Prevent discharge of Class I and Class II ODS to the atmosphere. Place recovered ODS in cylinders meeting AHRI Guideline K suitable for the type ODS (filled to no more than 80 percent capacity) and provide appropriate labeling. Recovered ODS must be [Put recovered ODS back into the existing equipment.] [Turn over recovered ODS to the Contracting Officer.] [Remove recovered ODS from Government property and dispose of in accordance with 40 CFR 82.] Dispose products, equipment and appliances containing ODS in a sealed, self-contained system (e.g. residential refrigerators and window air conditioners) in accordance with 40 CFR 82. Submit Receipts or bills of lading, as specified. Submit a shipping receipt or bill of lading for all containers of ozone depleting substance (ODS) shipped to the Defense Depot, Richmond, Virginia.

3.3.5.1 Special Instructions

No more than one type of ODS is permitted in each container. Apply a warning/hazardous label to the containers in accordance with Department of Transportation regulations. Provide a tag with the following information on all cylinders including but not limited to fire extinguishers, spheres, or canisters containing an ODS:

a. Activity name and unit identification code

b. Activity point of contact and phone number

c. Type of ODS and pounds of ODS contained

d. Date of shipment

e. National stock number (for information, call (804) 279-4525).

3.3.5.2 Fire Suppression Containers

Deactivate fire suppression system cylinders and canisters with electrical charges or initiators prior to shipment. Also, safety caps must be used to cover exposed actuation mechanisms and discharge ports on these special cylinders.

3.3.6 Transportation Guidance

Ship all ODS containers in accordance with MIL-STD-129, DLA 4145.25 (also referenced one of the following: Army Regulation 700-68, Naval Supply Instruction 4440.128C, Marine Corps Order 10330.2C, and Air Force Regulation 67-12), 49 CFR 173.301, and DOD 4000.25-1-M.

3.3.7 Unsalvageable and Non-Recyclable Material

Dispose of unsalvageable and non-recyclable noncombustible material in the disposal area located [_____]. Maintain the fill in the disposal area below elevation [_____] and after disposal is completed, uniformly grade the disposal area to drain. Dispose of unsalvageable and non-recyclable combustible material [in the sanitary fill area located [_____]] [off the site] [by burning].

3.4 CLEANUP

Remove debris and rubbish from [basement] [project site] and similar excavations. Remove and transport the debris in a manner that prevents spillage on streets or adjacent areas. Apply local regulations regarding hauling and disposal.

3.5 DISPOSAL OF REMOVED MATERIALS

3.5.1 Regulation of Removed Materials

Dispose of debris, rubbish, scrap, and other nonsalvageable materials resulting from removal operations with all applicable federal, state and local regulations as contractually specified [off the [_____] center] [in the Waste Management Plan] [_____]. [Storage of removed materials on the project site is prohibited.]

3.5.2 Burning on Government Property

[Burning of materials removed from demolished and deconstructed structures will not be permitted on Government property] [Transport combustible materials removed from demolished and deconstructed structures to the areas designated for burning. Control fires for protection of persons and property. Monitor fires continuously until the fires have burned out or have been extinguished. Comply with Federal, State and local laws regulating the building and maintaining of brush and trash fires].

3.5.3 Removal to Spoil Areas on Government Property

Transport noncombustible materials removed from demolition and deconstruction structures to designated spoil areas on Government property.

3.5.4 Removal from Government Property

Transport waste materials removed from demolished and deconstructed structures, except waste soil, from Government property for legal disposal. Dispose of waste soil [as directed] [per Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS].

3.6 REUSE OF SALVAGED ITEMS

Recondition salvaged materials and equipment designated for reuse before installation. Replace items damaged during removal and salvage operations or restore them as necessary to usable condition.

PART 1 GENERAL

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically

place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF SAFETY PROFESSIONALS (ASSP)

ASSP A10.6	(2006) Safety & Health Program Requirements for Demolition Operations - American National Standard for Construction and Demolition Operations

U.S. ENVIRONMENTAL PROTECTION AGENCY (EPA)

EPA 340/1-90/018	(1990) Asbestos/NESHAP Regulated Asbestos Containing Materials Guidance
EPA AP-42	(1995) Compilation of Air Pollution Emission Factors

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

40 CFR 61-SUBPART M	National Emission Standard for Asbestos
40 CFR 247	Comprehensive Procurement Guideline for Products Containing Recovered Materials

1.2 SUMMARY

****

NOTE: Recycled materials are listed in the EPA's Comprehensive Procurement Guidelines (CPG) http://www.epa.gov/cpg/. Guidelines are stated for the recommended recycling of Building Materials, Paint, and other miscellaneous materials.

If the Architect/Engineer/Contracting Officer determines that the salvage value of certain materials meeting the CPG guidelines is insufficient in quantity to merit recycling, or if due to geographical considerations impractical to implement, a waiver may be initiated for the project.[Written justification may be submitted on a Request for Waiver Form to the[_____] Environmental Program Manager for approval.]

****

Furnish a contract for used carpet reclamation, including planned procedures for removal and reclamation of used carpet.

Refer to related Section 09 68 00 CARPETING for floor preparation prior to installation of new carpet.

1.3 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

Use the "S" Classification only in SD-11 Closeout Submittals. The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Dust-Control Measures; G, [_____]

Packing and Transportation Measures; G, [_____]

Schedule of Carpet Reclamation Activities; G, [_____]

Carpet Reclamation Agency Records; G, [_____]

1.4 QUALITY CONTROL

1.4.1 Carpet Reclamation Agency

Provide documentation of being a Carpet America Recovery Efforts (CARE) approved carpet removal contractor (or designated agent firm) providing used carpet recycling under the most current EPA recognized Carpet Reclamation Program, or equivalent from alternate recycling agent.

1.4.2 Carpet Remover Requirements

Submit details for the following:

dust-control measures

packing and transportation measures

1.4.3 Carpet Reclamation Agency Submittal

Submit a copy of carpet reclamation agency records verifying receipt and disposition of used carpet.

1.4.4 Regulatory Requirements

Comply with governing regulations; including, but not limited to:

a. EPA 340/1-90/018

b. EPA AP-42

c. 40 CFR 61-SUBPART M

d. ASSP A10.6

e. 40 CFR 247

Comply with hauling and disposal regulations of authorities having jurisdiction. Record and maintain records of all off-site removal of debris and materials.

Provide the following information regarding the removed materials within the schedule of carpet reclamation activities:

a. Time and Date of Removal.

b. Type of Material.

c. Weight and Quantity of Materials.

d. Final Destination of Materials.

1.4.4.1 Carpet Reclamation Agency and Carpet Remover Certification

Certify in writing that used carpet was removed and recycled in accordance with the current EPA recognized Carpet Reclamation Program. Do not place removed carpet and associated materials in a landfill.

1.5 PROJECT/SITE CONDITIONS

1.5.1 Environmental Requirements

Obtain approval of Owner before performing operations which generate contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Carpet Reclamation Agency

The current approved reclamation agency is Carpet America Recovery Effort (CARE).

2.1.2 Carpet Removers

Submit documentation of being a CARE approved carpet removal contractor.

2.2 MATERIALS

2.2.1 Adhesive Removal Solvents

Comply with Carpet and Rug Institute Publication 104.

2.2.2 Used Carpet

Maintain possession of removed used carpet. Immediately remove from site and place in container or trailer.

Carefully remove, store, and protect designated materials and equipment for re-installation under other Sections or for retention by Owner.

2.2.3 Carpet Pad

Provide recycling of carpet padding where locally available or as designated by Carpet Reclamation Agency.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Verification of Conditions

Examine areas and conditions under which work is to be performed. Identify conditions detrimental to proper or timely completion. Do not proceed until unsatisfactory conditions have been corrected.

3.2 PREPARATION

Provide, erect, and maintain barricades, lighting, and guardrails as required to protect general public, workers, and adjoining property.

Vacuum used carpet before removal.

3.3 APPLICATION

3.3.1 Carpet Removal

Remove used carpets in large pieces, roll tightly, and pack neatly in container. Include carpet scrap and waste from new installation.

Deposit only clean, dry carpet in containers. "Clean" is defined as free from demolition debris, asbestos contamination, garbage, and tack strips.

Remove adhesive according to recommendations of the Carpet and Rug Institute (CRI).

3.3.2 Container Disposal

Place used carpet in fully-enclosed, front [end] loading 30 cubic m 40-yard container supplied by Carpet Reclamation Agency. Place only used commercial carpeting in collection container. Keep container locked or supervised.

Use effective packing techniques to maximize the amount of material in the container. On average, a container holds 1700-2500 square m 2,000-3,000 square yards. Neatly stack carpet tiles or repack in cardboard boxes before placing in container.

When container is full, contact Carpet Reclamation Agency to coordinate pickup and drop-off of replacement container. If container is locked for security purposes, remove lock before pickup.

3.3.3 Truck Trailer Disposal

Place used carpet in a 16 m 53 foot trailer supplied by Carpet Reclamation Agency. Place only used commercial carpeting in trailer. Keep trailer locked or supervised.

Use effective packing techniques to maximize the amount of material in the trailer. Comply with Department of Transportation regulations for weight limits. Typical maximum weight of used carpet on trailers is 20,000 kg 45,000 pounds.

Neatly stack carpet tiles or repack in cardboard boxes before placing in trailer. Do not stack higher than 2 m 6 feet. When trailer is full, contact Carpet Reclamation Agency to coordinate pickup and drop-off of replacement trailer. If trailer is locked for security purposes, remove lock before pickup.

3.3.4 Interior Operations

Seal doors and other openings with duct tape at heads, jambs, and sills to contain contaminants from work which occurs within a single room.

Use window exhaust systems to establish negative pressure in contaminant-producing work areas, ensuring continuous flow of air into work area.

Do not open windows in work area except when an exhaust fan is used. Close windows at end of each work shift. Seal exhaust system ductwork which might leak into building or mechanical systems.

Damp mop hard surface floors in work area daily to minimize tracking of contaminants from work area. In carpeted areas, protect carpet with plastic and plywood. Provide hard-surfaced area at entrances for daily damp mopping.

****
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

29 CFR 1910.1000	Air Contaminants
29 CFR 1926.55	Gases, Vapors, Fumes, Dusts, and Mists
40 CFR 261	Identification and Listing of Hazardous Waste

1.2 PROJECT DESCRIPTION

The work includes removal and salvage of identified historic items and materials, and removal of resulting rubbish and debris. General demolition of non-historic materials and removal of resulting rubbish and debris must comply with the requirements of Section 02 41 00 [DEMOLITION] [AND] [DECONSTRUCTION]. Store salvaged or recycled materials daily in areas and in a manner specified by the Contracting Officer. In the interest of conservation, pursue salvage and recycling to the maximum extent possible. Submit a Work Plan that includes procedures proposed for the accomplishment of the work. The Work Planprocedures must provide for safe conduct of the work, careful removal and disposition of materials specified to be salvaged or recycled, dust control, protection of property which is to remain undisturbed, coordination with other work in progress, and timely disconnection of utility services. Include a detailed description of the methods and equipment to be used for each operation, and the sequence of operations in the Work Plan.

1.2.1 Dust Control

Control the amount of dust resulting from removal, salvage and demolition operations to prevent the spread of dust to occupied portions of the construction site, to avoid creation of a nuisance in the surrounding area and to minimize occupational exposures. Occupational exposures cannot exceed the requirements in 29 CFR 1910.1000 and 29 CFR 1926.55. Use of water to control dust will not be permitted when it will result in, or create, damage to existing building materials and hazardous or objectionable conditions such as ice, flooding and pollution.

1.2.2 Protection

1.2.2.1 Protection of Existing Historic Property

Survey the site and examine the drawings and specifications to determine the extent of work before beginning any removal, salvage or demolition work. Take necessary precautions to avoid damage to existing historic items that are to remain in place, to be reused, or to remain the property of the Government. Repair or restore items damaged by the Contractor to original condition, or replace, as approved by the Contracting Officer. Coordinate the work of this section with all other work and construct and maintain shoring, bracing and supports, as required. Ensure that structural elements are not overloaded and provide additional supports as may be required as a result of any cutting, removal, or demolition work performed under this contract.

1.2.2.2 Protection From the Weather

Protect the interior of buildings to remain and salvageable materials from the weather at all times. Store salvaged historic materials off the ground and under weathertight covering.

1.2.2.3 Environmental Protection

Comply with the requirements of [Section 02 82 00 ASBESTOS REMEDIATION][Section 02 83 00 LEAD REMEDIATION] [_____]. Ensure a thorough inspection has been performed for hazardous materials prior to beginning work.

1.3 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Work Plan; G, [_____]

1.4 QUALIFICATIONS

Provide qualified workers trained and experienced in whole-building recycling, including removal and salvage of historic materials. Submit documentation of five consecutive years of work of this type with a list of similar projects identifying when, where, and for whom the work was done. Provide a current point-of-contact for identified references.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 HAZARDOUS MATERIALS

Unforeseen hazardous materials may exist in wall cavities, beneath floors, in chases, inside various components, as well as other building materials. Exercise extreme care when performing demolition and salvage operations to ensure unexpected hazardous materials area not inadvertently disturbed creating a potential exposure concern. If suspect hazardous materials are observed or encountered, stop work and notify the Contracting Officer immediately.

3.2 SALVAGED ITEMS

Salvage items to the maximum extent possible. Remove historic items to be salvaged from the structure prior to demolition work. Remove salvageable items by hand labor to the maximum extent possible. Do not damage historic portions of the structure to remain or items identified for salvage. Remove furnishings, equipment, and materials not scheduled for salvage or recycling prior to any salvaging procedures. Keep a complete recording of all salvaged materials including the condition of such materials before, and after, salvage operations.

3.2.1 Site Work

Remove intact and salvage the following site items: [fences and gates] [site furnishings] [fountains] [sculpture] [site ornaments] [site lighting fixtures] [_____].

3.2.2 Concrete

Remove intact and salvage the following concrete items: [precast architectural elements] [_____].

3.2.3 Masonry

Remove intact and salvage the following masonry items: [brick] [stone] [terra cotta] [cast stone] [clay tile trim elements] [cornerstones] [_____].

3.2.4 Metals

Remove intact and salvage the following metal items: [ladders] [stairs and handrails] [cast architectural ornament] [architectural metalwork] [ornamental ironwork] [gratings and metal walkways] [_____].

3.2.5 Wood

Remove intact and salvage the following materials: [wood decking] [millwork] [custom paneling] [wood stairs and handrails] [ladders] [architectural woodwork] [custom casework] [wood timbers (125 x 125 mm 5 x 5 inch or larger)] [_____].

3.2.6 Thermal and Moisture Protection

Remove intact and salvage the following materials: [slate tiles] [clay tiles] [gutters, leaders, and downspouts] [skylights] [roof accessories] [exterior siding] [_____].

3.2.7 Doors and Windows

Remove doors and windows with associated hardware and operating mechanisms intact (including glass) and salvagein accordance with the schedule.

3.2.8 Finishes

[Remove][protect] the following special or historic finishes : [stenciling] [decorative tile] [molded ornament] [decorative ceiling materials] [wood flooring] [textured wall coverings] [murals] [_____].

3.2.9 Equipment and Specialty Items

Remove intact and salvage the following equipment and specialty items: [chalkboards and tackboards] [toilet partitions] [louvers and vents] [stoves] [plaques] [lockers] [mirrors] [bath accessories] [partitions] [contents of cornerstones] [document boxes] [_____].

3.2.10 Mechanical Equipment

Remove intact and salvage the following mechanical equipment: [bathroom fixtures] [radiators] [registers and grilles] [fans] [_____].

3.2.11 Electrical Equipment

Remove intact and salvage the following electrical fixtures and equipment: [light fixtures] [switches] [switch plates] [outlet covers] [clocks] [telecommunications equipment] [_____].

3.3 RECYCLED MATERIALS

Recycle materials to the maximum extent possible. Use hand labor wherever possible to remove recyclable materials. Do not damagehistoric portions of the structure indicated to remain and items identified for salvage while removing materials for recycling. Recycle the following materials: [dimension lumber] [scrap wood] [paper and cardboard] [gypsum wallboard] [asphalt] [rubble] [glass] [metals] [_____].

3.4 DISPOSITION OF MATERIALS

The Contractor, upon receipt of notice to proceed, is vested with the title to materials and equipment to be demolished, except Government and using service salvage and historical items. The Government will not be responsible for the condition, loss or damage to such property after notice to proceed.

3.4.1 Material Salvaged for the Contractor

Temporarily store salvaged material as approved by the Contracting Officer and remove from Government property before completion of the contract. Sale of salvaged material on the site is prohibited.

3.4.2 Items Salvaged for the Government

Remove salvaged items to remain the property of the Government in a manner to prevent damage, packed or crated to protect the items from damage, or as directed by the Contracting Officer. Repair or replace items damaged during removal or storage to match existing items. Properly label and identify containers as to contents. Deliver the following items reserved as property of the Government to the areas designated: [_____].

3.4.3 Items Salvaged for the Using Service

Prior to commencement of work under this contract, remove the following items reserved as property of the using service: [_____].

3.5 CLEAN-UP

Upon completion of the work, clean portions of structure to remain and adjacent areas and structures of dust, dirt, and debris caused by salvage and demolition operations. Verify that debris and rubbish created by the work is non-hazardous. If any debris and rubbish is suspect hazardous waste characterize it in accordance with 40 CFR 261. If the debris and rubbish is determined to be hazardous materials notify the Contracting

Officer. Remove and transport non-hazardous debris and rubbish in a manner that prevents spillage on streets or adjacent areas. Transport and dispose of all material in accordance with all local, state and Federal regulations.   Provide copies of all disposal manifests to the the Contracting Officer.

SECTION 02 51 19

SOLIDIFICATION AND STABILIZATION DECONTAMINATION
02/25

****

NOTE: This guide specification covers the requirements for solidification/stabilization (S/S) of contaminated materials.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This guide specification provides the framework for developing a project-specific S/S specification. This guide specification is not intended for in situ applications of the S/S technology, specifically when contaminated materials are present at depth and specialized equipment is required for reagent delivery and mixing. This guide specification should be modified as necessary for a given site, to incorporate the conditions, mix design, mixing method, and regulatory requirements which are specific to the site. This guide specification specifically considers S/S

applications using ex-situ mixing of contaminated materials and reagents in a dedicated mixing system such as a pug mill. This guide specification can also be modified to accommodate other applications of the S/S technology such as mixing reagents into contaminated materials at the surface or at shallow in-situ depths (e.g. using an excavator bucket or soil tiller for mixing). For these relatively simple applications, many elements of this guide specification will be un-necessary and should be deleted.

The S/S treatment considered in this guide specification starts with the raw contaminated material; continues through preparation, feeding, and mixing reagents into the contaminated material. Other specification sections would provide requirements for handling, stockpiling, and final disposition of the treated material (either left in-place, moved to an on-site designated permanent storage unit, or transported off-site for final disposal). As applicable, refer to Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL for requirements related to excavation and stockpiling of the contaminated materials; Section 31 00 00 EARTHWORK for placement of treated materials in on-site permanent storage; and Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS for requirements relevant to offsite transportation and disposal.

****

1.1 MEASUREMENT AND PAYMENT

1.1.1 Unit Prices

****

NOTE: Edit this paragraph based on whether the Contract will use a single job price or unit prices. If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is in the project, move these paragraphs to that Section for editing.

If the project includes Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS, coordinate measurement and payment methods and contaminated material handling and stockpiling between this Section and Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS.

****

1.1.1.1 Contaminated Materials

****

Use the first bracketed paragraph for measurement by volume. Use the second bracketed paragraph for measurement by weight. Batch processing is likely to use weight as the method of measurement. In situ processes are more likely to use volume as the

method of measurement.
****

[Measure contaminated materials by the cubic meter cubic yard of contaminated material that is treated by solidification and stabilization (S/S). Compute volume by[the average end area method from cross sections taken before and after excavation of contaminated material][the surficial area and treatment depth when treating contaminated material in-situ].

][Measure contaminated materials by the metric ton ton of contaminated material treated by S/S. Use a properly calibrated weighing system to accurately measure the gross (bulk) weight of the contaminated material. Convert the measured gross (bulk) weight of the contaminated materials to be treated to dry weight based on the[percent moisture content of representative contaminated material samples. Determine the percent moisture content in accordance with[ASTM D2216][ASTM D4643][ASTM D4959][_____]. Determine moisture content[daily][for every[500][_____] metric tons tons of contaminated material that is treated]][_____].

] Unit price must include costs for materials, labor[, moisture reduction][, hauling][, stockpiling], processing and treatment, testing and analyzing,[and] operation and maintenance[, and wastes (solid, liquid and/or gaseous) treatment and disposal].

1.1.2   Single Job Prices

[1.1.2.1   Bench-Scale Treatability Studies

****
NOTE: Delete this paragraph if bench-scale treatability studies have already been performed.
****

If the Government requires the Contractor to perform bench-scale treatability studies, the studies will be[included as part of base bid items][measured at a single job price][_____]. The price must include costs for labor and materials for:

a. Preparing plans.

b. Collecting representative contaminated materials.

c. Conducting the studies (including sampling and analysis).

d. Evaluating results.

e. Report preparation.

f. Treating and disposing of study-derived wastes.

]1.1.2.2   Field Demonstration

Payment for field demonstrations will be[included as part of base bid items][based on a single job price for each field demonstration requested by the Contracting Officer and properly completed]. The price will include costs for labor and materials for:

[a. Moisture reduction.

][b. Hauling.

][c. Stockpiling.

] d. Processing and treating.

e. Testing and analyzing.

f. Preparing reports.

g. Treating and disposing of wastes (solid liquid and/or gaseous) generated during field demonstrations.

h. Other incidental work (such as manufacturers' field services, health and safety monitoring and controls, and utilities).

1.1.2.3 Other Work Items

****

NOTE: Coordinate this paragraph with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS. Temporary utility connections are covered in Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.

****

Include work items related to the work of this Section, but not included in the above paragraphs, in the base bid for treatment of the contaminated materials. Such work items include:

a. Submittals related to operation of the S/S treatment system.

b. Mobilization and demobilization.

c. Site preparation in the treatment area.

d. Configuration and installation of the treatment system.

e. Manufacturers' field services.

f. Environmental compliance monitoring.

g. Health and safety monitoring and controls.

h. Utilities required for the S/S treatment, if approved by the Government as necessary for the project.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this aragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of

the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 PRE-INSTALLATION MEETINGS

****

NOTE: Delete this paragraph if the requirements are included in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS, Section 01 32 01.00 10 PROJECT SCHEDULE, or other Specification Section.

Appropriate facility personnel should be present at the pre-installation meeting if siting of the treatment facility and other associated work areas will be discussed.

****

Conduct a pre-installation meeting at the jobsite at least[five business days prior to the start of operations on the project][_____]. Arrange the pre-installation meeting and follow the written pre-installation meeting agenda submitted prior to the meeting. The purpose of this meeting is to review the requirements of this Section and the associated plans. The following individuals must be in attendance at this meeting: Contractor's Project Manager and Site Foreman and [Contracting Officer][_____].

Record pre-installation meeting minutes and publish via email within 48 hours to all attendees. Re-publish the minutes within 48 hours via email pending any subsequent comments from the attendees.

1.4 SYSTEM DESCRIPTION

****

NOTE: Indicate if the Government knows/assumes that there are multiple dissimilar types of contaminated materials that will require different S/S treatment processes. This may be based on site investigations and/or previously completed treatability studies.

****

The work consists of S/S treatment of approximately [_____][cubic meters cubic yards][metric tonstons] of contaminated material.

1.4.1 Design Requirements

****

NOTE: The complexity of S/S treatment processes can vary. Examples of simplistic applications would be spreading reagents onto contaminated materials and mixing with an excavator bucket or tow-behind tractor tiller. Examples of more complex applications would be multi-step processes of separating oversize material, blending/homogenizing

contaminated materials, feeding contaminated materials and reagents into a mixing unit, and conveying treated materials to a stockpile location or load-out area. The design requirements below are written for a complex S/S application. Edit as necessary for a simplistic S/S application.

Omit the third- and fourth-to-last sentences of this paragraph ("The Contractor may propose … must be addressed in detail…") if a specific method of treatment (in situ or ex-situ) is desired.

****

Configure the treatment plant based on the contaminated material characteristics data, [the Contractor's own interpretation of the previously conducted treatability study results][_____], and [the bench-scale [and][or] pilot-scale treatability studies performed by the Contractor][_____] to ensure the treated material conforms to paragraph PERFORMANCE REQUIREMENTS.[The treatment plant must be transportable.] The materials, components, accessories, and equipment used to fabricate the treatment plant must meet their functional requirements and must be compatible with the contaminants of concern, the reagents used in the treatment processes, and the operating conditions of each unit operation.[The Contractor may propose a treatment plant different from the treatment plant specified. Government approval of a Contractor-proposed treatment plant does not relieve the Contractor of responsibility for meeting specified requirements for safety, reliability, and performance.] Provide a safe and reliable treatment plant in compliance with the applicable codes and regulations and specified requirements. The treatment plant must consist of the following:

1.4.1.1 Contaminated Material Preparation and Feed System

****

NOTE: Since heterogeneity and inconsistent feed conditions can impact S/S treatment efficiency, if appropriate, pre-processing steps to maintain homogenization for optimal treatment efficiency should be specified. Alternatively, contaminated materials may need to be segregated by order of magnitude concentrations and treated using different process conditions to optimize treatment throughput and minimize treatment costs, which should be determined during the treatability/design steps.

Oversize material will likely need to be removed when S/S is performed ex-situ. Edward Bates and Colin Hills' Stabilization and Solidification of Contaminated Soil and Waste: A Manual of Practice (2015) indicates that most ex-situ S/S mixers require feed material to be less than 2.5 cm 1 in.

Bates & Hills "Stabilization and Solidification of Contaminated Soil and Waste: A Manual of Practice" is available at: https://clu-in.org/download/techfocus/stabilization/S-S-Manual-of-Practice.pdf

****

Provide a contaminated material preparation and feed system which includes, but is not limited to:

a. Oversize material separation.

b. Blending or separation of different materials to provide a consistent feedstock(if needed).

c. Stockpiling of oversize and feed contaminated materials.

d. Conveying, feeding, treatment [and][or] disposal of oversize material.

e. [Dust][emission] controls.

f. Measurement of oversize and feed contaminated materials.

Base the capacity of this system on the downstream treatment system operations. Refer to Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL for requirements related to excavation and stockpiling of the contaminated materials.

1.4.1.2 Reagent Feed and Mixing System

****

NOTE: The suggested mixing equipment production rates provided below are average values from the Edward Bates' and Colin Hills' 2015 Stabilization and Solidification of Contaminated Soil and Waste: A Manual of Practice. When specifying minimum production rates, the designer should also be aware of potential production rate limitations associated with the available storage area for stockpiling treated materials and turnaround times for testing of treated materials for performance requirement verification.

****

Provide satisfactory means, incorporating weighing, metering, or volumetric measurement to deliver the required quantity of each reagent. Equip and operate silos and feeders to prevent caking of reagent and variation in feed. Ensure that each reagent can be easily sampled. Provide mixing equipment [with a minimum capacity adequate to meet performance and schedule requirements] [capable of treating[515][_____] cubic meters/day[675][_____] cubic yards/day] and with positive means for controlling the mix proportions, maintaining the time of mixing constant, and maintaining the appropriate rotation speed of the mixer.

1.4.1.3 Plant Supporting System

Include a supporting system in the treatment plant for water storage and distribution, reagents storage and distribution, power generation and distribution, and fire safety. Provide these supporting facilities with adequate capacities to deliver water, reagents, power,[_____], and fire protection necessary for operation of the S/S system. Refer to [Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____] for requirements related to spill containment structures and stormwater pollution prevention.

1.4.1.4 Utilities

****

NOTE: The locations and details (such as utility point of contact, sizes, capacities, and flows) of the utility hookups should be provided on the drawings for the Contractor's use. Verify the utilities are available on-site before including the second sentence.

****

In accordance with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS, provide the utilities associated with the installation and operation of the treatment plant including, but not limited to:[telecommunications,][electricity,][water,][gas,][_____,][sanitary,] and solid waste facilities.[The[telecommunications][electricity][water][gas][sanitary] and[solid waste facilities][_____] are available at the site.]

1.4.1.5 Material Measurement

****

NOTE: This paragraph is primarily intended to ensure that calibrated scales are being used to weigh materials when weight is being used as the basis for measurement and payment.

****

Provide scales, meters, and volumetric measuring devices for measuring oversize materials, feed contaminated materials, reagents, and water which conform to the applicable requirements of NIST HB 44, except that the accuracy must be plus or minus[0.1][_____] percent of the quantity being measured. For scales used to measure weight of material in vehicles, provide scales of sufficient length to permit simultaneous weighing of all axle loads. For scales used to make measurement for payment, ensure the scale is certified[by an acceptable scales company representative][by an inspector of the State Inspection Bureau charged with scales inspection] prior to weighing any materials. Perform a check of calibration of measuring equipment prior to initial use, and once every [seven][_____] calendar days. The requirements of this paragraph do not apply to measurement of chemical or physical data for purposes of demonstrating compliance with paragraph PERFORMANCE REQUIREMENTS.

[1.4.1.6 Bench-Scale Treatability Study Work Plan

****

NOTE: Typically, a bench-scale treatability study will have been performed prior to development of this specification; however, the Contractor is sometimes required to complete a bench-scale treatability study prior to performing full-scale work at the site. Bench-scale treatability study test results should include the proposed reagents and mix ratios to be used during full scale treatment. The test results submitted should verify that the mix design proposed meets the post-treatment criteria listed in paragraph PERFORMANCE REQUIREMENTS. Consideration should also be given to the need to monitor off-gas and dust emissions during the bench-scale treatability study.

Further guidance on conducting treatability studies

for S/S treatment can be found in the Interstate Technology and Regulatory Council's July 2011 Development of Performance Specifications for Solidification/Stabilization and Edward Bates' and Colin Hills' 2015 Stabilization and Solidification of Contaminated Soil and Waste: A Manual of Practice.

ITRC "Development of Performance Specifications for Solidification/Stabilization" (2011) is available at:
https://itrcweb.org/HigherLogic/System/DownloadDocumentFile.ashx?DocumentFileK
****

Submit a Bench-Scale Treatability Study Work Plan within[60][_____] calendar days after notice to proceed. Do not perform the treatability study until the work plan is approved. Prepare [draft for Government review] [draft-final for [regulatory][_____] review] and final versions of the Bench-Scale Treatability Study Work Plan. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Address the technical requirements, listed below and in paragraph BENCH-SCALE TREATABILITY STUDY, in the work plan. The technical requirements include, but are not limited to:

1.4.1.6.1 Conceptual Implementation Plan

Describe the proposed means of meeting the S/S treatment requirements in paragraph PERFORMANCE REQUIREMENTS for the contaminated materials, including reagent delivery and mixing methods, anticipated cure times for treated materials, and methods for transporting contaminated and treated materials between various stages of the treatment process.

1.4.1.6.2 Proposed Mixes

Submit multiple proposed mixes of contaminated soil and reagents to be included in the bench-scale treatability study designed to optimize the treatment effectiveness. At a minimum, include the following reagents in the proposed mixes:[Portland cement,][fly ash,][activated carbon,][_____].

1.4.1.6.3 Laboratory Procedures

Describe how the parent contaminated material sample will be processed to remove oversize materials, homogenized, and subdivided into aliquots for testing of different proposed mixes. Describe how reagents will be mixed with contaminated materials. Identify and justify deviations between the Conceptual Implementation Plan and Laboratory Procedures (e.g., the Conceptual Implementation Plan is to mix dry reagents into contaminated materials, but the Laboratory Procedure proposes mixing reagents as slurries).

[1.4.1.6.4 Testing Approach

****
NOTE: If a UFP-QAPP is prepared and covers testing during the Bench-Scale Treatability Study, this paragraph should be deleted or replaced with a reference to the UFP-QAPP.
****

Describe the testing approach which will be used to assess performance of the different proposed mixes.

]]1.4.1.7 S/S Treatment Work Plan

****

NOTE: The Designer may wish to require the S/S Treatment Work Plan, UFP-QAPP, and other preconstruction submittals required under this section to be completed concurrently or with the other plans being appendices of one primary plan. This Section should be edited to reflect such a requirement if applicable.

****

Submit an S/S Treatment Work Plan[within[200][_____] calendar days after notice to proceed][not less than[60][_____] calendar days prior to the anticipated start of full-scale S/S operations]. Do not perform S/S of contaminated material until the work plan is approved. Prepare [draft for Government review] [draft-final for [regulatory][_____] review] and final versions of the S/S Treatment Work Plan. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Address the technical requirements, below, in the work plan. The technical requirements include, but are not limited to:

a. Schedule. Specify dates for the start and completion of design documentation, mobilization, installation, field demonstrations, treatment of contaminated materials, disposal of treated materials and wastes, and demobilization. Include details such as intended hours of operation, scheduled downtime, and routine maintenance downtime.

b. Project Organization. Propose a project organization for carrying out the S/S treatment. Provide an organization chart including subcontractors. Clearly define the project responsibilities of each individual, including, but not limited to:

    (1) Project management and coordination.

    (2) Scheduling and schedule control.

    (3) Quality control.

    (4) Sampling, measurement, analysis, and data management.

    (5) Operation and maintenance of the treatment plant.

c. Mix Design: Propose the mix design and method of mixing to be used in treating the contaminated material. Indicate if different mix designs will be needed for dissimilar types of contaminated materials based on Contractor interpretation of existing conditions. Document that sufficient quantities of reagents are available to complete the project. Identify the proposed source of water for the S/S process.

d. Equipment: Propose the homogenization and mixing equipment, batching equipment, and process control instrumentation. Include process flow diagrams, mixing times, and processing rates. Identify anticipated pretreatment of the contaminated material and indicate if there is a maximum allowable particle size for the S/S mixing equipment. Identify equipment foundation requirements to ensure a stable and safe area for S/S treatment equipment.

e. Drawings: Provide drawings indicating dimensions and layout of the S/S system, material laydown areas, and haul routes on the site. Drawings must be to scale.

f. Quality Control: Provide a quality control plan as required in Section 01 45 00 QUALITY CONTROL which addresses control and documentation of batch proportions, mixing time, mixing speed, sample collection, sample curing, and post-treatment testing. This program must ensure that the Contractor's operations comply with the Contract requirements with respect to quality of materials, workmanship, construction, finish, functional performance, and accuracy of data.

g. Mobilization and Demobilization: Include a mobilization plan and a post-treatment demobilization plan detailing the cleanup and sampling plan for the treatment area. Address the requirements in paragraphs MOBILIZATION and DEMOBILIZATION.

h. Outline the planned Field Demonstration and evaluation activities. This plan must address, but not be limited to:

    (1) Contaminated materials characterization.

    (2) Proposed demonstration testing runs (including specification of mix design and testing/operating conditions of the unit processes/operations for each run).

[(3) Sampling locations.

][(4) Analyses and analytical methods.

] (5) Mass balance calculation and performance evaluation [for each major piece of equipment].

    (6) Treated materials and waste characterization.

    (7) Health and safety monitoring and control.

    (8) Waste treatment and disposal.

i. Oversize Material Surface Cleaning Decontamination (if needed): If the S/S project has the potential to generate oversize material that cannot be treated via S/S, develop a surface cleaning decontamination plan. Consult EPA 600/2-85/028 when preparing the surface cleaning decontamination plan.

j. Process Material Tracking Schedule. Provide a Process Material Tracking Schedule for recording and managing the quantities of the contaminated materials processed,[other waste streams requiring disposal such as [_____]][reprocessing of treated materials that fail to meet post treatment criteria][_____], and the treated materials to be re-deposited on-site (e.g., use as backfill) or materials requiring off-site disposal. Track each material from the original source, continue through various stages of handling and treatment, and end at the ultimate disposal.

k. Permits, permit equivalents, and certifications in accordance with paragraph REGULATORY REQUIREMENTS. For items requiring a longer time frame, submit copies of applications and scheduled dates for receiving final approval.

[

l. Bench-Scale Treatability Study Test Report: After completion of testing, compile the data from the bench-scale treatability study and prepare a Bench-Scale Treatability Study Test Report that includes but is not limited to, the materials, procedures, and methods used in the study; tests performed; sampling and analysis results; conclusions with supporting dialog; and proposed conditions to be tested in the Field Demonstration. Submit the Bench-Scale Treatability Study Test Report as an attachment to the S/S Treatment Work Plan.]

1.4.1.8 Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)

****

NOTE: This section may reference a separate specification section requiring preparation of a quality assurance project plan or may be excluded entirely if the requirements are part of another specification section.

****

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the UFP-QAPP WKSTS. Incorporate sampling and analysis requirements from this Section into the UFP-QAPP. Prepare [draft for Government review] [draft-final for [regulatory][_____] review] and final versions of the UFP-QAPP. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Submit the UFP-QAPP [within [30][_____] calendar days after notice to proceed] [at the same time the S/S Treatment Work Plan is submitted][_____]. Do not perform work at the site, with the exception of site inspection and surveys, until the UFP-QAPP is approved. Tailor the content to the requirements of the project and the site conditions.

1.4.2 Performance Requirements

1.4.2.1 Treated Material

****

NOTE: The table in this paragraph should be developed on a site specific basis considering the purpose of S/S treatment in the overall strategy for managing the contaminated material. Ideally, post-treatment testing criteria will be defined in a site-specific decision document. Post-treatment testing depends on the purpose of the S/S treatment. In general, S/S treatment is either completed as on-site pre-treatment prior to disposing the treated material off-site, or S/S treatment is performed to reduce chemical leachability and improve strength properties for material that will remain on-site (either in-situ or in a designated permanent storage unit).

The Toxicity Characteristic Leaching Procedure (TCLP) by EPA Method 1311 is usually the definitive test for contaminated materials that are pre-treated via S/S prior to off-site disposal. TCLP test results are used to determine if a contaminated material must be managed as a hazardous waste. In some instances, such as when a contaminated material is considered a listed hazardous waste, "total" chemical testing data may be needed in addition to or instead of TCLP data.

TCLP testing should generally not be used to demonstrate performance when contaminated materials are left on-site after S/S treatment. The Synthetic Precipitation Leaching Procedure (SPLP) by EPA Method 1312 is an alternative testing method that can be used to determine the mobility of both organic and inorganic contaminants. Note that the SPLP method involves mechanically reducing the particle size of samples if greater than 9.5 mm 0.375 inch, so if the S/S treatment process creates a monolithic solid material, the SPLP method may overestimate the leachability of contaminants by artificially creating a greater surficial area for leaching than actually exists. For monolithic materials, EPA's Leaching Environmental Assessment Framework (LEAF) Methods 1313 - 1316 provide a testing method which may be more applicable.

Physical testing methods may also be appropriate when S/S-treated contaminated materials are left on-site. Physical tests such as unconfined compressive strength represent the treated materials capacity to support loads placed on the treated material and can also serve as a surrogate measure of durability and chemical reaction success between the treatment reagent and contaminated material. Permeability testing indicates the degree to which liquids can move through treated material and cause contaminants to leach.

The excessive addition of reagents during treatment can result in a greater than anticipated volume increase. Limiting volume increase is important if the treated material is to be placed in an onsite permanent storage unit with limited storage space. For this reason, monitoring of volume increase is often done during the treatability study, field demonstration, and/or full-scale treatment. A volume increase performance requirement may not be necessary if there is abundant space available for disposal of treated contaminated material. A volume increase performance requirement is also not appropriate if the plans and specifications require specific treatment mixtures and application methods, in which case the Contractor would have little control over volume increase.

Two approaches are provided for attaining

performance criteria: meeting performance criteria for every sample of treated material (conservative approach) or meeting performance criteria on the average for all samples of treated material. The averaging approach would not be appropriate if S/S treated materials are to be sent off-site for disposal, because averaging of sample results cannot be used for waste characterization to determine if a material is or is not a hazardous waste.

****

Conduct the work in a manner that will ensure that treated material is a homogenous mixture of contaminated materials and reagents[with no clumps of intact contaminated material larger than the size specified in Table 1 that have not been mixed].[Each sample of treated material must meet the criteria shown in Table 1.][An average of all samples of treated material must meet the performance criteria in Table 1; for chemical properties no individual sample can be greater than [_____][110 percent] of the criteria in Table 1 with no more than [_____][20 percent] of the samples exceeding; for physical properties other than maximum clump size no individual sample can be less than [_____][90 percent] of the criteria in Table 1 with no more than [_____][20 percent] of the samples falling short.]

Table 1 - POST-TREATMENT PERFORMANCE CRITERIA

PROPERTY	TEST VALUE	TEST METHOD
Chemical Properties		
pH	[_____]	[_____]
[_____]	[_____]	[_____]
Physical Properties		
Paint Filter Liquids Test	No Free Liquids	EPA SW-846 9095B
Min. Unconfined Compressive Strength	[_____] kPa [_____] psi	ASTM D1633
Hydraulic Conductivity	[_____] centimeters per second (cm/s) [_____] feet per second (f/s)	ASTM D5084
Maximum Volume Increase(1)	[_____] percent	
Maximum Clump Size	[10][_____] cm [4][_____] inches	Visual
[_____]	[_____]	[_____]

Note (1): Determine the volume increase by comparing the volume of in situ contaminated material to be treated to the volume of treated material using the following formula:

B= 100 x [(1+R) x (D in situ/D treated) - 1], where

B= Volume increase in percent.
R= Dry weight ratio of solidifying agent to contaminated material.
D in situ = Dry unit weight of in-situ contaminated material.
D treated = Dry unit weight of compacted treated material.

1.4.2.2 Emission and Dust Controls

****

NOTE: Specifications for emission and dust controls should be provided in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. The remaining text in this note discusses S/S technology-specific emission and dust control considerations to incorporate into Section 01 57 19. An air pathways analysis should be performed during design in accordance with EP 200-1-24 Air Pathway Analysis for the Design of Hazardous, Toxic and Radioactive Waste (HTRW) Remedial Action Projects. Depending upon the contaminants of concern in the contaminated materials, the unit processes/operations employed in the treatment plant, the amount of pollutants emitted, and the geographical location of the site, the emission standards and limitations for certain contaminants and dust control can be identified from the following regulations including, but not limited to, National Primary and Secondary Ambient Air Quality Standards, National Emission Standards for Hazardous Air Quality Pollutants, and state and local regulations.

Based on the regulatory requirements, the proper technologies or apparatus for the emissions control if required can be determined. Upon completion of the design of the treatment plant, these emission requirements and control technologies should be defined by the design engineer.

If a performance specification is prepared, the emissions, dust sources, and contaminants of concern should meet specified requirements based on applicable regulations. Section 01 57 19 should list the emissions criteria for the contaminants of concern for each emission and dust source, and if applicable, monitoring requirements should be specified. The applicable federal, state, and local regulations should also be identified. If the specification is prepared based on detailed design, the technologies or apparatus for controlling the emissions and dust sources should also be specified.

****

Provide an S/S treatment system which meets the emissions and dust control requirements in accordance with[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____].

1.4.2.3 Noise Control

****

NOTE: Specifications for noise controls should be covered in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. The remaining text in this note discusses S/S technology-specific emission and dust control considerations to incorporate into Section 01 57 19. Based on the geographical location of the site, and the land uses and environment surrounding the site, the site-specific noise level requirements for the day and night operations and monitoring requirements can be identified from state and local regulations and/or developed by interacting with the state and local agencies.

****

Provide an S/S treatment system which meets the noise control requirements in accordance with[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____].

1.5 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S"

classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Pre-Installation Meeting Agenda

Pre-Installation Meeting Minutes; G, [_____]

S/S Treatment Work Plan; G, [_____]

Bench-Scale Treatability Study Work Plan; G, [_____]

Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP); G, [_____]

Pre-Installation Equipment Examination

Pre-Installation Examination Report

SD-05 Design Data

Adjusted Mix Design; G, [_____]

SD-06 Test Reports

Field Demonstration Report; G, [_____]

Operations Reports

Water Supply Analysis

Qualifications; G, [_____]

Reagent Certificates Of Analysis

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

****

NOTE: Include Federal, state, and local regulatory requirements; utility company regulations; and applicable codes and standards published by scientific and engineering institutions where appropriate in the body of this Section. Some of the potentially applicable Federal regulations are listed as follows:

Toxicity Characteristic Leaching Procedure (TCLP)

Recording and Reporting Occupational Injuries and Illnesses

Occupational Safety and Health Standards

Safety and Health Regulations for Construction

Permitting

National Primary and Secondary Ambient Air Quality Standards

National Emission Standards for Hazardous Air Quality Pollutants

State and Local Air Quality Standards

National Pollution Discharge Elimination System (NPDES) Discharge Limitations and Permit Procedures

Hazardous Waste Identification and Standards Applicable to Generators, Transporters, and Owners and Operators of Treatment, Storage and Disposal Facilities (TSDF)

Land Disposal Restrictions (LDRs)

Department of Transportation Hazardous Materials Program Procedures

Hazardous Materials Transportation Regulations

Standards for Protection Against Radiation

Land Disposal of Low-Level Radioactive Waste

Packaging and Transportation of Radioactive Materials

For sites addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, delete this section.

****

Obtain the permits, permit equivalents, and certifications; and meet the regulatory requirements necessary for the installation, operation, and closure of the project.[Correspondence from regulatory agencies, and other relevant information, is attached to the specifications to indicate the level of effort necessary to obtain finalized permits, permit equivalents, certifications and to meet substantive regulatory requirements.]

1.6.2 Qualifications

****

NOTE: Requirements for the Contractor's experience should be determined and specified based on the experience, availability, and state of the S/S

treatment technology industry and the site-specific requirements. If S/S treatment is being used for unique contaminants, consider specifically identifying contractor S/S experience requirement for those contaminants in the optional bracket at the end of paragraph CONTRACTOR EXPERIENCE.
****

1.6.2.1 Contractor Experience

Submit evidence of successful completion of[at least one S/S project][[_____] S/S projects of comparable size and scope][at least[three][_____] S/S pilot scale treatability studies, demonstration studies, or full scale remediation projects that required handling and transportation of materials contaminated with[RCRA hazardous wastes][CERCLA hazardous material][_____]] using the proposed system or a similar system.

1.6.2.2 Key Personnel

Provide key personnel who have a minimum of[three][_____] years of S/S field experience. Include system operators, quality control personnel, and supervisory engineering and technical staff involved with the S/S system operation in key personnel. Submit a list of these personnel with their qualifications.

1.6.2.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory meeting the requirements of[Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.7 DELIVERY, STORAGE, AND HANDLING

Safely transport, store, and handle equipment and raw materials (including reagents). Package and ship these items in compliance with United States Department of Transportation requirements. Store and handle these items onsite in accordance with the manufacturer's recommendations and in compliance with applicable regulatory requirements.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Environmental Requirements

****
NOTE: Consider the site-specific conditions when determining allowable ambient temperatures at which S/S and curing may take place. Low temperatures near or below freezing can be very detrimental due to inability to adequately mix frozen material and limiting of chemical reactions which occur in the aqueous phase. Very high temperatures above 32 degrees C 90 degrees F can also have a negative effect on S/S performance when curing of cementitious materials is important; however high temperatures are overall less likely to be

detrimental compared to low temperatures. Treatability studies can be used to address the situation of high temperatures during curing.

****

Do not perform S/S in an ambient temperature below[4][_____] degrees C[40][_____] degrees F without approval from the Contracting Officer. Ensure the temperature of the treated material remains above freezing while curing. Do not treat contaminated material if it contains any frozen material. Do not perform S/S during periods of heavy rainfall as this will result in the addition of excess water to the mixture.

1.8.2 Existing Conditions

****

NOTE: Place the site characterization data in an appendix to the Specifications or on the Drawings. Include:

- **Available information about the extent and characterization of significant quantities of debris.**
- **The detail to which site characterization has been performed and indicate where obvious data gaps exist.**
- **Construction limits.**
- **Property utilities.**
- **Chemical data.**
- **Geotechnical data.**
- **Sampling locations.**
- **Boring logs.**
- **Locations and details (such as utility point of contact, sizes, capacities, and flows) of the utility hookups.**

Indicate if there are multiple dissimilar types of contaminated materials that will require different S/S treatment processes. Materials may be considered dissimilar due to different types or relative concentrations of contaminants. Determination of dissimilar materials may be based on site investigations and/or previously completed treatability studies.

****

The existing site conditions are presented[in Appendix [_____]][and][on the Drawings]. These include[physical configuration,][utilities,][topography,][land uses,][geotechnical characteristics of the contaminated materials (including[grain size analysis,][total organic content,][cation exchange capacity,][pH,][moisture content,][bulk density,][porosity,]),][hydrogeology,][treatability study results,] and[nature and extent of contamination]. The existing conditions presented are the result of site investigations at specific locations; variations in the existing site conditions could occur. Perform an independent interpretation of the site characterization data. Notify the Contracting Officer within[48 hours][_____] of discrepancies between the data provided and actual field conditions.

PART 2 PRODUCTS

2.1 WATER

****

NOTE: Two options are provided. The first option is to only allow the Contractor to use potable water. The second option allows the Contractor to use non-potable water, but includes a testing requirement to limit the chance that the Contractor supplies a water that could introduce contaminants into the treated materials. The first option is simpler, but could lead to higher project costs if the volume of water needed is significant and/or potable water sources are not readily available. When specifying the chemical contaminant criterion to be met for water, the Designer should consider if there are other standards which are more appropriate for the specific project (e.g. state groundwater cleanup criteria).

Maximum concentrations for potential chemical interferences from water used with cementitious binders are available in ASTM C1602/C1602M Standard Specification for Mixing Water Used in the Production of Hydraulic Cement Concrete. Requiring testing for these chemicals may not be considered necessary given that the specification requires using the water in a bench-scale treatability study, which would demonstrate performance.

****

Supply the water used to facilitate S/S treatment.[Use only potable water from a regulated public water system.][If non-potable water is to be used, provide water that does not contain oils, acids, salts, alkalis, organic matter, solids, or other substances at concentrations that could be detrimental to the successful treatment of the contaminated materials. If non-potable water is to be used, the proposed water must be used during a Bench-Scale Treatability Study conducted in accordance with the requirements of this Section to demonstrate that the water is acceptable for use. Also characterize non-potable water prior to its use by collecting a sample from the water source and analyzing according to Table 2. Submit a Water Supply Analysis demonstrating that water meets requirements.

TABLE 2 - TREATMENT WATER CRITERIA

ANALYTICAL METHOD NUMBER (From EPA SW-846)	ANALYSIS TYPE	CRITERION TO BE MET

TABLE 2 - TREATMENT WATER CRITERIA

6010[and 7470A]	Metals[and Mercury]	[Less than Maximum Contaminant Level (MCL)] [_____]
8260	Volatile Organics	
8270	Semi-volatile Organics	
8082	PCBs	
1633	PFAS	
8081	Pesticides	

Within each Analytical Method, only analyze for analytes which have a [MCL] [_____].]

2.2 REAGENTS

Provide reagents which are free of chemicals which could result in secondary contamination of the material being treated. Provide a Reagent Certificates of Analysis with each shipping unit of reagent. A confidentiality agreement may be requested if proprietary reagents are being used.

[2.3 SAMPLES OF CONTAMINATED MATERIAL FOR TREATABILITY STUDIES

****

NOTE: This paragraph should be included if bench-scale treatability studies are to be performed by the Contractor. Action level criteria should be specified for the purpose of collecting representative samples for bench-scale treatability studies. Table 3 should be edited based on site-specific contaminants of concern and their corresponding action levels. Additional testing may be needed to verify that physical properties (e.g. grain size, total organic content, density, porosity, moisture content) of the samples are also representative of site conditions.

To reduce the overall risk to the Government, it is strongly advised that the project team should require the Contractor to collect samples for the bench-scale treatability study unless the nature of the site prevents the Contractor from doing so. Depending on site conditions and project needs (e.g. site security, access issue, etc.), the government may provide samples to the Contractor to conduct bench-scale treatability studies.

****

[The Contracting Officer will provide the required samples to conduct the bench-scale treatability studies.][Select sampling locations and collect representative samples to conduct the bench-scale treatability studies. Consider the existing site conditions presented in paragraph EXISTING

CONDITIONS when selecting sampling locations. Coordinate the sampling protocol with the Contracting Officer before obtaining the samples.] The collected bench-scale treatability study samples must have contaminant concentration levels [representative of the average concentration of the contaminants identified][and][meeting than the action level criteria presented in Table 3]. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria. Test samples of contaminated materials intended to be used in the bench-scale treatability studies in accordance with procedures in the[Bench-scale Treatability Study Work Plan][and][UFP-QAPP]. Do not commence bench-scale treatability studies until contaminated material sample results meet the aforementioned concentration criteria.

TABLE 3 - ACTION LEVEL CRITERIA

PARAMETER	ACTION LEVEL CRITERIA
pH	[<][>] [_____]
[_____]	[_____]

]2.4 MIX DESIGN

****

NOTE: In most instances, the Government will have conducted treatability studies prior to advertisement for bids. Results of these treatability studies are generally provided to bidders and included in the contract documents. In some limited circumstances, the designer may elect to specify the exact reagent mix to be used by the Contractor; modify the paragraph below if using this approach. This is generally not recommended because it places project performance risk on the Government.

****

Select a mix design which is capable of producing treated materials meeting the performance criteria listed in paragraph PERFORMANCE REQUIREMENTS for use during full scale treatment.

PART 3 EXECUTION

3.1 EXAMINATION

[3.1.1 Bench-Scale Treatability Study

****

NOTE: If a Treatability Study has previously been performed or is otherwise not needed, delete this paragraph. To reduce the chances of using soil samples that are not representative of site conditions, a minimum volume of 4 liters 1 gallon is recommended for each condition to be tested at the bench scale.

****

Perform at least [three][_____] replicate tests simultaneously for each selected mix from the approved Bench-Scale Treatability Study Workplan. Homogenize and divide the contaminated soil into replicate volumes prior to initiating testing. Do not use less than less than [4][_____] liters [1][_____] gallon of contaminated soil in each mix. Test samples of curing treated materials in accordance with procedures in the [Bench-Scale Treatability Study Work Plan][and][UFP-QAPP] and at a frequency of no less than every [7][_____] days. Cure treated material for a period of not less than [28 days][_____] or until target levels identified in paragraph PERFORMANCE REQUIREMENTS are reached, whichever is shorter.

]3.1.2 Pre-Installation Equipment Examination

Conduct a pre-installation examination of the S/S treatment equipment for damage, defects, and dilapidation. Submit the results of the pre-installation examination to the Contracting Officer for review and information. The Contracting Officer may conduct an independent examination to ascertain the condition and functionality of the equipment. Based on this examination, the Contracting Officer has the right to reject the entire system or damaged, defective, or dilapidated equipment. The cost associated with equipment or control replacement or repair, and delays caused by the rejection must be borne by the Contractor. Routinely and properly inspect and maintain the equipment to provide the operation of the treatment plant as required by the Contract schedule. Schedule delays and costs due to lack of inspections and maintenance are the responsibility of the Contractor. Provide alternate/auxiliary power source if sufficiently reliable sources are not available.

3.1.3 Infrastructure Conditions

Conduct a pre-installation examination of the on-site infrastructure, utility conduits, monitoring points, and site access constraints. Photographically document, with identifying labels, the existing condition of infrastructure and utilities, particularly for comparison to post-operation conditions. Verify locations of critical utilities that cannot be disrupted and those utilities that would potentially have significant impacts on operations and public safety. Submit a Pre-Installation Examination Report documenting the examination activity. Obtain all necessary utility clearances before initiation of subsurface work.

3.2 PREPARATION

3.2.1 Mobilization

****

NOTE: Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES includes requirements for decontaminating equipment that has been used in contaminated zones. Modify that Section to extend decontamination/cleaning requirements to equipment being brought on-site to cover the requirements of this paragraph.

****

Follow the approved mobilization and demobilization plans submitted as part of the S/S Treatment Work Plan. Do not mobilize the treatment plant to the site until the [S/S Treatment Work Plan][UFP-QAPP] has been approved by the Contracting Officer and the Contractor has received written confirmation. Delays caused by the Contractor's failure to meet regulatory requirements must result in no additional cost to the Government. In accordance with[Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR

CONTAMINATED SITES][_____], the equipment which is rented and/or previously used for other site remediation must be decontaminated and tested for contaminants of concern before being brought to the site.

3.2.2 Stockpiles

****

NOTE: Sufficient area should be prepared for stockpiling untreated and treated contaminated materials based on consideration of equipment production rates, allowable stockpile sizes, and overall project schedule. Background sampling under the stockpiles of contaminated materials should be performed before their construction, unless previous information is adequate. Coordinate with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL. If Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL is not in the project, copy stockpiling information from paragraphs EXCAVATION WORK PLAN, GEOMEMBRANE, CONTAMINATED MATERIAL STORAGE, and SAMPLING BENEATH STORAGE UNITS into this section.

****

Prepare areas that will be used to stockpile untreated and treated contaminated materials in accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL. Provide sufficient area to stockpile [_____] [cubic meters][metric tons][cubic yards][tons] of untreated contaminated material and[six][_____] stockpiles of[500][_____][cubic meters][metric tons][cubic yards][tons] of treated contaminated material.

[3.2.3 Foundations

****

NOTE: Delete this paragraph if the S/S treatment does not involve erecting/installing a fixed S/S system (e.g. treating contaminated materials in-situ). Minimum requirements should be specified for the foundation/containment area of the treatment plant. An option is provided at the end of the paragraph to require installing a liner and berm in the location where the S/S treatment plant will be constructed; this option addresses cross-contamination risk if the treatment plant is located on non-contaminated ground.

****

Construct equipment foundations in accordance with the approved S/S Treatment Work Plan and this paragraph. Grade the area around the S/S treatment plant so that the water drains away from the work area adjacent to the treatment area.[Construct a liner and berm surrounding the S/S treatment plant. Construct the liner and berm[in accordance with the stockpile liner and berm requirements in Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL][_____]].

][3.3 ERECTION, INSTALLATION, AND DEMOBILIZATION

****

NOTE: Delete this paragraph if the S/S treatment

does not involve erecting/installing a fixed S/S system (e.g. treating contaminated materials in-place). Referenced UFGS should be edited to include only the minimum requirements applicable to a temporary installation.

****

Erect and install the treatment plant on a temporary basis so that it can be readily removed from the site after completion of the Contract work. Perform the erection and installation to incur minimal damage to the existing site environment.[Complete mechanical work in accordance with the requirements of Section 23 30 00 HVAC AIR DISTRIBUTION.][Complete electrical work in accordance with Sections[33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION,][33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION,][and][26 20 00 INTERIOR DISTRIBUTION SYSTEM][and [_____]].][Complete plumbing work in accordance with[Section 22 00 00 PLUMBING, GENERAL PURPOSE][Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING][_____]].

]3.4 FIELD DEMONSTRATION

****

NOTE: The need for a formal Field Demonstration should be discussed with the Contracting Officer and would be a function of the uncertainty of the materials to be treated. For well-defined contaminants and contaminated material compositions that are known to be amenable to S/S treatment, data obtained from the bench-scale treatability or full-scale system startup should be adequate to negate the need for a formal Field Demonstration. If the contaminants/contaminated material is not known to be amenable to S/S treatment, then a formal Field Demonstration in accordance with the following requirements will need to be performed. If a formal Field Demonstration is not required, sufficient startup testing should be done to validate performance prior to ramping up to full-scale operation.

If processing of contaminated material must stop pending field demonstration results, the Contract must provide for issuing a second notice (or third notice in a project where treatability studies are performed) to proceed by Contracting Officer upon approval of the field demonstration.

****

Prior to full-scale operations, perform a field demonstration. Process at least [500][_____][cubic meters][metric tons][cubic yards][tons] of contaminated material. Perform a field demonstration on each dissimilar type of contaminated material and reagent mix to be treated. During the field demonstration, handle dissimilar materials in accordance with paragraph DISSIMILAR MATERIALS, and follow paragraph CHANGE OF OPERATING CONDITIONS as needed.

3.4.1 Full-Scale Processing Equipment

Use the full-scale processing equipment, reagents, mix ratios, and mixing procedures proposed for full scale S/S treatment.

3.4.2 Contaminated Material Sourcing

****

NOTE: Prior to implementing the field demonstration, chemical testing should generally be performed to verify that the materials to be used for the test run contain the contaminants of concern at high enough concentrations to adequately test the system. Additional testing may be warranted to verify that the physical properties of the materials are also representative of site conditions.

****

Obtain contaminated material used for the field demonstration from [the location specified by the Contracting Officer][_____]. Prior to performing the field demonstration, test each dissimilar type of contaminated material to be used for the field demonstration. Consider the existing site conditions presented in paragraph EXISTING CONDITIONS when selecting sampling locations. The contaminated material samples must have contaminant concentration levels [representative of the average concentration of the contaminants identified][and][meeting the action level criteria presented in Table 4]. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria. Test samples of contaminated materials intended to be used in the field demonstration in accordance with procedures in the [Bench-Scale Treatability Study Work Plan][and][UFP-QAPP].

TABLE 4 - ACTION LEVEL CRITERIA

PARAMETER	ACTION LEVEL CRITERIA
pH	[<][>] [_____]
[_____]	[_____]

3.4.3 Field Demonstration Treated Material Testing

****

NOTE: Consideration should be given to the need for monitoring off-gas, dust, and noise generation during the field demonstration to ensure compliance with local, state, and federal regulations.

****

Once the field demonstration has generated the required quantity of treated material, perform the tests identified in paragraph POST TREATMENT TESTING on on[five][_____] representative samples of the treated material. If the treated materials produced during the field demonstration do not meet the criteria in the paragraph PERFORMANCE REQUIREMENTS, process an equal quantity of the same type of material using properly modified operating conditions and/or incorporation of reagents that have been proven effective as part of the treatability testing, until satisfactory results are obtained. Return the treated materials that failed the demonstration testing to the contaminated materials stockpile for re-processing during full-scale treatment.

3.4.4 Field Demonstration Test Results

****

NOTE: Two options are provided for the next step after the field demonstration. The first option (halting processing contaminated soils until results from the field demonstration testing indicate the Contractor's proposed operating conditions can successfully treat the contaminated soils) would generally only be appropriate if the S/S treatment process has yet to be demonstrated on a large scale for the specific contaminants and soil composition.

****

Submit a Field Demonstration Report including pre-treatment and post-treatment test results. Document other relevant field demonstration data including but not limited to: batch proportions, mixing time, and mixing speed. Include off-gas, dust, and noise test results. After completion of the field demonstration,[do not process additional contaminated material until test results from the field demonstration verify that the treated material meets the criteria listed in paragraph PERFORMANCE REQUIREMENTS. Allow[14][_____] calendar days in the schedule for Government review and approval of the field demonstration report.][contaminated material may continue to be processed. However, if test results from the field demonstration do not pass the criteria in paragraph PERFORMANCE REQUIREMENTS, reprocess the contaminated material treated with the failing mix design in accordance with paragraph RETESTING AND REPROCESSING].

3.5 OPERATION

3.5.1 Dissimilar Materials

****

NOTE: Delete the bracketed text item if dissimilar materials are not known to be present at time of preparing project specifications.

****

Do not mix together dissimilar materials that either prior testing or field quality control observations during S/S operations have indicated need different mix formulations.[Materials known to be dissimilar at the site are defined in[paragraph EXISTING CONDITIONS][_____].]

3.5.2 Oversize Material

****

NOTE: This paragraph can be deleted if S/S is performed in-situ unless there is large debris that needs to be removed to facilitate mixing and/or protect mixing equipment from damage. An optional requirement is included if oversize material must be decontaminated before it is transported off-site for disposal.

****

Reduce the size of oversize contaminated material to less than [2.5 cm one inch][the maximum allowable particle size of the S/S mixing unit as defined in the S/S Treatment Work Plan][_____]. Treat oversize contaminated material which can be reduced to an allowable size for the S/S process. Remove oversize material that cannot be reduced to an allowable size for the S/S unit process.[Decontaminate oversize materials in accordance with the procedure developed in the S/S Treatment Workplan]. Dispose oversize material off-site in accordance with [Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIAL][_____].

3.5.3 Treated Materials

3.5.3.1 Temporary Storage of Treated Materials

****

NOTE: The second option in the paragraph below applies only to S/S treatment when the treated material is placed into permanent on-site storage. To prevent double handling it is preferable to place treated material directly into the permanent storage area rather than stockpiling until post-treatment testing is completed.

****

[Separate treated material into units (stockpiles) for post-treatment testing. Keep dissimilar materials in separate stockpiles pending test results. Unit size greater than the quantity pertaining to the most frequent quality control test is prohibited. If the test results indicate the treated materials of a stockpile meet the post treatment criteria presented in paragraph PERFORMANCE REQUIREMENTS, this stockpile of treated materials[may][must][_____] be combined with other stockpiled material which has also met the post treatment criteria.]

[Place treated material directly into the permanent storage unit after treatment. Place treated material such that the material from specific batches/runs can be defined and removed if it fails post-treatment testing.]

3.5.3.2 Final Disposal of Treated Materials

Dispose treated materials which meet the treatment performance requirements in paragraph PERFORMANCE REQUIREMENTS[off-site in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS][in the designated permanent storage unit. Place treated materials in accordance with Section 31 00 00 EARTHWORK].

3.5.4 Change of Operating Conditions

****

NOTE: If adjustment to the mix design is required due to change in contaminated material characteristics, then the Contractor's adjusted mix design should be evaluated by the Contracting Officer for the extent of changes from the previous mix design. Further, price negotiation may be required based on the extent of changes from the previous mix design.

****

The following two requirements must be met in order to be considered for change of operating conditions:

a. The physical and chemical characteristics of the contaminated materials are significantly different from the originally defined characteristics.

b. The treatment requirements cannot be met under the current S/S treatment plant design and related mix design/operating conditions.

When change of operating condition is necessary, notify the Contracting Officer before changes are made to the mix design and related operating conditions. The Contracting Officer may require the Contractor to perform a field demonstration for significant changes made to the mix design and related operating conditions in accordance with paragraph FIELD DEMONSTRATION, for approval. If adjustment to the mix design is required due to change in contaminated material characteristics, submit an adjusted mix design for the extent of changes from the previous mix design for approval. Further, price negotiation may be required based on the extent of changes from the previous mix design.

3.6 FIELD QUALITY CONTROL

****

NOTE: Leaching and hydraulic conductivity tests are not amenable to real time quality control because of the time required to perform the tests; therefore, it is preferable to minimize the number of leaching and hydraulic conductivity tests performed and to maintain quality control of the S/S process by verifying that the mix design works during the field demonstration and maintaining quality control by monitoring batch proportions and mixing time. Real time indicator tests such as pH, specific conductance, mix temperature, and water content can also be used as quality control tools.

****

The post treatment testing specified in this paragraph is needed by the Government to generate documentation that the S/S treatment has been accomplished in accordance with performance requirements approved by applicable authorities. The results of these tests may be used as part of the Contractor's QC program; however it is the contractor's sole responsibility to meet the performance requirements specified in this section. Therefore, it is expected that the Contractor will perform additional testing and measurements to assure that treated materials meet requirements without rejection of batches, retesting, and/or reprocessing.

3.6.1 Tests

3.6.1.1 Post Treatment Testing

****

NOTE: If cementitious reagents are used in treatment, a requirement is included to collect samples for post-treatment testing immediately after treatment. This eliminates the need to remove samples from the treated mass after it has cured.

The values shown in Table 5 for frequency of testing are only examples and need to be determined on a site specific basis. Coordinate the properties in this table with the properties in paragraph PERFORMANCE REQUIREMENTS. Edward Bates' and Colin

Hills' 2015 Stabilization and Solidification of Contaminated Soil and Waste: A Manual of Practice includes discussion on sampling frequency (Section 6.2.1) and provides examples. It may be acceptable to change the number of samples during development of a UFP-QAPP, but attempt to establish a reasonable sampling frequency in the Specifications to provide a basis for the Contractor to bid the project.

****

Collect post treatment confirmation samples in accordance with the [UFP-QAPP][basewide QAPP][_____] and this paragraph. Collect confirmation samples at a minimum frequency [defined in Table 5][_____]. Collect samples as [discrete grabs][composites][incremental samples][_____]. Collect samples for quality control and quality assurance testing immediately after treatment and allow to cure as specified in ASTM D1632 or by another approved method. Analyze samples for the parameters identified in paragraph PERFORMANCE REQUIREMENTS. Complete all other sampling and analysis activities in accordance with the [UFP-QAPP][basewide QAPP][_____] (including but not limited to sample handling, preservation, transportation, collection/analysis of quality control samples, data validation, and data reporting). Any deviations to sampling frequency, number of samples, or sample collection methods must be [established in the approved [UFP-QAPP][basewide QAPP]][approved by the Contracting Officer].

Table 5 - POST-TREATMENT QUALITY CONTROL TESTING FREQUENCY

PROPERTY	FREQUENCY [Cubic Meters][Metric Tons]
Chemical Properties	
pH	1 per [500][_____]
[_____]	1 per [500][_____]
Physical Properties	
Paint Filter Liquids Test	1 per [500][_____]
Min. Unconfined Compressive Strength	1 per [500][_____]
Hydraulic Conductivity	1 per [500][_____]
Maximum Volume Increase(1)	1 per [500][_____]
Maximum Clump Size	1 per [500][_____]
[_____]	1 per [500][_____]

3.6.1.2 Retesting and Reprocessing

****

NOTE: An option is provided for retesting treated contaminated materials which fail to meet performance requirements. Retesting without first reprocessing treated contaminated materials should

generally be prohibited unless there is reason to believe the original test result was inaccurate due to mislabeling/mishandling of the sample or analytical error discovered during validation of laboratory results (simply believing that a sample did not reflect the treatment is not sufficient to consider a result inaccurate).

If S/S treated material is being sent off-site for disposal, do not permit retesting unless there is reason to believe the original test result was inaccurate as described in the paragraph above. This is because waste characterization and disposal is based on grab sampling results, and averaging of sampling results cannot be used to determine that a waste meets regulatory disposal requirements.

****

Reprocess and then retest units of treated contaminated materials that do not meet the post-treatment criteria in paragraph PERFORMANCE REQUIREMENTS[or quality assurance testing].[The Contractor may propose to retest failing units of treated contaminated soils prior to reprocessing. If the Contracting Officer approves retesting, collect and test two additional samples for the failed parameter(s). If both samples pass, re-processing the unit will not be required. If either sample fails, reprocess the unit.]

3.6.1.3 Government Quality Assurance Testing

****

NOTE: Consider the need for quality assurance testing on a project-by-project basis. If QA testing is unnecessary, delete this paragraph. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. Use of quality assurance testing data use also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project Performance Requirements, and failing result would be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for identifying and correcting meaningful differences should be documented in a project-specific Quality Assurance Project Plan and referenced in this specification; the process is likely to complex to be adequately defined in this specification.

****

Provide duplicate samples to the Government's quality assurance laboratory for Government quality assurance. Submit samples at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. Provide additional quality assurance samples upon request.

3.6.2 Inspection

3.6.2.1 Batch Proportions

Visually inspect treated materials to confirm that a homogeneous mixture has been created and maximum clump size is being met as defined in paragraph PERFORMANCE REQUIREMENTS. Record the mixing time, mixing speed, and quantities of contaminated material, reagents, and water added to each batch. Maintain mixing time, mixing speed, and batch proportions within the limits specified in the approved Work Plan and as modified during the field demonstration.

3.6.2.2 Government Inspection

The Government may conduct inspection of the system installation and perform periodic inspections during the S/S treatment operation to verify that the project activities are performed in accordance with the approved plans, specifications, and the regulatory requirements. Inspection findings must be addressed immediately and resolved to the Government's satisfaction.

3.6.2.3 Operations Reports

Submit operations reports [daily][weekly] for the first [10][_____] weeks, and at a frequency of [_____] thereafter. The operations reports must consist of a log of operating conditions including, but not limited to: hours of operation; staffing; weather conditions; process materials tracking schedule; sample shipment (include chain of custody documents); receipt of analytical results; changes in operating parameters; results of the testing and calibration activities; and inspection and maintenance activities. In addition, attach the physical and chemical test results generated onsite or received from offsite laboratories to the report. Include the following information with test results: time of sampling, location of sampling, and Contractor Quality Control (such as duplicate sample analysis, field and trip blank analysis, laboratory QC analysis, etc.) results. Perform data validation of the test results [in accordance with the project UFP-QAPP][before submittal].

3.7 DEMOBILIZATION

****

NOTE: If there is a separate Specification Section which provides overall requirements for demobilization/site cleanup, such as 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS, move the requirements from this paragraph into that Section.

****

Follow the approved mobilization and demobilization plans submitted as part of the S/S Treatment Work Plan. Demobilize to restore the site to its initial state, prior to the construction and operation of the S/S treatment facilities. Do not commence demobilization until written approval is received from the Contracting Officer. Demobilization must include, but must not be limited to:[disconnecting of utility service lines,][decontamination and removal of equipment and materials,][disposal of decontamination wastes,][disposal of any residual wastewater,] [removal of unused amendments and other materials,][removal of material overlying liners,][removal of liners,][regrading and removal of berms,][demolition and disposal of the treatment pad, other foundation slabs, and paved surfaces,][_____].[Perform post-treatment testing of soils below stockpile storage units and work area surfaces in accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL.]

SECTION 02 53 16.13

REMEDIATION OF CONTAMINATED SOILS BY THERMAL DESORPTION

02/25

****

NOTE: This guide specification covers the requirements for onsite thermal desorption of non-radioactive materials contaminated by hazardous or toxic organic wastes and by petroleum, oil, or lubricants (POL).

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This guide specification provides the framework for developing a project-specific thermal desorption specification. This guide specification should be modified as necessary for a given site, to incorporate the conditions, contaminants, thermal desorption heating method, and regulatory requirements specific to the site.

A systematic project planning approach should be employed when developing sampling procedures to demonstrate the performance of the thermal desorption treatment process, ideally through implementation of the Uniform Federal Policy for

Quality Assurance Project Plans (UFP-QAPP) or some such similar process. The sampling procedures may affect the maximum allowable size of a stockpile, and subsequently, determine the number of days required to reach this quantity based on the daily generation of the treated materials.

The thermal desorption treatment considered in this guide specification starts with the raw contaminated material; continues through preparation, feeding, stockpiling of treated contaminated material (if necessary); and ends with final disposition of the treated material (either returned to its original location, moved to an on-site designated permanent storage unit, or transported off-site for final disposal). As applicable, refer to Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL for requirements related to excavation and stockpiling of the contaminated materials; Section 31 00 00 EARTHWORK for placement of treated materials in on-site permanent storage; and Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS for requirements relevant to offsite transportation and disposal.

****

1.1 MEASUREMENT AND PAYMENT

1.1.1 Unit Prices

****

NOTE: Edit this paragraph based on whether the Contract will use a single job price or unit prices. If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is in the project, move these paragraphs to that Section for editing.

If the project includes Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS, coordinate measurement and payment methods and contaminated material handling and stockpiling between this Section and Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS.

****

1.1.1.1 Contaminated Materials

****

NOTE: Use the first bracketed paragraph for measurement by volume. Use the second bracketed paragraph for measurement by weight. The unit price for thermal desorption of contaminated soils/solids should generally be based on in-situ volume. For liquids and sludges the unit of measure should be mass.

****

[Measure contaminated materials by the cubic meter cubic yard of contaminated material that is treated. Compute volume by the average end area method from cross sections taken before and after excavation of contaminated material.

][Measure contaminated materials by the metric ton ton of contaminated material treated by thermal desorption. Use a properly calibrated weighing system to accurately measure the gross (bulk) weight of the contaminated material. Convert the measured gross (bulk) weight of the contaminated materials to be treated to dry weight based on the[percent moisture content of representative contaminated material samples. Determine the percent moisture content in accordance with[ASTM D2216][ASTM D4643][ASTM D4959][_____]. Determine moisture content[daily][for every[500][_____] metric tons tons of contaminated material that is treated]][_____].

] Unit price must include costs for materials, labor[, moisture reduction][, hauling][, stockpiling], processing and treatment, testing and analyzing,[and] operation and maintenance[, and wastes (solid, liquid and/or gaseous) treatment and disposal].

1.1.2 Single Job Prices

[1.1.2.1 Bench-Scale Treatability Studies

****

NOTE: Delete this paragraph if treatability studies have already been performed.

****

If the Government requires the Contractor to perform bench-scale treatability studies, the studies will be[included as part of base bid items][measured at the single job price][_____]. The price must include costs for labor and materials for:

a. Preparing plans.

b. Collecting representative contaminated materials.

c. Conducting the studies (including sampling and analysis).

d. Evaluating results.

e. Report preparation.

f. Treating and disposing of study-derived wastes.

]1.1.2.2 Field Demonstration

Payment for field demonstrations will be[included as part of base bid items][based on single job price for each field demonstration requested by the Contracting Officer and properly completed]. The price will include costs for labor and materials for:

[a. Moisture reduction.

][b. Hauling.

][c. Stockpiling.

] d. Processing and treating.

e. Testing and analyzing.

f. Preparing reports.

g. Treating and disposing of wastes (solid liquid and/or gaseous) generated during field demonstrations.

h. Other incidental work (such as manufacturers' field services, health and safety monitoring and controls, and utilities).

1.1.2.3 Other Work Items

****

NOTE: Coordinate this paragraph with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS. Temporary utility connections are covered in Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.

****

Include work items related to the work of this Section, but not included in the above paragraphs, in the base bid for treatment of the contaminated materials. Such work items include:

a. Submittals related to operation of the thermal desorption treatment system.

b. Mobilization and demobilization. Mobilization includes transportation of the equipment to the site, equipment erection and installation, but not start-up and operation.

c. Site preparation in the treatment area.

d. Configuration and installation of the treatment system.

e. Manufacturers' field services.

f. Environmental compliance monitoring.

g. Health and safety monitoring and controls.

h. Utilities required for the thermal desorption treatment, if approved by the Government as necessary for the project.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also

use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

[1.3 ADMINISTRATIVE REQUIREMENTS

****

NOTE: Delete this paragraph if the requirements are included in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS, Section 01 32 01.00 10 PROJECT SCHEDULE, or other Specification Section.

Appropriate facility personnel should be present at the pre-installation meeting if siting of the treatment facility and other associated work areas will be discussed.

****

1.3.1   Pre-Installation Meetings

Conduct a pre-installation meeting[and site walk-through] at least[five business days prior to the start of operations on the project][_____]. Arrange the pre-installation meeting and follow the written pre-installation meeting agenda submitted prior to the meeting. The purpose of this meeting is to identify key logistical, safety, and community concerns. The following individuals must be in attendance at this meeting: Contractor's Project Manager and Site Foreman and [Contracting Officer] [_____].

Record pre-installation meeting minutes and publish via email within 48 hours to all attendees. Re-publish the minutes within 48 hours via email pending any subsequent comments from the attendees.

1.3.2   Sequencing and Scheduling

The Government will not permit the Contractor to begin the next phase of operations until the Contractor has submitted documentation of successful accomplishment of the objectives of the previous phase of operation. Do not commence mobilization until approval of the mobilization plan as part of the Remedial Action Work Plan is received from the Contracting Officer.

]1.4   SYSTEM DESCRIPTION

****

NOTE: Indicate if the Government knows/assumes that there are multiple dissimilar types of contaminated materials that will require different thermal desorption treatment processes. This may be based on site investigations and/or previously completed treatability studies.

****

The work consists of thermal desorption treatment of approximately[[_____] cubic meters [_____] cubic yards][[_____] metric tons [_____] tons] of contaminated material. Provide and operate the thermal desorption system to transfer organic compounds from contaminated materials to a gaseous stream drawn through the system. The system must consist of a process or series of processes to remove organic contaminants from the contaminated materials by heating the soil or sludge matrix. Complete removal/treatment of organic vapors in one or more air pollution control systems.

1.4.1   Design Requirements

****

NOTE: The first option for thermal desorption system capacity is preferred. It is more difficult to enforce schedule constraints with the second option.

Omit the third- and fourth-to-last sentences of this paragraph ("The Contractor may propose … must be addressed in detail…") if a specific method of treatment is desired.

****

Provide a thermal desorption treatment system with a capacity that is[consistent with the remedial action schedule][a minimum of[_____] kg/hr

[_____] tons/hour]. Configure the treatment plant based on the contaminated material characteristics data[, the Contractor's own interpretation of the previously conducted treatability study results, [_____], and[the bench-scale or pilot-scale treatability studies performed by the Contractor] so that the treated material conforms to paragraph PERFORMANCE REQUIREMENTS.][The treatment plant must be transportable.] The materials, components, accessories, and equipment of the treatment plant must meet their functional requirements and be compatible with the contaminants of concern and the operating conditions of each unit operation.[The Contractor may propose a treatment plant different from the treatment plant specified. Government approval of a Contractor-proposed treatment plant does not relieve the Contractor of responsibility for meeting specified requirements for safety, reliability, and performance.] Provide a safe and reliable treatment plant in compliance with the applicable codes, regulations, and specified requirements. The treatment plant must consist of the following major systems:

1.4.1.1 Primary Desorption Chamber

****

NOTE: The nature of the heating process may invoke other requirements if it is considered "incineration." The designer should particularly verify the ramifications of the use of a direct-fired chamber on the regulatory status.

****

The primary desorption chamber volatilizes the compounds of concern. The primary chamber must be[directly fired with the primary chamber operated at a pressure lower than atmospheric.][indirectly fired.][An inert carrier gas must be recycled through the desorber and stack emissions treatment system.]

1.4.1.2 Air Pollution Control System Requirements

****

NOTE: If site materials contain polychlorinated biphenyls (PCBs), consider eliminating the use of an afterburner to alleviate permitting problems during construction. If per- and polyfluoroalkyl substances (PFAS) are present, the designer should determine if there are any prohibitions against incineration, such as a Department of Defense moratorium or state/local regulation. An afterburner could not be used if there is any prohibition on PFAS incineration.

****

Provide an air pollution control system containing[an afterburner. The temperature of the afterburner must be greater than the temperature of the primary desorption chamber][an afterburner operating at a minimum temperature of [_____] degrees C [_____] degrees F][a quench followed by an adsorption type treatment system][a condenser followed by an adsorption type treatment system][_____].

1.4.1.3 Auxiliary Fuel System

1.4.1.3.1 Feed Capability

Provide an auxiliary fuel system with direct feed capability to the thermal destruction system. Provide meters, pressure gages, and controls to maintain proper operating conditions. Design must be in conformance with NFPA 30 and NFPA 31, NFPA 54 or NFPA 58, as appropriate to the fuel type.

1.4.1.3.2 Secondary Containment

Provide auxiliary fuel storage tanks with secondary containment in accordance with[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][NFPA 30].

1.4.1.4 Contaminated Material Feed System

[1.4.1.4.1 Conveyors

****

NOTE: Use this paragraph only if there is a potential for unacceptable quantities of volatile organic chemicals (based on calculations from the Remedial Action Work Plan). This paragraph may not apply for batch-type desorption systems and may be deleted if batch treatment is anticipated.

****

Cover contaminated material feed conveyors and vent to the air pollution control system if calculations in the Remedial Action Work Plan indicate unacceptable quantities of volatile organic compounds (VOCs) would be released during contaminated material conveying.

]1.4.1.4.2 Support Equipment

****

NOTE: Address rocks, construction debris, trees, stumps, drums, barrels, etc. and oversize materials. Oversize materials are any materials too large to be compatible with the thermal desorber. Materials may be required to be shredded and treated or separated from the feed material, decontaminated and disposed on or offsite. Maximum allowable sizes to be treated in the thermal desorber should be specified.

****

Provide material handling and contaminated material feed systems capable of[shredding][, conveying][, pumping][, and][screw feeding] of contaminated materials, separately or in combination, to the primary chamber. Pre-treatment includes crushing or grinding and screening as required to produce material no larger than [_____] mm [_____] inch in diameter and which is otherwise compatible with the thermal desorber.

1.4.1.4.3 Capacity

Provide the contaminated material feed system such that its capacity is consistent with the capacity of the other components of the thermal desorption system.

1.4.1.4.4 Material Measurement

****

NOTE: This paragraph is primarily intended to ensure that calibrated scales are being used to weigh materials, when weight is being used as the basis for measurement and payment.

****

Provide scales; meters; and volumetric measuring devices for measuring the contaminated materials (liquid and solid) introduced into the thermal desorption system which conform to the applicable requirements of NIST HB 44, except that the accuracy must be plus or minus[0.1][_____] percent of the quantity being measured. For scales used to measure weight of material in vehicles, provide scales of sufficient length to permit simultaneous weighing of all axle loads. For scales used to make measurement for payment, ensure the scale is certified[by an acceptable scales company representative][by the State Inspection Bureau charged with scales inspection] prior to weighing any materials. Perform a check of calibration of measuring equipment prior to inital use and at least once every[week][[_____] working days]. The requirements of this paragraph do not apply to measurement of chemical or physical data for purposes of demonstrating compliance with paragraph PERFORMANCE REQUIREMENTS.

1.4.1.4.5 Rehydration

****

NOTE: Final moisture content may be specified here, if appropriate.

****

Include provisions for rehydration, prior to storage, of material leaving the thermal desorption system to reduce fugitive emissions and to confine the materials to the proper storage area. Rehydrate treated soils to achieve a minimum moisture content of [_____] percent.

1.4.1.5 Air Supply And Pollution Control Systems

1.4.1.5.1 Air Supply

Use a forced draft (FD) blower/fan or fans to provide combustion air for the burners.

1.4.1.5.2 Induced Draft (ID) Fan

Use ID blower/fan or fans to maintain negative pressure throughout the system.

1.4.1.5.3 Fugitive Emissions Control

****

NOTE: Select the second bracketed option for indirectly fired units.

****

[Control emissions from the desorption zone by keeping the desorption zone sealed and maintaining a desorption zone pressure lower than atmospheric pressure.][With the approval of the Contracting Officer, implement means that have been demonstrated to provide fugitive emissions control.]

1.4.1.5.4 Quench

Cool off-gases from the primary soil treatment zone to temperatures that protect downstream units and equipment.

1.4.1.5.5 Stack Emissions Control

****

NOTE: Indicate design wind force the stack will have to withstand. Structural design must also include seismic resistance in accordance with UFC 3-301-01, when appropriate.

****

The air pollution control system must be capable of controlling gaseous, solid, and aerosol type emissions to meet the performance requirements. Provide stack support in accordance with NFPA 82 and NFPA 211, as applicable. Provide vertical and lateral supports for exterior chimneys to withstand wind forces of [_____] kph [_____] mph. Provide stack sampling port and equipment for collecting discrete and composite samples with adequate access for personnel and equipment.

1.4.1.5.6 Water and Liquid Waste

Design the air pollution control system to minimize water consumption and liquid waste generation. Recirculate liquids in the air pollution control system to the maximum extent practicable prior to wasting to the liquid waste system.

1.4.1.6 Instrumentation And Controls

Provide continuous emission monitors in accordance with paragraph PERFORMANCE REQUIREMENTS and EPA 450/4-80/023R. Protect systems from damage from onsite activity.

1.4.1.6.1 Instrumentation, Sensors, Recorders, and Sampling

Provide instrumentation and equipment including sensors, local indicators, connecting devices, recorders, analyzers and components necessary to monitor and control the safe and efficient operation of the system. Provide thermometers conforming to ASME PTC 19.3 TW, with wells and temperature range suitable for the use encountered. Provide draft gauges conforming to ASME B40.100 with a diaphragm or bellows actuating system and a circular scale. The gauges must have a zero adjustment screw. Provide suitable shutoff cocks.

Provide pressure gauges conforming to ASME B40.100 that are the pressure detecting class, single Bourdon tube style, and suitable for detecting air pressure. Provide sensors in the desorption chamber or as otherwise directed. Provide thermocouples suitable for continuous operation and control at temperatures up to[1,540][_____] degrees C[2,800][_____] degrees F, accurate to 0.75 percent, and long enough to be inserted 150 mm 6 inches into the furnace. Provide thermocouples with an adjustable flange and a high-temperature metal alloy, closed-end, protecting tube suitable for insertion into the furnace without support of the projecting end. Supply compensating lead wire 1.52 mm 16 gauge in diameter and 30 meters 100 feet long with a weatherproof braid supplied for connecting the thermocouple to the instrument. The installed unit must indicate gas passage temperatures and must control burner operation.

1.4.1.6.2 Control Room

****

NOTE: Consult the military installation regarding the usage of radio communications. Closed circuit TV requirements should be deleted if specified in Section 28 10 05 ELETRONIC SECURITY SYSTEMS (ESS).

****

Maintain a fully enclosed control room provided with system controls, instrument readouts, and data recording devices. The control room must be heated and air conditioned, permitting year round occupancy, and must meet instrumentation and control equipment manufacturer's operating specifications. If the control room is located in the exclusion zone, provision must be made for personnel using protective clothing and equipment. If the control room is located in the support zone, provide a[hard-wired][or][radio] intercommunication system with two communication channels between the control room and thermal desorption system operating area to allow control room operators to communicate with system operators.[Provide closed circuit television monitoring of operations in the control room.]

1.4.1.6.3 Redundancies

Provide fully redundant backup capability within each subsystem to safely terminate system operations at the control room and at the thermal desorption system. Provide uninterrupted continuous monitoring of the emissions and demonstrate operation in accordance with the approved operating conditions using adequate duplexing or redundancies withing the instrumentation and control systems. Provide documentation of these redundancy measures.

1.4.1.6.4 Displays and Data

Locally display and record monitored parameters and excursion alarms in the control room. Maintain digital process and emissions data in the control room in the approved digital format. Maintain hard copies of recorded data and summaries of recorded data in the control room. Provide copies upon request.

1.4.1.7 Interlocks and Alarms

1.4.1.7.1 Visible Alarms

Visible alarms consist of lights on the main control panel, flashing symbols on the screen of the microprocessor controller in the control room and, for each interlock that stops the contaminated material feed system, lights at the equipment location.

1.4.1.7.2 Audible Alarms

Provide audible alarm activation for each interlock that stops the feed to the thermal processing unit.

[1.4.1.7.3 Remote Alarms

****

NOTE: Delete this paragraph if remote alarms are not required. Furnish the calling sequence, in priority order, at the pre-installation meeting. The Contracting Officer or a designated representative must be included in the calling sequence.

****

Provide auto dialing to the indicated remote locations for each interlock that stops the contaminated material feed to the thermal processing unit. The Government will provide the calling sequence and priority order.

]1.4.1.8 Utilities

****

NOTE: The system utilities requirements should be identified in the Contractor's design. Verify the utilities are available on-site before including the second sentence. The following information may be used as a check: the amount required for a 12,000 - 18,000 kg 15 - 20 ton per hour unit is 5 - 35 L per second 75 - 600 gpm of water, 1,200 - 2,500 kw of electricity and 30 - 60 cubic meters per minute 1,000 - 2,000 scfm of natural gas. The Contractor should verify the adequacy of the existing utilities and be responsible for the required agreements with the utility companies for usage and any required changes.

****

In accordance with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS, provide the utilities associated with the installation and operation of the treatment plant including, but not limited to: [telecommunications][, electricity][, water][, steam,][gas,][_____], sanitary, and solid waste facilities. The[telecommunications][, electricity][, steam][, water][, gas][, sanitary][, and][solid waste facilities][_____] are available at the site.

1.4.1.9 Remedial Action Work Plan

****

NOTE: The Designer may wish to require the Remedial Action Work Plan, UFP-QAPP, and other preconstruction submittals required under this section to be completed concurrently or with the other plans being appendices of one primary plan. This Section should be edited to reflect such a requirement if applicable.

****

Submit a Remedial Action Work Plan[within[200][_____] calendar days after notice to proceed][not less than[60][_____] calendar days prior to the anticipated start of full-scale thermal desorption treatment operations]. Do not perform thermal desorption of contaminated material until the work plan is approved. Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Remedial Action Work

Plan.[Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review].] Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Submit the following in a Remedial Action Work Plan:

a. Flow diagram for process equipment associated with the thermal desorption system and data, including but not limited to: contaminated material stream flows; direction of material flow, including range of flow rate and range of composition, identified by lines and arrows denoting the direction and destination of the flow; material, mass and energy balances for the entire thermal desorption system.

b. Piping and instrumentation diagram indicating: process equipment; instrumentation; piping and valves; stacks, vents and dampers; control equipment (including sensors, process controllers, control operators, valves, interlocks, alarms, and contaminated material feed cut-off systems); labels and other necessary information to correlate to the process flow diagram.

c. Detail drawings showing dimensions of the equipment, layout of the thermal desorption system and subsystems, including location of components and onsite improvements. Drawings showing dimensions, layout, location of barriers, capacities, and placement of the stockpiles. Drawings must be to the approved scale.

d. System schedule including dates and durations for system mobilization, start-up, Field Demonstration, interim operation, production operations, and demobilization prior to beginning site activities.

e. Specific procedures and requirements for onsite placement of the thermal desorption system and its subsystems.

f. Plan identifying instruments requiring calibration and describing the required calibration procedure and tolerances.

g. List of the proposed operating conditions for process parameters to be continuously monitored and recorded. Include detailed descriptions of the Field Demonstration schedule, operating conditions and parameters, material sources, and required sampling and analyses.

h. Include specific detailed procedures for continued operation of the system, based on the Field Demonstration results; and adjustments for variation in the contaminated material feed. Include schedule of inspection and maintenance procedures and activities.

i. Mobilization and demobilization plan detailing specific procedures to be used for decontamination of system components, test methods for verification of decontamination, and the schedule for equipment decontamination and removal from the site. Address the requirements in paragraphs MOBILIZATION and DEMOBILIZATION.

j. Information on function, design capacity, and expected operational capacity for the following equipment in the thermal desorption system: feed preparation equipment, feed/treated materials conveying equipment, thermal treatment equipment (primary chamber, blowers, air pollution control equipment). Equipment specifications identifying manufacturer and model number, materials of construction, interior and exterior dimensions, design limitations, and normal operating conditions. Operating capacity and operating conditions for subsystem equipment;

pumps, valves and other in-line devices; sizes of conveying and/or feeding devices; size and number of parallel components or lines.

k. Detailed manufacturer's data on the overall controls, sequence of control, description of components, wiring diagrams, logic diagrams, control panel layouts, legends and standard symbols, sensors, process controllers, control operators, valves, alarms, interlocks and contaminated material feed cut-off systems. Data describing in detail the equipment used to monitor stack emissions, including the stack sampling probe, filters, gas transport tubing, sampling pump, moisture removal system, analyzer's calibration system, and data recorder. Instructions for use of software packages necessary to evaluate the operating data from the control system.

l. An analysis demonstrating that the noise generated at a distance of[30][_____] meters[100][_____] feet for the following octave band frequencies: 31.5, 63, 125, 250, 500, 1000, 2000, 4000, and 8000 hertz will not exceed the approved noise levels.

m. A determination of the maximum contaminated material feed rate which could be sustained without releasing volatile organic compounds to the air in violation of air quality regulations. This determination should be made using feed rates and contaminant concentrations typical of full scale production.

n. Backup and redundancy analysis containing a failure mode analysis and an emergency manual that indicates responses to be taken under the following circumstances:

(1) Sudden loss of integrity of refractory lining.

(2) Puffing or sudden occurrence of fugitive emissions.

(3) Failure of temperature monitoring control mechanism.

(4) Primary burner and/or air port clogging or failure.

(5) Electrical power failure (primary or secondary).

(6) Scrubber water flow or scrubber water makeup flow out of range.

(7) Excessive solids deposition in the air pollution control system.

(8) Loss of quench water.

(9) Increase in gas temperature after quench zone.

(10) Demister operation failure.

o. Permits, permit equivalents, and certifications in accordance with paragraph REGULATORY REQUIREMENTS. For above-listed items requiring a longer time frame, submit copies of applications and scheduled dates for receiving final approval.

[p. Bench-Scale Treatability Study Test Report: After completion of testing, compile the data from the bench-scale treatability study and prepare a Bench-Scale Treatability Study Test Report that includes but is not limited to, the materials, procedures, and methods used in the study; tests performed; sampling and analysis results; conclusions with supporting dialog; and proposed conditions to be tested in the Field Demonstration. Submit the Bench-Scale Treatability Study Test Report as an attachment to the Remedial Action Work Plan.]

q. Field Demonstration Plan: Outline the planned Field Demonstration and evaluation activities. This plan must address, but not be limited to, contaminated materials characterization, proposed demonstration testing runs (including testing/operating conditions of the unit processes/operations for each run),[sampling locations,][analyses and analytical methods,] mass balance calculation and performance evaluation[for each major piece of equipment], treated materials and waste characterization, health and safety monitoring and control, and waste treatment and/or disposal.

1.4.1.10 Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)

****

NOTE: This Section may reference a separate Specification Section requiring preparation of a quality assurance project plan or may be excluded entirely if the requirements are part of another Specification Section.

Indicate in this paragraph if the UFP-QAPP should include any testing protocols specific to the contaminated soil matrix and thermal desorption technology (e.g., soil organic matter content, moisture content, etc.).

****

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the UFP-QAPP WKSTS. Incorporate sampling and analysis requirements from this Section into the UFP-QAPP. Prepare [draft for Government review] [draft-final for [regulatory] [_____] review] and final versions of the UFP-QAPP. Allow [30] [_____] calendar days for [Government] review [and [30] [_____] calendar days for regulatory review]. Allow [45] [_____] days for comment resolution following each review and preparing the next version of the document. Submit the UFP-QAPP [within [30][_____] calendar days after notice to proceed] [at the same time the Remedial Action Work Plan is submitted] [_____]. Do not perform work at the site, with the exception of site inspection and surveys, until the UFP-QAPP is approved. Tailor the content to the requirements of the project and the site conditions.

[1.4.1.11 Bench-Scale Treatability Study Work Plan

****

NOTE: A bench-scale treatability study may have been performed prior to development of this Specification; however, the Contractor is sometimes required to complete a treatability study prior to performing full-scale work at the site. Treatability study test results should include the proposed operating conditions to be used during full scale treatment. The test results submitted should verify that the proposed operating conditions meet the post-treatment criteria listed in paragraph PERFORMANCE REQUIREMENTS. Consideration should also be given to the need to monitor off-gas and dust

emissions during the treatability study.

Further guidance on conducting treatability studies for thermal desorption treatment can be found in the U.S. EPA's Guide for Conducting Treatability Studies under CERCLA: Thermal Desorption Remedy Selection, EPA/540/R-92/074A, September 1992.

****

Submit a Bench-Scale Treatability Study Work Plan within[60][____] calendar days after notice to proceed. Do not perform the bench-scale treatability study until the work plan is approved. Prepare [draft for Government review] [draft-final for [regulatory][_____] review] and final versions of the Bench-Scale Treatability Study Work Plan. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Address the technical requirements, listed below and in paragraph BENCH-SCALE TREATABILITY STUDY, in the work plan. The technical requirements include, but are not limited to:

1.4.1.11.1 Conceptual Implementation Plan

Describe the proposed means of meeting the treatment performance requirements in paragraph PERFORMANCE REQUIREMENTS for the contaminated materials, including methods for transporting contaminated and treated materials between various stages of the treatment process.

1.4.1.11.2 Laboratory Procedures

Describe how the parent contaminated material sample will be processed to remove oversize materials, homogenized, and subdivided into aliquots for testing. Identify and justify deviations between the Conceptual Implementation Plan and Laboratory Procedures.

[1.4.1.11.3 Testing Approach

****

NOTE: If a UFP-QAPP is prepared and covers testing during the Treatability Study, this paragraph should be deleted or replaced with a reference to the UFP-QAPP.

****

Describe the testing approach which will be used to assess performance.

]]1.4.2 Performance Requirements

1.4.2.1 Treatment Criteria

****

NOTE: The table in this paragraph should be developed on a site specific basis considering the purpose of thermal desorption in the overall strategy for managing the contaminated material. Ideally, post-treatment testing criteria will be defined in a site-specific decision document. Post-treatment testing depends on the purpose of the thermal desorption treatment. In general, thermal

desorption treatment is performed to reduce chemical concentrations for material that will remain on-site (either in-situ or in a designated permanent storage unit). In rare instances, the thermally treated material is removed for off-site disposal (e.g., where there is no room for on-site placement).

The Toxicity Characteristic Leaching Procedure (TCLP) by EPA Method 1311 is usually the primary test for contaminated materials that are pre-treated via thermal desorption prior to off-site disposal. TCLP test results are used to verify if a contaminated material need not be managed as a hazardous waste. In some instances, such as when a contaminated material is considered a listed hazardous waste, "total" chemical testing data may be needed in addition to or instead of TCLP data.

Two approaches are provided for attaining performance criteria: meeting performance criteria for every sample of treated material (conservative approach) or meeting performance criteria on the average for all samples of treated material. The averaging approach would not be appropriate if thermal desorption treated materials are to be sent off-site for disposal, because averaging of sample results cannot be used for waste characterization to determine if a material is or is not a hazardous waste.

The "chemical properties" in Table 1 would include specific chemicals or totals of a contaminant class (e.g., PCBs) of concern. These are site- and project-specific requirements for the designer to populate in the table.
****

Conduct the work to ensure that treated material is evenly heated[with no clumps of intact contaminated material larger than the size specified in Table 1].[Each sample of treated material must meet the criteria shown in Table 1.][An average of all samples of treated material must meet the performance criteria in Table 1; no individual sample shall can be greater than[_____][110 percent] of the criteria in Table 1 with no more than[_____][20 percent] of the samples exceeding.]

TABLE 1 - TREATMENT CRITERIA		
PROPERTY	TREATMENT CRITERIA	TEST METHOD
Chemical Properties		
[_____]	[_____]	[_____]
Physical Properties		
Maximum Clump Size	[_____] mm [_____] inch	

TABLE 1 - TREATMENT CRITERIA		
[_____]	[_____]	[_____]

1.4.2.2 Emission Criteria

****

NOTE: Current federal regulations are not directly applicable to thermal desorption. The designer should perform an air pathway analysis per EP 200-1-24 and obtain the State or air quality regional requirements. Note that obtaining an actual permit would not be required at a site managed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), but compliance with substantive requirements would be required. Include mass or concentration limits, as appropriate.

****

Do not exceed emissions criteria, as shown in TABLE 2.

TABLE 2 - EXHAUST GAS EMISSIONS CRITERIA

COMPONENT	CRITERIA 1	CRITERIA 2
Organic removal efficiency (minimum percent)	[_____]	[_____]
Total hydrocarbons	[_____]	[_____]
Principal Organics	[_____]	[_____]
Opacity	[_____]	[_____]
Oxygen (minimum)	[_____]	[_____]
Carbon Monoxide	[_____]	[_____]
Carbon Dioxide	[_____]	[_____]
Metals	[_____]	[_____]
Particulates	[_____]	[_____]
Hydrogen chloride	[_____]	[_____]
Hydrogen fluoride	[_____]	[_____]
[Products of Incomplete Combustion (PICs)]	[_____]	[_____]
[_____]	[_____]	[_____]

1.4.2.3 Slagging Control

****

NOTE: The bench-scale treatability study should determine the ash fusion temperature of the feed materials in accordance with ASTM E953/E953M.
****

Minimize slagging by operating at [_____] degrees C [_____] degrees F less than the ash fusion temperature of the feed materials, as determined by ASTM E953/E953M.

1.4.2.4 Noise Control

****
NOTE: Specifications for noise controls should be covered in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. The remaining text in this note discusses noise control considerations to incorporate into Section 01 57 19. Based on the geographical location of the site, and the land uses and environment surrounding the site, the site-specific noise level requirements for the day and night operations and monitoring requirements can be identified from the state and local regulations and/or developed by interacting with the state and local agencies.
****

Provide a thermal desorption treatment system which meets the noise control requirements in [Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS] [_____].

1.4.2.5 Material Handling Fugitive Emissions Dust Controls

****
NOTE: Specifications for fugitive dust controls associated with handling (stockpiling, conveying, etc.) of untreated and treated contaminated materials should be provided in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. The remaining text in this note discusses thermal desorption technology-specific emission and dust control considerations to incorporate into Section 01 57 19. An air pathways analysis should be performed during design in accordance with EP 200-1-24 Air Pathway Analysis for the Design of Hazardous, Toxic and Radioactive Waste (HTRW) Remedial Action Projects. Depending upon the contaminants of concern in the contaminated materials, the unit processes/operations employed in the treatment plant, the amount of pollutants emitted, and the geographical location of the site, the emission standards and limitations for certain contaminants and dust control can be identified from the following regulations including, but not limited to, National Primary and Secondary Ambient Air Quality Standards, National Emission Standards for Hazardous Air Quality Pollutants, and state and local regulations.

Based on the regulatory requirements, the proper technologies or apparatus for the emissions control

if required can be determined. Upon completion of the design of the treatment plant, these emission requirements and control technologies should be defined by the design engineer.

If a performance specification is prepared, the emissions, dust sources, and contaminants of concern should meet specified requirements based on applicable regulations. Section 01 57 19 should list the emissions criteria for the contaminants of concern for each emission and dust source, and if applicable, monitoring requirements should be specified. The applicable federal, state, and local regulations should also be identified. If the specification is prepared based on detailed design, the technologies or apparatus for controlling the emissions and dust sources should also be specified.

****

Provide a thermal desorption treatment system with material handling practices which meet the fugitive dust control requirements in[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____].

1.5 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S"

classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Remedial Action Work Plan; G, [_____]

Pre-Installation Meeting Minutes; G, [_____]

Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP); G,[_____]

Bench-Scale Treatability Study Work Plan; G, [_____]

Pre-Installation Equipment Examination

Pre-Installation Examination Report

Pre-Installation Meeting Agenda

SD-03 Product Data

Startup Plan; G, [_____]

Adjusted Operating Conditions; G

SD-06 Test Reports

Operations Reports

Water Supply Analysis

Field Demonstration Report; G

Startup Report

SD-07 Certificates

Qualifications; G, [_____]

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

****

NOTE: Include Federal, state, and local regulatory requirements; utility company regulations; and applicable codes and standards published by scientific and engineering institutions where appropriate in the body of this Section. Some of the potentially applicable Federal regulations are listed as follows:

TCLP

Recording and Reporting Occupational Injuries and Illnesses

Occupational Safety and Health Standards

Safety and Health Regulations for Construction

Permitting

National Primary and Secondary Ambient Air Quality Standards

National Emission Standards for Hazardous Air Quality Pollutants

State and Local Air Quality Standards

National Pollution Discharge Elimination System (NPDES) Discharge Limitations and Permit Procedures

Hazardous Waste Identification and Standards Applicable to Generators, Transporters, and Owners and Operators of Treatment, Storage and Disposal Facilities (TSDF)

Land Disposal Restrictions (LDRs)

Department of Transportation Hazardous Materials Program Procedures

Hazardous Materials Transportation Regulations

Standards for Protection Against Radiation

Land Disposal of Low-Level Radioactive Waste

Packaging and Transportation of Radioactive Materials

For sites addressed under CERCLA, administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, delete this section.

****

Obtain the permits, permit equivalents, and certifications; and meet the regulatory requirements necessary for the installation, operation, and closure of the project.[Correspondence from regulatory agencies, and other relevant information, is attached to the specifications to indicate the level of effort necessary to obtain finalized permits, permit equivalents, certifications and to meet substantive regulatory requirements.]

1.6.2 Qualifications

****

NOTE: Requirements for the Contractor's experience should be determined and specified based on the experience, availability, and state of the thermal desorption treatment technology industry and the site-specific requirements. If thermal desorption treatment is being used for unique contaminants, consider specifically identifying contractor thermal desorption experience requirement for those contaminants in the optional bracket at the end of paragraph CONTRACTOR EXPERIENCE.

****

1.6.2.1 Contractor Experience

Submit evidence of successful completion of[at least one thermal desorption project][[_____] thermal desorption projects] of comparable size[and scope][at least[three][_____] thermal desorption pilot scale treatability studies, demonstration studies, or full scale remediation projects that required handling and transportation of materials contaminated with[RCRA hazardous wastes][CERCLA hazardous material][_____]] using the proposed system or a similar system.

1.6.2.2 Key Personnel

Provide key personnel with a minimum of [three][_____] years of thermal desorption field experience. Include system operators, quality control personnel, and supervisory engineering and technical staff involved with the thermal desorption system operation in key personnel. Perform welding in accordance with AWS D1.1/D1.1M by welders certified to have passed qualification tests using procedures covered in AWS B2.1/B2.1M or ASME BPVC SEC IX. Require welders to retake the test when, in the opinion of the Contracting Officer, the work creates reasonable doubt as to the welder's proficiency. Submit a list of these personnel with their qualifications.

1.6.2.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory meeting the requirements of [Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.7 SITE CONDITIONS

****

NOTE: The pertinent site characterization data should be placed in the appendix of the specifications or on the drawings and referenced here. If the contaminated material to be treated contains a significant amount of debris, the available information about its extent and characterization should also be provided. Indicate the detail to which site characterization has been performed and indicate where obvious data gaps

exist. The information should also include construction limits, property utilities, chemical data, geotechnical data, sampling locations, and boring logs. The locations and details (such as utility point of contact, sizes, capacities, and flows) of the utility hookups should also be provided for the Contractor's use.

Indicate if there are multiple dissimilar types of contaminated materials that will require different thermal desorption operations. Materials may be considered dissimilar based on possessing different types or relative concentrations of contaminants. Determination of dissimilar materials may be based on site investigations and/or previously completed treatability studies.

****

1.7.1 Existing Conditions

The existing site conditions are presented [in Appendix [_____]][and][on the Drawings]. These include [physical configuration][topography][land uses][geotechnical characteristics of the contaminated materials (including [grain size analysis][total organic carbon content][pH][moisture content][bulk density][porosity]) [hydrogeology]] and [nature and extent of contamination][_____]. The existing conditions presented are the result of site investigations at specific locations; variations in the existing site conditions could occur. Perform an independent interpretation of the site characterization data. Notify the Contracting Officer within [48 hours][_____] if discrepancies between the data provided and actual field conditions are discovered.

[1.7.2 Results of Previously Conducted Treatability Studies

****

NOTE: Delete this paragraph if previous treatability studies have not been conducted.

The unit processes/operations employed in the previous treatability studies (bench and/or pilot scale) may not be the same as those proposed by the Contractor. Documentation of the previous treatability studies should provide prospective Contractors with sufficient information to prepare a detailed proposal and should include the testing materials, procedures and conditions, sampling and analytical methods, evaluation, and results.

****

The previously conducted treatability study documents in Appendix [_____] are for information purposes only. The results indicate that thermal desorption is capable of meeting the post treatment criteria identified in this Section. Nevertheless, perform an independent evaluation of these studies and results. If deemed necessary, perform additional studies [at the Contractor's own expense] to confirm the previously conducted treatability studies and results. Based on the Contractor's interpretation of the previous studies and results [and the Contractor's studies and results], provide a full-scale treatment plant which meets the requirements of this Section.

]PART 2   PRODUCTS

2.1   MATERIAL HANDLING EQUIPMENT

Provide equipment and storage facilities for removing, handling and storing residues resulting from thermal treatment, including treated material and solids captured by the pollution control system.

[2.2   SAMPLES OF CONTAMINATED MATERIAL FOR TREATABILITY STUDIES

****

NOTE: This paragraph should be included if bench-scale treatability studies are to be performed by the Contractor. Action level criteria should be specified for the purpose of collecting representative samples for bench-scale treatability studies. Table 3 should be edited based on site-specific contaminants of concern and their corresponding action levels. Additional testing may be needed to verify that physical properties (e.g. grain size, total organic content, density, porosity, moisture content) of the samples are also representative of site conditions.

To reduce the overall risk to the Government, it is strongly advised that the project team should require the Contractor to collect samples for the bench-scale treatability study unless the nature of the site prevents the Contractor from doing so. Depending on site conditions and project needs (e.g. site security, access issue, etc.), the government may provide samples to the Contractor to conduct bench-scale treatability studies..

****

[The Contracting Officer will provide the required samples to conduct the treatability studies.][Select sampling locations and collect representative samples to conduct the bench-scale treatability studies. Consider the existing site conditions presented in paragraph EXISTING CONDITIONS when selecting sampling locations. Coordinate the sampling protocol with the Contracting Officer before obtaining the samples.] The collected treatability study samples must have contaminant concentration levels [representative of the average concentration of the contaminants identified][and][greater than the action level criteria presented in Table 3]. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria. Test samples of contaminated materials intended to be used in the bench-scale treatability studies in accordance with procedures in the [Bench-Scale Treatability Study Work Plan][and][UFP-QAPP]. Do not commence treatability studies until contaminated material sample results meet the aforementioned concentration criteria.

TABLE 3 - ACTION LEVEL CRITERIA

PARAMETER	ACTION LEVEL CRITERIA
[_____]	[_____]

]2.3 WATER

****

NOTE: Two options are provided. The first option is to only allow the Contractor to use potable water. The second option allows the Contractor to use non-potable water, but includes a testing requirement to limit the chance that the Contractor supplies a water that could introduce contaminants into the treated materials. The first option is simpler, but could lead to higher project costs if the volume of water needed is significant and/or potable water sources are not readily available. When specifying the chemical contaminant criterion to be met for water, the Designer should consider if there are other standards which are more appropriate for the specific project (e.g. state groundwater cleanup criteria).

****

Supply water used to facilitate thermal desorption treatment.[Use only potable water from a regulated public water system.][If non-potable water is to be used, provide water that does not contain oils, acids, salts, alkalis, organic matter, solids or other substances at concentrations that could be detrimental to the successful treatment of the contaminated materials. Also characterize non-potable water prior to its use by collecting a sample from the water source and analyzing according to Table 4. Submit a Water Supply Analysis demonstrating that water meets requirements.

TABLE 4 - TREATMENT WATER CRITERIA

ANALYTICAL METHOD NUMBER (From EPA SW-846)	ANALYSIS TYPE	CRITERION TO BE MET
6010[and 7470A]	Metals[and Mercury]	[Less than Maximum Contaminant Level (MCL)] [_____]
8260	Volatile Organics	
8270	Semi-volatil Organics	
8082	PCBs	
1633	PFAS	
8081	Pesticides	

Within each Analytical Method, only analyze for analytes which have a [MCL] [_____].]

PART 3 EXECUTION

3.1 EXAMINATION

[3.1.1 Bench-Scale Treatability Study

****

NOTE: If a Treatability Study has previously been

performed or is otherwise not needed, delete this paragraph. To reduce the chances of using soil samples that are not representative of site conditions, a minimum volume of 4 liters 1 gallon is recommended for each condition to be tested at the bench scale.

****

Complete a bench-scale treatability study in accordance with the Bench-Scale Treatability Study Work Plan and this paragraph. Perform at least [three][_____] replicate tests simultaneously for each proposed operating condition from the approved Bench-Scale Treatability Study Work Plan. Homogenize and divide the contaminated soil into replicate volumes prior to initiating testing. Do not use less than less than [four][_____] liters [one] gallon of contaminated soil in each replicate. Test samples of treated materials in accordance with the procedures in the [Bench-Scale Treatability Study Work Plan][and][UFP-QAPP].

]3.1.2 Pre-Installation Equipment Examination

Conduct a pre-installation examination of the thermal desorption treatment equipment for damage, defects, and dilapidation. Submit the results of the pre-installation examination to the Contracting Officer for review and information. The Contracting Officer may conduct an independent examination to ascertain the condition and functionality of the equipment. Based on this examination, the Contracting Officer has the right to reject the entire system or damaged, defective, or dilapidated equipment. The cost associated with equipment or control replacement or repair, and delays caused by the rejection must be borne by the Contractor. Routinely and properly inspect and maintain the equipment to provide the operation of the treatment plant as required by the Contract schedule. Schedule delays and costs due to lack of inspections and maintenance are the responsibility of the Contractor. Provide alternate/auxiliary power source if sufficiently reliable sources are not available.

3.1.3 Infrastructure Conditions

Conduct a pre-installation examination of the on-site infrastructure, utility conduits, monitoring points, and site access constraints. Photographically document, with identifying labels, the existing condition of infrastructure and utilities, particularly for comparison to post-operation conditions. Verify locations of critical utilities that cannot be disrupted and those utilities that would potentially have significant impacts on operations and public safety. Submit a Pre-Installation Examination Report documenting the examination activity. Obtain all necessary utility clearances before initiation of subsurface work.

3.2 PREPARATION

****

NOTE: Coordinate the drawings to allow the best access possible to the work area. If thermal desorption treatment is part of a larger project which includes specification sections for activities such as Section 31 11 00 CLEARING AND GRUBBING and Section 31 00 00 EARTHWORK, reference to those specification sections instead. Otherwise edit this paragraph as needed.

****

Do not increase the size of the process area without approval of the Contracting Officer. Costs associated with area increases are borne by the Contractor, including costs of construction, demolition, and site restoration.

3.2.1 Mobilization

****

NOTE: Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES includes requirements for decontaminating equipment that has been used in contaminated zones. Modify that Section to extend decontamination/cleaning requirements to equipment being brought on-site to cover the requirements of this paragraph.

****

Follow the approved mobilization and demobilization plans submitted as part of the Remedial Action Work Plan. Do not mobilize the treatment plant to the site until the Remedial Action Work Plan has been approved by the Contracting Officer and the Contractor has received written confirmation. Delays caused by the Contractor's failure to meet regulatory requirements must result in no additional cost to the Government. In accordance with[Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____], the equipment which is rented and/or previously used for other site remediation must be decontaminated and tested for contaminants of concern before being brought to the site.

3.2.2 Clearing and Grubbing

****

NOTE: If Section 31 11 00 CLEARING AND GRUBBING is in the project, select the first bracketed option. If 31 11 00 CLEARING AND GRUBBING is not in the project, select the second bracketed option.

****

[Perform clearing and grubbing in accordance with Section 31 11 00 CLEARING AND GRUBBING.][Clear and grub the process area [as-indicated][as required and directed by the Contracting Officer] of all trees, stumps, downed timber, brush, rubbish, roots larger than 75 mm 3 inches in diameter, and matted roots prior to commencing operations. Saw cut concrete or asphalt pavement at the limits of removal and break, remove and dispose of the resulting debris [off Government Property][at the location indicated]. Remove fencing or other items in the process area and [salvage for reuse][dispose offsite].]

3.2.3 Foundations

****

NOTE: Minimum requirements should be specified in the Remedial Action Work Plan for the foundation/containment area of the treatment plant. An option is provided at the end of the paragraph to require installing a liner and berm in the location where the thermal desorption treatment plant will be constructed; this option addresses

cross-contamination risk if the treatment plant is located on non-contaminated ground.
****

Construct equipment foundations in accordance with the approved Remedial Action Work Plan. Grade the area around the thermal desorption treatment plant so that the water drains away from the work area adjacent to the treatment area.[Construct a liner and berm surrounding the thermal desorption treatment plant. Construct the liner and berm[in accordance with the stockpile liner and berm requirements in Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL.][_____]].

3.2.4 Equipment

Use the area indicated for equipment such as:

a. Auxiliary generator.

b. Dewatering equipment.

c. Pre-treatment equipment such as shredders and screens.

d. Air emission controls and monitoring equipment.

e. Contaminated material conveyance, preparation and loading equipment.

f. Fuel tanks.

3.2.5 Stockpiles

****
NOTE: Sufficient area should be prepared for stockpiling untreated and treated contaminated materials based on consideration of equipment production rates, allowable stockpile sizes, and overall project schedule. Background sampling under the stockpiles of contaminated materials should be performed before their construction, unless previous information is adequate. Coordinate with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL. If Section 02 61 13 is not in the project, copy stockpiling information from paragraphs EXCAVATION WORK PLAN, GEOMEMBRANE, CONTAMINATED MATERIAL STORAGE, and SAMPLING BENEATH STORAGE UNITS into this section.
****

Provide separate storage for treated material and solids captured by the pollution control system handling systems. Prepare areas for stockpiling untreated and treated contaminated materials in accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL. Provide sufficient area to stockpile [_____] [cubic meters][metric tons] [cubic yards][tons] of untreated contaminated material and [six][_____] stockpiles of [500][_____] [cubic meters][metric tons] [cubic yards][tons] of treated contaminated material.

3.2.6 Fuel System

Perform fuel system installation and testing in compliance with the applicable requirements of NFPA 30 and either NFPA 31, NFPA 54 or NFPA 58, as appropriate to the type of fuel.

3.3 INSTALLATION/ERECTION/REMOVAL

****

NOTE: Referenced UFGS should be edited to include only the minimum requirements applicable to a temporary installation.

****

Perform the installation/erection of the thermal desorption system to allow removal of the system from the site and site restoration. Erect and install the system to incur minimal damage to the existing site environment.[Complete mechanical work in accordance with the requirements of Section 23 30 00 HVAC AIR DISTRIBUTION.][Complete electrical work in accordance with[Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION,][Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION,][and][Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM][and [_____]].][Complete plumbing work in accordance with[Section 22 00 00 PLUMBING, GENERAL PURPOSE][, Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING][and [_____]].]

3.4 STARTUP

****

NOTE: To streamline the project schedule, startup requirements in this paragraph could be incorporated into the Field Demonstration activity instead of being a standalone activity. In that case, the subparagraphs for Instrumentation Calibration, Control Interlock Demonstration, and 24-Hour Operation would need to be moved under the Field Demonstration paragraph.

****

Startup includes material handling systems demonstration, instrumentation calibration, [and] control interlock demonstration[, and 24-hour operation]. Demonstrate that the system is capable of processing material at the proposed feed rate and that the air pollution control system is capable of attaining the required throughput rates during startup operations. Perform startup activities using uncontaminated material.

3.4.1 Startup Plan

Submit a startup plan. Describe control system functions and specific procedures proposed to demonstrate each function and for testing the system with uncontaminated materials; formats and procedures for reporting the material handling demonstration and hot check results; proposed operating procedures for the Field Demonstration with detailed descriptions of the sampling and analysis to be performed.

3.4.2 Systems Demonstration

Demonstrate the contaminated material preparation and feed systems and the treated material and solids captured by the pollution control system handling systems. Do not perform the systems demonstration until written approval is received from the Contracting Officer. The systems and the treated material and solids captured by the pollution control system handling systems must operate continuously at the proposed maximum feed rate for 4 hours without a malfunction or shutdown related to the systems. Conduct the systems demonstration using uncontaminated material. Fugitive emissions, or "dusting" is prohibited.

3.4.3 Instrumentation Calibration

Perform instrumentation calibration to ensure that compliance-related instrumentation functions will be performed reliably and accurately. Calibrate test instruments by a recognized standards laboratory 30 days prior to testing with standards traceable to NIST SP 250. Instrumentation and control system calibrations may be witnessed by the Contracting Officer.

3.4.4 Control Interlock Demonstration

Following instrumentation calibration, demonstrate that control system interlocks and alarms are programmed correctly and are fully functional. Test each alarm point for proper response. Demonstrate alarms, interlocks, and emergency responses (activation of combustion gas by-pass system or an emergency system shut down). Operating conditions which trigger system alarms may be artificially induced in the field, or the control set points may be altered to invoke the desired response alarm. Demonstrate appropriate control system responses (including interlocks, alarms, by-pass activation and/or emergency shutdowns) to each of the specified stimuli.

3.4.5 24-Hour Operation

Place the system in operation under conditions proposed in the Field Demonstration Plan for 24 hours or the treatment of one batch (if a batch system). The system must operate without a malfunction or shutdown related to the contaminated material feed or the treated material and solids captured by the pollution control system handling systems and with the continuous emissions monitoring systems functional throughout the 24-hour operation. Begin shakedown after the 24 hour prove-out period; shakedown may be performed on contaminated materials.

3.4.6 Reporting

An interim letter-report will be acceptable with the results formally reported in the startup report.

3.5 FIELD DEMONSTRATION

****

NOTE: The need for a formal Field Demonstration should be discussed with the Contracting Officer and would be a function of the uncertainty of the materials to be treated. For well-defined contaminants and contaminated material compositions that are known to be amenable to low-temperature thermal desorption treatment, data obtained from the bench-scale treatability or full-scale system startup should be adequate to negate the need for a formal Field Demonstration. If the contaminants/contaminated material is not known to be amenable to low-temperature thermal desorption treatment, then a formal Field Demonstration in accordance with the following requirements will need to be performed. If a formal Field Demonstration is not required, sufficient startup testing should be

done to validate performance prior to ramping up to full-scale operation.

The system should not be approved for operation until acceptable removal and other operating parameters are successfully achieved during the Field Demonstration. Production operating conditions should be established from the Field Demonstration results.

Approved production operating conditions should become contract requirements.

If acceptable removal and other operating parameters are not achieved, production operations should not be approved. Results of the Field Demonstration should be analyzed, and the causes of deficiencies evaluated. The Contractor should be required to make physical and operational changes to the thermal desorption system to bring it into compliance with the required operating parameters and removal efficiencies.

If the first attempt at performing a Field Demonstration fails, each subsequent attempt should include a separate Field Demonstration report. Second and third Field Demonstrations, if needed, should be performed at no extra cost to the Government.

Upon completion of a successful Field Demonstration, the thermal desorption system should be approved for production operations contingent on the specified operating conditions established from the successful Field Demonstration test results.

A complete Field Demonstration, regardless of similarities between treatment trains, should be conducted on each treatment train of multiple secondary treatment trains or air pollution control trains that are used with a single thermal desorption unit. Each train should be tested simultaneously to the maximum practical extent. For multiple treatment trains that will be operated under different operating conditions or different contaminated material feed rates, each proposed set of conditions should be demonstrated during the Field Demonstration.

An interim operating period should commence within 7 calendar days after receipt of the Field Demonstration test results and the issuance of interim operating conditions. The interim operating period should continue for the total number of calendar days remaining in the period of time allowed for preparation and submittal of the Field Demonstration report and the number of calendar days allowed for review and approval. Loss of potential interim operating time resulting from delays in

submittal of an acceptable Field Demonstration report should be the responsibility of the Contractor. The interim operating approval should expire at the end of the period described above and operation should cease until a final production operation approval is issued. Operating conditions during the interim operating period should be determined based upon performance data obtained during Field Demonstration operations. At a minimum, these conditions should include:

a. Total mass feed should be based on the feed rate demonstrated to meet treated material quality standards during preproduction operations.

b. Desorber operating conditions should demonstrate the ability to meet treatment standards during preproduction operations.

c. Air pollution control system operating conditions should be demonstrated during the Field Demonstration to ensure compliance with all emissions standards.

d. Sampling and analysis requirements of treated materials should be in accordance with the Sampling and Analysis Plan.
****

Conduct Field Demonstration in accordance with the Field Demonstration Plan that is included in the Remedial Action Work Plan.

3.5.1 Schedule

Provide written notification of the anticipated date of the full Field Demonstration at least seven calendar days prior to the projected start date. Field Demonstration operations may begin upon receipt of written approval of the Field Demonstration Plan and written notification that final shake down activities have been completed and that all systems are ready to conduct a full Field Demonstration.

3.5.2 Source of Material

****
NOTE: Prior to implementing the field demonstration, chemical testing should generally be performed to verify that the materials to be used for the test run contain the contaminants of concern at high enough concentrations to adequately test the system. Additional testing may be warranted to verify that the physical properties of the materials are also representative of site conditions.
****

Obtain contaminated material used for the field demonstration from [the location specified by the Contracting Officer][_____]. Prior to performing the field demonstration, test each dissimilar type of contaminated material to be used for the field demonstration. Consider the existing site conditions presented in paragraph EXISTING CONDITIONS when selecting sampling locations. The contaminated material samples must have contaminant concentration levels [representative of the average concentration of the contaminants identified][and][greater][than the action level criteria presented in Table 5]. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria. Test samples of contaminated materials intended to be used in the field demonstration in accordance with procedures in the [Field Demonstration Plan][and][UFP-QAPP].

TABLE 5 - ACTION LEVEL CRITERIA

PARAMETER	ACTION LEVEL CRITERIA
[_____]	[_____]

3.5.3 Operating Conditions

Operate all systems at the conditions specified in the Field Demonstration Plan for the duration of the Field Demonstration.

3.5.4 Field Demonstration Report

Include results of the Field Demonstration, including sample analysis data, calculations, and conclusions within [seven][14][_____] days of the completion of a Field Demonstration in the Field Demonstration report. After completion of the field demonstration, [do not process additional contaminated material until test results from the field demonstration verify that the treated material meets the criteria listed in paragraph PERFORMANCE REQUIREMENTS. Allow [14][_____] calendar days in the schedule for Government review and approval of the field demonstration report.][contaminated material may continue to be processed in an interim operations period.] At a minimum, collect sufficient data during each Field Demonstration to make the following determinations:

3.5.4.1 Quantitative Analysis of the Materials

A quantitative analysis of each contaminated feed, treated material, and pollution control system stream for each individual run for each parameter stated in the Field Demonstration Plan. Once the field demonstration has generated the required quantity of treated material, perform the tests identified in paragraph CONTAMINATED MATERIAL TREATMENT TESTING on representative samples of the treated material. If the treated materials produced during the field demonstration do not meet the criteria in the paragraph PERFORMANCE REQUIREMENTS, process an equal quantity of the same type of material using properly modified operating conditions until satisfactory results are obtained. Return the treated materials that failed the demonstration testing to the contaminated materials stockpile for re-processing during full-scale treatment.

3.5.4.2 Quantitative Analysis of the Stack Gases

A quantitative analysis of the stack exhaust gases for the concentration and mass emissions of constituents listed in paragraph EMISSION CRITERIA[and [_____]]. Continuously measure and record the stack gas velocity and the concentration of constituents listed in paragraph EMISSION CRITERIA[and [_____] in the stack exhaust gases].

3.5.4.3 Material and Energy Balances

****

NOTE: If the contaminated material characterization data showed negligible chloride content, delete the hydrochloric acid (HCl) requirement.

****

Compute the mass emission rate of particulates in accordance with 40 CFR 264, Subpart O. If the hydrochloric acid (HCl) emission rate exceeds 1.8 kg 4 pounds of HCl per hour, compute the HCl removal efficiency in accordance with 40 CFR 264, Subpart O.

3.5.4.4 Fugitive Emissions

Identification of sources of fugitive emissions and means of control of the emissions.

3.5.4.5 Continuous Measurement and Recording

Continuous measurement and recording of operating parameters as required in the approved Field Demonstration Plan.

3.5.4.6 Other Requirements

Other monitoring, sampling, and analyses required by the approved Field Demonstration Plan. Submit an Operating Plan based on the Field Demonstration results.

3.6 OPERATION

3.6.1 Dissimilar Materials and Pre-Treatment Material Handling

****

NOTE: Delete the bracketed text item if dissimilar materials are not known to be present at time of preparing project specifications.

****

Do not mix together dissimilar materials that either prior testing or field quality control observations during operations have indicated need different thermal desorption operational parameters.[Materials known to be dissimilar at the site are defined in [paragraph EXISTING CONDITIONS][_____]]. Ensure maximum moisture content of the materials to be treated does not exceed [20][_____] percent by weight.

3.6.2 Oversize Material

****

NOTE: An optional requirement is included if oversize material must be decontaminated before it is transported off-site for disposal.

****

Reduce the size of oversize contaminated material to less than [2.5 cm one inch][the maximum allowable particle size of the thermal desorption process as defined in the Remedial Action Work Plan][_____]. Treat oversize contaminated material which can be reduced to an allowable size for the thermal desorption process. Remove oversize material that cannot be reduced to an allowable size for the thermal desorption process.[Decontaminate oversize materials in accordance with the procedure developed in the Remedial Action Work Plan.] Dispose oversize material off-site in accordance with[Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIAL][_____].

3.6.3 Treated Materials

3.6.3.1 Temporary Storage of Treated Materials

****

NOTE: Thermal desorption is a separation process. Combining the air pollution control residuals with the treated materials may make the treated material fail performance requirements. Regulations generally allow combining prior to testing. The second option in the paragraph below applies only to thermal desorption treatment when the treated material is placed into permanent on-site storage. To prevent double handling it is preferable to place treated material directly into the permanent storage area rather than stockpiling until post-treatment testing is completed.

****

Do not mix dissimilar contaminated materials, treated materials and solids captured by the pollution control system.[Separate treated material into units (stockpiles) for post-treatment testing. Unit size greater than the quantity pertaining to the most frequent quality control test is prohibited. If the test results indicate the treated materials of a stockpile meet the post treatment criteria presented in paragraph PERFORMANCE REQUIREMENTS, this stockpile of treated materials [may][must][_____] be combined with other stockpiled material which has also met the post treatment criteria.][Place treated material directly into the permanent storage unit after treatment. Place treated material such that the material from specific batches/runs can be defined and removed if it fails post-treatment testing.]

3.6.3.2 Final Disposal of Treated Materials

****

NOTE: If treated materials are intended to be used as on-site surficial backfill, additional requirements for properly conditioning the soils should be developed in the appropriate specification section. Without additional post-treatment conditioning, soils that have been treated by thermal desorption will generally lack adequate organic carbon content to support vegetation growth.

****

Dispose treated materials which meet the treatment performance requirements in paragraph PERFORMANCE REQUIREMENTS[off-site in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS][in the designated permanent storage unit. Place treated materials in accordance with Section 31 00 00 EARTHWORK].

3.6.4 Change of Operating Conditions

****

NOTE: If adjustment to the thermal desorption operating parameters is required due to change in contaminated material characteristics, then the Contractor's proposed adjustments should be evaluated by the Contracting Officer for the extent of changes from the previous operating parameters. Further, price negotiation may be required based on the extent of changes from the previous operating parameters.

****

The following two requirements must be met in order to be considered for change of operating conditions:

a. The physical and chemical characteristics of the contaminated materials are significantly different from the originally defined characteristics.

b. The treatment requirements cannot be met under the current thermal desorption treatment plant design and related mix design/operating conditions.

When change of operating condition is necessary, notify the Contracting Officer before changes are made to the operating conditions. The Contracting Officer may require the Contractor to perform a field demonstration for significant changes made to the operating conditions in accordance with paragraph FIELD DEMONSTRATION, for approval. If adjustment to operating conditions is required due to change in contaminated material characteristics, submit an adjusted operating conditions for the extent of changes from the previous operating conditions for approval. Further, price negotiation may be required based on the extent of changes from the previous operating conditions.

3.7 FIELD QUALITY CONTROL

3.7.1 Tests

****

NOTE: Sampling requirements are project specific. Sampling frequency requirements and composite sampling techniques are negotiated with the regulatory agency.

Typically, treated materials from each day are stockpiled separately. Therefore, testing is normally done on a daily basis with varying composite sampling requirements.

****

Sample and analyze contaminated material feed, treated material, and solids captured by the air pollution control system as allowed by the permits and as specified. The post treatment testing specified in this paragraph is needed by the Government to generate documentation that the thermal desorption treatment has been accomplished in accordance with performance requirments approved by applicable authorities. The results of these tests may be used as part of the Contractor's QC program; however it is the Contractor responsibility to meet the performance requirements specified.

Therefore, it is expected that the Contractor will perform additional testing and measurements to ensure that treated materials meet requirements without rejection of batches, retesting, or reprocessing.

3.7.1.1 Stack Emissions Monitoring and Sampling

Provide continuous monitoring with calibration/verification sampling as shown in TABLE 6. Record process parameters at intervals not exceeding one minute. Calibrate sensors with standards traceable to NIST and in conformance with NIST SP 250.

TABLE 6 - STACK EMISSIONS MONITORING AND SAMPLING SCHEDULE

PARAMETER	OPERATING PERIOD	FREQUENCY

	[Operations]	[_____][not required]

3.7.1.2 Contaminated Material Treatment Testing

****

NOTE: The values shown in Table 7 for frequency of testing are only examples and need to be determined on a site specific basis. Coordinate the properties in this table with the properties in paragraph PERFORMANCE REQUIREMENTS. It may be acceptable to change the number of samples during development of a UFP-QAPP, but the Designer should attempt to establish a reasonable sampling frequency in the specifications to provide a basis for the Contractor to bid the project.

****

Collect confirmation samples for post treatment testing in accordance with the [UFP-QAPP][basewide QAPP] and this paragraph. Analyze samples for the parameters listed in paragraph PERFORMANCE REQUIREMENTS. Collect samples for testing at a minimum frequency [provided in Table 7][_____]. Complete all other sampling and analysis activities in accordance with the [UFP-QAPP][basewide QAPP][_____] (including but not limited to sample handling, preservation, transportation, [collection][analysis] of quality control samples, data validation, and data reporting). Any deviations to sampling frequency, number of samples, or sample collection methods must be [established in the approved [UFP-QAPP][basewide QAPP]][approved by the Contracting Officer].

TABLE 7 - MATERIAL SAMPLING FREQUENCY REQUIREMENTS			
PROPERTY	MATERIAL SAMPLING FREQUENCY [cubic meter][(metric ton)][(cubic yard)][ton]		
	CONTAMINATED MATERIAL	TREATED MATERIAL	SOLIDS CAPTURED BY THE POLLUTION CONTROL SYSTEM
[_____]	One per [100][_____]	One per [100][_____]	One per [100][_____]

3.7.1.3 Retesting and Reprocessing

****

NOTE: An option is provided for retesting treated contaminated materials which fail to meet performance requirements. Retesting without first reprocessing treated contaminated materials should generally be prohibited unless there is reason to believe the original test result was inaccurate due to mislabeling/mishandling of the sample or analytical error discovered during validation of laboratory results (simply believing that a sample did not reflect the treatment is not sufficient to consider a result inaccurate).

If thermal desorption treated material is being sent off-site for disposal, do not permit retesting unless there is reason to believe the original test result was inaccurate as described in the paragraph above. This is because waste characterization and disposal is based on grab sampling results, and averaging of sampling results cannot be used to determine that a waste meets regulatory disposal requirements.

****

Reprocess and then retest units of treated contaminated materials that do not meet the post-treatment criteria in paragraph PERFORMANCE REQUIREMENTS[or quality assurance testing].[The Contractor may propose to retest failing units of treated contaminated soils prior to reprocessing. If the Contracting Officer approves retesting, collect and test two additional samples for the failed parameter(s). If both samples pass, re-processing the unit will not be required. If either sample fails, reprocess the unit.]

3.7.1.4 Government Quality Assurance Testing

****

NOTE: Consider the need for quality assurance testing on a project-by-project basis. If QA testing is unnecessary, delete this paragraph. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. Use of quality assurance testing data use also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project Performance Requirements, and failing result would

be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for identifying and correcting meaningful differences should be documented in a project-specific Quality Assurance Project Plan and referenced in this specification; the process is likely to complex to be adequately defined in this specification.

****

Provide duplicate samples to the Government's quality assurance laboratory for Government quality assurance. Submit samples at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. Provide additional quality assurance samples upon request.

3.7.2 Inspections

3.7.2.1 Visual Inspections

Inspect the thermal desorber and associated equipment (pumps, valves, conveyors, pipes, etc.) for leaks, spills, fugitive emissions, and signs of tampering or mechanical failure as indicated in TABLE 8. Inspect feed materials for changes in composition and presence of particles larger than [gravel][____] size. Visually inspect treated materials to confirm that maximum clump size is being met as defined in paragraph PERFORMANCE REQUIREMENTS.

TABLE 8 - VISUAL INSPECTION SCHEDULE

PHASE OF OPERATION	MINIMUM INSPECTION FREQUENCY
Field Demonstration	[Once per 8-hour shift][Daily]
Interim operations	[Once per 8-hour shift][Daily]
Operations	[Daily][Weekly]

3.7.2.2 Interlocks, Automatic Cut-Offs and Alarms

Test interlocks, automatic contaminated material feed cut-off and associated alarms [weekly][_____].

3.8 OPERATIONS REPORTS

Submit operations reports [daily][weekly] for the first [10][_____] weeks, and at a frequency of [_____] thereafter. The operations reports must consist of a log of operating conditions including, but not limited to:

a. Hours of operation.

b. Staffing.

c. Weather conditions.

d. Process materials tracking schedule.

e. Sample shipment (including chain of custody documents).

f. Receipt of analytical results.

g. Changes in operating parameters.

h. Results of the testing and calibration activities.

i. Inspection and maintenance activities.

Attach the physical and chemical test results generated onsite or received from offsite laboratories to the report. Include the following information with test results: time of sampling, location of sampling, and Contractor Quality Control (such as duplicate sample analysis, field and trip blank analysis, laboratory QC analysis) results. Perform data validation of the test results [in accordance with the project UFP-QAPP][before submittal].

3.9 DEMOBILIZATION

****

NOTE: If there is a separate Specification Section which provides overall requirements for demobilization/site cleanup, such as 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS, move the requirements from this paragraph into that Section.

****

Follow the approved mobilization and demobilization plans submitted as part of the Remedial Action Work Plan. Demobilize to restore the site to its initial state, prior to the construction and operation of the thermal desorption treatment facilities. Do not commence demobilization until written approval is received from the Contracting Officer. Demobilization must include, but must not be limited to: [disconnecting of utility service lines,][decontamination and removal of equipment and materials,][disposal of decontamination wastes,][disposal of any residual wastewater,][removal of unused amendments and other materials,] [removal of material overlying liners,][removal of liners,][regrading and removal of berms,][demolition and disposal of the treatment pad, other foundation slabs, and paved surfaces,][_____].[Perform post-treatment testing of soils below stockpile storage units and work area surfaces in accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL.]

UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated January 2025

****

SECTION 02 53 16.16

IN-SITU THERMAL REMEDIATION

02/25

****

NOTE: This guide specification covers the requirements for in-situ thermal remediation (ISTR) of materials contaminated by hazardous or toxic organic wastes and/or by petroleum, oil, or lubricants (POL). The ISTR can be achieved by electrical resistance heating, thermal conduction heating, or steam enhanced extraction. Site-specific criteria for temperature, mass removal, target treatment zone (TTZ), and treatment of extracted fluids would be determined and presented in this specification.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

1.1 UNIT PRICES

****

NOTE: This paragraph should be deleted if the work is in one single job price or there is a separate Measurement and Payment Section.

Any requirements for bid items need to be consistent with any bid sheet or list of contract line items. Payment for operations can be done as a single job price, especially for performance-based contracts, but if specifications are used, the work is usually bid on a unit-cost basis.

****

1.1.1 Preparation of Planning Documents, Permits[, and Community Relations Support] (Single Job Price)

The preparation of all required planning documents and obtaining permits [and providing community relations support] will be a single job price.

1.1.2 Site Preparation (Single Job Price)

The necessary actions to prepare the site for installation of the heating and treatment infrastructure, for installation of fencing, and for utility coordination will be a single job price.

1.1.3 Monitoring Point Installation and Baseline Sampling (Single Job Price)

The installation of new monitoring points, abandonment of existing monitoring points, and sampling of soil, soil vapor, and groundwater prior to heating will be a single job price.[Include costs for any additional characterization in this bid item.]

1.1.4 Installation (Single Job Price, Plus Unit Cost per Area or Volume)

****

NOTE: The language of this section allows payment for installation of subsurface and above-ground treatment infrastructure based on the identified TTZ as a single job amount. If treatment of additional volumes is necessary based on assessment of observed baseline concentrations or observations during installation of monitoring points or heater wells, contract options can be included to provide flexibility in expanding the TTZ without need for contract modification.

****

Installation of all components will be a single job price.[Bid options for installation of components to remediate additional treatment [area][volume] units on a [per square meter] [per square foot] [per cubic meter] [per cubic yard][_____] basis according to the bid sheet.]

1.1.5 Operations (Heating and Utilities)

****

NOTE: The language of this section allows payment for operations based on the actual effort required to meet the overall objectives. The operations bid costs may ideally be broken out into unit costs for operations per time and energy and power costs. Alternatively, the operations can be bid for an assumed amount of time at full target temperature and for the identified TTZ as a single job price though this shifts risks to the contractor. If a

single job price-approach is taken, and if additional treatment time or treatment of additional volumes is necessary based on assessment of observed concentrations or mass removal rates, contract options can be included to provide flexibility to continue operations for additional periods without need for contract modification. If the Government procures power or natural gas via separate contract directly with the utility provider, it can avoid contractor markup on those costs.

****

Bid prices for operations will be provided separately for operations and utility costs. Operations, other than utility costs,[for heating to target temperature] will be bid on a single job price[with contract options for additional operations time as per the bid sheet].

1.1.5.1 Operations During Heating to Target Temperature

Bid prices for operations necessary to bring the target treatment zone (TTZ) to target temperature will be bid on a single job price.

1.1.5.2 Operations at Target Temperature

Bid prices for operations will be per [week][day] spent at full temperatures.

1.1.5.3 Utilities Costs

****

NOTE: The contractor normally coordinates with local utility purveyors and pays for utility costs. There is often an administrative cost or mark-up associated with the contractor managing payment for the utilities. Some cost savings may be possible if the Government directly pays for the utilities. On active Department of Defense (DoD) installations, the Government may be better positioned to directly provide the utilities.

****

Include all utility costs, including but not limited to usage, distribution, and other fees associated with power, water, sewer, fuel, and other consumable materials to operate all equipment related to the in-situ thermal remediation (ISTR) system in the bid[except for the cost of [_____] to be provided by the Government].[Energy costs will be bid on a megawatt-hours of power delivered to the subsurface.][British thermal units (BTUs) delivered to the subsurface.] Non-energy utility costs will be bid as a single job price.

1.1.6 Site Restoration (Single Job Price, Plus Unit Cost per Well, Electrode, and Area)

Site restoration will be bid as a single job price. Additional [area][volume] requiring restoration will be bid on a [per square meter][per square foot][per cubic meter][per cubic yard][_____] basis.

1.1.7 Treatability Study

****

NOTE: Treatability studies are generally not required for ISTR for typical contaminants, but may be necessary where complex mixes of contaminants or emerging contaminants with less history of treatment are present, or where design parameters would be refined by such a study.

****

Bid treatability study as a single job price. Include costs for collecting necessary samples of site media and any characterization necessary to identify the media for the treatability study.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D2488	(2017; E 2018) Standard Practice for Description and Identification of Soils (Visual-Manual Procedure)
ASTM D5092	(2016) Standard Practice for Design and Installation of Ground Water Monitoring Wells in Aquifers

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70	(2023; ERTA 1 2024; TIA 24-1) National Electrical Code
NFPA 86	(2023) Standard for Ovens and Furnaces

U.S. ENVIRONMENTAL PROTECTION AGENCY (EPA)

EPA 505-B-04-900A	(2005) Intergovernmental Data Quality Task Force - Uniform Federal Policy for Quality Assurance Project Plans: Evaluating, Assessing, and Documenting Environmental Data Collection and Use Programs Part 1: UFP-QAPP Manual
UFP-QAPP WKSTS	(2012) Intergovernmental Data Quality Task Force - Uniform Federal Policy for Quality Assurance Project Plans, Optimized UFP-QAPP Worksheets

1.3 DEFINITIONS

1.3.1 Target Treatment Zone (TTZ)

The TTZ encompasses the full three-dimensional limits of the subsurface requiring heating to meet the performance criteria. The heated volume will include subsurface media beyond the TTZ to allow for necessary contaminant mass removal and containment and to prevent redistribution of contamination due to condensation or migration.

1.3.2 Critical Infrastructure

Utilities, roadways, and structures whose function must be maintained during ISTR treatment are considered critical infrastructure.

1.3.3 Temperature Strings

Temperature strings are series of temperature sensors (e.g., thermocouples) arranged in a linear fashion in boreholes in and around the TTZ to assess the temperature response to energy input to the subsurface.

[1.4 ADMINISTRATIVE REQUIREMENTS

****

NOTE: These paragraphs should be omitted if the requirements are identified in other specifications, such as 01 30 00 Administrative Requirements.

****

1.4.1 Pre-Installation Meetings

A pre-installation meeting [and site walk-through] will be held to identify key logistical, safety, and community concerns. Prepare minutes of this meeting and submit these for review as part of the Pre-Installation Examination Report[and include them in the Remedial Action Work Plan].

1.4.2 Sequencing and Scheduling

If the treatment is to be conducted in discrete phases, the phasing of treatment, referred to herein as "stages" must occur in a manner that does not allow recontamination of a treated area or from upgradient. Similarly, the operation of each stage of treatment must not impact newly treated areas by maintaining hydraulic and pneumatic control.

]1.5   SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Remedial Action Work Plan; G, [_____]

Uniform Federal Policy Quality Assurance Project Plan; G, [_____]

Treatability Study Work Plan; G, [_____]

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

****
NOTE: Additional references from Federal, state, and local regulatory requirements; utility company regulations; and applicable codes and standards published by scientific and engineering institutions should be included where appropriate in the body of the specification. Some of the potentially applicable Federal regulations are listed as follows:

Recording and Reporting Occupational Injuries and Illnesses

Occupational Safety and Health Standards

Safety and Health Regulations for Construction

Permitting

National Primary and Secondary Ambient Air Quality Standards

National Emission Standards for Hazardous Air Quality Pollutants

State and Local Air Quality Standards

National Pollution Discharge Elimination System (NPDES) Discharge Limitations and Permit Procedures

Hazardous Waste Identification and Standards Applicable to Generators, Transporters, and Owners and Operators of Treatment, Storage and Disposal Facilities (TSDF)

Land Disposal Restrictions (LDRs)

Department of Transportation Hazardous Materials Program Procedures

Hazardous Materials Transportation Regulations

Standards for Protection Against Radiation

Land Disposal of Low-Level Radioactive Waste

Packaging and Transportation of Radioactive Materials

For sites addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. The permits or permit equivalents may include those addressing air discharges, treated water discharge, well installation and abandonment, underground injection, and possibly others. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, delete this section.

****

Coordinate and obtain all[permits][, permit equivalents][, and meet the substantive regulatory requirements] necessary for the installation, operation and closure of the project prior to the initiation of the relevant activities. Submit documentation of the completed permitting or permit equivalent to the Contracting Officer [as part of the Remedial Action Work Plan (RAWP)]. Comply with all Federal, state, and local regulations. For any of the above-listed items requiring a longer time frame, copies of applications, and scheduled dates for receiving final approval, must be included.

1.6.2 Qualifications

****

NOTE: Requirements for the Contractor's experience should be determined and specified based on the

experience, availability, and state of the ISTR industry and the site-specific requirements. If not provided in other portions of the contract documents, the requirements can be provided below.

****

1.6.2.1 Contractor Experience

Submit evidence of successful completion of[at least [1][_____] ISTR project of comparable size and scope][at least [3][_____] ISTR pilot scale treatability studies, demonstration studies, and/or full scale remediation projects that required treatment of materials contaminated with[RCRA hazardous wastes][CERCLA hazardous material][_____]] using the proposed system or a similar system.

1.6.2.2 Key Personnel

Provide key personnel with a minimum of [3][_____] years of ISTR field experience, including project engineer, lead operator, site safety and health officer, quality control officer, project chemist and other lead technical staff involved with the ISTR system operation. Submit a list of these personnel with their qualifications.

1.6.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory meeting thein accordance with[Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.7 DELIVERY, STORAGE, AND HANDLING

Safely store, transport, and handle the equipment, materials, and any contaminated materials. Follow United States Department of Transportation (USDOT) requirements for packaging and shipping of these items. Store and handle these items onsite in accordance with the manufacturer's recommendations and in compliance with applicable regulatory requirements.

1.8 PROJECT/SITE CONDITIONS

****

NOTE: This section would provide necessary background information on conditions at the site that are relevant to the ISTR system construction and would affect the performance of the ISTR. Alternatively, reference can be made to other Government-furnished information. Important considerations would include site contaminants (location, depth, and concentrations); the TTZ; areas for material and equipment laydown and treatment and control system construction; soil types and groundwater flow conditions; surface topography; subsurface utilities, including potential for leaking water and sewer lines, potential subsurface obstructions or buried waste; and available utility connections.

****

The existing site conditions as currently understood are presented [in Appendix [_____]][and][on the drawings][and][in the specifications]. These include [physical configuration,][utilities,][topography,][land uses,][site access,][project limits,][geotechnical characteristics of the contaminated materials (including[grain size analysis,][total organic content,][moisture content,][density,] and[porosity])][hydrogeology,][treatability study results,][nature and extent of contamination,][mass estimate and approximate breakdown by constituent type within the TTZ,] and [_____]. The contaminants of concern are given in [Table 1][_____]. The existing conditions presented are the result of site investigations at specific locations; variations in the existing site conditions may be anticipated. Perform an independent interpretation of the site characterization data. Notify the Contracting Officer within[48 hours][_____] if discrepancies between the data provided and actual field conditions or apparent data gaps are discovered.

1.9 WARRANTY

****

NOTE: Vendors may offer warranties for attaining the cleanup goals. If the ISTR services are obtained under a performance-based contract, the full contract payment is based on the attainment of the goals, and therefore, a warranty does not provide additional value beyond the existing contract terms. A performance bond may be required.

****

Provide all warranties for the performance of the work[in the RAWP].

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

****

NOTE: Vendors normally provide their own equipment for the duration of the treatment and retain the equipment at the completion of the project. The requirements for the heating and treatment equipment can be specified here, but a performance-based approach will generally obviate the need for the specification of the products and materials.

To maximize the pool of potential bidders, recommend leaving the ISTR technology unspecified and focusing on the performance requirements. The bidders will identify what they believe to be the most cost-effective approach that may include one or more ISTR technologies. It is important to provide the necessary site information that will allow the bidders to assess the technology applicability, including contaminant type, concentration, and mass; groundwater depth and flow velocities; surface constraints, etc.

****

Provide and install an ISTR system that will introduce the energy into the subsurface necessary to attain all treatment requirements and to collect and appropriately manage all recovered vapors and liquids to meet all discharge and disposal requirements.

2.1.1 Design Requirements

Design the ISTR system in accordance with all applicable building codes and licensing requirements with the following design requirements.

2.1.1.1 Remedial Action Work Plan

Prepare a Remedial Action Work Plan (RAWP) and submit for approval within [60][_____] calendar days of receiving the notice to proceed. If the work is to be conducted in stages, each stage of ISTR will require a work plan addendum detailing any changes to the approach outlined in the RAWP and stage-specific treatment details omitted from the RAWP. Address all items in the RAWP and associated addenda as discussed in this specification and other relevant specifications.

Address the following topics in the RAWP:

a. Contractor’s basis of design for its selected equipment and approach including targeted design temperature, heating element layout/spacing, materials of construction, and design approach/basis for vapor/liquid treatment equipment.[If the treatment of the TTZ is to be conducted in discrete phases, referred to herein as "stages," describe how the stages will be treated in a manner that does not allow recontamination of a treated area. In addition, explain how lessons learned from initial stages will be incorporated into operations for later stages.]

b. Modeled estimates of energy needs for optimal temperature increase and duration necessary to reduce subsurface mass and concentration to performance requirements and/or provide results from other field efforts substantiating the operational assumptions.

c. Equipment sizing, staging locations, and installed layout.

d. Well-field layout (number, spacing, depths of heating wells and elements, monitoring wells, extraction wells, all other wells, and temperature sensor strings).

e. Process piping and instrumentation diagrams.

f. Electrical one-line diagrams.

g. Vapor/liquid collection and treatment system layout plans.

h. Component process flow diagrams.

i. Estimated amount of energy, water, fuel, and other consumable materials (e.g., granular activated carbon) to operate the ISTR system and vapor/liquid treatment system during the duration of the treatment period.

j. Connections for electrical, water, sewer, natural gas, communications, and the layout of these utility connections.

k. System Commissioning Plan, including a pre-commissioning checklist.

l. Other information as required to describe the design, construction, installation, and operations approach of the system to implement the remediation in accordance with the Contract Documents.

m. Contingency planning for operations in the event of various failure scenarios (i.e., develop a risk register with likely mitigation actions for the important risks).

n. Proposed decision logic for heating shutdown and logic/approach for confirmation sampling.

o. Security and fencing plans.

p. Traffic control plan.

q. Stormwater protection plan.

r. Waste management plan.

s. Contingent actions if downgradient groundwater concentration limits are exceeded.

t. Comprehensive schedule for mobilization, installation, operation, and close-out activities.

u. Surface cover materials, thickness, seaming details, and R-values (thermal resistance per unit area).

[Prepare [draft for Government review][, draft-final for [regulatory] [_____] review][, and] final versions of the RAWP. Allow [30][_____] calendar days for [Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.]
[
A review meeting to discuss and resolve Government comments and concerns on the draft RAWP will be held prior to the submittal of a final draft version of that plan.]

2.1.1.2 Uniform Federal Policy Quality Assurance Project Plan

****

NOTE: This section may reference a separate specification section requiring preparation of a quality assurance project plan or may be excluded entirely if the requirements are part of another specification section.

****

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with EPA 505-B-04-900A and UFP-QAPP WKSTS. Tailor the content to the requirements of the project and the site conditions and media of interest and address the collection of chemical and physical data necessary to make operational and shut-down decisions. Include the standard procedures for sampling hot media in the UFP-QAPP.[Prepare [draft for Government review] [draft-final for [regulatory] [_____] review] and final versions of the UFP-QAPP. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.]

2.1.2 Performance Requirements

****

NOTE: As ISTR projects are typically done under a performance-based contracting approach, the performance standards provided in this section are critical to the project success. Multiple performance standards are recommended to assure the desired outcome, but not all of the requirements listed below need to be included.

****

Meet the following performance requirements. These are either primary or secondary requirements, where primary requirements are to be met upon shutdown of the ISTR treatment and secondary requirements are those that to be met during operation of the ISTR system.

2.1.2.1 Target Treatment Zone

****

NOTE: The appropriate delineation of the TTZ is the most critical performance requirement. If ISTR projects fail to meet other performance requirements, it is often due to an incomplete understanding of the actual extent of this zone. The zone is three-dimensional, and lateral and vertical dimensions are given. There is an opportunity to revise the zone based on observations during installation of ISTR subsurface system components, and the specification allows for adjustment of the TTZ. Depending on the contract approach, this can be accomplished through performance-based contract requirements or through the exercise of options for additional treatment volumes. If the top of the contaminated zone is below the water table, the TTZ needs to extend some distance above the water table to assure capture of contaminant vapors before they condense.

****

The TTZ is shown[on the drawings][Figure [_____] of the [_____] report]. Meet performance requirements throughout the entire TTZ as specified below. The basis for the TTZ is the [_____][ug/kg][mg/kg][ug/L][mg/L][soil concentration][groundwater concentration][soil vapor] contour [based on the maximum concentration observed at any depth][and the contact with the [_____] geologic unit]. During construction of the subsurface components of the remedy, inform the Contracting Officer of any unexpected contamination above the concentrations used as a basis for the TTZ but that exists outside the defined TTZ.

2.1.2.2 Soil Concentration Goals

Attain the target soil concentrations described in Table 1 below[on average][at each sampling interval][at [_____] percent of sampling points] [_____][with no point exceeding [_____] times the performance goal] within the TTZ based on the approved post-treatment verification sampling program described in the appropriate UFP QAPP. If measured soil concentration[s] exceed[s] the values shown in the table below, resume treatment as described in paragraph BASIS FOR SYSTEM RESTART.

2.1.2.3 Groundwater Concentrations Goals

****

NOTE: The operation of the ISTR system may induce groundwater flow into the TTZ. If significantly contaminated groundwater exists outside the TTZ, this may affect the ability to attain a groundwater performance goal. Periodic sampling of groundwater during heating can be used to track progress toward goals.

****

Attain the target groundwater concentrations described in Table 1[on average][at each prescribed sampling point][at [_____] percent of the sampling points][with no sampling point exceeding [_____] times the groundwater performance requirements] [_____] based on the approved post-treatment verification sampling program described in the UFP QAPP. If measured groundwater concentration[s] exceed[s] the values shown in Table 1, resume treatment as described in paragraph BASIS FOR SYSTEM RESTART. Containment or treatment actions are required if exceedances of downgradient groundwater concentration limits are observed.

TABLE 1 - PERFORMANCE REQUIREMENTS

Contamina	Soil concentratio ^{1} [ug/kg] [mg/kg]	Groundwater concentratio ^{1} [ug/L] [mg/L]	Treated air discharge limit ^{2} [ug/L] [ug/m ^{3}] [ppmv] [ppbv] [lb/day] [kg/day]	Downgradie groundwate concen-tra limit ^{1,2} [ug/L] [mg/L]	Soil Vapor Concentra ^{1,2} [ug/L] [ug/m ^{3}]	Treated water discharge limit ^{2} [ug/L] [mg/L]
[_____]	[_____]	[_____]	[_____]	[_____]	[_____]	[_____]

[1] Primary requirement; [2] Secondary requirement

2.1.2.4 Temperature

****

NOTE: Time of heating and minimum temperature requirements should only be specified as a minimum and the other criteria should be the primary lines of evidence for true attainment of treatment goals. Although azeotropic boiling may occur at temperatures below100 degrees C 212 degrees F, progress is fastest and remediation more likely to be complete if temperatures of 100 degrees C 212 degrees F (or higher temperatures at depth below the water table) are targeted.

****

Achieve a temperature of[[100][_____] degrees C [212][_____] degrees F][equal to boiling accounting for hydrostatic pressure] at [95][_____] percent of the temperature monitoring points with no point in the TTZ below

[90][_____] degrees C [194][_____] degrees F. Continue full heating for a minimum of [_____] weeks following the attainment of a minimum temperature of [_____] degrees C degrees F at all temperature monitoring points and an average temperature of [_____] degrees C degrees F across the TTZ prior to proposing cessation of heating.

2.1.2.5 Mass Removal

Continue treatment until mass removal rates have[reached asymptotic conditions as defined in the RAWP][fallen below levels observed at start-up][fallen below [_____] percent of the peak weekly average mass removal][fallen below [_____] kg/day lbs/day for [_____] days [_____] based on measurements of the recovery of [all contaminants][contaminants listed in Table 1] in vapors, non-aqueous phase liquid (NAPL), and dissolved form][and no extraction point is continuing to recover mass at a considerable rate]. Compute mass removal rates for this purpose when all the intended heating and recovery wells are operating.

2.1.2.6 Vapor Control

Capture and manage all contaminants volatilized and mobilized by the thermal treatment via a vapor recovery system and convey them to a treatment system.[Facilitate capture through the installation of a surface cover as specified in paragraph SURFACE COVER.] Do not allow surface breakthrough of steam and contaminant vapors to occur.[Maintain an inward pneumatic gradient to the TTZ.][Monitor vapor concentrations in sampling points outside and above the TTZ to demonstrate vapor control as required by the UFP-QAPP and RAWP.] Prevent lateral migration of contaminant vapors outside the TTZ described in paragraph VAPOR RECOVERY of this specification and contaminant vapor migration into occupied buildings [at concentrations above [EPA Regional Screening Levels][_____]].

2.1.2.7 Off-gas Treatment Concentration Limits

Treat recovered vapors[to the standards specified in Table 1][to the level specified in the applicable permit equivalent] prior to discharge.

2.1.2.8 Liquid Treatment Concentration Limits

****

NOTE: The goal for treatment of water will depend on the discharge location (e.g., publicly owned treatment works [POTW], surface water, reinjection). If the disposal of the treated water is left to the Contractor to propose in the RAWP, direct the Contractor to determine and achieve the applicable treatment requirements based on applicable statutes, regulations, and rules for the selected discharge location, in accordance with paragraph PERMITS. Modify Table 1 to reflect the need for the Contractor to determine the appropriate treatment goals. Discharge to a local POTW offers advantages, and information on the local POTW and any pre-treatment requirements should be made available to the bidders.

****

Treat condensed and recovered liquids[to standards specified in Table 1][to the level specified in the applicable permit equivalent for the selected discharge location] prior to discharge. Discharge treated water[to the sanitary sewer][to the storm sewer][to the surface water body][to injection wells][to [_____]][as indicated on the drawings].

2.1.2.9 Noise Limits and Operational Hours

****

NOTE: Noise limitations may also be addressed in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. If specified there, this paragraph can be omitted.

****

Provide noise mitigation measures to reduce sound levels at[the site boundary][nearby homes and businesses][_____] to [[_____] decibels (dB)][levels that comply with local noise ordinances]. Normal hours of operation during ISTR construction installation, and close-out activities must be between [7:00 am][_____] and [7:00 pm][_____] for all noise generating activities, [Monday through Friday][_____], excluding federal holidays. Do not conduct construction work outside these working hours without first obtaining written approval from the Government. These working hours may be further modified based on local ordinances, as applicable. ISTR operations will be on a 24-hour per day basis, from heating commencement through completion.

2.1.2.10 Permits

Obtain all necessary permits, including but not limited to air discharge permits, well drilling and abandonment permits, electrical permits, construction permits, water discharge permits, and underground injection permits, as required by Federal, state, and local agencies and in accordance with paragraph REGULATORY REQUIREMENTS.

2.1.3 Backup Power Supply

Provide a back-up power source capable of operating the ISTR vapor and liquid extraction and treatment equipment as well as monitoring and controls to maintain pneumatic and hydraulic control if the primary power source is lost. The backup power source will be capable of maintaining pneumatic and hydraulic control without refueling for at least [24][_____] hours[and will engage automatically upon loss of primary power (e.g., automatic transfer switch)]. Configure the back-up power supply to maintain continuity of control system function and to cause the operator to be notified of a loss of line power. Use EPA Tier 4 Final certified generators for on-site back-up and non-emergency purposes.

2.2 EQUIPMENT

2.2.1 Government-Furnished Equipment

****

NOTE: If there is no Government-furnished equipment, Table 2 should be omitted and other tables renumbered as necessary.

****

There [is][is not any] Government-furnished equipment available for this project.[The available equipment is described in Table 2.]

TABLE 2 - GOVERNMENT-FURNISHED EQUIPMENT		
Item	Location	Notes
Dedicated sampling pumps	Monitoring wells	[_____]
Transformer	[_____]	[_____]
[_____]	[_____]	[_____]

2.2.2 Contractor Equipment

Provide all equipment necessary to perform the work[except for the Government-furnished equipment noted in paragraph GOVERNMENT-FURNISHED EQUIPMENT]. Prepare the site for equipment installation prior to delivery and off-loading of equipment and system components. Decontaminate all equipment prior to entering or leaving the site. Include and describe in detail any additional equipment not specified below in the RAWP. Design, install, construct, operate, control, and monitor all equipment as one complete, compatible unit. Assure all components utilized at the site are constructed of materials that are thermally and chemically compatible with the contaminants and temperatures of the vapors and liquids recovered. Select all equipment to be properly rated for the environment and location where it will be operating, to include the potential for being in contact with hazardous, flammable, or explosive materials or explosive vapors, as well as extreme weather. Provide and install all equipment in conformance to pertinent local and national codes.

2.3 COMPONENTS

****

NOTE: As ISTR projects are typically done under a performance-based contracting approach, the individual above-ground equipment provided for extraction and treatment of site contaminants are not normally specified, but additional requirements for specific equipment can be added.
Delete requirements for secondary containment if these are addressed in Section 01 57 19, TEMPORARY ENVIRONMENTAL CONTROLS. If Section 33 56 19 FUEL IMPERMEABLE LINER SYSTEM is used, the Designer should review that section to remove specific requirements that may be excessive for a temporary secondary containment.

****

Provide and install an above-ground treatment system with appropriate heat exchangers and condensation capabilities; air-liquid separators, with adequate liquid storage and transfer capabilities to allow continuous operations; vacuum blowers suitable to capture all generated vapors; liquid treatment equipment appropriate for the liquid production rates and site contaminants and other extracted compounds that may be recovered in liquid form; and vapor treatment equipment appropriate for the non-condensable vapor extraction rates and vapor-phase contaminants. Provide secondary containment of all liquid storage and treatment equipment[in accordance with specification Section 33 56 19 FUEL IMPERMEABLE LINER SYSTEM.][with either double-walled containers or impermeable surfaces suitable to contain a spill or release of liquid.

Impermeable means having a maximum permeability for any hazardous substance that is being contained of 1x10-7 centimeters per second 3x10-9 feet per second at the maximum anticipated hydrostatic pressure.]

2.3.1 Instrumentation

Provide instrumentation and controls, including but not limited to indicators, sensors, transmitters, recorders, alarms, and auto-dialers, necessary to monitor and operate the equipment and heating infrastructure continuously,[remotely,] and safely. Provide such equipment that detect, monitor, record, and control key operating parameters such as liquid levels, equipment and air temperatures, gas and liquid flow rates, pressures, subsurface temperatures and pressures, etc. Select temperature, pressure, and flow sensors suitable for and tolerant of the expected range of conditions to be encountered.

Provide a system control panel that contains, at a minimum, all local control devices, circuit breakers, power control transformers, system disconnect switches, and alarm components, as necessary to operate the system effectively and safely. Provide the control system with all functions required for complete automatic and manual operation of the system, including but not limited to the following:

a. System shutdown and alarm on high-high liquid level conditions in moisture separator, other liquid handling equipment, and discharge locations,

b. Manual start and stop for blowers,

c. System shutdown if the secondary containment around critical process vessels indicates a spill,

d. System shutdown and alarm on low and no flow in system,

e. Automatic call-out and notification in the event of an alarm,

[

f. Automatic shutdown or opening of dilution valve if lower-explosive limit sensors indicate the influent concentrations to a thermal oxidizer will cause its operation outside of National Fire Protection Association guidelines, including those in NFPA 86.]

g. Automatic shutdown if an emergency stop is engaged.

The control system must also be furnished with a means to allow for remote, real-time access to monitoring data and data retrieval. Provide catalog information on the supervisory control and data acquisition (SCADA) system to be used during start-up and operations. Include this information in the RAWP.

2.3.2 Spare and Redundant Critical Components

Provide redundant or spare critical system components, including sensors [primary blowers,][transfer pumps,][and][_____]. Identify the redundant and spare components in the RAWP.

2.4 MATERIALS

2.4.1 Well and Piping Materials

Propose well and piping materials in the RAWP and select materials for well and piping construction that are compatible with site contaminants and other compounds that may be extracted in vapor or liquid form and can withstand the temperatures and pressures or vacuum levels encountered during operation without failure or excessive pressure drop. Provide insulation or other means of protection on piping that will conduct hot fluids that could be contacted by site personnel or trespassers.[Provide features, such as heat tracing, to winterize all parts of the system that will be exposed to cold weather.] Polyvinyl chloride (PVC) and chlorinated polyvinyl chloride (CPVC) piping is prohibited for vapor transport under pressurized, above-ground service.

2.4.2 Electrical Supply and Equipment

****

NOTE: The designer should modify this section to provide site-specific details about electrical connection and coordination requirements. The designer should determine the following details about the electrical supply: 1) nearest suitable power, 2) infrastructure for the purveyor to bring power to the site, 3) the available voltages at the primary electrical feed, 4) requirements for secondary metering, 5) seasonal or daily restrictions on power availability and pricing policies, 6) necessary lead time for power drop to the site, 7) approximate costs for bringing service to the site.

****

[Necessary electrical service at the site will be provided by the Government.][Provide electrical service to the site of adequate capacity to support all planned remediation operations.] Coordinate with the local power utility company as necessary[and provide all engineering support to evaluate the adequacy of existing service lines]. All material, equipment, and incidentals in hazardous locations must meet local and state codes, and NFPA 70 National Electrical Code (NEC). Bury all primary service lines connecting the power drop to any transformer. Provide proper electrical grounding for all equipment. All cables and conductors must be rated for electrical loading specified in the RAWP and constructed with materials compatible with its designated environment.

2.4.3 Natural Gas Supply

Provide natural gas service in accordance with Section 33 11 23 NATURAL AND LIQUID PETROLEUM PIPING.

2.4.4 Surface Cover

****

NOTE: A surface cover is usually necessary to prevent the release of steam and contaminant vapors at the surface, inhibit infiltration of cold moisture, and to allow higher temperatures at shallow depths to facilitate vapor recovery and

prevent condensation of vapor-phase contaminants near the surface. Higher R values may be necessary for treatment of high-boiling-point compounds close to the surface. If the target ISTR treatment zone does not extend vertically to near the surface (e.g., is more than 3 meters 10 feet below the surface), a surface cover may not be necessary.
****

Install an insulating and vapor-controlling surface cover capable of achieving a minimum R value of [20][_____]. If thick concrete surface slabs are in place, the R value may be proportionally adjusted. Integrate a [seamed geomembrane][or equivalent] vapor barrier into the cover.

2.5 TESTS, INSPECTIONS, AND VERIFICATIONS

2.5.1 Piping Coupon Testing

****
NOTE: Coupon testing would be warranted if there are concerns about potentially corrosive treatment streams generated during treatment. The coupon testing can be conducted during a pilot test or initial stage of treatment where multiple stages of treatment are necessary due to TTZ size or power limitations. Conducting such testing during design and providing results as part of Government-furnished information would reduce risk to the bidder and result in bids with lower risk premiums.
****

Conduct coupon testing for corrosion for proposed piping, well construction, and treatment equipment to demonstrate compatibility with site conditions and contaminants. Propose coupon testing procedures in the RAWP. Submit results of the coupon testing.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Site Conditions

Conduct a pre-installation examination of the on-site infrastructure, utility conduits, monitoring points, site access constraints, and infrastructure. Photographically document, with identifying labels, the existing condition of infrastructure and utilities, particularly for comparison to post-treatment conditions. Verify locations of critical utilities that cannot be disrupted and those utilities that would potentially have significant impacts on treatment and public safety. Examine location, condition, and construction of monitoring points in the treatment zone and surrounding area to assess the need to protect, abandon, or replace any monitoring point. Submit a Pre-Installation Examination Report documenting the examination activity. Obtain all necessary utility clearances before initiation of subsurface work.

3.1.2 Contractor-Supplied Equipment

The Government may examine equipment provided by the Contractor for the project to identify any that is dilapidated, damaged, unsafe, or defective. Based on this examination, the Contracting Officer has the right to reject the entire system or any damaged, defective, unsafe, or dilapidated equipment. The cost associated with equipment or control replacement or repair, and delays caused by the rejection will be borne by the Contractor. Properly and routinely inspect and maintain equipment to provide the operation of the system as required by the contract schedule. Any schedule delay and cost associated with improper functioning of equipment and controls, unavailability of labor and materials, etc., is the responsibility of the Contractor.

3.1.3 Treatability Study and Pre-Design Characterization

****

NOTE: The need for a treatability study may depend on the site contaminants and ISTR method to be used. Treatability studies are not normally needed for common contaminants such as trichloroethylene or benzene and would be more appropriate for complex mixtures of unusual contaminants. Treatability study testing to assess steam volumes needed to achieve cleanup goals, changes in NAPL density and viscosity with temperature, or treatment options may be specified.

If there are data gaps, additional characterization may be required. Optional text in this paragraph addresses the requirements for the additional investigations to refine the TTZ or assess groundwater flux.

****

Conduct treatability testing to determine the[response of site NAPL viscosity and density to temperature increases][design and operational parameters for treatment of influent streams][necessary steam pore-volume flushes][_____]. Propose treatability testing procedures, including sampling of site media, test instrumentation, chemical analysis, and data analysis[in the RAWP][in a Treatability Study Work Plan]. Submit the Treatability Study Testing Results and Recommendations.

[

Perform initial field-scale pilot test to verify design assumptions and treatment performance. Propose objectives, location, duration, methodology, monitoring, and data analysis for the pilot test in the Treatability Study Work Plan.]

[

Conduct additional characterization activities as necessary to address data gaps regarding[the definition of the TTZ][and][groundwater flux through the TTZ]. Include [groundwater,][soil,][and][soil vapor] sampling[and permeability testing] in the characterization effort. Provide the rationale, number, location, and methodology for the proposed characterization in the RAWP. Present the results in the Baseline Sampling and Monitoring Point Installation Report.]

3.2 SITE PREPARATION

3.2.1 Protection

3.2.1.1 Stormwater Management

Provide stormwater collection and conveyance systems to prevent interference of stormwater with the ISTR system.[Stormwater collection piping exists on the property including within the ISTR treatment area[as shown on the drawings][as indicated in the design report].] Identify the locations of stormwater infrastructure and impact of existing infrastructure on ISTR operations. Design the ISTR system and surface cover to account for possible infiltration of site surface water. The impact that the footprint of the thermal cover has on stormwater runoff must be considered within the construction and stormwater permits detailed in[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____]. If required, describe upgrades to stormwater drainage features in the RAWP.

3.2.1.2 Environmental and Infrastructure Protection

Protect site vegetation, wetlands and critical habitat, site features, and infrastructure in accordance with the approved Environmental Protection Plan prepared in accordance with[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____]. Restore damaged areas and site infrastructure to at least its original condition upon completion of the project. Areas within the footprint of the TTZ, under conveyance systems and wiring, along site access roads, and within the area of the above-ground control and treatment systems are considered separate from these requirements and restoration of these areas is addressed in paragraph CLOSE-OUT ACTIVITIES.

3.2.2 Clearing and Grubbing

Conduct clearing, grubbing, and filling and grading necessary to prepare the site for placement of the surface cover, site access, and equipment in accordance with Section 31 11 00 CLEARING AND GRUBBING. Provide necessary filling, grading, compaction, and placement of aggregate necessary to provide stable conditions for site access and placement of equipment. Avoid disturbance to contaminated soils.

3.2.3 Infrastructure Removal, Rerouting, and Protection

****

NOTE: Critical infrastructure (e.g., communications lines, water supplies, sewer service) that cross or lie adjacent to the TTZ may need to be maintained and protected from the effects of heating or will need to be rerouted around the TTZ (e.g., non-watertight storm sewers). Other utilities may be heat-tolerant (e.g., ductile iron piping or pre-cast concrete sewer lines). If unneeded or if relocated, the abandoned utilities in the TTZ may need to be sealed to prevent undesirable contaminant migration or infiltration of cold water into the TTZ. Provide clear information and direction to the contractor on what utilities exist in the area of the TTZ in Government-furnished information or drawings.

****

Protect or relocate critical infrastructure indicated on the drawings.

Other utilities and infrastructure within the TTZ may be left in place, abandoned, or removed. Properly decommission monitoring wells that would be damaged during ISTR treatment in accordance with all applicable State and local requirements. Assure all materials used in the monitoring well decommissioning are compatible with temperatures and pressures to be generated during treatment so the locations will not allow releases of contaminants to the atmosphere or detrimentally affect treatment. Describe all procedures for protection, relocation, and decommissioning in the RAWP.

3.2.4 Monitoring Well Replacement

****

NOTE: The presence of monitoring or extraction wells within or near the TTZ that are not constructed with materials compatible with the elevated temperatures during treatment (e.g., PVC) or that may interfere with heating (e.g., metal wells near electrodes) need to be abandoned, and where necessary replaced with appropriately constructed wells. Section 33 51 39 MONITORING WELLS can be used to describe the installation requirements for the monitoring wells, but modifications to that specification would be necessary to address the conditions during ISTR. If Section 33 51 39 is used, delete all but the first sentence of this paragraph and replace with a reference to Section 33 51 39.

****

Replace or abandon monitoring wells identified on the drawings and in Table 3 with materials compatible with the conditions to be created during treatment. Follow State and local requirements, including regarding licensing of any driller, and ASTM D5092, with necessary and allowable modifications for the ISTR application. Develop the new wells until turbidity levels are less than [10][_____] nephelometric turbidity units (NTUs)[or as approved by the Government]. Install pressure- and temperature-rated wellhead fittings on monitoring wells within or near the TTZ. Include a sample port, and ball valve to allow pressure relief prior to opening. Describe well construction, installation methods, development, and abandonment techniques in the RAWP. Submit documentation of well construction and materials encountered in accordance with ASTM D5092 and ASTM D2488.

TABLE 3 - MONITORING WELLS

Well Name	Construction Details (Depth, diameter, screened interval, casing and screen material, grout type)	Abandon	Replace
[_____]	[_____]	[_____]	[_____]

3.2.5 Pre-Heating Sampling

****

NOTE: If groundwater remediation is required, sampling of new and existing groundwater monitoring wells in and near the TTZ prior to treatment should be conducted to establish a baseline condition. Pre-treatment soil or soil vapor sampling may be conducted if groundwater treatment is not required and remediation of the unsaturated soil is desired, or if unsaturated soil and groundwater are both to be remediated.

****

Sample the monitoring wells listed in Table 4 within [____] days prior to initiating heating.[Collect soil samples during the installation of new monitoring wells and temperature monitoring strings.] Collect, transport, and analyze samples in accordance with the requirements of the UFP-QAPP. Submit pre-heating sampling results in a Baseline Sampling and Monitoring Point Installation Report.

TABLE 4 - MONITORING WELL SAMPLING			
Well to be Sampled	New/Existing	Analyses to be Performed	Depth/Screened Interval
[_____]	[_____]	[_____]	[_____]

3.3 SYSTEM INSTALLATION

3.3.1 Equipment

Stage equipment in a location that minimizes impact to nearby residences and offset the staging area from the property boundary by at least [23][_____] meters [75][_____] feet. Assure all outdoor installations are weather-proof and all installations in hazardous locations meet NEC, NFPA, UL, National Electrical Manufacturers Associated (NEMA), and the US Occupational Safety and Health Administration (OSHA) requirements.[Winterize the ISTR system to allow operation during subfreezing conditions. Winterization may include, but is not limited to, insulation and heat tracing around piping and liquid vessels, insertion heaters, and recirculation within liquid storage vessels.]

3.3.2 Subsurface Instrumentation

Decontaminate drilling equipment prior to use at the site. Provide a copy of the drillers' licenses as part of the RAWP along with other personnel qualifications. Provide logs at representative locations as proposed in the RAWP with descriptions of materials encountered during drilling for information in accordance with ASTM D2488, including evidence of contamination potentially above treatment goals outside the TTZ.[Include details about the installation, location, and construction of temperature and pressure monitoring points in the Baseline Sampling and Monitoring Point Installation Report.]

3.3.2.1 Heating Infrastructure

Install [electrodes][heater wells][steam injection wells] at locations and to depths necessary to achieve treatment requirements and prevent contaminant migration from the TTZ in accordance with the RAWP.

3.3.2.2 Temperature Monitoring

Install temperature monitoring strings at locations indicated in the RAWP in boreholes dedicated for this purpose. Provide temperature sensors at a vertical interval of[1.5 meters 5 feet][3 meters 10 feet] [_____] meters [_____] feet within and including 3 meters 10 feet above and below the TTZ and with a density of one temperature string per[[380][_____] square meters [4,000][_____] square feet][[3,800][_____] cubic meters [5,000][_____] cubic yards]. Install a minimum of [75][_____] percent of temperature strings at the centroid between heating locations. Install additional temperature strings [3][_____]meters [10][_____] feet laterally outside the TTZ with a spacing of [15][_____] meters [50][_____] feet around the perimeter of the TTZ[and within [3][_____] meters [10][_____] feet of sensitive receptors].

3.3.2.3 Vapor and Pressure Monitoring

Install vapor monitoring points at locations indicated in the RAWP to allow vapor sampling and temperature and pressure monitoring. Provide vapor monitoring points within the vadose zone within and above the TTZ at a rate of at least one vapor monitoring point per [460][_____] square meters [5,000][_____] square feet and surrounding the TTZ at a rate of at least one every [60][_____] meters [200][_____] feet where no buildings are adjacent to the TTZ and every [30][_____] meters [100][_____] feet where buildings are adjacent to the TTZ. Install vapor monitoring ports every [3][_____] meters [10][_____] feet vertically above the TTZ and at likely steam migration depths outside the TTZ.

3.3.2.4 Subsidence Monitoring

****

NOTE: Where soils with high organic content (e.g., peat) exist within the TTZ, subsidence may occur during treatment. Monitoring of ground subsidence and settlement of engineered structures over or near the TTZ should be monitored.

****

Conduct a baseline elevation survey using a surveyor licensed in the state and monthly subsidence monitoring of surveyed elevation points over the TTZ and near footings or other load-bearing engineered structures. Survey in accordance with Section 33 51 39 MONITORING WELLS. Conduct a pre-heating structural survey of building over and near the TTZ. Report the results of the baseline surveys and the pre-heating structural survey in the RAWP and the results of monthly settlement measurements in the [weekly][monthly][_____] reports.

3.3.2.5 Vapor Recovery

Install vapor recovery wells [and surface plenum] as described in the RAWP. Vapor recovery wells may be integrated with heating wells. Install an adequate number and distribution of vapor recovery wells to recover volatilized contaminant mass and to prevent lateral contaminant vapor migration outside of the TTZ or uncontrolled contaminant vapor discharge to the atmosphere. Capture, manage, and transport volatilized and mobilized contaminants through a vapor recovery system to a treatment system.

3.3.3 Utilities

Arrange for the design, permitting, furnishing, and installation of all utilities required supporting the ISTR operations, including the electrical service drop and natural gas and process water supply. Provide a description of all utility work to be conducted and a drawing of the proposed utility layout as part of the RAWP. Install all wiring, conduits, and interconnections necessary for a fully operable system.

3.3.4 Surface Cover

****

NOTE: Unless the top of the TTZ is deep and there are no potential surface receptors, a surface cover is typically required to prevent vapor/steam emissions at the surface, prevent infiltration, and to insulate the ground surface to prevent condensation of contaminant vapors near the surface.

****

Install the surface cover over the [entire][portions of the] TTZ as described in the RAWP. Where the TTZ extends to within 3 meters 10 feet of the existing ground surface, extend the surface cover a minimum of [3][_____] meters [10][_____] feet beyond the lateral limits of the TTZ.

3.3.5 Piping and Cables

Construct all piping and other lines in such a manner (sloped) to prevent any media from condensing or collecting where it would not be recovered or otherwise interfere with effective operations. Install and maintain all piping/connections in a neat manner and properly support all piping in accordance with local and national codes. Lay out electrical supply lines and cables between power distribution equipment and the well field and treatment system using conduit, ramps, and cable bundling to minimize slip, trip, and fall hazards and exposure to vehicle traffic. All cables and conductor must be rated for electrical loading specified in the RAWP and constructed with materials compatible with its designated environment.

3.4 SITE SECURITY

Provide site security during ISTR installation and operation to protect site equipment and public safety[, including on-site security personnel,][security patrols,][and][cameras and motion detectors]. Provide[temporary]fencing with warning signs and gate access that is lockable. Provide adequate area lighting to support security monitoring and inspection of facilities[and assure that lighting is not directed at nearby residences]. During operation, integrate controls to shutdown the system if unauthorized site intrusion occurs. Provide security and fencing plans as part of the RAWP.

3.5 FIELD QUALITY CONTROL

3.5.1 Tests

Identify all field quality control tests in the [RAWP][Contractor Quality

Control Plan required in accordance with Section 01 45 00 QUALITY CONTROL]. Report the results of these tests in the Daily Contractor Quality Control Reports.

3.5.2 Inspection

Allow on-site audits and inspections by the Government during the remedial construction and operation.

3.6 COMMISSIONING AND STARTUP

Submit a Commissioning Plan as part of the RAWP. Notify the Contracting Officer at least 14 calendar days before starting commissioning. If multiple phases of thermal treatment are proposed, a separate commissioning plan is not required for each stage of treatment, but submit significant changes to the Commissioning Plan as an addendum.

3.6.1 Start-up Testing

Designate team members to participate in the pre-commissioning checks and the functional performance testing. Prepare pre-commissioning checklists that detail the critical system interlocks including type of alarm (shutdown or warning), instrument involved, and equipment affected by the alarms. The Government will be represented by the Contracting Officer[, the Design Agent's Representative, and a representative of the Using Agency]. Include the following team members:

Contractor's Chief Quality Control Representative
Contractor's Mechanical Representative
Contractor's Electrical Representative
Contractor's Testing, Adjusting, and Balancing Representative
Contractor's Controls Representative

Prepare commissioning checklists to be included with the Commissioning Plan. The commissioning team will complete each checklist. Indicate acceptance by each commissioning team member of each pre-commissioning checklist item by initials and date. Acceptance by each commissioning team member for each functional performance test checklist must be indicated by signature and date.

3.6.2 Commissioning Testing

Provide all materials, services, and labor required to perform the pre-commissioning checks and functional performance tests. Abort the pre-commissioning check or functional performance test if any system deficiency prevents the successful completion of the test or if any participating non-Government commissioning team member of which participation is specified is not present for the test.

3.6.2.1 Pre-Commissioning Tests

Perform pre-commissioning checks for the items indicated on the checklists. Correct deficiencies discovered during these checks and re-test in accordance with the applicable contract requirements. Complete and submit the Pre-Commissioning Checklist for Government approval.

3.6.2.2 Functional Performance Tests

Conduct functional performance tests for the items indicated on the checklists. Begin functional performance tests only after all pre-commissioning checks have been successfully completed. Tests must prove all modes of the sequences of operation and must verify all other relevant contract requirements. Begin tests with equipment or components and progress through subsystems to complete systems. Upon failure of any functional performance test checklist item, correct all deficiencies in accordance with the applicable contract requirements. The checklist must then be repeated until it has been completed with no errors. Submit a Commissioning Report.

3.7 APPLICATION

Commence operations following successful commissioning in accordance with the RAWP.

3.7.1 Safety and Environmental Controls

Take corrective measures to cease any unexpected release of steam and contaminant vapors at the surface or in nearby potentially occupied spaces.[Prevent stray voltages above 15 Volts within the TTZ and within [_____] meters [_____] feet of the TTZ.] Prevent contact with hot piping and equipment by workers, visitors, and trespassers.

3.7.2 Monitoring and Data Collection

****

NOTE: Most ISTR contractors have automated data collection systems that record temperature data from thermistors and flow rates on essentially a continuous basis. Concentration data for vapors are typically collected using photoionization detectors or similar equipment on a daily (or more frequent) basis, supplemented by confirmatory fixed-laboratory analyses. Treated vapor and liquid effluent concentrations are measured on a frequency that are sensitive to the rate of contaminant loading, regulatory expectations, and the robustness of the treatment system.

****

Monitor the following parameters in accordance with Table 5. Describe the sampling locations and frequencies for parameters not listed in Table 5 in the RAWP. Include summaries of recorded parameters and interpretations of these data in weekly reports. Submit monthly reports that roll up the interpretation of these data and propose any changes necessary to operations.

3.7.2.1 Temperature Monitoring

The Government may require replacement of a temperature sensor if it fails and is critical for evaluating the attainment of performance goals.

3.7.2.2 Mass Removal Monitoring

Monitor mass removal rates in all media including vapor and condensed liquids based on the inflow to the treatment systems. Monitor, as needed for optimization of subsurface treatment, mass removal from specific wells or system legs.

3.7.2.3 Air Monitoring

Prepare and implement under the supervision of the Safety and Health Manager an exposure monitoring and air sampling program to identify and quantify safety and occupational health hazards and airborne levels of hazardous substances to assure proper selection of engineering controls, work practices and personal protective equipment for affected site personnel[and nearby residences, business, and other occupied structures or activities]. Describe the program in the [Site Safety and Health Plan][RAWP] in accordance with Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES.

3.7.2.4 Power Input

Monitor total power input to the TTZ and to all individual energy delivery points daily.

3.7.2.5 Piezometric Monitoring

Monitor piezometric levels to assess groundwater flow through or below the TTZ.

3.7.2.6 Groundwater Monitoring

Collect groundwater samples from locations and with a frequency as specified in Table 5. Propose well-head design and hot groundwater sampling methods in the UFP-QAPP and conduct the sampling in accordance with all safety requirements described in the Site Safety and Health Plan.

TABLE 5 - OPERATIONAL MONITORING

Parameter	Frequency	Locations	Required Analysis Turn-Around Time (days)	Notes
Subsurface Temperature	[continuous] [daily] [______]			
Subsurface vapor concentrations	[weekly] [______]			
Subsurface pressures or vacuum	[weekly] [______]			
Piezometric levels	[monthly] [______]			
Groundwater contaminant concentrations	[monthly] [______]			

TABLE 5 - OPERATIONAL MONITORING				
Parameter	Frequency	Locations	Required Analysis Turn-Around Time (days)	Notes
Air monitoring results	[per permit equivalent] [_____]			
Power input (total and by individual point)	[weekly] [_____]			
Extracted vapor contaminant concentrations	[daily] [_____]			
Condensate contaminant concentrations	[weekly] [monthly] [_____]			
NAPL recovery	[weekly] [_____]			
Total extracted vapor flow rate	[daily] [hourly] [_____]			
Recovered liquid flow rates	[daily] [_____]			
Liquid treatment effluent contaminant concentrations permit parameters	[per permit equivalent] [_____]			
Vapor treatment effluent contaminant concentrations permit parameters	[per permit equivalent] [_____]			

3.7.3 Availability of Monitoring Data

Make all parameter data available to the Government via a secure project web page or similar means. Include tabulated data identified in Table 5, and provide temperature[, subsurface vacuum/pressure data][, power input,][and][_____] available in graphical form in both map and cross-sectional view to facilitate Government assessment of project progress. Include the same data in weekly and monthly reports.

3.7.4 Adjustments to Operations

Make adjustments to vapor [and liquid] recovery system, energy input, or groundwater controls to address areas that are not making necessary progress toward meeting treatment goals as expected or where unacceptable contaminant migration may be occurring. Propose cessation of heating to limited portions of the site that are believed to have met treatment goals for Government approval in weekly and monthly report.

3.7.5 Notification of Critical Alarms and Shutdowns

Notify the government within [24][_____] hours of critical alarms and unplanned shutdowns that last longer than 2 hours. Outline these alarm conditions in the RAWP.

3.7.6 Weekly and Monthly Reports

Submit an electronic version of the process monitoring result reports to the Government on a weekly basis during the ISTR start-up, testing, operation and maintenance phases of the project to document monitoring of the treatment process. The electronic data must be submitted in a spreadsheet (e.g., Microsoft Excel). The process monitoring data to be included are specified in paragraph MONITORING AND DATA COLLECTION, and include the following parameters, tabulated, when possible, with a short associated text description:

a. Power and energy input during period.

b. Temperatures at each measurement point and depth as well as at heater wells.

c. Pressures at each measurement point and depth.

d. Vacuums and flow rates from each vapor recovery well and through the entire system.

e. Vapor volatile organic compound (VOC) measurements at each location monitored.

f. Mass (discrete and cumulative) of total VOCs removed.

g. Running mass (discrete points and cumulative total) of VOC emissions from the well-field.

h. Running indication of vapor treatment removal efficiency.

i. Amount of groundwater/process water generated during the reporting period.

j. Description of any wastes generated during reporting period and their disposition.

k. System runtime hours, and downtime log with description of reasons and corrective actions; and

l. Any other data (soil, groundwater, air, soil gas, etc.) obtained during the reporting period.

Monthly progress reports must be submitted within 14 days of the reporting period. Monthly reports must include all cumulative routine operational data, any available analytical data collected, and a summary of progress towards meeting the performance criteria.

3.8 SHUTDOWN AND CLOSEOUT

****

NOTE: The cessation of heating is based on the interpretation of the temperature, energy delivered, mass removal rates, and media concentrations, in that order, conducted jointly by the contractor and the Government. The contractor may propose the cessation of heating for Government approval. The Government may allow a temporary shutdown of power input to facilitate sampling of soil and groundwater with the understanding that the system may need to be restarted based on the sampling results. Until confirmation is received that all performance requirements have been attained, all contractor equipment should remain on-site.

****

3.8.1 Basis for Shutdown

Propose cessation of heating when it can be inferred based on parameter measurements, including temperatures, energy input, mass removal, and media concentrations, that the [soil][and][groundwater][has][have] achieved performance goals set forth in paragraph PERFORMANCE REQUIREMENTS. Cease heating only with the approval of the Government. Assume Government review and approval will be provided within [5][_____] business days. Continue vapor control measures following cessation of heating[for two weeks][for four weeks][for [_____] days][, and until vapor migration to the surface and contaminant condensation outside the TTZ is no longer a risk to workers or the community]. Maintain all equipment in stand-by condition pending confirmation of attainment of all performance goals. These requirements also apply for cessation of heating in a portion of the TTZ. If performance goals have not been attained, resume heating throughout the TTZ, or with Government approval, within a portion of the TTZ that has not attained performance goals. Submit all Post Heating Sampling Results to the Government in a timely manner to support shutdown decisions.

3.8.1.1 Confirmation Groundwater Sampling

****

NOTE: If groundwater concentration targets are part of the treatment goals, requiring the acquisition of groundwater samples at other locations may be prudent, especially those areas that did not sustain boiling temperatures or that were still yielding some contaminant mass. Specifying obtaining

groundwater grab sampling at a number of location as directed by the Government is optional, but recommended.

****

Consider groundwater sampling results in assessing attainment of performance goals, including the potential for rebound and inflow of contaminants from areas outside the TTZ. Conduct a minimum of [one][two][_____] round[s] of groundwater sampling after cessation of heating to verify attainment of the performance goals. Obtain samples from the monitoring wells identified in Table 4 and analyze the samples for the analytes in Table 4. Conduct all sampling in accordance with hot sampling methods outlined in the UFP-QAPP and the Site Safety and Health Plan.[Obtain additional groundwater grab samples during soil sampling at [_____] locations directed by the Government, and analyze these samples for the same list of contaminants as the samples from the monitoring wells.]

3.8.1.2   Soil Sampling

****

NOTE: Subsurface soil sampling is difficult during active heating given the typical presence of piping, cabling, and a surface cover that prevents access for even small drill rigs. Pre-planned drilling access or temporary removal of piping and other infrastructure can make sampling possible. Such sampling can be very useful in assessing progress. Soil sampling can be conducted after cessation of heating for confirmation sampling. Removal (or extraordinary protection) of surface infrastructure is required, so confirmation soil sampling is not typically conducted without a high level of confidence that performance goals have been achieved.

****

Conduct soil sampling to confirm attainment of performance goals only after other evidence, including mass removal rates and extracted concentrations, indicate a high likelihood of attainment of these goals. Remove surface cover, if this can be safely done without allowing discharge of contaminant vapors and steam, and relocate piping and cabling as necessary to provide access for drilling equipment.[Replace surface cover following the soil sampling.] Sample soil at[one location per [____] square meters [____] square feet of the TTZ] [[____] locations][as specified in the UFP-QAPP][as directed by the Government][at the centroid of areas between heater locations][and at locations that either did not attain target temperatures or attained them for the shortest time]. Obtain soil samples at up to [5][_____] locations above and below the TTZ and at locations [2][_____] meters [6][_____] feet outside the TTZ lateral boundary and spaced every [30][_____] meters [100][_____] feet around the perimeter of the TTZ to assess condensation or downward migration of contaminant. Conduct hot soil sampling in accordance with procedures described in the UFP-QAPP and in accordance with the Site Safety and Health Plan.

3.8.2   Retention of Equipment

Retain all contractor-furnished equipment upon the verification of the attainment of the treatment goals. Government-furnished equipment will remain the property of the Government.

3.8.3 Basis for System Restart

****

NOTE: It is common for the ISTR system to be restarted after confirmation soil sampling at least until the receipt of the analytical results.

****

Following the initial cessation of heating, restart the system upon the direction of the Government or if the [soil][and][groundwater] sampling results indicate the treatment goals have not been fully achieved. These criteria also apply for restart of heating in a portion of the TTZ.

3.8.4 Close-Out Activities

Begin close-out activities only after receiving authorization from the Government.

3.8.4.1 Equipment, Cover, and Piping Removal

Remove all the contractor-furnished equipment, material, temporary facilities, and supplies from the site and clean the area. If a surface cover is used, remove and dispose of it off site in accordance with applicable local, state, and federal requirements. Restore the site to the condition that existed before commencement of the ISTR. Restore any impacted stormwater drainage pipes to full working condition at the end of ISTR operations. If the Contractor protected existing infrastructure from elevated temperatures in the TTZ, conduct tests during restoration to document restored conditions match or exceed baseline conditions.

3.8.4.2 Recycling and Waste Disposal

Recycle or process for reuse any materials and equipment that would have suitable value. This may include plastic and/or concrete cover materials, piping, wiring, and spent non-hazardous granular activated carbon.[Manage spent carbon and other wastes in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.] Decontaminate materials for recycling or reuse to the extent necessary prior to removal from the site.

3.8.4.3 Well Decommissioning

****

NOTE: Suggest including an approximate estimate of the number of monitoring wells that will be retained. The number of monitoring wells to be retained will likely depend on the results of the ISTR and can't easily be predicted. It may be best to retain all monitoring wells and decommission them at a later date under separate contract.

Well abandonment procedures are usually governed by state or local requirements and often involve pressure grouting and removal of the upper 0.6 to 1.5 meters 2 to 5 feet of the well or other infrastructure with necessary backfilling.

****

Decommission subsurface infrastructure, including heater, extraction, and injection wells, temperature sensor strings, vapor/vacuum monitoring points in accordance with state and local requirements with modification as necessary for the construction of the features and the residual heat in the TTZ. The Government will identify monitoring wells to be retained for future monitoring. Provide documentation of the decommissioning activities in the remedial action report.

3.8.4.4 Site Restoration

Restore the site to the condition that existed before commencement of the ISTR (except for the items discussed above), grade to ensure proper drainage, and revegetate to prevent erosion until final site restoration. Provide photographic documentation of completed restoration activities in the remedial action report.

3.8.4.5 Remedial Action Report

Submit a Remedial Action Report. The remedial action report must include, but is not limited to the following:

a. Description of field operations including energy applied, duration of treatment, temperatures reached, mass removal rates and cumulative totals over time, monitoring point concentrations over time.

b. Evaluation of ISTR effectiveness relative to treatment requirements.

c. All sampling results, which are to include process monitoring and confirmation sampling results, perimeter and work zone air monitoring results, and monitoring results.

d. Any deviations from the approved RAWP, UFP-QAPP, and rationale/justification for each.

e. Any site restoration activities.

f. As-built drawings which are to detail well field infrastructure locations, all confirmation sampling locations, air monitoring locations, monitoring well locations, and depict post restoration site conditions.

g. As-built drawings for excavations detailing the horizontal and vertical extent of excavations and confirmation sampling locations.

h. Wastes generated and disposition (including characterization analysis of wastes).

i. Chemical data final report.

j. Lessons Learned as an appendix.

k. Photos of the installed wells, piping, surface cover, treatment equipment, sampling activities, effluent discharge locations, any recovered NAPL, and pre- and post-treatment site surface conditions, as appropriate.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**
****

PART 1 GENERAL

****
NOTE: An edited version of this Section may be used to solicit a request for proposal (RFP). Use of an RFP approach may prevent the contract from being awarded to a Contractor that is not technically qualified. This guide specification was developed based on the use of landfarming to treat contaminated soil. Other terms that have been used in place of "landfarming" include "land treatment" and "prepared bed bioreactors." The same process is believed to be applicable for treatment of some other types of organic contaminants in soil. Bioremediation processes, such as landfarming, are usually considered innovative

technologies, and may satisfy CERCLA/SARA considerations of innovation in remediation.

According to Landfarming guidance from the Federal Remediation Technologies Roundtable (FRTR), Landfarming typically applies to treat aerobically biodegradable compounds including nonhalogenated volatile organic compounds, nonhalogenated semivolatile organic compounds, oily sludge, wood-preserving wastes (e.g. pentachlorophenol [PCP] and creosote), and fuels. Landfarming does not effectively degrade chlorinated and nitrate-containing compounds due to the need for anaerobic conditions. Other conditions should be considered when selecting Landfarming. A large amount of space is required and debris greater than 8 3 inches in diameter typically should be removed prior to processing. Very high contaminant concentrations and heavy metals can be toxic to microorganisms. Local regulatory requirements should also be taken into consideration since some volatile contaminants may evaporate during aeration instead of being biodegraded. These constituents may be required to be trapped and treated to avoid release to the atmosphere. This specification section presumes that the project team has confirmed landfarming is generally a feasible remedy for the site before the specs and contract are prepared.

Please also note that "Contracting Officer" mentioned throughout this document is intended to be an umbrella term for anyone, including the Contracting Officer, designated by the Contracting Officer.

Recommended references for design and operation of landfarming facilities include:

1. Bioremediation of Contaminated Soils, Agronomy Monograph no. 37, American Society of Agronomy, Crop Science Society of America, Soil Science Society of America, 1999. This includes the following chapter titles: "Prepared Bed Bioreactors", Sims, J. L., et al., and "Landfarming of Petroleum Contaminated Soils", Sims, R. C. and Sims, J. L.

6. Website: Center for Public Environmental Oversight, Webpage: Land Farming, http://www.cpeo.org/techtree/ttdescript/lanfarm.htm>http://www.cpeo.org/techtr accessed December 2023 .

7. Website: Federal Remediation Technologies Roundtable, Webpage: Landfarming, https://www.frtr.gov/matrix/Landfarming/>https://www.frtr.gov/matrix/Landfarmi Accessed July 2024.

A systematic project planning approach should be employed when developing sampling procedures to demonstrate the performance of the landfarming treatment process, ideally through implementation of the Uniform Federal Policy for Quality Assurance Project Plans (UFP-QAPP). A specific landfarming work plan documented the sampling procedures is also acceptable and can be an appendix of a UFP-QAPP or a standalone document, depending on the project.

The landfarming treatment considered in this guide specification starts with the raw contaminated material; a treatment cell is constructed; contaminated soils are pre-processed, placed into the treatment cell, and amended with various treatment agents; contaminated soils are tilled, aerated, and moisture controlled as necessary; testing is conducted to confirm treatment performance; and ends with final disposition of the treated material (either left in-place, moved to an on-site designated permanent storage unit, or transported off-site for final disposal). As applicable, refer to Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL for requirements related to excavation and stockpiling of the contaminated materials; Section 31 00 00 EARTHWORK for placement of treated materials in on-site permanent storage; and Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS for requirements relevant to offsite transportation and disposal.

****

1.1 MEASUREMENT AND PAYMENT

****

NOTE: Edit this paragraph based on whether the Contract will use a single job price or unit prices. If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is in the project, move these paragraphs to that Section for editing. The project team should involve their Contracting Office to determine the best way to create a payment schedule/milestone

for their Contract or Task Order.

If the project includes Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS, coordinate measurement and payment methods and contaminated material handling and stockpiling between this Section and Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS.

If the quantities of contaminated soils are well defined, payment may be based upon a single job price structure. However, it is usually more cost-effective to use a unit price structure when there is a significant degree of uncertainty in the amount of contaminated material. When the amount of contaminated material is inadequately defined or uncertain, a data gap investigation is generally advised before any landfarming activity begins. When specifying a unit price structure for treatment, separate items should be provided in the Contract Price Schedule to cover any other work required. Other work items include, but are not limited to: preparation of submittals, mobilization and demobilization, site preparation, construction of the treatment cell and run on/runoff controls, water storage facilities, contact water treatment and disposal, sampling and testing, implementing health and safety requirements, and utilities. Inclusion of separate items in the Contract Price Schedule for the above work tasks should result in a lower unit price for treatment.

****

1.1.1 Unit Prices

1.1.1.1 Field Demonstration

****

NOTE: Prior to planning the field demonstration, bench-scale treatability study testing should be performed to determine if the contaminants of concern are amenable to landfarming in the site-specific soil matrix. The field demonstration may either be conducted prior to the construction of the full-scale facilities, or conducted using the full-scale facilities and equipment. Payment for the field demonstration should be covered by a separate single job price, or by a unit price that is separate from the unit price for full-scale treatment. Because more intensive monitoring is usually required during the field demonstration, the unit price for the field demonstration will usually be higher than the unit price for full-scale treatment. Testing for chemical data is not included as a component of the price in this paragraph. The contract price schedule should include separate, unit price items for testing for chemical data.

If the results of the field demonstration indicate that an extended treatment period (or other special measures) will be required to meet cleanup goals, it may become necessary to modify the bid item that covers treatment pricing for full-scale operations.

****

Payment for the field demonstration must be[by the Contract unit price schedule for each[cubic meter yard][_____] treated during the field demonstration][a lump sum price for completion of approved tests]. The price must include the cost of labor, materials, equipment usage, utilities, and fuel for: [pre-processing,][operation, maintenance and process monitoring (not including testing for chemical data),][ancillary waste treatment and disposal,][preparation of Field Demonstration Report,][and][_____]. Costs for procurement and handling of amendments must be included in the unit price for treatment.

1.1.1.2 Contaminated Soils Treatment Unit Price

****

NOTE: Testing for chemical data is not included in the unit price. The contract price schedule should include separate, unit price items for testing for chemical data.

Unit price payment may either be based on weight or volume (in-place or ex-situ). This paragraph uses ex-situ volume as the default unit.

If unit price payment will be based on weight, dry weight should be specified and requirements should be included for moisture content testing so that dry weight can be determined. However, surveys are usually required before and after excavation of contaminated material, so that excavation and backfilling can be paid for on the basis of in-place volume. Thus, in some cases, it may be advantageous to pay for processing and treatment of soils using in-place volume as the pricing unit.

If the size of the site is well-known, it may be reasonable to simplify contracting and subsequent billing, performance verification and payment by awarding the project as a fixed single job price. If flexibility is desired, additional volume or additional weight may be contracted at fixed unit rates, however additional surveying or other performance verification will be needed for the additional effort beyond the single job price effort.

This paragraph should be coordinated with the treatment criteria and sampling requirements paragraphs so that it will be possible to distinguish between soil that passes, and does not pass, treatment criteria.

****

[Payment for treatment of contaminated soil will be by the contract unit price schedule for each cubic meter yard of contaminated soil that is treated based on [ex-situ volume, after separation of oversize material][_____].

][Payment for treatment of contaminated soil will be by the contract unit price schedule for each metric ton ton of contaminated soil that is treated. Use a properly calibrated weighing system to accurately measure the gross (bulk) weight of the contaminated material. Convert the measured gross (bulk) weight of the contaminated materials to be treated to dry weight based on the[percent moisture content of representative contaminated material samples. Determine the percent moisture content in accordance with[ASTM D2216][ASTM D4643][ASTM D4959][_____]. Determine moisture content[daily][for every[500][_____] metric tons tons of contaminated material that is treated]][_____].

]This unit price must include the cost of labor, materials, equipment usage, utilities, and fuel for: [pre-processing,][operation, maintenance and process monitoring (not including testing for chemical data),][ancillary waste treatment and disposal,][preparation of operations reports,][and][_____]. Costs for procurement and handling of amendments must be included in the unit price for treatment. After each lift of soil has been treated, the quantity of soil that does not meet treatment criteria must be reported and subtracted from the quantity of soil comprising the lift, when determining payment for treatment. See paragraph TREATMENT CELL SIZING for a definition of "lift of soil". Payment will not be made for soil that does not meet treatment criteria. If additional tests, or additional processing and testing, are necessary to show that material meets treatment criteria, the additional costs must be borne by the Contractor.

1.1.1.3 Oversize Materials from Contaminated Areas

****

NOTE: This paragraph should be deleted if payment for treatment and disposal of oversize materials will be included as part of the unit price item for treatment of contaminated soil. Payment for disposal of oversize materials may be by weight or volume, depending on the nature of the materials. Oversize materials may include brush, trees, roots, rocks, rubble, and construction debris.

****

Payment for[treatment][and][disposal] of oversize material separated from contaminated soil will be by the Contract unit price schedule for each[kilogram pound][_____]. Separate soil, free water, and other extraneous materials from oversize materials prior to measuring quantities.

1.1.2 Single Job Prices

[1.1.2.1 Bench-Scale Treatability Study Testing

****

NOTE: Single job pricing is recommended for each bench-scale treatability study testing run. The single job price should include the cost for testing for chemical data. However, bidders should also be required to provide a unit cost amount for testing for chemical data. This will provide a basis for

payment for additional analytical costs, if it is determined that more testing will be required.
****

Payment for bench-scale treatability study testing will be a single job price for completion of specified tests. Include in the price the cost of labor, materials, equipment usage, utilities, and fuel for:

[a. Preparation of the bench-scale treatability study test plan.

][b. Collecting samples.

][c. Sample shipment.

][d. Pre-processing.

][e. Process monitoring (including testing for chemical data).

][f. Disposal of treated material and waste.

][g. Ancillary waste treatment and disposal.

][h. Preparation of the bench-scale test treatability study report.

][i. [_____]].

Costs for procurement and handling of amendments must be included in the unit price for treatment.

]1.1.2.2 Other Work Items

****
NOTE: Coordinate this paragraph with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS. Temporary utility connections are covered in Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.
****

Payment for work items not included above must be included in the payment for the base bid for treatment of the contaminated materials. The other work items include submittals related to mobilization and demobilization, site preparation in the treatment cell, manufacturers' field services, environmental compliance monitoring, health and safety monitoring and controls, and utilities required for the landfarming treatment if approved by the Government as necessary for the project.

1.2 REFERENCES

****
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of

the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

[1.3 PRECONSTRUCTION MEETING

****

NOTE: Delete this paragraph if the requirements are included in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS, Section 01 32 01.00 10 PROJECT SCHEDULE, or other Specification Section.

Appropriate facility personnel should be present at the pre-installation meeting if siting of the treatment facility and other associated work areas will be discussed.

****

Arrange and conduct a preconstruction meeting at the jobsite[at least five business days prior to the start of operations on the project][_____]. The preconstruction meeting must follow the written preconstruction meeting agenda submitted [_____] days prior to the meeting. The purpose of this meeting is to review the requirements of this Section and the associated plans. The following individuals must attend this meeting: [Contractor's project manager,][site foreman,][and Contracting Officer].

Record preconstruction meeting minutes and publish via email within 48 hours to the attendees. Re-publish the meeting minutes within 48 hours via email pending subsequent comments from the attendees.

]1.4 SYSTEM DESCRIPTION

****

NOTE: Requirements for a specific method of treatment are provided below. If the use of a variation on landfarming process described will be allowed, this paragraph should be revised to indicate that a process, other than described in this Section, may be proposed by the Contractor; that the Contractor's approved submittals must demonstrate equivalent capabilities; and that such approval will not relieve the Contractor of responsibility for meeting specified requirements for safety, reliability, and performance.

****

Perform treatment using a safe, reliable method to treat contaminated material conforming to paragraph PERFORMANCE REQUIREMENTS. Requirements for a specific method of treatment are provided below.[The Contractor may propose an alternative treatment method. Government approval of a Contractor-proposed plans does not relieve the Contractor of responsibility for meeting specified requirements for safety, reliability, and performance.]

1.4.1 DESIGN REQUIREMENTS

1.4.1.1 Landfarming Treatment Cell

****

NOTE: Siting of the treatment facility should be in accordance with regulatory requirements. The prevailing wind direction and the potential for dust generation should also be taken into consideration. The design of the treatment cell should include provisions for control of storm water and contact water, and should take into account the expected wheel loads of material handling equipment.

In-situ applications of landfarming are usually not recommended due to the potential for spreading contamination into the vadose zone and groundwater. Typically, treatment of contaminated soil is performed in a lined treatment cell. Lined treatment cells usually include a composite clay or geomembrane liner with a leachate collection system.

Care should be used when applying standards established for landfill liner systems, to avoid requiring over-conservative and costly designs.

****

Locate the treatment cell in an area where seasonal, high water table level is at least [1.5][_____] meters [5.0][_____] feet below the lowest level of the liner. The treatment cell must be designed to support the load of material handling and tilling equipment. Provide the water collection system and sump in accordance with paragraph CONTACT WATER MANAGEMENT SYSTEM AND DESIGN STORM.

1.4.1.1.1 Treatment Cell Sizing

****

NOTE: The dimensions of the treatment cell should be based on the amount of time required to reach cleanup goals for each lift of soil (including laboratory turn-around time for compliance testing), the volume of soil and amendments that can be held in the treatment cell, the configuration of the irrigation system, and the type of material handling equipment that will be used. A pie-shaped, or semi-circular, treatment cell lends itself well to the use of a center-pivot irrigation system. Laboratory turn-around time is usually about 2 to 4 weeks. The depth to which soil can be treated (i.e., lift depth) is limited by the practical depth of tilling (usually about 300 mm 1 foot).

Traditionally, new lifts of contaminated soil were placed in the treatment cell after treatment of

preceding lifts were completed. However, material handling requirements may be decreased by placing the entire volume of contaminated soil onto the treatment cell at once. Under the latter scenario, treated lifts are successively removed after they have been shown to meet clean-up goals. One-time placement of all the contaminated soil onto the treatment cell may also eliminate the need to establish a contaminated soil stockpile area.
****

Locate the treatment cell [within the area indicated on the drawings][_____]. Size the treatment cell to hold at least [_____] cubic meters cubic yards of soil per lift, based on a lift depth of [0.3][_____] meters [1][_____] foot. A lift is a single layer of contaminated soil contained within the treatment cell which can be mixed to it full thickness by tilling. Active treatment occurs primarily in the uppermost lift of soil in the treatment cell. Traditionally, a new lift of contaminated soil is placed in the treatment cell after treatment of the preceding lift has been completed. Alternatively, the entire volume of contaminated soil may be placed onto the treatment cell at once; then treated lifts are successively removed after they have been shown to meet clean-up goals. Size the treatment cell based on completing treatment of the estimated, total volume of contaminated soil in [_____] months from initiating treatment of the first lift, assuming treatment is initiated on the following date: [_____].

1.4.1.1.2 Porous Drainage Layer

****
NOTE: Specification of the drainage layer is deferred to Section 33 46 16 SUBDRAINAGE PIPING. The remaining information is provided for consideration when preparing that specification section. The gradation limits of the porous drainage layer should be compatible with the grain-size distribution of the contaminated soil. Gradation limits should be determined as shown in EM 1110-2-1913, Engineering and Design - Design of Construction Levees (see Appendix D Filter Design). The slot width of the leachate drainage piping (or pore size of filter fabric around the drainage piping) must also be compatible with the gradation limits of the porous drainage layer.

Geotextiles may be incorporated into the porous drainage layer to help prevent fines from migrating into the leachate collection system. Due to the potential for clogging, use of geotextiles could pose a problem for a treatment cell that is designed for long-term operation. Geotextiles provide attachment sites for microorganisms. Growth of biomass may lead to reductions in the permeability of the geotextile material. However, experience at Region 8 EPA landfarming operations for treatment of creosote-contaminated soil indicates that clogging of geotextile has not been observed at projects that were completed within about 5 years.

To protect the drainage piping, a minimum distance should be maintained between the top of the drainage piping and the top of the porous drainage layer (e.g., 203 to 254 mm 8 to 10 inches). Use of low-profile piping, such as panel pipe for highway edge drains, laid flat against the geomembrane will allow the thickness of the porous drainage layer to be minimized.

****

Provide a porous drainage layer in accordance with Section 33 46 16 SUBDRAINAGE PIPING. Design the porous drainage layer to facilitate drainage of free water and to prevent entry of contaminated soils.

1.4.1.1.3 Leachate Controls and Collection

****

NOTE: Specification of the drainage layer leachate controls and collection is deferred to Section 33 46 16 Subdrainage Piping. The remaining information is provided for consideration when preparing that specification section. Lined landfarm units should have a granular drainage layer to allow free water to drain from the soil layer, and a leachate collection system to remove drainage. Some problems unique to landfarming applications are:

a. Exposure to equipment traffic (e.g., applying soil, tilling, and removing soil), can damage drainage layers and liners.

b. Removing lifts of treated soil requires scraping and shoveling the treated lift from the treatment cell, typically with a front-end loader. To protect the leachate collection and geomembrane layers, an armoring layer (gravel or crushed stone) is often used to indicate over-excavation to the equipment operator. The armoring layer is usually positioned immediately above the porous drainage layer.

Slotted piping generally has more area available for water to flow into the pipe than perforated piping, and is less susceptible to clogging and fouling than filter fabric covered piping. Thus slotted piping should be considered for treatment cells that are designed for long-term operation, or where clogging or fouling is a strong concern.

Perforated piping is generally less expensive than slotted. The combination of perforated piping within a geotextile (filter fabric) sleeve has been used with success in landfarm drainage layers. The pore size of the geotextile must be compatible with the grain-size distribution of the porous drainage layer. Installing a layer of geotextile across the entire area of a treatment cell is not recommended because it would require substantially more material than using only geotextile sleeves around the collection piping, and geotextile sheets would be

susceptible to damage during removal of lifts of treated soil.

Leachate drainage lines are routed to a sump, which is usually placed below the treatment cell. The sump usually consists of a lined depression in the impermeable layer packed with gravel. Water holding facilities outside of the treatment cell are commonly used for additional water storage capacity. When the gravel sump reaches a set level, water is pumped from the sump to the outer water holding facility. Options for water storage facilities outside of the treatment cell include: an above-ground storage tank, a reinforced concrete basin, vertical caisson piping, or a lined earthen pit.

See U.S. Army Corps of Engineers, CPD-74B, Hydrologic Modeling System HEC-HMS, Technical Reference Manual, March 2000 for additional information on runoff issues relevant to landfarming.

****

Provide leachate controls and collection in accordance with Section 33 46 16 SUBDRAINAGE PIPING.

1.4.1.1.4 Geomembrane and Clay Liners

****

NOTE: Liners usually consist of high density polyethylene (HDPE) geomembrane or recompacted clay. It is atypical to require a composite liner system for a temporary landfarming facility. Options have been provided for HDPE liners and recompacted clay liners.

If granular material in the drainage layer is greater than 13 mm 1/2 inch, a sand or geotextile protective layer should be required between the geomembrane liner and the granular material.

The drawings should provide requirements for sloping of the surface of the liner. Recommended, minimum sloping requirements are as follows: 2 percent from the sides of the treatment cell to the central drainage line, and 1 percent over the length of the central drainage line (from the upslope end to the entry into the gravel sump).

Sections 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT and 02 56 13.16 CLAY WASTE CONTAINMENT provide some testing requirements for the liner. Additional testing and leak monitoring may be necessary for some projects. Leak monitoring will be more important for projects where the treatment cell is located over an area with clean groundwater and a clean vadose zone.

Monitoring wells, downgradient of the treatment

cell, can be used to determine if leaks have occurred in the past. Lysimeters may be installed within and around the perimeter of the treatment cell. If used, lysimeters should be installed before the liner to avoid damage to the liner during placement of lysimeters. Penetrations through the liner must also be properly sealed. Generally there is greater potential for leaks to occur in the sump, than in other locations of the liner. Water may remain in the sump for extended periods if the sump is being used to store contact water.

Leak sensing technologies are described in the following reference, Leak Detection for Landfill Liners, Overview of Tools for Vadose Zone Monitoring, Karen Hix, Technology Status Report Prepared for USEPA Technology Innovation Office under a National Network of Environmental Management Studies Fellowship, Aug. 1998. The reference can be accessed at the following internet site: http://www.clu-in.org/download/char/leaklnfl.pdf

Most of the leak sensing technologies involve installation of leak sensing devices below the liner, prior to placement of the liner. Because of the relatively high capital and operation and maintenance (O&M) costs for leak detection systems, they are usually not installed.

As a relatively inexpensive construction QA measure, the Two Electrode method can be used for leak testing of the sump area. The test can be performed by filling the sump with water (before it has been filled with gravel) for a set period (e.g., 24 hours), and monitoring for passage of current from the inside the sump to the soil outside of the sump area. If current is detected in the electrode placed in the soil outside of the sump area, then the liner is checked for penetrations, repaired, and the test is repeated.

Leak testing, using one of the methods or devices described in the above reference, is highly recommended; especially in the area immediately below the sump.

****

Line the treatment cell with [a chemically resistant, high density polyethylene geomembrane liner with a minimum thickness of [0.1][_____] mm [40][_____] mils.][a recompacted clay liner with a minimum thickness of [0.6][_____] meters [2][_____] feet and a maximum permeability of [1 x 10^{-7}][_____] cm/s [3.28 x 10^{-9}][_____] feet/s.] Subgrade preparation and installation, testing, inspection, and protection of the liner, must be in accordance with Section [02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT][02 56 13.16 CLAY WASTE CONTAINMENT]. The surface of the liner must be sloped [as indicated][_____].

1.4.1.1.5 Other Work Area Surfaces

****

NOTE: This paragraph should be revised if paved surfaces will not be required. It may be necessary to require paving in areas designated for handling contaminated material and operation of heavy equipment (e.g., front-end loaders). Concrete pads are typically more expensive, though less permeable than asphalt pads. Asphalt pads have been used for hazardous waste composting projects.

****

Locate the soils pre-processing area[within the area indicated][_____], and construct and pave in accordance with Section [03 30 00 CAST-IN-PLACE CONCRETE][_____].

1.4.1.2 Contact Water Management System and Design Storm

****

NOTE: In accordance with regulatory requirements, excess contact water may be discharged to National Pollutant Discharge Elimination System (NPDES) storm water discharge outfalls, publicly owned treatment works (POTW) sewers, facility sewer to onsite treatment systems, or treated and disposed of offsite.

The source of data for the design storm should be referenced. Sources for hypothetical storm information in the United States are referenced in Appendix A of Hydrological Analysis of Ungaged Watersheds Using HEC-1, Training Document No. 15, USACE Hydrologic Engineering Center, April 1982; another source is NOAA Atlas 14. Previous through current versions of the HEC Hydrologic Modeling System (HMS), as well as training materials, are available at https://www.hec.usace.army.mil/software/hec-hms/documentation.aspx

The surface of the treatment cell must be sloped so that surface run-off from high intensity precipitation events and snow melt can be collected and transferred to contact water storage facilities. If too much surface water penetrates the contaminated soil layer, the soil may become waterlogged and contaminant degradation rates may decrease. The degree of slope must be tailored to account for the frequency of the high intensity precipitation events and the wind and humidity patterns at the project site. It is critical that the landfarming cell be able to drain rapidly after high intensity precipitation events.

****

Contact water is defined as water that has come into contact with contaminated materials, or other contaminated surfaces. Sources of contact water may include, but are not limited to: water from decontamination of equipment, personnel, and PPE; runoff water from storage and pre-processing areas; and water that leaches through the treatment cell. The design storm must be the [24][_____] hour duration storm with a return interval of [25][_____] years, based on data from [_____]. Water head in the gravel sump (under the treatment cell), in excess of [0.3][_____] meter [1][_____] foot, must be removed within [24][_____] hours of the design storm event. The water head in the gravel sump (under the treatment cell) must be maintained at no more than [0.3][_____] meter [1][_____] foot between storm events. The surface of the top layer of the treatment cell must be sloped, [as shown on the drawings,][_____] to allow surface run-off to be collected and transferred to contact water storage facilities.

1.4.1.2.1 Perimeter Berms

Berms must be constructed around the perimeter of the following areas: [treatment cell,][contact water storage,][laydown and storage areas,][and][_____]. Size the perimeter berms to prevent flood water run-on from the [25][_____] year flood while maintaining a minimum freeboard of [0.3][_____] meter [1][_____] foot. The perimeter berms must also be sized to contain water from the design storm that collects on the surface, inside of bermed areas, while maintaining a minimum freeboard of [0.3][_____] meter [1][_____] foot. Key berms constructed around the [treatment cell and contact water storage facility][_____] into the underlying liners of these areas, [as shown on drawings][_____]. Include ramps to permit vehicle access across berms constructed around the [treatment cell, and laydown and storage areas][_____].

1.4.1.2.2 Storage Volume

****

NOTE: Typically, storage and testing of contact water is required prior to discharge. Thus contact water storage facilities should be sized to contain the peak detention volume for the design storm. In order to minimize treatment and disposal costs, it is often desirable to reuse the contact water to irrigate the treatment cell. Using this approach, the storage volume must be sufficient to retain the volume of water in storage prior to the design storm, and the volume of water generated by the design storm.

Sources of contact water include: water from decontamination of equipment, personnel, and personal protective equipment; and water that drains from storage, pre-processing and treatment areas. If the storage, pre-processing, or treatment areas are covered, then the volume of contact water resulting from precipitation events should be reduced.

****

Size contact water storage facilities to contain [30][_____] percent above that required for the design storm, and [the maximum volume that will be held in storage for reuse][_____].

1.4.1.2.3 Reuse, Treatment, and Disposal

****

NOTE: It is possible for contact water to

accumulate compounds (e.g., acids, bases, or salts) at levels which may inhibit microbial activity. However, contact water can usually be applied to contaminated soil with little or no treatment. Water which has accumulated excessive levels of acids, bases or salts may require treatment, or offsite disposal.

****

Reuse contact water to the maximum extent, to minimize the need for new makeup water and to limit the treatment, discharge and offsite disposal of wastewater. Prior to reuse, test contact water in accordance with paragraph CONTACT WATER TESTING and confirm that contact water meets the requirements of paragraph WATER SUPPLY. Prior to disposal, collect and test contact water that cannot be applied to contaminated soil in accordance with paragraph TREATMENT CRITERIA FOR CONTACT WATER. Treat process sludge (resulting from the removal of suspended material in the contact water) to meet the requirements of[paragraph TREATMENT CRITERIA FOR SOIL][_____].

1.4.1.3 Irrigation Equipment

****

NOTE: Irrigation is critical to maintaining optimum moisture content, and maintaining high degradation rates. In arid climates, water usage rates will obviously be higher than in non-arid climates. Drip irrigation systems are generally not recommended for landfarming because they are not designed to distribute moisture uniformly. Center-pivot irrigation systems have been successfully used in conjunction with pie-shaped, or semi-circular, treatment cells.

****

Provide irrigation equipment capable of delivering at least 0.7 L/s/1000 m^2 40 gpm/acre distributed uniformly over the surface of the treatment cell. Design the irrigation system to minimize interference with tilling of the treatment cell. Do not use flood or overland flow irrigation methods.

1.4.1.4 Weather Cover

****

NOTE: This paragraph should be deleted if there will be no requirement for use of a weather cover. Weather covers allow an added measure of control over moisture delivery to the treatment cell, and may also be used to increase soil temperature. Use of a weather cover will also allow the scale of the contact water management facilities to be reduced. Clam-shell buildings, metal buildings, pole barns, large tents, or other prefabricated structures may serve as weather covers. The section containing requirements for the weather cover (e.g., Section 13 34 19 METAL BUILDING SYSTEMS), should include the design snow load, maximum wind speed, soil bearing capacity, seismic parameters in accordance with UFC 3-301-01, and maximum and minimum ambient air temperatures.

If landfarming will be performed inside of an enclosed structure, adequate ventilation must be provided. A rate of 3 to 6 air changes per hour has been recommended for composting facilities. Carbon dioxide is generated and oxygen may become depleted during landfarming. However, rates of oxygen consumption for most landfarming applications will be significantly lower than that of composting. During material handling operations (e.g., tilling) dust and engine exhaust fumes will accumulate. To ensure that proper and consistent ventilation requirements are specified, this section should be coordinated with Section 23 30 00 HVAC AIR DISTRIBUTION.

****

Use weather covers, or appropriate structures, to prevent precipitation from coming into contact with soil in the treatment cell, and design in accordance with Section[13 34 19 METAL BUILDING SYSTEMS][_____]. Provide covers which allow for free exchange of gases between the atmosphere and the soil. Size weather covers to allow unimpaired maneuvering of [front-end loaders,][soil mixing equipment,][and][_____]; size openings in weather covers to allow for entry and exit of [front-end loaders,][soil mixing equipment,][and][_____]. Provide ventilation of the covered facility in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION.

1.4.1.5 Stockpiles

****

NOTE: Typical stockpile design requirements are provided in Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL. In very arid climates, covers may not be necessary. If operations will continue during subfreezing conditions, it may be necessary to ensure that the Contractor has included provisions to prevent a portion of the contaminated soil stockpile from freezing. The stockpile requirements in that section should be edited based on site-specific factors and regulatory requirements.

****

In accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL, prepare areas that will be used to stockpile [contaminated material,][oversize material,][treated material][and][_____].

1.4.1.6 Material Measurement

****

NOTE: This paragraph is primarily intended to ensure that calibrated scales are being used to weigh treated soil, when weight is being used as the basis for measurement and payment.

****

Provide scales, meters, and volumetric measuring devices for measuring oversize materials, feed contaminated materials, reagents, and water which conform to the applicable requirements of NIST HB 44, except that the accuracy must be plus or minus [0.1][_____] percent of the quantity being measured. For scales used to measure weight of material in vehicles, provide scales of sufficient length to permit simultaneous weighing of all axle loads. For any scales used to make measurement for payment, ensure the scale is certified [by an acceptable scales company representative][by an inspector of the State Inspection Bureau charged with scales inspection within the state in which the project is located] prior to weighing any materials. Perform a check of calibration of measuring equipment prior to initial use, and once every [seven][_____] calendar days. The requirements of this paragraph do not apply to measurement of chemical or physical data for purposes of demonstrating compliance with paragraph PERFORMANCE REQUIREMENTS.

1.4.1.7 Utilities

****

NOTE: The locations and details (such as utility point of contact, sizes, capacities, and flows) of the utility hookups should be provided on the drawings for the Contractor's use. Verify the utilities are available on-site before including the second sentence.

****

In accordance with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS, provide the utilities associated with landfarming including, but not limited to:[telecommunications,][electricity,][water,][gas,][sanitary,][_____,] and solid waste facilities. The [telecommunications,][electricity,][water,][gas,][sanitary,][_____,] and [solid waste facilities] are available at the site.

1.4.2 PERFORMANCE REQUIREMENTS

1.4.2.1 Treatment Criteria and Criteria for Reuse of Treated Soil

****

NOTE: Landfarming is primarily applicable to nonvolatile and semi-volatile organic contaminants, including: low-volatility components of fuels, diesel fuel, kerosine-based fuels, fuel oils, PCP, some polycyclic aromatic hydrocarbons (PAHs, as found in creosote), some pesticides, and some herbicides. Biodegradation of PAHs becomes more difficult as the number of aromatic rings increases. Thus, landfarming is usually not considered to be an efficient process for treating PAHs that contain more than four aromatic rings. Contaminated soil will be aerated during tilling and material handling operations. Thus, the volatility of contaminants of concern should be taken into consideration to ensure that air emissions requirements are not exceeded. Non-weathered, light fuels such as gasoline are not suitable for landfarming since the most toxic components (i.e., BTEX) will readily volatilize.

Depending on regulatory requirements, both total concentration and leachability concentrations for some compounds may be required. Total

concentrations can be used to estimate worst case leachate concentrations. If the contaminated material is classified as characteristic waste, leachability testing will usually be required, and the appropriate leachability test (e.g., EPA Synthetic Precipitation Leaching Procedure (SPLP) or EPA Toxicity Characteristic Leaching Procedure (TCLP)) must be selected. If the treated material will not be disposed of in a landfill, SPLP testing may be appropriate.

Although there are EPA Land Application regulations for metals and pathogens (40 CFR 503 - Standards for Use or Disposal of Sewage Sludge), these regulations are not normally applicable to hazardous waste landfarming.

For compounds whose partial breakdown products (intermediates) have been defined, it may be necessary to include testing for key intermediates. However, it may not be practical to require testing for intermediates if chemical standards are not available. A compound should not be targeted for analysis unless there is a defensible basis for acquiring the data (e.g., if there is strong probability of generating an intermediate with higher toxicity than the parent compound).

Treatment criteria, and criteria for disposal (or reuse) should be in accordance with Federal, state and local regulations. Prior approval by regulatory representatives should be acquired for treatment criteria values.

****

1.4.2.1.1   Treatment Criteria for Soil

****

NOTE: Treatment criteria can be based on the total concentrations of a class of substances particularly if an analytical method exists that outputs only the total, such as for total petroleum hydrocarbons (TPH), however it is more typical that treatment criteria are based on individual substances.

It is possible for petroleum, oils and lubricants (POLs) and other fluids from material handling equipment to be spilled onto soil during process operations. Thus, testing for POLs should be considered.

In some cases attaining a target concentration for the site's contaminants of concern might not be sufficient; landfarming may not completely degrade, or mineralize, the contaminants but rather converts them to a series of complex degradation products which may not be analyzable with regular lab methods, and which will likely not have health based screening values. These products may bind

irreversibly to the soil, indicating that landfarming is a technology that has both degradation and stabilization aspects. In this case it may be necessary to augment the treatment criteria by adding a bacterial assay, such as the Ames Mutagenicity test, to verify the safety of the finished landfarming soils or the safety of the leachate from the finished landfarming. Another factor is that the mixing of the soils with carbon rich amendments, and their bacterial degradation, will change the redox balance of the soil and possibly convert native insoluble metals to mobile forms. This can be detected with TCLP testing of the finished soil. Lastly, there can be the concern that mixing large amounts of amendments with contaminated soil causes dilution of the contaminants, that is, it causes an immediate decrease in contaminant concentration without any landfarming having occurred. It is possible that stakeholders may insist on reducing the soil remedial criteria by this dilution factor, in order that no benefit is provided solely by the amendment mixing step toward attaining those criteria. This paragraph should be edited to include site-specific criteria.

If a statistically based criteria for determining attainment of treatment criteria will be used, the contract should be prepared to allow some flexibility as to the number of samples that will be required for confirmatory sampling.

****

Treat contaminated material to the criteria shown in Table 1A. The mean of the data for [the grids representing the top lift of soil in the treatment cell][_____] must be less than the level shown for each contaminant in Table 1A. Analyze data [using the One-Sample t-Test in accordance with EPA 600/R-96/084 (see p. 3-8 of the reference for an example of this procedure), and apply the following statistical conditions][_____]. The statistical conditions include: [true mean greater than or equal to action level (assume site is dirty) maximum false rejection rate (alpha) = 5 percent; maximum false acceptance rate (beta) = 20 percent; width of grey region (delta) = 15 percent of treatment criteria value][_____].

TABLE 1A - TREATMENT CRITERIA FOR ORGANICS

CONTAMINANT	MAXIMUM TOTAL CONCENTRATION IN SOIL
[_____]	[_____] mg/kg
[_____]	[_____] mg/kg

1.4.2.1.2 Criteria for Reuse of Treated Soil

****

NOTE: For some projects this paragraph could be combined with the above paragraph, Treatment Criteria for Soil. For the purposes of this guide specification, this paragraph has been separated to

emphasize that a separate set of regulatory criteria may have to be met before treated soil can be incorporated into topsoil.

The land application or beneficial use of treated soil will be largely controlled by existing land disposal restrictions (40 CFR 268), specifically toxicity characteristics for RCRA metals, volatiles, and semi-volatiles and any triggered universal treatment standards (40 CFR 268.48). While the metals loading rates found in 40 CFR 503 (i.e., 40 CFR 503.13 - Pollutant limits) may be useful in evaluating beneficial reuse alternatives, the designer is cautioned that the scope of that standard is for domestic sewage sludge. Soils treated via landfarming may not meet that definition, and therefore would not be excluded from hazardous waste management regulations. The application of ceiling values listed in 40 CFR 503.13 to treated soil not excluded from hazardous waste regulations is not allowed under regulation (40 CFR 503.6).

Although reductions in concentrations of heavy metals may occur due to mixing and dilution effects, landfarming is usually not considered a treatment process for inorganics. Depending on regulatory requirements and intended end use, it may be necessary to require testing for some inorganic parameters. This paragraph should be edited to include site-specific criteria.

****

Prior to final disposition, treat contaminated material to the criteria shown in Table 1B. The mean of the data for [the grids representing the top lift of soil in the treatment cell][_____] must be less than the level shown for each contaminant in Table 1B. Analyze data [using the One-Sample t-Test in accordance with EPA 600/R-96/084 (see p. 3-8 of the reference for an example of this procedure), and apply the following statistical conditions][_____]. The statistical conditions include: [true mean greater than or equal to action level (assume site is dirty) maximum false rejection rate (alpha) =5.0 percent; maximum false acceptance rate (beta) =20.0 percent; width of grey region (delta) =15.0 percent of treatment criteria value][_____].

TABLE 1B - REUSE CRITERIA FOR INORGANICS

INORGANIC CONTAMINANT	MAXIMUM TOTAL CONCENTRATION IN SOIL
[_____]	[_____] mg/kg
[_____]	[_____] mg/kg

1.4.2.1.3 Particle Size Criteria for Treated Soil

****

NOTE: Oversized materials are typically separated

from contaminated soil during soil pre-processing. Relatively impermeable oversize materials (e.g., rocks) are often treated by rinsing or pressure washing. However, clods of contaminated soil or other large particle-size materials that are not broken-up during tilling cannot be assumed to be adequately treated by landfarming. If attrition of this chunk-material does not occur with repeated tilling, it may be necessary to perform additional sampling and analysis specifically to determine if chunk-material is being treated.

Particle size criteria may be waived if sampling and analysis of the large particle-size materials demonstrates that treatment criteria is being achieved. A sufficient quantity of large particle-size material should be collected so that samples will be representative of the "chunk-fraction" throughout the treatment cell. The large particle-size material must then be ground-up so that subsamples can be submitted for testing.

If treatment of large particle-size materials cannot be adequately demonstrated, then an additional processing step may be necessary. Equipment such as soil shredders will increase the cost of treatment, but can be used to reduce the particle size and thereby improve the degree of treatment achieved. The goal should be to reduce the particle size of treated soil to approximately 13 to 40 cm 0.5 to 1.5 inches.

****

To achieve uniform treatment, reduce particle size of clumps of soil as necessary by tilling or other mechanical means. The maximum particle size in the treated soil matrix must be not greater than [40][_____] mm [1.5][_____] inches.

1.4.2.2 Treatment Criteria for Contact Water

****

NOTE: Treatment and disposal options for contact water include: onsite treatment and discharge; offsite treatment and disposal; and storage and reuse as irrigation water. It is possible for POLs and other fluids from material handling equipment to be spilled onto soil during process operations. Thus, testing for POLs should be considered. This paragraph should be edited to include site-specific criteria. A State permit under the Clean Water Act may be required for onsite discharge of water, and will include criteria that must be met and documented prior to discharge. The permit may limit discharge of the constituents that are being treated, as well as other constituents introduced in the amendments or conditions caused by the introduction of the amendments.

****

Contact water must meet the criteria shown in Table 2 at the time of [discharge][offsite disposal][_____]. If a State permit is required for onsite discharge, the water must be documented to have met the criteria in the permit prior to discharge.

TABLE 2 - WATER DISPOSAL/DISCHARGE CRITERIA	
PARAMETER	MAXIMUM CONCENTRATION
[_____]	[_____]
[_____]	[_____]

1.4.2.3 Treatment Criteria for Other Waste

****

NOTE: Other waste may include sludge or sediment resulting from treatment of contact water and oversize material. Treatment may not be required for some wastes. Treatment criteria should be provided if treatment will be conducted onsite. Treatment criteria and methods for porous oversize material such as wood chips may be difficult to develop. A separate table should be developed for the criteria. If treatment criteria already provided in the preceding paragraphs do not adequately cover "Other Wastes", it may be necessary to provide additional criteria, specific to "Other Wastes". Oversize material is often pressure-washed prior to disposal. Sludge or sediment may often be blended with contaminated soil for processing in the treatment cell.

****

Treat the following materials prior to disposal: [sludge or sediment resulting from treatment of contact water, and oversize material that has been separated from contaminated soil][_____]. Treat in accordance with regulatory requirements.

1.4.2.4 Emissions and Dust Controls

****

NOTE: Specifications for emission and dust controls should be provided in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. If Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS is not included in the project specifications, emissions, dust, and odor control sources and control activities should be specified here. The remaining text in this note discusses landfarming technology-specific emission and dust control considerations to incorporate into Section 01 57 19. An air pathways analysis should be performed during design in accordance with EP 200-1-24 Air Pathway Analysis for the Design of Hazardous, Toxic and Radioactive Waste (HTRW) Remedial Action Projects. Depending upon the contaminants of concern in the contaminated

materials, the unit processes/operations employed in landfarming, the amount of pollutants emitted, and the geographical location of the site, the emission standards and limitations for certain contaminants and dust control can be identified from the following regulations including, but not limited to, National Primary and Secondary Ambient Air Quality Standards, National Emission Standards for Hazardous Air Quality Pollutants, and state and local regulations.

When editing Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, consider the following: For each stage of operations, an air pollution control plan must include, but not be limited to: the sources of emissions, dust and odors during each stage of operations, and proposed control measures. The stages of operation must include, but are not limited to: construction of paved or lined surfaced, soil preprocessing; treatment, transport, and disposal of oversize material; blending of soil and amendments; during the landfarming process, including during mixing; transport, storage, and disposal of treated material. The plan must specifically address fugitive emissions and odor control during the following activities: amendment delivery and storage; blending of soil and amendments; during the landfarming process, including during mixing; transport of compost; storage of compost; and disposal of compost. If local air pollution regulations require capture and control of specific emissions, the type of collection and treatment equipment should be identified. If air monitoring will be required, the following must also be included: type and locations of monitoring devices, secure retention of the data; and for each stage of operations: frequency of sampling, number of samples from each location, the total number of samples, and the parameters to be monitored. If operations are to occur near occupied areas, consideration must be given to using perimeter air monitoring to generate a defensible record showing that unacceptable air concentrations have not extended past the boundaries of the site .

Based on the regulatory requirements, the proper technologies or apparatus for the emissions control if required can be determined. Upon completion of the design of the landfarming operation, these emission requirements and control technologies should be defined by the design engineer. It may be necessary to implement control measures during the following activities: the field demonstration, excavation, hauling, stockpiling, separation of oversize materials, spreading of amendments, tilling, and disposal of treated soil.

If a performance specification is prepared, the emissions, dust sources, and contaminants of concern

should meet specified requirements based on applicable regulations. Section 01 57 19 should list the emissions criteria for the contaminants of concern for each emission and dust source, and if applicable, monitoring requirements should be specified. The applicable federal, state, and local regulations should also be identified. If the specification is prepared based on detailed design, the technologies or apparatus for controlling the emissions and dust sources should also be specified.
****

Execute the landfarming process to meet the emissions and dust control requirements in [Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][___].

1.4.3 LANDFARMING WORK PLAN

****
NOTE: To avoid duplications in submittal requirements, submittals in this Section should be coordinated with other sections of the contract (e.g., 01 45 00 QUALITY CONTROL, and 01 32 01.00 10 PROJECT SCHEDULE).

If an RPF contract is being prepared, this paragraph and the Submittals paragraph should be edited and used to form the basis for Contractor proposals.
****

Submit a Landfarming Work Plan [as an appendix of the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)][as a standalone document] not more than [480][_____] calendar days after notice to proceed. [Prepare [draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Landfarming Work Plan. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.] The plan must include, but not be limited to, the following.

1.4.3.1 Schedule

****
NOTE: Landfarming may rely substantially on the supply of seasonal farm-generated inputs like manure and straw. The seasonal availability of these items must be incorporated into the operating schedule. The seasonality may be lessened by stockpiling these materials; if so this feature must be described in the workplan.
****

Provide a schedule specifying dates and durations for: excavation, hauling, stockpiling, start and completion of mobilization, treatment cell construction, separation of oversize materials, delivery and stockpiling of amendments, field demonstration, full-scale treatment of contaminated materials, storage of treated material, disposal of treated material and other wastes, and demobilization. Provide the following details: intended days and hours of operation; plans for operating, or scaling back operations during winter conditions; routine maintenance down-time for tilling equipment; anticipated time to reach cleanup goals for each lift of soil; and laboratory turn-around time to receive data from compliance samples.

1.4.3.2 Project Organization and Personnel

Provide an organization chart, including subcontractors; include the names, responsibilities, education, and resume of the key project personnel. Key personnel must meet the requirements of this paragraph and paragraph KEY PERSONNEL. Key personnel must include, but must not be limited to: project managers, quality control personnel, supervisory operators and technicians, and engineering staff. Clearly define responsibilities of each individual in the organization in terms of project activities including, but not limited to: project management and coordination; scheduling; quality control and quality assurance; sampling; measurement; field and laboratory analysis; data management; operation and maintenance; and health and safety management.

1.4.3.3 Selection of Amendments

****

NOTE: Options are provided for the Designer to either specify that inoculants will not be allowed, or prompting the Contractor to indicate what inoculants they intend to use. The second option provides more flexibility if the Designer does not have a strong reason to disallow inoculants. With some manure amendments, sufficient bacteria are present to inoculate the landfarming cell without resorting to purchase and introduction of a laboratory or factory grown consortia. Some research indicates that bioaugmentation with inoculants can improve landfarming results.

****

Provide rationale for use of each proposed amendment. [Do not use any inoculants as part of the landfarming amendments.][Include rationale for use of any inoculants that will be used in combination with other landfarming amendments.] Provide a description of, and sources for, each amendment; including at least one alternative source for each category of amendment. Include locations of each source, and distances from the site. For amendments that are only available on a seasonal basis, provide a plan for substituting alternative types of amendments. For organic amendments, such as manure or wood products, state the intended freshness of the amendment; or the length of the planned period of aging, prior to incorporating the amendment into soil. Include the proposed quantity of each amendment that will be added to each cubic meter cubic yard of contaminated soil.

1.4.3.4 Operations and Process Monitoring

Provide a detailed description of the proposed operation in the [UFP-QAPP][the Landfarming Work Plan]. The description must include: plans for pre-processing of contaminated soils; plans for stockpiling materials; plans and schedule for pick-up, transport, delivery and storage of each amendment during operations; plans for mixing amendments into soil; methods for measuring quantities of soil and amendments; treatment cell area required for each lift; contact water management plans; parameters that will be monitored during landfarming; frequency of monitoring, tilling and irrigation during operations; locations of each sampling station shown from plan view; sampling locations shown on a diagram depicting a cross-section of the treatment cell; the number of sampling stations per each lift of soil; moisture and temperature monitoring locations must also be shown; and plans for storage and disposal of treated materials.

1.4.3.5 Non-Landfarming Treatment Processes

Provide a detailed description of the procedures for treatment of air, liquid, and solid wastes that will be treated by a process other than landfarming, including: treatment criteria for oversize material and other wastes.

1.4.3.6 Equipment and Servicing

Provide a detailed description of the proposed treatment equipment. For each proposed piece of equipment, describe: function, design capacity, equipment specifications identifying manufacturer and model number, material of construction, recommended operating conditions, and the number of units that will be present on-site during each stage of operations. Equipment described must include, but must not be limited to: tilling devices; pumps; irrigation equipment. Provide plans for servicing equipment, and explain how material handling and tilling will be accomplished during servicing of equipment, and during unanticipated breakdown of machinery. Decontamination of equipment is as required in the mobilization and demobilization plans included in the UFP-QAPP.

1.4.3.7 Process Material Tracking Schedule

Provide a Process Material Tracking Schedule for recording and managing the quantities of the contaminated materials processed. Provide the dates and duration of the following activities for each lift of contaminated material: initiation of landfarming; completion of landfarming; re-processing of any treated materials that failed to meet treatment criteria; storage of treated material; disposal of treated material.

1.4.3.8 Disposal and Reuse of Wastes

Provide a detailed description of the plans for disposal of solid and liquid wastes. For each type of waste that will be generated, specify: origin and description of waste; estimated total quantity of waste; method of transport to disposal location; disposal location; disposal documentation to be provided by the receiving facility; and schedule showing the anticipated quantities and dates for generation, transport, and disposal of the wastes. Waste types must include: treated soil, oversize materials, contact water, and other solid and liquid wastes generated during the project.

1.4.3.9 Uniform Federal Policy Quality Assurance Project Plan

a. Prepare a UFP-QAPP in accordance with EPA 505-B-04-900A and using the UFP-QAPP WKSTS.

b. Provide a detailed, chronological description of the sequence of procedures and tests that will be used to determine whether the soil has met [treatment][and][or][disposal] criteria, including:

   (1) The location of each sampling station shown from plan view.

(2) The number of sampling stations per each lift of soil.

(3) Sampling locations shown on a diagram depicting a cross-section of the treatment cell.

(4) The number of samples that will be tested for each type of test performed.

(5) The decision process to be made with the sample results, i.e., whether the results are to be used individually and applied to the individual areas of the lift, or averaged in order to make a volume-average decision for the entire lift.

(6) If decisions are made based on individual samples instead of lift-wide, the means for reproducibly defining the boundaries of the individual areas within the lift, and the means of segregating out-of-specification soils in one individual area from in-specification soils in another area, and re-treating the out-of-specification soils.

c. Describe any sampling and testing devices for process monitoring; and moisture and temperature monitoring devices that will be used at the landfarming site.

d. For air, liquid, and solid wastes that will be treated by processes other than landfarming, include: testing parameters; sampling locations; number of samples; monitoring frequency; and laboratory turn-around-time.

e. Provide a mobilization and demobilization plan as an attachment to the UFP-QAPP to include, but not be limited to: transport of personnel, material, and equipment; decontamination and disposal of materials and equipment brought to the site; decontamination and disposal of the treatment pad and other paved surfaces; and decontamination of equipment during demobilization. Include a Post-Treatment Cleanup and Sampling Plan in the mobilization and demobilization plan for areas where there was contact with contaminated materials and were disturbed by the Remedial Action/Site Work. Also, discuss the restoration of disturbed areas such as grading, seeding, etc.

f. Submit the UFP-QAPP not more than [480][_____] calendar days after notice to proceed. Prepare [draft for Government review][draft-final for [regulatory][_____] review] and final versions of the UFP-QAPP. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.

[1.4.3.10 Bench-Scale Treatability Study Test Report

Provide the bench-scale treatability study test report as part of the Landfarming Work Plan and after completion of the bench-scale treatability study test. Include: characterization test results for each amendment; the source of each amendment; for each condition tested, the quantity of each amendment that was added per unit volume of soil; the date that the bench scale treatability study test was initiated; chronological table showing all materials added, quantity added, date of addition, and each mixing, irrigation and sampling event. For organic amendments, such as manure or wood products, state the freshness of the amendment; and the length of the period of aging, prior to incorporating the amendment into soil. The report must also include: physical and chemical monitoring data from before, and during treatment; degradation rates; final disposition of wastes and treated material; and conclusions. Provide recommendations for the field demonstration in the report.

]1.4.3.11 Materials Data

Provide safety data sheets (SDSs), certificates of analysis, and product performance data. SDSs must be in accordance with 29 CFR 1910.1200(g).

1.4.3.12 Permits, Permit Equivalents, and Certifications

Provide copies of the permits, permit equivalents and certifications with the Landfarming Work Plan. For the above-listed items requiring a longer time frame, include copies of applications and scheduled dates for receiving final approval.

1.4.4 Other Submittal Requirements

****

NOTE: Submittal scheduling should allow for an adequate amount of time for:
1. Preparation and review of submittals.
2. The treatment period of the bench-scale treatability study test and the field demonstration.
3. Receipt of analytical results from the laboratory for samples collected on the last day of the treatment period.

The time periods shown for completing submittals have been sequenced to illustrate this point. Ideally, the Bench-scale Treatability Study Test Report should be completed before the Contractor is required to submit the Field Demonstration Plan, and the Field Demonstration Report should be completed before the Contractor is required to submit the Landfarming Work Plan.

****

Submit the following as specified:

[1.4.4.1 Bench-Scale Treatability Study Test Plan

Prepare [draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Bench-Scale Treatability Study Test Plan. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Submit a Bench-Scale Treatability Study Test Plan not more than [30][_____] calendar days after notice to proceed. This plan must incorporate the requirements in paragraph BENCH-SCALE TREATABILITY STUDY TEST and must include:

a. Location of test facility.

b. Minimum and maximum initial levels of contaminants in the soil to be used for the study.

c. Locations that will serve as the source of soil for the study.

d. Test parameters and number of samples that will be used to confirm that the soil meets criteria for the study

e. Rationale for use of each proposed amendment.

f. The source of each amendment. For organic amendments, such as manure or wood products, state the intended freshness of the amendment and the length of the period of aging, prior to incorporating the amendment into soil.

g. For each test condition, provide:

    (1) Quantity of each amendment that will be added per unit volume of soil.

    (2) Temperatures under which testing will be performed.

    (3) The number of replicate tests for each test condition.

    (4) Description of containers that will be used.

    (5) Procedure for mixing soil.

    (6) Frequency of mixing.

    (7) Testing and monitoring parameters.

    (8) Number of samples.

    (9) Monitoring frequency.

    (10) Length of monitoring period.

    (11) Laboratory turn-around-time.

h. Test methods, and other sampling and analysis requirements for the bench-scale treatability study test must be [_____].

]1.4.4.2 Field Demonstration Plan

****

NOTE: It is important that the field demonstration match the intended implementation as closely as possible in terms of inputs and process. Landfarming is sensitive to a variety of factors like moisture, temperature, chemical conditions, and most critically, the survival and propagation of the bacteria. The difference in scale between the demonstration and the implementation will inevitably introduce changes in the conditions. The conditions in the demonstration need to be measured to a greater degree than might be initially supposed, such as greater resolution in the temperature and moisture over time and across the volume of soil being treated, so that the differences due to scale can be identified and minimized, and the implementation can reproduce as

closely as possible the successful conditions of the demonstration.

****

Submit a Field Demonstration Plan not more than [270][_____] calendar days after notice to proceed. Prepare [draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Field Demonstration Plan. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. This plan must include:

a. Location for performing the field demonstration.

b. Minimum, initial levels of contaminants in the soil to be used for the demonstration.

c. Locations that will serve as the source of soil for the demonstration. test parameters and number of samples that will be used to confirm that the soil meets criteria for the demonstration.

d. Rationale for use of each proposed amendment and the source of each amendment.

e. For organic amendments, such as manure or wood products, state the intended freshness of the amendment and the length of the period of aging, prior to incorporating the amendment into soil.

f. For each test condition, indicate:

    (1) Quantity of each amendment that will be added to each cubic meter yard of contaminated soil.

    (2) Anticipated temperatures under which the field demonstration will be performed.

    (3) Irrigation and tilling equipment specifications.

    (4) Irrigation water source.

    (5) Plan for operation, maintenance and process monitoring.

    (6) Laboratory turn-around-time.

g. Test methods, and other sampling and analysis requirements for the field demonstration test must be [_____].

1.5 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's

Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

****

NOTE: Regulatory requirements will be location specific and may include local ordinances and State regulatory requirements. Correspondence from regulatory agencies, and other relevant information, should be attached to the specifications to indicate the level of effort necessary for the Contractor to obtain finalized permits, permit equivalents, certifications and to meet substantive regulatory requirements.

For sites addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. The permits or permit equivalents may include those addressing air discharges, treated water discharge, well installation and abandonment, underground injection, and possibly others. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, delete this section.

****

Obtain the permits, permit equivalents, and certifications; and meet the substantive regulatory requirements necessary for the installation, operation, and closure of the project.[Correspondence from regulatory agencies, and other relevant information, are attached to the specifications to indicate the level of effort necessary to obtain finalized permits, permit equivalents, certifications and to meet substantive regulatory requirements.]

1.6.2 Qualifications

****

NOTE: For sites with unusual, or difficult to treat, contaminants of concern, the designer should consider including a requirement that the Contractor have completed a field demonstration or full-scale

project where the same type of contaminants were successfully treated. However, including such a requirement may limit the number of qualified bidders, and drive up the price of the contract. Delete the paragraph if the Contractor has been pre-selected.
****

1.6.2.1 Contractor Experience

Have successfully completed at least[one][_____] landfarming project that required processing of a volume of contaminated soil comparable to the estimated volume that will require treatment during this project. Also have successfully completed at least[one][_____] full-scale project, that required handling and transport of soil contaminated with[a RCRA hazardous constituent, or CERCLA hazardous substance, or petroleum waste][_____]. For each project, provide the following:

a. Site name.

b. Location.

c. Names of the Contractor's key personnel.

d. Key points of contact and phone numbers (including Government representatives, and other parties involved in the project).

e. Dates of mobilization/demobilization.

f. Contaminants of concern.

g. The volume of contaminated soil handled or treated.

Also provide the following, if available:

h. Dates for initiating and completing treatment.

i. Quantity of time required to treat each lift of contaminated soil.

j. Volume and weight of amendments added per unit volume and weight of contaminated soil.

k. Initial volume of soil, and final volume after treatment.

l. Concentrations of contaminants of concern in soil before treatment, during treatment period, and after treatment.

m. The treatment concentration goal.

1.6.2.2 Key Personnel

Provide key personnel with a minimum of[three][_____] years of landfarming field experience. Include system operators, quality control personnel, and supervisory engineering and technical staff involved with the landfarming operation in key personnel. Perform all survey work under the supervision of a registered land surveyor licensed in the [applicable jurisdiction] [State of [_____]].[Perform surveys in accordance with Section:[_____].]

1.6.2.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory[in accordance with [Section 01 45 00 QUALITY CONTROL][_____] and][approved by the Contracting Officer]. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.6.3 Drawings

Project drawings must include:

a. Limits of planned excavations.

b. Layout of the facility.

c. Dimensions of amendment storage areas, pre-processing areas, and treatment cell.

d. Details of treatment cell liner and sumps.

e. Dimensions and volumes of stockpiles for contaminated soils, oversize materials, and treated materials.

f. Locations, dimensions, and volume of collection sumps and any ancillary water storage facilities.

g. Plan view and cross sections of perimeter berms and collection sumps.

h. Ancillary water storage facilities.

i. Size of contact water conveyance devices and structures.

j. Piping and instrumentation diagrams.

k. Process flow diagrams.

1.7 DELIVERY, STORAGE, AND HANDLING

Safely transport, store, and handle equipment and raw materials (including reagents). Package and ship these items in compliance with United States Department of Transportation (USDOT) requirements. Store and handle these items onsite in accordance with the manufacturer's recommendations and applicable regulatory requirements.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Environmental Requirements

When soil temperatures fall below[5 degrees C 40 degrees F, remain below that temperature for[[_____] hours][[_____] days], and written approval has been received from the Contracting Officer,][_____], suspend operation of the landfarm for the season. Resume operation of the landfarm when soil temperatures remain above [5 degrees C 40 degrees F for[[_____] hours][[_____] days], and written approval has been received from the Contracting Officer][_____]. Do not conduct tilling within[24][_____] hours of a rainfall or irrigation event which saturates the soils.

1.8.2 Existing Conditions

****

NOTE: The pertinent site characterization data should be placed in the appendices of the technical specifications or on the drawings, and referenced here. If the site contains a significant amount of debris, the available information about its extent and characterization should also be provided. Indicate the detail to which site characterization has been performed. The information should also include: construction limits, property survey, access gates and haul roads available to the Contractor, locations of utilities, water sources, area available for the field demonstration and treatment cell, restricted areas adjacent to the project site, chemical data, geotechnical data, sampling locations, and boring logs. Reference the administrative record locations, whether they are physical or digital, of the site if they exist.

Indicate if there are multiple dissimilar types of contaminated materials that will require different operations. Materials may be considered dissimilar based on possessing different soil properties, types of contaminants, or relative concentrations of contaminants. Determination of dissimilar materials may be based on site investigations and/or previously completed treatability studies.

****

The existing site conditions are presented [in Appendix [_____]][and][on the drawings]. These include [physical configuration][utilities][topography][land uses][geotechnical characteristics of the contaminated materials (including [grain size analysis][total organic content][cation exchange capacity][pH][moisture content][density][porosity]) [hydrogeology]] and [nature and extent of contamination][_____]. The existing conditions presented are the result of site investigations at specific locations; variations in the existing site conditions could occur. Perform an independent interpretation of the site characterization data. Notify the Contracting Officer within [48 hours][_____] if discrepancies between the data provided and actual field conditions are discovered.

[1.8.3 Previously Conducted Bench-Scale Treatability Studies

****

NOTE: This paragraph should be deleted if no previous treatability studies have been conducted.

The methods employed in previous bench-scale treatability studies may not be the same as those proposed by the Contractor. Documentation of the previous bench-scale treatability studies should include the same information shown in the following sub-paragraphs: BENCH-SCALE TREATABILITY STUDY TEST REPORT and FIELD DEMONSTRATION REPORT. Bench-Scale Treatability study reports should be prepared to provide prospective Contractors with sufficient

information to prepare a responsive bid, or proposal, for the contract.
****

Appendix [A][_____] "Bench-Scale Treatability Study Report" is for information purposes only.

]PART 2 PRODUCTS

2.1 STANDARD PRODUCTS

Materials and equipment must be the standard products of a manufacturer regularly engaged in the manufacture of such products and must essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, capable of providing service, materials and equipment in an expedient manner.

2.2 WATER SUPPLY

****
NOTE: One important concern for irrigation water is to ensure that salts do not accumulate to levels that inhibit biological activity. Conductivity is an indicator of salt content. Conductivity may be reported in micro-siemen per cm, or micro-mho per cm. Total dissolved solids (TDS) testing may be substituted for conductivity.

Possible water sources include: a nearby pond, or other surface water body; a hydrant, or other connection to a water distribution line; runoff from precipitation; and contact water; see paragraph Storage Volume.
****

Water for irrigation must not contain oils, acids, salts, alkalis, organic matter, solids or other substances at concentrations that could be detrimental to the successful treatment of the contaminated materials. The acceptable ranges, or levels, of the following parameters in the irrigation water must not exceed the criteria established in Table 3.

TABLE 3 - IRRIGATION WATER LANDFARMING CRITERIA CRITERIA

PARAMETER	REUSE CRITERIA
maximum conductivity	[_____] micro-mho per cm
minimum pH	[_____] standard units
maximum pH	[_____] standard units
[_____]	[_____]

Provide water for irrigation that does not contain contaminants that would persist through the landfarming process and that would thereby cause the landfarmed soil to be considered contaminated and not suitable for reuse. Contaminants must also be avoided that may leach through the project site and contaminate groundwater.[If non-potable water is to be used, the irrigation water must be characterized prior to its use using Table 4. Sufficient numbers of samples must be collected to characterize the irrigation water source. Irrigation water that does not meet the criteria in this table may be treated to these criteria prior to landfarming use. Submit a Water Supply Analysis demonstrating that irrigation water meets requirements.

TABLE 4 - IRRIGATION WATER CONTAMINANT CRITERIA

Chemical Contaminants

ANALYTICAL METHOD NUMBER From EPA SW-846	ANALYSIS TYPE	CRITERION TO BE MET
6010 [and 7470A]	Metals [and Mercury]	[Less than Maximum Contaminant Level (MCL)] [_____]
8260	Volatile Organics	
8270	Semi-volatile Organics	
8082	PCBs	
1633	PFAS	
8081	Pesticides	
Within each Analytical Method, only analyze for analytes which have a [MCL] [_____].		

]2.3 AMENDMENTS

****

NOTE: Use of amendments may not be necessary for treatment of some types of soils. Adding amendments such as manure at too high of a rate can change porosity characteristics, and may prevent proper drainage and aeration. Organic contaminants will adsorb onto organic amendments (e.g., wood chips), and may become less available to degrading microorganisms. Adsorption of contaminants can make it appear like the contaminants have been biodegraded. An in-depth discussion of adsorption and bio-transformation reactions can be found in the chapter titled, "Microbe-Soil-Organic Contaminant Interactions", Haider, K., from the text, Bioremediation of Contaminated Soils, Agronomy Monograph no. 37, American Society of Agronomy, Crop Science Society of America, Soil Science Society of America, 1999.

Factors driving selection of amendments include: seasonal availability, proximity of sources to the site, costs, storage and handling properties, moisture content, odor potential, texture and porosity, carbon-to-nitrogen (C:N) ratio, previous

experience with using an amendment, and consistency in the quality of an amendment.

Addition of manure is an inexpensive way to bolster microbial activity, provide nutrients (nitrogen, phosphorous and micro-nutrients), and increase the field capacity of sandy soils. Relative to most other types of manure, chicken manure has a high nitrogen content. Fresh manure will contain higher levels of nitrogen than dried. Nutrients will leach more readily from fresh than from dried manure. Swine manure is not recommended due to the potential for odor problems. Because of the diversity of the bacterial populations within their digestive systems, manure from ruminant animals (e.g., cows) is generally considered to be good source of microbial inoculum. Bedding materials will often be intermixed with manure. These bedding materials may help increase porosity, depending on the soil type. Pope and Matthews previously recommended that manure be applied to each lift at a rate of about 3-4 percent by weight of soil (Bioremediation Using the Land Treatment Concept, EPA/600/R-93/164). Pope currently recommends a 2-4 application rate.

Arsenic-containing compounds are often fed to chicken, turkey and swine as growth promoters. Thus, there is potential for residual levels of arsenic to be present in these types of manure (see "Sources and Practices Contributing to Soil Contamination", Knox, A. S., et al., from the text, Bioremediation of Contaminated Soils, Agronomy Monograph no. 37, American Society of Agronomy, Crop Science Society of America, Soil Science Society of America, 1999.

The C and N contents of candidate amendments can be estimated using literature values, see Appendix A of the On-Farm Composting Handbook (Northeast Regional Agricultural Engineering Service, 1992). Laboratory testing, for moisture and ash content, may also be used to estimate carbon content. By subtracting the ash content from the dry weight, the organic matter content can be determined. The carbon content is usually estimated by dividing the organic matter content by 1.8.

Carbon in the form of aged wood, or other aged wood products is generally considered to be unavailable. Carbon in manure and other relatively soluble organic materials is generally considered to be available. Amendments with high C:N ratios, and high levels of available carbon, will tend to exert a nitrogen demand. Microorganisms will consume nitrogen as they degrade the organic carbon in the amendment. Use of amendments high in available carbon and with high C:N ratios should be limited; as their use will increase the amount of fertilizer needed to replenish nitrogen.

Wood chips, shredded wood or bark may be used to increase the porosity of soil; however, depending on plans for end-use, large-diameter materials may have to be separated from treated soil. It becomes more difficult to maintain aerobic conditions as the porosity decreases, and as the moisture content increases (see paragraph MOISTURE CONTROL). Organic contaminants will often adsorb and accumulate onto wood products present in the contaminated-soil matrix.

Wood products derived from treated wood should not be used, as this may result in secondary contamination of soil. Treated wood especially older treated wood, may contain CCA (chromated copper arsenate), PAHs (from creosote), PCP, or other contaminants. Even newer treated wood that uses wood preservatives approved by the USEPA in the 2010 or later timeframe should be avoided due to the risk of contamination and inhibition of microbial activity. Types of wood which contain naturally occurring compounds that inhibit microbial activity (e.g., cedar) should be avoided. Freshly processed wood products can also release other organic compounds (e.g., organic acids) that can be detrimental to the treatment process. Wood products should be aged under moist conditions for several months prior to use.

****

Provide amendments that are free of chemicals, such as wood preservatives, which could result in secondary contamination of soil. The concentration of glass, plastic, and other foreign materials in each shipment of amendment must not exceed [5][_____] percent, by dry weight. Do not use asbestos containing materials as amendments.

Analyze manure amendments to verify absence of constituents that would pass unaltered through the landfarming process and possibly accumulate in the product soil. The following table should be used:

TABLE 5 - MANURE AMENDMENT CONTAMINANT CRITERIA		
Chemical Contaminants		
ANALYTICAL METHOD NUMBER From EPA SW-846	ANALYSIS TYPE	CRITERION TO BE MET
6010 [and 7470A]	Metals [and Mercury]	[Less than USEPA Residentional Soil Regional Screening Level if one exists] [_____]
8082	PCBs	
1633	PFAS	

TABLE 5 - MANURE AMENDMENT CONTAMINANT CRITERIA
Chemical Contaminants
Within each Analytical Method, only analyze for analytes which have a [Residential Soil RegionalScreening Level] [_____].

2.4 SYNTHETIC OR MANUFACTURED ADDITIVES

Commercial fertilizers are an example of a synthetic or manufactured additive. A Certificate of Analysis for Synthetic or Manufactured Additives must accompany each shipping unit of synthetic or manufactured additive supplied by the vendor.

[2.5 Samples for Bench-Scale Tests

****

NOTE: To reduce the overall risk to the government, it is strongly advised that the project team should require the Contractor to collect samples for the bench-scale treatability study test unless the nature of the site prevents the Contractor to do so. Depending on site conditions and project needs (e.g. site security, access issue, etc.), the Government may provide samples to the Contractor to conduct bench-scale treatability study tests.

****

[The Contracting Officer will provide the required samples to conduct the bench-scale treatability study test.][Select sampling locations and collect representative samples to conduct the bench-scale treatability study test. Consider the existing site conditions presented in paragraph EXISTING CONDITIONS when selecting sampling locations.[Conduct sample collection activity in the presence of Contracting Officer.]] The collected bench-scale treatability study test samples must have contaminant concentration levels [representative of the average concentration of the contaminants identified][and][greater than the action level criteria presented in Table 6]. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria. A minimum of [2 composite samples][_____] must be tested. Also provide a physical description of each soil sample, either prepared by or under the supervision of a licensed geologist, to demonstrate that soil-type is representative of the contaminated zone. Do not commence bench-scale treatability study testing until contaminated material sample results meet the aforementioned concentration criteria.

TABLE 6 - ACTION LEVEL CRITERIA	
PARAMETER	ACTION LEVEL CRITERIA
[_____]	[_____] mg/kg

]PART 3 EXECUTION

[3.1 SOIL AND AMENDMENT TESTING AND BENCH-SCALE TREATABILITY STUDY TESTING

****

NOTE: Bench-scale treatability study tests should be performed to confirm that the landfarming process is capable of meeting treatment criteria for the specific contaminants and soil matrix. For contaminants that are known to be amenable to landfarming in a soil matrix similar to that of the project site, bench scale testing may not be necessary. The following reference should be used to prepare the plan for Bench-Scale Treatability Study Testing: EPA 540/R-93-519a, Guidance for Conducting Treatability Studies Under CERCLA, Biodegradation Remedy Selection, 1993.

These paragraphs, and the corresponding submittal descriptions, should be deleted if amendment testing and bench-scale testing were performed prior to awarding this contract.

****

3.1.1 Amendment Test Report

****

NOTE: If a proven type of amendment will be used, testing may not be necessary. However, if a type of amendment has been proposed for which there is no previous experience, the following tests should be considered: bulk density, moisture content, field capacity (or water holding capacity), conductivity, pH, organic matter content (or volatile solids), ash content, and total Kjeldahl nitrogen (TKN). The field capacity of coarse, sandy soils may be improved by adding an amendment with a high field capacity. Conductivity is an indicator of salt content. High salt levels can be detrimental to microbial activity. Organic matter content, ash content, and TKN can be used to determine C:N ratios (see note under paragraph AMENDMENTS).

Contaminants may be present in an amendment that could affect plans for disposal of treated soil. Testing should be performed if it is suspected that use of an amendment could result in secondary contamination of soil.

****

Prior to the bench-scale test, collect and test samples of amendments for: [moisture content, pH, and conductivity][_____]. For each type of amendment, [2 composite samples][_____] must be tested. Submit the amendment test report along with the Bench-Scale Treatability Study Test Report in accordance with paragraph BENCH-SCALE TREATABILIITY STUDY TEST REPORT. Include the following in the report: characterization test results for each amendment; the source and approximate age of each amendment; the date that each amendment was shipped, received and tested by the laboratory; procedure used to ship each amendment (including type of containers and temperature); if amendments were stored for any period of time, the temperature of storage; testing methods used; certification or laboratory reports showing the amendment is contaminant-free; and proposed recipes of soil and amendments for bench-scale treatability study testing.

3.1.2 Bench-Scale Treatability Study Test

****

NOTE: To reduce the chances of using soil samples that are not representative of site conditions, a minimum volume of 4 liters 1 gallon is recommended for each condition to be tested at the bench scale. Use of large particle-size amendments (e.g., bark chips) makes it all-the-more important to require relatively large soil samples for bench-scale treatability study testing.

Prior to initiating the bench-scale treatability study, the soil to be used in the study should be tested to confirm that the levels of contaminants are within the desired range. If test results indicate that the soil is not representative, or contaminant levels are outside of the desired range, then more soil may need to be collected. The bench-scale treatability study should not be initiated until it can be ascertained that the soil that has been collected meets the desired criteria.

****

Submit the proposed test conditions to be included in the bench-scale treatability study testing. Perform at least [two, replicate][_____] tests simultaneously for each selected test condition. Prior to initiating testing, homogenize and divide the soil into replicate volumes. The volume of contaminated soil included in each soil pan must be not less than [[4][_____] liters [1][_____] gallons][_____]. Bench-scale treatability study testing must be performed for a period of not less than [60 days][_____] or until target levels are reached, whichever is shorter.

3.1.2.1 Bench-Scale Test Report

After completion of testing, compile the data, submit the Bench-Scale Test Report and propose the conditions to be tested in the field demonstration, and include the proposal for the in the Bench-Scale Test Report.

]3.2 PREPARATION

****

NOTE: Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES includes requirements for decontaminating equipment that has been used in contaminated zones. That section should be modified to extend decontamination/cleaning requirements to equipment being brought on-site to cover the requirements of this paragraph.

****

3.2.1 Mobilization

Do not mobilize to the site until [the Landfarming Work Plan][UFP-QAPP] has been approved by the Contracting Officer and the Contractor has received written confirmation. Delays caused by the Contractor's failure to meet regulatory requirements must result in no additional cost to the Government. In accordance with[Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____], do not bring rented equipment and equipment previously used for other site remediation to the site until such equipment has been decontaminated and tested.

3.2.2 Pre-Operation Examination

Conduct a pre-operation examination of the on-site infrastructure, utility conduits, monitoring points, and site access constraints. Photographically document, with identifying labels, the existing condition of infrastructure and utilities, particularly for comparison to post-treatment conditions. Verify locations of critical utilities that cannot be disrupted and those utilities that would potentially have significant impacts on treatment and public safety. Submit a Pre-Operation Examination Report documenting the examination activity [before mobilization begins][_____]. Obtain the necessary utility clearances before initiation of subsurface work.

3.2.3 Preconstruction Equipment Examination

Conduct a preconstruction examination of the landfarming equipment for damages, defects, and dilapidation. Submit the Preconstruction Equipment Examination Report to the Contracting Officer [before construction begins][_____]. The Contracting Officer may conduct an independent examination to ascertain the condition and functionality of the equipment. Based on this examination, the Contracting Officer may reject the entire system or damaged, defective, or dilapidated equipment. The cost associated with equipment or control replacement or repair, and delays caused by the rejection must be borne by the Contractor. Routinely and properly inspect and maintain the equipment to provide the operation as required by the Contract schedule. Schedule delays and the associated costs are the responsibility of the Contractor. Provide an alternate or auxiliary power source if sufficiently reliable sources are not available.

3.3 FIELD DEMONSTRATION

****

NOTE: Field demonstrations should be performed to confirm that the landfarming process is capable of meeting treatment criteria in a reasonable time frame.

The field demonstration requirements are a function of the uncertainty of the materials to be treated. For well defined wastes, known to be amenable to landfarming, optimization testing may be adequate. Optimization testing would typically be performed using full-scale equipment and facilities. If the amenability of the contaminated material to landfarming, has not been established, the field demonstration should be preceded by bench-scale testing. If the process has yet to be demonstrated on a large scale for the specific soil type and contaminants of concern, it may be advantageous to perform the field demonstration prior to construction of full-scale facilities.

The treatment conditions and amendments used in the

field demonstration should be based on the results of the bench-scale treatability study test. To prevent scale-up problems between the field demonstration and full-scale operations, the area of each treatment cell used for the field demonstration should be at least 5 percent of the area planned for each full-scale treatment cell.

****

Prior to full scale landfarming operations, a field demonstration must be performed. If the materials treated during the field demonstration do not meet the treatment criteria, an equal quantity of the same type of material that failed must be processed, using modified operating conditions, until satisfactory results are obtained. Any treated materials that failed the field demonstration must be kept segregated and returned to the contaminated materials stockpile area for processing during full-scale remediation. The area of each demonstration treatment cell must be a minimum of [9][_____] square meters [100][_____] square feet. Separate treatment cells spaced to prevent intermingling of contaminated material, must be provided for each condition being tested. Conditions to be tested must include: [_____]. The field demonstration must be conducted using the same lift-depth, and similar irrigation and tilling methods as proposed for the full scale operations. The field demonstration must not be initiated until written approval has been received from the Contracting Officer.

3.3.1 Sampling Locations

****

NOTE: Chemical testing should be performed to verify that the materials to be used for the field demonstration contain the contaminants of concern at high enough concentrations to adequately test the process. Additional testing may be warranted to verify that the physical properties of the materials are representative of site conditions.

****

Obtain contaminated material used for the field demonstration from [the location specified by the Contracting Officer][_____]. Prior to performing the field demonstration, test [three composite samples][_____] of the contaminated material to be used for the field demonstration. Consider the existing site conditions presented in paragraph EXISTING CONDITIONS when selecting sampling locations. The contaminated material samples must have contaminant concentration levels [representative of the average concentration of the contaminants identified][and][greater][than the action level criteria presented in Table 7]. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria. Test samples of contaminated materials intended to be used in the field demonstration in accordance with procedures in paragraph PRE-COMPLIANCE TESTING. Do not commence the field demonstration until soil samples meet the aforementioned concentration criteria. Also provide a physical description of each soil sample, either prepared by or under the supervision of a licensed geologist, to demonstrate that soil-type is representative of the contaminated zone.

TABLE 7 - ACTION LEVEL CRITERIA	
PARAMETER	ACTION LEVEL CRITERIA
[_____]	[_____] mg/kg
[_____]	[_____] mg/kg

3.3.2 Monitoring

****

NOTE: Because a more intensive level of monitoring is usually required during the field demonstration than during full-scale operations, a separate set of Operation, Maintenance and Process Monitoring requirements may need to be prepared. The following differences in monitoring requirements are typical for the field demonstration versus full-scale operations: sampling stations may be spaced more densely; temperature, moisture, and respiration testing may be performed more frequently; and sampling and analysis for contaminants of concern may be performed on a more frequent, and more regular basis. A sufficient number of samples should be tested to assess the heterogeneity of contaminant concentrations. The field demonstration may also provide an opportunity to develop a site-specific correlation between field, and laboratory analysis methods.

A sufficient amount of time,which should be based on the results from the bench-scale treatability study test, should be scheduled for the field demonstration to determine the amount of time it will take to reach cleanup goals during full-scale operations. Degradation rates typically decrease as contaminant levels decrease; e.g., it may take 3 times as long to go from 25 to 10 mg/kg as it takes to from 100 to 25 mg/kg. Thus, trends in contaminant levels should not be extrapolated in an attempt to predict how long it will take to reach cleanup goals.

****

During the field demonstration, sampling and analysis must be performed as indicated under paragraph OPERATION AND FIELD QUALITY CONTROL; in addition to these requirements, the following processing monitoring requirements must be implemented: [_____]. The treatment period of the field demonstration must not exceed [180][_____] days, without written approval from the Contracting Officer.

3.3.3 Field Demonstration Operations Reports

During the field demonstration furnish reports weekly for the first [10][_____] weeks, and every [two][_____] weeks thereafter. Maintain copies of the reports at the facility. Record and maintain the following information until closure of the facility: description (including sources) of contaminated soil and amendments on site; the locations of all amendments and contaminated soil on site, and the quantity at each location; receipt, storage, treatment, disposal date, offsite disposal location, volume, and weight of hazardous and non-hazardous wastes including contaminated and treated soil and amendments; and manifests/proof of receipt from the disposal facility for hazardous and non-hazardous wastes. Dispose of all hazardous materials and wastes in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS. Record the location and quantity of each type of material on a map or diagram of the site. Include cross-references to specific manifest document numbers, if the waste was accompanied by a manifest. Provide summary reports and details of all incidents that require implementing contingency plans, or corrective action measures. Also include:

a. Date and time of each monitoring or testing event.

b. Results from each monitoring or testing event.

c. Monitoring procedure, or test method used.

d. Individual performing the monitoring or testing, and other individuals present.

e. Remarks.

Cross-reference to submittals specified in other Sections to prevent duplicate information in separate submittals.

3.3.4 Field Demonstration Report

****

NOTE: If the results of the field demonstration will be used to inform the Landfarming Work Plan, it may be preferred to report the field demonstration results in the Landfarming Work Plan instead of having a separate Field Demonstration Report. Update the Landfarming Work Plan paragraph and delete this paragraph if using that approach.

****

Provide the field demonstration report[not more than [60][_____] calendar days after completion of the field demonstration. Prepare [draft for Government review] [draft-final for [regulatory][_____] review] and final versions of the Field Demonstration Report. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document]. Include: characterization test results for each amendment; the source of each amendment; for each condition tested, the amount of each amendment that was added per unit volume of soil; chronological table showing all materials added, amount added, date of addition, and each mixing, precipitation, irrigation and sampling event. For organic amendments, such as manure or wood products, state the freshness of the amendment; and the length of the period of aging, prior to incorporating the amendment into soil. The report must also include: physical and chemical monitoring data from before, and during treatment; degradation rates; final disposition of wastes and treated material; and conclusions. Provide recommendations for full-scale operations in the report. In addition, include the day-to-day log of operations and adjustments in an appendix.

3.4 SOIL PRE-PROCESSING

****

NOTE: Soil pre-processing may include stockpiling, screening, and blending of soil and amendments. The maximum recommended particle diameter for soil mixing / tilling equipment can range from 25 to 100 mm 1 to 4 inches. Although it is possible to include relatively large particles in the soil matrix during landfarming, an additional screening step may also be necessary to remove the large particles prior to disposal. The end use for the treated soil often governs the maximum allowable particle diameter. More stringent requirements will apply if treated soil will be allowed to be incorporated into top soil. For surficial landscaping purposes, the concentration of glass, plastic, and other foreign materials should not exceed 5 percent, by dry weight. This paragraph should be coordinated with paragraph AMENDMENTS.

Relatively impermeable oversize materials (e.g., rocks) are usually treated by rinsing or pressure washing. For further discussion see paragraph, Particle Size Criteria for Treated Soil.

****

Pre-process contaminated soils as necessary by [screening][blending][shredding][_____] to provide a maximum particle size in the contaminated soil matrix [compatible with approved material handling and tilling equipment][and no greater than 80 mm 3 inches][_____]. Oversize materials must be separated from contaminated soil prior to mixing soil with amendments.

3.5 OPERATION AND FIELD QUALITY CONTROL

****

NOTE: Operation and monitoring requirements should be based on: applicable literature references; knowledge gained from bench-scale treatability studies and the field demonstration; and historical data from projects with similar soils, and contaminants. Aeration of soil (via tilling) and maintaining proper moisture content are fundamental to successful landfarming. Because there will always be exceptions, where the default values provided in these paragraphs do not suit a specific project, the following paragraphs should be edited appropriately. These paragraphs should be coordinated with Division 1 Sections of the contract; operations, maintenance, and process monitoring requirements are covered in a Division 01 Section of some contracts.

Reference a UFP-QAPP that has been prepared in accordance with DoD and EPA guidance. UFP-QAPPs follow the Data Quality Objectives (DQO) process and are required for DoD environmental restoration work. If a UFP-QAPP has been prepared for the overall

project that landfarming is being used on, referencing to the UFP-QAPP for testing requirements avoids potential for conflicting requirements between the UFP-QAPP and the specifications.
****

Do not initiate full-scale operations until the Landfarming Work Plan[and the UFP-QAPP] has been approved, and written approval has been received from the Contracting Officer. Operation of the landfarming must proceed continuously, through the term of the contract, except as described in paragraph ENVIRONMENTAL REQUIREMENTS. The testing specified in the following sub-paragraphs is needed by the Government to generate documentation that the landfarming treatment has been accomplished in accordance with performance requirements listed in the decision document and approved by the government and regulators (e.g. EPA or other state agencies). The results of these tests may be used as part of the Contractor's QC program; however the Contractor must meet the performance requirements specified in this Section. Perform additional testing and measurements to ensure that treated materials meet requirements without rejecting batches, retesting, or reprocessing.

3.5.1 Dissimilar Soils

****
NOTE: Delete the bracketed text item if dissimilar materials are not known to be present at time of preparing project specifications.
****

Do not mix together dissimilar soils if the bench-scale treatability study and/or field demonstration testing results indicate that different operating conditions have to be implemented to achieve effective treatment of these soils.[Materials known to be dissimilar at the site are defined in [paragraph EXISTING CONDITIONS][_____].]

3.5.2 Containment Inspection

****
NOTE: Routine operation of heavy equipment within lined landfarm facilities can result in damage to the geomembrane liner. Periodically, the granular drainage layer and geomembrane liner should be inspected. Use of rubber-tracked equipment may minimize the risk of such damage.

Containment inspection may not be necessary where the mode of operation involves successively placing new lifts of contaminated soil on top of treated lifts of soil.

Electrical leak location may be an alternative to visually inspecting the geomembrane liner. If electrical leak location is specified, the designer should have a good understanding of electrical leak location methods, availability of testing firms to perform the work, and integration into the project schedule. Refer to ASTM D6747 Standard Guide for Selection of Techniques for Electrical Leak Location of Leaks in Geomembranes to determine the

appropriate location technique. If electrical leak location is retained, the specification and references must indicate how leaks will be identified and how repairs will be made.

****

Inspect the geomembrane liner when the liner may have been damaged during removal of soil from the treatment cell. This requirement does not apply when completing final disposition of the treatment cell. Reason to suspect damage to the geomembrane liner includes [inadvertent removal of more than [half][_____] the thickness of the drainage layer][observations of potential damage by Contractor or Government QC personnel][_____]. Define the limits of potential damage, remove the porous drainage layer material by hand, and conduct a visual inspection of the geomembrane liner [with the Contracting Officer present]. Repair damages to the geomembrane liner in accordance with Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT. Restore the porous drainage layer to the approved design requirements.

3.5.3 Tilling and Aeration

****

NOTE: Tilling too soon after heavy precipitation or irrigation may lead to the formation of hard clods; especially, for soils with high clay content. Light irrigation prior to tilling will help keep dust down.

The direction of tilling should be alternated to facilitate thorough mixing and uniform treatment of the contaminated material. Thorough tilling will result in more homogenous soil, and should reduce the variability of chemical data.

The goal of tilling is to mix and aerate the soil while minimizing compaction. Tilling too frequently can compromise soil structure (i.e., reduce pore volume, and lead to compaction). Although conventional agricultural plowing methods (e.g., using a disk harrow or chisel plows) can result in some degree of mixing and aeration, they are usually much less effective than rotary tilling equipment. Periodic deep tilling (to a depth of about 500 mm1.6 ft) using subsoil tillers can be used to provide a limited degree aeration at depth, and may hasten treatment of soil below the depth limit of a rotary tiller.

Although most categories of organic contaminants biodegrade most readily under aerobic conditions, there are some types of contaminants that are more amenable to biodegradation under anaerobic conditions. There are also some contaminants that are most readily biodegraded under alternating conditions (e.g., anaerobic followed by aerobic conditions). It may be necessary to modify tilling requirements to accommodate these types of alternative treatment strategies. Tilling and aeration procedures should be based on the results and recommendations from the Field Demonstration report approved by the government.

****

Till using a [rotary tiller, with tines attached to a rotating shaft][_____]. Alternate the direction of tilling between lengthwise, crosswise, and diagonal. A light irrigation event, prior to tilling, may be used as a dust control measure. Till the soil in the treatment cell at least once every [14][_____] days, unless monitoring indicates that soil gas oxygen levels are greater than [2 percent][_____], by volume, in which case it may be tilled less frequently. Additional tilling may be required in response to process monitoring; for example, to provide additional aeration.

3.5.4 Moisture Control

****

NOTE: The water content at saturation will vary with soil type, and depending on whether amendments were added. Determination of water content as a percent of field capacity (or water holding capacity) provides a more universal indicator of the degree of saturation. Field capacity is determined by saturating a sample, allowing the free water to drain, and then determining the moisture content; field capacity is the mass of water in the sample divided by the dry weight. According to Bioremediation Using the Land Treatment Concept, EPA/600/R-93/164, field capacity can range from 5 percent (for a sandy soil) to 30 percent (for a clay soil). The recommended moisture content for landfarming is between 40 and 80 percent of the moisture content at field capacity. For example, if the field capacity of a soil is determined to be 20 percent, then optimum moisture content would be between 8 and 16 percent.

****

3.5.4.1 Field Capacity

****

NOTE: The following methods may be used as approximate measures of field capacity: ASTM D425 or ASTM D6836.

When using porous-plate or pressure-membrane apparatus, the pressure that should be applied depends on the soil-specific factors such as organic matter content, soil structure, compaction, and percent sand, silt, and clay. As a general guideline, Methods of Soil Analysis recommends the following pressures for the following soil types: 5-10 kPa 0.7-1.4 psi for coarse-textured, 33 kPa 4.8 psi for medium-textured, and 50 kPa 7.3 psi for fine-textured. If the centrifuge method is used, the centrifuge speed should be adjusted to accommodate differences in soil types (this is analogous to the above guideline for pressure versus soil type).

****

Prior to treating each lift of contaminated material, a minimum of [4][_____] representative composite samples must be tested to determine field capacity (or water holding capacity). Testing soil for field capacity must be performed in accordance with [ASTM D6836][_____].

3.5.4.2 Moisture Content

****

NOTE: Visual/manual methods for estimating moisture content should be used in conjunction with laboratory and field testing. Moisture content should be monitored more frequently than other process parameters. The frequency of monitoring usually depends on the climate and soil type; more frequent monitoring is required in arid climates and for high permeability soils.

ASTM D2974 and ASTM D2216 are equivalent, gravimetric laboratory methods for moisture content testing.

Many moisture monitoring devices used in agricultural applications are not suitable for landfarming because they must be positioned in one location and left undisturbed. Because landfarming involves frequent tilling, moisture monitoring devices that can be inserted into the soil to take immediate readings are preferred.

Several types of electronic moisture sensing devices that provide real-time readings are available. Electrical conductivity moisture sensors are inexpensive but not highly accurate, compared to some of the more sophisticated instruments available. Neutron probes and time domain reflectometry (TDR) moisture sensors offer a higher degree of accuracy, but at a substantially higher capital cost. However, neutron probes are not particularly well suited to landfarming because they are not accurate for measurements less than 180 mm 7 inches from the surface.

****

Quantitatively test the moisture content using a field method (for example, electronic field instrument) at least every [Monday, Wednesday, and Friday][_____] for the first [six][_____] weeks, and every [Monday and Thursday][_____] thereafter. The field method may involve the use of an instrument that correlates moisture content to electrical conductivity. Collect samples for laboratory analysis, and test in accordance with [ASTM D2216][ASTM D2974][_____] to determine moisture content, according to the following schedule: [a minimum of two samples per week, for the first four weeks; and a minimum of two samples, once every eight weeks thereafter][_____]. Collect these samples immediately after testing using the field method, and from the same location as the samples tested using the field method.

3.5.4.3 Irrigation

****

NOTE: Factors influencing irrigation water requirements include the field capacity of the soil, water holding properties of amendments (if used), and the climate. A tank truck or a water storage tank may be necessary if a local water source is not available.

****

Irrigate the treatment cell when testing indicates that the soil moisture content is below [40][_____] percent of the field capacity. Do not irrigate at a rate greater than [13][_____] mm [1/2][_____] inch per hour. Irrigate sufficiently to bring the moisture content to within the acceptable limits within [24][_____] hours. Immediately cease irrigation if ponded water is observed in the treatment cell, or if irrigation water is observed running off the treatment cell. Measure the application rate with a water meter. Record the application rate, duration of the irrigation period, and volume of water applied. Measure and record the quantity of water from each precipitation event each weekday.

3.5.4.4 Contact Water Testing

Test contact water, to be reused as irrigation water, for pH and conductivity on the [first,][second,][_____][and][fourth][_____] week after initiating treatment of each lift of soil. If there is more than [13][_____] mm [1/2][_____] inch of precipitation in 24 hours, test the pH and conductivity of the contact water after water from the precipitation event has collected in the contact water storage facility. Each time testing is performed, either withdraw one representative sample from the contact water holding vessel, or directly test the water in the holding vessel by immersing the instrument probe in the water.

3.5.5 Nitrogen and Phosphorus Control

****

NOTE: Commercial fertilizers are often used as a source of nitrogen (N) for landfarming operations. In commercial fertilizer specifications, N is the first of the three components listed (i.e., 33:3:3 refers to N:P:K). The N and P (phosphorous) content is usually expressed as weight percent of N and phosphorus pentoxide equivalents (P2O5) in the fertilizer. To determine the percent of P, by weight, the number corresponding to P should be divided by 2.3. The potassium content, expressed as K2O, in commercial fertilizers is much more significant for plants than it is for microbial nutrition. Slow release fertilizers require less frequent application and supply nutrients at a more constant level. Examples of slow-release, nitrogen fertilizers include: sulfur-coated urea, urea formaldehyde, as well as some organic products (e.g., fish meal, blood meal, etc.). Agricultural spreaders are commonly used to distribute fertilizer across the treatment cell, or it may be dissolved into irrigation water and applied to the cell by the irrigation system.

When measuring nutrients in soils it is important to distinguish between available and total

concentrations of N and P. Readily available nutrients are in a form that can be rapidly assimilated by microorganisms. Total nitrogen is usually determined by adding the level of total Kjeldahl nitrogen (TKN) to that of nitrate nitrogen. TKN includes ammonia nitrogen and nitrogen bound to organics. Nitrate and ammonia (inorganic N) represent the most readily available forms of nitrogen.

There are several different methods for determining available phosphorous in soil. Agricultural labs often use the Bray P-1 method (also known as Phosphorous Soluble in Dilute Acid-Fluoride). For highly calcareous soils (greater than 4 percent calcium carbonate), the Olsen P method (also known as Phosphorous Soluble in Sodium Bicarbonate) is recommended. For additional information on test methods see, Methods of Soil Analysis, Part 2 Chemical and Microbiological Properties, American Society of Agronomy and Soil Science Society of America, 1982.

The following information are found in the literature and are for information only. The Contractor can propose different ratios based on the results from the bench-scale treatability study

testing and field demonstration.

A wide range of optimal carbon-to-nitrogen (C:N) and carbon to phosphorous (C:P) ratios for landfarming have been reported in the literature. A C:N:P ratio range of 100:10:1 to 300:10:1 was recommended (Pope & Matthews, EPA/600/R-93/164). C:N ratios between 25:1 and 38:1 have also been recommended (Huddleston, R.L., et al., Land treatment biological degradation processes. p. 41-61. In R.C. Lowhr and J.F. Malina, Jr. (editors) Land treatment: A hazardous waste management alternative. Water Resour. Symposium 13th. Center for Research in Water Resour., Univ. of Texas, Austin, 1986.)

Insufficient nitrogen levels may lead to sub-optimal degradation rates. However, excessive levels of nitrate and ammonia can also reduce hydrocarbon degradation rates (see Huesemann, "Guidelines for Land-Treating Petroleum Hydrocarbon-Contaminated Soils", Journal of Soil Contamination, 3(3):299-318, 1994). Also organic nitrogen is often present in soil before fertilizer has been added, and recycling of nitrogen will occur as microorganisms die-off. According to Huesmann, one-time additions of inorganic N should be limited, and inorganic N levels should be maintained above a threshold level of about 50 mg/kg. Treatment of soil with high levels of organic contaminants usually requires repeated applications of N.

If the Contractor can demonstrate that increasing one-time applications of N to a value higher than the recommendations from the bench-scale testing, field demonstration, or that prescribed below does not adversely affect contaminant degradation rates, then the Contractor should present such data to obtain approval to increase one-time N application rates. However the data should be from the same site, using the same soil type, the same type of N amendment, and treating the same contaminants.

****

Test the levels of nitrogen and phosphorous within the [first two weeks][_____] of initiating treatment of each new lift of contaminated soil in the treatment cell. Perform subsequent nitrogen and phosphorous testing once every [90 days][_____]. Nutrient testing and application of nutrients may be performed as a pre-treatment step, prior to placement of the soil in the treatment cell. Test a minimum of one representative, composite sample per each 1,000 cubic meters 1,300 cubic yards. Nitrogen analysis must include testing for the following parameters: [nitrate, ammonia, and total Kjeldahl nitrogen][_____]. Phosphorous analysis must be performed by testing for [phosphorous soluble in dilute acid - fluoride][_____]. When the sum of the nitrate and ammonia levels fall below [50][_____] mg/kg as N, apply fertilizer to restore nitrogen levels. Do not exceed 0.18 kg 0.31 pounds of N per cubic meter yard during one time applications of nitrate and ammonia. Apply phosphorous-containing fertilizer when the levels of phosphorous fall below [5][_____] mg/kg as P. Each time fertilizer is applied, record the product name, quantity, and N:P:K content. Take necessary precautions to prevent the release of chemicals, such as nitrate, to the vadose zone and groundwater.

3.5.6 Temperature Monitoring

****

NOTE: Control of temperature is usually not practical for large-scale treatment cells. The treatment cell can be covered by a layer of mulch to help insulate the soil. However the mulch layer may reduce the rate of oxygen diffusion from the atmosphere to the soil, and will have to be removed prior to tilling. In cold climates, activity at large-scale landfarming operations is usually seasonal. Follow the recommended effective temperature range in the Landfarming Work Plan and cease landfarming operation when it becomes impractical. The typical effective Soil temperature range is between 10 and 45 degrees C 50 and 113 degrees F for landfarming operation based on the guidance from Federal Remediation Technologies Roundtable (https://www.frtr.gov/matrix/Landfarming/).

For small-scale projects, it may be possible to perform landfarming inside of a heated building or other type of covered structure during the winter. Structures similar to temporary greenhouses have been used to extend the "landfarming season" during cold periods. More than 3 temperature monitoring locations should be required if a cover structure is being used to determine if adequate temperatures are being maintained throughout the treatment cell.

****

Use the recommended low/high temperature range in the approved Landfarming Work Plan for reference, which should also follow the temperature range requirements listed in paragraph ENVIRONMENTAL REQUIREMENTS. Measure the temperature of the soil in the treatment cell[once every four weeks at the following times: 0800 hours, 1200 hours, and 1600 hours][_____]. Monitor the temperature at a minimum of [three][_____] locations, in the treatment cell. Monitor at the same locations during each event, and at a depth of at least 76 mm 3 inches below the surface of the soil. Record the temperature, time, depth and location of each temperature reading during each monitoring event. Record ambient air temperatures at the time of monitoring.

3.5.7 Soil pH

****

NOTE: The optimum pH range for biodegradation of most types of contaminants is between 6.0 and 8.5 standard units. However, where acclimated populations of microbes are present, degradation may proceed at an adequate rate when the pH is as low as 5.0. The pH can influence the availability of N, P, micronutrients, metals and some types of organic contaminants (see Sims, et al., Prepared Bed Bioreactors, in Bioremediation of Contaminated

Soils, Agronomy Monograph no. 37, American Society of Agronomy, Crop Science Society of America, Soil Science Society of America, 1999).

Biological degradation of organic constituents may result in a reduction of the pH of soils. Strong caustics should not be used to adjust the pH of the soil because they can cause large, rapid changes in soil pH, which may inhibit biological activity. Crushed limestone or lime are commonly used to increase the pH. Agricultural lime is available in several particle-size grades. Finely graded material acts faster than coarsely graded product.

Some soils are naturally alkaline and may require downward pH adjustment. Sulfur-based amendments (e.g., elemental sulfur) may be used to decrease the pH of the soil.

The goal of pH adjustment should be to adjust the pH in small increments. If it appears that pH adjustment may be necessary, samples should be sent to a local soils laboratory (after ascertaining that the laboratory can accept soil from a hazardous waste site). Agricultural extension services (e.g., USDA, Natural Resources Conservation Service) possess knowledge of local soil characteristics any may be able to identify site-specific factors that can influence pH, nutrient availability and other considerations.

Test results should be used to calculate how much pH adjustment agent should be added (e.g., lime requirement test, or excess lime test). Amendments used to adjust the pH should be added in conservative, calculated doses.

****

Unless otherwise described in the approved Landfarming Work Plan, at a minimum, test the pH of soil in the treatment cell[each Monday of the first, second, fourth, and eighth week after initiating treatment of each new lift of contaminated soil, and every six weeks thereafter][_____]. Test a minimum of one representative, composite sample per each 1,000 cubic meters 1,300 cubic yards. The first [three][_____] times pH testing is performed, test a minimum of [two][_____] samples in accordance with ASTM D4972 to determine the pH, and to verify the field method. After the field method has been verified, all subsequent testing may be performed in the field. If the soil pH is greater than 8.5, or less than 6.0, send soil samples to a local soil testing laboratory (such as an agricultural extension laboratory) to determine how much pH adjustment product should be added. Prior to sending any samples, notify the local soil testing laboratory regarding the contaminants that are present in the soil, to determine if they can accept such samples. Test samples for [Lime Requirement or Excess Lime][_____]. The first time the pH is adjusted, not more than [one fifth][_____] of the area of the treatment cell must be adjusted. Do not perform additional pH adjustment until after pH adjustment has been demonstrated to result in increased rates of contaminant degradation, and written approval has been received from the Contracting Officer. Laboratory or field demonstration data may be used to demonstrate that pH adjustment results in increased rates of contaminant degradation. After approval for pH adjustment has been obtained, the pH of stockpiled soil may be adjusted as a pre-treatment step, prior to placement of the soil in the treatment cell. Each time a pH adjustment product is applied, test the soil pH before and after adding the pH adjustment product. Also record the product name, quantity, and supplier of the pH adjustment product used after each application. Do not use aqueous caustics, such as sodium hydroxide, as pH adjusting agents.

3.5.8 Odor Control

****

NOTE: If Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS is not included in the project specifications, emissions, dust, and odor sources and control activities should be specified here. To help control odor problems, storage of manure on-site should be avoided. If it is being used as an amendment, manure should be incorporated into soil as soon as possible after delivery to the site.

****

Implement odor control requirements as specified in the approved Landfarming Work Plan [and in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____].

3.5.9 Microbial Activity

****

NOTE: Several categories of tests are available for assessing microbial activity; however, these tests are almost never direct indicators of the rate of biodegradation of the contaminants of concern. If chemical data indicates that the levels of contaminants of concern are steadily decreasing, then there may not be any need to test for microbial activity. In addition to plate counts and respiration testing (as discussed in the following paragraphs), there are a host of other tests that can be used as indicators of microbial activity.

Nucleic acid probes can be used to determine whether a gene coding for an enzyme capable of degrading a specific contaminant of concern is present in soil, or to determine whether a specific strain of microorganisms are present. Use of nucleic acid probes requires that the gene that codes for the specific enzyme be known, or that the nucleic acid sequence of the specific microorganism be known. It is important to note that nucleic acid probes usually measure the potential for expression of a gene. Only messenger RNA (mRNA) probes measure the actual activity of a gene. For additional information on microbial activity assays see, Methods of Soil Analysis, Part 2 Microbiological and Biochemical Properties, Soil Science Society of America, 1994.

****

3.5.9.1 Enumeration of Soil Bacteria

****

NOTE: It is not uncommon for topsoil to contain greater than 1 X 10 6 colony forming units (CFU) of heterotrophic bacteria per gram of soil. However, enumeration methods that rely on non-selective media (e.g., counts of heterotrophic bacteria) do not target the specific microorganisms responsible for degrading contaminants of concern. Furthermore, enumeration data is generally not well correlated with microbial activity in soil.

Plate counts performed using selective media can be used to enumerate microorganisms capable of degrading specific contaminants of concern. Selective culturing procedures (i.e., enrichment culture methods) require use of defined growth media. For example, to select for PCP degrading microorganisms, a defined media which includes PCP as the sole carbon source would be used.

****

Enumeration of soil bacteria will not be required, but may be used as a diagnostic, or trouble-shooting, tool. Contaminant-specific selective culturing methods (e.g., pentachlorophenol-degrading bacteria), are recommended over non-specific test methods (e.g., total heterotrophic bacteria).

3.5.9.2 Field Respiration Testing

****

NOTE: Depleted oxygen and elevated carbon dioxide levels in soil gas are often used as indicators of microbial respiration. Soil gas testing may be performed in the field, and can provide a real-time indicator of microbial activity. However, respiration tests do not target the specific groups of microorganisms responsible for degrading contaminants of concern. Oxygen is usually considered to be a better indicator than carbon dioxide because carbon dioxide can be released (or consumed) via abiotic reactions. Levels of respiration are dependent on temperature and moisture. Thus, respiration measurements should be accompanied by temperature and moisture measurements.

Oxygen levels will usually decrease gradually after each tilling event as aerobic microorganisms consume oxygen. Oxygen concentrations greater than about 2 percent, by volume, are generally indicative of aerobic conditions. The concentration of oxygen in the atmosphere is approximately 21 percent, by volume. For most types of organic contaminants, rates of biodegradation will be highest under aerobic conditions.

The depth of insertion of the gas probe and the volume of sample withdrawn must be synchronized to

minimize the chances of drawing in air from the atmosphere. For example, assuming an air-filled pore volume of 25 percent, a 4 mL 0.25 cubic inch air sample drawn from a depth of 100 mm 4 inch would theoretically come from a spherical zone with a diameter of about 78 mm 3 inch (from a depth of 61 to 139 mm 2.4 to 5.5 inches)

****

Unless otherwise described in the approved Landfarming Work Plan, perform soil gas monitoring at least once every [seven][_____] days for the first [six][_____] weeks of treatment, and every [two][_____] weeks thereafter. Perform soil gas monitoring at not less than [five][_____] randomly selected locations in the treatment cell. Test soil gas for levels of [oxygen and carbon dioxide][_____]. The soil gas meter must be sensitive to [oxygen and carbon dioxide][_____] levels of at least [0.1][_____] percent, by volume. The depth of insertion for the soil gas probe must be no less than [200][_____] mm [7.9][_____] inches, and the volume of air withdrawn for the sample must not be greater than [10][_____] milliliters (mL) [0.61][_____] cubic inches. Perform field measurements of soil temperature and moisture at the same time and location of each soil gas measurement. When soil gas monitoring is performed record the following information: the monitoring location, soil temperature, soil moisture (by field method), the elapsed time since the last tilling event, and the time of day when monitoring was performed.

3.5.10 Sampling and Analysis for Contaminants of Concern

****

NOTE: Field analysis methods (e.g., immunoassay or colorimetric test kits) are usually much less expensive than laboratory analysis for contaminants of concern. However, a site-specific correlation between data from field and laboratory analysis should be developed. Pigmented materials present in extracts from soil samples may cause interferences in colorimetric, definitive field analysis. Laboratory analysis should be required on a minimum percentage of samples to verify data from definitive field analysis.

The goal of the sampling should be to collect samples that are chemically and physically representative of the soil in the treatment cell. The strategy for sampling and analysis should be consistent with the regulatory requirements for the data.

Sample designs that may be applied to treatment cells include: simple random, ranked set, and systematic grid. Systematic grid sampling is simple to apply, and provides for relatively uniform coverage of the area of interest (i.e., the treatment cell). See the following reference for more information on sampling designs: Guidance on Choosing a Sampling Design for Environmental Data Collection (G-5S), EPA/240/R-02/005, Dec. 2002. Visual Sampling Plan, a useful software program that can be used to develop sampling designs, can be

accessed at the following internet site: https://www.pnnl.gov/projects/visual-sample-plan

The following paragraphs provide an example of sampling and analysis requirements, using a systematic grid sampling approach, with randomly selected sample locations within each grid (also known as unaligned grid). This example also includes a field analysis component for pre-compliance testing. This is only an example of sampling and analysis requirements. Compliance testing requirements are project specific, and usually based on negotiations with regulatory officials.

****

Perform sampling and analysis in accordance with the approved UFP-QAPP. Furnish results from each sampling event to the Contracting Officer no more than [24][_____] hours after data is recorded by the Contractor, or released by the laboratory.

3.5.10.1 Pre-Compliance Sampling Design

****

NOTE: In the sample design described in these paragraphs, one of the purposes of pre-compliance testing is to determine the variability of the data (i.e., standard deviation). The variability of the data is then used to determine the minimum number of samples (i.e., maximum grid-size) that will be required for confirmatory sampling via the One-Sample t-Test. Typical, default assumptions include: that the data is normally distributed, and that the clean-up goals have not been met (assume site is dirty). An example of using the One-Sample t-Test to determine the minimum, required number of samples is shown on page 3-8 of the following reference: Guidance for Data Quality Assessment, EPA QA/G-9, EPA/600/R-96/084. The same calculation can be performed using the Visual Sampling Plan software program (see https://www.pnnl.gov/projects/visual-sample-plan).

The grid size shown in this example was arbitrarily set at a maximum of 1,000 square meters 10,800 square feet. Grid sizing is a function of the variability of the data, and the statistical criteria that will be used to demonstrate attainment of clean-up criteria. As the grid size increases, the required number of grids (and samples) decrease. Larger grid sizes may be allowable for data that exhibits low variability. An estimate of data variability should be used to arrive at the grid size (and number of samples) for pre-compliance sampling.

Based on landfarming project experience at "wood treater" sites in EPA Region 8, about 10-12 samples per treatment cell are usually needed to meet the

statistical requirements to show that clean-up goals were met. Thus, the default number in this paragraph was set at a minimum of 8 samples. It may be necessary to perform additional sampling and analysis, if the One-Sample t-Test indicates that too few samples were collected.

The default specified by this paragraph is for composite sampling within each grid. Relative to discrete sampling, compositing provides a better measure of the mean contaminant level at a given number of analyses. Discrete sampling is useful for assessing variability within the treatment cell. A round of discrete sampling is recommended during treatment of the first one or two lifts of soil to assess the effectiveness of the Contractor's mixing (i.e., tilling) practices. Discrete sampling would typically involve sampling from one randomly selected location per grid.

****

To determine pre-compliance sampling locations, divide the treatment cell into grids of equal area. Divide the treatment cell into a minimum of [eight][_____] grids. Each grid must be a maximum [1,000][_____] square meters [10,800][_____] square feet. Sample from [four, randomly selected locations][_____] within each grid. Samples from each grid must be [composited][_____] prior to testing. Each sample must include material from the entire depth interval of the top lift of soil in the treatment cell.

3.5.10.2 Sampling Frequency for Pre-Compliance Testing

****

NOTE: Another purpose of pre-compliance testing is to determine whether contaminant levels have decreased to the point where compliance testing should be performed. Performing pre-compliance testing using a field analysis method can result in considerable cost savings by avoiding the expense of unnecessary (i.e., premature) compliance testing.

****

Approved field analysis methods may be used for pre-compliance testing. Sampling must be performed at least twice during treatment of each lift of soil in the treatment cell: (1) immediately after initiating treatment of new lift of contaminated soil; and (2) at the estimated time at which the cleanup levels will have been met (based on the results of the field demonstration). Intermediate sampling may be performed to determine if contaminant degradation is occurring according to schedule expectations.

3.5.10.3 Pre-Compliance Testing

****

NOTE: Low-cost, definitive field analysis methods are recommended for pre-compliance testing (if they are available for the contaminants of concern).

****

Test for the following analytes during pre-compliance testing: [_____].

Test using the [field analysis][_____] method for pre-compliance testing.

3.5.10.4 Compliance Sampling Design

****

NOTE: Compositing samples from each grid is recommended in order to provide a reliable determination of the mean concentration of contaminant levels in the treatment cell while minimizing analytical costs. However, compositing will decrease the variability of the data.

Determination of the minimum number of samples will be dependent on the data variability. Data from discrete samples will usually exhibit a greater degree of variability than data from composite samples. A data set produced from discrete samples may result in more samples being required to demonstrate attainment of treatment criteria, relative to a data set produced from composite samples. Thus, the determination of the required, minimum number of confirmatory samples will be influenced by whether data from discrete (or composite) samples was used.

****

To determine compliance sampling locations [use the same grid divisions from pre-compliance testing][_____]. The required, minimum number of samples must be[based on a statistical analysis of the data from pre-compliance testing, using the One-Sample t-Test in accordance with EPA 600/R-96/084 (see p. 3-8 of the reference for an example of this procedure)][_____]. Sample from [four, randomly selected locations][_____] within each grid. Samples from each grid must be [composited][_____] prior to testing. Each sample must include material from the entire depth interval of the top lift of soil in the treatment cell.

3.5.10.5 Compliance Sampling Collection

****

NOTE: Oversight must be performed to ensure that representative samples are being collected by the Contractor, and to ensure that proper sampling procedures are being followed. The proportion of fines and coarse particles in samples should be nearly the same as that within the treatment cell. Clumps of soil should not be excluded from samples. Clumps of soil present in samples should be crushed before finishing homogenizing the sample. The procedure for excluding other types of particles (e.g., rocks that exceed a maximum diameter) should be established up front, and in accordance with the approved UFP-QAPP/Landfarming Work Plan.

****

Perform compliance testing after pre-compliance testing indicates that a lift of soil has met treatment criteria, and written approval has been received from the Contracting Officer. Perform compliance sampling in the presence of the Contracting Officer. Conduct testing using the method specified in [_____].

3.5.10.6 Government Quality Assurance Testing

****

NOTE: The need for quality assurance testing should be considered on a project-by-project basis, and if not considered necessary this paragraph should be deleted. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. Use of quality assurance testing data also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project Performance Requirements, and a failing result would be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for identifying and correcting meaningful differences should be documented in a project-specific UFP-QAPP and referenced in this specification; the process is likely to complex to be adequately defined in this specification.

****

Provide duplicate samples to the Government's quality assurance laboratory for Government quality assurance. Submit samples at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. Provide additional quality assurance samples upon request.

3.5.11 Post-Treatment Procedure

****

NOTE: If treatment criteria for contaminants of concern have been met, but criteria for re-use (see paragraph CRITERIA FOR REUSE OF TREATED SOIL, in PART 1) have not been met, the soil should either remain in the treatment cell, or be moved to a storage area.

At one Superfund project, lifts of treated soil were overlain by a new lifts of contaminated material, gradually increasing the height of the treatment cell, as each lift was treated. This decreased material handling requirements, as the treatment cell location served as the final disposal site. However, such a plan may also require monitoring to determine if contaminants are migrating into and

re-contaminating the treated material.

There may be a benefit to purposely leaving a small volume of fully treated soil in the treatment cell to mix with the new lift of contaminated soil. Mixing about 50 mm 2 inches of the treated lift with untreated soil may decrease the treatment time for the untreated lift; i.e., material from the treated lift may act as a "starter culture" for the untreated lift.

****

After compliance test data indicates that treatment criteria have been met, and written approval from the Contracting Officer has been received, [remove the treated lift of soil from the treatment cell][_____]. Submit Treatment Completion Records which include, but are not limited to, a summary of the activities performed at the site as part of landfarming, materials and equipment used, and the testing and sampling results.

3.5.12 Procedure for Non-Attainment of Treatment Criteria

****

NOTE: The situation may arise where there are one or two grids that still exhibit substantially higher contaminant levels than other grids (i.e., outlier data points). If the statistical criteria for demonstrating attainment of clean-up criteria can be satisfied based on data from all but the one or two outlier grids, then it may be acceptable to move all of the treated soil (except for the outlier grids) to the disposal location. Soil from the one or two outlier grids should continue to undergo treatment (either by themselves, or via mixing the soil from the outlier grids with the next lift of soil across the entire treatment cell).

If additional sampling is performed to provide more data points for statistical analysis, the Contractor should not be allowed to exclude "selected" data from samples collected during the same time period. Following additional treatment, and more time for biodegradation to occur, data from new samples should be considered separate from pre-existing data sets.

****

If the treatment criteria is not achieved, implement corrective action at no additional cost. The corrective action may include: [supplemental sampling and analysis to increase the size of the data set, to allow the statistical analysis to be repeated; or continued treatment followed by additional sampling and analysis][_____]. If there are sections of the treatment cell for which substantial reduction of contaminants of concern was not observed after the end of the estimated treatment period, prepare a report detailing all activities associated with those sections of the treatment cell. The report must include: probable causes as to why significant reductions were not observed; measures that will be implemented to prevent the same problems from recurring; and a proposed plan for continued treatment of those sections of the treatment cell where treatment criteria were not met. Obtain written approval from the Contracting

Officer prior to implementing measures that deviate from the Landfarming Work Plan. Continue monitoring (at no additional cost, and in accordance with paragraph OPERATIONS AND FIELD QUALITY CONTROL), until the treatment criteria is attained. Submit Treatment Completion Records as specified.

3.5.13 Post-Treatment Screening

****

NOTE: If wood chips or other large diameter particles must be separated from the treated soil prior to disposal, it may be desirable to reuse this material in subsequent lifts of contaminated soil.

Additional sampling and analysis may be required prior to disposal of wood chips. Organic contaminants will often adsorb and accumulate on wood, or other organic materials present in the contaminated-soil matrix. Even though soil may meet clean-up goals, interspersed wood chips may contain relatively high levels of contaminants.

****

Wood chips or other materials whose diameter exceeds the maximum acceptable particle size for the intended end use must be separated from the treated soil prior to disposal.

3.5.14 Operations Reports

Submit operations reports weekly for the first [10][_____] weeks, and every [2][_____] weeks thereafter. Requirements of the Operations Reports must be in accordance with paragraph FIELD DEMONSTRATION OPERATIONS REPORT.

3.5.15 Change of Operating Conditions

****

NOTE: If adjustment to the landfarming operating conditions is required due to change in contaminated material characteristics, then the Contractor's adjusted operating conditions should be evaluated by the Contracting Officer for the extent of changes from the previous operating conditions. Further, price negotiation may be required based on the extent of changes from the previous operating conditions.

****

The following two requirements must be met in order to be considered for change of operating conditions:

a. The physical and chemical characteristics of the contaminated materials are significantly different from the originally defined characteristics.

b. The treatment requirements cannot be met under the current landfarming amendment design and related operating conditions.

When change of operating condition is necessary, notify the Contracting Officer before changes are made to the amendment design and related operating conditions. The Contracting Officer may require the Contractor to perform a field demonstration for significant changes made to the amendment design and related operating conditions in accordance with paragraph FIELD DEMONSTRATION, for approval. If adjustment to the amendment design and/or operating conditions is required due to change in contaminated material characteristics, submit an adjusted design for the extent of changes from the previous design for approval. Further, price negotiation may be required based on the extent of changes from the previous mix design.

3.6 DISPOSAL

****

NOTE: Depending upon the characteristics and quantities, the potential disposal scenarios for wastes may include: on-site treatment and backfilling; partial on-site treatment / backfill, and partial offsite disposal; and offsite disposal. Asphalt surfaces may be removed and sent offsite for recycling, or left in place if desired by stakeholders. One disposal scenario for each type of waste should be clearly defined.

If the treated soil will be incorporated into topsoil, the following indices should meet quality guideline standards: pH, conductivity, maximum particle size, foreign material content, and the levels of heavy metals. See the On-Farm Composting Handbook (Natural Resource, Agriculture, and Engineering Service, 1992) regarding quality guidelines for different end uses of compost; also, see paragraph Criteria for Reuse of Treated Soil.

****

Dispose treated soil that has met Treatment Criteria for Soil[and Criteria for Reuse of Treated Soil] in accordance with regulatory requirements and [UFP-QAPP][Landfarming Work Plan]. After it has been demonstrated that the treated soil meets disposal criteria, dispose the following materials on-site: [oversize materials][sludge resulting from treatment of contact water][excess amendments][and][_____]. Treat, if necessary, and dispose the following materials of off-site: [spent personal protective equipment][spent granular activated carbon][and][_____]. Perform offsite disposal of hazardous wastes in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS, which includes the preparation and submission of manifests and disposal certificates for materials disposed of offsite.

3.7 DEMOBILIZATION

****

NOTE: A separate table should be prepared if criteria for soils below the treatment pad, or other areas of the treatment facility, differ from criteria in paragraph TREATMENT CRITERIA FOR SOIL. This paragraph should be edited appropriately if it is desired to retain portions of the landfarming treatment facilities after project completion. This paragraph should also be coordinated with Division 1 Sections of the contract.

After treatment of the final lift of contaminated

soil, an economical approach for disposition of the treatment cell would involve: leaving the treated lift in-place, puncturing the liner, and re-seeding the treated soil.

The paragraph ENVIRONMENTAL REQUIREMENTS FOR OFF-SITE SOIL in Section 31 00 00 EARTHWORK should be edited to include an appropriate list of chemical testing parameters for off-site soil. Some backfill sources may have chemical testing data already available; the Government should require chemical testing if the backfill chemical testing data is inadequate or does not exist. Off-site backfill should not be tested for only the site contaminants of concern. At a minimum, samples should be analyzed for target contaminant list (TCL) VOCs, TCL SVOCs, target analyte list (TAL) Metals, and Pesticides/PCBs. Additional analyses such as Total Petroleum Hydrocarbons may be appropriate also. Individual States or military installations may require or recommend additional parameters. Typical frequency of sampling would be one sample per 1,900 to 2,300 cubic meters 2,500 to 3,000 cubic yards. However, individual States or military installations may require or recommend more frequent or less frequent sampling.

****

Do not commence demobilization until written approval is received from the Contracting Officer. Follow the approved mobilization and demobilization plan and requirements under paragraph MOBILIZATION AND DEMOBILIZATION. Demobilization must include restoration of the [following areas, as shown on drawings, to their original condition: [_____]]. Disposition of paved surfaces, and subsurface liners must include: [_____]. Disposition of the treatment cell must include: [leaving the last lift of treated soil in-place, puncturing the liner on 2-meter 6.6-foot centers across the length and width of the cell, re-seeding the treated soil[in accordance with Section 32 92 19 SEEDING]]. Demobilization must include, but must not be limited to: [removal of structures and materials used to house or cover the treatment cell,][disconnecting of utility service lines,][decontamination and removal of equipment and materials,][disposal of decontamination wastes,][disposal of residual wastewater,][removal of fertilizer, amendments and other unused materials,][and regrading of berms, as shown on drawings][_____].[Perform post-treatment testing of soils below work area surfaces to verify that the area is not contaminated. These soils must meet the following criteria: [treatment criteria in accordance with paragraph TREATMENT CRITERIA FOR SOIL.][_____]]. If soil excavation is also part of the field activity, excavated areas need to be backfilled and restored to the original condition in accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL and Section 31 00 00 EARTHWORK.[Perform confirmation sampling within the excavated areas in accordance with the UFP QAPP to ensure all contaminated soil above treatment criteria are removed.]

SECTION 02 54 19.16

BIOREMEDIATION OF SOILS USING WINDROW COMPOSTING

02/25

****

NOTE: This guide specification covers the requirements for reduction of the concentrations of organic contaminants in soils by bioremediation using windrow composting.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This guide specification was developed based on the use of composting to treat explosives-contaminated soil. According to Composting guidance from Federal Remediation Technologies Roundtable (FRTR), composting also applies to treat soils and sediments contaminated with petroleum hydrocarbons and aerobically biodegradable organic compounds such as nonhalogenated volatile organic compounds (VOCs) and semivolatile organic compounds (SVOCs). Composting effectiveness is varied for halogenated VOCs, SVOCs, and pesticides and is not effective for more highly

chlorinated compounds (such as polychlorinated biphenyls (PCBs)). This Specification presumes that the project team has confirmed composting is generally a feasible remedy for the site before the specs and contract are prepared.

Please also note that "Contracting Officer" mentioned throughout this document is intended to be an umbrella term for anyone, including the Contracting Officer, designated by the Contracting Officer.

An edited version of this Section may be used to solicit a request for proposal (RFP). Use of an RFP approach may prevent the contract from being awarded to a Contractor that is not technically qualified.
****

1.1 MEASUREMENT AND PAYMENT

****
NOTE: Edit this paragraph based on whether the Contract will use a single job price or unit prices. If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is in the project, move these paragraphs to that Section for editing. The project team should involve their Contracting Office to determine the best way to create a payment schedule/milestone for their Contract or Task Order.

If the project includes Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS, coordinate measurement and payment methods and contaminated material handling and stockpiling between this Section and Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS.

If the quantities of contaminated soils are well defined, payment may be based upon a single job price structure. When the amount of contaminated material is inadequately defined or uncertain, a data gap investigation is generally advised before any windrow composting activity begins. When specifying a unit price structure for treatment, separate items should be provided in the Contract Price Schedule to cover any other work required. Other work items include, but are not limited to: preparation of submittals, mobilization and demobilization, site preparation, construction of the treatment pad and run on/runoff controls, water storage facilities, contact water treatment and disposal, sampling and testing, implementing health and safety requirements, and utilities. Inclusion of separate items in the Contract Price Schedule for the above work tasks should result in a lower unit price for treatment.
****

1.1.1 Unit Prices

1.1.1.1 Field Demonstration

****

NOTE: Prior to planning the field demonstration, bench-scale treatability study testing should be performed to arrive at a suitable recipe of amendments, and to determine if the contaminants of concern are amenable to composting in the site-specific soil matrix. The field demonstration may either be conducted prior to the construction of the full-scale facilities or conducted using the full-scale facilities and equipment. Payment for the field demonstration should be covered by a separate single job price, or on a unit price that is separate from the unit price for full-scale treatment. Because more intensive monitoring is usually required during the field demonstration, and because a demonstration generally has a smaller weight of treated soil over which fixed costs can be distributed, the unit price for the field demonstration will usually be higher than the unit price for full-scale treatment. Analytical Testing for chemical data is not included as a component of the price in this paragraph. The contract price schedule should include separate, unit price items for analytical testing.

If the results of the field demonstration indicate that an extended treatment period (or other special measures) will be required to meet cleanup goals, it may become necessary to modify the bid item that covers treatment pricing for full-scale operations.

****

Payment for the field demonstration will be[by the contract unit price schedule for each[cubic meter yard][_____] treated during the field demonstration][a single job price for proper completion of approved tests]. The price must include the cost of labor, materials, equipment usage, utilities, and fuel for: [pre-processing,] [operation, maintenance and process monitoring (not including testing for chemical data),][ancillary waste treatment and disposal,][preparation of Field Demonstration Report,][and][_____]. Costs for procurement and handling of amendments used in the compost must be included in the unit price for treatment.

1.1.1.2 Contaminated Soils Treatment Unit Price

****

NOTE: Except for equipment usage costs (e.g., rental), other equipment costs are not included as a component of the unit price for treatment in this paragraph; testing for chemical data is also not included in the unit price. The contract price schedule should include separate, unit price items for testing for chemical data.

If unit price payment will be based on weight, dry

weight should be specified and requirements should be included for moisture content testing so that dry weight can be determined. However, surveys are usually required before and after excavation of contaminated material, so that excavation and backfilling can be paid for on the basis of in-place volume. Thus, it is advantageous to pay for processing and treatment of soils using in-place volume as the pricing unit.

****

[Payment for composting treatment of contaminated material will be by the contract unit price schedule for each cubic meter yard of contaminated soil that is treated based on[in-situ volume, or for each measured unit of weight, after separation of oversize material][_____].]

[Payment for composting treatment of contaminated material will be by the contract unit price schedule for each metric ton ton of contaminated soil that is treated. Use a properly calibrated weighing system to accurately measure the gross (bulk) weight of the contaminated material. Convert the measured gross (bulk) weight of the contaminated materials to be treated to dry weight based on the[percent moisture content of representative contaminated material samples. Determine the percent moisture content in accordance with[ASTM D2216][ASTM D4643][ASTM D4959][_____]]. Determine moisture content[daily][for every[500][_____] metric tons tons of contaminated material that is treated][_____].]

[This unit price must include the cost of labor, materials, equipment usage, utilities, and fuel for: [pre-processing,][operation, maintenance and process monitoring (not including testing for chemical data),][ancillary waste treatment and disposal,][preparation of operations reports,][and][_____]. Costs for procurement and handling of amendments used in the compost must be included in the unit price for treatment. After each batch has been treated, the quantity of material that does not meet treatment criteria must be reported and subtracted from the quantity of material comprising the batch, when determining payment for treatment. Payment will not be made for material that does not meet treatment criteria. If additional tests, or additional processing and testing, are necessary to show that material meets treatment criteria, the additional costs must be borne by the Contractor.]

1.1.1.3 Oversize Materials from Contaminated Areas

****

NOTE: This paragraph should be deleted if payment for treatment and disposal of oversize materials will be included as part of the price item for treatment of contaminated soil. Payment for disposal of oversize materials may be by weight or volume, depending on the nature of the materials. Oversize materials may include brush, trees, roots, rubble, construction debris, and materials that cannot be composted.

****

Payment for [disposal][and treatment] of oversize material separated from contaminated soil will be by the contract unit price schedule for each[kilogram pound][_____]. Soil, free water and other extraneous materials must be separated from oversize materials prior to measuring quantities.

1.1.2 Single Job Prices

[1.1.2.1 Bench-Scale Testing

****

NOTE: Single job pricing for each bench-scale treatability study testing run is recommended for this item. The single job price should include analytical costs to evaluate the treatment effectiveness. However, bidders should be required to provide a unit cost amount for testing for chemical data. This will provide a basis for payment for additional analytical costs, if it is determined that more testing will be required. The following reference should be used to prepare the Bench-Scale Treatabilit Study Test Plan: EPA 540/R-93-519a, Guidance for Conducting Treatability Studies Under CERCLA, Biodegradation Remedy Selection, 1993.

****

Payment for bench-scale treatability study testing will be a single jobprice for proper completion of specified tests. The price must include the cost of labor, materials, equipment usage, utilities, and fuel for:

[a. Preparation of the bench-scale treatability study test plan.

][b. Collecting samples.

][c. Sample shipment.

][d. Pre-processing.

][e. Process monitoring (including testing for chemical data).

][f. Disposal of treated material and waste.

][g. Ancillary waste treatment and disposal.

][h. Preparation of the bench-scale test treatability study report.

][i. [_____].]

]1.1.2.2 Other Work Items

****

NOTE: Coordinate this paragraph with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS. Temporary utility connections are covered in Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.

****

Payment for other work items not included in the above paragraphs will be included in the payment for the base bid for treatment of the contaminated materials. The other work items include submittals related to mobilization and demobilization, site preparation in the treatment pad, manufacturers' field services, environmental compliance monitoring, health and safety monitoring and controls, and utilities required for the composting treatment if approved by the Government as necessary for the project.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

[1.3 PRE-CONSTRUCTION MEETING

****

NOTE: Delete this paragraph if the requirements are included in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS, Section 01 32 01.00 10 PROJECT SCHEDULE, or other Specification Section.

Appropriate facility personnel should be present at the pre-installation meeting if siting of the treatment facility and other associated work areas will be discussed.

****

Arrange and conduct a preconstruction meeting at the jobsite[at least five business days prior to the start of operations on the project][_____]. The preconstruction meeting must follow the written pre-construction meeting agenda submitted [_____] days prior to the meeting. The purpose of this meeting is to review the requirements of this Section and the associated plans. The following individuals must attend this meeting: [Contractor's project manager,][site foreman,][and Contracting Officer].

Record pre-construction meeting minutes and publish via email within 48 hours to the attendees. Re-publish the meeting minutes within 48 hours via email pending subsequent comments from the attendees.

]1.4 SYSTEM DESCRIPTION

****

NOTE: Requirements for a specific method of treatment are provided below. If the use of a process other than windrow composting will be allowed, this paragraph should be revised to indicate that a process, other than described in this section, may be proposed by the Contractor; other composting methods may include static piles, aerated static piles, or in-vessel. The Contractor's approved submittals must demonstrate equivalent capabilities; and that such approval will not relieve the Contractor of responsibility for meeting specified requirements for safety, reliability, and performance.

It is also recommended that copies of USAEC CETHA-TS-CR-93043, and USAEC SFIM-AEC-ET-CR-96184 be made available to prospective Contractors to provide descriptions of the intended treatment process.

****

Perform treatment using a safe, reliable method to treat contaminated material conforming to paragraph PERFORMANCE REQUIREMENTS, USAEC CETHA-TS-CR-93043, and USAEC SFIM-AEC-ET-CR-96184.[Requirements for a specific process are provided below. The Contractor may propose an alternative process. Government approval of a Contractor-proposed plan does not relieve the Contractor of responsibility for meeting specified requirements for safety, reliability, and performance.]

1.4.1 Design Requirements

1.4.1.1 Composting Treatment Pad

****

NOTE: Siting of the treatment facility should be in accordance with regulatory requirements. The prevailing wind direction and the potential for odor and dust generation should also be taken into consideration. The design of the treatment pad and weather cover should include provisions for control of storm water and contact water, and should take into account the expected wheel loads of and contact with material handling equipment. Besides the windrow mixer, various bladed and/or bucketed equipment may have to be used to establish, dress or maintain, and remove the windrows. Concrete pads are typically more expensive, though less permeable than asphalt pads. Asphalt pads have been used for hazardous waste composting projects. It may also be necessary to construct asphalt pads for the following areas: soils pre-processing area; and the amendment and soil blending area.

As an alternative to paving, a polyvinyl chloride (PVC) liner may be used to cover the treatment pad area with laying 2 feet of impermeable soil on top. Place a layer of straw before windrows are formed. The straw layer is an indicator where the bottom of the windrow is. Soil pad should be sampled before disposing of offsite in accordance with federal, state, and local regulatory requirements, and 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS. Generally, PVC liner can be disposed at an off-site, non-hazardous waste landfill.

****

[Pave the treatment pad and other work area surfaces in accordance with Section [32 12 16.16 ROAD-MIX ASPHALT PAVING.][03 30 00 CAST-IN-PLACE CONCRETE.]][_____]. Design the treatment pad to withstand operation of material handling equipment, and to prevent infiltration of contact water. The slope of the surface of the treatment pad must be not less than [2 percent][_____]. Water collection channels must be incorporated into the paved treatment pad, and the pad must drain, by gravity, to collection sumps. The water collection system and sump must be in accordance with paragraph CONTACT WATER MANAGEMENT SYSTEM AND DESIGN STORM. Sloping, placement of collection channels, and sump must be sufficient to prevent ponding in the treatment pad area.

1.4.1.1.1 Treatment Pad Sizing

****

NOTE: The dimensions of the treatment pad should be based on the amount of time required to reach cleanup goals for each batch of compost (including laboratory turn-around time for compliance testing), the amount of time allotted for treatment of the contaminated soil within the contract schedule (i.e., the project duration), the "per-batch amount" of material that will be composted, the bulk density of the compost and soil, windrow dimensions and spacing, and the type of material handling equipment that will be used. A batch is defined as that amount of material, including soil and amendments, for which treatment is initiated at the same time during full-scale operations. After cleanup goals have been met for contaminants of concern, it may be necessary to continue to cure the compost (see paragraph CURING AND STORAGE). The compost may be moved to a separate area for curing. On a previous composting project for explosives, each batch required about 4 weeks on the treatment pad (about 2 weeks treatment time, plus about 2 weeks to receive laboratory data from confirmation samples). Curing was not required on this project.

Formulas for the areas of typical windrow cross sections are provided in NRAES-54. The bulk density of compost will vary depending on what amendments are used and the proportions of soil and amendments (see paragraph AMENDMENTS). See paragraph WINDROW CONSTRUCTION 3 for information on windrow

dimensions. Use of long, narrow treatment pads may allow windrow mixing equipment to process a greater volume of material using a minimal number of turn-arounds. Thus long, narrow treatment pads may result in a more efficient operation than a wider treatment pad. It may be economically advantageous for the Contractor to divide the treatment pad into separate areas, so that mixing equipment does not sit idle: on a portion of the pad, daily mixing of windrows may continue until definitive field analysis indicates that the compost is ready for compliance testing; on the other portion of the pad, the windrows may be allowed to set static while waiting for laboratory data from compliance testing.

****

Locate the treatment pad within the area indicated.[Size the treatment pad to avoid constricting other parts of the composting operations that must be conducted within the designated area available for composting operations.][Size the treatment pad based on the information from, but not limited to, the Remedial Investigation Report, Decision Documents, Bench Scale Treatability Study Test Report, Field Demonstration Report, and Amendment Test Report.]

1.4.1.1.2 Other Work Area Surfaces

****

NOTE: The dimensions of the curing and storage area should be based on the amount of time required for curing, the amount of time that cured compost will remain in storage, and the dimensions of curing and storage piles. The volume of treated material will usually be less than the initial volume of the compost (see paragraph DISPOSAL). The compost is usually allowed to cure until after the following has been observed: the high temperature (43 to 65 degrees C 110 to 150 degrees F) stage of the process has been completed; the temperature has fallen back to about 38 degrees C 100 degrees F or less; and the windrows no longer heat-up after turning. The On-Farm Composting Handbook recommends curing for at least one month. Immature, or improperly cured compost may be detrimental to plants.

It may be necessary to require paving in areas designated for handling contaminated material, and operation of heavy equipment (e.g., front-end loaders).

Curing and storage may not be needed for some projects based on the results of bench-scale treatability study testing, field demonstration, or project team's site-specific knowledge. The main text below may need to be modified if curing and storage are not part of the project requirements.

****

The slope of the surface of the areas for curing and storage must be not less than [2 percent][_____]. The surfaces of areas for curing and storage must be well drained and kept free of standing water at all times. Locate the soils pre-processing area, curing and storage area, and the area designated for blending soil and amendments within the area indicated; and construct and pave in accordance with paragraph COMPOSTING TREATMENT PAD.

1.4.1.2 Contact Water Management System and Design Storm

****

NOTE: Windrow composting areas may generate contact water from precipitation if they are uncovered, or from wetting or irrigation to achieve a certain moisture content whether they are covered or uncovered. If in accordance with regulatory requirements, excess contact water may be discharged to national pollutant discharge elimination system (NPDES) storm water discharge outfalls, publicly-owned treatment works (POTW) sewers, facility sewer to onsite treatment systems, or treated and disposed of offsite. If the treatment area is uncovered, the source of data for the design storm should be referenced. Sources for hypothetical storm information in the United States are referenced in Appendix A of Hydrological Analysis of Ungaged Watersheds Using HEC-1, Training Document No. 15, USACE Hydrologic Engineering Center, April 1982; another source is NOAA Atlas 14.

****

Contact water is defined as water that has come into contact with contaminated materials, or other contaminated surfaces. Sources of contact water may include, but are not limited to: water from decontamination of equipment, personnel, and personal protective equipment (PPE); and runoff water from storage, preprocessing and treatment areas. Use a design storm with [24][_____] hour duration and a return interval of [25][_____] years, based on data from [_____]. The collection, conveyance, storage, treatment and disposal system must remove all contact water from the design storm in not more than [24][_____] hours.

1.4.1.2.1 Perimeter Berms

****

NOTE: Use of barriers constructed from interlocking concrete blocks may, for some applications, be an acceptable substitute for berms.

****

Construct berms around the perimeter of the following work areas: [treatment,] [storage areas,][and][_____]. Size the perimeter berms to prevent flood water run-on from the [25][_____] year flood, and to contain runoff from the design storm. Maintain a minimum of [0.3][_____] meter [1][_____] foot from the top of the berm to the surface inside of the work area, and from the top of the berm to the surface outside of the work area. Provide at least [3][_____] meters [10][_____] feet of lateral distance between berms and windrows in the treatment pad area to allow passage of equipment for mixing and dressing windrows. Include ramps to permit vehicle access across berms constructed around the [treatment cell and laydown and storage areas][_____].

1.4.1.2.2 Storage Volume

****

NOTE: Typically, storage and testing of contact water is required prior to discharge. Thus contact water storage facilities should be sized to contain the peak detention volume for the design storm. In order to minimize treatment and disposal costs, it is often desirable to reuse the contact water to irrigate windrows. If this approach is applied, the storage volume must be sufficient to retain the volume of water in storage prior to the design storm, and the volume of water generated by the design storm.

Sources of contact water include: water from decontamination of equipment, personnel, and PPE; and runoff water from storage, preprocessing and treatment areas. If the storage, preprocessing, and treatment areas are adequately covered, then the amount of contact water resulting from precipitation events should be limited.

****

Size contact water storage facilities to contain [30][_____] percent above that required for the design storm, and [the maximum volume that will be held in storage for reuse][_____]. The design storm is defined above.

1.4.1.2.3 Reuse, Treatment, and Disposal

****

NOTE: Although it is possible for contact water to accumulate compounds (e.g., acids, bases, or salts) at levels which may inhibit microbial activity, contact water may, typically, be applied to contaminated soil or compost with little or no treatment. Water which has accumulated excessive levels of acids, bases or salts may require treatment and/or offsite disposal.

****

Reuse contact water to the maximum extent in order to minimize the need for new makeup water and to limit the treatment, discharge and offsite disposal of wastewater. Prior to reuse, test contact water in accordance with paragraph CONTACT WATER TESTING and confirm that contact water meets the requirements of paragraph WATER SUPPLY. Prior to disposal, collect and test contact water that cannot be applied to contaminated soil or compost in accordance with paragraph TREATMENT CRITERIA FOR CONTACT WATER. Treat process sludge (resulting from the removal of suspended material in the contact water) to meet the requirements of paragraph [TREATMENT CRITERIA FOR OTHER WASTE][TREATMENT CRITERIA FOR COMPOSTED SOIL][_____].

1.4.1.3 Irrigation Equipment

****

NOTE: Water may be added at many different points in the process: to the raw materials prior to blending; during blending of amendments, before soil has been added; during the initial blending of

compost; and during turning of the compost windrows. Mixing equipment may be equipped with spray nozzles for applying water. Timely irrigation of compost is critical during thermophilic stages of composting, when the highest rates of evaporation occur. In arid climates, water usage rates will obviously be higher than in non-arid climates.

****

Provide irrigation equipment capable of delivering at least [2.9][_____] liters of water per cubic meter [1.0][_____] gallons of water per cubic yard of compost per day, and meeting the requirements of paragraph MOISTURE CONTROL.

1.4.1.4 Weather Cover

****

NOTE: Although "breathable", water resistant cover material is available, direct contact between the covering material and the compost should be avoided. Clam-shell buildings, metal buildings, pole barns, large tents, or other prefabricated structures may serve as weather covers. The section containing requirements for the weather cover (e.g., Section 13 34 19 METAL BUILDING SYSTEMS), should include the design snow load, maximum wind speed, soil bearing capacity, seismic parameters in accordance with UFC 3-301-01, maximum and minimum ambient air temperatures. The interior of the weather cover should be suitable for a high water-vapor environment. Metal surfaces may be subject to corrosive conditions. If the composting will be conducted inside of an enclosed structure, adequate ventilation must be provided. A rate of 3 to 6 air changes per hour has been recommended for composting facilities. Carbon dioxide is generated and oxygen may become depleted during composting. Ammonia gas is commonly generated as well. If volatile compounds are being remediated in the piles and the piles are in the thermophilic stage, such compounds can be volatilized. It is also possible for methane to be generated, if anaerobic conditions are allowed to develop. Finally, steaming can be extensive enough to block the vision of equipment operators. To ensure that proper and consistent ventilation requirements are specified, this section should be coordinated with other sections; e.g., Section 23 30 00 HVAC AIR DISTRIBUTION, edited accordingly.

****

Use weather covers, or appropriate structures, to prevent precipitation from coming into contact with windrows, and design in accordance with Section [13 34 19 METAL BUILDING SYSTEMS][_____]. Provide covers which allow for free exchange of gasses between the atmosphere and the compost. Size weather covers to allow unimpaired maneuvering of[front-end loaders,][windrow mixing equipment,][and][_____]; size openings in weather covers to allow for entry and exit of[front-end loaders,][windrow mixing equipment,][and][_____]. Provide ventilation of the composting facility in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION.

1.4.1.5 Stockpiles

****

NOTE: Typical stockpile design requirements are provided in Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL. However, in very arid climates, covers may not be necessary. If composting operations will continue during subfreezing conditions, it may be necessary to ensure that the Contractor has included provisions to prevent a portion of the contaminated soil stockpile from freezing. The stockpile requirements in that section should be edited based on site-specific factors and regulatory requirements.

****

In accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL, prepare areas that will be used to stockpile[contaminated material,][oversize material,][treated material that has not been fully cured,][treated material that has been fully cured,][and][_____].

1.4.1.6 Amendment Storage Facilities

****

NOTE: Some types of amendments should be kept covered to prevent contact with precipitation. However, in very arid climates covers may not be necessary. Usually, synthetic membranes are used as covers. To ensure that stored material can be removed from stockpiles and blended with other compost ingredients in subfreezing conditions, it may be necessary to store a portion of some materials at above 0 degrees C 32 degrees F.

To prevent undesired infiltration, some types of amendments (e.g., manure) should be stored in containers, or on a paved surface (e.g., asphalt pad) with containment walls. However, if the amendment is delivered directly to a blending vessel, use of storage facilities may not be necessary. See paragraph AMENDMENT STORAGE regarding controls for insects and rodents.

****

Cover the following amendments to prevent contact with precipitation: [_____]. Covers will not be required for [woodchips][_____]. Use frames, or other materials to prevent contact between covers, and the following amendments: [manure,][and][_____]. Design the storage area to withstand operation of material handling equipment, and to minimize infiltration of contact water. The slope of the surface of the storage area must be not less than [2][_____] percent. Water collection channels must be incorporated into the surface of the storage area, and the storage area must drain, by gravity, to collection sumps. The water collection system and sump must be in accordance with paragraph CONTACT WATER MANAGEMENT SYSTEM AND DESIGN STORM. Sloping, placement of collection channels, and sump must be sufficient to prevent ponding in the storage area.

1.4.1.6.1 Paved Storage Area

Store the following amendments on a paved surface with perimeter berms: [manure,][potato waste (or other vegetable wastes),][and][_____]. Pave the storage area in accordance with Section [32 12 16.16 ROAD-MIX ASPHALT PAVING.][03 30 00 CAST-IN-PLACE CONCRETE.] Provide berms surrounding the paved storage area in accordance with paragraph PERIMETER BERMS.

1.4.1.6.2 Unpaved Storage Area

Store the following amendments on an unpaved surface with containment walls, or stockpile in accordance with paragraph STOCKPILES: [manure,][potato waste (or other vegetable wastes),][and][_____]. Geomembrane liners will not be required for storage of the following amendments: [sawdust,][alfalfa,][wood chips,][and][_____].

1.4.1.7 Material Measurement

Provide scales, meters, and volumetric measuring devices for measuring oversize materials, feed contaminated materials, reagents, and water which conform to the applicable requirements of NIST HB 44, except that the accuracy must be plus or minus [0.1][_____] percent of the quantity being measured. For scales used to measure weight of material in vehicles, provide scales of sufficient length to permit simultaneous weighing of all axle loads. For any scales used to make measurement for payment, ensure the scale is certified [by an acceptable scales company representative][by an inspector of the State Inspection Bureau charged with scales inspection within the state in which the project is located] prior to weighing any materials. Perform a check of calibration of measuring equipment prior to initial use, and once every [seven][_____] calendar days. The requirements of this paragraph do not apply to measurement of chemical or physical data for purposes of demonstrating compliance with paragraph PERFORMANCE REQUIREMENTS.

1.4.1.8 Utilities

****

NOTE: The locations and details (such as utility point of contact, sizes, capacities, and flows) of the utility hookups should be provided on the drawings for the Contractor's use. Verify the utilities are available on-site before including the second sentence.

****

In accordance with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS, provide the utilities associated with windrow composting including, but not limited to: [telecommunications,][electricity,][water,][gas,][_____], sanitary, and solid waste facilities. The [telecommunications][electricity][water][gas][sanitary][and][solid waste facilities][_____] are available at the site.

1.4.2 Performance Requirements

1.4.2.1 Treatment Criteria and Criteria for Reuse of Composted Soil

****

NOTE: Some types of nonvolatile and semi-volatile organic contaminants are believed to be amenable to

composting, including some explosives, polynuclear aromatic hydrocarbons (PAHs, as found in creosote), and some pesticides and herbicides (see Engineering Bulletin, Composting, EPA 540/S-96-/502; also, see The Science of Composting, by Epstein, 1997). Since temperatures may exceed 65 degrees C 150 degrees F during composting, the volatility of contaminants of concern should be taken into consideration (see paragraph TEMPERATURE).

Depending on regulatory requirements, both total concentration and leachability concentrations for some compounds may be required. Total concentrations can be used to estimate worst case leachate concentrations. If the contaminated material is classified as characteristic waste, leachability testing will usually be required, and the appropriate leachability test (e.g., EPA Synthetic Precipitation Leachate Procedure (SPLP) or EPA Toxicity Characteristic Leachate Procedure (TCLP)) must be selected. If the treated material will not be disposed of in a landfill, SPLP testing may be appropriate.

Although there are EPA Land Application regulations for metals and pathogens (40 CFR 503 - Standards for Use or Disposal of Sewage Sludge), these regulations are not normally applicable to hazardous waste composting (see paragraph CRITERIA FOR REUSE OF COMPOSTED SOIL). Treatment criteria, and criteria for reuse should be in accordance with Federal, state and local regulations. Prior approval by regulatory representatives should be acquired for treatment criteria values.

For those parent compounds for which partial breakdown products (intermediates) have been defined and analytical standards are readily available, it may be necessary to include testing for key intermediates. A compound should not be targeted for analysis unless there is a defensible basis for including the compound.
****

1.4.2.1.1 Treatment Criteria for Composted Soil

****
NOTE: Paragraph CONFIRMATION OF ATTAINMENT OF TREATMENT CRITERIAshould be coordinated with this paragraph, and reviewed for guidance on adding a separate set of "ceiling values", 40 CFR 503.13 for each contaminant of concern to this paragraph. In some cases attaining a target concentration for the site's contaminants of concern might not be sufficient; composting typically does not completely degrade, or mineralize, the contaminants but rather converts them to a series of complex degradation products which may not be analyzable with regular lab methods, and which will likely not have health

based screening values. These products may bind irreversibly to the soil, indicating that composting is a technology that has both degradation and stabilization aspects. In this case it may be necessary to augment the treatment criteria by adding a bacterial assay, such as the Ames Mutagenicity test, to verify the safety of the finished compost, or the safety of the leachate from the finished compost. Another factor is that the mixing of the soils with carbon rich amendments, and their bacterial degradation, will change the redox balance of the soil and possibly convert native insoluble metals to mobile forms. This can be detected with TCLP testing of the finished soil. Lastly, there can be the concern that mixing large amounts of amendments with contaminated soil causes dilution of the contaminants, that is, it causes an immediate decrease in contaminant concentration without any composting having occurred. Soil remedial criteria could be reduced by a dilution factor to demonstrate that treatment is actually occurring and not just dilution. However, the amendments should be added to the windrows per the bench-scale treatability study test recommendations and be controlled to ensure the recommended amount of amendments was added. Periodic testing should be conducted to confirm the degradation rate and contaminant concentrations and determine if the performance requirements will be or have been met. This paragraph should be edited to include site-specific criteria. Table 1 would include contaminants specific to the project objectives.

****

The mean of the data for each batch of compost must be less than the criteria shown in Table 1. The definition of a batch of compost, over which a "pass/fail" decision will be made, must be determined during project planning, and may be defined as large as one or more windrows, or as small as individual sampling sections of a windrow. If the batch is as small as the 23 cubic meter 30 cubic yards sampling unit, the workplans must define how such a unit of compost can be removed from the windrow if the unit is the only one in the windrow to attain the Treatment Criteria.

TABLE 1 - TREATMENT CRITERIA FOR ORGANICS

ORGANIC CONTAMINANT	TOTAL CONCENTRATION IN COMPOST
[_____]	[_____] mg/kg

1.4.2.1.2 Criteria for Reuse of Composted Soil

****

NOTE: The land application or beneficial use of the compost will be largely controlled by existing land disposal restrictions (40 CFR 268), specifically toxicity characteristics for RCRA metals, volatiles, and semi-volatiles and any triggered universal treatment standards (40 CFR 268.48). While the

metals loading rates found in 40 CFR 503 - Standards for the Use or Disposal of Sewage Sludge (i.e. 40 CFR 503.13 - Pollutant limits) may be useful in evaluating beneficial use alternatives, the designer should be cautioned that the scope of that standard is for domestic sewage sludge. Composted materials may not meet that definition, and therefore the designer must confirm and check with hazardous waste management regulations prior to land application or beneficial use of the materials. The application of ceiling values listed in 40 CFR 503.13 to finished compost not excluded from hazardous waste regulations, is not allowed under regulation (40 CFR 503.6).

Although reductions in concentrations of heavy metals may occur due to dilution (through addition of amendments), composting is usually not considered a treatment process for inorganics. However, depending on regulatory requirements and intended end use, it may be necessary to require testing for some inorganic parameters (in both compost and compost TCLP leachate), for pathogens, and to include requirements to ensure that the compost has been properly cured (see paragraph CURING AND STORAGE). Toxicological testing of treated and untreated material was previously performed as part of a treatability study (see Characterization of Explosives Processing Waste Decomposition Due to Composting [DTIC ADA294505] , prepared for USATHAMA by Oak Ridge National Laboratory, Sep. 1994); however, toxicity testing is usually not required during full-scale operations. This paragraph should be edited to include site-specific criteria.

****

Prior to final disposition, the compost must meet the following criteria to determine if it has been properly cured:

a. Minimum and maximum pH [5.0][_____] and [7.6][_____], respectively.

b. The increase in temperature observed during the Dewar self-heating test must be not more than [15][_____] degrees C[60][_____] degrees F above the ambient temperature; and the ambient temperature must not be greater than 25 degrees C 77 degrees F.

c. The soluble salt concentration (conductivity) of the finished compost must be less than [20][_____] Millimhos per centimeter (mmhos/cm).

d. Dewar self-heating testing, and conductivity testing must be performed in accordance with paragraph NON-STANDARD SAMPLING AND ANALYSIS, in PART 3.

e. The treated material must meet the criteria shown in Table 2.

TABLE 2 - REUSE CRITERIA FOR INORGANICS	
MAXIMUM TOTAL INORGANIC CONTAMINANT	CONCENTRATION IN COMPOST
[_____]	[_____] mg/kg
[_____]	[_____] mg/kg

1.4.2.2   Treatment Criteria for Contact Water

****
NOTE: Treatment and disposal options for contact water include: onsite treatment and discharge; offsite treatment and disposal; and storage and reuse as irrigation water. It is possible for petroleum, oils and lubricants (POLs) and other fluids from material handling equipment to be spilled onto compost during process operations. Thus, testing for POLs should be considered. The treatment criteria shown below are only examples. This paragraph should be edited to include site-specific criteria. A State permit under the Clean Water Act may be required for onsite discharge of water, and will include criteria that must be met and documented prior to discharge. The permit may limit discharge of the constituents that are being treated, as well as other constituents introduced in the amendments or conditions caused by the introduction of the amendments. If treated contact water is to be disposed of at an offsite facility, the facility's specific standards and analysis criteria should be met.
****

Contact water must meet the criteria shown in Table 3 at the time of [discharge][offsite disposal][_____]. If a State permit is required for onsite discharge, the water must be documented to have met the criteria in the permit prior to discharge.

TABLE 3 - WATER DISPOSAL/DISCHARGE CRITERIA	
PARAMETER	MAXIMUM CONCENTRATION
[_____]	[_____]

1.4.2.3   Treatment Criteria for Other Waste

****
NOTE: Other waste may include: excess amendments, sludge resulting from treatment of contact water, oversize material, and manufactured material. Treatment may not be required for some wastes. Treatment criteria should be provided if treatment will be conducted onsite. Treatment criteria and methods for porous oversize material such as wood chips may be difficult to develop. A separate table should be developed for the criteria. One treatment

scenario for each type of waste should be clearly defined. If treatment criteria already provided in the preceding paragraphs do not adequately cover "Other Wastes", it may be necessary to provide additional criteria, specific to "Other Wastes". Oversize material is often pressure-washed prior to disposal. Sludge or sediment may often be blended with contaminated soil for processing in the composting operation.

****

The following materials must be treated prior to disposal: [excess manure and vegetable wastes, sludge resulting from treatment of contact water, and oversize material that has been separated from contaminated soil][_____]. Treatment must be in accordance with regulatory requirements.

1.4.2.4 Emissions and Dust Control

****

NOTE: Specifications for emission and dust controls should be provided in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. If Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS is not included in the project specifications, emissions, dust, and odor control sources and control activities should be specified here. The remaining text in this note discusses composting technology-specific emission and dust control considerations to incorporate into Section 01 57 19. An air pathways analysis should be performed during design in accordance with EP 200-1-24 Air Pathway Analysis for the Design of Hazardous, Toxic and Radioactive Waste (HTRW) Remedial Action Projects. Depending upon the contaminants of concern in the contaminated materials, the unit processes/operations employed in the treatment plant, the amount of pollutants emitted, and the geographical location of the site, the emission standards and limitations for certain contaminants and dust control can be identified from the following regulations including, but not limited to, National Primary and Secondary Ambient Air Quality Standards, National Emission Standards for Hazardous Air Quality Pollutants, and state and local regulations. For projects near sensitive populations, contaminant, dust, and wind speed monitoring may be considered at the property boundary to provide evidence of no adverse offsite effect. If perimeter air monitoring, and emission control requirements are not necessary, this paragraph should be deleted.

When editing Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, consider the following: For each stage of operations, an air pollution control plan must include, but not be limited to: the sources of emissions, dust and odors during each stage of operations, and proposed control measures. The stages of operation must include, but are not limited to: construction of paved or lined surfaced,

soil preprocessing; treatment, transport, and disposal of oversize material; blending of soil and amendments; during the composting process, including during mixing; transport of compost; storage of compost; disposal of compost. The plan must specifically address fugitive emissions and odor control during the following activities: amendment delivery and storage; blending of soil and amendments; during the composting process, including during mixing; transport of compost; storage of compost; and disposal of compost. If local air pollution regulations require capture and control of specific emissions, the type of collection and treatment equipment should be identified. If air monitoring will be required, the following must also be included: type and locations of monitoring devices, secure retention of the data ; and for each stage of operations: frequency of sampling, number of samples from each location, the total number of samples, and the parameters to be monitored. If operations are to occur near occupied areas, consideration must be given to using perimeter air monitoring to generate a defensible record showing that unacceptable air concentrations have not extended past the boundaries of the site .

Based on the regulatory requirements, the proper technologies or apparatus for the emissions control if required can be determined. Upon completion of the design of the treatment plant, these emission requirements and control technologies should be defined by the design engineer. It may be necessary to implement control measures during the following activities: the field demonstration, excavation, hauling, stockpiling, separation of oversize materials, blending amendments, blending amendments and soil, construction of windrows, mixing windrows, transport of compost, disposal of finished compost, and reuse of finished compost (e.g., land application). There may be an increased potential for human exposure to ammonia gas and mold spores (e.g., Aspergillus fumagatus) during composting.

If a performance specification is prepared, the emissions, dust sources, and contaminants of concern should meet specified requirements based on applicable regulations. Section 01 57 19 should list the emissions criteria for the contaminants of concern for each emission and dust source, and if applicable, monitoring requirements should be specified. The applicable federal, state, and local regulations should also be identified. If the specification is prepared based on detailed design, the technologies or apparatus for controlling the emissions and dust sources should also be specified.

****

Execute the windrow composting process to meet the emissions and dust control requirements in [Section 01 57 19 TEMPORARY ENVIRONMENTAL

CONTROLS][_____].

1.4.3 Composting Work Plan

****

NOTE: To avoid duplications in submittal requirements, submittals in this Section should be coordinated with other sections of the contract (e.g., 01 45 00 QUALITY CONTROL, and 01 32 01.00 10 PROJECT SCHEDULE).

If a request-for-proposal contract is being prepared, this paragraph and the Submittals paragraph should be edited and used to form the basis for Contractor proposals.

****

Submit a Composting Work Plan [as an appendix of the Unified Federal Policy-Quality Assurance Project Plan (UFP-QAPP)][as a standalone document] no more than [200][_____] calendar days after notice to proceed.[Prepare [draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Landfarming Work Plan. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.] The composting work plan must include, but must not be limited to, the following:

1.4.3.1 Schedule

****

NOTE: Composting may rely substantially on the supply of seasonal farm-generated amendments like manure and straw. The seasonal availability of these items must be incorporated into the operating schedule. The seasonality may be lessened by stockpiling these materials; if so this feature must be described in the workplan.

****

Provide a schedule specifying dates and durations for: excavation, hauling, stockpiling, start and completion of mobilization, treatment pad construction, separation of oversize materials, delivery and stockpiling of amendments, field demonstration, full-scale treatment of contaminated materials, storage of treated material, disposal of treated material and other wastes, and demobilization. Provide the following details: intended hours of operation, routine maintenance downtime, other scheduled downtime, anticipated time to reach cleanup goals for each batch of soil and amendments, anticipated laboratory turn-around time to receive data from compliance samples.

1.4.3.2 Project Organization and Personnel

Provide an organization chart, including sub-contractors; include the names, responsibilities, education, and resume of the key project personnel. Key personnel must meet the requirements of this paragraph and paragraph KEY PERSONNEL. Key personnel must include, but must not be limited to: project managers, quality control personnel, supervisory operators and technicians, and engineering staff. Clearly define responsibilities of each individual in the organization in terms of project activities including, but not limited to: project management and coordination; scheduling; quality control and quality assurance; sampling; measurement; field and laboratory analysis; data management; operation and maintenance; and health and safety management.

1.4.3.3 Selection of Amendments

The selection of amendments and the prescribed quantities needed should be based on the recommendations of the Bench-Scale Treatability Study Test Report. Provide a description of, and preferred sources for each proposed amendment; including at least one alternative source for each category of amendment. Include total quantity needed, timeframe (estimated year and month) when needed, locations of each source, and distances from the site. Amendment categories must include: carbon and microbial sources (e.g., manure, vegetable waste) and bulking (e.g., alfalfa hay, and wood materials). For amendments that are only available on a seasonal basis, provide a plan for substituting alternative types of amendments. Include the proposed quantity of each amendment that will be added to each cubic meter cubic yard of contaminated soil.

1.4.3.4 Operations and Process Monitoring

Provide a detailed description of the proposed operation in the [UFP-QAPP][the Composting Work Plan]. The description must include: plans for pre-processing of contaminated soils; plans for stockpiling materials; plans and schedule for pick-up, transport, delivery and storage of each amendment during operations; plans for mixing amendments, soil and constructing windrows; initial volumes of soil and amendments to be treated in each batch; methods for measuring quantities of soil, amendments, and compost; treatment pad area required for each batch; water management plans; parameters that will be monitored during composting, curing and storage; frequency of monitoring, windrows turnover, and irrigation/moisture addition during each stage of operations; locations of each windrow sampling station shown from plan view; sampling locations shown on a diagram depicting a cross-section of a windrow; the number of sampling stations per each batch of compost; windrow moisture and temperature monitoring locations must also be shown; and plans for storage of treated materials.

1.4.3.5 Non-Composting Treatment Processes

Provide a detailed description of the procedures for treatment of solid and liquid wastes that will be treated by a process other than composting; including: treatment criteria for oversize material and other wastes.

1.4.3.6 Equipment and Servicing

Provide a detailed description of the proposed treatment equipment. For each proposed piece of equipment, describe: function, design capacity, equipment specifications identifying manufacturer and model number, material of construction, recommended operating conditions, and the number of units that will be present onsite during each stage of operations. Equipment described must include, but must not be limited to: mixing devices; windrow turning equipment; pumps, valves and other in-line devices; irrigation/moisture equipment.[For equipment that will be in contact with explosives-contaminated material, a copy of the explosives hazard analysis report for each piece of equipment must be provided; this includes equipment used to homogenize and grind samples. Explosives hazard analysis reports must be in accordance with DA PAM 385-64.] Provide plans for servicing equipment and explain how material handling and windrow mixing will be accomplished during servicing of equipment, and during unanticipated breakdown of machinery. Decontamination of equipment is as required in the mobilization and demobilization plans included in the UFP-QAPP.

1.4.3.7   Process Material Tracking Schedule

Provide the Process Material Tracking Schedule for recording and managing the quantities of the contaminated materials treated. Provide the dates and duration of the following activities for each batch of contaminated material: initiation of composting; completion of composting; reprocessing of any treated materials that failed to meet treatment criteria; storage of treated material; disposal of treated material.

1.4.3.8   Disposal and Reuse of Wastes

Provide a detailed description of the plans for disposal or on-site treatment of solid and liquid wastes. For each type of waste that will be generated, specify: origin and description of waste; estimated total quantity of waste; method of transport to disposal location; disposal location; on-site water treatment equipment and planned discharge option if allowed; disposal documentation to be provided by the receiving facility; and schedule showing the anticipated quantities and dates for generation, transport, and disposal of the wastes. Waste types must include, but must not be limited to: finished compost, other treated material, oversize materials, contact water, and other solid and liquid wastes generated during the project.

1.4.3.9   Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the UFP-QAPP WKSTS. Submit the UFP-QAPP no more than [200][_____] calendar days after notice to proceed. Prepare [draft for Government review][draft-final for [regulatory][_____] review] and final versions of the UFP-QAPP. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.

1.4.3.9.1   Procedures And Tests

Provide a detailed, chronological description of the sequence of procedures and tests that will be used to determine whether the compost has met criteria for[disposal][and][or][reuse]; including: the location of each sampling station shown from plan view; the number of sampling stations per each batch of compost; sampling locations shown on a diagram depicting a cross-section of a compost pile; the number of samples that will be collected and tested for each type of test performed; and the manner in which the data will be used, such as compositing the data over the entire windrow for a windrow-wide "pass/reject" decision, or dividing a windrow into multiple sectors for individual "pass/reject" decisions.

For the solid and liquid wastes that will be treated by a process other than composting, provide testing parameters; sampling locations; number of samples; monitoring frequency; and laboratory turn-around-time. Describe moisture and temperature control instrumentation and sampling and testing devices for process monitoring.

1.4.3.9.2 Mobilization and Demobilization

Provide a mobilization and demobilization plan as an attachment to the UFP-QAPP to include, but not be limited to: transport of personnel, material, and equipment; decontamination and disposal of materials and equipment that brought to the site; decontamination and disposal of the treatment pad and other paved surfaces; and decontamination of equipment during demobilization. Include a Post-Treatment Cleanup and Sampling Plan in the mobilization and demobilization plan for areas where there was contact with contaminated materials and were disturbed by the Remedial Action/Site Work. Also, discuss the restoration of disturbed areas such as, grading and seeding.

[1.4.3.10 Bench-Scale Treatability Study Test Report

Submit the bench-scale treatability study test report as part of the Composting Work Plan after completion of the bench-scale treatability study test. Include: characterization test results for each amendment; the source and approximate age of each amendment; the proportions of amendments and soil in each recipe tested; the date that each amendment was shipped and received by the laboratory; procedure used to ship each amendment (including type of containers and temperature); how long amendments were stored prior to use and the ambient temperature of the storage area; the date that the bench scale test was initiated; physical and chemical monitoring data; and proposed recipes of soil and amendments for the field demonstration. Graphs of temperature versus time must be provided for each self-heating test performed. Both ambient temperatures and compost temperatures must be provided. After completion of bench-scale testing, review the test results, and propose the recipes of soil and amendments to be included in the field demonstration. Include the proposal for the field demonstration in the Field Demonstration submittal.

]1.4.3.11 Materials Data

Provide safety data sheets (SDSs), certificates of analysis, and product performance data. SDSs must be in accordance with 29 CFR 1910, Section 1200(g).

1.4.3.12 Permits, Permit Equivalents, and Certifications

Provide copies of the permits, permit equivalents and certifications with the Composting Work Plan. For any of the above-listed items requiring a longer time frame, include copies of applications and scheduled dates for receiving final approval.

1.4.4 Other Submittals Requirements

****

NOTE: Submittal scheduling should allow for an adequate amount of time for:
1. Preparation and review of submittals.
2. The treatment period of the bench-scale treatability study test and the field demonstration.
3. Receipt of analytical results from the laboratory for samples collected on the last day of the treatment period.

The time periods shown for completing submittals

have been sequenced to illustrate this point. Ideally, the Bench-Scale Treatability Study Test Report should be completed before the Contractor is required to submit the Field Demonstration Plan, and the Field Demonstration Report should be completed before the Contractor is required to submit the Composting Work Plan.
****

Submit the following as specified:

1.4.4.1 Amendment Test Plan

Submit the amendment test plan not more than [21][_____] calendar days after notice to proceed. Prepare[draft for Government review][draft-final for [regulatory] [_____] review] and final versions of the Amendment Test Plan. Allow [30][_____] calendar days for[Government]review[and [30] [_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. This plan must address, but must not be limited to: the source of each amendment; testing parameters; and the number of samples. Proposed procedures for shipping amendments to the laboratory must also be provided, including: type of containers; and the maximum time periods between shipping, laboratory receipt, and initiation of testing.

[1.4.4.2 Bench-Scale Treatability Study Test Plan

****
NOTE: The following reference should be used to evaluate the Bench-Scale Treatability Study Test Plan: EPA 540/R-93-519a, Guidance for Conducting Treatability Studies Under CERCLA, Biodegradation Remedy Selection, 1993. Consider including these references as requirements in for the Bench-Scale Test Plan.
****

Submit the Bench-Scale Treatability Study Test Plan no more than [90][_____] calendar days after notice to proceed. Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Bench-Scale Treatability Study Test Plan. Allow [30][_____] calendar days for[Government]review[and [30] [_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. This plan must incorporate the requirements in paragraph BENCH-SCALE TREATABILITY STUDY TEST and must address, but must not be limited to: location of test facility; amendment selection rationale; the various amendment recipes to be testing with rationale; the source of each amendment; test parameters, number of samples, and sampling locations that will be used determine the source of soil; the proposed proportions of amendments and soil in each recipe; the number of replicate tests for each selected recipe; procedure for mixing soil and amendments; types of containers that will be used; frequency of mixing; testing and monitoring parameters; number of samples; monitoring frequency; length of monitoring period; and laboratory turn-around-time. Proposed procedures for shipping amendments to the laboratory must also be provided, including: type of containers; and the maximum time periods between shipping, test facility receipt, and initiation of testing. Test methods, and other sampling and analysis requirements for the bench-scale treatability study test must be [_____].

]1.4.4.3 Field Demonstration Plan

****

NOTE: It is important that the field demonstration match the intended implementation as closely as possible in terms of inputs and process. Composting is sensitive to a variety of factors like moisture, temperature, chemical conditions, etc. The difference in scale between the demonstration and the implementation will inevitably introduce changes in the conditions. The conditions in the demonstration need to be measured to a greater degree than might be initially supposed, such as greater resolution in the temperature and moisture over time and across the volume of soil being treated, so that the differences due to scale can be identified and minimized, and the implementation can reproduce as closely as possible the successful conditions of the demonstration .

****

Submit a field demonstration plan not more than [150][_____] calendar days after notice to proceed. Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Field Demonstration Plan. Allow [30][_____] calendar days for[Government]review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. This plan must address, but must not be limited to: target levels of contaminants in soil that will be treated; test parameters, number of samples, and sampling locations that will be used to determine the source of contaminated soil; sources of amendments; the proposed quantity of each amendment that will be added to each cubic meter cubic yard of contaminated soil; irrigation water source; plan for physical and chemical monitoring; laboratory turn-around-time; plan for maintaining proper temperatures, and moisture contents; irrigation and mixing equipment specifications; and waste disposal plan. Test methods, and other sampling and analysis requirements for the field demonstration test must be [_____]. For equipment that will be in contact with explosives-contaminated material, a copy of the explosives hazard analysis report for each piece of equipment must be provided. Explosives hazard analysis reports must be in accordance with DA PAM 385-64.

1.5 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or

complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Pre-Construction Meeting Agenda

Pre-Construction Meeting Minutes; G, [_____]

Bench-Scale Treatability Study Test Plan; G, [_____]

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

****

NOTE: Regulatory requirements will be location specific and may include local ordinances and State regulatory requirements. Correspondence from regulatory agencies, and other relevant information, should be attached to the specifications to indicate the level of effort necessary for the Contractor to obtain finalized permits, permit equivalents, certifications and to meet substantive regulatory requirements.

For sites addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. The permits or permit equivalents may include those addressing air discharges, treated water discharge, well installation and abandonment, underground injection, and possibly others. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, delete this section.

****

Obtain the permits, permit equivalents and certifications; and meet the substantive regulatory requirements necessary for the installation, operation and closure of the project.[Correspondence from regulatory agencies, and other relevant information, is attached to the specifications to indicate the level of effort necessary to obtain finalized permits, permit equivalents, certifications and to meet substantive regulatory requirements.]

1.6.2 Qualifications

****

NOTE: The majority of composting projects completed to date have involved treatment of soil contaminated primarily with explosive compound trinitrotoluene (TNT). Literature research should be conducted to review past projects or lesson learned to determine

if windrow composting is suitable and effective for the site before remedy selection. For sites with unusual, or difficult to treat, contaminants of concern (e.g., exceptionally high levels of HMX or RDX), the designer should consider including a requirement that the Contractor have completed a field demonstration or full-scale project where explosives-contaminated soil was successfully treated. Although including such a requirement may limit the number of qualified bidders and drive up the price of the contract, coordinate with Contracting Office to conduct market research to identify possible qualified vendor or contractor that could perform the contract requirements successfully.

****

1.6.2.1 Contractor Experience

Have successfully completed at least [one][_____] windrow composting project[s] that required processing of a volume of compost comparable to the estimated volume of compost that will be generated during this project. Also have successfully completed at least [one][_____] full-scale project[s], that required handling and transport of soil contaminated with a [RCRA hazardous constituent, or CERCLA hazardous substance][_____]. For each project, provide the following: site name, location, the names of the Contractor's key personnel; key points of contact and phone numbers (including government representatives, and other parties involved in the project); dates of mobilization/demobilization; contaminants of concern; and the volume of contaminated soil handled or treated. Provide the following also, if applicable: dates for initiating and completing treatment; quantity of time required to treat each batch of contaminated soil; volume of amendments added per unit volume of contaminated soil; final volume of finished compost; concentrations of contaminants of concern in soil (before treatment), day zero (in compost), during treatment, and after treatment.

1.6.2.2 Key Personnel

Provide key personnel with a minimum of[three][_____] years of composting field experience. Include system operators, quality control personnel, and supervisory engineering and technical staff involved with the landfarming windrow composting operation in key personnel. Perform all survey work under the supervision of a registered land surveyor licensed in the [applicable jurisdiction][State of [_____]].[Perform surveys in accordance with Section:[_____].]

1.6.2.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP)accredited commercial testing laboratory in accordance with[Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.6.3 Drawings

Project drawings must include, and not be limited to:

a. Layout of the facility.

b. Dimensions of amendment storage areas, preprocessing areas, treatment pad, noting areas under roof and within structures.

c. Dimensions and volumes of contaminated soils stockpiles, treated materials stockpiles, and waste stockpiles.

d. Locations, dimensions, and volume of collection sumps and any ancillary water storage facilities.

e. Dimensions, volumes, and cross-sections of windrows.

f. Plan view and cross-sections of perimeter berms and collection sumps.

g. Ancillary water storage facilities.

h. Size of contact water conveyance devices and structures.

i. Piping and instrumentation diagrams.

j. Process flow diagrams.

1.7 DELIVERY, STORAGE, AND HANDLING

Safely transport, store, and handle equipment and raw materials (including reagents). Package and ship these items in compliance with United States Department of Transportation (USDOT) requirements. Store and handle these items onsite in accordance with the manufacturer's recommendations and in compliance with applicable regulatory requirements.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Existing Conditions

****

NOTE: The pertinent site characterization data should be placed in the appendices of the technical specifications or on the drawings, and referenced here. If the site contains a significant amount of debris, the available information about its extent and characterization should also be provided. Indicate the detail to which site characterization has been performed. The information should also include: construction limits, property survey, access gates and haul roads available to the Contractor, locations of utilities, water sources, area available for the field demonstration and treatment cell, restricted areas adjacent to the project site, chemical data, geotechnical data, sampling locations, and boring logs. Reference the administrative record locations, whether they are physical or digital, of the site if they exist.

Indicate if there are multiple dissimilar types of contaminated materials that will require different operations. Materials may be considered dissimilar based on possessing different soil properties, types

of contaminants, or relative concentrations of contaminants. Determination of dissimilar materials may be based on site investigations and/or previously completed treatability studies.

****

The existing site conditions are presented[in Appendix [_____]][and][on the drawings]. These include [physical configuration][utilities][topography][land uses][geotechnical characteristics of the contaminated materials (including [grain size analysis][total organic content][cation exchange capacity][pH][moisture content][density][porosity])[hydrogeology]][and][nature and extent of contamination][_____]. The existing conditions presented are the result of site investigations at specific locations; variations in the existing site conditions could occur. Perform an independent interpretation of the site characterization data. Notify the Contracting Officer within [48 hours][_____] if discrepancies between the data provided and actual field conditions are discovered.

[1.8.2 Previously Conducted Treatability Studies

****

NOTE: This paragraph should be deleted if no previous treatability studies have been conducted.

The methods employed in the previous treatability studies may not be the same as those proposed by the Contractor. Documentation of the previous treatability studies should include the same information shown in the following sub-paragraphs: Bench-Scale Treatability Study Test Report and Field Demonstration Report. Bench-Scale Treatability Study Reports should be prepared to provide prospective Contractors with sufficient information to prepare a responsive bid, or proposal, for the contract. Treatability studies are a necessary part of each composting project. Bench-scale treatability study tests and field demonstrations should be performed to determine which recipes of soil and amendments are most likely to fulfill the treatment criteria.

****

Appendix [A][_____] "Bench-Scale Treatability Study Report" is for information purposes only.

]PART 2 PRODUCTS

2.1 STANDARD PRODUCTS

****

NOTE: It may be necessary to perform an explosive hazard analysis on equipment used to process explosives-contaminated material (see DA PAM 385-64). Equipment used on previous composting projects may already have been subject to an explosives hazard analysis (see Hazard Review of KW Windrow Composter, March 1992, in Appendix E of USAEC CETHA-TS-CR-93043).

****

Provide materials and equipment that are the standard products of a manufacturer regularly engaged in the manufacture of such products and essentially duplicate items that have been in satisfactory use for at least two years prior to bid opening. Provide support for equipment by a service organization that is, in the opinion of the Contracting Officer, capable of providing service, materials and equipment in an expedient manner.

2.2 WATER SUPPLY

****

NOTE: One important concern for irrigation water is to ensure that salts do not accumulate to levels that inhibit biological activity. Conductivity is an indicator of salt content. Conductivity may be reported in micro-Siemen per cm, or micro-mho per cm. Total dissolved solids (TDS) testing may be substituted for conductivity.

Possible water sources include: a nearby pond, or other surface water body; a hydrant, or other connection to a water distribution line; used decontamination water; and runoff from precipitation; see paragraph STORAGE VOLUME. For most composting operations, spontaneous combustion is an unlikely occurrence. However, if large quantities of very dry materials (e.g., leaves) will be used as amendments, it may be necessary to include provisions for fire detection and/or fire protection (see paragraph MOISTURE CONTROL). If there are susceptible structures nearby, it may be necessary to ensure that the local water distribution system is adequate to prevent a fire from spreading. It may also be necessary to coordinate this Section with Sections 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE; 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE; 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE; or 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE . This Section does not include provisions for fire protection.

****

Provide water for irrigation that does not contain oils, acids, salts, alkalis, organic matter, solids or other substances at concentrations that could be detrimental to the successful treatment of the contaminated materials. The acceptable ranges, or levels, of the following parameters in the irrigation water must not exceed the criteria established in Table 4.

TABLE 4 - IRRIGATION WATER CRITERIA

PARAMETER	REUSE CRITERIA
maximum conductivity	[_____] micro-mho per cm

TABLE 4 - IRRIGATION WATER CRITERIA	
PARAMETER	REUSE CRITERIA
minimum pH	[_____] standard units
maximum pH	[_____] standard units
[_____]	[_____]

Provide water for irrigation that does not contain contaminants that would persist through the composting process and that would thereby cause the composted soil to be considered contaminated and not suitable for reuse. Contaminants must also be avoided that may leach through the project site and contaminate groundwater.[If non-potable water is to be used, the irrigation water must be characterized prior to its use using Table 5. Sufficient numbers of samples must be collected to characterize the irrigation water source. Irrigation water that does not meet the criteria in this table may be treated to these criteria prior to windrow composting use. Submit a Water Supply Analysis demonstrating that irrigation water meets requirements.

TABLE 5 - IRRIGATION WATER CONTAMINANT CRITERIA		
ANALYTICAL METHOD NUMBER from US EPA SW-846	ANALYSIS TYPE	CRITERIA TO BE MET
6010[and 7470A]	Metals[and Mercury]	[Less than Maximum Contaminant Level (MCL)] [_____]
8260	Volatile organics	
8270	Semi volatile organics	
8081	Pesticides	
8082	PCBs	
1633	PFAS	
Within each Analytical Method, only analyze for analytes which have a [MCL][_____].		

]

2.3 AMENDMENTS

****

NOTE: Factors driving selection of amendments should include: seasonal availability, proximity of sources to the site, costs, amenability to storage and handling, moisture content, odor potential, texture and porosity, carbon-to-nitrogen (C:N)

ratio, previous experience with using an amendment, and variability in the quality of an amendment. Amendment mixtures that have been successfully used for previous projects, involving treatment of hazardous-waste-contaminated soil, should be given primary consideration.

Theoretically, the C:N ratio of the compost recipe should be between 20:1-40:1. The C and N contents of candidate amendments can be estimated using literature values (see Appendix A of the On-Farm Composting Handbook). Laboratory testing, for moisture and ash content, may also be used to determine carbon content. By subtracting the ash content from the dry weight, the organic matter content can be determined. The carbon content is usually determined by dividing the organic matter content by 1.8. Other amendment selection considerations are provided in paragraph AMENDMENT TESTING AND BENCH-SCALE TREATABILITY STUDY TESTING, .

If the bulk density of the amendment recipe (not including soil) is greater than 640 kg per cubic meter 40 lbs per cubic foot, the recipe may not be sufficiently porous. Wood chips may be used to increase the porosity of a compost recipe; however, depending on plans for end-use, large-diameter materials may have to be separated from the finished material (see paragraphs SOIL PRE-PROCESSING, CURING AND STORAGE, and DISPOSAL). It becomes more difficult to maintain aerobic conditions in the windrow as the porosity decreases, and as the moisture content increases (see paragraph MOISTURE CONTROL in PART 3). Use of amendments with an extremely high moisture content (e.g., liquid manure) should be avoided. The moisture content of the soil and amendments will control the initial moisture content of the compost. If the initial moisture content is too high, the windrow may not heat up properly, and the process may fail.

The following amendment mixture has been successfully used for full-scale treatment of explosives-contaminated soil: 30 percent soil, 17.5 percent sawdust, 17.5 percent hay, 21 percent cow manure, 10.5 percent chopped potato waste, 3.5 percent chicken manure (as reported in USAEC CETHA-TS-CR-93043). Based on previous, successful composting projects for explosives-contaminated soil, the following recipe of soil and amendments is recommended:

a. 30 percent Contaminated Soil. It may be necessary to reduce the soil percentage if clayey soils are being treated.

b. 15 - 20 percent Saw Dust/Wood Chips. It may be advantageous to substitute all or a portion of the sawdust with wood chips. Wood chips provide for

greater porosity in the compost. Use of cedar chips, or other aromatic wood chips, should be avoided.

c. 15 - 17 percent Alfalfa Hay. The quality of the hay may be marginal. Moldy alfalfa hay has been found to perform satisfactorily, and it is usually less expensive than feed quality hay.

d. 10 - 20 percent Potato Waste. Chopped potatoes are better than whole potatoes. It may be possible to use other starch sources in lieu of potatoes.

e. 15 - 25 percent Manure. Must be fresh (not dried). Although chicken manure has a higher nitrogen content, satisfactory results have been obtained using only cow or steer manure. Manure from ruminant animals (e.g., cows) is thought to be the best source of microbial inoculum.
****

Test representative samples from the first shipment of [manure, and potato waste (or other vegetable waste)][_____] for: conductivity, and moisture content. The concentration of glass, plastic, and other foreign materials in each shipment of amendment must not exceed [5][_____] percent, by dry weight. Do not use asbestos containing materials as amendments. The initial soluble salt content (conductivity) of the compost (including soil and amendments) must not exceed [20][_____] mmhos/cm. The initial moisture content of the compost (including soil and amendments) must not exceed [60][_____] percent of the moisture content at field capacity (or water holding capacity).

Analyze manure amendments to verify absence of constituents that would pass unaltered through the windrow composting process and possibly accumulate in the product soil. The following table should be used:

TABLE 6 - MANURE AMENDMENT CONTAMINANT CRITERIA		
ANALYTICAL METHOD NUMBER from USEPA SW-846	ANALYSIS TYPE	CRITERION TO BE MET
6010 [and 7470A]	Metals [and Mercury]	[Less than USEPA Residentional Soil Regional Screening Level if one exists] [_____]
8082	PCBs	
1633	PFAS	
Within each Analytical Method, only analyze for analytes which have a [Residential Soil RegionalScreening Level] [_____].		

2.4 SYNTHETIC OR MANUFACTURED ADDITIVES

****
NOTE: It is usually unnecessary to include synthetic or manufactured additives (e.g., surfactants or microbial inoculum) in compost recipes. This paragraph should be deleted if synthetic or

manufactured additives will not be used.
****

A Certificate of Analysis for Synthetic or Manufactured Additives must accompany each shipping unit of synthetic or manufactured additive supplied by the vendor.

[2.5 SAMPLES FOR BENCH-SCALE TREATABILITY STUDY TESTS

****
NOTE: To reduce the overall risk to the government, it is strongly advised that the project team should require the Contractor to collect samples for the bench-scale treatability study test unless the nature of the site prevents the Contractor to do so. Depending on site conditions and project needs (e.g. site security, access issue, etc.), the Government may provide samples to the Contractor to conduct bench-scale treatability study tests.
****

[The Contracting Officer will provide the required samples to conduct the bench-scale treatability study test.][Select sampling locations and collect representative samples to conduct the bench-scale treatability study test in accordance with the approved work plan. Consider the existing site conditions presented in paragraph EXISTING CONDITIONS when selecting sampling locations. [Conduct sample collection activity in the presence of Contracting Officer.]] The collected bench-scale treatability study test samples must have contaminant concentration levels [representative of the average concentration of the contaminants identified][and][greater than the action level criteria presented in Table 7]. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria. A minimum of [two composite samples][_____] must be tested. Also provide a physical description of each soil sample, either prepared by or under the supervision of a licensed geologist, to demonstrate that soil-type is representative of the contaminated zone. Do not commence bench-scale treatability study testing until contaminated material sample results meet the aforementioned concentration criteria.

TABLE 7 - ACTION LEVEL CRITERIA

PARAMETER	ACTION LEVEL CRITERIA
[_____]	[_____] mg/kg

]PART 3 EXECUTION

[3.1 AMENDMENT TESTING AND BENCH-SCALE TREATABILITY STUDY TESTING

****
NOTE: If a proven recipe will be used, testing of amendments may not be necessary (see paragraph AMENDMENTS). However, if a type of amendment has been proposed for which there is no previous experience, the following tests may be warranted: bulk density, moisture content, field capacity (or water holding capacity), free carbonate, organic matter content (or volatile solids), ash content,

pH, conductivity, and total Kjeldahl nitrogen. These paragraphs, and the corresponding submittal descriptions, should be deleted if amendment testing and bench-scale treatability study testing were performed prior to awarding this contract.
****

3.1.1 Amendment Test

Prior to the bench-scale treatability study test, collect and test samples of amendments for: [moisture content, pH, and conductivity][_____]. For each type of amendment,[two composite samples][_____] must be tested. The following amendments must be included in testing: [manure, potato waste (or other vegetable waste),][_____]. Submit the amendment test report along with the Bench-Scale Treatability Study Test Report in accordance with paragraph BENCH-SCALE TREATABILITY STUDY TEST REPORT. Include the following in the report: characterization test results for each amendment; the source and approximate age of each amendment; the date that each amendment was shipped, received and tested by the laboratory; procedure used to ship each amendment (including type of containers and temperature); if amendments were stored for any period of time, the temperature of storage; testing methods used; and proposed recipes of soil and amendments for bench-scale treatability study testing.

3.1.2 Bench-Scale Treatability Study Test

****
NOTE: The testing described below is closely related to the Dewar self-heating test that is used to determine the maturity of compost. However, the testing described below requires more intensive monitoring, a larger volume of material, and more time than a standard Dewar self-heating test.

Self-heating tests are typically performed using insulated containers (e.g., Dewar flasks), and may be used to assess whether recipes of soil and amendments are suitable for composting; a recipe may be suitable if it heats up, and remains at a sufficiently high temperature for an extended period of time. Self-heating tests may also be used to determine if an organic contaminant that has not previously been treated via composting, is amenable to composting.

It is possible to use vacuum-insulated containers with a volume of less than 4 L 1 gallon for self-heating tests; however, a minimum volume of 4 L 1 gallon is recommended for the following reasons: to more accurately simulate conditions of a compost windrow (height of about 1.5 m 5 feet); and to reduce the chances of using soil samples that are not representative of site conditions.
****

After completion of amendment testing, review the test results, and submit the proposed recipes of soil and amendments to be included in the bench-scale treatability study testing designed to optimize the treatment effectiveness. At a minimum, the proposed recipe should include the following: selected carbon/nutrient amendment (e.g., wastewater treatment sludge/biosolids, manure, potato waste, corn processing waste) and selected bulking agent[s] (e.g., mulch, wood bark, corn stalks, straw); ratio of soil to treatment and bulking amendments (e.g., 30 percent soil to 70 percent amendment); moisture level (e.g., 50 percent to 60 percent of field capacity); carbon to nitrogen ratio (e.g., 20-40:1); projected treatment timeframe (typically 15-45 days). Perform at least [three, replicate][_____] self-heating tests simultaneously for each selected recipe. Prior to testing, homogenize and divide each recipe into replicate volumes. The volume of material (including soil and amendments) included in each container for the self-heating tests must be not less than [[4][_____] L [1][_____] gal][_____]. Self-heating tests must be performed for a period of not less than [28 days][_____], during which temperature monitoring must be performed [daily][_____].

]3.2 PREPARATION

3.2.1 Mobilization

****

NOTE: Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES includes requirements for decontaminating equipment that has been used in contaminated zones. That section should be modified to extend decontamination/cleaning requirements to equipment being brought on-site to cover the requirements of this paragraph.

****

Do not mobilize to the site until [the Composting Work Plan][UFP-QAPP] has been approved by the Contracting Officer and the Contractor has received written confirmation. Delays caused by the Contractor's failure to meet regulatory requirements must result in no additional cost to the Government. In accordance with[Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____], the equipment which is rented and/or previously used for other site remediation must be decontaminated and tested for contaminants of concern before being brought to the site.

3.2.2 Pre-Operation Examination

Conduct a pre-operation examination of the on-site infrastructure, utility conduits, monitoring points, site access constraints, and infrastructure. Photographically document, with identifying labels, the existing condition of infrastructure and utilities, particularly for comparison to post-treatment conditions. Verify locations of critical utilities that cannot be disrupted and those utilities that would potentially have significant impacts on treatment and public safety. Submit a Pre-Operation Examination Report documenting the examination activity [before mobilization begins][_____]. Obtain all necessary utility clearances before initiation of subsurface work.

3.2.3 Pre-Construction Equipment Examination

Conduct a preconstruction examination of the landfarming equipment for damages, defects, and dilapidation. Submit the Preconstruction Equipment Examination Report to the Contracting Officer[before construction begins][____]. The Contracting Officer may conduct an independent examination to ascertain the condition and functionality of the equipment. Based on this examination, the Contracting Officer may reject the entire system or damaged, defective, or dilapidated equipment. The cost associated with equipment or control replacement or repair, and delays caused by the rejection must be borne by the Contractor. Routinely and properly inspect and maintain the equipment to provide the operation as required by the Contract schedule. Schedule delays and the associated costs are the responsibility of the Contractor. Provide an alternate/auxiliary power source if sufficiently reliable sources are not available.

3.3 FIELD DEMONSTRATION

****

NOTE: The field demonstration requirements are a function of the uncertainty of the materials to be treated. For well defined wastes that are known to be amenable to composting, optimization testing (performed using full-scale equipment and facilities) may be adequate. If the amenability of the contaminated material to composting has not been established, the field demonstration should be preceded by bench-scale treatability study testing. If the process has yet to be demonstrated on a large scale for the specific soil type and contaminants of concern, it may be advantageous to perform the field demonstration prior to construction of full-scale facilities.

The recipe of soil and amendments used in the field demonstration will be based on the results of the bench-scale treatability study test. To prevent scale-up problems between the field demonstration and full-scale operations, the batch size used for the field demonstration should be at least 23 cubic meters 30 cubic yards, and not less than 5 percent of the proposed batch size for full-scale operations. A batch is defined as that amount of material, including soil and amendments, for which treatment is initiated at the same time during full-scale operations.

****

Prior to full scale composting operations, perform a field demonstration. If the materials treated during the field demonstration do not meet the treatment criteria, process an equal quantity of the same type of material that failed, using properly modified operating conditions, until satisfactory results are obtained. Segregate any treated materials that failed the field demonstration and return this material to the contaminated materials stockpile area for processing during full-scale remediation. The volume of each windrow, including soil and amendments, included in the field demonstration must be no less than [23][_____] cubic meters [30][_____] cubic yards. Separate windrows, spaced to prevent intermingling of contaminated material, must be provided for each recipe and/or condition being tested. Recipes and/or conditions to be tested must include: [_____]. Conduct the field demonstration using the same windrow dimensions, and similar irrigation and mixing methods as proposed for the full scale operations. Do not initiate the field demonstration until written approval has been received from the Contracting Officer.

3.3.1 Samples for Field Demonstration Tests

****

NOTE: Chemical testing should be performed to verify that the materials to be used for the field demonstration contain the contaminants of concern at high enough concentrations to adequately test the process. Additional testing may be warranted to verify that the physical properties of the materials are representative of site conditions.

****

Obtain contaminated material used for the field demonstration from [the location specified by the Contracting Officer][_____]. Prior to performing the field demonstration, test [three composite samples][_____] of the contaminated material to be used for the field demonstration. Consider the existing site conditions presented in paragraph EXISTING CONDITIONS when selecting sampling locations. The contaminated material samples must have contaminant concentration levels [representative of the average concentration of the contaminants identified] [and] [greater] [than the action level criteria presented in Table 8]. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria. Test samples of contaminated materials intended to be used in the field demonstration in accordance with procedures in paragraph PRE-COMPLIANCE TESTING. Do not commence the field demonstration until soil samples meet the aforementioned concentration criteria. Also provide a physical description of each soil sample, either prepared by or under the supervision of a licensed geologist, to demonstrate that soil-type is representative of the contaminated zone.

TABLE 8 - ACTION LEVEL CRITERIA

PARAMETER	ACTION LEVEL CRITERIA
[_____]	[_____] mg/kg

3.3.2 Monitoring

****

NOTE: Because a more intensive level of monitoring is usually required during the field demonstration than during full-scale operations, a separate set of Operation, Maintenance and Process Monitoring requirements may need to be prepared. The following differences in monitoring requirements are typical for the field demonstration versus full-scale operations: sampling stations may be spaced more densely; temperature, moisture content, and field capacity testing may be performed more frequently; and sampling and analysis for contaminants of concern may be performed on a more frequent, and more regular basis. The field demonstration may also provide an opportunity to develop a site-specific correlation between field, and laboratory analysis methods. A sufficient amount of time, which should be based on the results from the bench-scale treatability study test, should be

scheduled for the field demonstration to allow each contaminant of concern to reach asymptotic levels. Also, the amount of sampling and analysis for contaminants of concern should be sufficient to assess the degree of variability in the final concentrations; so that it can be determined if cleanup goals will be reached.
****

During the field demonstration, perform sampling and analysis as indicated under paragraph OPERATION AND FIELD QUALITY CONTROL; in addition to these requirements, implement the following processing monitoring requirements: [_____]. The field demonstration must extend long enough for project treatment goals to be attained with reasonable confidence, or to reach an asymptotic limit to the concentrations, but not to exceed [60][_____] days from the initial blending of soil and amendments until completion of composting.

3.3.3 Field Demonstration Operations Report

During the field demonstration furnish reports weekly. Maintain copies of the reports at the facility. Record and maintain the following information until closure of the facility: description (including sources) of contaminated soil and amendments on site; the locations of all amendments and contaminated soil on site, and the quantity at each location; receipt, storage, treatment, disposal date, offsite disposal location, volume, and weight of hazardous and non-hazardous wastes including contaminated and treated soil and amendments; and manifests/proof of receipt from the disposal facility for hazardous and non-hazardous wastes. Dispose of all hazardous materials and wastes in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS. Record the location and quantity of each type of material on a map or diagram of the site. Include cross-references to specific manifest document numbers, if the waste was accompanied by a manifest. Provide summary reports and details of all incidents that require implementing contingency plans, or corrective action measures. Also include: date and time of each monitoring or testing event; results from each monitoring or testing event; monitoring procedure, or test method used; individual performing the monitoring or testing, and other individuals present; and remarks. Cross-reference to submittals specified in other Sections to prevent duplicate information in separate submittals.

3.3.4 Field Demonstration Report

****
NOTE: If the results of the field demonstration will be used to inform the Composting Work Plan, it may be preferred to report the field demonstration results in the Composting Work Plan instead of having a separate Field Demonstration Report. Update the Composting Work Plan paragraph and delete this paragraph if using that approach.
****

Submit the field demonstration report not more than [120][_____] calendar days after completion of the field demonstration. Prepare[draft for Government review][draft-final for [regulatory][_____] review]and final versions of the Field Demonstration Report. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. The report must document relevant data including, but not limited to: characterization test results for each amendment; the source and age of each amendment; the proportions of amendments and soil in each recipe tested; chronological table showing all materials added to each windrow, quantity added, date of addition, and each mixing, precipitation, irrigation and sampling event. The report must also include: physical and chemical monitoring data from before, during and after treatment; degradation rates; final disposition of wastes and treated material; conclusions; recommendations; and proposed recipe of soil and amendments for full-scale operations. In addition, the day-to-day log of operations and adjustments must be included in an appendix. After completion of field demonstration, review the data from the field demonstration. Proposed changes in Operations, Maintenance and Process Monitoring must be included in the Field Demonstration Report submitted to the Contracting Officer for review.

3.4 SOIL PRE-PROCESSING

****

NOTE: Soil pre-processing may include stockpiling, screening, and blending of contaminated materials. The maximum recommended particle diameter for compost mixing equipment can range from 25 to 100 mm 1 to 4 inches. However, the end use for the compost may dictate that the maximum particle diameter not exceed 13 mm 0.5 inch (see paragraph CURING, STORAGE AND DISPOSAL); and that the concentration of glass, plastic, and other foreign materials in soil not exceed 5 percent, by dry weight. Although it may be possible to include relatively large particles in compost, an additional screening step may also be necessary to remove the large particles prior to disposal. This paragraph should be coordinated with paragraph AMENDMENTS. In addition, composting is generally not effective for materials with high concentration of nitroaromatics. If encountered during pre-processing, materials with high level of nitroaromatics should be segregated and disposed of at an offsite facility. If explosives-contaminated soil will be treated, it may be necessary to require that an explosives hazard analysis be performed on the material handling equipment (see DA PAM 385-64; and Hazard Review of KW Windrow Composter, March 1992, in Appendix E of USAEC CETHA-TS-CR-93043r).

****

Pre-process contaminated soils as necessary by [screening][blending][shredding][_____] to provide a maximum particle size in soil [compatible with approved material handling equipment][_____]. Separate oversize materials[and materials with high concentration of nitroaromatics that cannot be composted successfully] from contaminated soil prior to mixing soil with amendments.

3.5 OPERATION AND FIELD QUALITY CONTROL

****

NOTE: Operation and monitoring requirements should be based on: applicable literature references;

knowledge gained from treatability studies and the field demonstration; and historical data from projects with similar soils, amendments, and contaminants. Diligent process monitoring (e.g., monitoring temperature and controlling moisture content) is fundamental to successful composting. Because there will always be exceptions, where the default values provided in these paragraphs do not suit a specific project, the following paragraphs should be edited appropriately. These paragraphs should be coordinated with Division 1 Sections of the contract; operations, maintenance, and process monitoring requirements are covered in a Division 01 Section of some contracts.

Reference a UFP-QAPP that has been prepared in accordance with DoD and EPA guidance. UFP-QAPPs follow the Data Quality Objectives (DQO) process and are required for DoD environmental restoration work. If a UFP-QAPP has been prepared for the overall project that composting is being used on, referencing to the UFP-QAPP for testing requirements avoids potential for conflicting requirements between the UFP-QAPP and the specifications.

****

Do not initiate full-scale composting operations until the Composting Work Plan [and the UFP-QAPP] has been approved, and written approval has been received from the Contracting Officer. The testing specified in the following sub-paragraphs is needed by the Government to generate documentation that the composting treatment has been accomplished in accordance with performance requirements in the decision document and approved by the government and regulators (e.g. EPA or other state agencies). The results of these tests may be used as part of the Contractor's QC program; however it is the contractor's sole responsibility to meet the performance requirements specified in this Section. Perform additional testing and measurements to assure that treated materials meet requirements without rejection of batches, retesting, and reprocessing.

3.5.1 Dissimilar Soils

****

NOTE: Delete the bracketed text item if dissimilar materials are not known to be present at time of preparing project specifications.

****

Do not mix together dissimilar soils if the bench-scale treatability study and/or field demonstration testing results indicate that different operating conditions have to be implemented to achieve effective treatment of these soils.[Materials known to be dissimilar at the site are defined in [paragraph EXISTING CONDITIONS][_____].]

3.5.2 Amendment Storage

****

NOTE: Manure and vegetable wastes are the primary sources of objectionable odor during composting. After blending manure and vegetable wastes with the

woody bulking amendments, objectionable odors will usually dissipate after about 7 to 14 days. It may be allowable to relax the maximum holding time for manure and vegetable wastes, if the site is remotely located and odor control is not an issue.

Depending on amendment selection and other site-specific factors, controls may be necessary to prevent insects and rodents from infesting the amendment storage area. Consider including a requirement here to keep amendment piles covered (if such requirement is not included in other specifications dealing with air/emissions controls).

****

To minimize odor generation, deliver manure and vegetable wastes to the site not more than [72 hours][_____] prior to blending of soil and amendments. Any excess manure and vegetable wastes, not blended with soil, must either be removed from the site not more than [24 hours][_____] after blending was initiated; or must be blended with other excess amendments and composted onsite. Excess manure and vegetable wastes must be disposed of in accordance with regulatory requirements.

3.5.3 Windrow Construction

****

NOTE: Initial homogenization may be accomplished by layering the raw materials into the shape of a windrow, and then mixing with windrow turning equipment. However, it may be possible to achieve a more thorough mix of the soil and amendments if they are blended in a separate vessel prior to forming windrows. The percentage of soil in the compost mixture should be based on previous composting projects, or preferably bench-scale treatabiity study testing and a field demonstration.

Typical dimensions for compost piles created by self propelled windrow turners are: 1.2 to 2.7 m 4 to 9 feet high, and 3 to 6 m 10 to 20 feet wide. However, sufficient temperatures may not be reached unless the initial height of the windrows is at least 1.5 m 5 feet. The height of the windrows will decrease during treatment.

****

The following measures must be taken to prevent freezing of contaminated soil that is scheduled to be composted during sub-freezing conditions: [_____]. The initial height of compost windrows must be not less than [1.5][_____] m [5][_____] feet.

3.5.4 Mixing

****

NOTE: If irrigation and turning are performed separately, mixing should be performed soon after irrigation to provide for more uniform distribution of moisture.

The frequency of mixing should be related to temperature monitoring. When temperatures exceed 65 degrees C 150 degrees F, mixing may be implemented to cool the pile. If excessively high temperatures cannot be controlled through turning, then the size of the compost windrows may have to be reduced. Low temperatures may indicate that oxygen levels in pore spaces within the pile are insufficient, and that the pile should be mixed. However, excessive mixing may impede the pile from reaching optimal temperatures. Isolated hot or cool spots may indicate the location of incompletely mixed pockets. After optimal temperatures have been maintained for about 10 days, it may be possible to reduce the frequency of mixing without adversely affecting the process. However, frequent and thorough mixing should result in more homogenous compost, and should reduce the variability of chemical data. On a previous project, daily windrow mixing was discontinued after definitive field analysis indicated that cleanup goals had been met. Thus, after about 12 days of mixing, the windrows were allowed to remain undisturbed until after data from compliance samples was received. Even if mixing is discontinued, temperature and moisture content monitoring should continue.

****

Unless otherwise indicated, mix the compost pile each day. To ensure the entire cross-section of the windrow is mixed, the windrow turner must be adjusted to its lowest height without actually contacting the treatment pad, and the turner must extend beyond each side of the windrow. Perform mixing at least once per day, for at least [10][_____] days. Additional mixing may be required in response to process monitoring; for example, to control temperature, odor and to provide additional aeration.

3.5.5 Moisture Control

****

NOTE: The potential for spontaneous combustion will increase as the moisture content falls below optimum levels. The water content at saturation will vary depending on what raw materials were used in the compost. Determination of water content as a percent of field capacity (or water holding capacity) provides a more "universal" indicator of the degree of saturation. Field capacity is determined by saturating a sample, allowing the free water to drain, and then determining the moisture content; field capacity is the mass of water in the sample divided by the dry weight. According to Bioremediation Using the Land Treatment Concept, EPA 600/R-93/164, field capacity can range from 5 percent (for a sandy soil) to 30 percent (for a clay soil).

The recommended moisture content for windrow composting is between 40 and 80 percent of the moisture content at field capacity. For example, if

the field capacity of a soil is determined to be 20 percent, then optimum moisture content would be between 8 and 16 percent. The procedure shown in USAEC CETHA-TS-CR-93043 has been used to determine the field capacity of compost for previous projects. Because the field capacity will change as the compost matures, periodic testing for field capacity should be required. Finally, a crude indicator of proper moisture content has been described as follows: the compost should feel moist, but not so moist that free water is released when squeezed by the hand.

****

3.5.5.1 Moisture Content and Field Capacity Testing

Immediately after initiating treatment of each batch of compost, test a minimum of one representative, composite sample per each [69][_____] cubic meters [90][_____] cubic yards of compost to determine percent moisture (by weight) and the moisture content at field capacity. Perform field capacity testing every week for the first [four][_____] weeks and [every two weeks][_____], thereafter. Perform testing for moisture content three times each of the first [four][_____] weeks and twice per week thereafter.

3.5.5.2 Irrigation

****

NOTE: Factors influencing irrigation water requirements include the initial moisture content of the soil and amendments, and the climate. A tank truck or a water storage tank may be necessary if a local water source (e.g., surface water body) is not available; see paragraph STORAGE VOLUME.

****

Irrigate the moisture-deficient portions of each windrow when testing indicates that the moisture content is below [40][_____] percent of the design field capacity. Measure the water application rate. Record the application rate, duration of the irrigation period, and volume of water applied. Provide sufficient irrigation to bring the moisture content to within the acceptable limits in not more than [48][_____] hours. Irrigation and mixing must be synchronized so that water is distributed uniformly throughout the windrows. Immediately cease irrigation if ponded water is observed near any windrow; record the time, date, and location of the ponded water in the Operations Reports, and remove the ponded water.

3.5.5.3 Contact Water Testing

Test contact water, to be reused as irrigation water, for pH and conductivity on the [first,][second,][_____][and][fourth][_____] week after initiating treatment of each batch of compost. If there is more than [13][_____] mm [1/2][_____] inches of precipitation in a 24 hour period, test the pH and conductivity of the contact water after water from the precipitation event has collected in the contact water storage facility. Each time testing is performed, either withdraw one representative sample from the contact water holding vessel, or directly test the water in the holding vessel by immersing the instrument probe in the contact water.

3.5.6 Temperature

****

NOTE: Temperature is indicator of microbial activity, and one of the most important parameters for monitoring the composting process. The temperature of windrows should be monitored immediately before and after mixing. The temperature range for the thermophilic stage of composting is usually considered to be between 43 and 65 degrees C 110 and 150 degrees F, preferably between 54 and 60 degrees C 130 and 140 degrees F. When temperatures continue to increase past 71 degrees C 160 degrees F, microbes become dormant or die. See paragraph MIXING regarding control of excessively high temperatures. The temperature of a compost pile will gradually stratify after mixing. The highest temperatures may be observed in the outer layer of the pile while initially heating, but may become highest along the center core of the pile later, especially if not mixed frequently. Temperature is affected by the composting heat generation which is driven by amendment content, moisture, and oxygen availability, and by the heat loss to the environment, so temperature is highly location- and time-dependent in a windrow pile. It is important to have a method to easily measure temperature anywhere in the windrow pile. Reference: TEMPERATURE DISTRIBUTION AND VARIATION IN PASSIVELY AERATED STATIC COMPOST PILES, Bioresource Technology 48 (1994) 257-263.

****

3.5.6.1 Temperature Probe Calibration

Provide temperature probes with a measurement range from [0][_____] to at least [100][_____] degrees C [32][_____] to at least [212][_____] degrees F. Calibrate probes by taking readings in an ice bath, and in boiling water. Mark each temperature probe for identification and calibrate prior to use. Record readings from each probe with each calibration event, before and after calibration, and include the identifier on the temperature probe in the recording. Maintain an identified composting design temperature (e.g., approximately 52 to 68 degrees C 125 to 155 degrees F). Submit corrective measures to the Contracting Officer if an optimal design temperature is not maintained.

3.5.6.2 Temperature Monitoring

Measure the temperature of the windrows each day immediately before and after mixing. Monitor the temperature at a minimum of [two][_____] locations, per [23][_____] cubic meter [30][_____] cubic yard section of compost. Record the temperature, time, and monitoring location during each monitoring event. Record the depth and location of each temperature reading. Record ambient air temperatures in the treatment area, and the time of monitoring daily.

3.5.7 Compost pH

****

NOTE: The pH should usually be maintained between 5.5 and 9, preferably between 6 and 8 standard units. Excessive volatilization of ammonia may result if the pH exceeds 5.5. However, it is usually unnecessary to adjust the pH during composting; and use of pH adjusting agents (e.g., lime) may be detrimental to the process.
****

At a minimum, test the pH of the compost twice during the [first, second, and third][_____] week after initiating treatment of each batch of compost, and once per week thereafter until treatment criteria has been met for contaminants of concern. Perform testing of the pH of compost in accordance with paragraph NON-STANDARD SAMPLING AND ANALYSIS. Maintain pH above 5.5, and preferably below 8. Adjust pH below 5.5 by careful addition of typical soil pH adjusting materials like lime, or limestone. Each time a pH adjustment product is applied, test the soil pH before and after adding the pH adjustment product. Also record the product name, quantity, and supplier of the pH adjustment product used after each application. Do not use aqueous caustics, such as sodium hydroxide, as pH adjusting agents.

3.5.8 Odor Control

****
NOTE: If Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS is not included in the project specifications, odor control sources and control activities should be specified here. When editing Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, consider the following:

Odor is an important indicator of the condition of a compost pile. Strong putrid odors usually indicate that anaerobic conditions are present, and that mixing (aeration) may be necessary for the pile from which odors are arising. Strong odors may also indicate that the pile, or a portion of the pile is too wet. Excessive ammonia odors may indicate that the C:N ratio of the compost recipe is too low, and/or that the pH is too high. Odors will usually be generated during the following activities: amendment delivery and storage; blending of soil and amendments; and during the composting process, including during mixing. See paragraph AMENDMENT STORAGE for more information.

The following text can be considered when editing Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. Monitor and record the presence or absence of odors in the treatment facility [each day][_____], for not less than [five][_____] days of each week. If objectionable odors are detected, record the following in the Operations Reports: locations where the odors are the strongest; description of the odors; the times and dates when the odors were detected; and the name of individual who observed, described and recorded the odor. If, in the opinion of the Contracting Officer, there is a persistent problem with objectionable odors that has not been

properly addressed, the Contractor will be notified to implement measures to reduce odor levels. Odor control measures must be implemented not more than [24][_____] hours after notification from the Contracting Officer. The initial choice of remedy for odor in the windrow pile is additional mixing.
****

Implement odor control requirements as specified in [Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____].

3.5.9 Oxygen

****
NOTE: The concentration of oxygen in the air spaces within the compost pile should typically be greater than 5 percent by volume (the concentration of oxygen in air is approximately 21 percent by volume). Oxygen levels will continually decrease after each mixing event as aerobic microorganisms consume oxygen. If used, oxygen monitoring should be performed at regular intervals, after each mixing event. Usually, temperature monitoring is adequate to control the composting process, and oxygen monitoring is unnecessary.
****

Regularly scheduled monitoring of interstitial oxygen levels will not be required. However, oxygen monitoring may be used as a diagnostic, or trouble-shooting tool. If oxygen monitoring is performed, record the monitoring location, the time of the last mixing event, and the time of each oxygen monitoring event. Maintain a minimal oxygen level of greater than 2 percent. Increase the frequency of windrow turnovers if this minimum oxygen level is not maintained.

3.5.10 Non-Standard Sampling and Analysis

****
NOTE: This paragraph only contains methods for relatively uncommon tests, and tests that are unique to composting. Field capacity may also be determined via ASTM D6836 Standard Test Methods for Determination of the Soil Water Characteristic Curve for Desorption Using a Hanging Column, Pressure Extractor, Chilled Mirror Hygrometer, and/or Centrifuge.

As alternatives to the Dewar self-heating test, respiration tests may be used to determine the maturity of compost. The text, The Science of Composting, by Epstein, 1997, provides compost stability index values for respiration testing (both for oxygen uptake, and carbon dioxide evolution). ASTM D5975 also uses oxygen consumption to assess compost maturity. Depending on the planned end use for the compost, some tests shown in this paragraph may not be necessary and should be deleted.

The solicitation package should provide prospective

Contractors with a means to acquire any references that are not included with the contract documents, and are not publicly available. The BIOCYCLE reference shown below is only a few pages and should be included with the solicitation package to provide information on self-heating tests, and compost stability testing. It is also recommended that copies of USAEC CETHA-TS-CR-93043 be made available to prospective Contractors to provide descriptions of the intended treatment process.

****

Perform testing of compost for field capacity (or water holding capacity) in accordance with USAEC CETHA-TS-CR-93043, Section 3.8.1 (Moisture Monitoring). Perform testing of compost for pH and conductivity (soluble salts) in accordance with NRAES 54, Chapter 3 (Raw Materials), the Saturated Paste Method.[Perform the Dewar self-heating test for compost maturity in accordance with BIOCYCLE][_____].

3.5.11 Sampling and Analysis for Contaminants of Concern

****

NOTE: Under some conditions, it may be more cost-effective to use field analysis methods (e.g., immunoassay or colorimetric methods), than to require laboratory analysis for all contaminants of concern. However, it may also be necessary to develop a site-specific correlation between data from field, and laboratory analysis. Pigmented materials present in extracts from compost samples may cause interferences in colorimetric, definitive field analysis. For more information see EPA 540 R-97/501, Field Sampling and Selective On-Site Analytical Methods for Explosives in Soil. Laboratory analysis should be required on a minimum percentage of samples to verify data from definitive field analysis.

Collecting samples from the edges and outer surface of the pile should be avoided, since these locations may not be representative of the bulk of the pile. The strategy for sampling and analysis should be consistent with the regulatory requirements for the data. States may impose more restrictive sampling requirements than those under Federal regulations. Compliance testing requirements are usually project specific, and agreed upon by the regulatory officials.

****

Perform sampling and analysis in accordance with the approved UFP-QAPP. Furnish results from each sampling event to the Contracting Officer not more than [24][_____] hours after data are recorded by the Contractor or released by the laboratory.

3.5.11.1 Sampling Frequency and Locations for Pre-Compliance Testing

****

NOTE: This is an example of a pre-compliance testing

protocol used during a previous composting project, and should be applicable to projects where field analysis will be used.
****

At a minimum, conduct sampling two times during treatment of each batch: (1) immediately after initial blending of soil and amendments; and (2) at the estimated time at which the cleanup levels will have been met (based on the results of the field demonstration). To determine locations of sampling stations, divide the windrows into sections. Each section must be a maximum [23][_____] cubic meters [30][_____] cubic yards. Each section must include one sampling station. Sampling stations must be represented by vertical planes that traverse the width of the windrow. Collect samples from a minimum of [four][_____], separate locations within each sampling station. Samples from each sampling station must be [composited prior to testing][_____].

3.5.11.2 Pre-Compliance Testing

****
NOTE: Definitive field analysis methods have been used for pre-compliance testing during previous composting projects.
****

Test for the following analytes during pre-compliance testing: [_____]. Test using the [field analysis][_____] method for pre-compliance testing.

3.5.11.3 Compliance Sampling

****
NOTE: Various methods of statistical analysis may be used to determine if treatment criteria has been attained. For example, after treatment of each batch is completed, the Contractor may be required to show that the mean of the data for each batch is below a specified value, and/or that the upper 95th percentile of the data for each batch is below a specified value. Although the following EPA reference describes procedures for determining whether a specified percentile of material is less than a cleanup standard (EPA 230/02-89-042, Methods of Evaluation and Attainment of Cleanup Standards), it may not be practical to implement this type of requirement. One alternative is to establish "ceiling" values for each contaminant of concern. Thus, in addition to requiring that the mean of the data for each batch be below a specified value, there may be a requirement that "single-sample" values must not exceed a pre-determined ceiling value. Use of ceiling values may eliminate the need for statistical analysis of data by construction QA representatives. There should be a statistical basis for ceiling values, and the basis for establishing ceiling values should be proposed early-on in design (e.g., in the design analysis report). Establishing ceiling values for contaminants of concern should be project specific, and based on negotiations with regulatory

officials. The contract should require a UFP-QAPP which provides a clear and consistent basis for determining the amount of sampling and analysis that will be required.

Treatment criteria should be specified on a "per-batch basis" so that the Contractor will be free to proceed with treating subsequent batches after the data from each batch has been received. This paragraph should be coordinated with paragraph, TREATMENT CRITERIA FOR COMPOSTED SOIL. This is only an example of compliance testing requirements, based on a contract from a previous composting project.

****

After pre-compliance testing indicates that a batch of compost has met treatment criteria, and written approval has been received from the Contracting Officer, perform compliance sampling. To determine sampling locations, [use the same section divisions from pre-compliance testing][_____]. Test two discrete samples, collected from randomly selected locations within each section. If the samples collected for analysis contain rock or gravel, remove this material from the sample and return it to the windrow before submitting the sample for analysis . Conduct testing in accordance with [_____].

3.5.11.4 Government Quality Assurance Testing

****

NOTE: The need for quality assurance testing should be considered on a project-by-project basis, and if not considered necessary this paragraph should be deleted. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. Use of quality assurance testing data also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project Performance Requirements, and a failing result would be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for identifying and correcting meaningful differences should be documented in a project-specific UFP-QAPP and referenced in this specification; the process is likely too complex to be adequately defined in this specification.

****

Provide duplicate samples to the Government's quality assurance laboratory for Government quality assurance. Submit samples at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. Provide additional quality assurance samples upon request.

3.5.12 Post-Treatment Procedure

****

NOTE: If treatment criteria for contaminants of concern have been met, but criteria for re-use (see paragraph TREATMENT CRITERIA AND CRITERIA FOR REUSE OF COMPOSTED SOIL) have not been met, the compost should either remain on the treatment pad, or be moved to a curing/storage area.

****

After compliance test data indicates that treatment criteria have been met, and written approval from the Contracting Officer has been received, the treated material may be removed from the treatment pad to a curing and storage location or kept on the treatment pad until final disposal, at the Contractor's option. Submit Treatment Completion Records which include, but are not limited to, a summary of all activities performed at the site as part of Windrow Composting, materials and equipment used, and all testing and sampling results.

3.5.13 Procedure for Non-Attainment of Treatment Criteria

If the Treatment Criteria and Criteria for Reuse of Composted Soil are not achieved, implement corrective action (continued windrow composting) at no additional cost to the Government until the criteria have been achieved. The corrective action may include: additional sampling to provide more data points for statistical analysis; or continued treatment. If there are portions of compost for which substantial reduction of contaminants of concern was not observed after the end of the estimated treatment period, prepare a report detailing all activities associated with those portions of the compost. The report must include: probable causes as to why significant reductions were not observed; measures that will be implemented to prevent the same problems from recurring; and a proposed plan for continued treatment of those portions of the compost where treatment criteria were not met. Obtain written approval from the Contracting Officer prior to implementing measures that deviate from the approved Composting Work Plan. Continue monitoring and windrow composting (at no additional cost to the Government, and in accordance with paragraph OPERATION AND FIELD QUALITY CONTROL), until the treatment criteria have been attained.

3.5.14 Curing and Storage

****

NOTE: Properly cured compost should have no objectionable odor. Although it is usually unnecessary to turn compost during curing, the compost should remain aerobic. Thus, the size of the piles should be limited. During curing and storage, the potential for spontaneous combustion and development of anaerobic conditions (or souring) increases as the dimensions of the compost piles increase. Monitoring for temperature, moisture and

oxygen will be needed for curing piles, though at a lesser frequency than is needed for treatment windrows. On a previous composting project, a cellulose tackifying agent was used to prevent the wind from dispersing treated compost. Only readily biodegradable tackifying agents should be used.
****

If anaerobic conditions develop during curing or storage, remix the compost, spread on a covered, dry surface, and allow to aerate for at least 24 hours before reforming the piles.

3.5.15 Post-Treatment Screening

****

NOTE: If wood chips or other large diameter particles must be separated from the finished compost prior to disposal, it may be desirable to reuse this material in subsequent batches of compost. If this material cannot be reused in other batches and must instead be repurposed or disposed, it may have to be ground to a powder and representative samples be submitted for chemical analysis to verify that Treatment Criteria have been met and no other contaminants are present above allowable limits.
****

Separate wood chips or other materials whose size exceeds the maximum acceptable size for the intended end use from the finished compost prior to disposal.

3.5.16 Operations Reports

Submit operations reports weekly for the first [10][_____] weeks, and every [two][_____] weeks, thereafter. The report must be kept at the facility during the [field demonstration][and][full-scale operation]. The following information must be recorded and maintained until closure of the facility: description (including sources) of contaminated soil and amendments on site; the dates of receipt, storage, treatment, and disposal of contaminated soil and amendments; the location of all amendments, contaminated soil, and compost on site; and the quantity at each location. The location and quantity of each type of material must be recorded on a map or diagram of the site. This information must include cross-references to specific manifest document numbers, if the waste was accompanied by a manifest. Summary reports and details of all incidents that require implementing contingency plans, or corrective action measures must also be provided. The reports must also include: date and time of each monitoring or testing event; results from each monitoring or testing event; monitoring procedure, or test method used; individual performing the monitoring or testing, and other individuals present; and remarks. Cross-references to submittals specified in other Sections may be provided to prevent duplicate information in separate submittals. Copies of records for treated or processed materials which have been disposed of not more than [45][_____] calendar days after disposal of each batch of materials. The following must be included for each batch of treated material: disposal location; date of transport to disposal location; volume or weight of material; and chemical data reports. Cross-references to the submittal specified in Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS, which includes the manifests and disposal certificates, must be provided for materials disposed of offsite. For non-manifested materials disposed of offsite, the following information must also be provided: address, phone number, proof of receipt from the disposal facility, and point of contact for each receiving offsite disposal facility.

3.5.17 Change of Operating Conditions

****

NOTE: If adjustment to the composting operating conditions is required due to change in contaminated material characteristics, then the Contractor's adjusted operating conditions should be evaluated by the Contracting Officer for the extent of changes from the previous operating conditions. Further, price negotiation may be required based on the extent of changes from the previous operating conditions.

****

The following two requirements must be met in order to be considered for change of operating conditions: (1) the physical and chemical characteristics of the contaminated materials are significantly different from the originally defined characteristics, and (2) the treatment requirements cannot be met under the current composting amendment design and related operating conditions. When change of operating condition is necessary, notify the Contracting Officer before changes are made to the amendment design and related operating conditions. The Contracting Officer may require the Contractor to perform a field demonstration for significant changes made to the amendment design and related operating conditions in accordance with paragraph FIELD DEMONSTRATION, for approval. If adjustment to the amendment design and/or operating conditions is required due to change in contaminated material characteristics, submit an adjusted design for the extent of changes from the previous design for approval. Further, price negotiation may be required based on the extent of changes from the previous mix design.

3.6 DISPOSAL

****

NOTE: Depending upon the characteristics and quantities, the potential disposal scenarios for wastes may include: onsite treatment and backfilling; partial onsite backfill and partial offsite disposal; and offsite disposal. Asphalt surfaces may be removed and sent offsite for recycling. One disposal scenario for each type of waste should be clearly defined.

After treatment, a volume decrease of approximately 50 percent may be observed for compost that originally contained 30 percent soil and 70 percent amendments. If the compost will be applied as a soil amendment, the following indices should meet quality guideline standards: pH, the Dewar self-heating test, conductivity, maximum particle size, foreign material content, and the levels of heavy metals. In addition, the plan for final disposition of the compost should take into account

the conductivity, maximum particle size, foreign material content, and the levels of heavy metals in the untreated soil to assess if the final product will be suited for the desired end use. See the On-Farm Composting Handbook for more on quality guidelines for different end uses of compost; also, see paragraph TREATMENT CRITERIA AND CRITERIA FOR REUSE OF COMPOSTED SOIL. According to the On-Farm Composting Handbook, if the end use for compost will be as a soil amendment, the compost application rate should not exceed 4 cubic meters per 110 square meters 4 cubic yards per 1,000 square feet.

****

Dispose or recycle/reuse compost that has met treatment criteria [and criteria for reuse] in accordance with regulatory requirements. If necessary, [treat and] dispose of the following materials on-site: [oversize materials][sludge resulting from treatment of contact water][excess amendments][and][_____]. If necessary, treat the following materials and dispose of off-site: [spent personal protective equipment][spent granular activated carbon][and][_____]. Perform offsite disposal of hazardous material and wastes in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS, which includes the preparation and submission of manifests and disposal certificates for materials disposed of offsite.

3.7 DEMOBILIZATION

****

NOTE: A separate table should be prepared if criteria for soils below the treatment pad, or other areas of the treatment facility, differs from criteria in paragraph TREATMENT CRITERIA AND CRITERIA FOR REUSE OF COMPOSTED SOIL. This paragraph should be edited appropriately if it is desired to retain portions of the composting treatment facilities after project completion. This paragraph should also be coordinated with Division 01 Sections of the contract.

The paragraph ENVIRONMENTAL REQUIREMENTS FOR OFF-SITE SOIL in Section 31 00 00 EARTHWORK should be edited to include an appropriate list of chemical testing parameters for off-site soil. Some backfill sources may have chemical testing data already available; the Government should require chemical testing if the backfill chemical testing data is inadequate or does not exist. Off-site backfill should not be tested for only the site contaminants of concern. At a minimum, samples should be analyzed for target contaminant list (TCL) VOCs, TCL SVOCs, target analyte list (TAL) Metals, and Pesticides/PCBs. Additional analyses such as Total Petroleum Hydrocarbons may be appropriate also. Individual States or military installations may require or recommend additional parameters. Typical frequency of sampling would be one sample per 1,900 to 2,300 cubic meters 2,500 to 3,000 cubic yards. However, individual States or military installations

may require or recommend more frequent or less frequent sampling.
****

Do not commence demobilization until written approval is received from the Contracting Officer. Follow the approved mobilization and demobilization plan and requirements under paragraph MOBILIZATION AND DEMOBILIZATION. Demobilization must restore the site to its initial state, prior to the construction and operation of the composting treatment facilities. Demobilization must include, but must not be limited to: [removal of structures and materials used to house or cover the compost piles,][disconnecting of utility service lines,][decontamination and removal of equipment and materials,][disposal of decontamination wastes,][disposal of any residual wastewater,][removal of unused amendments and other materials,][removal of material overlying liners,][removal of liners,][regrading and removal of berms,][demolition and disposal of the treatment pad, other foundation slabs, and paved surfaces,][seeding of disturbed, previously vegetated areas,][_____]. [Perform post-treatment testing of soils below work area surfaces (after the liners or pavement have been removed), to verify that the area is not contaminated. These soils must meet the following criteria: [treatment criteria in accordance with paragraph TREATMENT CRITERIA FOR COMPOSTED SOIL.][_____.]] If soil excavation is also part of the field activity, excavated areas need to be backfilled and restored to the original condition in accordance with Section 02 61 13 EXCAVATION OF AND HANDLING OF CONTAMINATED MATERIAL and Section 31 00 00 EARTHWORK.[Perform confirmation sampling within the excavated areas in accordance with the UFP QAPP to ensure all contaminated soil above treatment criteria are removed.]

SECTION 02 54 23

SOIL WASHING THROUGH SEPARATION/SOLUBILIZATION
02/25

****
NOTE: This guide specification covers the requirements for removal of contaminants by soil washing.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**
****

PART 1 GENERAL

****
NOTE: This UFGS provides the framework for developing a project-specific soil washing specification. It should be modified as necessary for a given site, to incorporate the conditions, soil washing technology, and regulatory requirements which are specific to the site.

Soil washing can be applied to the removal of most contaminants, including heavy metals and other inorganics, organics (including per- and polyfluoroalkyl substances [PFAS]), and radioactive wastes. Water-based applications involve separation of fine from coarse-grained soil particles to reduce

the volume requiring on- or off-site disposal (i.e., adsorption to the soil matrix, which consists of organic carbon content and soil particles themselves). Larger soil fractions may need to undergo attrition scrubbing or other methods to remove attached contaminated finer soil fractions. Solvent-based applications involve the dissolution of contaminants into the aqueous phase for removal and subsequent treatment or disposal of the extraction solvent/reagent waste stream. Refer to paragraph BENCH-SCALE TREATABILITY STUDY WORK PLAN for more details regarding the applicability and physical limitations of soil washing.

A systematic project planning approach should be employed when developing sampling procedures to demonstrate the performance of the soil washing treatment process, ideally through implementation of the Uniform Federal Policy for Quality Assurance Project Plans (UFP-QAPP) or some such similar process.

The soil washing operation considered in this section starts with the raw contaminated soil piles; continues through preparation, feeding, washing, separation, stockpiling, waste (solid, liquid and/or gaseous) treatment and disposal; and ends at the treated clean soil piles. As applicable, refer to Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL for requirements related to excavation, stockpiling, and handling of the contaminated soils; Section 31 00 00 EARTHWORK for placement of treated soils in on-site permanent storage; and Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS for requirements relevant to offsite transportation and disposal

****

1.1 MEASUREMENT AND PAYMENT

1.1.1 Unit Prices

****

NOTE: Edit this paragraph based on whether the Contract will use a single job price or unit prices. If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is in the project, move these paragraphs to that Section for editing.

If the project includes Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS, coordinate measurement and payment methods and contaminated material handling and stockpiling between this Section and Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS.

This paragraph should be modified based on the project specific conditions. Special Clauses should address modification of the full scale remediation

unit price due, if warranted, based on the results of bench-scale treatability studies or the field demonstration testing. For remediation using soil washing, a Request for Proposal rather than Invitation for Bid procurement process is generally used to select a Contractor.
****

1.1.1.1 Contaminated Materials

Payment for soil washing treatment of the feed soils will be based on the contract unit price schedule for each [metric ton ton][_____] on a dry weight basis of the previously untreated feed soils entering the treatment plant following removal of feed oversize soil. This unit price will include costs for materials, labor, processing and treatment, testing and analyzing, operation and maintenance.

Weigh the feed oversize and the feed soils separately during operation of the soil washing treatment plant (the treatment plant). The feed oversize (or debris) consists of the oversized soils separated from the raw contaminated soils by the soil preparation and feed system. The feed soils are the balance of the raw contaminated soils after the feed oversize has been removed. Convert the measured gross (bulk) weight of the feed soils to be treated by soil washing to dry weight based on the [percent moisture content][_____] of representative feed soil samples.[Determine the percent moisture content in accordance with [ASTM D2216][ASTM D4643][ASTM D4959][_____].][Determine moisture content[daily.][for every [500][_____] metric tons tons of feed soil.]]

1.1.2 Single Job Prices

[1.1.2.1 Bench-Scale Treatability Studies

****
NOTE: Delete this paragraph if bench-scale treatability studies have already been performed.
****

Payment for bench-scale treatability studies will be[included as part of base bid items][based on a single job price for each bench-scale treatability study test run requested by the Contracting Officer and properly completed][_____]. Include costs for labor and soils materials for: preparing plans; collecting representative contaminated soils; conducting the studies (including sampling and analysis); evaluating results; preparing the treatability study report; and treating [and][or] disposing of study-derived wastes.

]1.1.2.2 Field Demonstration

Payment for field demonstration test runs will be[included as part of base bid items][based on a single job price for each test run requested by the Contracting Officer and properly completed]. Include costs for labor and materials for: processing and treatment, testing and analyzing, report preparation, and other incidental work (such as, manufacturers' field services, health and safety monitoring and controls, and utilities).

1.1.2.3 Feed Oversize Materials Treatment [and][or] Disposal

Payment for treatment [and][or] disposal of feed oversize soils, washwater process sludge, spent washwater, and process treatment soils exceeding post-treatment criteria is provided in [Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS][_____].

1.1.2.4 Other Work Items

****

NOTE: Coordinate this paragraph with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS. Temporary utility connections are covered in Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS.

****

Payment for other work items not included in the above paragraphs will be included in the payment for the base bid for remediation of the contaminated soils. The other work items include submittals related to operation of the treatment plant, mobilization and demobilization, configuration and installation of the treatment plant, manufacturers' field services, environmental compliance monitoring, health and safety monitoring and controls, and utilities required for the soil washing treatment if approved by the Government as necessary for the project.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

[1.3 PRE-INSTALLATION MEETINGS

****

NOTE: Delete this paragraph if the requirements are included in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS, Section 01 32 01.00 10 PROJECT SCHEDULE, or other Specification Section.

Appropriate facility personnel should be present at the pre-installation meeting if siting of the treatment facility and other associated work areas will be discussed.

****

Conduct a pre-installation meeting at the jobsite at least [five business days prior to the start of operations on the project][_____]. Arrange the pre-installation meeting and follow the written pre-installation meeting agenda submitted prior to the meeting. The purpose of this meeting is to review the requirements of this specification and the associated plans. The following individuals must be in attendance at this meeting: Contractor's Project Manager and Site Foreman and [Contracting Officer][_____].

Record pre-installation meeting minutes and publish by way of email within 48 hours to all attendees. Re-publish the meeting minutes within 48 hours pending any subsequent comments from the attendees.

]1.4   SYSTEM DESCRIPTION

****

NOTE: If pretreatment such as blending for a homogenous feed or separating contaminated soils with different characteristics for different treatment operating conditions is required, some of the pretreatment requirements should be specified in Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS so the pretreatment required can be properly specified in this specification without any duplication. In addition, representative samples of the contaminated soils excavated and stockpiled should be collected and analyzed regularly to check and document its physical and chemical characteristics for design consistency and suitability as a feed of the contaminated soils.

Indicate if the Government knows/assumes that there are multiple dissimilar types of contaminated materials that will require different soil washing treatment processes. This may be based on site investigations and/or previously completed treatability studies.

****

The work consists of soil washing treatment of approximately [_____] metric tons [_____] tons of contaminated material.

1.4.1   Design Requirements

1.4.1.1   Soil Washing Treatment Process

****

NOTE: Modify this paragraph if the Designer will require the use of specific washwater mixtures (e.g. methanol solvent for PFAS-contaminated materials) based on previously conducted treatability studies, etc.

****

Provide washwater consisting of[water only][water plus approved extraction [solvents][reagents] such as acids, bases, surface active agents (surfactants), solvents, and chelating or sequestering agents] to enhance the solubilization [and][or] separation of the contaminants from the coarser [and][or] finer grained soils as needed to increase the efficiency of the soil washing treatment. Identify specific extraction [solvents][reagents] during the bench-scale treatability [study][design] steps.

1.4.1.2   Soil Washing Treatment Plant

****

NOTE: Omit the third- and fourth-to-last sentences of this paragraph ("The Contractor may propose … must be addressed in detail…") if a specific method of treatment is desired.

****

Configure the treatment plant based on the contaminated soils characteristics data and the Contractor's own interpretation of the bench-scale or pilot-scale treatability study results performed by the Contractor. Provide a full-scale treatment plant that is transportable. The capacity of the soil washing system must be [_____][consistent with the remedial action schedule]. The materials, components, accessories, and equipment used to fabricate the treatment plant must meet their functional requirements, and must be compatible with the contaminants of concern, the extraction [solvents][reagents] used in the treatment processes, and the operating conditions of each unit operation.[The Contractor may propose a treatment plant different from the treatment plant specified, in which case the proposed treatment plant capable of providing equivalent performance must be addressed in detail [in the Contractor's proposal][and][in the Soil Washing Work Plan][_____].] Provide a safe and reliable soil washing treatment plant in compliance with the applicable codes, regulations, and specified requirements. The treatment plant must consist of the following major systems:

1.4.1.2.1   Soil Preparation and Feed System

Soil preparation and feed system must include, but not be limited to, feed oversize separation, blending [and][or] separation of different soil particle sizes [and][or] contaminant levels (if needed) to provide a consistent feed, stockpiling of feed oversize and feed soils, conveying, feeding, treatment [and][or] disposal of feed oversize, dust/emission controls, and measurement of feed oversize and feed soils. Base the capacity of this system on the downstream treatment system operations. Refer to Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL for requirements related to excavation, handling, and stockpiling of the contaminated soils. Since heterogeneity and inconsistent feed conditions can impact soil washing removal efficiency, if appropriate, pre-processing steps to maintain homogenization for optimal removal efficiency should be specified in the Soil Washing Work Plan. Soils may need to be segregated by order of magnitude contaminant concentrations and either blended for more homogeneity or treated using different process conditions to optimize treatment throughput and minimize treatment costs, which should be determined during the [treatability][design] steps.

1.4.1.2.2   Soil Washing and Separation System

Provide a soil washing and separation system which includes mixing, washing [(including the preparation and addition of any extraction [solvents][reagents])], [solids and liquid separation][soil particle size separation][_____], dewatering of treated soil, and measurement of process parameters and treated soils. For example, coarse grained soils can be separated using vibratory screens or trommels. Additional separation of the finer grained soils can be performed using hydrocyclones or spiral classifiers that leverage differences in settling velocities of the particles. Treated soils are the feed soils having been washed and separated by the soil washing and separation system. Treated clean soils are the treated soils which meet the post-treatment criteria. Provide a soil washing system that is equipped with direct means for controlling the washwater settings including[pH][temperature][pressure][composition][quantity][contact time][and][particle size separation][_____]. The mixing and washing equipment must have the capability to dissociate the contaminated fine soil particulate [types][sizes] from the coarse soil particulate [types][sizes] [and][or] to solubilize the contaminants into the washwater mixture so that the post-treatment criteria can be achieved at a minimum for the coarser grained soils.[Magnetic separation of ferrous soil must be done using electromagnets.] Provide dewatering equipment that is capable of lowering the moisture content of treated soils and corresponding washwater treatment sludges to less than [10][15][_____] percent as required for on-site backfilling [and][or] offsite disposal.

1.4.1.2.3 Spent Washwater Treatment System

Spent washwater is washwater that has been in contact with contaminated feed soils or other contaminated surfaces, consisting of a mixture of contaminated fine particles [and][or] dissolved contaminants, washwater, and run off water from soil storage and treatment areas. If required, provide a spent washwater treatment system to include physical, chemical, [and][or] biological treatment of spent washwater; dissolved [and][or] suspended solids removal; process sludge dewatering; recycle, reuse, [and][or] discharge of treated washwater; and measurement of treatment parameters and dewatered [and][or] treated process sludge. Process sludge is the sludge resulting from the removal of dissolved contaminants [and][or] the contaminated suspended [soils][solids] in the spent washwater. If a washwater treatment system is required, it must have the capacity and capability to treat the generated volume from the design capacity of the treatment plan (also including collected stormwater run-off and any leachate collected from the soil piles) for recycle, reuse, or treatment and discharge. The treated washwater must meet the quality limits for [recycle][reuse][discharge], [and][or] [disposal][_____]. The process sludge must be treated [and][or] disposed of according to its characteristics and regulatory requirements.

1.4.1.2.4 Plant Supporting System

Include a supporting system in the treatment plant for water storage and distribution, extraction [solvents][reagents] storage and distribution, [power and steam][power] generation and distribution, and fire safety. Provide these supporting facilities with adequate capacities to deliver water, extraction [solvents][reagents], power, [steam][_____], and fire protection necessary for operation of the soil preparation and feed system, soil washing and separation system, and[spent washwater treatment system][_____].[Provide [alternate][auxiliary] power source if sufficiently reliable source is not available. Provide emergency power for lighting, controls, and computer system operation[, _____].] Provide material feeding equipment for each extraction [solvent][reagent] consisting of a feed tank and mixer for preparing feed stock, and a metering pump for controlled feeding. Refer to [Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____] for requirements related to spill containment structures, stormwater pollution prevention, and air quality.

1.4.1.2.5 Sampling, Monitoring, and Control Requirements

****

NOTE: The process and waste generation data storage requirements should be specified based on the quantity, frequency, and requirement of data reduction and analysis for a specific project.

****

Provide appropriate sampling and monitoring equipment for controlling the performance of the treatment processes and for complying with design and regulatory requirements. Provide monitoring and control equipment for the treatment processes with the necessary accuracy and sensitivity to measure and control the operating ranges for system parameters such as[material feed rate][washwater flow rate][pH][contact time][cut size][_____] so that the treatment plant can perform to its designed capacity, efficiency, and reliability. The unit operations of the treatment plant must be complete with required instruments, controls, and local control panels. Provide a main control center to facilitate the overall control of the treatment plant. The main control center must have the necessary provisions for heating, ventilation, and air conditioning for proper operation of the instruments, controls, and electronic data storage system. Refer to Section 23 30 00 HVAC AIR DISTRIBUTION for proper heating, ventilation, air conditioning. The signal transmission to and from the main control center must be [4-20 mA][_____].

1.4.1.3 Utilities

****

NOTE: The locations and details (such as utility point of contact, sizes, capacities, and flows) of the utility hookups should be provided on the drawings for the Contractor's use. Verify the utilities are available on-site before including the second sentence.

****

In accordance with Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS, provide the utilities associated with the installation and operation of the treatment plant including, but not limited to: [telecommunications][electricity][water][steam][gas][sanitary][and][solid waste facilities][_____]. The[telecommunications][electricity][steam][water][gas][sanitary][and][solid waste facilities][_____] are available at the site.[Refer to the drawings for hookup locations and other details.]

1.4.1.4 Material Measurement

****

NOTE: This paragraph is primarily intended to ensure that calibrated scales are being used to weigh treated soil, when weight is being used as the basis for measurement and payment.

****

Provide scales, meters, and volumetric measuring devices for measuring oversize materials, feed contaminated materials, reagents, and water which conform to the applicable requirements of NIST HB 44, except that the accuracy must be plus or minus[0.1][_____] percent of the quantity being measured. For scales used to measure weight of material in vehicles, provide scales of sufficient length to permit simultaneous weighing of all axle loads. For scales used to make measurement for payment, ensure the scale is certified[by an acceptable scales company representative][by an inspector of the State Inspection Bureau charged with scales inspection] prior to weighing any materials. Perform a check of calibration of measuring equipment prior to initial use, and once every [seven][_____] calendar days. The requirements of this paragraph do not apply to measurement of chemical data.

[1.4.1.5 Bench-Scale Treatability Study Work Plan

****

NOTE: Typically, a bench-scale treatability study will have been performed prior to development of this specification; however, the Contractor is sometimes required to complete a bench-scale treatability study prior to performing full-scale work at the site. Bench-scale treatability study test protocol and results should include any proposed extraction solvents/reagents (including water) and the respective mix ratios to be used during full-scale treatment. This paragraph should indicate if the Designer will require bench-scale treatability testing of any specific extraction solvents/reagents (e.g. methanol for PFAS-contaminated materials). The test results submitted should verify that the mix design proposed meets the post-treatment criteria listed in paragraph PERFORMANCE REQUIREMENTS.

Since soil particle size separation represents the primary method of contaminant removal/soil volume disposal reduction, the bench-scale treatability study work plan must include a detailed soil grain size analysis and laboratory testing for contaminant distribution within pre-determined ranges of separated soil types/grain sizes. Outcomes from the bench-scale treatability study should first establish and determine a go/no- go decision point for the viability and cost effectiveness for moving forward with soil washing for the identified soil particle size mix and contaminant distribution and the viability of meeting post-treatment criteria. In general based on soil washing's history, it is less cost effective as the percentage of finer grained soils increases. For example, a literature rule-of-thumb particle size distribution of 0.25 to 2 millimeters 0.001 to 0.08 inches is considered optimal for soil washing, while <0.063 millimeters 0.002 inches may not be viable - which correlates to <25% silts and clays considered optimal and >50% may not be viable. High clay content with corresponding high moisture levels poses a soil handling and feed challenge.

****

Submit a Bench-Scale Treatability Study Work Plan consistent to the extent practical with EPA 540/2-91/020A within [30][_____] calendar days after notice to proceed. Do not perform the bench-scale treatability study until the work plan is approved. Prepare [draft for Government review] [draft-final for [regulatory][_____] review] and final versions of the Bench-Scale Treatability Study Work Plan. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. The technical requirements to address include, but are not limited to, the following: procedures for obtaining contaminated soils to be used in the bench-scale treatability study; contaminant distribution as a function of distribution within defined soils lithology types/grain sizes); washwater requirements determination and optimization; residuals management; mass balance calculation; unit processes/operations evaluation; definition of particle size separation requirements based on fine versus coarse grain sizes or specific particle size distribution that meets the post-treatment criteria to allow for on-site re-deposition and minimizes the off-site disposal volume; soil [testing][sampling] protocols and analytes. If appropriate, the work plan should also include the testing of appropriate extraction [solvents][reagents] besides water for more difficult to extract contaminants or for higher percentages of finer grained soils to optimize removal efficiencies. In addition, the work plan must include a thorough discussion of how the study's operating conditions will compare with full-scale conditions, and how the variances will be addressed in scale-up. If proprietary extraction [solvents][reagents] are to be used in the processes, Safety Data Sheets and other non-proprietary type information must be provided to assess their potential for secondary contamination or other exposures during the installation and operation of the treatment plant.

]1.4.1.6 Soil Washing Work Plan

****

NOTE: The Designer may wish to require the Soil Washing Work Plan, UFP-QAPP, and other preconstruction submittals required under this section to be completed concurrently, or with the other plans being appendices of one primary plan. This Section should be edited to reflect such a requirement if applicable.

****

Submit a Soil Washing Work Plan[within [60][_____] calendar days after completion of the Bench-Scale Treatability Study][no less than [120][_____] calendar days prior to the anticipated start of full-scale soil washing operations]. Do not perform soil washing until the Work Plan is approved. Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Soil Washing Work Plan. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. The Work Plan must address the technical requirements listed in this Section and must include, but is not limited to, the following:

a. Schedule. Specify dates for the start and completion of [treatability studies][_____], design documentation, mobilization, installation, field demonstrations, treatment of contaminated soils, disposal of wastes, and demobilization. Include details such as intended hours of operation, scheduled downtime, and routine maintenance downtime.

b. Project Organization. Propose a project organization for carrying out the remediation of contaminated soils by soil washing treatment. Provide an organization chart including subcontractors. Clearly define the responsibilities of each individual in the organization in terms of project activities including, but not limited to: project management and coordination; scheduling and schedule control; quality control; sampling, measurement, analysis, and data management; and operation and maintenance of the treatment plant.

c. Principles of Operation. Provide a detailed description of the proposed treatment plant. Include treatment systems and corresponding unit operations, treatment capacity, preparation of feed soils, soil handling and feed systems, treatment requirements for washwater, properties and handling of extraction [solvents][reagents] (including reuse, reclamation, or disposal of spent or recovered materials), mechanism of contaminant removal, characteristics and stockpiling of the treated soils, and wastes generation and disposal. Post treatment soil criteria for on-site re-deposition,[disposal criteria][washwater treatment discharge criteria][and][air emissions criteria][_____] must be presented based on regulator [feedback][permit] requirements and other site requirements.

d. Equipment. Describe treatment system equipment completely, including, but not be limited to, equipment identification, manufacture make and model, physical size, operating conditions, and materials of construction.

e. Drawings. Provide drawings showing at least: layout of the treatment plant, including feed soil stockpiles; storm water drainage and soil pile leachate collection plan for the soil stockpile storage areas; pre-treatment and post-treatment soil stockpile construction; washwater treatment system and discharge design/construction; and piping, instrumentation, and electrical process flow diagrams and details.

f. Quality Control. Provide a quality control plan as required in Section 01 45 00 QUALITY CONTROL, to detail the procedures for inspection, testing, and correction of deficiencies. This program must ensure that the Contractor's operations comply with the requirements of the contract plans and specifications with respect to quality of materials, workmanship, construction, finish, functional performance, and accuracy of data.

g. Process Soils Tracking Schedule. Provide a Process Soils Tracking Schedule for recording and managing the quantities of the contaminated soils processed,[feed oversize treated [and][or] requiring disposal],[process sludge treated [and][or] requiring disposal,][other waste streams requiring disposal such as [_____],][reprocessing of treated soils that fail to meet post treatment criteria][_____], and the treated clean soils to be re-deposited on-site (e.g., use as backfill) or soils exceeding post-treatment criteria requiring off-site disposal. Track each soil from the original source, continue through various stages of handling and treatment, and end at the ultimate disposal.

h. Mobilization and Demobilization. Include a mobilization and demobilization plan containing, but not be limited to: transport of personnel, material, and equipment; decontamination and disposal of materials and equipment brought to the site; decontamination and disposal of the treatment area and other paved surfaces; and decontamination of equipment during demobilization. Include a Post-Treatment Cleanup and Sampling Plan in the mobilization and demobilization plan for areas where there was contact with contaminated materials and were disturbed by the remedial action/site work. Also, discuss the restoration of disturbed areas such as grading, seeding, etc. Address the requirements in paragraphs MOBILIZATION and DEMOBILIZATION.

i. Soil Handling Plan. Elements of the plan must include excavation of contaminated soils (refer to Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS and Section 31 00 00 EARTHWORK); storage of the feed soils; conveyance of soils through the pretreatment and soil washing process; storage of treated soils until sampling is completed; segregation of soils that meet the post-treatment criteria for on-site [backfilling][re-deposition] versus soils requiring off-site disposal; and excavation backfilling (using treated soils or clean borrow soils). This plan needs to account for and balance the following: factors: minimizing the open excavation area for safety and minimization of rainfall contact with contaminated soils; optimizing and matching of the daily capacity of the soil washing treatment system with the daily soil excavation volumes and capacity for final deposition of the treated soils (including post-treatment sampling and analysis timeframe); minimizing of pre- and post-treatment soil storage volumes that must also fit available treatment system footprint area; and soil storage area [cover][liner][stormwater] diversion measures to prevent direct contact of precipitation with pre- and post-treatment soils. This plan must include appropriate drawings and specifications for the various soil handling operations and storage areas for review.

j. Permits, certifications, [and][or] substantive regulatory requirements necessary for the configuration, installation, operation, and closure of the soil washing treatment plant. For those permits, certifications, [and][or] substantive regulatory requirements which have not been obtained, provide a copy of these applications. Possible permits or substantive regulatory requirements that may be applicable include [air emissions from the soil washing operation (e.g., particulates, fugitive emissions from extraction [solvent][reagent]] [washwater treatment discharge (e.g., national pollutant elimination system discharge to surface water body or direct discharge to municipal publicly owned treatment works)].

[k. Bench-Scale Treatability Study Test Report: After completion of testing, compile the data from the treatability study and propose the conditions to be tested in the Field Demonstration. Submit the Bench-Scale Treatability Study Test Report, describing the protocol and results for the treatability study that addresses, but is not be limited to, the materials, procedures, and methods used in the study; tests performed; sampling and analysis; mass balance and performance evaluation; and results, conclusions with supporting dialog, and recommendations.]

****

NOTE: It would be normal practice that a Field Demonstration Plan be included as part of the Soil Washing Work Plan unless a separate submission is required by the regulator or due to site circumstances and schedule. If a separate Field Demonstration Work Plan is required, the specification should be edited to include that requirement, including schedule and reviews.

****

l. Field Demonstration Plan. This plan must address, but not be limited to, the following: contaminated feed soil characterization (including the contaminant concentrations as a function of grain size to evaluate consistency with the bench-scale treatability study; proposed demonstration testing runs (including verification [and][or] optimization of the washwater mix design and [testing][operating] conditions and other key operating parameters for the unit [processes][operations] for each run); sampling protocol, locations, and analytical methods to verify that the design output criteria have been met, including required particle size separation, target contaminant concentration distribution; attainment of soil cleanup levels for any on-site re-deposition, and attainment of [permit][substantive] regulatory criteria; overall mass balance calculation and performance evaluation; and soil and waste characterization of any treatment residuals requiring disposal (e.g., washwater treatment sludges). In addition, the day-to-day log of operations and adjustments to optimize the treatment system must be included in the appendices.

1.4.1.7 Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)

****

NOTE: This section may reference a separate specification section requiring preparation of a quality assurance project plan or may be excluded entirely if the requirements are part of another specification section.

Indicate in this paragraph if the UFP-QAPP should include any testing protocols specific to the contaminated soil matrix and soil washing technology (e.g. filtering or homogenizing samples if larger contaminant debris may be present).

****

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the UFP-QAPP WKSTS. Tailor the content to the requirements of the project and the site conditions and media of interest and address the collection of chemical and physical data necessary to make operational decisions. Prepare [draft for Government review] [draft-final for [regulatory][_____] review] and final versions of the UFP QAPP. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Do not perform work at the site, with the exception of site inspection and surveys, until the UFP-QAPP is approved.

1.4.2 Performance Requirements

1.4.2.1 Contaminant Concentrations

****

NOTE: The table in this paragraph should be developed based on site-specific contaminants of concern and regulatory requirements.

Planned post-treatment criteria, as well as sampling and analysis requirements, should be reviewed by regulatory agencies in the early stages of design. These criteria generally consist of cleanup levels and/or contaminant limits derived from risk-based requirements, Toxicity Characteristic Leaching Procedure (TCLP) limits, Synthetic Precipitation Leachate Procedure, Resource Conservation and Recovery Act (RCRA), Land Disposal Restrictions (LDRs), and RCRA delisting requirements. Coordinate backfilling with Section 31 00 00 EARTHWORK to

ensure geotechnical parameters are specified.

Two approaches are provided for attaining performance criteria: meeting performance criteria for every sample of treated soil (conservative approach) or meeting performance criteria on the average for multiple samples of treated soils from a defined soil volume or decision unit (e.g., soil stockpile). For purposes of waste characterization, collected soil sample(s) must be considered representative of the total waste stream.

****

The concentrations of the contaminants in the treated coarser or finer grained soils intended for on-site re-depostion must not exceed the post treatment criteria specified in Table 2. The determination for attaining the post-treatment criteria will be based on applicable sampling protocol described in the UFP QAPP. Examples of possible post-treatment criteria include the following: [Each sample of post-treatment soil must meet the criteria shown in Table 2.] [An average of all samples of treated soil must meet the performance criteria in Table 2 with no individual sample greater than [_____][110 percent] of the criteria in Table 2 and with no more than [_____][20 percent] of the samples exceeding.] Projected removal efficiencies for the finer grained soils should at least be consistent with the levels identified during the bench-scale treatability and design steps. Post-treatment soils that do not meet the post-treatment criteria must either be re-treated until the applicable criteria are met or staged for off-site disposal.

TABLE 2 - POST TREATMENT CRITERIA

	CLEANUP LEVEL IN TREATED MATERIAL	
PARAMETER	TOTAL CONCENTRATION IN TREATED MATERIAL	TCLP EXTRACT LIMIT
[_____]	[_____] mg/kg	[_____] mg/L

[1.4.2.2 Cut Size Requirement

****

NOTE: This paragraph should be deleted if removal of contaminants is not dependent upon separation of contaminated fine particles (i.e., entirely due to solubilization or other removal techniques). This paragraph provides options for either the design engineer to specify or the Contractor to choose the cut size requirements. The feed materials at a given site may have different physical and chemical characteristics. Therefore, during soil washing treatment, different cut sizes may be used so that the treated materials will meet the post-treatment criteria. If the design engineer chooses to specify the cut size, and if treatment involves a variety of cut sizes, then the different cut sizes should be specified for different feed materials.

****

Cut size is the targeted grain size used to define the demarcation of the coarse and fine grained soil fractions of the feed materials to be separated during the soil washing operation. Cut size specification for purposes of soil particle size separation design to attain the post-treatment criteria must be identified by the Contractor based on experience and bench-scale [treatability][pilot] study results. Each selected cut size with supporting documentation must be submitted for review prior to implementation. The supporting document must include information correlating contaminant concentrations for the various size fractions based on the grain size distribution.

]1.4.2.3 Spent Washwater Treatment and Disposal Requirements

****

NOTE: These paragraphs provide the generic requirements for washwater treatment and disposal, solid waste treatment and disposal, and emission and dust control. These paragraphs should be modified based on the site specific design of the soil washing treatment plant and regulatory requirements. The spent washwater should be treated if necessary and reused, discharged in accordance with applicable regulations (federal, state, and local), or sent for offsite disposal.

Modify this paragraph to reflect the following site-specific requirements.

If a performance specification is prepared, the treatment and disposal requirements should be specified based on the conceptual/process design and applicable regulations. Table 3 should be presented to list the disposal/discharge criteria for the contaminants of concern in accordance with regulatory requirements. If the specification is prepared based on detailed design, the detailed design requirements describing the treatment and disposal scenario as well as the unit processes/operations employed should also be specified.

If sent for off-site disposal, spent washwater should be characterized to determine whether it constitutes a RCRA hazardous waste in accordance with RCRA Identification and Listing of Hazardous Wastes or applicable state regulations. The "derived-from" rule requires treatment residues from the treatment of RCRA listed waste to be managed as listed waste. If the spent washwater is classified as a hazardous waste, a determination should be made as to whether additional treatment is required to comply with RCRA land disposal restrictions. In addition, the requirements in RCRA Standards for Generators of Hazardous Waste and applicable state regulations should be identified and satisfied.
If other washwaters are treated along with the spent washwater, they should be mentioned in this paragraph. These washwaters may include, for example, the rainfall run offs from the stockpiles

of feed oversize, feed soils, treated soils, and process sludge; and the washwaters generated from onsite treatment of feed oversize, process sludge, and/or spent process treatment materials.

In the event the project is performance-based, Table 3 will be left blank, and the Contractor must define the spent washwater permit or substantive discharge criteria in the Soil Washing Work Plan.
****

The spent washwater must meet the criteria presented in Table 3 at the time of [disposal][discharge].

TABLE 3 - SPENT WASHWATER DISPOSAL/DISCHARGE CRITERIA	
PARAMETER	DISPOSAL/DISCHARGE CRITERIA
[_____]	[_____] mg/L

1.4.2.4 Solid Waste Treatment and Disposal Requirements

****
NOTE: Solid wastes generated during the plant operation may include feed oversize, process sludge, and/or spent process treatment materials. One treatment and disposal scenario for each of these solid wastes should be clearly defined. If a performance specification is prepared, the treatment and disposal requirements should be specified based on the conceptual/process design. Table 4 should be presented to list the disposal criteria for the contaminants of concern for each of the solid wastes. The applicable federal, state, and local regulations specifically related to the site should be identified. If the specification is prepared based on detailed design, the description of the treatment and disposal scenario as well as the individual treatment components should also be specified.

If secondary solid, liquid, and gaseous wastes are generated by onsite treatment, their treatment and disposal requirements should be addressed in the same manner as the solid, liquid, and gaseous wastes generated by the treatment plant. If the liquid wastes are treated along with the spent washwater, their treatment and disposal requirements should be addressed in the paragraph entitled SPENT WASHWATER TREATMENT AND DISPOSAL REQUIREMENTS. Similarly, the gaseous wastes can also be addressed in the paragraph titled EMISSIONS AND DUST CONTROL.
****

The[oversize debris, rocks, minor quantities of clayey soil clumps too large to be processed, etc. screened out of the feed soils][washwater process sludge][fine grained soils not meeting treatment criteria][spent process treatment soil][_____] from installation, operation and closure of the treatment plant must be properly treated [and][or] disposed to the levels specified in Table 4. Spent process treatment material is the process treatment material for which the capacity to remove contaminants from the contaminated medium in a treatment process has been used or exhausted (e.g., spent adsorbent media from washwater treatment). The Contractor must present the waste characterization data and identify disposal options for all applicable media in the Soil Washing Work Plan.

TABLE 4 - SOLID WASTE DISPOSAL CRITERIA

	DISPOSAL CRITERIA	
PARAMETER	CONCENTRATION LEVEL IN TREATED SOLID WASTE	TCLP EXTRACT LIMIT
[_____]	[_____] mg/kg	[_____] mg/L

1.4.2.5 Emissions and Dust Control

****

NOTE: Specifications for emission and dust controls should be provided in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. The remaining text in this note discusses soil washing technology-specific emission and dust control considerations to incorporate into Section 01 57 19. An air pathways analysis should be performed during design in accordance with EP 200-1-24 Air Pathway Analysis for the Design of Hazardous, Toxic and Radioactive Waste (HTRW) Remedial Action Projects. Depending upon the contaminants of concern in the contaminated soils, the unit processes/operations employed in the treatment plant, the amount of pollutants emitted, and the geographical location of the site, the emission standards and limitations for certain contaminants and dust control can be identified from the following regulations including, but not limited to, National Primary and Secondary Ambient Air Quality Standards, National Emission Standards for Hazardous Air Quality Pollutants, and state and local regulations.

Based on the regulatory requirements, the proper technologies or apparatus for the emissions control if required can be determined. Upon completion of the design of the treatment plant, these emission requirements and control technologies should be defined by the design engineer.

If a performance specification is prepared, the emissions, dust sources, and contaminants of concern should meet specified requirements based on applicable regulations. Section 01 57 19 should list the emissions criteria for the contaminants of concern for each emission and dust source, and if applicable, monitoring requirements should be specified. The applicable federal, state, and local regulations should also be identified. If the specification is prepared based on detailed design,

the technologies or apparatus for controlling the emissions and dust sources should also be specified.

****

Provide and operate a soil washing treatment system which meets the emissions and dust control requirements in [Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____].

1.4.2.6 Noise Control

****

NOTE: Specifications for noise controls should be covered in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. The remaining text in this note discusses soil washing technology-specific emission and noise control considerations to incorporate into Section 01 57 19. Based on the geographical location of the site, and the land uses and environment surrounding the site, the site-specific noise level requirements for the day and night operations and monitoring requirements can be identified from the state and local regulations and/or developed by interacting with the state and local agencies. These requirements should be specified in this paragraph.

****

Provide and operate a soil washing treatment system which meets the noise control requirements in [Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS] [_____].

1.5 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required

as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Pre-Installation Meeting Agenda

Pre-Installation Meeting Minutes; G, [_____]

Bench-Scale Treatability Study Work Plan; G, [_____]

Reagent Certificates of Analyses

Qualifications; G, [_____]

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

****

NOTE: The appropriate regulatory agencies should be consulted to obtain their approval of work plans, specifications, drawings, and on the sampling methodology for a soil washing treatment project.

Additional references from federal, state, and local regulatory requirements; utility company regulations; and applicable codes and standards published by scientific and engineering institutions should be included where appropriate in the body of the specification. Some of the potentially applicable Federal regulations are listed as follows:

TCLP

Permitting

National Primary and Secondary Ambient Air Quality Standards

National Emission Standards for Hazardous Air Quality Pollutants

State and Local Air Quality Standards

National Pollution Discharge Elimination System (NPDES) Discharge Limitations and Permit Procedures

Hazardous Waste Identification and Standards Applicable to Generators, Transporters, and Owners and Operators of Treatment, Storage and Disposal Facilities (TSDF)

Land Disposal Restrictions (LDRs)

Department of Transportation Hazardous Materials Program Procedures

Hazardous Materials Transportation Regulations

Land Disposal of Low-Level Radioactive Waste

Packaging and Transportation of Radioactive Materials

For sites addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, delete this section.

****

Obtain the permits, permit equivalents and certifications; and meet the substantive regulatory requirements necessary for the installation, operation, and closure of the project.[Correspondence from regulatory agencies, and other relevant information, is attached to the specifications to indicate the level of effort necessary to obtain finalized permits, permit equivalents, certifications and to meet substantive regulatory requirements.]

1.6.2 Qualifications

****

NOTE: Requirements for the Contractor's experience should be determined and specified based on the experience, availability, and advancement of the soil washing technology industry and the site-specific requirements. If soil washing is being used for unique contaminants, consider specifically identifying contractor soil washing experience requirement for those contaminants in the optional bracket at the end of the paragraph CONTRACTOR EXPERIENCE.

****

1.6.2.1 Contractor Experience

Demonstrate a minimum of [three][_____] years of experience in the field of soil washing or the successful completion of [at least [one][_____] soil washing project of comparable size and scope][at least [three][_____] soil washing pilot scale treatability studies, demonstration studies, [and][or] full scale remediation projects that required handling and transportation of soils contaminated with [RCRA hazardous wastes][CERCLA hazardous substances][_____]].

1.6.2.2 Key Personnel

Provide key personnel with a minimum of [three][_____] years of soil washing field experience. Include soil washing unit operators, quality control personnel, supervisory engineering, and technical staff involved with the soil washing unit operation in key personnel. Submit a list of these personal with their qualifications.

1.6.2.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory meeting the requirements of[Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.7 DELIVERY, STORAGE, AND HANDLING

Safely transport, store, and handle equipment and raw materials (including extraction [solvents][reagents]). Package and ship these items in compliance with United States Department of Transportation (USDOT) requirements. Ensure that extraction [solvents][reagents] are shipped in properly labeled containers with instructions for handling and storage. Store and handle these items onsite in accordance with the manufacturer's recommendations and in compliance with applicable regulatory requirements. Store sufficient quantities of the required extraction [reagents][additives] in the plant area to support the operation of the treatment plant. Do not exceed the extraction [solvent][reagent] holding times.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Environmental Requirements

****

NOTE: When temperature is below the freezing point, the treatment plant equipment may not function properly or efficiently. Frozen soils can make excavation, conveying, screening, and blending operations difficult and less cost-effective. The general practice is to avoid the operation of an outdoor treatment plant during extreme winter weather. In places where there is a long winter season or in projects where the plant operation is required throughout the year to meet the project schedule, it may be necessary to perform soil washing inside a temporary building with proper heating and ventilation.

Two options are provided. The first option is more restrictive and does not allow the Contractor to operate in adverse environmental conditions. The second option requires that the Contractor develops plans to mitigate adverse environmental conditions.

****

[Do not implement soil washing during winter [conditions][temperatures] (e.g., ambient temperature below [0][_____] degrees C [32][_____] degrees F.][It is not recommended to implement soil washing during winter [conditions][temperatures] (e.g., ambient temperature below [0][_____] degrees C [32][_____] degrees F due to the mechanical and logistical issues associated with the required equipment and soil handling requirements, which includes use and treatment of water. If there is a need to operate during winter conditions, include in the Soil Washing Work Plan an appropriate structure [and][or] heat tracing and other appropriate operating procedures to minimize downtime due to freezing.][It is also not recommended to perform soil washing during periods of heavy rainfall if this will interfere with the effective operation of the treatment plant, because of adverse impacts to soil handling or particle size separation operations.] Do not perform operations during inadequate daylight or at night unless sufficient lighting is available for treatment plant operation.[Section 26 56 00 EXTERIOR LIGHTING for illumination.]

1.8.2 Existing Conditions

****

NOTE: The pertinent site characterization data should be placed in the appendix of the specifications or on the drawings and referenced here. If the contaminated soils to be treated contain a significant amount of feed oversize (aka debris), the available information about its extent and characterization should also be provided. Indicate the detail to which site characterization has been performed and indicate where obvious data gaps exist. The information should also include construction limits, property utilities, chemical data, geotechnical data, sampling locations, and boring logs. The locations and details (such as

utility point of contact, sizes, capacities, and flows) of the utility hookups should also be provided for the Contractor's use.

Indicate if there are multiple dissimilar types of contaminated materials that will require different soil washing operations. Materials may be considered dissimilar based on possessing different soil properties, types of contaminants, or relative concentrations of contaminants. Determination of dissimilar materials may be based on site investigations and/or previously completed treatability studies.

****

Available information that describe existing site conditions are presented [in Appendix [_____]][and][on the Drawings]. This includes[physical configuration][utilities][topography][land uses][geotechnical characteristics of the contaminated soils (including[grain size analysis][total organic content][cation exchange capacity][pH][moisture content][density][porosity])[hydrogeology][and][nature and extent of contamination][_____]]. The existing conditions presented are the result of site investigations at specific locations; variations in the existing site conditions could occur. Perform an independent interpretation of the site characterization data. Notify the Contracting Officer within [48 hours][_____] if discrepancies between the data provided and actual field conditions are discovered. The Contractor must communicate any additional data needs to complete the soil washing design to the Contracting Officer.

[1.8.3 Results of Previously Conducted Treatability Studies

****

NOTE: This paragraph should be deleted if no previous treatability studies have been conducted.

In some instances, the Government will have conducted treatability studies prior to advertisement for bids. Results of these treatability studies are generally provided to bidders and included in the contract documents. In most instances, the Contractor will perform the bench-scale treatability studies to support its full-scale design (i.e., soil washing contractors typically perform turnkey design/construction, and operation and maintenance services as the subject matter expert for this technology).

The unit processes/operations employed in the previous treatability studies (bench and/or pilot scale) may not be the same as those proposed by the Contractor. Documentation of the previous treatability studies should provide prospective Contractors with sufficient information to prepare a detailed proposal and should include the testing soils, procedures and conditions, sampling and analytical methods, evaluation, and results.

****

The previously conducted treatability study documents in Appendix [_____] are for information purposes only. The results indicate that soil washing is capable of meeting the post treatment criteria identified in this Section. Nevertheless, perform an independent evaluation of these studies and results. If deemed necessary, perform additional bench-scale treatability studies [at the Contractor's own expense] to confirm the previously conducted treatability studies and results. Based on the Contractor's own interpretation of the previous studies and results [and the Contractor's own studies and results], provide a full-scale treatment plant which meets the requirements identified in this Section.

]PART 2   PRODUCTS

2.1   MATERIALS AND EQUIPMENT

2.1.1   Water Supply

****

NOTE: Two options are provided. The first option is to only allow the Contractor to use potable water. The second option allows the Contractor to use non-potable water, but includes a testing requirement to limit the chance that the Contractor supplies a water that could introduce contaminants into the treated materials. The first option is simpler, but could lead to higher project costs if the volume of water needed is significant and/or potable water sources are not readily available. When specifying the chemical contaminant criterion to be met for water, the Designer should consider if there are other standards which are more appropriate for the specific project (e.g. state groundwater cleanup criteria).

****

Supply water used to facilitate soil washing.[Use only potable water from a regulated public water system.][If non-potable water is to be used, provide water that does not contain oils, acids, salts, alkalis, organic matter, solids or other substances at concentrations that could be detrimental to the successful treatment of the contaminated materials. Also characterize non-potable water prior to its use by collecting a sample from the water source and analyzing according to the following table. Submit a Water Supply Analysis demonstrating that water meets requirements.

TABLE 5 - TREATMENT WATER CRITERIA

Chemical Contaminants

ANALYTICAL METHOD NUMBER From EPA SW-846	ANALYSIS TYPE	CRITERION TO BE MET

TABLE 5 - TREATMENT WATER CRITERIA		
Chemical Contaminants		
6010 [and 7470A]	Metals [and Mercury]	[Less than Maximum Contaminant Level (MCL)] [_____]
8260	Volatile Organics	
8270	Semi-volatile Organics	
8082	PCBs	
1633	PFAS	
8081	Pesticides	
Within each Analytical Method, only analyze for analytes which have a [MCL] [_____].		

]

2.1.2 Extraction Solvent/Reagent Certificates of Analyses

The treatment plant may use [reagents][additives] for formulation of washwater, treatment of spent washwater, control of air emissions, and treatment of solid wastes. The residuals of these [reagents][additives] in the treated soils or the solid, liquid and gaseous wastes from the treatment plant must not cause secondary contamination to the environment. The parameters for each [reagent][additive] to be provided must include, but are not limited to, chemical formula, [grade][purity], form, strength, and typical supplier. Provide a Reagent Certificates of Analysis with each shipping unit of reagent. A confidentiality agreement may be requested if proprietary extraction [solvents][reagents] are being used.

[2.1.3 Samples For Bench-Scale Treatability Studies

****

NOTE: This paragraph should be included if treatability studies are to be performed by the Contractor. Action level criteria should be specified for the purpose of collecting representative samples for treatability studies. Table 6 should be developed based on site-specific contaminants of concern and their corresponding action levels. Since the action level criteria are also applicable to excavation, coordination between this section and the section dealing with excavation and stockpiling should be made with respect to these criteria.

To reduce the overall risk to the government, it is strongly advised that the project team should require the Contractor to collect samples for the bench-scale test unless the nature of the site is preventing the Contractor to do so. Depending on site conditions and project needs (e.g. site security, access issue, etc.), the government may provide samples to the Contractor to conduct bench-scale tests.

****

[The Contracting Officer will provide the required samples to conduct the bench-scale treatability study.][Select sampling locations and collect representative samples to conduct the bench-scale treatability study. The soil sampling protocol, locations, volume, and analytes will be included in the Bench-Scale Treatability Study Work Plan. Consider the existing site conditions presented in paragraph EXISTING CONDITIONS when selecting sampling locations. Multiple samples may need to be collected to obtain optimal information regarding the soil washing efficacy over a range of site lithology mix and contaminant concentrations that may be processed.[Conduct sample collection activity in the presence of Contracting Officer.]] The collected treatability study samples for bench-scale treatability study testing must have contaminant concentrations representative of[the average contaminant concentrations and site lithology mix,][greater than the action level criteria presented in Table 6,][projected worst-case contaminant concentrations that may be processed from different areas,][and][different mixes of fine- and coarse-grained lithology mixes that may be processed from different areas]. Otherwise, repeat sampling until the above criteria are successfully met. Test samples of contaminated soils intended to be used in the bench-scale treatability studies in accordance with procedures in paragraph CONTAMINATED SOILS TREATMENT TESTING. Do not commence treatability studies until contaminated soil sample results meet the aforementioned concentration and soil lithology mix criteria and approved by the Government.

TABLE 6 - ACTION LEVEL CRITERIA

PARAMETER	ACTION LEVEL CRITERIA
[_____]	[_____] mg/kg

]PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Pre-Installation Equipment Examination

Conduct a pre-installation examination of the treatment plant equipment versus specifications, as well as for any damage, defect, and dilapidation. Document the results of the pre-installation examination and submit to the Contracting Officer for review and documentation. Upon completion of the treatment plant installation, perform a pre-operational test of the equipment and controls under operating conditions using clean water to check for leaks, continuity, and functionality of operating controls and shutdown alarms. The Contracting Officer may conduct an independent examination to ascertain the condition and functionality of the equipment. Based on this examination, the Contracting Officer has the right to reject the entire system or any damaged, defective or dilapidated equipment. The cost associated with equipment or control replacement or repair, and delays caused by the rejection must be borne by the Contractor. Routinely and properly inspect and maintain the equipment to provide the operation of the treatment plant as required by the Contract schedule. Schedule delays and costs due to lack of inspections and maintenance, power failure, line plugging, improper functioning of equipment and controls, unavailability of labor and materials, etc. are the responsibility of the Contractor. Provide [alternate][auxiliary] power source if sufficiently reliable sources are not available.

3.1.2 Infrastructure Conditions

Conduct a pre-installation examination of the on-site infrastructure, utility conduits, monitoring points, and site access constraints. Photographically document, with identifying labels, the existing condition of infrastructure and utilities, particularly for comparison to post-operation conditions. Verify locations of critical utilities that cannot be disrupted and those utilities that would potentially have significant impacts on operations and public safety. Submit a Pre-Installation Examination Report documenting the examination activity. Obtain all necessary utility clearances before initiation of subsurface work.

[3.1.3 Bench-Scale Treatability Study

****

NOTE: If a Treatability Study has previously been performed or is otherwise not needed, delete this paragraph. To reduce the chances of using soil samples that are not representative of site conditions, a minimum volume of 4 liters 1 gallon is recommended for each condition to be tested in the treatability study.

****

Perform at least [three][_____] replicate tests simultaneously for each proposed operating condition. Homogenize and divide the contaminated soil into replicate volumes prior to initiating testing in accordance with the Bench-Scale Treatability Study Work Plan requirements. Do not use less than less than [four][_____] liters [one][_____] gallons of contaminated soil in each replicate. Test samples of treated soils in accordance with procedures in paragraph CONTAMINATED SOIL TREATMENT TESTING.

]3.2 PREPARATION

3.2.1 Mobilization

****

NOTE: Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES includes requirements for decontaminating equipment that has been used in contaminated zones. That section should be modified to extend decontamination/cleaning requirements to equipment being brought on-site to cover the requirements of this paragraph.

****

Follow the approved mobilization and demobilization plans submitted as part of the Soil Washing Work Plan. Do not mobilize the treatment plant to the site until the [Soil Washing Work Plan][UFP-QAPP] has been approved by the Contracting Officer and the Contractor has received written confirmation. Delays caused by the Contractor's failure to meet regulatory requirements must result in no additional cost to the Government. In accordance with [Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____], the equipment which is rented [and][or] previously used for other site remediation must be decontaminated and tested for contaminants of concern before being brought to the site.

3.2.2 Clearing and Grubbing

****

NOTE: If Section 31 11 00 CLEARING AND GRUBBING is not included in the projects specifications, include clearing and grubbing requirements here. Clearing and grubbing requirements should specify limits of work, methods of cutting pavement, how salvageable items such as fencing will be managed, and how waste materials generated from clearing and grubbing will be disposed, particularly if activities occur within areas of contamination.

****

Perform clearing and grubbing in accordance with Section 31 11 00 CLEARING AND GRUBBING.

3.2.3 Foundations

****

NOTE: Minimum requirements should be specified in the Soil Washing Work Plan for the foundation/containment area of the treatment plant. An option is provided at the end of the paragraph to require installing a liner and berm in the location where the soil washing treatment plant will be constructed; this option addresses cross-contamination risk if the treatment plant is located on non-contaminated ground.

****

Construct equipment foundations in accordance with the approved Soil Washing Work Plan. Grade the area around the soil washing treatment plant so that the water drains away from the work area adjacent to the treatment area.[Construct a liner and berm surrounding the soil washing treatment plant. Construct the liner and berm [in accordance with the stockpile liner and berm requirements in Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL.][_____]].

3.2.4 Stockpiles of Contaminated Soils

****

NOTE: Sufficient area should be prepared for stockpiling untreated and treated contaminated soil based on consideration of equipment production rates, allowable stockpile sizes, and overall project schedule. If Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS is not included in project specifications, copy stockpiling information from paragraphs EXCAVATION WORK PLAN, GEOMEMBRANE, CONTAMINATED MATERIAL STORAGE, and SAMPLING BENEATH STORAGE UNITS into this section.

Background sampling under the stockpiles of contaminated soils should be performed before their construction, unless previous information is adequate. Coordinate with Section 02 61 13

EXCAVATION AND HANDLING OF CONTAMINATED SOIL.
****

Prepare areas that will be used to stockpile untreated and treated contaminated materials in accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL. Provide sufficient area to stockpile [_____][metric tons][tons] of untreated contaminated material and [six][_____] stockpiles of [500][_____][metric tons][tons] of treated contaminated material.

3.3 ERECTION, INSTALLATION, AND DEMOBILIZATION

****
NOTE: Referenced UFGS should be edited to include only the minimum requirements applicable to a temporary installation.
****

Erect and install the treatment plant in accordance with applicable action-specific and location-specific federal, state, and local regulations. If the technical specifications overlook [and][or] conflict with the applicable codes, standards, [and][or] regulations, inform and consult with the Contracting Officer for interpretation. Erect and install the treatment plant on a temporary basis so that it can be readily removed from the site after completion of the contract work. Perform the erection and installation such that there is minimal damage to the existing site environment.

Complete the mechanical work in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION. Complete the electrical work in accordance with[Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION][Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION][_____],[and][Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM]. Complete the plumbing work in accordance with[Section 22 00 00 PLUMBING, GENERAL PURPOSE][Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING][_____].[Refer to Section 46 07 13.13 PRECIPITATION, COAGULATION, AND FLOCCULATION for respective treatment requirements related to the removal of suspended solids as part of the washwater treatment; as well as Section 46 61 00 FILTRATION for respective requirements for the removal of colloidal suspended particulates as part of the washwater treatment.]

3.4 FIELD DEMONSTRATION

****
NOTE: The need for a formal Field Demonstration should be discussed with the Contracting Officer and would be a function of the uncertainty of the materials to be treated. For well-defined contaminants and soil compositions that are known to be amenable to soil washing, data obtained from the bench-scale treatability study or full-scale system startup should be adequate to negate the need for a formal Field Demonstration, and a written waiver will then be issued by the Contracting Officer. If the amenability of the contaminants/soil composition is not known to be amenable to soil washing, then a formal Field Demonstration in accordance with the following requirements will need to be performed. If a formal "Field Demonstration" is not required,

sufficient startup testing should be done to validate performance prior to ramping up to full-scale operation.

If processing of contamianted material must stop pending field demonstration results, the contract should contain provisions for issuing a second notice (or third notice in project where treatability studies are performed) to proceed by Contracting Officer upon approval of the field demonstration.

This paragraph is prepared based on a continuous operation of the treatment plant. If the treatment plant is operated as a batch process, the requirements on the minimum operation time and the sample frequency should be modified accordingly.
****

Prior to full scale soil washing operations, perform a field demonstration at the full scale throughput capacity to verify the performance of the treatment plant. Perform preliminary tests and system checkout prior to the field demonstration in order to minimize problems during the field demonstration. Conduct each field demonstration run for a minimum period of [eight][_____] hours per day for at least [two][_____] days. Perform field demonstration run on each dissimilar type of soil or contaminant which requires a substantial change in treatment plant operating conditions.

3.4.1   Full Scale Processing Equipment

Use the full scale treatment plant and operating conditions proposed for use during full scale soil washing.

3.4.2   Contaminated Soil Sourcing

****
NOTE: Prior to implementing the field demonstration, chemical testing should generally be performed to verify that the soils to be used for the test run contain the contaminants of concern at high enough concentrations to adequately test the system. Additional testing may be warranted to verify that the physical properties of the soils are also representative of site conditions. If paragraph SAMPLES FOR BENCH-SCALE TREATABILITY STUDIES is deleted, copy the range of contaminant concentrations and soil lithology requirements into this paragraph.
****

Obtain contaminated soils used for the field demonstration from [the location specified by the Contracting Officer][_____]. Prior to performing the field demonstration, test, [one][_____] initial composite sample(s) of contaminated for chemical analysis per each demonstration run. The contaminated soil samples must be representative of the range of contaminant concentrations and soil lithology mixes as described in paragraph SAMPLES FOR BENCH-SCALE TREATABILITY STUDIES. Otherwise, repeat sampling until the contaminant concentration levels exceed the action level criteria or upon approval by the Contracting Officer. Test samples of contaminated soils intended to be used in the field demonstration in accordance with procedures in paragraph CONTAMINATED SOIL TREATMENT TESTING. Do not commence the field demonstration until soil samples meet the aforementioned concentration criteria.

3.4.3 Treated Soil Testing

During the demonstration run, collect confirmation samples of the treated soils in accordance with the UFP-QAPP. Examples of confirmation sampling of the treated soils include [composites samples][_____] every [two][_____] hours from the feed soils, [feed oversize][_____], spent washwater, effluent from treatment of spent washwater, treated soils, process sludge, and the other locations necessary to perform mass balance calculations and to verify that the treated soils from the soil washing operation meets the post-treatment criteria listed in paragraph PERFORMANCE REQUIREMENTS. Perform testing of the contaminated and the treated soils before and after demonstration test runs in accordance with the same testing protocol as proposed for the full-scale operation described in the UFP-QAPP and paragraph CONTAMINATED SOIL TREATMENT TESTING. If the treated soils produced during the field demonstration do not meet the post-treatment criteria, process an equal quantity of the same type of soils until satisfactory results are attained using properly modified operating conditions [and][or] incorporation of extraction [solvents][reagents] that have been proven effective as part of the treatability testing. Return the treated soils that failed the demonstration testing to the contaminated soils stockpile for re-processing during full-scale treatment.

3.4.4 Field Demonstration Test Results

****

NOTE: Two options are provided for the next step after the field demonstration. The first option (halting processing contaminated soils until results from the field demonstration testing indicate the Contractor's proposed operating conditions can successfully treat the contaminated soils) would generally only be appropriate if the soil washing treatment process has yet to be demonstrated on a large scale for the specific contaminants and soil composition.

****

After completion of the field demonstration, [do not process additional contaminated soil until written approval has been received from the Contracting Officer, and the following submittals have been approved: [Field Demonstration Report][_____]. Allow [10][_____] working days in the schedule for Government review and approval of the Field Demonstration Report.][contaminated soils may continue to be processed. However, if test results indicate that treated soils do not meet the post treatment criteria listed in paragraph PERFORMANCE REQUIREMENTS, the contaminated soils treated with the failed operating conditions must be reprocessed at no additional cost to the Government.]

3.5 OPERATION

3.5.1 Dissimilar Soils

****

NOTE: Delete the bracketed text item if dissimilar

materials are not known to be present at time of preparing project specifications.

****

Do not mix together dissimilar soils if the bench-scale treatability study [and][or] field demonstration testing results indicate that different operating conditions of the treatment plant have to be implemented to achieve effective treatment of these soils. Materials known to be dissimilar at the site are defined in [paragraph EXISTING CONDITIONS] [_____].

[3.5.2 Feed Soil Stockpiles

****

NOTE: Delete this paragraph if feed soils will already be placed in stockpiles prior to performing the soil washing operation.

****

Limit feed soil stockpiles to the number and sizes of soil stockpiles defined in the Soil Handling Plan prepared as part of the Soil Washing Work Plan.

]3.5.3 Feed Oversize

Pre-screening operations should include a combination of removing oversize materials, clayey soil clumps too large to be processed, and debris (e.g., rocks, man-made debris). At the discretion of the Contractor if it will not interfere with the soil washing operation (i.e., clay content too dominant), reduce the size of any clayey soil clumps to less than [2.5 cm 1 inch][the maximum allowable particle size of the soil washing process][_____]. Also reduce any oversize contaminated soils which can be reduced to an allowable size for the soil washing process. Remove oversize soil that cannot be reduced to an allowable size for the soil washing process.[Decontaminate oversize materials in accordance with the procedure developed in the Soil Washing Work Plan]. Dispose of oversize materials off-site in accordance with [Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS][_____].

3.5.4 Material Management

****

NOTE: During the design, the design engineer should interact with the regulatory agencies to determine the requirements pertaining to the type of storage facility, accumulation time, and permitting for feed oversize, feed soils, treated soils, and process sludge for incorporation into the related subparagraphs.

****

Handle soils, washwater, solid wastes, and dust generated during stockpile management as specified in paragraph SYSTEM DESCRIPTION. Manage the soil stockpiles so no contaminants or fine particles are released into the environment. Control stormwater run on and run off water from contacting the soil stockpile areas. Collect and treat the stormwater runoff and any collected leachate soil from the stockpile areas for discharge/disposal or use for make-up water in the treatment plant.

3.5.4.1 Treated Soils

Handle treated soils per protocol described in the Soil Handling Plan included as part of the Soil Washing Work Plan. Stage treated soils segregated by cut size (i.e., defined finer versus coarser grained soils separated during the soil washing process as discussed in paragraph CUT SIZE REQUIREMENT) into units (stockpiles) for post-treatment testing. Stockpile sizes greater than the soil confirmation sampling decision unit as defined in the UFP-QAPP are prohibited. Manage the treated soils such that specific [batches][runs] can be defined and stored following post-treatment testing either as; clean backfill for on-site redisposition that meets the post-treatment criteria; off-site disposal of finer grained soils that exceed the post-treatment criteria; or coarser grained soils for re-processing that exceeds the post-treatment criteria. The post-treatment criteria are defined in paragraph PERFORMANCE REQUIREMENTS. Conduct backfilling in accordance with Section 31 00 00 EARTHWORK.

3.5.4.2 Treated Soils Above Post-Treatment Criteria

Treated soils that do not meet the post-treatment criteria in paragraph PERFORMANCE REQUIREMENTS must be handled in accordance with direction from the Contract Officer, which could include the re-processing of coarser grained soils if the [treatability][field] demonstration studies determine that the post-treatment criteria should be met; or the segregation of finer grained soils for off-site disposal[or coarser grained soils if the Contract Officer determines that further re-processing will not be cost effective or would not likely meet the treatment criteria based on, e.g. contaminant concentrations and total fines content]. Dispose of treated soils above post-treatment criteria approved by the Contracting Officer in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS.

3.5.4.3 Treatment Plant Washwater

Recycle [and][or] reuse the washwater generated by the unit operations of the soil washing treatment plant to the maximum extent for plant operations in order to minimize the need for new makeup water and limit the treatment, discharge, [and][or] offsite disposal of washwater. Treated washwater discharged to a regulatory approved receptor, or sent to an offsite treatment facility, must comply with the requirements identified in paragraph SPENT WASHWATER TREATMENT AND DISPOSAL REQUIREMENTS.

3.5.4.4 Stockpile Leachate

****

NOTE: Leachate may not need treatment. If treatment is needed, it can be treated and disposed of at an offsite facility or treated along with the spent washwater for reuse, discharge, and/or offsite disposal. If the leachate is classified as derived waste from a listed hazardous waste, it should be contained and then characterized.

Coordinate this paragraph with requirements in paragraph SPENT WASHWATER TREATMENT AND DISPOSAL REQUIREMENTS. Typically, water will be treated on a batch basis. If a continuous discharge is anticipated, modify the paragraph accordingly and include sample type and frequency.

****

Characterize the leachate collected from the stockpiles to determine the need for treatment prior to reuse in the soil washing process. Do not discharge the leachate to the environment, or transport it offsite for disposal prior to analyzing for and meeting the discharge requirements in paragraph SPENT WASHWATER TREATMENT AND DISPOSAL REQUIREMENTS. The vessel, impoundment, [_____], storing the leachate must be tested prior to emptying that storage facility. No leachate must be added to a storage facility after a sampling event until the unit is emptied.

3.5.5 Change of Operating Conditions

****

NOTE: If adjustment to the mix design is required due to change in feed material characteristics, then the Contractor's adjusted mix design should be evaluated by the Contracting Officer for the extent of changes from the previous mix design. Further, price negotiation may be required based on the extent of changes from the previous mix design.

****

The following two requirements must be met in order to be considered for change of operating conditions: (1) the physical and chemical characteristics of the contaminated soils are significantly different from the originally defined characteristics, and (2) the treatment requirements cannot be met under the current treatment plant design and related operating conditions. When change of operating condition is necessary, notify the Contracting Officer before changes are made to the design and related operating conditions. The Contracting Officer may require the Contractor to perform a field demonstration for significant changes made to the design and related operating conditions in accordance with paragraph FIELD DEMONSTRATION, for approval. If adjustment to the design is required due to change in feed soils characteristics, submit an adjusted design for the extent of changes from the previous design for approval. Further, price negotiation may be required based on the extent of changes from the previous mix design.

3.6 FIELD QUALITY CONTROL

3.6.1 Tests

****

NOTE: The amount of post treatment testing performed should be minimized. It is preferable to maintain quality control of the treatment plant by verifying the designed operating conditions during the field demonstration and by monitoring and controlling the operating parameters to achieve the designed performance.

****

The post treatment testing specified in this paragraph is needed by the Government to generate documentation that the soil washing treatment has been accomplished in accordance with performance requirements approved by applicable authorities. The results of these tests may be used as part of the Contractor's QC program; however it is the contractor's sole responsibility to meet the performance requirements specified in this

Section. Therefore, it is expected that the Contractor will perform additional testing and measurements to assure that treated soils meet requirements without rejection of batches, retesting, [and][or] reprocessing

3.6.1.1 Contaminated Soil Treatment Testing

****

NOTE: The values shown in Table 7 for frequency of testing are only examples and need to be determined on a site specific basis. It may be acceptable to change the number of samples during development of a UFP-QAPP, but the Designer should attempt to establish a reasonable sampling frequency in the specifications to provide a basis for the Contractor to bid the project.

Time limits for sample shipment, analysis, and reporting of results should be selected based on the analytical costs and the management of stockpiles. The shorter the turnaround time requested, the higher the analytical cost will be. In addition, there are time limits on how fast the requested analyses can be completed. Coordinate with the regulators regarding the maximum quantity of soil volume per composite sample. This will define the size of each stockpile, and the time required to reach this quantity.

The feed oversize is generally handled by either onsite decontamination for backfilling or offsite disposal. The disposal of spent process treatment materials such as activated carbon is generally negotiated as part of the suppliers contract and may not require post treatment testing. Therefore, only treated soils and the process sludge are addressed in this paragraph. Offsite transportation and disposal of feed oversize, spent process treatment materials, and process sludge require manifesting and record keeping for each shipment.

****

Collect samples for post-treatment testing in accordance with the [UFP-QAPP][basewide QAPP][_____] and this paragraph. Analyze the samples for the parameters specified in the [UFP-QAPP][basewide QAPP][waste disposal][applicable permit or substantive requirements]. Collect samples for testing at a minimum frequency [provided in Table 7][_____]. Complete all other sampling and analysis activities in accordance with the [UFP-QAPP][basewide QAPP][_____] (including but not limited to sample handling, preservation, transportation, [collection][analysis] of quality control samples, data validation, and data reporting). Any deviations to sampling frequency, number of samples, or sample collection methods must be established in the approved [UFP-QAPP][basewide QAPP][approved by the Contracting Officer].

TABLE 7 - SOIL WASHING OPERATION TESTING FREQUENCIES	
SOIL STREAM	TESTING FREQUENCY Metric Tons Tons
Contaminated Feed Soil	1 per [100][_____]
Treated Soil	1 per [100][_____]
Process Sludge	1 per [100][_____]
Feed Oversize Material	1 per [100][_____]
Treated Washwater	1 per [_____] liters gallons

3.6.1.2 Reprocessing and Retesting

****

NOTE: An option is provided for retesting soils which fail to meet performance requirements. Retesting without first reprocessing treated soils should generally not be allowed unless there is reason to believe the original test result was inaccurate due to mislabeling/mishandling of the sample or analytical error discovered during validation of laboratory results (simply believing that a grab sample did not reflect the treatment is not sufficient to consider a result inaccurate). Retesting should also generally not be allowed if samples are being used for waste characterization and disposal. This is because waste characterization and disposal is based on grab or composite sampling results, and averaging of sampling results cannot be used to determine that a waste meets regulatory disposal requirements.

****

Reprocess and then retest any unit of treated soils that does not meet the post-treatment criteria in paragraph PERFORMANCE REQUIREMENTS [or quality assurance] testing.[The Contractor my propose to retest any failing unit of treated soils prior to reprocessing. If the Contracting Officer approves retesting, collect and test two additional samples for the failed parameter(s). If both tests pass, re-processing of the soils will not be required. If either sample fails, a coarser-grained soils unit should re-processed while a finer-grained soil unit should be staged for off-site disposal. The Contracting Officer should be consulted regarding the final disposition of any soils unit that does not meet the post-treatment criteria.]

3.6.1.3 Government Quality Assurance Testing

****

NOTE: Consider the need for quality assurance testing on a project-by-project basis. If QA

testing is unnecessary, delete this Paragarph. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. Use of quality assurance testing data use also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project Performance Requirements, and failing result would be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for identifying and correcting meaningful differences should be documented in a project-specific Quality Assurance Project Plan and referenced in this specification; the process is likely to complex to be adequately defined in this specification.

****

Provide duplicate samples to the Government's quality assurance laboratory for Government quality assurance. Submit samples at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. Provide additional quality assurance samples upon request.

3.6.2 Inspections

3.6.2.1 Operations Reports

Submit operations reports [daily][weekly] for the first [10][_____] weeks, and at a frequency of [_____] thereafter. The operations reports must consist of a log of operating conditions including, but not limited to: hours of operation; staffing; weather conditions; noise, dust, and emissions monitoring data; process soils tracking schedule; sample shipment; receipt of analytical results; changes in operating parameters; results of the testing and calibration activities; and inspection and maintenance activities. In addition, attach the physical and chemical test results generated on-site or received from offsite laboratories to the report.

3.6.2.2 Government Inspection

The Government may conduct inspection of the system installation and perform periodic inspections during the plant operation to verify that the project activities are performed in accordance with the approved plans, specifications, and the regulatory requirements. Address and resolve inspection findings immediately to the Government's satisfaction.

3.7 DEMOBILIZATION

****

NOTE: If there is a separate specification section which provides overall requirements for demobilization/site cleanup, such as 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS, move the requirements from this paragraph into that section.

****

Demobilize to restore the site to its initial state, prior to the construction and operation of the soil washing treatment facilities. Do not commence demobilization until written approval is received from the Contracting Officer. Demobilization must begin only after the contaminated soils, spent washwater, and solid wastes have been treated and disposed of in accordance with paragraph MATERIAL MANAGEMENT. Follow the approved mobilization and demobilization plan prepared as part of the Soil Washing Work Plan. Demobilization must include, but must not be limited to: [disconnecting of utility service lines,][decontamination and removal of equipment and materials,][disposal of decontamination wastes,][disposal of any residual washwater,][removal of unused amendments and other materials,][removal of soil overlying liners,][removal of liners,][regrading and removal of berms,][demolition and disposal of the treatment pad, other foundation slabs, and paved surfaces,][_____].[Perform post-treatment testing of soils below stockpile storage units and work area surfaces in accordance with Section 02 61 13 EXCAVATION AND HANDLING OF CONTAMINATED MATERIALS.]

SECTION 02 56 13.13

GEOMEMBRANE WASTE CONTAINMENT
02/25

****

NOTE: This guide specification covers the requirements for geomembrane barrier for waste containment applications.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This section is intended for geomembrane applications in waste containment applications only. Other UFGS sections should be used for geomembrane applications in other situations. Refer to Section 33 56 19 FUEL IMPERMEABLE LINER SYSTEM (and Standard Design AW 78-24-27). Refer to Section 33 47 13 POND AND RESERVOIR LINERS.

This specification section is referenced in several other UFGS sections as a requirement for lining stockpiles of contaminated and treated materials. For those applications, Designers should consider reducing the overall scope of requirements in this specification section. Some of the requirements in

this specification section may be overly conservative for applications where a geomembrane is used for a short period of time (months to years) and then the contaminated materials and geomembrane are ultimately removed from the site. In those applications, the integrity of the geomembrane may not be as critical compared to using a geomembrane for indefinite storage of contaminated materials in a landfill, for example. Requirements which could be reduced in this specification section include qualifications of the manufacturer/installer and frequency of quality assurance/quality control testing.

This guide specification includes multiple different types of geomembrane materials that may be used depending on the specific application. The Designer must select the appropriate geomembrane material for the specific application; this guide specification is not intended as design recommendation or to endorse specific geomembrane materials. High density polyethylene (HDPE) is the geomembrane material that is almost always used in long-term waste containment applications (i.e. landfill liner and cover systems). Other geomembrane materials which have been used in certain waste containment applications include linear low density polyethylene (LLDPE), polyvinyl chloride (PVC), or polypropylene (PP). Some newer or less-commonly used materials include flexible polypropylene (fPP), ketone ethylene ester/ethylene interpolymer alloy (KEE/EIA), and urethane. These materials can be produced with both smooth and textured surfaces. The need for a textured versus a non-textured material will be based on containment system stability analyses (e.g. veneer stability). The drawings must clearly indicate the limits of placement for textured and non-textured geomembranes.

****

1.1 UNIT PRICES

****

NOTE: These paragraphs should be edited based on whether the contract will use a single job price or unit prices. If there is a separate Measurement and Payment section, edited versions of these paragraphs should be inserted in that section.

****

1.1.1 Measurement

Complete a survey to measure the total surface area in square meters square feet covered by geomembrane. Final quantities will be based on as-built conditions. Allowance will be made for geomembrane in anchor and drainage trenches; however, no allowance will be made for waste, overlap, repairs, or materials used for the convenience of the Contractor.

1.1.2 Payment

Geomembrane installed and accepted by the Contracting Officer will be paid for at the respective contract unit price in the bidding schedule. This unit price will include the costs of materials, equipment, installation, testing, and other costs associated with placement of the geomembrane.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 DEFINITIONS

****

NOTE: These definitions are adapted from Waste Containment Facilities, Guidance for Construction Quality Assurance and Construction Quality Control of Liner and Cover Systems, Daniel and Koerner, 2nd Edition.
****

a. Construction Quality Assurance (CQA): CQA includes inspections, audits, and evaluations of materials and workmanship to determine and document the quality of the constructed facility. CQA is performed by a party independent from the Contractor.

b. Construction Quality Control (CQC): A planned system of inspections that is used to directly monitor and control the quality of the geomembrane installation project. CQC is normally performed by the geomembrane installation contractor/subcontractor, and is necessary to achieve quality in the geomembrane system. CQC refers to measures taken by the installer or contractor to determine compliance with the requirements for materials and workmanship as stated in the plans and specifications for the project

c. Manufacturing Quality Control (MQC): A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of the geomembrane material and is necessary to ensure minimum (or maximum) specified values in the geomembrane. MQC refers to the measures taken by the manufacturer to determine compliance with the requirements for materials and workmanship as stated in certification documents and contract specifications

1.4 SUBMITTALS

****
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required

as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Layout And Detail Drawings; G, [_____]

As-Built Drawings; G, [_____]

Geomembrane Manufacturer's Installation Instructions

1.5 QUALITY CONTROL

1.5.1 Manufacturer's [and Fabricator's] Quality Control Manual

Submit the Manufacturer's Quality Control Manual[and Fabricator's Quality Control Manual] which describes testing procedures, frequency of testing and [acceptance][rejection] criteria for MQC[and Fabricator Quality Control] testing at least [14][_____] calendar days prior to delivery of the geomembrane.

1.5.2 Installer's Quality Control Manual

Submit the installer's quality control manual a minimum of [seven][_____] calendar days prior to geomembrane placement.

1.5.3 Qualifications

Submit manufacturer[and fabricator] qualification statements a minimum of [seven][_____] calendar days prior to geomembrane shipment. Also submit installer, CQC inspector, [MQC][CQC] laboratory, and Licensed Surveyor qualification statements including resumes of key personnel involved in the project a minimum of [seven][_____] calendar days prior to geomembrane placement.

1.5.3.1 Manufacturer

Manufacturer will have produced the proposed geomembrane sheets for at least five completed projects having a total minimum area of [930,000][_____] square meters [10][_____] million square feet.

1.5.3.2 Fabricator

****

NOTE: Fabricators produce geomembrane products that are combinations of individual manufactured components (e.g. seaming together smaller off-the-shelf geomembrane panels into larger panels). Fabricators are not used on every geomembrane project, so this paragraph can be deleted if a fabricator is not anticipated/allowed on the specific project.

****

TThe fabricator is responsible for [seaming geomembrane sheets into panels][_____]. Fabricator will have fabricated the proposed geomembrane panels for at least [five][_____] completed projects having a total minimum area of [186,000][_____] square meters [2][_____] million square feet.

1.5.3.3 Installer

****

NOTE: The International Association of Geosynthetic Installers (IAGI) provides a certification program for installer personnel engaged in seaming (referred to as welding by IAGI). An optional requirement for installer personnel to have IAGI certification is included; the designer should confirm that this requirement does not violate any contracting requirements.

****

The Installer is responsible for field handling, deploying, seaming, and anchoring of the geomembrane. The Installer will have installed the proposed geomembrane material for at least [five][_____] completed projects having a total minimum area of [186,000][_____] square meters [2] [_____] million square feet. At least one seamer, designated the Master Seamer, will have experience seaming a minimum of [93,000][_____] square meters [1][_____] million square feet of the proposed geomembrane using the same type of seaming equipment specified for this project.[Installer personnel conducting seaming operations will be Certified Welding Technicians by the International Association of Geosynthetic Installers.]

1.5.3.4 Licensed Surveyor

Perform all survey work under the supervision of a Surveyor licensed in the [applicable jurisdiction][State of [_____]].[Perform surveys in accordance with Section [_____].]

1.5.3.5 CQC Inspector

****

NOTE: A separate third party CQA contract should be considered based on the qualifications of the Government CQA personnel, the size and importance of the project, and impacts of a geomembrane failure. CQC inspectors are still considered necessary even if the Government provides independent third-party CQA inspection.

****

The CQC inspector is the person or corporation hired by the Contractor, who is responsible for monitoring and documenting activities related to the CQC of the geomembrane from manufacturing through installation. The CQC inspector will have provided CQC and/or CQA inspection during installation of the proposed geomembrane material for at least [five][_____] completed projects having a total minimum area of [186,000][_____] square meters [2][_____] million square feet.

1.5.3.6 [MQC][CQC] Laboratory

The [MQC][CQC] laboratory will have provided [MQC][CQC] or CQA testing of the proposed geomembrane and geomembrane seams for at least [five][_____] completed projects having a total minimum area of [186,000][_____] square meters [2][_____] million square feet. The [MQC][CQC] laboratory must be accredited by the [Geosynthetic Accreditation Institute's Laboratory Accreditation Program (GAI-LAP)][_____] for the tests the [MQC][CQC] laboratory will be required to perform.

1.5.4 Construction Quality Assurance

****

NOTE: Although independent CQA by the Government is strongly recommended, this paragraph should be deleted if CQA will not be performed and only CQC will be performed. If CQA is not performed, references to CQA throughout the specification should be deleted. Note that the specification section uses the term Contracting Officer as a blanket term that would include CQA personnel acting under the Contracting Officer. Activities specified for the CQA personnel acting under the Contracting Officer would also need to be removed.

Depending on the project, the Government may also elect to implement Manufacturing Quality Assurance (MQA) activities, which include manufacturing facility inspections, verifications, audits, and evaluation of the raw materials and finished products (Daniel and Koerner, 2007). MQA is done in addition to MQC. The Contractor does not have an active role in MQA, but must be aware if MQA will occur on a project.

****

All work must be constructed, monitored, and tested in accordance with the requirements of a CQA[and MQA] Plan. Be aware of all activities outlined in the CQA[and MQA] Plan and account for these activities in the construction schedule. If CQA inspections or testing indicate work which does not meet the requirements of the specifications, the Contracting Officer will establish the extent of the nonconforming area. Repair the nonconforming area in accordance with paragraph DEFECTS AND REPAIRS.[If MQA inspections indicate products do not meet the requirements of this specification, applicable portions of the product will be rejected.]

1.6 DELIVERY, STORAGE, AND HANDLING

****

NOTE: ASTM D4873/4873M provides guidance on delivery, storage, and handling of geomembrane materials. The designer should be familiar with the requirements of that ASTM standard; in some cases the ASTM standard provides options or suggestions as opposed to strict requirements. The designer can edit this paragraph to include stricter or more specific requirements than allowed in the ASTM.

****

Deliver only approved geomembrane materials to the project site. Deliver, store, and handle geomembrane materials in accordance with ASTM D4873/D4873M and this section.[Deliver the geomembrane materials to the project site at least [14][_____] calendar days prior to installation to allow sufficient time for testing in accordance with paragraph PRODUCT ACCEPTANCE.] Deliver and unload the geomembrane with the CQC inspector [and Contracting Officer] present. Confirm the presence of a label on each geomembrane [roll][panel] with the manufacturer's name, product identification number, [roll][panel] number, and roll dimensions. Reject geomembrane rolls which are not labeled upon delivery to the project site.

1.7 PROJECT/SITE CONDITIONS

****

NOTE: To minimize geomembrane contraction stresses, seaming should ideally be carried out in the morning and late evening when the geomembrane is relatively contracted, and during the middle of the day if overcast conditions prevail. If the geomembrane is to be seamed in the middle of a sunny day, the Contractor must ensure that there is sufficient slack in the geomembrane to prevent excessive stresses or trampolining when the geomembrane contracts as cooler temperatures prevail. The required amount of slack must be determined by the Contractor, and it should not be so much so as to cause excessive wrinkling of the geomembrane. Bridging/trampolining is a condition where the geomembrane lifts off the subgrade; this is often observed due to thermal contraction at breaks in grade. If excessive trampolining or wrinkling of the geomembrane is observed, the Contractor will be required to make repairs to eliminate the problem at no additional cost to the Government.

****

Do not deploy or field-seam geomembrane in the presence of excess moisture (i.e., rain, fog, dew), in areas of ponded water, or in the presence of excess wind. Unless authorized by the Contracting Officer, do not place or seam at ambient temperatures below 0 degrees C 32 degrees F or above 40 degrees C 104 degrees F. Measure ambient temperature at a height less than 150 mm 6 inches above the ground or geomembrane surface. If seaming is allowed below 0 degrees C 32 degrees F, follow the procedures outlined in GSI GRI GM9. In marginal conditions, cease seaming unless destructive field seam tests, conducted by the CQC laboratory, confirm that seam properties meet the requirements listed in paragraph PERFORMANCE REQUIREMENTS. Conduct tests in accordance with paragraph DESTRUCTIVE FIELD SEAM TESTING.

1.8 WARRANTY

****

NOTE: Several manufacturers should be contacted to determine what length of warranty is available for geomembrane materials and installation. Manufacturers provide prorated material warranties ranging from 1 to 30 years depending on the application. Installation warranties are generally specified as 1 to 2 years in length.

****

Provide manufacturer's warranty stating that the geomembrane materials meet all requirements of the Contract documents and that for the intended use, the geomembrane is warranted for [_____] years against deterioration. Provide installer's warranty stating that the geomembrane will not fail due to improper installation within [_____] years.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design Requirements

2.1.1.1 Layout And Detail Drawings

****

NOTE: Minimize the number of penetrations and show their locations on the drawings. Referencing the manufacturer's typical penetration details is generally acceptable. When reviewing submitted penetration details, Designer's and others involved in a project such as CQA personnel may wish to consult ASTM D6497 Standard Guide for Mechanical Attachment of Geomembrane to Penetrations or Structures.

****

Submit geomembrane panel layout and penetration detail drawings a minimum of [seven][_____] calendar days prior to geomembrane placement. Provide geomembrane penetration details [as indicated][as recommended by the geomembrane manufacturer].

2.1.2 Performance Requirements

2.1.2.1 Field Seams

****

NOTE: Field seam strength and related property requirements for HDPE, LLDPE, and fPP are defined in GRI-GM19a Seam Strength and Related Properties of Thermally Bonded Homogeneous Polyolefin Geomembranes/Barriers". For PVC, Reference ASTM D7408 Standard Specification for Non-Reinforced PVC (Polyvinyl Chloride) Geomembrane Seams

****

Construct seams in the field conforming to the strength and related property requirements defined in [GSI GRI GM19a][ASTM D7408][_____].

2.2 FABRICATION

****

NOTE: Polyethylene geomembranes are not usually factory seamed. Delete this paragraph when factory seaming is not applicable.

****

Factory seam geomembrane sheets into maximum sized panels to minimize field seaming. Factory seaming must be by methods approved by the geomembrane manufacturer. Seams must meet the minimum shear and peel strength requirements in paragraph Performance Requirements. Factory seams must extend to the end of the sheet so that no unbonded edges greater than 3.2 mm 0.125 inch wide are present.

2.3 MATERIALS

****

NOTE: Non-Government standards are available for the various types of geomembranes considered in this specification section. This specification section is formatted to reference those standards without repeating the requirements from those standards. The designer should be familiar with those standards, and any deviations should be noted in this specification section. For other geomembrane material types not covered by one of the referenced standards, evaluate at least three current manufacturer's property sheets for each acceptable material type before specifying property test values.

****

2.3.1 Raw Material Properties

Use raw materials meeting the requirements of[ASTM D7176][GSI GRI GM13] [GSI GRI GM17][GSI GRI GM18][GSI GRI GM34][_____] and this paragraph. All regrind, reworked, or trim materials must be from the same manufacturer and exactly the same formulation as the geomembrane sheet being produced. Submit a copy of the test reports and MQC certificates for materials used in the manufacturing of the geomembrane shipped to the site.

2.3.2 Sheet Material Properties

****

NOTE: USACE practice on landfill cover systems has been to use a minimum nominal geomembrane thickness of 1 mm 40 mils. This criterion is based on survivability. USACE practice for landfill liner systems has been to use a minimum nominal geomembrane thickness of 1.5 mm 60 mils. Site-specific analyses should be conducted to determine the appropriate thickness for both landfill liners and covers. Reinforced geomembranes are generally not recommended where geomembrane elongation properties are critical (i.e., landfill covers) but may be suitable for other applications such as liquid surface impoundments.

****

Provide geomembrane sheets meeting the requirements in Table 1. Provide geomembrane sheets that are uniform in color, thickness, and surface texture. The textured surface features consist of raw materials identical to that of the parent sheet material and are uniform over the entire face of the geomembrane. Provide sheets that are free of and resistant to fungal or bacterial attack and free of cuts, abrasions, holes, blisters, contaminants and other imperfections.

TABLE 1 - GEOMEMBRANE PROPERTIES	
Nominal Thickness	[_____] mm [_____] mils

TABLE 1 - GEOMEMBRANE PROPERTIES	
Manufactured in Accordance with	[GSI GRI GM13 for HDPE] [GSI GRI GM17 for LLDPE] [ASTM D7176 for PVC] [GSI GRI GM18 for fPP and fPP-R] [GSI GRI GM34 for EIA] [_____]
Material Type	[HDPE] [LLDPE] [PVC] [fPP] [fPP-R] [EIA] [_____]
Category	[unreinforced] [reinforced]
Surface Finish [for geomembrane on slopes greater than or equal to 1V on [_____] H]	[smooth] [textured one side] [textured both sides]
Minimum Manufactured Sheet Width	[_____] meter[s] [_____] feet
Minimum Manufactured Sheet Length	[_____] meter[s] [_____] feet
[_____]	[_____]

2.3.3 Field Seaming Materials

****

NOTE: Requirements for the resin used in extrusion welding are provided below. If welding by other means is allowed/required and that welding involves use of materials such as adhesives or chemicals, provide requirements for those materials here.

****

[Manufacture seaming rods and pellets using materials which are essentially identical to that used in the geomembrane sheet. Test seaming rods and pellets for density, melt index and carbon black content in accordance with the approved Manufacturer's Quality Control manual. Do not use seaming rods and pellets which fail to meet the corresponding property values required for the sheet material for seaming.][_____.]

2.3.4 Interface Shear Testing Soil Sample

****

NOTE: This paragraph can be deleted if the geomembrane interface is not against a soil layer, but rather another geosynthetic. An optional requirement is included for the contractor to test the soil that will be used in the interface shear testing, to demonstrate that the soil meets project requirements. This demonstration testing would not be necessary if the borrow source has already been adequately investigated, or if the soil used for interface testing is collected at the same time that other borrow source sampling is conducted.

To reduce the overall risk to the Government, it is strongly advised that the Contractor is required to collect samples for interface shear testing unless the nature of the site prevents the Contractor to do so. Depending on site conditions and project needs

(e.g. site security, access issues, etc.), the Government may provide samples to the Contractor to conduct interface shear testing.

****

[The Contracting Officer will provide][Obtain] soil to be used for interface shear testing from [the proposed borrow source][_____].[Conduct one set of tests and submit testing results demonstrating that the soils to be used for interface shear testing meet the material requirements in accordance with [______].]

2.4 EQUIPMENT

****

NOTE: Optional requirements are included for the Contractor to provide a spare seaming apparatus and specifying the type of seaming apparatus. These requirements can be deleted if they are considered excessively strict for the particular project.

****

Use the geomembrane manufacturer's recommended equipment to perform the work and maintain equipment in satisfactory working condition.[Maintain at least one spare operable seaming apparatus on site.][Provide seaming apparatuses that are automated vehicular mounted devices equipped with gauges indicating the applicable temperatures and pressures.]

2.5 ACCESSORIES

2.5.1 Geomembrane Fittings

Provide geomembrane fittings (e.g., pipe vents, boots, sleeves, etc.) that are factory prefabricated components [produced by the same manufacturer as the geomembrane][confirmed to be compatible by the geomembrane manufacturer][_____] and having the same fabrication characteristics as the geomembrane.

2.5.2 Fasteners

Provide fasteners (e.g. clamps, slips, bolts, nuts, etc.) to secure the geomembrane to each fitting. Provide fasteners that are factory prefabricated components[produced by the same manufacturer as the geomembrane][confirmed to be compatible by the geomembrane manufacturer][_____].

2.5.3 Temporary Ballast

Provide temporary ballast used during geomembrane installation including sandbags, tires, or other material as recommended by the geomembrane manufacturer. Use non-abrasive material, free of sharp edges or other features that may damage the geomembrane liner.

2.6 TESTS, INSPECTIONS, AND VERIFICATIONS

2.6.1 Interface Friction Testing

****

NOTE: Interface friction testing should be conducted on all potential slip interfaces. The

rate of displacement and normal stresses used for interface friction testing are dependent on the materials being tested and anticipated site conditions. Normal stresses specified should cover the range of anticipated field loads. Selection of peak versus residual values should be based on anticipated interface displacements taking into account seismic activities and long term conditions. Table 2 is from ASTM D5321/5321M; the Designer should verify that the table is current if ASTM D5321/53231M is updated.

The number of interface friction tests must be determined on a site specific basis considering regulator input and the potential for damage due to a shear failure. This testing should be completed during design or by the Contractor prior to the start of construction.

A method sometimes used to model saturated conditions at the shear interface is to wet these surfaces prior to shearing.

Note that if an interface surface for the geomembrane is a geosynthetic clay liner (GCL), interface friction/shear testing should be a requirement of the specification for that GCL and should follow ASTM D6243/D6243M Standard Test Method for Determining the Internal and Interface Shear Strength of Geosynthetic Clay Liner by the Direct Shear Method.

****

The frequency of testing for each interface is [1 per [_____] hectares [_____] acres of geomembrane placed][[_____] per project]. Conduct tests in accordance with ASTM D5321/D5321M using the conditions specified in Table 2. Use the same soil components that are used for full scale construction. Provide geosynthetics that are the same materials as those proposed for use during full scale construction. A minimum [peak][residual] interface friction angle of [_____] degrees is required for all interfaces. Submit certified laboratory interface friction test results including description of equipment and test method, a minimum of [seven][_____] calendar days prior to geomembrane shipment.[For interfaces between a geomembrane and geosynthetic clay liner, perform interface [friction][shear] testing in accordance with [Section 02 56 13.16 GEOSYNTHETIC CLAY LINER WASTE CONTAINMENT][_____].]

TABLE 2 - INTERFACE FRICTION TESTING PROPERTIES	
Type of test	[Procedure A - Geosynthetic on Geosynthetic Interface Friction] [Procedure B - Soil on Geosynthetic Interface Friction]
Material(s) for which shear will be tested	1 - [_____] 2 - [_____]

TABLE 2 - INTERFACE FRICTION TESTING PROPERTIES	
Side or characteristics for the side of material to be tested at the interface	1 - [_____] 2 - [_____]
Orientation of material	1 - [Machine Direction][Cross Direction][N/A] 2 - [Machine Direction][Cross Direction][N/A]
Soil Interface Compaction Density and Moisture Content (MC) (Note 1)	[Lightly Compacted] [Specified Density = [_____] kN/m3 [_____] lb/ft3] [As-received MC] [Specified MC = [_____] percent] [Based on ASTM D698 test results: Maximum Dry Density = [_____] kN/m3 [_____] lb/ft3, Optimum MC = [_____] percent] [Based on ASTM D1557 test results: Maximum Dry Density = [_____] kN/m3 [_____] lb/ft3, Optimum MC = [_____] percent] If compaction unit weight and moisture content for soil placement based on ASTM D698 or D1557 test results, compaction [_____] percent of maximum dry unit weight and Moisture Content [optimum water content] [plus [_____] percent relative to optimum] [minus [_____] percent relative to optimum]
Conditioning of Geosynthetic Materials	[Wetted by pouring water over entire specimen][Wetted by spraying water over entire specimen][As-received]
Shear Test Normal Loads (Note 2)	[_____], [______],[_____], [______], [_____] kPa[_____], [______],[_____], [______], [_____] psi
List if there is a specified Normal Load Application Sequency to be applied:	[_____]
Interface saturation condition	[Inundated with Water - Interface is submerged in water prior to consolidation and through duration of shear][Spray Wetted - The interface is wetted using a spray bottle during placement of specimens, but not submerged in water][Dry - No addition of water during placement of specimens or shear]
Settling/Consolidation time under test normal load prior to shearing	[_____] hours
Shear displacement rate	[1.0][5.0][_____] mm [0.04][0.2][_____] inches per minute

TABLE 2 - INTERFACE FRICTION TESTING PROPERTIES	
Other test instructions	[_____]
Note 1 - Over-sized corrected test values from ASTM D698 and ASTM D1557 are typically not applied in calculating compaction density and moisture content as gradations minus 19.5 mm 0.75 inch sieve of soil sample are used due to dimensions of most shear boxes. If requesting use of rock correction values to be applied, indicate so. Note 2 - The normal loads selected should bracket the design normal loads being evaluated.	

2.6.2 Manufacturing, Sampling, and Testing

****

NOTE: The testing required in this paragraph and subparagraphs occurs at the manufacturing facility. Additional testing is required once materials are delivered to the site, as defined in paragraph PRODUCT ACCEPTANCE.

****

Submit manufacturer's certified raw and sheet material test reports and a copy of the MQC certificates, a minimum of [seven][_____] calendar days prior to shipment of geomembrane to the site.

2.6.2.1 Raw Material Testing

Test raw materials in accordance with the approved Manufacturer's Quality Control Manual and[ASTM D7176][GSI GRI GM13][GSI GRI GM17][GSI GRI GM18][GSI GRI GM34][_____]; test according to the stricter standard if there are deviations. Do not use any raw material which fails to meet the requirements of paragraph RAW MATERIAL PROPERTIES.

2.6.2.2 Sheet Material Testing

Test geomembrane sheets in accordance with the approved Manufacturer's Quality Control Manual and[ASTM D7176][GSI GRI GM13][GSI GRI GM17][GSI GRI GM18][GSI GRI GM34][_____]; test according to the stricter standard if there are deviations. Do not send sheets not meeting the minimum requirements specified in paragraph SHEET MATERIAL PROPERTIES to the site.

2.6.3 Product Acceptance

****

NOTE: The testing required in this paragraph and subparagraphs occurs at project site.

****

2.6.3.1 Product Acceptance Samples

Obtain one CQC sample, 500 mm 18 inches in length, for the entire width of a roll, for every 9,000 square meters 100,000 square feet of material delivered to the site. Do not obtain samples from the first three feet of the roll. For accordion folded geomembranes, collect samples of equivalent size from approved locations. Identify the samples by manufacturer's name, product identification, lot and roll/panel number. Also, note the date, a unique sample number, and the machine direction. In addition, collect and label a [305 by 305 mm][_____] [12 inch by 12 inch][_____] CQA Product Acceptance Sample, and submit to the Contracting Officer each time CQC samples are collected.[Collect all CQC and CQA samples for product acceptance with the [Contracting Officer][_____] present.]

2.6.3.2 Product Acceptance Tests

****

NOTE: The testing methods listed below are those recommended by Daniel and Koerner 2007. Note that puncture is not a test specified by ASTM D7167 for PVC geomembranes, and ply adhesion only applies for reinforced geomembranes.

****

Provide all CQC samples to the CQC laboratory to determine[thickness,] [tensile strength at break,][elongation at break,][puncture,][tear,][and][ply adhesion]. Test the samples in accordance with the methods specified in [ASTM D7176][GSI GRI GM13][GSI GRI GM17][GSI GRI GM18][GSI GRI GM34][_____]. Samples not meeting the specified requirements will result in the rejection of applicable [rolls][panels]. As a minimum, test [rolls][panels] produced immediately prior to and immediately after the failed [roll][panel] for the same failed parameter. Continue testing until a minimum of three successive [rolls][panels] on both sides of the original failing [roll][panel] pass the failed parameter.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Certificate of Subgrade Acceptance

****

NOTE: An example Certificate of Subgrade Acceptance can be found in the USACE Engineering Manual EM 1110-1-4011. Depending on the specific design of the geomembrane and subgrade, the examination items specified below should be revised.

****

Each day during placement of geomembrane, the CQC Inspector [and Contracting Officer] and installer must inspect the surface on which geomembrane is to be placed and certify in writing on a Certificate of Subgrade Acceptance that the surface is acceptable. Examine the subgrade for compliance with the items in the list below. Perform repairs to the subgrade in accordance with paragraph PREPARATION, and at no additional cost to the Government.

a. A project-qualified land surveyor has verified the lines and grades of the subgrade meet project design;

b. All CQC and CQA of the underlying soils or geosynthetics has been completed and results have been accepted by the Contracting Officer;

c. The subgrade is free of irregularities, protrusions, loose soil, and abrupt changes in grade;

d. The subgrade is not excessively deformed or rutted by construction equipment used to deploy geomembrane rolls. Ruts of the underlying soil should not exceed [25][_____] mm [1][_____] inch in depth.

e. The underlying soil surface (if present) does not contain stones, litter, or organic matter which may be damaging to the geomembrane. Rocks larger than [13][_____] mm [0.5][_____] inch in diameter and any other material which could damage the geomembrane must be removed from the surface to be covered with the geomembrane;

f. If installed on soil, no area of the underlying soil surface is excessively softened by high water content; and

g. If installed on soil, no area of the underlying soil surface contains desiccation cracks which may damage the geomembrane.

3.2 PREPARATION

****

NOTE: Ensure other sections of the specification package adequately address compaction requirements for soil subgrade layers. If the geomembrane is placed directly on top of a compacted clay layer, reference Section 02 56 13.16 CLAY WASTE CONTAINMENT for repairs/preparation.

****

3.2.1 Subgrade Repair

For any subgrade found deficient in accordance with paragraph EXAMINATION, perform repairs in accordance with [Section 31 00 00 EARTHWORK][Section 02 56 13.16 CLAY WASTE CONTAINMENT][_____].

3.2.2 Anchor Trenches

****

NOTE: Anchor trench dimensions are often site-specific and are therefore defined in the project drawings. If that is the case, replace the dimensioning sentences with a reference to the project drawings/plans. Dimensions for a 90 degree anchor trench are included in the paragraph; if other standard anchor trench designs such as a "V" trench or horizontal runout are used instead, replace the dimensions as appropriate.

****

Where an anchor trench is required, place it [610][_____] mm [24][_____] inches back from the edge of the slope to be covered. Provide an anchor trench [610][_____] mm [24][_____] inches deep and [460][_____] mm [18][_____] inches wide. If the anchor trench is excavated in cohesive soil susceptible to desiccation, excavate only the quantity of anchor trench required for placement of geomembrane in a single day. Remove ponded water from the anchor trench while the trench is open. Slightly round trench corners to avoid sharp bends in the geomembrane. Remove loose soil, rocks larger than [13][_____] mm [0.5][_____] inch in diameter, and any other material which could damage the geomembrane from the surfaces of the trench. Extend the geomembrane down the front wall and across the bottom of the anchor trench. Perform backfilling and compaction of the anchor trench in accordance with [Section 31 00 00 EARTHWORK][_____].

3.3 GEOMEMBRANE INSTALLATION

3.3.1 Geomembrane Placement

****

NOTE: An optional requirement is provided for using a rub/slip sheet when placing the geomembrane. Rub sheets are thin sheets of plastic placed between the geomembrane and another surface. Rub sheets facilitate movement/placement of the geomembrane, particularly when the geomembrane is textured.

****

At least [seven][_____] calendar days prior to placement, submit geomembrane manufacturer's installation instructions. Complete geomembrane placement in accordance with the geomembrane manufacturer's installation instructions and this paragraph. Do not elongate, wrinkle, scratch, or otherwise damage the geomembrane, other geosynthetic layers, or the underlying subgrade. Replace or repair geomembrane damaged during installation at the [CQC inspector's][and][Contracting Officer's] discretion. Only deploy geomembrane panels that can be anchored and seamed together the same day.[Deploy a [rub][slip] sheet (e.g. 0.50 mm 20 mil smooth HDPE) when placing the geomembrane and carefully remove the rub sheet to avoid shifting the geomembrane once the geomembrane is in place.] Place adequate ballast on the geomembrane, without damaging the geomembrane, to prevent uplift by wind. On side slopes, anchor the geomembrane at the top and deploy down the slope to minimize wrinkles. Minimize dragging of geomembrane panels over the ground surface. Do not operate equipment on the top surface of the geomembrane without permission from the Contracting Officer. Orient seams parallel to the line of maximum slope. Where seams can only be oriented across the slope, lap the upper panel over the lower panel. Minimize wrinkles and tensile stresses in the geomembrane. Provide adequate slack to prevent the creation of tensile stress. Wrinkle height to width ratio for installed geomembrane exceeding 0.5 is unacceptable. In addition, geomembrane wrinkles exceeding 150 mm 6 inches in height is prohibited. Cut out and repair wrinkles that do not meet the above criteria in accordance with the installer's approved CQC manual.

3.3.2 Field Seaming

3.3.2.1 Trial Seams

Make trial seams under field conditions on strips of excess geomembrane. Make trial seams each day prior to production seaming, whenever there is a change in seaming personnel or seaming equipment and at least once every four hours, by each seamer and each piece of seaming equipment used that day. Collect and test trial seam samples in accordance with ASTM D6392. Obtain one sample from each trial seam. This sample must be at least 920 mm long by 305 mm wide 36 inches long by 12 inches wide with the seam centered lengthwise. Where necessary, conduct accelerated curing of trial seams made by chemical methods in accordance with GSI GRI GM7. To be acceptable, four out of five replicate test specimens must meet seam strength requirements specified in paragraph PERFORMANCE REQUIREMENTS. If the field tests fail to meet these requirements, repeat the entire operation. If the additional trial seam fails, do not use the seaming apparatus or seamer until the deficiencies are corrected by the installer and two consecutive successful trial seams are achieved. Submit trial seam logs following the completion of installation.

3.3.2.2 Field Seams

****

NOTE: Additional requirements for geomembrane seaming apparatuses may be considered on a project-specific basis. As discussed in GSI GRI GM 32 Geomembrane Seaming Data Using Data Acquisition Hot Wedge Welding Devices, welding/seaming devices which continuously record and display temperature, pressure, and speed data can be used. These devices provide information that can be used by both the geomembrane installer during installation and CQC/CQA personnel during inspection and testing. Furthermore, automatic feedback welders (aka "smart welding devices") exist which can be used to maintain operations within a seaming window for temperature, speed, and pressure.

****

Completely unroll and layout adjacent geomembrane panels/sheets before performing field seaming. Seam panels in accordance with the geomembrane manufacturer's recommendations and the requirements listed in this paragraph. Perform seaming with an automated seaming device [equipped with gauges for measuring [temperature][pressure][speed]][_____]. Where the geomembrane manufacturer's recommendations disagree with the requirements of this specification [follow the more stringent requirement][notify the Contracting Officer].

a. Complete seaming only when the Master Seamer is present.

b. In sumps, corners and odd-shaped geometric locations, minimize the number of field seams.

c. Overlap geomembrane panels a minimum of [75][_____] mm [3][_____] inches and a maximum of [150][_____] mm [6][_____] inches.

d. Only use temporary bonding procedures that [are approved by the geomembrane manufacturer][will not damage the geomembrane].

e. Extend seaming to the outside edge of panels.

f. Clean the seam area to provide an area that is free of moisture, dust, dirt, and foreign material at the time of seaming. Do not use solvent for cleaning.

g. If grinding is required, follow a grinding process approved by the geomembrane manufacturer. Complete grinding in a manner that does not damage the geomembrane.

h. Repair fish mouths (half-cylinder openings/voids caused by wrinkling/shifting) in seam.

i. Provide adequate illumination when seaming at night.

j. Protect exposed geomembrane edges at the end of each day or whenever an installation activity is temporarily suspended during the day.

3.3.2.3 Polyethylene Seams

Seam polyethylene geomembranes by thermal fusion methods. Only use extrusion welding for patching and seaming in locations where thermal fusion methods are not feasible. Ground seam overlaps that are to be attached using extrusion welds prior to welding. Orient grinding marks perpendicular to the seam direction and do not extend marks beyond the extrudate after placement. Begin extrusion welding within 10 minutes after grinding. Where extrusion welds are temporarily terminated long enough to cool, ground prior to applying new extrudate over the existing seam. The total depth of the grinding marks greater than 10 percent of the sheet thickness is unacceptable.

3.3.2.4 Non-Polyethylene Seams

Seam non-polyethylene geomembranes by methods as recommended by the geomembrane manufacturer. Store seaming adhesives, solvents, or chemical cleaning agents away from the geomembrane and only use spill-resistant containers while working on the geomembrane. If low temperatures slow the curing process of chemically fused seams and delay seam testing, use the procedures in GSI GRI GM7 to accelerate sample curing.

3.3.3 Penetrations

Install geomembrane fittings (e.g., pipe vents, boots, sleeves, etc.) as shown on the drawings and in accordance with any manufacturer's recommendations.

3.3.4 Defects and Repairs

3.3.4.1 Destructive Seam Test Repairs

Seams that fail destructive seam testing may be overlaid with a strip of new material and seamed (cap stripped). Alternatively, retrace the seaming path to an intermediate location a minimum of 3 meters 10 feet on each side of the failed seam location. At each location, take a 305 by 460 mm 12 by 18 inch minimum size seam sample for two additional shear strength and two additional peel adhesion tests using an approved quantitative field tensiometer. If these tests pass, send the remaining seam sample portion to the CQC laboratory for five shear strength and five peel adhesion tests in accordance with the CQC laboratory's approved procedures. To be acceptable, four out of five replicate test specimens must meet specified seam strength requirements. If these laboratory tests pass, cap strip or repair the seam using other approved methods between that location and the original failed location. If field or laboratory tests fail, repeat the process. After repairs are completed, non-destructively test the repaired seam in accordance with paragraph NON-DESTRUCTIVE FIELD SEAM TESTING. Submit CQC inspector certified test results on all repaired seams.

3.3.4.2 Patches

Repair tears, holes, blisters and other defects with patches. Provide patches that have rounded corners, are made of the same geomembrane, and extend a minimum of 150 mm 6 inches beyond the edge of defects. Repair minor localized flaws by spot welding or seaming as determined by the CQC inspector. Non-destructively test repairs. The Contracting Officer or the

CQC inspector may also elect to perform destructive seam tests on suspect areas.

3.4 FIELD QUALITY CONTROL

3.4.1 Visual Inspection of Field Seams

Visually inspect each field seam to confirm that the seams are tightly bonded. Perform the inspection of a seam within 30 hours after the manufacturer's suggested application, curing, and cooling time. Repair and re-inspect seams found to be defective in accordance with manufacturer's recommendations.

3.4.2 Non-Destructive Field Seam Testing

****

NOTE: Multiple non-destructive field seam testing methods are included below. Not all testing methods are applicable to all types of geomembranes. The pressurized air channel test is only applicable when a dual track hot wedge seaming method is employed. The pressurized air channel test method is considered a preferred method when applicable. Because the pressurized air channel method is not applicable for testing extrusion welds, at least one other non-destructive testing method should be required such as the vacuum box test.

****

Perform non-destructive testing on all field seams over the full seam length and on any other areas showing damage or other distresses. Allowable methods are stated below. Alternate methods approved by the geomembrane manufacturer may be submitted for approval by the Contracting Officer. Submit non-destructive field seam test reports following the completion of installation and prior to covering the geomembrane liner. Non-destructively test field seams for penetrations in accordance with the installer's approved CQC manual. Repair seams that fail non-destructive testing in accordance with the installer's approved CQC manual and non-destructively test prior to acceptance.

3.4.2.1 Liner Pressurized Air Channel Test

Perform air pressure testing in accordance with ASTM D5820. Upon completion of the test, relieve pressure from the opposite end of the seam being tested to verify continuity of the seam.

3.4.2.2 Liner Vacuum Box Test

Perform a vacuum box test in accordance with ASTM D5641/D5641M on each field seam, the area around the seams, and each liner surface showing injury due to scuffing, penetration by foreign objects, or distress from rough subgrade. If the vacuum box test indicates a continuous stream of bubbles on repeated testing at the same location, then the area being tested is considered damaged and must be repaired and retested. Perform repairs in accordance with manufacturer's recommendations.

3.4.3 Destructive Field Seam Testing

****

NOTE: Destructively testing field seams at a fixed frequency (the method described in this paragraph) is a fairly standard approach for testing geomembrane seams. However, it is also a somewhat dated approach that was established prior to development of additional concepts that improve quality of geomembrane installations (e.g. taped edges, automatic welders, advanced non-destructive testing methods, certification of geomembrane installers). Destructive seam testing creates holes in a geomembrane where the samples are collected. These holes are patched/repaired using an extrusion seaming method which may be challenging to execute correctly. See Geosynthetic Institute's GRI Test Method GM29, December 2013 for additional discussion. The designer may wish to specify a different frequency of destructive field seam testing based on their own experience, the concepts discussed in GM29, and the application of some of the improved quality concepts mentioned above. However if doing so, the designer should be aware of any specific regulatory requirements on destructive field seam testing (i.e. a destructive testing method that is not acceptable to regulators should not be specified).

****

Obtain a minimum of one test sample per [230][_____] meter[s] [750][_____] feet of field seam. Recommended locations include the ends of seams or anchor trenches, so as to minimize the impact of required repairs to the geomembrane; however, final sample locations will be determined by the [CQC inspector][Contracting Officer]. Do not identify sample locations prior to seaming. Provide samples that are a minimum of 305 mm 12 inches by 1.1 meter[s] 42 inches long with the seam centered lengthwise. Cut each sample into three equal pieces, with one piece retained by the installer, one piece given to the CQC laboratory, and the remaining destructive field seam test sample submitted to the Contracting Officer for CQA testing and/or permanent record. Number and cross reference each sample to a field log which identifies: (1) panel number; (2) seam number; (3) date and time cut; (4) ambient temperature within 150 mm 6 inches above the geomembrane; (5) seaming unit designation; (6) name of seamer; and (7) seaming apparatus temperature and pressures (where applicable). Cut ten 25 mm 1 inch wide replicate specimens from the installer's sample. Field test in accordance with [ASTM D6392 for non-reinforced liner][or][ASTM D751 and ASTM D413 for fabric-reinforced liner]. Jaw separation speed must be in accordance with the approved CQC manual. To be acceptable, four out of five replicate test specimens must meet the seam strength requirements specified in paragraph PERFORMANCE REQUIREMENTS. If the field tests pass, test five specimens at the CQC laboratory for shear strength and five for peel adhesion in accordance with the CQC laboratory's approved procedures. To be acceptable, four out of five replicate test specimens must meet the seam strength requirements specified in paragraph PERFORMANCE REQUIREMENTS. If the field or laboratory tests fail, repair the seam in accordance with paragraph DESTRUCTIVE SEAM TEST REPAIRS. Repair holes for destructive seam samples the same day they are cut. Submit Installer and certified CQC laboratory test results on all destructively tested field seams.

[3.4.4 Electrical Leak Location

****

NOTE: Electrical leak location is strongly encouraged by some organizations as a means of investigating and improving installed geomembranes. The designer should have a good understanding of electrical leak location methods, availability of testing firms to perform the work, and scheduling of electrical leak location testing to align with completion of placement of the geomembrane and covering/protection of the geomembrane. Refer to ASTM D6747 Standard Guide for Selection of Techniques for Electrical Leak Location of Leaks in Geomembranes to determine the appropriate location technique. If electrical leak location is used, the frequency of destructive testing of geomembrane seams can potentially be reduced (for more information see the note for paragraph DESTRUCTIVE FIELD SEAM TESTING). If electrical leak location is retained, the specification and references must indicate how leaks will be identified and how repairs will be made.

****

Perform electrical leak location in accordance with [_____].

]3.4.5 Visual Inspection And Evaluation

Immediately prior to covering, the CQC inspector [and Contracting Officer] will visually inspect the geomembrane, seams, and non-seam areas for defects, holes, or damage due to weather conditions or construction activities. At the Contracting Officer's or the CQC inspector's discretion, the surface of the geomembrane must be brushed, blown, or washed by the Installer if the quantity of dust, mud, or foreign material inhibits inspection or functioning of the overlying material. Non-destructively test each suspect location in accordance with paragraph NON-DESTRUCTIVE FIELD SEAM TESTING. Repair each location that fails non-destructive testing in accordance with paragraph PATCHES, and non-destructively retest.

[3.5 PROTECTION AND BACKFILLING

Do not leave any tools or equipment on the geomembrane after active work ceases in the area. Do not cover the geomembrane until the Contracting Officer approves the geomembrane liner installation. Cover the deployed and seamed geomembrane with the specified material within [five][14][_____] calendar days of acceptance. Prevent wrinkles in the geomembrane from folding over during placement of cover materials. Do not drop cover soil onto the geomembrane or overlying geosynthetics from a height greater than 1 meter 3 feet. Push the soil out over the geomembrane or overlying geosynthetics in an upward tumbling motion. Place soil from the bottom of the slope upward. Provide an initial loose soil lift thickness of [350][_____] mm [12][_____] inches. Do not operate equipment directly on the geomembrane. Use equipment with ground pressures less than 50 kPa 7 psi to place the first lift over the geomembrane. Maintain a minimum of [460][610][915][_____] mm [18][24][36][_____] inches of soil between construction equipment with ground pressures greater than 50 kPa 7 psi and the geomembrane. Cover soil compaction and testing requirements are described in [Section 31 00 00 EARTHWORK][_____]. While placing cover soil do not operate equipment by stopping abruptly, making sharp turns, spinning their wheels, or traveling at speeds exceeding [2.2][_____] m/s [5][_____] mph.

]3.6 As-Built drawings

Submit final as-built drawings of the geomembrane installation. Include panel numbers with a unique identifier that can be linked to the [resin][roll] [number][factory] panel number, seam numbers, location of repairs, destructive seam samples, and penetrations in these drawings.

SECTION 02 56 13.16

CLAY WASTE CONTAINMENT
02/25

****
NOTE: This guide specification covers the requirements for construction of a clay barrier layer (liner and cover) to isolate contaminated material from the environment.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**
****

PART 1 GENERAL

1.1 UNIT PRICES

****
NOTE: These paragraphs should be edited based on whether the contract will use a single job price or unit prices. If there is a separate Measurement and Payment section, edited versions of these paragraphs should be inserted in that section.

Weight measurement may be used to supplement volume measurement surveys if significant subgrade settlement (landfill cover applications) is anticipated.
****

Base measurement and payment for the clay barrier layer on the unit price schedule for each cubic meter cubic yard of clay in place. Include the cost for development of the clay borrow source, cost of clay, excavation, hauling, equipment, placement, testing, and other incidental work required to construct the clay barrier layer in this unit cost.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this Specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

1.3 SYSTEM DESCRIPTION

****

NOTE: Describe other components of the liner or cover system and reference specification Sections that contain the requirements for these components. Other specification sections that may be included in a liner or cover project are: Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT, Section 02 56 13.19 GEOSYNTHETIC CLAY LINER WASTE CONTAINMENT, Section 02 66 13 SELECT FILL AND TOPSOIL FOR LANDFILL COVER, and Section 02 66 16 TEST FILL.

State regulations may provide for different hydraulic conductivity than the value recommended below.

If this guide specification is being prepared to include requirements for both a liner and cover system on the same project, the Designer should ensure that appropriate edits are made throughout the specification section to identify requirements that are specific to either the liner or cover component (e.g. a liner may have different thickness and hydraulic conductivity requirements that a cover).

****

Construct a clay waste containment[liner][cover] layer consisting of a minimum [_____] inch thick compacted clay with a hydraulic conductivity of less than [1 x 10^{-7}][_____] cm/s.

[1.4 PRE-INSTALLATION MEETING

****

NOTE: Delete this paragraph if a separate specification section is developed for the entire project to cover pre-installation meetings and other administrative requirements.

****

Conduct a pre-installation meeting at the jobsite [at least five business days prior to the start of earthwork operations on the project][_____]. The pre-installation meeting is to be arranged by the Contractor and is to follow the written pre-installation meeting agenda submitted prior to the meeting. The purpose of this meeting is to review the requirements of this Specification and the associated plans. The following individuals must be in attendance at this meeting: Contractor's Project Manager and Project Superintendent, earthwork subcontractor's Project Manager and Site Foreman, Contractor's Geotechnical Engineer and Testing Agency, Government Geotechnical Engineer and Civil Engineer, and Government Construction Manager and Engineering Technician.

Record pre-installation meeting minutes and publish by way of email within 48 hours to all attendees. The minutes must be re-published within 48 hours pending any subsequent comments from the attendees.

]1.5 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions

in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Pre-Installation Meeting Agenda

Pre-Installation Meeting Minutes; G, [_____]

Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP); G, [_____]

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

****

NOTE: Regulatory requirements will be location specific and may include local ordinances and State regulatory requirements. At a minimum, an approved Soil Erosion and Sediment Control Plan will be required by the local Soil Conservation District.

For sites addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. The permits or permit equivalents may include those addressing air emissions, water discharge, stormwater pollution prevention, and possibly others. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, such as Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, delete this section.

****

Obtain all State and Local [permits][permit equivalents] required to perform the work.

1.6.2 Qualifications

Provide a Professional Geotechnical Engineer licensed in the [applicable jurisdiction][state that work is being performed] to provide inspection of the clay barrier layer throughout construction. The Geotechnical Engineer must have [five][_____] years of experience in design, construction, Quality [Assurance][Control], or certification of [landfill][dump] liners including low permeability clay barrier liners. The Geotechnical Engineer is responsible for performing pre-construction, periodic during construction, and final at completion of construction site visits to inspect and [approve][certify] that the clay barrier layer meets specifications. The Geotechnical Engineer is responsible for preparing and updating the Materials Handling Plan and Borrow Source Assessment Report as construction progresses to reflect changing conditions and submit updated plans if necessary. Submit a [monthly][_____] Geotechnical Evaluation

Report, informing the Contractor and Contracting Officer of the status of the plans and an accounting of the Contractor's adherence to the plans addressing any present or potential problems. The Contractor is responsible for arranging meetings with the Geotechnical Engineer and Contracting Officer throughout the contract duration.

1.6.3 Qualified Technician

Provide a Qualified Technician to inspect, monitor, sample, and perform field testing. The technician qualifications need to be one of the following: a current National Institute for Certification in Engineering Technologies (NICET) Level II minimum certification in Construction Materials Testing Soils; Professional Civil or Geotechnical Engineer with minimum [two][_____] years of experience in design, construction, Quality [Assurance][Control], or certification of [landfill][dump] liners including low permeability clay barrier liners.

1.6.4 Lab Validation

Perform testing by an accredited commercial testing laboratory meeting the requirements listed below. Items a-c apply to testing laboratories used for soil geotechnical testing (all tests other than chemical contamination tests). Item d applies to testing laboratory used for chemical contamination tests. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

a. Comply with applicable requirements of ASTM E329.

b. Testing laboratory must be licensed to operate in the State of [_____]. Third party laboratory testing must be conducted by a laboratory either validated by the USACE Materials Testing Center or have an AASHTO Materials Reference Laboratory (AMRL) certification for the required tests.

c. Testing equipment used by laboratory must be calibrated at maximum intervals of 12 months by devices of accuracy traceable to one of the following: NIST Standard Reference Materials, ISO ISO/IEC 17025, certified by state or local bureau.

d. Perform the testing in paragraph CHEMICAL CONTAMINATION TESTING by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory meeting the requirements of [Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.7 DELIVERY, STORAGE, AND HANDLING

1.7.1 Delivery

Deliver clay to the site in trucks that meet all local, state, and federal transportation regulations[and have added containment of material in the form of a fabric cover to prevent spillage].

1.7.2 Storage

Keep stockpiles in a neat and well drained condition, giving due consideration to drainage at all times. Clear and grub the ground surface at stockpile locations. Protect stockpiles from contamination from unsuitable materials, including but not limited to soils not meeting the definition of Clay defined in this Specification, volunteer vegetation growth, or windblow waste [material][debris], which may destroy the quality and fitness of the clay material. If the Contractor fails to protect the stockpiles, and any clay material becomes unsatisfactory, remove and replace such material with satisfactory clay material from approved sources. Unsatisfactory materials include materials which do not comply with the requirements for satisfactory materials in this Section, and also include man-made fills; trash; refuse; backfills from previous construction; roots and other organic matter or frozen material. Do not place stockpiles on prepared subgrade or any portion of the prepared subgrade or clay barrier layer. Place a [geotextile][geocomposite][____] beneath stockpiles and between stockpiles of dissimilar material to keep materials separated. Provide stormwater sediment and erosion controls in accordance with[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____]. Do not allow water to pond in the stockpile areas.

1.8 [PROJECT][SITE] CONDITIONS

1.8.1 Environmental Requirements

Do not install the clay barrier layer when temperatures are below freezing or during precipitation events. Do not install the clay barrier layer when the subgrade is frozen, excessively wet, or extremely dry such that the subgrade compaction requirements in paragraph SUBGRADE EXAMINATION AND PREPARATION cannot be met, or in a condition otherwise detrimental to proper grading. Any relaxation of this requirement must be approved by the Contracting Officer.

1.8.2 Existing Conditions

****

NOTE: Existing conditions are site specific and are generally shown on the plans and provided in design or investigation documents prepared for the site. If there are specific conditions the Contractor should be made aware of that are contained in plans or documents provided, describe here.

****

The existing site conditions are presented [in Appendix [_____]][on the Drawings]. Immediately notify the Contracting Officer if there are discrepancies between the existing site conditions as presented and field conditions discovered during execution.

PART 2 PRODUCTS

2.1 EQUIPMENT

****

NOTE: A soil stabilizer or road regrader is often specified for use on soils that have clods or particles which are difficult to reduce to an acceptable size.

****

Do not operate equipment to place the clay barrier layer by braking suddenly, turning sharply, or traveling at speeds exceeding 8 km 5.0 miles per hour.

2.1.1 Compaction Equipment

Use compaction equipment consisting of tamping foot compactors which have a minimum weight of [20,500][_____] kg [45,000][_____] pounds. Provide at least one tamping foot for each [81,000][_____] square mm [126][_____] square inches of drum surface. The length of each tamping foot, from the outside surface of the drum, must be [25][_____] mm [1][_____] inch greater than the loose lift thickness to assure proper permeability between lifts. During compaction operations, keep the spaces between the tamping feet clear of materials which would impair the effectiveness of the tamping foot compactors.

2.1.2 Scarification Equipment

****

NOTE: Tamping foot compactors create a roughened surface on each lift of clay. The designer must determine if scarification is required to further roughen the surface of the clay barrier layer prior to placement of additional lifts of clay. If additional scarification is not required, omit this paragraph and other references to scarification throughout this section.

****

Provide disks, rotor tillers, [stabilizers][reclaimers], or other approved means to scarify the surface of each lift of clay prior to placement of the next lift. Provide scarification equipment capable of controlling depth to uniformly disturb the upper 25 mm 1 inch of each lift of the clay barrier layer to provide bonding, elimination of failure planes, and to assure continuous homogenous hydraulic conductivity between lifts.

2.1.3 Steel Wheeled Rollers

****

NOTE: The upper surface of the clay barrier layer must be smooth rolled if a geosynthetic will be placed on top of the clay barrier layer. Smooth rolling is also required to control moisture (precipitation infiltration or drying out) of the clay barrier layer between placement of lifts.

****

Use a smooth, non-vibratory steel wheeled roller to produce a smooth compacted surface on the clay barrier layer and to prevent moisture intrusion or drying. Steel wheeled rollers less than [9,070][_____] kg [20,000][_____] pounds are not acceptable.

2.1.4 Hand Operated Tampers

Provide hand operated tampers consisting of rammers or other impact type equipment. Vibratory plate-type equipment will not be allowed.

2.2 MATERIALS

2.2.1 Clay

****

NOTE: The physical criteria listed in Table 1 are minimum requirements. More restrictive criteria may be appropriate depending on local soils. For composite geomembrane/clay covers and liners, the maximum particle size should be reduced to 13 mm 0.5 inches in the upper lift of clay barrier layer to prevent puncturing of the geomembrane.

Bentonite is often added to soils that do not contain enough clay to achieve the desired hydraulic conductivity. Refer to EPA/600/R-93/182 - Quality Assurance and Quality Control for Waste Containment Facilities if bentonite will be used as an additive to the available soils.

****

Provide clay that has a Unified Soil Classification System classification (USCS) of CH, CL, or SC and is free of roots, debris, organic or frozen material. Clay material must comply with the criteria listed in Table 1. Submit a minimum of 23 kg 50 pounds of clay from each proposed borrow source to the Government at least [15][_____] business days prior to placement; this material is for possible Government Quality Assurance testing and not the Quality Control testing required by the Contractor.

TABLE 1 - REQUIRED PHYSICAL PROPERTIES OF CLAY

PROPERTY	TEST VALUE	TEST METHOD
Max. particle size	[25][__] mm [1][__] inch	ASTM D6913/D6913M
In Contact With Geomembrane Max. particle size	[13][_____] mm [1/2][_____] inch	ASTM D6913/D6913M
Min. percent passing 4.75 mm No. 4 sieve	[80] [_____]	ASTM D6913/D6913M
Min. percent passing 0.075 mm No. 200 sieve	[50] [_____]	ASTM D1140
Min. liquid limit	[35] [_____]	ASTM D4318
Min. plasticity index	[10] [_____]	ASTM D4318
Max. plasticity index	[30] [_____]	ASTM D4318

2.2.2 Water

****

NOTE: Two options are provided. The first option is

to only allow the Contractor to use potable water. The second option allows the Contractor to use non-potable water, but includes a testing requirement to limit the chance that the Contractor supplies a water that could introduce contaminants into the clay barrier layer. The first option is simpler, but could lead to higher project costs if the volume of water needed is significant and/or potable water sources are not readily available. When specifying the criterion to be met for water, the Designer should consider if there are other standards which are more appropriate for the specific project (e.g. state groundwater cleanup criteria).

****

Supply water used to increase moisture content of the clay barrier layer for the sake of compaction during installation. Maintain an accurate record of water usage.[Use only potable water from a regulated public water system.][If non-potable water is to be used, provide water that does not contain oils, acids, salts, alkalis, organic matter, solids, or other substances at concentrations that could be detrimental. Also characterize non-potable water prior to its use by collecting a sample from the water source and analyzing according to Table 2. Submit a Water Supply Analysis demonstrating that water meets requirements.

TABLE 2 - MOISTURE CONDITIONING AND DUST CONTROL WATER CRITERIA

ANALYTICAL METHOD NUMBER (From EPA SW-846; use current version)	ANALYSIS TYPE	CRITERIA TO BE MET
6010 [and 7470A]	Metals [and Mercury]	[Less than Maximum Contaminant Level (MCL)][_____]
8260	Volatile Organics	
8270	Semi-volatile Organics	
8082	PCBs	
1633	PFAS	
8081	Pesticides	
Within each Analytical Method, only analyze for analytes which have an [MCL][_____].		

]

2.3 TESTS, INSPECTIONS, AND VERIFICATIONS

2.3.1 Borrow Source Assessment

****

NOTE: Shear strength testing is often required for landfill covers and liners which contain geosynthetics. Testing should be conducted on all potential slip interfaces. Criteria for shear

strength testing (also referred to as interface friction testing) are described in Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT or Section 02 56 13.19 GEOSYNTHETIC CLAY LINER WASTE CONTAINMENT.

The testing defined in paragraphs MOISTURE-DENSITY (COMPACTION) TESTING and HYDRAULIC CONDUCTIVITY TESTING is performed to determine the acceptable zone of moisture and compaction to assure that hydraulic conductivity of the clay barrier layer meets requirements; this testing is not to assure structural compaction of the soil. The compaction and moisture testing utilized in field quality control is used to indirectly determine hydraulic conductivity through plotting on the developed acceptable zone.

****

Perform borrow source assessment tests on each principal type and combination of materials proposed for use in the clay barrier layer to assure compliance with specified requirements and to develop compaction requirements for placement. Perform one set of borrow assessment tests for each [400][_____] cubic meters [500][_____] cubic yards for each borrow source proposed. Perform at least three borrow assessment tests for each soil type and borrow source. A set of borrow source assessment tests is comprised of classification testing, moisture-density (compaction) testing, and hydraulic conductivity testing.

2.3.1.1 Classification Testing

****

NOTE: Test pits should be used, if possible, because they provide a better method of characterizing borrow sources than borings.

****

Use [test pits][borings] placed in a grid pattern to characterize each proposed borrow source. Extend the [test pits][borings] to the full depth of the proposed borrow source. Perform visual classification as described in ASTM D2488 over the full depth of each [test pit][boring] by the [Geotechnical Engineer described in paragraph GEOTECHNICAL ENGINEER][Qualified Technician described in paragraph QUALIFIED TECHNICIAN]. Group soils into "principal types" based on visual classification. Perform classification testing on representative samples of each principal type and combination of materials. Classification testing consists of the tests identified in the table in paragraph CLAY.

2.3.1.2 Moisture-Density (Compaction) Testing

****

NOTE: A minimum of two compaction efforts are recommended to adequately define the relationship between moisture-density and hydraulic conductivity.

****

Test representative samples from each principal type and combination of borrow materials to establish compaction curves using ASTM D698 and ASTM D1557. Use a minimum of [five][_____] points to develop each compaction curve. Plot the compaction curves for each principal type and combination of borrow materials on a single graph of dry density versus moisture content.

2.3.1.3 Hydraulic Conductivity Testing

****

NOTE: When performing hydraulic conductivity testing, the average effective confining pressure should be representative of post construction conditions. The minimum effective confining pressure should be equal to or greater than 21 kPa 3 psi to avoid side wall leakage.

If the clay barrier layer will be placed beneath hazardous waste, chemical compatibility testing may be appropriate. Chemical compatibility testing consists of performing hydraulic conductivity tests on the clay liner material using a representative leachate sample as the permeant.

****

Perform hydraulic conductivity tests on representative samples of each principal type and combination of borrow materials. A set of tests is comprised of one hydraulic conductivity test run on a representative sample corresponding to each point from each compaction curve (ASTM D698 and ASTM D1557) at or above ASTM D1557 optimum moisture content. Conduct hydraulic conductivity testing referenced in this Section in accordance with ASTM D5084. In addition, adhere to the following procedures when performing the hydraulic conductivity testing:

a. Verify saturation of test specimens by determining the B coefficient. The B coefficient must be at least 0.95. The B coefficient is defined as the change in pore water pressure divided by the change in confining pressure.

b. During consolidation of the test specimens, record outflow volumes versus time on a semi-log graph to confirm primary consolidation has been completed prior to permeation of the specimens.

c. Use a permeant of 0.01 molar calcium chloride solution created from deaired, deionized water as specified in ASTM D5084 for back pressure saturation and permeation.

d. Provide an average effective confining pressure of [_____] kPa [_____] psi.

2.3.1.4 Chemical Contamination Testing

****

NOTE: This section includes a requirement to prepare a UFP-QAPP to define chemical contamination testing. Alternatively, this section may reference a separate specification section in the project requiring preparation of a UFP-QAPP. If that is the case, ensure that UFP-QAPP requirements from this section are appropriately incorporated into the separate specification section.

Suggested chemical analyses, sampling frequency, sample collection methods, and chemical concentration screening level standards are included as optional requirements to be considered in the UFP-QAPP. The Designer can include more specific requirements in the list of UFP-QAPP elements to be addressed. Individual states where work is being completed may have requirements that should also be considered.

The Designer should take care that requirements are not too strict for what is considered "clean" soils. Natural and anthropogenic background concentrations of chemicals should be considered in addition to health-based screening levels defined by regulatory agencies. The Designer may wish to use alternative methods instead of conducting project-specific specific chemical contamination testing; alternative methods could include using previously approved borrow sources where chemical contamination testing has already been conducted or using borrow sources where chemical contamination is not suspected based on knowledge of land use, etc.

****

2.3.1.4.1 Uniform Federal Policy Quality Assurance Project Plan

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the UFP-QAPP WKSTS. Submit the UFP-QAPP within [30][_____] calendar days after notice to proceed. Do not perform chemical contamination testing until the UFP-QAPP is approved. Prepare [draft for Government review][draft-final for [regulatory][_____] review] and final versions of the UFP-QAPP. Allow [30][_____] calendar days for [Government] review [and [30][_____] calendar days for regulatory review]. Allow [45][_____] calendar days for comment resolution following each review and preparing the next version of the document. Tailor the content to the requirements of the project and the site conditions. The UFP-QAPP must specifically address the following elements:

a. Chemical analyses: Specify the chemicals to be analyzed in each sample. [At minimum the following analyses must be included: [target compound list volatile organic compounds][target compound list semi-volatile organic compounds][target analyte list metals][pesticides/polychlorinated biphenyls][______].]

b. Acceptable chemical concentrations for the clay barrier layer soils. [At minimum the following standards must be considered: [U.S. Environmental Protection Agency Regional Screening Levels][state-specific screening levels defined at [______]][background chemical concentrations defined at [______]].]

c. Chemical contamination sampling frequency. Assume a minimum sampling frequency of one sample for every [2,000][_____] cubic meters [2,500][_____] cubic yards of clay brought on site. Consider other sampling frequency requirements such as state regulations or guidance.

d. Sample collection method (e.g. discrete grabs, composites, incremental samples).

e. Borrow source chemical contamination acceptance criteria, indicating how sample results will be compared to acceptable chemical concentrations to determine if the borrow source is acceptable (e.g. each sample must meet acceptable concentrations, average of samples must meet acceptable concentrations).

2.3.1.4.2 Chemical Contamination Sampling and Analysis

Sample and analyze each proposed borrow source for chemical contamination in accordance with [the UFP-QAPP][_____]. Any deviations to sampling frequency, number of samples, or sample collection methods must be [established in the approved [UFP-QAPP][_____]][approved by the Contracting Officer].

2.3.1.5 Borrow Source Assessment Report

****

NOTE: Additional testing may be required to determine the "Acceptable Zone" based on shear strength considerations. The Designer would need to modify the Acceptable Zone requirement listed below in that case. For more discussion on this approach, see Chapter 3.4 of Waste Containment Facilities, Guidance for Construction Quality Assurance and Construction Quality Control of Liner and Cover Systems, 2nd Edition, 2007 (ASCE Press).

Experience with some materials indicates that the Acceptable Zone can be expanded to include soils that are 1-2 percent less than optimum moisture content while still achieving the require hydraulic conductivity. This would represent a less conservative approach, but one that could be less costly and difficult to achieve.

****

Submit a Borrow Source Assessment Report at least [15][_____] business days prior to clay placement. Do not place clay until the Borrow Source Assessment Report is approved. Include the following in the report:

a. Location of each borrow source.

b. Plan view and estimated available quantity of clay.

c. Locations and logs of subsurface explorations.

d. Laboratory test results.

e. Acceptable Zone of moisture contents and densities, displayed with the compaction curve graphs for each principal type of borrow material and combination of borrow materials. The Acceptable Zone is comprised of moisture-density values that meet the following requirements: maximum hydraulic conductivity = [1×10^{-7} cm per second][_____]; the minimum allowable moisture content must be no less than [optimum moisture content][_____] and no greater than [four][_____] percent above optimum based on ASTM D1557; the minimum allowable density must be no less than [90][_____] percent of maximum dry density based on ASTM D698.

f. Chemical testing data demonstrating that clay material is acceptable.

PART 3 EXECUTION

3.1 SUBGRADE EXAMINATION AND PREPARATION

****

NOTE: An example Certificate of Subgrade Acceptance can be found in the USACE Engineering Manual (EM) 1110-1-4011.

****

3.1.1 Examination

Each day during placement of the clay barrier layer, the Qualified Technician[and Government QA representative] must inspect the subgrade to verify it is acceptable for placement of the clay barrier layer. Examine the subgrade for compliance with the items in the list below. If subgrade is not suitable to place the clay barrier layer, prepare the subgrade in accordance with paragraphs CLEARING AND GRUBBING, GRADING, SUBGRADE COMPACTION, and PROOF ROLLING. Inspect and submit a Certificate of Subgrade Acceptance each day that the clay barrier layer is placed.

a. A project-qualified land surveyor has verified the lines and grades of the subgrade meet project design.

b. All CQC and CQA of the underlying geosynthetics has been completed and results have been accepted by the Contracting Officer.

c. The subgrade is free of irregularities, protrusions, loose soil, and abrupt changes in grade. The subgrade is free of vegetation and ruts and is not wet or frozen.

d. All tools, equipment, and temporary covers have been removed from the geosynthetic.

3.1.2 Clearing and Grubbing

[Clear and grub in accordance with Section 31 11 00 CLEARING AND GRUBBING.] Remove trees, stumps, logs, shrubs, brush and vegetation and other items that would interfere with construction operations. Remove stumps entirely. Grub out matted roots and roots over 75 mm 3 inches in diameter to at least 500 mm 18 inches below existing surface. Remove all organics and rocks greater than 25 mm 1 inch from the top 150 mm 6 inches.

3.1.3 Grading

Grade subgrade to the lines and grades indicated on the plans. Provide finished surface that are uniformly graded and free from depressions, mounds, or windrows. The top surface of the subgrade must be between 0 and minus 76 mm 3 inches of the grades indicated on the plans. No plus tolerance will be permitted.

3.1.4 Subgrade Compaction

Subgrade materials that exhibit deflection greater than 25 mm 1 inch or rutting during proof rolling need to be scarified, aerated, and re-compacted to 90 percent of maximum dry density based on ASTM D1557 or 95 percent of maximum dry density based on ASTM D698 at [plus][0-4][_____]

percent of optimum moisture content prior to being considered for remedial action by the Contracting Officer.

3.1.5 Proof Rolling

Perform proof rolling on exposed subgrade that is unfrozen and free of surface water (wet conditions resulting from rainfall).[Notify the Contracting Officer a minimum of three business days prior to proof rolling.][Perform proof rolling in the presence of the Contracting Officer.][After final grading to the planned elevation,] proof roll the existing subgrade of all areas to receive compacted clay barrier layer with six passes of a[[45][_____] metric ton [50][_____] short ton loaded offroad dump truck] [[45][_____] metric ton[50][_____] short ton loaded scraper]. Operate the [scraper][truck] in a systematic manner to ensure the number of passes over all areas, and at speeds between 4 to 5.5 km 2.5 to 3.5 miles per hour. The subgrade is considered to extend 1.5 meters 5 feet beyond the limits of the clay barrier layer. Smooth drum roll the final subgrade surface with a smooth drum compactor.

3.2 INSTALLATION

3.2.1 Material Handling Plan

Submit a Material Handling Plan at least [15][_____] business days prior to clay placement. Do not place clay until the Material Handling Plan is approved. Include the following in the plan: processing and placement of the clay; type, model number, weight and critical dimensions of equipment to be used for soil processing, compaction, scarification, and smooth rolling; method of protecting clay from changes in moisture content and freezing after placement.

3.2.2 Pre-Processing

****

NOTE: Clods of soil can be broken down with tilling equipment. Stones can be sieved out of the soil with large vibratory sieves, mechanized "rock pickers" passed over a loose lift of soil, or by laborers who remove oversized material by hand. Pulverization machines can process soil in a loose lift, breaking down hard chunks and crushing stone or large clods.

****

Prior to placement of the clay barrier layer, process clay to break down clods of soil to less than 50 mm 2 inches, to remove rocks greater than the maximum particle size specified in paragraph CLAY, and condition the soil to the proper moisture content for compaction. Process clay at the location designated on the drawings or approved by the Contracting Officer. The Materials Handling Plan must identify equipment and methods to process the soil in preparation of placement.

3.2.3 Clay Placement

****

NOTE: Clay is placed parallel to the direction of maximum slope. Clay placement parallel to the slope becomes difficult on slopes steeper than 3 horizontal on 1 vertical. Horizontal lifts should

be considered for clay placement on slopes steeper than 3 horizontal on 1 vertical.

The U.S. Environmental Protection Agency document, EPA/600/R-93/182 Quality Assurance and Quality Control for Waste Containment Facilities discourages the use of grade stakes which penetrate the clay barrier layer to control lift thickness.

If a test pad is considered necessary, include Section 02 66 16 TEST FILL in the project specifications and provide a reference in this section. Section 02 66 16 TEST FILL should be modified to include hydraulic conductivity testing per ASTM D6391.

****

Place clay to the lines and grades shown on the drawings. The thickness of the clay liner at any location must be measured perpendicular to the slope at that location. Place the clay in loose lifts not to exceed 25 mm 1 inch less than the foot length of the compactor. Do not place subsequent lifts until the previous lift has passed all testing requirements described in paragraph FIELD QUALITY CONTROL. In areas where hand operated tampers must be used, the loose lift thickness exceeding [100][_____] mm [4][_____] inches is not acceptable.[Do not drive grade stakes into the clay barrier layer.][If grade stakes are driven into the clay barrier layer to control lift thickness, number and account for them at the end of each shift. When removing grade stakes, do not leave broken portions of the grade stakes in the clay barrier layer. Backfill and compact holes left by grade stakes by following the procedure in paragraph Repair of Voids.]

For clay barrier layers placed over geosynthetics, the first lift must be 305 mm 12 inches. This lift is not considered in determining the required thickness of the clay barrier layer. For clay barrier layers placed above geosynthetics, require the placement and compaction equipment work from the base of the slope up to prevent damage to underlying geosynthetics. Do not operate equipment directly on the top surface of geosynthetics.

3.2.4 Moisture Control

Place and compact clay within the "Acceptable Zone" moisture content range in the approved Borrow Source Assessment Report. Maintain uniform moisture content throughout each lift. Add and thoroughly incorporate water into the clay to ensure uniformity of moisture content prior to compaction. Seal roll the clay barrier layer with approved steel wheeled rollers and make smooth and free from ruts or indentations at the end of every working day, when precipitation is forecast, or at the completion of compaction operations in an area.

3.2.5 Compaction

****

NOTE: Special compaction procedures are required if geosynthetic layers are located immediately beneath the clay barrier layer. This lift of soil is typically placed with low ground pressure track mounted equipment with a track pressure of 21 to 41 kPa 3 to 6 psi.

****

Compact clay to meet the density requirements in the approved Borrow Source Assessment Report and by at least [six][_____] one-way passes of the approved compaction equipment over all areas of each lift. Compactor wheel passes must have 15 percent to 25 percent overlap to assure compaction over the entire area. For self-propelled compactors, one pass is defined as one pass of the entire vehicle. Use hand operated tampers in areas where standard compaction equipment cannot be operated.

The transition from an existing full-depth section of clay barrier layer to the beginning of an adjacent section that is to be constructed subsequently must be accomplished by cutting minimum 3 meter 10 foot wide stair steps for each lift of the clay barrier layer, scarifying the surface of each stair step, and then immediately placing the adjacent lifts of clay liner.

3.2.6 Scarification

****

NOTE: For geomembrane/clay composites, the final lift of clay is smooth rolled instead of being scarified to allow intimate contact between the clay surface and the overlying geomembrane. Smooth rolling also helps to prevent desiccation and precipitation infiltration increasing moisture outside of the workable range during delays in construction.

****

Prior to placement of the next lift, perform scarification on all areas of the upper surface of each clay lift that has been seal rolled. Accomplish scarification with approved equipment. If a geosynthetic is to be placed in contact with the clay surface, do not scarify the final lift of clay. Roll the final lift with the approved smooth steel wheeled roller to provide a smooth surface with no ridges or depressions.

3.2.7 Repair of Voids

Repair voids created in the clay barrier layer during construction (including, but not limited to, penetrations for test samples, grade stakes, and other penetrations necessary for construction) by removing sand or other non-clay material, placing clay backfill in lifts no thicker than 76 mm 3 inches and tamping each lift with a steel rod. Tamp each lift a minimum of 25 times altering the location of the rod within the void for each blow. Scarify, fill and compact to grade other ruts and depressions in the surface of the lift.

3.2.8 Construction Tolerances

Provide finished surfaces that are uniformly graded and free from depressions, mounds, or windrows. The top surface of the clay barrier layer greater than [76][_____] mm [3][_____] inches above the lines and grades shown on the drawings is prohibited. No minus tolerance will be permitted.

3.3 FIELD QUALITY CONTROL

3.3.1 Clay Material Laboratory and Field Test Results

During construction of the clay barrier layer, take representative samples for testing at the frequencies listed in Table 3 [from the borrow source][from onsite stockpiles][after a loose lift of clay has been placed][_____]. Test results must meet the requirements listed in Table 1.

TABLE 3 - CLAY MATERIAL PROPERTIES		
Property	Frequency	Test Method
Particle size analysis (Note 1)	[800][_____] cubic meters[1,000][_____] cubic yards	ASTM D6913/D6913M
Percent Passing 0.075 mm (No. 200 sieve)	[800][_____] cubic meters[1,000][_____] cubic yards	ASTM D1140
Liquid Limit (Note 1)	[800][_____] cubic meters[1,000][_____] cubic yards	ASTM D4318
Plastic Limit (Note 1)	[800][_____] cubic meters[1,000][_____] cubic yards	ASTM D4318
Plasticity Index (Note 1)	[800][_____] cubic meters[1,000][_____] cubic yards	ASTM D4318
Compaction (Note 2)	[5,000][_____] cubic meters[6,500][_____] cubic yards	ASTM D698 ASTM D1557
Note 1: Perform at least one test each day that soil is placed. Note 2: Compare compaction test results to previous results on the same material type to verify the compaction characteristics have remained the same.		

3.3.2 Moisture Content and Density Tests of Clay

****

NOTE: Test results using ASTM D6938 may show a significant amount of scatter in some situations. ASTM D4643 (microwave method) can be used as an alternative to ASTM D6938 for quick determinations of moisture content.

****

Perform moisture content and density tests, for clay in-place, in a grid pattern staggered for successive lifts, so that sampling points are not at the same location in each lift. These tests are needed to assure hydraulic conductivity is within acceptable zone and meets specifications. Perform moisture content and density tests in accordance with Table 4.

TABLE 4 MOISTURE CONTENT AND DENSITY TESTS OF IN-PLACE CLAY		
Property	Frequency Per Lift	Test Method
Nuclear Moisture Content	[450][_____] square meters [5000][_____] square feet - Minimum of 3 tests per day	ASTM D6938
Standard Moisture Content	1 for every 10 nuclear tests, minimum 1 test per day	ASTM D2216
Nuclear Density	[450][_____] square meters [5000][_____] square feet - Minimum of 3 tests per	ASTM D6938
Standard Density	1 for every 20 nuclear density tests, minimum 1 test per day	ASTM D1556/D1556M or ASTM D2167

3.3.2.1 Test Frequencies and Locations

Perform nuclear density and moisture content tests at locations that are representative of moisture and compaction based on visual observations during placement of the lift. Perform standard tests at locations which are underneath the nuclear gauge or as close as possible to the location of the nuclear tests being checked.

3.3.2.2 Nuclear Density and Moisture Content Tests

Take nuclear density readings in the direct transmission mode. When ASTM D6938 is used, check and adjust calibration curves using only the sand cone method as described in ASTM D1556/D1556M. ASTM D6938 results in a wet unit weight of soil and when using this method, use ASTM D6938 to determine the moisture content of the soil. Check calibration curves furnished with the moisture gauges along with density calibration checks as described in ASTM D6938; make calibration checks of both the density and moisture gauges at the beginning of a job on each different type of material encountered and at intervals as directed by the Contracting Officer.

3.3.2.3 Test Results

Plot the field moisture content and density test results on the "Acceptable Zone" plot that corresponds to the appropriate material type being tested. If test results are not within the "Acceptable Zone" for moisture content or density, repair the lift of soil out to the limits defined by the Qualified Technician based on visual observation, process monitoring, and additional nuclear testing. Retest the area as directed. Document repairs to the clay barrier layer including location and volume of soil affected, corrective action taken, and results of retests.

3.3.3 Hydraulic Conductivity Tests of Clay

****

NOTE: Laboratory hydraulic conductivity tests during clay barrier layer installation constitute a major inconvenience because the tests usually take several days to perform. For this reason, the use of laboratory hydraulic conductivity tests should be minimized or eliminated if possible.

****

Take undisturbed samples from the in-place clay for hydraulic conductivity testing at a frequency of once per 3,720 square meter 40,000 square feet for each lift of clay placed. Cut samples from the lift in accordance with ASTM D1587/D1587M and transport in the vertical position in accordance with ASTM D4220/D4220M, Group C. Test each undisturbed sample for hydraulic conductivity in accordance with ASTM D5084[, moisture content in accordance with ASTM D2216,][particle size analysis in accordance with ASTM D6913/D6913M,][and][liquid and plastic limits in accordance with ASTM D4318]. Conduct hydraulic conductivity testing in accordance with paragraph HYDRAULIC CONDUCTIVITY TESTING. If any test result is greater than the "Maximum Allowable Hydraulic Conductivity", modifications must be proposed and approved for future placement of clay of that type. If the hydraulic conductivity of any test is more than one-half of one order of magnitude greater than the "Maximum Allowable Hydraulic Conductivity", perform [three][_____] additional tests near the location of the original failed test. If all retests pass, take no additional action. If any of the retests fail, repair the area out to the limits defined by passing hydraulic conductivity tests. Retest the area as directed. Document repairs to the clay barrier layer including location and volume of soil affected, corrective action taken, and results of retests.

3.3.4 Government Quality Assurance Testing

****

NOTE: Quality assurance (QA) testing and inspections should be performed on all landfill construction as the liability is long term and cost due to failure is significant. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. If conducting quality assurance testing, a separate third-party quality assurance contract should be considered based on the qualifications of the Government QA personnel, the size and importance of the project, and the impacts of clay barrier layer failure.

Use of quality assurance testing data also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project performance requirements, and failing result would be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for identifying and correcting meaningful differences should be documented in a project specific CQA Plan or Quality Assurance Project Plan and referenced in

this specification; the process is likely too complex to be adequately defined in this specification.

Two options are provided for defining Government Quality Assurance. The first option is to defer details of the Government QA to a separate CQA Plan. The CQA Plan would need to be developed and provided to the Contractor with the project specifications. This option would be preferred for large, complex projects where the clay barrier layer is one component of a larger waste containment system. A second, simpler option is provided to define Government QA testing frequency.

The Government's QA personnel should visit off-site borrow sources to assure that soils identified in the Borrow Source Assessment Report are being utilized and no water is being added.

****

[Work will be monitored and tested in accordance with the CQA Plan. Be aware of all monitoring and testing activities defined in the CQA Plan and account for these activities in the construction schedule. Quality Assurance testing and monitoring does not relieve the Contractor of the responsibility to complete the quality control testing and monitoring defined in this specification Section.]

[

[Provide][The Contracting Officer will provide] duplicate quality assurance samples to the Government's quality assurance laboratory at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. A failed quality assurance test will require the same corrective actions defined in this Section as a failed Contractor quality control test. The Contracting Officer may require additional quality assurance tests as a result of failed quality assurance or quality control tests. Account for Government quality assurance testing in the construction schedule. Quality Assurance testing and monitoring does not relieve the Contractor of the responsibility to complete the quality control testing and monitoring defined in this specification Section.]

3.4 PROTECTION

3.4.1 Moisture Content

****

NOTE: Smooth rolling or other measures as defined in the Material Handling Plan are necessary to limit moisture loss and/or promote run-off of surface water.

****

After placement, maintain or adjust moisture content per the procedure defined in the Material Handling Plan to meet the acceptable zone criteria.

3.4.2 Erosion

Repair all visible erosion, including but not limited to erosion rills greater than 13 cm 0.5 inch depth that occurs in the clay barrier layer and re-establish grades.

3.4.3 Freezing and Desiccation

Prevent freezing and desiccation of the clay barrier layer. If freezing or desiccation (soils outside the acceptable moisture window, cracking, or platelet failure) occurs, remove or recondition the affected soil as directed.

3.4.4 Retests

Retest areas that have been repaired as directed. Document repairs to the clay barrier layer including location and volume of soil affected, corrective action taken, and results of retests.

SECTION 02 56 13.19

GEOSYNTHETIC CLAY LINER WASTE CONTAINMENT
02/25

****
NOTE: This guide specification covers the requirements for geosynthetic clay liners.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
****

PART 1 GENERAL

1.1 UNIT PRICES

****
NOTE: These paragraphs should be edited based on whether the contract will use a single job price or unit prices. If there is a separate Measurement and Payment section, edited versions of these paragraphs should be inserted in that section.
****

1.1.1 Measurement

Complete a survey to measure the total surface area covered by geosynthetic clay liner (GCL) in square meters square yards. Final quantities will be based on as-built conditions. Allowance will be made for GCL in anchor and drainage trenches; however, no allowance will be made for waste, overlap, repairs, or materials used for the convenience of the Contractor.

1.1.2 Payment

GCL installed and accepted by the Contracting Officer will be paid for at the respective Contract unit price in the bidding schedule. This unit price will include the costs of materials, equipment, installation, testing, and other costs associated with placement of the GCL.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D698	(2012; E 2014; E 2015) Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/cu. ft. (600 kN-m/cu. m.))
ASTM D1557	(2012; E 2015) Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft3) (2700 kN-m/m3)
ASTM D5887/D5887M	(2020) Standard Test Method for Measurement of Index Flux Through Saturated Geosynthetic Clay Liner Specimens Using a Flexible Wall Permeameter
ASTM D5888	(2006; R 2016) Standard Guide for Storage and Handling of Geosynthetic Clay Liners
ASTM D5890	(2011) Swell Index of Clay Mineral Component of Geosynthetic Clay Liners

ASTM D5993	(2014) Measuring Mass Per Unit of Geosynthetic Clay Liners
ASTM D6072/D6072M	(2019) Standard Practice for Obtaining Samples of Geosynthetic Clay Liners

ASTM D6496/D6496M	(2020) Standard Test Method for Determining Average Bonding Peel Strength Between Top and Bottom Layers of Needle-Punched Geosynthetic Clay Liners
ASTM D6768/D6768M	(2020) Standard Test Method for Tensile Strength of Geosynthetic Clay Liners

GEOSYNTHETIC INSTITUTE (GSI)

GSI GRI GCL3	(2005; R2019) Test Methods, Required Properties, and Testing Frequencies of Geosynthetic Clay Liners (GCLs)

1.3 DEFINITIONS

****

NOTE: NOTE: These definitions are adapted from Waste Containment Facilities, Guidance for Construction Quality Assurance and Construction Quality Control of Liner and Cover Systems, Daniel and Koerner, 2nd Edition.

****

a. Construction Quality Assurance (CQA): CQA includes inspections, audits, and evaluations of materials and workmanship to determine and document the quality of the constructed facility. CQA is performed by a party independent from the Contractor.

b. Construction Quality Control (CQC): A planned system of inspections that is used to directly monitor and control the quality of the geomembrane installation project. CQC is normally performed by the GCL installation [contractor][subcontractor], and is necessary to achieve quality in the geomembrane system. CQC refers to measures taken by the installer or contractor to determine compliance with the requirements for materials and workmanship as stated in the plans and specifications for the project.

c. Manufacturing Quality Control (MQC): A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of the geomembrane material and is necessary to ensure minimum (or maximum) specified values in the geomembrane. MQC refers to the measures taken by the manufacturer to determine compliance with the requirements for materials and workmanship as stated in certification documents and Contract specifications.

1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

SD-08 Manufacturer's Instructions

GCL Manufacturer's Installation Instructions

1.5 QUALITY CONTROL

1.5.1 Manufacturer's Quality Control Manual

Submit the manufacturer's quality control manual which describes testing procedures, frequency of testing and acceptance/rejection criteria for MQC testing at least [14][_____] days prior to delivery of the GCL.

1.5.2 Installer's Quality Control Manual

Submit the installer's quality control manual a minimum of [7][_____] calendar days prior to GCL placement.

1.5.3 Qualifications

Submit manufacturer qualification statements a minimum of [7][_____] calendar days prior to GCL shipment. Also submit installer, CQC inspector, [MQC][CQC] laboratory, and Licensed Surveyor qualification statements including resumes of key personnel involved in the project a minimum of [7][_____] calendar days prior to GCL placement.

1.5.3.1 Manufacturer

Provide GCL that is the product of a GCL Manufacturer who has produced the proposed GCL using the same bentonite,[geotextiles,][polyethylene geomembrane,][polymer,][sewing thread,][and][adhesive] for at least [5][_____] completed projects and has produced a minimum of

[186,000][_____] square meters [2][_____] million square feet of the proposed GCL.

1.5.3.2 Installer

****
NOTE: Small projects may not require the use of a specialized GCL installer. If a specialized GCL installer will not be required, this paragraph should be omitted and the submittal requirements above edited accordingly.
****

The installer is responsible for field handling, deploying, seaming, and anchoring the GCL. The installer will have installed GCL at a minimum of [5][_____] projects of comparable scope and complexity and will have installed a minimum of [186,000][_____] square meters[2][_____] million square feet of the proposed GCL.

1.5.3.3 CQC Inspector

****
NOTE: A separate third party CQA contract should be considered based on the qualifications of the Government CQA personnel, the size and importance of the project, and impacts of a GCL failure. CQC inspectors are still considered necessary even if the Government provides independent third-party CQA inspection.
****

The CQC inspector is the person or corporation hired by the Contractor, who is responsible for monitoring and documenting activities related to the CQC of the GCL from manufacturing through installation. The CQC inspector will have provided CQC [and][or] CQA inspection during installation of GCL material for at least [5][_____] projects and performed CQC [and][or] CQA inspection on a minimum of [186,000][_____] square meters [2][_____] million square feet of GCL.

1.5.3.4 [MQC][CQC] Laboratory

The [MQC][CQC] laboratory will have provided [MQC][CQC] [and][or] CQA testing of GCL for at least [5][_____] completed projects and performed [MQC][CQC] [and][or] CQA testing for a minimum of [186,000][_____] square meters [2][_____] million square feet of GCL. The [MQC][CQC] laboratory must be accredited via the [Geosynthetic Accreditation Institute's Laboratory Accreditation Program (GAI-LAP)][_____] for the tests the [MQC][CQC] laboratory are required to perform.

1.5.3.5 Licensed Surveyor

Perform all survey work under the supervision of a Surveyor licensed in the [applicable jurisdiction][State of [_____]].[Perform surveys in accordance with Section [_____].]

1.5.4 Construction Quality Assurance

****
NOTE: Although independent CQA by the Government is

strongly recommended, this paragraph should be deleted if CQA will not be performed and only CQC will be performed. If CQA is not performed, references to CQA throughout the specification should be deleted. Note that the specification section uses the term Contracting Officer as a blanket term that would include CQA personnel acting under the Contracting Officer. Activities specified for the CQA personnel acting under the Contracting Officer would also need to be removed.

Depending on the project, the Government may also elect to implement Manufacturing Quality Assurance (MQA) activities, which include manufacturing facility inspections, verifications, audits, and evaluation of the raw materials and finished products (Daniel and Koerner, 2007). MQA is done in addition to MQC. The Contractor does not have an active role in MQA, but must be aware if MQA will occur on a project.

****

All work will be constructed, monitored, and tested in accordance with the requirements of a CQA [and MQA] Plan. Be aware of all activities outlined in the CQA [and MQA] Plan and account for these activities in the construction schedule. If CQA inspections or testing indicate work which does not meet the requirements of the specifications, the Contracting Officer will establish the extent of the nonconforming area. Repair the nonconforming area in accordance with paragraph DEFECTS AND REPAIRS.[If MQA inspections indicate products do not meet the requirements of this specification, applicable portions of the product will be rejected.]

1.6 DELIVERY, STORAGE, AND HANDLING

****

NOTE: ASTM D5888 provides guidance on delivery, storage, and handling of GCL materials. The designer should be familiar with the requirements of that ASTM standard; in some cases the ASTM standard provides options or suggestions as opposed to strict requirements. The designer can edit this paragraph to include stricter or more specific requirements than allowed in ASTM D5888.

****

Perform delivery, storage, and handling of GCL in accordance with ASTM D5888 and this Section. Deliver only approved GCL materials to the project site.[Deliver the GCL materials to the project site at least [14][_____] calendar days prior to installation to allow sufficient time for testing in accordance with paragraph PRODUCT ACCEPTANCE.] Deliver and unload the geomembrane with the CQC inspector [and Contracting Officer] present. Confirm the presence of a label on each GCL [roll][panel] with the manufacturer's name, product identification number, [roll][panel] number, and roll dimensions. Reject GCL rolls which are not labeled upon delivery to the project site.

1.7 PROJECT/SITE CONDITIONS

****

NOTE: The primary concern associated with weather conditions and GCL placement is exposure of the GCL to moisture that can result in premature hydration. GCL should be covered relatively quickly after it is placed, but a competing interest is the need to allow adequate time for CQC and CQA inspections of the GCL before covering it with the subsequent layer of the waste containment system. Temporary covering (aka tarping) can be considered, but temporary covers may not be effective on relatively flat areas where rain/snow can penetrate seams in temporary covers. The designer should consider the site specific design, speed at which CQC/CQA can be completed, and temporary/permanent covering methods when specifying buffer time between GCL placement and forecasted precipitation.

****

Consider present and forecasted weather conditions prior to GCL placement. Do not place GCL during periods of rain or snow or if rain or snow is forecasted within [4][_____] hours after placement will end.

1.8 WARRANTY

****

NOTE: Several manufacturers should be contacted to determine what length of warranty is available for GCL materials and installation. Manufacturers provide prorated material warranties ranging from 1 to 30 years depending on the application. Installation warranties are generally specified as 1 to 2 years in length.

****

Provide manufacturer's warranty stating that the GCL materials meet all requirements of the Contract and that for the intended use, the GCL is warranted for [_____] years against deterioration. Provide installer's warranty stating that the GCL will not fail due to improper installation within [_____] years.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design Requirements

2.1.1.1 Layout and Detail Drawings

****

NOTE: The proposed GCL panel layout should be reviewed by the project engineer for compliance with the design conditions and best practices in laying-out panels. On slopes, panels should be installed with the long dimension of the panel parallel to the maximum slope. If end-of-panel seams (i.e. seams are perpendicular to the direction

of maximum slope) are proposed, the designer must confirm that the GCL is not expected to be in tension.

Minimize the number of penetrations and show their locations on the drawings. Referencing the manufacturer's typical penetration details is generally acceptable. When reviewing submitted penetration details, Designer's and others involved in a project such as CQA personnel may wish to consult the penetration examples in ASTM D6102 Standard Guide for Installation of Geosynthetic Clay Liners.
****

Submit GCL panel layout and detail drawings, for approval, a minimum of [seven][_____] calendar days prior to placement. Provide GCL penetration details [as indicated][as recommended by the GCL manufacturer]. At a minimum, pipe penetrations must incorporate a collar of GCL wrapped around the pipe and securely fastened.

2.2 MATERIALS

2.2.1 GCL

****
NOTE: GRI-GCL3 is used as the basis for specifying the properties of the GCL components (bentonite, geosynthetic bonding components) and the finished GCL. GRI-GCL3 provides material properties, minimum/maximum acceptable values, testing methods, and testing frequencies. Depending on the specific application of the GCL, the designer may wish to modify the specific requirements of GRI-GCL3. Any modifications to the material property requirements in GRI-GCL3 should be specified in this paragraph. ASTM D5889 is an alternative to GRI-GCL3. The primary difference is that GRI-GCL3 provides minimum/maximum property values for the GCL; ASTM D5889 only provides the testing methods and frequencies. Apart from this difference the two standards are overall very similar. If the Designer wishes to use the ASTM standard instead, replace the references to GRI-GCL3 in this paragraph and in paragraph MANUFACTURING SAMPLING AND TESTING. Provide minimum/maximum tested properties for the GCL.

Test method ASTM D5887 is an index test used to determine the flux rate of water through a GCL specimen. If a contaminated fluid will contact the GCL, compatibility testing should be considered during the design phase to ensure that the GCL can perform as desired. The following ASTM test methods should be referenced when performing compatibility testing:

ASTM D6141 - Standard Guide for Screening Clay Portion and Index Flux of Geosynthetic Clay Liner

(GCL) for Chemical Compatibility to Liquids, and

ASTM D6766 REV A - Standard Test Method for Evaluation of Hydraulic Properties of Geosynthetic Clay Liners Permeated with Potentially Incompatible Aqueous Solutions.

A residual mid-plane shear strength should never be specified. The designer must ensure that the design is configured such that the allowable peak mid-plane shear stress is not exceeded.

Certain aggressive leachates may interfere with the performance of traditional sodium bentonite GCLs. GCLs made with polymer-modified bentonite or other bentonite additives may provide improved performance. If the designer determines that a polymer (or other additive) modified bentonite is needed, this paragraph and the paragraph MANUFACTURER QUALIFICATIONS should be modified to reflect that requirement.

GCL constructed with nonwoven geotextiles on both sides should be considered for situations where increased frictional resistance is required. Required values for internal friction and interface friction must be based on site-specific conditions including, but not limited to, normal stresses, saturation conditions, liquid type, consolidate time, shearing rate, shearing distance, etc.

****

Provide a GCL that is a manufactured product consisting of a [sodium montmorillonite clay (bentonite) layer][_____]. Provide a GCL that meets the requirements in Table 1 and is free of tears, holes, or other defects that may affect its serviceability. Provide a GCL with overlap lines printed onto the GCL [in accordance with GSI GRI GCL3][_____]. Mechanically bond encapsulating geotextiles together using a needle punch or stitch bonding process. If needle punching or stitch bonding is used for construction of the GCL, provide a GCL that has been continuously inspected for broken needles using an in-line metal detector, and all broken needles have been removed.

TABLE 1 - GCL PROPERTIES	
Tested Properties	As defined in [GSI GRI GCL3][_____]
GCL Category	[Reinforced][Nonreinforced]
GCL Joining	[geotextile][polymer-coated geotextile][smooth geomembrane/geofilm][textured geomembrane/geofilm]
Minimum Peak Internal Friction	[_____] degrees
Minimum [Peak][Residual] Interface Friction	[_____] degrees
Minimum Manufactured Sheet Width	[4.1][_____] meters [13.5][_____] feet

TABLE 1 - GCL PROPERTIES	
Minimum Manufactured Sheet Length	[30][_____] meters [98][_____] feet
Note 1: GCL which is [capped][carried] by geotextile is identified as "Geotextile Related" in GSI GRI GCL3; GCL which is [capped][carried] by polymer coated geotextile is identified as "Geotextile Polymer Coated" in GSI GRI GCL3; GCL which is attached to a geomembrane or geofilm is identified as "Geomembrane/Geofilm Related" in GSI GRI GCL3.	

2.2.2 Accessory Bentonite

Provide accessory bentonite used for sealing seams, penetrations, or repairs that is produced by the same manufacturer as the GCL and confirmed by the manufacturer to be compatible for use in sealing seams. Submit manufacturer documentation demonstrating compatibility.

[2.2.3 Interface Shear Testing Soil Sample

****

NOTE: This paragraph can be deleted if the GCL interface is not against a soil layer, but rather another geosynthetic. An optional requirement is included for the contractor to test the soil that will be used in the interface shear testing, to demonstrate that the soil meets project requirements. This demonstration testing would not be necessary if the borrow source has already been adequately investigated, or if the soil used for interface testing is collected at the same time that other borrow source sampling is conducted.

To reduce the overall risk to the Government, it is strongly advised that the Contractor is required to collect samples for interface shear testing unless the nature of the site prevents the Contractor to do so. Depending on site conditions and project needs (e.g. site security, access issues, etc.), the Government may provide samples to the Contractor to conduct interface shear testing.

****

[The Contracting Officer will provide][Obtain] soil to be used for interface shear testing from [the proposed borrow source][_____].[Conduct one set of tests and submit testing results demonstrating that the soils to be used for interface shear testing meet the material requirements in accordance with [______].]

]2.2.4 Adhesive

Provide adhesives used for securing repair patches that is approved for use by the GCL manufacturer. Submit manufacturer documentation demonstrating compatibility.

2.3 ACCESSORIES

2.3.1 Temporary Ballast

Provide temporary ballast used during GCL installation including sandbags, tires, or other material as recommended by the GCL manufacturer. Use non-abrasive material, free of sharp edges or other features that may damage the GCL.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

2.4.1 Manufacturing Sampling and Testing

****

NOTE: The testing required in this paragraph and subparagraphs occurs at the manufacturing facility. Additional testing is required once materials are delivered to the site, as defined in paragraph PRODUCT ACCEPTANCE. GRI-GCL3 provides testing frequencies, test methods, and minimum/maximum required properties. If paragraph GCL provides any required properties for the GCL that differ from GRI-GCL3, this paragraph must indicate the testing methods and frequencies associated with those properties.

****

Sample and test GCL and its components in accordance with the Manufacturer's Quality Control Manual and GSI GRI GCL3; sample and test according to the stricter requirement if there are deviations. Test results not meeting the requirements specified in paragraph GCL will result in the rejection of applicable rolls. Describe procedures used to determine rejection of applicable rolls in the Manufacturer's Quality Control Manual. As a minimum, test rolls produced immediately prior to and immediately after the failed roll tested for the same failed parameter. Continue testing until a minimum of three successive rolls on both sides of the original failing roll pass the failed parameter. Submit manufacturer's certified raw and roll material data sheets. The certified data sheets must be attested to by a person having legal authority to bind the GCL manufacturing company. If needle punching or stitch bonding is used in construction of GCL, indicate that the GCL has been continuously inspected for broken needles using an in-line metal detector and all broken needles have been removed in the certification.

2.4.2 Shear Strength Testing

****

NOTE: Frictional resistance of GCL is highly dependent on the hydrating fluid, hydration state, confining stresses during saturation, confining stresses during shear, and strain rate. These parameters should be specified on a site specific basis. For interface shear strength testing, a set of direct shear tests should consist of a minimum of three tests performed at normal stresses bracketing the anticipated average normal field stresses. For additional discussion on the significance of GCL shear strength and design, see GRI-GCL5 Design Considerations for Geosynthetic Clay Liners (GCLs)

in Various Applications.

Tables 2 and 3 are from ASTM D6243/6243M; the Designer should verify that the tables are current if ASTM D6243/6243M is updated.

The hydration state of the GCL can have a significant effect on its shear strength. The shear strength of bentonite decreases with increasing moisture content. In addition, hydration of bentonite may affect the properties of reinforced GCL by stretching the reinforcement as the bentonite swells. For geotextile backed GCLs, interface shear strength is reduced due to the bentonite extruding into the interface. As a preliminary guideline, minimum hydration time should be 24 hours for mid-plane and interface shear strength testing. However, it must be pointed out that research indicates these hydration times will probably not result in complete hydration of the GCL. Hydration times of up to 25 days are required to attain complete hydration.

ASTM D6243/6243M indicates that strain/shear rates of 1 mm/min 0.04 in/min for interface shear and 0.1 mm/min 0.004 in/min for internal shear provide appropriate shear strengths for design when hydrated under normal stress of at least 7 kPa 1 psi and consolidated under normal stress of 70 kPa 10 psi. However, other conditions can require different hydrating/consolidation/strain parameters. Additional guidance on determining the appropriate strain rate to prevent the build-up of pore pressure is provided in ASTM D6243/D6243M.

****

Perform mid-plane and interface shear strength testing in accordance with ASTM D6243/D6243M. Submit mid-plane and interface shear strength test results at least [14][_____] calendar days prior to GCL shipment. Include the final moisture content of the GCL at the center of each specimen with the test results. Submit modifications to the test procedures described in this Section for approval prior to use.

2.4.2.1 Internal Shear Strength Testing

Perform [one set][[_____] sets] of internal shear tests. Conduct tests using the conditions specified in Table 2.

TABLE 2 - Internal Shear Strength Testing	
Material(s) for which shear will be	1 - [_____] 2 - [_____]
Side or characteristics for the side of material to be tested at the	1 - [_____] 2 - [_____]

TABLE 2 - Internal Shear Strength Testing	
Orientation of material	1 - [Machine Direction][Cross Direction][N/A] 2 - [Machine Direction][Cross Direction][N/A]
Soil Interface Compaction Density and Moisture Content (MC) (Note 1)	[Lightly Compacted] [Specified Density = [_____] kN/m3 [_____] lb/ft3] [As-received MC][Specified MC = [_____] percent] [Based on ASTM D698 test results: Maximum Dry Density = [_____] kN/m3 [_____] lb/ft3, Optimum MC = [_____] percent] [Based on ASTM D1557 test results: Maximum Dry Density = [_____] kN/m3 [_____] lb/ft3, Optimum MC = [_____] percent] If compaction unit weight and moisture content for soil placement based on ASTM D698 or ASTM D1557 test results, compaction [_____] percent of maximum dry unit weight and Moisture Content [optimum water content][plus [_____] percent relative to optimum][minus [_____] percent relative to optimum]
Conditioning of GCL	[Hydrated] [Partially hydrated to [_____] percent Water Content] [Wetted by pouring water over entire specimen] [Wetted by spraying water over entire specimen]
If GCL hydrated under applied normal load other than test normal load prior to application of test normal load	Normal load = [_____] kPa [_____] psi Minimum duration = [_____] hours
Conditioning of Other Geosynthetic Materials	[Wetted by pouring water over entire specimen] [Wetted by spraying water over entire specimen] [As-received]
Shear Test Normal Loads (Note 2)	[_____], [______],[_____], [______], [_____] kPa [_____], [______],[_____], [______], [_____] psi
List if there is a specified Normal Load Application Sequencey to be applied	[_____] hours
Interface saturation condition	[Inundated with Water - Interface is submerged in water prior to consolidation and through duration of shear][Spray Wetted - The interface is wetted using a spray bottle during placement of specimens, but not submerged in water][Dry - No addition of water during placement of specimens or shear]
Settling/Consolidatio time under test normal load prior to shearing	[_____]

TABLE 2 - Internal Shear Strength Testing	
Shear displacement rate	[0.1][_____] mm per minute [0.004][_____] inches per minute
Other test instructions	Provide free drainage along both sides of the GCL to aid in hydration. Do not relieve the normal stresses prior to or during shearing of the specimens. Run tests until peak strength is determined. Use [tap water][_____] for testing. [_____]
Note 1: Over-sized corrected test values from ASTM D698 and ASTM D1557 are typically not applied in calculating compaction density and moisture content as gradations minus 19.5 mm 0.75 in sieve of soil sample are used due to dimensions of most shear boxes. If requesting use of rock correction values to be applied, indicate so. Note 2: The normal loads selected should bracket the design normal loads being evaluated.	

2.4.2.2 Interface Shear Strength Testing

Perform [one set][[_____] sets] of interface direct shear tests on both interfaces of the GCL. Conduct tests using the conditions specified in Table 3. Place the other side of the GCL against the interface material on which the test will be run. Keep the interface material in place during hydration, consolidation, and shearing.

TABLE 3 - Interface Shear Strength Testing Properties	
Material(s) for which shear will be	1 - [_____] 2 - [_____]
Side or characteristics for the side of material to be tested at the	1 - [_____] 2 - [_____]
Orientation of material	1 - [Machine Direction][Cross Direction][N/A] 2 - [Machine Direction][Cross Direction][N/A]

Shear Test Normal Loads (Note 2)	[_____], [______],[_____], [______], [_____] kPa [_____], [______],[_____], [______], [_____] psi
List if there is a specified Normal Load Application Sequence to be applied	[_____]
Interface saturation condition	[Inundated with Water - Interface is submerged in water prior to consolidation and through duration of shear][Spray Wetted - The interface is wetted using a spray bottle during placement of specimens, but not submerged in water][Dry - No addition of water during placement of specimens or shear]
Settling/Consolidatio time under test normal load prior to shearing	[_____] hours
Shear displacement rate	[1][_____] mm per minute [0.04][_____] inches per minute

TABLE 3 - Interface Shear Strength Testing Properties	
Other test instructions	Provide free drainage along both sides of the GCL to aid in hydration. Do not relieve the normal stresses prior to or during shearing of the specimens. Run tests until a minimum total displacement of [50][_____] mm [2][_____] inches is reached. Use [tap water][_____] for testing.
Note 1: Over-sized corrected test values from ASTM D698 and D1557 are typically not applied in calculating compaction density and moisture content as gradations minus 19.5 mm 0.75 in sieve of soil sample are used due to dimensions of most shear boxes. If requesting use of rock correction values to be applied, indicate so. Note 2: The normal loads selected should bracket the design normal loads being evaluated.	

2.4.3 Product Acceptance

****

NOTE: The testing required in this paragraph and subparagraphs occurs at the project site. Some technical documents refer to this type of testing as "conformance testing". The need for and amount of CQC testing performed by the CQC laboratory should be determined on a site specific basis. Permeability and tensile strength tests are often performed at a reduced frequency in comparison to the mass per unit area test referenced in this paragraph. Daniel and Koerner (2007) presents an alternative approach to specifying testing frequencies on the basis of amount of GCL received.

****

2.4.3.1 Product Acceptance Samples

Collect CQC Product Acceptance samples at approved locations upon delivery to the site. Collect, package, and transport samples in accordance with ASTM D6072/D6072M and this paragraph. Identify samples with a waterproof marker; include the date and other information as specified in ASTM D6072/D6072M. Collect samples by cutting the full-width of the GCL sheet a minimum of 1 meter 3 feet wide in the machine direction. Collect and label an additional [610 by 610][_____] mm [24 by 24][_____] inch CQA Product Acceptance Sample and submit to the Contracting Officer each time CQC Product Acceptance samples are collected.[Collect all CQC and CQA Product Acceptance samples with the [Contracting Officer][_____] present].

2.4.3.2 Product Acceptance Tests

Provide CQC Product Acceptance samples to the CQC laboratory for testing as required in Table 4. Based on testing results, reject rolls and complete supplemental testing as described in paragraph MANUFACTURING SAMPLING AND TESTING.

TABLE 4 - PRODUCT ACCEPTANCE TESTS		
Property	Test Method	Test Frequency
Bentonite Mass per Unit Area	ASTM D5993	[once per [10,000][_____] square meters [100,000][_____]
Swell Index	ASTM D5890	[once per [10,000][_____] square meters [100,000][_____]
Flux	ASTM D5887/D5887M	[once per [10,000][_____] square meters [100,000][_____]
Internal Shear Strength	ASTM D6243/D6243M	[once per [10,000][_____] square meters [100,000][_____]
Peel Strength (1)	ASTM D6496/D6496M	[once per [4,000][_____] square meters [45,000][_____] square feet] [_____]
Tensile Strength, MD	ASTM D6768/D6768M	[once per [10,000][_____] square meters [100,000][_____]
[_____]	[_____]	[_____]
(1) Peel Strength testing is not applicable for a non-reinforced GCL.		

PART 3 EXECUTION

****

NOTE: Designers may wish to consult ASTM D6102 Standard Guide for Installation of Geosynthetic Clay Liners when using this UFGS section. ASTM D6102 is not written in a way that it can wholly replace a project specification, but it does provide useful information and refences as well as example GCL penetration details and CQA checklists. The execution concepts discussed in the 2023 version of that ASTM are substantially addressed in this UFGS section.

****

3.1 CERTIFICATES OF SUBGRADE ACCEPTANCE

****

NOTE: An example Certificate of Subgrade Acceptance can be found in the USACE Engineering Manual EM 1110-1-4011 Construction Quality Assurance (CQA) Plan - Requirements for Hazardous Waste Landfills. The list of subgrade conditions in this paragraph is written assuming that the GCL is underlain by soil;

if a different subgrade is used such as a geosynthetic, the examination items specified below should be revised (e.g. requirements related to rutting, soil surfaces, etc. will not be necessary).

Guidance from GCL manufacturers indicates that in applications where a GCL is the sole barrier providing containment, subgrade surfaces consisting of granular soils or gravel may not be appropriate due to large void content. Minimum recommended properties of subgrade in this application are greater than 80% of soil finer than 0.25 mm #60 sieve and no particles larger than 25 mm 1 inch. This requirement should be included in a specification section for subgrade preparation, but could also be included in this specification section at the discretion of the Designer.

****

Each day during placement of GCL, the CQC Inspector [and Contracting Officer] and installer must inspect the surface on which GCL is to be placed and certify in writing on a Certificate of Subgrade Acceptance that the surface is acceptable. Examine the subgrade for compliance with the items in the list below. Perform repairs to the subgrade in accordance with paragraph PREPARATION, and at no additional cost to the Government.

a. A project-qualified land surveyor has verified the lines and grades of the subgrade meet project design.

b. All CQC and CQA of the underlying soils or geosynthetics has been completed and results have been accepted by the Contracting Officer.

c. The subgrade is free of irregularities, protrusions, loose soil, ice, standing water, and abrupt changes in grade.

d. The subgrade is not excessively deformed or rutted by construction equipment used to deploy GCL rolls. Ruts should not exceed [25][_____] mm [1][_____] inch in depth.

e. The underlying soil surface (if present) does not contain stones, litter, or organic matter which may be damaging to the GCL. Rocks larger than [13][_____] mm [0.5][_____] inch in diameter and any other material which could damage the GCL must be removed from the surface to be covered with the GCL.

f. If installed on soil, no area of the underlying soil surface is excessively softened by high water content.

g. If installed on soil, no area of the underlying soil surface contains desiccation cracks which may damage the GCL.

3.2 PREPARATION

3.2.1 Subgrade Repair

****

NOTE: Ensure other sections of the specification package adequately address compaction requirements for soil subgrade layers. If the geomembrane is

placed directly on top of a compacted clay layer, reference Section 02 56 13.16 CLAY WASTE CONTAINMENT for repairs/preparation. If the GCL is placed onto a geomembrane, reference Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT.
****

For any subgrade found deficient in accordance with paragraph EXAMINATION, perform repairs in accordance with [Section 31 00 00 EARTHWORK][Section 02 56 13.16 CLAY WASTE CONTAINMENT][Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT][_____].

3.2.2 Anchor Trench

****
NOTE: Anchor trench dimensions are often site-specific and are therefore defined in the project drawings. If that is the case, replace the dimensioning sentences with a reference to the project drawings/plans. Dimensions for a 90 degree anchor trench are included in the paragraph; if other standard anchor trench designs such as a "V" trench or horizontal runout are used instead, replace the dimensions as appropriate.
****

Where anchor trenches are required, place them a minimum of [610][_____] mm [24][_____] inches back from the edge of slopes to be covered. Make anchor trenches a minimum of [610][_____] mm [24][_____] inches deep and [457][_____] mm [18][_____] inches wide. If the anchor trench is excavated in cohesive soil susceptible to desiccation, excavate only the quantity of anchor trench required for placement of GCL in a single day. Remove ponded water from the anchor trench while the trench is open. Round the front edge of the trench so as to eliminate sharp corners that could damage the GCL. Remove loose soil, rocks larger than [13][_____] mm [0.5][_____] inch in diameter, and any other material which could damage the GCL from the surfaces of the trench. Extend the GCL down the front wall and across the bottom of the anchor trench. Use soils for backfill with a maximum particle size of 25 mm 1.0 inch. Compaction and testing requirements are described in [Section 31 00 00 EARTHWORK][_____].

3.3 GCL INSTALLATION

3.3.1 CGL Placement

****
NOTE: An optional requirement is provided for using a rub/slip sheet when placing the GCL. Rub sheets are thin sheets of plastic placed between the GCL and another surface. Rub sheets facilitate movement/placement of the GCL, particularly when the GCL is in contact with a textured geomembrane or other geosynthetic.
****

At least [seven][_____] calendar days prior to placement, submit GCL manufacturer's installation instructions detailing the following:

a. Penetration completion methods.

b. Acceptable temporary ballasting methods.

c. Seam overlap dimensions.

d. Accessory bentonite placement rates.

e. Method(s) of securing repair patches to underlying GCL.

Complete GCL placement in accordance with the GCL manufacturer's installation instructions and this paragraph. Install GCL as soon as practical after completion and approval of the subgrade. Deliver rolls to the work area in their original packaging. Immediately prior to deployment, carefully remove the packaging without damaging the GCL. If the subgrade is soil, construction equipment may be used to deploy GCL. If the subgrade is a geosynthetic, deploy GCL by hand or by use of approved light weight equipment with pneumatic tires which will not damage the underlying geosynthetic. Do not operate equipment on the top surface of the GCL. On side slopes, anchor GCL at the top and deploy down the slope to minimize wrinkles. Minimize dragging of GCL panels over the ground surface.[Deploy a [rub][slip] sheet (e.g. 0.50 mm 20 -mil smooth HDPE) when placing the GCL and carefully remove the rub sheet to avoid shifting the geomembrane once the geomembrane is in place.] Lay deployed GCL panels flat on the subgrade surface, with no wrinkles or folds.

3.3.2 Seams

****

NOTE: The geomembrane portion of geomembrane-backed GCLs may be seamed/welded together. Refer to Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT for geomembrane seaming requirements. The Designer may wish to consult GSI GRI GCL6 Practice for Field Seaming of Overlapped Geosynthetic Clay Liners (GCLs).

****

Completely unroll and layout adjacent GCL [panels][sheets] before performing field seaming. On side slopes, place GCL with seams oriented parallel to the line of maximum slope and free of tension or stress upon completion of installation. Position panels with the overlap recommended by the manufacturer, but not less than 150 mm 6 inches for panel sides or 500 mm 20 inches for panel ends. Remove soil or other foreign matter from the overlap area immediately prior to seaming. If recommended by the manufacturer, place accessory bentonite along the entire overlap width at a minimum rate of 0.37 kg/linear meter 0.25 lbs./linear foot or as recommended by the manufacturer. Use construction adhesive or other approved seaming methods recommended by the manufacturer for horizontal seams on slopes. Construct overlaps which occur on slopes with the up slope GCL shingled over the down slope GCL. Alternate seaming methods approved by the manufacturer may be proposed.

3.3.3 Penetrations

Install penetrations (e.g., pipe vents, boots, sleeves) as shown on the drawings and in accordance with any manufacturer's recommendations. Place dry bentonite or bentonite paste around the penetration as recommended by the GCL manufacturer.

3.3.4 Defects and Repairs

Repair holes, tears, or other defects in GCL by placing a patch of the same GCL extending a minimum of 305 mm 12 inches beyond the edges of the hole or tear on all sides. If recommended by the manufacturer, apply accessory bentonite in the overlap area. Secure patches to the underlying GCL with a construction adhesive or other approved methods as recommended by the manufacturer. Remove and replace GCL which has been hydrated prior to being covered by an overlying geomembrane or a minimum of 305 mm 12 inches of cover soil.

3.4 FIELD QUALITY CONTROL

3.4.1 Visual Inspection and Evaluation

Immediately prior to covering or at the end of each day GCL is installed (whichever comes first), the CQC inspector[and Contracting Officer] must[will] visually inspect the GCL, seams, and non-seam areas for defects, holes, evidence of hydrated GCL, proper orientation of the GCL (top and bottom sides), seaming practices, or damage due to weather conditions or construction activities. Hydrated GCL is defined as having become soft as determined by squeezing the material with finger pressure or material which has exhibited swelling. At the Contracting Officer's or the CQC inspector's discretion, the surface of the GCL must be brushed or blown by the installer if the quantity of dust, mud, or foreign material inhibits inspection or functioning of the overlying material. Repair each location where defects are identified in accordance with paragraph DEFECTS AND REPAIRS. Submit a Visual Inspection and Evaluation report for each day that GCL is installed.

3.5 PROTECTION AND COVERING

3.5.1 Protection

Unpack and install only those GCL panels which can be anchored and covered in the same day. If exposed GCL cannot be permanently covered before the end of a working day, temporarily cover with plastic or other waterproof material to prevent hydration. Ballast the temporary cover and ensure that water cannot enter from the sides. Do not leave any tools or equipment on the GCL after active work ceases in the area.

3.5.2 Covering

****

NOTE: This paragraph should be modified or removed if the GCL will be covered by another geosynthetic layer.

Generally, cover soil should have a maximum particle size of 25 mm1 inch or less. The required maximum particle size should be based on design and compatible with the manufacturer's recommendations. Final thickness of cover soil is typically at least 305 mm1 foot thick to provide confining stress, eliminate the potential for seam separation, and prevent damage from equipment, soil erosion, etc.

In cases where a non-aqueous liquid (i.e. jet fuel, gasoline, etc.) is being contained by the GCL, it

may be necessary to hydrate the GCL with water prior to use. Hydration may be accomplished by introducing water into the containment area either by flooding or by the use of sprinklers. The GCL supplier should be contacted for specific procedures if manual hydration is necessary.

****

Do not cover GCL prior to inspection and approval by the CQC Inspector [and Contracting Officer]. Use cover soil that is free of angular stones or other foreign matter which could damage the GCL. A maximum particle size of the cover soil greater than [25][_____] mm [1][_____] inch is unacceptable. Do not drop cover soil directly onto the GCL from a height greater than 1 meter 3 feet. Push the soil out over the GCL in an upward tumbling motion. The direction of backfilling must proceed in the direction of down gradient shingling of GCL overlaps; except that on side slopes, place soil backfill from the bottom of the slope upward. Place cover soil such that soil does not enter the GCL overlap zone and tensile stress are not mobilized in the GCL. Do not operate equipment on the top surface of the GCL. The initial loose soil lift thickness must be [305][_____] mm [12][_____] inches. Use equipment with ground pressures less than 50 kPa 7.0 psi to place the first lift over the GCL. Maintain a minimum of [305][610][915][_____] mm [12][24][36][_____] inches of soil between construction equipment with ground pressures greater than 50 kPa 7 psi and the GCL during the covering process. While placing cover soil do not operate equipment by stopping abruptly, making sharp turns, spinning their wheels, or traveling at speeds exceeding [2.2][_____] m/s [5][_____] mph. Cover soil compaction and testing requirements are described in [Section 31 00 00 EARTHWORK][_____].

3.6 AS-BUILT DRAWINGS

Submit final as-built drawings of the GCL installation. Include panel numbers with a unique identifier that can be linked to the roll number/factory panel number, location of repairs, and penetrations in these drawings.

SECTION 02 61 13

EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL
02/25

****

NOTE: This guide specification covers the requirements for excavation, handling, and temporary storage of contaminated material.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

1.1 UNIT PRICES

****

NOTE: These paragraphs should be edited based on whether the contract will use a single job price, or unit prices. If there is a separate Measurement and Payment Section, edited versions of these paragraphs should be inserted in that section.

The amount of contaminated material to be excavated is often subject to uncertainty due to the difficulty in fully characterizing subsurface conditions prior to excavation. For this reason, single job pricing that is fair to both the

Government and Contractor can be a challenge. One option if using single job pricing is to set the base bid using the best estimate of the amount of contaminated material to be excavated and include options that can be exercised for additional volumes or weights. Coordinate requirements of these paragraphs with the bidding schedule.

****

1.1.1 Measurement

****

NOTE: Options are provided for payment by either volume or weight. If payment is on a weight basis, weights must either be measured on-site using a scale system (provided by the Government or the Contractor) or off-site at the point of disposal (e.g. a landfill).

****

Base measurement for excavation and onsite handling on the[actual number of cubic meters cubic yards of contaminated material in-place prior to excavation. Base determination of the volume of contaminated material excavated on cross-sectional volume determination reflecting the differential between the original elevations of the top of the contaminated material and the final elevations after removal of the contaminated material.][metric tons tons of contaminated material excavated. Use a properly calibrated weighing system to accurately measure the gross (bulk) weight of the contaminated material. Covert the measured gross (bulk) weight of the contaminated material to dry weight based on the[percent moisture content][_____] of representative contaminated material samples. Determine the percent moisture content in accordance with[ASTM D2216][ASTM D4643][ASTM D4959][_____]. Determine moisture content[daily.][for every [500][_____] metric tons tons of excavated contaminated material.]] Base measurement for construction, maintenance, and removal of stockpile areas on the number of square meters square yards of stockpile liner constructed.

1.1.2 Payment

1.1.2.1 Excavation and Handling

Compensation for excavation and onsite handling of contaminated material will be paid as a unit cost. Include any other items incidental to excavation and handling not defined as having a specific unit cost.

1.1.2.2 Stockpiling

Compensation for construction of stockpile areas will be paid for as a unit cost. Include all aspects of grading stockpile areas, preparation of stockpile areas, handling and placing contaminated materials in the stockpiles, maintenance of stockpile liners covers, leachate collection systems, removal of contaminated materials from stockpiles, disposal of stockpile cover materials and liner materials, and all other items incidental to construction of stockpiles in the unit cost.

1.1.2.3 Other Work Items

****

NOTE: If extensive dewatering to facilitate excavation of contaminated materials may be needed, or dewatering quantities are especially uncertain, consider including a separate unit price payment item for dewatering.

****

Payment for other work items not included in the above paragraphs will be included in the payment for the base bid for excavation, handling, and temporary storage of the contaminated materials. The other work items include preparation of submittals, mobilization and demobilization, site preparation, environmental compliance monitoring, health and safety monitoring and controls, and utilities required for the project if approved by the Government as necessary for the project.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D2216	(2019) Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass

U.S. ENVIRONMENTAL PROTECTION AGENCY (EPA)

EPA 505-B-04-900A	(2005) Intergovernmental Data Quality Task Force - Uniform Federal Policy for Quality Assurance Project Plans: Evaluating, Assessing, and Documenting Environmental Data Collection and Use Programs Part 1: UFP-QAPP Manual
UFP-QAPP WKSTS	(2012) Intergovernmental Data Quality Task Force - Uniform Federal Policy for Quality Assurance Project Plans, Optimized UFP-QAPP Worksheets

1.3 SYSTEM DESCRIPTION

****

NOTE: The Designer should include the bracketed text if the amount and type of debris anticipated to be present in the PCB-contaminated soil will not impact the work described in this section and referenced sections. If the amount or type of debris is significant (see Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, for definitions related to debris), this section and associated sections should be edited to indicate how debris will be managed.

****

The work consists of excavation and temporary storage of approximately[cubic meters cubic yards][metric tons tons][_____] of contaminated material[and any debris contained within the contaminated material].

1.3.1 Design Requirements

1.3.1.1 Excavation Work Plan

****

NOTE: The Designer may wish to require the Excavation Work Plan, UFP-QAPP, and any other preconstruction submittals required under this section to be completed concurrently or with all other plans being appendices of one primary plan. This section should be edited to reflect such a requirement if applicable.

****

Submit an Excavation Work Plan within [30][_____] calendar days after notice to proceed. Do not perform work at the site, with the exception of site inspections and surveys, until the work plan is approved. Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Excavation Work Plan. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. No adjustment for time or money will be made if resubmittals of the work plan are required due to deficiencies in the plan. At a minimum, include the following in the work plan:

a. Schedule of activities.

b. Method of excavation and equipment to be used.

c. Shoring or side-wall slopes proposed.

d. Dewatering and Leachate Management Plan which includes: anticipated sources and quantities of water that will enter the excavation, means of removing water from the excavation, means of storage and treatment, discharge requirements, and discharge methods.

e. Storage methods and locations for liquid and solid contaminated material. Provide design details for stockpiles including but not limited to: geomembrane liner and cover, berms, anchors/ballast for cover, vehicle access points, and leachate collection sumps.

f. Haul routes.

g. Decontamination procedures developed in accordance with[Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____].

h. Temporary use areas required for staging equipment and supplies, for temporary storage of excavated materials, or for stockpiles.

1.3.1.2 Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the 2012 UFP-QAPP WKSTS. Submit the UFP-QAPP within [30][_____] calendar days after notice to proceed. Do not perform work at the site, with the exception of site inspection and surveys, until the UFP-QAPP is approved. Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the UFP-QAPP. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Tailor the content to the requirements of the project and the site conditions. If field analyses methods are used as described in paragraph EXCAVATION, include those field analysis in the UFP-QAPP.

1.3.2 Performance Requirements

****

NOTE: This paragraph provides for two approaches to excavation of contaminated materials. The first approach is to excavate only a fixed volume of contaminated material. This approach could be used in a situation where excavation cannot proceed beyond certain limits, or excavation is being used to target hot-spots of contamination only. If this approach is used, the bracketed text and Table should be deleted. The second approach is to excavate to "clean" soil, using post-excavation

confirmation samples to demonstrate achievement of cleanup goals. Cleanup goals should be determined on a site-specific basis considering the purpose of the excavation, applicable regulations, and other criteria. Ideally, cleanup goals will be defined in a site-specific decision document. Guidance on defining cleanup goals is beyond the scope of this section.

****

Excavate to the limits as shown on the drawings.[When excavation samples collected in accordance with paragraph FIELD QUALITY CONTROL indicate that remaining contaminant concentrations exceed the cleanup goals specified in Table 1, conduct additional excavations to achieve the cleanup goals in the excavation.

TABLE 1 - CLEANUP GOALS FOR EXCAVATION BASE AND SIDEWALLS

CONTAMINANT	TOTAL CONCENTRATION IN EXCAVATION BASE/SIDEWALL
[_____]	[_____] mg/kg
[_____]	[_____] mg/kg
[_____]	[_____] mg/kg

][1.4 PRE-INSTALLATION MEETING

****

NOTE: Delete this paragraph if a separate specification section is developed for the entire project to cover pre-installation meetings and other administrative requirements.

****

Conduct a pre-installation meeting at the jobsite[at least five business days prior to the start of operations on the project][_____]. The pre-installation meeting is to be arranged by the Contractor and is to follow the written pre-installation meeting agenda submitted prior to the meeting. The purpose of this meeting is to review the requirements of this specification and the associated plans. The following individuals must be in attendance at this meeting: Contractor's Project Manager and Site Foreman and [Contracting Officer][_____].

Record pre-installation meeting minutes and publish via email within 48 hours to all attendees. The minutes must be re-published within 48 hours via email pending any subsequent comments from the attendees.

]1.5 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity

or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Pre-Installation Meeting Agenda

Pre-Installation Meeting Minutes; G, [_____]

Excavation Work Plan; G, [_____]

Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP); G, [_____]

Pre-Installation Examination Report

Pre-Construction Equipment Examination

SD-02 Shop Drawings

Surveys

SD-06 Test Reports

Dewatering Performance Records

SD-07 Certificates

Qualifications; G, [_____]

SD-11 Closeout Submittals

Closeout Report; G, [_____]

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

1.6.1.1 Permits and Licenses

****

NOTE: For sites addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. The permits or permit equivalents may include those addressing air emissions, water discharge, stormwater pollution prevention, and possibly others. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, such as 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, delete this section.

****

Coordinate and obtain all necessary [permits][permit equivalents] prior to the initiation of the relevant activities. Submit documentation of the completed permitting or permit equivalent to the Contracting Officer[as part of the Excavation Work Plan]. Comply with all Federal, state, and local regulations. Obtain the permits, permit equivalents and certifications, and meet the substantive regulatory requirements necessary for the execution of the project. For any of the above-listed items requiring a longer time frame, copies of applications, and scheduled dates for receiving final approval, must be included.

1.6.1.2 Environmental Protection

****

NOTE: This specification section does not attempt to provide comprehensive environmental protection requirements, but rather refers to a separate specification section that would be prepared using UFGS Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. Specific technical considerations for excavation projects are discussed below.

An air pathway analysis should be performed during design to determine what air monitoring and controls are required. Guidance on air pathway analyses is provided in EP 200-1-24 Air Pathway Analysis for the Design of Hazardous, Toxic, and Radioactive Waste (HTRW) Remedial Action Projects. Specify perimeter air monitoring requirements in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.

UFGS Section 01 57 19 provides information related to regulations of spills including notification and

response requirements. Spills on excavation projects can occur due to releases from equipment, fuel storage tanks, etc. Excavated materials can also be inadvertently spilled during transport between the excavation and storage locations. Lastly, although not directly related to spills, excavation projects have the potential to encounter unanticipated materials such as buried tanks, containers, munitions and explosive constituents, etc. An environmental protection plan prepared under Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS should include provisions for managing both spills and encountering unanticipated materials.

****

Develop and implement environmental protection requirements in accordance with[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____].

1.6.2 Qualifications

****

NOTE: Requirements for the Contractor's experience should be determined and specified based on the experience and availability of Contractors in the area as well as the complexity of the project. An option is included to require the Contractor to demonstrate experience with excavation of regulated hazardous waste/material. The Designer could also edit the option text to list specific contaminants applicable to the project.

****

1.6.2.1 Contractor Experience

Submit evidence of successful completion of at least [1][_____] project of comparable size and scope[for materials contaminated with[RCRA hazardous wastes][CERCLA hazardous material][_____]].

1.6.2.2 Key Personnel

Provide key personnel with a minimum of [3][_____] years of excavation field experience. Include the Site Foreman, quality control personnel, and supervisory engineering and technical staff involved with operation in key personnel. Perform all survey work under the supervision of a registered land surveyor licensed in the[applicable jurisdiction][State of [_____]]. Submit a list of these personnel with their qualifications.

1.6.2.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory meeting the requirements of[Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.7 [PROJECT][SITE] CONDITIONS

1.7.1 Environmental Requirements

****

NOTE: Revise this paragraph if requirements are provided in other specification sections, health and safety plans, environmental permits/permit equivalents, etc. The conditions described in the following paragraph represent challenges to environmental protection (winds causing dust, rain causing stormwater contamination), saturation of excavated materials (rain), or site damage (saturated soils).

****

Do not conduct excavation or handling of contaminated materials in the following conditions: [wind speeds in excess of [50][_____] kilometers [30][_____] miles per hour,][moderate rain greater than [5][_____] mm [0.2][_____] inches per hour,][saturated soils caused by recent [rains][snowmelt] such that equipment traffic would cause excessive rutting or damage].

1.7.2 Existing Conditions

****

NOTE: Include any pertinent information regarding project/site conditions in this paragraph, the appendices to the specifications, or on the drawings. If the contaminated material to be excavated contains a significant amount of debris, the available information about its extent and characterization should also be provided. Indicate the detail to which site characterization has been performed and indicate where obvious data gaps exist. The following information should be shown on the project drawings (unless the Contractor is required to develop any aspects of the project design under a performance-based project):

a. Overall site plan, borrow areas, stockpile areas, storage areas, security requirements, special shoring requirements, boring logs, and access routes.

b. Individual site plans of each area of contamination with site features such as buildings, roads, utilities, topography, trees, shrubs, surface conditions, etc.

c. Limits of pavement removal, fence removal, and the location of ancillary equipment to be removed.

****

The existing site conditions are presented[in Appendix [_____]][and][on the Drawings]. These include[physical configuration][utilities][topography][land uses][groundwater depth][geotechnical characteristics of the contaminated materials (including[grain size analysis][pH][moisture content][density][porosity])[hydrogeology][nature and extent of contamination][_____]]. The existing conditions presented are the result of site investigations at specific locations; variations in the existing site conditions could occur. Perform an independent interpretation of the site characterization data. Notify the Contracting Officer within [48 hours][_____] if discrepancies between the data provided and actual field conditions are discovered.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Backfill

****

NOTE: If Section 31 00 00 EARTHWORK is not in the project, backfill information can be copied from that section and edited as appropriate.

The paragraph ENVIRONMENTAL REQUIREMENTS FOR OFF-SITE SOIL in Section 31 00 00 EARTHWORK should be edited to include an appropriate list of chemical testing parameters for off-site soil. Some backfill sources may have chemical testing data already available; the Government should require chemical testing if the backfill chemical testing data is inadequate or does not exist. Off-site backfill should not be tested for only the site contaminants of concern. At a minimum, samples should be analyzed for target contaminant list (TCL) VOCs, TCL SVOCs, target analyte list (TAL) Metals, and Pesticides/PCBs. Additional analyses such as Total Petroleum Hydrocarbons may be appropriate also. Individual States or military installations may require or recommend additional parameters. Typical frequency of sampling would be one sample per 1,900 to 2,300 cubic meters 2,500 to 3,000 cubic yards. However, individual States or military installations may require or recommend more frequent or less frequent sampling.

In many cases, the degree of engineering control of the materials used as backfill may not need to be as stringent as described in Section 31 00 00 EARTHWORK. In other cases, such as under pavements, special compaction and material requirements may apply and the specifications will need to address these special requirements.

At some sites, previously contaminated material which has been removed from the excavation is reused as backfill following treatment to remove the contaminant of concern.

****

Provide backfill in accordance with[Section 31 00 00 EARTHWORK][_____].

2.1.2 Topsoil

****

NOTE: If Section 31 00 00 EARTHWORK is not in the

project, topsoil information can be copied from that section and edited as appropriate. Section 31 00 00 EARTHWORK includes a provision to strip existing on-site topsoil for re-use. The project specifications should only allow that practice if topsoil has been tested or will be tested to confirm that it is not considered contaminated.

****

Provide topsoil in accordance with the requirements in[Section 31 00 00 EARTHWORK][_____]. Stripping existing topsoil for re-use on-site[is][is not] allowed.

2.1.3 Geomembrane

****

NOTE: If Section 02 56 13.16 GEOMEMBRANE WASTE CONTAINMENT is not in the project, geomembrane material information can be copied from that section and edited as appropriate.

Scrim reinforced geomembranes are commonly specified for stockpile covers and liners. Due to their higher strength properties, scrim reinforced geomembranes can generally be thinner than non-reinforced geomembranes. For bottom liners, a commonly used minimum thickness is 0.5 mm (20 mils) for non-reinforced geomembrane and for scrim reinforced geomembranes a common minimum weight is 20 kg/100 square meter (40 lbs./1000 square feet). For stockpile cover geomembranes, a commonly used minimum thickness is 0.25 mm (10 mils) for non-reinforced geomembrane and for scrim reinforced geomembranes a common minimum weight is 13 kg/100 square meter 26 lbs./1000 square feet.

Section 02 56 13.16 GEOMEMBRANE WASTE CONTAINMENT includes substantial levels of effort for construction quality control and construction quality assurance (CQC/CQA) that are meant to ensure performance when geomembranes are used in long-term applications like a landfill. For use of geomembranes in temporary stockpiles of contaminated soils, the designer should consider reducing the level of CQC/CQA in Section 02 56 13.16 GEOMEMBRANE WASTE CONTAINMENT. Specific CQC/CQA requirements that could be reduced include Qualifications, requirements for Layout and Detail Drawings, Tests/Inspections/Verifications of materials conducted off-site, and on-site CQA/CQC of Field Seams. Reduced material requirements for temporary applications of geomembranes can also be considered; instead of using HDPE geomembranes that are 1 mm (40 mil) or greater (typical for landfills), other materials such as PVC may be appropriate.

****

Provide geomembranes for lining [and][or] covering contaminated material stockpiles. Provide geomembranes in accordance with[Section 02 56 13.16

GEOMEMBRANE WASTE CONTAINMENT][_____].

2.2 EQUIPMENT

2.2.1 Scales

****

NOTE: This paragraph is primarily intended to ensure that calibrated scales are being used to weigh excavated contaminated material, when weight is being used as the basis for measurement and payment. If off-site scales will be used (e.g. at a weighing station or disposal facility), this paragraph can be deleted.

****

Provide scales of sufficient length to permit simultaneous weighing of all axle loads and with an accuracy within 0.2 percent throughout the range of the scales. Ensure the scale's accuracy conforms to the applicable requirements of NIST HB 44 and is certified[by an acceptable scales company representative][by an inspector of the State Inspection Bureau charged with scales inspection within the state in which the project is located] prior to weighing any excavated contaminated material.[Locate the scales at the site of work.][Ensure the scales are capable of printing a weight ticket including time, date, truck number, and weight.] Perform a check of calibration of measuring equipment prior to initial use, and once every [7][_____] calendar days. The requirements of this paragraph do not apply to measurement of chemical data.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Surveys

****

NOTE: If payment for the project is based on a single job price or based on weight of material exported/imported from the site, then a highly accurate survey by a registered land surveyor may not be necessary. A lower level of effort in these cases could be to require the Contractor to survey only the excavation, using a handheld, sub-meter accurate GPS unit.

****

Perform surveys immediately prior to and after excavation of contaminated material to determine the volume of contaminated material removed. Provide cross-sections on [7.6][_____] meter [25][_____] foot intervals and at break points for all excavated areas. Survey and show locations of confirmation samples on the drawings. Perform surveys in accordance with Section: [_____].

3.1.2 Conditions

Conduct a pre-installation examination of the on-site infrastructure, utility conduits, monitoring points, site access constraints, and infrastructure. Photographically document, with identifying labels, the existing condition of infrastructure and utilities, particularly for comparison to post-excavation conditions. Verify locations of critical utilities that cannot be disrupted and those utilities that would potentially have significant impacts on excavation and public safety. Submit a Pre-Installation Examination Report documenting the examination activity. Obtain all necessary utility clearances before initiation of subsurface work.

3.1.3 Pre-Construction Equipment Examination

Conduct a pre-construction examination of the excavation equipment for any damage, defect, and dilapidation. Submit the results of the pre-construction examination to the Contracting Officer for review and information. The Contracting Officer may conduct an independent examination to ascertain the condition and functionality of the equipment. Based on this examination, the Contracting Officer has the right to reject any damaged, defective or dilapidated equipment. The cost associated with equipment or control replacement or repair, and delays caused by the rejection must be borne by the Contractor. Routinely and properly inspect and maintain the equipment to provide the project execution as required by the contract schedule. Any schedule delay and cost associated with power failure, improper functioning of equipment and controls, unavailability of labor and materials, etc., must be the responsibility of the Contractor.

3.2 PREPARATION

3.2.1 Mobilization

****

NOTE: Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES includes requirements for decontaminating equipment that has been used in contaminated zones. That section should be modified to extend decontamination/cleaning requirements to equipment being brought on-site to cover the requirements of this paragraph.

****

Do not mobilize to the site until the [Excavation Work Plan][_____] has been approved by the Contracting Officer and the Contractor has received written confirmation. Delays caused by the Contractor's failure to meet regulatory requirements must result in no additional cost to the Government. In accordance with[Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____], the equipment which is rented [and][or] previously used for other site remediation must be decontaminated and tested for contaminants of concern before being brought to the site.

3.2.2 Clearing

****

NOTE: Grubbing is typically not required at sites where contaminated soil is being excavated for treatment and/or disposal. Typically, vegetation that is cut off above a certain height is defined as clean and any stumps and brush below this height are defined as contaminated.

****

Perform clearing to the limits[shown on the drawings][defined in the Excavation Work Plan][_____] in accordance with[Section 31 11 00 CLEARING AND GRUBBING][_____].

3.3 CONTAMINATED MATERIAL REMOVAL

Notify the Contracting Officer [_____] calendar days prior to the start of excavation of contaminated material. The [Contracting Officer][Contractor] is responsible for contacting regulatory agencies in accordance with the applicable reporting requirements.

3.3.1 Excavation

****

NOTE: For large excavations, more than one excavation log may be required.

When the intent of excavation is to remove all contamination exceeding cleanup goals, the use of onsite field screening or field analysis (supported at a prescribed frequency by fixed laboratory analysis) should be encouraged to avoid prolonged delays or equipment downtime. Optional text is provided for using field screening/field analysis. Common field analytical tools include handheld X-ray fluorescence (XRF) analyzers for measuring metals concentrations, photoionization detector (PID) or flame ionization detectors (FID) for measuring volatile organics, and various field screening kits for measuring individual chemicals or groups of chemicals.

****

Excavate areas of contamination to meet the requirements in paragraph PERFORMANCE REQUIREMENTS.[After all material suspected of being contaminated has been removed, examine the excavation for evidence of contamination. If the excavation appears to be free of contamination, use field analysis to determine the presence of contamination using[a real time vapor monitoring instrument][X-ray fluorescence analyzer][immunoassay field kits][_____]. Calibrate and use field analysis equipment in accordance with manufacturer instructions[and the UFP QAPP]. Excavate additional material as directed by the Contracting Officer.] Maintain an excavation log describing visible signs of contamination encountered for each area of excavation. Prepare excavation logs in accordance with ASTM D5434.

Use methods and equipment that result in minimal disturbance to remaining soil beyond the excavation limits. Remove and dispose of any material that becomes contaminated as a result of the Contractor's operation at no additional cost to the Government. Stage operations to minimize the time the contaminated soil is exposed to the weather .

3.3.2 Shoring, Sloping, or Bracing

Implement shoring, sloping, bracing, or any other excavation health and safety requirements in accordance with[Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS][_____].

3.3.3 Dewatering

****

NOTE: Dewatering can significantly increase the cost of a project involving the excavation of contaminated material and should be carefully considered during design. UFC 3-220-05 Dewatering and Groundwater Control provides guidance on the design of dewatering systems.

If water from dewatering operations will be allowed to discharge onto the ground, a National Pollutant Discharge Elimination System (NPDES) permit for dewatering may be required (see Paragraph REGULATORY REQUIREMENTS Designer's Note for more details on permits). Reference the permits paragraph of Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS for permit requirements.

Note that Section 31 00 00 EARTHWORK also includes dewatering requirements, but they are limited in scope and do not include any consideration of collection, treatment, sampling, or discharge of contaminated waters. If Section 31 00 00 EARTHWORK is included in the project, either delete dewatering requirements from that section or cut and paste the dewatering requirements from this section into Section 31 00 00.

****

Divert surface water to prevent entry into the excavation.[Limit dewatering to that necessary to assure adequate access, a safe excavation, prevent the spread of contamination, and to ensure that compaction requirements can be met.][Do not perform dewatering without prior approval of the Contracting Officer.] Conduct dewatering in accordance with the Dewatering and Leachate Management Plan developed as part of the Excavation Work Plan.

[3.3.3.1 Collection and Disposal of Incidental Contaminated Water

****

NOTE: Determine appropriate disposal method. Choose this paragraph when significant quantities of groundwater will not be encountered and only small amounts of rinse and other contaminated waters are expected.

****

Collect rinsewater. Collect ground, surface, and rain water contaminated by operations including water collected in the open excavation pit or temporary containment. Soak up with absorbent material so that no free liquid is present. Containerize, sample, and analyze contaminant absorbed material and dispose of as specified for contaminated soils.

][3.3.3.2 Collection, Treatment, and Discharge of Contaminated Water

****

NOTE: Choose these paragraphs when groundwater will be encountered or when significant amount of rinse

water or other contaminated water is expected, and on-site treatment is allowed. Typical treatment system consists of particulate/suspended solids removal by various means such as settling or filtration and contaminant removal by carbon filtration. Location of discharge for water after it is treated must be coordinated and approved by appropriate (EPA, State, station, local, and regional) authority.

Another option to consider is to containerize liquid and haul to off-site publicly-owned treatment works (POTW) with pretreatment capability, however this can be extremely costly for large quantities of water. Use unit pricing, assumed quantities, or some other method to give Contractor something to base bids on when water is to be taken off site. Where off site facilities are involved, verify such facilities exist, that they are permitted to accept, and that they will accept the liquid waste stream. Specification will require modifying for site specific requirements.

****

Furnish labor, materials, and equipment necessary for collecting, treating, and discharging of contaminated surface and subsurface water in excavations at the site. Conduct excavation and backfilling operations at the site in a manner that minimizes the amount of surface and subsurface water which may collect in the open excavation. Collect standing surface water in contact with contaminated material.

3.3.3.2.1 Subsurface Drainage

Remove water by pumping or other methods to prevent softening of surfaces exposed by excavation. Provide water treatment necessary to treat water to levels specified in the Dewatering and Leachate Management Plan. Operate dewatering system continuously until construction work below static water levels is complete. Submit Dewatering Performance Records weekly. Measure and record performance of the dewatering system at the same time each day by use of observation wells or piezometers installed in conjunction with the dewatering system.

3.3.3.2.2 Treatment System Requirements

The Contractor is responsible for all aspects of verifying design parameters designing, providing, installing, operating, maintaining, and removing collection, storage, and treatment facilities as required to discharge treated waters within the treatment limits required. The treatment system must:

a. Be capable of removing contaminants to below the limit defined in the Dewatering and Leachate Management Plan for contaminated water.

b. Include effluent holding tanks designed to allow on-site testing of water quality prior to discharge.

c. Include recycle capability for retreatment of effluent not meeting the discharge requirements of this specification, as determined by on-site testing.

3.3.3.2.3 Treatment System Operations

Monitor, test, and adjust the treatment system in accordance with the Dewatering and Leachate Management Plan[and [UFP-QAPP][and basewide QAPP][_____]], or as otherwise modified by special regulatory requirements. If there is a conflict between requirements, the more stringent requirement prevails.

3.3.3.2.4 Discharge of Treated Water

Do not discharge any water until tests results show water is below contaminated water limits as specified in the Dewatering and Leachate Management Plan. Provide erosion control at outlet of piping to minimize erosion. Discharge treated water to the [_____].

3.3.3.2.5 Cleanup and Removal of Treatment System

Upon completion of work, close and remove from the site the surface water and groundwater treatment system. Decontaminate equipment in accordance with the[Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____]. Containerize, sample, test, and dispose of carbon, residues, cleaning aids, decontamination liquids, and waste as specified for the contaminated soils.

]3.3.4 Contaminated Material Storage

****

NOTE: For CERCLA sites, permits are not required to store hazardous waste in a stockpile. However, storage structures and conditions must be in compliance with the Applicable, Relevant, and Appropriate Regulations (ARARs). For RCRA sites, permits are required to store hazardous waste in a stockpile. However, for RCRA sites, hazardous waste can be stored in a drum or roll-off unit for up to 90 days without a permit.

For temporary storage of more than 90 days, dual containment of hazardous liquid and some hazardous solids may be required. Containment system requirements are described in 40 CFR 264.175. For stockpiles that meet the definition of a waste pile, see 40 CFR 264.250.

To provide secondary containment, tanks and roll-off units are sometimes stored on lined areas similar in design to what is described in paragraph Contaminated Material Stockpiles.

****

Place material in temporary storage[immediately after excavation][after treatment while awaiting test results]. The following paragraphs describe acceptable methods of material storage. Provide storage units that are in good condition and constructed of materials that are compatible with the material or liquid to be stored. If multiple storage units are required, clearly label each unit with an identification number and keep a written log to track the source of contaminated material in each temporary storage unit.

3.3.4.1 Contaminated Material Stockpiles

****

NOTE: Check state regulations to determine the minimum requirements for stockpiles and modify this paragraph accordingly. For contaminated material with high moisture content, the subgrade for the stockpile must be sloped and a sump should be provided.

For post treatment stockpiles, chemical testing is usually required to determine if material is contaminated or clean. Maximum stockpile size should be based on the required frequency of chemical testing. For example, if chemical tests are required at a frequency of one per 1,000 cubic meters cubic yards, then stockpiles should be no greater than 1,000 cubic meters cubic yards in size.

As noted in paragraph GEOMEMBRANE, the Designer may wish to reduce the level of CQC/CQA requirements if using Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT as the requirement for installation of the stockpile bottom liner.

****

Construct stockpiles to isolate stored contaminated material from the environment. Cover stockpiles at the end of each workday. Stockpile size greater than [_____] cubic meters cubic yards is prohibited. Construct stockpiles to include:

a. [Place a geomembrane liner on a ground surface that is free of rocks greater than 13 mm 0.5 inches in diameter and any other object which could damage the membrane. Where multiple geomembrane panels are necessary to construct the liner, seam the panels together and test the seams in accordance with[manufacturer requirements][Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT]][Use pavement as the liner system. Construct pavement in accordance with Section [_____]].

b. Place a geomembrane cover over the stockpiles. Extend the cover material over the berms and anchor or ballast to prevent it from being removed or damaged by wind. Where multiple geomembrane panels are necessary to construct the cover, shingle the upslope panel over the downslope panel and overlap the panels at least [150][_____] mm [6][_____] inches. Secure the panels together using[ballast such as sandbags or tires][adhesives][thermal fusion seams][_____].

c. Construct berms surrounding the stockpile, a minimum of 300 mm 12 inches in height. Berm vehicle access points.

d. Slope the liner system to allow collection of leachate. Construct sumps to facilitate removal of leachate from the stockpile. Store and remove liquid which collects in the stockpile, in accordance with paragraph[COLLECTION AND DISPOSAL OF INCIDENTAL CONTAMINATED WATER][COLLECTION, TREATMENT, AND DISCHARGE OF CONTAMINATED WATER].

3.3.4.2 Roll-Off Units

Use water-tight roll-off units to temporarily store contaminated material. Place a cover over the units to prevent precipitation from contacting the stored material. Remove liquid which collects inside the units and store in accordance with paragraph[COLLECTION AND DISPOSAL OF INCIDENTAL CONTAMINATED WATER][COLLECTION, TREATMENT, AND DISCHARGE OF CONTAMINATED WATER].

3.3.5 Backfilling and [Finishing][Finish] Operations

Backfill excavations immediately after all contaminated materials have been removed and confirmation test results have been approved. Conduct backfilling and [finishing][finish] operations in accordance with[Section 31 00 00 EARTHWORK][_____].

3.3.6 Treatment and Disposal of Excavated Contaminated Material

****

NOTE: If excavated contaminated materials will be taken off-site for treatment (if necessary) and disposal, select the first set of bracketed text. If on-site treatment will be used, select the second set of bracketed text and indicate the section(s) that define the onsite treatment.

****

[Perform offsite disposal of excavated contaminated material in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS.][Perform treatment of excavated contaminated material onsite in accordance with Section [_____].]

[3.3.7 Closeout Report

****

NOTE: If there is a separate section in Division 01 that defines project close-out documentation, edited versions of this paragraph should be inserted in that section, and this paragraph deleted. In addition to progress photos, video has been used at some sites to record site activities.

****

Submit [_____] copies of a Closeout Report within [60][_____] calendar days of completing work at the site. Label the report with the contract number, project name, location, date, name of general Contractor, and the Government agency contracting for the work. As a minimum, include the following information:

a. A cover letter signed by a[responsible company official][Professional Engineer registered in the State of [_____] who is a responsible company official] certifying that all services involved have been performed in accordance with the terms and conditions of the contract documents and regulatory requirements.

b. A narrative report including, but not limited to, the following:

   (1) site conditions, ground water elevation, and cleanup goals;

(2) excavation logs;

(3) field screening readings;

(4) quantity of materials removed from each area of contamination;

(5) quantity of water/product removed during dewatering;

(6) sampling locations and sampling methods;

(7) sample collection data such as time of collection and method of preservation;

(8) sample chain-of-custody forms; and

(9) source of backfill.

c. Copies of all chemical and physical test results.

d. Copies of all manifests and land disposal restriction notifications.

e. Copies of all certifications of final disposal signed by the responsible disposal facility official.

f. Waste profile sheets.

g. Scale drawings showing limits of each excavation, limits of contamination, known underground utilities within 15 m 50 feet of excavation, sample locations, and sample identification numbers. Show on-site stockpile, storage, treatment, loading, and disposal areas on the drawings. Provide separate cross-sections of each excavation area before and after excavation and after backfilling, based on survey data.

h. Progress Photographs. Use color photographs to document progress of the work. Take a minimum of four views of the site showing the location of the area of contamination, [entrance][exit] road, and any other notable site conditions before work begins. After work has been started, photographically record [daily][weekly] activities at each work location. Provide photographs including:

(1) Soil removal and sampling.

(2) Dewatering operations.

(3) Unanticipated events such as spills and the discovery of additional contaminated material.

(4) Contaminated material/water storage, handling, treatment, and transport.

(5) Site or task-specific employee respiratory and personal protection.

(6) Fill placement and grading.

(7) Post-construction photographs. After completion of work at each site, take a minimum of four views of each excavation site.

Include a digital version of all photos shown in the report with the Closure Report. Provide photographs with a minimum of 181.11 pixels per cm

300 pixels per inch resolution for all photo files. Provide photos in a lossless compression file format that does not lose any pixels in the compression process (e.g. .TIFF, .PNG, and .GIF). Ensure no loss of original resolution from the raw photo if converted to a lossless format. Create digital images and metadata that meet or exceed the specifications of the Exchangeable Image File Format (EXIF) version [_____][2.3] or higher. In addition to the raw digital photo submissions, submit a PDF document as part of the Closeout Report displaying all required progress or other photos organized into separate documents. Render the photos in the PDF with a resolution that represents the original photo resolution to the human eye. Place photos according to their proper orientation (portrait or landscape). Create an index with bookmarks for each PDF organized by submittal section and suborganized by work area (if applicable) and then by date in the sequence which they were taken.

Process all raw photos for inclusion in the PDF submission with a border including a 13 mm 0.5 inch caption at the base of each photo for descriptive information. Include the following information for each photographic image in the caption:

Project Name
Contract Number
Contractor Name
Date
Station and Offset
Photo Number
Orientation View
Work Element Depicted
General Project Area

]3.4 FIELD QUALITY CONTROL

3.4.1 Tests

3.4.1.1 Sampling Excavations

****

NOTE: The number of confirmation samples must be based on the size of the excavation and regulatory requirements. For small excavations, a minimum of one sample should be taken from near the center of the excavation (or where there is the highest potential for contamination). It may be acceptable to change the number of samples during development of a UFP-QAPP, but the Designer should attempt to establish a reasonable sampling frequency in the specifications to provide a basis for the Contractor to bid the project. Additional samples may be oriented symmetrically relative to the center sample and the limits of the excavation. Incremental sampling should be considered as discussed below.

Many military facilities have base-wide sampling and analysis plans which have been approved by the applicable regulatory agencies. These plans may specify the number of confirmation samples which must be taken.

For larger excavations, EPA 230/02-89-042 Methods of

Evaluation and Attainment of Cleanup Standards provides guidance on the design of statistically based sampling intervals.

With regulator approval, confirmation sampling and analysis may be accomplished using an averaging technique for comparison to cleanup criteria. This is based on the fact that most soil risk exposure scenarios do not model contamination as existing in discrete hot spots but as a more disperse phenomenon. Two ways to accomplish this averaging technique are to take discrete samples and average the data or by using an incremental sampling approach. Incremental sampling has an objective of obtaining a single sample per decision unit for laboratory analysis. Further information on incremental sampling can be found in the Interstate Technology Regulatory Council's Incremental Sampling Methodology (ISM-1), February 2012 and update (ISM-2), October 2020.

Confirmation sampling at a site with radioactive contamination in surface soils or on building surfaces will be performed in accordance with the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM), NUREG-1575 Rev-1, EPA 402-R-97-016, Rev-1. This manual is a guide for confirmation survey design (planning) and for data evaluation. Its primary purpose is to acquire legally defensible data concerning the post excavation residual radioactivity at the site to demonstrate that the site meets release criteria.

The sentences regarding additional excavation would not be necessary if the project requirement is to only excavate a fixed volume of contaminated material as discussed in the Performance Requirements paragraph Designer's Note.
****

Collect excavation base and sidewall confirmation samples in accordance with the[UFP-QAPP][basewide QAPP][_____], and this paragraph. Collect confirmation samples at a minimum frequency of one per [_____] square meter square yard from the bottom [and each of the side walls]. Collect a minimum of one sample from the bottom [and each side wall] of the excavation. Collect samples as[discrete grabs][composites][incremental samples][_____]. Analyze samples for the contaminants identified in paragraph PERFORMANCE REQUIREMENTS. Complete all other sampling and analysis activities in accordance with the[UFP-QAPP][basewide QAPP][_____] (including but not limited to sample handling, preservation, transportation, [collection][analysis] of quality control samples, data validation, and data reporting). Any deviations to sampling frequency, number of samples, or sample collection methods must be[established in the approved[UFP-QAPP][basewide QAPP]][approved by the Contracting Officer].[Based on confirmation sample results, propose any additional excavation which may be required to remove material which is contaminated above the cleanup goals defined in paragraph PERFORMANCE REQUIREMENTS. Additional excavation is subject to approval by the Contracting Officer.] Mark locations of samples in the field and document on the as-built drawings.

3.4.1.2 Sampling of Stored Material

****

NOTE: Additional samples are sometimes collected from excavated material to determine the contaminants present prior to treatment or disposal.

Composite samples are often collected from stockpiled material. However, composite samples cannot be taken if the samples are being analyzed for volatile organic contaminants.

At sites with radioactive contamination, ex-situ sampling of excavated material is typically performed to ensure that the material meets disposal facility acceptance criteria and, in some cases, to assist with the preparation of shipping papers. The ex-situ sampling regime is site-specific. It is usually determined in consultation with the disposal facility and its regulatory agency.

****

Collect samples of stored material in accordance with the[UFP-QAPP][basewide QAPP][_____] and this paragraph. Collect samples of stored material at a minimum frequency of once per [_____] cubic meters cubic yards. Collect samples as[discrete grabs][composites][incremental samples][_____]. Complete all other sampling and analysis activities in accordance with the[UFP-QAPP][basewide QAPP][_____] (including but not limited to sample handling, preservation, transportation, [collection][analysis] of quality control samples, data validation, and data reporting). Any deviations to sampling frequency, number of samples, or sample collection methods must be[established in the approved[UFP-QAPP][basewide QAPP]][approved by the Contracting Officer]. Test samples for the following parameters: [_____].

3.4.1.3 Sampling Beneath Storage Units

****

NOTE: At some sites, samples are collected to verify the soil underlying a contaminated material storage unit has not become contaminated due to leachate migration or mixing of contaminated soils with underlying soils .

Sampling along any connecting pipelines that transport contaminated liquid may also be appropriate. A standard practice is to sample at 6 m (20 foot) intervals under piping and at connections such as bends, elbows, or tees.

****

Collect samples from beneath storage units in accordance with the[UFP-QAPP][basewide QAPP][_____] and this paragraph. Collect samples from beneath each storage unit[prior to construction of and] after removal of the storage unit. Collect samples at a minimum frequency of one per each [_____] square meter square yard from a depth interval of [0 to 0.15][_____] meters [0 to 0.5][_____] feet and analyze for the contaminants identified in paragraph PERFORMANCE REQUIREMENTS. Collect samples as[discrete grabs][composites][incremental samples][_____]. Complete all other sampling and analysis activities in accordance with the[UFP-QAPP][basewide QAPP][_____] (including but not limited to sample handling, preservation, transportation, [collection][analysis] of quality control samples, data validation, and data reporting). Any deviations to sampling frequency, number of samples, or sample collection methods must be[established in the approved[UFP-QAPP][basewide QAPP]][approved by the Contracting Officer].

If sample results from beneath storage units exceed the cleanup goals specified in paragraph PERFORMANCE REQUIREMENTS, remove soil which has become contaminated at no additional cost to the Government. Handle contaminated material which is removed from beneath the storage unit in accordance with paragraph TREATMENT AND DISPOSAL OF EXCAVATED CONTAMINATED MATERIAL. As directed by the Contracting Officer and at no additional cost to the Government, perform additional sampling and testing per the requirements of this paragraph to verify areas of contamination found beneath stockpiles have been excavated to below action levels.

3.4.1.4 Government Quality Assurance Testing

****

NOTE: The need for quality assurance testing should be considered on a project-by-project basis, and if not considered necessary this paragraph should be deleted. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. If conducting quality assurance testing, a separate third-party quality assurance contract should be considered based on the qualifications of the Government QA personnel, and the size and importance of the project.

Use of quality assurance testing data also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project performance requirements, and failing result would be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for identifying and correcting meaningful differences should be documented in a project-specific CQA Plan or Quality Assurance Project Plan and referenced in this specification; the process is likely too complex to be adequately defined in this specification.

Two options are provided for defining Government Quality Assurance. The first option is to defer details of the Government QA to a separate CQA Plan. This option would be preferred for large, complex projects where the excavation is one component of a larger process. A second, simpler option is provided to define Government QA testing frequency.

****

[Work will be monitored and tested in accordance with the requirements of the Construction Quality Assurance (CQA) Plan. Be aware of all monitoring and testing activities defined in the CQA Plan and account for these activities in the construction schedule. Quality Assurance testing and monitoring does not relieve the contractor of the responsibility to complete the quality control testing and monitoring defined in this specification section.

][[Provide][The Contracting Officer may provide] duplicate quality assurance samples to the Government's quality assurance laboratory at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. The Contracting Officer may require additional quality assurance tests as a result of failed quality assurance or quality control tests. Account for Government quality assurance testing in the construction schedule. Quality Assurance testing and monitoring does not relieve the contractor of the responsibility to complete the quality control testing and monitoring defined in this specification section.]

3.5 PROTECTION

Do not store or stockpile contaminated materials on excavation areas that have been completed and tested in accordance with paragraph FIELD QUALITY CONTROL.

****

SECTION 02 61 23

REMOVAL AND DISPOSAL OF PCB CONTAMINATED SOILS
02/25

****

NOTE: This guide specification covers the requirements for the removal of polychlorinated biphenyls (PCBs) contaminated soils.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This guide specification is intended for use where as-found concentrations of PCBs in soils exceed 50 parts per million (ppm). The as-found concentration is defined in the Environmental Protection Agency's (EPA's) PCB Question and Answer Manual (June 2014): "The concentration of the PCBs in the waste at the site at the time the waste is discovered, as opposed to the concentration of the PCBs in the material that was originally spilled, released, or otherwise disposed of at the site. For example, if dielectric fluid containing PCBs at greater than 500 ppm was spilled onto soil, and testing revealed the PCB concentration of the soil to be less than 50 ppm, the soil would be managed as

having a concentration of less than 50 ppm, not as having the concentration of the dielectric fluid that spilled. You may not dilute the as-found concentration of the contaminated soil by mixing it with clean soil during excavation or other management activities."

For disposal and removal of PCBs not in soils, use Section 02 84 33 REMOVAL AND DISPOSAL OF POLYCHLORINATED BIPHENYLS (PCBs).

This guide specification section is intended for use when PCBs are either the sole contaminant or the contaminant "driving" cleanup decisions. However, if PCBs are only a co-contaminant and not the sole/"driving" contaminants, Section 02 61 13 EXCAVATION AND HANDING OF CONTAMINATED MATERIAL should be used, and relevant requirements from this section should be copied into that section, including but not limited to paragraphs 1) REGULATORY REQUIREMENTS, 2) PERFORMANCE REQUIREMENTS, 3) FIELD SCREENING TEST KITS, 4) DECONTAMINATION MATERIALS, 5) DECONTAMINATION OF NON-POROUS SURFACES, 6) REMOVAL OF POROUS SURFACES, and 7) SAMPLING SOLID SURFACES.

****

1.1 UNIT PRICES

****

NOTE: These paragraphs should be edited based on whether the contract will use a single job price or unit prices. If there is a separate Measurement and Payment section, edited versions of these paragraphs should be inserted in that section.

The amount of contaminated material to be excavated is often subject to uncertainty due to the difficulty in fully characterizing subsurface conditions prior to excavation. For this reason, single job pricing that is fair to both the Government and Contractor can be a challenge. One option if using single job pricing is to set the base bid using the best estimate of the amount of contaminated material to be excavated and include options that can be exercised for additional volumes or weights. Coordinate requirements of these paragraphs with the bidding schedule.

****

1.1.1 Measurement

****

NOTE: Options are provided for payment by either volume or weight. If payment is on a weight basis, weights must either be measured on-site using a scale system (provided by the Government or the Contractor) or off-site at the point of disposal (e.g., a landfill).

****

Base measurement for removal and onsite transportation on the[actual number of cubic meters cubic yards of PCB-contaminated material in-place prior to excavation. Base determination of the volume of contaminated material excavated on cross-sectional volume determination reflecting the differential between the original elevations of the top of the PCB-contaminated material and the final elevations after removal of the contaminated material.][metric tons tons of PCB-contaminated material excavated. Use a properly calibrated weighing system to accurately measure the gross (bulk) weight of the PCB-contaminated material. Covert the measured gross (bulk) weight of the PCB-contaminated material to dry weight based on the[percent moisture content] [_____] of representative PCB-contaminated material samples. Determine the percent moisture content in accordance with[ASTM D2216][ASTM D4643][ASTM D4959] [_____]. Determine moisture content[daily.][for every [500][_____] metric tons tons of excavated PCB-contaminated material.]] Base measurement for construction, maintenance, and removal of stockpile areas on the number of square meters square yards of stockpile liner constructed.

1.1.2 Payment

1.1.2.1 Excavation and Handling

Compensation for excavation and onsite handling of PCB contaminated soil will be paid as a unit cost. Include any other items incidental to excavation and handling not defined as having a specific unit cost.

1.1.2.2 Stockpiling

Compensation for construction of stockpile areas will be paid for as a unit cost. Include all aspects of grading, preparation, handling, placement, maintenance, removal, treatment, and disposal of stockpile cover materials and liner materials and all other items incidental to construction of stockpiles in the unit cost.

1.1.2.3 Other Work Items

Payment for other work items not included in the above paragraphs will be included in the payment for the base bid for excavation, handling, and temporary storage of the PCB contaminated soils. The other work items include preparation of submittals; mobilization and demobilization; site preparation; environmental compliance monitoring; health and safety monitoring and controls; and utilities required for the project if approved by the Government as necessary for the project.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically

place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SYSTEM DESCRIPTION

****

NOTE: The Designer should include the bracketed text if the amount and type of debris anticipated to be present in the PCB-contaminated soil will not impact the work described in this section and referenced sections. If the amount or type of debris is significant (see Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS for definitions related to debris), this section and associated sections should be edited to indicate how debris will be managed.

****

The work includes removal of approximately [_____] [metric tons][cubic meters] [tons][cubic yards] of PCB-contaminated soils[and any debris contained within the contaminated soils].

1.3.1 Design Requirements

1.3.1.1 PCB Contaminated Soil Removal Plan

****

NOTE: The Designer may wish to require the PCB Contaminated Soil Removal Plan, UFP-QAPP, and any other preconstruction submittals required under this section to be completed concurrently or with all other plans being appendices of one primary plan. This section should be edited to reflect such a requirement if applicable.

****

Submit a PCB Contaminated Soil Removal Plan within [30][_____] calendar days after notice to proceed. Do not perform work at the site, with the exception of site inspection and surveys, until the Removal Plan is approved. Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the PCB Contaminated Soil Removal Plan. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. No adjustment for time or money will be made if resubmittals of the Removal Plan are required due to deficiencies in the plan. Describe methods, techniques, and phases of dealing with the PCB contaminated soil, including: a schedule to be employed in the excavation, a sequence of operations, the method of excavation, hauling, and handling of the contaminated materials, and the proposed equipment. Provide design details for stockpiles including but not limited to: geomembrane liner and cover, berms, anchors/ballast for cover, vehicle access points, and leachate collection sumps. Identify temporary use areas required for staging equipment and supplies, for temporary storage of excavated materials, or for stockpiles.

1.3.1.2 Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the UFP-QAPP WKSTS. Submit the UFP-QAPP within [30][_____] calendar days after notice to proceed. Do not perform work at the site, with the exception of site inspection and surveys, until the UFP-QAPP is approved. Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the UFP-QAPP. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document. Tailor the content to the requirements of the project and the site conditions. If field screening test kits are used as described in paragraphs EXCAVATION and FIELD SCREENING, include those field analysis in the UFP-QAPP.

1.3.1.3 PCB Contaminated Water Handling Plan

****

NOTE: Include the bracketed items when on site treatment of contaminated water is required.

****

Prepare and submit a plan detailing methods and techniques for collection[and treatment] of PCB contaminated water.[For treatment system, include size and location of equipment, catalog data on all components of system, size and arrangement of filters, type and quantity of filtering material, and method of containment.]

1.3.1.4 Hazardous Waste Management Plan

****

NOTE: If Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS is not in the project, details of a Hazardous Waste Management Plan can be copied from that section and edited as appropriate.

A Hazardous Waste Management Plan should include the following minimum elements: identification of PCB wastes associated with the work; estimated quantities of wastes to be generated and disposed of; names and qualifications of each Contractor that will be transporting, storing, treating, and disposing of the wastes. Include the facility location and a 24-hour point of contact. Include regulatory agency PCB waste permits and regulatory identification numbers; spill prevention, containment, and cleanup contingency measures to be implemented.

****

Prepare a Hazardous Waste Management Plan in accordance with [Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS][_____].

1.3.2 Performance Requirements

****

NOTE: This paragraph provides for two approaches to excavation of contaminated materials. The first approach is to excavate only a fixed volume of contaminated material. This approach could be used in a situation where excavation cannot proceed beyond certain limits, or excavation is being used to target hot-spots of contamination only. If this approach is used, the bracketed text and Table should be deleted. The second approach is to excavate to "clean" soil, using post-excavation confirmation samples to demonstrate achievement of cleanup goals.

Typical PCB cleanup goals for soils are 1 ppm, 10 ppm, or up to 25 ppm or more. Cleanup levels for non-porous surfaces are those defined in 40 CFR 761.61. Cleanup goals depend on many factors including the State that work is located in, land use (high occupancy, low occupancy, etc.), and proximity to surface and ground water. Cleanup goals should be determined on a site-specific basis considering the purpose of the excavation, applicable regulations, and other criteria. Ideally, cleanup goals will be defined in a site-specific decision document. Guidance on

defining cleanup goals is beyond the scope of this section.

This section includes provisions for managing PCB-contaminated non-porous and porous surfaces that are known to be present or may be encountered during excavation. If non-porous and porous surfaces are not present, the optional text in this paragraph, cleanup goals in Table 1, and work requirements related to non-porous and porous surfaces in Part 3 need to be deleted.
****

Excavate to the limits as shown on the drawings.[Excavation includes decontamination of non-porous surfaces and removal of porous surfaces[as shown on the Drawings][encountered within the excavation limits] [_____].][When excavation samples collected in accordance with paragraph FIELD QUALITY CONTROL indicate that remaining contaminant concentrations exceed the cleanup goals specified in Table 1, conduct additional excavations to achieve the cleanup goals in the excavation.]

TABLE 1 - CLEANUP GOALS	
SAMPLE TYPE	PCB CLEANUP GOAL
PCB Contaminated Soil and Porous Surfaces	
[_____]	[<=1][<=10][<=25][_____] mg/kg (parts per million)
[_____]	[<=1][<=10][<=25][_____] mg/kg (parts per million)
Non-Porous Surfaces	
[_____]	[<=10][<=100][_____]ug/100 cm^2
[_____]	[<=10][<=100][_____]ug/100 cm^2
Run-on Stormwater, Dewatered Groundwater, and Rinsewater Containing PCBs	
[_____]	[<=0.5][<3][_____]ug/L

[1.4 PRE-INSTALLATION MEETING

****
NOTE: Delete this paragraph if a separate specification section is developed for the entire project to cover pre-installation meetings and other administrative requirements.
****

Conduct a pre-installation meeting at the jobsite [at least 5 business days prior to the start of operations on the project][_____]. The pre-installation meeting is to be arranged by the Contractor and is to follow the written pre-installation meeting agenda submitted prior to the meeting. The purpose of this meeting is to review the requirements of this specification and the associated plans. The following individuals must be in attendance at this meeting: Contractor's Project Manager and Site

Foreman and [Contracting Officer][_____].

Record pre-installation meeting minutes and publish via email within 48 hours to all attendees. The minutes must be re-published within 48 hours via email pending any subsequent comments from the attendees.

]1.5 DEFINITIONS

PCB and PCBs (Polychlorinated Biphenyls), 40 CFR 761. PCB and PCBs means any chemical substance that is limited to the biphenyl molecule that has been chlorinated to varying degrees or any combination of substances which contain such substance.

1.6 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

[Pre-Installation Meeting Agenda

][Pre-Installation Meeting Minutes; G, [_____]

1.7 QUALITY CONTROL

1.7.1 Regulatory Requirements

****

NOTE: Some States regulate PCBs as hazardous waste. The Designer should verify presence of State-level PCB regulations and their impact on this section and associated referenced sections.

****

Maintain at the job site one readily available copy each of 29 CFR 1910.1000, 40 CFR 761, and all contractor prepared plans required under paragraph SUBMITTALS. Ensure that work operations or processes involving PCB-contaminated materials are conducted in accordance with 40 CFR 761 and the applicable requirements of this section, including but not limited to:

a. Obtaining advance approval of PCB storage sites.

b. Notifying Contracting Officer prior to commencing the operation.

c. Reporting leaks and spills to the Contracting Officer.

d. Cleaning up spills.

e. Maintaining an access log of employees working in a PCB control area and providing a copy to the Contracting Officer upon completion of the operation.

f. Inspecting PCB and PCB-contaminated items and waste containers for leaks and forwarding copies of inspection reports to the Contracting Officer.

g. Maintaining a spill kit.

h. Maintaining inspection, inventory, and spill records.

1.7.1.1 Environmental Protection

****

NOTE: This specification section does not attempt to provide comprehensive environmental protection requirements, but rather refers to a separate specification section that would be prepared using UFGS Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. Specific technical considerations for excavation projects are discussed below.

An air pathway analysis should be performed during design to determine what air monitoring and controls are required. Guidance on air pathway analyses is provided in EP 200-1-24 Air Pathway Analysis for the Design of Hazardous, Toxic, and Radioactive Waste (HTRW) Remedial Action Projects. Specify perimeter air monitoring requirements in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.

Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS provides information related to regulations of spills including notification and response requirements. Spills on excavation projects can occur due to releases from equipment, fuel storage tanks, etc. Excavated materials can also be inadvertently spilled during transport between the excavation and storage locations. Lastly, although not directly related to spills, excavation projects have the potential to encounter unanticipated materials such as buried tanks, containers, munitions and explosive constituents, etc. An environmental protection plan prepared under Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS should include provisions for managing both spills and encountering unanticipated materials.

The environmental protection plan should also consider the following spill-prevention and control related requirements: use appropriate vehicles and operating practices to prevent spillage or leakage of contaminated materials from occurring during operations; inspect vehicles leaving the contaminated soil removal site to ensure that no

contaminated soil adheres to the wheels or undercarriage; immediately report any spills to the Contracting Officer and provide cleanup in accordance with 40 CFR 761, Subpart G.
****

Develop and implement environmental protection requirements per [Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____].

1.7.2 Qualifications

****
NOTE: Requirements for the Contractor's experience should be determined and specified based on the experience and availability of Contractors in the area as well as the complexity of the project.
****

1.7.2.1 Contractor Experience

Submit evidence of successful completion of at least [one][_____] project of comparable size and scope.

1.7.2.2 Key Personnel

Provide key personnel with a minimum of [3][_____] years of contaminated soil excavation field experience. Include the Site Foreman, quality control personnel, and supervisory engineering and technical staff involved with operation in key personnel. Perform all survey work under the supervision of a registered land surveyor licensed in the[applicable jurisdiction][State of [_____]]. Submit a list of these personal with their qualifications.

1.7.2.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory meeting the requirements of [Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Environmental Requirements

****
NOTE: Revise this paragraph if requirements are provided in other specification sections, health and safety plans, environmental permits/permit equivalents, etc. The conditions described in the following paragraph represent challenges to environmental protection (winds causing dust, rain causing stormwater contamination), saturation of excavated materials (rain), or site damage (saturated soils).
****

Do not conduct excavation or handling of PCB-contaminated materials in the following conditions: [wind speeds in excess of [50][_____] kilometers [30][_____] miles per hour,][moderate rain greater than [5][_____] mm [0.2][_____] inches per hour,][saturated soils caused by recent rains/snowmelt such that equipment traffic would cause excessive rutting or damage].

1.8.2 Existing Conditions

****

NOTE: Include any pertinent information regarding project/site conditions in this paragraph, the appendices to the specifications, or on the drawings. If the PCB-contaminated soil to be excavated contains a significant amount of debris, the available information about its extent and characterization should also be provided. Indicate the detail to which site characterization has been performed and indicate where obvious data gaps exist. The following information should be shown on the project drawings (unless the Contractor is required to develop any aspects of the project design under a performance-based project):

a. Overall site plan, borrow areas, stockpile areas, storage areas, security requirements, special shoring requirements, boring logs, and access routes.

b. Individual site plans of each area of contamination with site features such as buildings, roads, utilities, topography, trees, shrubs, surface conditions, etc.

c. Limits of pavement removal, fence removal, and the location of ancillary equipment to be removed.

****

The existing site conditions are presented[in Appendix [_____]][and][on the Drawings]. These include[physical configuration,][utilities,][topography,][land uses,][groundwater depth,][geotechnical characteristics of the contaminated materials (including[grain size analysis,][pH,][moisture content,][density,][porosity]),][hydrogeology,][nature and extent of contamination,] [_____]. The existing conditions presented are the result of site investigations at specific locations; variations in the existing site conditions could occur. Perform an independent interpretation of the site characterization data. Notify the Contracting Officer within [48 hours][_____] if discrepancies between the data provided and actual field conditions are discovered.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Field Screening Test Kits

Provide PCB field screening test kits which analyze PCBs by EPA SW-846 Method 4020 or equivalent screening method having a false negative rate of less than 5 percent when PCBs are present at 1 ppm, and providing on-site results within 2 hours of sample collection.

2.1.2 Backfill

****

NOTE: If Section 31 00 00 EARTHWORK is not in the project, backfill information can be copied from that section and edited as appropriate.

The paragraph ENVIRONMENTAL REQUIREMENTS FOR OFF-SITE SOIL in Section 31 00 00 EARTHWORK should be edited to include an appropriate list of chemical testing parameters for off-site soil. Some backfill sources may have chemical testing data already available; the Government should require chemical testing if the backfill chemical testing data is inadequate or does not exist. Off-site backfill should not be tested for only the site contaminants of concern. At a minimum, samples should be analyzed for target contaminant list (TCL) VOCs, TCL SVOCs, target analyte list (TAL) Metals, and Pesticides/PCBs. Additional analyses such as Total Petroleum Hydrocarbons may be appropriate also. Individual States or military installations may require or recommend additional parameters. Typical frequency of sampling would be one sample per 1,900 to 2,300 cubic meters 2,500 to 3,000 cubic yards. However, individual States or military installations may require or recommend more frequent or less frequent sampling.

In many cases, the degree of engineering control of the materials used as backfill may not need to be as stringent as described in Section 31 00 00 EARTHWORK. In other cases, such as under pavements, special compaction and material requirements may apply and the specifications will need to address these special requirements.

At some sites, previously contaminated soil which has been removed from the excavation is reused as backfill following treatment to remove the contaminant of concern.

****

Provide backfill in accordance with the requirements in [Section 31 00 00 EARTHWORK][_____].

2.1.3 Topsoil

****

NOTE: If Section 31 00 00 EARTHWORK is not in the project, topsoil information can be copied from that section and edited as appropriate. Section 31 00 00 EARTHWORK includes a provision to strip existing on-site topsoil for re-use. The project specifications should only allow that practice if topsoil has been tested or will be tested to confirm that it is not considered contaminated.

****

Provide topsoil in accordance with the requirements in [Section 31 00 00 EARTHWORK][_____]. Stripping existing topsoil for re-use on-site[is][is not] allowed.

2.1.4 Decontamination Materials

Provide solvents for decontaminating non-porous surfaces. Suggested solvents are stoddard solvent or hexane.

2.1.5 Geomembrane

****

NOTE: If Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT is not in the project, geomembrane material information can be copied from that section and edited as appropriate.

Scrim reinforced geomembranes are commonly specified for stockpile covers and liners. Due to their higher strength properties, scrim reinforced geomembranes can generally be thinner than non-reinforced geomembranes. For bottom liners, a commonly used minimum thickness is 0.5 mm 20 mils for non-reinforced geomembrane and for scrim reinforced geomembranes a common minimum weight is 20 kg/100 square meter 40 lbs./1000 square feet. For stockpile cover geomembranes, a commonly used minimum thickness is 0.25 mm 10 mils for non-reinforced geomembrane and for scrim reinforced geomembranes a common minimum weight is 13 kg/100 square meter 26 lbs./1000 square feet.

Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT includes substantial levels of effort for quality control and quality assurance (QC/QA) that are meant to ensure performance when geomembranes are used in long-term applications like a landfill. For use of geomembranes in temporary stockpiles of contaminated soils, the designer should consider reducing the level of QC/QA in Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT. Specific QC/QA requirements that could be reduced include Qualifications, requirements for Layout and Detail Drawings, Tests/Inspections/Verifications of materials conducted off-site, and on-site QA/QC of Field Seams. Reduced material requirements for temporary applications of geomembranes can also be considered; instead of using HDPE geomembranes that are 1 mm 40 mil or greater (typical for landfills), other materials such as PVC may be appropriate.

****

Provide geomembranes for lining and/or covering PCB contaminated soil stockpiles. Provide geomembranes in accordance with [Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT][_____].

[2.2 SCALES

****

NOTE: This paragraph is primarily intended to ensure that calibrated scales are being used to weigh excavated contaminated soil, when weight is being used as the basis for measurement and payment. If off-site scales will be used (e.g., at a weighing station or disposal facility), this paragraph can be deleted.

****

Provide scales of sufficient length to permit simultaneous weighing of all axle loads and with an accuracy within 0.2 percent throughout the range of the scales. Ensure the scale's accuracy conforms to the applicable requirements of NIST HB 44 and is certified[by an acceptable scales company representative][by an inspector of the State Inspection Bureau charged with scales inspection within the state in which the project is located] prior to weighing any excavated contaminated soil.[Locate the scales at the site of work.][Ensure the scales are capable of printing a weight ticket including time, date, truck number, and weight.] Perform a check of calibration of measuring equipment prior to initial use, and once every [7][_____] calendar days. The requirements of this paragraph do not apply to measurement of chemical data.

]PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Surveys

****

NOTE: If payment for the project is based on a single job price or based on weight of material exported/imported from the site, then a highly accurate survey by a registered land surveyor may not be necessary. A lower level of effort in these cases could be to require the Contractor to survey only the excavation, using a handheld, sub-meter accurate GPS unit.

****

Perform surveys immediately prior to and after excavation of PCB contaminated soils to determine the volume of contaminated soil removed. Provide cross-sections on [7.6][_____] meter [25][_____] foot intervals and at break points for all excavated areas. Survey and show locations of confirmation samples on the drawings.[Perform surveys in accordance with Section: [_____].]

3.1.2 Site Conditions

Conduct a pre-installation examination of the on-site infrastructure, utility conduits, monitoring points, site access constraints, and infrastructure. Photographically document, with identifying labels, the existing condition of infrastructure and utilities, particularly for comparison to post-removal conditions. Verify locations of critical utilities that cannot be disrupted and those utilities that would potentially have significant impacts on removal and public safety. Submit a Pre-Installation Examination Report documenting the examination activity. Obtain all necessary utility clearances before initiation of subsurface work.

3.1.3 Pre-Construction Equipment Examination

Conduct a pre-construction examination of the excavation equipment for any damage, defect, and dilapidation. Submit the results of the pre-construction examination to the Contracting Officer for review and information. The Contracting Officer may conduct an independent examination to ascertain the condition and functionality of the equipment. Based on this examination, the Contracting Officer has the right to reject any damaged, defective or dilapidated equipment. The cost associated with equipment or control replacement or repair, and delays caused by the rejection must be borne by the Contractor. Routinely and properly inspect and maintain the equipment to provide the project execution as required by the contract schedule. Any schedule delay and cost associated with power failure, improper functioning of equipment and controls, unavailability of labor and materials, etc., must be the responsibility of the Contractor.

3.2 PREPARATION

3.2.1 Mobilization

****

NOTE: Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES includes requirements for decontaminating equipment that has been used in contaminated zones. That section should be modified to extend decontamination/cleaning requirements to equipment being brought on-site to cover the requirements of this paragraph.

****

Do not mobilize to the site until the [PCB Contaminated Soil Removal Plan][_____] has been approved by the Contracting Officer and the Contractor has received written confirmation. Delays caused by the Contractor's failure to meet regulatory requirements must result in no additional cost to the Government. In accordance with [Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____], the equipment which is rented [and][or] previously used for other site remediation must be decontaminated and tested for contaminants of concern before being brought to the site.

3.2.2 Clearing

****

NOTE: Grubbing is typically not required at sites where contaminated soil is being excavated for treatment and/or disposal. Typically, vegetation that is cut off above a certain height is defined as clean and any stumps and brush below this height are defined as contaminated.

****

Perform clearing to the limits[shown on the Ddrawings][defined in the PCB Contaminated Soil Removal Plan] [_____] in accordance with [Section 31 11 00 CLEARING AND GRUBBING][_____].

3.3 PCB CONTAMINATED SOIL REMOVAL

Notify the Contracting Officer [_____] calendar days prior to the start of excavation of PCB contaminated soil. The[Contracting Officer][Contractor] is responsible for contacting regulatory agencies in accordance with the applicable reporting requirements.

3.3.1 Excavation

****

NOTE: For large excavations, more than one excavation log may be required.

****

Excavate areas of contamination to meet the requirements in paragraph PERFORMANCE REQUIREMENTS. Perform excavation in a manner that will limit spills and the potential for contaminated soil to be mixed with uncontaminated soil. Maintain an excavation log describing visible signs of contamination encountered for each area of excavation. Prepare excavation logs, describing materials in accordance with ASTM D5434.

Use methods and equipment that result in minimal disturbance to remaining soil beyond the excavation limits. Remove and dispose of any material that becomes contaminated as a result of the Contractor's operation at no additional cost to the Government. Stage operations to minimize the time the contaminated soil is exposed to the weather.

3.3.2 Shoring, Sloping, or Bracing

Implement shoring, sloping, bracing, or any other excavation health and safety requirements in accordance with [Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS][_____].

3.3.3 Contaminated Soil Storage

Place material in temporary storage[immediately after excavation][after treatment while awaiting test results]. The following paragraphs describe acceptable methods of material storage. Provide storage units that are in good condition and constructed of materials that are compatible with the material or liquid to be stored. If multiple storage units are required, clearly label each unit with an identification number and keep a written log to track the source of contaminated material in each temporary storage unit.

3.3.3.1 PCB Contaminated Soil Stockpiles

****

NOTE: Check state regulations to determine the minimum requirements for stockpiles and modify this paragraph accordingly. For contaminated soil with high moisture content, the subgrade for the stockpile must be sloped and a sump should be provided.

For post treatment stockpiles, chemical testing is usually required to determine if material is contaminated or clean. Maximum stockpile size should be based on the required frequency of chemical testing. For example, if chemical tests are required at a frequency of one per 1,000 cubic meters cubic yards, then stockpiles should be no greater than 1,000 cubic meters cubic yards in size.

If anticipated volumes of PCB contaminated soils are small, consider requiring work methods that do not use stockpiles, such as storing PCB contaminated soils in roll-offs (included below) or in trucks suitable for carrying PCB contaminated soils as specified herein. Avoiding use of stockpiles means that soils do not need to be double handled, liners and covers do not need to be constructed, and sampling under stockpiles is not necessary.

As noted in paragraph GEOMEMBRANE, the Designer may wish to reduce the level of QC/QA requirements if using Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT as the requirement for installation of the stockpile bottom liner.

****

Construct stockpiles to isolate stored contaminated soil from the environment. Cover stockpiles at the end of each workday. Stockpile size greater than [_____] cubic meters cubic yards is prohibited. Construct stockpiles to include:

a. [Place a geomembrane liner on a ground surface that is free of rocks greater than 13 mm 0.5 inches in diameter and any other object which could damage the membrane. Where multiple geomembrane panels are necessary to construct the liner, seam the panels together and test the seams in accordance with[manufacturer requirements][Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT].][Use pavement as the liner system. Construct pavement in accordance with Section [_____]].

b. Place a geomembrane cover over the stockpiles. Extend the cover material over the berms and anchor or ballast to prevent it from being removed or damaged by wind. Where multiple geomembrane panels are necessary to construct the cover, shingle the upslope panel over the downslope panel and overlap the panels at least [150][_____] mm [6][_____] inches. Secure the panels together using[ballast such as sandbags or tires][adhesives][thermal fusion seams] [_____].

c. Construct berms surrounding the stockpile, a minimum of 300 mm 12 inches in height. Berm vehicle access points.

d. Slope the liner system to allow collection of leachate. Construct sumps to facilitate removal of leachate from the stockpile. Store and remove liquid which collects in the stockpile, in accordance with paragraph[COLLECTION AND DISPOSAL OF INCIDENTAL CONTAMINATED WATER][COLLECTION, TREATMENT, AND DISCHARGE OF CONTAMINATED WATER].

3.3.3.2 Roll-Off Units

Use water-tight roll-off units to temporarily store contaminated soil. Place a cover over the units to prevent precipitation from contacting the stored material. Remove liquid which collects inside the units and manage in accordance with paragraph[COLLECTION AND DISPOSAL OF INCIDENTAL CONTAMINATED WATER][COLLECTION, TREATMENT, AND DISCHARGE OF CONTAMINATED WATER].

3.3.4 Decontamination of Non-Porous Surfaces

****

NOTE: Management of decontaminated non-porous surfaces should be specified here and should align with the cleanup goals provided in paragraph PERFORMANCE REQUIREMENTS.

****

Non-porous surfaces as defined in 40 CFR 761.3 encountered within the limits of excavation may be decontaminated in accordance with the requirements of 40 CFR 761, Subpart D, and this paragraph. Brush to remove soil materials and clean by double rinsing. Collect and manage washdown water in accordance with paragraph CONTAMINATED WATER. Repeat cleaning process and testing until PCBs are below the limits defined in paragraph PERFORMANCE REQUIREMENTS. Manage decontaminated non-porous surfaces by [_____].

3.3.5 Removal of Porous Surfaces

Remove porous surfaces as defined in 40 CFR 761.3 encountered within the limits of excavation. PCB-contaminated concrete may be scarified to remove the contaminated portion of the concrete; following scarification, collect samples in accordance with paragraph POROUS SURFACES. Manage the removed porous surface materials[in accordance with the same requirements for excavated contaminated soils in this section] [_____].

3.3.6 Contaminated Water

****

NOTE: Water treatment can significantly increase the cost of a project involving the excavation of contaminated soil and should be carefully considered during design. UFC 3-220-05 Dewatering and Groundwater Control provides guidance on the design of dewatering systems.

If water from dewatering operations will be allowed to discharge onto the ground, an NPDES permit for dewatering may be required (see Regulatory Requirements Designer's Note for more details on permits). Reference the permits paragraph of Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS for permit requirements.

Note that Section 31 00 00 EARTHWORK also includes dewatering requirements, but they are limited in scope and do not include any consideration of collection, treatment, sampling, or discharge of contaminated waters. If Section 31 00 00 EARTHWORK is included in the project, either delete dewatering requirements from that section or cut and paste the dewatering requirements from this section into 31 00 00.

****

Divert surface water to prevent entry into the excavation.[Limit dewatering to that necessary to assure adequate access, a safe excavation, prevent the spread of contamination, and to ensure that compaction requirements can be met.][Do not perform dewatering without prior approval of the Contracting Officer.]

[3.3.6.1 Collection and Disposal of Incidental PCB-Contaminated Water

****

NOTE: Determine appropriate disposal method. Choose this paragraph when significant quantities of groundwater will not be encountered and only small amounts of rinse and other contaminated waters are expected.

****

Collect rinsewater. Collect ground, surface, and rain water contaminated by operations including water collected in the open excavation pit or temporary containment. Soak up with absorbent material so that no free liquid is present. Containerize, sample, and analyze PCB absorbed material and dispose of as specified for contaminated soils.

][3.3.6.2 Collection, Treatment, And Discharge Of PCB-Contaminated Water

****

NOTE: Choose these paragraphs when groundwater will be encountered or when significant amount of rinse water or other contaminated water is expected, and on-site treatment is allowed. Paragraphs may need modifying to fit site specific requirements. Typical treatment system consists of particulate/suspended solids removal by various means such as settling or filtration and contaminant removal by carbon filtration. Location of discharge for water after it is treated must be coordinated and approved by appropriate (EPA, State, station, local, and regional) authority.

Another option to consider is to containerize liquid and haul to off-site publicly-owned treatment works (POTW) with pretreatment capability, however this can be extremely costly for large quantities of water. Use unit pricing, assumed quantities, or some other method to give Contractor something to base bids on when water is to be taken off site. Where off site facilities are involved, verify such facilities exist, that they are permitted to accept, and that they will accept the liquid waste stream. Specification will require modifying for site specific requirements.

****

Furnish labor, materials, and equipment necessary for collecting, treating, and discharging of PCB-contaminated surface and subsurface water in excavations at the site. Conduct excavation and backfilling operations at the site in a manner that minimizes the amount of surface and subsurface water which may collect in the open excavation. Collect standing surface water in contact with PCB contaminated soil.

3.3.6.2.1 Subsurface Drainage

Remove water by pumping or other methods to prevent softening of surfaces exposed by excavation. Provide water treatment necessary to treat water to levels specified in paragraph PERFORMANCE REQUIREMENTS. Operate dewatering system continuously until construction work below static water levels is complete. Submit Dewatering Performance Records weekly. Measure and record performance of the dewatering system at the same time each day by use of observation wells or piezometers installed in conjunction with the dewatering system.

3.3.6.2.2 Treatment System Requirements

The Contractor is responsible for all aspects of verifying design parameters, designing, providing, installing, operating, maintaining, and removing the collection, storage, and treatment facilities as required to discharge treated waters within the treatment limits required. The treatment system must:

a. Be capable of removing PCB contaminants to below the limit defined in paragraph PERFORMANCE REQUIREMENTS for contaminated water.

b. Include effluent holding tanks designed to allow on-site testing of water quality prior to discharge.

c. Include recycle capability for retreatment of effluent not meeting the discharge requirements of this specification, as determined by on-site testing.

3.3.6.2.3 Treatment System Operations

Monitor, test, and adjust the treatment system in accordance with the PCB Contaminated Water Handling Plan[and UFP-QAPP][basewide QAPP], or as otherwise modified by special regulatory requirements. If there is a conflict between requirements, the more stringent requirement prevails.

3.3.6.2.4 Discharge of Treated Water

Do not discharge any water until tests results show water is below PCB contaminated water limits as specified in paragraph PERFORMANCE REQUIREMENTS. Provide erosion control at outlet of piping to minimize erosion. Discharge treated water to the [_____].

3.3.6.2.5 Cleanup and Removal of Treatment System

Upon completion of work, close and remove from the site the surface water and groundwater treatment system. Restore the site to its original condition. Decontaminate equipment in accordance with [Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____]. Containerize, sample, test, and dispose of carbon, residues, cleaning aids, decontamination liquids, and waste as specified for the contaminated soils.

]3.3.7 Backfilling and Finishing/Finish Operations

Backfill excavations immediately after all contaminated soils have been removed and confirmation test results have been approved. Conduct backfilling and finishing/finish operations in accordance with [Section 31 00 00 EARTHWORK][_____].

3.3.8 Disposal Requirements

****

NOTE: Federal Regulations (40 CFR 761) require (with some exceptions) that generators, transporters, commercial storers, and disposers of PCB waste possess U.S. EPA identification numbers. If required, verify that the activity has a U.S. EPA generator identification number for use on the Uniform Hazardous Waste Manifest. (There are exceptions to this requirement of obtaining an identification number. In the case of a Very Small Quantity Generator, for example, who is not required to use the hazardous waste manifest except when shipping PCBs, which are not hazardous waste in most states, but still require the use of a hazardous manifest.) If not, the activity must file and obtain an identification number with EPA prior to commencement of removal work. Where disposal will be through the Defense Logistics Agency (DLA), modify paragraphs to meet DLA requirements.

Specific information for PCB waste shipment documents is described in 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS.

****

Provide transportation and disposal of PCB-contaminated soils and materials per [02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS][_____].

3.3.9 Closeout Activities

Maintain surfaces of the PCB control area free of accumulations of PCBs. Restrict the spread of dust and debris; keep waste from being distributed over work area. Do not remove any PCB control area and warning signs required per [Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____] prior to the Contracting Officer's approval. Reclean areas showing residual PCBs.

3.3.9.1 Cleanup Wastes

****

NOTE: If the reference to Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES is used, the Designer should ensure that the cleanup waste procedures in 40 CFR 761.61 (a)(5)(v) are referenced in that section.

****

Decontaminate or dispose of cleanup wastes, such as contaminated tools and containers, after use in accordance with [Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES][_____].

3.3.9.2 Closeout Report

****

NOTE: If there is a separate section in Division 01 that defines project close-out documentation, edited

versions of this paragraph should be inserted in that section, and this paragraph deleted. In addition to progress photos, video has been used at some sites to record site activities.
****

Submit [_____] copies of a Closeout Report within [60][_____] calendar days of completing work at the site. Label the report with the contract number, project name, location, date, name of general Contractor, and the Government Agency contracting for the work. As a minimum, include the following information:

a. A cover letter signed by a[responsible company official][Professional Engineer registered in the State of [_____] who is a responsible company official] certifying that all services involved have been performed in accordance with the terms and conditions of the contract documents and regulatory requirements.

b. A narrative report including, but not limited to, the following:

    (1) site conditions, ground water elevation, and cleanup criteria;

    (2) excavation logs;

    (3) field screening readings;

    (4) quantity of materials removed from each area of contamination;

    (5) quantity of water/product removed during dewatering;

    (6) sampling locations and sampling methods;

    (7) sample collection data such as time of collection and method of preservation;

    (8) sample chain-of-custody forms; and

    (9) source of backfill.

c. Copies of all chemical and physical test results.

d. Copies of all manifests and land disposal restriction notifications.

e. Copies of all certifications of final disposal signed by the responsible disposal facility official.

f. Waste profile sheets.

g. Documentation verifying that vehicles and containers were decontaminated prior to leaving the disposal site, were properly operating, and were covered.

h. Scale drawings showing limits of each excavation, limits of contamination, known underground utilities within 15 m 50 feet of excavation, sample locations, and sample identification numbers. Show on-site stockpile, storage, treatment, loading, and disposal areas on the drawings.

i. Progress Photographs. Use color photographs to document progress of the work. Take a minimum of four views of the site showing the location of the area of contamination, entrance/exit road, and any other notable site conditions before work begins. After work has been started, photographically record[daily][weekly] activities at each work location. Provide photographs including:

(1) Soil removal and sampling.

(2) Dewatering operations.

(3) Unanticipated events such as spills and the discovery of additional contaminated soil.

(4) Contaminated soil/water storage, handling, treatment, and transport.

(5) Site or task-specific employee respiratory and personal protection.

(6) Fill placement and grading.

(7) Post-construction photographs. After completion of work at each site, take a minimum of four views of each excavation site.

Include a digital version of all photos shown in the report with the Closure Report. Provide photographs with a minimum of 181.11 pixels per cm 300 pixels per inch resolution for all photo files. Provide photos in a lossless compression file format that does not lose any pixels in the compression process (e.g., .TIFF, .PNG, and .GIF). Ensure no loss of original resolution from the raw photo if converted to a lossless format. Create digital images and metadata that meet or exceed the specifications of the Exchangeable Image File Format (EXIF) version [_____][2.3] or higher. In addition to the raw digital photo submissions, submit a PDF document as part of the Closeout Report displaying all required progress or other photos organized into separate documents. Render the photos in the PDF with a resolution that represents the original photo resolution to the human eye. Place photos according to their proper orientation (portrait or landscape). Create an index with bookmarks for each PDF organized by submittal section and suborganized by work area (if applicable) and then by date in the sequence which they were taken.

Process all raw photos for inclusion in the PDF submission with a border including a 13 mm 0.5 inch caption at the base of each photo for descriptive information. Include the following information for each photographic image in the caption:

Project Name

Contract Number

Contractor Name

Date

Station and Offset

Photo Number

Orientation View

Work Element Depicted

General Project Area

3.4 FIELD QUALITY CONTROL

3.4.1 Tests

****

NOTE: If a UFP-QAPP will be prepared for the project, the detailed requirements included in this paragraph and it's sub-paragraphs can be replaced with simple statements indicating that sampling is to be performed in accordance with the UFP-QAPP. If that approach is used, the unique PCB sampling requirements in 40 CFR 761 (detailed below) would need to be incorporated into the UFP-QAPP to ensure compliance.

****

3.4.1.1 Sampling Solid Surfaces

3.4.1.1.1 Non-Porous Surfaces

Collect wipe samples from non-porous surfaces that are either removed from the excavation area or washed down in accordance with paragraph DECONTAMINATION OF NON-POROUS SURFACES.[Collect wipe samples in accordance with the[UFP-QAPP][basewide QAPP] [_____], which defines sampling frequency, location, and analysis.][40 CFR 761. A 10 cm by 10 cm template gauze pad or glass wool of known size which has been saturated in the laboratory with hexane and stored in sealed glass vials. Wipe immediately after exposing medium to air. Place sample in precleaned glass bottle, cap, label, and place in ice chest until analyzed.]

3.4.1.1.2 Porous Surfaces

Collect destructive samples from porous surfaces[in accordance with the[UFP-QAPP][basewide QAPP] [_____], which defines sampling frequency, location, and analysis.][in accordance with EPA 560/5-86-017 and this paragraph. Remove sufficient sample for analysis using chisel, hole saw, drills, etc. Take samples less than 1 cm 3/8 inch deep and place in glass precleaned sample bottle, cap, label, and place in ice chest.]

3.4.1.2 Sampling Excavations

****

NOTE: If excavations are limited to a fixed extent and do not proceed until clean soils are encountered, delete the field screening requirements included below.

****

3.4.1.2.1 Field Screening

Collect soil samples at the same interval as determined for the confirmatory grid sampling plan along the bottom and along the sidewalls of the excavation, and test using field screening test. Follow field screening test kit manufacturer directions[and the UFP-QAPP].

3.4.1.2.2 Confirmation Sampling and Testing

[Collect excavation base and sidewall confirmation samples in accordance with the[UFP-QAPP][basewide QAPP] [_____], which defines sampling frequency, location, and analysis.][When field screening results show PCB concentrations below the cleanup goals defined in paragraph PERFORMANCE REQUIREMENTS, test using confirmation sampling and testing. Sample along the bottom and sidewalls of excavation. Use sampling grid scheme and number of samples as defined in EPA 560/5-86-017. Do not composite samples for analysis. Submit and receive approval of Confirmatory Grid Sampling Plan scheme prior to starting work. Analyze samples in accordance with EPA SW-846, Method 8080 for PCBs. Determine moisture content of the sample in accordance with EPA Method 160.3. Provide quality control in accordance with EPA guidelines, and as a minimum as follows:

a. Duplicate samples - collect and analyze duplicate soil samples at the rate of 10 percent of the total number of samples (rounded to the next highest number).

b. Matrix spike and matrix spike duplicate - collect one matrix spike sample for every 20 samples collected (rounded to the next highest number). Split the matrix spike sample, and analyze both the matrix spike and the matrix spike duplicate.]

3.4.1.3 Sampling of Stored PCB-Contaminated Soil

[Collect samples of stored material in accordance with the[UFP-QAPP][basewide QAPP] [_____], which defines sampling frequency, location, and analysis.][Take composite samples from stored material prior to removing from site. Analyze a minimum of one composite sample for every [75][_____] cubic meters [100][_____] cubic yards or fraction thereof of soil to be disposed of from any one site. To develop a composite sample of the size necessary to run the required tests, take several samples from different areas along the surface and in the center of the stockpile. Combine these samples and thoroughly mix to develop the composite sample.]

3.4.1.4 Sampling Beneath Storage Units

****

NOTE: At some sites, samples are collected to verify the soil underlying a contaminated material storage unit has not become contaminated due to leachate migration or mixing of contaminated soils with underlying soils.

Sampling along any connecting pipelines that transport contaminated liquid may also be appropriate. A standard practice is to sample at 6 meter 20 foot intervals under piping and at connections such as bends, elbows, or tees.

Options are provided for defining sampling requirements by either reference to a UFP-QAPP/basewide QAPP (first option) or including the requirements in this section (second option). As noted previously, referencing a UFP-QAPP is the preferred approach.

****

Collect samples from beneath storage units in accordance with the[UFP-QAPP][basewide QAPP] [_____] and this paragraph. Collect samples from beneath each storage unit[prior to construction of and] after removal of the storage unit. Collect samples at a minimum frequency of one per each [_____] square meter [_____] square yard from a depth interval of [0 to 0.15][_____] meter [0 to 0.5][_____] feet and analyze for the contaminants identified in paragraph PERFORMANCE REQUIREMENTS. Collect samples as[discrete grabs][composites][incremental samples] [_____]. Complete all other sampling and analysis activities in accordance with the[UFP-QAPP][basewide QAPP] [_____] (including but not limited to sample handling, preservation, transportation, collection/analysis of quality control samples, data validation, and data reporting). Any deviations to sampling frequency, number of samples, or sample collection methods must be[established in the approved[UFP-QAPP][basewide QAPP]][approved by the Contracting Officer].

If sample results from beneath storage units exceed the cleanup goals specified in paragraph PERFORMANCE REQUIREMENTS, remove soil which has become contaminated at no additional cost to the Government. Handle contaminated soil which is removed from beneath the storage unit in accordance with the requirements for managing excavated PCB contaminated soils. As directed by the Contracting Officer and at no additional cost to the Government, perform additional sampling and testing per the requirements of this paragraph to verify areas of contamination found beneath stockpiles have been excavated to below the cleanup goals specified in paragraph PERFORMANCE REQUIREMENTS.

3.4.1.5 Government Quality Assurance Testing

****

NOTE: The need for quality assurance testing should be considered on a project-by-project basis, and if not considered necessary this paragraph should be deleted. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. If conducting quality assurance testing, a separate third-party quality assurance contract should be considered based on the qualifications of the Government QA personnel, and the size and importance of the project.

Use of quality assurance testing data also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project performance requirements, and failing result would be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for

identifying and correcting meaningful differences should be documented in a project-specific CQA Plan or Quality Assurance Project Plan and referenced in this specification; the process is likely too complex to be adequately defined in this specification.

Two options are provided for defining Government Quality Assurance. The first option is to defer details of the Government QA to a separate CQA Plan. This option would be preferred for large, complex projects where the excavation is one component of a larger process. A second, simpler option is provided to define Government QA testing frequency.

****

[Work will be monitored and tested in accordance with the requirements of the Construction Quality Assurance (CQA) Plan. Be aware of all monitoring and testing activities defined in the CQA Plan and account for these activities in the construction schedule. Quality Assurance testing and monitoring does not relieve the contractor of the responsibility to complete the quality control testing and monitoring defined in this specification section.

][[Provide][The Contracting Officer may provide]duplicate quality assurance samples to the Government's quality assurance laboratory at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. The Contracting Officer may require additional quality assurance tests as a result of failed quality assurance or quality control tests. Account for Government quality assurance testing in the construction schedule. Quality Assurance testing and monitoring does not relieve the contractor of the responsibility to complete the quality control testing and monitoring defined in this specification section.

]3.5 PROTECTION

Do not store or stockpile contaminated soils on excavation areas that have been completed and tested in accordance with paragraph FIELD QUALITY CONTROL.

UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated January 2025

****

SECTION 02 62 13.00 10

AIR AND STEAM STRIPPING

08/18

****

NOTE: This guide specification covers the requirements for systems to transfer volatile compounds from a water stream to an air stream.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This guide specification covers air strippers for removal of volatile substances from water. Refer to Design Guide (DG) 1110-1-3 Air Stripping.

****

1.1 UNIT PRICES

****

NOTE: If the Contractor is required to treat water, as well as to furnish the equipment, measurement and payment and unit pricing may be necessary to cover treatment costs.

****

Determine measurement and payment and unit prices for quantities of water treated (if applicable) in accordance with the Bid Schedule.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B40.100	(2022) Pressure Gauges and Gauge Attachments

AMERICAN WATER WORKS ASSOCIATION (AWWA)

AWWA C653	(2020) Disinfection of Water Treatment Plants
AWWA D100	(2021) Welded Steel Tanks for Water Storage
AWWA D102	(2024) Coating Steel Water-Storage Tanks

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 [Pre-Installation Meetings] [Partnering Conference]

Participation by the Contractor in the [Pre-installation][Partnering] conference is [requested][required] by the Contracting Officer. Ensure that all of the involved subcontractors, suppliers, and manufacturers are represented. Furnish to the Contracting Officer the date and time of the conference for approval.

1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

- Process Flow Diagrams
- Process and Instrumentation Diagram (P&ID)
- Installation drawings

SD-03 Product Data

- Air Stripping System
- Qualifications
- Field Training
- Framed Instructions
- Spare Parts

SD-05 Design Data

- Calculations
- Foundations

SD-06 Test Reports

- Tests

SD-07 Certificates

- Manufacturer's Representative
- Materials and Equipment

SD-08 Manufacturer's Instructions

- Air Stripping System

SD-09 Manufacturer's Field Reports

- Air Stripping System

SD-10 Operation and Maintenance Data

- Air Stripping System
- Maintenance

1.5 QUALITY CONTROL

1.5.1 Qualifications

Submit qualifications of the installer, supplier's representative, and the people listed in the following subparagraphs.

1.5.1.1 Constructor

A minimum of [2][3][5][_____] years' experience in the construction of water treatment, wastewater treatment, and/or industrial wastewater treatment and/or industrial wastewater pretreatment plants is required for the Constructor to be considered qualified.

1.5.1.2 Manufacturer's Representative

Provide the services of a manufacturer's field representative who is experienced in the installation, adjustment, and operation of the equipment furnished and who has complete knowledge of the proper operation and maintenance of the system. Submit names and qualifications of each manufacturer's field representative and training engineer with written certification from the manufacturer that each representative and trainer is technically qualified.

1.5.1.3 Welding

****

NOTE: Use wording in second set of brackets when critical pipe welding is required.

****

[Weld piping in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders are to be qualified in accordance with [_____]. Welding procedures qualified by others, and welders and welding operators qualified by another employer are acceptable as permitted by [_____]. Notify the Contracting Officer 24 hours in advance of tests. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] [Welding and nondestructive testing procedures for piping is specified in Section 40 05 13.96 WELDING PROCESS PIPING.] [Welding qualifications for welding procedures, welders, and welding operators are to in accordance with Sections 8.2 and 8.8 of AWWA D100 and Section 40 05 13.96 WELDING PROCESS PIPING.] [Procedures and welders are required to be qualified in accordance with the code under which the welding is specified to be accomplished.]

1.5.2 Single Source Supplier

Assign to a single supplier the full responsibility for the furnishing of the air stripping system. The designated single supplier need not manufacture the system but is responsible for coordinating the design, assembly, installation, and testing of the entire system as specified herein. Submit a complete list of material, including manufacturer's descriptive and technical literature, catalog cuts, drawings, and installation instructions, performance charts, technical literature, catalog cuts for [packing,] [mist eliminator,] [perforated trays and number,] [perforated bubbler tubes,] [venturi design] stripper, instrumentation and controls, including capacities, make and model, materials of construction, valving, and pressure gauges.

1.6 DELIVERY, STORAGE, AND HANDLING

Preassemble parts to the maximum extent practical, compatible with transportation limitations and equipment protection considerations. Field assembly, if any, consists merely of bolting together of match-marked components. Crate and protect equipment against damage during shipping and delivery. Protect flange faces from damage. Cover openings to prevent entrance of dirt, water and debris. Protect parts so that no damage or deterioration occurs during a prolonged delay from the time of shipment until installation is completed and the units and equipment are ready for operation. Protect finished iron or steel surfaces to prevent rust and corrosion. Protect all equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, and other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design Requirements

****

NOTE: The contaminant concentration and flow rate to be used in the design are critical to this specification. Install multiple strippers to accommodate extreme variations from the design flow rate and contaminant concentrations or to maintain the groundwater gradient.

Determine design wind speed from ASCE 7-16; use 161 km/h 100 mph minimum. Use 1.2 kPa 25 psf snow load for most heavy snow climates; delete snow load where maximum snow is insignificant. Local climates and topography may dictate that a value greater than 1.2 kPa 25 psf be used for snow loading. Consult ANSI A58 and local codes. Wind speed and snow load can be deleted if the air stripper is installed inside.

Seismic criteria are given in paragraph Seismic Protection. Consult NFPA 780 to determine if lightning protection is needed.

****

Provide a system complying with the following requirements:

	Maximum	Minimum
Water/wastewater flow rate	[_____] L/s gpm	[_____] L/s gpm
Water/wastewater temperature	[_____] degrees C F	[_____] degrees C F
Ambient air temperature	[_____] degrees C F	[_____] degrees C F
Air Stripper system dimensions Maximum vertical projection	[_____] mm ft	
Maximum ground surface coverage including blower, motor and other appurtenances	[_____] by [_____] mm [_____] by [_____] ft	
Soil bearing capacity	[_____] MPa psf	
Seismic parameters	[_____]	[_____]
Wind speed	[_____] km/h mph	

	Maximum	Minimum
Ground snow load	[_____] kPa psf	[_____] kPa psf
Design Life		[_____] years

2.1.2 Influent Inorganic Chemical Conditions

Measured influent inorganic chemical concentrations of [waste water][water from surface impoundment][ground water][total][filtered]have been:

	Average	Maximum
pH [_____] Minimum	[_____]	[_____]
Total Hardness as CaCO3	[_____] mg/L	[_____] mg/L
Total alkalinity as CaCO3	[_____] mg/L	[_____] mg/L
Hydroxide alkalinity as CaCO3	[_____] mg/L	[_____] mg/L
Carbonate	[_____] mg/L	[_____] mg/L
Bicarbonate	[_____] mg/L	[_____] mg/L
Total Dissolved Solids	[_____] mg/L	[_____] mg/L
Langelier Index	[_____]	[_____]
Total Suspended Solids	[_____] mg/L	[_____] mg/L
Total Iron	[_____] mg/L	[_____] mg/L
Dissolved Iron	[_____] mg/L	[_____] mg/L
Total Manganese	[_____] mg/L	[_____] mg/L
Dissolved Manganese	[_____] mg/L	[_____] mg/L
Calcium	[_____] mg/L	[_____] mg/L
Magnesium	[_____] mg/L	[_____] mg/L
Sodium	[_____] mg/L	[_____] mg/L
Potassium	[_____] mg/L	[_____] mg/L
Sulfate	[_____] mg/L	[_____] mg/L
Nitrate	[_____] mg/L	[_____] mg/L
Chloride	[_____] mg/L	[_____] mg/L
Fluoride	[_____] mg/L	[_____] mg/L

2.1.3 System Performance Requirements

2.1.3.1 Air to Water Ratio

Maximum at maximum flow	[_____] volume/volume
Minimum at minimum flow	[_____] volume/volume

2.1.3.2 Influent and Effluent Organic Contaminant Concentrations

****

NOTE: Either specify maximum effluent concentrations or percent removal requirements.

****

Maximum Influent	[_____] µg/L
Average Influent	[_____] µg/L
Minimum Influent	[_____] µg/L

[

Maximum Effluent	[_____] µg/L

][

Removal Required	[_____] percent
Determine removal percentage as follows: ((Maximum Influent concentration - Maximum Effluent concentration)/Maximum Influent concentration) times 100 percent	

]

2.1.3.3 Operating Schedule

****

NOTE: Air stripping systems can be designed to be operated either continuously or intermittently. Typically, groundwater treatment systems have a central influent holding tank. The air stripper may be designed to cycle on and off, depending on the water level in the influent holding tank. Use of an influent holding tank allows for greater flexibility in accommodating variable flow rates from extraction wells. However, the air stripping system must be designed to accommodate a maximum, projected flow rate.

****

Size the system for capacity and design the air stripper and accessories to operate continuously for [24 hours per day, 7 days per week][_____].

2.1.4 Seismic Protection

****

NOTE: Provide seismic details on the drawings or remove the second bracketed sentence.

****

Design the air stripper shell and components structurally for seismic forces [in accordance with UFC 3-301-01 and Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT][as indicated]. [The calculations and drawings are required to be stamped by a professional engineer qualified to practice at the site.]

2.1.5 Design Loads

Structurally design the air stripper and appurtenances for the wind loads listed in the system performance requirements, plus live and dead loads resulting from internally supported parts, weight of operating liquid when the shell is completely full of water, piping structural supports, and internal or external pressures with an appropriate safety factor. Design the concrete base in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.1.6 Foundations

****

NOTE: Coordinate with paragraph Design Requirements.

The footprint and the piping connections for the air stripper on the floor plan, and height required may vary considerably depending on the type of air stripper. The designer should allow enough space for the type of air stripper that will be selected (usually, either a low-profile air stripper, or a packed tower).

****

Design the reinforced concrete foundations to support the stripper full of water in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE and in accordance with Section 12 of AWWA D100 or Sections 11 and 8.5 of AWWA D103 for earth, with the bearing value stated in the design requirements. Provide an AWWA D100 Type 1 or an AWWA D103 Type 1 or Type 2 foundation for the stripper. Use a factor of safety on overturning under design wind load of 1.5 minimum. When a footing is required, using an inverted truncated pyramid of earth with 2 on 1 side slopes above top of footing in determining overturning stability is acceptable. Ensure the elevation at the top of the foundations is not less than 200 mm 8 inches above the finished grade. Submit calculations for the shell and concrete foundations, mounting and support details including the seismic analysis, where appropriate.

2.1.7 Anchors

2.1.7.1 Number of Anchors

Install an adequate number of anchors designed to prevent overturning of the [stripper][shell] when empty. If anchor bolts are used, provide with a nominal diameter not less than 25 mm 1 inch, plus a corrosion allowance of at least 6 mm 1/4 inch on the diameter. If anchor straps are used, pre-tension them before welding to the shell.

2.1.7.2 Anchor Bolts and Straps

Provide bolts with a right angle bend, hook, or plate washer. Provide anchor straps with only a plate welded to the bottom. Insert the anchors into the foundation to resist the computed uplift.

2.1.7.3 Attachment

Attach anchors to the shell in a manner that does not add localized stresses to the shell in excess of the material tolerance. When determining the method of attachment, consider the effects of deflection and rotation of the shell. Do not attach anchors to the shell bottom. Attach the anchor bolts to the shell through stiffened chair-type assemblies or anchor rings of adequate size and height.

2.1.7.4 Seismic Requirements

Provide anchors in accordance with UFC 3-301-01 and Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT.

2.2 EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment, which are the standard products of a manufacturer regularly engaged in the manufacture of the products, and that essentially duplicate equipment that has been in satisfactory operation for at least [2] [_____] years prior to bid opening. Support equipment by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Submit verification from a Registered Professional Engineer, registered in the state where the system is located, that the stack, [the shell, ladder, platform and cage calculations for the air stripper,] the foundation and lifting lugs were designed for the listed conditions in accordance with the appropriate requirements, codes and standards.

2.2.2 Nameplates

Provide major equipment items with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment. Ensure each piece of equipment bears the approval designation and the markings required for that designation. Mark valves in accordance with MSS SP-25 to bear a securely attached tag with the manufacturer's name, catalog number and valve identification permanently displayed.

2.3 COMPONENTS

****

NOTE: Consider if the influent or the stripper must be acid cleaned or chlorine-treated in selection of materials. Stainless steel may not be appropriate if a chlorine solution will be used for extended periods of time. Galvanized steel or corrodible metal internals should not be used.

****

2.3.1 Pump

Provide pumps in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.3.2 Blower

Provide fans, blowers and or vacuum pumps in accordance with Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS.

2.3.3 Pipe Connections

Provide influent pipe connections with full line diameter of the connecting pipe. Make effluent pipe connections with standard reducing fittings only if there is adequate vertical run to avoid back-up. Provide air and off-gas piping as specified in Section 31 21 00 OFF-GASSING MITIGATION. Provide liquid piping as specified in Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING.

2.3.4 Mist Eliminator

Provide a mist eliminator that has the minimum separation efficiency stated in the performance requirements. Ensure materials are provided as specified for the stripper internals.

2.3.5 Exhaust Stack

****

NOTE: Maintain velocities within limits to reduce condensation/freezing on the stack surface.

****

Size exhaust stack for gas velocity between 3 and 7.5 m/sec 10 and 25 feet/second. Ensure materials are provided as specified for the stripper.

2.3.6 Off-Gas Control

****

NOTE: An air pollution control device may not be required depending on state and local regulations. The air pollution control system is a separate unit process, with different design requirements.

****

Convey off gas from the air stripper column to an air pollution control unit for treatment as specified in Section [44 13 10.13 VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS] [44 13 51 THERMAL OXIDATION EQUIPMENT].

2.3.7 Instrumentation and Controls

****

NOTE: Specify the instrumentation and controls as either direct-reading instruments at the column or remote-reading at some other location.

****

Provide instrumentation and controls that conform to the requirements of Section 40 60 00 PROCESS CONTROL and the requirements specified for each piece of the equipment with the interlocks and control devices specified herein.

a. Provide gauges with 150 mm 6 inch dials, stem mounted, that conform to ASME B40.100. Ensure the accuracy of gauges is Grade A or better. Calibrate gauges in kPa and psi psi in not more than 10 kPa and 2 psi 2 psi increments from 0 to 350 kPa and 0 to 50 psi 0 to 50 psi in excess of the normal operating pressure at the tank.

b. Control to shut down the system and activate an alarm if the blower fails and if water level in the bottom of the stripper exceeds the high-level set point.

c. Interlock for concurrent operation of blowers and influent [pumps] [control valves].

d. Water flow indicators [_____] to [_____] L/second [_____] to [_____] gpm.

e. Effluent water temperature gauge [_____] to [_____] degrees C [_____] to [_____] degrees F.

f. Pressure drop instrument [_____] to [_____] mm [_____] to [_____] inch water.

g. Direct reading pressure gauges in the air inlet and outlet throats.

2.3.8 Chemical Feed Systems

****

NOTE: Determine if there is an environmentally preferred alternative and evaluate the options for cleaning compounds. The potential for reuse of cleaning chemicals will depend on the fouling material composition and if the suspended biomass or chemicals can be easily removed by settling and/or filtration. Consider conventional acids (HCl, H_2SO_4) with environmentally safer products such as acetic and citric acids for chemical fouling. NaOCl may be needed for biological fouling.

Perform a cost/benefit study to select between alternative cleaning solutions, reusing the cleaning solution and disposal options. This specification does not include the disposal of sludge generated during the cleaning.

Acid-feed or sequestrant-feed systems are often used immediately upstream of air strippers to control scaling. Acid-feed systems, when used, are integrated with a pH monitoring and control system. For example, a target pH range is set, and the acid feed rate automatically adjusts to maintain the pH within the set range before the water enters the air stripper.

****

Meet chemical feed requirements as specified in Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS and/or Section 46 31 11 CHLORINE GAS FEED EQUIPMENT (AUTOMATIC, SEMIAUTOMATIC AND MANUAL).

2.3.9 Cleaning Provisions

****

NOTE: The type of cleaning chemicals used to remove mineral deposits and/or biological growth which may foul the air stripper interior and adversely affect the unit's performance will be unique to each site and depends on whether the fouling is from biological growth or chemical deposition and on the materials of construction. Tests may be needed before or after the system is started to determine the best cleaning solution.

For some types of relatively small, low-profile air strippers, the trays can easily be removed and cleaned by submerging and soaking in an acidic solution. Relatively large, low-profile air strippers, may require the use of an overhead hoist system to remove individual trays; which would tend to make in-place cleaning be more practical than a procedure that involves removing the trays. For packed tower air strippers, unless the packed tower air stripper is relatively small, and the packing can be easily removed, cleaning is usually performed via an in-place procedure (e.g., circulation of a cleaning solution). Periodic, replacement of the packing may need to be considered for situations where the cleaning procedure has limited effectiveness.

****

[Furnish the air stripper with a cleaning package capable of being operated periodically. The system includes tanks, pipes and valves to allow flushing with chemical cleaners, biocides or disinfectants. The package includes a corrosion resistant pump, chemical addition port, [cleaning solution storage tank] and plumbing accessories to allow the re-circulation of cleaning solutions through the stripper.] [Design the air stripper for a cleaning procedure during which the air stripper is isolated and filled or flooded with a [[10][_____] percent maximum [sulfuric] [hydrochloric] [_____] acid solution] [_____] cleaning solution.]

2.3.10 Assembly

Factory pre-assemble the system into reasonably sized modules for easy field assembly and mounted on a skid. Supply the skid with a welded steel frame with [2.4][6.4] mm [3/32][1/4] inch thick steel plate or fiberglass reinforced plastic (FPU) grating with ultraviolet (UV) inhibitors decking.

2.3.11 Lifting Lugs

Provide [trays][columns][stacks] and other major components with lifting lugs, as necessary for easy handling with a crane or similar device during installation, maintenance and replacement of column internals.

2.3.12 Guy Wires

****

NOTE: Size of the columns should be taken into

account. In temporary installations, or in areas of high seismic activity, guy wires may be acceptable.

****

Supply air strippers and air stripper that are free standing and supported entirely by anchoring in a concrete base and are compatible with the dimensional constraints indicated. Each column air stripper [and stack] are to be self-supporting. A superstructure or frame not extending beyond the foundation is permitted. Guy wires are not be permitted unless directed by the Contracting Officer.

2.3.13 Freeze Protection

****

NOTE: When cold dry air is used for stripping, the evaporative cooling may chill the water more than the conduction of heat through the shell of the stripping column. If evaporative calculations show that this will significantly lower the rate at which the volatiles are removed from the water, the problem can be eliminated by stripping with re-circulated air.

In cold climates, ice may accumulate where the air exits the exhaust stack. The configuration of the exhaust stack should be designed to safely allow for the ice to periodically be removed.

****

[Provide insulation in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Insulate and jacket the system to prevent freezing under the most severe conditions stated in the performance requirements with a water temperature drop of less than 3 degrees C 5 degrees F.] [Recirculating air from the stripper that had the volatilized contaminants removed by the subsequent air pollution control device into the bottom of the column is allowable].

2.3.14 Sump

Provide each air stripper with a sump to receive and store the treated effluent. Size sump to provide a minimum residence time of [2][5][10] minutes when the stripper is operating at the specified capacity. Provide [an inspection port][and][a 13 mm 1/2 inch diameter (minimum) drain/sample port with manually operated valve] at the bottom of the sump to completely drain the air stripper.

2.3.15 Electrical Equipment

****

NOTE: Show NFPA 70 hazardous area classification on the drawings. If the potential for an explosive atmosphere exists, the wiring, blower, motor and other electrical equipment must meet the applicable explosive prevention standards.

****

The electrical equipment is required conform to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide equipment and wiring in accordance with NFPA 70, with proper consideration given to environmental conditions such as moisture, dirt, corrosive agents, and hazardous area classification. Provide equipment located outdoors, not provided with climate controlled enclosure that is capable of operating in the ambient temperature range indicated in paragraph Design Requirements unless otherwise specified. Provide electrical motor-driven equipment specified herein complete with motor control centers, panels, motor starters, etc.

2.3.16 STRIPPER

****

NOTE: See DG 1110-1-3 Air Stripping for recommendations.

****

The stripper system consist of [1][2][_____] [packed column] [perforated plate (sieve tray)] or [enclosed low profile mass transfer mechanism] air stripper to transfer volatile organic compounds from the water phase to the air base. Use manufacturer's standard size units whenever possible.

2.3.16.1 Materials

****

NOTE: Limit the materials of construction to those that will not be corroded or dissolved by the contaminants in the water or cleaning solutions (acids).

****

2.3.16.1.1 Shell

****

NOTE: Use coated steel for short term applications only, since cracking of the coating could allow the column to corrode.

****

Construct the air stripper of [polyethylene (HDPE) seamless one piece molded modular sections,] [polyvinylchloride (PVC) with ultraviolet (UV) inhibitors,] [fiberglass reinforced plastic (FRP) with ultraviolet (UV) inhibitors,] [structural grade aluminum,] [304 stainless steel,] [316 stainless steel,] or [steel with internal and external coating as specified,] of suitable thickness to prevent deformation. Provide steel tank materials that conform to the applicable provisions of Section 2 of AWWA D100 or Section 2 of AWWA D103 or AWWA D120. Ensure design, fabrication, and erection comply the applicable requirements of AWWA D100 or AWWA D103 except as modified herein and in the design requirements of this specification. Ensure shop fabrication conforms [to Section 9 of AWWA D100 or Section 7 of AWWA D103 or AWWA D120][the manufacturer's recommended fabrication procedures].

2.3.16.1.2 Internals

Construct the air stripper internals of [polyethylene (HDPE)][polyvinylchloride (PVC)][fiberglass reinforced plastic (FRP)][aluminum] [304 stainless steel][316 stainless steel] or copper.

2.3.16.2 Low Profile (Sieve Tray) Stripper

****

NOTE: Low-profile air strippers may also be referred to as sieve-tray, tray-aeration, or perforated-plate air strippers.

Determining the number of trays needed in a perforated plate air stripper is more difficult than determining the height of packing in a packed column air stripper. The efficiency of each tray must be known or estimated to determine the number of trays required. The designer may have to rely on the manufacturer's test data or other estimation methods. These methods may be empirical, scale up from smaller units or more theoretical mass transfer calculation methods.

Volatile organic chemicals in the water phase transfer to the bubbles in the air phase. The air phase containing the volatile chemicals then leaves the top of the column.

****

2.3.16.2.1 Features

Provide the stripper with the following features: Vertically stacked trays with horizontal perforated plate (sieve trays) bottoms that are enclosed in a shell and are separated vertically. Contaminated water is introduced at the top, flows across a perforated plate, over a weir and down to the next lower plate. The process is repeated for each tray until the water reaches the bottom of the unit and enters the sump. Air is introduced at the bottom of the unit and is forced up through the perforations in the trays to form bubbles.

2.3.16.2.2 Calculations

Submit manufacturer calculations to clearly show the basis for the selected number of trays (each tray contains one perforated plate), size and number of the perforations on each plate, tray spacing, size of trays and tray efficiency. Submit actual performance data from the manufacturer or submit calculation methods. Submit design calculations indicating removals of each of the listed volatile compounds; air and water pressure drops through each component of the system, including line sizing, hydraulic loading (L/sq. m gal/sq. ft), air volume (cubic m/second CFM, air to water ratio (dimensionless and with appropriate units).

2.3.16.2.3 Perforated Plates (Sieve Trays)

****

NOTE: Stainless steel is recommended on large units. Plastic materials are acceptable for small low profile air strippers; plastic materials on large air strippers may warp and then leak between the trays.

If frequent fouling is anticipated, stainless steel should be used as it is easier to clean. Plastic can be damaged by scraping and steam or high pressure water cleaning.

****

Provide all materials for perforated plates, downcomers, downcomer seals, baffles and other components constructed of materials allowed by paragraph Internals, of suitable thickness to prevent deformation. Design tray to prevent short-circuiting of air or water. Provide the number and size of perforations to maximize mass transfer.

2.3.16.2.4 Gaskets

Provide the trays with gaskets that prevent air and water leakage in and out of the shell and between trays. Supply gaskets made of a material compatible with the influent and with the cleaning methods.

2.3.16.2.5 Disassembly

****

NOTE: Once disassembled, high pressure water, steam or physical scraping can be used to clean the trays.

****

Ensure the strippers are easily disassembled for cleaning or have hatches for access to the individual trays or other internal components for inspection and cleaning.

2.3.16.3 Diffused-Aeration Air Stripper

****

NOTE: Diffused-aeration air strippers employ a variety of methods to facilitate the mass transfer of volatile chemicals from the water phase to the air phase. Calculation methods for these air strippers are unique to each design and may not be readily available. Designers may have to rely heavily on manufacturer supplied performance data, or use mass transfer calculation methods developed for other processes, such as distillation or waste water aeration, to verify the performance. If manufacturer supplied performance data are relied on, the designer should determine whether the computer models use theoretical equations calibrated to actual test data, or whether they are based only on theoretical equations or empirical data.

****

Furnish a diffusion-aeration air stripper that is enclosed, uses mass transfer mechanisms which include, but are not limited to perforated bubble tubes or the venturi design to transfer (volatilize) contaminants from the water phase to the air phase.

2.3.16.4 Packed Column

****

NOTE: Calculations must be provided to clearly show the basis for the diameter and packing height. Base the diameter of the column on a maximum liquid loading rate of 60 to 80 per cent of the flooding loading rate. Data for the mass transfer coefficient (Kla) and pressure drop/flooding calculations must be obtained from a pilot plant run with this packing on the same or similar pollutants

or vendor supplied data run with this packing on the same or similar pollutants.

These data and the requirement that the Contractor must meet the removal efficiencies or effluent criteria specified in the system performance requirements should assure that the column is sized properly.
****

Furnish a packed column air stripper with the following features: A column filled with packing material that has a large surface area to volume ratio. The contaminated water is pumped to the top of the column above the packing and is distributed uniformly over the packing. Air is forced up through the bed of packing at the same time the water is "trickling" down through the packing (i.e. countercurrent flow).

2.3.16.4.1 Packing

Furnish the column filled with high efficiency open packing, either structured "arranged" or random "dumped" polypropylene, PVC, stainless steel, ceramic or other media that is durable under the service conditions. Packing diameter does not exceed 20 percent of the column diameter and is as near 9 percent of the column diameter as is feasible with the type of media supplied. Provide the packed section of the column between [_____] and [_____] mm [_____] and [_____] feet in diameter and the height of the packing between [_____] and [_____] mm [_____] and [_____] feet.

2.3.16.4.2 Water Distribution and Re-distribution System

****
NOTE: Columns that are wider relative to their depth need more distributor and re-distributors than are considered in the manufacturer literature
****

Furnish water distribution system made of [PVC] [[304][316] stainless steel] [aluminum] full solid cone spray nozzle or distributor tray that distributes the water over the fill area of the packing. Ensure water distribution system produces a minimum of [125][50][_____] streams/sq. m [12][4.8] [_____] streams/sq. ft at the normal pumping rate. Design the distribution system for easy removal and replacement. If a full solid cone spray nozzle is used, place it at the correct distance from the top of the packing to distribute the spray uniformly over the top of the packing. Provide water re-distribution systems as recommended by the manufacturer. Space the distance between re-distributors to not exceed [_____] mm ft and to be less if recommended by the packing manufacturer.

2.3.16.4.3 Packing Support

Furnish packing support make of [PVC][HDPE][fiberglass reinforced plastic] [aluminum] [[304][316] stainless steel]. If the bed depth exceeds the packing manufacturer's recommended maximum vertical depth of packing, install an intermediate support. Provide a support of suitable thickness to prevent deformation when the packing becomes plugged and the entire shell above the packing support fills with water.

2.3.16.4.4 Access

****

NOTE: View ports should be considered if the column is tall and the water can become poorly distributed or if biological, iron, manganese, or calcium fouling is likely to occur.

****

Bolt the top of each column to provide access to tower internals from above. Install view ports at the [top] [and bottom] of the column to check the water distribution and to check for fouling. Design the stripper for easy removal of the packing.

2.3.16.4.5 Manholes and Pipe Connections

****

NOTE: Additional ports should be provided if packing fouling is expected to be a problem.

****

Provide the number, type, location, and size of manholes and pipe connections as shown on the drawings and as specified herein. Section 7 of AWWA D100 and Section 5 of AWWA D103 contain the minimum requirements for manholes and pipe connections. Provide flanged access ports, [460][525][600] mm [18][21][24] inch in diameter, that are water and vapor tight, and able to withstand all loads and internal pressures during construction, operation, and cleaning. Provide one or two access ports at the top of the column for access to the mist eliminator and liquid distributor, and locate one near the bottom of the column to provide removal of the packing and packing support; and provide one with access to the sump.

2.3.16.4.6 View Ports

****

NOTE: View ports may not be necessary if the concentration of minerals in the water is low and iron, calcium or biological fouling is not expected to be a problem.

****

Provide view ports at the top and bottom of the packing to allow checks of the distribution and check for fouling.

2.3.16.4.7 Ladders, Platforms and Cages

****

NOTE: Ladder should start 2.5 m 8 feet above the ground, if the area is not secured. Ladders, platforms and cages may not be appropriate for small units.

****

Provide the air stripper with a platform at the top of the column, and an access ladder to provide access to each access port. Provide catwalks, ladders, cages, and guardrails where indicated or required for safe operation and maintenance of equipment and in accordance with Sections 7.4 and 7.5 of AWWA D100 or Sections 5.4 and 5.5 of AWWA D103. Make provision for the attachment of a scaffold cable support at the top of the roof on welded tanks. Provide ladders with side rails and non-slip rungs that are a minimum of 19 mm 3/4 inches in diameter and 406 mm 16 inches long. Start the access ladder at [ground level] [2.5 m 8 feet] above the ground. Ensure the distance between rungs does not exceed 305 mm 12 inches. Bolt the ladder and platform onto brackets that are welded to the columns, or welded directly to the column. Design platforms to support a uniform live load of 3.6 kPa 75 psf plus the dead load of the structure. Provide a platform that is a minimum of 915 mm 3 feet wide and fabricated from steel, aluminum, or fiberglass reinforced plastic. Grating openings are required to have no dimension greater than 25 mm 1 inch.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 PREPARATION

Requirements for excavating, filling, and grading in Section 31 00 00 EARTHWORK.

3.3 INSTALLATION

Install equipment as shown and in accordance with the written instructions of the manufacturer, under the direct supervision of the manufacturer's representative, and in accordance with the applicable provisions of Section 10 of AWWA D100 or Section 8 of AWWA D103 or Section 7 of AWWA D120. Submit installation drawings containing complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and properly functions as a unit. Show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation in the provided drawings.

3.4 FIELD QUALITY CONTROL

3.4.1 Manufacturer's Field Service

Prior to startup, inspect the equipment for alignment and connections by a factory representative. The manufacturer's representative inspection of the final installation is required to include supervising the adjustment and testing of the equipment. The manufacturer's representative is required to demonstrate that the system meets the performance requirements.

3.4.2 Framed Instructions

Post framed instructions, under glass or in laminated plastic, for installation instruction procedures, sequences, and precautions, including tolerances for level, horizontal, and vertical alignment. Include grouting requirements, grout spaces and materials, process flow diagrams and wiring and control diagrams showing the complete layout of the entire system, where directed. Submit process flow diagrams showing all major pieces of process equipment with flow rates and material balances. Prepare in typed form, the condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system.

Framed as specified above for the wiring and control diagrams and post beside the diagrams. Submit posted diagrams, instructions, and other sheets prior to posting. Submit [one][_____] framed process and instrumentation diagram (P&ID) showing all instrumentation and control locations, functions and settings; major process equipment, pumps, pipes, valves, instruments direction of flow, flow rates pressures and temperatures.

3.4.3 Tests

****

NOTE: Avoid further mention of sampling or analytical methods in this section. Always refer to the chemistry section to avoid conflicts.

****

3.4.3.1 Hydrostatic Tests

Hydrostatically test each unit by completely filling the shell with water and inspecting for leaks. Repair leaks and retest the column. Check equipment for leaks after it has been filled for at least one hour. Conduct shell inspections and testing in accordance with Section 11 of AWWA D100 or Section 9 of AWWA D103. [Perform mill and shop inspections using an approved commercial inspection agency.] [Perform radiographic inspections of the welded shell.] Perform the hydrostatic test and the vacuum box leak test of the tank bottom. Perform final leak test and hydrostatic test before painting.

3.4.3.2 Performance Testing

Operate each unit at the maximum flow specified in the performance requirements for at least one hour prior to sampling. Submit performance reports in booklet form, upon completion of testing of the installed system. Include in the test reports all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate within each test report the final position of all controls. Reflect all performance test data in the operating instructions.

3.4.3.3 Influent and Effluent Sampling

Collect samples in the presence of the Contracting Officer and transport the samples to the laboratory for analysis.

3.4.3.4 Influent and Effluent Analyses

Inspect and test all equipment under operating conditions after installation. Demonstrate the unit to run without operator intervention for 72 contiguous hours. If inspection or test shows defects, correct such defects, and the inspection and test will then be repeated. Performance test samples will be tested in accordance with [_____].

3.4.3.5 Discharge

****

NOTE: A holding/mixing tank requirement can be deleted if an NPDES or sewer discharge permit has been secured.

****

During the performance testing, contain the effluent from the air stripper system within the holding/mixing tank with no flow discharged to the [system] [stream] [sewer].

3.4.3.6 Noncompliance

Removals will meet or exceed the specified system performance requirements. If at any time the result of the organic analyses of the influent and effluent water indicate that the air stripping system is not in compliance with Contract Documents, stop flow through the air stripper and declare the system inoperable. If at any time the operation of the air stripping system does not meet the hydraulic, instrumentation, or control requirements set forth in this contract, stop flow through the air stripping system and declare the system inoperable. Upon notification of the air stripping system non-compliance, immediately proceed to repair or modify the system to meet compliance. Make repairs or modifications at no cost to the government. Notify the Contracting Officer one day before the restarting/retesting the air stripping system.

3.5 SYSTEM STARTUP

****

NOTE: Modify this paragraph for Contractor operation.

****

After completion of all testing, the plant operators are required to be assisted by the manufacturer's representative during plant startup.

3.6 ADJUSTING AND CLEANING

3.6.1 Adjustments

Make adjustments, within the control range, to obtain optimum performance under actual field conditions.

3.6.2 Cleaning

For potable water systems, cleaning [is] [and disinfection in accordance with AWWA C653 are] required prior to placing the unit in service.

3.7 CLOSEOUT ACTIVITIES

3.7.1 Field Training

Conduct a training course of operating staff as designated by the Contracting Officer. Start the training period, for a total of [24][36][_____] hours of normal working time, immediately after the system is functionally complete but prior to final acceptance tests. Cover the topics included in the Operating and Maintenance Manuals in the field instructions. Submit training course curriculum and training instructions, [14][_____] days prior to the start of training.

3.8 PROTECTION

****

NOTE: Some state and local health agencies have listings of acceptable paint materials for the

interior of potable water tanks; they will also apply to the interior of the air stripper. The designer must contact the appropriate state and local authorities to determine if the proposed paint systems are acceptable. If these systems are not acceptable, the designer must determine the best acceptable system and revise this specification accordingly. Any deviation from this specification and AWWA Standards must be submitted with justification to CEMP-RT for approval.

****

3.8.1 Welded Tanks

3.8.1.1 Exterior Surfaces

Apply the paint system to the outside of the tank air stripper in accordance with Section 09 90 00 PAINTS AND COATINGS. Solvent-clean all factory primed surfaces before painting. Prepare and prime surfaces that have not been factory primed in accordance with the paint manufacturer's recommendations.

3.8.1.2 Interior Surfaces

Coat tank interior surfaces in accordance with Sections 3.2, 3.3, 3.4, 3.5, 3.6 or 3.7 of AWWA D102.

3.8.2 Touch-up Painting

Touch up factory painted items as needed. Clean items of all foreign material and prime and top coat with the manufacturer's standard factory finish.

3.8.3 Field Painting

Paint equipment which did not receive a factory finish as specified in Section 09 90 00 PAINTS AND COATINGS.

3.8.4 Corrosion Resistant Metals

Do not paint corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel unless otherwise specified.

3.9 MAINTENANCE

****

NOTE: Select the option that is compatible with the Bid Schedule.

****

a. Manage, operate, maintain, and monitor the off-gas control system [until contract close out] [for at least [one year][_____] after construction, startup and performance testing are complete]. At a minimum, provide an operator onsite [eight][_____] hours per week to operate, maintain, and calibrate the equipment and instruments, and to collect samples for analyses. Ensure a qualified person is on call to respond to emergencies and alarm conditions at the off-gas system within two hours of alarm conditions. Prepare and maintain compliance and monitoring records and reports for the Contracting Officer and regulatory agencies. The operator is required to maintain a log of the actions taken.

b. Provide spare parts for each different item of material and equipment specified, including all parts recommended by the manufacturer to be replaced after [1 year][and][3 years]service. Submit spare parts data for each different item of material and equipment specified, after approval of the related submittals, and not later than [_____] months prior to the date of beneficial occupancy. Include a complete list of parts and supplies, with current unit prices and source of supply. List of all special tools, instruments, accessories, and special lifting and handling devices required for periodic maintenance, repair, adjustment, and calibration.

c. Include the following information in either the manual or manufacturer literature that contains the information and furnish it with the O&M Manuals. Include in each manual an index listing the contents. Bind all manuals in sturdy three-ring, loose-leaf binders. Provide copies of the O&M Manuals and the manufacturer's literature in electronic format.

  (1) Submit [six][_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, normal operation, short- and long-term deactivation, and shutdown. Include an introduction and overall equipment description, purpose, functions, and simplified theory of operation in the beginning of the instructions. Include within theinstructions the manufacturer's name, model number, service manual, parts list and brief description of each piece of equipment and its basic theory and operating features. Include within the instructions piping and component layouts and wiring and control diagrams for the systems as installed. Reflect all performance test data in the operating instructions.

  (2) Submit [six][_____] complete copies of maintenance instructions listing routine maintenance procedures, calibration procedures, possible breakdowns and repairs and troubleshooting guides. Include procedures for cleaning and removal of scale.

SECTION 02 62 16.13 10

OPERATION, MAINTENANCE, AND PROCESS MONITORING FOR SOIL VAPOR EXTRACTION (SVE) SYSTEMS

08/18

****
NOTE: This guide specification covers the requirements for operation, maintenance, and process monitoring for soil vapor extraction (SVE) systems.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**
****

PART 1 GENERAL

****
NOTE: This guide specification covers the initial period of operations (usually a 12 month period following completion of construction, commissioning and demonstration), or periods of operation beyond the initial period. Requirements for start-up and prove-out of SVE systems are covered by Section 02 62 16.16 10 COMMISSIONING AND DEMONSTRATION FOR SOIL VAPOR EXTRACTION (SVE) SYSTEMS.

Operations, Maintenance and Process Monitoring covers requirements to be followed by the operations staff to ensure proper operation of the SVE system equipment (e.g., monitoring vacuum levels and air

flow rates, vapor stream monitoring, and performing preventative maintenance). The operations and maintenance manual should be completed during the initial period of operation (see paragraph, Assistance in Preparation of O & M Manuals). Additional guidance on design and operation of SVE systems can be found in EM 1110-1-4001, Soil Vapor Extraction and Bioventing, June 2002.

The following information should be shown on the project drawings:

a. Individual site plans of each area of contamination with site features such as buildings, roads, utilities, trees, surface covers, locations of *vapor* extraction wells, vadose zone pressure monitoring points, and groundwater monitoring wells. Depths of screened intervals for wells should also be shown in cross-section.

b. Process flow diagram of above-ground process equipment and, piping diagrams showing the locations of devices for monitoring pressure, temperature, flow. Locations of sampling ports and valves should also be shown.

****

1.1 UNIT PRICES

****

NOTE: If there is a separate Price and Payment Procedures Section, edited versions of these paragraphs should be inserted in that section. Coordinate requirements of these paragraphs with the bidding schedule. The bid schedule should include separate unit price items for laboratory analysis of samples for chemical data. Under the pricing structure shown below, costs for laboratory analysis of samples for chemical data are not covered by this section. Unit pricing should also be considered for replacement of granular activated carbon (GAC), if GAC vapor stream treatment will be required.

These paragraphs should be coordinated with Sections 44 13 10.13 VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS and 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS.

The bid sheet should include separate, optional items for tasks such as: training, pneumatic flow meter testing, and completion testing.

****

Measurement is based on completion of contract requirements. Payment is based on the respective contract prices in the bidding schedule.

1.1.1 Unit Pricing

****

NOTE: Incentives for the Contractor to complete remedial action in a timely manner should be incorporated into the pricing structure, if possible. Unit pricing alternatives for payment include: hours of operation, volume of air extracted, and mass of contaminants removed.

Although pricing by mass of contaminants removed creates incentive, mass of contaminants removed is more difficult to accurately measure than time or air volumes. Also there is typically a high degree of uncertainty in predicting mass removal rates, which will make it difficult for bidders to assign reasonable prices when preparing bids.

Another performance based payment option is to make periodic payments to the Contractor based on the degree of reduction in contaminant levels. For example, partial payment to the Contractor is made based on the percentage reduction in contaminant levels. However this type of payment scheme should be used with caution, since removal rates typically decrease as contaminant levels decrease; e.g., it may take 3 times as long to go from 25 to 10 mg/kg as it takes to go from 100 to 25 mg/kg.

Lump sum pricing, with performance requirements (see paragraph Operation of the SVE System), is generally recommended for Operations, Maintenance and Process Monitoring. Under this pricing structure, the Contractor receives periodic payments (e.g., monthly) so long as performance requirements are being met. If performance requirements are not met, then the Contracting Officer may withhold payment until the Contractor demonstrates that performance requirements are being met.

If it is expected that large volumes of condensate will be generated, and that treatment or offsite disposal will be required; then a separate paragraph should be added to cover treatment and disposal of condensate. A unit pricing structure would be appropriate to pay for treatment or offsite disposal of condensate.

****

Compensation is based on a lump sum price for Operation of the SVE System, Maintenance, and Process Monitoring. [Include costs for Contaminated Material Storage and Disposal in this price.] [Costs for replacement adsorption media for the vapor stream treatment system is covered under a separate paragraph and not included in this price.] Include physical and chemical testing performed in the field, and sampling in this price. Costs for laboratory analysis of samples is not included in this price.

1.1.2 Training

****

NOTE: If it is expected that close out of the site will be completed within the period of the contract,

then Training should be listed as an optional item on the bid sheet.
****

Compensation is lump sum price for Training.

1.1.3 Disposal and Replacement of Vapor Phase Activated Carbon

****
NOTE: This paragraph should be deleted if any of the following conditions apply: vapor steam treatment will not be required; the vapor stream treatment system does not use activated carbon; or payment for activated carbon is covered under a separate Section.
****

Compensation for disposal of spent vapor phase activated carbon is based on and calculated by the contract unit price schedule for each [_____] [kgpound], based on [the dry weight of the spent activated carbon][_____]. Compensation for replacement of spent vapor phase activated carbon is calculated by the contract unit price schedule for each [_____][kg pound], based on [invoices from the supplier of the replacement activated carbon][_____].

1.1.4 Pneumatic Flow Meter Testing

****
NOTE: This paragraph should be deleted if pneumatic flow meter testing will not be required. If this paragraph is retained, the bid sheet should include a separate, optional item for pneumatic flow meter testing.
****

Compensation for pneumatic flow meter testing by the contract unit price schedule on a per well basis. Include physical and chemical testing performed in the field, and sampling will be included in this price. Costs for laboratory analysis of samples is not included in this price.

1.1.5 Completion Testing

****
NOTE: Completion testing is defined as testing that is performed determine if regulatory requirements have been met, so that the SVE system can be permanently shut down.

This paragraph should be deleted if completion testing will not be included in the contract. If this paragraph is retained, the bid sheet should include a separate, optional item for completion testing.
****

Base compensation for completion testing on a lump sum price. Include physical and chemical testing performed in the field, and sampling in this price. Costs for laboratory analysis of samples is not included in this price.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. ENVIRONMENTAL PROTECTION AGENCY (EPA)

EPA SESDPROC-105-R2	(2013) Groundwater Level and Well Depth Measurement

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

40 CFR 302	Designation, Reportable Quantities, and Notification

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Chemical Testing

Conduct chemical sampling and analysis.

1.3.2 Assistance in Preparing O & M Manuals

****

NOTE: Traditionally, O & M manuals are prepared by the designers of the treatment system, e.g. under Title II services. The draft O & M manual should be required after completing construction of the treatment system. Since unanticipated events often occur during the period of operation (e.g., changes in levels of contaminants), it is not uncommon for operating procedures to deviate from the procedures set out in the draft O & M manual. The authors should seek input from the operators of the treatment system during preparation of the final O & M Manual. The final O & M manual should be required

before the period of the operations contract expires.

On some projects, it may be more expedient to have the Contractor prepare the O & M Manuals. If the Contractor will be tasked to prepare the O & M Manuals, this paragraph should be rewritten, and submittal requirements for draft and final O & M Manuals should be added.
****

Provide assistance to the team tasked to prepare the Draft and Final O & M Manuals. Include the following assistance: [providing equipment manufacture's literature, as requested; 24 hours of demonstrating operation, maintenance, and monitoring protocols during facility tours; and 4 hours of answering follow-up questions][_____].

1.3.3 Sequencing and Scheduling

****
NOTE: The initial period of operation should not begin until the Contractor has fulfilled the requirements for commissioning and demonstration of the full-scale SVE system.
****

Do not initiate the first period of operation of the full-scale system until after test and inspection reports in Section 02 62 16.16 10 COMMISSIONING AND DEMONSTRATION FOR SOIL VAPOR EXTRACTION (SVE) SYSTEMS have been submitted and approved. Notify the Contracting Officer not less than [14][_____] calendar days prior to initiating the first period of operation.

1.4 SUBMITTALS

****
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy

and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

SVE System Operation Plan; G, [_____]

Process Monitoring; G, [_____]

Contaminated Material Storage and Disposal; G, [_____]

Completion Testing; G, [_____]

SD-06 Test Reports

Contract Completion Report; G, [_____]

1.5 QUALITY ASSURANCE

1.5.1 Permits and Licenses

****

NOTE: It is important for the designer to become familiar with the appropriate state and local

requirements to determine if there is a need to obtain an operating permit for the system and to include those requirements in these paragraphs. The designer should also bear in mind that any SVE system operated as part of site remediation under CERCLA authority does not require federal, state or local permits. This includes all NPL and non-NPL sites being remediated under CERCLA authority such as DERP, IRP, FUDS, or BRAC program projects. Permits that have already been acquired should be attached to the specifications and referenced.

These paragraphs should be coordinated with Sections 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS and 44 13 10.13 VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS (if used).

****

Obtain required federal, state, and local permits for operation of the SVE system.

1.5.2 Air Emissions

****

NOTE: An air pathway analysis should be performed during design to determine if air monitoring will be required. Guidance on air pathway analyses is provided in EP 200-1-24 - Air Pathway Analysis for the Design of Remedial Action Projects, 30 September 2015.

Appropriate federal, state, and local permits should be identified in this paragraph, and site specific permit requirements should also be provided. For projects where a permit is required, usually the State agency will issue an air pollution control permit (or permit equivalent) that will specify emissions control requirements. The following requirement is an example from a State air pollution control permit equivalent, "The maximum emission rate of total VOC not exceed 0.092 lbs/hr".

****

Monitor, control and report air emissions in accordance with the following regulatory requirements: [_____]. [The air pollution control permit equivalent has been acquired and is shown in Appendix [_____]].

1.5.3 Noise Control

****

NOTE: In the equipment specifications there should be a requirement for the blower not to exceed a specified noise level. This paragraph is intended to ensure that the Contractor maintains noise control throughout the period of operation, during all site activities. Ensuring that noise levels are adequately controlled is especially important for projects near residential areas.

****

Ensure the SVE system [meets state and local noise pollution control regulations.][does not exceed [_____] decibels at any site boundary.]

1.5.4 Operator Qualifications

****

NOTE: Some states may already have licensing or certification requirements for operators at sites where an air pollution control permit is required (e.g., on most RCRA projects). If the project does not require an air pollution control permit (e.g., on some CERCLA projects), then there are usually not any state licensing requirements for operators.

If remediation is not being performed under CERCLA authority (this includes both National Priority List (NPL) and non-NPL sites under Defense Environmental Restoration Program (DERP), Installation Restoration Program (IRP), Formerly Used Defense Sites (FUDS), or Base Realignment and Closure (BRAC) programs), the operator must comply with applicable state or local requirements for certification and training for operation of the SVE system. As some states have these requirements and others do not, the designer must research the state or local requirements and include them in this paragraph.

****

Provide a the chief operator with at least [2][_____] years of experience in operating air emissions control equipment, and at least [3][_____] years of experience working on projects involving clean-up of CERCLA hazardous substances, or RCRA hazardous wastes. Each member of the operations staff is required to possess a [high school diploma or equivalent] [_____]. Submit Operator Qualifications not more than [21][_____] calendar days prior to initiating the first period of operation. Allow a period of not less than [14][_____] calendar days in the schedule for Government review. Provide resume of each member of the operations including a chronology of education, state licenses, and relevant work experience.

1.6 PROJECT/SITE CONDITIONS

****

NOTE: Include any pertinent information regarding project/site conditions in this paragraph and on the drawings.

****

Approximate locations of contaminated zones are shown on the drawings. Chemical analysis of contaminated material and soil gas testing [has not been performed][has been performed and is shown in Appendix [_____]]. Boring logs are shown [on the drawings][in Appendix [_____]]. Ground water is approximately [_____] meters feet below ground surface. [A pilot-scale SVE demonstration has been performed and the report is shown in Appendix [_____]].

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Spill Response Materials

Keep the following spill response materials on site: [containers, adsorbents, shovels, and personal protective equipment][_____]. Keep spill response materials available at all times in which hazardous materials/wastes are being handled or transported. Ensure spill response materials are compatible with the type of materials being handled, and are located [as shown on drawings][_____].

PART 3 EXECUTION

3.1 APPLICATION

3.1.1 SVE System Operation

****

NOTE: The length of the initial period of operation should be defined in the bid schedule, typically the construction Contractor is required to operate the treatment system for a period of about 12 months, after completion of the prove-out period. Contracts may also be written to include options for additional periods of operation. The length of the periods of operation should be based on the expected time to complete the remedial action. Use of optional periods of operation makes for a more flexible contract. Once clean-up goals have been reached, any remaining options for additional periods of operation would not be exercised.

****

Submit an SVE System Operation Plan not more than [30][_____] calendar days after notice to proceed. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. In the plan, include an outline of the Operations Reports. The period of operation begins after approval of the following plans, and receipt of written approval from the Contracting Officer: (a) System Operation, (b) Maintenance Plan, (c) Process Monitoring Plan, and (d) Contaminated Material Storage and Disposal Plan.

3.1.1.1 Period of Operation

Operate the SVE system for a period of [365][_____] calendar days. Do not include time required to complete commissioning and demonstration in the period of operation.

3.1.1.2 Hours of Operation and Reliability

****

NOTE: The reliability requirement should allow enough downtime for the Contractor to perform scheduled maintenance.

****

Unless otherwise directed by the Contracting Officer, keep the SVE system in operation [24 hours per day, 7 days a week][_____]. Reliability is the percent of time that the system is on, and minimum airflow rates are being maintained. Ensure the reliability of the system is at least [95 percent][_____] of the total hours available in each 30 calendar day period. Record hours of operation and downtime in the Operations Log, at least once every [14][_____] calendar days. Keep the Operations Log at the facility, and available for inspection.

3.1.1.3 Operational Airflow Rates

For the SVE system to be considered in operation, turn the blower on and ensure air is flowing from the wells designated in Table 1 at the flow rates shown in Table 1, [except during off-cycle periods as designated in Table 2][_____].

TABLE 1 - AIRFLOW RATES

WELL IDENTIFICATION	MINIMUM AIRFLOW RATE
[_____]	[_____]

3.1.1.4 Intermittent Operation of Wells

****

NOTE: This paragraph should be deleted unless there are wells that will be operated intermittently.

Periodic shutdown of selected SVE wells can be used to allow time for subsurface VOC levels to rebound, and to thereby maintain higher recovery rates from active wells. The length of the shut down period is site specific, and should be based on soil gas monitoring at the site. At some sites soil gas VOC levels will increase very slowly after shutdown, and a longer shutdown period may be required. Periodic sampling of the soil gas concentrations during the shutdown can also assist in assessment of the remaining mass in the site. Refer to Appendix F of EM 1110-1-4001.

The frequency of vapor stream monitoring should be increased immediately after bringing SVE wells back on line, in order to measure the rebound spike. Periodic rebound testing is a useful tool for assessing the progress of SVE operations. See paragraph, Rebound Testing.

****

Cycle operation of designated wells in accordance with Table 2.

TABLE 2 - SCHEDULE FOR CYCLICAL OPERATION OF WELLS

WELL IDENTIFICATION	ON-CYCLE PERIOD	OFF-CYCLE PERIOD
[_____]	[_____]	[_____]

3.1.1.5 Adjustments to Mode of Operation

****

NOTE: After the system has been in continuous operation for a few months (and vapor stream data has been reviewed), strategies that may hasten completion of the project (and reduce operating costs) should be considered. Such strategies may include: installing impermeable surface covers; increasing, decreasing or stopping air flow from certain wells; and periodic cycling of designated wells. In extremely arid climates, controlled irrigation may improve contaminant removal rates. Also see paragraph, Pneumatic Flow Meter Testing. Any changes may require that the contract be modified

Value Engineering (VE) Clauses are usually included in contracts to provide incentive for the Contractor to identify areas where savings can be realized. If there are clearly areas that show a strong potential for substantial cost savings, then it may be worthwhile to request that the Contractor submit a VE proposal to change the mode of operation. The Design Team should verify that a VE Clause is included in the contract.

Remedial System Evaluations(RSE) offer another way to assess the performance of the system, and to determine if changes should be made to hasten completion of the project, and reduce operating costs. A description of RSEs and RSE checklists can be found at the following internet site: . RSEs are typically performed after a treatment system has been in operation for at least one year. If RSE recommendations will require costly modifications to the treatment system equipment, and the period of the Contract is nearly over, then it may be best to build these recommendations into a future contract. The Contractor tasked to make substantial changes to the treatment system should be responsible for a minimum period of operation after the changes have been implemented.

****

Obtain written approval from the Contracting officer before implementing any changes to the mode of operation.

3.1.1.6 Operations Reports

Submit Reports as specified and scheduled as follows: [weekly for the 1st two weeks; every 4 weeks for the 3rd through the 10th week; and every 3 months thereafter][_____]. Submit reports within 7 [_____] days of the end of the period covered by the report. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. For the period covered by each Operations Report, provide the following data: [hours of operation and hours of downtime; the amount of time that each SVE well was in use; and the cumulative total hours of operation][_____].

Organize results of Process Monitoring according to category, and shown chronologically within each category. Include Meteorological and Subsurface Monitoring data, and Process Air Stream and Equipment Monitoring data in each report. Provide the following graphs with each Operations Report. For each SVE well, plots of: volume of air extracted versus time, cumulative volume of air extracted versus time, field measurements of concentration of [contaminants of concern] [_____] versus time, vacuum responses in [all] vacuum monitoring points [_____], mass removal rate of [contaminants of concern] [_____] versus time, and cumulative mass of [contaminants of concern] [_____] removed versus time. For the SVE system as a whole, plots of: the concentration of [contaminants of concern] [_____] versus time, mass removal rate of [contaminants of concern] [_____] versus time, and cumulative mass of [contaminants of concern] [_____] removed versus time. Sign and date the reports by the Contractor's Quality Control representative. If warranted, provide in the reports any recommendations for changing airflow rates from individual wells, and other proposed adjustments to the mode of operation.

3.1.1.7 Operations Log

Submit copies of operations log sheets with each Operations Report for the period covered by the Operations Report. Keep the original log sheets in notebooks organized in chronological order, and submitted with the Contract Completion Report not more than [14][_____] calendar days after completing work at the site.

3.1.2 Process Monitoring

****

NOTE: Periodically the monitoring parameters, and the frequency of monitoring should be re-evaluated to determine if monitoring requirements should be changed. For most projects, the frequency of monitoring can be decreased as more operational data is generated.

Labor costs and the accessibility of the site should be factored into the monitoring schedule. For small-scale SVE systems that are designed to operate with minimal operator attention, the frequency of monitoring should be less than that of a large-scale, more complex SVE system.

****

Evaluate the monitoring schedule every [6 months][_____]. Propose recommended changes to the monitoring schedule, if warranted. Obtain written approval from the Contracting officer before implementing any changes to the monitoring schedule. Submit a plan for Process Monitoring not more than [30][_____] calendar days after notice to proceed. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Include physical and chemical monitoring requirements, including test parameters, frequency of sampling, number of samples, and sampling locations; and laboratory turn-around-time in the plan.

3.1.2.1 Meteorological and Subsurface Monitoring

Perform meteorological and subsurface monitoring to assess the response of the subsurface to the SVE system.

3.1.2.1.1 Meteorological Monitoring

****

NOTE: Automated monitoring equipment can be used to collect meteorological data. Meteorological data may also be available from a monitoring site in the immediate vicinity (e.g., an airport).

****

Record the following data at least once every [Monday, Tuesday, Wednesday, Thursday, and Friday][_____]: ambient temperature, and daily amount of precipitation. Record the barometric pressure each time that airflow rate monitoring is performed.

3.1.2.1.2 Vadose Zone Pressure Monitoring

****

NOTE: Vadose zone pressure should be monitored periodically, and each time that changes are made to the air extraction rates, or to the configuration of active extraction wells. Ideally, the site should be equipped with nested pressure monitoring points, placed at discrete depth intervals (corresponding to the depths of contaminated zones), and at several locations within the contaminated zones. It is also important to monitor from locations in the contaminated zone that are mid-way between SVE wells, and at relatively long distances from SVE wells, since "stagnant zones" (or reduced airflow rates) may occur at these locations.

Vadose zone pressure monitoring should be performed as part of the assessment of the zone of influence. Determination of air velocity (or travel time), rather than just vacuum levels, at vadose zone monitoring points should be used to assess the zone of influence. If vadose zone modeling will be performed, then data requirements for the model should be consistent with the monitoring procedures.

****

Perform vadose zone pressure monitoring at least once every [28][_____] calendar days, and each time that changes are made to the configuration of active SVE wells. Monitor at the following locations: [_____].

3.1.2.1.3 Groundwater Levels

****

NOTE: Groundwater level monitoring may be necessary to determine if operation of the SVE system results in upwelling of the water table, or if fluctuations in the water table (not related to SVE operations) are limiting the effective depth of SVE. If upwelling is occurring, then soils that were previously part of the lower vadose zone may become saturated and thus will not be treated via operation of the SVE system. Upwelling is usually localized around extraction wells (especially in porous soils), but some monitoring may be necessary to

determine the extent of upwelling. If the contaminated zones are well above the water table then groundwater level monitoring may not be necessary.

Site-specific considerations should be incorporated into the monitoring schedule. Water levels may be influenced by factors such as tidal cycles, and seasonal pumping from irrigation wells.
****

Measure groundwater levels at least once every [90][_____] calendar days at the following monitoring wells: [_____]. Perform water level measurement in accordance with EPA SESDPROC-105-R2. Record water level readings to the nearest 3.0 mm 0.01 foot. Decontaminate the part of the measuring device that was wetted after each measurement.

3.1.2.1.4 Pneumatic Flow Meter Testing

****
NOTE: This paragraph should be deleted if pneumatic flow meter testing will not be required. If it has not already been performed, pneumatic flow meter testing of the SVE wells should be considered. Ideally, pneumatic flow meter testing should be performed during design investigations. However, information gained from these tests can be used as part of a systematic plan to optimize operation of an SVE system.

Pneumatic logging of SVE wells is analogous to borehole flow meter testing of groundwater wells. A probe accurately measures the incremental increases in airflow as it moves up from the bottom of the well while air is extracted from the well. A sampling port on the probe allows the determination of the soil gas concentration in the well at the depth of the probe. The sampling data, coupled with the flow data, allows a determination of the contaminant mass input at different depths.

Pneumatic logging data is useful for producing vertical air permeability profiles, evaluating the distribution of contaminants, tailoring well construction, and changing operating strategy. Pneumatic logging data may also be used to define input values for vadose zone modeling.
****

Perform pneumatic flow meter testing at the following SVE wells [_____]. Monitor the following parameters continuously during testing: [airflow rate, vacuum, probe depth, and PID or FID response][_____].

3.1.2.2 Process Air Stream and Equipment Monitoring

Perform process air stream and equipment monitoring as part of the overall assessment of the SVE system, and to monitor operation of SVE system equipment.

3.1.2.2.1 Combustible Organic Vapor Monitoring

****

NOTE: Some SVE systems are designed to handle vapor stream contaminant levels that are above the lower explosive limit. However, even if an explosion-proof blower and motor are being used, ignition of an organic-laden vapor stream is still possible (e.g., static electricity may build up inside piping that is not grounded, and a spark may be released). Combustible organic vapor monitoring should be performed to reduce the risk of a fire or explosion during operation of SVE systems.

A flame ionization detector (FID) is usually recommended for this type of monitoring. Combustible gas indicators (CGI) can also be used, but only if oxygen levels are also being monitored. Combustible gas indicators can produce false readings if the level of oxygen in the sample is less than the minimum level of oxygen required for the instrument to function properly.

Site-specific action levels should be established prior to initiating the first period of operation. Action levels should be based on the types of volatile organic compounds present in the vadose zone, and the specific monitoring instrument and calibration gas being used. The action levels may require modification as more monitoring data is generated.

****

After opening the valves to begin extracting air from an extraction well that is being brought on-line for the first time, initiate monitoring during the following time intervals: [0-1 minute, 30-45 minutes, 60-75 minutes, and 120-135 minutes][_____]. In addition, monitor at least one time daily during the first [_____][200 hours] of operation of the SVE system, and at least one time daily until each extraction well has been in continuous operation for a minimum of [_____][72 hours]. During each monitoring event, record [at least 3 readings, separated by 1 minute increments,] [_____]. Monitor at the following location: [in the combined piping manifold (upstream from the inlet bleed line)] [_____]. If the [flame ionization detector][_____] indicates that the vapor stream has reached [5000 ppmV as isobutylene][_____], then immediately make adjustments to decrease the level of organic compounds in the vapor stream. Such adjustments may include adjusting airflow rates from selected wells. Repeat the monitoring and adjustment procedure until the organic vapor level of the vapor stream has been decreased to less than [5000 ppmV as isobutylene][_____].

3.1.2.2.2 Airflow Rate Monitoring

****

NOTE: To accurately determine volumetric airflow rates the density of the air stream should be calculated. Air density is dependent on relative humidity, temperature and barometric pressure. The Contractor's measurement of airflow rates should

periodically be independently verified by a NEEB or AABC certified Testing, Adjusting, and Balancing specialist.

****

Monitor pressures, temperatures, and airflow rates at the following locations at least once every [14][_____] calendar days: [in piping from each individual SVE well being used; in the combined piping manifold (upstream from the inlet bleed line); in the inlet bleed line; and at the discharge stack][_____]. Monitor airflow rate in accordance with manufacturer's instructions for the airflow monitoring devices. Record instrument readings, and provide, in each Operations Report, any assumed values that were used to calculate airflow rates. Verify measurement of airflow rates independently by a NEEB or AABC certified Testing, Adjusting, and Balancing specialist at least once every [90][_____] calendar days, and perform in accordance with Section 23 05 93 TESTING, ADJUSTING AND BALANCING OF HVAC SYSTEMS. Attach a copy of the airflow rates determined and signed by the NEEB or AABC certified Testing, Adjusting, and Balancing specialist to the Operations Report for the period when the airflow rate was verified.

3.1.2.2.3 Air/Water Separator and Condensate

****

NOTE: During cold weather, greater volumes of condensate may accumulate than during warm weather. More frequent monitoring may be necessary during periods of cold weather.

****

Record the volume of condensate in the air/water separator at least once every [14][_____] calendar days. Also record the volume of condensate generated since the previous monitoring event and cumulative total volume of condensate.

3.1.2.2.4 Blower and Particulate Filter

Record the following parameters at least once every [14][_____] calendar days: hour meter readings from the totalizing hour meter on the blower; pressures and temperatures immediately upstream from the blower and immediately downstream from the blower; and pressures immediately upstream and downstream from the inlet particulate air filter.

3.1.2.3 Vapor Stream Contaminant Level Monitoring

****

NOTE: Real-time vapor monitoring instruments are sensitive to the gasoline, or light fuel fraction contaminants such as benzene, toluene, ethyl benzene, and xylene (BTEX). A photo-ionization detector (PID) or flame-ionization detector (FID) may be used to detect constituents normally found in gasoline such as BTEX. For some types of contaminants (e.g., PCE and TCE), use of an FID is preferred over a PID. For SVE applications, an FID is usually recommended over a PID because the vapor stream is commonly moist, and an FID is less sensitive to moisture.

Vapor stream monitoring requirements are site specific, and must be in accordance with regulatory requirements. Regulatory representatives should be provided the opportunity to provide input on vapor stream monitoring requirements in the early stages of remedial design. The monitoring protocol shown below is provided as an example only, and has no regulatory basis.

****

Perform vapor stream monitoring within the first hour after startup, every six hours for the first two days, and once per day for the next five days. Monitor in accordance with regulatory requirements.

3.1.2.3.1 Field Analysis

Perform vapor stream monitoring at least once every [14][_____] calendar days. During each monitoring event, record [at least 3 readings, separated by 2 minute increments,] [_____]. Collect in each monitoring event the [flame ionization detector readings][_____] from the following locations: [each individual SVE well being used; in the combined piping manifold (upstream from the inlet bleed line); the inlet of the vapor stream treatment system; between the lead and lag vapor stream treatment units; and from the discharge stack][_____].

3.1.2.3.2 Laboratory Analysis

Perform laboratory analysis of vapor stream samples as follows: [weekly for the first 2 weeks, every 4 weeks for week 3 through 11, and at least once every 90 calendar days thereafter.][_____]. Collect one air stream sample for laboratory analysis from each of the following locations: [in the combined piping manifold (upstream from the inlet bleed line); the inlet of the vapor stream treatment system; and from the discharge stack] [_____]. Take the sample for laboratory analysis immediately after collecting the sample for field analysis at each sample port. Test samples for the following analytes: [_____].

3.1.2.4 Vapor Stream Treatment System

****

NOTE: These paragraphs should be deleted if vapor stream treatment will not be required. If the vapor stream treatment system involves a process other than granular activated carbon adsorption, then these paragraphs should be revised accordingly.

****

Whenever soil vapor is being extracted, route the vapor stream continuously through [2 adsorption vessels, configured in series,] [_____] before being released to the atmosphere.

3.1.2.4.1 Vapor Stream Heating

****

NOTE: If granular activated carbon is being used for vapor stream treatment, then the relative humidity of the vapor stream should be less than 50 percent before entering the carbon vessels. Adsorption efficiency will be reduced, and carbon

consumption will increase as the relative humidity increases. The heat generated by the blower can often be used to decrease the relative humidity of the vapor stream. A temperature rise of about 11 degrees F 20 degrees F is usually sufficient to reduce the relative humidity of the vapor stream to about 50 percent. If the temperature and pressure of the vapor stream are being monitored at locations upstream and downstream of the blower, then the change in relative humidity across the blower can be calculated.

****

Before entering the lead adsorption vessel, heat the vapor stream to at least [11 degrees C 20 degrees F] [_____] higher than the temperature coming out of the extraction wells.

3.1.2.4.2 Pressure and Temperature

Monitor pressures, and temperatures of the vapor stream at the following locations at least once every [14][_____] calendar days: [at the inlet to the lead adsorption vessel; between the lead and lag adsorption vessels; and at the outlet of the lag adsorption vessel][_____].

3.1.2.4.3 Change-Out of Adsorption Vessels

****

NOTE: Site-specific action levels should be established prior to initiating the first period of operation. Action levels should be based on the types of volatile organic compounds present in the vadose zone, and the specific monitoring instrument and calibration gas being used. The action levels may require modification as more monitoring data is generated.

****

Not more than [72][_____] hours after detection of breakthrough, replace the lead vessel by the lag vessel and place a fresh vessel in the lag position. Breakthrough is defined as follows: when field analysis indicates that contaminant concentrations at the outlet of the lead vessel [has reached the level that corresponds to the permitted maximum emission rate][exceed [_____]% of the influent concentrations]. Record the volume of air that was treated from the time that the vessel was placed in the upstream position until breakthrough was consistently determined as the breakthrough volume. Submit to the Contracting Officer a written record of the field analysis data, and the breakthrough volume, not more than [24][_____] hours after breakthrough was detected.

3.2 QUALITY CONTROL

3.2.1 Completion Testing

****

NOTE: This paragraph should be deleted if completion testing will not be included in the contract. There is often a great deal of uncertainty regarding how long the treatment system will be required to operate. At some sites,

completion testing may not be appropriate until after the contract for construction and the initial period of operation of the treatment system has been completed. However, it may be advantageous to include a separate, optional item in the contract for completion testing. If it is not possible to determine the completion testing requirements when this contract is being written, then a contract modification may be required as soon as the completion testing requirements have been determined.

Many military facilities have base-wide sampling and analysis plans that have been approved by the applicable regulatory agencies. However these plans may not specify the number of confirmation samples which must be taken. The number of confirmation samples should be based on the depth and area extent of the contaminated zone and regulatory requirements. The following reference provides guidance on the design of statistically based sampling intervals: EPA 230/02-89-042 - Methods of Evaluation and Attainment of Cleanup Standards.

Some of the samples used for completion testing should be collected from locations that are mid-way between SVE wells, and near the perimeter of the area of concern, to determine if SVE operations have adequately remediated the contaminated zone. One or more lines of evidence may be required as part of completion testing. The following reference includes guidance for obtaining closure of SVE operations: Evaluation of Mass Flux to and from Groundwater Using a Vertical Flux Model (VFLUX): Application to the Soil Vapor Extraction Closure Problem; DiGiulio, et al., Groundwater Monitoring and Remediation, Spring 1999, Vol. 19, No. 2; Soil Vapor Extraction System Optimization, Transition, and Closure Guidance, PNNL-21842, February 2013, available at https://bioprocess.pnnl.gov/SVEET_Request.htm.

Completion testing requirements are site specific, and must be in accordance with regulatory requirements. Regulatory representatives should be provided the opportunity to provide input on completion testing requirements during design. If attainment of the original completion requirements is later determined to be technically impractical, then regulatory input will be required to explore the possibility of revising the completion testing requirements. The requirements shown below are provided as examples only, and have no regulatory basis.

****

a. Completion testing is defined as testing to determine whether to continue, or shutdown, operation of the SVE system. Provide written notification to the Contracting Officer not less than [14] [_____] calendar days prior to performing completion testing. Include the following information in the notification: the type of testing to be performed, the date and time of testing, and the names of the Contractor's representatives who will be present. Submit a plan for Completion Testing not more than [14] [_____] calendar days after requested. Allow a period of not less than [30] [_____] calendar days in the schedule for Government review. Address testing requirements for determining if regulatory clean-up criteria have been met, and for determining if the SVE system can be permanently shut down in the plan.

b. Submit a Completion Testing Report not more than [45] [_____] calendar days after finishing Completion Testing. Allow a period of not less than [30] [_____] calendar days in the schedule for Government review. Include narrative descriptions of each type of testing that was performed, and scaled drawings showing: [type of sample; sampling locations (and depths, if applicable); and sample identification numbers] [_____]in the report. Organize results of testing according to category, and shown chronologically within each category. Ensure the report is signed and dated by the Contractor's Quality Control representative.

3.2.1.1 Soil Boring Sampling

****

NOTE: This paragraph should be deleted if soil boring sampling will not be a required component of completion testing. Immunoassay field kits are available that are sensitive to light fuel fractions. EM 200-1-2, Appendix G, provides additional guidance on field analysis methods. See ASTM D4700, Standard Guide for Soil Sampling from the Vadose Zone, for additional information on sampling methods.

****

Collect soil boring samples from the following locations and depth intervals: [_____]. Record locations of samples in the field, and documented on the as-built drawings. Perform soil boring sampling in accordance with Section 02 32 13 SUBSURFACE DRILLING AND SAMPLING. Samples are to be tested for the following analytes: [_____].

3.2.1.2 Groundwater Sampling

****

NOTE: This paragraph should be deleted if groundwater testing will not be a required component of completion testing. Groundwater monitoring may be necessary after the levels of volatile organics in the vapor stream have dropped to asymptotic levels. If high levels of volatile organics are present in groundwater, then VOCs from groundwater may be continually migrating into, and re-contaminating, the vadose zone. Volatile organic vapors can also transfer contamination to the ground water.

****

Perform groundwater sampling as part of an assessment of the mass transfer rate of volatile organic contaminants from groundwater to the vadose zone. Perform sampling at the following monitoring wells: [_____]. Test samples for the following analytes: [_____].

3.2.1.3 Rebound Testing

****

NOTE: This paragraph should be deleted if rebound (or equilibrium) testing will not be a required component of completion testing. If the level of contaminants represented by the "rebound spike" is less than about ten times the level of the initial contaminant level spike (from when the system was first started up), this may indicate that recovery of volatiles has become diffusion limited and that continued operation of the SVE system will be of limited value. However, it still may be possible to increase contaminant removal rates through other means, see Analysis of Selected Enhancements for Soil Vapor Extraction, EPA-542-R-97-007, Sept. 1997.

Periodic rebound testing is a useful tool for assessing the progress of SVE operations. On some projects rebound testing is performed on a regularly scheduled basis (e.g., every 4 months). Comparison of the initial contaminant level spike to subsequent rebound spikes should play into the decision on whether to continue SVE operations. Analysis of rebound behavior can provide information on the remaining mass and progress toward closure. References that can guide the analysis include Brusseau, Rohay, and Truex, 2010, Analysis of Soil Vapor Extraction Data to Evaluate Mass-Transfer Constraints and Estimate Source Zone Mass Flux, Groundwater Monitoring and Remediation, Vol. 30, No.3, pp. 57-64 and Appendix F of the US Army Corps of Engineers Soil Vapor Extraction and Bioventing Engineer Manual EM 1110-1-4001, 2002 (see www.publications.usace.army.mil/LinkClick.aspx?fileticket=2t7j4pDfSiA%3ddtabid **).**

The length of the shut down period is site specific, and should be based on soil gas monitoring at the site. At some sites soil gas VOC levels will increase very slowly after shutdown, and a longer shutdown period may be required.

****

a. After the level of contaminants in the vapor stream have reached asymptotic levels, and written approval has been received from the Contracting Officer, shut the SVE system down for a period of [28][_____] calendar days. After the SVE system has remained idle for the prescribed time period, turn the system back on. Commence vapor stream monitoring immediately after turning the SVE system back on. perform vapor stream monitoring [every 30 minutes for the first 4 hours, every hour for the 4th through the 24th hour, and every 4 hours for the 24th through the 60th hour] [_____]. During each monitoring event, record [at least 3 readings, separated by 2 minute increments,][_____]. Data collected each monitoring event will include [flame ionization detector readings][_____] from the following locations: [each individual SVE well being used; and in the combined piping manifold (upstream from the inlet bleed line)][_____].

b. Submit Laboratory Analysis Reports for the vapor stream contaminant as specified in the Submittals paragraph. Results from laboratory analysis not more than [40][_____] calendar days after collecting samples. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Provide a table comparing field data to the laboratory data, for samples collected at the same time and from the same sampling port, with each set of laboratory analysis results. Sign and date the reports along with the Contractors Quality Control representative.

3.2.1.4 Soil Gas Monitoring

****

NOTE: This paragraph should be deleted if soil gas monitoring will not be a required component of completion testing. Use of passive soil gas sampling devices is generally not recommended at SVE sites; i.e., air should be withdrawn from the vadose zone to collect soil gas samples. If levels of volatile organics in whole air samples are below detection limits, they can be concentrated by passing a known volume of extracted soil gas through an adsorption device. See ASTM D5314, Standard Guide for Soil Gas Monitoring in the Vadose Zone, for additional information.

****

Perform soil gas monitoring by extracting air from the following soil vapor extraction wells and vadose zone monitoring points: [_____]. [In addition, perform a soil gas survey to collect samples from the following locations and depth intervals: [_____].] Perform soil gas sampling by either collecting whole-air samples, or by passing a known volume of extracted soil gas through an adsorption device. Test samples for the following analytes: [_____].

3.3 CLOSEOUT ACTIVITIES

3.3.1 Training

****

NOTE: If continued operation of the treatment system will be required after the contract expires, then the outgoing Contractor should be required to train the incoming Contractor. This paragraph should be coordinated with training prescribed in Sections 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS; OFF-GAS and 44 13 10.13 VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS.

****

Provide a minimum of [32 hours][_____] of training to the incoming Contractor prior to completion of the contract. Scheduling of training will be subject to approval by the Contracting Officer. In the Training sessions, include: [familiarizing the incoming Contractor with the O & M Manual; touring the treatment facility; demonstrating the use of each piece of equipment; demonstrating the use all interlocks and system controls;

demonstrating start-up and shut-down of system; demonstrating maintenance procedures; demonstrating process monitoring requirements and sampling procedures during a scheduled monitoring event; providing written inventory and showing the locations of materials and spare parts that will be left on-site; and answering questions][_____].

3.3.2 Contract Completion Report

****

NOTE: In addition to progress photos, video tapes have been used at some sites to record site activities.

****

Submit [_____] copies of Contract Completion Report not more than [14][_____] calendar days after completing work at the site. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Label the report with the contract number, project name, location, date, name of general Contractor, and the Corps of Engineers District Contracting for the work. Include in the report the following information as a minimum:

a. A cover letter signed by a [responsible Contractor representative] [Professional Engineer registered in the State of [_____] who is a responsible Contractor representative] certifying that all services involved have been performed in accordance with the terms and conditions of the contract specifications.

b. A narrative report including but not limited to the following:

    (1) site conditions, ground water elevation, and clean-up criteria;

    (2) monitoring locations and methods;

    (3) dates of the last 3 monitoring events;

c. Copies of the most recent test results and the final Operations Report.

d. Copies of manifests.

e. For materials that required offsite disposal, copies of certifications of final disposal signed by the responsible disposal facility official, and waste profile sheets.

3.4 MAINTENANCE

3.4.1 Contaminated Material Storage and Disposal

****

NOTE: For SVE systems, the most common type of potentially-contaminated media that may require collection and disposal is condensate from the air/water separator. However, the level of volatile contaminants in the condensate will be limited by the continuous flow of air through the piping. If significant volumes of condensate accumulate in the air/water separator, periodic testing may be necessary to determine storage and disposal requirements.

If activated carbon is being used for vapor stream treatment, then spent activated carbon will have to be regenerated or sent to a disposal facility.

For RCRA sites, hazardous waste can be stored in a drum or roll-off unit for up to 90 days without a permit. For temporary storage of more than 90 days, dual containment of hazardous liquid and some hazardous solids is required. Containment system requirements are described in 40 CFR 264.175 - Containment.

Storage requirements will depend on factors such as whether the contaminated material is determined to be hazardous waste. If there are site-specific factors that dictate the need for dual containment, this paragraph should be revised accordingly. The Contractor may be required to identify all necessary permits or permit equivalents and actions necessary to comply with applicable regulations.
****

Ensure the methods of contaminated material storage are in accordance with regulatory requirements. If multiple storage units are required, label each unit clearly with an identification number and keep a written log to track the source of contaminated material in each temporary storage unit. Submit a plan for Contaminated Material Storage and Disposal not more than [30] [_____] calendar days after notice to proceed. Allow a period of not less than [30] [_____] calendar days in the schedule for Government review. Include testing requirements, including test parameters, frequency of sampling, number of samples, and sampling locations; laboratory turn-around-time in the plan.

3.4.1.1 Liquid Storage

Store liquid collected temporarily in [220 L 55 gallon barrels] [[2000] [_____] L [500] [_____] gallon tanks]. Ensure liquid storage containers have no leaks and are be located [as shown on the drawings] [_____].

3.4.1.2 Sampling Liquid

****
NOTE: The frequency of testing should be based on the rate of liquid generation, the size of the storage containers, and regulatory requirements. Offsite disposal may require additional testing and analysis prior to disposal. NPDES requirements must be considered for onsite disposal of liquids.
****

Sample liquid collected at a frequency of at least once every [2,000] [_____] L [500] [_____] gallons of liquid collected. Test samples for the following analytes: [_____].

a. Chemical Parameter: [_____].

b. Regulatory Limit: [_____].

Treat liquid with contaminant levels that exceed regulatory limits [offsite. Analyses for contaminated liquid to be taken to an offsite treatment facility conforming to local, state, and federal criteria as well as to the requirements of the treatment facility. Furnish documentation of all analyses performed to the Contracting Officer. Additional sampling and analysis required by the receiving off-site treatment, storage or disposal (TSD) facility is the responsibility of the Contractor] [onsite. Treat liquid in accordance with Section [_____]].

3.4.2 Spills

****

NOTE: Regarding pre-established spill reporting procedures, the designer should consult CEMP-RT memorandum of 20 July 1995, Subject: Spill Reporting Procedures for USACE Personnel Involved in HTRW Projects.

****

In the event of a spill or release of a hazardous substance (as designated in 40 CFR 302), pollutant, contaminant, or oil (as governed by the Oil Pollution Act (OPA), 33 U.S.C. 2701 et seq.), notify the Contracting Officer immediately. If the spill exceeds the reporting threshold, follow the pre-established procedures for immediate reporting to the Contracting Officer. Take immediate containment actions to minimize the effect of any spill or leak. Clean-up in accordance with applicable federal, state, and local regulations. Additional sampling and testing may be required to verify spills have been cleaned up. Perform spill clean-up and testing at no additional cost to the Government.

3.4.3 Disposal Requirements

Dispose of contaminated material offsite in accordance with SECTION 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS.

3.4.4 Maintenance

****

NOTE: Proper servicing of equipment is especially important for equipment that will remain onsite after the contract expires. Maintenance oversight for equipment that will be retained by the Contractor may not be necessary.

****

3.4.4.1 Equipment Maintenance Schedules

Perform maintenance of equipment in accordance with manufacture's recommendations. Submit a preventative maintenance schedule for inspecting equipment, and a schedule for servicing of major equipment items. Submit a plan for Maintenance of the SVE System not more than [30][_____] calendar days after notice to proceed. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Perform maintenance according to schedule, and in response to monitoring data.

3.4.4.2 Maintenance Logs

Keep maintenance logs for each of the following units of equipment:

[air/water separator, particulate filters, blower, motor, instrumentation and control system, and vapor stream treatment system][_____]. Each time one of these units is serviced, make an entry in the maintenance log. Include the following entries in the maintenance log: date, reason for servicing, description of service performed, a list of the parts that were replaced, name of the service organization and technician performing the maintenance, and signature of the Contractor's Quality Control Representative. Keep the Maintenance Log at the facility, and available for inspection. Submit maintenance log sheets attached to each Operations Report for the period covered by the Operations Report. Keep the original log sheets in notebooks organized in chronological order, and submit with the Contract Completion Report not more than [14][_____] calendar days after completing work at the site.

SECTION 02 62 16.16 10

COMMISSIONING AND DEMONSTRATION FOR SOIL VAPOR EXTRACTION (SVE) SYSTEMS

08/18

****

NOTE: This guide specification covers the requirements for commissioning and demonstration for soil vapor extraction (SVE) systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

****

NOTE: Commissioning is performed after construction has been completed, and is an ordered process for testing and start-up of SVE system equipment. During commissioning, pre-commissioning checklists are completed, and functional performance tests are performed to test individual components of the system and subsystems. Demonstration serves as a prove-out period. The purpose of the demonstration is to show that the SVE system, as a whole, is ready to be put into service.

This guide specification should be used in conjunction with Section 02 62 16.13 10 OPERATION, MAINTENANCE, AND PROCESS MONITORING FOR SOIL VAPOR

EXTRACTION SYSTEMS. For small-scale SVE projects, editing and combining this section with Section 02 62 16.13 10 should be considered. Additional guidance on start-up of SVE systems can be found in EM 1110-1-4001 SOIL VAPOR EXTRACTION AND BIOVENTING.

This guide specification should be coordinated with other sections that may also include commissioning requirements for SVE system components, to avoid unnecessary duplication of requirements.

****

1.1 UNIT PRICES

****

NOTE: If there is a separate Price and Payment Procedures Section, edited versions of these paragraphs should be inserted in that section. Coordinate these paragraphs with the bidding schedule.

Separate, lump sum prices are generally recommended for Baseline Monitoring, Commissioning, and Demonstration. However it is also recommended that bidders be required to provide unit cost amounts for laboratory testing for chemical data. Unit costs will provide a basis for negotiating for additional tests, if determined that more testing than was originally anticipated is required.

It is recommended that the bid sheet be structured so that a portion of the payment (i.e., at least 30 percent) for construction of the SVE system be withheld at least until the full-scale demonstration has been completed. If acceptance of the SVE system is granted before the bugs are worked out, there may not be sufficient incentive for the Contractor to finish fixing problems with the SVE system.

****

Base all measurements in accordance with completion of contract requirements. Payment is calculated at the respective contract prices in the bidding schedule.

1.1.1 Baseline Monitoring

Compensation is based on a lump sum price for Baseline Monitoring. Include physical and chemical testing performed in the field and sampling in this price. Cost for laboratory analysis of samples is not included in this price.

1.1.2 Commissioning

****

NOTE: Laboratory analysis of samples is usually not required during Commissioning. Vapor stream monitoring during commissioning typically involves using a field instrument, such as a flame ionization detector (FID).

****

Compensation is based on a lump sum price for completion of Commissioning. Include physical and chemical testing performed in the field and sampling in this price. Laboratory analysis of samples [is][is not] required during Commissioning.

1.1.3 Demonstration

****

NOTE: Vapor stream monitoring during the full-scale demonstration typically involves using a field instrument, such as an FID, in conjunction with laboratory analysis of a limited number of samples.

****

Compensation is based on a lump sum price for completion of Demonstration. Include physical and chemical testing performed in the field and sampling in this price. Costs for laboratory analysis of samples are not included in this price.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. ENVIRONMENTAL PROTECTION AGENCY (EPA)

EPA SESDPROC-105-R2	(2013) Groundwater Level and Well Depth Measurement

1.3 ADMINISTRATIVE REQUIREMENTS

****

NOTE: Commissioning and demonstration of the full-scale SVE system should be preceded by a pilot-scale demonstration. The pilot-scale

demonstration (or field demonstration) is usually the last step of the design investigation. Data gained during the pilot-scale demonstration are critical to proper sizing of the blower and other process equipment, and to proper lateral and vertical placement of SVE wells. This section only addresses commissioning and demonstration for full-scale SVE systems.

The specifications for the treatment system, or for components of the treatment system, should include requirements for testing, adjusting and balancing. Blowers, motors and air handling components of the SVE system should be tested in accordance with Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS prior to commissioning. Although Section 23 05 93 is oriented primarily toward HVAC systems, the same testing, adjusting, and balancing requirements should be applied to components of the SVE system.

****

1.3.1 Chemical Testing

Conduct chemical sampling and analysis.

1.3.2 Submittal Requirements

Provide submittals in both hard copy, and electronic files on disc. Provide electronic files compatible with the following software: [_____]. If a part of a submittal is not available in electronic format, include a note describing which items were not provided in electronic format and explaining why the items could not be provided in electronic format.

1.3.3 Sequencing and Scheduling

Follow the sequence of work as outlined below: construction completion, commissioning, and full-scale field demonstration. [Complete baseline monitoring prior to initiating commissioning.] Do not initiate commissioning of the full-scale system until after work required in the following Sections has been completed, and test requirements in these Sections have been substantially completed: [Sections 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS, 31 21 00 OFF-GASSING MITIGATION, 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS, and 44 13 10.13 VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS][_____].

1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item,

if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Baseline Monitoring Plan; G, [_____]

Commissioning Team

Commissioning Plan; G, [_____]

Full-Scale Demonstration Plan; G, [_____]

Pre-Commissioning Tests; G, [_____]

Baseline Monitoring Schedule

Full-Scale Demonstration Log

Laboratory Analysis Report

1.5 QUALITY CONTROL

1.5.1 Regulatory Requirements

1.5.1.1 Permits and Licenses

****

NOTE: It is important for the designer to become familiar with the appropriate state and local requirements to determine if there is a need to obtain an operating permit for the system and to include those requirements in these paragraphs. The designer should also bear in mind that any SVE system operated as part of site remediation under CERCLA authority does not require federal, state or local permits. This includes all NPL and non-NPL sites being remediated under CERCLA authority such as DERP, IRP, FUDS, or BRAC program projects. Permits that have already been acquired should be attached to the specifications and referenced.

These paragraphs should be coordinated with Sections 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS and 02 62 16.13 10 OPERATION, MAINTENANCE, AND PROCESS MONITORING FOR SOIL VAPOR EXTRACTION (SVE)SYSTEMS.

****

As required by regulations, obtain federal, state, and local permits for commissioning and demonstration of the SVE system. [Permits that have already been acquired are attached to the specifications.]

1.5.1.2 Air Emissions

****

NOTE: Federal, state, and local air quality requirements (as necessary during commissioning and demonstration) should be identified in this paragraph.

This paragraph should be deleted if air emissions monitoring will not be required during commissioning and demonstration.

****

Monitor, control, and report air emissions in accordance with the following regulatory requirements: [_____].

1.5.1.3 Noise Control

****

NOTE: In the equipment specifications there should be a requirement for the blower not to exceed a specified noise level. This paragraph is intended to ensure that the Contractor maintains noise control during commissioning and demonstration. Ensuring that noise levels are adequately controlled is especially important for projects near residential areas.

****

Ensure the SVE system [meets state and local noise pollution control regulations.][does not exceed [_____] decibels at any site boundary.]

PART 2 PRODUCTS (NOT APPLICABLE)

PART 3 EXECUTION

3.1 BASELINE MONITORING

Do not initiate baseline monitoring until after the Baseline Monitoring Plan has been approved, and written approval has been received from the Contracting Officer. Notify the Contracting Officer at least [14][_____] calendar days before starting baseline monitoring.

3.1.1 Baseline Monitoring Plan

Submit a plan for Baseline Monitoring at least [60][_____] calendar days before initiating Baseline Monitoring. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Include physical and chemical monitoring requirements, including test parameters, frequency of sampling, number of samples, and sampling locations; and laboratory turn-around-time in the plan. Include the field record data forms and an outline of the Baseline Monitoring Report in the plan. Submit Baseline Monitoring Schedule, at least [14][_____] calendar days prior to the start of baseline monitoring. Submit Baseline Monitoring Report not more than [35][_____] calendar days after completing baseline monitoring.

3.1.2 Team Members

Submit list of team members who represent the Contractor in the pre-commissioning checks and functional performance tests, at least [14][_____] calendar days prior to the start of pre-commissioning checks.

3.1.3 Sampling Results

Submit results from laboratory analysis not more than [40][_____] calendar days after collecting samples. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Provide table comparing field data to the laboratory data, for samples collected at the same time and from the same sampling port, with each set of laboratory analysis results. Submit the reports signed and dated by the Contractor's Quality Control representative.

3.1.4 Baseline Monitoring Requirements

3.1.4.1 Temperature and Precipitation

Record ambient temperature readings at least daily during baseline monitoring. Record temperature readings each time that barometric pressure readings are recorded. Record temperature readings to the nearest 0.5 degree C 1.0 degree F. Measure precipitation daily during baseline monitoring activities. Record precipitation readings to the nearest 2.0 mm 0.1 inch.

3.1.4.2 Barometric Pressure and Vadose Zone Pressure

****

NOTE: The subsurface response to changes in

barometric pressure should be established during baseline monitoring. At sites with low permeability layers there may be a pressure differential between the atmosphere and the subsurface, or there may be a lag period before the subsurface equilibrates with the atmosphere.

****

Record barometric pressure readings 3 times per day for 3 consecutive days at the following times: [0800, 1200, and 1700 hours][_____]. To establish subsurface response to changes in barometric pressure, record vadose zone pressures within 15 minutes of the barometric pressure readings at the following soil vapor extraction wells and vadose zone monitoring points: [_____]. Record pressure readings to the nearest 2.0 mm 0.1 inch of mercury.

3.1.4.3 Soil Gas Monitoring

****

NOTE: This paragraph should be deleted if baseline soil gas sampling has already been performed. In addition to contaminants of concern, testing for the following parameters should be considered: total volatile hydrocarbons, oxygen, carbon dioxide, and methane.

Use of passive soil gas sampling devices is generally not recommended at SVE sites; i.e., air should be withdrawn from the vadose zone to collect soil gas samples. If levels of volatile organics in whole air samples are below detection limits, they can be concentrated by passing a known volume of extracted soil gas through an adsorption device. See ASTM D5314, Standard Guide for Soil Gas Monitoring in the Vadose Zone, for additional information.

****

Prior to start-up of the system, perform soil gas monitoring by extracting air from the following soil vapor extraction wells and vadose zone monitoring points: [_____]. [In addition, perform a soil gas survey to collect samples from the following locations and depth intervals: [_____].] Perform soil gas sampling by either collecting whole-air samples, or by passing a known volume of extracted soil gas through an adsorption device. Test samples for the following analytes: [_____].

3.1.4.4 Groundwater Levels

Record water levels for each of the following wells: [_____]. Complete water level measurements for all designated wells in not more than [72][_____] hours, from start to finish. Perform water level measurement in accordance with EPA SESDPROC-105-R2. Record water level readings to the nearest 3.0 mm 0.01 foot. Decontaminate the part of the measuring device that was wetted after each measurement.

3.1.4.5 Soil Boring Sampling

****

NOTE: This paragraph should be deleted if the soil

boring sampling has already been performed. In addition to contaminants of concern, testing for the following parameters should be considered: percent moisture, and fraction organic carbon.

Immunoassay field kits are available that are sensitive to light fuel fractions. See ASTM D4700, Standard Guide for Soil Sampling from the Vadose Zone, for additional information on sampling methods.
****

Collect soil boring samples from the following locations and depth intervals: [_____]. Perform soil boring sampling in accordance with Section 02 32 13 SUBSURFACE DRILLING AND SAMPLING. Test samples for the following analytes: [_____].

3.1.5 Baseline Monitoring Report

Submit a baseline monitoring report. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Organize results of Baseline Monitoring according to category, and shown chronologically within each category. Include in the report monitoring locations (and depths, if applicable), and sample identification numbers. Prepare separate plan view maps showing monitoring locations and depths, and the results of [soil gas monitoring, groundwater levels, and soil boring sampling][_____]. Ensure that the report is signed and dated by the Contractor's Quality Control representative.

3.2 COMMISSIONING

Do not initiate commissioning until the Commissioning Plan has been approved, and written approval has been received by the Contracting Officer. Notify the Contracting Officer at least [14][_____] calendar days before starting commissioning. Perform combustible organic vapor monitoring during commissioning in accordance with paragraph 3.10.6.1, Combustible Organic Vapor Monitoring.

3.2.1 Commissioning Plan

Submit a plan for Commissioning at least [60][_____] calendar days before initiating Commissioning. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Include in the Commissioning Plan a list of Pre-Commissioning and Functional Performance Tests. Include the field record data forms. Include detailed procedures for pre-commissioning checks and functional performance tests, at least [35][_____] calendar days prior to the start of pre-commissioning checks. Allow a period of not less than [21][_____] calendar days in the schedule for Government review. A schedule for pre-commissioning checks and functional performance tests, at least [14][_____] calendar days prior to the start of pre-commissioning checks. Submit the Commissioning Report not more than [14][_____] calendar days after completing commissioning. Allow a period of not less than [14][_____] calendar days in the schedule for Government review. Submit completed pre-commissioning checklists and functional performance tests checklists (organized by system and by subsystems) as one package. Include the results of failed tests along with a description of the corrective action taken.

3.2.2 Team Members

Submit list of team members who represent the Contractor in the pre-commissioning checks and functional performance tests, at least [14][_____] calendar days prior to the start of pre-commissioning checks.

3.2.3 Sampling Results

Submit results from laboratory analysis not more than [40][_____] calendar days after collecting samples. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Provide table comparing field data to the laboratory data, for samples collected at the same time and from the same sampling port, with each set of laboratory analysis results. Submit the reports signed and dated by the Contractor's Quality Control representative.

3.2.4 Commissioning Requirements

3.2.4.1 Commissioning Team and Checklists

****

NOTE: The "design Agent's Representative" will be a member of the design team, i.e. from the AE or from Engineering Division. Where possible, the "Design Agent's Representative" should be included as a member of the commissioning team for the pre-commissioning checklists. The Design Agent's Representative will participate in functional performance tests. The planning, programming and funding for the Design Agent's Representative, whether in-house or A-E personnel will be used, must be addressed no later than the Predesign Conference.

The number of team members required to be present during commissioning should be based on the scale and complexity of the SVE system. The disciplines that need to be represented should be based on the types of equipment incorporated into the SVE system. Commissioning of a relatively simple system will require fewer individuals.

The checklists provided are to be used as guides for the preparation of project-specific checklists. An appropriate checklist should be included for each major component of the SVE system. The designer should insert additional checklists for equipment or systems not included in this guide specification, or modify the checklists where necessary for project-specific requirements.

****

Designate team members to participate in the pre-commissioning checks and the functional performance testing. In addition, the Government will be represented by a representative of the Contracting Officer, the Design Agent's Representative, and the Using Agency. The team members that are required are listed below:

Designation	Function
Q	Contractor's Chief Quality Control Representative
M	Contractor's Mechanical Representative
E	Contractor's Electrical Representative
T	Contractor's Testing, Adjusting, and Balancing Representative
C	Contractor's Controls Representative
D	Design Agent's Representative
O	Contracting Officer's Representative
U	Using Agency's Representative

The commissioning team is required to complete each checklist shown in Appendices A and B. Indicate acceptance by each commissioning team member of each pre-commissioning checklist item by entering initials and date unless an "X" is shown indicating that participation by that individual is not required. Indicate acceptance by each commissioning team member of each functional performance test checklist by signature and date.

3.2.4.2 Tests

Perform the pre-commissioning checks and functional performance tests in a manner that essentially duplicates the checking, testing, and inspection methods established in the related Sections. Where checking, testing, and inspection methods are not specified in other Sections, establish methods and document that provide the information required. Perform testing and verification required by this section during the Commissioning phase. Requirements in related Sections are independent from the requirements of this Section and may not be used to satisfy any of the requirements specified in this Section. Provide all materials, services, and labor required to perform the pre-commissioning checks and functional performance tests. Abort pre-commissioning check or functional performance test if any system deficiency prevents the successful completion of the test or if any participating non-Government commissioning team member of which participation is specified is not present for the test. Reimburse the Government for all costs associated with effort lost due to tests that are aborted. Include costs for salary, travel costs and per diem (where applicable) for Government commissioning team members.

a. Pre-commissioning Tests: Perform pre-commissioning checks for the items indicated on the checklists in Appendix A. Correct and retest deficiencies discovered during these checks in accordance with the applicable contract requirements.

b. Functional Performance Tests: Conduct functional performance tests for the items indicated on the checklists in Appendix B. Begin functional performance tests only after all pre-commissioning checks have been successfully completed. Prove all modes of the sequences of operation work by the tests. Verify all other relevant contract requirements by the tests. Begin tests with equipment or components and then progress through subsystems to complete systems. Upon failure of any functional performance test checklist item, correct all deficiencies in accordance with the applicable contract requirements. Repeat entire checklist until it has been completed with no errors. Submit a Commissioning Report as specified in the Submittals paragraph.

3.3 DEMONSTRATION OF FULL-SCALE SYSTEM

Do not demonstrate the full-scale system until after commissioning has been successfully completed, the Full-Scale Demonstration Plan has been approved, and written approval has been received from the Contracting Officer. Notify the Contracting Officer at least [14][_____] calendar days before starting the demonstration, and provide a schedule of demonstration activities at least [7][_____] calendar days before starting the demonstration.

3.3.1 Full-Scale Demonstration Plan

Submit plan for Full-Scale Demonstration at least [60][_____] calendar days before initiating the Full-Scale Demonstration. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Include Demonstration Plan Schedule, physical and chemical monitoring requirements, including test parameters, frequency of sampling, number of samples, and sampling locations; and laboratory turn-around-time in the plan.Include the field record data forms and an outline of the Full-Scale Demonstration Report. Submit Full-Scale Demonstration Report not more than [7][_____] calendar days after completion of the Demonstration. Operations log sheets attached to the Full-Scale Demonstration Report. Keep the log in notebooks organized in chronological order, and submit with the Full-Scale Demonstration Report not more than [14][_____] calendar days after completing the Full-Scale Demonstration.

3.3.2 Team Members

Submit list of team members who represent the Contractor in the Full-Scale Demonstration, at least [14][_____] calendar days prior to the start of pre-commissioning checks.

3.3.3 Sampling Results

Submit results from laboratory analysis not more than [40][_____] calendar days after collecting samples. Allow a period of not less than [30][_____] calendar days in the schedule for Government review. Provide a table comparing field data to the laboratory data, for samples collected at the same time and from the same sampling port, with each set of laboratory analysis results. Submit the reports signed and dated by the Contractor's Quality Control representative.

3.3.4 Demonstration Time Frame

3.3.4.1 Period of Demonstration

Operate the SVE system continuously for a period of at least [120][_____] hours. Do not include time required to complete commissioning in the period of demonstration.

3.3.4.2 Hours of Operation and Downtime

Unless otherwise directed by the Contracting Officer, operate the SVE system [24][_____] hours per day. Do not exceed [6 hours during the 120 hour demonstration period][_____] for SVE System Downtime. If downtime exceeds [6 hours during the 120 hour demonstration period][_____], re-start the demonstration, until the continuous operation requirement is satisfied. Record hours of operation and downtime in the Demonstration Log, at least once every [24][_____] hours. Maintain the Full-Scale Demonstration Log at the facility, and available for inspection.

3.3.4.3 Operational Airflow Rates

For the SVE system to be considered in operation, turn on the blower and ensure air is flowing from those wells designated in Table 1 at the flow rates shown in Table 1.

TABLE 1 - AIRFLOW RATES

WELL IDENTIFICATION	MINIMUM AIRFLOW RATE
[_____]	[_____]

3.3.4.4 Processing Monitoring

Obtain written approval from the Contracting officer before implementing any changes to the full scale demonstration schedule.

a. Meteorological Monitoring: Record the following data [daily][_____] during the full-scale demonstration: [ambient temperature, daily amount of precipitation, and barometric pressure][_____].

b. Vadose Zone Pressure Monitoring: Perform Vadose zone pressure monitoring at least [daily][_____] during the full-scale demonstration. Perform monitoring at the following vadose zone monitoring points: [_____].

3.3.4.5 Groundwater Levels

Measure groundwater levels on the [first and third][_____] day of the full-scale demonstration, while the system is in operation, at the following monitoring wells: [_____].

3.3.4.6 Process Air Stream and Equipment Monitoring

Monitor process air stream and equipment as part of the overall assessment of the SVE system, and to monitor operation of SVE system equipment.

a. Combustible Organic Vapor Monitoring: After opening the valves to begin extracting air from each extraction well for the first time, monitor during the following time intervals: [0-1 minute, 30-45 minutes, 60-75 minutes, 120-135 minutes][_____]. In addition, monitor at least once every [8][_____] hours during the full-scale demonstration. During each monitoring event, record [at least 3 readings, separated by 1 minute increments,][_____]. Monitor at the following location: [in the combined piping manifold (upstream from the inlet bleed line)][_____]. If the [flame ionization detector][_____] indicates that the vapor stream has reached [5000 ppmV as isobutylene][_____], then immediately make adjustments to decrease the organic vapor level. Such adjustments may include increasing and/or decreasing airflow rates from selected wells. Repeat the monitoring and adjustment procedure until the organic vapor level of the vapor stream has been decreased to less than [5000 ppmV as isobutylene][_____].

b. Airflow Rate Monitoring: Monitor pressures, temperatures, and air flow rates at the following locations at least [daily][_____] during the full-scale demonstration: [in piping from each individual SVE well being used; in the combined piping manifold (upstream from the inlet bleed line); in the inlet bleed line; and at the discharge stack][_____]. Maintain airflow rate monitoring in accordance with manufacturer's instructions for the air flow monitoring devices. Record instrument readings, and provide, in the Full-Scale Demonstration Report, any assumed values that were used to determine airflow rates. Independently verify measurement of airflow rates by a NEEB or AABC certified Testing, Adjusting, and Balancing specialist during the first day of the full-scale demonstration. Performed measurement in accordance with Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS. Attach a copy of the airflow rates determined and signed by the NEEB or AABC certified Testing, Adjusting, and Balancing specialist to the Full-Scale Demonstration Report.

c. Air/Water Separator and Condensate: Record the volume of condensate in the air/water separator at least [daily][_____] during the full-scale demonstration. Also record the volume of condensate generated since the previous monitoring event and cumulative total volume of condensate.

d. Blower and Particulate Filter: Record the following parameters at least once every [24][_____] hours during the full-scale demonstration: hour meter readings from the totalizing hour meter on the blower; pressures and temperatures immediately upstream from the blower and immediately downstream from the blower; and pressures immediately upstream and downstream from the inlet air filter.

3.3.4.7 Vapor Stream Contaminant Level Monitoring

Perform vapor stream contaminant level monitoring within [2][_____] hours of airflow rate monitoring to allow mass removal rates to be determined. Monitor in accordance with regulatory requirements.

a. Field Analysis of Vapor Stream Samples: Perform vapor stream monitoring [every 30 minutes for the first 4 hours, every hour for the 4th through the 24th hour, every 4 hours for the 24th through the 48th hour, and at least once every 8 hours thereafter][_____]. During each monitoring event, record [at least 3 readings, separated by 2 minute increments,][_____]. Ensure data collected in each monitoring event includes [FID readings][_____] from the following locations: [each individual SVE well being used; in the combined piping manifold (upstream from the inlet bleed line); the inlet of the vapor stream treatment system; between the lead and lag vapor stream treatment units; and from the discharge stack][_____].

b. Laboratory Analysis of Vapor Stream Samples: Collect vapor on the [first and last day][_____] of the full-scale demonstration. Collect one air stream sample for laboratory analysis from each of the following locations: [in the combined piping manifold (upstream from the inlet bleed line); the inlet of the vapor stream treatment system; and from the discharge stack][_____]. Take the sample for laboratory analysis immediately after collecting the sample for field analysis at each sample port. Test samples for the following analytes: [_____]. Submit the Laboratory Analysis Report.

3.3.5 Full-Scale Demonstration Report

Submit a full-scale demonstration report. Allow a period of not less than [14][_____] calendar days in the schedule for Government review. Include the following data in the report: [hours of operation and hours of downtime; the amount of time that each SVE well was in use; and the cumulative total hours of operation][_____]. Organize results of Process Monitoring according to category, and show it chronologically within each category. Include Meteorological and Subsurface Monitoring data, and Process Air Stream and Equipment Monitoring data in each report. Provide the following graphs in the Report. For each SVE well, plots of: volume of air extracted versus time, cumulative volume of air extracted versus time, concentration of [contaminants of concern][_____] versus time, mass removal rate of [contaminants of concern][_____] versus time, and cumulative mass of [contaminants of concern][_____] removed versus time. For the SVE system as a whole, plots of: the concentration of [contaminants of concern][_____] versus time, mass removal rate of [contaminants of concern][_____] versus time, and cumulative mass of [contaminants of concern][_____] removed versus time. The reports are required to be signed and dated by the Contractor's Quality Control representative. If warranted, provide in the report recommendations for changing airflow rates from individual wells, and other proposed adjustments to the mode of operation.

APPENDIX A

PRE-COMMISSIONING CHECKLISTS

Pre-commissioning checklist - Piping								
For SVE System Piping								
Checklist Item	Q	M	E	T	C	D	O	U
Installation								
Piping complete.			X		X			
Piping flushed / cleaned.			X		X			
Leak testing complete (except for joints that have to be tested while the blower is operating).			X		X			
Valves installed as required.			X		X			
Heat tracing installed as required.			X		X			
Piping insulated as required.								
Thermometers, gauges, sampling ports, and monitoring ports installed as required.			X		X			
Verify operation of valves.			X					
Flexible connectors installed as required.			X		X			
Verify that piping has been labeled and valves identified as required.			X					
If potentially flammable organic vapors will be extracted, verify that piping is properly grounded.					X			
As-built shop drawings submitted.			X		X			
Testing, Adjusting, and Balancing (TAB)								
Monitoring ports and airflow monitoring devices installed and properly			X		X			

Pre-commissioning checklist - Air / Water Separator								
For Air / Water Separator Unit: [_____]								
Checklist Item	Q	M	E	T	C	D	O	U
Installation								
Leak testing complete.			X		X			
Valves installed as required.			X	X	X			

Pre-commissioning checklist - Air / Water Separator								
For Air / Water Separator Unit: [_____]								
Checklist Item	Q	M	E	T	C	D	O	U
Verify operation of valves.			X	X				
Verify that piping has been labeled and valves identified as required.			X	X	X			
Condensate drainage is unobstructed. (Verify by draining water from collection vessel of air / water separator).			X	X	X			

Pre-commissioning checklist - Blower								
For Blower Unit: [_____]								
Checklist Item	Q	M	E	T	C	D	O	U
Installation								
Vibration isolation devices installed [and freed to float with adequate movement and seismic restraint] as specified.			X	X	X			
Casing undamaged.			X	X	X			
Silencers undamaged			X	X	X			
Proper belt tension, if belt driven.			X	X	X			
Protective covers over rotating equipment.			X	X	X			
Manufacturer's required maintenance clearance provided.			X	X	X			
Spare inlet air filters present on-site.			X	X	X			
Pressure/temperature gauges installed.			X					
Verify proper installation of air cooling equipment, for cooling blower exhaust, if used.			X					
Verify that special tools and spare parts are present on site.			X	X	X			
Electrical								

Pre-commissioning checklist - Blower								
For Blower Unit: [_____]								
Checklist Item	Q	M	E	T	C	D	O	U
Power available to unit disconnect.				X				
Power available to unit control panel.				X				
Control system interlocks functional.				X				
Motor and blower rotation checked.				X	X			
Verify that power disconnect is located within sight of the unit it controls.				X				
Grounding properly installed.				X				
Controls								
Control valves/actuators properly installed.			X					
Control valves/actuators operable.			X					
Control interlocks properly installed.			X	X				
Control interlocks operable.			X	X				
Testing, Adjusting, and Balancing (TAB)								
Construction filters removed and replaced.			X		X			
Pressure/temperature gauges installed.			X		X			

Pre-commissioning checklist - SVE System Controls								
For SVE System: [_____]								
Checklist Item	Q	M	E	T	C	D	O	U
Installation								
As-built shop drawings submitted.			X	X				
Layout of control panel matches drawings.			X	X				
Components properly labeled (on inside and outside of panel).			X	X				
Control components piped and/or wired to each labeled terminal strip.				X				
Control wiring and tubing labeled at all terminations, splices, and junctions.				X				
Shielded wiring used on electronic sensors.				X				
Main Power								
Power available to panel.				X				

Pre-commissioning checklist - Vapor Stream Treatment System								
For Vapor Stream Treatment System: [_____]								
Checklist Item	Q	M	E	T	C	D	O	U
Installation								
Piping complete.			X		X			
As-built shop drawings submitted.			X		X			
Leak testing complete.			X		X			
Valves installed as required.			X		X			
Piping insulated as required.			X		X			
Thermometers, gauges, sampling ports, and monitoring ports installed as required.			X					
Verify operation of valves.			X					

Pre-commissioning checklist - Vapor Stream Treatment System

For Vapor Stream Treatment System: [_____]

Checklist Item	Q	M	E	T	C	D	O	U
Flexible connectors installed as required.			X	X	X			
Verify that piping has been labeled and valves identified as required.			X					
Verify use of flexible lines and connectors for changing positions of lead, lag, and spare vessels, as required.			X	X	X			
Spare vessel on-site, if required.			X	X	X			
Verify status of air pollution control permit, if required.		X	X	X	X			

Pre-commissioning checklist - Ancillary Equipment

For SVE System: [_____]

Checklist Item	Q	M	E	T	C	D	O	U
Installation								
Field monitoring instruments calibrated.					X			
Lighting installed and functional.		X		X				

APPENDIX B

FUNCTIONAL PERFORMANCE TESTS CHECKLISTS

Functional Performance Test Checklist - Piping

For SVE System Piping

1. Functional Performance Test: Verify operation of the SVE system piping in accordance with specification. The following items are required to be verified while the blower is operating:

a. Check vacuum response at each SVE wellhead before and after valving on each well.

b. With the valves to all SVE wells in the open positions, gradually modulate the inlet bleed valve from fully open position, adjusting toward the fully closed position.

c. As wells are valved on, leak-test joints not previously tested. Also leak-test accessible portions of SVE wells and pressure monitoring points. Note the locations of any leaks.

2. If piping system includes drainage points, check for water at drainage points at the end of each day during commissioning.

3. Conduct Independent measurement of air flow rates (from each extraction well, and total extraction airflow rate) alongside TAB specialist. Ensure results differ by no more than 10 percent.

4. Verify operation of heat tracing.

5. Certification: We the undersigned have witnessed the above functional performance tests and certify that the item tested has met the performance requirements in this section of the specifications.

Functional Performance Test Checklist - Air / Water Separator

For Unit: [_____]

1. Start blower.

a. Check inlet and outlet connections for any signs of leaks. Note the

Functional Performance Test Checklist - Air / Water Separator

For Unit: [______]
locations of any leaks.

b. Check pressure drop across air / water separator:

Inlet pressure		kPa gauge psig
Outlet pressure		kPa gauge psig

c. If equipped with a sight glass, check for unobstructed view of water level.

d. Compare airflow rate and pressure drop to contract specifications, and manufacturer's performance specifications.

	CONTRACT	MANUFACTURER'S RANGE	ACTUAL
Airflow Rate (L/s) (CFM)			
Inlet pressure (kPa gauge) (PSIG)			
Outlet pressure (kPa gauge) (PSIG)			

2. Turn blower off.

a. Check operation of drain valve for condensate holding vessel.

b. Check setting of high level alarm in condensate holding vessel.

c. If the unit is designed to allow the drain valve to be used while the blower is operating, check operation of drain valve for condensate holding vessel while the blower is operating.

3. Unusual vibration, noise, etc.

____

4. Certification: We the undersigned have witnessed the above functional performance tests and certify that the item tested has met the performance requirements in this section of the specifications.

Functional Performance Test Checklist - Blower

For Blower Unit: [_____]

1. Functional Performance Test: Verify operation of blower in accordance with specification. Verify the following items after the blower has been operating for a minimum period of [30][_____] minutes:

a. Record current draw from blower, and voltage.

Amperage _____
Voltage _____

b. Record blower air flow rate and air temperatures.

Air flow rate		L/s cfm
Inlet air temperature		degrees C F
Outlet air temperature		degrees C F

c. Record blower fan speed. _____ rpm

d. Check noise level. _____ [decibels at 1 meter][_____]

e. Verify operation of variable speed (if equipped). _____

f. Verify setting of vacuum relief valve. _____

g. Verify setting of pressure relief valve. _____

h. Verify setting of high-temperature shutdown. _____

2. Plot test readings of pressure and airflow rate on blower curve, compare results to manufacture's specifications, and submit testing, adjusting, balancing (TAB) report. TAB results within acceptable ranges.

____

3. Unusual vibration, noise, etc.

____

4. Certification: We the undersigned have witnessed the above functional performance tests and certify that the item tested has met the performance requirements in this section of the specifications.

Functional Performance Test Checklist - SVE System Controls

For Control Unit: [_____]

1. Functional Performance Test: Verify operation of SVE controls in accordance with specification. Perform the following tests:

a. Verify that controller is maintaining the set point by manually measuring the controlled variable with a thermometer, differential pressure gage, etc.

b. Verify sensor/controller combination by manually measuring the controlled medium. Take readings from control panel display and compare readings taken manually. Record all readings.

Sensor	
Manual measurement	
Panel reading value	

c. Verify that interlocks function in accordance with specifications.

d. Verify interlock with other SVE controls.

2. Verify that operation of control system conforms to that specified in the sequence of operation.

3. Certification: We the undersigned have witnessed the above functional performance tests and certify that the item tested has met the performance requirements in this section of the specifications.

Functional Performance Test Checklist - Vapor Stream Treatment System

For Vapor Stream Treatment Unit: [_____]

1. Functional Performance Test: Verify operation of the Vapor Stream Treatment System in accordance with specification. Verify the following while the system is operating:

a. Check inlet and outlet connections for any signs of leaks. Note the locations of any leaks.

b. Check airflow rates at inlet and outlet of vapor stream treatment system:

Inlet Airflow Rate		L/s cfm
Outlet Airflow Rate		L/s cfm

c. Check temperature and pressure across [lead treatment vessel][_____]:

Inlet pressure		kPa gauge psig
Outlet pressure		kPa gauge psig
Inlet temperature		degrees C F
Outlet temperature		degrees C F

d. Check temperature and pressure across [lag treatment vessel][_____]:

Inlet pressure		kPa gauge psig
Outlet pressure		kPa gauge psig
Inlet temperature		degrees C F
Outlet temperature		degrees C F

e. Compare vapor stream temperatures, pressures and airflow rates, to contract specifications, and manufacturer's performance specifications.

	CONTRACT	MANUFACTURER'S RANGE	ACTUAL
Inlet airflow rate (L/s) (CFM)			
Inlet temperature (degrees C F)			
Inlet pressure (kPa gauge) (psig)			
Outlet airflow rate (L/s) (CFM)			

	CONTRACT	MANUFACTURER'S RANGE	ACTUAL
Outlet temperature			
Outlet pressure (kPa gauge) (psig)			
Pressure drop across lead vessel (kPa gauge) (psig)			
Pressure drop across lag vessel (kPa gauge) (psig)			

f. Using a [flame ionization detector][_____], check organic vapor level readings of the vapor stream at the following locations:

Inlet of Vapor Stream Treatment System		ppmV as [isobutylene][_____]
Between Lead and Lag Vessels		ppmV as [isobutylene] [_____]
Outlet of Vapor Stream Treatment System		ppmV as [isobutylene] [_____]

2. Unusual vibration, noise, etc.

____

3. Certification: We the undersigned have witnessed the above functional performance tests and certify that the item tested has met the performance requirements in this section of the specifications.

UNDERGROUND STORAGE TANK REMOVAL
11/22

****

NOTE: This guide specification covers the requirements for removal and disposal of underground, nonhardened tanks and piping used to store petroleum products, waste oils or hazardous wastes in accordance with Federal, State, and local regulations.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: Show the following information on the project drawings:

(1) Overall installation plan which identifies and locates tanks and equipment; borrow, disposal, and stockpile areas; temporary containment areas; special security areas; shoring and special support requirements; and access routes.

(2) Individual as-built site plans of tank locations which identify site features such as buildings, roads, utilities, topography, trees and shrubs, surface condition, etc. If as-built drawings are not available, a site investigation and site plans are required to show the general location of existing tanks and site features. Detail drawings to include dimensions, sections, elevations, slopes and size of excavations and temporary containment areas. Provide, as part of the Tank Closure Report, a detailed map showing exact location of the tank prior to removal.

(3) Limits of pavement removal, fence removal, and the location of ancillary equipment to be removed.

Hardened tanks are deep buried tanks as would be found with some missile facilities. Cut and Cover tanks are not considered hardened by this specification's defintion. Note this in the contract as they require deeper excavations and possibly substantial demolition of concrete.

Tanks will not be abandoned in place unless a waiver is granted in accordance with state or local requirements, Air Force Civil Engineer Center Environmental (AFCEC/CZ). Waivers will be obtained prior to advertising the closure project. Exceptions will be granted when requested in writing on a case by case basis. Absence of contamination must still be verified prior to closure and prior to obtaining a waiver.

Incorporate installation, state and local requirements into this specification, including the necessary approval processes, licensing, or having their representative on site during removal operations. In many cases, the state or local jurisdiction has final authority on approval of the Work Plan. While states often enforce petroleum tank removal regulations, counties and cities are sometimes delegated authority.

Petroleum sludge and contaminated media are often considered "special wastes" and are subject to regulations enforced by the State Fire Marshals Office, local agencies, etc. Some states have adopted federal rules for management of petroleum waste.

State requirements usually involve testing, analysis, and a report. The review by the state may require additional testing or other work, and may take several months; therefore, the designer is forewarned to investigate these requirements in advance. Areas most likely to be impacted are waste and tank disposal, tank cleaning, residue and soil sampling and analysis, contaminated soil disposal or remediation, reporting, and requirements for a clean

closure.

Petroleum sites which are known to have extensive soil contamination or where groundwater contamination is a possibility, should have a Corrective Action Plan under Subtitle I of RCRA and applicable state and local regulations; refer to EM 1110-1-4006, Removal of Underground Storage Tanks (USTs).

For sites where the tank contained a hazardous waste, remediation should occur under the RCRA Corrective Action requirements of 40 CFR 264, 40 CFR 265, and applicable state requirements.

Coordinate with the customer regarding possible designer's discussions with the regulators, and the existence of unique requirements. Some MACOMS require the Installation Project/Program Manager to either be responsible for all coordination or be included on all contacts with the regulators. For projects not on an active installation discuss requirements with the regulators and omit references to the installation and the Installation Environmental Coordinator.

For sites holding DLA-capitalized fuel, coordinate with DLA Energy on the requirements for removal, re-use, or disposal.

Include the applicable state and local regulatory references where appropriate in the body of the specification. It is recommended that the specifier refer to DoD "Policy and Guidelines for Acquisitions Involving Environmental Sampling or Testing (November 2007)

The following specifications must be used in conjunction with this section:

SECTION 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS

Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES

SECTION 01 32 01.00 10 PROJECT SCHEDULE

[SECTION 01 32 16.00 20 SMALL PROJECT CONSTRUCTION PROGRESS DOCUMENTATION] or

SECTION 01 45 00 QUALITY CONTROL

Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS

****

[1.1 UNIT PRICES

****

NOTE: This paragraph will be deleted if the work is in one lump sum contract price. If it is retained and more detail is needed, items of consideration may include: excavation, contaminated soil, clean backfill required, non-hazardous sludge, pumpable liquids, analytical (PCB & asbestos), analytical (contaminated water), remove piping, and remainder of work. Coordinate this paragraph with the bidding schedule.

****

Compensation for removal of [contaminated soil] [and] [pumpable liquids] will be paid as a unit cost. This unit cost includes testing, excavation, stockpiling, transportation and disposal of the contaminated soil and backfilling with non-contaminated soil. Payment for all other work is under the base bid for the tank removal and constitutes full payment for all work defined in the contract documents including testing of the contents, excavation and disposal of the tank, and testing of the underlying soil.

****

NOTE: Include unit prices for removal and disposal of temporarily stockpiled contaminated soil which was excavated for tank and piping removal, provision of clean fill material to replace contaminated soils for use in backfilling tank and piping excavations, and removal and disposal of temporarily stored contaminated water in Contract's price schedule as follows:

ITEM	**UNIT**	**UNIT PRICE**	**NO. UNITS**	**EXTENSION**
Removal and disposal of stockpiled contaminated soils from excavations for removal of underground storage tanks and associated piping.	**CUBIC METERS** **CUBIC YARDS**	**[$_____]**	**[_____]**	**[$_____]**
Furnish clean fill material for use in backfilling excavations for removal of underground storage tanks and piping.	**CUBIC METERS** **CUBIC YARDS**	**[$_____]**	**[_____]**	**[$_____]**

ITEM	UNIT	UNIT PRICE	NO. UNITS	EXTENSION
Removal and disposal of stored contaminated water collected during dewatering to remove underground storage tanks and piping.	LITERSGALLONS	[$_____]	[_____]	[$_____]
Quantities of contaminated soils, fill material and contaminated water must be estimated taking into consideration site conditions, and age and history of tanks.				

****

NOTE: For some locations, such as a contaminated site scheduled for site remediation, it may be permissible to use contaminated soil materials for backfill in tank and piping excavations. Get approval from local regulating authority before using contaminated soil materials.

****

Assume, for bidding purposes, that soil [bituminous pavement, concrete slabs,concrete deadman] and water encountered during the removal of the underground tanks are contaminated with [jet fuel] [and] [diesel fuel] [and] [AVGAS] [and] [gasoline] to be handled as specified herein. [Payment for removal from temporary stockpile and disposal of contaminated soil and furnishing clean soil will be paid for at the contract unit price per CUBIC METERS CUBIC YARDS.] Wash bituminous pavement and concrete slabs or deadmans and dispose of as demolition debris. Collect and store wash water. [Disposal of contaminated water will be paid for at the contract unit price per LITERSGALLONS.]

]

1.3 SYSTEM DESCRIPTION

****

NOTE: 40 CFR 280, RCRA Subtitle I closures are primarily performed on petroleum or chemical product tanks and require a minimum of 30 days notice prior to a change in service or closure.

The RCRA Subtitle C tank closures fit into three categories:

a. Hazardous waste accumulation tanks as per 40 CFR 262.34(a)(1)(ii). These tanks store hazardous waste for less than 90 days.

b. Tanks storing hazardous waste over 90 days without a permit (illegal storage).

c. Part B permitted storage tanks.

The Installation Environmental Coordinator should decide who is responsible for contacting the Implementing Agency. Accomplish Subtitle C tank closures in accordance with the closure plans previously prepared and approved, and other applicable regulatory standards including the Land Ban 40 CFR 268 requirements.

****

The work consists of removal, decontamination and disposal of [one] [_____], [_____] L gallon underground storage tank[s] and associated piping and ancillary equipment, including but not limited to dewatering (if approved), [disposal of contaminated soil,] [laboratory testing,] providing reports which are required by regulatory agencies, and backfilling.. The [tank is] [tanks are] constructed of [steel] [fiberglass] [_____] and [is] [are] at [the location shown on the drawings] [the following location: [_____]]. The [_____] L gallon tank was used for storing [jet fuel] [leaded gasoline] [unleaded gasoline] [fuel oil] [diesel fuel] [waste oil] [diesel oil] [hazardous waste] [_____] and was taken out of service in [_____]. Residue remaining in the tank is considered a [special] [hazardous] waste. Subsurface conditions are represented [herein] [on drawings] [in Appendix [_____]] [_____]. Existing native soils are predominantly [_____]. Available backfill material is typically [_____]. Groundwater [has been encountered within [_____] m feet of the surface] [is not expected to be encountered]. Verify the actual conditions prior to submitting a bid.[Treat the site as a hazardous waste site.] [The site is not a hazardous waste site, but due due to the nature of the materials and hazards present, use specified procedures until closure activities are complete.]

1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Work Plan; G, [_____].

Site Safety and Health Plan; G, [_____]

Excavation and Material Handling Plan; G, [_____]

Field Sampling and Laboratory Testing Plan; G, [_____]

Tank and Piping Removal And Disposal Plan; G, [_____]

Spill and Discharge Control Plan; G, [_____]

Qualifications; G, [_____]

Laboratory Services; G, [_____]

State Licensed [Hazardous]Waste Transporter

SD-06 Test Reports

Laboratory and Field Testing Reports

Backfill Material

Tank Contents Verification

Contaminated Water Disposal

Soil Examination, Testing, and Analysis

Backfilling; G, [_____].

SD-11 Closeout Submittals

Salvage Rights; G, [_____]

Tank Closure Report

1.5 QUALITY ASSURANCE

1.5.1 Qualifications

****

NOTE: Require certification for tank removals whenever work will be performed under a jurisdiction requiring certification.

The laboratory validation process for underground storage tank projects is addressed in EM 1110-1-4006 Removal of Underground Storage Tanks, dated 30 September 1998; EM 200-1-1 Validation of Analytical Chemistry Laboratories, dated 1 July 1994; and EM 200-1-7, dated 01 February 2001.

****

Substantiate a minimum of [2][_____] years of tank removal experience, including subcontractors and personnel employed on the project, and certification by the [[State] [County] [City] of [_____]] [local authority having jurisdiction] for tank removal work. Include experience for removal, transportation, and disposal of underground tanks and associated piping, in conformance with the following:

a. API RP 1604

b. 40 CFR 280, State and local regulations and procedures.

c. Applicable safety rules and regulations.

d. Use of equipment and procedures for testing and vapor-freeing tanks.

e. Handling and disposal of types of wastes encountered in underground tank and pipe removal including disposal of underground tanks and associated piping.

f. Excavation, testing, and disposal of petroleum contaminated soils, liquids, and sludge.

g. Project titles, dates performed, owner's names, points of contact for each project with current contact phone numbers.

1.5.2 Laboratory Services

Submit documentation for laboratory services in accordance with [EM 1110-1-4006, EM 200-1-1, EM 200-1-6 and EM 200-1-7]

1.5.3 Support Staff

Identify all staff involved for the various components, including personnel collecting and shipping samples, and detail staff member's qualifications.

1.5.4 Preconstruction Conference and Work Plan

Prior to the commencement of work, a preconstruction conference will be scheduled by the Contracting Officer. Prepare and submit a comprehensive Work Plan within [30][_____] days of contract award. The work plan will conform to the requirements of this specification, API RP 1604, API Std 2015, API RP 2003, API RP 2217A and API RP 2219. Allow [30][_____] days in the schedule for the Government's review and approval. No adjustment for time or money will be made for re-submittals required as a result of noncompliance. No work at the site is allowed, with the exception of site inspections and mobilization, until the Work Plan is approved. As a minimum, include the following in the Work Plan:

1.5.4.1 Site Safety and Health Plan

Furnish detailed safety, health, and accident prevention provisions and develop a Site Safety and Health Plan (SSHP). Incorporate the requirements of 29 CFR 1910 and EM 385-1-1 into the SSHP. Include current training certification statement for personnel prior to entry into the work site. Do not commence work until the SSHP is approved by the Contracting Officer. As a minimum, include the following:

a. Health and safety organization, including discussion of distribution of functions and responsibilities.

b. Organization and components of the SSHP.

c. Physical and chemical site hazard identification.

d. Basic toxicology and toxicity information.

e. Discussion of the EZ and CRZ.

f. Protective clothing.

g. Respiratory protection.

h. Air quality monitoring.

i. Personnel exposure guidelines.

j. Decontamination procedures.

k. Basic first aid review.

l. Emergency response and contingency plan.

m. Site entry and exit procedures.

n. Sampling procedures.

1.5.4.2 Excavation and Material Handling Plan

Describe methods, means, equipment, sequence of operations and schedule to be employed in excavation, transport, handling, borrowing source and stockpiling of soil during underground tank removal. Include shoring requirements. [Fifteen][_____] days before beginning tank removal work, submit to the Contracting Officer, for approval, a material handling plan that describes phases of dealing with the contaminated soil and water as it relates to the proposed tank[s] and piping removal, including methods of excavating, a material handling plan for the contaminated material, soil testing requirements, and water pumping and collection requirements.

1.5.4.3 Field Sampling and Laboratory Testing Plan

Submit a detailed Sampling and Analysis Plan in accordance with [_____].

Describe field sampling methods and quality control procedures. Identify laboratory and laboratory methods to be used for contamination testing. Include sample reports showing sample identification for location, date, time, sample method, contamination level, name of individual sampler, identification of laboratory, and quality control procedures.

1.5.4.4 Tank and Piping Removal and Disposal Plan

Describe methods, means, sequence of operations, and schedule to be employed in the testing, pumping, cleaning, de-vaporizing, inspecting, [cutting and]removal, and disposal of underground storage tanks and piping. Include methods to be employed for product, sludge, vapor, and pumpable liquid removal; purging and inerting; and storage methods proposed for control of surface water. Also address the following:

a. Treatment Options
b. Identification of waste, tank and contaminated soil transporters and means of transport.
c. Disposal and alternate facilities, disposal or remediation.
d. Decontamination procedures and coordination with SSHP.

[Coordinate decontamination procedures, shoring, and safety measures in accordance with Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES.]

1.5.4.5 Spill and Discharge Control Plan

Develop a comprehensive spill and discharge control plan. Consider and provide contingency measures for potential spills and discharges from handling and transportation of contaminated soils and water. A possible source of guidance for assessment and remediation is API PUBL 1628.

1.5.4.6 Site Safety And Health Officer

Identify an individual to serve as the Site Safety and Health Officer (SSHO) [Certified Industrial Hygienist (CIH)]to report problems and concerns regarding health and safety to the Contracting Officer. Provide documentation that the SSHO [CIH] possesses working knowledge of local and Federal occupational safety and health regulations, and provide training, in accordance with 29 CFR 1910 to Contractor employees in air monitoring practices and techniques. The SSHO [CIH or an Industrial Hygiene Technician (IHT) who is under the direction of the CIH] must remain onsite to provide day to day industrial hygiene support, including air monitoring, training, and daily site safety inspections. The SSHO [CIH] may be assigned other duties, such as project foreman or quality control manager.

1.5.5 Permits and Licenses

As required or as directed by the Contracting Officer, obtain local, state, or federal permits and licenses that directly impact the Contractor's ability to perform the work prior to commencing removal operations.

1.5.6 Statutes and Regulations

Perform tank closures, removal, and disposal in accordance with 40 CFR 280, 40 CFR 262, 40 CFR 264, and 40 CFR 265 as well as the applicable local, State of [_____], and Federal regulations. Transport hazardous [material] [waste] in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS.

1.6 PROJECT/SITE CONDITIONS

****

NOTE: Include any pertinent information regarding the former uses of the area as a gas station or waste oil storage facility, any results of chemical analyses done on contents and/or soils, leak testing results, and any hazardous material that has been stored there, if it has been removed and any unusual site features that may be helpful to the bidders. Refer to EM 1110-1-4006 for more information.

If waste oil tanks were included in the Installation Part B Permit, include that information in this paragraph.

Coordinate with state/local regulators, and EM 1110-1-4006 for information regarding designation of non-contaminated waste oil or petroleum wastes as special wastes.

Edit the specification to reflect the implementing Agency (IA) requirements regarding Treatment, Storage, and Disposal (TSD) facilities.

****

Notify the Installation Environmental Coordinator (IEC) and the Contracting Officer [_____] days prior to tank removal. The [Contractor is] [Contracting Officer will be] [IEC will be] responsible for contacting the Implementation Agency (IA) [_____] in accordance with the applicable reporting requirements.

PART 2 PRODUCTS

2.1 BACKFILL MATERIAL

****
NOTE: Part or all of this paragraph may be deleted if the subject is addressed in other sections. Refer to EM 1110-1-4006 for special compaction requirements such as under pavements.
****

Obtain backfill material from [the location indicated] [offsite]. Classify backfill in accordance with ASTM D2487 as GW, GP, GM, GC, SW, SP, SM, SC, MH, CL, or CH and free from roots and other organic matter, trash, debris, snow, ice or frozen materials. Secure and submit soil classification test results, including the chain-of-custody records, prior to bringing offsite materials onsite. The testing frequency for backfill material is 1 per 1000 cubic meters yards or a minimum of 1 test. Use non-contaminated material removed from the excavation for backfill in accordance with Paragraph BACKFILLING.

2.2 PLASTIC SHEETING

Provide plastic sheeting conforming to ASTM D4397.

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

Furnish labor, materials, necessary permits, laboratory tests, and reports and equipment to [remove and dispose of products remaining in the underground tanks; clean and vapor free the underground tanks and connecting product and vapor recovery piping;] excavate, remove underground tanks and associated piping, and backfill to the level of the adjacent ground; sample soil and water to determine if contaminated; dispose of tanks and associated piping[, and] [petroleum contaminated soil] [and] [water].

3.1.1 Safety Guidelines

Comply with personnel safety guidelines specified in Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES, and conform to the guidelines as stipulated in the approved SSHP.

3.1.2 Exclusion Zone (EZ) And Contamination Reduction Zone (CRZ)

Do not permit personnel, not directly involved with the project, to enter work zones, called the EZ and CRZ. The EZ is an area around the tank a minimum of 3 m 10 feet from the limits of the tank excavation. At the perimeter of the EZ, establish a CRZ. Clean equipment and personnel within the CRZ, as stated in the paragraph titled "Personnel and Equipment Decontamination." Locate the Contractor's site office, parking area, and other support facilities outside the EZ and CRZ. Clearly mark and post boundaries of the EZ and CRZ. Include a site map, outlining the extent of work zones and location of support facilities, in the SSHP.

3.1.3 Onsite Training

Prior to starting onsite work, conduct a health and safety training class directed by the SSHO [CIH] to discuss the implementation of the SSHP. Notify the Contracting Officer 24 hours prior to beginning the training class.

3.1.4 Personnel Protection

Furnish appropriate personal safety equipment and protective clothing to personnel and ensure that safety equipment and protective clothing is kept clean and well maintained. Furnish three clean sets of personal protective equipment and clothing for use by the Contracting Officer or official visitors as required for entry into the EZ.

3.1.5 Respiratory Protection Program

Fully employ respiratory protection program, addressing respirator usage and training, in accordance with 29 CFR 1910 and EM 385-1-1.

3.1.6 Decontamination

Decontaminate or properly dispose of personal protective equipment and clothing worn in contaminated areas at the end of the work day. The SSHO [CIH] is responsible for ensuring that personal protective clothing and equipment are decontaminated before being reissued.

3.1.7 Emergency Response and First Aid Equipment

a. Prior to commencement of work, thoroughly review emergency response and contingency plan in accordance with 29 CFR 1910. In an emergency, take action to remove or minimize the cause of the emergency, alert the Contracting Officer, and institute necessary measures to prevent repetition of the emergency. Equip site-support vehicles with route maps providing directions to the medical treatment facility.

b. Provide appropriate emergency first aid equipment for treatment of exposure to site physical and chemical hazards. Provide and post a list of emergency phone numbers and points of contact for fire, hospital, police, ambulance, and other necessary contacts. Provide and post a route map detailing the directions to the nearest medical facility.

c. Notify the Contracting Officer of any unforeseen hazard or condition which becomes evident during work.

3.1.8 Burning and Explosives

Use of explosives or burning debris is not allowed. Do not permit ignition sources in the EZ and CRZ.

3.1.9 Protection of Existing Structures and Utilities

Take all necessary precautions to avoid damage to existing structures, their appurtenances, monitoring wells, or utilities that may be affected by work activities. Repair any damage to [utilities][pavements] [monitoring wells] resulting from the Contractor's operations at no expense to the Government. Coordinate with the installation to locate underground utilities prior to beginning construction. Do not disturb utilities encountered which were not previously shown or otherwise located without approval from the Contracting Officer.

3.1.10 Shoring

Provide shoring in accordance with Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES.

3.2 TANK CONTENTS VERIFICATION

Conduct sampling and analysis in accordance with the approved Sampling and Analysis Plan. Submit reports, including the chain-of-custody records.

3.2.1 Sampling

****

NOTE: If the contents have been properly characterized or already removed and disposed, delete the non-applicable portions of the specification.

The designer will detail the sampling requirements (number of samples and analytical methodology) based on the state/local regulations and EM 1110-1-4006 (i.e. tank contents, contaminated water, pumpable liquids and sludge, stockpiled soils, and in situ soils).

If the Government is to perform sampling and analyses, specify what data will be available from the Government. This will enable the Contractor to ascertain if additional analysis will be required by the TSD facility and should be reflected in the bid.

****

Sample tank [product,] [pumpable liquids,] [tank coatings] [and] [sludge]. If the data is not adequate, additional sampling and analysis to the extent required by the approved [offsite] [permitted treatment, storage or disposal (TSD)] facility receiving the material is the responsibility of the [Contractor] [Government]. Meeting all regulatory requirements, including the preparation of hazardous materials and waste for transportation, is the responsibility of the Contractor.

3.2.2 Analysis

****

NOTE: The designer will consult the state/local regulations and EM 1110-1-4006 for assistance in determining the appropriate analytical parameters for tank contents samples. Analytical protocol will also be based on historical records of tank usage and/or tank contents testing. Ensure that the Contractor addresses the specific laboratory preparation and analytical methods to be employed, especially variations in fuel related analyses.

****

[Government will test] [Test] tank contents for the parameters listed herein. Include [total petroleum hydrocarbons (TPH)] [benzene, ethylbenzene, toluene and xylene (BETX)] [lead] [_____] in the analysis.

3.2.3 Characterization

****

NOTE: Regarding "in a special manner", some states require that petroleum contaminated soils (special wastes) be disposed of in specially designated landfills.

Refer to EM 1110-1-4006 for additional information.

****

[Prior to removing any of the tank contents, characterize the contents to determine the type of required disposal: [as a [hazardous] [special] waste] [in a special manner] based on local, state, and Federal disposal regulations. Characterize [tank product] [tank product, pumpable liquids, and sludge] in accordance with 40 CFR 261 and 40 CFR 279. Submit the waste contents determination and accompanying test results for each phase present in the tank to the Contracting Officer.] [The following analyses will be performed by the Government prior to removing the tank contents: [_____]. The Contractor is responsible for any additional requirements identified by the disposal facility. Do not remove the tank contents until approval is given by the Contracting Officer.]

3.3 CLEARING, GRUBBING AND REMOVALS

****

NOTE: If underground storage tank removal is part of a larger project which contains Section 31 11 00 CLEARING AND GRUBBING, use it instead of this paragraph. Otherwise edit this paragraph as needed.

****

[Perform clearing and grubbing in accordance with Section 31 11 00 CLEARING AND GRUBBING.] [Clear areas designated for clearing and grubbing [as indicated] [as required and directed by the Contracting Officer] of all trees, stumps, downed timber, brush, rubbish, roots larger than 75 mm 3 inches in diameter, and matted roots prior to commencing operations. Saw cut concrete or asphalt pavement at the limits of removal and break, remove and dispose of the the resulting debris [off Government Property] [at the location indicated]. Chain link fence must be [removed and salvaged for reuse] [disposed of offsite].]

3.4 TOPSOIL

****

NOTE: If underground storage tank removal is part of a larger project which contains Section 31 00 00 EARTHWORK, use it for topsoil requirements instead of this paragraph. Otherwise edit this paragraph as needed.

****

[Ensure topsoil meets the requirements in Section 31 00 00 EARTHWORK.] [Strip and stockpile uncontaminated topsoil separately for reuse [at the location shown] [at a location approved by the Contracting Officer] if it meets the requirements of clean fill given in Paragraph BACKFILLING.] [Obtain additional topsoil in excess of that produced by excavation [offsite] [from designated location onsite].] [Cover with topsoil all areas disturbed by tank removal operations, other than areas to receive pavement or similar surface under this contract.] [Use topsoil wherever shown or stated on the drawings.]

3.5 PREPARATIONS FOR EXCAVATION

Before excavating, [drain product piping back to the tank] [remove residual liquids trapped in the product lines] [and] remove all product from the tank. Purge and vent the tank in accordance with API RP 1604, and as specified herein.

3.5.1 Removal of Product, Pumpable Liquids, and Sludge

****

NOTE: See EM 1110-1-4006 for the analytical parameters required for recyclability, reusability and disposal consistent with characterization of tank contents.

If the DLA Disposition Services is unwilling to take the wastes, delete reference to delivery inside the installation. Early in the design stage coordinate with the DLA Disposition Services to ensure their capabilities are used to the maximum benefit of the Government and on approved containers that might be available or required by the DLA Disposition Services. The bid documents must have a letter of waste acceptance attached thereto to be considered a responsive bid. Coordinate with the state regulatory personnel. Other options are addressed in EM 1110-1-4006.

Petroleum contaminated water disposal is addressed in EM 1110-1-4006.

TSD facilities appropriate to accept the wastes generated by this project may be identified. If an analysis is available, bid acceptance may be subject to the bidders having a signed letter of acceptance from a permitted TSD attached to the bid; otherwise the bid should be declared nonresponsive.

****

[Contain and store tank product, pumpable liquids, and sludge onsite, prior to disposal. Treat contaminated water as specified. Analyze and segregate tank product, pumpable liquids, and sludge to recover reusable products prior to being transported to the [designated location] [treatment, storage and disposal (TSD) facility.]] [Remove and dispose of tank product, pumpable liquids, and sludge. Use of Government facilities for permanent storage or disposal of the wastes is prohibited. Temporary storage on Government facilities will be allowed only until testing is complete, manifests (if necessary) are complete, and transportation is arranged.] The Contractor is responsible for obtaining all required permits. Usable product will be the property of the [Government] [Contractor]. Provide approved containers, vehicles, equipment, labor, signs, labels, placards and manifests and associated land disposal restriction notices and notifications, necessary for accomplishment of the work, including materials necessary for cleaning up spills that could occur from tank removal operations.

3.5.2 Contaminated Water Disposal

3.5.2.1 Sampling, Analysis, and Containment

****

NOTE: The designer will detail the analytical parameters for contaminated water and treated effluent, treated onsite or offsite, according to the state regulations, the requirements of the recycler and/or TSD facility, and EM 1110-1-4006. Sampling and analysis are to be conducted for parameters consistent with characterization of tank contents.

****

Sample and analyze contaminated water both prior to and after treatment. [Analyze contaminated water produced from excavation operations and tank pumping treated onsite, for pH; benzene, ethylbenzene, toluene, and xylene (BETX); total lead; oil and grease; total petroleum hydrocarbons (TPH); and [_____]. Perform sampling and analysis prior to [discharge to the installation sanitary sewer] [disposal] for every [_____] [200,000] L [_____] [50,000] gallons of contaminated water treated.] [Conform analysis of contaminated water to be taken to an offsite treatment facility to the requirements of the treatment facility, with documentation of all analyses performed furnished to the Contracting Officer in accordance with paragraph RECORDS. Contain, store onsite, and analyze contaminated water [prior to transport to the approved treatment, storage and disposal facility] [and dispose of in accordance with applicable Federal and state disposal regulations].] Provide approved containers, vehicles, equipment, labor, signs, labels, placards and manifests and associated land disposal notices and notifications, necessary for accomplishment of the work. Conform to [_____] for sampling and analyses of contaminated water, treated water, the Contractor, and laboratory quality assurance program.

3.5.2.2 Treatment

Treat contaminated water [onsite] [offsite] by [oil water separation] [_____] [filtering] [air stripping] [and] [activated carbon], or other means as approved by the Contracting Officer. If contaminated water is to be treated onsite, specify the proposed treatment in the Work Plan and submit for approval, including the chain-of-custody records. Install temporary storage and treatment equipment [in the general vicinity of the tanks] at a location approved by the Contracting Officer. Sample and analyze treated effluent and secure approval of results by the Contracting Officer before discharge to [the sanitary sewer] [the surface] [_____]. Treat and discharge effluent in accordance with the discharge permit.

3.6 PURGING AND INERTING

****

NOTE: Coordinate explosive limits with health effects, especially for BTEX (benzene, toluene, ethylbenzene, xylene) containing mixtures. Coordinate with EM 1110-1-4006, health and safety specialists or industrial hygienists.

****

After the tank and piping contents have been removed, but prior to excavation beyond the top of the tank, disconnect all the piping (except the piping needed to purge or inert the tank). Purge flammable and toxic vapors from the tank or make the tank inert in accordance with API RP 1604, with the exception that filling with water is not permitted and, if dry ice is employed, use a minimum of 1.8 kg per 500 L 3 pounds per 100 gallons of tank volume. Continuously monitor the tank atmosphere for combustible vapors if the tank is purged, or continuously monitor for oxygen, if the tank is inerted.

3.7 EXCAVATION

****

NOTE: Some states may require the use of VOC emission suppression protocols during excavation, stockpiling, and transportation operations for VOC contaminated soil. The designer may need to include requirements for submittals of VOC suppression products (polyethylene sheeting, foam, or liquid VOC suppressants) and use field demonstrations to show there are no interferences from the suppression technology used with field screening devices. Approval from state/local regulators may be required prior to usage of these products and the designer should specify accordingly.

****

Mark all excavation areas, as well as work near roadways, in accordance with Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES.

3.7.1 Exploratory Trenches

a. Excavate exploratory trenches as necessary to determine the tank location, limits and the location of ancillary equipment. Upon commencing exploratory excavation, utilize organic vapor analyzer/flame ionization device (OVA/FID) equipment to obtain readings for [total petroleum hydrocarbons (TPH),] [and] [benzene, toluene, ethylbenzene, and xylene (BTX), [and] [toxicity characteristic leaching procedure (TCLP)].][If BTEX indicates gasoline, then provide TCLP.]

b. [Contaminated soil materials may be used as backfill for tank and pipe excavations.] [To determine soil contamination levels, continuously monitor soil materials excavated to remove tanks with an OVA/FID capable of detecting volatile organic vapors to a minimum of one ppm. Further test contaminated soils with OVA/FID readings of [10] [_____] ppm or greater for TPH and BTEX as specified herein. Soils with OVA/FID readings less than [10] [_____] ppm may be used as clean backfill.] [Dispose of contaminated soils in accordance with Federal, State, and local regulations.]

3.7.2 Tank Excavation

****

NOTE: Acceptable levels of contaminations are dependent on regulations applicable to the location where tanks and piping are being removed; therefore, verify acceptable levels.

For some locations, such as a contaminated site scheduled for site remediation, it may be permissible to use contaminated soil materials for backfill in tank and piping excavations. Get approval from local regulating authority before using contaminated soil materials.

If contaminated soil materials are approved for backfill, retain first bracketed sentence and delete the second and third bracketed sentences.
****

a. [Provide Contracting Officer with written documentation, no later than 30 days before work begins, that proper State or local authorities have been notified.] Notify the Contracting Officer at least 48 hours prior to start of tank removal work. Stage operations to minimize the time that tank excavation is open and the time that contaminated soil is exposed to the weather. Provide protection measures around the excavation area to prevent water runoff and to contain the soil within the excavation area.

b. Perform excavation around the perimeter of the tank to limit the amount of potentially [petroleum][_____] contaminated soil that could be mixed with previously uncontaminated soil. Segregate [petroleum][_____] contaminated soil in separate stockpiles.

c. Maintain an excavation around the tank of sufficient size to allow workers ample room to complete the work, but also protect the workers from sliding or cave-ins. Install sheeting, bracing, or shoring in the absence of adequate side slopes if there is a need for workers to enter the excavated area. Divert surface water to prevent direct entry into the excavation.

d. Dewatering of the excavation may require a discharge permit by the State and will be limited to allow adequate access to the tank and piping, to assure a safe excavation, and to ensure that compaction and moisture requirements are met during backfilling. Dewatering may result in the production of petroleum contaminated water and/or free product. Recover free product from the groundwater only as part of necessary dewatering.

e. Collect and test water generated by dewatering during excavation required for removal of tanks or piping, surface water collected in open excavation, or water used for washing equipment or existing concrete or bituminous surfaces, in accordance with EPA 530-R-97-007, EPA 600/4-79/020, EPA SW-846 and state or locally required analyses.

3.7.3 Temporary Containment of Excavated Soil

Provide temporary containment area near the excavated area. Cover containment area with 0.75 mm 30 mil polyethylene sheeting. Place excavated soil on the impervious barrier and cover with 0.15 mm 6 mil polyethylene sheeting. Provide straw bale berm around the outer limits of the containment area and cover with polyethylene sheets. Secure edges of sheets to keep the polyethylene sheeting in place.

3.7.4 Piping Excavation

Perform excavation as necessary to remove tank piping and ancillary equipment in accordance with paragraphs: Shoring, Tank Excavation, and Open Excavations.

3.7.5 Open Excavations

****

NOTE: The time that tank excavations are left open depends on a variety of factors, a major one being the capability of the Contractor's lab to provide analyses within the specified turnaround time. Since short turnaround time adds cost, carefully evaluate the need for short turnarounds to avoid unnecessary costs.

If the excavation cannot be left open, it should be lined with a geomembrane and backfilled. This will aid excavation if test results reveal further contamination. However, placing a geomembrane in the excavation prior to backfilling may interfere with future in-situ remediation (e.g. soil vapor extraction, bioventing, etc.) and should only be allowed after careful consideration.

****

Secure open excavations and stockpile areas while awaiting confirmation test results from the soil beneath the tank. Backfill the excavation as soon as possible after tank and contaminated soil removals have been completed and confirmation samples have been taken. Divert surface water around excavations to prevent water from directly entering into the excavation.

3.7.6 Hidden Structures

During excavation activities, if asphalt pavement, concrete slabs, or other hidden structures are encountered, remove and wash with high pressure water cleaning equipment. Remove and dispose of the pavement, concrete, and other structures as specified in Section 02 41 00 DEMOLITION.

3.7.7 Stockpiles

****

NOTE: Soils characterized or contaminated by a listed hazardous waste and not excluded by 40 CFR 261.4(b)(10) cannot be stockpiled unless the area has been designated by the state RCRA office as a corrective action management unit (CAMU); stockpiling of hazardous waste soil constitutes storage in a waste pile and requires a RCRA permit; placing hazardous waste contaminated soil onto plastic still constitutes a waste pile; therefore, except as stated above, all hazardous waste soils must be placed into containers such as drums, roll-offs or dumpsters.

If analytical tests have not been taken before editing of this specification, historical data may be used to assume whether a tank contained petroleum waste only or hazardous waste, until analytical test results are in and contents are verified. If the

historical information indicates that a tank did not contain hazardous waste (as defined by the state), and there is no reason to believe the tank ever contained hazardous waste, the soil may be stockpiled until analytical test results required of the Contractor are received. If at that time the results indicate the presence of hazardous waste, the contaminated soil must be managed according to RCRA: no stockpiles unless they are designated CAMUs. If historical data indicates the presence of hazardous waste, or if there is no historical data, the specification should be edited to assume that the contaminated soil is hazardous and should be containerized.

****

Uncontaminated excavated soil and petroleum contaminated soil, that is not a state-regulated hazardous waste, will be [stockpiled and used for backfill in the tank excavation prior to using borrow material] [disposed of in the area designated on the drawings] [disposed of offsite] [_____]. Excavated material that is regulated by the state as a hazardous waste [which is visibly stained] [for which real time vapor monitoring instrument readings exceed [_____] for volatile and possibly semi-volatile hydrocarbons depending on the performance criteria for the field screening method] [and] [which has an obvious petroleum odor] [or as required by the State of [_____] or implementing agency] is considered contaminated. [Stockpile material if the site is a RCRA-designated CAMU] [Place in containers such as drums, roll-offs or dumpsters] for sampling in accordance with paragraph Stockpiled Material Sampling. Separately stockpile uncontaminated soil from the contaminated soil, a safe distance away from, but adjacent to, the excavation. [Place allowable stockpiles of contaminated soil on an impermeable geomembrane a minimum of 3 layers, each [0.152] [0.762] [_____] mm [6] [30] [_____] mils thick, covered with a [0.152] [0.254] [_____] mm [6] [10] [_____] mils sheet of geomembrane [as detailed on the drawings] [as specified]. Place the geomembrane to prevent the stockpiled soil from coming into contact with surface water run-off.] Locate the [geomembrane] [container] cover to prevent rain or surface water from coming into contact with the contaminated soil, as well as limit the escape of the volatile constituents in the [container] [stockpile].

3.7.8 Acceptable Levels of Contamination

****

NOTE: Acceptable levels of contamination are dependent on regulations applicable to the location where tanks and piping are being removed. Specifier must verify acceptable levels.

For some locations such as a contaminated site scheduled for site remediation, it may be permissible to use contaminated soil materials for backfill in tank and piping excavations. Specifier must get approval from local regulating authority before using contaminated soil materials.

If contaminated soil materials are approved for backfill, delete paragraph.

****

Take further samples and test soils with OVA/FID readings of [10] [_____] ppm or greater for TPH and for BTEX in accordance with EPA SW-846 and EPA 600/4-79/020, and for toxicity characteristic leaching procedure (TCLP) for lead if leaded gasoline was stored in or near the underground tank being removed. For stockpiled soils, provide a minimum of one test for every [77] [_____] cubic meters [100] [_____] cubic yards for TPH, and one test for every [77] [19] [_____] cubic meters [100] [25] [_____] cubic yards for BTEX and TCLP. Soils that contain [50] [_____] ppm or more TPH, [10] [_____] ppm or more BTEX or have TCLP reading of [10] [_____] ppm lead or virgin petroleum products are considered contaminated materials. Soils which are less than the above may be used as clean fill. Furnish results to the Contracting Officer within 24 hours after the results are obtained.

3.8 REMOVAL OF PIPING, ANCILLARY EQUIPMENT, AND TANK

****

NOTE: Consult the state regulators to determine how the state views tank and ancillary equipment transportation, disposal and salvage rights, and what state requirements for cleaning are applicable. Depending on tank material and contents, permits and manifests and other documentation may be required.

****

3.8.1 Piping and Ancillary Equipment

Disconnect all piping and ancillary equipment from the tank. Remove the piping [completely (interior and exterior of the tank)] [from the exterior surface of the tank, cap and abandon in place] [as shown on the drawings] [or] [as directed by the Contracting Officer]. Cap all tank ancillary equipment and piping connections, except those connections necessary to inert the tank within the excavation zone. Clean the piping exterior and ancillary equipment to remove all soil and inspect for signs of corrosion and leakage. Ensure no spillage of the piping contents occurs, as specified in the Work Plan, and as required in paragraph SPILLS. If the soil under and around the tank pad is [contaminated, remove the tank pad and dispose of offsite at an approved [non-hazardous] [hazardous] waste facility.] [not contaminated, leave the tank pad in place.]

3.8.2 Tank

Remove the tank from the excavation and clean the exterior to remove all soil and inspect for signs of corrosion, structural damage, or leakage. Use only non-sparking type materials or equipment which comes into contact with the tank, or in the vicinity of the excavation such as shovels, slings and tools. After removal from the excavation, place the tank on a level surface [adjacent to the tank excavation] [at an approved location] [at the location shown on the drawings] and secure it with wood blocks to prevent movement.

3.8.3 Contaminated Soil, Tank and Piping Excavation Examination

****

NOTE: Determine the appropriate field-screening instruments for health and safety monitoring; methods should be based on historical records of tank contents testing and age of release; refer to EM 1110-1-4006 for selection. Consider the use of

immunoassay field kits to save time and money. Separate immunoassay field kits sensitive to the light and heavy fuel fractions are available; these kits will not be used as real time health and safety monitoring devices.

Include the Coordinator's Name, Office, and Phone Number.

If contamination is expected, the state may request to be present onsite to oversee contaminated soil excavation and supervise sampling efforts. The designer's or Environmental Coordinator's experience at the site or similar sites may provide a basis for estimating the amount of contaminated soil.

If USACE labs are expected to perform analysis, coordinate with them early on to verify they have the adequate resources to accomplish the work.
****

a. After the tank has been removed from the ground, examine and test the adjacent and underlying soil for any evidence of leakage. Visually inspect the soil for staining after removal of all obviously contaminated soil, then screen for the presence of [volatile and/or semi-volatile] [_____] contamination using [a real time vapor monitoring instrument] [immunoassay field kits].

b. If tank is [6] [_____] m [20] [_____] feet or less in length, take [two] [_____] samples. Take each sample [0.60] [_____] m [2] [_____] feet from each end of the tank and [0.60] [_____] m [2] [_____] feet below the bottom of the excavation.

c. If the tank is greater than [6] [_____] m [20] [_____] feet, take [three] [_____] samples. Take two samples [0.60] [_____] m [2] [_____] feet from each end of the tank and [0.60] [_____] m [2] [_____] feet below the bottom of the excavation. Take a third sample from the middle of the tank area and [0.60] [_____] m [2] [_____] feet below the bottom of the excavation.

d. Analyze samples for TPH, BTEX, and TCLP. Perform sampling and analysis conforming to standards specified above for stockpiled soils. Soils that contain [50] [_____] ppm or more TPH, [10] [_____] ppm or more BTEX, or have TCLP reading of [10] [_____] ppm of lead or virgin petroleum products are considered contaminated materials. Soils which are less than the above may be used as clean fill. Furnish results to the Contracting Officer within 24 hours after the results are obtained. Along with the results furnish a sketch showing underground tank, sampling location, and extent of excavations.

e. [Stockpile onsite in accordance with paragraph Stockpiles] [Transport offsite for disposal] uncontaminated soil or petroleum contaminated soil not regulated by the state as hazardous waste. Stockpile contaminated soil or suspected contaminated soil, or, if the site is a RCRA-designated CAMU, containerized until further disposition.

f. The [Contracting Officer] [State of [_____] inspector] will determine the extent of the contaminated soil to be removed from each site, not to exceed [_____] [cubic meters cubic yards] [kg tons] per site.

Report any evidence indicating that the amount of contaminated soil may exceed the individual site limit specified, to the [Installation's Environmental Coordinator] [Contracting Officer] [_____] the same day it is discovered. If minimal additional excavation is required, the Contracting Officer may allow the Contractor to proceed. If extensive contamination is encountered, sample the excavation and backfill in accordance with paragraph BACKFILLING.

g. After the known contaminated soil is removed, sample and analyze the excavation in accordance with [_____].

3.8.4 Testing Along Piping

****

NOTE: Testing requirements are dependent on regulations applicable to the locations where tanks and piping are being removed. Verify number of tests required and required location for tests.

****

For every [7.5] [_____] m [25] [_____] linear feet of product delivery piping, [for every change in direction,] [and at every mechanical joint] take [one] [______] soil sample and analyze for TPH, BTEX, and TCLP. Conform sampling and analysis of soil materials to EPA standards specified above.

3.9 TANK CLEANING

****

NOTE: 1. For tanks larger than 15,120 L 4,000 gallons or for projects that have tanks, some of which are smaller or larger than 15,120 L 4,000 gallons, select the first optional paragraph and include Section 33 01 50.55 CLEANING OF PETROLEUM STORAGE TANKS.

2. For tanks 15,120 L 4,000 gallons and smaller, select the second optional paragraph.

****

[Provide additional requirements for cleaning and vapor freeing tank as specified in Section 33 01 50.55 CLEANING OF PETROLEUM STORAGE TANKS.] [Provide clean and vapor free tank in accordance with API RP 1604 and the following:

****

NOTE: Data for these paragraphs should be obtained from the Commanding Officer of the individual Naval facility having tanks for cleaning.

****

a. Table of Tank History

Tank No.	Tank Location	Tank Capacity	Date Constructed	Type of Lining (If Applicable	Type of Fuel	Remarks From the Last Inspection

a. Table of Tank History						
[_____]	[_____]	[_____]	[_____]	[_____]	[_____]	[_____]
[_____]	[_____]	[_____]	[_____]	[_____]	[_____]	[_____]

****

NOTE: Contact the fuel department of the nearest Naval Supply Center or Depot to determine if dirty residual fuel can be accepted by the Government for reclamation. If not reclaimed by the Government, consider the following: Depending on the amount of residual fuel remaining in the tank after pump down by the Government and the degree of fuel emulsification, the designer, in consultation with the activity, should decide on whether to require fuel/water separation under the scope of this contract, dispose of the mixture as hazardous waste if tests show presence of hazardous constituents, or use other options available to the Government.

****

b. Fuel Removal: All possible fuel will be pumped or otherwise removed from the tank by the Government. Consider remaining fuel contaminated or waste fuel; [pump into 208 liters 55 gallon drums or other suitable containers for disposal in accordance with approved procedures meeting local, State, and Federal regulations] [provide oil/water separators for further recovery of fuels and turn over to the Government for use]. Dispose of remaining fuel emulsions in accordance with applicable local, State, and Federal regulations. Drums or tanks used for containerizing waste fuel will be furnished by the [Contractor] [Government]. Oil/water separator for fuel will be furnished by the [Contractor] [Government].

****

NOTE: Information on the hazardous waste characteristics of sludge in tanks should be provided by the activity. If not, sampling and analysis must be conducted during the 0 to 35 percent design stage to properly define scope and costs.

****

c. Identification of Tanks With Hazardous Waste Sludge and Residue

The following [tank is] [tanks are] known or suspected to contain hazardous wastes:

Tank No.	Product	Hazardous Waste, Status, Type and Basis Known[or Suspect]
[1]	[MOGAS]	[Sludge and sandblast residue; ignitibility and lead.]

]

3.9.1 Exterior

****

NOTE: Acceptable levels of contaminations are dependent on regulations applicable to the location where tanks and piping are being removed; therefore, verify acceptable levels.

For some locations, such as a contaminated site scheduled for site remediation, it may be permissible to use contaminated soil materials for backfill in tank and piping excavations. Get approval from local regulating authority before using contaminated soil materials.

If contaminated soil materials are approved for backfill, retain first bracketed sentence and delete the second and third bracketed sentences.
****

Remove soil from the exterior of the tank, piping, and associated equipment to eliminate soil deposition on roadways during transportation to a temporary storage area, ensure markings will adhere to the surfaces, and simplify tank cutting. Use non-sparking tools to remove soil. Recover removed uncontaminated soil and soil not regulated by the state as a hazardous waste [and use them as backfill in the former tank excavation] [and] [or] [disposed of onsite]. Remove and containerize soil believed to be contaminated, or if the site is a RCRA designated CAMU, collect it on 3 layers of [0.152] [0.762] [_____] mm [6] [30] [_____] mil impermeable geomembrane and stockpile it with other contaminated soil removed from the excavation.

3.9.2 Temporary Storage

****
NOTE: Add any special state/local regulatory requirements.
****

If the tank is stored after the tank exterior is cleaned and ancillary equipment is removed, and prior to being cut into sections, label the tank as directed in API RP 1604, place it on blocks, and temporarily store it [on a flat area adjacent to the excavation] [at the location indicated on the drawings] [in the area of the existing tank site]. Prior to cleaning the tank interior, monitor the tank atmosphere for combustible vapors and purge or inert it if combustible vapors are detected. Provide warning labels as follows:

"TANK HAS CONTAINED LEADED GASOLINE

NOT VAPOR FREE

NOT SUITABLE FOR STORAGE OF FOOD OR LIQUIDS
INTENDED FOR HUMAN OR ANIMAL CONSUMPTION

DATE OF REMOVAL: MONTH/DAY/YEAR"

[Make tank unusable for future use, then transport and dispose of tank [at an EPA approved disposal site in accordance with applicable local, State, and Federal regulations] [in accordance with Federal, State, and local regulations].
]

3.9.3 Interior

****

NOTE: In lieu of eliminating any sheen, many states require a triple rinse. Coordinate with the appropriate regulators to ascertain what "clean" is, regarding tank interiors and to determine cleaning requirements for the piping and ancillary equipment; cleaning operations are highly dependent upon tank material and contents, and which state requirements are applicable. Often the state fire inspector's office has been tasked with Subtitle I program implementation; hence the following NFPA and API standards may be used to a greater degree than in situations in which another office of state government has been tasked with enforcing the UST regulations.

NFPA-30 Flammable and Combustible Liquids Codes

NFPA-327 Standard Procedure for Cleaning or Safeguarding Small Tanks and Containers

NFPA-329 Recommended Practice for Handling Underground Leakage of Flammable and Combustible Liquids

API Std 2015 Cleaning Petroleum Storage Tanks

If API Std 2015 is used, flooding the tank should not be used in any circumstances.

****

[Clean tank interior using a high pressure (greater than 3.45 MPa 500 psi), low volume (less than 0.13 L/s 2 gpm) water spray] [or] [Steam clean tank interior until all loose scale and sludge is removed, and contamination, in the form of a sheen, is no longer visible in the effluent stream]. Also clean the interior surfaces of piping, to the extent possible, using the same method used for cleaning the tank. Contaminated water generated from interior cleaning operations (of both piping and tank) must not exceed the following quantities for each UST cleaned:

UST VOLUME (LITERS) (GALLONS)	PERCENT OF UST VOLUME
3,785 or less1,000 or less	5
37,850 or less10,000 or less	5 or 378 L, whichever is less5 or 100 gal., whichever is less
75,700 or less20,000 or less	1 or 568 L, whichever is less1 or 150 gal., whichever is less
greater than 75,700greater than 20,000	1 or 946 L, whichever is less1 or 250 gal., whichever is less

[Collect and store onsite] [Discharge to the installation sanitary sewer after passing through an oil water separator] [Handle in accordance with paragraph Contaminated Water Disposal] all contaminated water resulting from cleaning operations. Clean so as to eliminate, to the greatest extent possible, the need for personnel to enter the tank. Use specially designed tank cleaning equipment which allows the tank to be cleaned prior to cutting into sections without requiring personnel to enter the tank or, if less specialized equipment is used, the tank is to be partially dissected to overcome confined space entry hazards. Accomplish this work in accordance with Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES.

3.10 SOIL EXAMINATION, TESTING, AND ANALYSIS

3.10.1 Tank Excavation Sampling Procedures

****

NOTE: The designer will detail the confirmation soil sampling requirements and analytical parameters, including pipe trenches and near pump islands, based on the state/local regulations, EM 1110-1-4006.

In most cases, a 72-hour turnaround-time (TAT) is appropriate to avoid excessive downtime or remobilization of the Contractor; determine if a quicker TAT is warranted for the offsite analytical.

If the State will have an individual onsite to oversee sampling and/or excavation operations, the following may be substituted for the first sentence: "After soil known to be contaminated has been removed, collect and analyze soil samples as directed by the Contracting Officer in consultation with [_____]."

A backhoe should be used for soil sampling to eliminate the need to have personnel enter the excavation.

If the regulators do not specify the number of samples required, use a minimum of 2 samples at the bottom of the tank excavation zone, with one in the center of the tank excavation and one where the highest instrument reading was obtained or where contamination is most likely to occur.

If additional samples will likely be required, it may be best to include additional testing as a separate bid item so a credit can be easily obtained if the additional tests are not required.

If there is evidence of spillage around the tank or the possibility of horizontal movement of leaked material, the following requirement can be added: "A sample must be obtained from each of the 4 walls of the excavation at [[600] [_____] mm [2] [_____] foot vertical intervals] [approximately 2/3 of the total depth of the excavation] and [composited] [tested as individual samples].

****

After soil known to be contaminated has been removed or after soil excavation is complete, sample the excavation with procedures, number, location, and methodology [as specified] [in accordance with] [state regulations].[Obtain samples from the pits using a backhoe with a Shelby tube attached to the bucket.]

3.10.2 Stockpiled Material Sampling

****

NOTE: Detail the sampling requirements and include unique stockpile segregation procedures required by the implementing agency in the body of the specification. Analytical testing of stockpiled soils will be based on visual observation, knowledge of tank contents records and testing of tank contents.

Soil that is a hazardous waste will not be allowed to be stockpiled. Unless this is a designated corrective action management unit, stockpiling of hazardous waste will require a permit. Coordinate with the state on Subtitle C tanks.

****

[Stockpiled contaminated soil must be sampled and preserved in accordance with the approved Sampling and Analysis Plan.] [Sampling locations, number and specific procedures are as required by the [State of [_____]] [implementing agency] and the disposal facility.]

3.10.3 Analysis

****

NOTE: Hydrocarbon tests may vary vastly from state to state. Designer should consult the latest state requirements for the appropriate hydrocarbon test methods.

Take into consideration that testing of stockpiled soils and testing of the excavation pit to confirm "clean closure" may require different testing. Stockpiled materials testing is performed relative to disposal criteria, confirmation soil testing from the pit is tested to demonstrate clean closure.

****

Test soil samples from the excavation and stockpiled material in accordance with the approved Sampling and Analysis Plan for the following parameters: [total petroleum hydrocarbon (TPH)] [benzene, ethylbenzene, toluene, xylene (BETX)] [toxicity characteristic leaching procedure (TCLP)] [the following constituents: [_____]]. Submit copies of all test results, including the chain-of-custody records,.to the Contracting Officer.

3.11 BACKFILLING

****

NOTE: Coordinate with the IA regarding the maximum contaminant levels allowable for clean closure, and if waste from one stockpile can be used as backfill for another. Coordinate with the user concerning

preferences in regard to leaving excavations open pending lab results, state inspector's evaluations, road closures and other factors. Lab turnaround time plays a critical role in the duration of excavations left open and times must be coordinated. If field analysis is allowed by the state inspector, this would reduce or eliminate turnaround time concerns.

If the Government or state will analyze samples, revise this paragraph and give the length of time the Contractor should expect the excavation to be open.

If additional constituents require analyses to meet state/local closure requirements, include the appropriate limits in this paragraph and include the same limits in the definition for clean fill.

Add applicable requirements for backfilling the excavation in this section or revise the reference to the appropriate section of the specifications; see EM 1110-1-4006 for guidance.

****

a. Backfill the tank area and any other excavations [as soon as possible after tank and contaminated soil removals have been completed and confirmation samples have been taken] [only after the soil test results have been approved]. Complete contaminated soil removal after [the bottom of the tank excavation is determined to have soil contamination levels below the state standards of [100] [_____] ppm TPH] [approval by the [state inspector] [Contracting Officer]].

b. Dewater the excavation if necessary. Use stockpiled material, subjected to chemical confirmation testing as backfill, if it is found to [conform to the requirements of clean fill in accordance with appropriate [state] [local] regulations] [contain less than [100] [_____] ppm of total petroleum hydrocarbons (TPH)] [contain less than [10] [_____] ppm of BETX] [_____]. Place clean backfill in layers with a maximum loose thickness of [_____] [200] mm [_____] [8] inches, compacted to [90] [_____] percent maximum density for cohesive soils and [95] [_____] percent maximum density for cohesionless soils. Perform density tests using an approved commercial testing laboratory or by facilities furnished by the Contractor. Attach test results to Contractor's Quality Control Report; submit [_____] copies of the report for each UST site opened, prepared in a standard 3-ring binder, within 14 days of completing work at each site. Label each binder with contract number, project name, location and tank number; each binder must be indexed. Furnish a copy of the report to the Installation Environmental Coordinator. Perform a minimum of 1 density test on [each] [_____] lift. Determine laboratory tests for moisture density relations in accordance with ASTM D1557, Method B, C, or D, or ASTM D6938. A mechanical tamper may be used, provided that the results are correlated with those obtained by the hand tamper. Determine field in-place density is in accordance with ASTM D1556/D1556M, ASTM D6938, or ASTM D2167.

3.12 DISPOSAL REQUIREMENTS

3.12.1 Treatment, Disposal, and Recycling

****

NOTE: List approved facilities in the area of the project.

Many IA's allow contaminated soil treatment onsite and the specification revised accordingly with potential IA approval of a work plan. The approval process should be started by the designer, if possible, to ensure IA approval does not cause project delays.

Supply the EPA hazardous waste number in accordance with 40 CFR 261.

****

Perform disposal of [hazardous] [or] [special] wastes in accordance with all local, State, and Federal solid and hazardous waste laws and regulations; the RCRA; Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS; and conditions specified herein. This work includes all necessary personnel, labor, transportation, packaging, detailed analyses (if required for disposal, manifesting or completing waste profile sheets), equipment, and reports. Recycle product and pumpable liquids removed from the tank to the greatest extent practicable. Dispose of the tanks removed at one of the following state approved facilities: [_____]. Provide manifest for each tank disposed of in this manner as required by the State of [_____] to document delivery and acceptance at the disposal facility.

3.12.2 Tank and Ancillary Equipment Disposal

After the tank, piping, and ancillary equipment have been removed from the excavation and the tank cleaned, cut the tank into sections with no dimension greater than [1500][_____] mm [5][_____] feet. [Recycle] [Dispose of] tank and piping sections [in a State approved offsite disposal facility] [or] [in a salvage yard] [at the DLA Disposition Services] [at the location shown on the drawings]. Perform tank cutting prior to being taken [off Government property] [from the tank removal site]. Do not sell the tank intact. [Recycle] [Dispose of] ancillary equipment at [an approved offsite disposal facility] [a salvage yard] [the DLA Disposition Services] Piping must be disconnected from the tank and [removed] [grouted full of a portland cement and water slurry consisting of 22.7 L 6 gallons of clean water per 42.6 kg 94 pound sack of portland cement, thoroughly mixed and free of lumps] unless otherwise indicated.

3.12.3 Transportation of Wastes

Provide transportation in accordance with Department of Transportation (DOT) Hazardous Material Regulations and State and local requirements, including obtaining all necessary permits, licenses, and approvals. Submit evidence that a State licensed [hazardous]waste transporter is being used.

3.12.4 Salvage Rights

The Contractor retains the rights to salvage value of recycled or reclaimed product and metal not turned in to the DLA Disposition Services or otherwise identified, so long as the requirements of 40 CFR 266 and 40 CFR 279, or the applicable State requirements are met. At the end of the contract, provide documentation on the disposition of salvaged materials.

3.12.5 Manifest Records

****

NOTE: Manifests are required only when the tank contents are a RCRA regulated hazardous waste. If the tank contents are a DOT hazardous material but not a RCRA regulated hazardous waste, there are Bill of Lading requirements. Edit this paragraph accordingly.

****

Maintain records of all waste determinations, including appropriate results of analyses performed, substances and sample location, the time of collection, and other pertinent data as required by 40 CFR 280, Section 74 and 40 CFR 262 Subpart D. Also record transportation, treatment, disposal methods and dates, the quantities of waste, the names and addresses of each transporter and the disposal or reclamation facility, and available for inspection, as well as copies of the following documents:

a. Manifests.

b. Waste analyses or waste profile sheets.

c. Certifications of final treatment/disposal signed by the responsible disposal facility official.

d. Land disposal notification records required under 40 CFR 268for hazardous wastes.

Provide records in accordance with Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS. Upon contract close out, the records will become the property of the Government.

3.12.6 Hazardous/Special Waste Manifests

Provide manifesting conforming to the requirements specified in Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS.

3.12.7 Documentation of Treatment or Disposal

Take wastes, other than recyclable or reclaimable product or metal, to a treatment, storage, or disposal facility which has EPA or appropriate state permits and [hazardous] [or special] waste identification numbers and complies with the provisions of the disposal regulations. Furnish [documentation of acceptance of special waste by] [the original return copy of the hazardous waste manifest, signed by the owner or operator of] a facility legally permitted to treat or dispose of those materials are to be furnished to the Contracting Officer not later than [5] [_____] working days following the delivery of those materials to the facility; and include a copy in the Tank Closure Report. Furnish a statement of agreement from the proposed treatment, storage or disposal facility and certified transporters to accept [hazardous] [or special] wastes [in the Work Plan] [to the Contracting Officer not less than 14 days before transporting any wastes]. If the Contractor selects a different facility than is identified in the [contract] [Work Plan], provide documentation for approval to certify that the facility is authorized and meets the standards specified in 40 CFR 264.

3.13 SPILLS

Use appropriate vehicles and operating practices to prevent spillage or leakage of contaminated materials from occurring during operations. Inspect vehicles leaving the area of contamination to ensure that no contaminated materials adhere to the wheels or undercarriage. Take immediate containment actions as necessary to minimize effect of any spill or leak. Cleanup in accordance with applicable Federal, State, local laws and regulations, and district policy at no additional cost to the Government. Refer to Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS for spill response and reporting requirements.

3.14 INSPECTIONS

Arrange for and perform required inspections. Provide copies of inspections to Contracting Officer.

3.15 TANK CLOSURE REPORT

****

NOTE: Execute Subtitle C tank closures in accordance with previously prepared closure plans and 40 CFR 264, Section 197. Some states have forms and/or requirements that must be included.

The number of copies required is dependent on how many the state requires, what the installation requires, and what the Government wants. To avoid additional printing costs to the Government for unforeseen copies, get a realistic number.

Execute Subtitle I closures in accordance with 40 CFR 280 as well as applicable state regulations.

****

Submit a Site Assessment/Tank Closure Report in a single binder notebook containing a collection of reports, records, starting and ending dates of reporting period, inspections, documentation, and data as follows:

a. Complete UST Notification Form (within 30 days of closure).

b. Description of work, including removal procedures, number of tanks removed, identification of tanks removed and disposed of (include site map showing location of tank and piping), cubic yards of excavated soil, location of disposal sites, and dates of excavation.

c. Site plan, including location of tanks and piping, limits of excavation, sampling points, results of excavation, and depths.

d. Laboratory and field testing reports, copies of data and test results from testing laboratory and the chain-of-custody records.

e. Tank disposal paperwork ([_____] copies of UST Notification Form and method of conditioning tank for disposal), contaminated soil disposal paperwork (include laboratory testing reports), and contaminated water disposal paperwork (include laboratory testing reports).

f. Certifications required by implementing agency.

g. Building permit[, inspection permits,] and other permitsrequired for underground tank removal, notifications, and inspection reports.

[h. Cumulative quantities of soil excavated, beginning with start date for each tank and associated piping.

] Include in Tank Closure Reports the following information as a minimum:

a. A cover letter signed by a [responsible company official] [Professional Engineer registered in the State of [_____]] certifying that all services involved have been performed in accordance with the terms and conditions of this specification.

b. A narrative report describing what was encountered at each site, including:

   (1) condition of the UST.

   (2) any visible evidence of leaks or stained soils.

   (3) results of vapor monitoring readings.

   (4) actions taken including quantities of materials treated or removed.

   (5) reasons for selecting sample locations.

   (6) sample locations.

   (7) collection data such as time of collection and method of preservation.

   (8) reasons for backfilling site.

   (9) whether or not groundwater was encountered.

c. Copies of all analyses performed for disposal.

d. Copies of all waste analyses or waste profile sheets.

e. Copies of all certifications of final disposal signed by the responsible disposal installation official.

f. Information on who sampled, analyzed, transported, and accepted all wastes encountered, including copies of manifests, waste profile sheets, land disposal restriction, notification and certification forms, certificates of disposal, and other pertinent documentation.

g. Copies of all analyses performed for confirmation that underlying soil is not contaminated, with copies of chain-of-custody for each sample. Analyses must give the identification number of the sample used. Sample identification numbers are to correspond to those provided on the one-line drawings.

h. Scaled one-line drawings showing tank locations, limits of excavation, limits of contamination, underground utilities within 15 m 50 feet, sample locations, and sample identification numbers.

i. Progress Photographs. Take a minimum of 4 views of the site showing such things as the location of each tank, entrance/exit road, and any other notable site condition before work begins. After work has been started at the site, photographically record activities at each work location daily. Photographs are to be 89 x 127 mmdigital and include:

(1) Soil removal, handling, and sampling.

(2) Unanticipated events such as discovery of additional contaminated areas.

(3) Soil stockpile area.

(4) Tank.

(5) Site or task-specific employee respiratory and personal protection.

(6) Fill placement and grading.

(7) Post-construction photographs. After completion of work at each site, take a minimum of four (4) views of the site. Pictures are to be digital illustrate the condition and location of work and the state of progress. Each picture must contain a caption with the following information:

(8)

Project No.	Contract No.
Location	
Contractor/Photographer	
Photograph No.	Date/Time:
Description	
Direction of View	

j. [_____] copies of the report for each UST site opened, prepared in a standard 3-ring binder, within 14 days of completing work at each site. Label each binder with contract number, project name, location and tank number; each binder must be indexed. Furnish a copy of the report to the Installation Environmental Coordinator.

3.16 COMPACTION, FINISH GRADING, and SEEDING

Provide backfill, compaction, grading, and seeding in accordance with Section 31 00 00 EARTHWORK.[Line the excavation with two plastic sheets before backfilling.]

-- End of Section --

****

SECTION 02 66 13

SELECT FILL AND TOPSOIL FOR LANDFILL COVER

02/25

****

NOTE: This guide specification covers the requirements for select fill and topsoil layers for landfill cover systems. Select fill is the term used to describe soil layers (other than low permeability clay barrier layers placed above a gas collection layer) placed directly on geosynthetic materials.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

1.1 UNIT PRICES

****

NOTE: These paragraphs should be edited based on whether the contract will use a single job price or unit prices. If there is a separate Measurement and Payment section, edited versions of these paragraphs should be inserted in that section.

****

Base measurement and payment for "select fill" and "topsoil" on the respective unit prices for each cubic meter cubic yard of "select fill" and "topsoil" in place. Include the cost for development of borrow sources, cost of materials, excavation, hauling, equipment, placement, testing, and other work required to construct the "select fill" or "topsoil" layers in the unit cost.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D698	(2012; E 2014; E 2015) Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/cu. ft. (600 kN-m/cu. m.))
ASTM D1140	(2017) Standard Test Methods for Determining the Amount of Material Finer than 75-µm (No. 200) Sieve in Soils by Washing
ASTM D1556/D1556M	(2015; E 2016) Standard Test Method for Density and Unit Weight of Soil in Place by Sand-Cone Method
ASTM D2167	(2015) Density and Unit Weight of Soil in Place by the Rubber Balloon Method
ASTM D2216	(2019) Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
ASTM D2487	(2017; E 2020) Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification

	System)
ASTM D2488	(2017; E 2018) Standard Practice for Description and Identification of Soils (Visual-Manual Procedure)
ASTM D2974	(2020; E 2020) Moisture, Ash, and Organic Matter of Peat and Other Organic Soils
ASTM D4318	(2017; E 2018) Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
ASTM D4972	(2018) Standard Test Methods for pH of Soils
ASTM D6913/D6913M	(2017) Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
ASTM D6938	(2017a) Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)

1.3 SYSTEM DESCRIPTION

****

NOTE: Describe other components of the cover system and reference specification Sections that contain the requirements for these components. Other

specification sections that may be included in a landfill cover project are: 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT, 02 56 13.19 GEOSYNTHETIC CLAY LINER WASTE CONTAINMENT, 02 66 13 SELECT FILL AND TOPSOIL FOR LANDFILL COVER, and 02 66 16 TEST FILL.

****

Construct a landfill cover consisting of [_____] mm [_____] inch thick layer of compacted select fill covered by a [_____] mm [_____] inch thick layer of topsoil.

[1.4 PRE-INSTALLATION MEETING

****

NOTE: Delete this paragraph if a separate specification section is developed for the entire project to cover pre-installation meetings and other administrative requirements. Test(DJB)

****

Conduct a pre-installation meeting at the jobsite[at least five business days prior to the start of earthwork operations on the project][_____]. The pre-installation meeting is to be arranged by the Contractor and is to follow the written pre-installation meeting agenda submitted prior to the meeting. The purpose of this meeting is to review the requirements of this specification and the associated plans. The following individuals must be in attendance at this meeting: Contractor's Project Manager and Project Superintendent, earthwork subcontractor's Project Manager and Site Foreman, Contractor's Geotechnical Engineer and Testing Agency, Government Geotechnical Engineer and Civil Engineer, and Government Construction Manager and Engineering Technician.

Record pre-installation meeting minutes and publish via email within 48 hours to all attendees. The minutes must be re-published within 48 hours via email pending any subsequent comments from the attendees.

]1.5 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the

District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Pre-Installation Meeting Agenda

Pre-Installation Meeting Minutes; G, [_____]

Materials Handling Plan; G [_____]

Borrow Source Assessment Report; G, [_____]

SD-04 Samples

SD-07 Certificates

Qualifications; G, [_____]

Certificate Of Subgrade Acceptance; G, [_____]

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

****

NOTE: Regulatory requirements will be location specific and may include local ordinances and State

regulatory requirements. At a minimum, an approved Soil Erosion and Sediment Control Plan will be required by the local Soil Conservation District.

For sites addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), administrative permit requirements for on-site activities are not required, though the substantive requirements may need to be met. The permits or permit equivalents may include those addressing air emissions, water discharge, stormwater pollution prevention, and possibly others. Permitting requirements known to have substantive requirements should be listed here. If permit requirements are covered in other specifications, such as 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, delete this section.

****

Obtain all State and Local [permits][permit equivalents] required to perform the work.

1.6.2 Qualifications

1.6.2.1 Geotechnical Engineer

Provide a Professional Geotechnical Engineer licensed in the[applicable jurisdiction][state that work is being performed] to provide inspection of the select fill layer and topsoil layer throughout construction. The Geotechnical Engineer must have [five][_____] years of experience in design, construction, Quality [Assurance][Control], or certification of [landfill][dump] liners or covers. The Geotechnical Engineer is responsible for performing pre-construction, periodic during construction, and final at completion of construction site visits to inspect and [approve][certify] that the select fill and topsoil layers meet specifications. The Geotechnical Engineer is responsible for preparing and updating the Materials Handling Plan and Borrow Source Assessment Report as construction progresses to reflect changing conditions and submit updated plans if necessary. Submit a [monthly][_____] Geotechnical Evaluation Report, informing the Contractor and Contracting Officer of the status of the plans and an accounting of the Contractor's adherence to the plans addressing any present or potential problems. The Contractor is responsible for arranging meetings with the Geotechnical Engineer and Contracting Officer throughout the contract duration.

1.6.2.2 Qualified Technician

Provide a Qualified Technician to inspect, monitor, sample, and perform field testing. The technician qualifications need to be one of the following: a current National Institute for Certification in Engineering Technologies (NICET) Level II minimum certification in Construction Materials Testing Soils; Professional Civil or Geotechnical Engineer with minimum [two][_____] years of experience in design, construction, Quality [Assurance][Control], or certification of [landfill][dump] liners or caps.

1.6.2.3 Lab Validation

Perform testing by an accredited commercial testing laboratory meeting the requirements listed below. Items a. through c. apply to testing laboratories used for soil geotechnical testing (all tests other than chemical contamination tests). Item d. applies to testing laboratories used for chemical contamination tests. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

a. Comply with applicable requirements of ASTM E329

b. Testing laboratory must be licensed to operate in the State of [_____]. Third party laboratory testing must be conducted by a laboratory either validated by the USACE Materials Testing Center or have an AASHTO Materials Reference Laboratory (AMRL) certification for the required tests.

c. Testing equipment used by laboratory must be calibrated at maximum intervals of twelve months by devices of accuracy traceable to one of the following: NIST Standard Reference Materials, ISO ISO/IEC 17025, certified by state or local bureau.

d. Perform the testing in paragraph CHEMICAL CONTAMINATION TESTING by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory meeting the requirements of[Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.7   DELIVERY, STORAGE, AND HANDLING

1.7.1   Delivery

Deliver select fill and topsoil to the site in trucks that meet all local, state, and federal transportation regulations[and have added containment of material in the form of a fabric cover to prevent spillage].

1.7.2   Storage

Store select fill and topsoil in stockpiles. Keep stockpiles separate and in a neat and well drained condition, giving due consideration to drainage at all times. Clear, grub, and seal by rubber-tired equipment, the ground surface at stockpile locations. Protect stockpiles from contamination from unsuitable materials, including but not limited to soils not meeting the definition of Select Fill or Topsoil defined in this specification, volunteer vegetation growth, or windblow waste [material][debris], which may destroy the quality and fitness of the select fill and topsoil materials. If the Contractor fails to protect the stockpiles, and any select fill or topsoil material becomes unsatisfactory, remove and replace such material with satisfactory material from approved sources. Unsatisfactory materials include materials which do not comply with the requirements for satisfactory materials in this section, and also include man-made fills, trash, refuse, backfills from previous construction, roots, and other organic matter or frozen material. Do not place stockpiles on prepared subgrade, any select fill lifts, or topsoil lifts. Place a[geotextile][geocomposite][_____] beneath stockpiles and between stockpiles of dissimilar material to keep materials separated. Provide stormwater sediment and erosion controls in accordance with[Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS][_____]. Do not allow water to pond in the stockpile areas.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Environmental Requirements

Do not install the select fill or topsoil when temperatures are below freezing or during precipitation events. Any relaxation of this requirement must be approved by the Contracting Officer.

1.8.2 Existing Conditions

****

NOTE: Existing conditions are site specific and are generally shown on the plans and provided in design or investigation documents prepared for the site. If there are specific conditions the Contractor should be made aware of that are contained in plans or documents provided, describe here.

****

The existing site conditions are presented[in Appendix [_____]][on the plans]. Immediately notify the Contracting Officer if there are discrepancies between the existing site conditions as presented and field conditions discovered during execution.

PART 2 PRODUCTS

2.1 EQUIPMENT

Use equipment to place the select fill and topsoil layers as described in the approved Materials Handling Plan. The ground pressure of the equipment must be no greater than [49][_____] kPa [7][_____] psi. Do not operate equipment by accelerating or braking suddenly, turning sharply, or traveling at speeds exceeding 8 km per hour 5.0 miles per hour.

2.2 MATERIALS

2.2.1 Select Fill

****

NOTE: The default maximum allowable particle size is 25 mm 1 inch. The maximum particle size should be reduced to 13 mm 0.5 inches in the select fill layer to prevent puncturing of the geomembrane if the select fill layer is placed directly on top of a geomembrane. Manufacturers should be consulted for recommendations on select fill maximum allowable particle size when select fill is placed on top of other geosynthetics.

Selection of suitable select fill should be based on the type and availability of soils at or close to the site. The designer must verify that these soils will not clog underlying drainage layers. The soil types listed in Table 1 are generally acceptable for use as select fill.

Sands must be analyzed to ensure they are internally stable. A soil is internally stable if it is

self-filtering (i.e., the fine particles do not move through the pores of the coarser fraction). Federal Highway Administration Publication No. FHWA-HI-95-038 describes procedures for determining the clogging potential and internal stability of soil.

The Design Engineer must also ensure the select fill is compatible with the underlying filter. For landfill applications, the filter is typically a geotextile. Filter design is based on a comparison of the grain size distribution (ASTM D7928) of the select fill and the apparent opening size (AOS) of the underlying geotextile. Geotextile filter design procedures are outlined in Federal Highway Administration Publication No. FHWA-HI-95-038.

Criteria for Atterberg limits are sometimes included in Table 1 to control the properties of the select fill.

Hydraulic conductivity criteria may also need to be added to Table 1 for the select fill soil. The hydraulic conductivity of the select fill layer controls the rate at which precipitation infiltrates into the underlying drainage layer.

****

Provide select fill in compliance with the criteria listed in Table 1 and free of debris, frozen materials, angular rocks, roots, and organics. Submit a minimum of 23 kg 50 pounds of select fill from each proposed borrow source to the Government at least [15][_____] business days prior to placement; this material is for possible Government Quality Assurance testing and not the Quality Control testing required by the Contractor.

2.2.2 Topsoil

Provide topsoil consisting of natural, friable soil that is representative of soils in the vicinity which produce heavy growths of crops, grass, or other vegetation and is reasonably free from underlying subsoil, clay lumps, objectionable weeds, litter, brush, matted roots, toxic substances, or any material that might be harmful to plant growth or be a hindrance to grading, planting, or maintenance operations as determined by the Geotechnical Engineer, Qualified Technician [, or Government Quality Assurance Representative]. Submit a minimum of 2 kg 5 pounds of topsoil from each proposed borrow source to the Government at least [15][_____] business days prior to placement; this material is for possible Government Quality Assurance testing and not the Quality Control testing required by the Contractor. Also, provide topsoil complying with the criteria listed in Table 1.

TABLE 1 - REQUIRED PHYSICAL PROPERTIES OF SELECT FILL AND TOPSOIL

PROPERTY	TEST VALUE	TEST METHOD
Select Fill		

TABLE 1 - REQUIRED PHYSICAL PROPERTIES OF SELECT FILL AND TOPSOIL

PROPERTY	TEST VALUE	TEST METHOD
Soil classification	Lean clay (CL) Clayey sand (SC) Clayey gravel (GC) [_____]	ASTM D2487

Organic content (percent)	[5-20] [_____]	ASTM D2974

2.2.3 Water

****

NOTE: Two options are provided. The first option is to only allow the Contractor to use potable water. The second option allows the Contractor to use non-potable water, but includes a testing requirement to limit the chance that the Contractor supplies a water that could introduce contaminants into the select fill or topsoil layers. The first option is simpler, but could lead to higher project costs if the volume of water needed is significant and/or potable water sources are not readily available. When specifying the criterion to be met for water, the Designer should consider if there are other standards which are more appropriate for the specific project (e.g. state groundwater cleanup criteria).

****

Supply water used to increase moisture content of the select fill and topsoil layers for the sake of compaction during installation. Maintain an accurate record of water usage.[Use only potable water from a regulated public water system.][If non-potable water is to be used, provide water that does not contain oils, acids, salts, alkalis, organic matter, solids or other substances at concentrations that could be detrimental. Also characterize non-potable water prior to its use by collecting a sample from the water source and analyzing according to Table 2. Submit a Water Supply Analysis demonstrating that water meets requirements.

TABLE 2 - MOISTURE CONDITIONING AND DUST CONTROL WATER CRITERIA

ANALYTICAL METHOD NUMBER (From EPA SW-846; use current version)	ANALYSIS TYPE	CRITERIA TO BE MET
6010 [and 7470A]	Metals [and Mercury]	[Less than Maximum Contaminant Level (MCL)] [_____]
8260	Volatile Organics	
8270	Semi-volatile Organics	
8082	PCBs	
1633	PFAS	
8081	Pesticides	
Within each Analytical Method, only analyze for analytes which have an [MCL][_____].		

]

2.3 TESTS, INSPECTION, AND VERIFICATIONS

2.3.1 Select Fill

****

NOTE: Shear strength testing is often required for landfill covers and liners which contain geosynthetics. Testing should be conducted on all potential slip interfaces. Criteria for shear strength testing (also referred to as interface friction testing)are described in Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT or Section 02 56 13.19 GEOSYNTHETIC CLAY LINER WASTE CONTAINMENT.

If hydraulic conductivity of the select fill layer needs to be specified based on the design, requirements from Section 02 56 13.16 CLAY WASTE CONTAINMENT can be incorporated into this section.

****

Use[test pits][borings] placed in a grid pattern to characterize each proposed borrow source. Extend the[test pits][borings] to the full depth of the proposed borrow source. Perform visual classification as described in ASTM D2488 over the full depth of each[test pit][boring] by the[Geotechnical Engineer described in paragraph GEOTECHNICAL ENGINEER][Qualified Technician described in paragraph QUALIFIED TECHNICIAN]. Group soils into "principal types" based on visual classification.

2.3.1.1 Classification Testing

Perform borrow source assessment tests on each principal type and combination of materials proposed for use in the select fill layer to ensure compliance with specified requirements. Perform one set of borrow assessment tests for each [400][_____] cubic meters [500][_____] cubic yards of each soil type and borrow source proposed for use; test for the select fill properties listed in Table 1. Perform at least three borrow assessment tests for each soil type and borrow source. Based on borrow source assessment testing, classify soils in accordance with ASTM D2487.

2.3.1.2 Moisture-Density (Compaction) Testing

Test a representative sample from each principal type and combination of borrow materials to establish compaction curves using ASTM D698. Perform one compaction test for each [400][_____] cubic meters [500][_____] cubic yards of each borrow source proposed. Perform at least three compaction tests for each soil type and borrow source. Use a minimum of [five][_____] points to develop each compaction curve. During construction, conform to the following requirements for placement of select fill:

a. Minimum allowable dry density less than [90][_____] percent of maximum dry density is not acceptable.

b. The allowable moisture content range must be [+/-3][_____] percent of optimum.

2.3.2 Topsoil

Test representative samples of each principal type and combination of topsoil materials. Perform one set of tests for each [400][_____] cubic meters [500][_____] cubic yards of each borrow source proposed; test for the topsoil properties listed in Table 1. Perform at least three sets of tests for each borrow source. Based on borrow source assessment testing, classify soils in accordance with ASTM D2487.

2.3.3 Chemical Contamination Testing

****

NOTE: This section includes a requirement to prepare a UFP-QAPP to define chemical contamination testing. Alternatively, this section may reference a separate specification section in the project requiring preparation of a UFP-QAPP. If that is the case, ensure that UFP-QAPP requirements from this section are appropriately incorporated into the separate specification section.

Suggested chemical analyses, sampling frequency, sample collection methods, and chemical concentration screening level standards are included as optional requirements to be considered in the UFP-QAPP. The Designer can include more specific requirements in the list of UFP-QAPP elements to be addressed. Individual states where work is being completed may have requirements that should also be considered.

The Designer should take care that requirements are not too strict for what is considered "clean" soils. Natural and anthropogenic background concentrations of chemicals should be considered in addition to health-based screening levels defined by regulatory agencies. The Designer may wish to use alternative methods instead of conducting project-specific specific chemical contamination testing; alternative methods could include using previously approved borrow sources where chemical contamination testing has already been conducted or using borrow sources where chemical contamination is not suspected based on knowledge of land use, etc .

****

2.3.3.1 Uniform Federal Policy Quality Assurance Project Plan

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the UFP-QAPP WKSTS. Submit the UFP-QAPP within [30][_____] calendar days after notice to proceed. Do not perform chemical contamination testing until the UFP-QAPP is approved. Prepare[draft for Government review][draft-final for[regulatory][_____] review] and final versions of the UFP-QAPP. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] calendar days for comment resolution following each review and preparing the next version of the document. Tailor the content to the requirements of the project and the site conditions. The UFP-QAPP must specifically address the following elements:

a. Chemical analyses: Specify the chemicals to be analyzed in each sample.[At minimum the following analyses must be included:[target compound list volatile organic compounds][target compound list semi-volatile organic compounds][target analyte list metals][pesticides/polychlorinated biphenyls][______].]

b. Acceptable chemical concentrations for the select fill and topsoil layer soils.[At minimum the following standards must be considered:[U.S. Environmental Protection Agency Regional Screening Levels][state-specific screening levels defined at [______]][background chemical concentrations defined at [______].]]

c. Chemical contamination sampling frequency. Assume a minimum sampling frequency of one sample for every [2,000][_____] cubic meters [2,500][_____] cubic yards of select fill and topsoil brought on site. Consider other sampling frequency requirements such as state regulations or guidance.

d. Sample collection method (e.g. discrete grabs, composites, incremental samples).

e. Borrow source chemical contamination acceptance criteria, indicating how sample results will be compared to acceptable chemical concentrations to determine if the borrow source is acceptable (e.g. each sample must meet acceptable concentrations, average of samples must meet acceptable concentrations).

2.3.3.2 Chemical Contamination Sampling and Analysis

Sample and analyze each principal type and combination of select fill and topsoil from each proposed borrow source for chemical contamination in accordance with [the UFP-QAPP][_____]. Any deviations to sampling frequency, number of samples, or sample collection methods must be[established in the approved[UFP-QAPP][_____]][approved by the Contracting Officer].

2.3.4 Borrow Source Assessment Report

Submit a Borrow Source Assessment Report at least [15][_____] business days prior to select fill and topsoil placement. Do not place select fill or topsoil until the Borrow Source Assessment Report is approved. Include the following in the report:

a. Location of each borrow source.

b. Plan view and estimated quantity of borrow available.

c. Locations and logs of subsurface explorations.

d. Laboratory test results.

e. Chemical testing data demonstrating that select fill and topsoil is acceptable.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Select Fill Layer Subgrade

****

NOTE: Subgrade for the select fill layer should consist of a geosynthetic. The following paragraph includes a requirement for completing a Certificate of Subgrade Acceptance; this activity ensures that soils are not placed over a geosynthetic that has not been fully inspected, tested, and determined to meet requirements.

****

Each day during placement of the select fill layer, the Qualified Technician[and Government QA representative] must inspect the subgrade geosynthetic to verify it is acceptable for placement of the select fill layer. Submit a Certificate of Subgrade Acceptance each day that the select fill layer is placed. Examine the subgrade for compliance with the items in the list below:

a. A project-qualified land surveyor has verified the lines and grades of the subgrade meet project design.

b. All construction quality control and construction quality assurance of the underlying geosynthetics has been completed and results have been accepted by the Contracting Officer.

c. The subgrade is free of irregularities, protrusions, loose soil, and abrupt changes in grade.

d. All tools, equipment, and temporary covers have been removed from the geosynthetic.

3.1.2 Topsoil Subgrade

****

NOTE: Subgrade for the topsoil layer will either be select fill or common fill. If subgrade is not suitable to install the topsoil layer, require the subgrade to be reworked in accordance with the Specification Section that addresses subgrade preparation. The Certificate of Subgrade Acceptance is provided as an optional requirement for the topsoil layer as it is deemed less essential than for the select fill layer. Requiring this submittal creates more work for the Contractor's Quality Control program and Government's Quality Assurance activity; however it provides a checkpoint to verify that QA/QC testing has been performed on the subgrade or previously installed select fill lifts, limiting the chance for re-work.

****

Inspect the topsoil layer subgrade to verify it is acceptable for placement of the topsoil layer. The subgrade must be free of vegetation and ruts and must not be wet or frozen. If subgrade is not suitable to place the topsoil layer, rework subgrade in accordance with this section.[Submit a Certificate of Subgrade Acceptance completed by the Qualified Technician[and Government QA representative] each day that topsoil layer is placed.]

3.2 INSTALLATION

3.2.1 Materials Handling Plan

Submit a Materials Handling Plan at least [15][_____] business days prior to select fill or topsoil layer placement. Do not place select fill or topsoil until the Materials Handling Plan is approved. Include the following in the plan: processing and placement of the select fill or topsoil; type, model number, weight and critical dimensions of equipment to be used for soil processing and compaction.

3.2.2 Select Fill Placement

****

A temporary haul roads is required to allow access for large construction equipment during select fill placement. The haul roads are typically a minimum of 1 m 3 feet in thickness and are constructed using select fill.

A test fill should be required when needed to demonstrate placement technique or to determine cover or liner stability. Section 02 66 16 TEST FILL can be edited and included in the specification package if a test fill will need to be constructed.

****

Do not operate equipment directly on the top surface of geosynthetics without permission from the Contracting Officer. Push select fill out over geosynthetics in an upward tumbling motion so that wrinkles in geosynthetics do not fold over. Do not drop soil directly onto geosynthetics from a height greater than 915 mm[_____] 3 feet[_____]. On slopes, place select fill from the bottom of the slope upward.

3.2.2.1 Initial Lift of Select Fill Placed Over Geosynthetics

The first lift of soil placed over geosynthetics must be a minimum of [305][380][_____] mm [12][15][_____] inches in loose thickness. Use equipment with ground pressures less than [49][_____] kPa [7][_____] psi to place and traffic compact the first lift of select fill. Traffic compaction consists of a minimum of six one-way passes over all areas. Rubber-tire haul trucks can only operate over a geosynthetic if a haul road of minimum thickness 1 meter 3 feet is provided.

3.2.2.2 Subsequent Lifts of Select Fill

****

NOTE: Maximum loose lift thickness should be no greater than 200 mm 8 inches if a density criteria will be applied to the lift. The criteria for minimum number of passes can be omitted if the Contractor must meet a density criteria.

****

Do not provide a lift thickness of each subsequent lift greater than [205][305][_____] mm [8][12][_____] inches. Allow full scale placement and compaction equipment on areas underlain by geosynthetics after the[first][second] loose lift of soil has been placed. Rubber-tire haul trucks can only operate over a geosynthetic if a haul road of minimum thickness 1 meter 3 feet is provided.[Compaction consists of a minimum of six passes over all areas.]

3.2.3 Topsoil Placement

Place topsoil and evenly spread to a final compacted thickness as specified in paragraph SYSTEM DESCRIPTION. Traffic compact topsoil using approved placement equipment. On slopes, place topsoil from the bottom of the slope upward.

3.2.4 Construction Tolerances

****

NOTE: The U.S. Environmental Protection Agency document, EPA/600/R-93/182 Quality Assurance and Quality Control for Waste Containment Facilities discourages the use of grade stakes which penetrate the select fill layer to control lift thickness. Grade stakes can potentially damage underlying geosynthetic materials.

****

Provide finished surfaces that are uniformly graded and free from depressions, mounds, or windrows. Top surfaces of the select fill layer and topsoil layer greater than [76][_____] mm [3][_____] inches above the lines and grades shown on the drawings are prohibited. No minus tolerance will be permitted. Do not drive rigid grade stakes into the select fill layer to control placement.

3.3 FIELD QUALITY CONTROL

3.3.1 Select Fill and Topsoil Material Tests

During construction of the select fill layer, take representative samples for testing at the frequencies listed in Table 3[from the borrow source prior to placement][from stockpiled material prior to placement]. Test results must comply with the requirements listed in Part 2 PRODUCTS or the material will be rejected for use. Submit test results as specified.

TABLE 3 - SELECT FILL AND TOPSOIL MATERIAL TESTING FREQUENCIES

PROPERTY	FREQUENCY	TEST METHOD
Select Fill		
Grain size analysis	[1,500] [_____] cubic meters [2,000][_____] cubic yards	ASTM D6913/D6913M
Liquid Limit, Plastic Limit, Plastic Index	[1,500][_____] cubic meters[2,000][_____] cubic yards	ASTM D4318
Compaction (Note 1)	[4,000][_____] cubic meters[5,200][_____] cubic yards	ASTM D698
Topsoil		
Grain size analysis for maximum particle size	[1,500][_____] cubic meters[2,000][_____] cubic yards	ASTM D6913/D6913M
pH	[1,500][_____] cubic meters[2,000][_____] cubic yards	ASTM D4972
Organic content	[1,500][_____] cubic meters[2,000][_____] cubic yards	ASTM D2974
Note 1: Compare compaction test results with the results obtained during the borrow source assessment. When there are significant differences, adjustments to the acceptable moisture content or density ranges must be proposed by the Contractor for approval.		

3.3.2 Moisture Content and Density Tests of In-Place Select Fill

****

NOTE: Test results using ASTM D6938 may show a significant amount of scatter in some situations.

ASTM D4643 (microwave method) can be used as an alternative to ASTM D6938 for quick determinations of moisture content.
****

Perform moisture content and density tests for select fill in-place, in a grid pattern staggered for successive lifts, so that sampling points are not at the same location in each lift. Perform moisture content and density tests in accordance with Table 4. Submit test results as specified.

TABLE 4 - MOISTURE CONTENT AND DENSITY TESTS OF IN-PLACE SELECT FILL

PROPERTY	FREQUENCY PER LIFT	TEST METHOD
Nuclear moisture content	[925][____] square meters [7,000][____] square feet Minimum of three tests per day.	ASTM D6938
Standard moisture content	One for every 20 nuclear tests; minimum one test per day.	ASTM D2216
Nuclear density	[650][_____] square meters [7,000][_____] square feet Minimum of three tests per day.	ASTM D6938
Standard density	One for every 20 nuclear tests, minimum one test per day.	ASTM D1556/D1556M or ASTM D2167

3.3.2.1 Test Frequencies and Locations

Perform nuclear density and moisture content tests at locations that are representative of moisture and compaction based on visual observations during placement of the lift. Perform standard tests at locations which are underneath the nuclear gauge or as close as possible to the locations of the nuclear tests being checked.

3.3.2.2 Nuclear Density and Moisture Content Tests

Take nuclear density readings in the direct transmission mode. When ASTM D6938 is used, check and adjust the calibration curves using only the sand cone method as described in ASTM D1556/D1556M. ASTM D6938 results in a wet unit weight of soil and when using this method, use ASTM D6938 to determine the moisture content of the soil. Check the calibration curves furnished with the moisture gauges along with density calibration checks as described in ASTM D6938; make the calibration checks of both the density and moisture gauges at the beginning of a job on each different type of material encountered and at intervals as directed by the Contracting Officer.

3.3.2.3 Test Results

Compare field moisture content and density test results to the compaction curve for the appropriate material type being tested. If test results are not within the acceptable range for moisture content or density, as described in subparagraph Moisture-Density (Compaction) Testing, repair the lift of soil out to the limits defined by the Qualified Technician based on visual observation, process monitoring, and additional nuclear testing. Retest the area as directed. Document repairs to the select fill layer including location and volume of soil affected, corrective action taken, and results of retests.

3.3.3 Government Quality Assurance Testing

****

NOTE: Quality assurance (QA) testing and inspections should be performed on all landfill construction as the liability is long term and cost due to failure is significant. Factors to consider include whether the Government has access to a laboratory that can analyze quality assurance samples in a timely manner to not delay the project execution. If conducting quality assurance testing, a separate third-party quality assurance contract should be considered based on the qualifications of the Government QA personnel and the size and importance of the project.

Use of quality assurance testing data also needs to be considered. A relatively straightforward data use is to compare quality assurance sample results to the project performance requirements, and failing result would be treated the same way as a failing Contractor test result. A more complicated data use is to compare results from quality assurance samples and contractor quality control samples for the purpose of determining if there is meaningful disagreement between the results. In this case, procedures would need to be developed for determining when there is a meaningful disagreement between quality assurance and quality control sample results; corrective actions for when a meaningful disagreement was identified would also need to be developed. The process of defining procedures for identifying and correcting meaningful differences should be documented in a project-specific CQA Plan or Quality Assurance Project Plan and referenced in this specification; the process is likely too complex to be adequately defined in this specification.

Two options are provided for defining Government Quality Assurance. The first option is to defer details of the Government QA to a separate CQA Plan. The CQA Plan would need to be developed and provided to the Contractor with the project specifications. This option would be preferred for large, complex projects where the clay barrier is one component of a larger waste containment system. A second, simpler option is provided to define Government QA testing frequency.

The Government's QA personnel should visit off-site borrow sources to assure that soils identified in the Borrow Source Assessment Report are being

utilized and no water is being added.
****

[Work will be monitored and tested in accordance with the requirements of the CQA Plan. Be aware of all monitoring and testing activities defined in the CQA Plan and account for these activities in the construction schedule. Quality Assurance testing and monitoring does not relieve the contractor of the responsibility to complete the quality control testing and monitoring defined in this specification section.

][[Provide][The Contracting Officer will provide] duplicate quality assurance samples to the Government's quality assurance laboratory at a frequency of one set of samples per [10][_____] sets of quality control tests performed. Quality assurance samples will be tested for the same parameters as the parent quality control sample. A failed quality assurance test will require the same corrective actions defined in this section as a failed Contractor quality control test. The Contracting Officer may require additional quality assurance tests as a result of failed quality assurance or quality control tests. Account for Government quality assurance testing in the construction schedule. Quality Assurance testing and monitoring does not relieve the contractor of the responsibility to complete the quality control testing and monitoring defined in this specification section.
]

3.4 PROTECTION

Protect newly placed select fill and topsoil from traffic, erosion, and settlements that may occur. Prevent damage by ineffective drainage or traffic by heavy equipment. Do not stockpile material on finished surfaces. Repair or reestablish damaged areas to specified requirements.

3.4.1 Damage

Repair erosion rills or other damage that occurs and re-establish grades. Document repairs to the select fill layer or topsoil layer including location and volume of soil affected, corrective action taken, and results of retests.

3.4.2 Stockpiles

Storage or stockpiling of material on the completed surface of the select fill or topsoil layers will not be permitted.

SECTION 02 66 16

TEST FILL

02/21

****

NOTE: This guide specification covers the requirements for a test fill for a landfill liner or cover.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This guide specification must be used in conjunction with and coordinated with the referenced sections. Multiple borrow sources may be required for large projects; in that case, more than one test fill may need to be constructed. Test fills are generally listed as a lump sum item on the bidding schedule.

****

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide

specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D1556/D1556M	(2015; E 2016) Standard Test Method for Density and Unit Weight of Soil in Place by Sand-Cone Method
ASTM D2167	(2015) Density and Unit Weight of Soil in Place by the Rubber Balloon Method
ASTM D2216	(2019) Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
ASTM D4318	(2017; E 2018) Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
ASTM D4643	(2017) Standard Test Method for Determination of Water Content of Soil and Rock by Microwave Oven Heating
ASTM D5084	(2016a) Standard Test Methods for Measurement of Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter
ASTM D6938	(2017a) Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
ASTM D7928	(2017) Standard Test Method for Particle-Size Distribution (Gradation) of Fine-Grained Soils Using the Sedimentation (Hydrometer) Analysis

1.2 SYSTEM DESCRIPTION

Submit a construction plan for the test fill. Do not begin test fill construction until the test fill construction plan is approved. The materials proposed for use in the test fill and interface friction testing must also be approved prior to the start of test fill construction. The plan includes, but is not limited to, the following items:

a. Proposed modifications to the test fill design;

b. Placement sequence;

c. Surface water control and diversion;

d. Equipment to be used including operating speeds, traffic patterns, and number of passes;

e. Geosynthetics products to be used and geosynthetics manufacturer's equipment recommendations.

1.3 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the

"G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Construction Plan

QC Inspector

SD-06 Test Reports

Weekly Reports

Final Report

1.4 QUALITY ASSURANCE

****

NOTE: This paragraph and references to the QC inspector should be removed if a QC inspector will not be used.

****

The QC inspector must be present during test fill construction, review the Contractor's test data, and ensure that the Contractor has constructed each layer of the test fill as specified. The QC inspector must meet the qualifications identified in Section [02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT] [_____]. Submit the QC inspector qualifications, as specified.

PART 2 PRODUCTS

****

NOTE: Not all of the materials described below will be included in each test fill. Delete materials that are not applicable. The layer thicknesses specified should be modified on a site specific basis.

****

2.1 RANDOM FILL

Provide random fill consisting of a [300] [_____] mm [12] [_____] inch layer as specified in Section [31 00 00 EARTHWORK] [_____] and as shown on the drawings.

2.2 CLAY BARRIER LAYER

Provide clay barrier layer consisting of a [600] [_____] mm [24] [_____] inch compacted clay layer as specified in Section 02 56 13.16 CLAY WASTE CONTAINMENT and as shown on the drawings.

2.3 GEOMEMBRANE

Provide geomembrane barrier layer as specified in Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT and as shown on the drawings. Place a [smooth geomembrane] [geomembrane textured on the [top] [bottom] side] [geomembrane textured on both sides] in the test fill.

2.4 GEOSYNTHETIC CLAY LINER

Provide geosynthetic clay liner as specified in Section 02 56 13.19 GEOSYNTHETIC CLAY LINER WASTE CONTAINMENT and as shown on the drawings.

2.5 GEOSYNTHETIC DRAINAGE LAYER

Provide geosynthetic drainage layer as specified in Section 31 32 19.13 GEOSYNTHETIC DRAINAGE LAYER and as shown on the drawings.

2.6 GEOTEXTILE

Provide geotextile layer as specified in Section 31 32 19.16 GEOTEXTILE and as shown on the drawings.

2.7 GRANULAR DRAINAGE LAYER

Provide granular drainage layer consisting of a [300] [_____] mm [12] [_____] inch layer as specified in Section [32 11 13.13 LIME TREATED SUBGRADE] [_____] and as shown on the drawings.

2.8 SELECT FILL

****

NOTE: Top soil is usually not placed on the test fill. However, the weight of the top soil may be simulated by the placement of additional select fill.

****

Provide select fill consisting of a [600] [_____] mm [24] [_____] inch layer of select fill material as specified in Section 02 66 13 SELECT FILL AND TOPSOIL FOR LANDFILL COVER and as shown on the drawings.

2.9 EQUIPMENT

Construct the test fill to demonstrate that the proposed equipment and procedures are acceptable for construction of the full scale landfill [liner] [cover]. Use equipment as specified in the sections referenced. Contact the geosynthetics manufacturers for recommendations on geosynthetics and soil placement equipment.

PART 3 EXECUTION

3.1 GENERAL

3.1.1 Location

****

NOTE: The location of the test fill along with plan and section views should be included on the drawings.

****

Construct the test fill at the location shown on the drawings. Make [photographs] [and] [videotape] during construction of each layer of the test fill to document construction techniques.

3.1.2 Size

****

NOTE: The test fill should be a minimum of 3 to 4 times wider than the compaction equipment proposed. The demonstration area should be long enough to allow construction equipment to achieve normal operating speed for a distance of 8 m 25 feet.
****

The top surface of the test fill must be a minimum of [30] [_____] meters [100] [_____] feet long and [22] [_____] meters [70] [_____] feet wide. Extend the random fill layer a minimum of [1.5] [_____] meters [5] [_____] feet beyond the edge of the upper surface of the test fill.

3.1.3 Slope

****
NOTE: In situations where compaction of soil on side slopes is a concern, the specified slope for the test fill should represent the steepest designed slope.
****

Place the completed slope of each layer in the test fill [_____] horizontal on 1 vertical.

3.2 PLACEMENT

****
NOTE: Benches and haul roads are other potential components of a landfill cover that can be modeled by a test fill. A good deal of construction activity is required to construct benches. This increased construction activity may result in damage to the underlying cover system. The movement of large vehicles on haul roads may also cause damage to the cover system.
****

3.2.1 Clearing and Grubbing

Clear and grub the area beneath the test fill and [3] [_____] meters [10] [_____] feet beyond the edges of the test fill in accordance with Section 31 11 00 CLEARING AND GRUBBING.

3.2.2 Subgrade Compaction

After clearing and grubbing, compact the existing landfill surface beneath the test fill and [3] [_____] meters [10] [_____] feet beyond the edges of the test fill as described in Section [31 00 00 EARTHWORK] [_____].

3.2.3 Drainage Controls

Before beginning construction, construct drainage controls around the test fill to protect it from erosion damage. Maintain drainage control until completion of the post-construction monitoring period.

3.2.4 Anchor Trench

****
NOTE: Anchor trenches are often not required for

the construction of a test fill. An anchor trench allows specific interfaces to be tested for interface stability. Delete this paragraph when an anchor trench will not be a component of the test fill.
****

Construct an anchor trench along the full width of the top edge of the test fill to anchor the [geomembrane,] [geosynthetic drainage layer,] [geotextile,] and [_____]. Provide anchor trench that is a minimum of [450] [_____] mm [18] [_____] inches wide and [600] [_____] mm [24] [_____] inches deep. Backfill and compact the anchor trench as specified in Section [31 00 00 EARTHWORK] [_____].

3.2.5 Test Fill Placement

Construct all components of the test fill as described in the specification sections previously referenced. Extend geosynthetics a minimum of [300] [_____] mm [12] [_____] inches beyond the edge of the overlying layer.

3.2.6 Survey Control Points

****
NOTE: Control points should be shown on plan and section views of the test fill. Permanent marks should be placed on each geosynthetic layer which will be surveyed.
****

Provide the location of survey control points as shown on the drawings. For soil layers, survey control points consist of 450 mm 18 inch steel pins. Install steel pins without damaging underlying geosynthetics. Place three straight rows of control points horizontally across the test fill. The rows must be parallel to the top and bottom edges of the test fill. Ensure each row consists of the following:

a. Steel pins placed outside of the test fill, [3] [_____] meters [10] [_____] feet away from each side.

b. Steel pins placed in the select fill layer, [3] [_____] meters [10] [_____] feet from the outside edge of the select fill layer on both sides of the test fill.

c. Permanent marks on the upper surface of each geosynthetic layer, on both sides of the test fill.

3.2.7 Permanent Bench Mark

Tie surveys to a permanent bench mark outside the boundaries of the landfill.

3.3 TESTS

Test each layer of the test fill as specified below. For random fill, clay barrier layer, and select fill layers, rapid methods may be used to perform moisture and density tests in accordance with ASTM D6938, or ASTM D4643. However, perform at least [1] [_____] density test per lift using the methods described in ASTM D1556/D1556M or ASTM D2167 and perform at least [1] [_____] moisture content test per lift using the methods described in

ASTM D2216.

3.3.1 Random Fill Tests

Perform a minimum of [2] [_____] sets of classification tests on each lift of random fill placed. Perform classification tests in accordance with ASTM D7928 and ASTM D4318. Perform a minimum of [5] [_____] density and [5] [_____] moisture content tests per lift.

3.3.2 Clay Barrier Layer Tests

****

NOTE: Sealed double ring infiltrometer (SDRI) tests can be used to determine the hydraulic conductivity of the clay barrier layer. However, SDRI tests are not commonly performed due to the cost and length of time required to complete the test. SDRI tests should not be performed on slopes greater than 3 percent. EPA/600/R-93/182 provides additional information on double ring infiltrometer tests.

****

The QC Inspector must inspect the clay barrier layer during construction to verify material and placement methods are acceptable. Take a minimum of [5] [_____], 75 mm 3 inch Shelby tube samples from the completed clay layer at locations directed by the QC inspector. Extrude and visually examine Shelby tube samples for signs of inadequate bonding between lifts. Perform a set of classification tests and a hydraulic conductivity test on each Shelby tube sample taken. Perform classification tests in accordance with ASTM D7928 and ASTM D4318. Perform hydraulic conductivity tests in accordance with ASTM D5084. Perform a minimum of [5] [_____] field density tests and [5] [_____] moisture content tests on each lift of clay placed.

3.3.3 Geosynthetics Tests

****

NOTE: Geomembrane seam tests are sometimes performed on test fills. If seam tests are going to be performed, requirements for seam types and locations should be specified. Vertical pipes are also sometimes placed in the test fill to simulate gas vents in the cover system. A geomembrane boot is then installed around the pipe. Delete this paragraph if geomembrane seam tests will not be performed.

****

Perform [3] [_____] sets of quality control and [3] [_____] sets of quality assurance shear and peel tests on geomembrane seams at approved locations. Perform nondestructive testing for leaks on all geomembrane seams. Perform seam tests as specified in Section 02 56 13.13 GEOMEMBRANE WASTE CONTAINMENT.

3.3.4 Granular Drainage Layer Tests

****

NOTE: Granular drainage layer material is normally not compacted for landfill applications. Therefore, density tests are typically not required for a

granular drainage layer.
****

Perform a minimum of [2] [_____] sets of classification tests on each lift of the granular drainage layer, in accordance with ASTM D7928.

3.3.5 Select Fill Tests

****
NOTE: The select fill layer placed above geosynthetic layers can be constructed using both method and performance specifications. Modify this paragraph if a method specification will be used. The first lift of soil placed immediately above a geosynthetic layer is generally placed with low ground pressure equipment. No density testing requirements are generally specified for this first lift.
****

Perform a minimum of [2] [_____] sets of classification tests on each lift of select fill placed. Perform classification tests in accordance with ASTM D7928 and ASTM D4318. Perform a minimum of [5] [_____] density and [5] [_____] moisture content tests per lift. Density testing is not required on the first lift of soil placed above a geosynthetic layer.

3.3.6 Surveys

Perform the following surveys to monitor horizontal and vertical movement of the test fill. Provide horizontal and vertical accuracy of the surveys to the nearest [0.003] [_____] meter [0.01] [_____] foot.

a. During construction, survey all installed control points immediately after each layer is placed.

b. During the post-construction monitoring period, survey all control points once every [7] [_____] days.

3.3.7 Post-Construction Monitoring

****
NOTE: The duration of post-construction monitoring depends on the site specific testing which will be performed. If the only purpose of the test fill is to demonstrate construction methods and monitor for damage to geosynthetics, no post-construction monitoring period is necessary. A 14 to 60 day monitoring period is typical if surveys to monitor for horizontal movement will be performed.
****

Monitor the test fill for [_____] days following construction. Inspect the test fill daily and report its condition in the Construction Quality Control Daily Reports. After every precipitation event, inspect the condition of the test fill.

3.3.8 Weekly Reports

Include test results and survey data related to test fill construction and post-construction monitoring during the previous 7 days in weekly reports. The QC inspector must certify that the weekly reports are accurate. The presentation of survey data for control point monitoring includes tables and graphs which present down-slope and vertical displacement. Update these tables and graphs weekly. Submit weekly reports within [3] [_____] days of the end of the week in which data was obtained.

3.3.9 Final Geosynthetics Inspection

After the post-construction monitoring period, remove [select fill] [and] [granular drainage layer material] from a [3] [_____] by [6] [_____] meter [10] [_____] by [20] [_____] foot area of the test fill at a location selected by the QC inspector. Remove soils from the geosynthetics without damaging and maintain their relative positions. Visually inspect each layer of geosynthetics and document areas of damage. At the QC inspector's discretion, examine additional areas of the test fill in a similar manner. [Photograph] [and] [video tape] the inspection operation.

3.3.10 Final Report

Include the following in the final report: construction and monitoring test results; final geosynthetic inspection data; and conclusions related to test fill construction and monitoring. The QC inspector must review the final report and certify its accuracy. Include a copy of the [photographs] [and] [videotape] of the test fill construction and monitoring. Submit final report within [7] [_____] days of the completion of the "Final Geosynthetics Inspection". Allow [7] [_____] days for review and approval of the final report.

3.4 APPROVAL

Do not begin full-scale construction until the Contracting Officer has approved the final report. The test fill will be rejected if the Contractor's placement methods result in damage to system components or there is down-slope movement of any of the test fill survey control points. If rejected, remove the test fill. Submit a new test fill construction plan and construct and monitor another test fill at no additional cost to the Government. Use only materials, methods, and equipment from the approved test fill for full-scale construction.

3.5 REMOVAL

****

NOTE: In some cases, the test fill may be incorporated into the final cover or liner. Connection requirements should be specified if this option is utilized.

****

After approval of the final post-construction monitoring report, remove the test fill. [Select fill] [and] [granular drainage] material may be salvaged for use during full scale construction unless otherwise directed by the Contracting Officer. If reused, stockpile and protect these materials from contamination. Remove and discard the clay layer, or use as random fill. Remove and discard geosynthetics .

NOTE: This guide specification covers the requirements for drinking water treatment via a point of entry treatment (POET) system.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

****

NOTE: This guide specification is intended to be used when chemical contaminants have impacted a small potable water system such as an individual residence or small building. The chemical contaminants that are the focus of this specification include synthetic organic contaminants, of which organic solvents and per- and polyfluoroalkyl substances (PFAS) are most prevalent in Department of Defense (DoD) environmental restoration work. Other common contaminants that are known to be successfully treated by the POET systems covered in this specification section include arsenic, nitrate/nitrite, and perchlorate. The

treatment methods that are the focus of this specification include granular media such as activated alumina, ion exchange resins, and granular activated carbon. Reverse osmosis POET systems are not considered due to the limited water production capabilities of these systems and the large volumes of reject water that reverse osmosis systems generate. For more information on application of POETs, readers should consult EPA 815-R-06-010, Point-of-Use or Point-of-Entry Treatment Options for Small Drinking Water Systems.

This specification section is intended to be used in a performance-based application where the same contractor is responsible for design, procurement, and installation of the POET system. The specification section would need to be modified if the Government has a specific POET system design that is to be installed.

This specification is not intended to be used for point-of-use (POU) treatment applications where water is treated at a single tap (typically a sink/faucet). POU treatment units generally cannot be installed on showers/bathtubs, hot-water lines to sinks, dishwashing machines, or toilets. Because of this, POU treatment units cannot address health risks for contaminants which present inhalation or contact exposure risks at untreated taps. Furthermore, design and installation of POU treatment units is much simpler than POET systems; selecting a POU treatment unit essentially involves picking a certified treatment unit that is rated for the contaminant concentrations, water flow rates/volumes, and pressures at the tap to be treated. Installation, operation, and maintenance of a POU treatment unit should be done in accordance with the unit manufacturer's instructions.

Federal and state regulations place certain requirements on public water systems that use POETs to comply with the Safe Drinking Water Act. For example, regulatory approved monitoring plans are required and mechanical warning systems must be in-place to automatically notify customers of operational problems. This guide specification section is not intended to produce a fully compliant POET system for use in a public water system as defined by state and/or federal regulations. This section would need to be revised on a case-by-case basis depending on the applicable state/federal regulations. The Safe Drinking Water Act defines public water systems for federal regulations (i.e. a system that serves at least 15 connections and/or 25 individuals - see 40 CFR 125.58 for a complete definition). States and local regulations may also define public water systems more strictly than federal regulations (for example the State of Washington defines any system serving more than a

single home as a public water system). See EPA 815-R-06-010, Point-of-Use or Point-of-Entry Treatment Options for Small Drinking Water Systems for further discussion on regulation of POET units in public water systems.

The POET system considered in this guide specification section receives contaminated water from a source such as a groundwater well, spring, or surface water. Energy to move the water from the source through the POET system is provided by a pump, elevated storage tank, pressure tank, etc. Once water passes through the POET system it may pass through other treatment processes such as water softening before ultimately entering the distribution piping. This specification is limited to the POET system treatment processes. This specification does not cover requirements for all elements of a drinking water system, such as the wells, water storage equipment, common treatment processes like pH neutralization or softening, distribution piping, etc. Also note that the specification requires the contractor to develop an Operation and Maintenance Manual, but does not require the contractor to perform operations and maintenance (O&M) past the initial commissioning of the system.

Section 43 31 13.13 10 ACTIVATED CARBON-GAS AND LIQUID PURIFICATION FILTERS and Section 46 61 00 FILTRATION EQUIPMENT may provide supplementary information useful to designers editing this section.

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Pre-Installation Meetings

****

NOTE: Pre-installation meetings (also known as

pre-design meetings) are highly encouraged prior to POET system installation because POET systems are often installed in locations where information about the water system and access to the water system is limited. A pre-installation meeting provides an opportunity to identify the location where the POET system components will be placed and discuss installation schedules and water outage durations. If any building modifications are needed to facilitate installation of the POET system, they can also be discussed during the pre-installation meeting.
****

Conduct one [_____] pre-installation meeting with the[Contracting Officer][and][Contractor][and][POET system installation subcontractor][and][resident][owner][_____] present. Discuss the following project elements during the Pre-Installation Meeting:

a. Proposed location of POET system components.

b. Any potential modifications to the building necessary to install the POET system.

c. Proposed schedule for installing the POET system including anticipated duration of water outage and how the [resident][owner] will be notified that they can resume use of the water system.

1.3 SUBMITTALS

****
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification

and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Installer Qualifications

Basis Of Design; G, [_____]

SD-06 Test Reports

Acceptance Test Report; G, [_____]

Inspection Report

SD-07 Certificates

Warranty

SD-10 Operation and Maintenance Data

Operation And Maintenance Manual; G, [_____]

SD-11 Closeout Submittals

Spare Parts

1.4 MAINTENANCE MATERIAL SUBMITTALS

1.4.1 Spare Parts

****

NOTE: The Designer should verify if requiring spare parts is allowed by the Government's contracting agency. Spare parts are generally not allowed. Reasons to consider requiring spare parts are if a POET system is connected to a critical water system that requires near continuous operation. Spare parts may include consumables such as particulate filter elements or ultraviolet lamps/sleeves, or unique/critical components such as treatment vessels or control heads. Specify the number of spare parts required.

****

a. Concurrent with delivery and installation of the POET system, furnish the following spare parts [_____].

b. Provide special tools if the POET system equipment manufacturers or vendors recommend any special tools necessary for adjustment, operation, maintenance, and disassembly of POET system equipment. Deliver special tools at the same time as the POET system equipment and hand over on completion of the work.

1.5 QUALITY CONTROL

1.5.1 Regulatory Requirements

****

NOTE: The Designer should be aware of state and local regulations regarding allowable equipment and components in POET systems. There are no federal regulatory requirements for private wells/water systems. Some states require the use of certified equipment and components, others do not. Because regulations change with time, Designers should verify if there are applicable regulations at the time of executing the project. For context, it is important to understand that the Safe Drinking Water Act (SDWA) does regulate POETs used in public water systems. The SDWA requires that public water systems use products certified to American National Standards Institute (ANSI) standards when such standards exist for POETs. Because of this precedent, this section requires use of products meeting ANSI standards.

Standards establish appropriate performance requirements for products and define means of testing products. The most prominent standards for water treatment and conveyance equipment used in POET systems are the National Sanitation Foundation (NSF)/ANSI standards. Certification is a process in which accredited, independent third-parties test products against standards. In the United States, ANSI accredits certification organizations. Some of the more well-known accredited certification organizations include NSF, UL, Water Quality Association (WQA), CSA Group, and International Association of Plumbing & Mechanical Officials (IAPMO). Designers and those executing projects should be aware that manufacturers may claim that their products meet standards without actually engaging an accredited organization to certify those products. Most certification organizations maintain lists of certified products; those lists should be consulted to verify if a product is in fact certified.

NSF/ANSI drinking water standards can generally be grouped into two categories. The first category of standards is meant to ensure that water treatment products do not impart undesirable or unacceptable qualities to the water being treated. This could occur if a product was constructed with hazardous chemicals that could leach from the product into water contacting the product. Standards in this category include NSF/ANSI/CAN 14, 372, 60, and 61. A product that is certified to only these standards

has no guarantee that it will reduce contaminants in water that it treats. The second category of standards focuses on treatment units that are meant to perform a function such as improve aesthetic qualities of water or reduce contaminants that create health effect issues. Products in these categories are typically rated at specific flow rates, pressures, and contaminant concentrations. Products in this second category are most often single-tap POU units as opposed to whole-home treatment units. Standards in this category include NSF/ANSI 42, 44, 53, 55, 58, and 62. Note that NSF/ANSI Standard 55 is for ultraviolet disinfection units that can be deployed as a component of a POET system.

****

Provide NSF/ANSI/CAN 61 certified products for all POET system equipment, components, and treatment media, unless a more-specific NSF/ANSI standard is specified for a product elsewhere in this section or other referenced sections.

1.5.2 Qualifications

****

NOTE: The Designer should edit the following subparagraphs to remove requirements not applicable to the project. Some requirements may be perceived as a burden for simple/small POET system installations, but the Designer should use caution when removing requirements for convenience. "Point-of-use/Point-of-entry for Drinking Water Treatment" by Lykins et.al. 1992 cited POET system installation failures caused by plumbers or water treatment dealers that had failed to read and follow instructions. Individual states may or may not require installers to be licensed and trained in water treatment when POET systems are being installed for private properties that are not associated with a public water system.

****

Submit Qualifications as required in the following subparagraphs.

1.5.2.1 Installer Qualifications

****

NOTE: The Designer should be aware of state and local regulations related to private water systems. As previously noted, there are no federal regulatory requirements for private wells/water systems. State regulatory requirements vary in their scope; some states regulate individuals and companies that engage in treatment of private water systems, other states do not. It is also important to understand that while all states have some form of well driller regulations, those regulations often do not address water treatment that occurs downstream of the well

and pump, so a state-licensed well driller or pump installer may not have training and experience relevant to installation of a POET system. Note that some private organizations such as the Water Quality Association certify water treatment installers. An option is provided in the following paragraph requiring the installer to be certified; this could be in addition to state certification, or standalone in the event the POET system is being installed in a state that does not certify for private water treatment.

****

Installers are required to have a minimum of [2][_____] years experience in the installation of a minimum of [5][_____] similar POET systems. Installers are required to demonstrate satisfactory operation for a period not less than one year for each POET system counted toward meeting this requirement.[Installer must be licensed by [_____] to perform the work required by this specification section.][Installer must be professionally certified to [perform water treatment installations][_____] by [_____].] Submit information demonstrating conformance with the qualification requirements.

1.5.3 Lab Validation

Perform testing by a DoD Environmental Laboratory Accreditation Program (DoD ELAP) accredited commercial testing laboratory in accordance with[Section 01 45 00 QUALITY CONTROL][_____] and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until the Contracting Officer approves use of the testing laboratory.

1.6 DELIVERY, STORAGE, AND HANDLING

Cover all equipment and component openings during delivery and storage to prevent entrance of dirt, water, or debris. During delivery and storage, protect all equipment, components, and materials from the weather (humidity and temperature), dirt and dust, and other contaminants. Follow manufacturer's requirements for protecting equipment, materials, and components during delivery and storage. Reject any packages or containers of treatment media which are not properly labeled with the following information:[name of the material][name of the manufacturer][lot number][manufacture or filling date].

1.7 [PROJECT][SITE] CONDITIONS

[1.7.1 Environmental Requirements

****

NOTE: The following paragraph can be deleted if the Contractor is not required to determine the location of the POET system (i.e. the Government dictates the location of the POET system). POET systems should be installed in locations that have adequate space for the components, are accessible (no confined space), are not prone to flooding or excessive moisture, have adequate lighting, and have electrical supply if needed. POET systems should not be installed in locations that have no protection against

below-freezing temperatures. In some situations, there may not be an acceptable location in the interior of an existing structure to install a POET system; in these situations POET systems have been installed in enclosures built specifically for the system. Constructing an enclosure for a POET system is beyond the scope of this specification section; generally speaking designers need to ensure that an enclosure is appropriately insulated against freezing; structurally sound against wind, snow, and other loads; equipped with electrical power (if needed); large enough for equipment maintenance; and protected against excessive humidity.

****

Do not install the POET system in a location that is prone to flooding, excessive humidity, or freezing temperatures. Confirm that there is adequate physical space to install the POET system and do not install the POET system in a confined space as defined by 29 CFR 1910.146. If a location meeting the requirements in this paragraph cannot be found, notify the Contracting Officer [within 48 hours][_____].

]1.7.2 Existing Conditions

****

NOTE: Pertinent water system information should be summarized in this paragraph, placed in an appendix of the specifications, and/or described on drawings. Indicate the detail to which water system information has been investigated and indicate where obvious data gaps exist. The table should be edited with site-specific primary contaminants of concern (COCs).

The water quality data that is needed to appropriately design a POET system will depend mainly on the specific POET treatment technology being deployed; other factors to consider include the water source (groundwater, surface water, spring, etc.) and contaminants to be treated. If necessary water quality information is not available, provisions should be made to collect the information prior to finalizing POET system design and install.

Water demand as represented by average daily flow may not be known because many small/individual water systems are often not metered and do not keep water use data. If water demand is not known, literature references can generally be used by the designer. For residences, per capita water use is often represented in the range of 380-660 liters per capita per day 100-175 gallons per capita per day. Typical uses for other non-residential settings are given in EPA 570/9-91-004, Manual of Individual and Non-Public Water Supply Systems. One specific consideration for POET systems regarding water demand is potable vs. non-potable use. Every effort should be made to understand if there are

significant non-potable uses such as landscape watering, livestock watering, etc. These non-potable uses can require significant volumes of water at high flow rates, resulting in poorer than expected POET system performance if they are not understood and accounted for. In some instances, organizational policy or risk-informed decision making may also prohibit treating water used for non-potable purposes. In this case, the POET system installation would need to include modifications to the water system plumbing to separate potable and non-potable water feeds prior to the POET system.

Instantaneous flow rates and system pressures are important to understand when designing a POET system. For most small systems, flow and pressure are provided by a well pump that supplies a pressure/expansion tank. POET systems create additional pressure loss that the pump/pressure tank must overcome (for example a dual-vessel granular activated carbon system designed for 30 lpm 8 gpm has a pressure loss of approximately 70-100 kpa 10-15 psi. If the available flow and water pressure prior to the POET system installation are close to minimum values required for the water system, this may constrain the POET system design or may lead to requiring a new well pump or pressure tank. In very rare instances, system pressures may be high enough to approach/exceed allowable pressures for commercially available POET system components (e.g. pressures greater than 550 kpa 80 psi). In this case, a pressure reducing valve may be necessary; paragraph SYSTEM PIPING AND VALVES includes an optional requirement for a pressure reducing valve. Minimum allowable water pressures will vary; water pressures should never be less than 140 kpa 20 psi for sanitary purposes, and certain fixtures such as flush valves may not operate correctly at less than 210 kpa 30 psi. Desired pressures are typically 275-550 kpa 40-80 psi. Typical values for pump capacity, pressure tank size, and pressure are provided in EPA 570/9-91-004. For individual residences, typical maximum flow rates depend on the number of water fixtures and occupants but may be between 20-40 lpm 6-10 gpm as a general range. Local water supply well contractors or university extensions may be contacted for further information. For estimates of maximum flows for other small water systems, consult USACE Engineering Manual 1110-2-503, Chapter 4.

****

The existing conditions of the water system are presented[in Appendix [_____]][and][on the drawings][and][in the specifications]. These include[well construction][pump sizing][[pressure][expansion] tank details][presence of ancillary water treatment components][physical area available for POET system components][electrical outlet availability and type][wastewater collection point availability and type].

Known water quality and quantity parameters are given in [Table 1] [_____]. The existing conditions presented are the result of site investigations at specific times; variations in the existing site conditions could occur. Perform an independent interpretation of the existing condition data. Notify the Contracting Officer within [48 hours][_____] if discrepancies between the data provided and actual field conditions are discovered.

Table 1 - KNOWN WATER QUALITY AND QUANTITY PARAMETERS

1.8 WARRANTY

****

NOTE: Modify the paragraph to only include the POET system components for which a warranty is desired and generally commercially available. Industry-standard warranty durations are likely to vary for the different POET system components, so a single duration may not be appropriate. Common warranty durations are: treatment vessels 5-10 years; control valves and vessel heads 3-5 years; UV system housings 10 years; UV system electrical 3 years; UV system bulbs, sleeves, sensors 1 year.

****

Provide a POET system with minimum warranties for the following components:

TABLE 2 - POET SYSTEM WARRANT COMPONENTS	
COMPONENT	WARRANTY DURATION
Treatment Vessel	[_____] Years
Treatment Vessel Control Head	[_____] Years
Particulate Filter Housing	[_____] Years
Ultraviolet System Housing	[_____] Years
Ultraviolet System Electrical Components	[_____] Years
Ultraviolet System Bulbs, Sleeves, Sensors	[_____] Years

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design Requirements

****

NOTE: Delete the first sentence if the Contractor will decide the type of treatment media/treatment process for the POET system.

****

[Provide an[activated carbon][ion-exchange][_____] POET system.]Design, construct, and install the POET system to comply with the design and performance requirements specified in this specification section. Supply auxiliary systems and equipment required to maintain a complete and workable POET system, including, but not limited to, piping between units, auxiliary equipment for plumbing and power, and controls and interfaces between auxiliary equipment and the POET system. Construct the POET system[in the location specified on drawings][in the location determined during the PRE-INSTALLATION MEETING][_____]. Additional design requirements for specific components of the POET system are specified in the following subparagraphs.

2.1.1.1 Treatment Media Replacement Frequency

****

NOTE: Treatment media replacement frequencies will vary depending on water use, contaminant concentrations, general water quality, and POET system design. Minimum treatment media replacement frequencies should consider how frequently O&M visits can be conducted, turnaround time on analytical sampling, etc. Very short replacement frequencies of 3-6 months should be avoided due to the operations and maintenance burden; very long replacement frequencies (>5 years) should also be avoided because treatment media can become solidified in vessels after very long periods and toward the end of a very long operating period, the treatment media may have little remaining treatment capacity to manage an unexpected increase in contaminant concentrations.

****

Provide a POET system with an estimated treatment media replacement frequency of at least [_____] months. The treatment media replacement frequency is estimated in accordance with paragraph BASIS OF DESIGN.

2.1.1.2 Treatment Vessels

****

NOTE: General best-practice for POET systems is to provide two treatment vessels that operate in series-configuration (also known as "lead-lag"). Each vessel is typically sized to individually meet the effluent criteria for the POET system, which creates treatment redundancy. Designers may consider adding a third treatment vessel; the third vessel provides a factor of safety that treatment requirements will be met while allowing the first two treatment vessels to be operated for longer duration (thus using more of the treatment capacity of the media in the first two treatment vessels). If using this approach, the primary considerations would be total system pressure loss and available space for multiple treatment vessels.

Backwash requirements should be carefully considered. It is common to frequently backwash the treatment media vessels in POET systems installed for purposes such as softening or general aesthetic treatment; however this type of frequent backwashing can be detrimental in POET systems designed to adsorb dissolved contaminants. Furthermore,

backwashing is not recommended at all for some kinds of treatment media such as IX resins manufactured for PFAS or perchlorate; the resin beads are all similarly sized so they can be randomly redistributed in the vessel after a backwash. Properly performed backwashes require careful control of the backwash flowrate and duration, which may not be possible from an automatic backwash system for a POET system. Improperly performed backwashes can randomly redistribute treatment media particles in the treatment vessel; treatment media particles which are saturated with contaminants and located at the top of the bed can be inadvertently moved to the bottom of the bed. If this occurs, contaminants can desorb out of the treatment media into the treated water.

The Designer should confirm that an upflow configuration is appropriate for the site before specifying this configuration. A primary concern with upflow applications for trace contaminant removal is the possibility of re-sorting the treatment media in the vessel if actual flow rates periodically exceed flow rates that fluidize the treatment media. This can lead to a random redistribution of the treatment media as described in the paragraph above. This potential for re-sorting can be avoided by creating a packed bed configuration either by eliminating head-space in the vessel or adding something to confine the treatment media in-place. Such a design would need to be reviewed with POET system component vendors.

****

Provide [2][_____] treatment vessels designed to operate in [downflow][upflow] mode. When multiple treatment vessels are provided, the system must operate in [series][parallel][series or parallel] configuration[and each vessel must be designed to individually meet the contaminant reductions in accordance with paragraph PERFORMANCE REQUIREMENTS].[Provide a system capable of[manual][automatic flow-based][automatic time-based][_____] backwash].

2.1.1.3 System Piping and Valves

****

NOTE: Installing piping for complete bypass of the POET system is recommended during POET system install; in the event that the POET system needs to be bypassed in the future (either temporarily or permanently), the bypass would be available, and the Government would not need to hastily move to install the bypass. The final sentence of this paragraph provides an option to divert untreated water supply to location(s) where the Government does not intend to receive treated water, such as landscape watering, livestock watering, hose bibbs, yard hydrants, agricultural water use, or other non-potable uses.

****

Provide piping and valves to completely bypass the POET system.[Provide piping and valves to individually isolate the POET system[treatment vessels][particulate filter(s)][disinfection unit]].[Provide piping and valves to divert the water delivered to [_____] such that this water does not pass through the POET system.][Provide pressure reducing valves as necessary to reduce system pressures to within acceptable limits of POET system components.]

2.1.1.4 Particulate Filter

****

NOTE: Particulate filters remove dirt, sediment, and debris that can otherwise become trapped in a treatment vessel and lead to poor performance. Particulate filters can also reduce or eliminate clogging in the treatment vessels, making backwashing un-necessary. Particulate filters located upstream of the treatment vessels are encouraged for POET systems. Less commonly, particulate filters are also placed downstream of treatment vessels if there is sensitive equipment such as a disinfection unit located further downstream or if there is concern about loss of fine particulates from the treatment vessels.

****

Provide a particulate filter [before][and][after] the treatment vessels.

2.1.1.5 Disinfection Unit

****

NOTE: This paragraph assumes that a chlorine residual is not required for disinfection due to any state or local regulations (refer to the Part 1 Designer's Note for more discussion about regulations of POETs in Public Water Systems). The need to provide continuous disinfection of the water treated by a POET system is a topic that has been extensively considered. See "Point-of-use/Point-of-entry for Drinking Water Treatment", 1992, by Lykins, Clark, and Goodrich for further discussion. It is generally understood that POET systems can provide a growth medium for naturally present bacteria. Heterotrophic plate count (HPC) monitoring typically shows an increase in colonies in water treated by POET systems. The Safe Drinking Water Act states "The design and application of the POE device must consider the tendency for increase in heterotrophic bacteria concentrations in water treated with activated carbon. It may be necessary to use frequent backwashing, post contactor disinfection, and heterotrophic plate count (HPC) monitoring to ensure that the microbiological safety of the water is not compromised."

Ultraviolet (UV) light disinfection units are a relatively common component of POET systems.

Popularity of UV systems can be attributed to their relative simplicity compared to disinfection processes which involve chemical dosing. UV systems for POU/POET applications are also the only type of disinfection with an associated NSF/ANSI standard.

Generally speaking, the decision to provide disinfection does not rely upon water quality analysis of the source water. The reason for providing disinfection in a POET system should generally not be to treat source water that is known or suspected to be microbiologically unsafe. NSF/ANSI 330 provides a four-part definition of "microbiologically unsafe" waters. Although there are NSF/ANSI 55-certified UV disinfection units designed to treat microbiologically unsafe waters, the opportunity for growth of microbiological agents in the POET system components prior to the disinfection unit would be high. If a source water is known or suspected to be microbiologically unsafe, the preferred course of action is to find an alternative water source.

****

Provide an ultraviolet disinfection unit as the final water treatment component of the POET system.

2.1.1.6 Basis of Design

****

NOTE: An optional requirement is included in Item a. for the Contractor to determine a design maximum flowrate for the treatment system. Delete this requirement if the Government has sufficient information to specify a design maximum flowrate (which would be done in Paragraph PERFORMANCE REQUIREMENTS).

****

Submit a Basis of Design document no less than [60][_____] calendar days before the anticipated POET system installation date.[Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the Basis of Design.] Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review].[Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.] The Basis of Design must include, but is not limited to, the following:

a. Concept of Operation - Explain how the proposed POET system will operate and how each component will contribute to providing water treatment to meet the requirement of this specification section.[Identify a design maximum flowrate for the system and average daily consumption rate.][Provide estimates of replacement frequency for treatment media based on vendor information, performance of similar POET systems, or estimation methods in [textbooks][peer-reviewed] articles.]

b. Process & Instrumentation Diagram - Show all major components with controls, valves, and instrumentation for measuring [pressure][temperature][flow]. Identify connections to existing plumbing and any modifications that will alter how water is distributed to users.

c. POET System Layout Plan - Show proposed layout and anchorage of components; component relationship to other parts of the work; physical clearances for access to perform maintenance and operation.

d. Product Data - Provide manufacturer or vendor-created documents for all equipment, components, and material. Demonstrate that the proposed products meet the requirements of this specification section.

e. Building Modifications - Identify all building modifications necessary to install the POET system.

f. Installation and Commissioning Plan - Provide a schedule indicating anticipated duration of water system unavailability and overall installation and commissioning times. Identify all labor disciplines that will be involved in installation and commissioning.

g. O&M Consideration - Provide a basic consideration for how major O&M activities would be performed.

h. System Information Sheet - Develop a system information sheet that is no more than [2][_____] pages. Explain in plain language the purpose and function of the POET system, what O&M the Government will perform, any conditions which indicate an issue that should be reported to the Government, how the [resident][owner] can contact the Government[and the Government's designated O&M contractor] with any questions or problems, any actions to be taken if the POET system is unused for an extended period of time, and what O&M the [resident][owner] is authorized to perform.

2.1.1.7 Uniform Federal Policy Quality Assurance Project Plan

****

NOTE: This section may reference a separate specification section requiring preparation of a quality assurance project plan or may be excluded entirely if the requirements are part of another specification section.

****

Prepare a Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) in accordance with the requirements set forth in EPA 505-B-04-900A and using the 2012 optimized UFP-QAPP worksheets (UFP-QAPP WKSTS). Submit the UFP-QAPP within [60][_____] calendar days before the anticipated POET system installation date. Do not perform work at the site, with the exception of site inspection and surveys, until the UFP-QAPP is approved.[Prepare[draft for Government review][draft-final for [regulatory][_____] review] and final versions of the UFP-QAPP.] Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review].[Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.] Tailor the content to the requirements of the project and the site conditions.

2.1.2 Performance Requirements

****

NOTE: This paragraph should be edited to identify the effluent requirements for the COCs, which are generally dictated by regulatory requirements. The performance requirement includes an option provision for specifying the design maximum flowrate (if the Government does not require the Contractor to do this as part of the Basis of Design). Design maximum flowrate should be specified based on a combination of the actual maximum flow for the water system prior to POET system installation as well as the theoretical maximum flow based on literature references (see Designer's Note in paragraph EXISTING CONDITIONS). For example consider a residence with a current maximum flow of 20 lpm 5 gpm (limited by the current well pump capacity), but enough plumbing fixtures to theoretically need 40 lpm 10 gpm. In this case it would be prudent to specify the design maximum flow at 40 lpm 10 gpm in the event that the well pump is upsized in the future.

POET systems can in some circumstances cause unacceptable or undesirable water quality for parameters other than the COCs, so this paragraph should be edited to identify effluent requirements for non-COCs. Some of the most common occurrences of POETs creating unacceptable water quality include: 1) treatment media may contain residual contaminants from the manufacturing process which need to be adequately flushed-out before placing the POET system in-service (for example granular activated carbon is known to leach arsenic upon startup); 2) POET systems may introduce microbiological contamination during installation or provide a growth medium for microbiological contamination during operation; 3) bacteria can colonize a POET system and convert nitrate into the more toxic nitrite.

The Table reflects the recommended approach that for POET systems with multiple treatment vessels, COCs are reduced to the Performance Criteria in the effluent for each treatment vessel. For Water Quality parameters and flow characteristics, Performance Criteria only need to be met in the POET system effluent.

****

Provide a POET system capable of producing treated water meeting the performance criteria specified in Table 3[for a design maximum flowrate of [_____] lpm [_____] gpm].

TABLE 3 - POET SYSTEM PERFORMANCE CRITERIA		
PARAMETER	PERFORMANCE CRITERIA	LOCATION(S) WHERE PERFORMANCE CRITERIA APPLY
PRIMARY COCS		
[_____]	[_____]	[Effluent of Each Treatment Vessel] [and] [POET System Effluent]
Water Quality Parameters		
Total Dissolved Solids	[500] [_____] mg/L	[POET System Effluent] [_____]
Total Coliform	[0 colonies/ 100 mL][_____]	[POET System Effluent] [_____]
Heterotrophic Plate Count	[500] CFU/mL	[POET System Effluent] [_____]
Nitrate	[10] [_____] mg/L	[POET System Effluent] [_____]
Nitrite	[1] [_____] mg/L	[POET System Effluent] [_____]
pH	[6.5 - 8.5 S.U.] [_____]	[POET System Effluent] [_____]
Iron	[0.3] [_____] mg/L	[POET System Effluent] [_____]
Manganese	[0.05] [_____] mg/L	[POET System Effluent] [_____]
Flow Characteristics		
Total Pressure Loss (clean bed)	< [100] [_____] kpa [15] [_____] psi at flowrate of [15] [_____] lpm [4] [_____] gpm	[POET System Effluent] [_____]

2.2 EQUIPMENT

Provide equipment that is the standard product of a manufacturer regularly engaged in the manufacture of such products. Standard products are those products which have been in satisfactory commercial or industrial use for [2][_____] years prior to bid opening, include applications of equipment and materials under similar circumstances and of similar size, and have been for sale on the commercial market through advertisements, manufacturers' catalogs (digital or print), or brochures during the [2][_____] year period. Provide nameplates for each of the following items of equipment [_____]. Provide the following information on each nameplate: manufacturer's name, manufacturer's address, product name, and model or serial number. Secure each nameplate to the item of equipment.

2.2.1 Treatment Vessels

****

NOTE: Items a - d are standard requirements. Item c. sets the minimum height of the tank necessary to allow the treatment media to vertically expand during the initial sorting backwash; 50% is a conservative value for most treatment media, but this value can be reduced (or eliminated) in certain circumstances based on manufacturer recommendations for the specific type of treatment media. To avoid inadvertent exclusion of products which would otherwise meet all other requirements in this section, no requirement is given for vessel materials of construction; however the Designer can add a requirement on a project-specific basis if desired.

Items e. and f. provide options to specify the minimum size of the treatment vessels and how much treatment media is installed. Specifying these items may restrict the freedom of the contractor to meet performance requirements through whatever means they deem sufficient; however, specifying minimum requirements can protect the Government from the possibility of a contractor installing a treatment system that fails to meet performance requirements or requires frequent maintenance (that is, a "small" POET system may meet performance requirements during the initial sampling event but will likely require more frequent treatment media replacements).

For Item e. typical empty bed contact times for larger-scale treatment systems (not POETS) and various contaminants are provided below. It is common in the POET industry to provide lower empty bed contact times for GAC; for example EBCTs of 2-4 minutes are common for GAC treatment applications of PFAS and VOCs. Certain vendors and consultants claim that lower EBCTs are justified because flow in POET systems is often not continuous, so water effectively has a longer residence time than what can be calculated using the maximum system flow rate. Benefits of providing larger EBCTs include reduced treatment media change-out frequency and smaller pressure losses due to lower hydraulic loading rates. A concern with providing very large EBCTs is that when POET system flows are significantly lower than design/maximum, flows may not evenly distribute through the media and "channel" as described in item f. below.

	GAC - EMPTY BED CONTACT TIME (MIN)	**IX RESIN - EMPTY BED CONTACT TIME (MIN)**	**ACTIVATED ALUMINA / GRANULAR FERRIC HYDROXIDE / SPECIALTY IRON-BASED - - EMPTY BED CONTACT TIME (MIN)**
PFAS	**10**	**1.5-2.5**	**N.A.**
VOCs	**5-7**	**N.A.**	**N.A.**
Chlorine	**2**	**N.A.**	**N.A.**
Perchlorate	**N.A.**	**1.5-2.5**	**N.A.**
Arsenic	**N.A.**	**2-5**	**7.5-10**
Radon	**5**	**N.A.**	**N.A.**

For Item f. hydraulic loading rates should generally not be higher or lower than what is recommended by media manufacturers because at low and high loading rates flow can "channel" through the media leading to reduced performance. For GAC, hydraulic loading rates are typically 0.14-0.68 cm/sec 2-10 gpm/ft2; for IX resin hydraulic loading rates are typically 0.42-1.25 cm/sec 6-18 gpm/ft2.

****

Provide treatment vessels meeting the following requirements:

a. Maximum operating pressure at least [850][_____] kpa [120][_____] psi

b. Maximum operating temperature at least [40][_____] degrees C [100][_____] degrees F

c. Minimum sidewall height large enough for [50 percent][_____] treatment media bed depth expansion during backwash

d. Supported in an upright position with a leveling stand of approved construction[and lateral support strap or adjustable clamp fixed to a structural member located in proximity to the vessel].

e. Minimum empty bed contact time: [_____] minutes

f. Hydraulic loading rate between [_____] - [_____] lpm gpm

2.2.2 Treatment Vessel Control Heads

Provide treatment vessel control heads that are compatible with the treatment vessels and meet or exceed the design maximum flowrate and maximum operating temperatures and pressures required for the treatment vessels.[Provide treatment vessel control heads with integrated bypass valves that allow for the vessel to by bypassed.][Provide treatment vessel control heads that are capable of [automatic][manual] backwash.]

2.2.3 Pipe and Fittings

****

NOTE: The type of pipe and fittings that is allowed or required will be as determined by local experience. UFGS Section 22 00 00 PLUMBING, GENERAL PURPOSE indicates preference for material in the following order: copper, galvanized steel, polyethylene pipe, polypropylene, and PVC. An option is given to specify the pipe and fitting material either by reference to Section 22 00 00 PLUMBING, GENERAL PURPOSE or by specifying directly in this section.

****

Provide pipe and fittings with internal diameters no smaller than the internal diameter of the existing plumbing system that the POET system is being installed into.[Provide pipe and fitting material in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.][Pipe and fitting material must be [_____] and must conform to the standard identified for the material in [ICC IPC][_____].]

2.2.4 Valves and Appurtenances

[Provide valves in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.][Provide valves constructed from [_____]. Valves must conform to the standard identified for the material in [ICC IPC][_____].] Provide [locks][and][tamper indication] for any valve which can create a bypass of the POET system, either in part or in whole.

2.2.5 Pressure Gauges

Place sufficient pressure gauges to measure pressure before and after each particulate filter and treatment vessel. Provide pressure gauges with a scale range of 0 to [700][_____] kpa [100][_____] psi. Provide pressure gauges in accordance with [ASME B40.100][_____].

2.2.6 Flow Meter

Place [1][_____] totalizing flow meter. Provide totalizing flow meter[s] in accordance with[Section 22 00 00 PLUMBING, GENERAL PURPOSE][AWWA C700 or AWWA C710]. Provide totalizing flow meters sized for the design maximum flowrate. Provide totalizing flow meters reading in [Cubic Meters][Cubic Feet][US Gallons].

2.2.7 Particulate Filter Housing

Provide a particulate filter housing that meets or exceeds the design maximum flowrate and maximum operating temperatures and pressures required for the treatment vessels. Provide a particulate filter housing that uses replaceable filter media consisting of either bags or cartridges. Provide a particulate filter housing that is compatible with the material selected for the piping and fittings, constructed of stainless steel or plastic, and built with a manually operated pressure relief valve. Provide a particulate filter housing with a maximum empty housing pressure loss of [_____] kpa psi at [_____] lpm gpm as certified by the [manufacturer][vendor].

2.2.8 Sample Ports

Place sample ports at the influent, between treatment vessels, and effluent [; place additional sample ports [_____]]. Provide sample ports comprised of pipe fittings, pipe, and [ball][gate][_____] valves which comply with material, temperature, and pressure requirements of the associated piping system as specified in this Section.[Provide a tethered dust cap for each sample port.]

2.2.9 Air Gap Fitting

****

NOTE: Delete this paragraph if the POET system will not include any drain lines. Whenever a drain line is connected to a POET system there is a risk of backsiphoning contaminated wastewater into the POET system. To prevent this from occurring, the drain line should be installed with an air gap. Air gaps can consist of either physical separation between a drain line and the wastewater receiving point or an in-line air gap device. Typical minimum air gap requirements are double the effective opening of the pipe. An air gap fitting is a device with an internal air gap which physically connects a drain line to a wastewater receiving point. An alternative to requiring an air gap fitting is to just require that the drain line is installed with a sufficient air gap in accordance with ASME A112.1.2. The benefit of requiring an air gap fitting is that the discharge line and receiving line are physically connected, ensuring that discharge water goes into the intended location.

****

For all drain lines connected to the POET system, provide an air gap fitting in accordance with[Section 22 00 00 PLUMBING, GENERAL PURPOSE][ASME A112.1.3].

2.2.10 Ultraviolet Disinfection Unit

Provide an ultraviolet disinfection unit certified to NSF/ANSI 55 and rated for the design maximum flowrate and maximum operating temperatures and pressures required for the treatment vessels. Provide an ultraviolet disinfection unit designed to operate with [120V-60Hz AC current][_____]. Provide all appurtenant wiring, controls, and piping necessary to provide function of the unit in accordance with manufacturer recommendations.

2.2.11 Flow Regulator

****

NOTE: System flows may need to be regulated to ensure that the POET system components function as intended. Excessive flowrates can lead to short residence times and poor performance of primary treatment units and disinfection units. Note that flow regulators/restrictors are required for NSF-certified ultraviolet disinfection systems.

Installing a flow regulator may be prudent even if the water system current maximum flowrate does not exceed the maximum flowrate of any POET system component. If a new pump/pressure tank with higher flowrate were added after installing the POET system, the flow regulator would already be in-place.

****

Provide a flow regulator rated at the smallest of the maximum flowrates for the POET system components. Place the flow regulator downstream of all other POET system components.

2.3 MATERIALS

2.3.1 Treatment Media

****

NOTE: The minimum requirement for any treatment media is that it will not introduce contaminants into the treated water at levels that could cause negative health effects. The NSF/ANSI 61 standard included in the paragraph below is the most widely used standard for this requirement. Only virgin treatment media should be used; regenerated/reactivated treatment media should not be used.

This paragraph should be edited to include additional treatment media requirements on a site-specific basis. Specific types of treatment media (e.g. coconut-shell based GAC, microporous IX resin, etc.) should only be required if site-specific information supports the requirement (for example if a treatability study has been completed). Note that specifying additional requirements on the type of treatment media restricts the freedom of the Contractor to meet Performance Requirements as they see fit.

For GAC, one more common requirement would be to specify that the GAC is acid-washed, a manufacturing process that removes some amount of ash/residual impurities from the GAC. Acid-washed GAC can require less flushing during installation compared to GAC that has not been acid-washed. Ion exchange resins can also impact initial water quality, but with different chemical impacts than GAC. For example, ion exchange resins can significantly lower the pH, raise chloride levels, and decrease sulfate levels. Although this is a transient condition, the Designer may wish to specify buffered ion exchange resins, which require less water to be flushed through them before effluent water reaches equilibrium with influent water. An optional requirement to this effect is provided.

****

Provide virgin treatment media.[Provide treatment media that is pre-conditioned to reduce the amount of on-site [flushing][soaking] needed prior to use (e.g. acid washed, buffered, or as appropriate for the specific treatment media).]

2.3.2 Particulate Filter Media

****

NOTE: This paragraph can be deleted if design of the particulate filter will be by the Contractor. Determining the appropriate particle size for a particulate filter can involve a variety of factors. Local well drillers or water treatment vendors can be an information resource for the Designer. Particle size distribution analysis (e.g. by Standard Method 2560) can also be performed on the water to be treated. In general, the Designer should avoid being overly conservative and selecting the smallest particle size available; the University of Nebraska - Lincoln Institute of Agriculture and Natural Resources Sediment Filtration NebGuide G1492 indicates that "If the pore size of the filter medium is too small or if the concentration of suspended solids in the water is too high, the filter may easily clog and require frequent replacement. In general, the largest rating size that will remove the intended contaminants will require the least maintenance."

The downstream components of the POET system that are being "protected" by the particulate filter may provide requirements for sizing the particulate filter. For example, an ion exchange resin vendor recommends a 5-micron filter in front of it's single-use PFAS-selective resin. Ultraviolet disinfection unit manufacturers also recommend or require particulate filters (typically in the 5-20 micron range). If source water is known or suspected to contain particles in a variety of sizes, options for particulate filtration can include installing two particulate filters in series (e.g. a 50-micron filter followed by a 10-micron filter) or specifying a depth-type filter which has graded opening sizes that decrease in size moving from the outside to the central core.

****

Provide filter material consisting of [acetate][acrylic][glass][nylon][polyester][polypropylene][rayon][saran][cotton][polyethylene][_____] construction. Provide filter pore size of: [0.1][0.2][0.45][1][3][10][30][50][75][100][200][_____] microns.

[2.3.3 Support Media

****

NOTE: This paragraph should only be retained if the treatment vessels will use a gravel support media. Many treatment vessels use man-made collection systems that do not require support media.

****

Provide support gravel consisting of hard, rounded stones with a specific gravity of not less than[2.5 for silica gravel or 3.8 for high-density gravel][_____]. Ensure no more than [5][_____] percent by weight has a specific gravity less than required. Ensure gravel contains no more than [2][_____] percent by weight of thin, flat, or elongated pieces (pieces in which the larges dimension exceeds three times the smallest dimension), and is free from shale, mica, clay, sand, loam, and organic impurities of any kind.

]PART 3 EXECUTION

3.1 EXAMINATION

****

NOTE: Water will be offline for some amount of time during initial installation. The amount of time that the water system is offline can range from several hours to several days. Water system users should be notified prior to performing work, and provisions should be made for either providing alternate water or temporarily vacating the facility.

****

Verify all dimensions in the field; verify there is adequate physical space to place the POET system components and connect to existing water system plumbing without making unplanned building modifications.[Verify that electrical power for the POET system operation is available.][Verify that access to a wastewater discharge location is available.][Verify that any provisions for water shut-off (e.g. providing bottled water, temporarily vacating premises) are in place.] Notify the Contracting Officer of any discrepancies between the provided data and field conditions before performing the work.

3.2 PREPARATION

3.2.1 Surface Preparation

****

NOTE: In some instances, more extensive surface preparation may be necessary to ensure that an adequate area is provided for the POET system components. This may include leveling a floor, building a stand/pedestal, or other site-specific modifications. To the extent possible, necessary modifications should be identified during the PRE-INSTALLATION MEETING. Refer to another specification section (e.g. 03 30 00 CAST-IN-PLACE CONCRETE if installing a new concrete pad) for extensive preparation/modification activities.

****

Relocate any movable materials blocking access to the location where the POET system components will be installed. Coordinate with the [Contracting Officer][property owner][_____] prior to relocating materials, temporarily disassembling items, or otherwise modifying the structure to provide access for installing the POET system. Provide a clean and clear surface for placing the POET system components by sweeping, shoveling, or otherwise removing any debris.

3.2.2 Temporary Water

Provide temporary water supply consisting of[bottled water][potable water tanks][_____] whenever the POET system installation will result in the water system being unavailable for greater than [_____] hours.

3.3 INSTALLATION

Maintain sanitary conditions when working on water-contacting components of the POET system; clean all tools and materials used during installation to avoid introducing any contaminants into the POET system. Install equipment in accordance with written instructions of the manufacturer and the Government-approved Basis of Design. The following sub-paragraphs provide minimum installation requirements; notify the Contracting Officer of any conflicts between this specification and manufacturer instructions.

3.3.1 Treatment Vessel Installation

****

NOTE: This paragraph includes a provision for securing the treatment vessel(s) to a structural support member. This is not common in industry, but is considered an inexpensive and easy to implement best practice against damage to the POET system due to tipping/movement of the vessels because of either incidental contact by persons or hazardous seismic activity.

****

Place treatment vessels[in the location specified in paragraph DESIGN REQUIREMENTS]. Ensure that the treatment vessels are level after placement.[Secure the treatment vessels to a structural support member using a [mounting][restraint] system which includes manufacturer instructions indicating acceptable methods for making connections to the structural support member and allowable loads. Follow manufacturer instructions. The [mounting][restraint] system must not exert pressure on the treatment vessel or be fastened to the vessel using screws, nails, bolts, etc. unless approved by the vessel manufacturer.]

3.3.2 Pipes, Valves, Fittings, Appurtenances Installation

Install piping, valves, fittings, and appurtenances in a neat manner with all joints tight and with no undue marring of finishes. Ensure that installed piping, valves, fittings, and appurtenances are free from strain and excessive stresses caused by weight or misalignment. Install in accordance with[Section 22 00 00 PLUMBING, GENERAL PURPOSE][_____].

3.3.3 Particulate Filter Installation

Install the particulate filter[s][upstream][and][downstream] of the primary treatment vessel[s]. Mount the particulate filter[s] in accordance with manufacturer written instructions and using manufacturer [provided][approved] mounting hardware.

3.3.4 Disinfection Unit Installation

Install the disinfection unit in accordance with manufacturer written instructions.

3.3.5 Drain Line Installation

Install the drain line connecting the treatment vessel[s] to the wastewater drain location. Provide an air gap in accordance with[local plumbing code][ASME A112.1.2][_____].

3.3.6 Electrical Work

[Connect electrically-powered POET system components to existing electrical outlets that meet the POET system component manufacturer requirements. Connect only to electrical outlets which have integral ground fault circuit interrupter protection and are UL-listed for use in "wet locations".][Install electrical outlets to provide power to POET system components. Perform electrical work in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.]

3.3.7 Disinfection of Equipment and Components

****

NOTE: The disinfection procedure specified in International Plumbing Code essentially involves filling the water system with a water/chlorine solution, allowing that solution to stand for a period of time, and flushing until the chlorine is purged. This procedure cannot be completed after activated carbon or certain ion exchange resins have been installed in treatment vessels because the activated carbon will neutralize the chlorine and not allow it to enter downstream components; IX resin can be damaged when exposed to chlorine.

****

After all equipment and components are installed and before treatment media is installed, purge and disinfect the water system per[the procedure specified in ICC IPC][_____]. If treatment media is installed in the treatment vessels off-site in accordance with paragraph TREATMENT MEDIA INSTALLATION, perform the disinfection procedure on the treatment vessels prior to installing the treatment media. Then complete disinfection of the water system by bypassing the treatment vessels and following the purging and disinfection procedure specified above.

3.3.8 Treatment Media Installation

****

NOTE: Designers should consider requiring the Contractor to install and condition treatment media off-site in a controlled setting such as a shop. The reasons to install and condition treatment media off-site include 1) ensuring that there is an adequate supply of water to install/condition the media and 2) minimizing disruptions to the owners/tenants that will use the POET system. Reasons to avoid installing and conditioning the treatment media off-site generally are limited to logistical challenges (e.g. the filled treatment vessels would be too heavy/difficult to handle, treatment media is being installed in a vessel that is already in-place, the POET system is being

installed in a very remote location and there is no off-site facility within reasonable distance).

The amount of water needed to install and commission treatment media will depend on a variety of factors. A POET system with 0.1 cubic meters 4 cubic feet of GAC media treating water for a single household could require as much as 5,700-11,400 liters 1,500-3,000 gallons of water for initial flushing. Many water sources such as small residential-type wells have difficulty producing this volume of water in a short time. This flushing water also must be disposed, which can create issues if the discharge is going to a septic system/drainfield with limited capacity. On-site installation and conditioning of treatment media also necessitates using the contaminated/impacted water that the POET system is intended to treat, which may not be ideal in all circumstances.

Certain POET system treatment media types also require wetting. GAC media needs to be wetted to purge air from the pores for as much as 24 hours or more. If installing the media on-site this may add another day to the installation process, burdening the resident/tenant. Some designers may also wish to conduct initial sampling of installed treatment media to verify that chemicals are not leaching from the media at unacceptable levels; this can also extend the installation period and cause disruptions.

****

Install treatment media[off-site at a location with adequate water supply and wastewater handling facilities to complete the work described in the following sub-paragraphs][on-site at the location the POET system will serve].

3.3.8.1 Treatment Media Placement

****

NOTE: Specify the quantity of treatment media only if using a prescriptive design approach. If treatment media quantities and freeboard are specified, coordinate with Paragraph TREATMENT VESSELS to ensure that requirements do not conflict. If design of the POET system is performance based, use the less prescriptive text that refers to the design and performance requirements.

****

Place treatment media[in accordance with vessel [and][or] treatment media manufacturer directions]. Store and handle the treatment media in a manner that avoids contamination. Clean and disinfect any equipment used in placing the treatment media. Leave a freeboard of [_____] m ft between the top of the treatment media and the top of the vessel. Gently vibrate the vessel periodically to ensure the treatment media settles without voids or bridging.[Place sufficient quantities of treatment media in accordance with paragraph DESIGN REQUIREMENTS and paragraph PERFORMANCE REQUIREMENTS.][Place treatment media to the quantities specified in the following table:

TABLE 4 - TREATMENT MEDIA PLACEMENT QUANTITIES	
Media Type	Quantity
[_____]	[_____]

]

3.3.8.2   Treatment Media Conditioning

****

NOTE: Specific steps for treatment media conditioning will vary based on the type of treatment media being used. However, there are general concepts of conditioning that apply to most granular treatment media.

Adequate contaminant removal by granular treatment media requires uniform flow through the media bed. Uniform flow can be disrupted in several ways. If gases are trapped in the treatment media, this will block some pathways for water flow, increasing the flow rates in the remaining pathways and effectively decreasing the residence time for contaminated water. Gases are removed during conditioning by wetting the treatment media; water soaks into the treatment media and displaces the gases that occupied the pore structure of the media. The 16 hour recommendation is based on a POET system using GAC; shorter timeframes may be used for other treatment media like IX resin depending on manufacturer recommendations.

Most treatment media consist of particles of varying size; to function best, the treatment media needs to be properly sorted by size in the vessel. Treatment media can become improperly sorted during shipment, handling, and placement treatment. An improperly sorted treatment media bed is more likely to have regions of excessively high or low flow, effectively decreasing the residence time for contaminated water. After treatment media is placed into a vessel, this improper sorting process is remedied by performing a sorting backwash. During a sorting backwash, water flows upward through the treatment media at a sufficient rate to suspend the treatment media particles in the flowing water (a process called fluidizing). The various treatment media particles are evenly sorted by size with smaller particles moving to the top of the bed and larger particles to the bottom. Sorting backwashes require water flow at a sufficient rate and time. Treatment media manufacturers will supply appropriate values, but for reference GAC media backwash flow rates are typically 0.2-0.54 cm/sec 3-8 gpm/square foot and times are 30-45 minutes. IX resin flows are typically 0.1-0.2 cm/sec 1.5-3.0 gpm/square foot and times are 15-20 minutes. The treatment vessel must also

have sufficient freeboard to allow the media to expand (typically 30 percent of bed height for GAC and 50-100 percent of bed height for resin). It should be noted that some IX resins do not require backwash during commissioning (e.g. IX resins for treating PFAS or perchlorate). Equally important, these types of IX resin should not be backwashed once they are placed in service.

All treatment medias should be assumed to have an initial equilibration period during which time the treatment media can impart undesirable or unacceptable qualities to the treated water. These undesirable/unacceptable qualities can be aesthetic (taste, odor, color) or chemical quality (leaching of specific chemicals at concentrations above regulatory standards). One of the most common occurrences is leaching of arsenic from GAC treatment media during conditioning. It is important to understand that these water quality impacts should be temporary and non-recurring if the treatment media has been properly selected, manufactured, and handled. Treatment media can also temporarily alter the chemistry of treated water, such as the change in pH that can temporarily occur with IX resins. Proper conditioning involves flushing a sufficient volume of water through the treatment media to waste, such that these water quality impacts are eliminated or reduced to acceptable levels. The volumes of water required for flushing vary widely depending on the treatment media type and characteristics of the water being used to flush the treatment media. Treatment medias can also be pre-conditioned by the manufacturer to reduce the amount of flushing needed during install and conditioning. A popular example is acid washing GAC media or buffering anion exchange resin. Ultimately, proper conditioning is verified by collecting samples of water passing through the POET system after conditioning is believed to be complete.
****

Perform the following treatment media conditioning steps in the sequence specified. For POET systems with multiple treatment vessels, perform the backwash and forward flush steps separately for each vessel; do not conduct the backwash or forward flush in series using the same water in both vessels. Follow manufacturer requirements if those requirements are more stringent than what is specified here:

a. Wetting: Wet the media for a minimum of [16][_____] hours. Ensure that the water level remains above the top of the media during wetting. Provide a continuous opening for gases to escape the vessel during wetting, but ensure the opening is covered with a gas-permeable [screen][filter] (e.g. fine mesh wire screen) to prevent foreign materials entering the vessel.

b. Backwash: Perform an upflow backwash at a flow rate of [_____] to [_____] cm/sec gpm/square foot for a duration of [_____] minutes. Slowly open the water supply valve when starting backwash and slowly close the water supply valve when ending backwash. Once the minimum specified backwash duration has been met, collect a small volume of backwash water and visually inspect for particles; if particles are observed, continue backwashing until the backwash water is visually free of particles. Direct backwash water to the designated wastewater disposal location.

c. Forward Flush: Flush water through the treatment media at a flowrate of [_____] to [______] lpm gpm. Flush a minimum of [_____] bed volumes of water through the treatment media.[After the minimum prescribed volume of water has been flushed through the treatment media, conduct the field water quality testing specified in paragraph FIELD WATER QUALITY TESTING. Continue to flush the treatment media if any of the field testing indicates unacceptable results.] Direct the flush water to the designated wastewater disposal location.

3.4 FIELD QUALITY CONTROL

Perform field tests and inspections[in the presence of the Contracting Officer] and provide labor, equipment, and incidentals required for the test. Provide for disposal of all waste residuals resulting from the test[offsite][onsite via existing solid waste and wastewater disposal resources]. Notify the Contracting Officer [_____] days prior to the date and time for the field tests and inspections. Rectify any deficiencies found and retest any work affected by such deficiencies.

3.4.1 Tests

3.4.1.1 Performance Tests

After installation of the complete POET system, complete an operating test to assure that the POET system operates properly. If any deficiencies are revealed during any tests, correct such deficiencies and repeat the test. Flow water through the POET system by opening downstream discharge points such as faucets, showers, etc. Conduct a performance test at a minimum of [2][_____] discharge points, with water flowing from each discharge point for at least [15][_____] minutes. Once a steady flowrate is observed and any entrained air has been purged, measure flowrates at each discharge point using a container and stopwatch over a period of [5][_____] minutes. Open additional taps if necessary to achieve a combined flowrate equal or greater than the flowrate given for the pressure loss requirement in paragraph PERFORMANCE REQUIREMENTS. Visually inspect the water recovered during the flow test; if particulates are observed in the water this represents a deficiency requiring correction. During the performance test measure pressure loss across the POET system; pressure loss exceeding the value in paragraph PERFORMANCE REQUIREMENTS represents a deficiency requiring correction.

[

For POET systems designed to be backwashed either automatically or manually, initiate a backwash cycle. Observe the backwash discharge piping for adequate flow and free discharge. Once the backwash cycle is over, observe treated water exiting the POET system to verify that there are no particulates present.]

3.4.1.2 Field Water Quality Testing

****

NOTE: Field water quality testing is an optional means of verifying that the treatment media has been

adequately installed and conditioned. If no field water quality testing will be performed, delete this paragraph and the associated text in paragraph TREATMENT MEDIA CONDITIONING. Some parameters to consider for field water quality testing include pH, turbidity, dissolved solids, and arsenic (for activated carbon); parameters to test for should be determined based on the site water quality and treatment media used in the POET system.
****

Conduct water quality tests in the field using[testing meters][and][field test kits]. Conduct field water quality testing as specified in the table:

Table 5 - Field Water Quality Testing

Parameter	Field Testing Method	Field Testing Frequency
pH	Multi-parameter Digital Water Quality Meter	After flushing minimum volume specified in paragraph TREATMENT MEDIA CONDITIONING
Dissolved Solids	Multi-parameter Digital Water Quality Meter	After flushing minimum volume specified in paragraph TREATMENT MEDIA CONDITIONING
Arsenic	Test Kit with Detection Range equal or less than 10 ug/L	After flushing minimum volume specified in paragraph TREATMENT MEDIA CONDITIONING
[_____]	[_____]	[_____]

3.4.1.3 Water Sampling and Analysis

After completing the required performance tests and correcting any deficiencies, collect water samples from the POET system. Collect samples from the[POET system influent,][between treatment vessels,][downstream of the final POET system component,][at a tap served by the POET system]. Collect, label, preserve, and transport water samples in accordance with[a project-specific UFP-QAPP][a basewide QAPP][_____]. Analyze water samples for the parameters listed in paragraph PERFORMANCE REQUIREMENTS. Failure to meet the performance requirements in paragraph PERFORMANCE REQUIREMENTS for any parameter represents a deficiency requiring correction.

3.4.1.4 Acceptance Test Report

Submit test reports demonstrating compliance with the Performance Requirements specified in this specification section.

3.4.2 Inspection

After completing the performance testing and water sampling described in Paragraph TESTS, complete a final inspection of the POET system. Carefully inspect all components for defects in workmanship and material. Clean debris and foreign matter from exterior surfaces. Operate all valves and other mechanisms to check their proper functioning. Check all connections for tightness. Assure that there is no uncharacteristic vibration or noise from any components. If any deficiencies are revealed during the inspection, correct such deficiencies. Submit an Inspection Report documenting completion of the inspection. Include sufficient photographs of the POET system to clearly identify each component.

3.4.3 Manufacturer Field Service

****

NOTE: Manufacturer field service may not be available depending on the manufacturer providing the POET system components. If the POET system is being installed by a properly licensed/trained individual, manufacturer field service may not be necessary. Delete this paragraph if manufacturer field service is not desired.

****

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative is required to supervise the installation, adjustment, and testing of the equipment. Include up to [5][7][10][_____] days of service.

3.5 CLOSEOUT ACTIVITIES

3.5.1 Operation and Maintenance Manual

****

NOTE: Delete specific requirements from the following list if they are not applicable to the POET system being installed. Some requirements such as the Concept of Operations and Product Data will largely duplicate information previously provided in the Basis of Design, but this is intentionally done to ensure that the Operation and Maintenance Manual provides a single, complete document of the POET system. Delete the Sampling and Analysis Plan if sampling of the POET system will be completed in accordance with a separately prepared UFP-QAPP, Basewide QAPP, etc. Development of the O&M manual should include consideration for how treatment media will be replaced. Off-site replacement is often preferred when it is feasible because it allows for more control of the conditions when removing, placing, and conditioning treatment media.

Ideally, POET systems should be regularly used to avoid water stagnation, which can lead to bacterial growth particularly within the treatment media. For additional discussion on bacterial growth in POET systems, see EPA 815-R-06-010, Point-of-Use or Point-of-Entry Treatment Options for Small Drinking Water Systems. If there is an extended absence period when the POET system is not used, corrective actions will likely need to be taken before water from the POET system is used again. Extended absences may be defined as periods as short as one week or as long as three weeks. A common corrective

action is to flush several volumes of water through the POET system after the extended absence, although in some cases more extensive actions such as replacing the treatment media may be necessary. The Designer/Contractor should consider site-specific conditions, POET system design, and vendor recommendations when determining appropriate extended absence procedures.

****

Submit an Operation and Maintenance Manual no more than [45][_____] calendar days after installation of the POET system. Provide [two][_____] hard copies of the Operation and Maintenance Manual and an electronic copy (PDF).[Prepare[draft for Government review][draft-final for[regulatory][_____] review] and final versions of the Operation and Maintenance Manual. Allow [30][_____] calendar days for[Government] review[and [30][_____] calendar days for regulatory review]. Allow [45][_____] days for comment resolution following each review and preparing the next version of the document.] The Operation and Maintenance Manual must include, but is not limited to, the following:

a. Table of Contents

b. Revision Tracking Table

c. Safety Precautions

d. Concept of Operations - Narrative description of the sequence or sequences of operation of the overall POETs system.

e. As-built Drawings - Revised version of the Process Flow Diagram from the Basis of Design. Provide a unique identifier for each vessel, sampling port, valve, pressure gauge, flow meter, and any other piece of equipment which provides data regarding POET systems operation. Provide a valve sequence indicating the position of each valve for normal operation (treatment), POET system bypass, and any other unique operating mode.

f. Routine Maintenance Activities - Identify all routine maintenance activities; include procedures for performing each activity and [schedule][frequency] for performing each activity.

g. Treatment Media Replacement - Indicate what data/conditions will trigger treatment media replacement (e.g. sampling results, [pressure][flow] readings, time-in-service, etc.). Provide a detailed instruction for replacing spent treatment media. Define sanitary and disinfection procedures to be followed throughout the process and during specific steps. Indicate how the treatment vessel will be isolated and taken out of service; how treatment media will be removed from the vessel; empty vessel visual inspection procedures; treatment media placement procedures; treatment media conditioning procedures.

h. Possible Breakdowns, Repairs, and Troubleshooting

i. Extended Absence Procedures - Identify what length(s) of time constitute an extended absence (POET system not being used). Identify procedures for communicating extended absences. Specify actions to take to return the POET system to operation after an extended absence.

j. O&M Data Sheets - Provide separate data sheets for routine maintenance activities and treatment media replacement.

k. Product Data

l. Disposal - In accordance with applicable local and federal regulations, define any testing and waste characterization requirements for spent treatment media, wastewater generated during commissioning, and other wastes generated during operations and maintenance. Indicate proposed recycling and disposal locations to be used for the various waste streams.

m. System Shutdown - Identify conditions that would lead to the Government shutting down the POET system. Indicate if the POET system components would be removed or transferred to the [resident][property] owner.

[

n. Sampling and Analysis Plan]

3.5.2 Posting System Information Sheet

Post the system information sheet developed under paragraph Basis of Design [on][near][_____] the POET system. The system information sheet must be [laminated][under [glass][plexiglass]][_____]. Prior to posting the system information sheet, make revisions to reflect any changes to the system design after the Basis of Design document was finalized.

3.5.3 Training

****

NOTE: The need for training should be assessed based on the complexity of the POET system, level of engagement and interest of the resident/owner, and number of O&M activities that Government employees and resident/owner are expected to complete. In general, private property residents/owners SHOULD NOT (emphasis added) be expected to complete O&M activities because of their assumed lack of technical experience and the potential Government liabilities associated with the resident/owner altering the function of the POET system in a negative way.

****

After completing all required activities in paragraph FIELD QUALITY CONTROL, conduct an on-site training session for [Government representatives][and][the [resident][owner]]. The training session must cover each item contained in the Operations and Maintenance Manual.[Brief the [resident][owner] on the information provided in the System Information Sheet.]

3.6 PROTECTION

****

NOTE: The Designer should consult with decision makers and stakeholders to determine when the POET system is authorized for use after installation. A conservative approach is to not authorize use of water from the POET system until after initial Acceptance Testing results have been received,

reviewed for quality and usability, and most importantly found to meet the POET system's performance requirements. Variations of this approach include either not authorizing any water use or authorizing non-potable water uses such as flushing toilets, showering, etc. The burden of this approach is mainly felt by the resident/owner of the POET system due to the time that the water system will be unavailable for use. One important consideration is stagnation of water in the POET system if it is not used pending Acceptance Testing results. Some means should be provided to flush water through the POET system periodically until it is authorized for use. This could be accomplished with an automatic flushing control valve or manually (e.g. running water through a tap to waste). If the resident/owner of the POET system is expected to flush water through the system, this needs to be clearly communicated.

A less conservative approach is to authorize use of the water as soon as the POET system installation is complete and all FIELD QUALITY CONTROL activities have been performed and approved. Under this approach, the following paragraph could be deleted. This approach would ideally only be used if there is high confidence in the performance of the POET system (e.g. an identical system is being used for similar contaminants and water supply with success, the installer has extensive experience with the system, etc.)

****

Protect the water system from use[for potable purposes] during the period between when installation is completed and the Government approves the Acceptance Testing results. [The Government will inform][Inform] the [resident][owner] that the water is not to be used for[any purpose][potable purposes] until they are notified that the water system is ready to be used. Ensure that a minimum of [_____] liters gallons of water is flushed through the POET system to waste at least [weekly][_____] during this period.[Place tags on all[potable] water fixtures indicating that the "water is not to be used pending testing results"].

****

SECTION 02 81 00

TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS

11/18

****

NOTE: This guide specification covers the requirements for transportation and disposal of hazardous material.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

****

NOTE: This specification was developed for large management contracts where there is a technical evaluation in the selection process. For small purchases, portions of this specification may be applicable, but should be closely considered. This specification should be used in conjunction with the separate asbestos and PCB management specifications when work involves these hazardous materials.

For other than remedial action, corrective action, or disposal of ammunition contract, add DFAR clause 252.223.-7005

If work does not involve hazardous wastes,

submittals regarding the hazardous waste management plan, the EPA Biennial and State Annual Reports, exceptions reports, and records of inspection may be removed by the designer.

If work does not involve hazardous wastes, PCB waste, or asbestos containing waste, certificates of disposal may be removed by the designer.

Regarding pre-established spill reporting procedures, the designer should consult CEMP-RT memorandum of 20 July 1995, Subject: Spill Reporting Procedures for USACE Personnel Involved in HTRW Projects or updated memorandum scheduled to be available by Jan 2004.

Security planning requirements (49 CFR 172) contain responsibilities for both the offeror of the hazardous material as well as the transporter. Thus both the Government and Contractor have responsibilities for security planning that should be coordinated in the development of specific contract specifications. Implementation guidance is under development. The Government will NOT request development of, review, or approve the Contractors' security plans. This is a legal requirements placed upon hazmat employers and transporters by DOT. The Government will require the Contractor to certify to the Government that either a security plan is in place or to document exemption from the security plan requirement. In developing this specification, Designers should determine whether this specification requires modification to address Agency specific requirements for pre-transportation security requirements in addition to transportation related security requirements.

Regarding security plan certifications, for USACE the intent is to obtain a Contractor certification for pre-transportation activities as well as a separate certification from the initial transporter. Other agencies may take a different approach to implementing security planning requirements and specification should be modified accordingly.

USACE projects require certificates of disposal for all hazardous waste, CERCLA remediation wastes, PCBs, radionuclide containing waste, and asbestos as per Engineering Pamphlet 415-1-266.

****

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in

this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

1.2.1 Hazardous Material

A substance or material which has been determined by the Secretary of Transportation to be capable of posing an unreasonable risk to health, safety, and property when transported in commerce, and which has been so designated pursuant to the Hazardous Materials Transportation Act, 49 U.S.C. Appendix Section 1801 et seq. The term includes materials designated as hazardous materials under the provisions of 49 CFR 172, Sections .101 and .102 and materials which meet the defining criteria for hazard classes and divisions in 49 CFR 173. EPA designated hazardous wastes are also hazardous materials.

1.2.2 Hazardous Waste

A waste which meets criteria established in RCRA or specified by the EPA in 40 CFR 261 or which has been designated as hazardous by a RCRA authorized state program.

1.3 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal

items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Packaging Notifications

Hazardous Waste Management Plan; G, [_____]

Onsite Hazardous Waste Management; G, [_____]

Notices of Non-Compliance and Notices of Violation

SD-06 Test Reports

Recordkeeping; G, [_____]

Exception Report; G, [_____]

Spill Response

SD-07 Certificates

Transportation and Disposal Coordinator; G, [_____]

Training; G, [_____]

Certification

Shipping Documents and Packagings Certification; G, [_____]

Security Plan

Certificates of Disposal

Waste Minimization

1.4 QUALITY ASSURANCE

1.4.1 Transportation and Disposal Coordinator

Designate, by position and title, one person to act as the Transportation and Disposal Coordinator (TDC) for this contract. The TDC must serve as the single point of contact for all environmental regulatory matters and have overall responsibility for total environmental compliance at the site including, but not limited to, accurate identification and classification of hazardous waste and hazardous materials; determination of proper shipping names; identification of marking, labeling, packaging and placarding requirements; completion of waste profiles, hazardous waste manifests, asbestos waste shipment records, PCB manifests, bill of ladings, exception and discrepancy reports; and all other environmental documentation. The TDC must have, at a minimum, one year of specialized experience in the management and transportation of hazardous waste and have been Department of Transportation certified under 49 CFR 172, Subpart H.

1.4.2 Training

Hazardous materials employees must be trained, tested, and certified to safely and effectively carry out their assigned duties in accordance with [Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES] [_____]. Employees transporting hazardous materials or preparing hazardous materials for transportation, including samples, must be trained, tested, and certified in accordance with 49 CFR 172, Subpart H, including security awareness and any applicable security plans. Hazardous material employees must also be trained in accordance with IATA DGR when shipping hazardous materials by air. Employees must be trained, tested, and certified in accordance with 49 CFR 172, Subpart H to determine that shipments do not constitute DOT regulated hazardous materials.

1.4.3 Certification

The hazardous materials transporter must possess a current certificate of registration issued by the Research and Special Programs Administration (RSPA), U.S. Department of Transportation, when required by 49 CFR 107, Subpart G. Submit copies of the certificates or written statements certifying exemption from these requirements.

1.4.4 Laws and Regulations Requirements

Comply with Federal, state, and local laws and regulations which are applicable. These requirements are amended frequently and compliance with amendments is required as they become effective. Notify the Contracting Officer immediately if compliance exceeds the scope of work or conflicts with specific requirements of the contract.

PART 2 PRODUCTS

****

NOTE: For US Army Corps of Engineer (USACE) Projects involving shipments containing radioactive nuclides, additional products such as special marking may apply. See USACE Engineering Pamphlet 415-1-266, Chapter 7, Resident Engineer Management Guide for Hazardous, Toxic, and Radioactive Waste Projects and Engineering Manual 1110-35-1, Management Guidelines for Working with Radioactive and Mixed Waste.

****

2.1 MATERIALS

Provide all the materials required for the packaging, labeling, marking, placarding and transportation of hazardous wastes and hazardous materials in conformance with Department of Transportation standards[and][IATA DGR][and][EP 415-1-266][_____]. Details in this specification must not be construed as establishing the limits of the Contractor's responsibility.

2.1.1 Packagings

Provide [bulk][non-bulk][bulk and non-bulk] containers for packaging hazardous materials/wastes consistent with the authorizations referenced in the Hazardous Materials Table in 49 CFR 172, Section .101, Column 8. Bulk and non-bulk packaging must meet the corresponding specifications in 49 CFR 173 referenced in the Hazardous Materials Table, 49 CFR 172, Section .101. Packaging must conform to the general packaging requirements of Subpart B of 49 CFR 173, to the requirements of 49 CFR 178 at the specified packing group performance level, to the requirements of special provisions of column 7 of the Hazardous Materials Table in 49 CFR 172, Section .101, and be compatible with the material to be packaged as required by 40 CFR 262. Also provide other packaging related materials such as materials used to cushion or fill voids in overpacked containers. The hazardous materials being packaged must not react dangerously with, decompose or ignite the sorbent packaging materials. Additionally, sorbents used to treat free liquids to be disposed of in landfills must be non-biodegradable as specified in 40 CFR 264, Section .314. In addition, packaging notifications will be provided to the Government in accordance with 49 CFR 172, Section .178.2(c) regarding type and dimensions of closures, including gaskets, needed to satisfy performance test requirements.

2.1.2 Markings

Provide markings for each hazardous material/waste package, freight container, and transport vehicle consistent with the requirements of 49 CFR 172, Subpart D and [40 CFR 262, Section .32 (for hazardous waste)][40 CFR 761, Section .45 (for PCBs)][40 CFR 61, Section .149(d) (for asbestos)][EP 415-1-266 (for FUSRAP radionuclides)]. Markings must withstanda 180 day exposure to conditions reasonably expected to be encountered during container storage and transportation, without deterioration or substantial color change.

2.1.3 Labeling

Provide primary and subsidiary labels for hazardous materials/wastes consistent with the requirements in the Hazardous Materials Table in 49 CFR 172, Section .101, Column 6. Labels must meet design specifications required by 49 CFR 172, Subpart E including size, shape, color, printing, and symbol requirements. Labels must be durable weather resistant and withstanding a 180 day exposure to conditions reasonably expected to be encountered during container storage and transportation, without deterioration or substantial color change.

2.1.4 Placards

For each offsite shipment of hazardous material/waste, provide primary and subsidiary placards consistent with the requirements of 49 CFR 172, Subpart F. Provide placards for each side and each end of bulk packaging, freight containers, transport vehicles, and rail cars requiring such placarding. Placards may be plastic, metal, or other material capable of withstanding, without deterioration, a 30 day exposure to open weather conditions and must meet design requirements specified in 49 CFR 172, Subpart F.

2.1.5 Spill Response Materials

Provide spill response materials including, but not limited to, containers, adsorbent, shovels, and personal protective equipment. Spill response materials must be available at all times when hazardous materials/wastes are being handled or transported. Spill response materials must be compatible with the type of material being handled.

2.2 EQUIPMENT AND TOOLS

Provide miscellaneous equipment and tools necessary to handle hazardous materials and hazardous wastes in a safe and environmentally sound manner.

PART 3 EXECUTION

3.1 HAZARDOUS WASTE MANAGEMENT PLAN

Prepare a Hazardous Waste Management Plan detailing the manner in which hazardous wastes will be managed and describing the types and volumes of hazardous wastes anticipated to be managed. The plan must address both onsite and offsite hazardous waste management. Describe the methods to be used to ensure accurate piece counts or weights of shipments; describe waste minimization methods; identify and describe facilities to be used for treatment, storage, and disposal (TSD); identify areas onsite where hazardous wastes are to be handled; and identify whether transfer facilities are to be used; and if so, how the wastes will be tracked to ultimate disposal. Submit the plan to the Contracting Officer for approval prior to start of work. Submit written documentation of weekly hazardous waste inspections on a [monthly][quarterly][_____] basis.

3.2 ONSITE HAZARDOUS WASTE MANAGEMENT

****

NOTE: When work on a site is being performed pursuant to the authorities of CERCLA, it may be eligible for the permit waiver of CERCLA Section 121(e) such that accumulation time restrictions or other requirements may not be applicable. In that case the designer, with assistance from agency counsel as necessary, should determine whether this paragraph requires revision accordingly.

****

Coordinate the onsite management of all hazardous materials and waste with the installation environmental function and the Contracting Officer. These paragraphs apply to Government owned waste only. The Contractor is responsible for ensuring compliance with Federal, state, and local hazardous waste laws and regulations and verifying those requirements when preparing reports, waste shipment records, hazardous waste manifests, or other documents. Identify hazardous wastes using criteria set forth in 40 CFR 261 or applicable state and local laws, regulations, and ordinances. Comply with generator requirements in [40 CFR 262][and][applicable state or local law or regulations] when accumulating hazardous waste onsite. Onsite accumulation times must be restricted to applicable time frames referenced in [40 CFR 262, Section .34][and][applicable state or local law or regulation]. Accumulation start dates commence when waste container is transferred into a 90 day accumulation site or permitted storage facility. Only use containers in good condition and compatible with the waste to be stored. Ensure containers are closed except when adding or removing waste, and immediately mark all hazardous waste containers with the words "hazardous waste" and other information required by [40 CFR 262, Section .32][and][applicable state or local law or regulation] as soon as the waste is containerized. An additional marking must be placed on containers of "unknowns" designating the date sampled, and the suspected hazard. Inspect containers for signs of deterioration and for responding to any spills or leaks. Inspect all hazardous waste areas weekly and provide written documentation of the inspection. Include date and time of inspection, name of individual conducting the inspection, problems noted, and corrective actions taken on the inspection logs.

3.2.1 Hazardous Waste Classification

****

NOTE: If insufficient information exists to make a waste classification determination, the designer should develop contract clauses to provide for additional analysis.

****

Identify, in consultation with the [Contracting Officer][waste generator][_____], all waste codes applicable to each hazardous waste stream based on requirements in 40 CFR 261 or applicable state or local law or regulation. Also identify applicable treatment standards in 40 CFR 268 and state land disposal restrictions and make a determination as to whether or not the waste meets or exceeds the standards. Submit waste profiles, analyses, classification and treatment standards information to Contracting Officer for review and approval.

3.3 OFFSITE HAZARDOUS WASTE MANAGEMENT

****

NOTE: For US Army Corps of Engineer (USACE) Projects involving shipments containing radioactive nuclides, additional management requirements may apply. Designers should refer to USACE EP 415-1-266, Chapter 7, Resident Engineer Management Guide for Hazardous, Toxic, and Radioactive Waste Projects and EM 1110-35-1, Management Guidelines for Working with Radioactive and Mixed Waste. For example, a pink mark stating "Warning: Empty only at (destination)"

is required.

Designers should review new manifest requirements as they become available to ensure this specification remains consistency with regulatory changes.

****

Coordinate the off site transfer of all hazardous materials and waste with the installation environmental function and the Contracting Officer. Use RCRA Subtitle C permitted facilities which meet the requirements of 40 CFR 264 or facilities operating under interim status which meet the requirements of 40 CFR 265. Do not use offsite treatment, storage, and disposal facilities with significant RCRA violations or compliance problems (such as facilities known to be releasing hazardous constituents into ground water, surface water, soil, or air). Submit Notices of Non-Compliance and Notices of Violation by a Federal, state, or local regulatory agency issued to the Contractor in relation to any work performed under this contract. Immediately provide copies of such notices to the Contracting Officer. Also furnish relevant documents regarding the incident and any information requested by the Contracting Officer, and coordinate its response to the notice with the Contracting Officer or the designated representative prior to submission to the notifying authority. Also furnish a copy to the Contracting Officer of all documents submitted to the regulatory authority, including the final reply to the notice, and all other materials, until the matter is resolved.

3.3.1 Treatment, Storage, and Disposal Facility and Transporter

Provide the Contracting Officer with EPA ID numbers, names, locations, and telephone numbers of TSD facilities and transporters. This information must be contained in the Hazardous Waste Management Plan and be approved by the Contracting Officer prior to waste disposal.

3.3.2 Facility Status Information

Facilities receiving hazardous waste must be permitted in accordance with 40 CFR 270 or operating under interim status in accordance with 40 CFR 265 requirements, or permitted by a state authorized by the Environmental Protection Agency to administer the RCRA permit program. Additionally, prior to using a TSD Facility, contact the EPA Regional Offsite Coordinator specified in 40 CFR 300, Section .440, to determine the facility's status, and document all information necessary to satisfy the requirements of the EPA Offsite policy and submit this information to the Contracting Officer in the Hazardous Waste Management Plan.

3.3.3 Shipping Documents and Packagings Certification

Prior to shipment of any hazardous material offsite and a minimum of [14] [_____] days prior to anticipated pickup, provide for review written certification to the Contracting Officer that hazardous materials have been properly packaged, labeled, and marked in accordance with Department of Transportation and EPA requirements. Furnish designated disposal facility packaging assurances not later than 35 days after acceptance of the shipment. The Contractor's TDC must also provide written certification regarding waste minimization efforts documenting that efforts have been taken to reduce the volume and toxicity of waste to the degree economically practicable and that the method of treatment, storage, or disposal selected minimizes threats to human health and the environment.

3.3.4 Transportation

****

NOTE: When the additional cost of sending a qualified government representative to a remote location to sign a manifest for a small clean up project is unwarranted, the option of requiring the onsite Contractor to sign the manifests on behalf of the generator is permitted and should be considered. This option may only be exercised on a project specific basis, if prior to the solicitation process, written authorization of the customer and approval of the Chief, Construction Division at the executing district has been obtained, and the technical provisions of the contract solicitation provide competing Contractors notice of the requirement.

****

Prior to conducting hazardous materials activities, the Contractor responsible for pre-transportation activities must either certify to the Government that a Security Plan is in place which meets the requirements of 49 CFR 172, Subpart I or in the event that the types or amounts of hazardous materials are excluded from the security planning requirements, a written statement to that effect detailing the basis for the exception. Use manifests for transporting hazardous wastes as required by 40 CFR 263 or applicable state or local law or regulation. Transportation must comply with all requirements in the Department of Transportation referenced regulations in the 49 CFR series. Prepare hazardous waste manifests for each shipment of hazardous waste shipped offsite. Complete manifests using instructions in 40 CFR 262, Subpart B and applicable state or local law or regulation. Submit manifests and waste profiles to Contracting Officer for review and approval. Prepare land disposal restriction notifications as required by 40 CFR 268 or applicable state or local law or regulation for each shipment of hazardous waste. Submit notifications with the manifest to the Contracting Officer for review and approval. [In accordance with DOT 4500.9R, inspect motor vehicles used to transport hazardous materials in accordance the 49 CFR and DOT safety regulations and complete DDForm 626, Motor Vehicle Inspection][_____].

3.3.5 Treatment and Disposal of Hazardous Wastes

Coordinate any off site shipments of hazardous materials or hazardous wastes with the installation environmental function. Initial, or satellite hazardous waste accumulation is limited to 55 gallons (or 1 quart of acutely hazardous waste). Once a waste stream exceeds 55 gallons, it must be transferred to an on-site 90 day (180 day small quantity generator) accumulation area, or a permitted hazardous waste treatment, storage or disposal facility within three days. Ship hazardous wastes only to facilities which are properly permitted to accept the hazardous waste or operating under interim status. Ensure wastes are treated to meet land disposal treatment standards in 40 CFR 268 prior to land disposal. Propose TSD facilities via submission of the Hazardous Waste Management Plan, subject to the approval of the Contracting Officer. Submit Certificates of Disposal documenting the ultimate disposal, destruction or placement of [hazardous wastes,] [CERCLA remediation waste,] [polychlorinated biphenyls (PCBs),] [_____] and [asbestos] within [180][_____] days of initial shipment. Receipt of these certificates will be required for final payment.

3.4 RADIOACTIVE MATERIALS MANAGEMENT

****

NOTE: For US Army Corps of Engineer (USACE) Projects involving shipments containing radioactive nuclides, additional management requirements may apply. Designers should refer to USACE EP 415-1-266, Chapter 7, Resident Engineer Management Guide for Hazardous, Toxic, and Radioactive Waste Projects and EM 1110-35-1, Management Guidelines for Working with Radioactive and Mixed Waste. For example, a pink mark stating "Warning: Empty only at (destination)" is required.

****

Consult with the [Contracting Officer][generator][_____], to evaluate, prior to shipment of any material offsite, whether the material is regulated as a hazardous waste in addition to being regulated as a radioactive material. Perform the evaluation to determine proper shipping descriptions, marking requirements, and other criteria, as described below.

3.4.1 Identification of Proper Shipping Names

Use 49 CFR 172, Section .101 to identify proper shipping names for each hazardous material (including hazardous wastes) to be shipped offsite. Submit proper shipping names to the Contracting Officer in the form of draft shipping documents for review and approval.

3.4.2 Packaging, Labeling, and Marking

Package, label, and mark hazardous materials/wastes using the specified materials and in accordance with the referenced authorizations. Mark each container of hazardous waste of 416 L 110 gallons or less with the following:

"HAZARDOUS WASTE - Federal Law Prohibits Improper Disposal.
If found, contact the nearest police or public safety authority or the U.S. Environmental Protection Agency.
Generator's name _____________________________________
Manifest Document Number ___________________________".

3.4.3 Shipping Documents

Ensure that each shipment of hazardous material sent offsite is accompanied by properly completed shipping documents. This includes shipments of samples that may potentially meet the definition of a Department of Transportation regulated hazardous material.

3.4.3.1 PCB Waste Shipment Documents

Prepare hazardous waste manifests for each shipment of PCB waste shipped offsite. Complete manifests using instructions in 40 CFR 761, Sections .207 and .208 and other applicable requirements. Submit documents to Contracting Officer for review and approval.

3.4.3.2 Asbestos Waste Shipment Documents

Prepare waste shipment records, as required by 40 CFR 61, for shipments of asbestos. Submit waste shipment records to the Contracting Officer for review and approval. Waste shipment records must be signed by the Contractor.

3.4.3.3 Other Hazardous Material Shipment Documents

****

NOTE: The designer should determine whether bill of lading certifications will be signed by the Government or the Contractor. This determination should be based on whether the Government or the Contractor is responsible for classifying, packaging, marking, labeling, and placarding the shipment.

****

Prepare a bill of lading for each shipment of hazardous material which is not accompanied by a hazardous waste manifest or asbestos waste shipment record which fulfills the shipping paper requirements. The bill of lading must satisfy the requirements of 49 CFR 172, Subpart C, [and 40 CFR 279 if shipping used oil] and applicable state or local law or regulation, and must be submitted to the Contracting Officer for review and approval. For laboratory samples and treatability study samples, prepare bills of lading and other documentation as necessary to satisfy conditions of the sample exclusions in 40 CFR 261, Section .4(d) and (e) and any applicable state or local law or regulation. Bill of ladings requiring shipper's certifications must be signed by the [Government][Contractor].

3.5 SPECIAL REQUIREMENTS FOR ASBESTOS WASTES

****

NOTE: If work involves asbestos containing wastes, designer should determine whether reference to a separate asbestos specification should be added.

****

If work involves asbestos containing wastes, manage these wastes in accordance with specification Section 02 82 00 ASBESTOS REMEDIATION.

3.6 WASTE MINIMIZATION

Minimize the generation of hazardous waste to the maximum extent practicable and take all necessary precautions to avoid mixing clean and contaminated wastes. Identify and evaluate recycling and reclamation options as alternatives to land disposal. Requirements of 40 CFR 266 apply to: hazardous wastes recycled in a manner constituting disposal; hazardous waste burned for energy recovery; lead-acid battery recycling; and hazardous wastes with economically recoverable precious metals. Submit written certification that waste minimization efforts have been undertaken to reduce the volume and toxicity of waste to the degree economically practicable and that the method of treatment, storage, or disposal selected minimizes threats to human health and the environment.

3.7 RECORDKEEPING

Maintain adequate records to support information provided to the Contracting Officer regarding exception reports, annual reports, and biennial reports; maintain asbestos waste shipment records for a minimum of 3 years from the date of shipment or any longer period required by applicable law or regulation or other provision of this contract; and maintain bill of ladings for a minimum of 375 days from the date of shipment or longer period required by applicable law or regulation or other provision of this contract. Submit information necessary to file state annual or EPA biennial reports for hazardous waste transported, treated, stored, or disposed of under this contract. Do not forward these data directly to the regulatory agency but to the Contracting Officer at the specified time. Submit the information necessary for filing of the formal reports in the form and format required by the governing Federal or state regulatory agency. A cover letter must accompany the data to include the contract number, Contractor name, and project location. In the events that a manifest copy documenting receipt of hazardous waste at the treatment storage and disposal facility is not received within 35 days of shipment initiation, or that a manifest copy documenting receipt of PCB waste at the designated facility is not received within 35 days of shipment initiation, prepare and submit an exception report to the Contracting Officer within 37 days of shipment initiation.

3.8 SPILL RESPONSE

In the event of a spill or release of a hazardous substance (as designated in 40 CFR 302), or pollutant or contaminant, or oil (as governed by the Oil Pollution Act (OPA), 33 U.S.C. 2701 et seq.), notify the Contracting Officer immediately. Direction from the Contracting Officer concerning a spill or release is not considered a change under the contract. If the spill exceeds a reporting threshold, follow the pre-established procedures for immediate reporting to the Contracting Officer. Comply with applicable requirements of Federal, state, or local laws or regulations regarding any spill incident.

3.9 EMERGENCY CONTACTS

Comply with the emergency contact provisions in 49 CFR 172, Section .604. Whenever the Contractor ships hazardous materials, provide a 24 hr emergency response contact and phone number of a person knowledgeable about the hazardous materials being shipped and who has comprehensive emergency response and incident mitigation information for that material, or has immediate access to a person who possesses such knowledge and information. Monitor the phone on a 24 hour basis at all times when the hazardous materials are in transportation, including during storage incidental to transportation. Ensure that information regarding this emergency contact and phone number are placed on all hazardous material shipping documents. Designate an emergency coordinator and post the following information at areas in which hazardous wastes are managed:

a. The name of the emergency coordinator.

b. Phone number through which the emergency coordinator can be contacted on a 24 hour basis.

c. The telephone number of the local fire department.

d. The location of fire extinguishers and spill control materials.

NOTE: This guide specification covers the requirements for safety procedures and requirements for the demolition, removal, encapsulation, and disposal of asbestos containing materials (ACM). This specification is used in conjunction with Section 01 35 26 GOVERNMENT SAFETY REQUIREMENTS.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

****

NOTE: Federal regulations require EPA model accreditation plan training to edit this document. Furthermore, asbestos abatement designers must be accredited and licensed to design asbestos work in the location of the construction.

Nonfriable asbestos containing materials do not always require special handling. However, during demolition and removal of this material dust and airborne asbestos fibers will sometimes be released. If the project contains nonfriable asbestos which may release fibers when demolished

and removed, the nonfriable asbestos must be removed in the same way as friable asbestos. Friable ACM must always be removed prior to any building demolition.

OSHA regulations address worker protection, NESHAPS (EPA) regulations address disposal requirements, and they have different definitions as to what constitutes ACM in wallboard/joint compound systems. Therefore, where wallboard/joint compound are suspected to contain ACM, analyze both discrete samples (separate samples from wallboard and joint compound) to address worker protection and composite samples (wallboard system as a whole) to address disposal requirements. It is not unusual for the wallboard itself and the wallboard system (taken as a whole) to contain less than 1 percent asbestos, but the discrete joint compound samples to contain greater than 1 percent asbestos. Problems can arise if these materials are not properly categorized in the design. Also, if the material is applied as an "add on" or "skim coat", NESHAPS considers the layers separate and composite sampling is not appropriate.

Asbestos operations do not always indicate negative pressure enclosure type asbestos control with all of its attendant requirements. The location of the area, type of material, and initial as well as other exposure assessments for abatement workers and the environment must be reviewed and a judgment made by the designer as to the precise asbestos control techniques described herein that may be safely and legally used.

It is the policy of the Navy to eliminate the use of materials containing asbestos wherever possible. Therefore, the designer must not use asbestos containing materials wherever a substitute, suitable to the Navy, exists.

The limits and conditions of asbestos hazard abatement efforts must be indicated on the drawings or in the specification in sufficient detail for the Contractor to submit an accurate bid. Portions of the building where asbestos work will take place must be unoccupied during the removal operation. It is highly recommended that the entire building be unoccupied during asbestos hazard abatement operations. If portions of the building where asbestos hazard abatement is not taking place must remain occupied, additional requirements must be added for providing temporary heating/cooling and other utilities to the occupied portions of the building. The building heating/cooling system for example cannot be operated in the asbestos control area and due to wet removal procedures, electrical service to the asbestos control area may need to be shut off and resupplied through a ground fault

circuit interrupter. In addition, the rooms with openings into the room undergoing asbestos abatement must be empty with critical barriers installed to provide a buffer zone.

****

****

NOTE: Provide the following information on the project drawings:

1. Clearly show location, extent, condition and form of asbestos materials to be controlled or in contact with other non-ACM removals or new work.

****

****

NOTE: The work may involve a historic property. The designer must coordinate review of the proposed work with the appropriate cultural resources manager (CRM) and cultural resource laws and regulations, as part of the environmental review and permitting process. Consultation with stakeholders, including the state historic preservation office, may be required, and work involving historic properties will likely be required to confirm to the Secretary of the Interior's Standards for the Treatment of Historic Properties (usually at the REHABILITATION level). See https://www.nps.gov/tps/standards/four-treatments/treatment-rehabilitation.htm

****

PART 1 GENERAL

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

1.2.1 ACM

Asbestos Containing Materials.

1.2.2 Amended Water

Water containing a wetting agent or surfactant with a maximum surface tension of 2.9 Pa 0.00042 psi.

1.2.3 Area Sampling

Sampling of asbestos fiber concentrations which approximates the concentrations of asbestos in the theoretical breathing zone but is not actually collected in the breathing zone of an employee.

1.2.4 Asbestos

The term asbestos includes chrysotile, amosite, crocidolite, tremolite asbestos, anthophyllite asbestos, and actinolite asbestos and any of these minerals that has been chemically treated or altered. Materials are considered to contain asbestos if the asbestos content of the material is determined to be at least one percent.

1.2.5 Asbestos Control Area

That area where asbestos removal operations are performed which is isolated by physical boundaries which assist in the prevention of the uncontrolled release of asbestos dust, fibers, or debris.

1.2.6 Asbestos Fibers

Those fibers having an aspect ratio of at least 3:1 and longer than 5 micrometers as determined by National Institute for Occupational Safety and Health (NIOSH) Method 7400.

1.2.7 Asbestos Permissible Exposure Limit

0.1 fibers per cubic centimeter of air as an 8-hour time weighted average measured in the breathing zone as defined by 29 CFR 1926.1101 or other Federal legislation having legal jurisdiction for the protection of workers health.

1.2.8 Authorized Person

Any person authorized by the Contractor and required by work duties to be present in the regulated areas.

1.2.9 Background

The ambient airborne asbestos concentration in an uncontaminated area as measured prior to any asbestos hazard abatement efforts. Background concentrations for other (contaminated) areas are measured in similar but asbestos free locations.

1.2.10 Competent Person (CP)

****

NOTE: Check state requirements for licensing and edit appropriately.

****

A person meeting the requirements for competent person as specified in 29 CFR 1926.1101 including a person capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy for asbestos exposure, who has the authority to take prompt corrective measures to eliminate them, and is specifically trained in a training course which meet the criteria of EPA's Model Accreditation Plan (40 CFR 763) for project designer or supervisor, or its equivalent.[The competent person must have a current State of [_____] asbestos contractors or supervisors license.]

1.2.11 Contractor

The Contractor is that individual, or entity under contract to perform the herein listed work.

1.2.12 Disposal Bag

A 0.15 mm 6 mil thick, leak-tight plastic bag, pre-labeled in accordance with 29 CFR 1926.1101, used for transporting asbestos waste from containment to disposal site.

1.2.13 Disturbance

Activities that disrupt the matrix of ACM, crumble or pulverize ACM, or generate visible debris from ACM. Disturbance includes cutting away small amounts of ACM, no greater than the amount which can be contained in one standard sized glovebag or waste bag, not larger than 1.5 m 60 inches in length and width in order to access a building component.

1.2.14 Encapsulation

The abatement of an asbestos hazard through the appropriate use of chemical encapsulants.

1.2.15 Encapsulants

Specific materials in various forms used to chemically or physically entrap asbestos fibers in various configurations to prevent these fibers from becoming airborne. There are four types of encapsulants as follows which must comply with performance requirements as specified herein.

a. Removal Encapsulant (can be used as a wetting agent)

b. Bridging Encapsulant (used to provide a tough, durable surface coating to asbestos containing material)

c. Penetrating Encapsulant (used to penetrate the asbestos containing material encapsulating all asbestos fibers and preventing fiber release due to routine mechanical damage)

d. Lock-Down Encapsulant (used to seal off or "lock-down" minute asbestos fibers left on surfaces from which asbestos containing material has been removed).

1.2.16 Friable Asbestos Material

A term defined in 40 CFR 61-SUBPART M and EPA 340/1-90/018 meaning any material which contains more than 1 percent asbestos, as determined using the method specified in 40 CFR 763, Polarized Light Microscopy (PLM), that when dry, can be crumbled, pulverized, or reduced to powder by hand pressure.

1.2.17 Glovebag Technique

****

NOTE: Verify with the State regulations that glovebag removal is an acceptable technique.

****

Those asbestos removal and control techniques put forth in 29 CFR 1926.1101.

1.2.18 Government Consultant (GC)

That qualified person employed directly by the Government to monitor, sample, inspect the work or in some other way advise the Contracting Officer. The GC is normally a private consultant, but can be an employee of the Government.

1.2.19 HEPA Filter Equipment

High efficiency particulate air (HEPA) filtered vacuum and exhaust ventilation equipment with a filter system capable of collecting and retaining asbestos fibers. Filters must retain 99.97 percent of particles 0.3 microns or larger as indicated in UL 586.

1.2.20 Model Accreditation Plan (MAP)

USEPA training accreditation requirements for persons who work with asbestos as specified in 40 CFR 763.

1.2.21 Negative Pressure Enclosure (NPE)

That engineering control technique described as a negative pressure enclosure in 29 CFR 1926.1101.

1.2.22 NESHAP

National Emission Standards for Hazardous Air Pollutants. The USEPA NESHAP regulation for asbestos is at 40 CFR 61-SUBPART M.

1.2.23 Nonfriable Asbestos Material

Material that contains asbestos in which the fibers have been immobilized by a bonding agent, coating, binder, or other material so that the asbestos is well bound and will not normally release asbestos fibers during any appropriate use, handling, storage or transportation. It is understood that asbestos fibers may be released under other conditions such as demolition, removal, or mishap.

1.2.24 Permissible Exposure Limits (PELs)

1.2.24.1 PEL-Time Weighted Average(TWA)

Concentration of asbestos not in excess of 0.1 fibers per cubic centimeter of air (f/cc) as an 8-hour time weighted average (TWA).

1.2.24.2 PEL-Excursion Limit

An airborne concentration of asbestos not in excess of 1.0 f/cc of air as averaged over a sampling period of 30 minutes.

1.2.25 Personal Sampling

Air sampling which is performed to determine asbestos fiber concentrations within the breathing zone of a specific employee, as performed in accordance with 29 CFR 1926.1101.

1.2.26 Private Qualified Person (PQP)

That qualified person hired by the Contractor to perform the herein listed tasks.

1.2.27 Qualified Person (QP)

A Registered Architect, Professional Engineer, Certified Industrial Hygienist, consultant or other qualified person who has successfully completed training and is therefore accredited under a legitimate State Model Accreditation Plan as described in 40 CFR 763 as a Building Inspector, Contractor/Supervisor Abatement Worker, and Asbestos Project Designer; and has successfully completed the National Institute of Occupational Safety and Health (NIOSH) 582 course "Sampling and Evaluating Airborne Asbestos Dust" or equivalent. The QP must be qualified to perform visual inspections as indicated in ASTM E1368.[The QP must be appropriately licensed in the State of [_____].]

1.2.28 TEM

Refers to Transmission Electron Microscopy.

1.2.29 Time Weighted Average (TWA)

The TWA is an 8-hour time weighted average airborne concentration of asbestos fibers.

1.2.30 Transite

A generic name for asbestos cement wallboard and pipe.

1.2.31 Wetting Agent

A chemical added to water to reduce the water's surface tension thereby increasing the water's ability to soak into the material to which it is applied. An equivalent wetting agent must have a surface tension of at most 2.9 Pa 0.00042 psi.

1.2.32 Worker

Individual (not designated as the Competent Person or a supervisor) who performs asbestos work and has completed asbestos worker training required by 29 CFR 1926.1101, to include EPA Model Accreditation Plan (MAP) "Worker" training; accreditation, if required by the OSHA Class of work to be performed or by the state where the work is to be performed.[The worker must be appropriately licensed in the State of [_____].]

1.3 REQUIREMENTS

1.3.1 Description of Work

****

NOTE: Specify the form, condition and approximate quantity square meters or linear meters square feet or linear feet of asbestos material to be controlled in the first blank and the location of the material in the second blank. Example: "The asbestos work includes the demolition and removal of 90 m of 200 mm 300 feet of 8 inch diameter asbestos insulation located on existing steam piping indicated to be removed in the boiler room." or "The asbestos work includes the encapsulation of 270 square meters 3,000 square feet of sprayed on asbestos containing fire proofing materials located above the ceiling throughout the structure."

The use of this section in the contract specification means that known asbestos material is involved. Estimate the quantity and specify as unit price items in Section 00 21 13, INSTRUCTIONS TO BIDDERS or Section 01 20 00 Price and Payment Procedures per standard practice of the activity preparing the contract.

****

****

NOTE: Include reference to 40 CFR 763 when asbestos work occurs in a public or private school Grades K thru 12.

****

****

NOTE: Nonfriable ACM may not require special handling. However, during demolition and removal of this material dust and airborne asbestos fibers will sometimes be released. If the project contains nonfriable asbestos which may release fibers when demolished and removed, the nonfriable asbestos must be removed in the same way as friable asbestos. Include "Under normal... specified herein.", if

material traditionally defined as non-friable asbestos materials are to be removed.

****

****

NOTE: The appropriate engineering control technique must comply with the requirements outlined in 29 CFR 1926.1101 which is selected based on existing conditions, but must be that technique that provides the best control during abatement at most reasonable cost.

****

The work covered by this section includes the handling and control of asbestos containing materials and describes some of the resultant procedures and equipment required to protect workers, the environment and occupants of the building or area, or both, from contact with airborne asbestos fibers. The work also includes the disposal of any asbestos containing materials generated by the work. More specific operational procedures must be outlined in the Asbestos Hazard Abatement Plan called for elsewhere in this specification. The asbestos work includes the [demolition and removal][encapsulation] of [_____] located [_____] [which is governed by 40 CFR 763 and NAVFAC P-502].[Under normal conditions non-friable or chemically bound materials containing asbestos would not be considered hazardous; however, this material may release airborne asbestos fibers during demolition and removal and therefore must be handled in accordance with the removal and disposal procedures as specified herein.] Provide [negative pressure enclosure] [_____] techniques as outlined in this specification. The [building][work area] will be evacuated during the asbestos abatement work. A competent person must supervise asbestos removal work as specified herein.

1.3.1.1 Wallboard/Joint Compound

****

NOTE: When both composite and discrete sampling and testing is done on wallboard/joint compound, include and edit the following to address the site specific situation:

****

[Both composite samples of the wallboard and discrete samples of the components (wallboard and joint compound) have been tested and results are attached.

][Composite samples of the wallboard system were tested and found to contain [less than one percent asbestos] [_____]. Discrete samples of the wallboard were tested and found to contain [less than one percent asbestos] [_____]. Discrete samples of the joint compound were tested and found to contain [greater than one percent asbestos] [_____].

]1.3.2 Unexpected Discovery of Asbestos

****

NOTE: Discovery of Unexpected Asbestos: Suspect asbestos containing material that is discovered during demolition (in particular buildings constructed no later than 1980), which was previously inaccessible, must be sampled and

analyzed for its asbestos content. The Designer should anticipate additional sampling and analysis. The Designer should provide Unit Price options in the Bid Form. Coordinate with the Designer of Record. The number of additional samples should be based on the extent of demolition and previous survey data. Sampling activities undertaken to determine the presence of additional ACM should be conducted by personnel who have successfully completed the EPA Model Accreditation (MAP) training course and have EPA/State certification/license as an Asbestos Inspector.

****

Notify the Contracting Officer if any previously untested building components suspected to contain asbestos are impacted by the work.

1.3.3 Medical Requirements

Provide medical requirements including but not limited to medical surveillance and medical record keeping as listed in 29 CFR 1926.1101.

1.3.3.1 Medical Examinations

Before exposure to airborne asbestos fibers, provide workers with a comprehensive medical examination as required by 29 CFR 1926.1101 or other pertinent State or local directives. This requirement must have been satisfied within the 12 months prior to the start of work on this contract. The same medical examination must be given on an annual basis to employees engaged in an occupation involving asbestos and within 30 calendar days before or after the termination of employment in such occupation. Specifically identify x-ray films of asbestos workers to the consulting radiologist and mark medical record jackets with the word "ASBESTOS."

1.3.3.2 Medical Records

****

NOTE: Medical records must be retained at least 50 years. Some States require longer retention periods. Check with the State in which the project is located for the required retention time.

****

Maintain complete and accurate records of employees' medical examinations, medical records, and exposure data for a period of [50 years][indefinite time] after termination of employment and make records of the required medical examinations and exposure data available for inspection and copying to: The Assistant Secretary of Labor for Occupational Safety and Health (OSHA), or authorized representatives of them, and an employee's physician upon the request of the employee or former employee.

1.3.4 Employee Training

****

NOTE: Include bracketed sentence where required by law, regulation or statute.

****

Submit certificates, prior to the start of work but after the main abatement submittal, signed by each employee indicating that the employee has received training in the proper handling of materials and wastes that contain asbestos in accordance with 40 CFR 763; understands the health implications and risks involved, including the illnesses possible from exposure to airborne asbestos fibers; understands the use and limits of the respiratory equipment to be used; and understands the results of monitoring of airborne quantities of asbestos as related to health and respiratory equipment as indicated in 29 CFR 1926.1101 on an initial and annual basis. Organize certificates by individual worker, not grouped by type of certification.[Post appropriate evidence of compliance with the training requirements of 40 CFR 763.] Train personnel involved in the asbestos control work in accordance with United States Environmental Protection Agency (USEPA) Asbestos Hazard Emergency Response Act (AHERA) training criteria or State training criteria whichever is more stringent. Document the training by providing: dates of training, training entity, course outline, names of instructors, and qualifications of instructors upon request by the Contracting Officer. Furnish each employee with respirator training and fit testing administered by the PQP as required by 29 CFR 1926.1101 and 29 CFR 1926.103. Fully cover engineering and other hazard control techniques and procedures.[Asbestos workers must have a current State of [_____] asbestos worker's license.]

1.3.5 Permits[, Licenses,] and Notifications

****

NOTE: The USEPA has delegated the responsibility of notification requirements to most States. Verify with the State and local authorities where the project is located whether the city, county, State, or USEPA has jurisdiction and whether a license is required.

Verify the specific notification requirements for the state where the work is being performed.

****

Prior to the start of work, obtain necessary permits[and licenses] in conjunction with asbestos removal, encapsulation, hauling, and disposition, and furnish notification of such actions required by Federal, State, regional, and local authorities. Notify the [Regional Office of the United States Environmental Protection Agency (USEPA)][State's environmental protection agency][local air pollution control district/agency] and the Contracting Officer in writing [10] [20] [_____] working days prior to commencement of work in accordance with 40 CFR 61-SUBPART M[and [_____]]. Notify the Contracting Officer and other appropriate Government agencies in writing 20 working days prior to the start of asbestos work as indicated in applicable laws, ordinances, criteria, rules, and regulations. Submit copies of all Notifications to the Contracting Officer.[Notify the local fire department 3 days prior to removing fire-proofing material from the building including notice that the material contains asbestos.]

1.3.6 Environment, Safety and Health Compliance

****

NOTE: The designer must research the State, regional and local laws, regulations, statutes, and list by authority and document number in the blank spaces provided those which apply to the asbestos

work to be performed by the Contractor.
****

In addition to detailed requirements of this specification, comply with those applicable laws, ordinances, criteria, rules, and regulations of Federal, State, regional, and local authorities regarding handling, storing, transporting, and disposing of asbestos waste materials. Comply with the applicable requirements of the current issue of EM 385-1-1, 29 CFR 1926.1101, 40 CFR 61-SUBPART A, 40 CFR 61-SUBPART M, 40 CFR 763 and ND OPNAVINST 5100.23. Submit matters of interpretation of standards to the appropriate administrative agency for resolution before starting the work. Where the requirements of this specification, applicable laws, rules, criteria, ordinances, regulations, and referenced documents vary, the most stringent requirement as defined by the Government apply. The following laws, ordinances, criteria, rules and regulations regarding removal, handling, storing, transporting and disposing of asbestos materials apply:

a. [_____]

b. [_____]

c. [_____].

1.3.7 Respiratory Protection Program

Establish and implement a respirator program as required by 29 CFR 1926.1101, and 29 CFR 1926.103. Submit a written description of the program to the Contracting Officer. Submit a written program manual or operating procedure including methods of compliance with regulatory statutes.

1.3.7.1 Respirator Program Records

Submit records of the respirator program as required by 29 CFR 1926.103, and 29 CFR 1926.1101.

1.3.7.2 Respirator Fit Testing

The Contractor's PQP must conduct a qualitative or quantitative fit test conforming to 29 CFR 1926.103 for each worker required to wear a respirator, and any authorized visitors who enter a regulated area where respirators are required to be worn. A respirator fit test must be performed prior to initially wearing a respirator and every 12 months thereafter. If physical changes develop that will affect the fit, a new fit test must be performed. Functional fit checks must be performed each time a respirator is put on and in accordance with the manufacturer's recommendation.

1.3.7.3 Respirator Selection and Use Requirements

Provide respirators, and ensure that they are used as required by 29 CFR 1926.1101 and in accordance with CGA G-7 and the manufacturer's recommendations. Respirators must be approved by the National Institute for Occupational Safety and Health NIOSH, under the provisions of 42 CFR 84, for use in environments containing airborne asbestos fibers. For air-purifying respirators, the particulate filter must be high-efficiency particulate air (HEPA)/(N-,R-,P-100). The initial respirator selection and the decisions regarding the upgrading or downgrading of respirator type must be made by the Contractor's Designated IH based on the measured or anticipated airborne asbestos fiber concentrations to be encountered.

1.3.8 Asbestos Hazard Control Supervisor

The Contractor must be represented on site by a supervisor, trained using the model Contractor accreditation plan as indicated in the Federal statutes for all portions of the herein listed work.

1.3.9 Hazard Communication

Adhere to all parts of 29 CFR 1926.59 and provide the Contracting Officer with a copy of the Safety Data Sheets (SDS) for all materials brought to the site.

1.3.10 Asbestos Hazard Abatement Plan

Submit a detailed plan of the safety precautions such as lockout, tagout, tryout, fall protection, and confined space entry procedures and equipment and work procedures to be used in the [encapsulation] [removal] [and demolition] of materials containing asbestos. The plan, not to be combined with other hazard abatement plans, must be prepared, signed, and sealed by the PQP. Provide a Table of Contents for each abatement submittal, which follows the sequence of requirements in the contract. The plan must include but not be limited to the precise personal protective equipment to be used including, but not limited to, respiratory protection, type of whole-body protection[and if reusable coveralls are to be employed decontamination methods (operations and quality control plan)], the location of asbestos control areas including clean and dirty areas, buffer zones, showers, storage areas, change rooms, [removal] [encapsulation] method, interface of trades involved in the construction, sequencing of asbestos related work, disposal plan, type of wetting agent and asbestos sealer to be used, locations of local exhaust equipment, planned air monitoring strategies, and a detailed description of the method to be employed in order to control environmental pollution. The plan must also include (both fire and medical emergency) response plans and an Activity Hazard Analyses (AHAs) in accordance with EM 385-1-1. The Asbestos Hazard Abatement Plan must be approved in writing prior to starting any asbestos work. The Contractor, Asbestos Hazard Control Supervisor,, CP and PQP must meet with the Contracting Officer prior to beginning work, to discuss in detail the Asbestos Hazard Abatement Plan, including work procedures and safety precautions. Once approved by the Contracting Officer, the plan will be enforced as if an addition to the specification. Any changes required in the specification as a result of the plan must be identified specifically in the plan to allow for free discussion and approval by the Contracting Officer prior to starting work.

1.3.11 Testing Laboratory

Submit the name, address, and telephone number of each testing laboratory selected for the[sampling,] analysis, and reporting of airborne concentrations of asbestos fibers along with[evidence that each laboratory selected holds the appropriate State license and permits and] certification that each laboratory is American Industrial Hygiene Association (AIHA) accredited and that persons counting the samples have been judged proficient by current inclusion on the AIHA Asbestos Analysis Registry (AAR) and successful participation of the laboratory in the Proficiency Analytical Testing (PAT) Program. Where analysis to determine asbestos content in bulk materials or transmission electron microscopy is required, submit evidence that the laboratory is accredited by the National Institute of Science and Technology (NIST) under National Voluntary Laboratory

Accreditation Program (NVLAP) for asbestos analysis. The testing laboratory firm must be independent of the asbestos contractor and must have no employee or employer relationship which could constitute a conflict of interest.

1.3.12 Landfill Approval

****

NOTE: The USEPA has delegated the responsibility of approving landfills for the disposal of asbestos to most States. Verify with the State in which the project is located whether the State or USEPA has jurisdiction and what laws apply.

****

Submit written evidence that the landfill is approved for asbestos disposal by the U.S. Environmental Protection Agency, Region [3][_____], Air Enforcement Section [(38W12)][_____], and local regulatory agencies. Within three working days after delivery, submit detailed delivery tickets, prepared, signed, and dated by an agent of the landfill, certifying the amount of asbestos materials delivered to the landfill. Submit a copy of the waste shipment records within one day of the shipment leaving the project site.

1.3.13 Transporter Certification

****

NOTE: Designer should utilize and reference, where appropriate, Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS as a part of the contract documents or include the appropriate Department of Transportation (DOT) requirements from 49 CFR 107, 171, 172, and 173. If Section 02 81 00 is not included, edit this paragraph to include the DOT references. The contract documents must address all applicable DOT requirements including those for shipping, training, certifications, packaging, markings, labelings, and placards for shippers and transporters in addition to Government, OSHA and EPA requirements.

****

Submit written evidence that the transporter is approved to transport asbestos waste in accordance with the DOT requirements of 49 CFR 171, 49 CFR 172 and 49 CFR 173 as well as registration requirements of 49 CFR 107 and all other State and local regulatory agency requirements.

1.3.14 Medical Certification

Provide a written certification for each worker and supervisor, signed by a licensed physician indicating that the worker and supervisor has met or exceeded all of the medical prerequisites listed herein and in 29 CFR 1926.1101 and 29 CFR 1926.103 as prescribed by law. Submit certificates prior to the start of work but after the main abatement submittal.

1.4 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

****

NOTE: The submittals required for each project are very dependent upon the removal method to be used. Edit the submittals paragraph accordingly.

1.5 QUALITY ASSURANCE

1.5.1 Private Qualified Person Documentation

****

NOTE: Edit requirement for private qualified person to have licensing.

****

Submit the name, address, and telephone number of the Private Qualified Person (PQP) selected to prepare the Asbestos Hazard Abatement Plan, direct monitoring and training, and documented evidence that the PQP has successfully completed training in and is accredited and where required is certified as, a Building Inspector, Contractor/Supervisor Abatement Worker, and Asbestos Project Designer as described by 40 CFR 763 and has successfully completed the National Institute of Occupational Safety and Health (NIOSH) 582 course "Sampling and Evaluating Airborne Asbestos Dust" or equivalent.[The PQP must be appropriately licensed in the State of [_____] as a Project Monitor]. The PQP and the asbestos contractor must not have an employee/employer relationship or financial relationship which could constitute a conflict of interest. The PQP must be a first tier subcontractor.

1.5.2 Designated Competent Person Documentation

****

NOTE: Edit requirement for licensing.

****

The Designated Competent Person must be experienced in the administration and supervision of asbestos abatement projects including exposure assessment and monitoring, work practices, abatement methods, protective measures for personnel, setting up and inspecting asbestos abatement work areas, evaluating the integrity of containment barriers, placement and operation of local exhaust systems, ACM generated waste containment and disposal procedures, decontamination units installation and maintenance requirements, site safety and health requirements, notification of other employees onsite, [_____]. The Designated Competent Person must be on-site at all times when asbestos abatement activities are underway.Submit training certification and a current State of [_____] Asbestos Contractor's and Supervisor's License. Submit evidence that the Designated Competent Person has a minimum of [2] [_____] years of on-the-job asbestos abatement experience relevant to OSHA designated competent person requirements. The Designated Competent Person must be a first tier subcontractor.

1.5.3 Worker's License

****

NOTE: Edit requirement for licensing.

****

Submit documentation that workers meet the requirements of 29 CFR 1926.1101, 40 CFR 61-SUBPART M and have a current State of [_____] Asbestos Workers License.

1.5.4 Contractor's License

****

NOTE: Edit requirement for licensing.

****

Submit a copy of the asbestos contractor's license issued by the State of [_____]. Submit the following certification along with the license: "I certify that the personnel I am responsible for during the course of this project fully understand the contents of 29 CFR 1926.1101, 40 CFR 61-SUBPART MEM 385-1-1, and the Federal, State and local requirements for those asbestos abatement activities that they will be involved in." This certification statement must be signed by the Company's President or Chief Executive.

1.5.5 Air Sampling Results

****

NOTE: Normal practice is to have the Contractor hire one independent Private Qualified Person (the PQP) to perform all required functions. However, some applicable laws forbid this approach and will dictate when the PQP, the GC or both will be required to perform the function involved. However, the Contractor must always hire a PQP.

****

Complete fiber counting and provide results to the [PQP][and][GC] for review within 16 hours of the "time off" of the sample pump. Notify the Contracting Officer immediately of any airborne levels of asbestos fibers in excess of the acceptable limits. Submit sampling results to the Contracting Officer and the affected Contractor employees where required by law within three working days, signed by the testing laboratory employee performing air sampling, the employee that analyzed the sample, and the [PQP][and][GC]. Notify the Contractor and the Contracting Officer immediately of any variance in the pressure differential which could cause adjacent unsealed areas to have asbestos fiber concentrations in excess of 0.01 fibers per cubic centimeter or background whichever is higher. In no circumstance must levels exceed 0.1 fibers per cubic centimeter.

1.5.6 Pressure Differential Recordings for Local Exhaust System

****

NOTE: When an negative pressure enclosure is not required, delete the requirements for the local exhaust system and pressure differential recording.

****

****

NOTE: Normal practice is to have the Contractor hire one independent Private Qualified Person (the PQP) to perform all required functions. However, some applicable laws forbid this approach and will dictate when the PQP, the GC or both will be required to perform the function involved. However, the Contractor must always hire a PQP.

****

Provide a local exhaust system that creates a negative pressure of at least 0.51 mm 0.02 inches of water relative to the pressure external to the enclosure and operate it continuously, 24-hours a day, until the temporary enclosure of the asbestos control area is removed. Submit pressure differential recordings for each work day to the [PQP][and][GC] for review and to the Contracting Officer within 24-hours from the end of each work day.

[1.5.7 Protective Clothing Decontamination Quality Control Records

Provide all records that document quality control for the decontamination of reusable outer protective clothing.

][1.5.8 Protective Clothing Decontamination Facility Notification

Submit written evidence that persons who decontaminate, store, or transport asbestos contaminated clothing used in the performance of this contract were duly notified in accordance with 29 CFR 1926.1101.

]1.5.9 Federal, State or Local Citations on Previous Projects

Submit a statement, signed by an officer of the company, containing a record of any citations issued by Federal, State or local regulatory agencies relating to asbestos activities within the last 5 years (including projects, dates, and resolutions); a list of penalties incurred through non-compliance with asbestos project specifications, including liquidated damages, overruns in scheduled time limitations and resolutions; and situations in which an asbestos-related contract has been terminated (including projects, dates, and reasons for terminations). If there are none, a negative declaration signed by an officer of the company must be provided.

1.5.10 Preconstruction Conference

****

NOTE: Specify additional or modified requirements to be addressed in the preconstruction safety conference within the bracket if different from that described. Confer with the appropriate Construction Office and Safety and Occupational Health Office representatives to make this determination. For

Army projects refer to EP 415-1-260, Chapter 9, Resident Engineers Management Guide. If this conference is addressed in another specification section, reference the appropriate section.
****

Conduct a safety preconstruction conference to discuss the details of the Asbestos Hazard Abatement Plan, Accident Prevention Plan (APP) including the AHAs required in specification Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS [_____]. The safety preconstruction conference must include the Contractor and their Designated Competent Person, Designated IH and Project Supervisor and the Contracting Officer. Deficiencies in the APP will be discussed. Onsite work must not begin until the APP has been accepted. [_____]

1.6 SECURITY

****
NOTE: Specify onsite security requirements to be provided. Confer with the customer and the Contracting Officer for additional requirements.
****

[[_____] must be provided for each regulated area.]A log book must be kept documenting entry into and out of the regulated area. Entry into regulated areas must only be by personnel authorized by the Contractor and the Contracting Officer. Personnel authorized to enter regulated areas must be trained, medically evaluated, and wear the required personal protective equipment.

1.7 EQUIPMENT

1.7.1 Rental Equipment

Provide a copy of the written notification to the rental company concerning the intended use of the equipment and the possibility of asbestos contamination of the equipment.

PART 2 PRODUCTS

2.1 ENCAPSULANTS

Encapsulants must conform to current USEPA requirements, contain no toxic or hazardous substances as defined in 29 CFR 1926.59, and conform to the following performance requirements.

2.1.1 Removal Encapsulants

Requirement	Test Standard
Flame Spread - 25, Smoke Emission - 50	ASTM E84
Life Expectancy - 20 years	ASTM C732 Accelerated Aging Test
Permeability - Minimum 0.4 perms	ASTM E96/E96M

Requirement	Test Standard
Fire Resistance - Negligible affect on fire resistance rating over 3 hour test (Classified by UL for use over fibrous and cementitious sprayed fireproofing)	ASTM E119
Impact Resistance - Minimum 245.5 mm/N 43 in/lb	ASTM D2794 Gardner Impact Test
Flexibility - no rupture or cracking	ASTM D522/D522M Mandrel Bend Test

2.1.2 Bridging Encapsulant

Requirement	Test Standard
Flame Spread - 25, Smoke Emission - 50	ASTM E84
Life Expectancy - 20 years	ASTM C732 Accelerated Aging Test
Permeability - Minimum 0.4 perms	ASTM E96/E96M
Fire Resistance - Negligible affect on fire resistance rating over 3-hour test (Classified by UL for use over fibrous and cementitious sprayed fireproofing)	ASTM E119
Impact Resistance - Minimum 245.5 mm/N 43 in/lb	ASTM D2794 Gardner Impact Test
Flexibility - no rupture or cracking	ASTM D522/D522M Mandrel Bend Test

2.1.3 Penetrating Encapsulant

Requirement	Test Standard
Flame Spread - 25, Smoke Emission - 50	ASTM E84
Life Expectancy - 20 years	ASTM C732 Accelerated Aging Test
Permeability - Minimum 0.4 perms	ASTM E96/E96M
Cohesion/Adhesion Test - 729.5 N of force/meter 50 pounds of force/foot	ASTM E119

Requirement	Test Standard
Fire Resistance - Negligible affect on fire resistance rating over 3-hour test (Classified by UL for use over fibrous and cementitious sprayed fireproofing)	ASTM E119
Impact Resistance - Minimum 245.5 mm/N 43 in/lb	ASTM D2794 Gardner Impact Test
Flexibility - no rupture or cracking	ASTM D522/D522M Mandrel Bend Test

2.1.4 Lock-down Encapsulant

Requirement	Test Standard
Flame Spread - 25, Smoke Emission - 50	ASTM E84
Life Expectancy - 20 years	ASTM C732 Accelerated Aging Test
Permeability - Minimum 0.4 perms	ASTM E96/E96M
Fire Resistance - Negligible affect on fire resistance rating over 3-hour test (Tested with fireproofing over encapsulant applied directly to steel member)	ASTM E119
Bond Strength: 1459 N of force/meter 100 pounds of force/foot	ASTM E736/E736M
(Tests compatibility with cementitious and fibrous fireproofing)	

[2.2 ENCASEMENT PRODUCTS

****

NOTE: This technique is not used often. Before specifying, consult state requirements and ensure that the materials, use requirements and warranties are fully developed with the customer.

****

Encasement must consist of primary cellular polymer coat, polymer finish coat, and any other finish coat as approved by the Contracting Officer.

]2.3 DUCT TAPE

Industrial grade duct tape of appropriate widths suitable for bonding sheet plastic and disposal container.

2.4 DISPOSAL CONTAINERS

****

NOTE: Consult customer, federal, state, and local requirements for the type of disposal container allowed.

****

Leak-tight (defined as solids, liquids, or dust that cannot escape or spill out) disposal containers must be provided for ACM wastes as required by 29 CFR 1926.1101. Disposal containers can be in the form of:

a. Disposal Bags

b. Fiberboard Drums

c. Cardboard Boxes

2.5 SHEET PLASTIC

****

NOTE: Consult customer, federal, state and local requirements. If necessary, specify the type of sheet to be used and select the color and surface treatment.

****

Sheet plastic must be polyethylene of 0.15 mm 6 mil minimum thickness and must be provided in the largest sheet size necessary to minimize seams. Film must be [clear][frosted][or][black] and conform to ASTM D4397, except as specified below

2.5.1 Flame Resistant

Where a potential for fire exists, flame-resistant sheets must be provided. Film must be [frosted][or][black] and must conform to the requirements of NFPA 701.

2.5.2 Reinforced

Reinforced sheets must be provided where high skin strength is required, such as where it constitutes the only barrier between the regulated area and the outdoor environment. The sheet stock must consist of translucent, nylon-reinforced or woven-polyethylene thread laminated between 2 layers of polyethylene film. Film must meet flame resistant standards of NFPA 701.

2.6 MASTIC REMOVING SOLVENT

Mastic removing solvent must be nonflammable and must not contain methylene chloride, glycol ether, or halogenated hydrocarbons. Solvents used onsite must have a flash point greater than 60 degrees C 140 degrees F.

2.7 LEAK-TIGHT WRAPPING

Two layers of 0.15 mm 6 mil minimum thick polyethylene sheet stock must be used for the containment of removed asbestos-containing components or materials such as large tanks, boilers, insulated pipe segments and other materials. Upon placement of the ACM component or material, each layer must be individually leak-tight sealed with duct tape.

2.8 VIEWING INSPECTION WINDOW

Where feasible, a minimum of one clear, 3 mm 1/8 inch thick, acrylic sheet, 450 by 610 mm 18 by 24 inches, must be installed as a viewing inspection window at eye level on a wall in each containment enclosure. The windows must be sealed leak-tight with industrial grade duct tape.

2.9 WETTING AGENTS

****

NOTE: Review the abatement methods to be employed and edit the paragraph accordingly.

****

Removal encapsulant (a penetrating encapsulant) must be provided when conducting removal abatement activities that require a longer removal time or are subject to rapid evaporation of amended water. The removal encapsulant must be capable of wetting the ACM and retarding fiber release during disturbance of the ACM greater than or equal to that provided by amended water. Performance requirements for penetrating encapsulants are specified in paragraph ENCAPSULANTS above.

PART 3 EXECUTION

3.1 EQUIPMENT

****

NOTE: Modify the number of sets of protective equipment as required, depending on the size of the asbestos removal project. Larger projects may require more than two persons on an inspection team.

****

Provide the Contracting Officer or the Contracting Officer's Representative, with at least [two] [_____] complete sets of personal protective equipment [including decontaminating reusable coveralls]as required for entry to and inspection of the asbestos control area. Provide equivalent training to the Contracting Officer or a designated representative as provided to Contractor employees in the use of the required personal protective equipment. Provide manufacturer's certificate of compliance for all equipment used to contain airborne asbestos fibers.

3.1.1 Air Monitoring Equipment

The Contractor's PQP must approve air monitoring equipment. The equipment must include, but must not be limited to:

a. High-volume sampling pumps that can be calibrated and operated at a constant airflow up to 16 liters per minute.

b. Low-volume, battery powered, body-attachable, portable personal pumps that can be calibrated to a constant airflow up to approximately 3.5 liters per minute, and a self-contained rechargeable power pack capable of sustaining the calibrated flow rate for a minimum of 10 hours. The pumps must also be equipped with an automatic flow control unit which must maintain a constant flow, even as filter resistance increases due to accumulation of fiber and debris on the filter surface.

c. Single use standard 25 mm diameter cassette, open face, 0.8 micron pore size, mixed cellulose ester membrane filters and cassettes with 50 mm electrically conductive extension cowl, and shrink bands for personal air sampling.

[d. Single use standard 25 mm diameter cassette, open face, 0.45 micron pore size, mixed cellulose ester membrane filters and cassettes with 50 mm electrically conductive cowl, and shrink bands when conducting environmental area sampling using NIOSH NMAM Methods 7400 and 7402, (and the transmission electric microscopy method specified at 40 CFR 763 if required).

] e. A flow calibrator capable of calibration to within plus or minus 2 percent of reading over a temperature range of minus 20 to plus 60 degrees C minus 4 to plus 140 degrees F and traceable to a NIST primary standard.

3.1.2 Respirators

Select respirators from those approved by the National Institute for Occupational Safety and Health (NIOSH), Department of Health and Human Services.

3.1.2.1 Respirators for Handling Asbestos

Provide personnel engaged in pre-cleaning, cleanup, handling, [encapsulation][removal][and][or][demolition] of asbestos materials with respiratory protection as indicated in 29 CFR 1926.1101 and 29 CFR 1926.103. Breathing air must comply with CGA G-7.

3.1.3 Exterior Whole Body Protection

3.1.3.1 Outer Protective Clothing

Provide personnel exposed to asbestos with disposable "non-breathable,"[or reusable "non-breathable"] whole body outer protective clothing, head coverings, gloves, and foot coverings. Provide disposable plastic or rubber gloves to protect hands. Cloth gloves may be worn inside the plastic or rubber gloves for comfort, but must not be used alone. Make sleeves secure at the wrists, make foot coverings secure at the ankles, and make clothing secure at the neck by the use of tape.[Reusable whole body outer protective clothing must be either disposed of as asbestos contaminated waste upon exiting from the asbestos regulated work area or be properly decontaminated.]

3.1.3.2 Work Clothing

Provide cloth work clothes for wear under the outer protective clothing and foot coverings and either dispose of or properly decontaminate them as recommended by the [GC][PQP] after each use.

3.1.3.3 Personal Decontamination Unit

Provide a temporary, negative pressure unit with a separate decontamination locker room and clean locker room with a shower that complies with 29 CFR 1926.51(f)(4)(ii) through (V) in between for personnel required to wear whole body protective clothing. Provide two separate lockers for each asbestos worker, one in each locker room. Keep street clothing and street shoes in the clean locker. HEPA vacuum and remove asbestos contaminated disposable protective clothing while still wearing respirators at the boundary of the asbestos work area and seal in impermeable bags or containers for disposal.[HEPA vacuum and remove asbestos contaminated reusable protective clothing while still wearing respirators at the boundary of the asbestos work area, seal in two impermeable bags, label outer bag as asbestos contaminated waste, and transport for decontamination.] Do not wear work clothing between home and work. Locate showers between the decontamination locker room and the clean locker room and require that all employees shower before changing into street clothes. Collect used shower water and filter with approved water filtration equipment to remove asbestos contamination. Wastewater filters must be installed in series with the first stage pore size [20] [_____] microns and the second stage pore size of [5] [_____] microns. Dispose of filters and residue as asbestos waste. Discharge clean water to the sanitary system. Dispose of asbestos contaminated work clothing as asbestos contaminated waste[or properly decontaminate as specified in the Contractor's Asbestos Hazard Abatement Plan]. Keep the floor of the decontamination unit's clean room dry and clean at all times. Proper housekeeping and hygiene requirements must be maintained. Provide soap and towels for showering, washing and drying. Cloth towels provided must be disposed of as ACM waste or must be laundered in accordance with 29 CFR 1926.1101. Physically attach the decontamination units to the asbestos control area. Construct both a personnel decontamination unit and an equipment decontamination unit onto and integral with each asbestos control area.

[3.1.3.4 Decontamination of Reusable Outer Protective Clothing

When reusable outer protective clothing is used, transport the double bagged clothing to a previously notified commercial/industrial decontamination facility for decontamination. Perform non-destructive testing to determine the effectiveness of asbestos decontamination. If representative sampling is used, ensure the statistical validity of the sampling results. If representative sampling is used, reject any entire batch in which any of the pieces exceed 40 fibers per square millimeter. Inspect reusable protective clothing prior to use to ensure that it will provide adequate protection and is not or is not about to become ripped, torn, deteriorated, or damaged, and that it is not visibly contaminated. Notify, in writing, all personnel involved in the decontamination of reusable outer protective clothing as indicated in 29 CFR 1926.1101.

]3.1.3.5 Eye Protection

Provide eye protection that complies with ANSI/ISEA Z87.1 when operations present a potential eye injury hazard. Provide goggles to personnel engaged in asbestos abatement operations when the use of a full face respirator is not required.

3.1.4 Regulated Areas

All Class I, II, and III asbestos work must be conducted within regulated areas. The regulated area must be demarcated to minimize the number of persons within the area and to protect persons outside the area from exposure to airborne asbestos. Control access to regulated areas, ensure that only authorized personnel enter, and verify that Contractor required medical surveillance, training and respiratory protection program requirements are met prior to allowing entrance.

3.1.5 Load-out Unit

Provide a temporary load-out unit that is adjacent and connected to the regulated area[and][access tunnel]. Attach the load-out unit in a leak-tight manner to each regulated area.

3.1.6 Warning Signs and Labels

Provide[bilingual] warning signs[printed in English and [_____]] at all approaches to asbestos control areas. Locate signs at such a distance that personnel may read the sign and take the necessary protective steps required before entering the area. Provide labels and affix to all asbestos materials, scrap, waste, debris, and other products contaminated with asbestos. Containers with preprinted warning labels conforming to the requirements are acceptable

3.1.6.1 Warning Sign

****

NOTE: "WEAR RESPIRATORY PROTECTION AND PROTECTIVE CLOTHING IN THIS AREA" will be added to the warning sign when protective equipment is required.

****

Provide vertical format conforming to 29 CFR 1926.200, and 29 CFR 1926.1101 minimum 500 by 355 mm 20 by 14 inches displaying the following legend in the lower panel:

Legend	Notation
DANGER	25 mm one inch Sans Serif Gothic or Block
ASBESTOS	25 mm one inch Sans Serif Gothic or Block
MAY CAUSE CANCER	25 mm one inch Sans Serif Gothic or Block
CAUSES DAMAGE TO LUNGS	6 mm 1/4 inch Sans Serif Gothic or Block
AUTHORIZED PERSONNEL ONLY	6 mm 1/4 inch Sans Serif Gothic or Block
[WEAR RESPIRATORY PROTECTION AND PROTECTIVE CLOTHING IN THIS AREA]	6 mm 1/4 inch Sans Serif Gothic or Block

Spacing between lines must be at least equal to the height of the upper of any two lines.

3.1.6.2 Warning Labels

Provide labels conforming to 29 CFR 1926.1101 of sufficient size to be clearly legible, displaying the following legend:

DANGER
CONTAINS ASBESTOS FIBERS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
DO NOT BREATHE DUST AVOID CREATING DUST

3.1.7 Local Exhaust System

****

NOTE: When a negative pressure enclosure is not required, delete the requirements for the local exhaust system and pressure differential recording.

****

Provide a local exhaust system in the asbestos control area in accordance with ASSP Z9.2 and 29 CFR 1926.1101 that will provide at least four air changes per hour inside of the negative pressure enclosure. Local exhaust equipment must be operated 24-hours per day, until the asbestos control area is removed and must be leak proof to the filter and equipped with HEPA filters. Maintain a minimum pressure differential in the control area of minus 0.51 mm 0.02 inch of water column relative to adjacent, unsealed areas. Provide continuous 24-hour per day monitoring of the pressure differential with a pressure differential automatic recording instrument. The building ventilation system must not be used as the local exhaust system for the asbestos control area. Filters on exhaust equipment must conform to ASSP Z9.2 and UL 586. Terminate the local exhaust system out of doors and remote from any public access or ventilation system intakes.

3.1.8 Tools

Vacuums must be leak proof to the filter and equipped with HEPA filters. Filters on vacuums must conform to ASSP Z9.2 and UL 586. Do not use power tools to remove asbestos containing materials unless the tool is equipped with effective, integral HEPA filtered exhaust ventilation systems. Remove all residual asbestos from reusable tools prior to storage or reuse. Reusable tools must be thoroughly decontaminated prior to being removed from the regulated areas.

3.1.9 Rental Equipment

If rental equipment is to be used, furnish written notification to the rental agency concerning the intended use of the equipment and the possibility of asbestos contamination of the equipment.

[3.1.10 Glovebags

****

NOTE: Include this paragraph if glovebag technique is permitted to be used in the project.

****

Submit written manufacturers proof that glovebags will not break down under expected temperatures and conditions.

]3.1.11 Single Stage Decontamination Area

A decontamination area (equipment room/area) must be provided for Class I work involving less than 7.5 m 25 feet or 0.9 square meters 10 square feet of TSI or surfacing ACM, and for Class II and Class III asbestos work operations where exposures exceed the PELs or where there is no negative exposure assessment. The equipment room or area must be adjacent to the regulated area for the decontamination of employees, material, and their equipment which could be contaminated with asbestos. The area must be covered by an impermeable drop cloth on the floor or horizontal working surface. The area must be of sufficient size to accommodate cleaning of equipment and removing personal protective equipment without spreading contamination beyond the area.

3.1.12 Decontamination Area Exit Procedures

Ensure that the following procedures are followed:

a. Before leaving the regulated area, remove all gross contamination and debris from work clothing using a HEPA vacuum.

b. Employees must remove their protective clothing in the equipment room and deposit the clothing in labeled impermeable bags or containers for disposal or laundering.

c. Employees must not remove their respirators until showering.

d. Employees must shower prior to entering the clean room. If a shower has not been located between the equipment room and the clean room or the work is performed outdoors, ensure that employees engaged in Class I asbestos jobs: a) Remove asbestos contamination from their work suits in the equipment room or decontamination area using a HEPA vacuum before proceeding to a shower that is not adjacent to the work area; or b) Remove their contaminated work suits in the equipment room, without cleaning worksuits, and proceed to a shower that is not adjacent to the work area.

3.2 WORK PROCEDURE

****

NOTE: EPA NESHAP at 40 CFR 61, Subpart M and OSHA 29 CFR 1926.1101(g)(1)(ii) require adequately wet removal procedures. Use wet removal procedures in almost all cases. Wet removal is the preferred method and the least hazardous. Dry removal as an option can be used to allow the Contractor to use dry removal where wet removal may damage equipment or present an extreme hazard. Dry removal as the only method of removal should only be specified if freezing is likely to occur, safety hazards preclude the use of water, or severe water damage to equipment, would occur during wet removal. If dry removal alone is allowed, carefully edit the specification to remove all reference to amended water and wetting down procedures and to include a requirement for a written variance submitted by the Contractor along with the written approval of any regulatory authority having jurisdiction.

****

****

NOTE: Negative pressure enclosure and glovebag techniques pertain to the two most general but yet essentially different asbestos control techniques used for asbestos removal. Encapsulation work practice techniques are listed here, also. The use of unlisted removal work practice techniques will be acceptable if they are proven at least as safe as the listed practices. The appropriate technique depends on existing conditions, but must be that technique that provides the best control during abatement at most reasonable cost.

****

****

NOTE: Requirements for abatement of asbestos outdoors varies considerably with the work and the location involved. Specify minimum requirements for abatement of asbestos outdoors where construction of a containment is not practical. The designer will provide the best suited, specific requirements necessary for the particular project to prohibit or reduce asbestos exposure to other Contractor employees, customer resources and the general public.

****

Perform asbestos related work in accordance with 29 CFR 1926.1101, 40 CFR 61-SUBPART M,[NAVFAC P-502,] and as specified herein. Use [[wet][or][if given prior EPA approval, dry] removal procedures][appropriate encapsulation procedures as listed in the asbestos hazard abatement plan] and [negative pressure enclosure] [_____] techniques. Wear and utilize protective clothing and equipment as specified herein. No eating, smoking, drinking, chewing gum, tobacco, or applying cosmeticsis permitted in the asbestos work or control areas. Personnel of other trades not engaged in the [encapsulation][removal and demolition] of asbestos containing material must not be exposed at any time to airborne concentrations of asbestos unless all the personnel protection and training provisions of this specification are complied with by the trade personnel.[Seal all roof top penetrations, except plumbing vents, prior to asbestos roofing work.] Shut down the building heating, ventilating, and air conditioning system, cap the openings to the system, [and provide temporary [heating,][and][ventilation,][and][air conditioning]] prior to the commencement of asbestos work. Power to the regulated area must be locked-out and tagged in accordance with 29 CFR 1910.147.[Disconnect electrical service when [encapsulation][wet removal] is performed and provide temporary electrical service with verifiable ground fault circuit interrupter (GFCI) protection prior to the use of any [water][encapsulant].] All electrical work must be performed by a licensed electrician. Stop abatement work in the regulated area immediately when the airborne total fiber concentration: (1) equals or exceeds 0.01 f/cc, or the pre-abatement concentration, whichever is greater, outside the regulated area; or (2) equals or exceeds 1.0 f/cc inside the regulated area. Correct the condition to the satisfaction of the Contracting Officer, including visual inspection and air sampling. Work must resume only upon notification by the Contracting Officer. Corrective actions must be documented. If an asbestos fiber release or spill occurs[outside of the asbestos control area], stop work immediately, correct the condition to the satisfaction of the Contracting Officer including clearance sampling, prior to resumption of work.

3.2.1 Building Ventilation System and Critical Barriers

Building ventilation system supply and return air ducts in a regulated area must be[shut down and isolated by lockable switch or other positive means in accordance with 29 CFR 1910.147.][isolated by airtight seals to prevent the spread of contamination throughout the system.] The airtight seals must consist of [air-tight rigid covers for building ventilation supply and exhaust grills where the ventilation system is required to remain in service during abatement][2 layers of polyethylene]. Edges to wall, ceiling and floor surfaces must be sealed with industrial grade duct tape.

a. A Competent Person must supervise the work.

b. For indoor work, critical barriers must be placed over all openings to the regulated area.

c. Impermeable dropcloths must be placed on surfaces beneath all removal activity.

3.2.2 Protection of Existing Work to Remain

****

NOTE: Normal practice is to have the Contractor hire one independent Private Qualified Person (the PQP) to perform all required functions. However, some applicable laws forbid this approach and will dictate when the PQP, the GC or both will be required to perform the function involved. However, the Contractor must always hire a PQP.

****

Perform work without damage or contamination of adjacent work. Where such work is damaged or contaminated as verified by the Contracting Officer using visual inspection or sample analysis, it must be restored to its original condition or decontaminated by the Contractor at no expense to the Government as deemed appropriate by the Contracting Officer. This includes inadvertent spill of dirt, dust, or debris in which it is reasonable to conclude that asbestos may exist. When these spills occur, stop work immediately. Then clean up the spill. When satisfactory visual inspection and air sampling results are obtained from the [PQP][GC] work may proceed at the discretion of the Contracting Officer.

3.2.3 Furnishings

****

NOTE: Choose one of the following options. In most projects, the Government will remove furniture and equipment before the Contractor begins work. In this case the first paragraph should be used. The third paragraph should only be used when existing furnishings have been contaminated with asbestos fibers and the Contractor will be required to clean these items. When the third paragraph is used, identify the furnishings and indicate the quantity of each.

****

****

NOTE: The designer must decide if porous, non-solid surfaced items can be cleaned or must be disposed of as contaminated waste. If cleaning is chosen, specify methods.
****

[Furniture [,(_____)] and equipment will be removed from the area of work by the Government before asbestos work begins.

][Furniture [,(_____)] and equipment will remain in the building. Cover and seal furnishings with 0.15 mm 6-mil plastic sheet or remove from the work area and store in a location on site approved by the Contracting Officer.

][Furnishings listed below and located in the work area are considered to be contaminated with asbestos fibers. Transfer these items to an area on site approved by the Contracting Officer, decontaminate (wet methods where possible), and then store until the room from which they came is declared clean and safe for entry.[Carpets, draperies, and other items with porous, non-solid surfaces can not be suitably cleaned and must be properly disposed of as contaminated waste.] At the conclusion of the asbestos removal work and cleanup operations, transfer all objects so removed and cleaned back to the area from which they came and re-install them. Base bids on decontaminating:

a. [_____] Desks

b. [_____] Filing cabinets

c. [_____] Linear meters feet of shelving

d. [_____] Cubic meters feet of books, papers, files, [_____].

e. [_____].

]3.2.4 Precleaning

Wet wipe and HEPA vacuum all surfaces potentially contaminated with asbestos prior to establishment of an enclosure.

3.2.5 Asbestos Control Area Requirements

****
NOTE: When negative pressure enclosure is infeasible, use paragraph GLOVEBAG and delete paragraph NEGATIVE PRESSURE ENCLOSURE. If the project has both areas which can be enclosed and areas which cannot be enclosed, retain the appropriate paragraphs and identify the areas which must be enclosed and the areas which cannot be enclosed.
****

3.2.5.1 Negative Pressure Enclosure

****
NOTE: Describe the ACM that must be removed using a Negative Pressure Enclosure.
****

Removal of [asbestos contaminated acoustical ceiling tiles,] [spray applied fireproofing,] [thermal system insulation,] [gypsum wallboard/joint compound] [_____] require the use of a negative pressure enclosure. Block and seal openings in areas where the release of airborne asbestos fibers can be expected. Establish an asbestos negative pressure enclosure with the use of curtains, portable partitions, or other enclosures in order to prevent the escape of asbestos fibers from the contaminated asbestos work area. Negative pressure enclosure development must include protective covering of uncontaminated walls, and ceilings with a continuous membrane of two layers of minimum 0.15 mm 6-mil plastic sheet sealed with tape to prevent water or other damage. Provide two layers of 0.15 mm 6-mil plastic sheet over floors and extend a minimum of 300 mm 12 inches up walls. Seal all joints with tape. Provide local exhaust system in the asbestos control area. Openings will be allowed in enclosures of asbestos control areas for personnel and equipment entry and exit, the supply and exhaust of air for the local exhaust system and the removal of properly containerized asbestos containing materials. Replace local exhaust system filters as required to maintain the efficiency of the system.

3.2.5.2 Glovebag

****

NOTE: Specify the asbestos material to be removed in the first blank and identify the location of the area which cannot be enclosed in the second blank. Verify State and local regulations allow the use of glovebags.

****

If the construction of a negative pressure enclosure is infeasible for the [removal] [encapsulation] of [_____] located [_____]. Use alternate techniques as indicated in 29 CFR 1926.1101. Establish designated limits for the asbestos regulated area with the use of rope or other continuous barriers, and maintain all other requirements for asbestos control areas. The PQP must conduct personal samples of each worker engaged in asbestos handling (removal, disposal, transport and other associated work) throughout the duration of the project. If the quantity of airborne asbestos fibers monitored at the breathing zone of the workers at any time exceeds background or 0.01 fibers per cubic centimeter whichever is greater, stop work, evacuate personnel in adjacent areas or provide personnel with approved protective equipment at the discretion of the Contracting Officer. This sampling may be duplicated by the Government at the discretion of the Contracting Officer. If the air sampling results obtained by the Government differ from those obtained by the Contractor, the Government will determine which results predominate. If adjacent areas are contaminated as determined by the Contracting Officer, clean the contaminated areas, monitor, and visually inspect the area as specified herein.

3.2.5.3 Regulated Area for Class II Removal

Removal of [asbestos containing floor tile/mastic,] [carpet/mastic,] [sealants,] [_____] are Class II removal activities. Establish designated limits for the asbestos regulated work area with the use of red barrier tape; install critical barriers, splash guards and signs, and maintain all other requirements for asbestos control area except local exhaust. Place impermeable dropcloths on surfaces beneath removal activity extending out 3 feet in all directions. A detached decontamination system may be used. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If workers the airborne fiber concentration of the workers or designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work immediately and correct the situation.

3.2.6 Removal Procedures

****

NOTE: Choose REMOVAL PROCEDURES or ENCAPSULATION PROCEDURES as appropriate for the project.

****

Wet asbestos material with a fine spray of [amended water][a specific wetting agent such as light oil] during removal, cutting, or other handling so as to reduce the emission of airborne fibers. Remove material and immediately place in 0.15 mm 6 mil plastic disposal bags. Remove asbestos containing material in a gradual manner, with continuous application of the amended water or wetting agent in such a manner that no asbestos material is disturbed prior to being adequately wetted. Where unusual circumstances prohibit the use of 0.15 mm 6 mil plastic bags, submit an alternate proposal for containment of asbestos fibers to the Contracting Officer for approval. For example, in the case where both piping and insulation are to be removed, the Contractor may elect to wet the insulation, wrap the pipes and insulation in plastic and remove the pipe by sections. Containerize asbestos containing material while wet. Do not allow asbestos material to accumulate or become dry. Lower and otherwise handle asbestos containing material as indicated in 40 CFR 61-SUBPART M.

3.2.6.1 Sealing Contaminated Items Designated for Disposal

****

NOTE: Use this paragraph only when asbestos contaminated items are also designated for removal and disposal.

****

Remove contaminated architectural, mechanical, and electrical appurtenances such as venetian blinds, full-height partitions, carpeting, duct work, pipes and fittings, radiators, light fixtures, conduit, panels, and other contaminated items designated for removal by completely coating the items with an asbestos lock-down encapsulant at the demolition site before removing the items from the asbestos control area. These items need not be vacuumed. The asbestos lock-down encapsulant must be tinted a contrasting color and spray-applied by airless method. Thoroughness of sealing operation must be visually gauged by the extent of colored coating on exposed surfaces. Lock-down encapsulants must comply with the performance requirements specified herein.

3.2.6.2 Exposed Pipe Insulation Edges

Contain edges of asbestos insulation to remain that are exposed by a removal operation. Wet and cut the rough ends true and square with sharp tools and then encapsulate the edges with a 6 mm 1/4 inch thick layer of non-asbestos containing insulating cement troweled to a smooth hard finish. When cement is dry, lag the end with a layer of non-asbestos lagging cloth, overlapping the existing ends by at least 100 mm 4 inches. When insulating cement and cloth is an impractical method of sealing a raw edge of asbestos, take appropriate steps to seal the raw edges as approved by the Contracting Officer.

3.2.7 Methods of Compliance

3.2.7.1 Mandated Practices

The specific abatement techniques and items identified must be detailed in the Contractor's AHAP. Use the following engineering controls and work practices in all operations, regardless of the levels of exposure:

a. Vacuum cleaners equipped with HEPA filters.

b. Wet methods or wetting agents except where it can be demonstrated that the use of wet methods is unfeasible due to the creation of electrical hazards, equipment malfunction, and in roofing.

c. Prompt clean-up and disposal.

d. Inspection and repair of polyethylene.

e. Cleaning of equipment and surfaces of containers prior to removing them from the equipment room or area.

3.2.7.2 Control Methods

Use the following control methods:

a. Local exhaust ventilation equipped with HEPA filter;

b. Enclosure or isolation of processes producing asbestos dust;

c. Where the feasible engineering and work practice controls are not sufficient to reduce employee exposure to or below the PELs, use them to reduce employee exposure to the lowest levels attainable and must supplement them by the use of respiratory protection.

3.2.7.3 Unacceptable Practices

The following work practices must not be used:

a. High-speed abrasive disc saws that are not equipped with point of cut ventilator or enclosures with HEPA filtered exhaust air.

b. Compressed air used to remove asbestos containing materials, unless the compressed air is used in conjunction with an enclosed ventilation system designed to capture the dust cloud created by the compressed air.

c. Dry sweeping, shoveling, or other dry clean up.

d. Employee rotation as a means of reducing employee exposure to asbestos.

3.2.8 Class I Work Procedures

****

Note: OSHA believes that most outdoor Class I work may be safely done without enclosures (ref. OSHA Instruction CPL 2-2.63, change 1, dated 9 January 1996); that is, OSHA does not require enclosures. An exposure assessment must be made prior to outdoor

work to determine other required controls. Remove this paragraph when not required in the project.
****

In addition to requirements of paragraphs MANDATED PRACTICES and CONTROL METHODS, the following engineering controls and work practices must be used:

a. A Competent Person must supervise the installation and operation of the control methods.

b. For jobs involving the removal of more than 7.5 m 25 feet or 0.9 square m 10 square feet of TSI or surfacing material, place critical barriers over all openings to the regulated area.

c. HVAC systems must be isolated in the regulated area by sealing with a double layer of plastic or air-tight rigid covers.

d. Impermeable dropcloths (0.15 mm6 mil or greater thickness) must be placed on surfaces beneath all removal activity.

e. Where a negative exposure assessment has not been provided or where exposure monitoring shows the PEL was exceeded, the regulated area must be ventilated with a HEPA unit and employees must use PPE.

3.2.9 Specific Control Methods for Class I Work

****
NOTE: Remove these paragraph or subparagraphs when not required in the project.
****

Use Class I work procedures, control methods and removal methods for the following ACM:

a. Spray Applied Fireproofing

b. Gypsum Wallboard and Joint Compound

c. Thermal System Insulation and Mudded Pipe Fittings

d. Plaster and Textured Ceilings and Walls

e. Vermiculite

3.2.9.1 Negative Pressure Enclosure (NPE) System

****
NOTE: Before specifying a negative pressure enclosure system, the designer should determine if an enclosure system is feasible. The enclosure should be the minimum area to encompass all the working surfaces yet allow unencumbered movement by the workers, provide unrestricted air flow past the workers, and ensure walking surfaces can be kept free of tripping hazards.
****

The system must provide at least four air changes per hour inside the containment. The local exhaust unit equipment must be operated 24-hours per day until the containment is removed. The NPE must be smoke tested for leaks at the beginning of each shift and be sufficient to maintain a minimum pressure differential of minus 0.5 mm 0.02 inch of water column relative to adjacent, unsealed areas. Pressure differential must be monitored continuously, 24-hours per day, with an automatic manometric recording instrument and Records must be provided daily on the same day collected to the Contracting Officer. The Contracting Officer must be notified immediately if the pressure differential falls below the prescribed minimum. The building ventilation system must not be used as the local exhaust system for the regulated area. The NPE must terminate outdoors unless an alternate arrangement is allowed by the Contracting Officer. All filters used must be new at the beginning of the project and must be periodically changed as necessary and disposed of as ACM waste.

3.2.9.2 Glovebag Systems

Glovebags must be used without modification, smoke-tested for leaks, and completely cover the circumference of pipe or other structures where the work is to be done. Glovebags must be used only once and must not be moved. Glovebags must not be used on surfaces that have temperatures exceeding 66 degrees C 150 degrees F. Prior to disposal, glovebags must be collapsed using a HEPA vacuum. Before beginning the operation, loose and friable material adjacent to the glovebag operation must be wrapped and sealed in 2 layers of plastic or otherwise rendered intact. At least two persons must perform glovebag removal. Asbestos regulated work areas must be established for glovebag abatement. Designated boundary limits for the asbestos work must be established with rope or other continuous barriers and all other requirements for asbestos control areas must be maintained, including area signage and boundary warning tape.

a. Attach HEPA vacuum systems to the bag to prevent collapse during removal of ACM.

b. The negative pressure glove boxes must be fitted with gloved apertures and a bagging outlet and constructed with rigid sides from metal or other material which can withstand the weight of the ACM and water used during removal. A negative pressure must be created in the system using a HEPA filtration system. The box must be smoke tested for leaks prior to each use.

3.2.9.3 Mini-Enclosure

[Single bulkhead containment][Double bulkhead containment][or][Mini-containment (small walk-in enclosure)] to accommodate no more than two persons, may be used if the disturbance or removal can be completely contained by the enclosure. The mini-enclosure must be inspected for leaks and smoke tested before each use. Air movement must be directed away from the employee's breathing zone within the mini-enclosure.

3.2.9.4 Wrap and Cut Operation

****

NOTE: When pipes are insulated with ACM, removal of the entire pipe may be more protective, easier, and more cost-effective than stripping the asbestos insulation from the pipe. The wrap and cut procedure consists of two distinct operations. The wrap portion requires the removal of small amounts of asbestos from either side of the pipe to be cut;

this will be a Class I or III operation depending on the amount of asbestos removed. Once the asbestos is removed and wrapped, the pipe is then cut. OSHA considers the cutting portion of the job as unclassified, as it does not involve asbestos removal. If the wrap and cut operation is conducted in a negative pressure enclosure system, the glovebag step is not required, although recommended.
****

Prior to cutting pipe, the asbestos-containing insulation must be wrapped with polyethylene and securely sealed with duct tape to prevent asbestos becoming airborne as a result of the cutting process. The following steps must be taken: install glovebag, strip back sections to be cut 150 mm 6 inches from point of cut, and cut pipe into manageable sections.

3.2.9.5 Class I Removal Method

****
NOTE: The removal procedures described below are typical for asbestos abatement projects. Revise or add additional removal procedures as required to address the specific ACM to be abated. Consult with Federal, State and local regulations for additional information.
****

Class I ACM must be removed using a control method described above. Prepare work area as previously specified. Establish designated limits for the asbestos regulated work area with the use of red barrier tape, critical barriers, signs, and maintain all other requirements for asbestos control area. Spread one layer of 0.15 mm 6-mil seamless plastic sheeting on the floor below the work area.[Remove asbestos containing spray applied fireproofing using a scraper and wet methods and immediately place into 0.15 mm 6-mil thickness disposal bag. After removal of the material use a wire brush to clean the exposed substrate to remove residual material. Continue wet cleaning until surfaces are free of visible debris.][Cut manageable sections of gypsum wallboard and joint compound and immediately place into a 0.15 mm 6-mil minimum thickness disposal bag or other approved container. Make every effort to keep the material from falling to the floor of the work area. Use a wire brush and wet clean to remove residual material from studs. Continue wet cleaning until the surface is clean of visible material and encapsulate stud walls.][Remove ACM thermal system insulation and mudded pipe fittings using mechanical means and wet methods and immediately place into 0.15 mm 6-mil thickness disposal bag. Continue wet cleaning until surfaces are free of visible debris.][Remove ACM plaster ceilings or walls using mechanical means and adequately wet methods and immediately place into 0.15 mm 6-mil thickness disposal bag. Make every effort to keep the material from falling to the floor of the work area. Continue wet cleaning until surfaces are free of visible debris.][Remove ACM textured ceiling finish using a scraper and wet methods and immediately place into 0.15 mm 6-mil thickness disposal bag. Floors are considered contaminated from fallen textured ceiling finish. Clean up debris on floor and dispose of [carpet]as asbestos contaminated material. After removal of the material use a wire brush to clean the exposed [concrete]ceiling to remove residual material. Continue wet cleaning until surfaces are free of visible debris.][Remove ACM vermiculite using mechanical means and adequately wet methods and immediately place into 0.15 mm 6-mil thickness disposal bag. Make every effort to keep the material from falling to the floor of the work area. Continue wet cleaning until surfaces are free of visible debris.] Bag all asbestos debris which has fallen to the floor as asbestos-containing debris. Place all debris in plastic disposal bags of 0.15 mm 6-mil minimum thickness. Once the material is in the disposal bag, apply additional water as needed to achieve "adequately wet" conditions for NESHAP compliance. Place bagged asbestos waste under negative pressure with the use of a HEPA vacuum, goose neck and duck tape to seal the bag, wash to remove any visible contamination and place into a second 0.15 mm 6-mil minimum thickness disposal bag. Containerize asbestos containing waste while wet. Lower and otherwise handle asbestos containing materials as indicated in 40 CFR 61-SUBPART M. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If the quantity of airborne asbestos fibers monitored at the breathing zone of the workers or the designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work, and immediately correct the situation.

3.2.10 Class II Work Procedures

****

NOTE: Class II work may also be performed using a method allowed for Class I work, except that glovebags and glove boxes are allowed if they fully enclose the Class II material to be removed. Remove this paragraph when not required in the project.

****

In addition to the requirements of paragraphs MANDATED PRACTICES and CONTROL METHODS, the following engineering controls and work practices must be used:

a. A Competent Person must supervise the work.

b. For indoor work, critical barriers must be placed over all openings to the regulated area.

c. Impermeable dropcloths must be placed on surfaces beneath all removal activity.

3.2.11 Specific Control Methods for Class II Work

****

NOTE: If the removal of the adhesive is necessary, wet methods should be used when removing residual adhesive. The adhesive must be either wet-scraped manually or removed using low speed floor machine (300 RPM or less) and wetted sand or a removal solution. The adhesive residues must be placed in an impermeable trash bag while still wet. Remaining water or dirt in the area must then be HEPA vacuumed.

Removal of "intact" cements, coatings, mastics, and flashings is not Class II work. ACM is not rendered non-intact simply by being separated into smaller pieces.

Remove these paragraph or subparagraphs when not

required in the project.
****

****
NOTE: The removal procedures described below are typical for asbestos abatement projects. Delete, revise or add additional removal procedures as required to address the specific ACM to be abated. Consult with Federal, State and local regulations for additional information.
****

3.2.11.1 [Vinyl and Asphaltic Flooring Materials] [Carpet and Mastic]

Establish designated limits for the asbestos regulated work area with the use of red barrier tape, critical barriers, signs, and maintain all other requirements for asbestos control area except local exhaust. A detached decontamination system may be used. When removing [vinyl floor tile and mastic][carpet and mastic] which contains ACM, use the following practices. Remove [floor tile and mastic][carpet and mastic] using adequately wet methods. Remove [floor tiles][carpet and mastic] intact (if possible).[Wetting is not required when floor tiles are heated and removed intact.] Do not sand flooring or its backing. Scrape residual adhesive and backing using wet methods. Mechanical chipping is prohibited unless performed in a negative pressure enclosure. Dry sweeping is prohibited. Use vacuums equipped with HEPA filter, disposable dust bag, and metal floor tool (no brush) to clean floors. Place debris into a 0.15 mm 6-mil minimum thickness disposal bag or other approved container. Once the material is in the disposal bag, apply additional water as needed to achieve "adequately wet" conditions for NESHAP compliance. Place bagged asbestos waste under negative pressure with the use of a HEPA vacuum, goose neck and duck tape to seal the bag, wash to remove any visible contamination and place into a second 0.15 mm 6-mil minimum thickness disposal bag. Containerize asbestos containing waste while wet. Lower and otherwise handle asbestos containing materials as indicated in 40 CFR 61-SUBPART M. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If workers the airborne fiber concentration of the workers or designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work immediately and correct the situation.

3.2.11.2 Sealants and Mastic

Establish designated limits for the asbestos regulated work area with the use of red barrier tape, critical barriers and signs, and maintain all other requirements for asbestos control area except local exhaust. Spread 0.15 mm 6-mil plastic sheeting on the ground around the perimeter of the work area extending out in all directions. Using adequately wet methods, carefully remove the ACM sealants and mastics using a scraper of knife blade. As it is removed place the material into a disposal bag. Make every effort to keep the asbestos material from falling to the ground or work area floor below. Dry sweeping is prohibited. Use vacuums equipped with HEPA filter and disposable dust bag. Place debris into a 0.15 mm 6-mil minimum thickness disposal bag or other approved container. Once the material is in the disposal bag, apply additional water as needed to achieve "adequately wet" conditions for NESHAP compliance. Place bagged asbestos waste under negative pressure with the use of a HEPA vacuum, goose neck and duck tape to seal the bag, wash to remove any visible contamination and place into a second 0.15 mm 6-mil minimum thickness disposal bag. Containerize asbestos containing waste while wet. Lower and otherwise handle asbestos containing materials as indicated in 40 CFR 61-SUBPART M. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If the airborne fiber concentration of the workers or at designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work immediately and correct the situation.

3.2.11.3 Suspect Fire Doors

Establish designated limits for the asbestos regulated work area with the use of red barrier tape, critical barriers, signs, and maintain all other requirements for asbestos control area except local exhaust. A detached decontamination system may be used. Spread 0.15 mm 6-mil plastic sheeting on the ground beneath the work area and around the perimeter of the work area extending out in all directions. Remove door intact from hinges and wrap with 6-mil plastic sheeting. Inspect the interior areas of the door to determine if ACM is present. If ACM is not present the door may be disposed of as general construction debris. If ACM is present place whole door in enclosed container for disposal. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If the airborne fiber concentration of the workers or designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work immediately and correct the situation.

3.2.11.4 Roofing Materials

****

NOTE: Removal or repair of sections of intact roofing less than 2.5 square meters 25 square feet in area does not require use of wet methods or HEPA vacuuming as long as manual methods, which do not render the material non-intact, are used to remove the material without creating visible dust. In determining whether a job involves less than 2.5 square meters 25 square feet, the designer should specify all removal and repair work to be performed on the same roof on the same day.

****

Establish designated limits for the asbestos regulated work area with the use of red barrier tape, critical barriers, signs, and maintain all other requirements for asbestos control area except local exhaust. When removing roofing materials which contain ACM as described in 29 CFR 1926.1101 (g)(8)(ii), use the following practices. Roofing material must be removed in an intact state. Wet methods must be used to remove roofing materials that are not intact, or that will be rendered not intact during removal, unless such wet methods are not feasible or will create safety hazards. When removing built-up roofs, with asbestos-containing roofing felts and an aggregate surface, using a power roof cutter, all dust resulting from the cutting operations must be collected by a HEPA dust collector, or must be HEPA vacuumed by vacuuming along the cut line. Asbestos-containing roofing material must not be dropped or thrown to the ground, but must be lowered to the ground via covered, dust-tight chute, crane, hoist or other method approved by the Contracting Officer. Any ACM that is not intact must be lowered to the ground as soon as practicable, but not later than the end of the work shift. While the material remains on the roof it must be kept wet or placed in an impermeable waste bag or wrapped in plastic sheeting. Intact ACM must be lowered to the ground as soon as practicable, but not later than the end of the work shift. Unwrapped material must be transferred to a closed receptacle. Critical barriers must be placed over roof level heating and ventilation air intakes. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If the airborne fiber concentration of the workers or designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work immediately and correct the situation.

3.2.11.5 Cementitious Siding and Shingles or Transite Panels

****

NOTE: Alternate work practices which do not involve hand removal may be specified according to 29 CFR 1926.1101(g)(8)(vi), "Alternative Work Practices and Controls"; EPA 340/1-92/013 "A Guide to Normal Demolition Practices Under the Asbestos NESHAP"; EPA document Asbestos/Demolition Decision Tree (1994); state and local requirements. For application on multiple building demolition or siding removal, pilot tests to determine feasibility, practicality, and compliance are recommended.

****

Establish designated limits for the asbestos regulated work area with the use of red barrier tape, critical barriers, signs, and maintain all other requirements for asbestos control area except local exhaust. When removing cementitious asbestos-containing siding, shingles or Transite panels use the following work practices. Intentionally cutting, abrading or breaking is prohibited. Each panel or shingle must be sprayed with amended water prior to removal. Nails must be cut with flat, sharp instruments. Unwrapped or unbagged panels or shingles must be immediately lowered to the ground via covered dust-tight chute, crane or hoist, or placed in an impervious waste bag or wrapped in plastic sheeting and lowered to the ground no later than the end of the work shift. Place debris into a 0.15 mm 6-mil minimum thickness disposal bag or other approved container. Once the material is in the disposal bag, apply additional water as needed to achieve "adequately wet" conditions for NESHAP compliance. Place bagged asbestos waste under negative pressure with the use of a HEPA vacuum, goose neck and duck tape to seal the bag, wash to remove any visible contamination and place into a second 0.15 mm 6-mil minimum thickness disposal bag. Containerize asbestos containing waste while wet. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If the airborne fiber concentration of the workers or designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work immediately and correct the situation.

3.2.11.6 Gaskets

Establish designated limits for the asbestos regulated work area with the use of red barrier tape, critical barriers, signs, and maintain all other requirements for asbestos control area except local exhaust. Gaskets must be thoroughly wetted with amended water prior to removal and immediately placed in a disposal container. If a gasket is visibly deteriorated and unlikely to be removed intact, removal must be undertaken within a glovebag. Any scraping to remove residue must be performed wet. Place debris into a 0.15 mm 6-mil minimum thickness disposal bag or other approved container. Once the material is in the disposal bag, apply additional water as needed to achieve "adequately wet" conditions for NESHAP compliance. Place bagged asbestos waste under negative pressure with the use of a HEPA vacuum, goose neck and duck tape to seal the bag, wash to remove any visible contamination and place into a second 0.15 mm 6-mil minimum thickness disposal bag. Containerize asbestos containing waste while wet. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If the airborne fiber concentration of the workers or designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work immediately and correct the situation.

[3.2.12 Encapsulation Procedures

****

NOTE: Choose REMOVAL PROCEDURES or ENCAPSULATION PROCEDURES as appropriate for the project.

****

3.2.12.1 Preparation of Test Patches

****

NOTE: Prior to preparing plans and specifications for an encapsulation project, the designer will have to ascertain that encapsulation is feasible at all. The foremost design criteria is the soundness of the existing asbestos containing matrix, i.e. the bond of the matrix to the substrate and the shear strength of the matrix itself. The designer should test the existing matrix in accordance with the ASTM E1494, using the Field Testing Provisions for the Adhesion Test.

****

****

NOTE: Exercise discretion on the number and location of Contractor applied test patches. However, a minimum of three test patches should always be specified. Test locations, in areas of the matrix, that have a different appearance or raise doubts about their homogeneity. Specify number of test patches in first bracket and location in second bracket. Also show location on drawings.

****

Install [three] [_____] test patches of encapsulant in [_____], as indicated. Use airless spray at the lowest pressure and as recommended by the encapsulant manufacturer. Follow exactly the manufacturer's instructions for thinning recommendations, application procedures and rates. Curing time must be not less than five days or that recommended by the manufacturer, whichever is more. A test patch must be 0.8 square meter 9 square feet in size.

3.2.12.2 Field Testing

Field test the encapsulation test patches in accordance with ASTM E1494, paragraph "Required Field Test," in the presence of the Contracting Officer. Keep a written record of the testing procedures and test results. Upon successful testing of the encapsulant, submit a signed statement to the Contracting Officer certifying that the encapsulant is suitable for installation on the particular asbestos containing material.

3.2.12.3 Large-Scale Application

Apply encapsulant using the same equipment and procedures as employed for the test patches. Keep the encapsulant material stirred to prevent settling. Keep a clean work area. Change pre-filters in the ventilation equipment as soon as they appear clogged by encapsulant aerosol or pressure differential drops below 0.02 Hg.

]3.2.13 Abatement of Asbestos Contaminated Soil

Establish designated limits for the asbestos regulated work area with the use of red barrier tape, critical barriers, signs, and maintain all other requirements for asbestos control area except local exhaust. Asbestos contaminated soil must be removed from areas to a minimum depth of [50] [_____] mm [2] [_____] inches. Soil must be thoroughly dampened with amended water and then removed by manual shoveling into labeled containers. Place debris into a 0.15 mm 6-mil minimum thickness disposal bag or other approved container. Once the material is in the disposal bag, apply additional water as needed to achieve "adequately wet" conditions for NESHAP compliance. Place bagged asbestos waste under negative pressure with the use of a HEPA vacuum, goose neck and duck tape to seal the bag, wash to remove any visible contamination and place into a second 0.15 mm 6-mil minimum thickness disposal bag. Containerize asbestos containing waste while wet. Conduct area monitoring of airborne fibers during the work shift at the designated limits of the asbestos work area and conduct personal samples of each worker engaged in the work. If the airborne fiber concentration of the workers or designated limits at any time exceeds background or 0.01 fibers per cubic centimeter, whichever is greater, stop work immediately and correct the situation.

3.2.14 Air Sampling

****

NOTE: Air sampling regimen is very dependent on removal method and applicable laws, edit accordingly.

****

****

NOTE: Normal practice is to have the Contractor hire one independent Private Qualified Person (the PQP) to perform all required functions. However, some applicable laws forbid this approach and will dictate when the PQP, the GC or both will be required to perform the function involved. However, the Contractor must always hire a PQP.

****

Perform sampling of airborne concentrations of asbestos fibers in accordance with 29 CFR 1926.1101, the Contractor's air monitoring plan and as specified herein. Sampling performed in accordance with 29 CFR 1926.1101 must be performed by the PQP.[Sampling performed for environmental and quality control reasons must be performed by the [PQP][GC].] Unless otherwise specified, use NIOSH Method 7400 for sampling and analysis. Monitoring may be duplicated by the Government at the discretion of the Contracting Officer. If the air sampling results obtained by the Government differ from those results obtained by the Contractor, the Government will determine which results predominate. Results of breathing zone samples must be posted at the job site and made available to the Contracting Officer. Submit all documentation regarding initial exposure assessments, negative exposure assessments, and air-monitoring results.

3.2.14.1 Sampling Prior to Asbestos Work

Provide area air sampling and establish the baseline one day prior to the masking and sealing operations for each [demolition] [removal] [encapsulation] site. Establish the background by performing area sampling in similar but uncontaminated sites in the building.

3.2.14.2 Sampling During Asbestos Work

****

NOTE: Choose one of the following options. Normal practice is to have the Contractor hire one independent Private Qualified Person (the PQP) to perform all required functions. However, some applicable laws forbid this approach and will dictate when the PQP, the GC or both will be required to perform the function involved. However, the Contractor must always hire a PQP.

****

****

NOTE: When an "enclosed" asbestos control area is not required, retain the appropriate portion in brackets.

****

[The PQP must provide personal and area sampling as indicated in 29 CFR 1926.1101 and governing environmental regulations. Breathing zone samples must be taken for at least 25 percent of the workers in each shift, or a minimum of two, whichever is greater. Air sample fiber counting must be completed and results provided within 24-hours (breathing zone samples), and [_____] hours (environmental/clearance monitoring) after completion of a sampling period. In addition, provided the same type of work is being performed, provide area sampling at least once every work shift close to the work inside the enclosure, outside the clean room entrance to the enclosure, and at the exhaust opening of the local exhaust system. If sampling outside the enclosure shows airborne levels have exceeded background or 0.01 fibers per cubic centimeter, whichever is greater, stop all work, correct the condition(s) causing the increase, and notify the Contracting Officer immediately.[Where alternate methods are used, perform personal and area air sampling at locations and frequencies that will accurately characterize the evolving airborne asbestos levels.] The written results must be signed by testing laboratory analyst, testing laboratory principal and the [Contractor's PQP][GC]. The air sampling results must be documented on a Contractor's daily air monitoring log.

][The PQP must provide personal sampling as indicated in 29 CFR 1926.1101. Breathing zone samples must be taken for at least 25 percent of the workers in each shift, or a minimum of two, whichever is greater. Breathing zone samples must be taken for at least 25 percent of the workers in each shift, or a minimum of two, whichever is greater. Air sample fiber counting must be completed and results provided within 24-hours (breathing zone samples), and [_____] hours (environmental/clearance monitoring) after completion of a sampling period. At the same time the GC will provide area sampling close to the work inside the enclosure, outside the clean room entrance to the enclosure, and at the exhaust opening of the local exhaust system. In addition, provided the same type of work is being performed, the GC will provide area sampling once every work shift close to the work inside the enclosure, outside the clean room entrance to the enclosure, and at the exhaust opening of the local exhaust system. If sampling outside the enclosure shows airborne levels have exceeded background or 0.01 fibers per cubic centimeter, whichever is greater, stop all work, correct the condition(s) causing the increase, and notify the Contracting Officer immediately.[Where alternate methods are used, perform personal and area air sampling at locations and frequencies that will accurately characterize the evolving airborne asbestos levels.] The written results must be signed by testing laboratory analyst, testing laboratory principal and the [Contractor's PQP][GC]. The air sampling results must be documented on a Contractor's daily air monitoring log.

]3.2.14.3 Final Clearance Requirements, NIOSH PCM Method

For PCM sampling and analysis using NIOSH NMAM Method 7400, the fiber concentration inside the abated regulated area, for each airborne sample, must be less than 0.01 f/cc. The abatement inside the regulated area is considered complete when every PCM final clearance sample is below the clearance limit. If any sample result is greater than 0.01 total f/cc, the asbestos fiber concentration (asbestos f/cc) must be confirmed from that same filter using NIOSH NMAM Method 7402 (TEM) at Contractor's expense. If any confirmation sample result is greater than 0.01 asbestos f/cc, abatement is incomplete and cleaning must be repeated at the Contractor's expense. Upon completion of any required recleaning, resampling with results to meet the above clearance criteria must be done at the Contractor's expense.

3.2.14.4 Final Clearance Requirements, EPA TEM Method

For EPA TEM sampling and analysis, using the EPA Method specified in 40 CFR 763, abatement inside the regulated area is considered complete when the arithmetic mean asbestos concentration of the five inside samples is less than or equal to 70 structures per square millimeter (70 S/mm). When the arithmetic mean is greater than 70 S/mm, the three blank samples must be analyzed. If the three blank samples are greater than 70 S/mm, resampling must be done. If less than 70 S/mm, the five outside samples must be analyzed and a Z-test analysis performed. When the Z-test results are less than 1.65, the decontamination must be considered complete. If the Z-test results are more than 1.65, the abatement is incomplete and cleaning must be repeated. Upon completion of any required recleaning, resampling with results to meet the above clearance criteria must be done at the Contractor's expense.

3.2.14.5 Sampling After Final Clean-Up (Clearance Sampling)

****

NOTE: The designer must research the State, regional and local laws, regulations, statutes, to determine whether "aggressive" air sampling is

required. However, always use aggressive air sampling techniques after encapsulation type abatement efforts.

****

****

NOTE: Normal practice is to have the Contractor hire one independent Private Qualified Person (the PQP) to perform all required functions. However, some applicable laws forbid this approach and will dictate when the PQP, the GC or both will be required to perform the function involved. However, the Contractor must always hire a PQP.

****

****

NOTE: The designer must research the State, regional and local laws, regulations, statutes, to determine whether TEM analysis is required and the number of samples required.

****

Provide area sampling of asbestos fibers[using aggressive air sampling techniques as defined in the EPA 560/5-85-024] and establish an airborne asbestos concentration of less than 0.01 fibers per cubic centimeter after final clean-up but before removal of the enclosure or the asbestos work control area. After final cleanup and the asbestos control area is dry but prior to clearance sampling, the [PQP][and][GC] must perform a visual inspection in accordance with ASTM E1368 to ensure that the asbestos control and work area is free of any accumulations of dirt, dust, or debris.[Prepare a written report signed and dated by the PQP documenting that the asbestos control area is free of dust, dirt, and debris and all waste has been removed.][Perform at least [_____] samples.][Use transmission electron microscopy (TEM) to analyze clearance samples and report the results in accordance with current NIOSH criteria.] The asbestos fiber counts from these samples must be less than 0.01 fibers per cubic centimeter or be not greater than the background, whichever is greater. Should any of the final samples indicate a higher value take appropriate actions to re-clean the area and repeat the sampling and [TEM] analysis at the Contractor's expense.

3.2.14.6 Air Clearance Failure

If clearance sampling results fail to meet the final clearance requirements, pay all costs associated with the required recleaning, resampling, and analysis, until final clearance requirements are met.

3.2.15 Lock-Down

Prior to removal of plastic barriers and after pre-clearance clean up of gross contamination, the [PQP][GC] must conduct a visual inspection of all areas affected by the [removal][encapsulation] in accordance with ASTM E1368. Inspect for any visible fibers[, and to ensure that encapsulants were applied evenly and appropriately].[Spray apply a post removal (lock-down) encapsulant to ceiling, walls, floors and other areas exposed in the removal area. The exposed areaincludes but is not limited to plastic barriers, furnishings and articles to be discarded as well as dirty change room, air locks for bag removal and decontamination chambers.]

3.2.16 Site Inspection

While performing asbestos engineering control work, the Contractor must be subject to on-site inspection by the Contracting Officer who may be assisted by or represented by safety or industrial hygiene personnel. If the work is found to be in violation of this specification, the Contracting Officer or his representative will issue a stop work order to be in effect immediately and until the violation is resolved. All related costs including standby time required to resolve the violation must be at the Contractor's expense.

3.3 CLEAN-UP AND DISPOSAL

3.3.1 Housekeeping

Essential parts of asbestos dust control are housekeeping and clean-up procedures. Maintain surfaces of the asbestos control area free of accumulations of asbestos fibers. Give meticulous attention to restricting the spread of dust and debris; keep waste from being distributed over the general area. Use HEPA filtered vacuum cleaners. DO NOT BLOW DOWN THE SPACE WITH COMPRESSED AIR. When asbestos removal is complete, all asbestos waste is removed from the work-site, and final clean-up is completed, the Contracting Officer will attest that the area is safe before the signs can be removed. After final clean-up and acceptable airborne concentrations are attained but before the HEPA unit is turned off and the enclosure removed, remove all pre-filters on the building HVAC system and provide new pre-filters. Dispose of filters as asbestos contaminated materials. Reestablish HVAC mechanical, and electrical systems in proper working order. The Contracting Officer will visually inspect all surfaces within the enclosure for residual material or accumulated dust or debris. The Contractor must re-clean all areas showing dust or residual materials. If re-cleaning is required, air sample and establish an acceptable asbestos airborne concentration after re-cleaning. The Contracting Officer must agree that the area is safe in writing before unrestricted entry will be permitted. The Government must have the option to perform monitoring to determine if the areas are safe before entry is permitted.

3.3.2 Title to Materials

All waste materials, except as specified otherwise, become the property of the Contractor and must be disposed of as specified in applicable local, State, and Federal regulations and herein.

3.3.3 Disposal of Asbestos

****

NOTE: Disposal procedures and sites for asbestos materials vary considerably with each location. Contact local station Public Works and the NAVFAC Engineering Field Division Hazardous Waste Manager or Industrial Hygienist for local procedures.

****

3.3.3.1 Procedure for Disposal

Coordinate all waste disposal manifests with the Contracting Officer and NAVFAC EV. Collect asbestos waste, contaminated waste water filters, asbestos contaminated water, scrap, debris, bags, containers, equipment, and asbestos contaminated clothing which may produce airborne concentrations of asbestos fibers and place in sealed fiber-proof, waterproof, non-returnable containers (e.g. double plastic bags 0.15 mm 6 mils thick, cartons, drums or cans). Wastes within the containers must be adequately wet in accordance with 40 CFR 61-SUBPART M. Affix a warning and Department of Transportation (DOT) label to each container including the bags or use at least 0.15 mm 6 mils thick bags with the approved warnings and DOT labeling preprinted on the bag. Clearly indicate on the outside of each container the name of the waste generator and the location at which the waste was generated. Prevent contamination of the transport vehicle (especially if the transport vehicle is a rented truck likely to be used in the future for non-asbestos purposes). These precautions include lining the vehicle cargo area with plastic sheeting (similar to work area enclosure) and thorough cleaning of the cargo area after transport and unloading of asbestos debris is complete. Dispose of waste asbestos material at an Environmental Protection Agency (EPA) or State-approved asbestos landfill off Government property. For temporary storage, store sealed impermeable bags in asbestos waste drums or skids. An area for interim storage of asbestos waste-containing drums or skids will be assigned by the Contracting Officer or his authorized representative. Comply with 40 CFR 61-SUBPART M, State, regional, and local standards for hauling and disposal. Sealed plastic bags may be dumped from drums into the burial site unless the bags have been broken or damaged. Damaged bags must remain in the drum and the entire contaminated drum must be buried. Uncontaminated drums may be recycled. Workers unloading the sealed drums must wear appropriate respirators and personal protective equipment when handling asbestos materials at the disposal site.

3.3.3.2 Asbestos Disposal Quantity Report

****

NOTE: Normal practice is to have the Contractor hire one independent Private Qualified Person (the PQP) to perform all required functions. However, some applicable laws forbid this approach and will dictate when the PQP, the GC or both will be required to perform the function involved. However, the Contractor must always hire a PQP.

****

[Direct the PQP to record and report, to the Contracting Officer, the amount of asbestos containing material removed and released for disposal. Deliver the report for the previous day at the beginning of each day shift with amounts of material removed during the previous day reported in linear meters or square meters linear feet or square feet as described initially in this specification and in cubic meters feet for the amount of asbestos containing material released for disposal.

][Allow the GC to inspect, record and report the amount of asbestos containing material removed and released for disposal on a daily basis.

SECTION 02 83 00

LEAD REMEDIATION
11/18

****

NOTE: This guide specification covers the requirements for protection of workers, disposal of lead, cadmium and chromium painted material, abatement of lead based paint hazards in target housing and child occupied facilities and limiting occupational and environmental exposure to lead-based paint or paint with lead (LBP/PWL).

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

****

NOTE: This guide specification also provides guidelines/recommendations for cleanup of lead, cadmium and chromium on construction projects impacting material containing lead, cadmium and chromium or lead based paint.

****

****

NOTE: Obtain project specific information and appropriate sampling of Paint with Lead (PWL) or

Material Containing Lead (MCL) that will be removed or disturbed.

****

****

NOTE: This guide specification can be used in projects where LBP/PWL must be removed/controlled (including paint film stabilization) or lead-based paint hazards abated as defined by Public Law 102-550 Title X - Residential Lead-Based Paint Hazard Reduction Act of 1992. Local requirements may be substantially restrictive for the conduction of LBP or LBP hazard abatement projects.

****

****

NOTE: This guide specification should be used with all of the requirements of 40 CFR 745 (or state/local requirements in states with authorized programs) for projects involving lead-based paint hazard abatement in target housing and child occupied facilities being transferred or resolving facility-related work due to an occupant child with an elevated blood lead. In these projects, it is required that the specification editor has appropriate training regarding lead-based paint activities. Certification as a project designer per 40 CFR 745 is required.

****

****

NOTE: The classification of the lead-based paint or paint with lead as hazardous waste must be performed in accordance with 40 CFR 261, and in the design phase of the project. This classification is prerequisite to the requirement of special handling, storage, and disposal according to Federal, state and local hazardous waste management regulations.

****

****

NOTE: When historic preservation work will disturb PWL, refer to the Secretary of the Interior's Standards for the Treatment of Historic Properties and Brief 37, "Appropriate Methods for Reducing Lead-Paint Hazards in Historic Housing" as appropriate.

****

****

NOTE: The work may involve a historic property. The designer must coordinate review of the proposed work with the appropriate cultural resources manager (CRM) and cultural resource laws and regulations, as part of the environmental review and permitting process. Consultation with stakeholders, including the state historic preservation office, may be required, and work involving historic properties will likely be required to confirm to the Secretary

of the Interior's Standards for the Treatment of Historic Properties (usually at the REHABILITATION level). See https://www.nps.gov/tps/standards/four-treatments/treatment-rehabilitation.htm**.**

****

****

NOTE: Projects involving housing improvement, maintenance, or repair are not considered a lead-based paint hazard abatement action even if the effect of the work removes (or reduces) lead exposure potentials to the occupants. However, appropriate precautions for protecting occupants and leaving the housing clean (clearance) after concluding any work disturbing lead must be considered. Specific training and certification requirements (40 CFR 745 or authorized state program requirements) may not be necessary for all projects. However, it is strongly recommended that the specification editor have appropriate training regarding lead.

****

****

NOTE: Projects that involve cutting, sawing, sanding, scraping, needle gunning, abrasive blasting, high temperature removal, of lead-based paint/paint with lead and paints containing cadmium and chromium materials may result in exposures in excess of OSHA limits. Therefore, personal protective equipment should be used and controls implemented. Institute worker protection controls as indicated in 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 and herein. Also, some work practices are prohibited for LBP/LBP hazard abatement (e.g., machine sanding, abrasive blasting) unless used with HEPA exhaust controls (see 40 CFR 745.227).

****

****

NOTE: To assure protection of workers and proper disposal of lead, cadmium and chromium based paint, this guide specification is to be used together with Section 01 35 26 GOVERNMENT SAFETY REQUIREMENTS.

This guide specification is not to be used for removal of lead-based paint from hydraulic structures, steel structures, or other similar structures. For these types of structures, the designer should use Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

****

PART 1   GENERAL

1.1   REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

1.2.1 Abatement

Measures defined in 40 CFR 745, Section 223, designed to permanently eliminate lead-based paint hazards.

1.2.2 Action Level

Employee exposure, without regard to use of respirators, to an airborne concentration of lead of 30 micrograms per cubic meter of air averaged over an 8-hour period; to an airborne concentration of cadmium of 2.5 micrograms per cubic meter of air averaged over an 8-hour period; to an airborne concentration of chromium (VI) of 2.5 micrograms per cubic meter of air averaged over an 8-hour period.

1.2.3 Area Sampling

Sampling of lead, cadmium, chromium concentrations within the lead, cadmium, chromium control area and inside the physical boundaries which is representative of the airborne lead, cadmium, chromium concentrations but is not collected in the breathing zone of personnel (approximately 1.5 to 1.8 meters 5 to 6 feet above the floor).

1.2.4 Cadmium Permissible Exposure Limit (PEL)

Five micrograms per cubic meter of air as an 8-hour time weighted average as determined by 29 CFR 1926.1127. If an employee is exposed for more than 8-hours in a work day, determine the PEL by the following formula:

PEL (micrograms/cubic meter of air) = 40/No. hrs worked per day

1.2.5 Certified Industrial Hygienist (CIH)

As used in this section refers to a person retained by the Contractor who is certified as an industrial hygienist and who is trained in the recognition and control of lead, cadmium and chromium hazards in accordance with current federal, State, and local regulations. CIH must be certified for comprehensive practice by the American Board of Industrial Hygiene. The Certified Industrial Hygienist must be independent of the Contractor and must have no employee or employer relationship which could constitute a conflict of interest.

1.2.6 Child-Occupied Facility

Real property which is a building or portion of a building constructed prior to 1978 visited regularly by the same child, six-years of age or under, on at least two different days within any week (Sunday through Saturday period), provided that each day's visit lasts at least 3-hours, and the combined annual visits last at least 60-hours. Child-occupied facilities include but are not limited to, day-care centers, preschools and kindergarten classrooms.

1.2.7 Chromium Permissible Exposure Limit (PEL)

Five micrograms per cubic meter of air as an 8-hour time weighted average as determined by 29 CFR 1926.1126. If an employee is exposed for more than 8-hours in a work day, determine the PEL by the following formula:

PEL (micrograms/cubic meter of air) = 40/No. hrs worked per day

1.2.8 Competent Person (CP)

As used in this section, refers to a person employed by the Contractor who is trained in the recognition and control of lead, cadmium and chromium hazards in accordance with current federal, State, and local regulations and has the authority to take prompt corrective actions to control the lead, cadmium and chromium hazard. The Contractor may provide more than one CP as required to supervise and monitor the work. The CP must be a Certified Industrial Hygienist (CIH) certified by the American Board of Industrial Hygiene or a Certified Safety Professional (CSP) certified by the Board of Certified Safety Professionals or a licensed lead-based paint abatement Supervisor/Project Designer in the State of [_____].

1.2.9 Contaminated Room

Refers to a room for removal of contaminated personal protective equipment (PPE).

1.2.10 Decontamination Shower Facility

That facility that encompasses a clean clothing storage room, and a contaminated clothing storage and disposal rooms, with a shower facility in between.

1.2.11 Deleading

Activities conducted by a person who offers to eliminate lead-based paint or lead-based paint hazards or paints containing cadmium/chromium or to plan such activities in commercial buildings, bridges or other structures.

1.2.12 Eight-Hour Time Weighted Average (TWA)

Airborne concentration of lead, cadmium, chromium to which an employee is exposed, averaged over an 8-hour workday as indicated in 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127.

1.2.13 High Efficiency Particulate Air (HEPA) Filter Equipment

HEPA filtered vacuuming equipment with a UL 586 filter system capable of collecting and retaining lead, cadmium, chromiumcontaminated particulate. A high efficiency particulate filter demonstrates at least 99.97 percent efficiency against 0.3 micron or larger size particles.

1.2.14 Lead

Metallic lead, inorganic lead compounds, and organic lead soaps. Excludes other forms of organic lead compounds. The use of the term Lead in this section also refers to paints which contain detectable concentrations of Cadmium and Chromium. For the purposes of the section lead-based paint (LBP) and paint with lead (PWL) also contains cadmium and chromium.

1.2.15 Lead-Based Paint (LBP)

Paint or other surface coating that contains lead in excess of 1.0 milligrams per centimeter squared or 0.5 percent by weight.

1.2.16 Lead-Based Paint Activities

In the case of target housing or child occupied facilities, lead-based paint activities include; a lead-based paint inspection, a risk assessment, or abatement of lead-based paint hazards.

1.2.17 Lead-Based Paint Hazards

Paint-lead hazard, dust-lead hazard or soil-lead hazard as identified in 40 CFR 745, Section 65. Any condition that causes exposure to lead from lead-contaminated dust, lead-contaminated soil, lead-based paint that is deteriorated or present in accessible surfaces, friction surfaces, or impact surfaces that would result in adverse human health effects.

1.2.18 Lead, Cadmium, Chromium Control Area

A system[of control methods] to prevent the spread of lead, cadmium, chromium dust, paint chips or debris to adjacent areas that may include temporary containment, floor or ground cover protection, physical boundaries, and warning signs to prevent unauthorized entry of personnel. HEPA filtered local exhaust equipment may be used as engineering controls to further reduce personnel exposures or building/outdoor environmental contamination.

1.2.19 Lead Permissible Exposure Limit (PEL)

Fifty micrograms per cubic meter of air as an 8-hour time weighted average as determined by 29 CFR 1926.62. If an employee is exposed for more than 8-hours in a work day, determine the PEL by the following formula:

PEL (micrograms/cubic meter of air) = 400/No. hrs worked per day

1.2.20 Material Containing Lead/Paint with Lead (MCL/PWL)

Any material, including paint, which contains lead as determined by the testing laboratory using a valid test method. The requirements of this section does not apply if no detectable levels of lead are found using a quantitative method for analyzing paint or MCL using laboratory instruments with specified limits of detection (usually 0.01 percent). An X-Ray Fluorescence (XRF) instrument is not considered a valid test method.

1.2.21 Personal Sampling

Sampling of airborne lead, cadmium, chromium concentrations within the breathing zone of an employee to determine the 8-hour time weighted average concentration in accordance with 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127. Samples must be representative of the employees' work tasks. Breathing zone must be considered an area within a hemisphere, forward of the shoulders, with a radius of 150 to 225 mm 6 to 9 inches and centered at the nose or mouth of an employee.

1.2.22 Physical Boundary

Area physically roped or partitioned off around lead, cadmium, chromium control area to limit unauthorized entry of personnel.

1.2.23 Target Housing

Residential real property which is housing constructed prior to 1978, except housing for the elderly or persons with disabilities (unless any one or more children age 6-years or under resides or is expected to reside in such housing for the elderly or persons with disabilities) or any zero bedroom dwelling.

1.3 DESCRIPTION

****

NOTE: Specify the construction activities that will impact lead, cadmium and chromium based paint or lead containing material. Show the location of MCL/PWL impacted construction activities on the contract drawings and indicate its condition (well adhered sheets or wrappings, solid, aggregates, bricks or blocks, powdered, liquid, sludge). Example activities include: preparing surfaces for painting, saw cutting through painted material, sanding painted surfaces, scabbling painted or otherwise leaded concrete surfaces, blast cleaning painted surfaces, torch cutting through painted metal.

****

Construction activities impacting PWL or material containing lead, cadmium, chromium which are covered by this specification include the demolition or removal of material containing lead, cadmium, chromium in [_____] condition, located [_____] and as indicated on the drawings. [_____] The work covered by this section includes work tasks and the precautions specified in this section for the protection of building occupants and the environment during and after the performance of the hazard abatement activities.

1.3.1 Protection of Existing Areas To Remain

Project work including, but not limited to, lead, cadmium, chromium hazard abatement work, storage, transportation, and disposal must be performed without damaging or contaminating adjacent work and areas. Where such work or areas are damaged or contaminated, restore work and areas to the original condition.

1.3.2 Coordination with Other Work

Coordinate with work being performed in adjacent areas to ensure there are no exposure issues. Explain coordination procedures in the Lead, Cadmium, Chromium Compliance Plan and describe how the Contractor will prevent lead, cadmium and chromium exposure to other contractors and Government personnel performing work unrelated to lead, cadmium and chromium activities.

1.3.3 Sampling and Analysis

****

NOTE: Specify the sampling and analysis necessary to characterize effectiveness of equipment and procedures to prevent migration of contamination while lead, cadmium and chromium and lead hazard abatement activities are performed and to assure clearance/cleanup requirements have been achieved.

Select from the methods below to specify the sampling and analytical requirements for this project.

****

Submit a log of the analytical results from sampling conducted during the abatement. Keep the log of results current with project activities and brief the results to the Contracting Officer as analytical results are reported.

1.3.3.1 Dust Wipe Materials, Sampling and Analysis

Sampling must conform to [[ASTM E1728/E1728M][ASTM E1792]].[Analysis must conform to ASTM E1613 and ASTM E1644.]

1.3.3.2 Soil Sampling and Analysis

Sampling must conform to ASTM E1727.[Analysis must conform to ASTM E1613 and ASTM E1726.]

1.3.3.3 Clearance Monitoring

****

NOTE: Review 40 CFR 745 (e)(8)(v)(A), (B) and (C) to determine the quantity and location of clearance samples for target housing, child occupied facilities.

****

a. Collect dust wipe samples inside the lead, cadmium and chromium hazard control area after the final visual inspection in the quantities and at the locations specified.

    (1) Floors [_____].
    (2) Interior Window Sills [_____].
    (3) Window Troughs [_____].

b. Collect exterior bare soil samples inside the lead, cadmium and chromium hazard control area after the final visual inspection in the quantities and at the locations specified.

(1) Near the building foundation [_____].
(2) Nearby Play areas [_____].

1.3.4 Clearance Requirements

****

NOTE: Clearance criteria are as follows:

Target housing and child occupied facilities.

a) Building Interior:

Floors - 40 micrograms/square foot.
Interior Window Sills - 250 micrograms/square foot.
Window Troughs - 800 micrograms/square foot.

b) Building Exterior:

Bare soils in play areas used by children under the age of 6 - 400 mg/kg.
Bare soils, all other areas - 1200 mg/kg

It is recommended that the designer check with the project customer and state regulators to assure that the clearance criteria in this note are consistent with customer needs and state specific requirements.

****

Target housing and child occupied facilities clearance levels.

(1) Floors [_____].
(2) Interior Window Sills [_____].
(3) Window Troughs [_____].
(4) Bare soils in play areas accessible by children [_____].
(5) Bare soils in all other areas [_____].

1.4 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for

Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

]1.5 QUALITY ASSURANCE

1.5.1 Qualifications

1.5.1.1 Competent Person (CP)

Submit name, address, and telephone number of the CP selected to perform responsibilities specified in paragraph COMPETENT PERSON (CP) RESPONSIBILITIES. Provide documented construction project-related experience with implementation of OSHA's Lead in Construction standard (29 CFR 1926.62), Chromium standard (29 CFR 1926.1126), Cadmium standard (29 CFR 1926.1127) which shows ability to assess occupational and environmental exposure to lead, cadmium, chromium; experience with the use of respirators, personal protective equipment and other exposure reduction methods to protect employee health. Demonstrate a minimum of [3][5][_____] years experience implementing OSHA's Lead in Construction standard (29 CFR 1926.62), Chromium standard (29 CFR 1926.1126), and Cadmium standard (29 CFR 1926.1127). Submit proper documentation that the CP is trained [and licensed][and certified] in accordance with federal, State [_____] and local laws.[The competent person must be a licensed lead-based paint abatement Supervisor/Project Designer in the State of [_____]].

1.5.1.2 Training Certification

****

NOTE: State or local regulations may consider lead, cadmium and chromium, LBP/PWL or MCL removal work as "lead based paint hazard reduction activities" even if the work does not include lead based paint. The training provider may be required to be "accredited" by either the State or the United States Environmental Protection Agency (USEPA).

****

Submit a certificate for each worker and supervisor, signed and dated by the[accredited] training provider, stating that the employee has received the required lead, cadmium and chromium training specified in 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 [40 CFR 745][and is certified to perform or supervise deleading, lead removal or demolition activities][in the State of [_____]].

1.5.1.3 Testing Laboratory

Submit the name, address, and telephone number of the testing laboratory selected to perform the air[soil][and wipe] analysis, testing, and reporting of airborne concentrations of lead, cadmium and chromium. Use a laboratory participating in the EPA National Lead Laboratory Accreditation Program (NLLAP) by being accredited by either the American Association for Laboratory Accreditation (A2LA) or the American Industrial Hygiene Association (AIHA) and that is successfully participating in the Environmental Lead Proficiency Analytical Testing (ELPAT) program to perform sample analysis. Laboratories selected to perform blood lead analysis must be OSHA approved.

[1.5.1.4 Third Party Consultant Qualifications

****

NOTE: See Criteria Notes in paragraphs AIR AND WIPE SAMPLING and CLEARANCE CERTIFICATION to determine whether this paragraph should be included in the project.

****

Submit the name, address and telephone number of the third party consultant selected to perform the wipe sampling for determining concentrations of lead, cadmium and chromium in dust. Submit proper documentation that the consultant is trained and certified as an inspector technician or inspector/risk assessor by the USEPA authorized State (or local) certification and accreditation program.

]1.5.1.5 Certified Risk Assessor

The Certified Risk Assessor must be certified pursuant to 40 CFR 745, Section 226 and be responsible to perform the clearance sampling, clearance sample data evaluation and summarize clearance sampling results in a section of the abatement report. The risk assessor must sign the abatement report to indicate clearance requirements for the contract have been met.

1.5.2 Requirements

1.5.2.1 Competent Person (CP) Responsibilities

a. Verify training meets all federal, State, and local requirements.

b. Review and approve Lead, Cadmium, Chromium Compliance Plan for conformance to the applicable referenced standards.

c. Continuously inspect LBP/PWL or MCL work for conformance with the approved plan.

d. Perform (or oversee performance of) air sampling. Recommend upgrades or downgrades (whichever is appropriate based on exposure) on the use of PPE (respirators included) and engineering controls.

e. Ensure work is performed in strict accordance with specifications at all times.

f. Control work to prevent hazardous exposure to human beings and to the environment at all times.

g. Supervise final cleaning of the lead, cadmium, chromium control area, take clearance wipe samples if necessary; review clearance sample results and make recommendations for further cleaning.

h. Certify the conditions of the work as called for elsewhere in this specification.

i. The CP must be certified pursuant to 40 CFR 745, Section 226 and is responsible for development and implementation of the occupant protection plan, the abatement report and supervise lead, cadmium and chromium hazard abatement work activities.

1.5.2.2 Lead, Cadmium, Chromium Compliance Plan

****

NOTE: State or local regulations may have specific requirements for written project designs. Research specific State or local requirements for public, commercial buildings or structures. Consider the bracketed occupant protection plan for high profile sensitive work such as present in family housing, childcare facilities, administrative buildings, kitchens.

****

Submit a detailed job-specific plan of the work procedures to be used in the disturbance of lead, cadmium and chromium, LBP/PWL or MCL. Include in the plan a sketch showing the location, size, and details of lead, cadmium, chromium control areas, critical barriers, physical boundaries, location and details of decontamination facilities, viewing ports, and mechanical ventilation system. Include a description of equipment and materials, work practices, controls and job responsibilities for each activity from which lead, cadmium, chromium is emitted. Include in the plan, eating, drinking, smoking, hygiene facilities and sanitary procedures, interface of trades, sequencing of lead, cadmium, chromium related work, collected waste water and dust containing lead, cadmium, chromium and debris, air sampling, respirators, personal protective equipment, and a detailed description of the method of containment of the operation to ensure that lead, cadmium, chromium is not released outside of the lead, cadmium, chromium control area. Include site preparation, cleanup and clearance procedures. Include occupational and environmental sampling, training and strategy, sampling and analysis strategy and methodology, frequency of sampling, duration of sampling, and qualifications of sampling personnel in the air sampling portion of the plan. Include a description of arrangements made among contractors on multicontractor worksites to inform affected employees and to clarify responsibilities to control exposures.

[The plan must be developed and signed by a certified Lead Project Designer in the State of [_____]. The plan must include the name and certification number of the person signing the plan.

][In occupied buildings, the plan must also include an occupant protection program that describes the measures that will be taken during the work to[notify and] protect the building occupants.

]1.5.2.3 Occupational and Environmental Assessment Data Report

****

NOTE: Sampling results of previous jobs or initial monitoring during the job determine the requirements for further monitoring and the need to fully implement the control and protective requirements. Some LBP/PWL or MCL work may not require full implementation of the requirements of 29 CFR 1926.62. Based on the experience of the Contractor or the use of a specific process or method for performing the work, the Contractor may be able to provide historic data (previous 12 months) to demonstrate that airborne exposures are controlled below the action level. Such methods or controls must be fully presented in the Lead, Cadmium, Chromium Compliance Plan.

****

If initial monitoring is necessary, submit occupational and environmental sampling results to the Contracting Officer within three working days of collection, signed by the testing laboratory employee performing the analysis, the employee that performed the sampling, and the CP.

[In order to reduce the full implementation of 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 the Contractor must provide documentation. Submit a report that supports the determination to reduce full implementation of the requirements of 29 CFR 1926.62,29 CFR 1926.1126, 29 CFR 1926.1127 and supporting the Lead, Cadmium, Chromium Compliance Plan.

] a. The initial monitoring must represent each job classification, or if working conditions are similar to previous jobs by the same employer, provide previously collected exposure data that can be used to estimate worker exposures per 29 CFR 1926.62,29 CFR 1926.1126, 29 CFR 1926.1127. The data must represent the worker's regular daily exposure to lead, cadmium, chromium for stated work.

b. Submit worker exposure data gathered during the task based trigger operations of 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 with a complete process description. This includes manual demolition, manual scraping, manual sanding, heat gun, power tool cleaning, rivet busting, cleanup of dry expendable abrasives, abrasive blast enclosure removal, abrasive blasting, welding, cutting and torch burning where lead, cadmium and chromium containing coatings are present.

c. The initial assessment must determine the requirement for further monitoring and the need to fully implement the control and protective requirements including the lead, cadmium, chromium compliance plan per 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127.

1.5.2.4 Medical Examinations

Submit pre-work blood lead levels and post-work blood lead levels for all workers performing lead, cadmium, chromium activities during the execution of the work. Initial medical surveillance as required by 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 must be made available to all employees exposed to lead, cadmium, chromium at any time (one day) above the action level. Full medical surveillance must be made available to all employees on an annual basis who are or may be exposed to lead, cadmium and chromium in excess of the action level for more than 30 days a year or as required by 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127. Adequate records must show that employees meet the medical surveillance requirements of 29 CFR 1926.33, 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 and 29 CFR 1926.103. Provide medical surveillance to all personnel exposed to lead, cadmium, chromium as indicated in 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127. Maintain complete and accurate medical records of employees for the duration of employment plus 30 years.

1.5.2.5 Training

Train each employee performing work that disturbs lead, cadmium, chromium, who performs LBP/MCL/PWL disposal, and air sampling operations prior to the time of initial job assignment and annually thereafter, in accordance with 29 CFR 1926.21, 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127, 40 CFR 745 and State [_____] and local regulations where appropriate.

1.5.2.6 Respiratory Protection Program

a. Provide each employee required to wear a respirator a respirator fit test at the time of initial fitting and at least annually thereafter as required by 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127.

b. Establish and implement a respiratory protection program as required by 29 CFR 1926.103, 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 and 29 CFR 1926.55.

1.5.2.7 Hazard Communication Program

Establish and implement a Hazard Communication Program as required by 29 CFR 1926.59.

1.5.2.8 Lead, Cadmium, Chromium Waste Management

****

NOTE: Research local requirements. The EPA has clarified waste requirements where lead-based paint debris generated by contractors in households is excluded from RCRA Subtitle C hazardous waste regulations. Contractors may dispose of LBP-wastes as household wastes subject to applicable State

regulations. Determination of the expected waste materials as hazardous or solid waste for disposal should be performed in conjunction with site work. Some construction waste contains lead at lower concentrations, which may be disposed of at local sanitary landfills or Construction and Demolition (C&D) landfills, which are not approved by EPA.
****

The Lead, Cadmium, Chromium Waste Management Plan must comply with applicable requirements of federal, State, and local hazardous waste regulations and address:

a. Identification and classification of wastes associated with the work.

b. Estimated quantities of wastes to be generated and disposed of.

c. Names and qualifications of each contractor that will be transporting, storing, treating, and disposing of the wastes. Include the facility location[and operator] and a 24-hour point of contact. Furnish two copies of [USEPA] [State (in accordance with [_____])][and][local] hazardous waste [permit applications][permits][manifests][and][USEPA Identification numbers].

d. Names and qualifications (experience and training) of personnel who will be working on-site with hazardous wastes.

e. List of waste handling equipment to be used in performing the work, to include cleaning, volume reduction, and transport equipment.

f. Spill prevention, containment, and cleanup contingency measures including a health and safety plan to be implemented in accordance with 29 CFR 1926.65.

g. Work plan and schedule for waste containment, removal and disposal. Proper containment of the waste includes using acceptable waste containers (e.g., 55-gallon drums) as well as proper marking/labeling of the containers. Clean up and containerize wastes daily.

h. Include any process that may alter or treat waste rendering a hazardous waste non hazardous.

i. Unit cost for hazardous waste disposal according to this plan.

1.5.2.9 Environmental, Safety and Health Compliance

****
NOTE: Include applicable State, regional, and local laws, regulations, and statutes. Do careful research since not all State and local laws are similar. Verify with the State or local authorities whether the city, county, State or the USEPA has jurisdiction and whether licensing or certification is required. Also identify the authority or code sponsor and the laws, regulations and statutes cited under paragraph REFERENCES using complete title and number.
****

In addition to the detailed requirements of this specification, comply with laws, ordinances, rules, and regulations of federal, State, and local authorities regarding lead, cadmium and chromium. Comply with the applicable requirements of the current issue of 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127, EM 385-1-1, ND OPNAVINST 5100.23. Submit matters regarding interpretation of standards to the Contracting Officer for resolution before starting work. Where specification requirements and the referenced documents vary, the most stringent requirements apply. The following [local][and][State] laws, ordinances, criteria, rules and regulations regarding removing, handling, storing, transporting, and disposing of lead, cadmium and chromium-contaminated materials apply:

a. [_____]

b. [_____]

c. [_____]

[d. [Licensing][and certification] in the state of [_____] is required.

]1.5.3 Pressure Differential Recordings for Local Exhaust System

****

NOTE: When an negative pressure enclosure is not required, delete the requirements for the local exhaust system and pressure differential recording.

****

****

NOTE: Normal practice is to have the Contractor hire one independent Private Qualified Person (the PQP) to perform all required functions. However, some applicable laws forbid this approach and will dictate when the PQP, the GC or both will be required to perform the function involved. However, the Contractor must always hire a PQP.

****

Provide a local exhaust system that creates a negative pressure of at least 0.51 mm 0.02 inches of water relative to the pressure external to the enclosure and operate it continuously, 24-hours a day, until the temporary enclosure of the lead, cadmium, chromium control area is removed. Submit pressure differential recordings for each work day to the [PQP][and][GC] for review and to the Contracting Officer within 24-hours from the end of each work day.

1.5.4 Licenses, Permits and Notifications

****

NOTE: Consult with the customer, district engineering, construction and safety offices and all outside regulatory authorities (EPA, state, county, city) having jurisdiction over any part of the project to determine whether a license or permit is required and who is responsible for submitting required notifications to various agencies. The designer then must make the decision if the required permits are to be obtained by the Contractor or the

Government. If the Contractor is to provide the permits, include this paragraph and choose the appropriate bracketed items. If the Government is to obtain the permits/licenses, delete this entire paragraph.
****

Certify and submit in writing to the [Regional Office of the EPA] [state's environmental protection agency responsible for lead hazard abatement activities] [_____] [and the Contracting Officer] at least [10] [_____] days prior to the commencement of work that [_____] licenses, permits and notifications have been obtained. All associated fees or costs incurred in obtaining the licenses, permits and notifications are included in the contract price.

1.5.5 Occupant Protection Plan

The certified project designer must develop and implement an Occupant Protection Plan describing the measures and management procedures to be taken during lead, cadmium and chromium hazard abatement activities to protect the building occupants/building facilities and the outside environment from exposure to any lead, cadmium and chromium contamination while lead, cadmium and chromium hazard abatement activities are performed.

1.5.6 Pre-Construction Conference

Along with the CP, meet with the Contracting Officer to discuss in detail the Lead, Cadmium, Chromium Waste Management Plan and the Lead, Cadmium, Chromium Compliance Plan, including procedures and precautions for the work.

1.6 EQUIPMENT

1.6.1 Respirators

Furnish appropriate respirators approved by the National Institute for Occupational Safety and Health (NIOSH), Department of Health and Human Services, for use in atmospheres containing lead, cadmium and chromium dust, fume and mist. Respirators must comply with the requirements of 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127.

1.6.2 Special Protective Clothing

Personnel exposed to lead, cadmium, chromiumcontaminated dust must wear proper [disposable] [uncontaminated, reusable] protective whole body clothing, head covering, gloves, eye, and foot coverings as required by 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127. Furnish proper disposable plastic or rubber gloves to protect hands. Reduce the level of protection only after obtaining approval from the CP.

1.6.3 Rental Equipment Notification

If rental equipment is to be used during PWL or MCL handling and disposal, notify the rental agency in writing concerning the intended use of the equipment.

1.6.4 Vacuum Filters

UL 586 labeled HEPA filters.

1.6.5 Equipment for Government Personnel

****

NOTE: Verify the number of sets required with the Contracting Officer.

****

Furnish the Contracting Officer with [two] [_____] complete sets of personal protective equipment (PPE) daily, as required herein, for entry into and inspection of the lead, cadmium and chromium removal work within the lead, cadmium and chromium controlled area. Personal protective equipment must include disposable whole body covering, including appropriate foot, head, eye, and hand protection. PPE remains the property of the Contractor. The Government will provide respiratory protection for the Contracting Officer.

1.6.6 Abrasive Removal Equipment

The use of powered machine for vibrating, sanding, grinding, or abrasive blasting is prohibited unless equipped with local exhaust ventilation systems equipped with high efficiency particulate air (HEPA) filters.

1.6.7 Negative Air Pressure System

****

NOTE: Negative Air Pressure Systems are typically required only for projects using powered floor sanding or abrasive blasting techniques. Both techniques may have application for historical restoration, but are not typically used as lead, cadmium and chromium hazard abatement techniques. Remove the following two paragraphs if negative air pressure systems are not necessary for the project.

****

1.6.7.1 Minimum Requirements

Do not proceed with work in the area until containment is set up and HEPA filtration systems are in place. The negative air pressure system must meet the requirements of ASSP Z9.2 including approved HEPA filters in accordance with UL 586. Negative air pressure equipment must be equipped with new HEPA filters, and be sufficient to maintain a minimum pressure differential of minus 0.005 kPa 0.02 inch of water column relative to adjacent, unsealed areas. Negative air pressure system minimum requirements are listed as follows:

a. The unit must be capable of delivering its rated volume of air with a clean first stage filter, an intermediate filter and a primary HEPA filter in place.

b. The HEPA filter must be certified as being capable of trapping and retaining mono-disperse particles as small as 0.3 micrometers at a minimum efficiency of 99.97 percent.

c. The unit must be capable of continuing to deliver no less than 70 percent of rated capacity when the HEPA filter is 70 percent full or measures 0.625 kPa 2.5 inches of water static pressure differential on a magnehelic gauge.

d. Equip the unit with a manometer-type negative pressure differential monitor with minor scale division of 0.005 kPa 0.02 inch of water and accuracy within plus or minus 1.0 percent. The manometer must be calibrated daily as recommended by the manufacturer.

e. Equip the unit with a means for the operator to easily interpret the readings in terms of the volumetric flow rate of air per minute moving through the machine at any given moment.

f. Equip the unit with an electronic mechanism that automatically shuts the machine off in the event of a filter breach or absence of a filter.

g. Equip the unit with an audible horn that sounds an alarm when the machine has shut itself off.

h. Equip the unit with an automatic safety mechanism that prevents a worker from improperly inserting the main HEPA filter.

1.6.7.2 Auxiliary Generator

Provide an auxiliary generator with capacity to power a minimum of 50 percent of the negative air machines at any time during the work. When power fails, the generator controls must automatically start the generator and switch the negative air pressure system machines to generator power. The generator must not present a carbon monoxide hazard to workers.

1.6.8 Vacuum Systems

Vacuum systems must be suitably sized for the project, and filters must be capable of trapping and retaining all mono-disperse particles as small as 0.3 micrometers (mean aerodynamic diameter) at a minimum efficiency of 99.97 percent. Properly dispose of used filters that are being replaced.

1.6.9 Heat Blower Guns

Heat blower guns must be flameless, electrical, paint-softener type with controls to limit temperature to 590 degrees C 1,100 degrees F. Heat blower must be (grounded) 120 volts ac, and must be equipped with cone, fan, glass protector and spoon reflector nozzles.

1.7 PROJECT/SITE CONDITIONS

1.7.1 Protection of Existing Work to Remain

Perform work without damage or contamination of adjacent areas. Where existing work is damaged or contaminated, restore work to its original condition or better as determined by the Contracting Officer.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

Keep materials and equipment needed to complete the project available and on the site. Submit a description of the materials and equipment required; including Safety Data Sheets (SDSs) for material brought onsite to perform the work.

2.1.1 Expendable Supplies

Submit a description of the expendable supplies required.

2.1.1.1 Polyethylene Bags

Disposable bags must be polyethylene plastic and be a minimum of 0.15 mm 6 mils thick (0.1 mm4 mils thick if double bags are used) or any other thick plastic material shown to demonstrate at least equivalent performance; and capable of being made leak-tight. Leak-tight means that solids, liquids or dust cannot escape or spill out.

2.1.1.2 Polyethylene Leak-tight Wrapping

Wrapping used to wrap lead, cadmium, chromium contaminated debris must be polyethylene plastic that is a minimum of 0.15 mm 6 mils thick or any other thick plastic material shown to demonstrate at least equivalent performance.

2.1.1.3 Polyethylene Sheeting

Sheeting must be polyethylene plastic with a minimum thickness of 0.15 mm 6 mil, or any other thick plastic material shown to demonstrate at least equivalent performance; and be provided in the largest sheet size reasonably accommodated by the project to minimize the number of seams. Where the project location constitutes an out of the ordinary potential for fire, or where unusual fire hazards cannot be eliminated, provide flame-resistant polyethylene sheets which conform to the requirements of NFPA 701.

2.1.1.4 Tape and Adhesive Spray

Tape and adhesive must be capable of sealing joints between polyethylene sheets and for attachment of polyethylene sheets to adjacent surfaces. After dry application, tape or adhesive must retain adhesion when exposed to wet conditions, including amended water. Tape must be minimum 50 mm 2 inches wide, industrial strength.

2.1.1.5 Containers

When used, containers must be leak-tight and be labeled in accordance with EPA, DOT and OSHA standards.

2.1.1.6 Chemical Paint Strippers

Chemical paint strippers must not contain methylene chloride and be formulated to prevent stain, discoloration, or raising of the substrate materials.

2.1.1.7 Chemical Paint Stripper Neutralizer

Neutralizers for paint strippers must be compatible with the substrate and suitable for use with the chemical stripper that has been applied to the surface.

2.1.1.8 Detergents and Cleaners

Detergents or cleaning agents must not contain trisodium phosphate and have demonstrated effectiveness in lead, cadmium and chromium control work using cleaning techniques specified by HUD 6780 guidelines.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Protection

3.1.1.1 Notification

a. Notify the Contracting Officer [20] [_____] days prior to the start of any lead, cadmium and chromium work.

[b. Occupant Notification

****

NOTE: Projects in target housing involving improvement, or maintenance (renovation or repair), that disrupt more than 2 square feet of painted surface while being occupied requires occupant notification prior to work.

****

Submit occupant written acknowledgment of the delivery of lead hazard information pamphlet (EPA 747-K-99-001 "Protect Your Family From Lead in Your Home") prior to commencing the renovation work for each affected unit using language provided in 40 CFR 745 Subpart E.

][c. Notification of the Commencement of [LBP] Hazard Abatement

****

NOTE: In some states, notification of lead-based paint hazard abatement work by the contractor must be made prior to work. Research if prior notification is required for the locality where work is conducted.

****

[Submit a copy of the notification of the commencement of[LBP] hazard abatement to [_____] according to the procedures established by [_____].

]]3.1.1.2 Lead, Cadmium, Chromium Control Area

a. Physical Boundary - Provide physical boundaries around the lead, cadmium, chromium control area by roping off the area designated in the work plan or providing curtains, portable partitions or other enclosures to ensure that lead, cadmium and chromium will not escape outside of the lead, cadmium and chromium control area. Prohibit the general public from accessing the lead, cadmium, chromium control areas.

b. Warning Signs - Provide warning signs at approaches to lead, cadmium, chromium control areas. Locate signs at such a distance that personnel may read the sign and take the necessary precautions before entering the area. Signs must comply with the requirements of 29 CFR 1926.62.

3.1.1.3 Furnishings

****

NOTE: Verify with the activity furniture or

equipment requirements.
****

[The Government will remove furniture and equipment from the building before lead, cadmium and chromium work begins.

][Furniture [_____] and equipment will remain in the [building][lead, cadmium, chromium control area]. Protect and cover furnishings or remove furnishings from the work area and store in a location approved by the Contracting Officer.

][Existing [furniture][and][equipment] is lead, cadmium and chromium contaminated, [decontaminate][dispose of as lead, cadmium, chromium contaminated waste].

]3.1.1.4 Heating, Ventilating and Air Conditioning (HVAC) Systems

Shut down, lock out, and isolate HVAC systems that supply, exhaust, or pass through the lead, cadmium, chromium control areas. Seal intake and exhaust vents in the lead, cadmium, chromium control area with 0.15 mm 6 mil plastic sheet and tape. Seal seams in HVAC components that pass through the lead, cadmium, chromium control area.[Provide temporary HVAC system for areas in which HVAC has been shut down outside the lead, cadmium, chromium control area.]

3.1.1.5 Local Exhaust System

****
NOTE: When a negative pressure enclosure is not required, delete the requirements for the local exhaust system and pressure differential recording.
****

Provide a local exhaust system in the lead, cadmium, chromium control area in accordance with ASSP Z9.2, 29 CFR 1926.62, 29 CFR 1926.1126 and 29 CFR 1926.1127 that will provide at least [4][_____] air changes per hour inside of the negative pressure enclosure. Local exhaust equipment must be operated 24-hours per day, until the lead, cadmium, chromium control area is removed and must be leak proof to the filter and equipped with HEPA filters. Maintain a minimum pressure differential in the lead, cadmium, chromium control area of minus 0.51 mm 0.02 inch of water column relative to adjacent, unsealed areas. Provide continuous 24-hour per day monitoring of the pressure differential with a pressure differential automatic recording instrument. The building ventilation system must not be used as the local exhaust system for the lead, cadmium, chromium control area. Filters on exhaust equipment must conform to ASSP Z9.2 and UL 586. Terminate the local exhaust system out of doors and remote from any public access or ventilation system intakes.

3.1.1.6 Negative Air Pressure System Containment

****
NOTE: Require containment to be equipped with negative air pressure control equipment specified in paragraph NEGATIVE AIR PRESSURE SYSTEM in PART 2 and operated as specified below if lead, cadmium, chromium hazard control activities require blasting or power sanding techniques to remove lead, cadmium, chromium. Remove this paragraph if not required in

the project.
****

a. Operate the negative air pressure systems to provide at least [4][10][_____] air changes per hour inside the containment. Operate the local exhaust unit equipment continuously until the containment is removed. Smoke test the negative air pressure system for leaks at the beginning of each shift. The certified supervisor is responsible to continuously monitor and keep a pressure differential log with an automatic manometric recording instrument. Notify the Contracting Officer immediately if the pressure differential falls below the prescribed minimum. Submit the continuously monitored pressure differential log, as specified. Do not use the building ventilation system as the local exhaust system. Terminate the local exhaust system out of doors unless the Contracting Officer allows an alternate arrangement. All filters must be new at the beginning of the project and be periodically changed as necessary to maintain specified pressure differential and disposed of as lead, cadmium and chromium contaminated waste.

b. Discontinuing Negative Air Pressure System. Operate the negative air pressure system continuously during abatement activities unless otherwise authorized by the Contracting Officer. At the completion of the project, units must be run until full cleanup has been completed and final clearance testing requirements have been met. Dismantling of the negative air pressure systems must [conform to written decontamination procedures] [be approved by the Contracting Officer] be as presented in the Lead, Cadmium, Chromium Compliance Plan. Seal the HEPA filter machine intakes with polyethylene to prevent environmental contamination.

3.1.1.7 Decontamination Shower Facility

Provide clean and contaminated change rooms and shower facilities in accordance with this specification and 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127.

3.1.1.8 Eye Wash Station

Provide suitable facilities within the work area for quick drenching or flushing of the eyes where eyes may be exposed to injurious corrosive materials.

3.1.1.9 Mechanical Ventilation System

a. Use adequate ventilation to control personnel exposure to lead, cadmium and chromium in accordance with 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127. To the extent feasible, use local exhaust ventilation or other collection systems, approved by the CP. Evaluate and maintain local exhaust ventilation systems in accordance with 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127.

b. Vent local exhaust outside the building and away from building ventilation intakes or ensure system is connected to HEPA filters.

c. Use locally exhausted, power actuated tools or manual hand tools.

3.1.1.10 Personnel Protection

Personnel must wear and use protective clothing and equipment as specified herein. Eating, smoking, or drinking or application of cosmetics is not permitted in the lead, cadmium, chromium control area. No one will be permitted in the lead, cadmium, chromium control area unless they have been appropriately trained and provided with protective equipment.

3.2 ERECTION

3.2.1 Lead, Cadmium, Chromium Control Area Requirements

****

NOTE: Choose the first paragraph if PWL or MCL will be removed by means that will not create airborne, dust containing lead, cadmium, chromium (such as carefully unfastening sheets containing lead, cadmium, chromium from walls). Choose the second paragraph if removal practice will create airborne, dust containing lead, cadmium, chromium (such as sanding, sawing, grinding, thermal cutting or digging or demolition activities). Select the control method that will ensure efficiency and prevents lead, cadmium, chromium from escaping outside of the lead, cadmium, chromium control area.

****

[Establish a lead, cadmium, chromium control area by completely establishing barriers and physical boundaries around the area or structure where PWL or MCL removal operations will be performed.
]

****

NOTE: The Designer should consider the use of viewing ports for lead, cadmium and chromium control areas under 100 square meters 1,000 square feet to save inspection time.

****

[Full containment - Contain removal operations by the use of[critical barriers][and HEPA filtered exhaust][a negative pressure enclosure system with decontamination facilities and with HEPA filtered exhaust if required by the CP]. For containment areas larger than 100 square meters 1,000 square feet install a minimum of two 450 mm 18 inch square viewing ports. Locate ports to provide a view of the required work from the exterior of the enclosed contaminated area. Glaze ports with laminated safety glass.

]3.3 APPLICATION

3.3.1 Lead, Cadmium, Chromium Work

Perform lead, cadmium, chromium work in accordance with approved Lead, Cadmium, Chromium Compliance Plan. Use procedures and equipment required to limit occupational exposure and environmental contamination with lead, cadmium, chromium when the work is performed in accordance with 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127[or 40 CFR 745], and as specified herein. Dispose of all PWL or MCL and associated waste in compliance with federal, State, and local requirements.

3.3.2 Paint with Lead, Cadmium, Chromium or Material Containing Lead, Cadmium, Chromium Removal

****

NOTE: Use bracketed prohibition on manual and power sanding/grinding of lead, cadmium, chromium surfaces/materials when appropriate. Large scale manual or power sanding/grinding of lead, cadmium, chromium containing surfaces should never be allowed in family housing, child care facilities, administrative buildings, galleys, barracks, due to problems associated with the resulting dust fallout/contamination of crevices and cracks which may retain unseen quantities of lead, cadmium, chromiumcontaminated dust. Use of these techniques for exteriors should be limited because the resulting airborne dust could result in significant contamination of the ground in the immediate vicinity of the facility. Manual or power sanding/grinding of lead, cadmium, chromium containing surfaces may be an acceptable work method only if appropriate engineering controls for personnel/environmental protection are in place.

****

****

NOTE: For commercial/public buildings and industrial buildings, the designer will have to ascertain appropriate procedures, methods and techniques to control lead, cadmium, chromium hazards. The use of enclosure or soil barriers as a control system requires the input of engineering/ architectural experts familiar with these controls. Add additional paragraphs to address unique local or state requirements.

****

[Manual or power sanding or grinding of lead, cadmium, chromium surfaces or materials is not permitted unless tools are equipped with HEPA attachments or wet methods. The dry sanding or grinding of surfaces that contain lead, cadmium, chromium is prohibited.]Provide methodology for removing lead, cadmium, chromium in the Lead, Cadmium, Chromium Compliance Plan. Select lead, cadmium, chromium removal processes to minimize contamination of work areas outside the control area with lead, cadmium, chromium contaminated dust or other lead, cadmium, chromium contaminated debris or waste and to ensure that unprotected personnel are not exposed to hazardous concentrations of lead, cadmium, chromium. Describe this removal process in the Lead, Cadmium, Chromium Compliance Plan. [_____]

[Avoid [flash rusting][deterioration] of the substrate. Provide surface preparations for painting in accordance with Section 09 90 00 PAINTS AND COATINGS.

]

****

NOTE: Listed below are various types of paint removal techniques. Designer may be required to specify a particular technique in order to limit potential conflicts or problems.

1. Wood, Drywall, Interior Partitions
a. Scraping
b. Heat Stripping
c. Chemical Stripping
d. Power Tool Cleaning (least acceptable)
e. Wet Abrasive Blasting
Chemical stripping should be carefully researched as a removal method for soft wood (e.g., pine or redwood) substrates. The wrong chemical strippers can increase the risk of residual lead, cadmium, chromium contamination in the substrate.
2. Steel and Metal Surfaces (Industrial)
a. Power/Hand Tool Cleaning (least acceptable)
b. Dry Abrasive Blast with Water Ring (Wet "Halo")
c. Wet Abrasive Blast
d. Low Volume High Pressure Water Blast
e. Chemical Stripping
f. Vacuum Blast

The following practices are restricted during lead, cadmium and chromium hazard abatement work on housing per 40 CFR 745: Open flame burning or torching is prohibited; machine sanding or grinding or abrasive blasting on LBP is prohibited unless used with High Efficiency Particulate Air (HEPA) exhaust control; dry scraping in conjunction with heat guns, or around electrical outlets, is permitted if limited to no more than 2 square feet in any one room (20 square feet on exterior surfaces); heat guns must operate at a temperature below 1100 degrees Fahrenheit.

****

****

NOTE: For lead, cadmium and chromium hazard abatement work in housing or child occupied facilities, consult the risk assessment report to select abatement or interim control techniques to be used in target housing. For commercial/public buildings and industrial buildings, the designer will have to ascertain appropriate procedures, methods and techniques to control lead, cadmium and chromium hazards. The use of encapsulation, enclosure, or soil barriers as an abatement/control system requires the input of engineering/ architectural experts familiar with these controls. Encapsulation should not be specified for areas where water damage exists or could easily occur. The designer may need to test the existing substrates to ascertain that encapsulation is feasible at all. Methods listed or taken from the current HUD Guidelines may be considered. Add additional paragraphs to address unique local or state requirements.

****

Provide methodology for lead, cadmium and chromium, LBP/PWL [removal][abatement/control] and processes to minimize contamination of work areas outside the control area with lead, cadmium, chromium contaminated dust or other lead, cadmium, chromium contaminated debris/waste and to ensure that unprotected personnel are not exposed to hazardous concentrations of lead, cadmium, chromium. Describe this lead,, cadmium and chromium, LBP/PWL removal/control process in the Lead, Cadmium, Chromium Compliance Plan. [_____]

3.3.2.1 Paint with Lead, Cadmium, Chromium or Material Containing Lead, Cadmium, Chromium - Indoor Removal

Perform [manual][mechanical] removal[and thermal cutting] in the lead, cadmium, chromium control areas using enclosures, barriers or containments[and powered locally exhausted tools equipped with HEPA filters]. Collect residue and debris for disposal in accordance with federal, State, and local requirements.

3.3.2.2 Paint with Lead, Cadmium, Chromium or Material Containing Lead, Cadmium, Chromium - Outdoor Removal

Perform outdoor removal as indicated in federal, State, and local regulations and in the Lead, Cadmium, Chromium Compliance Plan. The worksite preparation (barriers or containments) must be job dependent and presented in the Lead, Cadmium, Chromium Compliance Plan.

3.3.3 Personnel Exiting Procedures

Whenever personnel exit the lead, cadmium, chromium controlled area, they must perform the following procedures and must not leave the work place wearing any clothing or equipment worn in the control area:

a. Vacuum all clothing before entering the contaminated change room.

b. Remove protective clothing in the contaminated change room, and place them in an approved impermeable disposal bag.

****

NOTE: Showering is the preferred method of personal decontamination. However, extenuating circumstances may prevent the use of a shower at the work site. In that event, choose the alternate selection. Note that the alternate is generally a very expensive method and should be used only when showering at the site is unfeasible.

****

[c. Shower.

][d. Wash hands and face at the site, don appropriate disposable or uncontaminated reusable clothing, move to an appropriate shower facility, shower.

] e. Change to clean clothes prior to leaving the clean clothes storage area.

3.4 FIELD QUALITY CONTROL

3.4.1 Tests

3.4.1.1 Air and Wipe Sampling

Conduct sampling for lead, cadmium, chromium in accordance with

29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 and as specified herein. Air and wipe sampling must be directed or performed by the CP.

a. The CP must be on the job site directing the air and wipe sampling and inspecting the PWL or MCL removal work to ensure that the requirements of the contract have been satisfied during the entire PWL or MCL operation.

b. Collect personal air samples on employees who are anticipated to have the greatest risk of exposure as determined by the CP. In addition, collect air samples on at least twenty-five percent of the work crew or a minimum of two employees, whichever is greater, during each work shift.

c. Submit results of air samples, signed by the CP, within 72-hours after the air samples are taken.

d. Conduct area air sampling daily, on each shift in which lead, cadmium and chromium and lead-based paint removal operations are performed, in areas immediately adjacent to the lead, cadmium and chromium control area. Conduct sufficient area monitoring to ensure unprotected personnel are not exposed at or above 30 micrograms of lead per cubic meter of air or 2.5 micrograms of cadmium/chromium per cubic meter of air. If 30 micrograms of lead per cubic meter of air or 2.5 micrograms of cadmium/chromium per cubic meter of air is reached or exceeded, stop work, correct the conditions(s) causing the increased levels. Notify the Contracting Officer immediately. Determine if condition(s) require any further change in work methods. Resume removal work only after the CP and the Contracting Officer give approval.

****

NOTE: Include the following paragraph for high profile, sensitive work such as present in family housing, child care facilities, administrative buildings, kitchens, barracks. Use the following paragraph along with clearance certification by a third party consultant specified in paragraph CLEARANCE CERTIFICATION to determine if significant contamination was due to the contract work. Surface dust sampling to determine clearance (i.e., that the work has not contaminated surfaces within and adjacent to the control area) should be performed by a third party to reduce a conflict of interest. Samples must be conducted by an individual not paid or employed or otherwise compensated by the lead Contractor. State or local regulations may require third party.

****

[e. Before any work begins,[a third party consultant must] collect and analyze baseline wipe[and soil] samples in accordance with methods defined by federal, State, and local standards inside and outside of the physical boundary to assess the degree of dust contamination in the facility prior to lead, cadmium and chromium disturbance or removal. Provide Initial Sample Results to the Contracting Officer before work begins.
]

****

NOTE: Lead, cadmium, chromium hazard control area

containment adequacy should be checked by surface wipe sampling of floors in all buildings that are or will be occupied. The exceptions being buildings to be demolished or industrial buildings.
****

[f. Surface Wipe Samples - Collect surface wipe samples on floors at a location no greater than 3 m 10 feet outside the lead, cadmium, chromium control area at a frequency of once per day while lead, cadmium, chromium removal work is conducted in occupied buildings. Surface wipe samples or Micro Vacuum surface sample results must meet criteria in paragraph CLEARANCE CERTIFICATION.

]3.4.1.2 Sampling After Removal

After the visual inspection,[conduct soil sampling if bare soil is present during external removal operations and] collect wipe[and soil] samples according to the HUD protocol contained in HUD 6780 to determine the lead, cadmium and chromium content of settled dust in micrograms per square meter foot of surface area[and micrograms per gram (ug/g) parts per million (ppm) for soil].

[3.4.1.3 Testing of Material Containing Lead, Cadmium, Chromium Residue

****
NOTE: Include this paragraph when the residue is questionable with respect to its lead, cadmium, chromium content, otherwise delete.
****

Test residue in accordance with 40 CFR 261 for hazardous waste.

]3.5 CLEANING AND DISPOSAL

3.5.1 Cleanup

Maintain surfaces of the lead, cadmium, chromium control area free of accumulations of dust and debris. Restrict the spread of dust and debris; keep waste from being distributed over the work area. Do not dry sweep or use pressurized air to clean up the area. At the end of each shift and when the lead, cadmium, chromium operation has been completed, clean the controlled area of all visible contamination by vacuuming with a HEPA filtered vacuum cleaner, wet mopping the area and wet wiping the area as indicated by the Lead, Cadmium, Chromium Compliance Plan. Reclean areas showing dust or debris. After visible dust and debris is removed, wet wipe and HEPA vacuum all surfaces in the controlled area. If adjacent areas become contaminated at any time during the work, clean, visually inspect, and then wipe sample all contaminated areas. The CP must then certify in writing that the area has been cleaned of lead, cadmium and chromium contamination before clearance testing.

3.5.1.1 Clearance Certification

****
NOTE: The second paragraph must be used for high profile, sensitive work such as present in family housing, child care facilities, kitchens. For work in administrative buildings or the conversion of industrial lead, cadmium and chromium work areas

(e.g., firing ranges) into non-industrial work areas open for public access, use the third paragraph otherwise delete. For industrial buildings, use visual clearance only. Surface dust sampling to determine clearance (i.e., that the work has not contaminated surfaces within and adjacent to the control area) should be performed by a third party to reduce a conflict of interest.

****

The CP must certify in writing that air samples collected outside the lead, cadmium, chromium control area during paint removal operations are less than 30 micrograms of lead per cubic meter of airand less than 2.5 micrograms of cadmium/chromium per cubic meter of air; the respiratory protection used for the employees was adequate; the work procedures were performed in accordance with 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127; and that there were no visible accumulations of material and dust containing lead, cadmium, chromium left in the work site. Do not remove the lead, cadmium, chromium control area or roped off boundary and warning signs prior to the Contracting Officer's acknowledgement of receipt of the CP certification.

[The third party consultant must certify surface wipe sample results collected inside and outside the work area are[less than 40 micrograms of lead per 0.1 square meter square foot on floors, less than 250 micrograms of lead per 0.1 square meter square foot on interior window sills and less than 400 micrograms of lead per 0.1 square meter square foot on window troughs][not significantly greater than the initial surface loading determined prior to work].

][The third party consultant must certify surface wipe sample or Micro Vacuum surface sample results collected inside and outside the work area are less than 200 micrograms of lead per 0.1 square meter square foot on floors or horizontal surfaces. Micro Vacuum technique should be used on rough or porous surfaces which are difficult to achieve clearance by the wipe sampling methodology.

][Certify surface wipe samples are not significantly greater than the initial surface loading determined prior to work.

][Clear the lead, cadmium, chromium control area in industrial facilities of all visible dust and debris.

][For exterior work, soil samples taken at the exterior of the work site must be used to determine if soil lead, cadmium, chromium levels have increased at a statistically significant level (significant at the 95 percent confidence limit) from the soil lead, cadmium, chromium levels prior to the operation. If soil lead, cadmium, chromium levels either show a statistically significant increase above soil lead, cadmium, chromium levels prior to work or soil lead, cadmium, chromium levels above any applicable federal or state standard for lead, cadmium, chromium in soil, the soil must be remediated.

][For lead, cadmium and chromium-based paint hazard abatement work, surface wipe and soil sampling must be conducted and clearance determinations made according to the work practice standards presented in 40 CFR 745.227.

]3.5.2 Disposal

****

NOTE: Notify the activity that Federal regulations (40 CFR 260-265) require a USEPA generator identification number for use on the Uniform Hazardous Waste Manifest prior to commencement of removal work. A USEPA generator identification number will not be required if it is certain that the work will not generate HW.

****

****

NOTE: Research State, regional, and local laws, regulations, and statutes and revise the specifications accordingly. Proper segregation and handling of waste can significantly reduce the generated volume (and cost) of disposing hazardous wastes.

****

****

NOTE: Research State, regional, and local requirements regarding the recycling of lead, cadmium and chromium wastes. Ensure that other hazardous components are not present. The entire waste stream or discreet portions of the waste may be appropriately packaged and transported for recycling (Consider Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL). If waste is eligible for sanitary landfill or C&D landfill disposal, some of these requirements are not applicable.

****

a. Dispose of material, whether hazardous or non-hazardous in accordance with all laws and provisions and all federal, State or local regulations. Ensure all waste is properly characterized. The result of each waste characterization (TCLP for RCRA materials) will dictate disposal requirements.

b. Contractor is responsible for segregation of waste. Collect lead, cadmium, chromium contaminated waste, scrap, debris, bags, containers, equipment, and lead, cadmium, chromiumcontaminated clothing that may produce airborne concentrations of lead, cadmium, chromium particles. Label the containers in accordance with 29 CFR 1926.62, 29 CFR 1926.1126, 29 CFR 1926.1127 and 40 CFR 261, 40 CFR 262 and corresponding state regulations.

c. Dispose of lead, cadmium, chromiumcontaminated material classified as hazardous waste at an [EPA][or][State] approved hazardous waste treatment, storage, or disposal facility off Government property.

d. Accumulate waste materials in U.S. Department of Transportation (49 CFR 178) approved 55 gallon drums or appropriately sized container for smaller volumes. Properly label each drum to identify the type of hazardous material (49 CFR 172). For hazardous waste, the collection container requires marking/labeling in accordance with 40 CFR 262 and corresponding state regulations during the accumulation/collection timeframe. The Contracting Officer or an authorized representative will assign an area for accumulation of waste containers. Coordinate authorized accumulation volumes and time limits with the host installation environmental function.

e. Handle, store, transport, and dispose lead, cadmium, chromium or lead, cadmium, chromium contaminated waste in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, and 40 CFR 265. Comply with land disposal restriction notification requirements as required by 40 CFR 268.

f. All lead, cadmium, and chromium waste generation, management,and disposal will be coordinated with the host installation environmental function.

3.5.2.1 Disposal Documentation

****

NOTE: Include the following paragraph if the Contractor is to dispose of waste.

****

Coordinate all disposal or off-site shipments of lead, cadmium, and chromium waste with the host installation environmental function. Submit written evidence of TSD approval to demonstrate the hazardous waste treatment, storage, or disposal facility (TSD) is approved for lead, cadmium, chromium disposal by the EPA, State or local regulatory agencies. Submit one copy of the completed hazardous waste manifest, signed and dated by the initial transporter in accordance with 40 CFR 262. Provide a certificate that the waste was accepted by the disposal facility.[Provide turn-in documents or weight tickets for non-hazardous waste disposal.]

3.5.2.2 Payment for Hazardous Waste

Payment for disposal of hazardous and non-hazardous waste will not be made until a signed copy of the manifest from the treatment or disposal facility is received and approved by the Contracting Officer. The manifest must detail and certify the amount of lead, cadmium, chromium containing materials or non-hazardous waste delivered to the treatment or disposal facility.

SECTION 02 84 16

HANDLING OF LIGHTING BALLASTS AND LAMPS CONTAINING PCBs AND MERCURY

11/22

****

NOTE: This guide specification covers the requirements for requirements for removal and disposal of polychlorinated biphenyl (PCB) containing lighting ballasts and mercury containing lamps, and the handling of resulting wastes.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

****

NOTE: Do not use this section if, in addition to ballasts, other PCB removal and disposal is included in the job, but use Section 02 84 33 REMOVAL AND DISPOSAL OF POLYCHLORINATED BIPHENYLS (PCBS) and include the removal and disposal of the ballasts in that section. Also, use Section 02 84 33 where a significant number of ballasts are known to be leaking.

****

PART 1   GENERAL

1.1   REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

29 CFR 1910.1000	Air Contaminants
40 CFR 260	Hazardous Waste Management System: General

40 CFR 761	Polychlorinated Biphenyls (PCBs) Manufacturing, Processing, Distribution in Commerce, and Use Prohibitions
49 CFR 178	Specifications for Packagings

1.2 REQUIREMENTS

Removal and disposal of PCB containing lighting ballasts and associated mercury-containing lamps. Contractor may encounter leaking PCB ballasts.

1.3 DEFINITIONS

1.3.1 Certified Industrial Hygienist (CIH)

A industrial hygienist hired by the contractor must be certified by the American Board of Industrial Hygiene.

1.3.2 Leak

Leak or leaking means any instance in which a PCB article, PCB container, or PCB equipment has any PCBs on any portion of its external surface.

1.3.3 Lamps

Lamp is defined as the bulb or tube portion of an electric lighting device. A lamp is specifically designed to produce radiant energy, most often in the ultraviolet, visible, and infra-red regions of the electromagnetic spectrum. Examples of common electric lamps include, but are not limited to, fluorescent, high intensity discharge, neon, mercury vapor, high pressure sodium, and metal halide lamps.

1.3.4 Polychlorinated Biphenyls (PCBs)

PCBs as used in this specification mean the same as PCBs, and all related items, as defined in 40 CFR 761, Section 3, Definitions.

1.3.5 Spill

Spill means both intentional and unintentional spills, leaks, and other uncontrolled discharges when the release results in any quantity of PCBs running off or about to run off the external surface of the equipment or other PCB source, as well as the contamination resulting from those releases.

1.3.6 Universal Waste

Universal Waste means any of the following hazardous wastes that are managed under the universal waste requirements 40 CFR 273:

(1) Batteries as described in Sec. 273.2 of this chapter;

(2) Pesticides as described in Sec. 273.3 of this chapter;

(3) Mercury containing equipment as described in Sec. 273.4 of this chapter; and

(4) Lamps as described in Sec. 273.5 of this chapter.

1.4 QUALITY ASSURANCE

1.4.1 Regulatory Requirements

Perform PCB related work in accordance with 40 CFR 761.[Perform mercury-containing lamps storage and transport in accordance with 40 CFR 261, 40 CFR 264, 40 CFR 265, 40 CFR 273.]

1.4.2 Training

Instruction and certification of training of all persons involved in the removal of PCB containing lighting ballasts and mercury-containing lamps is the responsibility of the Certified Industrial Hygienist (CIH). Include in the instruction: The dangers of PCB and mercury exposure, decontamination, safe work practices, and applicable OSHA and EPA regulations. The CIH must review and approve the PCB and Mercury-Containing Lamp Removal Work Plans.

1.4.3 Regulation Documents

Maintain at all times one copy each at the office and one copy each in view at the job site of 29 CFR 1910.1000, 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 265, 40 CFR 268, 40 CFR 270, 40 CFR 273 and of the Contractor removal work plan and disposal plan for PCB and for associated mercury-containing lamps.

1.5 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-07 Certificates

Qualifications of CIH; G, [_____]

Training Certification; G, [_____]

PCB and Lamp Removal Work Plan; G, [_____]

PCB and Lamp Disposal Plan; G, [_____]

SD-11 Closeout Submittals

Transporter Certification of notification to EPA of their PCB waste activities and EPA ID numbers; G, [_____]

Certification of Decontamination

Certificate of Disposal and/or recycling. Submit to the Government before application for payment within 30 days of the date that the disposal of the PCB and mercury-containing lamp waste identified on the manifest was completed.

DD Form 1348-1

[Testing Results

]1.6 ENVIRONMENTAL REQUIREMENTS

Use special clothing:

a. Disposable gloves (polyethylene)

b. Eye protection

c. PPE as required by CIH

1.7 SCHEDULING

Notify the Contracting Officer 20 days prior to the start of PCB and mercury-containing lamp removal work.

1.8 QUALITY ASSURANCE

1.8.1 Qualifications of CIH

Submit the name, address, and telephone number of the Industrial Hygienist selected to perform the duties in paragraph CERTIFIED INDUSTRIAL HYGIENIST. Submit training certification that the Industrial Hygienist is certified, including certification number and date of certification or re certification.

1.8.2 PCB and Lamp Removal Work Plan

Submit a job-specific plan within [20] [_____] calendar days after award of contract of the work procedures to be used in the removal, packaging, and storage of PCB-containing lighting ballasts and associated mercury-containing lamps. Include in the plan: Requirements for Personal Protective Equipment (PPE), spill cleanup procedures and equipment, eating, smoking and restroom procedures. The plan must be approved and signed by the Certified Industrial Hygienist. Obtain approval of the plan by the Contracting Officer prior to the start of PCB and/or lamp removal work.

1.8.3 PCB and Lamp Disposal Plan

****

NOTE: If Government disposal of PCB waste is available by the station, then omit this paragraph. Verify that Government disposal is available and make arrangements if so.

****

Submit a PCB and lamp Disposal Plan within [45] [_____] calendar days after award of contract, complying with the applicable requirements of federal, state, and local PCB and Universal waste regulations and address:

a. Estimated quantities of wastes to be generated, disposed of, and recycled.

b. Names and qualifications of each Contractor that will be transporting, storing, treating, and disposing of the wastes. Include the facility location. Furnish two copies of EPA and state PCB and mercury-containing lamp waste permit applications and EPA identification numbers, as required.

c. Names and qualifications (experience and training) of personnel who will be working on-site with PCB and mercury-containing lamp wastes.

d. Spill prevention, containment, and cleanup contingency measures to be implemented.

e. Work plan and schedule for PCB and mercury-containing lamp waste removal, containment, storage, transportation, disposal and or recycling. Clean up and containerize wastes daily.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 WORK PROCEDURE

Furnish labor, materials, services, and equipment necessary for the removal of PCB containing lighting ballasts, associated mercury-containing fluorescent lamps,[and high intensity discharge (HID) lamps] in accordance with local, state, or federal regulations. Do not expose PCBs to open flames or other high temperature sources since toxic decomposition by-products may be produced. Do not break mercury containing fluorescent lamps or high intensity discharge lamps.

3.1.1 Work Operations

Ensure that work operations or processes involving PCB or PCB-contaminated materials are conducted in accordance with 40 CFR 761, 40 CFR 262 40 CFR 263, and the applicable requirements of this section, including but not limited to:

a. Obtaining suitable PCB and mercury-containing lamp storage sites.

b. Notifying Contracting Officer prior to commencing the operation.

c. Reporting leaks and spills to the Contracting Officer.

d. Cleaning up spills.

e. Inspecting PCB and PCB-contaminated items and waste containers for leaks and forwarding copies of inspection reports to the Contracting Officer.

f. Maintaining inspection, inventory and spill records.

3.2 PCB SPILL CLEANUP REQUIREMENTS

3.2.1 PCB Spills

Immediately report to the Contracting Officer any PCB spills.

3.2.2 PCB Spill Control Area

Rope off an area around the edges of a PCB leak or spill and post a "PCB Spill Authorized Personnel Only" caution sign. Immediately transfer leaking items to a drip pan or other container.

3.2.3 PCB Spill Cleanup

40 CFR 761, subpart G. Initiate cleanup of spills as soon as possible, but no later than 24 hours of its discovery. Mop up the liquid with rags or other conventional absorbent. Properly contain and dispose of spent absorbent as solid PCB waste.

3.2.4 Records and Certification

Document the cleanup with records of decontamination in accordance with 40 CFR 761, Section 125, Requirements for PCB Spill Cleanup. Provide test results of cleanup and certification of decontamination.

3.3 REMOVAL

3.3.1 Ballasts

****

NOTE: Ballasts produced after 1998 do not contain PCBs.

If there are less than 1600 lighting ballasts to be removed and disposed, delete the bracketed sentence.

****

As ballast are removed from the lighting fixture, inspect label on ballast. Ballasts without a "No PCB" label must be assumed to contain PCBs and containerized and disposed of as required under paragraphs STORAGE FOR DISPOSAL and DISPOSAL. If there are less than 1600 "No PCB" labeled lighting ballasts, dispose of them as normal demolition debris.[If there are more than 1600 "No PCB" labeled ballasts, establish whether the "No PCB" labeled ballasts contain diethylhexyl phthalate (DEHP) either by test or by checking with the ballast manufacturer indicated on the label. Submit testing results and/or written confirmation from the manufacturer to the Contracting Officer. If the ballasts do not contain DEHP, dispose of them as normal construction debris. If they do contain DEHP, dispose of them as hazardous material in accordance with Federal, State, and local regulations. As a basis of bid assume ballasts with "No PCB" labels do not contain DEHP and may disposed of as normal construction debris. If 1600 or more DEHP ballasts are disposed of in a 24 hour period, notify the National Response Team at 800-424-8802.]

3.3.2 Lighting Lamps

Remove lighting tubes/lamps from the lighting fixture and carefully place (unbroken) into appropriate containers (original transport boxes or equivalent). In the event of a lighting tube/lamp breaking, sweep and place waste in double plastic taped bags and dispose of as universal waste as specified herein.

3.4 STORAGE FOR DISPOSAL

3.4.1 Storage Containers for PCBs

49 CFR 178. Store PCB in containers approved by DOT for PCB.

3.4.2 Storage Containers for lamps

Store mercury containing lamps in appropriate DOT containers. Store and label boxes for transport in accordance with 40 CFR 273.

3.4.3 Labeling of Waste Containers

Label with the following:

a. Date the item was placed in storage and the name of the cognizant activity/building.

b. "Caution Contains PCB," conforming to 40 CFR 761, CFR Subpart C. Affix labels to PCB waste containers.

c. Label mercury-containing lamp waste in accordance with 40 CFR 273. Affix labels to all lighting waste containers.

3.5 DISPOSAL

Dispose of off Government property in accordance with EPA, DOT, and local regulations at a permitted site.

3.5.1 Identification Number

Federal regulations 40 CFR 761, and 40 CFR 263 require that generators, transporters, commercial storers, and disposers of PCB waste posses U.S. EPA identification numbers. Verify that the activity has a U.S. EPA generator identification number for use on the Uniform Hazardous Waste manifest. If not, advise the activity that it must file and obtain an I.D. number with EPA prior to commencement of removal work. For mercury containing lamp removal, Federal regulations 40 CFR 273 require that large quantity handlers of Universal waste (LQHUW) must provide notification of universal waste management to the appropriate EPA Region (or state director in authorized states), obtain an EPA identification number, and retain for three years records of off-site shipments of universal waste. Verify that the activity has a U.S. EPA generator identification number for use on the Universal Waste manifest. If not, advise the activity that it must file and obtain an I.D. number with EPA prior to commencement of removal work.

3.5.2 Transporter Certification

****

NOTE: Choose this option and subparagraphs if the Contractor is to dispose of PCB waste.

****

Comply with disposal and transportation requirements outlined in 40 CFR 761 and 40 CFR 263. Before transporting the PCB waste, sign and date the manifest acknowledging acceptance of the PCB waste from the Government. Return a signed copy to the Government before leaving the job site. Ensure that the manifest accompanies the PCB waste at all times. Submit transporter certification of notification to EPA of their PCB waste activities (EPA Form 7710-53).

3.5.2.1 Certificate of Disposal and/or Recycling

40 CFR 761. Include in the certificate for the PCBs and PCB items disposed:

a. The identity of the disposal and or recycling facility, by name, address, and EPA identification number.

b. The identity of the PCB waste affected by the Certificate of Disposal including reference to the manifest number for the shipment.

c. A statement certifying the fact of disposal and or recycling of the identified PCB waste, including the date(s) of disposal, and identifying the disposal process used.

d. A certification as defined in 40 CFR 761.

3.5.3 Disposal by the Government

****

NOTE: Choose this option and subparagraphs if PCB waste transportation and disposal has been arranged with PWD/PWC and PCB waste is to be delivered to suitable storage site. Verify procedures with PWD/PWC. Omit paragraph when the Government will pick up PCB waste at the project site.

****

Comply with disposal and transportation requirements outlined in 40 CFR 761 and 40 CFR 263. Coordinate delivery of PCBs on-site with local Environmental for subsequent disposal on Defense Logistics Agency Disposition Services (DLA DS) contracts. If the primary [_____] site is filled to capacity, contact the Contracting Officer. The transport distance to any storage site will not exceed the distance between the project site and the DLA DS storage site at [_____].

3.5.3.1 [Delivery] [Government Pick Up]

****

NOTE: Choose the option for Government pick up if arrangements have been made for the Government to pick up the PCB waste at the project site. This will be required when DLA DS does not have a suitable storage site and the PCB waste must be picked up by the Government's PCB disposal contractor.

****

Contact DLA DS at least 5 working days in advance to make arrangements for [delivery of PCB to the storage site.] [pick up of PCB waste by the Government.] Phone [_____] or write to:

Defense Logistics Agency Disposition

[_____]

[_____]

3.5.3.2 DD Form 1348-1

Prepare DD Form 1348-1 Turn-in Document (TID), which will accompany the PCB to the storage site. Ensure that a responsible person from the activity that owns the PCB signs the DD Form 1348-1.

****

NOTE: This guide specification covers the requirements for the removal and disposal of polychlorinated biphenyls (PCBs) and the handling of PCB containing materials.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

****

NOTE: This guide specification is intended for use in projects where PCBs or materials containing PCB at concentrations of 50 parts per million (ppm) and above are to be removed and disposed of.

****

****

NOTE: A generator of PCB wastes who relinquishes control over the wastes by transporting, or offering for transport by his own vehicle or by a vehicle owned by another person, or relinquishing for commercial off-site storage or off-site disposal must prepare a manifest on EPA Form 8700-22 in accordance with 40 CFR 761, Part 207. The generator must specify on the manifest:

1. For each bulk load of PCBs, the identity of the PCB waste, the earliest date of removal from service for disposal, and the weight in kilograms of the PCB waste.

2. For each PCB Article Container or PCB Container, the unique identifying number, type of PCB waste (e.g., soil, debris, small capacitors), earliest date of removal from service for disposal, and weight in kilograms of the PCB waste contained.

3. For each PCB Article not in a PCB Container or PCB Article Container, the serial number if available, or other identification if there is no serial number, the date of removal from service for disposal, and weight in kilograms of the PCB waste in each PCB Article.

4. One off-site commercial storage or disposal facility approved for the commercial storage or disposal of the PCBs and PCB Items described on the manifest.

It is recommended that 40 CFR 761, Subpart K be read prior to the removal of PCB waste. Note: Contractor will not accept PCB waste for storage or disposal unless it is accompanied by a signed manifest by the generator.

****

1.2 REQUIREMENTS

The work includes the removal and disposal of [_____]. Perform work in accordance with 40 CFR 761 and the requirements specified herein.

1.3 DEFINITIONS

1.3.1 Leak

Leak or leaking means any instance in which a PCB Article, PCB Container, or PCB Equipment has any PCBs on any portion of its external surface.

1.3.2 PCBs

PCBs as used in this specification mean the same as PCBs, PCB Article, PCB Article Container, PCB Container, PCB Equipment, PCB Item, PCB Transformer, PCB-Contaminated Electrical Equipment, as defined in 40 CFR 761, Section 3, Definitions.

1.3.3 Spill

Spill means both intentional and unintentional spills, leaks, and other uncontrolled discharges when the release results in any quantity of PCBs running off or about to run off the external surface of the equipment or other PCB source, as well as the contamination resulting from those releases.

1.4 QUALITY ASSURANCE

1.4.1 Training

Instruct employees on the dangers of PCB exposure, on respirator use, decontamination, and applicable OSHA and EPA regulations.

1.4.2 Certified Industrial Hygienist (CIH)

Obtain the services of an industrial hygienist certified by the American Board of Industrial Hygiene to certify training, review and approve the PCB removal plan, including determination of the need for personnel protective equipment (PPE) in performing PCB removal work.

1.4.3 Regulation Documents

Maintain at all times one copy each at the office and one copy each in view at the job site 29 CFR 1910.1000, 40 CFR 761, and Contractor work practices for removal, storage and disposal of PCBs.

1.4.4 Surveillance Personnel

Surveillance personnel may enter PCB control areas for brief periods of time provided they wear disposable polyethylene gloves and disposal polyethylene foot covers, as a minimum. Additional protective equipment may be required if respiratory hazard is involved or if skin contact with PCB is involved.

1.5 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

PCB Removal Work Plan

PCB Disposal Plan

SD-07 Certificates

Training certification

Qualifications of CIH

Notification

Transporter Certification of notification to EPA of their PCB waste activities and EPA ID numbers

Certification of Decontamination for PCB Spill

Post Cleanup Sampling Data

Certificate of Disposal

1.6 EQUIPMENT

1.6.1 Special Clothing

Work clothes consist of PPE as required by OSHA regulations, including, but not limited to the following:

a. Disposable coveralls

b. Gloves (Disposable rubber gloves may be worn under these)

c. Disposable foot covers (polyethylene)

d. Chemical safety goggles

e. Half mask cartridge respirator.

1.6.2 Special Clothing for Government Personnel

Provide PPE specified in paragraph SPECIAL CLOTHING to the Contracting Officer as required for inspection of the work.

1.6.3 PCB Spill Kit

Assemble a spill kit to include the following items:

ITEM	MINIMUM QUANTITY
1. Disposable gloves (polyethylene)	6 prs
2. Gloves with a high degree of impermeability to PCB	6 prs
3. Disposable coveralls with permeation resistance to PCB	4 ea
4. Chemical safety goggles	2 ea
5. Disposable foot covers (polyethylene)	6 prs
6. PCB Caution Sign: "PCB Spill--Authorized Personnel Only"	2 ea
7. Banner guard or equivalent banner material	30 m 100 feet
8. Absorbent material	5 bags
9. Blue polyethylene waste bags	5 ea
10. Cloth backed tape	1 roll
11. Area access logs, blank	10 ea
12. Brattice cloth, 2 m x 2 m 6' x 6'	1 piece
13. Rags	20 ea
14. Ball point pens	20 ea
15. Herculite, 1.5 m x 1.5 m and 3 m x 3 m 4' x 4' and 8' x 8'	2 ea and 1 ea
16. Blank metal signs and grease pencils	2 ea
17. Waste containers 208 liters 55 gallon drum, may be used as container for kit	[1] [_____] ea

1.7 QUALITY ASSURANCE

1.7.1 Training Certification

Submit certificates, prior to the start of work but after the main abatement submittals, signed and dated by the CIH and by each employee stating that the employee has received training. Organize certificates by individual worker, not grouped by type of certificates.

1.7.2 Qualifications of CIH

Submit the name, address, and telephone number of the Industrial Hygienist selected to perform the duties in paragraph CERTIFIED INDUSTRIAL HYGIENIST. Submit proper documentation that the Industrial Hygienist is certified, including certification number and date of certification/recertification.

1.7.3 PCB Removal Work Plan

****

NOTE: Edit removal plan requirements to suit the project. Modify or delete decon and change rooms, showers, and ventilation. Delete air sampling requirements except for work at elevated temperatures sufficient to vaporize PCB or for work involving PCB contaminated dust or particulate generation such as grinding, sawing, or sweeping.

****

Submit a detailed job-specific plan of the work procedures to be used in the removal of PCB-containing materials, not to be combined with other hazardous abatement plans. Provide a Table of Contents for each abatement submittal which follows the sequence of requirements in the contract. Include in the plan a sketch showing the location, size, and details of PCB control areas[, location and details of decontamination rooms, change rooms, shower facilities, and mechanical ventilation system]. Include in the plan, eating, drinking, smoking and restroom procedures, interface of trades, sequencing of PCB related work, PCB disposal plan, respirators, protective equipment, and a detailed description of the method of containment of the operation to ensure that PCB contamination is not spread or carried outside of the control area.[Include provisions to ensure that airborne PCB concentrations of 0.50 milligrams per cubic meter 3.10 E-08 pound per cubic feet of air are not exceeded outside of the PCB control area. Include air sampling, training and strategy, sampling methodology, frequency, duration of sampling, and qualifications of air monitoring personnel in the air sampling portion of the plan.] Obtain approval of the plan prior to the start of PCB removal work.

1.7.4 PCB Disposal Plan

****

NOTE: Delete this paragraph if the Government is to dispose of PCB waste. Verify that Government disposal is available and make arrangements if so.

****

Submit a PCB Disposal Plan within 45 calendar days after award of contract for Contracting Officer's approval. Comply with applicable requirements of Federal, State, and local PCB waste regulations and address:

a. Identification of PCB wastes associated with the work.

b. Estimated quantities of wastes to be generated and disposed of.

c. Names and qualifications of each contractor that will be transporting, storing, treating, and disposing of the wastes. Include the facility location and a 24-hour point of contact. Furnish two copies of [EPA] [State] [and] [local] PCB waste [permit applications] [permits] [and]

[EPA Identification numbers].

d. Names and qualifications (experience and training) of personnel who will be working on-site with PCB wastes.

e. List of waste handling equipment to be used in performing the work, to include cleaning, volume reduction, and transport equipment.

f. Spill prevention, containment, and cleanup contingency measures to be implemented.

g. Work plan and schedule for PCB waste containment, removal and disposal. Clean up and containerize wastes daily.

1.7.5 Notification

Notify the Contracting Officer 20 days prior to the start of PCB removal work.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 PROTECTION

3.1.1 Decontamination Room, Clean Room and Shower Facilities

****

NOTE: Include this paragraph only if work involves cleanup of large PCB spills or if airborne contamination exists. Consult cognizant Industrial Hygienist for recommendations.

****

a. Provide material and labor for construction of a decontamination room, a clean room, and shower facilities. Provide rooms with doors and attach to the exit ways of PCB work areas. Provide rooms of sufficient size to accommodate the Contractor's operation within.[Existing facilities with water closets, urinals, wash basins and showers may be used if available.][Provide portable toilet and shower facilities. Locate shower facilities between the clean room and decontamination room.] Provide separate clothing lockers or containers in each room to prevent contamination of street and work clothes.

b. Remove PCB-contaminated PPE in the decontamination room before proceeding to showers. Workers must shower before lunch and at the end of each day's work. Hot water, towels, soap, and hygienic conditions are the responsibility of the Contractor.

3.1.2 PCB Control Area

Isolate PCB control area by physical boundaries to prevent unauthorized entry of personnel. Food, drink and smoking materials are not permitted in areas where PCBs are handled or PCB items are stored.

3.1.3 Personnel Protection

Workers must wear and use PPE, as recommended by the Industrial Hygienist, upon entering a PCB control area. If PPE is not required per the CIH, specify in the PCB removal work plan.

3.1.4 Footwear

Work footwear remains inside work area until completion of the job.

3.1.5 Permissible Exposure Limits (PEL)

PEL for PCBs is 0.5 mg/m3 3.1 E-08 lb/cubic foot on an 8-hour time weighted average basis.

3.1.6 Special Hazards

a. Do not expose PCBs to open flames or other high temperature sources since toxic decomposition by-products may be produced.

b. Do not heat PCBs to temperatures of 55 degrees C 135 degrees F or higher without Contracting Officer's concurrence.

3.1.7 PCB Caution Label

40 CFR 761, Subpart C. Affix labels to PCB waste containers and other PCB-contaminated items. Provide label with sufficient print size to be clearly legible, with bold print on a contrasting background, displaying the following: CAUTION: Contains PCBs (Polychlorinated Biphenyls).

3.1.8 PCB Caution Sign

29 CFR 1910.145. Provide signs at approaches to PCB control areas. Locate signs at such a distance that personnel may read the sign and take the necessary precautions before entering the area.

3.2 WORK PROCEDURE

Furnish labor, materials, services, and equipment necessary for the complete removal of PCBs located at the site as indicated or specified in accordance with local, State, or Federal regulations. Package and mark PCB as required by EPA and DOT regulations and dispose of off Government property in accordance with EPA, DOT, and local regulations at a permitted site.

3.2.1 No Smoking

Smoking is not permitted within 15 m 50 feet of the PCB control area. Provide "No Smoking" signs as directed by the Contracting Officer.

3.2.2 Work Operations

Ensure that work operations or processes involving PCB or PCB-contaminated materials are conducted in accordance with 40 CFR 761 and the applicable requirements of this section, including but not limited to:

a. Obtaining advance approval of PCB storage sites.

b. Notifying Contracting Officer prior to commencing the operation.

c. Reporting leaks and spills to the Contracting Officer.

d. Cleaning up spills.

e. Maintaining an access log of employees working in a PCB control area and providing a copy to the Contracting Officer upon completion of the operation.

f. Inspecting PCB and PCB-contaminated items and waste containers for leaks and forwarding copies of inspection reports to the Contracting Officer.

g. Maintaining a spill kit as specified in paragraph PCB SPILL KIT.

h. Maintaining inspection, inventory and spill records.

3.3 PCB TRANSFORMERS

3.3.1 Draining of Transformer Liquid

Perform work in accordance with 49 CFR 171, 49 CFR 172, 49 CFR 173, 49 CFR 174, 49 CFR 175, 49 CFR 176, 49 CFR 177, 49 CFR 178, and 49 CFR 179, Subchapter C and as specified herein. Drain the transformer, switches, and regulators of free flowing liquid prior to transportation. Place the drained liquids in DoT Spec drums. The drums must not contain more than 190 liters 50 gallons of oil. If the equipment cannot be drained, then place it in DoT Spec drums. DoT drum specifications must meet UN 1A1/Y1.6 (steel drum) or UN 1H1/Y1.6 (plastic drum).

****

NOTE: Choose this option and subparagraphs if the Contractor is to dispose of PCB waste.

****

3.3.2 Markings

Provide drums and drained PCB-contaminated electrical equipment with caution label markings as specified in paragraph PCB CAUTION LABEL.

****

NOTE: Choose this option and subparagraphs if PCB waste transportation and disposal has been arranged with PWD/PWC (Defense Logistics Agency Disposition Services (DLA DS)).

****

3.3.3 Laboratory Analysis

Provide all transformers with a laboratory analysis for turn-in. DLA DS prefers a gas chromatograph test. The only two exceptions to this rule are:

a. The transformer is hermetically sealed (solder sealed or fusion sealed. No access ports or openings).

b. The name plate states that the transformer contains Pyranol, Interteen, etc.

Attach a copy of the lab analysis to both the DD 1348-1 and the transformer itself.

3.3.4 Markings

3.3.4.1 Transformers, Less Than 50 ppm

Add absorbent material to absorb residue oil remaining after draining. Write the date drained on the transformer. Turn in transformers to DLA DS.

3.3.4.2 Transformers, 50-499 ppm

Same procedure as transformers in the less than 50 ppm range.

3.3.4.3 Transformers, Greater Than 500 ppm

Stencil date drained on the transformer. Turn in transformer to DLA DS.

3.3.4.4 Drums

Stencil on DOT-approved 208 liter 55 gallon drums containing PCB liquid the following:

a. ppm

b. Date drum filled

c. Serial number of transformer liquid came from

d. National Stock Number

    (1) "9999-00-OIL" for <50 ppm

    (2) "9999-00-CONPCB" for 50-499 ppm

    (3) "9999-00-PCBOIL" for >500 ppm

Do not mix different ppms in the same drum. Drums must have a 50 mm 2 inch ullage space from the top of the drum.

3.4 PCB REMOVAL

Select PCB removal procedure to minimize contamination of work areas with PCB or other PCB-contaminated debris/waste. Handle PCBs such that no skin contact occurs. PCB removal process should be described in the work plan.

3.4.1 Confined Spaces

As feasible, do not carry out PCB handling operations in confined spaces. A confined space means a space having limited means of egress and inadequate cross ventilation.

3.4.2 Control Area

Establish a PCB control area around the PCB item as specified in paragraph PCB CONTROL AREA. Only personnel briefed on the elements in the paragraph TRAINING and on the handling precautions are allowed into the area.

3.4.3 Exhaust Ventilation

If used, discharge exhaust ventilation for PCB operations to the outside and away from personnel.

3.4.4 Temperatures

As feasible, handle PCBs at ambient temperatures and not at elevated temperatures.

3.4.5 Solvent Cleaning

Clean contaminated tools, containers, etc., after use by rinsing three times with an appropriate solvent or by wiping down three times with a solvent wetted rag. Suggested solvents are Stoddard solvent or hexane.

3.4.6 Drip Pans

Drip pans are required under portable PCB transformers and rectifiers in use or stored for use. Provide the pans with a containment volume of at least one and one-half times the internal volume of PCBs in the item.

3.4.7 Evacuation Procedures

Provide written procedures for evacuation of injured workers. Do not delay aid for a seriously injured worker for reasons of decontamination.

3.5 PCB SPILL CLEANUP REQUIREMENTS

3.5.1 PCB Spills

Immediately report to the Contracting Officer any PCB spills on the ground or in the water, PCB spills in drip pans, or PCB leaks.

3.5.2 PCB Spill Control Area

Rope off an area around the edges of a PCB leak or spill and post a "PCB Spill Authorized Personnel Only" caution sign. Immediately transfer leaking items to a drip pan or other container.

3.5.3 PCB Spill Cleanup

40 CFR 761, Subpart G. Initiate cleanup of spills as soon as possible, but no later than 48 hours of its discovery.[To clean up spills, personnel must wear the PPE prescribed in paragraph SPECIAL CLOTHING of this section.] If misting, elevated temperatures or open flames are present, or if the spill is situated in a confined space, notify the Contracting Officer. Mop up the liquid with rags or other conventional absorbent. Properly contain and dispose of spent absorbent as solid PCB waste.

3.5.4 Records and Certification

Document the cleanup with records of decontamination in accordance with 40 CFR 761, Section 125, Requirements for PCB Spill Cleanup. Provide certification of decontamination.

3.5.5 Sampling Requirements

Perform post cleanup sampling as required by 40 CFR 761, Section 130, Sampling Requirements. Do not remove boundaries of the PCB control area until site is determined satisfactorily clean by the Contracting Officer.

3.6 STORAGE FOR DISPOSAL

3.6.1 Storage Containers for PCBs

49 CFR 178. Store liquid PCBs in Department of Transportation (DOT) Specification 17E containers. Store nonliquid PCB mixtures, articles, or equipment in DOT Specification 5, 5B, or 17C containers with removable heads.

3.6.2 Waste Containers

Label with the following:

a. "Solid (or Liquid) Waste Polychlorinated Biphenyls"

b. The PCB Caution Label, paragraph PCB CAUTION LABEL

c. The date the item was placed in storage and the name of the cognizant activity/building.

3.6.3 PCB Articles and PCB-Contaminated Items

Label with items b. through c. above.

3.6.4 Approval of Storage Site

Obtain in advance Contracting Officer approval using the following criteria without exception.

a. Adequate roof and walls to prevent rainwater from reaching the stored PCBs.

b. An adequate floor which has continuous curbing with a minimum 150 mm 6 inch high curb. Such floor and curbing must provide a containment volume equal to at least two times the internal volume of the largest PCB article or PCB container stored therein or 25 percent of the total internal volume of all PCB equipment or containers stored therein, whichever is greater.

c. No drain valves, floor drains, expansion joints, sewer lines, or other openings that would permit liquids to flow from the curbed area.

d. Floors and curbing constructed of continuous smooth and impervious materials such as portland cement, concrete or steel to prevent or minimize penetrations of PCBs.

e. Not located at a site which is below the 100-year flood water elevation.

f. Post each storage site with the PCB Caution Sign, paragraph PCB CAUTION SIGN.

3.7 CLEANUP

Maintain surfaces of the PCB control area free of accumulations of PCBs. Restrict the spread of dust and debris; keep waste from being distributed over work area.

Do not remove the PCB control area and warning signs prior to the Contracting Officer's approval. Reclean areas showing residual PCBs.

3.8   DISPOSAL

****

NOTE: Federal regulations (40 CFR 761) require that generators, transporters, commercial storers, and disposers of PCB waste possess U.S. EPA identification numbers. Verify that the activity has a U.S. EPA generator identification number for use on the Uniform Hazardous Waste Manifest. If not, the activity must file and obtain an I.D. number with EPA prior to commencement of removal work.

****

****

NOTE: Choose this option and subparagraphs if the Contractor is to dispose of PCB waste.

****

****

NOTE: Research State, regional, and local laws, regulations, and statutes.

****

Comply with disposal requirements and procedures outlined in 40 CFR 761. Do not accept PCB waste unless it is accompanied by a manifest signed by the Government. Before transporting the PCB waste, sign and date the manifest acknowledging acceptance of the PCB waste from the Government. Return a signed copy to the Government before leaving the job site. Ensure that the manifest accompanies the PCB waste at all times. Submit transporter certification of notification to EPA of their PCB waste activities.

3.8.1   Certificate of Disposal

40 CFR 761. Submit to the Government within 30 days of the date that the disposal of the PCB waste identified on the manifest was completed. Include in the certificate for the PCBs and PCB items disposed:

a. The identity of the disposal facility, by name, address, and EPA identification number.

b. The identity of the PCB waste affected by the Certificate of Disposal including reference to the manifest number for the shipment.

c. A statement certifying the fact of disposal of the identified PCB waste, including the date(s) of disposal, and identifying the disposal process used.

d. A certification as defined in 40 CFR 761, Section 3.

3.8.1.1   Payment Upon Furnishing Certificate of Disposal of PCBs

Payment will not be made until the certificate of disposal has been furnished to the Contracting Officer.

3.8.2 Disposal by the Government

****

NOTE: Choose this option and subparagraphs if PCB waste transportation and disposal has been arranged with PWD/PWC and PCB waste is to be delivered to suitable storage site. Verify procedures with PWD/PWC. Omit paragraph when the Government will pick up PCB waste at the project site.

****

Coordinate delivery of PCBs on-site with local Environmental for subsequent disposal on DLA DS contracts. If the primary [_____] site is filled to capacity, contact the Public Works Center Hazardous Waste Branch Environmental Engineer at [_____] to determine an alternate storage site. The transport distance to any storage site must not exceed the distance between the project site and the DLA DS storage site at [_____].

3.8.2.1 [Delivery] [Government Pick Up]

****

NOTE: Choose the option for Government pick up if arrangements have been made for the Government to pick up the PCB waste at the project site. This will be required when DLA DS does not have a suitable storage site and the PCB waste must be picked up by the Government's PCB disposal contractor.

****

Contact DRMO at least 5 working days in advance to make arrangements for [delivery of the PCBs to the storage site.] [pick up of PCB waste by the Government.] Phone: [_____] or write to:

Defense Reutilization and Marketing Office

[_____]

[_____]

3.8.2.2 DD Form 1348-1

Prepare DD Form 1348-1 Turn-in Document (TID), which will accompany the PCBs to the storage site. Ensure that a responsible person from the activity that owns the PCBs signs the DD Form 1348-1.

3.8.2.3 Payment Upon Furnishing DD Form 1348-1

Payment will not be made until a completed DD Form 1348-1 has been furnished to the Contracting Officer.

****

NOTE: The Contracting Officer shall furnish the Contractor, in the contract documents, an initial Microbial Assessment Survey with containment categories and remediation methods specified for each work area and material within the work area.

The Contracting Officer's initial Microbial Assessment Survey specified below shall be furnished and certified by a qualified assessor authorized by the Contracting Officer to do such work. The initial survey shall be included in the solicitation documents at the end of this specification section.

The Contracting Officer shall ensure that in the initial survey a cost analysis that identifies the potential for replacement of the contaminated items versus remediation is provided. This information shall not be shared with the contractor.

The Contracting Officer must require that the microbial assessor provide documentation proving that the assessor meets at least one of the following criteria:

1. Bachelor's degree from an accredited university or college with a major in engineering, architecture, building construction, occupational health, microbiology, occupational safety, or a related natural or physical science. Additionally, two years experience in conducting microbial investigations is required.

2. Associates degree from an accredited university or college with a concentration in environmental, natural or physical sciences. Additionally, four years experience in conducting microbial investigations is required.

3. Certification as an industrial hygienist (CIH) as certified by the American Board of Industrial Hygienists, safety professional (CSP) as certified by the Board of Certified Safety Professionals or engineer (PE). Additionally, one year experience in conducting microbial investigations is required.

4. Certification by the American Council for Accredited Certification (ACAC) as a Council-Certified Indoor Environmental Consultant (CIEC), Council-Certified Indoor Environmentalist (CIE), Council-Certified Microbial Consultant (CMC), Council-Certified Microbial Investigator (CMI), Council-Certified Residential Mold Inspector (CRMI), Council-Certified Microbial Remediation Supervisor (CMRS) or Council-Certified Microbial Remediator (CMR).

The procedures detailed in this specification are intended to be used for mold remediation projects in buildings occupied by the general population. This specification section may be a starting point for a project specification covering the requirements for removal of mold contaminated materials in facilities where sensitive populations will re-occupy the facility after remediation. Designer/Specifier will consult with the customer to determine if sensitive populations are present in the facility.

Sensitive populations as used here include those with health deficiencies such as people with immune deficiencies. Facilities where they are found include hospital wings and medical clinics.

Children in day care centers or senior citizens in nursing homes are also examples of sensitive populations.

For application to such sensitive facilities, the requirements for clearance and verification of removal of mold contaminated materials must meet the more stringent sampling requirements of Appendix B.

Prior to completing these specifications for facilities with sensitive populations, designer/specifier should consult with doctors, infection control, and risk management staff, Government Industrial Hygienist and Occupational, and Environmental Medicine Physician from the supporting Military Treatment Facility (MTF) familiar with or responsible for operation of the facilities.

Information regarding the types of mold found growing in the spaces may be used by the medical staff to determine the level of risk of the population, and help determine the requirements for verification of the remediation project.

Review and repair, if necessary, of HVAC and Building Envelope systems to prevent moisture incursions which could create conditions suitable for future mold growth must be included as part of any mold remediation project, but are not included as part of this specification.

The following information shall be shown on the project drawings:

The project drawings shall clearly show the location and extent of mold contamination and the materials to be removed.

****

****

NOTE: The Designer should include unit price items to address mold remediation. Include unit price items for removal and cleaning (e.g., drywall removal, ceiling tile removal, carpet removal, non-porous surface cleaning, semi-porous surface cleaning). Estimate the quantity and specify as unit price items in Section 00 21 13, INSTRUCTIONS TO BIDDERS or Section 01 20 00 Price and Payment Procedures per standard practice of the activity preparing the contract.

****

****

NOTE: The work may involve a historic property. The designer must coordinate review of the proposed work with the appropriate cultural resources manager (CRM) and cultural resource laws and regulations, as part of the environmental review and permitting

process. Consultation with stakeholders, including the state historic preservation office, may be required, and work involving historic properties will likely be required to confirm to the Secretary of the Interior's Standards for the Treatment of Historic Properties (usually at the REHABILITATION level). See https://www.nps.gov/tps/standards/four-treatments/treatment-rehabilitation.htm

****

UL SOLUTIONS (UL)

UL 586	(2009; Reprint Sep 2022) UL Standard for Safety High-Efficiency Particulate, Air Filter Units

1.2 DEFINITIONS

1.2.1 AIHA

American Industrial Hygiene Association.

1.2.2 AIHA EMLAP

American Industrial Hygiene Association's Environmental Microbiology Laboratory Accreditation Program

1.2.3 AFU

Air filtration unit with High Efficiency particulate air (HEPA) filtered vacuum and exhaust ventilation equipment with a filter system capable of collecting and retaining microbial contamination ASSP Z9.2. Filters must retain 99.97 percent of particles 0.3 microns 0.000012 inches or larger as indicated in UL 586.

1.2.4 Categories of Water

Category 1 Water: Water that originates from a sanitary water source and does not pose a substantial risk from dermal, ingestion, or inhalation exposure. IICRC S500

Category 2 Water: Water that contains significant contamination and has the potential to cause discomfort or sickness if contacted or consumed by humans. Can contain potentially unsafe levels of microorganisms or nutrients for microorganisms as well as other organic or inorganic matter. IICRC S500

Category 3 Water: Water that is grossly contaminated and can cause significant adverse reactions to humans if contacted or consumed. IICRC S500

1.2.5 Certified Industrial Hygienist (CIH)

An individual that has been certified by the American Board of Industrial Hygiene (ABIH), with professional qualifications and experience as required for an industrial hygienist, as presented in the definition of "Industrial Hygienist."

1.2.6 Complete Interior Building Demolition (Complete Gut)

Interior finishes of the building have been removed to expose basic structural elements.

1.2.7 Containment

Physical separation and engineering controls required to prevent contamination of undamaged materials and occupied areas. The level of containment varies depending on the extent of the contamination.

1.2.7.1 Source Containment

Use when the contaminated surface area is less than 0.93 square meters 10 square feet, in both residential and non-residential buildings. At a minimum, source containment will include the following (ANSI/IICRC S520):

a. Isolation of Work Areas. Install polyethylene barriers to isolate the areas or material to be demolished / remediated from non-remediation areas.

b. Floor protection. Maintain protection for finished floors through all construction activities.

c. HEPA vacuum to control dust created during the demolition. Hold HEPA vac intake at source of dust.

1.2.7.2 Limited Containment

Use when contaminated surface area is between 0.93 square meters and 9.3 square meters 10 square feet and 100 square feet per room in both residential and non-residential buildings. At a minimum, limited containment includes the following (ANSI/IICRC S520):

a. Containment. For residential buildings, a containment includes the entire room where work is being performed. The containment does not extend past the extents of the room unless there are instances of contamination extending from one room to the next. For non-residential buildings, the containment includes the area to be remediated, plus enough additional area to allow for all equipment and work activities.

b. Isolation of Work Areas. Install polyethylene barriers to isolate the areas to be demolished / remediated.

c. Floor protection. Maintain protection for finished floors through all construction activities.

d. Air Filtration / Pressurization Control. Install AFUs with HEPA filters in the containment. Configure the AFUs with splitters / diverters to allow some of the air to recirculate within the containment. Discharge the remainder of the air directly to the outside to maintain an overall negative pressure in the containment of 5 pascals 0.02 inch water column minimum to 10 pascals 0.04 inch water column maximum relative to the outside and other adjacent spaces not undergoing remediation(AIHA IMOM08-679). AFUs must filter a minimum of four air changes per hour and a maximum of six air changes per hour (ANSI/IICRC S520).

e. Protection for all items remaining in the containment. Protective devices must prevent physical damage (e.g., scratches and dents) and must provide a positive seal to prevent dust from settling in or on the items.

****

NOTE: The designer/specifier must consider the need for a decontamination air lock system.

****

[f. Decontamination. Construct a decontamination airlock for entry into and exit from the work area. HEPA vacuum the sealed bags of contaminated debris within the airlock. When possible, locate the decontamination airlock so that the sealed bags can be passed directly from the airlock to the outside, through a door or window.

] g. Containment Entrance. Install a triple-flap poly "door" to be used during demolition to provide a good separation between containment and occupied areas of the house / building.

h. HVAC System. Seal off all supply and return vents. HVAC may need to be shut down to ensure proper seal of the vents.

1.2.7.3 Full Containment

Use when contaminated surface area is greater than 9.3 square meters 100 square feet in both residential and nonresidential buildings. At a minimum, full containment includes the following(ANSI/IICRC S520):

a. Containment. For residential buildings, a containment includes the entire room where work is being performed. The containment does not extend past the extents of the room unless there are instances of contamination extending from one room to the next. For non-residential buildings, the containment includes the area to be remediated, plus enough additional area to allow for all equipment and work activities.

b. Isolation of Work Areas. Construct polyethylene barriers to isolate the areas to be demolished / remediated.

c. Floor protection. Maintain protection for finished floors through all construction activities.

d. Air Filtration / Pressurization Control. Install AFUs with HEPA filters in the containment. Configure the AFUs with splitters / diverters to allow some of the air to recirculate within the containment. Discharge the remainder of the air directly to the outside to maintain an overall negative pressure in the containment of 5 pascals 0.02 inch water column minimum to 10 pascals 0.04 inch water column maximum relative to the outside and other adjacent spaces not undergoing remediation (AIHA IMOM08-679). AFUs must filter a minimum of four air changes per hour and a maximum of six air changes per hour (ANSI/IICRC S520).

e. Protection for all items remaining in the containment. Protective devices must prevent physical damage (e.g., scratches and dents) and must provide a positive seal to prevent dust from settling in or on the items.

f. Decontamination. Construct a decontamination airlock for entry into and exit from the work area. HEPA vacuum the sealed bags of contaminated debris within the airlock. When possible, locate the decontamination airlock so that the sealed bags can be passed directly from the airlock to the outside, through a door or window.

g. Containment Entrance. Install a triple-flap poly "door" at the entrance to the airlock, and between the airlock and the work area during demolition to provide a good separation between containment and occupied areas of the house / building.

h. HVAC System. Seal off all supply and return vents. HVAC may need to be shut down to ensure proper seal of the vents.

1.2.7.4 Unoccupied Building Containment

Use when a building is unoccupied and large amounts of mold growth are present throughout the building:

a. Containment. The containment consists of the entire building. Install AFUs with HEPA filters in the building. Configure the AFUs to recirculate within the active remediation area. AFUs must filter a minimum of four air changes per hour and a maximum of six air changes per hour based on the size of the area undergoing active remediation (ANSI/IICRC S520).

b. Isolation of Work Areas. Install polyethylene barriers to isolate remediation areas from non-remediation areas. AFU discharge may be used to positively pressurize non-remediation areas from areas undergoing remediation to prevent the movement of spores into "clean" areas.

c. Floor Protection. Maintain protection for finished floors through all construction activities.

d. Protection for all items remaining in the containment. Protective devices must prevent physical damage (e.g., scratches and dents) and must provide a positive seal to prevent dust from settling in or on the items.

e. Decontamination. Construct a decontamination airlock for entry into and exit from the building.

f. Containment Entrance. Install a triple-flap poly "door" to be used during demolition to provide a good separation between containment and non-remediation areas of the house / building.

g. HVAC System. Seal off all supply and return vents. HVAC may need to be shut down to ensure proper seal of the vents.

1.2.7.5 Cleaning Containment

For items being salvaged, set up a temporary containment structure to clean items removed from the containment. At a minimum, the cleaning area must contain:

a. Two chambers. Construct walls with polyethylene. Clean the items in the first chamber. Store the clean items in the second chamber.

b. Air Filtration / Pressurization Control Cleaning Chamber. Install AFUs with HEPA filters in the cleaning chamber. Configure the AFUs with splitters / diverters to allow some of the air to recirculate within the containment. Discharge the remainder of the air directly to the outside to maintain an overall negative pressure in the containment of 5 pascals 0.02 inch water column minimum to 10 pascals 0.04 inch water column (maximum) relative to the storage chamber (AIHA IMOM08-679).

c. Air Filtration, Storage Chamber. Install AFUs with HEPA filters in the storage chamber. Configure the AFUs to allow air to recirculate within the chamber. AFUs must provide air filtration at a rate of between four and six air changes per hour (ANSI/IICRC S520).

d. Containment Entrance. Install a triple-flap poly "door" at the entrance to the cleaning chamber, between the cleaning and storage chambers, and at the exit of the storage chamber to provide a good separation between the chambers.

1.2.8 Decontamination Unit (Airlock)

An enclosed area adjacent to, and connected to, a regulated work area. It consists of various rooms that are used for the decontamination of workers, equipment, and materials.

1.2.9 Dehumidifier

Mechanism or machine to remove moisture from the air.

1.2.10 Detergent

A cleaning agent. The term refers to a prepared compound that may include surfactants, builders, dry solvents, softeners, etc, but does not include true soap.

1.2.11 Disinfectants or Biocide Sanitizing Solutions

One of three groups of antimicrobials registered by the EPA for public health uses. The EPA considers an antimicrobial to be a disinfectant when it destroys or irreversibly inactivates infectious or other undesirable organisms, but not necessarily their spores.

1.2.12 EPA

U.S. Environmental Protection Agency.

1.2.13 Fungal Growth Structures

Portions of fungi indicating active fungal growth is present on a surface. These include spores, conidiophores, hyphae, hyphal fragments, and mycelium.

1.2.14 Fungicidal Agents, (EPA)

An EPA registered fungicide that inhibits the spread and growth of mold with the ability to withstand moist and humid conditions.

1.2.15 HEPA Filter

A High Efficiency Particulate Air (HEPA) filter capable of trapping and retaining 99.97 percent of all particulate larger than 0.3 microns 0.000012 inches.

1.2.16 HVAC

Heating, Ventilating, and Air Conditioning (System).

1.2.17 Industrial Hygienist (IH)

An individual designated and provided by the Contractor that is a professional qualified by education, training, and experience to anticipate, recognize, evaluate, and develop controls for occupational and indoor air quality hazards. Education must include a minimum 12 semester hours or quarter hour equivalent of chemistry and 18 additional semester hours or quarter hour equivalent of courses in any combination of chemistry, physics, engineering, health physics, environmental health, biostatistics, biology, physiology, toxicology, epidemiology, or industrial hygiene. The Industrial Hygienist must be a CIH or under the supervision of a Certified Industrial Hygienist.

1.2.18 Microbial Remediation Supervisor

****

NOTE: State Certification requirements for mold remediation contractors and supervisors must be met. Modify and supplement the certification requirements specified in this paragraph if not equal to state requirements.

****

Individual responsible for the execution of the microbial remediation work as defined by the scope of work. This individual must have documented training in microbial remediation and have at least three years experience in microbial remediation work. Remediation contractor's on-site supervisor must have one of the following certifications: Council-Certified Microbial Remediator (CMR), or Council-Certified Microbial Remediation Supervisor (CMRS) as certified by the American Council for Accredited Certification, or Applied Microbial Remediation Specialist (AMRS), Institute of Inspection, Cleaning, and Restoration Certification (IICRC) or Contracting

Officer approved equivalent.

1.2.19 Non-Porous Material

A material that does not absorb nor is easily penetrated by liquids, especially water. Generally, non-porous materials have a permeable factor of less than one. Some examples are metal, glass, plastic, ceramic tile.

1.2.20 Occupied Spaces (Areas)

The phrase "occupied space" within this specification refers to spaces that are occupied by unprotected non-remediation personnel while work is in progress. It also refers to areas adjacent to work areas that are not currently undergoing remediation.

1.2.21 Personal Protective Equipment (PPE)

Any material or device worn to protect a worker from exposure to, or contact with, any harmful material or force. PPE must be cleaned or disposed of prior to removal from the remediation work area.

1.2.22 Poly

Polyethylene sheet with a minimum thickness of 0.15 millimeter 6 mils (IHFOM, CH 13, Sec. 3).

1.2.23 Porous Material

Permeable materials having the physical properties that allow liquids or gasses to pass through. These materials include but are not limited to the following: gypsum wall board, insulation, wallpaper, ceiling material, carpet, padding, paper goods (i.e., cardboard boxes, loose paper, books), stuffed furniture, wicker, fabrics.

1.2.24 Pressure Differential Measuring Instrument

Device used to measure the relative pressure difference between the work area/containment and areas outside the work area. For mold remediation, the device must measure accurately in the 0 to 10 Pascal 0 to 0.04 inch of water range.

1.2.25 Semi-porous Material

A material that can absorb liquids if exposed over long periods of time. These materials include but are not limited to wood, concrete, linoleum, vinyl wall covering, wooden or hardboard furniture, plaster.

1.2.26 Ventilation System Mold Remediator Qualifications (VSMR)

An individual certified by the North American Duct Cleaning Association (NADCA) to clean HVAC systems.

1.2.27 Work Area

The area where remediation operations are actively performed and controlled to prevent the spread of dust / spores and entry by unauthorized personnel. A work area is the space, group of spaces, or the building, as defined by the Microbial Assessment Survey.

1.3 REQUIREMENTS

1.3.1 Description of Work

****

NOTE: Specify the form, condition and approximate quantity square meters square feet of mold contaminated material to be controlled in the first blank, the type of material in the second blank, and the location of the material in the third blank. Example: "The mold contaminated material removal work includes the demolition and removal of 270 square meters 3,000 square feet of gypsum wallboard located on the first floor of the structure." The use of this section in the contract specification means that known mold contaminated material is involved. Estimate the quantity and specify as unit price items Contract's price schedule or Section 01 20 00 PRICE AND PAYMENT PROCEDURES per standard practice of the activity preparing the contract.

****

The Contracting Officer will furnish the Contractor, in the contract documents, an initial Microbial Assessment Survey with containment categories and remediation methods specified for each work area and material within the work area.

a. The Contracting Officer's initial Microbial Assessment Survey specified below must be furnished and certified by a qualified assessor authorized by the Contracting Officer to do such work. The initial survey is included in the solicitation documents at the end of this specification section.

b. Provide mold remediation work including the handling and control of mold contaminated materials and the resultant procedures and equipment required to protect workers, the environment and occupants of the building or area, or both, from contact with mold products and spores. The work also includes the disposal of any mold contaminated materials generated by the work. The mold removal work includes the demolition and removal of [_____] of [_____] located [_____]. Provide containment and engineering control techniques as outlined in this specification. All mold contaminated material removal work must be supervised by a microbial remediation supervisor as specified herein.

c. No work in this specification section can be provided by any person, contractor, or contracting entity involved in the preparation of the contract documents of which this specification section is a part.

d. The following microbial remediation specifications apply to the cleaning / removal and disposal of fungally-contaminated porous, semi-porous and non-porous surfaces within various types of structures. The level of containment and requirements for cleaning and remediation of materials will depend on the condition of the space and materials being remediated.

****

NOTE: The following paragraph directs the Contractor to inspect the premises and develop a work plan based on the amount of mold contaminated

materials found. Depending on the source of the moisture (flood, rainwater leaks), the amount of mold growth in the building may have increased since the Government-provided initial survey of the building. If there is a significant increase in the amount of work required of the Contractor, the Contracting Officer will likely have to modify the contract.

****

e. Immediately after award of the contract, prepare a preliminary visual assessment report using the standard microbial assessment form (Appendix A) to document the differences in the pre-remediation condition of the work areas as compared to the government provided Microbial Assessment Survey.Coordinate inspection with contracting officer. Only address the differences between the pre-remediation condition of the work areas and the government provided Microbial Assessment Survey. If required to indicate the differences, include the HVAC systems inspection required elsewhere in this specification section. Submit this written pre-remediation condition report to the Contracting Officer for approval and instructions to proceed.

f. After approval of the preliminary visual assessment report and having instructions from the Contracting Officer to proceed, prepare a microbial remediation plan for approval by the Contractor's Certified Industrial Hygienist. Include an assessment of the risk for people occupying areas adjoining the remediation area while remediation work is occurring in the microbial remediation plan . Upon the Contractor's CIH approval of the plan, submit the plan to the Contracting Officer for approval.

g. The Contractor's CIH or IH must monitor the site on a daily basis while remediation work is in progress, identifying work and work practices that are not in compliance with the approved microbial remediation plan, and performing all inspections required by this specification. The Contracting Officer may require the removal of any individual for non-compliance with quality requirements specified in the contract.

h. This specification section includes the protocol regarding proper disposal of the removed building material components from within the work site.

i. Use proper cleaning procedures, engineering controls, and apply best management practices to remove microbial growth and spore fallout from all surfaces and building materials to minimize the further release of microbial spores. Address semi-porous and nonporous surfaces within the facility in each cleaning phase of the project. Damp wipe and HEPA vacuum all surfaces, at a minimum. Remove and dispose of porous building materials that are supporting microbial growth.

1.3.2 Security Requirements

Prior to granting access to any work area (i.e., building, area, room, or space) for mold remediation work, a determination must be made by the government agency whether classified or controlled unclassified information (paper material or electronic media) or equipment is contained in the work area(s).

It may be necessary depending on the sensitivity of the work area or the information contained in the area to authorize the Government activity or tenant command responsible for the work area to provide their own appropriately cleared military or government personnel to properly remove or secure any classified or controlled unclassified information, electronic media or equipment located in their work area(s). Prior authorization would be required and the area would need to be evaluated to ensure it is safe for personnel to enter and all personnel must utilize the required PPE to safely enter the work area.

a. If Contractor personnel require access to classified information or spaces to perform mold remediation work, the Government must issue the Contractor facility a Facility Clearance Level (FCL) (Contract Security Classification Specification) prior to the initiation of the work under the contract. If the Contractor facility does not possess a valid FCL issued by the Defense Security Service (DSS), the Government will be required to submit a sponsorship request to DSS requesting that the Contractor be processed for and issued a current FCL at the appropriate level.

b. Access to classified information (paper material, electronic media, and equipment) must only be granted to authorized and appropriately cleared government and U.S. contractor personnel that possess a personnel security clearance commensurate with the level of information contained in the work area that requires a mold remediation effort.

c. Access to Controlled Unclassified information (i.e., For Official Use Only, Sensitive but Unclassified, Privacy Act Information, Export Controlled unclassified) can be granted to DOD cleared contractors, consultants and grantees that are conducting official business for the DOD or DON. Non-cleared U.S. contractor personnel who only require access to controlled unclassified information can be granted access if they get a favorable trustworthiness determination on an individual Favorable Tier 1 investigation and fingerprint result submitted on their behalf by the government agency issuing the contract.

d. Classified information and controlled unclassified information must be safeguarded / secured, reproduced, and destroyed in accordance with SECNAV M-5510.36.

1.4 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the

Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

****
NOTE: The submittals required for each project are very dependent upon the removal method to be used. Edit the submittals paragraph accordingly.
****

SD-11 Closeout Submittals

Submittals at Completion of Remediation Work; G, [_____]

1.4.1 Preconstruction Submittals

Within 10 days from the award of the contract and prior to the start of the work, submit to the Contracting Officer six copies of the following items for review and permanent file.

1.4.1.1 Preliminary Visual Assessment Report

A written report to document the pre-remediation condition of the work areas compared to the government provided Microbial Assessment Survey and the results of the HVAC systems inspection.

1.4.1.2 Microbial Remediation Plan

Submit a job-specific,[detailed][abbreviated] plan Approved by the Contractor's CIH to the Contracting Officer for final approval prior to start of work. The plan must address the following items at a minimum:

a. Description of materials to be remediated, providing location and quantities (map if available), and methods to be used for remediation.

b. Products: Disinfectants, detergents, biocides, sanitizing solutions, and fungicidal agents, (EPA).

c. Containment procedures to include description and locations of engineering controls and decontamination unit to include entry and exit procedures (provide sketch of floor plan showing location of containment barriers and decontamination units). Include locations of AFUs and AFU discharges to the outside.

d. Description of personal protective equipment to be used during the remediation.

e. Construction barricades and barriers in occupied areas.

f. HVAC Shut down and start-up procedures.

g. HVAC Evaluation and remediation procedures.

h. Moisture and relative humidity control procedures and equipment.

i. Packaging and disposal procedures.

j. Safety Precautions to include lockout / tag-out, fall protection, confined space entry procedures, and fire protection.

k. Description of the method to be employed to control cross contamination of areas not in the work area. Include a risk assessment related to the suitability of people to occupy areas adjoining the remediation area while remediation activities are ongoing.

l. IH Quality Control procedures to include visual inspection.

m. Procedures to control, abate, and dispose of Asbestos Containing Materials (ACM), Presumed Asbestos Containing Materials (PACM) and Lead Based Paint (LBP) coincident with microbial remediation. ACM, PACM, and LBP must be identified before work begins; Identify the presence, location, and quantity of ACM,PACM, and LBP therein pursuant to paragraphs (g),(k)(1) of 29 CFR 1926.1101 and for lead 29 CFR 1926.62.

1.4.1.3 Respiratory Protection Program

Provide written copy of Contractor's Respiratory Protection program.

1.4.1.4 Worker Records

Provide the following documents for all workers, including supervisory personnel. If new workers are added to the crew, provide the same documentation for them.

Employee Instruction and Release Form: Provide documentation showing that each employee has been instructed on the following items:

a. Use and fit of respirators (for employees entering and working in the containment).

b. Protective clothing.

c. Protective measures.

d. Safety and Emergency Egress Procedures.

e. Site specific fall protection plan and training.

f. Microbial remediation hazards and practices including engineering controls and isolation. Training should include "hands on" training for microbial remediation supervisors.

g. Workers' release forms stating the potential hazards involved with the scope of the work.

Worker Training Certification: Submit copies of training certificates for each employee indicating that the employee has received training at the appropriate level for the work prescribed in the description of work.

1.4.1.5 Certified Industrial Hygienist (CIH)/Industrial Hygienist (IH) Qualifications

Submit the name, address, and telephone number of the Certified Industrial Hygienist (CIH) and Industrial Hygienist (IH). Provide copies of board certificates, resume to document field experience, and evidence that the CIH and IH have successfully completed training in microbial investigation and remediation.

1.4.1.6 Microbial Remediation Supervisor Qualifications

Onsite supervisor must have one of the following certifications: Certified Microbial Remediator (CMR), Certified Microbial Remediation Supervisor (CMRS), or Applied Microbial Remediation Specialist (AMRS). Submit copies of supervisory training certificates.

1.4.2 Product Data

Within 10 days of contract award, submit product data for items identified for use in Microbial Remediation Plan.

1.4.3 IH Daily Reports

Prepare a written IH Daily Report for each day that microbial remediation work is being accomplished. Submit the IH Daily Report to the Contracting Officer by 1000 hours of the following day. The IH Daily Report at a minimum must include measurements of differential pressure and temperature and relative humidity in work areas, and detail any non-compliance issues observed.

1.4.4 Submittals at Completion of Remediation Work

Within 14 days of completion, provide the following information:

a. Daily Project Logs.

b. IH Daily Reports.

c. Photographic Logs.

d. Contractor's Industrial Hygienist Report certifying the microbial remediation is complete.

1.5 RECORD KEEPING

A Daily Project Log must form a permanent record of the project. Secure and maintain these logs and any other required documentation as part of the permanent project file.

1.5.1 Daily Project Log

The Microbial Remediation Supervisor must maintain a Daily Project Log. The Daily Project Log must be used each day of the project to document the following information.

a. Date.

b. Name of Microbial Remediation Supervisor.

c. Name of Industrial Hygienist monitoring work area.

d. Number of workers on site.

e. Equipment utilized.

f. Brief description of daily work activities.

g. Listing of any non-compliance noted, emergencies, stop work orders (with detailed explanation),[exhaust system pressure differential recordings] and descriptions of any other significant events.

PART 2 PRODUCTS

2.1 DISINFECTANTS, BIOCIDES, SANITIZING SOLUTIONS AND FUNGICIDAL AGENTS, (EPA)

****

NOTE: Designer/specifier must make a determination if biocides will be used for remediation activities. Edit the paragraph below to reflect the determination.

****

Must be EPA Registered for the use detailed in the Microbial Remediation Plan and used in accordance with the manufacturer's specifications.. Provide SDS sheets to the Contracting Officer for any chemicals that will be used during the performance of the work for approval.

2.2 HAZARD COMMUNICATION

Adhere to all parts of 29 CFR 1926.59 and provide the Contracting Officer with a copy of the Safety Data Sheets (SDS) for all materials brought to the site.

PART 3 EXECUTION

3.1 EQUIPMENT

Provide manufacturer's certificate of compliance for all equipment used to contain the microbial contamination.

3.1.1 Respirators

Select respirators from those approved by the National Institute for Occupational Safety and Health (NIOSH), Department of Health and Human Services. Provide personnel engaged in set-up, pre-cleaning, cleanup, handling, and removal of contaminated materials with the appropriate respiratory protection as specified in 29 CFR 1910.134. Microbial remediation plan must consider Table 17.1 in AIHA IMOM08-679 "Recognition, Evaluation, and Control of Indoor Mold", which lists the minimum levels of respiratory protection based on the activity and size of the remediated area.

3.1.2 Protective Clothing

Provide all workers with protective clothing as appropriate for the work being accomplished, as required by the Microbial Remediation Plan.

3.1.3 Warning Signs and Labels

Provide bilingual warning signs printed in English and [_____] at all approaches to the work areas IICRC S500. Locate signs at such a distance that personnel may read the sign and take the necessary protective steps required before entering the area. Warning signs may be in the form of continuous plastic tape. The warning signs must have black characters on a yellow background.

WARNING
DO NOT ENTER
MICROBIAL REMEDIATION WORK IN PROGRESS

Alternate wording for the warning signs will be approved by the Contracting Officer.

3.1.4 Dehumidifiers

Install and use dehumidifiers as needed during the remediation to maintain relative humidity below 60 percent in the work area. Drain the condensate water to a permanent drain, or empty as needed to prevent water overflowing from the dehumidifiers. IHFOM, CH 13, Sec. 3

3.1.5 Air Filtration Units (AFU)

Install and use AFUs with HEPA filters, and manufacturer specified pre-filters, as part of the exhaust ventilation system to develop and maintain the specified desired air pressure differential inside the enclosed work area relative to the outside areas. Acquire and pay for any licenses needed for use of any equipment, including but not limited to, air pressure differential systems and air filtration systems.

a. Replace HEPA filters and pre-filters for AFUs as required to maintain pressurization performance requirements during demolition and cleaning. Do not reuse filters. Bag used filters at a minimum in clear 0.15 millimeter 6 mil (IHFOM, CH 13, Sec. 3) polyethylene bags within the containment and disposed as contaminated waste.

****

NOTE: Some air from the AFUs may be allowed to recirculate into the remediation area only. The intent is to maintain the work area under a negative pressure relative to non-work areas. Excessive negative pressure will allow outside air to infiltrate into the building, either into the work area directly, or into other areas of the building. In humid climates, this outside air may bring in large amounts of moisture, and cause additional mold growth. Air discharged from the AFU may not be supplied to an occupied area.

****

b. Discharge air from any AFUs located in the work area containment to the outside environment when creating a negative pressure containment to create a negative pressure relative to the outside and adjacent work areas not undergoing active remediation of 5 pascals 0.02 inch H2O to 10 pascals 0.04 inch H20 AIHA IMOM08-679. Discharge air in excess of that required for creating the proper negative pressure to the work area. The AFUs must provide four to six air changes per hour in the work area (ANSI/IICRC S520). Under no circumstances may air from AFUs discharge to an occupied area. Coordinate location of window sashes or doors required for discharge openings with the Contracting Officer. Exhaust discharge openings may be constructed of plywood, and the seals around such opening must be airtight.

c. Seal all exhaust and intake openings in AFUs with one layer of 0.15 millimeters 6 mil (IHFOM, CH 13, Sec. 3) polyethylene sheeting when not in use.

3.1.6 Vacuum Cleaners Equipped with HEPA Filters

Provide vacuum cleaners equipped with HEPA filters designed for continuous operation in order to complete the work in a timely and efficient manner.

a. Provide nozzle attachments as required to adequately remove all dust. As a minimum, nozzle attachments must include crevice and extended bristle brush nozzles. Any vacuum that is not equipped with a HEPA filter must not be used at anytime.

b. Provide sufficient vacuum cleaners equipped with HEPA filters designed for continuous operation in the work area during microbial remediation inside the containment area.

c. Provide additional vacuum cleaners equipped with HEPA filters in the enclosed work area during remediation or cleaning work as required by the size (area) of the containment and to maintain timely progress of the work.

3.2 GENERAL REQUIREMENTS

3.2.1 Pre-Microbial Remediation Work Conference

Meet with the Contracting Officer prior to beginning work to discuss in detail the Microbial Remediation Plan, including work procedures and safety precautions. Once approved by the Contracting Officer, the plan will be enforced as if a part of this specification. Any variances to the specification as a result of the plan must be specifically identified to allow for free discussion and approved by the Contracting Officer in writing prior to starting work. Before work in areas with Asbestos Containing Materials (ACM), Presumed Asbestos Containing Materials (PACM) and Lead begins, identify the presence, location, and quantity of ACM, PACM and Lead. Ensure proper notification of regulatory authorities. Consult with Contracting Officer to obtain facility ACM / LBP surveys. Mitigate any disturbance of painted/coated surfaces in accordance with 29 CFR 1926.62, 29 CFR 1926.1126 and 29 CFR 1926.1127.

3.2.2 Containment Entry / Exit Procedure

Ensure that each worker and authorized visitor follows entry and exit procedures detailed in the Microbial Remediation Plan.

3.3 REMOVAL PROCEDURES

3.3.1 Protection of Existing Work Areas

Perform work in a manner to minimize the damage or contamination to areas outside or directly adjacent to the work area. Inspect areas inside and outside proposed work areas to identify existing damage and notify Contracting Officer prior to start of work.

Where materials outside work area are damaged or contaminated as a result of the Contractors work efforts as verified by the Contracting Officer using visual inspection or sample analysis, it must be restored to its original condition or decontaminated by the Contractor at no expense to the Government as deemed appropriate by the Contracting officer. Should adjacent or outside areas become contaminated as a result of the Contractors work efforts, stop work immediately. Clean the newly contaminated areas at no additional expense to the Government. The work may proceed at the discretion of the Contracting Officer once the area has been verified by visual inspection as restored.

3.3.2 Remediation of Fungally Contaminated Building Materials

The removal of contaminated materials must follow in general the listed sequence of work. The Contractor may make changes to improve work flow with the approval of the Contracting Officer.

a. Provide level of containment and PPE required by the Microbial Remediation Plan.

b. Disable all HVAC units and exhaust fans in the area to be remediated. Cover and seal all supply vents, return vents, and air handling units in the project area using two layers of 0.15 millimeter 6 mil poly (IHFOM, CH 13, Sec. 3).

c. Protect materials to remain in work area. Where possible, clean all materials to be salvaged in place to prevent possible cross-contamination created by moving materials through non-remediation areas.

d. Remove undamaged items and materials to be cleaned and salvaged from the work area. Store materials in an area with relative humidity maintained below 60 percent and where temperatures will not damage the material. Notify Contracting Officer of existing damage to items prior to removal.

e. Set up containments, including protection of materials remaining within the containment and AFUs. Notify Contracting Officer that the area is prepared for remediation activities.

f. Pre-demolition inspection by the Contracting Officer.

g. Demolition and removal / cleaning of contaminated materials.

h. Post-remediation inspection by the Contracting Officer.

i. Perform final cleaning in the containment.

j. Clean carpet in the containment if salvageable.

k. Clearance inspection by the Contracting Officer.

l. Duct and HVAC cleaning, if necessary.

m. Deconstruction of containment, removal of AFUs.

n. Return previously items that were removed and cleaned to the occupied area.

3.3.3 Remediation Procedures

3.3.3.1 Remediation of Non-Porous Materials

Method of remediating non-porous items:

a. HEPA vacuum all surfaces.

b. Damp wipe all surfaces using clean water or a detergent solution.

c. Ensure all cleaned surfaces are dried thoroughly.

3.3.3.2 Semi-Porous Materials (Unfinished Wood)

Use this method for remediating unfinished wood-based items, including wood and wood framing in wall cavities:

a. Cleaning

   (1) HEPA vacuum all surfaces.

   (2) Scrub surfaces with a brush and detergent to remove mold.

   (3) Ensure all cleaned surfaces are dried thoroughly.

   (4) HEPA vacuum all surfaces to remove dust.

   (5) Repair finishes as required to match original.

b. Removal

c. Where unfinished wood product has been structurally damaged, remove and replace with an equivalent product. This includes wall studs and sheathing, such as OSB used in flooring, wall, or roof construction. Lightly mist mold contaminated material before removal.

3.3.3.3 Semi-Porous Materials

Use this method for surface cleaning semi-porous materials such as concrete, vinyl wall covering, linoleum, leather furniture, and finished wood products:

a. HEPA vacuum all surfaces.

b. Damp wipe surfaces using clean water or a detergent solution. Avoid over-wetting the material. Ensure all materials are dried thoroughly

3.3.3.4 Porous Materials

a. Carpet

   (1) Removal: Remove carpet that has remained wet for 48-hours or longer (AIHA IMOM08-679). If carpet has dried out, lightly mist before removal.

   (2) Cleaning (for carpet that has been wet for less than 48-hours) AIHA IMOM08-679: Use a dry absorbent compound cleaning method as designated by IICRC S100. This method uses an absorbent compound to dissolve, suspend and absorb carpet soils. It does not add moisture back into the carpet. Ensure carpet is dried thoroughly after cleaning

b. Gypsum Wallboard (GWB)

   (1) Removal: Remove Gypsum Wallboard that has remained wet for 48-hours or longer (AIHA IMOM08-679), or has visible mold growth.

Where removal of GWB exposes insulation, remove the insulation. Lightly mist all contaminated materials before removal.

(2) Surface Cleaning: Where GWB has a small amount of surface mold growth and the GWB is structurally sound, a surface cleaning method may be used with the permission of the Contracting Officer. HEPA vacuum all surfaces and wipe down with a detergent solution. Do not use surface cleaning where mold growth penetrates wallboard substrate. Thoroughly dry the cleaned areas and paint to lock down any residual spores.

c. Ceiling Tile

(1) Removal: Remove ceiling tile that has remained wet for 48-hours or longer, or has visible mold growth (AIHA IMOM08-679). If ceiling tile has dried out lightly mist before removal.

d. Paper/Electronic Media and Sensitive Equipment

e. Classified and Controlled Unclassified Information whether it is paper, electronic media or equipment must be properly safeguarded / secured until it is properly destroyed in accordance with SECNAV M-5510.36 and it cannot be discarded without utilizing the proper destruction methods. Contractor personnel cannot be granted access to classified information or Controlled Unclassified Information until they have met the security requirements stated in the paragraph SECURITY REQUIREMENTS.

(1) Removal: Only papers or documents that are unclassified and do not contain controlled unclassified information can be discarded in the trash. Classified and Controlled Unclassified information must be destroyed by appropriately cleared military, government or contractor personnel using an approved DOD destruction method for that specific level of information. Discard paper materials that have remained wet for 48-hours or longer, or that have visible mold growth. Paper materials that have been wet for less than 48-hours may be allowed to dry if approved by the Contracting Officer.

(2) Containment: Where paper materials, such as personnel records must be retained, the following containment methods may be used with the permission of the Contracting Officer. The method of containment for paper products shall be:

(a) Thoroughly dry the paper material. Classified and Controlled Unclassified Information must be safeguarded at all times in a GSA approved security container, restricted area, vault, or under the direct physical control of appropriately cleared personnel.

(b) Where routine access to the material is required, a copy shall be made. Contractor personnel shall not reproduce copies of classified information or controlled unclassified information without the prior written approval of the Contracting Officer and the Government Agency Security department with responsibility for the work area. If approval is obtained, only appropriately cleared Contractor personnel shall be authorized to reproduce the information and they must use only DOD authorized reproduction equipment.

(c) When not in use, the classified and controlled unclassified information must be secured in an approved GSA security container, restricted area, or vault. Limit access to the container to only appropriately cleared personnel. Implement an access procedure involving opening the container in a secure area with provision for capturing mold spores and respiratory protection for workers opening the container for these materials. Store the container in an area where the relative humidity is maintained below 60 percent to prevent further mold growth.

f. Textiles

(1) Discard textiles with visible mold growth.

(2) Clean textile based items, including clothing, linens, and toys that do not have visible mold growth, but have been wet, in standard commercial or residential washing machines with standard washing machine detergent.

(3) Dry all items completely before returning to the building / house.

(a) When possible, use dryers to dry items.

(b) If dryers will cause irreversible harm to the item, hang the item on a drying rack in a temperature and humidity controlled space. Discard items not dry within 48-hours (AIHA IMOM08-679).

g. Upholstered Furniture

(1) Removal: Discard upholstered furniture that has remained wet for 48-hours or longer (AIHA IMOM08-679), or that have visible mold growth.

(2) Cleaning: Clean upholstered furniture that has been exposed to mold spores but does not have visible mold growth by HEPA vacuuming upholstery and wood or metal structure, followed by a damp wipe of semi-porous or non-porous portions of the furniture. Dry furniture thoroughly after cleaning.

3.4 DETAILED SEQUENCE OF WORK FOR MOLD REMOVAL UNDER CONTAINMENT

3.4.1 Preparation for Remediation Work

a. Provide level of containment and PPE required for the remediation based on the Microbial Remediation Plan.

b. Disable all HVAC units and exhaust fans in the area to be remediated.

c. Remove undamaged materials from the work area if they are to be salvaged but cannot be cleaned in place. Store materials in an area with relative humidity maintained below 60 percent (IHFOM, CH 13, Sec. 3) and where temperatures will not damage the material. Notify Contracting Officer of existing damage to items prior to removal. Clean materials using procedures detailed in Remediation Procedures.

d. Remove supply diffusers, return grilles and exhaust grilles. Clean diffusers and grilles using procedures detailed in Remediation

Procedures.

e. Construct containment barriers. Existing walls can be used as a portion of the containment barriers if existing openings in walls (such as doors, wall openings, vents) are sealed using 0.15 millimeter 6 mil polyethylene.

f. Install the AFUs and dehumidifiers.

g. Seal supply, return, and exhaust openings with 0.15 millimeter 6 mil polyethylene sheeting and protect intakes to air handling units. Air handling units are to remain off.

h. Install all equipment needed for removal work in the containment area to minimize egress during demolition.

i. The Contracting Officer will inspect the containment to verify that the containment is properly constructed and the containment area has an overall negative pressure of 5 to 10 pascals 0.02 to 0.04 inch water column AIHA IMOM08-679 relative to the outside and adjacent work areas not undergoing active remediation, prior to beginning demolition work.

3.4.2 Demolition

a. Remove mold contaminated materials to be discarded, such as paper, and furniture. Double bag material in 0.15 millimeter 6 mil (IHFOM, CH 13, Sec. 3) poly bags. Seal poly bags using duct tape inside the containment. HEPA vacuum bags before removing them from the containment or airlock. When possible, pass the bags directly from the containment or airlock to the outside. Transport bags to a dumpster. Do not leave the bags at the building / house.

b. Lightly mist all contaminated materials that are being discarded to minimize generation of airborne mold spores during demolition/removal.

c. Remove contaminated gypsum wallboard (GWB) at the preliminary limits of demolition specified in the Microbial Remediation Plan. Inspect back side of removed GWB. If mold is observed on the back side of the GWB, report this condition to the Contracting Officer. After obtaining Contracting Officer approval, continue removing GWB until no mold is observed. If hidden mold is discovered that will extend past the extents of the containment, stop work immediately and reconstruct the containment to extend past the suspected contamination. Re-evaluate level of containment and PPE. Continue to operate AFUs during reconfiguring of containment.

d. Remove drywall by cutting in pieces as large as possible to minimize aerosolization of fungal spores. Drywall screws can either be backed out during removal or later during cleanup.

e. Use dust collection attachments on all power tools, such as sanders, saws, to capture dust created when using the tools. Outlet of dust collector should discharge into inlet of AFU.

f. Remove fiberglass insulation behind removed gypsum board.

g. If wood studs are contaminated, HEPA vacuum all surfaces, scrub them with a brush and detergent to remove mold. After scrubbing studs, HEPA vacuum again to remove any remaining dust. Replace wood studs with damage severe enough to reduce the structural capacity of the member. Prior to removal of any structural member consult with the Contracting Officer.

h. Clean all metal framing with a dilute detergent solution. Clean metal framing with light rust using steel wool and coat with a rust inhibiting paint. Replace metal framing with rust damage severe enough to reduce the structural capacity of the member. Prior to removal of any structural material, consult with the Contracting Officer.

i. Remove contaminated carpet scheduled for removal.

j. Place removed gypsum board, insulation, carpet and remaining debris in two layers of 0.15 millimeter 6 mil (IHFOM, CH 13, Sec. 3) poly bags. Seal poly bags using duct tape inside the containment. HEPA vacuum bags before removing them from the containment or airlock. When possible pass the bags directly from the containment or airlock to the outside. Transport bags to a dumpster. Do not leave the bags at the building / house.

k. Remediation workers must HEPA vacuum their PPE, then remove their PPE within the airlock chamber. Discard disposable coverall suits into a 0.15 millimeter 6 mil (IHFOM, CH 13, Sec. 3) poly bag.

3.4.3 Post-Demolition Inspection

a. The Contracting Officer will inspect the containment area to verify that all contaminated materials have been removed.

b. Allow a minimum of 12-hours after completion of removal work, with AFUs operating, for airborne dust in the containment to settle or be removed by the AFUs.

3.4.4 Cleaning after Demolition, and Cleaning of Settled Spores from Porous / Non-Porous Materials

a. Continue to operate AFUs during cleaning.

b. Clean exposed surfaces.

   (1) HEPA vacuum all surfaces.

   (2) Damp wipe all non-porous exposed surfaces including polyethylene sheets used to protect materials, external surfaces of ductwork, studs, and floors with clean rag and clean potable water or detergent solution.

   (3) Remove poly sheeting inside the containment.

   (4) HEPA vacuum all surfaces protected by poly sheeting.

   (5) Damp wipe non-porous surfaces protected by poly sheeting with clean water or a detergent solution.

   (6) Clean carpet using procedures previously specified in paragraph POROUS MATERIALS above.

c. Final clearance inspection will be conducted by Contracting Officer. Clearance inspections will be performed using the procedures detailed in Post-Remediation Inspection. If areas fail final clearance inspections, additional corrective actions taken by the contractor will be at no additional cost to the Government. Maintain containments in place until spaces are inspected and accepted by the Government as being fully remediated. The Government will determine whether additional cleaning is required by the Contractor and whether the clearance process will be repeated.

3.5 DUCT AND HVAC SYSTEM CLEANING

****

NOTE: Designer/specifier must quantify HVAC materials to be removed or cleaned. Quantities must be included on design drawings or in specification.

****

3.5.1 Contractor Qualifications

a. The HVAC cleaning contractor must be a certified member of NADCA.

b. The HVAC cleaning contractor must have at least one individual with Ventilation System Mold Remediator Qualifications certified by NADCA onsite during duct and HVAC system cleaning.

3.5.2 Inspection

IH must visually inspect the HVAC system serving all work areas (or as required in the initial Microbial Assessment Survey performed by the Government), and determine if additional remediation is needed to clean the HVAC system, thus preventing re-contamination. Coordinate inspection with the contracting officer. Notify the Contracting Officer of the inspection results. The Contractor must receive written approval from the Contracting Officer before proceeding with HVAC microbial remediation.

3.5.3 HVAC Microbial Remediation

Conduct the following actions if authorized by the Contracting Officer.

a. Follow requirements of the NADCA ACR "Standard for Assessment, Cleaning, and Restoration of HVAC Systems".

b. Using a "gassing" or "fogging" method of cleaning with gaseous chlorine dioxide or ozone is not allowed.

c. Disable all HVAC equipment prior to cleaning any component of the system.

d. Use this method for cleaning the air handling units, terminal units, blowers and exhaust fans:

    (1) Construct a limited containment around equipment to be cleaned. Provide appropriate PPE for workers.

    (2) Remove filters. Seal filters in 0.15 millimeter 6 mil (IHFOM, CH 13, Sec. 3) poly bags for disposal.

    (3) Disassemble units as necessary to clean components. Contractor is responsible for correctly reassembling equipment after cleaning.

(4) Clean disassembled components within the containment or in a separate two chamber cleaning containment. Seal disassembled components in 0.15 millimeter 6 mil (IHFOM, CH 13, Sec. 3) poly bags for transport out of building / house. HEPA vacuum bags before removing them from the containment or airlock.

(5) HEPA vacuum all surfaces.

(6) Damp wipe all non-porous surfaces and components with clean water or a detergent solution.

e. Use this method for cleaning HVAC coils:

(1) Clean coils using a method which will render the coil visibly clean. Coil cleaners must be non-acidic / alkaline, detergent based. Clean condensate drain pans. The drain for the condensate drain pan must be operational during the cleaning.

(2) Rinse coils and drain pans with clean water to remove any latent residues.

(3) Cleaning methods must not cause damage to the coil surface or fins.

(4) Cleaning must restore the coil pressure drop to within 10 percent of the pressure drop measured when the coil was first installed. If the original pressure drop is not known, the coil is considered clean only if the coil is free of foreign matter and chemical residue.

f. Use this method for cleaning the duct system:

(1) During cleaning, connect a vacuum collection system to the downstream end of the section being cleaned. The vacuum collection device must be of sufficient power to render all areas of duct being cleaned under negative pressure relative to rooms and areas of duct not being cleaned. Negative pressure must be verified at the furthest point from the collection system with a micromanometer and verification measurements included in the IH Daily Report.

(2) Equip the vacuum collection systems with HEPA filters. Exhaust the vacuum collection systems directly to the outside.

(3) Use mechanical agitation devices to dislodge debris adhered to the ductwork, such that debris may be safely conveyed to vacuum collection devices. Cleaning methods must not damage the integrity of the ductwork, nor damage porous surface materials such as liners inside the ductwork.

(4) HEPA vacuum duct surfaces.

(5) When possible, damp wipe metal duct surfaces with clean water or detergent solution. Do not wet fibrous glass thermal or acoustical insulation.

(6) Identify areas where there is evidence of damage to or uncleanable mold in duct insulation. The Contracting Officer will make the decision to discard the insulation, if necessary.

g. Final clearance of HVAC and duct system will be based on a visual assessment (no visible dust, no visible mold) by Contracting Officer. If HVAC fails final clearance inspection, additional corrective actions taken by the contractor will be at no additional cost to the Government.

3.6 FIRE PROTECTION

Provide portable fire extinguishers within the containment area and outside the decontamination unit. Fire extinguishers Must be rated for the class of fire hazards in the work area and must be sized for coverage of the areas within the containment. At a minimum, one 4.5 kg 10 pound ABC fire extinguisher for every 930 square meters 1,000 square feet must be strategically placed around the containment. Personnel must be trained for emergency egress and the use of fire extinguishers. Notify fire officials of work activities as required. IICRC S500

3.7 CONSTRUCTION BARRIERS

a. Provide interior shoring, bracing, or support to prevent movement, settlement, or collapse of structure or element to be demolished and adjacent facilities or work to remain. Shoring, bracing or support will be necessary when structural wood studs or metal framing need to be removed and replaced when they cannot be cleaned.

b. Do not disturb microbial-contaminated building materials while isolating work areas. This precaution prevents the release of microbial spores.

c. Workers must wear respirators and other PPE as outlined in the microbial remediation plan when installing critical barriers where microbial contaminated surfaces (walls or surfaces with visible settled dusts) are likely to be disturbed. Operate an AFU if disturbance is likely during setup.

d. Monitor the air pressure differential across work area containments. The monitoring system must be in place before the start of remedial activities. Verification by the Industrial Hygienist is required prior to the start of the microbial remediation.

3.8 QUALITY ASSURANCE / QUALITY CONTROL REQUIREMENTS

3.8.1 Contractor Qualifications

Work must be performed by a qualified remediation contractor. Contractor must carry insurance that specifically covers mold remediation.

a. Remediation contractor's on-site supervisor must have one of the following certifications: Certified Microbial Remediator (CMR), Certified Microbial Remediation Supervisor (CMRS), or Applied Microbial Remediation Specialist (AMRS). Qualified supervisor must be onsite whenever active remediation is being performed. Set-up activities may be performed without supervisor present; qualified supervisor must review set-up prior to start of work.

b. Mold remediation workers must be given training in PPE and mold remediation activities as required for their particular job. Microbial remediation plan must provide details of worker training.

3.8.2 Waste Management and Removal

Keep the site and work area free from accumulations of dust, waste materials, or rubbish caused by Contractor operations and free from any flammable materials or other sources of fire hazard. Remove all waste materials and rubbish from and about the work site in strict accordance with the specifications and applicable codes and regulations.

3.8.3 Post-Remediation Inspection

Clean up all debris and dust in interior spaces outside the work area resulting from the Contractor's remediation work.

After all visible accumulations of material and debris are removed from the containment, provide the Contracting Officer a 24-hour notice for a final clearance visual inspection. The Contracting Officer and Contractor's Industrial Hygienist must conduct a thorough visual inspection of the work area. If during this inspection any visible debris or microbial contamination are observed, the Contractor must re-clean the work area without additional cost to the Government.

3.8.3.1 Clearance

a. Clearance Criteria

b. Clearance will be based on visual assessment (all visible mold removed, all visible dust removed, based on a "white glove" test) by Contracting Officer. "White glove" test will consist of wiping the surface with a clean cloth of color suitable to reveal expected type of dust. For most surfaces, a white cloth is suitable. For GWB dust, a dark cloth may be more appropriate.

c. Failed remediation areas will be recleaned at no additional cost to the Government and the AFUs kept in operation another 12-hours, followed by another visual assessment. Subsequent failures will follow the same routine until a pass condition is secured.

3.9 CLEAN-UP AND DISPOSAL

3.9.1 Disposal of Material

Dispose of contaminated bagged waste materials removed during this remediation as general construction debris. Follow all applicable local, State, and Federal requirements for the disposal of this material.

3.9.2 Material Packaging

Place waste, as waste is removed, into a disposal container promptly. Disposal containers must consist of at a minimum, two layers of clear 0.15 millimeter 6 mil (IHFOM, CH 13, Sec. 3) polyethylene bags. Tape bags in a gooseneck fashion to form an airtight seal and label appropriately. Bag waste from vacuums equipped with HEPA filters in 0.15 millimeter 6 mil (IHFOM, CH 13, Sec. 3) polyethylene bags.

3.9.3 Building Exit (Waste Disposal)

HEPA vacuum and damp wipe bags of contaminated waste material prior to removal from the building.. When possible pass the bags directly from the containment or airlock to the outside. Transport bags to a dumpster.

3.9.4 Hazardous Material

Should the Contractor encounter any hazardous materials, notify the Contracting Officer immediately for direction.

Appendix B

Sample Mold Remediation Clearance Criteria For Buildings Housing Sensitive Populations

****

Note: These sample clearance criteria involving the use of fungal air, bulk, and surface sampling are provided as guidelines for the development of detailed clearance contract requirements specific to the particular project. This criteria is intended to supplement the basic specification section and should not be added without thorough review and editing to suit the specific project requirements. Consult with the cognizant occupational medical physicians, infection control, and industrial hygiene, as a minimum, to ensure sampling and clearance criteria added to the contract are appropriate for the affected sensitive or high risk population.

****

****

Note a. Add the following as subparagraphs to paragraph 1.2 DEFINITIONS:

Fungal Growth Structures
Portions of fungi indicating active fungal growth is present on a surface. These include spores, conidiophores, hyphae, hyphal fragments, and mycelia.

AIHA EMLAP
American Industrial Hygiene Association's Environmental Microbiology Laboratory Accreditation Program

****

****

Note: b. Add the following to paragraph 1.4 SUBMITTALS:

In Paragraph SD-01 Preconstruction Submittals:

Testing Laboratory Qualifications; G

Microbial Assessor Qualifications; G

In Paragraph SD-11 Closeout Submittals:

Clearance Fungal Sampling Results; G

****

****

Note c. Add the following subparagraphs to Paragraph 1.4.1 Preconstruction Submittals:

Clearance Sampling Results: Clearance sampling results per the Paragraph CLEARANCE must be submitted to the Contracting Officer the day following receipt.

1.4.1.7 Testing Laboratory Qualifications

Submit for approval the name, address, and telephone number of each laboratory selected for the analysis and reporting of sample results. Each laboratory must be accredited by the AIHA under the EMLAP for the specific field of testing method(s) used. Accreditation must be verified by valid EMLAP certificate or listing in the AIHA Accredited Microbiology Laboratory list. If the Contractor establishes a mobile lab, the parent laboratory must be AIHA EMLAP accredited.

1.4.1.8 Microbial Assessor Qualifications

Submit for approval documentation that the microbial assessor meets at least one of the following criteria:

1. Bachelor's degree from an accredited university or college with a major in engineering, architecture, building construction, occupational health, microbiology, occupational safety, or a related natural or physical science. Additionally, two years experience in conducting microbial investigations is required.

2. Associate's degree from an accredited university or college with a concentration in environmental, natural or physical sciences. Additionally, four years experience in conducting microbial investigations is required.

3. Certification as an industrial hygienist (CIH) as certified by the American Board of Industrial Hygienists, safety professional (CSP) as certified by the Board of Certified Safety Professionals or engineer (PE). Additionally, one year experience in conducting microbial investigations is required.

4. Certification by the American Council for Accredited Certification (ACAC) as a Council-Certified Indoor Environmental Consultant (CIEC), Council-Certified Indoor Environmentalist (CIE), Council-Certified Microbial Consultant (CMC), Council-Certified Microbial Investigator (CMI), Council-Certified Residential Mold Inspector (CRMI),

Council-Certified Microbial Remediation Supervisor (CMRS) or Council-Certified Microbial Remediator (CMR).

****

****

Note d. Replace Paragraph CLEARANCE CRITERIA with the following paragraphs and renumber subsequent paragraphs as necessary.

For paragraph (3) Air Sampling Clearance Criteria and subsequent paragraphs, these paragraphs should only be required for mold remediation projects in buildings that will be occupied by sensitive or high risk populations, such as hospitals, child care centers, certain treatment centers, or when specified by the local medical support staff.

The following steps in subparagraphs (3)(a), (3)(b) and (3)(c) should be part of any air sampling clearance criteria plan.

For subparagraphs (3)(d), (3)(e) and (3)(f), determine the source of makeup air to the remediation area. The sampling protocol must be structured to compare the airborne fungal concentrations of the air entering the remediation work area, prior to commencement of remediation work, with the concentrations found in the work area after remediation is complete. Sampling times must be limited to prevent drying out of the media being used. Consult with the laboratory performing the analysis of samples to determine the appropriate sampling methods and times.

3.8.3.1 Clearance

a. Clearance Criteria

Clearance will be based on visual assessment, and surface and air sampling for fungi. Clearance fungal sampling results are included in the respective paragraphs below.

(1) Visual Assessment. Contracting Officer will verify that all visible mold and all visible dust has been removed. Contracting Officer may use a "white glove" test to verify that mold and dust have been removed. "White glove" test will consist of wiping the surface with a clean cloth of color suitable to reveal expected type of dust. For most surfaces, a white cloth is suitable. For GWB dust, a dark cloth may be more appropriate.

(2) Surface Sampling. Contracting Officer will collect tape-lift surface samples to determine if fungal growth structures are still present on surfaces. Results of tape lift samples will be considered acceptable if fungal growth structures

are not present. Detail quantity and location of tape surface samples in Microbial Remediation Plan. The Designer should research and verify an appropriate number of clearance samples is specified to ensure the protection of the sensitive population. A minimum of 5 samples per 93 square meters 1000 square feet of gypsum wallboard removed must be collected. For ductwork, one sample for every 10 variable air volume terminals and one sample for every 18.6 square meters 200 square feet of ductwork must be collected. These sample numbers should be adjusted for the specific application.

(3) Air Sampling Clearance Criteria

(a) Prior to the remediation process, microbial assessor must collect baseline bulk or surface samples from contaminated materials for culture on fungal growth media for laboratory analysis to determine the predominant fungal species growing in the areas being remediated. The predominant fungal species are the "marker" species for clearance air sampling after remediation. Consult with the laboratory performing the analysis of samples to determine the appropriate marker species in the sample data.

(b) In consultation with the laboratory performing the analysis, microbial assessor must determine the appropriate sampling method, including sample media and sample time and culture temperature for the marker species.

(c) In consultation with the laboratory performing the analysis, medical health professionals, infection control staff, industrial hygienists and microbial assessor must determine the clearance criteria for the marker species. The clearance criteria will be based on the limits of detection possible with the sampling method used and the occupant population expected after remediation is complete.

(d) After remediation is complete, but prior to removing AFUs, collect air samples in the areas remediated,[in adjacent areas providing makeup air to the remediation area,] and in the outdoor air for laboratory analysis. Adjust sampling times in the remediation area samples to account for the expected low particle counts in the air.

(e) For ductwork cleaning projects, supply clean filtered air from an AFU to the ductwork-do not use air from the air handling unit or room air. Samples must be collected using a hood or other device that allows sampling of air that comes from the ductwork and not from the room.

(f) Compare results of remediation area samples with

the results of samples collected in outdoor air[and adjacent areas providing makeup air]. Concentrations of fungal species in the remediation areas must be less than the clearance criteria determined in the paragraph AIR SAMPLING CLEARANCE CRITERIA.

PART 1 GENERAL

1.1 SCOPE

This specification governs the rehabilitation of structural concrete.

1.2 DEFINITIONS

1.2.1 Bracing

Temporary supplemental members used to avoid local or global instability during construction, evaluation, or repair that are intended to be removed after completion of construction.

1.2.2 Delamination

A planar separation in a material that is roughly parallel to the surface of the material.

1.2.3 Rehabilitation

Repairing or modifying an existing structure to a desired useful condition.

1.2.4 Repair

The reconstruction or renewal of concrete parts of an existing structure for its maintenance or to correct deterioration, damage, or faulty construction of members or systems of a structure.

1.2.5 Shoring

Props or posts of timber or other material in compression used for the temporary support of excavations, formwork, or unsafe structures; the process of erecting shores.

1.2.6 Termination Joint

The interface where a placement of repair material meets existing concrete, the edge of an expansion joint, or other existing surfaces.

1.2.7 Unsound Concrete

Concrete that is fractured, delaminated, spalled, deteriorated, defective, contaminated or otherwise damaged.

1.3 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Qualifications; G, [_____]

Work Plan; G, [_____]

Quality Control Plan; G, [_____]

SD-03 Product Data

Conventional Concrete

Polymers

Miscellaneous Materials And Equipment

SD-04 Samples

Reinforcement And Reinforcement Supports

1.5 QUALITY ASSURANCE

1.5.1 General Requirements

a. Follow the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE for Work involving portland cement concrete.

b. To protect personnel from overexposure to toxic materials, conform to the applicable manufacturer's Safety data sheets or local regulations. Submit manufacturer's Safety Data Sheets for all polymers as well as other potentially hazardous materials.

c. Submit the repair procedures for executing the work as well as the test data and documentation on materials used for repair. Submittal must include component materials, mixture proportions, and supplier's quality control program.

d. Inspection and testing of surface preparation as well as placement of reinforcing steel must be in accordance with provisions included herein and the Contract Document.

e. Sampling and testing of materials, as well as inspection and testing of work, must be in accordance with established procedures, manufacturer's instructions, specific instructions from the Contracting Officer if given, or recommended practices as referenced herein and the Contract Documents.

f. Trial batches and testing requirements for various repair materials specified are the responsibility of the Contractor.

g. The testing agency must inspect, sample, and test repair materials and concrete production as required. When it appears that material furnished or work performed by Contractor fails to conform to Contract Documents the testing agency will immediately report such deficiency.

1.5.2 Quality Control Plan

Submit a quality control plan as specified in Sections 01 45 00 QUALITY CONTROL [and] [03 30 00 CAST-IN-PLACE CONCRETE].

1.5.3 Qualifications

The submittals must where applicable, identify agencies and individuals who will be working on this contract and their relevant experience. Do not make changes in approved agencies or personnel without prior approval of the Contracting Officer.

1.5.3.1 Testing Agencies

In addition to the requirements of Section 01 45 00 QUALITY CONTROL, agencies that test concrete materials must meet the requirements of ASTM C1077. Testing agencies that test or inspect placement of reinforcing steel must meet the requirement of ASTM E329. Submit data on qualifications of Contractor's proposed testing agency for acceptance.

1.5.3.2 Quality Control Personnel

Field tests of repair materials required must be made by an ICRI Concrete Surface Repair Technician Tier 2. Submit resumes, pertinent information, past experience, training and education of all operators of specialized demolition equipment if needed for this and the three paragraphs above.

1.5.3.3 Contractor Qualifications

The contractor performing the repair work must have been involved in a minimum of [three][_____] concrete repair projects similar in size and scope to this project for at least [five][_____] years. Submit information, including name, dollar value, date, and point-of-contact for similar projects which demonstrates the required experience and/or training.

1.5.3.4 Worker Qualifications

a. Each worker engaged in the use of specialized removal or application equipment, including [saw operators] [milling machine operators,] [hydromilling equipment operators,] [epoxy injection] [_____], must have satisfactorily completed an instruction program and three years of experience in the operation of the equipment. [The worker must have active experience with the equipment within five years of the project.]

b. Workers installing adhesive anchors must be ACI Adhesive Anchor Installer certified or equivalent.

****

NOTE: Add worker qualification requirements for the usage of specialized equipment if needed. The instruction program for workers engaged in the use of grout injection equipment must have included theory on the nature and causes of cracking in concrete, the technical aspects of correct material selection and use, and the operation, maintenance, and troubleshooting of equipment used in the repair work.

****

1.5.3.5 Regulatory Requirements

Perform all work in accordance with applicable Federal, State, and local safety, health, and environmental requirements. The Contractor is responsible for obtaining all permits required by Federal, State, and local agencies for the performance of the work.

[1.5.4 Pre-Construction Conference

****

NOTE: Appropriate technical representatives for specialized repair materials should be required to meet with the Government and Contractor representatives to ensure that all parties involved are knowledgeable of the material properties and application requirements.

****

[Conduct a pre-construction conference to discuss repair materials performance requirements, control provisions, and roles and responsibilities for the Work to ensure that the Contractor's personnel understand all aspects of the repair material, its properties and application procedures. The conference must include the Contracting Officer or authorized representative, the Contractor's field superintendent and foreman, and a competent Technical Representative of the material manufacturer, and other involved trades or supplier representatives. The Technical Representative must be fully qualified to perform the work.]

]1.5.5 Work Plan

Prepare a work plan describing the methods of concrete removal and repair, including methods, equipment and materials to be used for each feature. Submit the work plan for approval at least 30 days prior to the start of the work. The plan must include, but not be limited to, repair materials to be used with specific information on products and/or constituents, and requirements for handling, storage, etc., equipment to be used, surface preparation, and requirements for placement, finishing, curing and protection specific to the materials used. Include a description of field demonstrations in the work plan. Do not commence work until the work plan and field demonstration representative of the type of work are approved.

1.6 ACCEPTANCE OF REHABILITATION WORK

1.6.1 General Requirements

a. Completed concrete rehabilitation work must conform to applicable requirements of Contract Document and this specification. The Contractor is responsible to bring Work into compliance with requirements of Contract Documents if the Concrete repair work fails to meet one or more requirements of Contract Documents.

b. Correct rejected repair work by removing and replacing or by strengthening with additional construction acceptable to the Contracting Officer. Use repair methods that meet applicable requirements for function, durability, dimensional tolerances, and appearance.

c. Submit proposed work plan, repair methods, materials, and modifications to the Work needed to correct rejected repair work to meet the requirements of Contract Documents.

1.6.2 Tolerances

a. Construction tolerances for repairs must conform to [ACI 117][_____]. Where existing conditions do not allow tolerances to conform to [ACI 117][_____], use the details and materials for such conditions as indicated in the Contract Documents. For conditions not shown or that are different than indicated in the Contract Documents, notify the Contracting Officer before proceeding with the work at those locations.[Provide a tolerence report as required by Section 03 30 00 CAST-IN-PLACE CONCRETE.]

b. Inaccurately formed concrete surfaces resulting in concrete members with dimensions that exceed [ACI 117][_____] tolerances are subject to rejection.

1.6.3 Appearance

Concrete surfaces not meeting the requirements of the Contract Documents must be brought into compliance.

1.7 PROTECTION OF COMPLETED REHABILITATION WORK

a. Do not allow construction loads to exceed the loads that a structural member or structure is safely capable of supporting without damage. Provide supplemental support if construction loads are expected to exceed safe load capacity.

b. Protect repaired and adjacent areas from damage by construction traffic, equipment, and materials. During the curing period, protect repair materials from damage by mechanical disturbances, including load-induced stresses, shock, and vibration.

c. Protect repair materials from environmental damage by weather events during the length of the curing period.

PART 2 PRODUCTS

****

NOTE: Unconventional products and materials could sometimes be the best solutions for repairs. Since the repair industry is evolving, products and materials not listed in this document that have had a record of success in the field could be allowed on a project. The Contracting Officer must permit the usage of those materials prior to application. Additional submittals for those materials should also be requested as needed.

****

Products or materials used must conform to the requirements included herein as well as the Contract Documents. The usage of other products or materials not covered by this requirement or specified in the Contract Documents are permitted upon approval by the Contracting Officer. Additional information and submittals for products and materials not included in this document including product data, samples, design data, test reports, certificates, manufacturer's instructions, and field reports must be submitted as requested by the Contracting Officer.

2.1 MATERIALS FOR SHORING AND BRACING

2.1.1 Shoring and Bracing Systems
