Bearings shall be either oil or grease lubricated and the lubricant used shall contain a corrosion inhibitor. Type and grade of lubricant used shall be shown on a special nameplate which shall be attached to the frame of the motor adjacent to the bearing lubricant filling device. In addition to the quantity of lubricant required to fill the system initially, spare lubricant shall be provided in sufficient quantity to purge and refill the system.

2.2.9.5 Housings

Bearing housings shall be of a design and method of assembly that will permit ready removal of the bearings, prevent escape of lubricant and entrance of foreign matter, and protected by the lubricant when the motor is idle. Except for prelubricated antifriction bearings of an approved type, suitable means shall be provided to apply and drain the lubricant. Oil-lubricated bearing housings shall be provided with oil-level indicator gauges that will be readily visible.

2.2.9.6 Cooling

All bearings shall be self-cooling unless otherwise specifically approved by the Contracting Officer. If the use of cooling is approved, the means employed shall, unless otherwise approved by the Contracting Officer, require no auxiliary pumping equipment; and suitable means shall be provided to indicate the bearing temperature, actuate an alarm when the bearing temperature is above normal, and actuate a device to shut down the motor when the maximum safe operating temperature of the bearing is reached. Cooling coils shall be of copper tubing and designed for the operating pressure used to circulate the cooling water. Cooling water temperature will be [____] degrees C.

2.2.9.7 Rating

Antifriction bearings shall be rated on the basis of a minimum life factor of 8,800 hours, based on the life expectancy of 90 percent of the group, unless otherwise approved by the Contracting Officer.

2.2.9.8 Shaft Currents

Bearings shall be insulated or otherwise protected against the damaging effects of shaft currents.

2.3 SURGE PROTECTION

2.3.1 Surge Capacitors

**************************************************************************
NOTE: To obtain the most reliable protection for 2,300- and 4,000-volt motors, surge capacitors and arresters, mounted at the motor terminals, should be specified. In addition, it is recommended that station-type arresters be installed on the line side of the supply transformers. For 480-volt systems, surge protection is not generally warranted if the station system is connected to the utility line.
through a transformer which has adequate surge protection on the high side. Each 480-volt installation should be investigated, however, to determine whether surge protection is required, especially where excessive switching voltages may occur or where the lightning incidence rate is high.

A three-pole capacitor unit, equipped with built-in discharge resistors and using a non-polychlorinated biphenyl (PCB) insulating medium, shall be provided in the main terminal box. Each pole shall be rated [0.5 microfarad and [2,400] [4,160] volts line-to-line] [1.0 microfarad and 650 volts line-to-line]. Removable bus links shall be provided for motor testing. These links shall be treated to resist corrosion, shall be designed to maintain a positive contact, and shall have low contact resistance.

2.3.2 Surge Arresters

NOTE: Arrester maximum continuous operating voltage (MCOV) rating shall be 3,000 volts line-to-ground for 2,400-volt systems and for effectively grounded 4,160-volt systems, 4,500 volts line-to-ground operating voltage for ungrounded or resistance-grounded 4,160-volt systems, or other ratings as required. An effectively grounded system is defined as one in which $X_0/X_1$ is positive and less than 3 and $R_0/X_1$ must be positive and less than 1 for all system conditions at the point of application of the surge arrester.

Surge arresters of the station type with porcelain tops shall be provided in the main terminal box. The arresters shall be of the metal-oxide type rated [3,000] [4,500] [_____] volts maximum continuous operating voltage (MCOV) line-to-ground. Removable bus links shall be provided for motor testing. These links shall be treated to resist corrosion, shall be designed to maintain a positive contact, and shall have low contact resistance.

2.3.3 Space Heater

If recommended by the surge protection manufacturer, a space heater of adequate capacity and rated 120 volts shall be provided. Space heaters shall have a maximum watt density of 20 watts per square inch.

2.4 MOTOR TERMINALS AND BOXES

2.4.1 Stator Terminal Box

Drip-proof cast iron or steel conduit terminal boxes, treated as specified for frames in paragraph GENERAL REQUIREMENTS, shall be supplied for housing the stator lead connections [surge capacitors] [and surge arresters] and shall have adequate space to facilitate the installation and maintenance of cables and equipment. Boxes shall have a [bolted] [hinged securable] cover providing unrestricted access, be mounted on the motor frame, and shall have an auxiliary floor supporting structure, when required, supplied by the motor manufacturer. Conduit entrance shall be from the bottom. The
boxes shall be designed to permit removal of motor supply leads when the motor is removed. [A "HIGH VOLTAGE - [_____] VOLTS" warning sign shall be provided on the cover of the box.] [When looking down on the motor/pump assembly, the terminal box shall be located between degrees and degrees clockwise from the discharge elbow of the pump.]

2.4.2 Stator Terminals

Insulated terminal leads shall receive a treatment equal to that of the motor winding. Leads shall be brought out of the stator frame and shall be provided with terminal lugs for connection to the motor supply wiring.

2.4.3 Grounding

A ground bus and means for external connection to the station grounding system shall be provided in the stator terminal box when surge protection is provided.

2.4.4 Accessory Leads and Boxes

Terminal leads for motor winding space heaters, [surge protection equipment space heater], [resistance temperature detectors] [thermistors] and any other auxiliary equipment shall be brought into conveniently located terminal boxes provided with terminal blocks for extension by others. The terminal boxes shall be drip-proof and treated as specified for frames in paragraph GENERAL REQUIREMENTS. All auxiliary wiring shall be stranded copper conductors with 600-volt flame-retardant insulation, except temperature detector leads may be in accordance with the manufacturer's standard practice. All wiring and terminals shall be properly identified.

2.5 WRENCHES, TOOLS, AND SPECIAL EQUIPMENT

Provide all nonstandard and special equipment required for dismantling, reassembly, and general maintenance of the motor units. Provide one complete set of lifting attachments such as detachable eyebolts or special slings for handling various parts with a hoist.

2.6 FACTORY TESTS

***************************************************************
NOTE: The designer should carefully consider whether to allow the Contracting Officer to waive these tests. Decision should be based on expertise in the field within the Division or District.
***************************************************************

One motor of each rating type, selected at random by the Contracting Officer, shall be given a complete test. The remainder of the motors shall be given a check test.

a. Submit [6] [_____] copies of test reports recording all data obtained during the tests specified to the Contracting Officer for each motor used. Test reports shall include performance curves indicating the results of subparagraph COMPLETE TEST below.

b. Submit [6] [_____] certified copies of the results of a "Complete Test" for duplicate equipment. It will be accepted in lieu of the "Complete Test" as specified in subparagraph COMPLETE TEST below for equipment of the respective rating and type.
c. No substitute will be accepted for the "Check Test." The base value shall be given whether ANSI or IEEE standard system is used. All complete tests shall be [witnessed by the Contracting Officer] [waived in writing].

2.6.1 Complete Test

A complete test of a motor shall include the following:

2.6.1.1 Excitation Test

Including a plot of volts as abscissa versus amperes and watts as ordinates.

2.6.1.2 Impedance Test

Including a plot of volts as abscissa versus amperes and watts as ordinates.

2.6.1.3 Performance Test

Including a plot of torque or percent load as abscissa versus efficiency, power factor, amperes, watts, and RPM or percent slip as ordinates.

2.6.1.4 Speed-Torque Test

Prony brake or other equivalent method. Including a plot of torque in foot-pounds as abscissa versus speed in RPM as ordinate.

2.6.1.5 Temperature Test

Made on completion of paragraph c above. (If screens are provided over openings, test will be made with screens removed and by thermometer).

2.6.1.6 Insulation Resistance-Temperature Test

Shall be taken following heat run, readings being taken at approximately 10 degrees C intervals. Temperature shall be determined by the resistance method. Test result values shall be plotted on semilogarithmic graphs, the insulation resistance values as logarithmic ordinates and the temperature values as uniform abscissas. For comparison purposes, a curve indicating the safe operating value of insulation resistance shall be plotted on the same sheet with the insulation resistance-temperature test curve.

2.6.1.7 Cold and Hot Resistance Measurement

2.6.1.8 Dielectric Test

2.6.1.9 Sound Level Test

In accordance with [______].

2.6.1.10 Vibration Measurement

In accordance with NEMA MG 1 paragraph 20.54.

2.6.1.11 Conformance Tests

In accordance with NEMA MG 1 paragraph 20.47.
2.6.2  Check Test

A check test of a motor shall include the following:

2.6.2.1  Routine Test

Test in accordance with NEMA MG 1 paragraph 12.51 or NEMA MG 1 paragraph 20.47.

2.6.2.2  Cold Resistance Measurement

2.6.2.3  Insulation Resistance and Winding Temperature

Insulation resistance and winding temperature at time the insulation resistance was measured.

2.6.2.4  Conformance Test

In accordance with NEMA MG 1 paragraph 20.47.

2.6.2.5  Vibration

Vibration measurement in accordance with NEMA MG 1 paragraph 12.07 or NEMA MG 1 paragraph 20.54.

2.6.3  Form Wound Coil Test

All form wound coils, either before or after they are placed in the slots, shall be tested for short circuits between turns of the individual coils by applying a high frequency voltage of not less than 75 percent of the voltage for which the machine is insulated, or by applying a surge test voltage of equivalent value to the terminals of each coil. Equivalent surge voltage shall be a wave whose peak value is equal to 1.06 times the voltage for which the motor is insulated.

2.6.4  Winding Space Heater Test

**************************************************************************
NOTE: Include this test only where winding space heaters are specified.
**************************************************************************

Each winding space heater unit shall be tested at the factory for successful operation and dielectric strength.

PART 3 EXECUTION
-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the procurement of three-phase vertical synchronous motors, 1118 kW 1500 horsepower and above, for driving storm-water pumps for local flood-control pumping stations. This section was originally developed for USACE Civil Works projects.

Adhere to **UPC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

PART 1 GENERAL

NOTE: This Section covers motors with special features of construction which are considered necessary to provide maximum insurance against failures where the motors are to be operated only for short periods of time, at infrequent intervals, and at locations where the average relative humidity of the air is high. Where operating characteristics or features of motor construction are different from those normally specified, this specification shall be modified accordingly. The designer shall also consider unusual service conditions such as direct exposure to the sun, vermin infestation, or high...
altitude.

In adapting this specification to any project, the form and phraseology will be changed as necessary to properly specify the work contemplated. When deviations from this specification are considered, necessary prior approval from HQUSACE will be obtained.

Instructions for Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE, specify that Section 4 of Part IV, Technical Provisions, be reserved for insertion of the technical provisions of this guide specification.

The following should be included in section "L" of standard form 36, Information to Bidders.

"It is preferred that the field poles be secured to the rotor structure by means of dovetails, but an alternate method of construction will be acceptable, provided that evidence of its adequacy, satisfactory to the Contracting Officer, is submitted with the bid."

The designer should consider prequalifying the bidders based on past experience with this type and size of motor. Criteria for qualifying should be included in section "L" of standard form 36.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority.
Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**********************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

1.3.1 Corrosion Prevention and Finish Painting

The equipment provided under these specifications will be subjected to severe moisture conditions and shall be designed to render it resistant to corrosion from such exposure. The general requirements to be followed to mitigate corrosion are specified below. Any additional special treatment or requirement considered necessary for any individual items is specified under the respective item. However, other corrosion-resisting treatments that are the equivalent of those specified herein may, with the approval of the Contracting Officer, be used.

1.3.1.1 Corrosion-Resisting Materials

Corrosion-resisting steel, copper, brass, bronze, copper-nickel, and nickel-copper alloys are acceptable corrosion-resisting materials.

1.3.1.2 Corrosion-Resisting Treatments

Hot-dip galvanizing shall be in accordance with ASTM A123/A123M or ASTM A153/A153M as applicable. Other corrosion-resisting treatments may be used if approved by the Contracting Officer.

1.3.1.3 Frames

Motor frames, end bells, covers, conduit boxes, and any other parts, if of steel, and if they will be coated during the process of insulating the windings, shall be cleaned of rust, grease, millscale, and dirt, and then treated and rinsed in accordance with manufacturers' standard process. If any of the above-listed parts are not coated during the process of insulating the windings then, in addition to the above, give them two coats of primer and then two coats of manufacturers' standard moisture-resistant coating, processed as required.

1.3.1.4 Cores

The assembled motor core shall be thoroughly cleaned and then immediately primed by applying a minimum of two coats of a moisture-resisting and oil-resisting insulating compound. Air gap surfaces shall be given a minimum of one coat.

1.3.1.5 Shafts

Exposed surfaces of motor shafts shall be cleaned of rust, grease, and dirt and, except for bearing surfaces, given one coat of a zinc molybdate or equivalent primer and two coats of a moisture-proof coating, each cured as required. Shafts of a corrosion-resisting steel may be used in lieu of the above-mentioned treatment.

1.3.1.6 Finish Painting

**************************************************************************
NOTE: If severely moist conditions exist, a separate paint system should be specified using Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, system 21, epoxy finish or equivalent. When such painting is specified, care must be taken to specify a paint that will adhere to and not be injurious to

SECTION 26 29 02.00 10  Page 8
the protective painting provided under these specifications.

Finish painting of all equipment in accordance with the standard practice or recommendation of the manufacturer, as approved by the Contracting Officer.

1.3.1.7 Fastenings and Fittings

Where practicable, all screws, bolts, nuts, pins, studs, springs, washers, and other similar fittings shall be of corrosion-resisting material or shall be treated in an approved manner to render them resistant to corrosion.

1.3.2 Government Study

NOTE: Item d. may be used only when the pump and motor are furnished under the same procurement.

Submit [6] [_____] copies of the specified data. Supply to the Government, for completion of its Motor Torque and Accelerating Time Studies (MTATS), the following data:

a. Complete equivalent circuit data referred to the stator with friction, windage, and stray load losses.

b. Current, power factor, and torque versus speed (0-100 percent, inclusive, in 1 percent increments up to 95 percent and 0.1 percent increments above 95 percent) and load (0-125 percent, inclusive, in 25 percent increments) as a function of line voltage (from 80 percent to 110 percent, inclusive, in 5 percent increments), for rated and 90 percent of rated voltage at starter. Only tabulated data will be required.

c. Load inertia, Wk2 of motor rotating parts, pound-foot2.

[ d. Load inertia, Wk2 of pump rotating parts (wet), pound-foot2.]

1.4 DELIVERY, STORAGE, AND HANDLING

Ship each motor in the vertical position with the rotor blocked inside the stator to prevent damage to the bearings. Securely mount the motor on a skid or pallet of ample size. All small parts or elements shall be boxed. Perform the skid mounting and boxing in a manner which will prevent damage or distortion to the motor during loading, shipment, unloading, indoor storage, and subsequent handling. Provide weatherproof covers as necessary to protect the motor during shipment. Any eyebolts, special slings, strongbacks, or other devices used in loading the equipment at the manufacturer's plant shall be furnished for unloading and handling at the destination and shall become the property of the Government.

1.4.1 Impact Recorder

Ship each motor with a three-way temporary impact recorder to measure magnitude and direction of longitudinal (Y), lateral (X), and vertical (Z) impacts suffered during shipment. If the recorder indicates impacts equal
to or greater than those determined by the Contractor prior to shipment for any of the three directions specified herein, inspect and test motor to determine extent of damage, if any, and repair or replace any damaged equipment.

1.4.2 Long Term Storage

**************************************************************************
NOTE: The designer will include this paragraph only when there is no available Government storage. The designer should also investigate storage to be used by the installation Contractor and the possibility of making this a requirement under the installation contract.
**************************************************************************

Store all equipment provided under this contract for [_____] [days] [months] at no cost to the Government. The storage site shall be subject to the approval of the Contracting Officer and shall meet the manufacturer's recommendations for indoor storage. The equipment will be subject to periodic inspection by the Government to ensure that proper storage conditions are maintained.

1.5 EXTRA MATERIALS

The following spare parts shall be furnished for each type and rating in addition to the assembled motors:

a. Two complete stator coils but not less than the number of coils to span one coil pitch with necessary wedges and material for installation for one motor.

b. Two complete field coils, including necessary materials for installation.

c. One complete exciter field coil, including necessary materials for installation.

d. One complete set of bearing parts for pump motors. Each set to include:
   (1) Stationary thrust bearing plate.
   (2) Rotating thrust bearing plate.
   (3) Upper guide bearing lining.
   (4) Lower guide bearing lining.
   (5) Two sets of oil rings for pump motors.
   [ (6) One complete set of parts necessary for replacement of antireverse device.]

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The work under this section includes furnishing all labor, equipment, and material and performing all operations required to design, manufacture,
assemble, factory test, prepare for shipment and storage, and to deliver the vertical synchronous motors required to drive the flood-control pumps specified under Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE. Supply these motors complete with all accessories, spare parts, tools, and manufacturer's data and instructions as specified herein.

a. Submit a complete list of renewal parts for the motor. The list shall accompany the instruction manuals.

b. Submit [6] [_____] copies of printed and bound instructions manual for the proper installation, erection, inspection, and maintenance of the machines furnished under this contract not later than the date the equipment is shipped from the manufacturer's plant. Manuals shall include complete installation, maintenance, and service instructions for the motors, lube oil system, thrust bearings (including cooling water requirements), and other accessories.

c. The instructions shall include a cross-sectional drawing indicating the major component parts of the motor and procedure for disassembly. The description in the manual for the motor shall be coordinated with the installation erection instructions specified in Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE for the pump and integrated with same for a complete motor and pump assembly.

**************************************************************************
NOTE: Include contract specification number where service conditions are described.
**************************************************************************

d. Insulation for the stator, rotor field, and exciter windings shall be full class "F" insulation as defined in NEMA MG 1 paragraph 1.66 and as described herein. The insulation system shall be a combination of materials and processes which provides high resistance to moisture, fungus, and other contaminants as experienced by a motor in the service conditions specified herein.

e. The insulation system shall also be of a type designed and constructed to withstand severe humidity conditions and to function properly after long periods of idleness without first drying out. All windings and connections shall be of the sealed type as defined in NEMA MG 1 paragraph 1.27.2. Insulated windings, unless otherwise approved, shall be completely assembled in the motor core before impregnating with the insulating compound. The compound shall consist of 100 percent solid resin. Submit a detailed description of and specification for the manufacturing process, the materials and the insulating compound used in insulating the windings for approval before manufacture of the motors is commenced. If, in the opinion of the Contracting Officer, the insulation proposed is not of the quality specified and if the methods of manufacture are not considered to be in accordance with best modern practice, the motors will not be accepted. Impregnation of the windings with the insulating compound shall be by vacuum impregnation method followed by baking. Repeat the procedure as often as necessary to fill in and seal over the interstices of the winding, but in no case shall the number of dips and bakes be less than two dips and bakes when the vacuum method of impregnation is used.

f. Process insulation to ground on the coil. Slot tubes or cells are not acceptable. The insulation shall be of adequate thickness and breakdown strength throughout the length of the coil. Use mica in the
slot portion of adequate thickness to withstand the dielectric tests specified in paragraph FACTORY TESTS.

2.2 NAMEPLATES

Nameplate data shall include rated voltage, rated full-load amperes, rated horsepower, service factor, number of phases, RPM at rated load, frequency, code letter, locked-rotor amperes, duty rating, insulation system designation, and maximum ambient design temperature. Each motor shall have a nameplate listing motor characteristics in accordance with NEMA MG 1 paragraph 21.61. A separate starting information nameplate shall be furnished as specified in paragraph OPERATING CHARACTERISTICS. A starting information nameplate setting forth the starting capabilities shall be provided on each motor in accordance with NEMA MG 1 paragraph 21.43.3. This nameplate shall also include the minimum time at standstill and the minimum running time prior to an additional start.

2.3 GUARDS AND PROTECTIVE ENCLOSURES

All moving, energized, or other parts where accidental contact might be hazardous to personnel shall be equipped with adequate guards, rails, or other suitable enclosures to prevent accidental contact. All lubrication fittings shall be piped to convenient locations where they can be serviced from regularly utilized access ways without removal of the guards or enclosures.

2.4 MOTORS

*************************************************************************
NOTE: For weak source (high thevenin source impedance), the electric utility should be contacted to determine starting restrictions, maximum inrush, or voltage dip limits. This is especially critical for motors over 75 kW 100 hp. The designer must then perform a motor torque and accelerating time study (MTATS) to evaluate the motor starting torque and voltage dip requirement. The selection of a reduced voltage starter will be based on the electric utility requirements and the motor pump arrangement.
*************************************************************************

The motors to be supplied under these specifications shall be of the vertical [solid] [hollow] shaft type as required by the pump manufacturer, with direct-connected brushless exciter, designed for full voltage starting, of drip-proof construction, [complete with antireversing ratchet or backstop device], and shall conform to the applicable requirements of NEMA MG 1, except as hereinafter specified.

a. Submit [6] [_____] copies of equipment foundation dimensions; outline drawings for motor and rotor set-down fixture and jacking provisions with weights, nameplate data, and details showing method of mounting and anchoring the motor. Contracting Officer's approval shall be obtained in writing prior to the commencement of manufacture of motors.

b. Submit [6] [_____] copies of complete descriptive specification for each type and size motor furnished, with necessary cuts, photographs, and drawings to clearly indicate the construction of the motor, specifications for the materials and treatments used to prevent
corrosion of parts, and of bearing construction.

c. Submit a complete listing of motor performance data in the form provided in NEMA MG 1 paragraph 21.50. Include with the submittal all information required for the selection of protective and control equipment and for operational settings. Information such as, but not limited to, normal and maximum operating temperatures for windings and bearings, V-curves, field control and protective equipment to be mounted on the motor controller cubicle, locked-rotor current, permissible locked-rotor time, starting times for each type of start as indicated above, and subtransient, transient, and synchronous reactance.

d. If duplicate equipment has not been manufactured previously, calculations or tests shall be made as necessary and confirmed as required by paragraph FACTORY TESTS. Contracting Officer's approval shall be obtained in writing prior to the commencement of manufacture of motors.

2.4.1 Rating

**************************************************************************
NOTE: The local electric utility should be consulted for the expected average and maximum values of percentage voltage unbalance, as defined in NEMA MG 1 paragraph 21.81.2, that will be present at the pumping station. If either value exceeds 1 percent as recommended in NEMA MG 1 paragraph 21.81, the utility should be requested to furnish their plans to improve the voltage unbalance. If they are unable to do so, then the motor should be derated where the voltage unbalance exceeds 1-2 percent. Voltage unbalance should never exceed 5 percent. Motor manufacturers should be consulted for voltage unbalance limits whenever motors have specified limits on locked-rotor currents, particularly the 500 percent limit.
**************************************************************************

Each motor shall be wound for three-phase, 60 Hz, alternating current, and for the respective operating voltage listed below:

Design the motor for operation in a 40 degrees C 104 degrees F ambient temperature, and all temperature risers shall be above this ambient temperature. The rated horsepower of the motor shall be not less than 110 percent of the determined maximum load requirement of the pump. [Supply voltage unbalance will be [_____] percent. The motor rated horsepower will be further derated according to NEMA MG 1 paragraph 21.81 for a voltage unbalance above [1.5 percent] [2 percent].] Motors shall have a power factor and service factor of 1.0. The temperature rise above the ambient temperature for continuous rated full load conditions and for the class of insulation specified shall not exceed the values given in NEMA MG 1.
paragraph 21.40.

2.4.2 Operating Characteristics

2.4.2.1 Torques

**************************************************************************
NOTE: This guide specification identifies closed
transition autotransformer-type reduced voltage
starters. These starters provide the most
flexibility during installation, when exact load and
line characteristics are not determined, since both
input voltage and inrush current may be adjusted.
This specification is not meant to limit the
selection of reduced voltage starter to only
autotransformer type. The use of wye-delta type
starter may be appropriate in certain situations.
The reduced starter cost must be weighed against the
increase cost in motor designs; however each design
should be evaluated for the most suitable type
starter. All reduced voltage starters will reduce
the motor starting torque, so the designer should
evaluate the load characteristics to ensure that
motor torque will be sufficient under all starting
conditions. If reduced-kVA starters are required,
EM 1110-2-3105 should be consulted for further
guidance.
**************************************************************************

Starting and accelerating torque shall be sufficient to start the pump and
accelerate it against all torques experienced in passing to the pull-in
speed under maximum head conditions and with rated excitation current and a
terminal voltage equal to [90 percent of rated value] [the output of a
closed-transition autotransformer type reduced-voltage starter supplied at
90 percent of rated voltage and connected on its [80] [65] percent tap].
The pull-in torque shall exceed that required by the pump under maximum
head conditions but shall not be less than 100 percent of motor full-load
torque, with a terminal voltage equal to 90 percent of rated value.
Pull-out torque shall not be less than 150 percent of motor full-load
torque for one minute minimum and with a terminal voltage equal to 90
percent of rated value.

2.4.2.2 Locked-Rotor Current

**************************************************************************
NOTE: The objective of this specification is to
limit the locked-rotor current to a value
sufficiently low to permit full-voltage starting.
The motor horsepower rating is to be a minimum of
110 percent of the maximum pump load at a service
factor of 1.0. Manufacturer's standard is to limit
locked-rotor current to 600 percent of full load
current. However, local utilities may have
additional limitations on inrush currents and should
be consulted. Motor design will permit some
reduction in inrush current in which case 500
percent should be used. If this is not sufficient,
reduced-voltage starting should be used. The inrush
current limit should be specified whenever possible.

SECTION 26 29 02.00 10  Page 14
The locked-rotor current shall not exceed [600] [500] percent of rated nameplate full load running current. [The locked-rotor current shall not exceed [_____] amperes at 90 percent of rated voltage during any point in the starting cycle under worst case starting conditions. For autotransformer reduced voltage starting, the above criteria shall apply to primary side and at any prescribed tap.]

2.4.2.3 Starting Capability

Each motor, when operating at rated voltage and frequency and on the basis of the connected pump load inertia, \( W_{k2} \), and the speed-torque characteristics of the maximum load during starting conditions as furnished by the pump manufacturer, shall be capable of making the starts required in NEMA MG 1 paragraph 21.43.

2.4.2.4 Balance

The balance for each motor when measured in accordance with NEMA MG 1 paragraph 20.53 shall not exceed the values specified in NEMA MG 1 paragraph 21.54. Each motor's characteristics shall be such that the maximum vibration requirements of Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE are met.

2.4.2.5 Noise

NOTE: The Department of Defense considers hazardous noise exposure of personnel as equivalent to 85 dB or greater: A-weighted sound pressure level for eight hours in any one 24-hour period. On the assumption that pumping plant operating personnel may be exposed to noise levels approaching or exceeding that defined by the DOD as hazardous, the motor noise limit should be specified not to exceed 85 dBA. The additional cost of providing motors meeting this requirement should be investigated and weighed against an alternate of providing a room to isolate these personnel from the noise exposure.

All motors shall operate at a noise level less than 85 decibels A-weighted mean sound pressure level (dBA). Noise shall be determined in accordance with NEMA MG 1 paragraph 21.53.

2.4.2.6 Overspeed Option

NOTE: NEMA MG 1 paragraphs 12.48 and 21.45 specify that overspeeds are for emergencies lasting no longer than one minute. Using this option will increase costs due to requirements well beyond standard limits. Designer must do a cost analysis before selection of this option.

Design each motor to withstand indefinitely, without injury, the maximum overspeed to which the motor will be subjected when the pump to which it is
connected is acting as hydraulic turbine under the maximum head with the pump discharge pipe open.

2.4.2.7 [Antireverse Device]

Install a self-actuated backstop device or antireversing ratchet, to prevent reverse rotation of the pump due to loss of power or failure of the electric prime mover, as an integral part of the motor. Submit the design of the antireverse device for approval by the Contracting Officer, such that its action is without intentional delay or excessive backlash. It shall have sufficient capacity to prevent reverse rotation with a back flow through the pump due to a [_____]-foot differential head. The device shall be precision machined and be complete with support housing and oil collector as required. An oil reservoir, independent of the one used for the thrust bearing, complete with oil-level gauge and 120-volt ac rated high and low level contacts shall be provided for the backstop device. The lubricant for the antireverse device shall contain a corrosion inhibitor, whose type and grade shall be shown on a special nameplate attached to the frame of the motor adjacent to the lubricating filling device.]

2.4.2.8 [Power Factor and Efficiency]

**************************************************************************
NOTE: List power factor and efficiency for each size only if high efficiency motors are required. Generally manufacturers' standards will be used.
**************************************************************************

The power factor and efficiency at full load, 3/4 full load, and 1/2 full load shall be not less than [____], [____], [____] and [____], [____], [____], respectively. Submit [6] [____] copies of certification guaranteeing value of power factor and efficiency for full load, 3/4 full load, and 1/2 full load. Motors will be rejected if factory tests specified in paragraph FACTORY TESTS do not demonstrate that these values will be met or exceeded.]

2.4.3 Frames and Brackets

Frames and end brackets shall be of cast iron, cast steel, or welded steel. The mounting ring, unless otherwise approved, shall be built integral with the frame or lower end bracket. Coordinate the motor installation with the mounting arrangement specified in Section 35 45 01 VERTICAL PUMPS: AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE, paragraph BASE PLATE AND SUPPORTS. Furnish all equipment and materials required to mount the motor, such as a base or pedestal, sole plates, and bolts or dowels. Install sufficient bolts and dowels to prevent any possible movement of the motor assembly when the motor is subjected to stresses resulting from the most severe short-circuit conditions. Treatment against corrosion shall be as specified in paragraph GENERAL REQUIREMENTS.

2.4.3.1 Stator Frame

The stator frame shall be rigid and sufficiently strong to support the weight of the upper bearing bracket load, the weight of the stator core and windings, and to sustain the operating torques without perceptible distortion.
2.4.3.2 Supporting Brackets

The upper bracket supporting the thrust bearing and upper guide bearings shall have sufficient strength and rigidity to support the weight of the entire rotating element of the motor, together with the pump impeller and shaft, and the unbalanced hydraulic thrust of the pump impeller. The lower bracket supporting the lower guide bearing shall preferably be so designed and constructed that the entire rotor can be lifted out as a unit without disturbing the bearing alignment. If it is not feasible to construct the rotor so that it can be lifted out as a unit, then the lower bracket shall be supported on separate base plates or structure and shall be designed so that it can be removed through the stator. The maximum deflection of the thrust bearing support system at any point shall not exceed the limits set by the pump manufacturer to maintain proper clearances for any operating condition.

2.4.3.3 Eyebolts

Provide eyebolts, lugs, or other approved means for assembling, dismantling, and removing the motors from above, utilizing the overhead pumping station building crane. Furnish with the motor all lifting devices for use in conjunction with the building crane.

2.4.3.4 Platforms and Stairways

Furnish each motor with a platform and stairway complete with railing. An easily removed section of railing shall be provided so that the rotor shaft does not have to be hoisted above the railing when the rotor is removed. The platform shall also provide maintenance access as required by the motor furnished. Locate the stairway [_____] degrees [counter-] clockwise from the discharge elbow of the pump, when looking down on the motor/pump assembly.

2.4.4 Insulation Against Stray Currents

The motor shall be adequately insulated against stray currents which may be set up by the field of the motor and which might cause injury to the motor or pump bearings. This insulation shall be arranged to break the possible path of such currents in not less than two places in series.

2.4.5 Motor Cooling

Provide the motor with an open-type system of ventilation, taking cooling air from above the operating floor level and discharging the heated air into the operating room through upper openings in the stator frame. The circulation of air shall be induced by means of the fan action of the rotor. No openings to the air space below the operating level are to be used in the motor design for ventilation or other uses that are not reasonably airtight.

2.4.6 Stator

2.4.6.1 Stator Core

The cores shall be built up of separately punched thin laminations of low-hysteresis loss, nonaging, annealed, electrical silicon steel; assembled under heavy pressure; and clamped in such a manner as to ensure that the assembled core is tight at the top of the teeth of the laminated core. Laminations shall be properly insulated from each other. Only
laminations free from burrs shall be used, and care shall be taken to remove all burrs or projecting laminations from the slots of the assembled cores. Cores shall be keyed, dovetailed, or otherwise secured to the shaft or frame in an approved manner. Treatment against corrosion shall be as specified in paragraph GENERAL REQUIREMENTS.

2.4.6.2 Stator Coils

The coils shall be thoroughly insulated and treated with a moisture and fungus-resisting compound in such a way that air will be excluded and the insulation will be protected from the absorption of moisture. Provide additional insulation for those portions of each coil which are within the slots. The coils shall fit the slots accurately and they shall be form wound and interchangeable. The end turns shall be so designed and supported that they will not be distorted under the most severe short-circuit conditions to which the motor may be subjected.

2.4.6.3 Insulated Stator Windings

The stator windings shall be insulated as specified in paragraph GENERAL REQUIREMENTS. Coils shall be of such uniformity that the stator windings of all similarly rated motors will be alike, in shape and size, and interchangeable. The stator winding and end turn connections shall be fully braced to withstand repeated full voltage starts. The bracing system shall essentially eliminate coil vibration under these high current conditions as well as during normal operation. A tieless bracing system will be acceptable. If a tied system is used it shall be such that no tie depends upon the integrity of any other tie within the system.

2.4.6.4 Temperature Detectors

Six standard copper resistance-type temperature detectors, with a resistance of 10 ohms at 25 degrees C 75 degrees F, shall be provided in the stator in accordance with NEMA MG 1 paragraph 20.63. Detectors shall be wired in accordance with paragraph ACCESSORY WIRING AND BOXES.

2.4.6.5 Grounding

The stator frame shall have provisions for solidly grounding to the station ground system which will be furnished and installed by others.

2.4.7 Rotor

The rotor shall be built in accordance with the best modern practice and in such a manner as to secure adequate strength for the operating conditions described herein. The pole pieces shall be built up of thin steel laminations accurately aligned and securely riveted or bolted together. It is preferred that the field poles be secured to the rotor structure by means of dovetails, but an alternate method of construction will be acceptable, provided that evidence of its adequacy, satisfactory to the Contracting Officer, is submitted with the bid.

2.4.7.1 Field Windings

The field windings shall be insulated as specified in paragraph GENERAL REQUIREMENTS. The field coils shall be adequately insulated between turns and from the pole pieces and shall be thoroughly braced to withstand the stresses which could be imposed under maximum pump speed.
2.4.7.2 Starting Windings

Design the starting windings for full-voltage starting, securely built into the field poles and designed to ensure conservative stresses when the unit is operating at maximum pump speed. The bars shall be silver soldered or brazed to heavy end segments to form a low-resistance joint of high mechanical strength. Design the starting windings to permit any pole or group of poles to be removed.

2.4.8 Exciter

Provide each synchronous motor with a direct connected exciter without brushes, commutators, or additional bearings. The exciter shall be capable of supplying continuously, and without overheating, the excitation for the motor to which it is connected when the latter is operating at rated power factor, voltage, frequency, and horsepower. Accomplish the field-protective function and the field switching and application function by semiconductor elements mounted on suitable heat sinks supported on the motor rotor and ventilated by rotation of the rotor. The exciter shall be either built into or so arranged that it is ventilated from the main motor enclosure. The enclosure of the exciter shall be of drip-proof construction comparable to that of the motor. The control system shall apply excitation to the motor field at the speed and phase angle required to obtain maximum pull-in torque. Insulate the exciter windings as specified in paragraph GENERAL REQUIREMENTS. The field coils shall be adequately insulated between turns and from the pole pieces and shall be thoroughly braced to withstand the stresses which could be imposed under maximum pump speed.

2.4.9 Shaft

**************************************************************************
NOTE: Use hollow shaft pumps whenever possible, since they are more readily adjusted. Pumps requiring large motors (above 746 kW, 1,000 hp) are limited by the available motors. Investigate the exact motor capabilities and sources of supply when using hollow shafts with motors above 746 kW, 1,000 hp. Solid shafts will be used only when the available motor designs require their use.
**************************************************************************

Make the motor shaft of high grade steel, finished all over, and of ample size to drive the pump under maximum load conditions. The shaft shall be of the [solid type and shall be connected to the pump shaft with a rigid adjustable coupling.] [hollow type and shall be connected to the pump shaft above the thrust bearing in a manner that will permit the pump impeller to be adjusted vertically]. Coordinate the connection with the pump shaft and furnish a motor shaft with all provisions, fittings, and devices required to conform to the shafting arrangement specified in Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE, paragraph SHAFTS. See paragraph GENERAL REQUIREMENTS for treatment against corrosion.

2.4.10 Bearings

2.4.10.1 Thrust Bearings

Provide thrust bearings of the spring type located above the rotor. A design in which each pivot shoe rests upon a support of metal which may
take a permanent deformation in order to equalize the load on the bearing shoes, or in which individual shoe pivots are supported on spring plates or spring disks, is not considered to be of the self-equalizing type and will not be acceptable. The stationary shoes shall be babbitt-lined. The thrust bearing shall have ample capacity to support the maximum pump hydraulic thrust load plus the static load while operating under maximum rated pump conditions. The thrust bearing shall be capable of withstanding without injury the pump being started normally without prior jacking of the rotor. The thrust bearing shall have a removable runner and shall be arranged to permit adjustments, dismantling, and assembly of the runner and shoes without disturbing the stator or rotor, other than jacking the load from the bearing. A spacer plate between the thrust bearing runner plate and the thrust block will not be permitted.

2.4.10.2 Guide Bearings

Except as permitted below, provide the motor with two guide bearings, one located above the rotor and the other below the rotor. The guide bearings shall be capable of withstanding all stresses incident to the normal operation of the unit [and to the maximum runaway speed]. Both guide bearings shall be self-cooled, of the oil-immersed, self-oiling type, and adequate provision shall be made for preventing oil or oil vapor from entering the motor cooling system. The guide bearings shall be of the split-sleeve type and shall be designed and constructed so that they can be dismantled without disturbing the thrust bearing or the motor rotor. If desired, the Contractor may combine the thrust bearing and the upper guide bearing into a combination integral guide and thrust bearing assembly in a common housing. In such a combination bearing, the vertical side of the thrust-bearing block, but not the runner plate, shall be used as the journal surface.

2.4.10.3 Lubrication

Use lubricating oil containing a corrosion inhibitor. Type and grade of lubricant used shall be shown on a special nameplate which shall be attached to the frame of the motor adjacent to the bearing filling device. In addition to the quantity of lubricant required to initially fill the system, furnish spare lubricant in sufficient quantity to purge and refill the system. Each lubrication system shall include oil reservoirs, oil-level sight gauge, oil piping, valves, and necessary appurtenances.

2.4.10.4 Housing

Bearing housing shall be of a design and method of assembly that will permit ready removal of the bearings, and prevent escape of lubricant and entrance of foreign matter. The bearings shall be protected by the lubricant when the motor is idle. Provide suitable means to apply and drain the lubricant.

2.4.10.5 Cooling

Each thrust bearing shall be self-cooling whenever possible. When required by motor speed or load, provide an oil cooler with suitable coils of corrosion-resisting metal in the oil reservoir of sufficient capacity to maintain the oil at the proper temperature with [30 percent glycol] cooling water entering the coils at a temperature of [30] [_____] degrees C and with a minimum pressure of 40 pounds per square inch. Design the cooler for safe operation at a maximum working pressure of 345 kPa 50 psi and shall be subjected at the factory to a hydrostatic test pressure of 517 kPa

SECTION 26 29 02.00 10  Page 20
for a period of one hour without leakage. Cooling water will be supplied by a central system, furnished by others, consisting of a radiator, circulating water pump, and piping system terminating at the exterior of each motor. If required an auxiliary-motor-driven circulating oil pump, rated at 480 volts, three-phase, with electrical leads terminated in a special terminal box on the motor, and an oil pressure sensing device shall be included in the bearing oil cooler system. Construct the cooler system so that the thrust bearing can be readily inspected or removed for repairs. Include a water flow indicator with adjustable alarm contacts in the water supply line. The oil reservoir shall have an oil-level gauge with high and low level normally open contacts rated 120 volts ac.

2.4.10.6 Temperature Detectors

Provide a standard copper resistance-type temperature detector, with a resistance of 10 ohms at 25 degrees C 75 degrees F, for each bearing. Casings shall be made of copper. Detectors shall be wired in accordance with paragraph ACCESSORY WIRING AND BOXES.

2.5 INSTRUMENTS AND GAUGES

Furnish the following instruments and gauges.

2.5.1 Thermometers

Indicating thermometers, 150 mm 6 inch vapor-tension [dial-type] [digital], with adjustable ungrounded alarm contacts suitable for 120 volts ac shall be provided for (a) the thrust bearing, (b) the thrust bearing oil reservoir, and (c) each guide bearing. The bulbs shall be located so as to indicate the temperatures of the hottest parts. The thermometers shall be mounted on a thermometer panel and located on the motor housing at a location approved by the Contracting Officer. Provide adequate length of tubing with each thermometer. The bulb and tubing shall be insulated where necessary to prevent bearing currents. [The dial-type thermometers shall be of the [round][square] semiflush type with black cases, white dials, and black figures and pointers.] [The digital thermometers shall be square, semiflush type with black cases and minimum 25 mm 1 inch high display.]

2.5.2 Temperature Relay

Provide a pneumatic bearing temperature relay having two sets of electrically independent contacts, located close to the babbitt of the thrust bearing [and each guide bearing]. Each relay shall close its contacts when the bearing temperature reaches approximately 105 degrees C 220 degrees F. The contacts shall have a current-carrying capacity of not less than 10 amperes, shall be ungrounded, and shall be suitable for 120 volts ac. The relays shall be mounted in an approved accessible location and the leads brought to a terminal block mounted on the stator frames in an approved location. The bulbs for the temperature relays shall be easily accessible and constructed for removal and testing without disturbing the bearing or bearing housing. The tubing shall be insulated where necessary to prevent bearing currents.

2.5.3 Oil-Level Gauge

Provide an oil-level gauge for each oil reservoir, with scale of sufficient length to indicate the oil level at all room and operating temperatures. The gauges shall be located near the reservoirs in an approved, accessible location where they can be easily read. Each oil-level gauge shall have
adjustable high and low oil-level ungrounded alarm contacts suitable for 120 volts ac.

2.6 PIPING

Design and furnish all piping systems within the motor for bearings, including valves and fittings. Bring these connections out to approved positions at the bottom of the stator frame. All piping shall be clean inside and where ending in open connections for other work, ends shall be capped for protection. Valves and other operating devices shall be easily accessible, and gauges and indicating devices shall be mounted on a control panel as approved by the Contracting Officer. Piping and fittings shall be of copper or brass as required. Valves shall have bronze seats and stems and shall be suitable for the service intended. At all points where the piping system must be disconnected for dismantling operations, provide bolted flange connections or unions. Arrangement of piping and location of valves and joints shall be such that there will be a minimum of disturbance to piping or interference with other service when the motor is dismantled or parts are removed for inspection or repairs.

2.7 WINDING SPACE HEATERS

**************************************************************************

NOTE: The inclusion or omission of "Winding Space Heaters" will depend upon the decision reached after giving due consideration to the problem of prevention of moisture condensation on the station equipment.

**************************************************************************

Install heaters in the lower section of the frame or wrap them around the winding end turns. They shall be designed for operation on 120 volts, single-phase, 60-Hz, alternating current and of sufficient capacity or wattage that, when energized, they will hold the temperature of the motor windings approximately 10 degrees C above the ambient temperature. Heaters shall be de-energized when motor is operating.

2.7.1 Construction

The heaters, except for wrap-around type, shall be of the tubular type, constructed with a chrome-nickel heating element embedded in a refractory insulating material, and encased in an approved watertight metal sheath. They shall be designed for continuous operation and have a maximum watt density of 20 watts per square inch. The rate of heat dissipation shall be uniform throughout the effective length of the heater. Cartridge-type heaters of equivalent construction, as approved by the Contracting Officer, will be acceptable. Heaters installed around the winding end turns shall consist of the required turns of heating cable wrapped around the end turns and secured in place before the winding is impregnated.

2.7.2 Element

Heating element shall conform to the requirements of ASTM B344 for an 80 percent nickel and 20 percent chromium alloy.

2.7.3 Sheath

Sheath shall be of a corrosion-resisting, nonoxidizing metal and shall have a wall thickness not less than 0.625 mm 0.025 inch.
2.7.4 Insulation

Insulation shall be a granular mineral refractory material, highly resistant to heat, and shall have a minimum specific resistance of 1,000 megohms per inch cubed at 585 degrees C, 1,000 degrees F. Insulation for the heating cable (winding wrap-around type heaters) shall be suitable for a conductor temperature of 180 degrees C, 356 degrees F.

2.7.5 Terminals

Terminals of the heater, including the leads, shall be watertight and shall be provided with leads suitable for making connections to a separate drip-proof terminal box located on the motor frame. The terminal box shall be readily accessible through the crating, so that winding heaters can be energized while motors are in storage.

2.8 MAIN LEADS AND TERMINAL BOX

2.8.1 Stator Terminals

Insulated terminal leads shall receive a treatment equal to that of the motor winding. Six leads shall be brought out of the stator frame and connections shall be made as required for the current transformers in paragraph ACCESSORY WIRING AND BOXES. Provide terminal lugs for connection to the motor shielded single-conductor supply wiring.

2.8.2 Stator Terminal Box

Drip-proof cast iron or steel terminal boxes, treated in the same manner specified for frames to resist corrosion, shall be supplied for housing the stator lead connections, surge capacitors, surge arresters, and current transformers and shall have adequate space to facilitate the installation and maintenance of cables and equipment. Boxes shall have a [bolted] [hinged lockable] cover providing unrestricted access, be mounted on the motor frame, and shall have an auxiliary floor supporting structure, when required, supplied by the motor manufacturer. Conduit entrance shall be from the bottom. The boxes shall be designed to permit removal of the motor supply leads when the motor is removed. Provide a "HIGH VOLTAGE [_____] VOLTS" warning sign on the cover of the box. When looking down on the motor/pump assembly, the terminal box shall be located between [_____] degrees and [_____] degrees [counter-] clockwise from the discharge elbow of the pump. A ground bus and means for external connection to the station grounding system shall be provided in the stator terminal box.

2.9 SURGE PROTECTION

**************************************************************************

NOTE: To obtain the most reliable protection for 2,300- and 4000-volt motors, surge capacitors and arresters, mounted at the motor terminals, should be specified. In addition, it is recommended that station-type arresters be installed on the line side of the supply transformers.

**************************************************************************

2.9.1 Surge Capacitors

Furnish and install, in the main terminal box, a three-pole capacitor unit
equipped with built-in discharge resistors and using a non-polychlorinated biphenyl (non-PCB) insulating medium. Each pole shall be rated 0.5 microfarad and [2,400] [4,160] volts line-to-line. Provide removable bus links for motor testing. These links shall be treated to resist corrosion, shall be designed to maintain a positive contact, and shall have low contact resistance.

2.9.2 Surge Arresters

**************************************************************************
NOTE: Use 3,000 MCOV arresters for 2,400-volt systems or effectively grounded 4,160-volt systems. Use 4,500-MCOV for ungrounded or resistance grounded 4,160-volt systems.
**************************************************************************

Surge arresters of the station type with porcelain tops shall be furnished and installed in the main terminal box. The arresters shall be of the metal-oxide type rated [3,000] [4,500] [_____] maximum continuous operating voltage line-to-ground. Provide removable bus links for motor testing. These links shall be treated to resist corrosion, shall be designed to maintain a positive contact, and shall have low contact resistance.

2.9.3 Space Heater

If recommended by the surge protection manufacturer, furnish a space heater of adequate capacity, rated 120 volts and install it in the terminal box. Space heater maximum watt density shall not exceed 20 watts per square inch.

2.10 CURRENT TRANSFORMERS

**************************************************************************
NOTE: For motor differential protection, the "Flux-Balancing Current Differential" scheme, as shown in Fig. 16 of IEEE C37.96, is preferred and will generally be applicable. In this case, the window-type current transformers should be used. However, when the KVA rating of a motor is approximately one-half the supply transformer KVA rating, or greater, it may be necessary to use the differential scheme shown in Fig. 15 of IEEE C37.96, in which case the "Differential Protection" scheme should be used.
**************************************************************************

Current transformer shall meet the applicable requirements of IEEE C57.13 and IEEE C37.96. Secondary circuits [shall] [shall not] be grounded at the motor, and all leads from each individual transformer shall be brought out to terminal blocks. They shall be of the dry or compound-insulated type and shall be provided with a suitable means of mounting and for grounding the frame. Each current transformer secondary lead shall be connected to a terminal block of the short-circuiting type and shall be conveniently located to permit short-circuiting the secondary windings without requiring access to the primary bus compartments. The polarity of the current transformers shall be plainly marked. [Each motor shall be provided with three indoor dry-type window transformers with single secondary and rated [50/5 amperes, 600 volts] [_____.] Current transformers shall have minimum full-wave insulation level of 10 kV and, when installed, shall meet the requirements for a [60 kV] [_____] basic impulse level (BIL).
transformers shall be mounted in the main terminal box and shall be arranged in the "flux-balancing" connection. [Each motor shall be provided with three current transformers of rated [4,160] [_____] and [60 kV] [_____] basic impulse level (BIL). The transformers shall be mounted in the main terminal box and shall be connected in the wye point of the winding for use with differential relays.] All current transformers shall be suitable for continuous operation at the full-rated voltage and current at a frequency of 60 Hz. All current transformers shall be designed to withstand, without damage, the thermal and mechanical stresses resulting from short-circuit currents corresponding to ratings of the breakers in the circuits to which they are connected.

2.11 ACCESSORY WIRING AND BOXES

Except for current transformer leads and field control leads, all accessory wiring shall terminate in an accessory terminal box, unless otherwise approved by the Contracting Officer. Boxes shall be drip-proof and treated in the same manner specified for frames to resist corrosion. The accessory terminal box shall be furnished with a door hinged full length and shall be mounted on the motor in a location approved by the Contracting Officer. Rigid galvanized steel conduit shall be used wherever practicable and shall be arranged to make removal unnecessary when the motor is dismantled. A wiring diagram within the enclosure shall be provided for all circuits and each conductor shall be identified with the designation shown on the diagram. All wiring shall terminate on terminal blocks as specified below.

2.11.1 Wiring

Except as otherwise approved, all wiring shall be 125 degrees C rated flexible copper conductors, No. 14 AWG minimum, with 600-volt insulation. The size and type of temperature detector leads may be in accordance with the manufacturer's standard practice and, where required, shall be suitable for contact with lubricating oil. Each detector shall be connected by three leads to terminal blocks, with one wire connected to a common point on the blocks. The common point for the stator detectors shall be separate from that for the bearing detectors.

2.11.2 Terminal Blocks

All terminal blocks shall be molded closed-back type as defined in NEMA ICS 4, rated not less than 600 volts and shall be provided with covers. The terminals shall be screw-clamp type or stud-and-nut type. White or other light-colored marking strips, fastened by screws to the molded sections at each block, shall be provided for circuit designation. Each connected terminal of each block shall have the circuit designation or wire number permanently marked on a strip. Reversible or spare marking strips shall be furnished with each block and at least 10 percent spare terminals shall be provided.

2.12 JACKING PROVISIONS

Provide suitable means for hydraulic jacking of the rotor to permit inspection, adjustment, or removal of the thrust bearing. Provisions shall also be made for blocking the rotor in the fully raised position. The blocking device shall not require maintenance of hydraulic pressure on the jacks while the assembly is in the raised position.
2.13 SPECIAL TOOLS AND EQUIPMENT

Provide special tools, jigs, fixtures, lifting tackle, and instruments which may be necessary in assembly, erection, operation, maintenance, and repair of equipment. Special tools and equipment are those the design, purpose, and use of which are peculiar to equipment furnished and which are not available from normal wholesale or retail outlets. The motor manufacturer shall provide hydraulic jacking devices as required in order to pull the thrust bearing thrust collar from the upper end of the shaft and shall also furnish one complete set of lifting attachments such as detachable eyebolts or special slings for handling various parts with a hoist.

2.14 SET-DOWN FIXTURES

Furnish one separate motor set-down fixture for each motor rating supplied. This fixture, when installed on the operating floor, shall provide sufficient clearance above the floor for the motor shaft and coupling extending below the motor frame. The fixture shall be suitable for holding the motor during assembly and disassembly. Furnish one separate rotor set-down fixture for each motor rating supplied. The fixture shall hold the rotor in the horizontal position above the floor without unduly stressing the rotor pole pieces or laminations. The motor and rotor fixtures shall be shipped to the pumping station prior to the shipment of any motor.

2.15 FACTORY TESTS

**************************************************************************
NOTE: The designer should carefully consider whether to allow the Contracting Officer to waive these tests. Decision should be based on expertise in the field within the Division or District.
**************************************************************************

Give one motor of each rating and type, selected at random by the Contracting Officer, a complete test. Check test the remainder of the motors. Submit [6] [_____] copies of test reports recording all data, calculations, and curves for each motor used. All complete tests shall be [witnessed by the Contracting Officer] [waived in writing].

2.15.1 Witness Test

When the Contractor is satisfied that a motor selected for a "Complete Test" performs in accordance with the requirements of the specifications, notify the Contracting Officer and submit two copies of the tabulated data, calculations, and curves required by paragraph COMPLETE TEST below.

a. Submit [6] [_____] copies of motor design (characteristic) curves or tabulated data indicating the efficiency, current, and kilowatt input at rated voltage and 110 and 90 percent rated voltage, all plotted or tabulated against torque or percent load as abscissas. Where values are given in percentages all base values will be indicated.

b. Three weeks will be required, after receipt, to review the foregoing information. Should the witness test indicate that a motor does not perform in accordance with the requirements of the specifications, changes or corrections shall be made and new complete witness tests run, at no additional cost to the Government.
NOTE: Use final sentence only when the pump and motor are furnished under the same procurement.

2.15.2 Complete Test

NOTE: For the large motors (1118 kW, 1,500 hp and above), the efficiency is high, i.e. 95 percent at 1/2 to full load, however, efficiency varies with motor design. In general, high efficiency motors are not cost effective in the large size motors covered by this specification. If other than manufacturer's standard efficiency is required, the designer should list those values in paragraph FACTORY TEST.

Submit [6] certified copies of the results of a "Complete Test" for duplicate equipment of the respective rating and type. Test will be accepted in lieu of the "Complete Test" specified for equipment of the respective rating and type. No substitute will be accepted for the "Check Test". A complete test of a synchronous motor shall including the following:

a. Resistance of armature and field windings.

b. Polarity of field coils.

c. High-potential tests of armature and field windings in accordance with NEMA MG 1 paragraph 21.52.

d. Air gap measurement.

e. V-curves (for zero, 1/2, 3/4, and full load).

f. Determination of the subtransient, transient, and synchronous reactance.

g. Conventional efficiency tests, in accordance with NEMA MG 1 paragraph 21.44. Motor shall meet manufacturer's published efficiency criteria for 1/2, 3/4, and full rated loads. Calculation of efficiency shall include [that portion of the thrust bearing loss produced by the motor itself] [bearing loss due to external thrust load].

h. Tests to determine temperature rise in accordance with NEMA MG 1 paragraph 21.40.
i. Insulation resistance-temperature test, in accordance with IEEE 43. Test result values shall be plotted on semilogarithmic graphs, the insulation resistance values as logarithmic ordinates and the temperature values as uniform abscissas. Readings shall be taken at approximately 10 degrees C intervals. Temperature shall be determined by the resistance method. Also, for comparison purposes, a curve indicating the safe operating value of insulation resistance shall be plotted on the same sheet.

j. Noise level tests in accordance with NEMA MG 1 paragraph 20-50.

k. Motor balance in accordance with NEMA MG 1 paragraph 20.54.

l. Conformance test in accordance with NEMA MG 1 paragraph 20.49.

m. Torques. Torque tests shall be performed in accordance with IEEE 115 to demonstrate that the values specified in paragraph "Torques," will be met or exceeded.

2.15.3 Check Tests

A check test of a synchronous motor and exciter shall include the following:

a. Routine test in accordance with NEMA MG 1 paragraph 21.51.

b. Cold resistance measurement.

c. Insulation resistance and winding temperature at time the insulation resistance was measured.

d. Conformance test in accordance with NEMA MG 1 paragraph 20.49.

e. Motor balance in accordance with NEMA MG 1 paragraph 20.54.

2.15.4 Stator Winding Coil Tests

All coils, either before or after they are placed in the slots, shall be tested for short circuits between turns of the individual coils by applying a high frequency voltage of not less than 75 percent of the voltage for which the machine is insulated, or by applying a surge test voltage of equivalent value to the terminals of each coil. Equivalent surge voltage shall be a wave whose peak value is equal to 1.06 times the voltage for which the motor is insulated.

2.15.5 Space Heater Tests

Each winding space heater unit shall be tested at the factory for successful operation and dielectric strength.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for variable frequency drive for motors rated up to 575 volts, for use on electric power systems of 600 volts or less, 50/60 hertz.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Pulse width modulated (PWM) is the predominant type of variable frequency drive (VFD). Other VFD types include current source inverter (CSI), voltage source inverter (VSI), and flux vector drive (FVD). For a description of each type of VFD, basic information on the principles of operation of VFD's, guidance of the proper application of VFD's, and installation guidelines, refer to Appendix D of MIL-HDBK-1003/3, which is part of UFC 3-410-02N, "Heating, Ventilating, Air Conditioning and Dehumidifying Systems".
PART 1   GENERAL

1.1   REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE 519 (2014) Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

NEMA 250 (2018) Enclosures for Electrical Equipment (1000 Volts Maximum)

NEMA ICS 6 (1993; R 2016) Industrial Control and Systems: Enclosures
1.2 RELATED REQUIREMENTS

Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM apply to this section with additions and modifications specified herein.

1.3 SYSTEM DESCRIPTION

1.3.1 Performance Requirements

1.3.1.1 Electromagnetic Interference Suppression

Computing devices, as defined by 47 CFR 15, MIL-STD-461 rules and regulations, shall be certified to comply with the requirements for class A computing devices and labeled as set forth in part 15.

1.3.1.2 Electromechanical and Electrical Components

Electrical and electromechanical components of the Variable Frequency Drive (VFD) shall not cause electromagnetic interference to adjacent electrical or electromechanical equipment while in operation.

1.3.2 Electrical Requirements

1.3.2.1 Power Line Surge Protection

IEEE C62.41.1 and IEEE C62.41.2, IEEE 519 Control panel shall have surge protection, included within the panel to protect the unit from damaging transient voltage surges. Surge arrestor shall be mounted near the
incoming power source and properly wired to all three phases and ground. Fuses shall not be used for surge protection.

1.3.2.2 Sensor and Control Wiring Surge Protection

I/O functions as specified shall be protected against surges induced on control and sensor wiring installed outdoors and as shown. The inputs and outputs shall be tested in both normal mode and common mode using the following two waveforms:

a. A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.

b. An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.
**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

- Schematic Diagrams; G[, [____]]
- Interconnecting Diagrams; G[, [____]]
- Installation Drawings; G[, [____]]

Submit drawings for government approval prior to equipment construction or integration. Modifications to original drawings made during installation shall be immediately recorded for inclusion into the as-built drawings.

**SD-03 Product Data**

- Variable Frequency Drives; G[, [____]]
- Wires and Cables
- Equipment Schedule

Include data indicating compatibility with motors being driven.

**SD-06 Test Reports**

- VFD Test
- Performance Verification Tests
- Endurance Test

**SD-08 Manufacturer's Instructions**

- Installation instructions

**SD-09 Manufacturer's Field Reports**

- VFD Factory Test Plan; G[, [____]]

Factory test results

**SD-10 Operation and Maintenance Data**

- Variable Frequency Drives, Data Package 4

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Provide service and maintenance information including preventive maintenance, assembly, and disassembly procedures. Include electrical drawings from electrical general sections. Submit additional information necessary to provide...
complete operation, repair, and maintenance information, detailed to the smallest replaceable unit. Include copies of as-built submittals. Provide routine preventative maintenance instructions, and equipment required. Provide instructions on how to modify program settings, and modify the control program. Provide instructions on drive adjustment, trouble-shooting, and configuration. Provide instructions on process tuning and system calibration.

1.5 QUALITY ASSURANCE

1.5.1 Schematic Diagrams

Show circuits and device elements for each replaceable module. Schematic diagrams of printed circuit boards are permitted to group functional assemblies as devices, provided that sufficient information is provided for government maintenance personnel to verify proper operation of the functional assemblies.

1.5.2 Interconnecting Diagrams

Show interconnections between equipment assemblies, and external interfaces, including power and signal conductors. Include for enclosures and external devices.

1.5.3 Installation Drawings

Show floor plan of each site, with V.F.D.'s and motors indicated. Indicate ventilation requirements, adequate clearances, and cable routes.

1.5.4 Equipment Schedule

Provide schedule of equipment supplied. Schedule shall provide a cross reference between manufacturer data and identifiers indicated in shop drawings. Schedule shall include the total quantity of each item of equipment supplied. For complete assemblies, such as VFD's, provide the serial numbers of each assembly, and a sub-schedule of components within the assembly. Provide recommended spare parts listing for each assembly or component.

1.5.5 Installation instructions

Provide installation instructions issued by the manufacturer of the equipment, including notes and recommendations, prior to shipment to the site. Provide operation instructions prior to acceptance testing.

1.5.6 Factory Test Results

Document test results and submit to government within 7 working days after completion of test.

1.6 DELIVERY AND STORAGE

Equipment delivered and placed in storage shall be stored with protection from the weather, humidity and temperature variations, dirt and dust, or other contaminants.
1.7 WARRANTY

The complete system shall be warranted by the manufacturer for a period of one year, or the contracted period of any extended warrantees agreed upon by the contractor and the Government, after successful completion of the acceptance test. Any component failing to perform its function as specified and documented shall be repaired or replaced by the contractor at no additional cost to the Government. Items repaired or replaced shall be warranted for an additional period of at least one year from the date that it becomes functional again, as specified in FAR 52.246-21 Warranty of Construction.

1.8 MAINTENANCE

1.8.1 Spare Parts

Manufacturers provide spare parts in accordance with recommended spare parts list.

1.8.2 Maintenance Support

During the warranty period, the Contractor shall provide on-site, on-call maintenance services by Contractor's personnel on the following basis: The service shall be on a per-call basis with 36 hour response. Contractor shall support the maintenance of all hardware and software of the system. Various personnel of different expertise shall be sent on-site depending on the nature of the maintenance service required. Costs shall include travel, local transportation, living expenses, and labor rates of the service personnel while responding to the service request. The provisions of this Section are not in lieu of, nor relieve the Contractor of, warranty responsibilities covered in this specification. Should the result of the service request be the uncovering of a system defect covered under the warranty provisions, all costs for the call, including the labor necessary to identify the defect, shall be borne by the Contractor.

PART 2 PRODUCTS

2.1 VARIABLE FREQUENCY DRIVES (VFD)

Provide frequency drive to control the speed of induction motor(s). The VFD shall include the following minimum functions, features and ratings.

a. Input circuit breaker per UL 489 with a minimum of 10,000 amps symmetrical interrupting capacity and door interlocked external operator.

b. A converter stage per UL 508C shall change fixed voltage, fixed frequency, ac line power to a fixed dc voltage. The converter shall utilize a full wave bridge design incorporating diode rectifiers. Silicon Controlled Rectifiers (SCR) are not acceptable. The converter shall be insensitive to three phase rotation of the ac line and shall not cause displacement power factor of less than .95 lagging under any speed and load condition.

c. An inverter stage shall change fixed dc voltage to variable frequency, variable voltage, ac for application to a standard NEMA design B squirrel cage motor. The inverter shall be switched in a manner to produce a sine coded pulse width modulated (PWM) output waveform.
d. The VFD shall be capable of supplying 120 percent of rated full load current for one minute at maximum ambient temperature.

e. The VFD shall be designed to operate from a [_____] volt, plus or minus 10 percent, three phase, 60 Hz supply, and control motors with a corresponding voltage rating.

f. Acceleration and deceleration time shall be independently adjustable from one second to 60 seconds.

NOTE: Modify this paragraph if constant torque required.

NOTE: If constant torque required modify to 150 percent of rated full load.

g. Adjustable full-time current limiting shall limit the current to a preset value which shall not exceed 120 percent of the controller rated current. The current limiting action shall maintain the V/Hz ratio constant so that variable torque can be maintained. Short time starting override shall allow starting current to reach 175 percent of controller rated current to maximum starting torque.

h. The controllers shall be capable of producing an output frequency over the range of 3 Hz to 60 Hz (20 to one speed range), without low speed cogging. Over frequency protection shall be included such that a failure in the controller electronic circuitry shall not cause frequency to exceed 110 percent of the maximum controller output frequency selected.

i. Minimum and maximum output frequency shall be adjustable over the following ranges: 1) Minimum frequency 3 Hz to 50 percent of maximum selected frequency; 2) Maximum frequency 40 Hz to 60 Hz.

j. The controller efficiency at any speed shall not be less than 96 percent.

k. The controllers shall be capable of being restarted into a motor coasting in the forward direction without tripping.

l. Protection of power semiconductor components shall be accomplished without the use of fast acting semiconductor output fuses. Subjecting the controllers to any of the following conditions shall not result in component failure or the need for fuse replacement:

(1) Short circuit at controller output
(2) Ground fault at controller output
(3) Open circuit at controller output
(4) Input undervoltage
(5) Input overvoltage
(6) Loss of input phase
(7) AC line switching transients
(8) Instantaneous overload
(9) Sustained overload exceeding 115 percent of controller rated current
(10) Over temperature
(11) Phase reversal

m. Solid state motor overload protection shall be included such that current exceeding an adjustable threshold shall activate a 60 second timing circuit. Should current remain above the threshold continuously for the timing period, the controller will automatically shut down.

n. A slip compensation circuit shall be included which will sense changing motor load conditions and adjust output frequency to provide speed regulation of NEMA B motors to within plus or minus 0.5 percent of maximum speed without the necessity of a tachometer generator.

o. The VFD shall be factory set for manual restart after the first protective circuit trip for malfunction (overcurrent, undervoltage, overvoltage or overtemperature) or an interruption of power. The VFD shall be capable of being set for automatic restart after a selected time delay. If the drive faults again within a specified time period (adjustable 0-60 seconds), a manual restart will be required.

p. The VFD shall include external fault reset capability. All the necessary logic to accept an external fault reset contact shall be included.

q. Provide critical speed lockout circuitry to prevent operating at frequencies with critical harmonics that cause resonant vibrations. The VFD shall have a minimum of three user selectable bandwidths.

r. Provide the following operator control and monitoring devices mounted on the front panel of the VFD:
   (1) Manual speed potentiometer.
   (2) Hand-Off-Auto (HOA) switch.
   (3) Power on light.
   (4) Drive run power light.
   (5) Local display.

s. Provide properly sized NEMA rated by-pass and isolation contactors to enable operation of motor in the event of VFD failure. Mechanical and electrical interlocks shall be installed between the by-pass and isolation contactors. Provide a selector switch and transfer delay timer.
2.2 ENCLOSURES

Provide equipment enclosures conforming to NEMA 250, NEMA ICS 7, NEMA ICS 6.

2.3 WIRES AND CABLES

All wires and cables shall conform to NEMA 250, NEMA ICS 7, NFPA 70.

2.4 NAMEPLATES

Nameplates external to NEMA enclosures shall conform with the requirements of Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS. Nameplates internal to enclosures shall be manufacturer's standard, with the exception that they must be permanent.

2.5 SOURCE QUALITY CONTROL

2.5.1 VFD Factory Test Plan

To ensure quality, each VFD shall be subject to a series of in-plant quality control inspections before approval for shipment from the manufacturer's facilities. Provide test plans and test reports.

PART 3 EXECUTION

3.1 INSTALLATION

Per NEMA ICS 3.1, install equipment in accordance with the approved manufacturer's printed installation drawings, instructions, wiring diagrams, and as indicated on project drawings and the approved shop drawings. A field representative of the drive manufacturer shall supervise the installation of all equipment, and wiring.

3.2 FIELD QUALITY CONTROL

Specified products shall be tested as a system for conformance to specification requirements prior to scheduling the acceptance tests. Contractor shall conduct performance verification tests in the presence of Government representative, observing and documenting complete compliance of the system to the specifications. Contractor shall submit a signed copy of the test results, certifying proper system operation before scheduling tests.

3.2.1 VFD Test

A proposed test plan shall be submitted to the contracting officer at least 28 calendar days prior to proposed testing for approval. The tests shall conform to NEMA ICS 1, NEMA ICS 7, and all manufacturer's safety regulations. The Government reserves the right to witness all tests and review any documentation. The contractor shall inform the Government at least 14 working days prior to the dates of testing. Contractor shall provide video tapes, if available, of all training provided to the Government for subsequent use in training new personnel. All training aids, texts, and expendable support material for a self-sufficient presentation shall be provided, the amount of which to be determined by the contracting officer.
3.2.2 Performance Verification Tests

"Performance Verification Test" plan shall provide the step by step procedure required to establish formal verification of the performance of the VFD. Compliance with the specification requirements shall be verified by inspections, review of critical data, demonstrations, and tests. The Government reserves the right to witness all tests, review data, and request other such additional inspections and repeat tests as necessary to ensure that the system and provided services conform to the stated requirements. The contractor shall inform the Government 14 calendar days prior to the date the test is to be conducted.

3.2.3 Endurance Test

Immediately upon completion of the performance verification test, the endurance test shall commence. The system shall be operated at varying rates for not less than 192 consecutive hours, at an average effectiveness level of .9998, to demonstrate proper functioning of the complete PCS. Continue the test on a day-to-day basis until performance standard is met. During the endurance test, the contractor shall not be allowed in the building. The system shall respond as designed.

3.3 DEMONSTRATION

3.3.1 Training

Coordinate training requirements with the Contracting Officer.

3.3.1.1 Instructions to Government Personnel

Provide the services of competent instructors who will give full instruction to designated personnel in operation, maintenance, calibration, configuration, and programming of the complete control system. Orient the training specifically to the system installed. Instructors shall be thoroughly familiar with the subject matter they are to teach. The Government personnel designated to attend the training will have a high school education or equivalent. The number of training days of instruction furnished shall be as specified. A training day is defined as eight hours of instruction, including two 15-minute breaks and excluding lunch time; Monday through Friday. Provide a training manual for each student at each training phase which describes in detail the material included in each training program. Provide one additional copy for archiving. Provide equipment and materials required for classroom training. Provide a list of additional related courses, and offers, noting any courses recommended. List each training course individually by name, including duration, approximate cost per person, and location of course. Unused copies of training manuals shall be turned over to the Government at the end of last training session.

3.3.1.2 Operating Personnel Training Program

Provide one 2-hour training session at the site at a time and place mutually agreeable between the Contractor and the Government. Provide session to train 4 operation personnel in the functional operations of the system and the procedures that personnel will follow in system operation. This training shall include:

a. System overview
b. General theory of operation
c. System operation
d. Alarm formats
e. Failure recovery procedures
f. Troubleshooting

3.3.1.3 Engineering/Maintenance Personnel Training

Accomplish the training program as specified. Training shall be conducted on site at a location designated by the Government. Provide a one-day training session to train 4 engineering personnel in the functional operations of the system. This training shall include:

a. System overview
b. General theory of operation
c. System operation
d. System configuration
e. Alarm formats
f. Failure recovery procedures
g. Troubleshooting and repair
h. Maintenance and calibration
i. System programming and configuration

NOTE: This specification covers the requirements for solar photovoltaic (PV) systems, and related equipment and materials.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments and suggestions on this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Show the following information on the project drawings:

1. Mounting surface features (i.e. drains, hatches, vents, and lightning protection).

2. Locations of solar PV modules, inverters, combiner and junction boxes, conduits and raceways, system monitoring panels, data acquisition sensors, cable tags with legend, control panels, overcurrent protection, lightning arrestors, and other related equipment and materials.

3. Circuit wiring diagram of solar PV energy system.

4. Mounting structure system for solar PV modules, including building roof or ground.

5. Number, location, and letter designation of
PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide
specification. The publications are referred to in the text by basic designation only and listed in
this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of
the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project
specification when you choose to reconcile references in the publish print process.

1.2 RELATED REQUIREMENTS

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM apply to this section with additions and modifications specified herein.

[1.2.1 Interconnection

**************************************************************************
NOTE: To expedite interconnection and activity, solicit local utility point of contact, if known.
**************************************************************************

Coordinate with local utility interconnection and activity. [Point of contact [_____]].]

1.3 DEFINITIONS

a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in the IEEE Stds Dictionary.

b. Unless otherwise specified or indicated, solar energy conversion terms used in these specifications, and on the drawings, are as defined in ASTM E772.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor QC approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29, SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 MAINTENANCE MATERIAL SUBMITTALS

Comply with requirements specified in Section 01 78 00 CLOSEOUT SUBMITTALS.

1.6 QUALITY ASSURANCE

1.6.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officers. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.6.2 Installation Drawings

In addition to requirements in Section 01 33 00 SUBMITTAL PROCEDURES, include the following:
a. Submit drawings for government approval prior to equipment construction or integration.

b. Submit shop drawings at a minimum of 279.4 by 431.8 mm 11 by 17 inches in size.

c. All details legible and all text no smaller than 2.54 mm 0.1 inches in height on any drawing. As needed, provide enlargements to ensure clarity of intent.

d. Shop drawings must include [one][three]-wire diagrams and installation details of photovoltaic (PV) system equipment indicating location as proposed in design drawings, layout and arrangement of PV modules, support and mounting mechanism, inverters, combiner boxes, AC and DC disconnects, equipment enclosures, conduits, monitors, meters, security systems, and all other accessories associated with the installation of the PV system. Wiring diagrams must identify circuit terminals and indicate the internal wiring for each item of equipment and the interconnection between each equipment item.

e. Shop drawings may include legible copies of manufacturer's product literature, with selected items and specifications highlighted thereon.

f. Modifications to original drawings made during installation must be immediately recorded for inclusion into the as-built drawings. When items have changed relative to the approved design, the designer must provide certification indicating that the changes will not negatively affect the system's operation or the structure supporting the system.

1.6.3 System Operation

Provide a complete description of the function of each component including PV modules, DC wiring, combiner boxes, inverters, AC wiring, AC and DC disconnect switches, and monitoring system. Provide a discussion of the overall system operation.

1.6.4 Installer

Submit NABCEP (North American Board of Certified Energy Practitioners) PV Installation Professional certification, and a resume with references that details least four successful projects that, in aggregate, equal or exceed the size of the proposed project.

1.6.5 Materials

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Submit proof of compliance with requirements of UL, where material or equipment is specified to comply. The label of or listing in UL Electrical Constructn Directory will be acceptable evidence. In lieu of the label or listing, a written certificate from an approved nationally recognized testing laboratory (NRTL) equipped to perform such services, stating that the items have been tested and conform to the requirements and testing methods of Underwriters Laboratories may be submitted.

1.6.5.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable
if the manufacturer has been regularly engaged in the design and production of solar photovoltaic products for a minimum of 5-years. Similar photovoltaic products must have been in satisfactory commercial or industrial use for 5-years prior to bid opening and must have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 5-year period.

1.6.5.2 Material and Equipment Manufacturing Date

Products manufactured more than 1-year prior to date of delivery to site must not be used, unless specified otherwise.

1.6.6 Cybersecurity Equipment Certification

**************************************************************************
NOTE: Coordinate equipment certification with Government's cybersecurity requirements and interpretations. Verify that the system includes remote control or remote access capability.
**************************************************************************

Furnish a certification that control systems are designed and tested in accordance with DoD Instruction 8500.01, DoD Instruction 8510.01, and as required by individual Service Implementation Policy.

1.6.7 Operation and Maintenance Data

Submit Solar Photovoltaic Systems data package for the following items in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

a. Troubleshooting guide.

b. Warranty.

c. Operation instructions.

d. Preventive maintenance and inspection data, including a schedule for system operators.

**************************************************************************
NOTE: To aid in identifying locations of modules for troubleshooting, identify modules on as-built plans according to groups or zones.
**************************************************************************

[ e. As-built plans displaying modules identified according groups or zones, coordinated with activity to organize as required.

]1.6.7.1 Electrical Systems

Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. In addition to requirements of Data Package 5, include the following for the actual solar photovoltaic (PV) system provided:

a. Service and maintenance information including preventive maintenance, assembly, and disassembly procedures.

b. Complete operation, repair, and maintenance information, detailed to
the smallest replaceable unit.
c. Adjustment, trouble-shooting, configuration, tuning, and system calibration instructions.
d. Programming information for the communications and monitoring interface.
e. An instruction manual with pertinent items and information highlighted.
f. A layout drawing showing locations as well as views of equipment; front, top, and side views.
g. A one-line drawing showing all components and interfaces to the electrical system.
h. Prices for spare parts and supply list.
i. Inverter efficiency report and field acceptance test reports.
j. Actual nameplate diagram.
k. Date of purchase.

1.6.7.2 Training Course

The proposed Training Course Curriculum (including topics and dates of discussion) indicating that all of the items contained in the operating and maintenance instructions, as well as demonstrations of safety and routine maintenance operations, including testing procedures included in the maintenance instructions, are to be covered. The proposed Training Course must be video-recorded and provided with any PowerPoint slides as part of the final documentation for those that cannot attend. Safety training must be extended to fire department representatives.

1.6.8 Bill of Materials

Submit a Bill of Materials listing each product being incorporated into the system. Bill of Materials includes a general description of the product, quantity, and exact manufacturer's model number. Where the manufacturer's model number does not fully identify the product, list options, accessories, or custom features by additional descriptions.

1.6.9 Qualified Testing Organization

Comply with requirements specified in Section 26 08 00 APPARATUS INSPECTION AND TESTING. Engage the services of a qualified testing organization, NABCEP-certified professional, or licensed electrician to provide inspection, testing, calibration, and adjustment of the solar photovoltaic electrical distribution system and equipment listed herein. Organization must be independent of the supplier, manufacturer, and installer of the equipment. The organization must be a first tier contractor.

Submit name and qualifications of organization. Organization must have been regularly engaged in the testing of electrical materials, devices, installations, and regularly engaged in solar PV systems for a minimum of five years.

Organization calibration program requirements:
a. Provide a calibration program which assures that all applicable test instruments are maintained within rated accuracy.

b. Accuracy: Traceable to the National Institute of Standards and Technology.

c. Instrument calibration frequency schedule: Less than or equal to 12 months for both test floor instruments and leased specialty equipment.

d. Dated calibration tables: Visible on all test equipment.

e. Calibrating standard: Higher accuracy than that of the instrument tested.

f. Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

   (1) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

   (2) Identify the third party laboratory calibrated instrument to verify that calibrating standard is met.

1.6.10 System Performance Calculations

Submit system performance calculations to show that the components provided will produce the minimum required production of power in accordance with PERFORMANCE REQUIREMENTS paragraph.

1.7 DELIVERY, STORAGE, AND HANDLING

a. Store solar PV modules in their original packaging according to the manufacturer's guidance, and do not remove from packaging until day of installation.

b. If a solar PV module is removed from its packaging, store it according to the manufacturer's guidance.

c. Do not store solar PV modules on-site for more than 12 months.

1.8 WARRANTY

******************************************************************************
NOTE: Option to provide spare modules and inverters is prohibited for the Navy, and do not provide for other Services without specific authority of Contracting Officer.
******************************************************************************

******************************************************************************
NOTE: Generally PV module degradation data is not readily available from the manufacturer. Environmental factors can significantly influence degradation. Long-term field degradation studies indicate 0.5-0.8 percent for monocrystalline and polycrystalline modules. Degradation is higher for thin-film modules at 0.7-1.0 percent. New PV module
designs generally have improved degradation rates.

The equipment items must be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

1.8.1 Solar Photovoltaic Modules

Furnish the solar photovoltaic module manufacturer's warranty. The warranty must be a 25-year linear 80 percent (minimum) power warranty (at the end of the 25th year after purchase an actual minimum power output of 80 percent based on the nameplate rating must be achieved) and not less than 10-years for workmanship material and manufacturing defects from the date of manufacture.

The warranty must state that the malfunctioning solar photovoltaic module must be exchanged by the manufacturer and promptly shipped to the using Government facility. The replacement solar module must be identical to, or an improvement upon, the original design of the malfunctioning solar module. [Provide an extra [_____] percent of spare modules in the event of necessary replacement of malfunctioning installed module.]

1.8.2 Inverters

Furnish the inverter manufacturer's warranty. The warranty period must be 15 years (minimum) from the date of manufacture. Inverter device installation, transportation, and on-site storage must not exceed 12 months, thereby permitting 14 years of the 15 year warranty to be in service and energized.

The warranty must state that the malfunctioning inverter must be exchanged by the manufacturer and promptly shipped to the using Government facility, and arrive in no more than ten days. The replacement inverter must be identical to, or an improvement upon, the original design of the malfunctioning inverter. [Provide an extra [_____] percent of spare inverters in the event of necessary replacement of malfunctioning installed inverter.]

1.9 CALCULATIONS

If construction deviates from design, provide relevant calculations to demonstrate that new design is satisfactory and approved by a licensed professional engineer.

1.10 HEALTH AND SAFETY RECOMMENDATIONS

Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS, applies to this section with additions and modifications specified herein.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

NOTE: System voltage greater than 1,000 VDC requires a waiver due to limitations in UFC 3-440-01 FACILITY-SCALE RENEWABLE ENERGY SYSTEMS and this
a. The PV system described in this document is of the grid-connected type and does not include battery/backup storage or secondary electrical generation devices. PV system feeds AC power into the local services when solar energy is available and immediately disconnects from the grid upon loss of grid power to the service in accordance with IEEE 1547 and local utility regulations.

b. PV system must comply with these specifications, all applicable construction document drawings, all applicable codes, and all local authorities having jurisdiction. System must comply with all policies and standards required by the electrical utility having jurisdiction and all applicable incentive program guidelines. PV system equipment includes, but is not limited to, PV modules and electrical insulating components such as encapsulants and backsheets, raceways, inverters, combiner boxes, disconnect switches, wire, conduit, junction boxes, mounting hardware, monitoring and communication equipment.

NOTE: Applies if PV array is roof-mounted.

[ c. Coordinate with roofing to provide certificate of roof warranty not invalidated by solar PV installation. For rigid solar cell PV systems on metal roofing panels, integrate with the roofing system, Section 07 60 00 FLASHING AND SHEET METAL.]

NOTE: Applies if lightning protection system is required.

[ d. Provide lightning arrestor listed to UL 1449.]

2.1.1 System Requirements

Conform electrical installations to IEEE C2, NFPA 70, and requirements specified herein.

NOTE: Input values generated from a solar PV computer program such as the System Advisor Model (SAM) computer program or PVWatts or from data supplemented by multiple programs. If another mounting structure is provided, the project documents must fully describe it.

a. Solar photovoltaic system characteristics provided includes:

(1) [_____] minimum rated kW DC output
(2) [_____] minimum rated kW AC output
(3) [_____] minimum kWh AC per year for year one
(4) [_____] system voltage
(5) [Ground][Roof][_____] mounted.

b. All equipment must be listed and labeled in accordance with OSHA-listed nationally recognized testing laboratories (NRTL) and installed in accordance with the listing requirements and the manufacturer's instructions.

c. Provide all accessories needed for a complete, secure, operational grid-tied PV system.

d. Wiring and connections of inverters, PV source circuits, AC branch circuits, and all interconnections must be rated at a minimum for IP65 in accordance with NEMA IEC 60529.

2.1.2 Performance Requirements

********************************************************************************
NOTE: ASHRAE 189.1 requires an annual renewable energy production requirement of no less than 20 kWh/m^2 6.0 kBTU/ft^2 multiplied by total roof area for single-story buildings, and not less than 32 kWh/m^2 10 kBTU/ft^2 multiplied by total roof area for all other buildings, over the life of the system. This result refers to the rated DC nameplate capacity of the system.
********************************************************************************

System components provided must be selected to achieve a minimum calculated energy production of [_____] kWh per year as required by ASHRAE 189.1.

2.2 PHOTOVOLTAIC MODULES

********************************************************************************
NOTE: For crystalline-silicon modules, manufacturer must submit a Letter of Conformance to certify the consistency and quality of materials used.

TO DOWNLOAD LETTER OF CONFORMANCE

Go to:

********************************************************************************

NOTE: IEC 61215 applies to crystalline-silicon modules and IEC 61646 applies to thin-film modules. Use UL 1703 applies to domestic projects and IEC 61730 applies to international projects.

********************************************************************************
a. PV modules must be [IEC 61215] [IEC 61646] compliant and [IEC 61730-1 compliant] [listed to UL 1703], and manufactured in an ISO 9001 certified facility.

********************************************************************************
NOTE: Select commercially-available solar PV module technology that meets the requirements in this UFGS and with the guidance from UFC 3-440-01
FACILITY-SCALE RENEWABLE ENERGY SYSTEMS. Warning: Currently, only monocrystalline and polycrystalline can meet energy density requirements. If building-integrated PV (BIPV) is the chosen technology, there must be at least three manufacturers that offer a viable product. If thin-film is the chosen technology, there must be at least three manufacturers that can be of different thin-film technologies.

b. PV modules must be of [monocrystalline ][polycrystalline ]technology and
   (1) [for rack-mounting.]
   (2) [BIPV.]

c. PV modules must be of thin-film technology and
   (1) [for rack-mounting.]
   (2) [amorphous.]
   (3) [BIPV.]

NOTE: Select efficiency appropriate to solar PV module technology. If selected technology is not given below, designer of record must have module efficiency measurement verified by a nationally-recognized testing laboratory (NRTL) under standard test conditions (STC): Irradiance of 1,000 W/m^2, solar spectrum of air mass (AM) 1.5, and module temperature of 25 degrees C 77 degrees F.

d. PV module efficiency must be greater than [15 percent for crystalline] [13 percent for thin film] [10 percent for amorphous and BIPV] [_____] technology.

e. PV modules must be of the same manufacturer and model number and consistent sub-components.

f. Submit on cutsheets PV module performance data from the manufacturer that must include a flash test data in accordance with IEC 61853-1, and temperature coefficients at: STC, nominal operating cell temperature (NOCT), low irradiance conditions (LIC), high temperature conditions (HTC), and low temperature conditions (LTC).

NOTE: Solar PV modules with single conductor output cables are commonly available. Conduit-ready junction boxes are only necessary in hazardous locations.

g. PV module bypass diodes must be inside the solar PV module's [conduit-ready] [single conductor cable] junction box.
NOTE: UL 6703 standard for multi-pole connectors for use in photovoltaic systems is in development. Once it is applicable, add to this UFGS.

h. Photovoltaic wire, wiring methods, and utilization of locking-type connectors must comply with the requirements of NFPA 70. Provide USE-2 or RHH or RHW-2 wire, and sunlight-resistant wire when exposed to sunlight.

2.2.1 Crystalline Photovoltaic Module Backsheet

a. Backsheet component must consist of a tri-layer construction (minimum thickness of 250 microns 9.8 mils) with outer layers of polyvinyl fluoride (PVF) and an inner layer of polyester for crystalline-silicon modules with a maximum system voltage of 1000 VDC.

b. Alternate polymeric backsheets consisting of different chemical composition, thickness, or construction must fulfill the safety and performance specifications and acceptance criteria in Table 1. The required component properties in Table 1 must be verified by a test report provided by an OSHA-listed nationally recognized testing laboratory (NRTL) and a cutsheet submitted.

### 2.2.2 Crystalline Photovoltaic Module Encapsulant

a. Encapsulant component must consist of ethyl vinyl acetate (EVA) with a total nominal (prelamination) thickness of 900 microns (35 mils) or greater in the completed module. The EVA must have a minimum of 28 percent VA content. Through statistical process control, the module manufacturer must ensure that the cured EVA has a minimum of 70 percent gel content per ASTM D7567 or ASTM D2765. The EVA must have a UV cutoff wavelength of 360 nm as measured according to ASTM E424. The EVA must have a minimum volume resistivity of $1 \times 10^{15}$ ohm-cm per ASTM D257.

b. Thermoplastic encapsulants consisting of different chemical composition, thickness, or construction must fulfill the safety and performance specifications and acceptance criteria described in Table 2. The required component properties described in Table 2 must be verified by a test report provided by an OSHA-listed nationally recognized testing laboratory (NRTL) and a cutsheet submitted.

### 2.3 INVERTERS

a. Array-to-inverter kW ratio must not exceed manufacturer recommendations. Inverter must be IEEE 1547 compliant, listed to UL 1741, comply with the latest applicable ANSI and FCC standards and addenda, and inspected before commissioning, testing, and operation of the
system. Submit documentation validating system performance requirements.

b. Inverter must be approved by FCC Part 15, Class A as an unintentional radiator.

c. All same-sized inverters supplied must be of the same manufacturer and model number.

d. Provide inverter utilizing a [floor-mount][wall-mount][support structure mount][module attached] system.

e. Provide inverter utilizing a [NEMA 6/6P outdoor for coastal environments][NEMA 3R outdoor][NEMA 1 indoor] enclosure in accordance with NEMA 250. Provide enclosure made of [steel][aluminum][stainless steel].

f. Provide inverter with anti-islanding protection to prevent back-feeding inverter generated power to the grid in the event of a utility outage. Anti-islanding protection must be listed to UL 1741 and IEEE 1547.

g. Overcurrent protection, ground fault protection, arc fault circuit interrupter (AFCI), and rapid shutdown must comply with the requirements of NFPA 70.

h. Provide inverter with self-diagnostics routines, and remote and local display of operating status and remote monitoring capabilities. Provide inverter compatible with monitoring system and metering system. If capability for remote monitoring and control does not exist, then it must be added.

i. Provide inverter with integrated monitoring system.

j. Rate inverter output as [_____] AC kW at unity (1), [_____] phase, [_____] volts, [_____] MPPT voltage range.

k. Match inverter DC input to the design of the PV module array outputs and account for the following:

(1) The inverter low voltage is 50 percent of the maximum system
voltage, to account for 25 year degradation.

(2) Voltage decrease due to high temperatures at project site.

**************************************************************************
NOTE: If inverters are provided without transformers built-in, provide an isolation transformer to serve multiple inverters for the PV system. Isolation transformer is necessary to isolate inverter AC components from entering the grid. Many utilities do not allow inverters without isolation.
**************************************************************************

1. Provide isolation transformer via [built into each inverter][system central transformer for multiple inverters] to provide safe galvanic separation between the AC side of the inverter and the grid.

**************************************************************************
NOTE: String inverter with integral AC and DC disconnecting means is optional. Disconnecting means may be internal or external to the inverter. Integral disconnecting means is not an option for microinverters.
**************************************************************************

m. [Inverter must include AC and DC disconnecting means. DC and AC disconnecting means must be listed with ratings suitable for the intended use and purpose.] System disconnecting means must meet the requirements of NFPA 70.

2.3.1 String Inverters

**************************************************************************
NOTE: String inverters sized greater than 600kW and DC-optimized string inverters of any size must have an efficiency of at least 98 percent. Conventional and smaller string inverters must have an efficiency of at least 96 percent.
**************************************************************************

**************************************************************************
NOTE: The California Energy Commission (CEC) weighted average inverter power conversion efficiency is a standardized method. Inverter efficiencies are updated on the CEC web site http://www.gosolarcalifornia.ca.gov/equipment/inverters.php
**************************************************************************

a. Submit String Inverter CEC Efficiency as verified by CEC SAND2007-5036 of having a weighted average inverter power conversion efficiency of [98 percent][96 percent][93 percent with external isolation transformer] or greater.

b. Allow the use of DC optimizers provided that a design which coordinates the DC optimizers and the inverter(s) is approved by the Contracting Officer.
NOTE: Apply if string inverter does not use DC power optimizer. DC power optimizer provides MPPT.

[ c. Inverter must feature maximum power point tracking (MPPT).

]2.3.2 Micro Inverters

**************************************************************************

NOTE: Micro-inverters may be provided preattached to each solar PV module, or may be installed on the racking or mounting system.

**************************************************************************

a. Provide microinverters [mounted on racking or mounting system by the installer][preinstalled on each solar PV module], and comply with applicable requirements in article INVERTERS.

**************************************************************************

NOTE: The California Energy Commission (CEC) weighted average inverter power conversion efficiency is a standardized method. Inverter efficiencies are updated on the CEC web site http://www.gosolarcalifornia.ca.gov/equipment/inverters.php

**************************************************************************

b. Submit Microinverter CEC Efficiency as verified by CEC SAND2007-5036 of having a weighted average inverter power conversion efficiency of 96 percent or greater.

c. Inverter must feature maximum power point tracking (MPPT).

2.4 COMBINER BOXES

**************************************************************************

NOTE: If photovoltaic system size becomes sufficiently large, refer to Section 48 14 00 SOLAR PHOTOVOLTAIC SYSTEMS - UTILITY.

**************************************************************************

a. All combiner boxes must be listed to UL 1741, and inspected before commissioning, testing, and operation of the system.

b. Provide combiner boxes [in wall-mount][support structure mount], [NEMA 6/6P outdoor for coastal environments][NEMA 4/4X outdoor][NEMA 3R outdoor][steel][aluminum][stainless steel][polymeric] enclosures in accordance with NEMA 250.

c. Supply combiner boxes designed for use with the inverter provided, and coordinated to the specific PV source circuit design.

d. Provide combiner boxes of compact design with simplified input and output wiring.

e. Provide overcurrent protection and output disconnecting means that comply with the requirements of NFPA 70.
**2.5 ROOF MOUNTING STRUCTURE FOR MODULES (RACKING)**

NOTE: Delete paragraph if the project does not utilize a roof mounting structure.

----------------------------------------------------------------------

NOTE: Coordinate with licensed professional engineer for the design of the mounting structure details and connection to existing building. Racking layout may include a gap between continuous rows of modules to allow for ventilation.

Coordinate with the Activity and determine if tracking is desired and ensure they understand the unique additional maintenance requirements involved. Refer to UFC 3-440-01 FACILITY-SCALE RENEWABLE ENERGY SYSTEMS for additional information.

----------------------------------------------------------------------

a. Provide racking [with [single-axis] [dual-axis] tracking] for array as indicated on the drawings, including the module azimuth and tilt [for each inverter's separate array]. [See paragraph entitled PV TRACKING SYSTEM for tracking requirements.] Provide racking compliant with UL 2703.

----------------------------------------------------------------------

NOTE: Indicate snow load and wind load requirements as applicable for the location and building occupancy category in accordance with UFC 3-301-01, ASCE 7 and IBC modifications in UFC 1-200-01.

----------------------------------------------------------------------

b. Racking and PV array, including modules, hardware, and attachments, must withstand [snow loads and] wind loads as required by ASCE 7 and ICC IBC.

----------------------------------------------------------------------

NOTE: Defer to local code where applicable, UFC 3-301-01, ASCE 7 and IBC modifications in UFC 1-200-01. Otherwise the structure's Seismic Design Category is based on the risk category of the structure, long and short period mapped acceleration parameters for the area, and site class based on soil conditions.

----------------------------------------------------------------------

c. Racking must be suitable for Seismic Design Category [_____] as defined by ASCE 7 and ICC IBC.

d. Submit seismic and wind [and snow] load design calculations for the array mounting system and its attachment to the structure showing compliance with seismic and wind [and snow] requirements while supporting the PV modules.

e. Provide the mechanical hardware for mounting the PV arrays and all other hardware required for assembling the PV modules, and the attachments to the building structure.
NOTE: In hostile environments, the additional cost of stainless steel components may be justified. Manufacturer's standard construction material is acceptable only in noncoastal and noncorrosive environments. Choose bracketed option for hostile environments. All fasteners for PV module aluminum frames must be stainless steel. Galvanized fasteners must not contact aluminum PV module frames or racking. Coordinate with structural engineer and geotechnical report.

f. Use array mounting hardware compatible with the site considerations and environment. [Select mechanical hardware for corrosion resistance and durability. ]Use a stainless steel, galvanized steel, or aluminum support structure. Do not use wood or plastic components for support.

NOTE: Choose bracketed option for corrosive soil. Coordinate with structural engineer and geotechnical report.

g. Use cathodic protection compatible with the site considerations and environment. Utilize galvanized anchor [encased in concrete] driven into ground.

2.5.1 Mounting System Base Supports

Fabricate with fastening points integral to the mounting structure. Mounting system supports must be permanently affixed stanchions that are anchored to the building structure. Coordinate height with thickness of roof insulation.

2.5.2 Flashing Boot

Fabricate for precision fit over base support. Coordinate height with base supports.

2.5.3 Base Cap

Fabricate to overlap base support and flashing boot a minimum of 51 mm 2 inches.

2.5.4 Base Cap Gasket

EPDM with self-adhesive closed cell foam or other gasketing material compatible with the roofing material.

2.5.5 Framing

Provide with wall thickness as determined by structural calculations.

2.5.6 Hardware

Bolts, nuts, washers, and screws must be 18-8 stainless steel.
[2.6] GROUND MOUNTING STRUCTURE FOR MODULES

**************************************************************************
NOTE: Delete paragraph if the project does not utilize a ground mounting structure.
**************************************************************************

**************************************************************************
NOTE: Coordinate with licensed professional engineer for the design of the mounting structure
details and connection to existing building. For tracking array design, refer to UFC 3-440-01
FACILITY-SCALE RENEWABLE ENERGY SYSTEMS and coordinate with Activity.
**************************************************************************

a. Provide racking [with [single-axis] [dual-axis] tracking] for array as indicated on the drawings, including the module azimuth and tilt [for each inverter's separate array]. [See paragraph entitled PV TRACKING SYSTEM for tracking requirements.] Provide racking compliant with UL 2703.

**************************************************************************
NOTE: Indicate snow load and wind load requirements as applicable for the location and building occupancy category in accordance with UFC 3-301-01, ASCE 7 and IBC modifications in UFC 1-200-01.
**************************************************************************

b. Racking and PV array, including modules, hardware, and attachments, must withstand [snow loads and] wind loads as required by ASCE 7 and ICC IBC.

**************************************************************************
NOTE: Defer to local code where applicable, UFC 3-301-01, ASCE 7 and IBC modifications in UFC 1-200-01. Otherwise the structure's Seismic Design Category is based on the risk category of the structure, long and short period mapped acceleration parameters for the area, and site class based on soil conditions.
**************************************************************************

c. Racking must be suitable for Seismic Design Category [_____] as defined by ASCE 7 and ICC IBC.

d. Submit seismic and wind [and snow] load design calculations for the array mounting system and its attachment to the structure showing compliance with seismic and wind [and snow] requirements while supporting the PV modules.

e. Provide the mechanical hardware for mounting the PV arrays and all other hardware required for assembling the PV modules, and the attachments to the mounting structure.

**************************************************************************
NOTE: In hostile environments, the additional cost of stainless steel components may be justified. Manufacturer's standard construction material is
acceptable only in noncoastal and noncorrosive environments. Choose bracketed option for hostile environments. All fasteners for PV module aluminum frames must be stainless steel. Galvanized fasteners must not contact aluminum PV module frames or racking. Coordinate with structural engineer and geotechnical report.

f. Use array mounting hardware compatible with the site considerations and environment. [Select mechanical hardware for corrosion resistance and durability. ]Use a stainless steel, galvanized steel, or aluminum support structure. Do not use wood or plastic components for support.

NOTE: Choose bracketed option for corrosive soil. Coordinate with structural engineer and geotechnical report.

NOTE: Choose bracketed option for corrosive soil. Coordinate with structural engineer and geotechnical report.

g. Use cathodic protection compatible with the site considerations and environment. Utilize galvanized anchor [encased in concrete] driven into ground.

[2.6.1 Driven Pile]

NOTE: For appropriate pile type, coordinate with structural engineer and geotechnical report.

Provide driven pile as indicated in accordance with PDCA Specification 103.

[2.6.2 Helical Pile]

NOTE: For appropriate pile type, coordinate with structural engineer and geotechnical report.

Provide helical pile as indicated in accordance with ICC IBC.

[2.7 CAST-IN-PLACE CONCRETE]

NOTE: Use the first bracketed paragraph when project includes a concrete section in Division 03; otherwise, the second bracketed paragraph may be used. Coordinate requirements with Section 03 30 00 CAST-IN-PLACE CONCRETE. Coordinate with structural engineer and geotechnical report.

[ Provide concrete associated with electrical work for other than encasement of underground ducts rated for 30 MPa 4000 psi minimum 28-day compressive strength unless specified otherwise. Conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE. ]
NOTE: If concrete requirements are detailed and no cast-in-place section is to be included in the project specification, refer to Section 03 30 00 CAST-IN-PLACE CONCRETE and select such portions as needed to provide complete requirements in addition to the requirements below.

Provide concrete associated with electrical work as follows:

a. Composed of fine aggregate, coarse aggregate, Portland cement, and water so proportioned and mixed as to produce a plastic, workable mixture.

b. Fine aggregate: hard, dense, durable, clean, and uncoated sand.

c. Coarse aggregate: reasonably well graded from 4.75 mm to 25 mm 3/16 inch to 1 inch.

d. Fine and coarse aggregates: free from injurious amounts of dirt, vegetable matter, soft fragments or other deleterious substances.

e. Water: fresh, clean, and free from salts, alkali, organic matter, and other impurities.

f. Concrete associated with electrical work for other than encasement of underground ducts: 30 MPa 4000 psi minimum 28-day compressive strength unless specified otherwise.

g. Slump: Less than 100 mm 4 inches. Retempering of concrete will not be permitted.

h. Exposed, unformed concrete surfaces: smooth, wood float finish.

i. Concrete must be cured for a period of not less than 7 days, and concrete made with high early strength Portland cement must be repaired by patching honeycombed or otherwise defective areas with cement mortar as directed by the Contracting Officer.

j. Air entrain concrete exposed to weather using an air-entraining admixture conforming to ASTM C260/C260M.

k. Air content: between 4 and 6 percent.

2.7.1 Foundation Anchorage

Anchor mounting structure to concrete pad in accordance with Section 05 12 00 STRUCTURAL STEEL.

2.8 PV TRACKING SYSTEM

Provide PV tracking system in accordance with IEC TS 62727.
2.9 PV SYSTEM MONITORING

a. Provide a PV system monitoring panel mounted as indicated.

**************************************************************************
NOTE: Select display option(s) as indicated.
Bracketed attributes are optional. Select attribute's source based on use of micro-inverters or string-inverters.
**************************************************************************

b. The following quantities must be viewable [from a [remote][local] [touch ]screen display mounted at location as indicated]:

(1) DC Input Voltage from PV [array][modules]
(2) DC Input Power from PV [system][module]
(3) DC Input Current from PV [system][module]
(4) AC Phase Current from [inverter][PV system] (average)
(5) AC Voltage from [inverter][PV system] (average)
(6) AC Real Power from [inverter][PV system]
(7) Daily, Weekly, Monthly, Yearly, and Cumulative Energy Production
(8) Fault Status Report
(9) DC Ground Current Report
(10) AC Neutral Current from [inverter][PV system]
(11) AC Reactive Power from [inverter][PV system]
(12) AC Apparent Power from [inverter]
(13) AC Power Factor
(14) AC Phase Current from inverter (A, B, C)
(15) AC Voltage from inverter (A, B, C)
(16) AC Voltage and Current Balance.

**************************************************************************
NOTE: Select data acquisition sensors as indicated. Irradiance measures amount of sunlight available. Wind speed, ambient temperature, and PV module temperature can affect performance.
**************************************************************************

c. Provide additional data acquisition sensors to measure [irradiance] [wind speed] [ambient temperature] [PV module temperature]. Any additional data acquisition sensors require a conduit separate from the current conductor conduit.
2.10 PV SYSTEM METERING

**************************************************************************

NOTE:  Navy projects require the use of Section 26 27 14.00 20 ELECTRICITY METERING. Air Force projects may require the use of Section 26 27 13.10 30 ELECTRIC METERS. Army projects refer to Section 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS.

Use a revenue-grade meter if excess power will be sent back to the utility, otherwise use a non-revenue-grade meter.

**************************************************************************

a. Comply with metering requirements in Section 26 27 14.00 20 ELECTRICITY METERING] [Section 26 27 13.10 30 ELECTRIC METERS] [Section 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS].

b. Provide a [revenue-grade][non-revenue-grade] Interval Data Recording (IDR) meter complete with industry standard telemetry for communications with Ethernet, cellular, or other common output capabilities. Conform to CSI requirements and electrical utility requirements.

c. Connect to a monitoring/data collection recording solar production through time increments applicable to installation and utility standards, with a minimum of 15-minute intervals and 30-day memory.

d. UL listed and conform to ANSI C12.1.

e. Measure kWh, demand, instantaneous power, volts, amps, and watts.

f. Provide UL listed communication and annunciator panel.

2.11 POSTED OPERATING INSTRUCTIONS

Provide for each system and principal item of equipment as specified in the technical sections for use by the operation and maintenance personnel. The operating instructions include the following:

a. Wiring diagrams, schematic diagrams, interconnection diagrams, control diagrams, and control sequence for each principal system and item of equipment.

b. Array layout showing the locations of all DC and AC disconnects.

c. Start up, proper adjustment, operating, and shutdown procedures.

d. Safety precautions.

e. The procedure in the event of equipment failure.

f. Other items of instruction as recommended by the manufacturer of each system or item of equipment.

Print operating instructions and frame under glass or in approved laminated plastic. Post instructions where directed. For operating instructions exposed to the weather, provide weather-resistant materials or weatherproof
enclosures. Operating instructions do not fade when exposed to sunlight and secure to prevent easy removal or peeling.

2.12 MANUFACTURER'S NAMEPLATE

Each item of equipment must have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable. For PV modules, a label on the back of the module is acceptable.

2.13 FIELD FABRICATED NAMEPLATES

**************************************************************************
NOTE: Use the following paragraph where nameplates are fabricated to identify specific equipment designated on the drawings.
**************************************************************************

ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified. Each nameplate inscription identifies the function and, when applicable, the position. Nameplates are of melamine plastic, 3.175 mm 0.125 inch thick, white with black center core. Surface is of matte finish. Square corners. Accurately align lettering and engrave into the core. Minimum size of nameplates is 25.4 mm by 63.5 mm 1 inch by 2.5 inches. Lettering is a minimum of 6.35 mm 0.25 inch high normal block style.

2.14 PV EQUIPMENT MARKING AND WARNING LABELS

Provide warning signs for the enclosures of electrical equipment having a nominal rating exceeding 600 volts.

a. Provide PV equipment with UL 969 weather-resistant marking and warning labels in compliance with NFPA 1 and NFPA 70.

b. When such equipment is guarded by a fence, mount signs on the fence. Provide metal signs having nominal dimensions of 355 mm by 255 mm 14 inches by 10 inches with the legend "DANGER HIGH VOLTAGE KEEP OUT" printed in three lines of nominal 75 mm 3 inches high white letters on a red and black field.

2.15 CABLE TAGS IN MANHOLES, HANDHOLES, AND VAULTS

**************************************************************************
NOTE: Verify cable labeling requirements with the local Activity. Provide lead cable tags only when specifically required by the Activity.
**************************************************************************

Provide tags for each power cable or wire located in manholes, handholes, and vaults. The tags must be polyethylene[ or sheet lead]. Do not provide handwritten letters. [The first position on the power cable tag must denote the voltage. The second through [sixth] [_____] positions on the tag must identify the circuit. [The next to last position must denote the phase of the circuit and must include the Greek "phi" symbol.] The last position must denote the cable size.] [Tag legend must be as indicated.]
2.16 GROUNDING AND BONDING

a. Provide properly sized equipment grounding conductors.

b. Provide bonding fittings on concentric/eccentric knockouts with metal conduits for circuits over 250 volts in accordance with NFPA 70.

c. Provide bonding fittings for ferrous metal conduits enclosing grounding electrode conductors in accordance with NFPA 70.

d. Provide grounding lugs for aluminum PV solar module frames of either stainless steel or tin-coated copper.

PART 3 EXECUTION

3.1 INSTALLATION INSTRUCTIONS AND INSTALLATION DRAWINGS

a. Complete all electrical work in accordance with NFPA 70.

b. Provide all permanent and temporary shoring, anchoring, and bracing required by the nature of this work in order to make all parts absolutely stable and rigid, even when such shoring, anchoring, and bracing are not explicitly called for.

c. Install the solar PV system in accordance with this section, installation drawings, and the printed installation instructions of the manufacturer.

d. Follow the manufacturer's installation recommendations to ensure no electricity is being fed to the grid and that all available disconnects are in the open position and fuses are not installed during wiring operations. Utilize on-site measurements in conjunction with engineering designs to accurately cut wires and layout before making permanent connections. Locate wires out of the way of windows, doors, openings, and other hazards. Ensure wires are free of snags and sharp edges that have the potential to compromise the wire insulation. If the system is roof-mounted, it must have direct current ground fault protection in accordance with NFPA 70. Ensure breakers in combiner box are in the off position (or fuses removed) during combiner box wiring.

e. Attach solar PV modules to the mounting structure according to the manufacturer's instructions and approved plans.

f. Install instrumentation according to the manufacturer's instructions, with control panels located as indicated.

3.1.1 Wiring Methods

Install wiring in accordance with NFPA 70 and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.1.2 Electrical Connections

a. Use twist on wire connectors listed for the environment (i.e. wet, damp, direct burial) and installed per manufacturer's instructions.

b. Use listed power distribution blocks.

c. Use terminals containing more than one conductor listed for multiple
conductors.

d. Use connectors and terminals used for fine strand conductors that are listed for use with such conductors.

e. Utilize appropriate tools for connector type as recommended by the manufacturer.

f. Tighten and secure module connectors.

g. Provide corrosion protection in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, and by adding a stainless steel isolating washer between components of incompatible metals on the racking structure.

3.1.3 Disconnects

a. Install disconnects for all current carrying conductors of the PV source.

b. Install disconnects for the PV equipment. For inverters and other equipment that are energized from more than one source, group and identify the disconnecting means.

c. Install disconnects and overcurrent protection for all ungrounded conductors in ungrounded (transformerless) PV power systems.

3.1.4 Overcurrent Protection

a. Install the PV interconnect overcurrent protective device as indicated in accordance with NFPA 70.

b. Install lightning arrester as indicated and in accordance with NFPA 780.

3.1.5 Fire Safety

Firestop conduit that penetrates fire-rated walls, fire-rated partitions, or fire-rated floors in accordance with Section 07 84 00 FIRESTOPPING.

3.2 GROUNDING

3.2.1 PV System Grounding

**************************************************************************
NOTE: Racking manufacturers allow for different grounding schemes. Follow the racking manufacturer's grounding scheme.
**************************************************************************

NFPA 70 and IEEE C2, except provide grounding systems with a resistance to solid earth ground not exceeding [25] [_____] ohms. [Ground according to racking manufacturer's recommendations.]

Install grounding lugs in locations on the solar PV module as designated by the module manufacturer, using stainless steel machine screws of the thread size provided in the pre-tapped holes, along with a stainless steel star washer placed between the grounding lug and the solar module frame.
3.2.2 Grounding Electrodes

NOTE: Include if grounding electrodes are provided.

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Connect ground conductors to the upper end of ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

3.3 INSTALLATION OF EQUIPMENT AND ASSEMBLIES

3.3.1 Roof Mounted Structures

a. Ensure roof access points, paths, and clearances are as indicated.

b. The solar photovoltaic system details must be accepted by warranty roofing system manufacturer prior to installation. Upon completion of a rooftop system installation, obtain written certification that the rooftop warranty is still valid.

(1) For installation on a new roof, coordinate with roof manufacturer of new roof and obtain certificate.

(2) For installation on existing roof, coordinate with activity to provide certificate of continued validity of warranty from manufacturer.

c. Flash and counter-flash all roof penetrations in accordance with ICC IBC.

d. Provide a minimum 115 mm 4.5 inches air gap between the solar PV module frame and the roof surface.

e. Comply with requirements in NRCA 3767 for working with different roof types.

3.3.2 Ground Mounted Structures

NOTE: Include if ground mounted structures are provided, and indicate appropriate foundation type.

[ a. For concrete ballast or pad, install in accordance with Section 05 12 00 STRUCTURAL STEEL.

][b. For driven pile, install in accordance with PDCA Specification 103.

][c. For helical pile, install in accordance with ICC IBC.

][3.3.3 Tracking Equipment

NOTE: Apply if tracking equipment is provided.

Install solar tracking equipment in accordance with IEC TS 62727.
3.4 FIELD APPLIED PAINTING

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Painting must be as specified in Section 09 90 00 PAINTS AND COATINGS.

3.5 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.6 WARNING SIGN MOUNTING

a. Display calculated maximum and minimum voltages and their respective amperages on engraved warning labels.

b. Provide the number of signs required to be readable from each accessible side. Space the signs in accordance with NFPA 70E.

3.7 CABLE TAG INSTALLATION

Install cable tags in each manhole, handhole, and vault as specified, including each splice. [Tag only new wire and cable provided and existing wire and cable which are indicated to have splices and terminations provided.] Install cable tags over the fireproofing, if any, and locate the tags so that they are clearly visible without disturbing any cabling or wiring in the manholes, handholes, and vaults.

3.8 FOUNDATION FOR EQUIPMENT AND ASSEMBLIES

**************************************************************************
NOTE:  Provide if ground mounted system. Use the first bracketed option when project includes a concrete section in Division 03; otherwise, the second bracketed option (metric) or the third bracketed option (English) may be used.
**************************************************************************

Provide cast-in-place concrete work in accordance with the requirements of [Section 03 30 00 CAST-IN-PLACE CONCRETE] [ ACI 318M] [ ACI 318].

3.9 FIELD QUALITY CONTROL

Perform in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.9.1 Performance of NABCEP Acceptance Checks and Tests

Perform all inspections using a NABCEP-certified professional and in accordance with NABCEP inspection procedures, and in accordance with the manufacturer's recommendations, and include the following visual and mechanical inspections and electrical tests.

3.9.1.1 PV Modules

a. Visual and Mechanical Inspection

(1) Solar PV module manufacturer, model, and number of modules must match the approved plans.
(2) Solar PV modules must be in good conditions (including but not limited to no broken glass or cells, no discoloration, frames not damaged).

b. Electrical Tests

(1) Verify output of PV modules according to manufacturer's recommendations and NABCEP practices.

3.9.1.2 Inverters

a. Visual and Mechanical Inspection

(1) Inverter manufacturer, model, and number of inverters must match the approved plans.

(2) Inverters must be in good condition.

b. Electrical Tests

(1) Verify output of inverters according to manufacturer's recommendations and NABCEP practices.

3.9.2 Performance of NETA Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations, and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.9.2.1 Grounding System

a. Visual and Mechanical Inspection

(1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical Tests

(1) Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod, perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground resistance tester in accordance with manufacturer's instructions to test each ground or group of grounds. Use an instrument equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

(2) Submit the measured ground resistance of each ground rod and grounding system, indicating the location of the rod and grounding system. Include the test method and test setup (i.e. pin location) used to determine ground resistance and soil conditions at the time the measurements were made.
3.9.3 Functional Acceptance Tests

a. Provide final and complete commissioning of the solar PV system in accordance with IEEE 1547.

b. Verify that all electrical components are installed and connected according to the requirements of the PV electrical drawings, specifications, and manufacturer's written instructions.

c. Before starting or operating the system, check continuity of all conductors and grounding conductors to verify that there are no faults and that all equipment has been properly installed according to the manufacturer's recommendations. Check factory instructions to see that installations have been made accordingly. Check equipment for any damage that may have occurred during shipment, after delivery, or during installation. Replace damaged equipment.

d. Before starting or operating the system, obtain a final inspection approval and final inspection from the Contracting Officer. Be present on site for both of these inspections.

e. Make final adjustments to all inverters and monitoring equipment so that they will be placed in an acceptable operating condition. Adjustable parameters must be set so that the PV system will produce the maximum possible amount of energy on an annual basis.

3.9.4 Cybersecurity Installation Certification

*********************************************************************************************************
NOTE: Coordinate equipment certification with Government's cybersecurity requirements and interpretations. Select this option if the solar photovoltaic system includes remote control or remote access capability.
*********************************************************************************************************

Furnish a certification that control systems are installed in accordance with DoD Instruction 8500.01, DoD Instruction 8510.01, and as required by individual Service Implementation Policy.

3.10 CLOSEOUT ACTIVITIES

3.10.1 Demonstration

Upon completion of the work and at a time approved by the Contracting Officer, provide instructions by a qualified instructor to the Government personnel in the proper adjustment, system operation, and maintenance of the specified systems and equipment, including pertinent safety requirements as required. Government personnel must receive training comparable to the equipment manufacturer's factory training. Instructor must provide a separate training course for the monitoring system.

3.10.2 Instructor's Qualification Resume

*********************************************************************************************************
NOTE: Use the most appropriate and available option to provide the necessary training.
*********************************************************************************************************
Instructor(s) must be employee(s) of [installer] [manufacturer] [certified solar photovoltaic system training program]. Instructors must be thoroughly familiar with all parts of the installation and trained in operating theory as well as practical operation and maintenance work. Submit the name(s) and qualification resume(s) of instructor(s) to the Contracting Officer for approval.

3.10.3 Training Plan

**************************************************************************
NOTE: Use the most appropriate hours to provide the necessary training. Video record instruction for absent and future employees.
**************************************************************************

The training period must consist of a total of [2] [_____] hours of normal working time and begin after the system is functionally completed but prior to final acceptance tests. Submit the training course curriculum for approval, along with the proposed training date, at least 14 days prior to the date of proposed conduction of the training course. Instruction must be [video-recorded and] given during the first regular work week after the equipment or system has been accepted and turned over to the Government for regular operation. Provide [video recording and] any PowerPoint slides as part of the final documentation for those that cannot attend. Extend safety training to fire department representatives. Coordinate with Contracting Officer for Fire Department first responder training.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for 1800 rpm diesel engine-generator sets with ratings up to 2000 kW at 0.8 power factor intended for use in low voltage, non paralleling, emergency electrical power systems meeting requirements of NFPA 70, NFPA 99, and MIL-HDBK-1191.

Adhere to **UPC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

NOTE: This guide specification will require modification for applications where automatic transfer switches are not used. When generators are to be operated in parallel with utility or with other generators, and for medium voltage (greater than 600 volt) systems, contact the responsible Facilities Engineering Command (FEC) for determination as to which specification or sample specification is to be used. If Echelon III Reach-back Support form NAVFAC LANT or NAVFAC PAC is required for shop drawing review or field acceptance testing, the FEC technical representative (electrical engineer) editing this document for a specific project must contact the appropriate
Capital Improvements Electrical Engineering Office
for consultation during the design stage of the project.

***************

NOTE: On drawings, show:

1. Engine-generator set foundation design and
details.

2. Piping for ventilation of engine crankcase to
atmosphere where required.

3. Details of exhaust, cooling water, and fuel
piping, including penetrations through walls and
roofs showing piping sleeves and exterior flashing
where applicable.

4. Diesel fuel day tank capacity where applicable.

5. Location of remote alarm annunciator where
applicable.

6. Circuiting for the jacket coolant heating
system, electric motor driven radiator fan where
applicable, diesel fuel supply system, starting
battery charger, remote alarm annunciator storage
battery charger where applicable, and generator
space heater.

7. Grounding plan. For applications using transfer
switches, the transfer switch must be four pole and
the generator must be grounded as a separately
derived system.

1.2 RELATED REQUIREMENTS

Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, and Section 26 08 00 APPARATUS INSPECTION AND TESTING apply to this section except as modified herein.

1.3 SYSTEM DESCRIPTION

1.3.1 Engine-Generator Set Data

Submit data pertaining to the diesel engine-generator set and to the auxiliary equipment including but not limited to the following:

a. Make of engine.

b. Type or model of engine.

c. Gross bhp rating of engine must be the total rated power output before deducting power requirements of electric motor-driven equipment or engine driven radiator fan.

d. Net brake power rating of engine must include deductions for the total power requirements of electric motor-driven or engine-driven accessories as defined in ISO 3046. Net ratings must include a deduction in power output for cooling media system power requirements including radiator fans and any other power consuming devices required to provide cooling as specified.

e. Strokes per cycle.

f. Number of cylinders.

g. Bore and stroke, mm inches.

h. Engine speed, rpm.

i. Piston speed, m/s fpm.

j. kW power rating of engine-generator set as defined in the paragraph ENGINE-GENERATOR SET RATINGS AND PERFORMANCE.

k. Induction method (naturally aspirated, turbocharged).

l. Intercooler type (air-to-air or jacket water).

m. Governor type, make, and model.

n. Make and model of turbochargers.
1.3.2  Engine-Generator Set Efficiencies

**************************************************************************
NOTE: Include the bracketed option below for projects located outside the continental United States (OCONUS).
**************************************************************************
Submit data pertaining to the diesel engine-generator set including but not limited to the following: Loads must be calculated on basis of rated engine-generator set power.

a. Fuel consumption at 0.80 power factor, liters per hr gallons per hr.
   (1) 1/2 load
   (2) 3/4 load
   (3) Full load

b. Generator efficiency at 0.80 power factor (percent) [in accordance with IEC 60034-2A].
   (1) 1/2 load
   (2) 3/4 load
   (3) Full load

c. Radiator capacity at design conditions.
   (1) Coolant must be antifreeze mixture as specified under paragraph COOLING SYSTEM.
   (2) L/s gpm of coolant
   (3) L/s cfm of air through radiator
   (4) kW Btu per hr of heat exchange based on optimum coolant temperature to and from engine.

1.3.3  Diesel Engine Data

Submit data certified by the engine manufacturer including but not limited to the following: Loads must be calculated on basis of rated engine-generator set power.

a. Approximate exhaust temperature degrees C F at full load

b. Weight of exhaust gas at full load kg per hr lb per hr

c. Weight of intake air at full load kg per hr lb per hr

d. Total heat rejected at full load kW Btu per hr
   (1) To jacket coolant system
   (2) To fuel oil cooling system
e. Emissions kg per hr lb per hr at full load

(1) Total Suspended Particulate

(2) Particulate matter with an average aerodynamic diameter of 10 microns (PM-10)

(3) Sulfur dioxides

(4) Nitrogen Oxides (as NO2)

(5) Carbon Monoxide

(6) Volatile Organic Compounds

f. Visible Emissions (percent opacity) at full load

1.3.4 Generator and Exciter Data

Submit data certified by the generator manufacturer including but not limited to the following:

a. Make and model number of generator

b. kW rating of generator

c. Generator reactances

(1) Synchronous reactance, Xd

(2) Transient reactance, X'd

(3) Subtransient reactance, X"d

(4) Negative sequence reactance, X2

(5) Zero sequence reactance, Xo

1.3.5 Capacity Calculations for Engine-Generator Set

Calculations must verify that the engine-generator set power rating is adequate for the load described in the paragraph LOAD PROFILE.

1.3.6 Torsional Vibration Stress Analysis Computations

Torsional vibrational stresses in the crankshaft and generator shaft of assembled diesel engine and driven generator must not exceed 34,450 kPa 5000 psi when engine is driving generator at rated speed while assembled unit is loaded to rated engine-generator set power. Computations must be based on a mathematical model of the assembled generator set provided or based on calculations using measured values from tests on a unit identical to the one provided. Calculations based on models of, or measured data from, the unassembled engine and generator will not be acceptable. Calculations must include:

a. A description of the system relating information pertinent to analysis such as operating speed range and identification plate data.

b. A mass elastic assembly drawing, showing the arrangement of the units
in the generator set and dimensions of shafting, including minimum
diameters (or section moduli) of shafting in the system.

c. A labeled line diagram of the mass elastic system indicating values of
masses, stiffness, equivalent lengths, and equivalent diameters
including basic assumptions and definition of terms.

d. Sample computations showing procedures used to obtain resulting stress
values.

e. Computations indicating assembled engine-generator speed of 1800 rpm
with assembly loaded to rated generator power and the resulting
computed critical torsional stress values in the assembled engine
crankshaft and generator shaft.

1.3.7 Capacity Calculations for Batteries

Calculation must verify that the engine starting battery capacity exceeds dc
power requirements.

1.3.8 Turbocharger Load Calculations

**************************************************************************
NOTE: When the engine-generator set installation
includes field installed exhaust system (i.e., the
engine-generator set is installed internal to a
building in lieu of in a self contained outdoor
enclosure), include the following paragraph.
**************************************************************************

When the proposed exhaust system layout is different from that shown on the
contract drawings, submit calculations showing that the external loads from
the exhaust system such as weight and thermal expansion do not exceed the
engine manufacturer's maximum allowed forces and moments on the
turbocharger.

]1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions
in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list to reflect only the submittals
required for the project.

The Guide Specification technical editors have
designated those items that require Government
approval, due to their complexity or criticality,
with a "G." Generally, other submittal items can be
reviewed by the Contractor's Quality Control
System. Only add a "G" to an item, if the submittal
is sufficiently important or complex in context of
the project.

For submittals requiring Government approval on Army
projects, a code of up to three characters within
the submittal tags may be used following the "G"
designation to indicate the approving authority.
Codes for Army projects using the Resident
Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval].[for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 QUALITY ASSURANCE

1.5.1 Drawing Requirements

1.5.1.1 Engine-Generator Set and Auxiliary Equipment

Submit drawings pertaining to the engine-generator set and auxiliary equipment, including but not limited to the following:

a. Certified outline, general arrangement (setting plan), and anchor bolt
details. Show total weight and center of gravity of assembled equipment on the steel subbase.

b. Detailed elementary, schematic wiring, and interconnection diagrams of the engine starting system, jacket coolant heating system, engine protective devices, engine alarm devices, engine speed governor system, generator and excitation system, and other integral devices.

c. Detailed elementary, schematic wiring; and interconnection diagrams of the diesel fuel system, starting battery system, engine-generator control panel, generator circuit breaker[, and remote alarm annunciator].

d. Dimensional drawings or catalog cuts of exhaust silencers, radiator, diesel fuel day tanks, fuel oil cooler, valves and pumps, intake filters, vibration isolators, and other auxiliary equipment not integral with the engine-generator set.

1.5.1.2 **Auxiliary Systems**

**************************************************************************
NOTE: When the engine-generator set installation includes field installed exhaust, air intake, fuel oil cooler, or jacket coolant water systems (i.e., the engine-generator set is installed internal to a building in lieu of in a self contained outdoor enclosure), include the following paragraph.
**************************************************************************

Submit drawings showing floor plan arrangement of[ exhaust,[ air intake,[ fuel oil cooler,[ and][ jacket coolant water] systems including arrangement of piping and pipe sizes.

1.5.2 **Vibration Isolation System** Certification

Submit certification from the manufacturer that the vibration isolation system will reduce the vibration to the limits specified in the paragraph VIBRATION ISOLATION SYSTEM.

1.5.3 **Fuel System** Certification

When the diesel fuel system requires a fuel oil cooler as described in the paragraph FUEL OIL COOLER, submit certification from the engine manufacturer that the fuel system design is satisfactory.

1.6 **DELIVERY, STORAGE, AND HANDLING**

Deliver equipment on pallets or blocking wrapped in heavy-duty plastic, sealed to protect parts and assemblies from moisture and dirt. Plug piping, conduit, exhaust, and air intake openings. Protect and prepare batteries for shipment as recommended by the battery manufacturer. Store auxiliary equipment at the site in covered enclosures, protected from atmospheric moisture, dirt, and ground water.

1.7 **SITE CONDITIONS**

Protect the components of the engine-generator set, including cooling system components, pumps, fans, and similar auxiliaries when not operating and provide components capable of the specified outputs in the following
environment:

a. Site Location: [____]

b. Site Elevation: [____] meters [____] feet above mean sea level

c. Ambient Temperatures:

**************************************************************************
NOTE: Ambient temperatures, design wind velocity, and prevailing wind direction must be as defined by
UFC 3-400-02, Design Engineering Weather Data.
**************************************************************************

(1) Maximum [____] degrees C [____] degrees F dry bulb, [____] degrees C [____] degrees F wet bulb.

(2) Minimum [____] degrees C [____] degrees F dry bulb.

d. Design Wind Velocity: [____] km/h [____] mph.

e. Prevailing Wind Direction: [____].

f. Seismic Zone: Zone [____] as defined by ICC IBC.

1.8 MAINTENANCE

1.8.1 Extra Materials

1.8.1.1 Paint

Furnish 4 liters one gallon of identical paint used on engine-generator set in manufacturer's sealed container with each engine-generator set.

1.8.1.2 Filters

Furnish four spare replacement elements in their original containers for each filter with each unit.

1.8.2 Posted Operating Instructions

Provide proposed operating instructions for the engine-generator set and auxiliary equipment laminated between matte-surface thermoplastic sheets and suitable for placement adjacent to corresponding equipment. After approval, install operating instructions where directed.

PART 2 PRODUCTS

2.1 DIESEL ENGINE-GENERATOR SET

Provide diesel engine-generator sets consisting of a water cooled diesel engine direct connected to an ac generator with a brushless excitation system and accessories. Equipment and materials must be the manufacturer's standard products offered in catalogs for commercial or industrial use.

2.1.1 Engine-Generator Set Ratings and Performance

ISO 8528. Each engine-generator set must have a power rating of not less than [____] kW at 0.8 power factor and supply[208Y/120][480Y/277][____]
-volt, three-phase, [60][50]-Hz ac output. Coordinate the engine-generator set to ensure an installed rating in the environment described in paragraph SITE CONDITIONS. The power of the engine-generator set is defined as the power output available at the generator terminals excluding the electrical power absorbed by the essential independent auxiliaries. Essential independent auxiliaries are items of equipment which are essential for the continued or repeated operation of the engine which uses power supplied from a source other than the engine.

2.1.1.1 Diesel Engine Capacity

The engine capacity must be based on the following:

**************************************************************************
NOTE: Contact the activity to find out fuel type to be used.
**************************************************************************

a. Engine burning diesel fuel conforming to [CID A-A-52557, Grade DF-2,] [MIL-DTL-16884,] [ASTM D975, Grade 2-D,] or [MIL-DTL-5624, Grade JP-5] at an ambient temperature of 29 degrees C 85 degrees F. For stationary engines operated in the United States, diesel fuel requirements are found in 40 CFR 60 Subpart IIII.

b. Engine cooled by a radiator fan mechanically driven by the diesel engine or remote with a motor driven fan.

c. Engine cooled by coolant mixture of water and ethylene glycol, 50 percent by volume of each.

[2.1.1.2 Diesel Engine Emission Limits

**************************************************************************
NOTE: Include the following paragraph when an air pollution permit is required by local, state, or federal law to install and operate the diesel engine generator set. Contact the engine-generator set manufacturer for achievable limits. Contact the activities environmental department representative to determine permit requirements.
**************************************************************************

Engine must be certified by the manufacturer to meet applicable EPA emission standards found in 40 CFR 60 Subpart IIII. In addition, engine must meet any applicable state or local emission requirements (ex: California SCAQMD).

[2.1.1.3 Performance Class

**************************************************************************
NOTE: See the following guidelines and table for selecting the appropriate performance class:

1. Select Class G1 where the connected loads are such that only basic parameters of voltage and frequency are needed, e.g., general purpose lighting and other simple electrical loads.

2. Select Class G2 where the demands on voltage
Characteristics are very much the same as for the commercial power system, e.g., lighting systems, pumps, fans, hoists.

3. Select Class G3 where the connected equipment may make severe demands on frequency, voltage, and waveform characteristics, e.g., telecommunications as thyristor-controlled loads.

4. Select Class G4 where the demands on the frequency, voltage, and waveform characteristics are exceptionally severe, e.g., data processing equipment or computer systems. Performance values for Class G4 must be determined by the designer and an appropriate table similar to the following table must be inserted into the specification.

**************************************************************************

The voltage and frequency behavior of the generator set must be in accordance with ISO 8528 operating limit values for performance Class [G1][G2][G3][G4 as follows].

2.1.1.4 Load Profile

The diesel engine-generator set must be of adequate capacity necessary for
the following load profile:

[a. Lighting [_____] kW

[b. Computer [_____] kW

[c. Uninterruptible power supplies (UPS) [_____] kVA, [3][6][12][24] pulse

[d. Variable frequency drives (VFD) [_____] kVA, [3][6][12][24] pulse

[e. Motor starting sequence

2.1.2 Diesel Engines and Accessories

******************************************************************************
NOTE: As of 8/98 major manufacturers are building only four-cycle engines in order to meet Federal emissions requirements. Two-cycle engines must not be specified.
******************************************************************************

ISO 3046. Diesel engines must be four-cycle naturally aspirated, or turbocharged, or turbocharged and intercooled; vertical in-line or vertical Vee type; designed for stationary service. Engines must be capable of immediate acceleration from rest to normal speed without intermediate idle/warm up period or prelubrication to provide essential electrical power. Two-cycle engines are not acceptable.

2.1.2.1 Subbase Mounting

Mount each engine-generator set on a structural steel subbase sized to support the engine, generator, and necessary accessories, auxiliaries and control equipment to produce a complete self-contained unit as standard with the manufacturer. Design the structural subbase to properly support the equipment and maintain proper alignment of the engine-generator set in the specified seismic zone. In addition, provide subbase with both lifting rings and jacking pads properly located to facilitate shipping and installation of the unit. Factory align engine and generator on the subbase and securely bolt into place in accordance with the manufacturer's standard practice. Crankshaft must have rigid coupling for connection to the generator.

2.1.2.2 Assembly

Completely shop assemble each engine-generator set on its structural steel subbase. Paint entire unit with manufacturer's standard paints and
colors. After factory tests and before shipping, thoroughly clean and retouch painting as necessary to provide complete protection.

2.1.2.3 Turbocharger

If required by the manufacturer to meet the engine-generator set rating, provide turbine type driven by exhaust gas from engine cylinders, and direct connected to the blower supplying air to the engine intake manifold.

2.1.2.4 Intercooler

Provide manufacturer's standard intercooler for engine size specified.

2.1.2.5 Crankcase Protection

**************************************************************************

NOTE: Include details on the drawings for the crankcase ventilation piping and associated penetrations through walls and roofs showing the piping sleeve and exterior flashing when the radiator is remote and the engine-generator set is to be installed inside a building.

**************************************************************************

Provide manufacturer's standard method of preventing crankcase explosions and standard method of crankcase ventilation. [Provide ventilation of crankcase via piping to the atmosphere as indicated on the drawings.]

2.1.2.6 Engine Lubricating Oil System

Provide each engine with the manufacturer's standard full pressure lubricating oil system arranged to cool the pistons and to distribute oil to moving parts of the engine. Provide oil type and oil filters as recommended by the engine manufacturer.

2.1.2.7 Engine Cooling System

Provide each engine with the manufacturer's standard jacket water pump. Provide a thermostatic control valve in the jacket coolant system for each engine-generator set to maintain a constant jacket coolant temperature to the engine.

2.1.2.8 Engine Fuel System

**************************************************************************

NOTE: Select the options for duplex filters when changing of the filter will be required while the engine-generator set is operating. Do not provide duplex filters when the engine-generator set is to be installed in an enclosure or provided with an engine-driven radiator.

**************************************************************************

Provide each engine with the manufacturer's standard fuel system integral with the engine, complete with necessary piping, fittings, and valves for connecting items of equipment which are a part of the system. Provide engine manufacturer's standard hand priming pump. Provide manufacturer's standard[ simplex][ duplex] filter for each engine, of the throwaway filter element type, consisting of shell filter elements, drains, and necessary
connections and fittings. [Arrange duplex filter such that flow may be diverted from one chamber to the other without interruption at any point of the changeover.]

2.1.2.9 Engine Intake Filter

Provide intake filter assemblies for each engine of the oil bath or dry type, as standard with the manufacturer. Filters must be capable of removing a minimum of 92 percent of dirt and abrasive 3 microns and larger from intake air. Size filters to suit engine requirements at 100 percent of rated full load. Design unit for field access for maintenance purposes.

2.1.2.10 Engine Starting System

Starting must be accomplished using an adequately sized dc starter system with a positive shift solenoid to engage the starter motor and to crank the engine continuously for 60 seconds without overheating.

2.1.2.11 Jacket Coolant Heating System

Provide a factory-installed, [120] volt ac, jacket coolant heating system to ensure rapid starting. Thermostatically control heater at the temperature recommended by engine manufacturer. Include necessary equipment, piping, controls, wiring, and accessories.

2.1.2.12 Engine Protective (Shutdown) Devices

Equip each engine with devices to shut down the engine by shutting off the fuel supply to the engine via a fuel shutoff solenoid. Auxiliary contacts must be suitable for activating a remote alarm system. Shutdown must open the associated generator circuit breaker. Provide the following shutdown devices:

a. Overspeed device which operates when engine speed exceeds normal synchronous speed by 18 percent or as recommended by manufacturer. Device must require manual reset.

b. Pressure switch which operates when lubricating oil pressure to engine drops below a preset value.

c. Temperature switch which operates when jacket coolant temperature exceeds a preset value.

d. Device which operates when the coolant level in the radiator drops below a preset level.

e. Other shutdown devices as recommended by the engine manufacturer.

2.1.2.13 Engine Alarm Devices

Equip each engine with alarm devices. Auxiliary contacts must be suitable for activating a remote alarm system. Alarm devices must have factory-fixed set points. Provide the following alarm contact devices:

a. Pressure switch which operates when lubricating oil pressure drops below a preset value.

b. Temperature switch which operates when jacket coolant temperature exceeds a preset value.
c. Temperature switch which operates when jacket coolant temperature is too low.

d. Other alarm devices as recommended by the engine manufacturer.

2.1.2.14 Miscellaneous Engine Accessories

Provide the following engine accessories where the manufacturer's standard design permits:

a. Piping on engine to inlet and outlet connections, including nonstandard companion flanges.

b. Structural steel subbase and vibration isolators, foundation bolts, nuts, and pipe sleeves.

c. Level jack screws or shims, as required.

d. Rails, chocks, and shims for installation of subbase on the foundation.

e. Removable guard, around fan. Support guard, on engine subbase, to suit manufacturer's standard.

2.1.2.15 Engine Speed Governor System

Provide a forward acting type engine speed governor system. Steady-state frequency band and frequency regulation (droop) must be in accordance with the operating limit values of the performance class specified in the paragraph PERFORMANCE CLASS.

2.1.3 Generator and Excitation System

2.1.3.1 Generator

******************************************************************************

NOTE: Use the following guidelines for specifying generators:

1. Select dripproof guarded option for generators without weatherproof enclosures.

2. Select NEMA MG 1, Part 16, standby duty, and temperature rise of 130 degrees C for engine-generator sets which are expected to operate for less than 300 hours per year. Select NEMA MG 1, Part 22, continuous duty, and temperature rise of 105 degrees C for engine-generator sets expected to operate 300 hours or greater per year or rated 300 kW and above.

3. Select 2/3 pitch design option for engine-generator sets rated 300 kW and above.

4. Select 10-12 lead reconnectable for engine-generator sets rated 300 kW to 800 kW.

5. For applications requiring high SCR loading or in harsh environments laden with salts and
chemicals, select vacuum pressure impregnation (VPI) insulated coils. When engine-generator sets are rated 800 kW and larger, also select form wound coils.

Provide salient-pole type, ac, brushless-excited, revolving field, air-cooled, self-ventilated, [dripproof guarded,] coupled type, synchronous generator conforming to NEMA MG 1, Part [16][22], NEMA C50.10, and IEEE C50.12. Generator must be rated for [standby][continuous] duty at 100 percent of the power rating of the engine-generator set as specified in paragraph ENGINE-GENERATOR SET RATINGS AND PERFORMANCE. Temperature rise of each of the various parts of the generator must not exceed [130][105] degrees C as measured by resistance, based on a maximum ambient temperature of 40 degrees C. Winding insulation must be Class H.

a. Stator: Stator windings must be [2/3 pitch design][,][10-12 lead reconnectable][ with VPI insulated[ and form wound] coils].

b. Rotor: The rotor must have connected amortiser windings.

c. Generator Space Heater: Provide [120][_____] volt ac heaters. Heater capacity must be as recommended by the generator manufacturer to aid in keeping the generator insulation dry.

d. Grounding: Provide non-corrosive steel grounding pads located at two opposite mounting legs.

e. Filters: Provide manufacturer's standard generator cooling air filter assembly.

2.1.3.2 Excitation System

**NOTE: Select all options for engine-generator sets rated 300 kW and above.**

Provide a brushless excitation system consisting of an exciter and rotating rectifier assembly[, and permanent magnet generator] integral with the generator and a voltage regulator. Insulation class for parts integral with the generator must be as specified in paragraph GENERATOR. System must provide a minimum short circuit of 300 percent rated engine-generator set current for at least 10 seconds. Steady state voltage regulation must be in accordance with the operating limit values of the performance class specified in the paragraph PERFORMANCE CLASS.

a. Exciter and Rotating Rectifier Assembly: Rectifiers must be provided with surge voltage protection.

b. Permanent Magnet Generator: Provide a voltage spike suppression device for permanent magnet generator (PMG) excitation systems.

c. Voltage Regulator: Voltage regulator must be solid state or digital, automatic, three-phase sensing, volts per hertz type regulator.[ Regulator must receive its input power from a PMG.] Voltage variation for any 40 degree C change over the operating temperature range must be less than plus or minus 1.0 percent. Operating temperature must be minus 40 degree C to plus 70 degree C. Voltage adjust range must be
plus to minus 5.0 percent of nominal. Inherent regulator features must include overexcitation shutdown.

[2.1.3.3 Electromagnetic Interference (EMI) Suppression

**************************************************************************
NOTE: Include electromagnetic interference (EMI) suppression for engine-generator set installations in the proximity of sensitive electronic equipment.
**************************************************************************

Provide as an integral part of the generator and excitation system, EMI suppression complying with MIL-STD-461.

]2.2 ENGINE-GENERATOR SET AUXILIARY SYSTEMS AND EQUIPMENT

Provide auxiliary systems and equipment designed for continuous duty at 100 percent of the power rating of the engine-generator set as specified in the paragraph ENGINE-GENERATOR SET RATINGS AND PERFORMANCE.

2.2.1 Vibration Isolation System

Install the subbase on vibration isolators that are secured to a suitable concrete foundation. Provide isolators as recommended by the engine-generator set and isolator manufacturers and provide integral or external lateral support to limit lateral movement and overturning moments. The isolation system must reduce the vibration transmitted to the adjacent floor slab to a maximum of 0.038 mm 0.0015 inch total amplitude throughout the frequency range down to 65 Hz.

2.2.2 Exhaust System

Provide exhaust systems for each engine.

2.2.2.1 Exhaust Silencers

**************************************************************************
NOTE: The normal values given in the table for exhaust sound reduction are for installations in residential applications. If the installation is in a critical environment (such as a hospital), more stringent criteria must be applied, including engine noise dampening, and the attenuation values in the table for critical class should be selected.
**************************************************************************

A[ residential class][ critical class] silencer must be provided for each engine which will reduce the exhaust sound spectrum by the following listed values at a 23 m 75 foot radius from the outlet, with generator set loaded to rated capacity and clear weather. Inlet and outlet connections must be flanged.

<table>

2.2.2.2 Field Installed Exhaust Piping System

------------------------------------------------------------------------------------------------------------------
NOTE: Include the following paragraph when the engine-generator set is installed internal to a building in lieu of in a self contained outdoor enclosure. The designer is responsible for ensuring that:

1. External loads from the exhaust system, such as weight and thermal expansion do not exceed the engine manufacturer's maximum allowed forces and moments on the turbocharger, and;

2. The exhaust piping system pressure loss is coordinated with the visible emission limits of the engine-generator set when air pollution permitting is required.
------------------------------------------------------------------------------------------------------------------

Field installed exhaust piping must conform to the following:

a. Exhaust Piping: Provide flanges for connections to diesel engines, exhaust mufflers, and flexible connections. Provide steel pipe conforming to ASTM A53/A53M for each engine complete with necessary fittings, flanges, gaskets, bolts, and nuts. Exhaust piping must be Schedule 40 pipe for 300 mm 12 inches and smaller, standard weight for sizes 350 mm 14 inches through 600 mm 24 inches, and 6 mm 0.25 inch wall thickness for sizes larger than 600 mm 24 inches. Flanges must be Class 150 slip-on forged steel welding flanges in accordance with ASME B16.5, with material in accordance with ASTM A181/A181M, Grade I. Fittings must be butt welding conforming to ASTM A234/A234M, with wall thickness same as adjoining piping. Fittings must be of same material and wall thickness as pipe. Built-up miter welded fittings may be used. Miter angles of each individual section must not exceed 22.5 degrees total and not more than 11.25 degrees relative to the axis of the pipe at any one cut. Gaskets for exhaust piping must be of high temperature asbestos-free material suitable for the service and must be ASME B16.21, composition ring, 1.6 mm 0.0625 inch thick. Bolting material for exhaust flanges must be alloy-steel bolt-studs conforming to ASTM A193/A193M, Grade B7 bolts and alloy-steel nuts conforming to ASTM A194/A194M, Grade 7. Bolts must be of sufficient length to obtain full bearing on the nuts and must project not more than two full threads beyond the nut. Provide stainless steel counterbalance type rain caps at termination of each exhaust pipe.

------------------------------------------------------------------------------------------------------------------
NOTE: Select option for liners in expansion joints when required to reduce exhaust pressure drop.
------------------------------------------------------------------------------------------------------------------
b. Expansion (Flexible) Joints: Provide sections of multiple corrugated stainless steel expansion joints with liners in the engine exhaust piping for each engine to absorb expansion strains and vibration transmitted to the piping. Flexible joints must be suitable for operation at 93 degrees C, 200 degrees F above normal exhaust gas temperature at 100 percent load, 10,000 cycles, minimum. Joints must be flanged and located between engine exhaust manifold and exhaust piping, must be the same size as exhaust piping size, and must be designed and constructed for diesel engine exhaust service.

**************************************************************************

NOTE: Include on the drawings a detail of the exhaust piping penetrations through walls and roofs showing the piping sleeve and exterior flashing.

**************************************************************************

d. Piping Sleeves: Provide where piping passes through masonry or concrete walls, floors, roofs, and partitions. Sleeves must be placed during construction. Unless indicated otherwise, pipe sleeves must comply with following requirements: sleeves in outside walls below and above grade, in floor, or in roof slabs, must be standard weight zinc coated steel pipe. Sleeves in partitions must be zinc coated sheet steel having a nominal weight of not less than 4.4 kg per square meter, 0.90 pound per square foot. Space between piping insulation and the sleeve must not be less than 6 mm, 0.25 inch. Sleeves must be held securely in proper position and location during construction. Sleeves must be sufficient length to pass through entire thickness of walls, partitions, or slabs. Sleeves in floor slabs must extend 50 mm, 2 inches above the finished floor. Space between the pipe and the sleeve must be firmly packed with insulation and caulked at both ends of the sleeve with plastic waterproof cement.

e. Piping Insulation: Provide exhaust piping insulation in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.2.3 Cooling System

Provide the specified cooling water system. Properly size equipment to handle the flow rate and pressure losses of the coolant mixture specified in the paragraph DIESEL ENGINE CAPACITY, and at the site elevation specified in the paragraph SITE CONDITIONS.

2.2.3.1 Radiators

**************************************************************************

NOTE: Generally utilize the engine subbase radiator as the less expensive option. In cases where insufficient cooling air or space or additional reliability is necessary (requiring cross-connecting of radiators), provide remote radiators.

**************************************************************************

NOTE: At the text below, use the maximum dry-bulb temperature of the site plus 8 degrees C, 15 degrees F for the first temperature, but not less than 43
degrees C 110 degrees F. Use minus 18 degrees C 0 degrees F, except where minimum dry-bulb temperature permits use of a higher temperature.

Provide for each engine-generator set, as standard with the manufacturer.

a. Design Conditions: Each radiator unit must have ample capacity to remove not less than the total kW Btu per hour of heat rejected by its respective engine at 100 percent full-rated load to the jacket water, fuel oil, and lubricating oil system, and intercooler. Radiator capacity must be rated at optimum temperature of coolant leaving the engine and intercooler as recommended by the engine manufacturer with an ambient dry bulb air temperature outside the enclosure of [_____] degrees C [_____] degrees F maximum, and [_____] degrees C [_____] degrees F minimum at the site elevation specified in the paragraph SITE CONDITIONS, and with the coolant mixture specified in the paragraph DIESEL ENGINE CAPACITY. Pressure drop through the radiator must not exceed 41.34 kPa 6 psi when circulating the maximum required coolant flow. Radiator air velocity must be a maximum of 7.6 meters per second 1500 feet per minute.

[ b. Engine Mounted Radiator Construction: Radiator fan must direct airflow from the engine outward through the radiator. Fan must be V-belt driven directly from the engine crankshaft. Radiator fan must have sufficient capacity to meet design conditions against a static restriction of [_____] Pa [_____] inch of water. Fan static capacity must be adjusted to suit the ductwork furnished. Cooling section must have a tube and fin-type core consisting of copper or copper base alloy tubes with nonferrous fins. Select engine-driven fans for quiet vibration-free operation. Make provision for coolant expansion either by self-contained expansion tanks or separately mounted expansion tanks, as standard with the manufacturer. Provide suitable guards for each fan and drive.]

NOTE: Radiator fan cycling controls should be considered for engines to be operated above 500 hours per year.

[ c. Remote Radiator Construction: Provide radiators as described above, except radiators must be remotely piped and provided with electric motor driven fan. Drive must be multiple V-belt or reduction gears. Expansion tanks must be separately mounted. Air flow must be vertical or horizontal as indicated. Interlock fan with engine operation such that fan must operate when engine operates when recommended by engine manufacturer.[ Provide controls and control devices complete which must cycle fan on and off based upon coolant temperature.] Provide motors, controllers, contactors, and disconnects in accordance with paragraph ELECTRICAL SUPPORT EQUIPMENT.

] d. Coolant solution must be a mixture of clean water and ethylene glycol, 50 percent by volume each. Provide an anti-freeze solution tester suitable for the mixture.

[2.2.3.2 Jacket Coolant Water Piping Systems]
NOTE: Include the following paragraph when providing cooling system with a remote radiator.

Field installed jacket coolant water piping must conform to the following:

a. Piping: Provide seamless steel pipe, Schedule 40, conforming to ASTM A53/A53M, Grade A.

b. Fittings and Flanges: Fittings, 40 mm 1 1/2 inches or smaller, must be malleable iron conforming to ASME B16.3 for Class 300 threaded type. Fittings, 50 mm 2 inches and larger, must be steel butt welding conforming to ASME B16.9. Utilize either ASME B16.1 or Class A of ASTM A126 for Class 125 cast-iron flanged fittings. Flanges must be Class 150 slip-on forged steel welding flanges in accordance with ASME B16.5, with material in accordance with ASTM A181/A181M, Grade I. Provide flat face flanges for connecting to Class 125 standard cast-iron valves, fittings, and equipment connections.

c. Valves

   (1) Gate Valves: For valves, 40 mm 1 1/2 inches and smaller, provide double disk, rising stem, inside screw, union bonnet type, Class 125 bronze material conforming to MSS SP-80. For valves, 50 mm 2 inches and larger, provide double-disk, parallel seat type, hydraulic-rated, Class 125, outside screw and yoke type with flanged ends and bronze trim conforming to MSS SP-70. Provide stem packing of material compatible with the system coolant.

   (2) Globe Valves: For valves, 40 mm 1 1/2 inches and smaller, provide rising stem, inside screw, union bonnet type, Class 125 bronze valves conforming to MSS SP-80. For valves, 50 mm 2 inches and larger, provide Class 125 cast iron, flanged ends, bronze trim globe valves conforming to MSS SP-85. Valves must have renewable composition or cast iron discs compatible with the system coolant.

   (3) Check Valves: MSS SP-71 or MSS SP-80, swing check type.

d. Hangers and Supports: MSS SP-58.

NOTE: Include on the drawings a detail of the cooling piping penetrations through walls and roofs showing the piping sleeve and exterior flashing.

Piping Sleeves: Provide where piping passes through masonry or concrete walls, floors, roofs, and partitions. Place sleeves during construction. Unless indicated otherwise, pipe sleeves must comply with following requirements: Sleeves in outside walls below and above grade, in floor, or in roof slabs, must be standard weight zinc coated steel pipe. Sleeves in partitions must be zinc coated sheet steel having a nominal weight of not less than 4.4 kg per square meter 0.90 pound per square foot. Space between piping insulation and the sleeve must be not less than 6 mm 0.25 inch. Sleeves must be held securely in proper position and location during construction. Sleeves must be of sufficient length to pass through entire thickness of walls, partitions, or slabs. Sleeves in floor slabs must extend 50 mm 2 inches above the finished floor. Space between the pipe and the sleeve must
be firmly packed with insulation and caulked at both ends of the sleeve with plastic waterproof cement.

2.2.4 Diesel Fuel System

NFPA 30 and NFPA 37 and the requirements herein.

2.2.4.1 Diesel Fuel Piping System

Factory installed piping must conform to the engine manufacturer's standard.

2.2.4.2 Diesel Fuel Supply System

Provide[ 120][_____] volt ac diesel fuel supply system. Include necessary equipment, piping, controls, wiring, and accessories.

**************************************************************************
NOTE: Use the following guidelines for specifying diesel fuel integral base tanks:

1. Select integral base tank in skid where applicable and available. Tank capacity available varies from 100 gallons to 5,000 gallons.

2. See NFPA 37 for allowable tank sizes and restrictions.

3. Provide an overflow or return line between the diesel fuel day tank and storage tank in accordance with NFPA 37 if the generator is equipped with both an external supply tank and a day tank.

4. Tank capacity must be in accordance with the following table for facilities complying with MIL-HDBK-1191, "DOD Medical and Dental Treatment Facilities Design and Construction Guide."

<table>
<thead>
<tr>
<th>GEN SET</th>
<th>MIN</th>
<th>MAX</th>
</tr>

<tr>
<td>201 KW - 300 KW</td>
<td>75</td>
<td>100</td>
</tr>
<tr>
<td>OVER 300 KW</td>
<td>100</td>
<td>250</td>
</tr>
</tbody>
</table>

**************************************************************************
a. All Tanks: UL 142. Provide[ integral in skid][ free standing] double wall (110 percent containment) diesel fuel tanks with a[ minimum capacity of [_____] hours of engine-generator set operation at full-rated load][ capacity as indicated]. Epoxy coat day tanks inside and prime and paint outside. Construct tanks of not less than 4.76 mm 3/16 inch steel plate with welded joints and necessary stiffeners on exterior of tank. Provide a braced structural steel frame support. Weld tank top tight. Provide 114 mm 4 1/2 inch square inspection port with a 2 inch NPT fill connection and spill box. Provide proper normal and emergency venting for the primary tank and emergency venting only for the secondary tank / containment basin in accordance with UL 142 requirements.[ Provide an overflow or return line between the diesel fuel day tank and storage tank in accordance with NFPA 37.]

b. Float Switches for Day Tanks: Provide tank-top mounted or external
float cage, single-pole, single-throw type designed for use on fuel oil tanks. Arrange high level float switches to close on rise of liquid level, and low level float switches to close on fall of liquid level. Mount float cage units with isolating and drain valves. Contacts must be suitable for the station battery voltage.

(1) Critical low level float switch which must activate at 5 percent of normal liquid level must shut engine off.

(2) Low-low level float switch which must activate alarm at 30 percent of normal liquid level.

(3) Low level float switch which must open the fuel oil solenoid valve and start the[ remote] fuel transfer pump at 75 percent of normal liquid level.

(4) High level float switch which must close the fuel oil solenoid valve and stop the[ remote] fuel transfer pump at 90 percent of normal liquid level.

(5) Critical high level float switch which must activate alarm at 95 percent of normal liquid level.

c. Leak Detector Switch for all tanks: Actuates when fuel is detected in containment basin, stops fuel transfer pump, and closes the fuel oil solenoid valve.

d. Control Panel for all tanks: Provide NEMA ICS 6, Type[ 1][____], enclosed control panel for each day tank. Control panel must include the following accessories.

(1) Power available LED (green).

(2) Critical low fuel alarm contacts for shut down of engine.

(3) Low-low level fuel alarm LED.

(4) Low-low level fuel alarm contacts for remote annunciator.

(5) Critical high level fuel alarm LED.

(6) Leak detecting alarm LED.

(7) Alarm horn.

e. Tank Gagesfor all tanks: Provide buoyant force type gages for diesel fuel tanks with dial indicator not less than 100 mm 4 inches in size and arranged for top mounting. Calibrate each reading dial or scale for its specific tank to read from empty to full, with intermediate points of 1/4, 1/2, and 3/4.

[f. Integral Base tanks used as Primary tank: Provide a 2 inch opening at the tank fillport, fitted an overfill prevention valve (OPV). Additionally, the fill opening must be perpendicular to the tank in order to allow operation of the OPV. Integral base tank must be sized and configured such that the filling and venting nozzles are outside the generator cabinet for ease of accessibility, inspection, and maintenance. Level gage must be in the line of sight from the fill port.}
g. Integral Base Tanks located inside buildings: The tank vents must discharge outside the building in accordance with NFPA 30 and NFPA 37. The fill pipe must terminate outside the building. The fill pipe connection point must be housed in a sealed spill box. High level alarms or level gauges used as overfill protection mechanisms must annunciate at the fill connection point. Provide an overfill prevention valve (OPV) at the tank with a check valve mounted on the fill line in the spill box. The fill connection point must be labeled with tank contents and capacity.

h. External Tanks (all non-integral base tanks) are specified in Section 33 56 10 Factory-Fabricated Fuel Storage Tanks.

2.2.4.3 Fuel Transfer Pump[s]

********************************************
NOTE: Delete this paragraph when remote fuel transfer pump(s) are provided. Select duplex pumps for facilities complying with UFC 4-510-01, "Design: Medical Military Facilities".
********************************************

Fuel transfer pumps may be mounted on the day tank. Pump[s] must be duplex, horizontal, positive displacement. Direct-connect pump to motor through a flexible coupling. Equip each pump with a bypass relief valve, if not provided with an internal relief valve. Provide motor and controller in accordance with paragraph ELECTRICAL SUPPORT EQUIPMENT.

2.2.4.4 Fuel Oil Solenoid Valve

UL 429. Provide electric solenoid type control valve for each day tank. Solenoid must be rated for starting battery voltage. Valve body must have a minimum working pressure rating of 1033 kPa 150 psig at 93 degrees C 200 degrees F. Valve must be capable of passing 0 to 0.63 L/s 0 to 10 gpm of fuel oil. Valves must be two-way, direct acting, normally closed (open when energized, closed when de-energized), with brass stainless steel body and resilient seat material. Solenoid enclosures must be NEMA ICS 6, Type 1. Body connections must be same size as connecting piping. Valve must be in line before the fuel pump.

2.2.4.5 Strainer

********************************************
NOTE: Select the options for duplex filters when changing of the filter will be required while the engine-generator set is operating. Do not provide duplex filters when the engine-generator set is to be installed in an enclosure or provided with an engine-driven radiator.
********************************************

[Simplex] [Duplex] strainers must comply with Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION).

2.2.4.6 Fuel Oil Meters

********************************************
NOTE: Provide fuel oil meters when required by the
Fuel oil meter must comply with Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION).

2.2.4.7 Fuel Oil Cooler

Provide an air cooled fuel oil cooler if the temperature of the fuel returned to the tank from the engine will cause overheating of the tank fuel above the maximum fuel temperature allowed by the engine manufacturer when operating at maximum rated generator power output and low fuel level in the tank. The fuel oil cooler must be furnished by the engine manufacturer for the application and the installation must be complete including piping and power requirements.

2.2.5 Starting Battery System

NOTE: Starting battery system must be 24-volt dc for engine-generator sets greater than 100 kW and 12-volt dc for engine-generator sets rated 100 kW and less.

Provide a 24-volt dc starting battery installation for starting of each engine-generator set utilizing an electric cranking system.

2.2.5.1 Engine Starting Battery

NOTE: The ambient temperature selected must be the lowest temperature at which the engine might be cranked. Battery configuration must be two parallel sets of two 12-volt batteries for engine-generator sets rated 750 kW and above.

Provide maintenance free, sealed, lead-acid, SAE Type D diesel engine starting batteries. Battery configuration must be two parallel sets of two 12-volt batteries. Batteries must have sufficient capacity to provide 60 seconds of continuous cranking of the engine in an ambient temperature of [_____] degrees C [_____] degrees F.

2.2.5.2 Starting Battery Charger

UL 1236. Provide 120 volt ac, enclosed, automatic equalizing, dual-rate, solid-state, constant voltage type battery charger with automatic ac line compensation. Dc output must be voltage regulated and current limited. Charger must have two ranges, float and equalize, and must provide continuous taper charging. The charger must have a continuous output rating of not less than 10 amperes and must be sized to recharge the engine starting batteries in a minimum of 8 hours while providing the control power needs of the engine-generator set. Enclosure must be NEMA ICS 6, Type 1. The following accessories must be included:

a. Dc ammeter

b. Dc voltmeter
c. Equalize light

d. Ac on light

e. Low voltage light

f. High voltage light

g. Equalize test button/switch

h. Ac circuit breaker

i. Low dc voltage alarm relay

j. High dc voltage alarm relay

k. Current failure relay

l. Ac power failure relay

2.2.6 Engine-Generator Control Panel

Provide NEMA ICS 6, Type [ 1][____], enclosed control panel mounted on the engine-generator set with vibration isolators. Provide the following control panel mounted devices and control features.

2.2.6.1 Control Panel Mounted Devices

a. Engine Control Switch (ECS): Provide a three position control switch with "MANUAL START" - "OFF/RESET" - "AUTO START" positions.

b. Emergency Stop Push Button (ESPB): Provide a red, mushroom head, twist-to-reset, maintained contact type push button.

c. Generator Metering: Provide ac metering package that displays ac voltage, current, and frequency of one phase of the generator output simultaneously. Metering package must include a voltmeter/ammeter phase selector switch to allow viewing of each phase.

b. Generator Voltage Adjust Potentiometer (VAP): Provide a potentiometer, locking screwdriver type, to adjust generator voltage.

e. Engine Instrumentation: Provide instrumentation package that displays the following engine information:

   (1) Engine oil pressure

   (2) Engine coolant temperature

   (3) Engine speed (rpm)

   (4) Engine running hours. Engine hour meter must be non-resettable.

f. Indicating Lamps: Provide LED type indicating lamps and a lamp test switch. Lamps must indicate the following alarm and shutdown conditions:

   (1) Low engine lubricating oil pressure alarm
(2) Low engine lubricating oil pressure shutdown
(3) High engine coolant temperature alarm
(4) High engine coolant temperature shutdown
(5) Engine overcrank shutdown
(6) Engine overspeed shutdown
(7) Emergency stop shutdown
(8) Starting battery system trouble alarm
(9) Day tank low fuel shutdown
(10) Low engine coolant temperature alarm
(11) Low coolant level shutdown
(12) High fuel level
(13) Leak detection basin

g. Alarm Horn: Provide an alarm horn and a horn silence switch.

h. Panel Lamp: Provide a panel lamp and lamp "ON-OFF" switch.

2.2.6.2 Crank Cycle/Terminate Relay

Provide crank cycle/terminate relay with adjustable crank/rest periods of 1 to 60 seconds (initially set for 15 seconds) and adjustable total crank time of 30 seconds to 10 minutes (initially set for 75 seconds).

2.2.6.3 Engine Cooldown Relay

Provide cooldown relay with adjustable cool down time of 0 to 30 minutes (initially set at engine manufacturer's recommended time).

[2.2.7 Remote Alarm Annunciator

**************************************************************************
NOTE: Include option for remote alarm panel located in a location readily observed by operating personnel when the engine-generator set is not in a readily observed location. For most applications the remote alarm annunciator should be powered from the engine starting battery system. When a separate battery power source is necessary, select the option for "Storage Battery."
**************************************************************************

Provide NEMA ICS 6, Type[1][____], enclosed remote alarm annunciator[powered by the engine starting battery system]. The annunciator must have a lamp test switch and LED type indicating lamps. The annunciator must give visual and audible warnings for the following operating and alarm conditions:
a. Provide lamps for the following operating conditions:
   (1) Operating power source, normal or emergency
   (2) Starting battery system trouble
b. Provide lamps and an audible signal for the following alarm conditions:
   (1) Low engine lubricating oil pressure
   (2) Low engine coolant temperature
   (3) High engine coolant temperature
   (4) Low fuel
   (5) Engine overcrank shutdown
   (6) Engine overspeed shutdown

[2.2.7.1 Storage Battery]

Provide storage batteries of suitable rating and capacity to supply and maintain power for the remote alarm annunciator for a period of 90 minutes minimum without the voltage applied falling below 87.5 percent of normal. Provide a 120 volt ac automatic battery charger.

]2.2.8 Generator Circuit Breaker

UL 489, molded case, adjustable thermal magnetic trip type circuit breaker. The circuit breaker continuous current rating must be adequate for the power rating of the engine-generator set and the circuit breaker must be rated to withstand the short circuit current provided by the generator set. Provide circuit breaker in a NEMA ICS 6, Type 1 enclosure mounted on the engine-generator set.

2.2.9 Electrical Support Equipment

Furnish with respective pieces of equipment. Motors, controllers, contactors, and disconnects must conform to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical connections under Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide controllers and contactors with maximum of 120-volt control circuits, and auxiliary contacts for use with controls furnished. When motors and equipment furnished are larger than size indicated, the cost of providing additional electrical service and related work must be included under this section.

[2.2.10 Weatherproof Enclosure]

Provide for each engine-generator set and fabricate from zinc coated or phosphatized and shop primed 16 gage minimum sheet steel in accordance with the manufacturer's standard design. Provide a complete, weatherproof enclosure for the engine, generator, and auxiliary systems and equipment. Support exhaust piping and silencer so that the turbocharger is not subjected to exhaust system weight or lateral forces generated in connecting piping that exceed the engine manufacturer's maximum allowed forces and moments. The housing must have sufficient louvered openings to allow entrance of outside air for engine and generator cooling at full load. Design louvered openings to exclude driving rain and snow. Provide
properly arranged and sized, hinged panels in the enclosure to allow convenient access to the engine, generator, and control equipment for maintenance and operational procedures. Provide hinged panels with spring type latches which must hold the panels closed securely and will not allow them to vibrate. Brace the housing internally to prevent excessive vibration when the set is in operation.

2.3 SPECIAL WRENCHES AND TOOLS

Wrenches and tools specifically designed and required to work on the new equipment, which are not commercially available as standard mechanic's tools, must be furnished to the Contracting Officer.

2.4 IDENTIFICATION OF EQUIPMENT

Provide plates and tags sized so that inscription is readily legible to operating or maintenance personnel and securely mounted to or attached in proximity of their identified controls or equipment. Lettering must be normal block lettering, a minimum of 6.4 mm 0.25 inch high.

2.4.1 Materials

Construct ID plates and tags of 16 gage minimum thickness bronze or stainless steel sheet metal engraved or stamped with inscription. Construct plates and tags not exposed to the weather or high operational temperature of the diesel engine of laminated plastic, 3.2 mm 0.125 inch thick, matte white finish with black center core, with lettering accurately aligned and engraved into the core.

2.4.2 Control Devices and Operation Indicators

Provide ID plates or tags for control devices and operation indicators, including valves, off-on switches, visual alarm annunciators, gages and thermometers, that are required for operation and maintenance of provided mechanical systems. Plates or tags must be minimum of 13 mm 0.5 inch high and 50 mm 2 inches long and must indicate component system and component function.

2.4.3 Equipment

Provide ID plates of a minimum size of 75 mm 3 inches high and 130 mm 5 inches long on provided equipment indicating the following information:

a. Manufacturer's name, address, type and model number, serial number, and certificate of compliance with applicable EPA emission standards;

b. Contract number and accepted date;

c. Capacity or size;

d. System in which installed; and

e. System which it controls.

2.5 ASSEMBLED OPERATION AND MAINTENANCE MANUALS

The contents of the assembled operation and maintenance manuals must include the manufacturer's O&M information required by the paragraph SD-10, OPERATION AND MAINTENANCE DATA and the manufacturer's O&M information.
specified in Section 26 36 23.00 20 AUTOMATIC TRANSFER SWITCHES.

a. Manuals must be in separate books or volumes, assembled and bound securely in durable, hard covered, water resistant binder, and indexed by major assembly and components in sequential order.

b. A table of contents (index) must be made part of the assembled O&M. The manual must be assembled in the order noted in table of contents.

c. The cover sheet or binder on each volume of the manuals must be identified and marked with the words, "Operation and Maintenance Manual."

2.6 SOURCE QUALITY CONTROL

**************************************************************************
NOTE: Include the bracketed option below for projects located outside the continental United States (OCONUS)
**************************************************************************

Perform and report on factory tests and inspections prior to shipment. Provide certified copies of manufacturer's test data and results. Test procedures must conform to ASME, IEEE,[ IEC,] and ANSI standards, and to ISO requirements on testing, as appropriate and applicable. The manufacturer performing the tests must provide equipment, labor, and consumables necessary for tests and measuring and indicating devices must be certified to be within calibration. Tests must indicate satisfactory operation and attainment of specified performance. If satisfactory, equipment tested will be given a tentative approval. Equipment must not be shipped before approval of the factory test reports for the following tests.

2.6.1 Engine Tests

Perform customary commercial factory tests in accordance with ISO 3046 on each engine and associated engine protective device, including, but not limited to the following:

a. Perform dynamometer test at rated power. Record horsepower at rated speed and nominal characteristics such as lubricating oil pressure, jacket water temperature, and ambient temperature.

b. Test and record the values that the low oil pressure alarm and protective shutdown devices actuate prior to assembly on the engine.

c. Test and record values that the high jacket water temperature alarm and protective shutdown devices actuate prior to assembly on the engine.

2.6.2 Generator Tests

**************************************************************************
NOTE: Include the bracketed option below for projects located outside the continental United States (OCONUS)
**************************************************************************

Tests must be performed on the complete factory assembled generator prior to shipment. Conduct tests in accordance with IEEE 115, NEMA C50.10[, IEC 60034-2A], and NEMA MG 1.
2.6.2.1 Routine Tests

Perform the following routine tests on the generators and their exciters:

a. Resistance of armature and field windings
b. Mechanical balance
c. Phases sequence
d. Open circuit saturation curve and phase (voltage) balance test
e. Insulation resistance of armature and field windings
f. High potential test

2.6.2.2 Design Tests

Submit the following design tests made on prototype machines that are physically and electrically identical to the generators specified.

a. Temperature rise test
b. Short circuit saturation curve and current balance test

2.6.3 Assembled Engine-Generator Set Tests

**************************************************************************
NOTE: Select the first option for engine-generator sets rated up to 250 kW. Select the second option for engine-generator sets rated greater than 250 kW.
**************************************************************************

[Submit the following tests made on prototype machines that are physically and electrically identical to the engine-generator set specified.][Perform the following tests on the assembled engine-generator set.]

2.6.3.1 Initial Stabilization Readings

Operate the engine-generator set and allow the set to stabilize at rated kW at rated power factor, rated voltage, and rated frequency. During this period record instrument readings for output power (kW), terminal voltage, line current, power factor, frequency (rpm) generator (exciter) field voltage and current, lubricating oil pressure, jacket water temperature, and ambient temperature at minimum intervals of 15 minutes. Adjust the load, voltage, and frequency to maintain rated load at rated voltage and frequency. Adjustments to load, voltage, or frequency controls must be recorded on the data sheet at the time of adjustment. Stabilization must be considered to have occurred when four consecutive voltage and current recorded readings of the generator (or exciter) field either remain unchanged or have only minor variations about an equilibrium condition with no evident continued increase or decrease in value after the last adjustment to the load, voltage, or frequency has been made.

2.6.3.2 Regulator Range Test

Remove load and record instrument readings (after transients have subsided). Adjust voltage to the maximum attainable value or to a value
just prior to actuation of the overvoltage protection device. Apply rated load and adjust voltage to the minimum attainable value or a value just prior to activation of the undervoltage protection device. The data sheets must indicate the voltage regulation as a percent of rated voltage and the maximum and minimum voltages attainable. Voltage regulation must be defined as follows:

\[
\text{Percent Regulation} = \frac{((\text{No-Load Voltage}) - (\text{Rated-Load Voltage})) \times 100}{(\text{Rated-Load Voltage})}
\]

2.6.3.3 Frequency Range Test

Adjust the engine-generator set frequency for the maximum attainable frequency at rated load. Record instrument readings. Adjust the engine-generator set frequency for the specified minimum attainable frequency at rated load. Record instrument readings. Reduce the load to zero and adjust the engine-generator set frequency for the maximum attainable frequency. Record instrument readings. Adjust the engine-generator set frequency for the minimum attainable frequency. Record instrument readings. The data sheet must show the maximum and minimum frequencies attained at rated load, and at no load.

2.6.3.4 Transient Response Test

Drop the load to no load and re-apply rated load three times to ensure that the no load and rated load voltage and frequency values are repeatable and that the frequency and voltage regulation is within the limits specified. Record generator terminal voltage and frequency using a high speed strip chart recorder. The data sheet must show the following results:

a. Frequency
   (1) Stability bandwidth or deviation in percent of rated frequency.
   (2) Recovery time.
   (3) Overshoot and undershoot.

b. Voltage
   (1) Stability bandwidth or deviation in percent of rated voltage.
   (2) Recovery time.
   (3) Overshoot and undershoot.

PART 3 EXECUTION

3.1 INSTALLATION

Installation must conform to the applicable requirements of IEEE C2, NFPA 30, NFPA 37, and NFPA 70.

3.2 GROUNDING

**************************************************************************
NOTE: Where rock or other soil conditions prevent obtaining a specified ground value, other methods of grounding should be specified. Where it is
impractical to obtain the indicated ground resistance values, make every effort within reason to obtain ground resistance values as near as possible to the indicated values.

NFPA 70 and IEEE C2, except that grounding systems must have a resistance to solid earth ground not exceeding 5 ohms.

3.2.1 Grounding Electrodes

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION and Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION. Connect ground conductors to the upper end of ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

3.2.2 Engine-Generator Set Grounding

Provide separate copper grounding conductors and connect them to the ground system as indicated. When work in addition to that indicated or specified is required to obtain the specified ground resistance, the provision of the contract covering "Changes" must apply.

3.2.3 Connections

Make joints in grounding conductors by exothermic weld or compression connector. Exothermic welds and compression connectors must be installed as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION paragraph regarding GROUNDING.

3.2.4 Grounding and Bonding Equipment

UL 467, except as indicated or specified otherwise.

3.3 START-UP ENGINEER

Provide the services of a qualified factory trained start-up engineer, regularly employed by the engine-generator set manufacturer. The start-up services must include conducting preliminary operations and functional acceptance tests. The start-up engineer must be present at the engine generator set installation site, full-time, while preliminary operations and functional acceptance tests are being conducted.

3.4 PREREQUISITES FOR FUNCTIONAL ACCEPTANCE TESTING

Completion of the following requirements is mandatory prior to scheduling functional acceptance tests for the engine-generator set and auxiliary equipment.

3.4.1 Piping Tests

Complete as specified in Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION).

3.4.2 Performance of Acceptance Checks and Tests

The acceptance checks and tests must be accomplished by the testing organization as described in Section 26 08 00 APPARATUS INSPECTION AND
TESTING.

3.4.2.1 Generator Sets

Complete as specified in the paragraph ACCEPTANCE CHECKS AND TESTS.

3.4.2.2 Automatic Transfer Switches

Complete acceptance checks and tests as specified in Section 26 36 23.00 20 AUTOMATIC TRANSFER SWITCHES.

3.4.3 Preliminary Operations

The start-up engineer must conduct manufacturer recommended start-up procedures and tests to verify that the engine-generator set and auxiliary equipment are ready for functional acceptance tests. Give the Contracting Officer 15 days' advance notice that preliminary operations will be conducted. After preliminary operation has been successfully conducted, the start-up engineer will notify the Contracting Officer in writing stating the engine-generator set and auxiliary equipment are ready for functional acceptance tests.

3.4.4 Preliminary Assembled Operation and Maintenance Manuals

Preliminary assembled operation and maintenance manuals must have been submitted to and approved by the Contracting Officer. Manuals must be prepared as specified in the paragraph ASSEMBLED OPERATION AND MAINTENANCE MANUALS.

3.4.5 Functional Acceptance Test Procedure

Test procedure must be prepared by the start-up engineer specifically for the engine-generator set and auxiliary equipment. The test agenda must cover the requirements specified in the paragraph FUNCTIONAL ACCEPTANCE TESTS. The test procedure must indicate in detail how tests are to be conducted. A statement of the tests that are to be performed without indicating how the tests are to be performed is not acceptable. Indicate what work is planned on each workday and identify the calendar dates of the planned workdays. Specify what additional technical support personnel is needed such as factory representatives for major equipment. Specify on which testing workday each technical support personnel is needed. Data recording forms to be used to document test results are to be submitted with the proposed test procedure. A list of test equipment and instruments must also be included in the test procedure.

3.4.6 Test Equipment

Test equipment and instruments must be on hand prior to scheduling field tests or, subject to Contracting Officer approval, evidence must be provided to show that arrangements have been made to have the necessary equipment and instruments on site prior to field testing.

3.5 FIELD QUALITY CONTROL

**************************************************************************
NOTE: Include the bracketed option below for NAVFAC projects. coordinate Echelon III Reach-back Support with NAVFAC LANT CI44 Office or NAVFAC PAC CI44 Office during the design stage of the specific
**************************************************************************
Give Contracting Officer[ NAVFAC [____], Code [____]] 30 days notice of dates and times scheduled for tests which require the presence of the Contracting Officer. The Contracting Officer will coordinate with the using activity and schedule a time that will eliminate or minimize interruptions and interference with the activity operations. The Contractor must be responsible for costs associated with conducting tests outside of normal working hours and with incorporating special arrangements and procedures, including temporary power conditions. The Contractor must provide labor, equipment, diesel fuel, test load, and consumables required for the specified tests. The test load must be a cataloged product. Calibration of measuring devices and indicating devices must be certified. Refer to Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, for requirements for a cataloged product. Perform the following field tests.

3.5.1 Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations, and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.5.1.1 Circuit Breakers - Low Voltage Insulated Case/Molded Case

a. Visual and mechanical inspection

   (1) Compare nameplate data with specifications and approved shop drawings.

   (2) Inspect circuit breaker for correct mounting.

   (3) Operate circuit breaker to ensure smooth operation.

   (4) Inspect case for cracks or other defects.

   (5) Verify tightness of accessible bolted connections and cable connections by calibrated torque-wrench method. Thermographic survey is not required.

   (6) Inspect mechanism contacts and arc chutes in unsealed units.

b. Electrical Tests

   (1) Perform contact-resistance tests.

   (2) Perform insulation-resistance tests.

   (3) Adjust Breaker(s) for final settings in accordance with engine-generator set manufacturer's requirements.

3.5.1.2 Current Transformers

a. Visual and Mechanical Inspection

   (1) Compare equipment nameplate data with specifications and approved shop drawings.

   (2) Inspect physical and mechanical condition.
(3) Verify correct connection.

(4) Verify that adequate clearances exist between primary and secondary circuit.

(5) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method. Thermographic survey is not required.

(6) Verify that all required grounding and shorting connections provide good contact.

b. Electrical Tests

(1) Perform insulation-resistance tests.

(2) Perform polarity tests.

(3) Perform ratio-verification tests.

3.5.1.3 Metering and Instrumentation

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify tightness of electrical connections.

b. Electrical Tests

(1) Determine accuracy of meters at 25, 50, 75, and 100 percent of full scale.

(2) Calibrate watthour meters according to manufacturer's published data.

(3) Verify all instrument multipliers.

(4) Electrically confirm that current transformer secondary circuits are intact.

3.5.1.4 Battery Systems

a. Visual and mechanical inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method. Thermographic survey is not required.

(4) Measure electrolyte specific gravity and temperature and visually
check fill level.

(5) Verify adequacy of battery support racks, mounting, anchorage, and clearances.

b. Electrical tests

(1) Set charger float and equalizing voltage levels.

(2) Verify all charger functions and alarms.

(3) Measure each cell voltage and total battery voltage with charger energized and in float mode of operation.

(4) Perform a capacity load test.

3.5.1.5 Engine-Generator Set

a. Visual and mechanical inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Inspect for correct anchorage and grounding.

b. Electrical and mechanical tests

(1) Perform an insulation-resistance test on generator winding with respect to ground. Calculate polarization index.

(2) Perform phase rotation test to determine compatibility with load requirements.

3.5.1.6 Grounding System

a. Visual and mechanical inspection

(1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical tests

(1) Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground testing megger in accordance with manufacturer's instructions to test each ground or group of grounds. The instrument must be equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

3.5.2 Functional Acceptance Tests

**************************************************************************

SECTION 26 32 13.00 20 Page 44
The tests must be performed by the start-up engineer. Upon successful test completion, the start-up engineer must provide the Contracting Officer with a written test report within 15 calendar days showing the tests performed and the results of each test. The report must include the completed approved test data forms and certification from the start-up engineer that the test results fall within the manufacturer's recommended limits and meet the specified requirements performance. The report must be dated and signed by the start-up engineer, and submitted for approval by the Contracting Officer. The Contracting Officer[ and NAVFAC [_____] , Code [_____] ] will witness final acceptance tests. Testing must include but not be limited to:

a. Verify proper functioning of each engine protective shutdown device and pre-shutdown alarm device. Testing of the devices must be accomplished by simulating device actuation and observing proper alarm and engine shutdown operation.

b. Verify proper functioning of the engine overspeed trip device. Testing of the overspeed trip device must be accomplished by raising the speed of the engine-generator set until an overspeed trip is experienced.

c. Verify proper functioning of the crank cycle/terminate relay. Testing of the relay must be accomplished by engaging the starter motor with the engine being prevented from running. Observe the complete crank/rest cycle as described in the paragraph CRANK CYCLE/TERMINATE RELAY.

d. Verify proper functioning of the following automatic and manual operations. Testing must include but not be limited to:

   (1) Loss of Utility: Initiate a normal power failure with connected test load of rated kW at 1.0 power factor. Record time delay on start, cranking time until engine starts and runs, time to come up to operating speed, voltage and frequency overshoot, and time to achieve steady state conditions with all switches transferred to emergency position.

   (2) Return of Utility: Return normal power and record time delay on retransfer for each automatic transfer switch, and time delay on engine cooldown and shutdown.

   (3) Manual starting

   (4) Emergency stop

e. Operate the engine-generator set at rated current (amperes) until the jacket water temperature stabilizes. Stabilization will be considered to have occurred when three consecutive temperature readings remain unchanged. Continue to operate the generator set for an additional 2 hours. Record instrument readings for terminal voltage, line current, frequency (Hz), engine speed rpm, lubricating oil pressure, jacket water temperature, and ambient temperature at 5 minute intervals for first 15 minutes and at 15 minute intervals thereafter.
3.5.3 Emissions Tests

**************************************************************************
NOTE: Include the following paragraph when verification of diesel engine emission limits are required by air pollution permit.
**************************************************************************

Provide on site testing by a certified testing organization of each engine-generator set. Testing must be in accordance with an EPA approved method, 40 CFR 60, (Appendix, Method 7, 7A, 7B, 7C, 7D or 7E). Emissions at rated full load must be within the limits specified in the paragraph DIESEL ENGINE EMISSIONS LIMITS.

3.6 DEMONSTRATION

Upon completion of the work and at a time approved by the Contracting Officer, the Contractor must provide instructions by a qualified instructor to the Government personnel in the proper operation and maintenance of the equipment. Government personnel must receive training comparable to the equipment manufacturer's factory training. The duration of instruction must be for not less than one 8 hour working day for instruction of operating personnel and not less than one 8 hour working day for instruction of maintenance personnel.

3.6.1 Instructor's Qualification Resume

Instructors must be regular employees of the engine-generator set manufacturer. The instruction personnel provided to satisfy the requirements above must be factory certified by the related equipment manufacturer to provide instruction services. Submit the name and qualification resume of instructor to the Contracting Officer for approval.

3.6.2 Training Plan

Submit training plan 30 calendar days prior to training sessions. Training plan must include scheduling, content, outline, and training material (handouts). Content must include but not limited to the following:

3.6.2.1 Operating Personnel Training

This instruction includes operating the engine-generator set, auxiliary equipment including automatic transfer switches in all modes, and the use of all functions and features specified.

3.6.2.2 Maintenance Personnel Training

Training must include mechanical, hydraulic, electrical, and electronic instructions for the engine-generator set and auxiliary equipment including automatic transfer switches.

a. Mechanical Training: Must include at least the following:
   (1) A review of mechanical diagrams and drawings.
   (2) Component location and functions.
   (3) Troubleshooting procedures and techniques.
(4) Repair procedures.
(5) Assembly/disassembly procedures.
(6) Adjustments (how, when, and where).
(7) Preventive maintenance procedures.
(8) Review of flow diagram.
(9) Valve locations and function.
(10) Valve and hydraulic equipment adjustment and maintenance procedures.
(11) Hydraulic system maintenance and servicing.
(12) Lubrication points, type, and recommended procedures and frequency.

b. Electrical and Electronic Maintenance Training: Must include at least the following:

(1) A review of electrical and electronic systems including wiring diagrams and drawings.
(2) Troubleshooting procedures for the machine and control systems.
(3) Electrical and electronic equipment servicing and care.
(4) Use of diagnostics to locate the causes of malfunction.
(5) Procedures for adjustments (locating components, adjustments to be made, values to be measured, and equipment required for making adjustments).
(6) Maintenance and troubleshooting procedures for microprocessor or minicomputer where applicable.
(7) Circuit board repair procedures where applicable (with schematics provided).
(8) Use of diagnostic tapes.
(9) Recommended maintenance servicing and repair for motors, switches, relays, solenoids, and other auxiliary equipment and devices.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for stationary diesel driven generator sets in the 15 to 300 kilowatt capacity for standby applications.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification is for procurement of engine-generator sets which are suitable for serving general purpose and commercial-grade loads (loads which may be served by an electric utility). These are loads which can endure or recover quickly from transient voltage and frequency changes (as much as 30 percent transient voltage drop, and plus or minus 5 percent frequency deviation, with recovery time of 2 seconds). For applications where strict control of voltage, frequency, and transient response is required, provide uninterruptible power supplies or utilize Section 26 32 15.00 10 DIESEL-GENERATOR SET STATIONARY 100-2500 KW, WITH AUXILIARIES. This specification is for procurement of engine-generator...
sets for standby, stand-alone applications. For prime or parallel applications, incorporate the appropriate paragraphs from Section 26 32 15.00 10. Select the features and fill in blanks with values appropriate for the design condition. This specification does not apply to 400 Hz applications.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SYSTEM DESCRIPTION

a. Provide and install each engine-generator set complete and totally functional, with all necessary ancillary equipment to include air filtration; starting system; generator controls, protection, and isolation; instrumentation; lubrication; fuel system; cooling system; and engine exhaust system. Each engine generator set shall satisfy the requirements specified in the Engine Generator Parameter Schedule. Submit certification that the engine-generator set and cooling system function properly in the ambient temperatures specified.

b. Provide each engine-generator set consisting of one engine, one generator, and one exciter, mounted, assembled, and aligned on one base; and all other necessary ancillary equipment which may be mounted separately. Sets shall be assembled and attached to the base prior to shipping. Set components shall be environmentally suitable for the locations shown and shall be the manufacturer's standard product offered in catalogs for commercial or industrial use. Provide a generator strip heater for moisture control when the generator is not operating.

1.2.1 Engine-Generator Parameter Schedule

**************************************************************************
NOTE: Where multiple engine-generator sets of different sizes or applications are to be provided,
a Parameter Schedule should be shown on the contract drawings (one for each engine-generator set to be installed). If only one engine-generator set is provided (or multiples of the same type, size, etc.), the schedule may be in the body of the specification. Note that the specifications refer to the Engine Generator parameter Schedule and the designer must provide one each by that name.

Power Ratings and Industry Terminology. The following definition is from the Electrical Generating Systems Association Standard 101P, Engine Driven Generating Sets. Stationary diesel-engine-driven electric generator sets are divided into the following four rating categories: EMERGENCY STANDBY, LIMITED RUNNING TIME, PRIME POWER, and INDUSTRIAL.

"EMERGENCY STANDBY RATING means the power that the generator set will deliver continuously under normal varying load factors for the duration of a power outage". It must be understood that this definition uses the term "normal varying load conditions". Most manufacturers use this terminology to indicate that their units typically are not rated for continuous operation at the nameplate rating, but rather that the units provided are rated for continuous operation at 70 to 80 percent of their nameplate rating, with periodic loading up to 100 percent of the nameplate rating for short (cyclical) periods during a power outage. Additionally, the designer must analyze the load characteristics and profiles of the load to be served to determine the peak demand, maximum step load increase and decrease, motor starting requirements represented as starting kVA, and the non-linear loads to be served. This information should be included in the engine-generator set parameter schedule or on the drawings for each different unit provided. For this application service load is the peak estimated loading to be placed on the engine generator set. Peak demand calculation provides a figure from which to determine the service load. When specifying a genset be sure to specify what the peak load is and how much is continuous.

Power Factor. Commercial genset power ratings are usually based on 0.8 power factor. Select 0.8 unless the application requires one more stringent.

Motor Starting Load. Motor starting requirements are important to properly size engine generator sets because the starting current for motors can be as much as six times the running current, and can cause generator output voltage and frequency to drop, even though the genset has been sized to carry the running load. The designer must analyze the motor loads to determine if the starting characteristics of a motor or a group of motors to be started
simultaneously will cause objectionable genset performance. Provide a starting kVA value for the largest motor or combination of motors to be started simultaneously. An increase in the size rating of the genset may be necessary to compensate for the inrush current. This assists the genset supplier in properly sizing the engine generator set.

Maximum Speed. The maximum allowable speed is 1800 RPM. If there is no specific requirement or user requirement for slower speed machines, select 1800 RPM.

Heat Exchanger Type. Fin-tube exchangers (radiators) are the predominate method of cooling. Specify either a fin-tube or a shell-tube heater exchanger for each engine-generator set. Heat exchangers located remote from the engine-generator set (i.e., not mounted on the engine-generator set base) shall be shown on the project plans, including the power source for associated fans and pumps.

Governor. The type of governor to be used on each engine generator set should be identified as isochronous or droop on the engine-generator set parameter schedule. Isochronous governors hold frequency at the setpoint frequency (within bandwidth) for all steady state loads from 0 to 100 percent load and are required for applications where severe demands are made on voltage and frequency regulation. Droop governors allow frequency to droop to the specified percentage proportional to steady state loads from 0 to 100 percent load and are generally acceptable for general purpose and commercial applications.

Engine-generator sets in stand alone service (isolated bus) may utilize either droop or isochronous governors. The designer should analyze the application and loads to determine if the more expensive isochronous unit is actually required. Droop units provide added stability (less engine cycling) in single unit applications where constant speeds are not critical and are less expensive than isochronous governors.

Frequency Bandwidth. Governor frequency bandwidth defines the allowable steady state variation in frequency and is typically quite small for commercially available governors (typically less than + 0.4 percent with + 0.25 percent readily available). The predominant type of device loads which are susceptible to steady state frequency deviations less that + 0.4 percent are those which employ switching power supplies (computers and variable frequency drives). The designer should select the least restrictive value for bandwidth for the application.
Voltage Regulators. Solid state regulators are easily available which maintain the voltage level (regulation or voltage droop) to + 0.5 percent. Voltage regulator bandwidth is important relative primarily to transient response. EGSA Standard 100R-1992 defines three performance classes for voltage regulators: standard (2 percent bandwidth); high (1 percent bandwidth); and precision (0.5 percent bandwidth). Select the least restrictive bandwidth necessary to satisfy the application requirement.

Generator frequency, and voltage should be shown on the engine-generator set schedule. (For example: 60 Hz, 208Y/120 volts, 3-phase, 4-wire).

Subtransient Reactance. The subtransient reactance of a generator is the impedance characteristic which determines current during the first cycle after a system short circuit condition is presented to the generator. Therefore, it is used to determine the necessary interrupting capacity of the genset circuit interrupting device. It also is utilized to predict generator response to non-linear loads. Typical values for generator subtransient reactance are found in IEEE Std 141. Subtransient reactance is specified in per unit of the generator rated kVA. Also, see the following discussion on non-linear loads.

Non-linear Loads: Non-linear loads are addressed in IEEE 519. They are loads that draw a non-sinusoidal current waveform when supplied by a sinusoidal voltage source. Typical non-linear loads include solid state switching power supplies, computer power supplies (including those found in desktop PC’s, uninterruptible power supplies, variable frequency drives, radar power supplies, and solid state ballasts in fluorescent light fixtures. They cause distortion of the source voltage and current waveforms that can have harmful effects on many types of electrical equipment and electronics, including generators. Non-linear loads are similar to short circuits in that they provide momentary, sub-cycle-duration, short-circuiting of two phases. Switching power supplies consist of SCR/thyristors-controlled rectifier bridges which act as three single-phase loads, each connected across two phases of the power system. When the SCR/thyristors are switched on and off a notch in the voltage waveform will occur as a result of an instantaneous phase-phase short-circuit during the commutation of current. A low generator subtransient reactance minimizes the voltage waveform distortion in the presence of such loads. For this reason, when the non-linear loads comprise 25 percent or more of the loads served, the generator subtransient reactance should be limited to more than 0.12.
Generators are particularly vulnerable to control problems and instability, excessive winding heating, neutral overheating, reduced efficiency, reduced torque, shaft fatigue, accelerated aging, and induced mechanical oscillations when non-linear loads are applied without careful consideration of the generator's capability to supply them. Measures which can be used to mitigate the effects of non-linear loads on generators include: procurement of low impedance generators with special windings to compensate for the additional heating; installation of harmonic filter traps; avoidance of self-excited generators; use of 2/3 pitch factor (rather than 5/6 pitch) generator windings; and generator derating with oversized neutrals.

For large non-linear loads, filter traps which are tuned to the dominant harmonic frequencies of the non-linear loads should be procured/provided with the load component. This approach is normally less costly than procurement of specially designed or derated generators.

For combinations of linear and non-linear loads where the percentage of non-linear loads is small relative to the capacity rating of the generator (25 percent or less), standard generator configurations are normally acceptable.

Provide a list of the non-linear loads in the parameter schedule either on the drawings (and denoted on the single-line diagram) or in tabular form in the specification section. The list should contain a description of the load including equipment type, whether the rectifier is 6-pulse or 12-pulse, kVA rating, and frequency. Provide a linear load value (kVA @ PF) which represents the maximum linear load demand when non-linear loads will also be in use. The generator manufacturer will be required to meet the total harmonic distortion limits established in IEEE 519. Delete the non-linear load paragraph when non-linear loads are not served from the engine-generator set.

Maximum Step Load Increase. Maximum step load increase is used to account for the addition of block loads. This affects engine-generator set frequency and voltage output and usually initiate governor and regulator response. The change in engine-generator set output and the response of the governor and regulator defines the transient loading response. In the size range covered by this specification (and for standby applications) acquisition of full load in one step is typical for major genset manufacturers (voltage deviation of 30 percent or less, frequency deviation of + 5 percent, recovery time 3 to 5 seconds, typical). If the application requires a more stringent response,
specify the actual maximum step load and add the allowable deviations and recovery times to the Engine Generator Set Parameter Schedule. If it is critical enough to add these requirements, also add the Transient Response Test from Section 26 32 15.00 10 DIESEL-GENERATOR SET STATIONARY 100-2500 KW, WITH AUXILIARIES, to verify the results in the field. It should be noted that this adds significant cost to the cost of a genset.

Transient Recovery Criteria (short time duration). Genset response and recovery times vary according to the size of the set, the block load, and the controls specified. Normal response to addition of a block load will include dips in either output voltage or frequency or both and possible "overshoot" as the governor and voltage regulator respond to bring the voltage and frequency back within bandwidth. Normal response to lose of a block load will include an upward spike in output voltage or frequency back within bandwidth. The Maximum Voltage and Frequency deviation apply to undervoltage/underfrequency ("dips") from the addition of block loads and any undershoot resulting from the recovery of an upward spike, as well as overvoltage/overfrequency (upward spikes) from the loss of block loads and any overshoot resulting from the recovery of a dip.

Cost Impact. If stringent transient-response requirements are specified the manufacturer may select engine and generator models which have nominal rating much larger than the service load; may use an unnecessarily expensive governor; and may use a higher inertia flywheel. The designer should investigate what may actually be provided so that the cost estimate will be reasonably accurate and to confirm the selected transient requirements are not unnecessarily stringent. A maximum size for the engine-generator set may be needed to avoid the problems associated with a small load on a large capacity set.

The designer must determine the cost benefits of providing an uninterruptible power system for transient ride-through versus purchasing a generator with stringent transient response requirements. In determining the allowable voltage and frequency variation and recovery times, analyze the effects on equipment performance and recovery. Consult the NEMA utilization equipment standards to determine the maximum allowable voltage dips/overshoots (excursions).

Maximum Voltage Deviation. Select 5 percent Maximum Voltage Deviation option only if communication equipment or other sensitive electronic equipment are a critical part of the load, and there is no UPS provided. Fluorescent lights can tolerate a maximum
of 10 percent voltage variation. NEMA induction motors and control relays can tolerate a maximum of 10 percent variation, for 30 cycles and one cycle respectively. Solenoids (brakes, valves, clutches) and ac & dc starter coils can tolerate a maximum of minus 30 percent variation, for 1/2 cycle, 2 cycles (dropout), and 5 - 10 cycles (dropout) respectively. (The times listed in cycles are not given to define the recovery time back to bandwidth, but to assist the designer in defining the maximum allowable voltage deviation.) The designer should realistically assess the need for limiting the transient voltage dip to less than 30 percent.

Maximum Frequency Deviation. Computers can usually tolerate only + 0.5 Hz variation, so an UPS is normally required where computer service should not be interrupted, or where system recovery times are critical. Inverters can tolerate + 2 Hz variation. NEMA induction motors and control relays can tolerate a maximum of 5 percent frequency variation. (The times listed in cycles are not given to define the recovery time back to bandwidth, but to assist the designer in defining the maximum allowable frequency deviation.) The designer must be realistic in assessing the needs of the facility to be served so that unnecessarily stringent requirements are not specified.

Recovery Time Back to Bandwidth. The designer should determine the required recovery time for the loads served. The recovery time to bandwidth is not critical to operation of most equipment if the voltage and frequency do not deviate from the critical limits, or if momentary interruption is acceptable to the loads being served. The primary importance of this requirement is to ensure that the engine generator set recovers and stabilizes after load changes. Most engine generator sets can respond to 100 percent block loads; and return to voltage and frequency bandwidths within 15 - 20 seconds, depending on the size of the machine (RPM, relative mass of the rotating elements, and ambient conditions).

Transient Recover Time [_____] seconds (Voltage).

Transient Recovery Time [_____] seconds (Frequency).
Maximum Step Load Decrease (without shutdown). An engine generator set should be capable of being unloaded in a single step without tripping offline. In these situations the voltage and frequency transients are of no concern because there is no load being served.

Nominal Step Load Decrease. Step load decrease is used to account for dropping of block loads. This affects engine-generator set frequency and voltage output and usually initiates governor and regulator response. The change in engine-generator set output and the response of the governor and regulator defines the transient loading response. Where the load served may be sensitive to voltage and frequency variation due to significant load decrease, included the items below in the Parameter Schedule. The Nominal Step Load Decrease provided the genset manufacturer with the information necessary to set the governor response for load decreases such that an overspeed (over-frequency) condition does not occur. The cost of engine-generator sets increase by large percentages for smaller frequency and voltage deviations from bandwidth and improved recovery times. Carefully analyze the user's need for restrictions on frequency, voltage, and waveform characteristics. If required add the following to the Engine Generator Set Parameter Schedule and also add the Transient Response Test from Section 26 32 15.00 10 DIESEL-GENERATOR SET STATIONARY 100-2500 KW, WITH AUXILIARIES to verify the results in the field.

Maximum Time to Start and Assume Load. Choose 10 seconds for emergency-standby applications (critical for life safety), NFPA 70 requires that standby engine-generator sets used in emergency applications start and assume load in 10 seconds. Most
commercially available engine generator sets are capable of starting and assuming load within 10 seconds, however, a default value of 20 seconds is non-restrictive and provides a reasonable maximum value for non-critical applications.

Temperature Management. The designer is responsible for temperature control in the space occupied by the engine generator set. However, because the genset supplier normally provides the engine cooling system (and block heaters where required), the designer must provide ambient conditions under which the engine generator must operate, so that the supplier can size the equipment. Typically, high temperature provides the most restrictive condition, therefore the designer must design air-flow of adequate temperature and sufficient quantity to maintain the temperature of the generator and engine space within acceptable limits. This requires the designer to consult manufacturers literature and/or representatives to determine the nominal heat rejection to the surroundings at rated capacity (from all heat sources) to determine the required cooling or air flow through the engine generator set room or enclosure. In turn the manufacturer must submit the specific operating data in order for the Contracting Officer and designers to verify that the proposed equipment meets the design parameters.

**Output Capacity**

NOTE: The service load for each genset should be shown on the Engine-Generator Parameter Schedule. The designer has control over the service load. The Contractor through the supplier's manufacturer/assembler has control of the efficiency and associated ancillary equipment loads.
Provide each generator set with power equal to the sum of service load plus the machine's efficiency loss and associated ancillary equipment loads. Rated output capacity shall also consider engine and/or generator oversizing required to meet requirements in paragraph Engine-Generator Parameter Schedule.

1.2.3 Power Rating

Standby ratings shall be in accordance with EGSA 101P.

1.2.4 Engine Generator Set Enclosure

**NOTE:** If the engine-generator set is to be installed out-of-doors, include requirement for the weatherproof enclosure in the engine-generator set schedule. Define corrosion resistance and/or material required for the environment. Provide structural loading required for the geographic area (wind loads, snow loads, etc.). A generator set enclosure may also be needed to mitigate excessive noise caused by the engine generator set mechanical components. Delete the reference to mechanical noise limitations if an enclosure is not needed to mitigate sound emissions. If a sound enclosure is not provided, the designer must provide a design to prevent excessive noise (meet OSHA requirements. Delete this paragraph if no engine-generator set enclosure is needed.

The engine generator set enclosure shall be corrosion resistant, fully weather resistant, contain all set components, and provide ventilation to permit operation at rated load under secured conditions. Provide doors for access to all controls and equipment requiring periodic maintenance or adjustment. Provide removable panels for access to components requiring periodic replacement. The enclosure shall be capable of being removed without disassembly of the engine-generator set or removal of components other than exhaust system. The enclosure shall reduce the noise of the generator set to within the limits specified in the paragraph SOUND LIMITATIONS.

1.2.5 Vibration Isolation

**NOTE:** See UFC 3-450-02, Power Plant Acoustics, and UFC 3-450-01, Noise and Vibration Control For Mechanical Equipment for vibration criteria. Choose between a vibration-isolation system and the manufacturer's standard mounting. Vibration isolation systems should be applied where vibration transmitted through the generator set support structure produces (either directly or by resonant frequencies of structural members) annoying or damaging vibration in the surrounding environment. Select the manufacturer's standard or provide the maximum allowable vibration force necessary to limit
the maximum vibration. Delete the vibration isolation requirement for applications where vibration does not affect the floor or foundation.

1.2.5.1 Vibration Limitations

The maximum engine-generator set vibration in the horizontal, vertical and axial directions shall be limited to 0.15 mm or 6 mils (peak-peak RMS), with an overall velocity limit of 24 mm/seconds or 0.95 inches/seconds RMS, for all speeds through 110 percent of rated speed. [Install a vibration-isolation system between the floor and the base to limit the maximum vibration transmitted to the floor at all frequencies to a maximum of [_____] (peak force).] [The engine-generator set shall be provided with vibration-isolation in accordance with the manufacturer's standard recommendation.] Where the vibration-isolation system does not secure the base to the structure floor or unit foundation, provide seismic restraints in accordance with the seismic parameters specified.

1.2.5.2 Torsional Analysis

Submit torsional analysis including prototype testing or calculations which certify and demonstrate that no damaging or dangerous torsional vibrations will occur when the prime mover is connected to the generator, at synchronous speeds, plus/minus 10 percent.

1.2.5.3 Performance Data

Submit vibration isolation system performance data for the range of frequencies generated by the engine-generator set during operation from no load to full load and the maximum vibration transmitted to the floor. Also submit a description of seismic qualification of the engine-generator mounting, base, and vibration isolation.

1.2.6 Reliability and Durability

Submit documentation which cites engines and generators in similar service to demonstrate compliance with the requirements of this specification. Certification does not exclude annual technological improvements made by a manufacturer in the basic standard model set on which experience was obtained, provided parts interchangeability has not been substantially affected and the current standard model meets all the performance requirements of this specification. For each different set, 2 like sets shall have performed satisfactorily in a stationary power application, independent and separate from the physical location of the manufacturer's and assembler's facilities, for a minimum of 2 consecutive years without any failure to start, including periodic exercise. The certification shall state that for the set proposed to meet this specification, there were no failures resulting in downtime for repairs in excess of 72 hours or any failure due to overheating during 2 consecutive years of service. Like sets are of the same model, speed, bore, stroke, number and configuration of cylinders, and output power rating. Like generators are of the same model, speed, pitch, cooling, exciter, voltage regulator and output power rating. A list shall be provided with the name of the installations, completion dates, and name and telephone number of a point of contact.

1.3 SUBMITTALS
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Conformance to Codes and Standards

Where equipment is specified to conform to requirements of any code or standard such as UL, the design, fabrication and installation shall conform to the code.

1.4.2 Site Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, qualify procedures and welders in accordance with ASME BPVC SEC IX.

a. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1.
b. Welder qualification tests shall be performed for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests. The qualification tests shall be performed at the work site if practical.

c. The welder or welding operator shall apply the assigned personal symbol near each weld made as a permanent record.

d. Submit a letter listing the welder qualifying procedures for each welder, complete with supporting data such as test procedures used, what was tested to, and a list of the names of all welders and their qualifications symbols.

1.4.3 Experience

Each component manufacturer shall have a minimum of 3 years experience in the manufacture, assembly and sale of components used with stationary diesel engine-generator sets for commercial and industrial use. The engine-generator set manufacture/assembler shall have a minimum of 3 years experience in the manufacture, assembly and sale of stationary diesel engine-generator sets for commercial and industrial use. Submit a statement showing and verifying these requirements.

1.4.4 Field Engineer

The engine-generator set manufacturer or assembler shall furnish a qualified field engineer to supervise the complete installation of the engine-generator set, assist in the performance of the onsite tests, and instruct personnel as to the operational and maintenance features of the equipment. The field engineer shall have attended the engine-generator manufacturer's training courses on installation and operation and maintenance for engine generator sets. Submit a letter listing the qualifications, schools, formal training, and experience of the field engineer.

1.4.5 Seismic Requirements

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if no seismic details are provided. Pertinent portions of UFC 3-310-04 and Sections 13 48 00, 23 05 48.19, and 26 05 48.00 10, properly edited, must be included in the contract documents.
**************************************************************************

Seismic requirements shall be in accordance with UFC 3-310-04 and Sections 13 48 00 [SEISMIC] BRACING FOR MISCELLANEOUS EQUIPMENT, 23 05 48.19 [SEISMIC] BRACING FOR HVAC and 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT [as shown on the drawings].

1.4.6 Detailed Drawings

Submit detailed drawings showing the following:

a. Base-mounted equipment, complete with base and attachments including
anchor bolt template and recommended clearances for maintenance and operation.

b. Starting system.
c. Fuel system.
d. Cooling system.
e. Exhaust system.
f. Electric wiring of relays, breakers, programmable controllers, and switches including single line and wiring diagrams.
g. Lubrication system, including piping, pumps, strainers, filters, [heat exchangers for lube oil and turbocharger cooling,] [electric heater,] controls and wiring.
h. Location, type, and description of vibration isolation devices.
i. The safety system, including wiring schematics.
j. One-line schematic and wiring diagrams of the generator, exciter, regulator, governor, and all instrumentation.
k. Panel layouts.
l. Mounting and support for each panel and major piece of electrical equipment.
m. Engine-generator set rigging points and lifting instructions.

1.5 DELIVERY, STORAGE AND HANDLING

Properly protect materials and equipment in accordance with the manufacturers recommended storage procedures, before, during, and after installation. Protect stored items from the weather and contamination. During installation, piping and similar openings shall be capped to keep out dirt and other foreign matter.

1.6 MAINTENANCE SERVICE

Submit the operation and maintenance manuals and have them approved prior to commencing onsite tests.

1.6.1 Operation Manual

Provide [three] [_____] copies of the [manufacturers standard operation manual] [operation manual in 216 by 279 mm 8-1/2 by 11 inch three-ring binders]. Sections shall be separated by heavy plastic dividers with tabs which identify the material in the section. Drawings shall be folded blue lines, with the title block visible, and placed in 216 by 279 mm 8-1/2 by 11 inch plastic pockets with reinforced holes. The manual shall include:

a. Step-by-step procedures for system startup, operation, and shutdown;
b. Drawings, diagrams, and single-line schematics to illustrate and define the electrical, mechanical, and hydraulic systems with their controls, alarms, and safety systems;
c. Procedures for interface and interaction with related systems to include [automatic transfer switches] [fire alarm/suppression systems] [load shedding systems] [uninterruptible power supplies] [______].

1.6.2 Maintenance Manual

Provide [three] [_____] copies of the [manufacturers standard maintenance manual] [maintenance manual containing the information described below in 216 x 279 mm 8-1/2 x 11 inch three-ring binders]. Each section shall be separated by a heavy plastic divider with tabs. Drawings shall be folded, with the title block visible, and placed in plastic pockets with reinforced holes. The manual shall include:

a. [Procedures for each routine maintenance item.] [Procedures for troubleshooting.] [Factory-service, take-down overhaul, and repair service manuals, with parts lists.]

b. The manufacturer's recommended maintenance schedule.

c. A component list which includes the manufacturer's name, address, type or style, model or serial number, rating, and catalog number for the major components listed in paragraph GENERAL REQUIREMENTS.

d. A list of spare parts for each piece of equipment and a complete list of materials and supplies needed for operation.

1.6.3 Extra Materials

Provide two sets of special tools and two sets of filters required for maintenance. Special tools are those that only the manufacturer provides, for special purposes, or to reach otherwise inaccessible parts. One handset shall be provided for each electronic governor when required to indicate and/or change governor response settings. Supply two complete sets of filters in a suitable storage box in addition to filters replaced after testing.

PART 2 PRODUCTS

2.1 NAMEPLATES

**************************************************************************

NOTE: Delete any equipment not applicable to the project.
**************************************************************************

Each major component of this specification shall have the manufacturer's name, type or style, model or serial number, and rating number on a plate secured to the equipment. As a minimum, nameplates shall be provided for: Engines; Relays; Generators; Day tanks; Transformers (CT & PT); Regulators; Pumps and pump motors; Governors; Generator Breaker; Economizers; Heat exchangers (other than base-mounted).

Where the following equipment is provided as a standard component by the diesel-engine generator set manufacturer, the nameplate information may be provided in the maintenance manual in lieu of nameplates.

Battery charger           Heaters
Exhaust mufflers          Exciters
2.2 SAFETY DEVICES

Exposed moving parts, parts that produce high operating temperatures, parts which may be electrically energized, and parts that may be a hazard to operating personnel during normal operation shall be insulated, fully enclosed, guarded, or fitted with other types of safety devices. The safety devices shall be installed so that proper operation of the equipment is not impaired.

2.3 MATERIALS AND EQUIPMENT

Materials and equipment shall be as specified. Submit a letter certifying that where materials or equipment are specified to comply with requirements of UL, or other standards, written proof of such compliance has been obtained. The label or listing of the specified agency, or a written certificate from an approved, nationally recognized testing organization equipped to perform such services, stating that the items have been tested and conform to the requirements and testing methods of the specified agency are acceptable as proof.

2.3.1 Circuit Breakers, Low Voltage

UL 489 and UL 489.

2.3.2 Filter Elements (Fuel-oil, Lubricating-oil, and Combustion-air)

Manufacturer's standard.

2.3.3 Instrument Transformers

NEMA/ANSI C12.11.

2.3.4 Pipe (Fuel/Lube-oil, Compressed-Air, Coolant and Exhaust)

ASTM A53/A53M, ASTM A106/A106M or ASTM A135/A135M, steel pipe. Pipe smaller than 50 mm 2 inches shall be Schedule 80. Pipe 50 mm 2 inches and larger shall be Schedule 40.

2.3.5 Pipe Flanges and Fittings

2.3.5.1 Pipe Flanges and Flanged Fittings

ASTM A181/A181M, Class 60, or ASME B16.5, Grade 1, Class 150.

2.3.5.2 Pipe Welding Fittings

ASTM A234/A234M, Grade WPB or WPC, Class 150, or ASME B16.11, 1360.7 kg 3000 lb.

2.3.5.3 Threaded Fittings

ASME B16.3, Class 150.

2.3.5.4 Valves

MSS SP-80, Class 150.
2.3.5.5 Gaskets

Manufacturers Standard.

2.3.6 Pipe Hangers

MSS SP-58.

2.3.7 Electrical Enclosures

2.3.7.1 General

NEMA ICS 6.

2.3.7.2 Panelboards

NEMA PB 1.

2.3.8 Electric Motors

Electric motors shall conform to the requirements of NEMA MG 1. Motors shall have sealed ball bearings, a maximum speed of 1800 rpm and integral automatic or manual reset thermal overload protectors. Motors used indoors shall have drip proof frames; those used outside shall be totally enclosed. AC motors larger than 373 W 1/2 Hp shall be of the squirrel cage induction type for standard voltage of [[200][230][460][560] volts, 60 Hz][[240][380] volts, 50 Hz] three phase power. AC motors 373 W 1/2 Hp or smaller, shall be for standard voltage [[115][230] volts, 60 Hz,][[110][220][240] volts, 50 Hz,] single phase power.

2.3.9 Motor Controllers

Motor controllers and starters shall conform to the requirements of NFPA 70 and NEMA ICS 2.

2.4 ENGINE

******************************************************************************************************************************
NOTE: Specify fuel type if different from No. 2 diesel.
******************************************************************************************************************************

Each engine shall operate on No. 2-D diesel conforming to ASTM D975, shall be designed for stationary applications and shall be complete with ancillaries. The engine shall be a standard production model described in the manufacturer's catalog data, which describes and depicts each engine-generator set and all ancillary equipment in sufficient detail to demonstrate specification compliance. The engine shall be naturally aspirated, scavenged, supercharged or turbocharged. The engine shall be two- or four-stroke-cycle and compression-ignition type. The engine shall be vertical inline, V-, or opposed-piston type, with a solid cast block or individually cast cylinders. The engine shall have a minimum of two cylinders. Opposed-piston type engines shall have no less than four cylinders. Each block shall have a coolant drain port. Each engine shall be equipped with an overspeed sensor.
2.5 FUEL SYSTEM

The fuel system for each engine generator set shall conform to the requirements of NFPA 30 and NFPA 37 and contain the following elements.

2.5.1 Pumps

2.5.1.1 Main Pump

Each engine shall be provided with an engine driven pump. The pump shall supply fuel at a minimum rate sufficient to provide the amount of fuel required to meet the performance indicated within the parameter schedule. The fuel flow rate shall be based on meeting the load requirements and all necessary recirculation.

2.5.1.2 Auxiliary Fuel Pump

****************************************************************
NOTE: The auxiliary fuel pump is required to support the main pump if the length of pipe from the day tank to the main pump is greater than the value recommended by the engine manufacturer. This value may be approximately 12m 40 feet; however, engine manufacturers should be consulted during design to verify the pumping requirements.
****************************************************************

Auxiliary fuel pumps shall be provided to maintain the required engine fuel pressure, either required by the installation or indicated on the drawings. The auxiliary pump shall be driven by a dc electric motor powered by the starting/station batteries. The auxiliary pump shall be automatically actuated by a pressure detecting device.

2.5.2 Filter

A minimum of one full flow fuel filter shall be provided for each engine. The filter shall be readily accessible and capable of being changed without disconnecting the piping or disturbing other components. The filter shall have inlet and outlet connections plainly marked.

2.5.3 Relief/Bypass Valve

A relief/bypass valve shall be provided to regulate pressure in the fuel supply line, return excess fuel to a return line, and prevent the build-up of excessive pressure in the fuel system.

2.5.4 Integral Main Fuel Storage Tank

****************************************************************
NOTE: Delete this paragraph if an integral main fuel storage tank is not desired.
****************************************************************

An integral main fuel storage tank will be the only fuel source for the engine. These tanks may be useful for applications that require a minimal fuel storage capacity.

Due to the minimal storage capacity, integral main fuel storage tanks are not practical for prime power
usage. They are also not practical for standby units that require large fuel quantities. The designer should consider the availability and anticipated frequency of fuel truck deliveries when deciding whether or not to use an integral main fuel storage tank. These tanks should also not be used in locations where a truck fueling hose can not reach the diesel generator set.

See NFPA 99 and NFPA 110 for guidance on fuel tank sizes.

See NFPA 37 restrictions on allowable tank sizes and enclosures. Integral tanks allow for 1 to 8 hours of operation depending on diesel generator size and configuration. Consult generator set manufacturer for the proper hours of operation for the application of integral tanks. Standby applications for use with fire pumps will have tanks sized for 8 hours duration. The tank can be sized by the designer or the Contractor. The size of the tank should be based on a fuel flow rate that is equal to the value of a typical engine manufacturer for the indicated engine generator size. A value of 200 percent of the expected fuel consumption of the engine is not unusual for the flow rate of the main fuel pump. Since the excess fuel will be returned to the tank, the designer should consider the impact of heat buildup when sizing the tank. If a fuel oil cooler is not used, the day tank size may need to be increased to properly dissipate the heat absorbed by the fuel.

********************************************************************************

Each engine shall be provided with an integral main fuel tank. Each tank shall be factory installed and provided as an integral part of the diesel generator manufacturer's product. Each tank shall be provided with connections for fuel supply line, fuel return line, local fuel fill port, gauge, vent line, and float switch assembly. A fuel return line cooler shall be provided as recommended by the manufacturer and assembler. The temperature of the fuel returning to the tank shall be below the flash point of the fuel. Each engine-generator set provided with weatherproof enclosures shall have its tank mounted within the enclosure. The fuel fill line shall be accessible without opening the enclosure.

2.5.4.1 Capacity

Each tank shall have capacity [as indicated] [to supply fuel to the engine for an uninterrupted [4-hour][_____] period] at 100 percent rated load without being refilled.

2.5.4.2 Local Fuel Fill

Each local fuel fill port on the day tank shall be provided with a screw-on cap.

2.5.4.3 Fuel Level Controls

Each tank shall have a float-switch assembly to perform the following
functions:

a. Activate the "Low Fuel Level" alarm at 70 percent of the rated tank capacity.

b. Activate the "Overfill Fuel Level" alarm at 95 percent of the rated tank capacity.

2.5.4.4 Arrangement

Integral tanks may allow gravity flow into the engine. Gravity flow tanks and any tank that allows a fuel level above the fuel injectors shall be provided with an internal or external factory installed valve located as near as possible to the shell of the tank. The valve shall close when the engine is not operating. Integral day tanks shall be provided with any necessary pumps to supply fuel to the engine as recommended by the generator set manufacturer. The fuel supply line from the tank to the manufacturer's standard engine connection shall be welded pipe.

2.5.5 Day Tank

**************************************************************************

NOTE: Delete this paragraph if an integral main fuel storage tank is used.

See NFPA 37 restrictions on allowable day tank sizes and enclosures. Select either self-supporting or integral day tank. Select the first option below for applications where fuel is returned to the day tank. Select the second option below for applications where fuel is returned to the main tank. Integral day tanks allow for 1 to 8 hours of operation. Consult generator set manufacturer for the proper hours of operation for the application of integral day tanks. Standby applications for use with fire pumps will have day tanks sized for 8 hours duration. Select day tank capacity for either prime or standby application. The day tank can be sized by the designer or the Contractor. The size of the day tank should be based on a fuel flow rate that is equal to the value of a typical engine manufacturer for the indicated engine generator size. A value of 200 percent of the expected fuel consumption of the engine is not unusual for the flow rate of the main fuel pump. The excess fuel may be returned to the day tank or main tank. The designer should also consider the impact of heat build up when sizing the day tank. If a fuel oil cooler is not used or if fuel is returned to the day tank, the day tank size may need to be increased to properly dissipate the heat absorbed by the fuel.

**************************************************************************

Provide each engine with [a separate self-supporting][integral] day tank. Provide each day tank with connections for fuel supply line, fuel return line, fuel overflow line, local fuel fill port, gauge, vent line, drain line, and float switch assembly for control. Provide a fuel return line cooler as recommended by the manufacturer and assembler. The temperature of the fuel returning to the day tank shall be below the flash point of the
fuel. Install a temperature sensing device in the fuel supply line. [Provide each day tank with connections for fuel supply line, fuel overflow line, local fuel fill port, gauge, vent line, drain line, and float switch assembly for control.] Each engine-generator set provided with weatherproof enclosures shall have its day tank mounted within the enclosure. The fuel fill line shall be accessible without opening the enclosure.

2.5.5.1 Capacity, Standby

Each day tank shall have capacity [as indicated] [to supply fuel to the engine for an uninterrupted [4-hour] [_____] period at 100 percent rated load without being refilled, plus any fuel which may be returned to the main fuel storage tank. Submit calculations for the capacity of each day tank, including allowances for recirculated fuel, usable tank capacity, and duration of fuel supply. The calculation of the capacity of each day tank shall incorporate the requirement to stop the supply of fuel into the day tank at 90 percent of the ultimate volume of the tank.]

2.5.5.2 Drain Line

Each day tank drain line shall be accessible and equipped with a shutoff valve. Self supporting day tanks shall be arranged to allow drainage into a 305 mm 12 inch tall bucket.

2.5.5.3 Local Fuel Fill

Provide each local fuel fill port on the day tank with a screw-on cap.

2.5.5.4 Fuel Level Controls

Each day tank shall have a float-switch-assembly to perform the following functions:

a. [When the main storage tank is located higher than the day tank, open the solenoid valve located on the fuel supply line entering the day tank and start the supply of fuel into the day tank] [Start the supply of fuel into the day tank] when the fuel level is at the "Low" level mark, 75% of the rated tank capacity.

b. [When the main storage tank is located higher than the day tank, stop the supply of fuel into the day tank and close the solenoid valve located on the fuel supply line entering the day tank] [Stop the supply of fuel into the day tank] when the fuel level is at 90 percent of the rated tank capacity.

c. Activate the "Overfill Fuel Level" alarm at 95 percent of the rated tank volume.

d. Activate the "Low Fuel Level" alarm at 70 percent of the rated tank Capacity.

e. Activate the automatic fuel supply shut-off valve located on the fill line of the day tank and shut down the fuel pump which supplies fuel to the day tank at 95 percent of the rated tank volume. The flow of fuel shall be stopped before any fuel can be forced into the fuel overflow line.
2.5.5.5 Arrangement

**************************************************************************
NOTE: Select between integral and self supporting day tanks. Also, select between applications where the main fuel storage tank is located above the day tank and applications where the main fuel storage tank is located below the day tank. The location of all tanks, piping, and valves should also be indicated on the drawings.
**************************************************************************

[Integral day tanks may allow gravity flow into the engine. Gravity flow tanks shall be provided with an internal or external valve located as near as possible to the shell of the tank. The valve shall close when the engine is not operating. Integral day tanks shall be provided with any necessary pumps to supply fuel to the engine as recommended by the generator set manufacturer. The overflow connection and the fuel supply line for integral day tanks which do not rely upon gravity flow shall be arranged so that the highest possible fuel level is below the fuel injectors.] [Self-supporting day tank shall either be arranged so that the fuel level in the day tank remains above the suction port of the engine driven fuel pump or be provided with a transfer pump to provide fuel to the engine driven pump. The overflow connection and fuel supply line shall be arranged so that the highest possible fuel level is below the fuel injectors.] [When the main fuel storage tanks are located below the day tank, a check valve shall be provided in the fuel supply line entering the day tank.] [When the main fuel storage tanks are located above the day tank, a solenoid valve shall be installed in the fuel supply line entering the day tank. The solenoid valve shall be in addition to the automatic fuel shut off valve.] The fuel supply line from the day tank to the manufacturer's standard engine connection shall be welded pipe.

2.5.6 Fuel Supply System

**************************************************************************
NOTE: Delete this paragraph if an integral main fuel storage tank is used.
**************************************************************************

The fuel supply from the main storage of fuel to the day tank shall be as specified in Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.6 LUBRICATION

Each engine shall have a separate lube-oil system conforming to NFPA 30 and NFPA 37. Each system shall be pressurized by engine-driven oil pumps. Each system shall be furnished with a relief valve for oil pressure regulation (for closed systems) and a dip-stick for oil level indications. The crankcase shall be vented in accordance with the manufacturer's recommendation except that it shall not be vented to the engine exhaust system. Crankcase breathers, if provided on engines installed in buildings or enclosures, shall be piped to vent to the outside. The system shall be readily accessible for service such as draining, refilling, etc. Each system shall permit addition of oil and have oil-level indication with the set operating. The system shall utilize an oil cooler as recommended by the engine manufacturer.
2.6.1 Filter

One full-flow filter shall be provided for each pump. The filter shall be readily accessible and capable of being changed without disconnecting the piping or disturbing other components. The filter shall have inlet and outlet connections plainly marked.

2.6.2 Lube-Oil Sensors

Each engine shall be equipped with lube-oil pressure sensors. Pressure sensors shall be located downstream of the filters and provide signals for required indication and alarms.

2.7 COOLING SYSTEM

**************************************************************************
NOTE: Coordinate with paragraph SYSTEM DESCRIPTION.
**************************************************************************

Each engine cooling system shall operate automatically while the engine is running. Each cooling system shall be sized for the maximum summer [outdoor] [indoor] design temperature and site elevation. Water-cooled system coolant shall use a combination of water and ethylene-glycol sufficient for freeze protection at the minimum winter outdoor temperature specified. The maximum temperature rise of the coolant across the engine shall be no more than that recommended and submitted.

a. The maximum and minimum allowable inlet temperatures of the [coolant fluid][cooling air].

b. The maximum allowable temperature rise in the [coolant fluid through the engine][cooling air across the engine].

c. The minimum allowable inlet fuel temperature.

2.7.1 Coolant Pumps

Coolant pumps shall be the centrifugal type. Each engine shall have an engine-driven primary pump. Secondary pumps shall be electric motor driven and have automatic controllers.

2.7.2 Heat Exchanger

Each heat exchanger shall be of a size and capacity to limit the maximum allowable temperature rise in the coolant across the engine to that recommended and submitted in accordance with paragraph SUBMITTALS for the maximum summer outdoor design temperature and site elevation. Each heat exchanger shall be corrosion resistant, suitable for service in ambient conditions of application. Submit manufacturers data to quantify heat rejected to the space with the engine generator set at rated capacity.

2.7.2.1 Fin-Tube-Type Heat Exchanger (Radiator)

**************************************************************************
NOTE: Keep this paragraph and delete the next paragraph, if required by the project.
**************************************************************************

Heat exchanger may be factory coated with corrosive resistant film
providing that corrosion measures are taken to restore the heat rejection capability of the radiator to the initial design requirement via oversizing, or other compensating methods. Internal surfaces shall be compatible with liquid fluid coolant used. Materials and coolant are subject to approval by the Contracting Officer. Heat exchangers shall be pressure type incorporating a pressure valve, vacuum valve and a cap. Caps shall be designed for pressure relief prior to removal. Each heat exchanger and the entire cooling system shall be capable of withstanding a minimum pressure of 48 kPa gauge 7 psi. Each heat exchanger shall be protected with a strong grille or screen guard. Each heat exchanger shall have at least two tapped holes. One tapped hole in the heat exchanger shall be equipped with a drain cock, the rest shall be plugged.

2.7.2.2 Shell and U-Tube Type Heat Exchanger

**************************************************************************
NOTE: Keep this paragraph and delete paragraph above, if required by the project.
**************************************************************************

Heat exchanger shall be multiple pass shell and U-tube type. Exchanger shall operate with low temperature water in the shell and high temperature water in the tubes. Exchangers shall be constructed in accordance with ASME BPVC SEC VIII D1 and certified ASME stamp secured to the unit. U-tube bundles shall be completely removable for cleaning and tube replacement and shall be free to expand with the shell. Shells shall be constructed of seamless steel pipe or welded steel. Tubes shall be cupronickel or inhibited admiralty, constructed in accordance with ASTM B395/B395M, suitable for the temperature and pressure specified. Tubes shall be not less than 19 mm 3/4 inch unless otherwise indicated. Shell side and tube side shall be designed for 1.03 kPa 150 psi working pressure and factory tested at 2.06 kPa 300 psi. High and low temperature water and pressure relief connections shall be located in accordance with the manufacturers standard practice. Water connections larger than 76 mm 3 inches shall be ASME Class 150 flanged. Water pressure loss through clean tubes shall be as recommended by the engine manufacturer. Minimum water velocity through tubes shall be 300 mm 1 foot per second and assure turbulent flow. One or more pressure relief valves shall be provided for each heat exchanger in accordance with ASME BPVC SEC VIII D1. The aggregate relieving capacity of the relief valves shall be not less than that required by the above code. Discharge from the valves shall be installed as indicated. The relief valves shall be installed on the heat exchanger shell. A drain connection with 19 mm 3/4 inch hose bib shall be installed at the lowest point in the system near the heat exchanger. Additional drain connection with threaded cap or plug shall be installed wherever required for thorough draining of the system.

2.7.3 Expansion Tank

**************************************************************************
NOTE: Delete this paragraph if a shell and U-tube type heat exchanger is not needed.
**************************************************************************

The cooling system shall include an air expansion tank which will accommodate the expanded water of the system generated within the normal operating temperature range, limiting the pressure increase at all components in the system to the maximum allowable pressure at those components. The tank shall be suitable for an operating temperature of 121
degrees C 250 degrees F and a working pressure of 0.86 MPa 125 psi. The tank shall be constructed of welded steel, tested and stamped in accordance with ASME BPVC SEC VIII D1 for the stated working pressure. A bladder type tank shall not be used. The tank shall be supported by steel legs or bases for vertical installation or steel saddles for horizontal installation.

2.7.4 Ductwork

Ductwork shall be as specified in Section [23 31 13.00 40 METAL DUCTS] [23 00 00 AIR SUPPLY, DISTRIBUTION, VENTILATION, AND EXHAUST SYSTEMS] [23 35 19.00 20 INDUSTRIAL VENTILATION AND EXHAUST] except that a flexible connection shall be used to connect the duct to the diesel engine radiator. Material for the connection shall be wire-reinforced glass. The connection shall be rendered practically airtight.

2.7.5 Temperature Sensors

Each engine shall be equipped with coolant temperature sensors. Temperature sensors shall provide signals for pre-high and high indication and alarms.

2.8 SOUND LIMITATIONS

**************************************************************************
NOTE: The designer must perform an analysis in accordance with UFC 3-450-01 NOISE AND VIBRATION CONTROL and UFC 3-450-02 POWER PLANT ACOUSTICS. The designer must consider air intake, exhaust, and diesel generator casing noise. The designer must also coordinate with the architect for proper material selections for the sound transmittance characteristics of the mechanical equipment room and adjacent areas. The designer should consider sound within the equipment room, adjacent areas and building exterior. Acceptable sound levels will vary depending on the function of the space. As a minimum the design should comply with the following OSHA safety requirements; however, more stringent sound restrictions may be required to meet the functional requirements of the occupied spaces.

<table>

Typically, the diesel generator manufacturer can provide information concerning the noise generated by the diesel generator in a free field environment. The manufacturer does not have control over any other building parameters or additional mechanical equipment noise. Therefore the designer should indicate the required sound limits for each of the indicated octave bands for the sound pressure level of the diesel generator set operating at 100 percent load in a free field. The designer should develop these numbers based on the desired sound levels that should exist at various locations after the generator is installed. This information should be based on the values used in the acoustical analysis and verified by coordination with equipment manufacturers during design. In some cases, a sound attenuated enclosure may be needed to achieve the desired result.

The designer should also indicate the desired sound pressure levels that will be measured in the field. The pressure levels should be based on the acoustical analysis and should consider the specified operating conditions of the diesel generator operating in a free field, other mechanical equipment, the building’s sound absorption characteristics, OSHA requirements, and the building’s functional requirements. The location of the measurement points for the installed diesel generator should be coordinated with the SAFETY RUN TEST paragraph. Modify the radial distance requirement from the engine, air-intake, and exhaust to account for obstructions, variations in site conditions, building configurations or indicate points on the contract drawings at which measurements are to be made.

**************************************************************************

The noise generated by the diesel generator set operating at 100 percent load shall not exceed the following sound pressure levels in any of the indicated frequencies when measured in a free field at a radial distance of 7 meters 22.9 feet at 45 degrees apart in all directions. Submit data to demonstrate compliance with these sound limitation requirements. Also submit certification from the manufacturer stating that the sound emissions meet the specification.
The noise generated by the installed diesel generator set operating at 100 percent load shall not exceed the following sound pressure levels in any of the indicated frequencies when measured at a distance of [22.9] [_____] m [75] [_____] feet from the end of the exhaust and air intake piping directly along the path of intake and discharge for horizontal piping; or at a radius of [22.9] [10.7] [_____] m [75] [35] [_____] feet from the engine at 45 degrees apart in all directions for vertical piping. Submit data to demonstrate compliance with these sound limitation requirements. Also submit certification from the manufacturer stating that the sound emissions meet the specification.

2.9 AIR INTAKE EQUIPMENT

Filters and silencers shall be provided in locations that are convenient for servicing. The silencer shall be of the high-frequency filter type, located in the air intake system as recommended by the engine manufacturer. Silencer shall be capable of reducing the noise level at the air intake to a point below the maximum acceptable levels specified in paragraph SOUND LIMITATIONS. A combined filter-silencer unit meeting requirements for the separate filter and silencer items may be provided. Expansion elements in air-intake lines shall be [copper][rubber].

2.10 EXHAUST SYSTEM

**************************************************************************
NOTE: Include on the drawings a detail of the exhaust piping that penetrates building construction such as walls or roof.
**************************************************************************

The system shall be separate and complete for each engine. Piping shall be supported so as to minimize vibration. Where a V-type engine is provided, a V-type connector with necessary flexible sections and hardware shall connect the engine exhaust outlets.

2.10.1 Flexible Sections and Expansion Joints

A flexible section at each engine and an expansion joint at each muffler shall be provided. Flexible sections and expansion joints shall have flanged connections. Flexible sections shall be made of convoluted seamless tube without joints or packing. Expansion joints shall be the bellows type. Expansion and flexible elements shall be stainless steel suitable for diesel-engine exhaust gas at the maximum exhaust temperature that is specified by the engine manufacturer. Expansion and flexible elements shall be capable of absorbing vibration from the engine and compensation for thermal expansion and contraction.

2.10.2 Exhaust Muffler

**************************************************************************
NOTE: Muffler locations and mountings shall be shown on the drawings.
**************************************************************************

A chamber type exhaust muffler shall be provided. The muffler shall be constructed of welded steel and designed for [outside] [inside] [vertical] [horizontal] mounting. Eyebolts, lugs, flanges, or other items shall be provided as necessary for support in the location and position indicated. Pressure drop through the muffler shall not exceed the recommendations of the engine manufacturer. Outside mufflers shall be zinc coated or painted with high temperature 204 degrees C 400 degrees F resisting paint. The muffler and exhaust piping together shall reduce the noise level to less than the maximum acceptable level listed for sound limitations in paragraph
SOUND LIMITATIONS. The muffler shall have a drain valve, nipple, and cap at the low-point of the muffler.

2.10.3 Exhaust Piping

**************************************************************************
NOTE: Exhaust piping shall be sized at a gas velocity of less than 25.4 m/second 5000 fpm. Piping should be shown on the drawings.
**************************************************************************

Horizontal sections of exhaust piping shall be sloped downward away from the engine to a condensate trap and drain valve. Changes in direction shall be long-radius. Exhaust piping, mufflers and silencers installed inside any building shall be insulated in accordance with paragraph THERMAL INSULATION and covered to protect personnel. Vertical exhaust piping shall be provided with a hinged, gravity operated, self-closing, rain cover.

2.11 EMISSIONS

**************************************************************************
NOTE: The designer will coordinate emissions requirements with the installation (base/post) environmental office and provide a listing of the requirements. The identification of environmental requirements should be identified at the beginning of the project as a special study effort which requires funding separate from the normal design.
**************************************************************************

The finished installation shall comply with Federal, state, and local regulations and restrictions regarding the limits of emissions, as listed herein: [____]

Submit a certification from the engine manufacturer stating that the engine exhaust emissions meet federal, state, and local regulations and restrictions specified. At a minimum, this certification shall include emission factors for criteria pollutants including nitrogen oxides, carbon monoxide, particulate matter, sulfur dioxide, non-methane hydrocarbon, and for hazardous air pollutants (HAPs).

2.12 STARTING SYSTEM

**************************************************************************
NOTE: Select the first option for emergency applications and delete subsequent paragraphs. Select second option for all other standby applications.
**************************************************************************

[The starting system for standby engine generator sets used in emergency applications shall be in accordance with NPPA 99 and NPPA 110 and as follows.] [The starting system for engine generator sets used in non-emergency applications shall be as follows.]

2.12.1 Controls

An engine control switch shall be provided with functions including: run/start (manual), off/reset, and automatic mode. Start-stop logic shall
be provided for adjustable cycle cranking and cool down operation. The logic shall be arranged for [manual starting] [and] [fully automatic starting in accordance with paragraph AUTOMATIC ENGINE-GENERATOR SET SYSTEM OPERATION]. Electrical starting systems shall be provided with an adjustable cranking limit device to limit cranking periods from 1 second up to the maximum duration.

2.12.2 Capacity

The starting system shall be of sufficient capacity, at the maximum [outdoor][indoor] summer temperature specified to crank the engine without damage or overheating. The system shall be capable of providing a minimum of three cranking periods with 15-second intervals between cranks. Each cranking period shall have a maximum duration of 15 seconds.

2.12.3 Functional Requirements

Starting system shall be manufacturers recommended dc system utilizing a negative circuit ground. Starting motors shall be in accordance with SAE ARP892.

2.12.4 Battery

**************************************************************************
NOTE: Select nickel-cadmium when the battery temperature cannot be maintained above minus 6 degrees C 22 degrees F.
**************************************************************************

A starting battery system shall be provided and shall include the battery, battery rack, intercell connectors, and spacers. The battery shall be in accordance with SAE J537. Critical system components (rack, protection, etc.) shall be sized to withstand the seismic acceleration forces specified. The battery shall be [lead-acid][nickel-cadmium] type, with sufficient capacity, at the minimum [outdoor][indoor] winter temperature specified to provide the specified cranking periods. Valve-regulated lead-acid batteries are not acceptable.

2.12.5 Battery Charger

A current-limiting battery charger, conforming to UL 1236, shall be provided and shall automatically recharge the batteries. The charger shall be capable of an equalize charging rate for recharging fully depleted batteries within [24][_____] hours and a float charge rate for maintaining the batteries in prime starting condition. An ammeter shall be provided to indicate charging rate. A timer shall be provided for the equalize charging rate setting. A battery is considered to be fully depleted when the output voltage falls to a value which will not operate the engine generator set and its components.

2.12.6 Starting Aids

**************************************************************************
NOTE: Jacket coolant heaters are normally provided for most applications to aid starting. Some manufacturers may require glow plugs for combustion air temperatures significantly below 0 degrees C 32 degrees F; however, use if these alone do not ensure NFPA availability in the application size range.
**************************************************************************
Consult manufacturers for availability in the application size range.

The manufacturer shall provide one or more of the following methods to assist engine starting.

2.12.6.1 Glow Plugs

Glow plugs shall be designed to provide sufficient heat for combustion of fuel within the cylinders to guarantee starting at an ambient temperature of -32 degrees C (-25 degrees F).

2.12.6.2 Jacket-Coolant Heaters

A thermostatically controlled electric heater shall be mounted in the engine coolant jacketing to automatically maintain the coolant within plus or minus 3 degrees of the control temperature. The heater shall operate independently of engine operation so that starting times are minimized. The control temperature shall be the temperature recommended by the engine manufacturer to meet the starting time specified.

2.13 GOVERNOR

NOTE: Coordinate with paragraph Engine Generator Parameter Schedule.

Each engine shall be provided with a governor which maintains the frequency within a bandwidth of the rated frequency, over a steady-state load range of zero to 100 percent of rated output capacity. The governor shall be configured for safe manual adjustment of the speed/frequency during operation of the engine generator set, without special tools, from 90 to 110 percent of the rated speed/frequency, over a steady state load range of zero to 100 percent of rated capacity. [Isochronous governors shall maintain the midpoint of the frequency bandwidth at the same value for steady-state loads over the range of zero to 100 percent of rated output capacity.] [Droop governors shall maintain the midpoint of the frequency bandwidth linearly for steady-state loads over the range of zero to 100 percent of rated output capacity, with 3 percent droop.]

2.14 GENERATOR

NOTE: Armature and field winding insulation classes are specified based on the allowable temperature rise (the temperature in the windings above the temperature of the air used to cool the windings). See NEMA MG 1 for a discussion of the classes with respect to size range, elevation, method of measurement, and ambient temperature. Select the class insulation for each application based on operating conditions. Class F is considered industry standard. If a different class is required for different machines, specify the one for each application in the parameter schedule for the respective generator set.
Each generator shall be of the synchronous type, one or two bearing, conforming to NEMA MG 1, equipped with winding terminal housings in accordance with NEMA MG 1, equipped with an amortisseur winding, and directly connected to the engine. Insulation shall be [Class H][Class F]. Generator design shall protect against mechanical, electrical and thermal damage due to vibration, 25 percent overspeeds, or voltages and temperatures at a rated output capacity of 100 percent. Generator ancillary equipment shall meet the short circuit requirements of NEMA MG 1. Frames shall be the drip-proof type. Submit each generator KW rating and short circuit capacity (both symmetric and asymmetric).

2.14.1 Current Balance

At 100 percent rated load, and load impedance equal for each of the three phases, the permissible current difference between any two phases shall not exceed 2 percent of the largest current on either of the two phases. Submit manufacturer's certification that the flywheel has been statically and dynamically balanced and is capable of being rotated at 125 percent of rated speed without vibration or damage.

2.14.2 Voltage Balance

At any balanced load between 75 and 100 percent of rated load, the difference in line-to-neutral voltage among the three phases shall not exceed 1 percent of the average line-to-neutral voltage. For a single-phase load condition, consisting of 25 percent load at unity power factor placed between any phase and neutral with no load on the other two phases, the maximum simultaneous difference in line-to-neutral voltage between the phases shall not exceed 3 percent of rated line to neutral voltage. The single-phase load requirement shall be valid utilizing normal exciter and regulator control. The interpretation of the 25 percent load for single phase load conditions means 25 percent of rated current at rated phase voltage and unity power factor.

2.14.3 Waveform

The deviation factor of the line-to-line voltage at zero load and at balanced full rated load at 0.8 power factor shall not exceed 10 percent. The RMS of all harmonics shall be less than 5.0 percent and that of any one harmonic less than 3.0 percent at full rated load. Each engine-generator shall be designed and configured to meet the total harmonic distortion limits of IEEE 519.

2.15 EXCITER

The generator exciter shall be of the brushless type. Semiconductor rectifiers shall have a minimum safety factor of 300 percent for peak inverse voltage and forward current ratings for all operating conditions, including 110 percent generator output at 40 degrees C 104 degrees F ambient. The exciter and regulator in combination shall maintain generator-output voltage within the limits specified.

2.16 VOLTAGE REGULATOR

Each generator shall be provided with a solid-state voltage regulator, separate from the exciter. The regulator shall maintain the voltage within a bandwidth of the rated voltage, over a steady-state load range of zero to 100 percent of rated output capacity. Regulator shall be configured for
safe manual adjustment of the engine generator voltage output without special tools, during operation from 90 to 110 percent of the rated voltage over the steady state load range of zero to 100 percent of rated output capacity. Regulation drift shall not exceed plus or minus 0.5 percent for an ambient temperature change of 20 degrees C (36 degrees F). The voltage regulator shall have a maximum droop of 2 percent of rated voltage over a load range from 0 to 100 percent of rated output capacity and automatically maintain the generator output voltage within the specified operational bandwidth.

2.17 GENERATOR PROTECTION

******************************************************************************************************************
NOTE: Generator protection shall be based on the application and size of the generator and should comply with the recommendations of IEEE 242 and IEEE Std 446 for both generator breaker features and protection schemes. See AFMAN 32-1077 for recommended protection schemes for Air Force projects. The designer must perform a power system coordination study (reference UFC 3-520-01) to specify the breaker ratings, breaker trip unit features and settings, relay protection scheme, and relay settings for coordination for each generator set installed. The configuration should always include a disconnecting means for taking clearance on the generator for maintenance purposes. If the scope of protection is small the designer may elect to delete the paragraphs in this section and reference Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION. Show panelboard ratings on the contract drawings for each generator set. Rating information should include voltage, phase, bus continuous capacity (amperes), bus withstand capacity (amperes) (see NEMA PB 1 for necessary rating information). Show breaker frame, trip, and interrupting ratings on the contract drawings.

Surge capacitors and surge arresters should be provided when the sets are to be connected to exposed overhead lines directly or through transformers, even though connection may be only for transfer of load without service interruption. Surge arrester protection is not required where sets serve single buildings isolated from overhead lines by automatic or manual transfer switches where provision has been made to prevent simultaneous connection to both sources. The designer will specify the surge arrester rating.

Fuse and circuit breaker ratings should be shown on the contract drawings. Show voltage, phase, continuous current (ampere), short circuit withstand, interrupting, neutral size, etc.

******************************************************************************************************************

Short circuit and overload protection for the generator shall be provided. The generator circuit breaker (IEEE Device 52) ratings shall be consistent with the generator rated voltage and frequency, with continuous, short
circuit and interrupting current ratings to match the generator capacity. The manufacturer shall determine the short circuit current interrupting rating of the breaker. The breaker shall be engine generator base mounted by the engine-generator set manufacturer. Molded case breakers shall be provided with shunt trip. Surge protection shall be provided for each phase of the generator, to be mounted at the generator terminals.

2.17.1 Panelboards

Panelboards shall be metal-enclosed, general purpose, [3-phase, 4-wire], [1-phase, 3-wire], [600][_____] volt rated, with neutral bus and continuous ground bus, conforming to NEMA PB 1 and UL 891. Neutral bus and ground bus capacity shall be [as shown][full capacity]. Enclosure designs, construction, materials and coatings shall be [as indicated][suitable for the application and environment]. Bus continuous current rating shall be [at least equal to the generator rating and correspond to UL listed current ratings specified for panelboards and switchboards][as indicated]. Current withstand rating (short circuit rating) shall match the generator capacity. Buses shall be copper.

2.17.2 Devices

Switches, circuit breakers, switchgear, fuses, relays, and other protective devices shall be as specified in Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

2.18 SAFETY SYSTEM

Devices, wiring, remote panels, local panels, etc., shall be provided and installed as a complete system to automatically activate the appropriate signals and initiate the appropriate actions. The safety system shall be provided with a self-test method to verify its operability. Alarm signals shall have manual acknowledgement and reset devices. The alarm signal systems shall reactivate for new signals after acknowledgment is given to any signal. The systems shall be configured so that loss of any monitoring device shall be dealt with as an alarm on that system element.

2.18.1 Audible Signal

**************************************************************************
NOTE: High dB levels are required for alarms located near engine. Specify over 100 dB for engine room application and show alarm location.
**************************************************************************

The audible alarm signal shall sound at a frequency of [70] [_____] Hz at a volume of [_____] [75] dB at 3.1 m 10 feet. The sound shall be continuously activated upon alarm and silenced upon acknowledgment. Signal devices shall be located as shown.

2.18.2 Visual Alarm Signal

The visual alarm signal shall be a panel light. The light shall be normally off, activated to be blinking upon alarm. The light shall change to continuously light upon acknowledgement. If automatic shutdown occurs, the display shall maintain activated status to indicate the cause of failure and shall not be reset until cause of alarm has been cleared and/or restored to normal condition. Shutdown alarms shall be red; all other alarms shall be amber.
2.18.3 Alarms and Action Logic

2.18.3.1 Shutdown

Simultaneous activation of the audible signal, activation of the visual signal, stopping the engine, and opening the generator main circuit breakers shall be accomplished.

2.18.3.2 Problem

Activation of the visual signal shall be accomplished.

2.18.4 Local Alarm Panel

**************************************************************************

NOTE: The designer must provide design features in accordance with the requirements of NFPA 70, NFPA 99 for medical facilities. The designer must provide design features in accordance with the requirements of NFPA 70 and NFPA 110 for emergency and standby applications. For emergency and standby applications select either Level 1 or Level 2. Level 1 defines the most stringent equipment performance requirements for applications where the failure of the equipment to perform could result in loss of human life or serious injury. Level 2 defines equipment performance where failure of the equipment to operate is less critical to human life. Edit the table to include all required shutdowns and alarms. Delete optional alarms which are not required. Delete all columns except the first column, the appropriate code reference column, and the column that shows Corps of Engineers required alarms/controls. Add necessary parameters to define critical limits for alarms or shutdown.

The designer should remove all references to day tanks if integral main fuel tanks are used.

The designer should remove all references to integral main fuel storage tanks if day tanks are used.

The following alarms are standard offerings of one or more manufacturers (Kohler, Caterpillar, Cummins - Onan, Detroit Diesel). They are not required by NFPA, but may be added if there is a specific requirement. Please note that some are not typically offered by three or more manufacturers, and may constitute a sole-source requirement.

### 2.18.5 Time-Delay on Alarms

For startup of the engine-generator set, time-delay devices shall be installed bypassing the low lubricating oil pressure alarm during cranking, and the coolant-fluid outlet temperature alarm. The lube-oil time-delay device shall return its alarm to normal status after the engine starts. The coolant time-delay device shall return its alarm to normal status 5 minutes after the engine starts.

Submit the magnitude of monitored values which define alarm or action setpoints, and the tolerance (plus and/or minus) at which the device activates the alarm or action.

### 2.18.6 Remote Alarm Panel

**************************************************************************
**NOTE:** The Remote Alarm Panel should be shown on the drawings. Delete remote alarm panel where not required. Select the first option if the application is a prime power plant. For prime power units provide panel elevations depicting desired configurations, together with a listing of alarms and instruments. Select the second option for engine generator sets utilized in emergency or standby applications. The designer must provide design features in accordance with the requirements.
of NFPA 70, and NFPA 99 for medical facilities. The designer must provide design features in accordance with the requirements of NFPA 70 and NFPA 110 for emergency and standby applications. A remote panel is required for NFPA 99 and for NFPA 110, Level 1 applications. A remote panel is not required for NFPA 110, Level 2 applications. Edit the table to include all required alarms. Delete optional alarms which are not required. Delete all columns except the first column and the appropriate code reference column. Add necessary parameters where required to define critical limits for alarms.

**************************************************************************

[A remote alarm panel shall be provided as indicated.] [A remote alarm panel shall be provided in accordance with [NFPA 99] [NFPA 110] and as follows:

2.19 ENGINE GENERATOR SET CONTROLS AND INSTRUMENTATION

Devices, wiring, remote panels, local panels, etc., shall be provided and installed as a complete system to automatically activate the appropriate signals and initiate the appropriate actions.

2.19.1 Controls

**************************************************************************
NOTE: Delete the remote control (control room) panel if the application is not a prime power application. Provide plan and elevation drawings of the remote control panels for prime power applications, depicting specific devices, instrument, and meters, including layouts. Generator circuit breaker controls with position indication may be added if required (Not available for standard molded-case breakers. Use only for power circuit breakers or switchgear).

Edit the table to include all required devices. Delete all columns except the first column and the appropriate reference columns (always delete "MFG Offering" column).

A remote stop switch is required by NFPA 37 for 100 hp and above engines, and by NFPA 110 for both Level 1 and Level 2 applications. A remote fuel shutoff switch, and a remote lube-oil shutoff switch are required by NFPA 37 for 100 hp and above engines. Delete the remote fuel shutoff switch, and a remote lube-oil shutoff switch where not required.

**************************************************************************

A local control panel shall be provided with controls [as indicated] [in accordance with NFPA 110 level [1] [2]] [and as follows] mounted [either on or adjacent to the engine generator set] [as indicated]. A remote control
A panel shall be provided [with devices as indicated] [fully redundant to the local control panel].

2.19.2 Engine Generator Set Metering and Status Indication

**********************************************************************************************

NOTE: Delete the remote (control room) panel if the application is not a prime power application. Provide plan and elevation drawings of the remote panels for prime power applications, depicting specific devices, instrument, and meters, including layouts. Edit the table to include all required devices. Delete optional devices that are not required for the application. Delete all columns except the first column and the appropriate reference column (always delete the "MFG Offering" column). Add any necessary parameters to define devices required. A fuel meter display should be added for prime rated applications. A fuel header
pressure display should be added for prime rated applications. Delete the pyrometer devices for sets smaller than 200 kW, KWh, kVAR, power factor meters and reverse power indication may be added as required.

The following instruments may be added as required.

Indicating VAR meter. Power-factor meter, indicating. (Specify one of these. They are normally used only for prime applications, however can be specified for standby units as required.)

Indicating wattmeter. (Normally used only for prime applications, however can be specified for standby units as required.)

Totalizing Kilowatt-hour meter with 15 or 30 minute demand register. ( Normally used only for prime applications, however can be specified for standby units as required.)

Recording Kilowatt-hour/demand meter. ( Normally used only for prime applications, however can be specified for standby units as required.)

The 15-minute demand register is preferred to the 30-minute register in most cases, because it permits more accurate timing of facility peak load occurrence.

Delete Frequency and Volt meters if a Synchronizing Panel is provided.

A local panel shall be provided with devices [as indicated] [in accordance with NFPA 110 level [1] [2]] [and as follows] mounted [either on or adjacent to the engine generator set] [as indicated]. A remote control panel shall be provided [with devices as indicated] [fully redundant to the local control panel].

2.20 PANELS

**************************************************************************
NOTE: Panels, except the remote panel, can be combined into a single panel paragraph.

Provide a panel-mounting location and detail for panels not mounted on the generator set base. The designer may elect other locations such as adjacent to engine generator set; in the generator enclosure; or in or on the switchgear enclosure.

Provide panel nameplate and instrument nameplate unique identifiers or user preferred identifiers. Provide sizes, materials, and attachment preferences.

Delete either the "standard panel" or "electronic panel".

**************************************************************************

Each panel shall be of the type necessary to provide specified functions. Panels shall be mounted [on the engine generator set base by vibration/shock absorbing type mountings] [as shown]. Instruments shall be mounted flush or semiflush. Convenient access to the back of instruments shall be provided to facilitate maintenance. Instruments shall be calibrated using recognized industry calibration standards. Each panel shall be provided with a panel identification plate which clearly identifies the panel function as indicated. Each instrument and device on the panel shall be provided with a plate which clearly identifies the device and its function as indicated. Panels except the remote alarm panel can be combined into a single panel.
2.20.1 Enclosures

**************************************************************************
NOTE: Delete locking mechanism when not required.
**************************************************************************

Enclosures shall be designed for the application and environment, conforming to NEMA ICS 6, and provided with locking mechanisms which are keyed alike.

2.20.2 Analog

Analog electrical indicating instruments shall be in accordance with ANSI C39.1 with semiflush mounting. Switchgear, and control-room panel-mounted instruments shall have 250 degree scales with an accuracy of not less than 1 percent. Unit-mounted instruments shall be the manufacturer's standard with an accuracy of not less than 2 percent. The instrument's operating temperature range shall be minus 20 to plus 65 degrees C minus 4 to plus 130 degrees F. Distorted generator output voltage waveform of a crest factor less than 5 shall not affect metering accuracy for phase voltages, hertz and amps.

2.20.3 Electronic

Electronic indicating instruments shall be true RMS indicating, 100 percent solid state, microprocessor controlled to provide all specified functions. Control, logic, and function devices shall be compatible as a system, sealed, dust and water tight, and shall utilize modular components with metal housings and digital instrumentation. An interface module shall be provided to decode serial link data from the electronic panel and translate alarm, fault and status conditions to set of relay contacts. Instrument accuracy shall be not less than 2 percent for unit mounted devices and 1 percent for control room, panel mounted devices, throughout a temperature range of minus 20 to plus 65 degrees C minus 4 to plus 130 degrees F. Data display shall utilize LED or back lit LCD. Additionally, the display shall provide indication of cycle programming and diagnostic codes for troubleshooting. Numeral height shall be [13 mm 1/2 inch][______].

2.20.4 Parameter Display

Indication or readouts of the lubricating-oil pressure, ac voltmeter, ac ammeter, frequency meter, and coolant temperature.

2.20.5 Exerciser

**************************************************************************
NOTE: Delete the exerciser when it is not required. Ensure that the exerciser is compatible with the automatic transfer scheme. It is highly desirable to utilize system loads for generator set exercise loads and to exercise the complete standby system periodically. Coordinate requirements with the user. The designer shall ensure that the design provides warning signs in areas where the engine generator can start automatically.
**************************************************************************

The exerciser shall be in accordance with Section 26 36 00.00 10 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.
2.21 SURGE PROTECTION

Electrical and electronic components shall be protected from, or designed to withstand the effects of surges from switching and lightning.

2.22 AUTOMATIC ENGINE-GENERATOR-SET SYSTEM OPERATION

**************************************************************************

NOTE: Adapt to fit application and provide desired actuation sequence.
**************************************************************************

Fully automatic operation shall be provided for the following operations: engine-generator set starting and source transfer upon loss of [normal] [preferred] source; retransfer upon restoration of the [normal] [preferred] source; sequential starting; and stopping of each engine-generator set after cool down. Devices shall automatically reset after termination of their function.

2.22.1 Automatic Transfer Switch

Automatic transfer switches shall be in accordance with Section 26 36 00.00 10 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.

2.22.2 Monitoring and Transfer

Devices shall be provided to monitor voltage and frequency for the [normal] [preferred] power source and each engine generator set, and control transfer from the [normal] [preferred] source and retransfer upon restoration of the [normal] [preferred] source. Functions, actuation, and time delays shall be as described in Section 26 36 00.00 10 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.

2.23 MANUAL ENGINE-GENERATOR SET SYSTEM OPERATION

Complete facilities shall be provided for manual starting and testing of each set without load, loading and unloading of each set.

2.24 BASE

The base shall be constructed of steel. The base shall be designed to rigidly support the engine-generator set, ensure permanent alignment of all rotating parts, be arranged to provide easy access to allow changing of lube-oil, and ensure that alignment will be maintained during shipping and normal operation. The base shall permit skidding in any direction during installation and shall be provided with suitable holes for foundation bolts. The base shall also withstand and mitigate the effects of synchronous vibration of the engine and generator, and shall be provided with [suitable holes for anchor bolts] [[_____] diameter holes for anchor bolts] and jacking screws for leveling.

2.25 THERMAL INSULATION

Thermal insulation shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.
2.26 PAINTING AND FINISHING

The engine-generator set shall be cleaned, primed and painted in accordance with the manufacturer's standard color and practice.

2.27 FACTORY INSPECTION AND TESTS

Perform factory inspection and tests on each engine-generator set proposed to meet this specification section. Inspections shall be completed and necessary repairs made prior to testing. Inspectors shall look for leaks, looseness, defects in components, and proper assembly. Factory tests shall be NEMA MG 1 routine tests and the manufacturers routine tests. Submit a certification that each engine generator set passed the factory tests and inspections and a list of the test and inspections.

PART 3 EXECUTION

******************************************************************************
NOTE: Provide an equipment layout on the plans which provides the clear space for operation and maintenance in accordance with NFPA 70 and IEEE C2. Include requirements for a staging/laydown area for disassembly or removal and replacement of major parts of the generator set. Additionally, it is advisable to provide access to remove the unit and/or major parts of equipment from the room and building either through doors/passageways or equipment hatches.
******************************************************************************

3.1 EXAMINATION

After becoming familiar with all details of the work, perform a Site Visit to verify details of the work. Submit a site visit letter stating the date the site was visited and listing discrepancies found and advise the Contracting Officer in writing of any discrepancies before performing any work.

3.2 GENERAL INSTALLATION

Submit a complete copy of the manufacturer's installation procedures. A detailed description of the manufacturer's recommended break-in procedure.

Provide clear space for operation and maintenance in accordance with NFPA 70 and IEEE C2. Configure installation of pipe, duct, conduit, and ancillary equipment to facilitate easy removal and replacement of major components and parts of the engine-generator set.

3.3 PIPING INSTALLATION

3.3.1 General

Piping shall be welded. Connections at valves shall be flanged. Connections at equipment shall be flanged except that connections to the diesel engine may be threaded if the diesel-engine manufacturer's standard connection is threaded. Except as otherwise specified, flanged fittings shall be utilized to allow for complete dismantling and removal of each piping system from the facility without disconnecting or removing any portion of any other system's equipment or piping. Connections to all...
equipment shall be made with flexible connectors. Pipes extending through the roof shall be properly flashed. Piping shall be installed clear of windows, doors, and openings to permit thermal expansion and contraction without damage to joints or hangers, and with a \(13 \text{ mm } 1/2 \text{ inch}\) drain valve at each low point.

3.3.2 Supports

Hangers, inserts, and supports shall be of sufficient size to accommodate any insulation and shall conform to MSS SP-58. Supports shall be spaced not more than \(2.1 \text{ m } 7 \text{ feet}\) on center for pipes \(50 \text{ mm } 2 \text{ inches}\) in diameter or less, not more than \(3.6 \text{ m } 12 \text{ feet}\) on center for pipes larger than \(50 \text{ mm } 2 \text{ inches}\) but no larger than \(100 \text{ mm } 4 \text{ inches}\), and not more than \(5.2 \text{ m } 17 \text{ feet}\) on center for pipes larger than \(100 \text{ mm } 4 \text{ inches}\) in diameter. Supports shall be provided at pipe bends or change of direction.

3.3.2.1 Ceiling and Roof

Exhaust piping shall be supported with appropriately sized type 41 single pipe roll and threaded rods; all other piping shall be supported with appropriately sized type 1 clevis and threaded rods.

3.3.2.2 Wall

Wall supports for pipe shall be made by suspending the pipe from appropriately sized type 33 brackets with the appropriate ceiling and roof pipe supports.

3.3.3 Flanged Joints

Flanges shall be \text{Class 125 125 pound}\ type, drilled, and of the proper size and configuration to match equipment and diesel-engine connections. Gaskets shall be factory cut in one piece \(1.6 \text{ mm } 1/16 \text{ inch}\) thick.

3.3.4 Cleaning

After fabrication and before assembly, piping interiors shall be manually wiped clean of all debris.

3.3.5 Pipe Sleeves

Pipes passing through construction such as ceilings, floors, or walls shall be fitted with sleeves. Each sleeve shall extend through and be securely fastened in its respective structure and shall be cut flush with each surface. The structure shall be built tightly to the sleeve. The inside diameter of each sleeve shall be \(13 \text{ mm } 1/2 \text{ inch}\), and where pipes pass through combustible materials, \(25 \text{ mm } 1 \text{ inch}\) larger than the outside diameter of the passing pipe or pipe covering.

3.4 ELECTRICAL INSTALLATION

Electrical installation shall comply with \text{NFPA 70, IEEE C2}, and Section \text{26 20 00 INTERIOR DISTRIBUTION SYSTEM}. For vibration isolation, flexible fittings shall be provided for all conduit, cable trays, and raceways attached to engine-generator sets; metallic conductor cables installed on the engine generator set and from the engine generator set to equipment not mounted on the engine generator set shall be flexible stranded conductor; and terminations of conductors on the engine generator set shall be crimp-type terminals or lugs. Submit manufacturer's standard certification
that prototype tests were performed for the generator model proposed.

3.5 FIELD PAINTING

**************************************************************************
**NOTE: For Air Force work add that the exterior of all equipment shall be finished in the base standard color.**
**************************************************************************

Field painting shall be as specified in Section 09 90 00 PAINTS AND COATINGS.

3.6 ONSITE INSPECTION AND TESTS

**************************************************************************
**NOTE: Delete tests not necessary.**
**************************************************************************

3.6.1 Submittal Requirements

a. A letter giving notice of the proposed dates of all onsite inspections and tests at least [14] [_____] days prior to beginning tests.

b. A detailed description of the Contractor's proposed procedures for onsite tests including the test including the test plan and a listing of equipment necessary to perform the tests. Submission shall be at least [_____] days prior to beginning tests.

c. [Six] [_____] copies of the onsite test data described below in 216 by 279 mm 8-1/2 by 11 inch 3-ring binders with a separate section for each test. Sections shall be separated by dividers with tabs. Data plots shall be full size 216 by 279 mm 8-1/2 by 11 inches minimum), showing all grid lines, with full resolution.

(1) A description of the procedures for onsite tests.

(2) A list of equipment used, with calibration certifications.

(3) A copy of measurements taken, with required plots and graphs.

(4) The date of testing.

(5) The parameters verified.

(6) The condition specified for the parameter.

(7) The test results, signed and dated.

(8) A description of all adjustments made.

3.6.2 Test Conditions

3.6.2.1 Data

Measurements shall be made and recorded of parameters necessary to verify that each set meets specified parameters. If the results of any test step are not satisfactory, adjustments or replacements shall be made and the step repeated until satisfactory results are obtained. Unless otherwise
indicated, data shall be taken during engine-generator set operation and recorded in 15 minute intervals and shall include: readings of engine-generator set meters and gauges for electrical and power parameters; oil pressure; ambient temperature; and engine temperatures available from meters and gauges supplied as permanent equipment on the engine-generator set. In the following tests where measurements are to be recorded after stabilization of an engine-generator set parameter (voltage, frequency, current, temperature, etc.), stabilization is considered to have occurred when measurements are maintained within the specified bandwidths or tolerances, for a minimum of four consecutive readings. Electrical measurements shall be performed in accordance with IEEE 120. Definitions and terms are in accordance with IEEE Stds Dictionary. Temperature limits in the rating of electrical equipment and for the evaluation of electrical insulation shall be in accordance with IEEE 1.

3.6.2.2 **Power Factor**

Engine-generator set operating tests shall be made utilizing a load with [the power factor specified in the engine generator set parameter schedule] [a [_____] power factor]. Submit generator capability curve showing generator kVA output (kW vs. kvar) for both leading and lagging power factors ranging from 0 to 1.0.

3.6.2.3 **Contractor Supplied Items**

Provide all equipment and supplies required for inspections and tests including fuel, test instruments, and loadbanks at the specified power factors.

3.6.2.4 **Instruments**

Readings of panel gauges, meters, displays, and instruments, provided under this specification shall be verified during test runs by test instruments of precision and accuracy greater than the tested items. Test instrument accuracy shall be at least as follows: current, 1.5 percent; voltage, 1.5 percent; real power, 1.5 percent; reactive power, 1.5 percent; power factor, 3 percent; frequency, 0.5 percent. Test instruments shall be calibrated by a recognized standards laboratory within [30] [90] days prior to testing.

3.6.2.5 **Sequence**

The sequence of testing shall be as specified in the approved testing plan unless variance is authorized by the Contracting Officer. Field testing shall be performed in the presence of the Contracting Officer. Tests may be scheduled and sequenced in order to optimize run-time periods; however the following general order of testing shall be followed: Construction Tests; Inspections; Safety run Tests; and Performance Tests and Final Inspection.

3.6.3 **Construction Tests**

**************************************************************************
NOTE: Coordinate the construction test requirements with the other specification sections to eliminate redundant tests and provide additional reference to necessary tests.
**************************************************************************
Individual component and equipment functional tests for fuel piping, coolant piping, and lubricating-oil piping, electrical circuit continuity, insulation resistance, circuit protective devices, and equipment not provided by the engine-generator set manufacturer shall be performed prior to connection to the engine-generator set.

3.6.3.1 Piping Test

a. Lube-oil and fuel-oil piping shall be flushed with the same type of fluid intended to flow through the piping, until the outflowing fluid has no obvious sediment or emulsion.

b. Fuel piping which is external to the engine-generator set shall be tested in accordance with NFPA 30. All remaining piping which is external to the engine generator set shall be pressure tested with air pressure at 150 percent of the maximum anticipated working pressure, but in no case less than 1 MPa 150 psig, for a period of 2 hours to prove the piping has no leaks. If piping is to be insulated, the test shall be performed before the insulation is applied.

3.6.3.2 Electrical Equipment Tests

**************************************************************************

NOTE: Delete ground resistance test where covered by other project specifications, or where no grounds are installed.

**************************************************************************

a. Low-voltage cable insulation integrity tests shall be performed for cables connecting the generator breaker to the [automatic transfer switch] [panelboard] [main disconnect switch] [distribution bus] [____]. Low-voltage cable, complete with splices, shall be tested for insulation resistance after the cables are installed, in their final configuration, ready for connection to the equipment, and prior to energization. The test voltage shall be 500 volts dc, applied for one minute between each conductor and ground and between all possible combinations conductors in the same trench, duct, or cable, with all other conductors in the same trench, duct, or conduit. The minimum value of insulation shall be:

(1) \[ R \text{ in megohms} = \frac{(\text{rated voltage in kV} + 1) \times 304,800}{\text{length of cable in meters}} \]

(2) \[ R \text{ in megohms} = \frac{(\text{rated voltage in kV} + 1) \times 1000}{\text{length of cable in feet}} \]

(3) Each cable failing this test shall be repaired or replaced. The repaired cable shall be retested until failures have been eliminated.

b. Medium-voltage cable insulation integrity tests shall be performed for cables connecting the generator breaker to the [generator switchgear] [main disconnect switch] [distribution bus]. After insulation and before the operating test or connection to an existing system, the medium-voltage cable system shall be given a high potential test. Direct-current voltage shall be applied on each phase conductor of the system by connecting conductors as one terminal and connecting grounds or metallic shieldings or sheaths of the cable as the other terminal for each test. Prior to making the test, the cables shall be isolated
by opening applicable protective devices and disconnecting equipment. The test shall be conducted with all splices, connectors, and terminations in place. The method, voltage, length of time, and other characteristics of the test for initial installation shall be in accordance with [NEMA WC 74/ICEA S-93-639] for the particular type of cable installed, except that 28kV and 35kV insulation test voltages shall be in accordance with either AEIC CS8 or AEIC CS8 as applicable, and shall not exceed the recommendations of IEEE 404 for cable joints and IEEE 48 for cable terminations unless the cable and accessory manufacturers indicate higher voltages are acceptable for testing. Should any cable fail due to a weakness of conductor insulation or due to defects or injuries incidental to the installation or because of improper installation of cable, cable joints, terminations, or other connections, make necessary repairs or replace cables as directed. Repaired or replaced cables shall be retested.

c. Ground-Resistance Tests. The resistance of [each grounding electrode] [each grounding electrode system] [the ground mat] [the ground ring] shall be measured using the fall-of-potential method defined in IEEE 81. Ground resistance measurements shall be made before the electrical distribution system is energized and shall be made in normally dry conditions not less than 48 hours after the last rainfall. Resistance measurements of separate grounding electrode systems shall be made before the systems are bonded together below grade. The combined resistance of separate systems may be used to meet the required resistance, but the specified number of electrodes must still be provided.

(2) Multiple rod electrodes - [_____] ohms.
(3) Ground mat - [_____] ohms.

d. Circuit breakers and switchgear shall be examined and tested in accordance with manufacturer's published instructions for functional testing.

3.6.4 Inspections

The following inspections shall be performed jointly by the Contracting Officer and the Contractor, after complete installation of each engine-generator set and its associated equipment, and prior to startup of the engine-generator set. Checks applicable to the installation shall be performed. The results of those which are physical inspections (I) shall be documented and submitted as a letter certifying that all facilities are complete and functional, that each system is fully functional, and that each item of equipment is complete, free from damage, adjusted, and ready for beneficial use. Present manufacturer's data for the inspections designated (D) at the time of inspection. Inspections shall verify that equipment type, features, accessibility, installation and condition are in accordance with the contract specification. Manufacturer's statements shall certify provision of features which cannot be verified visually.

1. Drive belts. (I)
2. Governor type and features. (I)
3. Engine timing mark. (I)
4. Starting motor. (I)
5. Starting aids. (I)
6. Coolant type and concentration. (D)
7. Radiator drains. (I)
8. Block coolant drains. (I)
9. Coolant fill level. (I)
10. Coolant line connections. (I)
11. Coolant hoses. (I)
12. Combustion air filter. (I)
13. Intake air silencer. (I)
14. Lube oil type. (D)
15. Lube oil drain. (I)
16. Lube-oil filter. (I)
17. Lube-oil-fill level. (I)
18. Lube-oil line connections. (I)
19. Lube-oil lines. (I)
20. Fuel type. (D)
21. Fuel-level. (I)
22. Fuel-line connections. (I)
23. Fuel lines. (I)
24. Fuel filter. (I)
25. Access for maintenance. (I)
26. Voltage regulator. (I)
27. Battery-charger connections. (I)
28. Wiring & terminations. (I)
29. Instrumentation. (I)
30. Hazards to personnel. (I)
31. Base. (I)
32. Nameplates. (I)
33. Paint. (I)
34. Exhaust system. (I)
35. Access provided to controls. (I)
36. Enclosure. (I)
37. Engine & generator mounting bolts (proper application). (I)

3.6.5 Safety Run Tests

**************************************************************************

NOTE: For the sound level tests, modify the radial distance requirement from the engine intake and exhaust to account for obstructions, variations in site conditions, building configurations; or indicate points on the contract drawings at which measurements are to be made.

Delete item w if a day tank is not used.

Add the following test under item x below when over/under frequency alarms are provided. Coordinate the requirement with paragraph Alarm Panels.

x. Manually adjust the governor to speed up the engine to a level beyond the over frequency alarm setpoint and record the frequency when the audible alarm sounds. Manually adjust the governor to slow down the engine to a level below the under frequency alarm setpoint and record the frequency when the audible alarm sounds. Return the speed to the rated value. Shut down the engine-generator set.

**************************************************************************

a. Perform and record engine manufacturer's recommended prestarting checks
and inspections.

b. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

c. Activate the manual emergency stop switch and verify that the engine stops.

d. Remove the high and pre-high lubricating oil temperature sensing elements from the engine and temporarily install temperature gauge in their normal locations on the engine (required for safety, not for recorded data). Where necessary, provide temporary wiring harness to connect the sensing elements to their permanent electrical leads.

e. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set at no load until the output voltage and frequency stabilize. Monitor the temporarily installed temperature gauges. If temperature reading exceeds the value for an alarm condition, activate the manual emergency stop switch.

f. Immerse the elements in a vessel containing controlled-temperature hot oil and record the temperature at which the pre-high alarm activates and the temperature at which the engine shuts down. Remove the temporary temperature gauges and reinstall the temperature sensors on the engine.

g. Remove the high and pre-high coolant temperature sensing elements from the engine and temporarily seal their normal location on the engine and temporarily install temperature gauges in their normal locations on the engine (required for safety, not for recorded data). Where necessary provide temporary wiring harness to connect the sensing elements to their permanent electrical leads.

h. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set at no load until the output voltage and frequency stabilize.

i. Immerse the elements in a vessel containing controlled-temperature hot oil and record the temperature at which the pre-high alarm activates and the temperature at which the engine shuts down. Remove the temporary temperature gauges and reinstall the temperature sensors on the engine.

j. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

k. Operate the engine generator-set for at least 30 minutes at 100 percent of service load.

l. Verify proper operation of the governor and voltage regulator.

m. Verify proper operation and setpoints of gauges and instruments.

n. Verify proper operation of ancillary equipment.
o. Manually adjust the governor to increase engine speed past the overspeed limit. Record the RPM at which the engine shuts down.

p. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 75 percent of rated load.

q. Manually fill the day tank to a level above the overfill limit. Record the level at which the overfill alarm sounds. Verify shutdown of the fuel transfer pump. Drain the day tank down below the overfill limit.

r. Shut down the engine. Remove the time-delay low lube oil pressure alarm bypass and try to start the engine. Record the results.

s. Attach a manifold to the engine oil system (at the oil sensor pressure port) that contains a shutoff valve in series with a connection for the engine's oil pressure sensor followed by an oil pressure gauge ending with a bleed valve. The engine's oil pressure sensor shall be moved from the engine to the manifold and its normal location on the engine temporarily sealed. The manifold shutoff valve shall be open and bleed valve closed.

t. Start the engine, record the starting time, make and record all engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 75 percent of service load.

u. Close the manifold shutoff valve. Slowly allow the pressure in the manifold to bleed off through the bleed valve while watching the pressure gauge. Record the pressure at which the engine shuts down. Catch oil spillage from the bleed valve in a container. Add the oil from the container back to the engine, remove the manifold, and reinstall the engine's oil pressure sensor on the engine.

v. Start the engine, record the starting time, make and record all engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 100 percent of service load. Record the maximum sound level in each frequency band at a distance of [_____] [22.9] m [_____] [75] feet from the end of the exhaust and air intake piping directly along the path of intake and discharge horizontal piping; or at a radius of [22.9] [10.7] m [75] [35] feet from the engine at 45 degrees apart in all directions for vertical piping. The measurements should comply with the paragraph SOUND LIMITATIONS. [If a sound limiting enclosure is provided, the enclosure, the muffler, and intake silencer shall be modified or replaced as required to meet the sound requirements contained within this specification.] [If a sound limiting enclosure is not provided, the muffler and air intake silencer shall be modified or replaced as required to meet the sound limitations of this specification. If the sound limitations can not be obtained by modifying or replacing the muffler and air intake silencer, notify the Contracting Officer and provide a recommendation for meeting the sound limitations.]

w. Manually drain off fuel slowly from the day tank to empty it to below the low fuel level limit and record the level at which the audible alarm sounds. Add fuel back to the day tank to fill it above low level alarm limits.
3.6.6 Performance Tests

Submit calculations of the engine and generator output power capability, including efficiency and parasitic load data.

3.6.6.1 Continuous Engine Load Run Test

**************************************************************************
NOTE: If contractually possible, specify an ambient temperature for the load run test which is typical for the average maximum temperature. This is the most strenuous operating condition. Specify a month which typically provides the most restrictive operating condition.
**************************************************************************

The engine-generator set and ancillary systems shall be tested at service load to: demonstrate reliability and durability (see paragraph RELIABILITY AND DURABILITY for submittal requirements); verify that heat of extended operation does not adversely affect or cause failure in any part of the system; and check all parts of the system. If the engine load run test is interrupted for any reason, the entire test shall be repeated. The engine load run test shall be accomplished principally during daylight hours, with an average ambient temperature of [_____] degrees C [_____] degrees F, during the month of [______]. After each change in load in the following test, measure the vibration at the end bearings (front and back of engine, outboard end of generator) in the horizontal, vertical, and axial directions. Verify that the vibration is within the allowable range. Measurements are to be recorded after stabilization of an engine-generator set parameter (voltage, frequency, current, temperature, etc.). Stabilization is considered to have occurred when measurements are maintained within the specified bandwidths or tolerances, for a minimum of four consecutive readings. Data taken at 15 minutes intervals shall include the following:

a. Electrical: Output amperes, voltage, real and reactive power, power factor, frequency.

b. Pressure: Lube-oil.

c. Temperature: Coolant, Lube-oil, Ambient.

(1) Perform and record engine manufacturer's recommended prestarting checks and inspections. Include as a minimum checking of coolant fluid, fuel, and lube-oil levels.

(2) Start the engine; make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

(3) Operate the engine generator-set for at least 2 hours at 75 percent of service load.

(4) Increase load to 100 percent of service load and operate the engine generator-set for at least 2 hours.

(5) Remove load from the engine-generator set.
3.6.6.2 Load Acceptance Test

Engine manufacturer's recommended prestarting checks and inspections shall be performed and recorded. The engine shall be started, and engine manufacturer's after-starting checks and inspections made and recorded during a reasonable warm-up period. For the following steps, the output line-line and line-neutral voltages and frequency shall be recorded after performing each step instruction (after stabilization of voltage and frequency). Stabilization is considered to have occurred when measurements are maintained within the specified bandwidths or tolerances, for a minimum of four consecutive readings.

a. Apply load in steps no larger than the Maximum Step Load Increase to load the engine-generator set to 100% of Service Load.

b. Verify that the engine-generator set responds to the load addition and that the output voltage returns to and stabilizes within the rated bandwidths.

3.6.7 Automatic Operation Tests for Stand-Alone Operation

**************************************************************************

NOTE: Substitute manual operation and transfer for automatic operation where automatic operation is not required by the project. Delete automatic loading system where not required. The designer will provide the sequence of operation (load sequences for load acquisition and load shedding) in the design documents.

**************************************************************************

The automatic loading system shall be tested to demonstrate [automatic starting,] [and] [loading and unloading] of each engine-generator set. The loads for this test shall utilize the actual loads to be served, and the loading sequence shall be the indicated sequence. Perform this test for a minimum of two successive, successful tests. Data taken shall include the following:

a. Ambient temperature (at 15 minute intervals).

b. Generator output current (before and after load changes).

c. Generator output voltage (before and after load changes).

d. Generator output frequency (before and after load changes.)

   (1) Initiate loss of the primary power source and verify automatic sequence of operation.

   (2) Restore the primary power source and verify sequence of operation.

   (3) Verify resetting of controls to normal.

3.7 ONSITE TRAINING

**************************************************************************

NOTE: Delete onsite training if not required.

**************************************************************************
Conduct training course for operating staff as designated by the Contracting Officer. The training period shall consist of a total [4] [_____] hours of normal working time and shall start after the system is functionally completed but prior to final acceptance. The course instructions shall cover pertinent points involved in operating, starting, stopping, servicing the equipment, as well as all major elements of the operation and maintenance manuals. Additionally, the course instructions shall demonstrate all routine maintenance operations such as oil change, oil filter change, and air filter change.

3.8 FINAL INSPECTION AND TESTING

a. Start the engine, record the starting time, make and record all engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

b. Increase the load in steps no greater than the maximum step load increase to 100 percent of service load, and operate the engine-generator set for at least 30 minutes. Measure the vibration at the end bearings (front and back of engine, outboard end of generator) in the horizontal, vertical, and axial directions. Verify that the vibration is within the same range as previous measurements and is within the required range.

c. Remove load and shut down the engine-generator set after the recommended cool down period. Perform the pre-test inspections and take necessary corrective actions.

d. Remove the lube oil filter and have the oil and filter examined by the engine manufacturer for excessive metal, abrasive foreign particles, etc. Any corrective action shall be verified for effectiveness by running the engine for 4 hours at service load, then re-examining the oil and filter.

e. Remove the fuel filter and examine the filter for trash, abrasive foreign particles, etc.

f. Visually inspect and check engine and generator mounting bolts for tightness and visible damage.

g. Replace air, oil, and fuel filters with new filters.

3.9 MANUFACTURER'S FIELD SERVICE

The engine generator-set manufacturer shall furnish a qualified representative to supervise the installation of the engine generator-set, assist in the performance of the onsite tests, and instruct personnel as to the operational and maintenance features of the equipment.

3.10 INSTRUCTIONS

**********NOTE: The designer should check with the customer to determine if framed instructions can be placed in the project area (requires wall space), and where they are to be placed. Select the 216 x 279 mm 8 1/2 x 11 inches notebook option where instructions will have to be placed in the genset enclosure or a switchgear cubicle (or other suitable enclosure).**********
Two sets of instructions shall be typed and framed under weatherproof laminated plastic, and posted side-by-side where directed before acceptance. First set of instructions shall include a one-line diagram, wiring and control diagrams and a complete layout of the system. Second set of instructions shall include the condensed operating instructions describing manufacturer's pre-start checklist and precautions; start procedures for test-mode, manual-start mode, and automatic-start mode (as applicable); running checks, procedures, and precautions; and shutdown procedures, checks, and precautions. Instructions shall include procedures for interrelated equipment (such as heat recovery systems, co-generation, load-shedding, and automatic transfer switches).

Two sets of instructions shall be typed in 216 x 279 mm 8 1/2 x 11 inches format, laminated in weatherproof plastic, and placed in three-ring vinyl binders. The binders shall be placed as directed by the Contracting Officer. The instructions shall be in place prior to acceptance of the engine generator set installation. First set of instructions shall include a one-line diagram, wiring and control diagrams and a complete layout of the system. Second set of instructions shall include the condensed operating instructions describing manufacturer's pre-start checklist and precautions; startup procedures for test-mode, manual-start mode, and automatic-start mode (as applicable); running checks, procedures, and precautions; and shutdown procedures, checks, and precautions. Instructions shall include procedures for interrelated equipment (such as heat recovery systems, co-generation, load-shedding, and automatic transfer switches).

3.11 ACCEPTANCE

Final acceptance of the engine-generator set will not be given until the Contractor has successfully completed all tests and after all defects in installation material or operation have been corrected.

Submit drawings which accurately depict the as-built configuration of the installation, upon acceptance of the diesel-generator set installation. Revise layout drawings to reflect the as-built conditions and submit them with the as-built drawings.

NOTE: This guide specification covers the requirements for stationary diesel-driven generator sets in the 100 to 2500 kilowatt capacity.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This Specification is not for Procurement of Gas-fueled Engine-generator Sets.

Transient-load-response performance characteristics of natural gas, digester gas, propane, and liquefied petroleum gas engines differ significantly from those of diesel engines because of the fuel differences. Consult manufacturers for sample specifications.

Select the features and fill in blanks with values appropriate for the design condition. This specification does not apply to 400 Hz applications.
1.1 REFERENCES

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control.
System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

1.3.1 Conformance to Codes and Standards

Where equipment is specified to conform to requirements of any code or standard such as UL, NEMA, etc., the design, fabrication and installation shall also conform to the code.

1.3.2 Site Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1. Submit a copy of qualifying procedures and a list of names and identification symbols of qualified welders and welding operators. A letter listing the welder qualifying procedures for each welder, complete with supporting data such as test procedures used, what was tested to, and a list of the names of all welders and their identification symbols. Perform welder qualification
tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests which shall be performed at the work site, if practical. The welder or welding operator shall apply the personally assigned symbol near each weld made as a permanent record.

1.3.3 Vibration Limitation

The maximum engine-generator set vibration in the horizontal, vertical, and axial directions shall be limited to 0.15 mm 6 mils (peak-peak RMS), with an overall velocity limit of 24 mm/second 0.95 inches/second RMS, for all speeds through 110 percent of rated speed.

1.3.4 Seismic Requirements

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-310-04 and Sections 13 48 00, 23 05 48.19, and 26 05 48.00 10, properly edited, must be included in the contract documents.
**************************************************************************

[Seismic requirements shall be in accordance with UFC 3-310-04 and Sections 13 48 00 [SEISMIC] BRACING FOR MISCELLANEOUS EQUIPMENT, 23 05 48.19 [SEISMIC] BRACING FOR HVAC and 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT] [as shown on the drawings].

1.3.5 Experience

Each component manufacturer shall have experience in the manufacture, assembly and sale of components used with stationary diesel engine-generator sets for commercial and industrial use. The engine-generator set manufacturer/assembler shall have a minimum of 3 years experience in the manufacture, assembly and sale of stationary diesel engine-generator sets. Submit a statement showing that each component manufacturer has a minimum of 3 years experience in the manufacture, assembly and sale of components used with stationary diesel engine-generator sets. The engine-generator set manufacturer/assembler has a minimum of 3 years experience in the manufacture, assembly and sale of stationary diesel engine-generator sets for commercial and industrial use.

1.3.6 Field Engineer

The engine-generator set manufacturer or assembler shall furnish a qualified field engineer to supervise the complete installation of the engine-generator set, assist in the performance of the onsite tests, and instruct personnel as to the operational and maintenance features of the equipment. Submit a letter listing the qualifications, schools, formal training, and experience of the field engineer. The field engineer shall have attended the engine generator manufacturer's training courses on installation and operation and maintenance of engine generator sets.

1.3.7 Detailed Drawings

Submit detailed drawings showing the following:
a. Base-mounted equipment, complete with base and attachments, including anchor bolt template and recommended clearances for maintenance and operation.

b. Complete starting system.

c. Complete fuel system.

d. Complete cooling system.

e. Complete exhaust system.

f. Layout of relays, breakers, programmable controllers, switchgear, and switches including applicable single line and wiring diagrams with written description of sequence of operation and the instrumentation provided.

g. The complete lubrication system, including piping, pumps, strainers, filters, [heat exchangers for lube oil and turbocharger cooling,] [electric heater,] controls and wiring.

h. Location, type, and description of vibration isolation devices for all applications.

i. The safety system, together with a detailed description of how it is to work. Wiring schematics, safety devices with a listing of their normal ranges, alarm and shutdown values (to include operation parameters such as pressures, temperatures voltages, currents, and speeds) shall be included.

j. One-line schematic and wiring diagrams of the generator, exciter, regulator, governor, and instrumentation.

k. Layout of each panel.

l. Mounting and support for each panel and major piece of electrical equipment.

m. Engine-generator set lifting points and rigging instructions.

1.4 DELIVERY, STORAGE, AND HANDLING

Properly protect material and equipment, in accordance with the manufacturers recommended storage procedures, before, during, and after installation. Protect stored items from the weather and contamination. During installation, piping and similar openings shall be capped to keep out dirt and other foreign matter.

1.5 EXTRA MATERIALS

Submit a complete list of spare parts for each piece of equipment and a complete list of all material and supplies needed for continued operation. Lists shall include supply source and current prices. Separate each list into two parts, those elements recommended by the manufacturer to be replaced after 3 years of service, and the remaining elements.
NOTE: Engine Generator Parameter Schedule. Where multiple engine-generator sets of different sizes or applications are to be provided, a Parameter Schedule should be shown on the contract drawings (one for each engine-generator set to be installed). If only one engine-generator set is provided (or multiples of the same type, size, etc.), the schedule may be in the body of the specification. Note that the specifications refer to the Engine Generator Parameter Schedule and the designer must provide one each by that name.

Some load applications require precise generator output frequency, voltage, level waveform characteristics and control of transient response. Most loads do not require stricter control than most off-the-shelf engine generator sets can provide. The criticality of the output and response characteristics can affect: selection of the governor type, whether it is to be isochronous or droop, and its steady state bandwidth; selection of the voltage regulator parameters; transient recovery time for frequency and voltage; maximum voltage and frequency deviation for a transient event; and because of the maximum deviations and transient recovery times, the sizing or oversizing of the engine and generator. The notes below are included to assist the designer in making informed choices when filling in the Engine Generator Parameter Schedule.

Power Ratings and Industry Terminology. The following definitions are from the Electrical Generating Systems Association Standard 101P, Engine Driven Generating Sets. Stationary diesel-engine-driven electric generator sets are divided into the following four rating categories: EMERGENCY STANDBY, LIMITED RUNNING TIME, PRIME POWER, and INDUSTRIAL.

"EMERGENCY STANDBY RATING means the power that the generator set will deliver continuously under normal varying load factors for the duration of a power outage." It must be understood that this definition uses the term "normal varying load conditions". Most manufacturers use this terminology to indicate that their units typically are not rated for continuous operation at the nameplate rating, but rather that the units provided are rated for continuous operation at 70 to 80 percent of their nameplate rating, with periodic loading up to 100 percent of the nameplate rating for short (cyclical) periods during a power outage. When specifying a genset be sure to specify what the peak load is and
how much is continuous.

"LIMITED RUNNING TIME RATING means the power that the generator set will deliver when used as a utility type power source, typically in load curtailment type service, for a limited number of hours, where there are non-varying load factors and/or constant dedicated loads."

"PRIME POWER RATING means the power that the generator set will deliver when used as a utility type power plant under normal varying load factors to run continuously. This rating requires a minimum momentary overload capability of 10 percent."

"INDUSTRIAL RATING means the power that the generator set will deliver 24 hours per day when used as a utility type power plant where there are non-varying load factors and/or constant dedicated loads."

Overload Capacity. Overload capacity is only for PRIME rated units. Delete for standby applications.

Power Factor. Commercial genset power ratings are usually based on 0.8 power factor. Select 0.8 unless the application requires one more stringent.

Loading. When specifying engine-generator sets the designer will analyze the load characteristics and profiles of the load to be served to determine the peak demand, maximum step load increase and decrease, motor starting requirements represented as starting kVA, continuous and non-continuous (cyclical/periodic), and the non-linear loads to be served. This information should be included in the engine-generator set parameter schedule or on the drawings for each different unit provided. For this application, service load is the peak estimated loading (continuous plus non-continuous) to be placed on the engine generator set.

Peak demand calculation provides a figure from which to determine the service load. For prime applications the service load should include spare capacity for future load growth and spinning reserve (reserve generation beyond that required to satisfy immediate needs and/or system peak demands). Spare capacity for prime applications should be based on the facility master plan load projections.

Motor Starting Load. Motor starting requirements are important to properly size engine generator sets because the starting current for motors can be as much as six times the running current, and can cause generator output voltage and frequency to drop, even though the genset has been sized to carry the running load. The designer must analyze the motor loads to determine if the starting characteristics
of a motor or a group of motors to be started simultaneously will cause objectionable genset performance. Provide a motor starting kVA value for the largest motor or combination of motors to be started simultaneously. An increase in the size rating of the genset may be necessary to compensate for the inrush current. This assists the genset supplier in properly sizing the engine generator set.

Maximum Speed. The maximum allowable speed is 1800 RPM. If there is not specific requirement or user requirement for slower speed machines, select 1800 RPM. Selection of the maximum 1800 RPM does not preclude provision of slower speed machines, for example, in the larger sizes (above 2000 kW), where 1800 RPM machines may not be available.

Heat Exchanger Type. Fin-tube heat exchangers (radiators) are the predominate method of cooling. Specify either a fin-tube or a shell-tube heat exchanger for each engine-generator set. Heat exchangers located remote from the engine-generator set (i.e., not mounted on the engine-generator set base) will be shown on the project plans, including the power source for associated fans and pumps.

Governor. The type of governor to be used on each engine generator set should be identified as isochronous or droop on the engine-generator set parameter schedule. Isochronous governors hold frequency at the setpoint frequency (within bandwidth) for all steady state loads from 0 to 100 percent load and are required for applications where severe demands are made on voltage and frequency regulation. Droop governors allow frequency to droop to the specified percentage proportional to steady state loads from 0 to 100 percent load and are generally acceptable for general purpose and commercial applications.

Engine-generator sets in stand alone service (isolated bus) may utilize either droop or isochronous governors. The designer should analyze the application and loads to determine if the more expensive isochronous unit is actually required. Droop units provide added stability (less engine cycling) in single unit applications where constant speeds are not critical and are less expensive than isochronous governors.

Engine-generator sets in parallel (on an isolated bus) may also utilize either droop or isochronous governors. Load swings are shared proportionally based on the governor droop settings. The load will be split equally among the units for all units equipped with isochronous governors with load sharing controls, or if all units have droop governors that are set with the same droop. "Lead units" are often designated in multiple unit
applications for tighter frequency control by setting one governor at a much lower droop than the others. A "lead unit" can be designated for gensets equipped with isochronous governors if all units have governors with load sharing controls. In this case the "lead unit" will accept all load swings and the other units will remain at a constant load. When all units have droop governors, the "lead units" will accept most of the load swings and the other units will equally split a small portion of the load. If isochronous governors are specified for two or more units to be paralleled on an isolated bus, the governors must be specified with load sharing controls. For applications involving units in parallel operation which are not operator supervised the designer should specify a load-sharing system which can proportionally load two or more sets in parallel, each having isochronous governors. Generators for use with existing generators in parallel applications must have similar characteristics. Droop paralleling is specified for electrical and electro-hydraulic governors where interconnection of all controls is not possible such as when paralleling to a large electrical utility grid network. When paralleling two or more droop units with a utility grid (or with other droop units), to achieve load sharing, the unit governors must be compatible, their speed settings must be matched, and the droop must be set the same on all units. Droop adjustment range of 0 to 7 percent is typical for mechanical-hydraulic governors, and 0 to 10 percent is typical for electro-hydraulic governors. Isochronous units should not be paralleled with an infinite bus (utility grid system) without also specifying synchronizing and governor-load sharing controls. Delete speed droop adjustment for isochronous governors in non-parallel applications.

Frequency Bandwidth. Governor frequency bandwidth defines the allowable steady state variation in frequency as is typically quite small for commercially available governors (typically less than + 0.4 percent with + 0.25 percent readily available). The predominant type of device loads which are susceptible to steady state frequency deviations less than + 0.4 percent are those which employ switching power supplies (computers and variable frequency drives). The designer should select the least restrictive value for bandwidth for the application.

Voltage Regulators. Solid state regulators are readily available which maintain the voltage level (regulation or voltage droop) to + 2 percent from no load to full load, while some manufacturers offer regulators which limit the droop to + 0.5 percent. Voltage regulator bandwidth is important relative primarily to transient response. EGSA Standard
100R-1992 defines three performance classes for voltage regulators: standard (2 percent bandwidth); high (1 percent bandwidth); and precision (0.5 percent bandwidth). Select the least restrictive bandwidth necessary to satisfy the application requirement.

Generator frequency and voltage should be shown on the engine-generator set schedule. (For example: 208Y/120 volts, 3-phase, 4-wire).

Subtransient Reactance. The subtransient reactance of a generator is the impedance characteristic which determines current during the first cycle after a system short circuit condition is presented to the generator. Therefore, it is used to determine the necessary interrupting capacity of the genset circuit interrupting device. It also is utilized to predict generator response to non-linear loads. Typical values for generator subtransient reactance are found in IEEE Std 141. Subtransient reactance is specified in per unit of the generator rated kVA. Also, see the following discussion on non-linear loads.

Non-linear Loads: Non-linear loads are addressed in IEEE 519. They are loads that draw a non-sinusoidal current waveform when supplied by a sinusoidal voltage source. Typical non-linear loads include solid state switching power supplies, computer power supplies (including those found in desktop PC's, uninterruptible power supplies, variable frequency drives, radar power supplies, and solid state ballasts in fluorescent light fixtures. They cause distortion of the source voltage and current waveforms that can have harmful effects on many types of electrical equipment and electronics, including generators. Non-linear loads are similar to short circuits in that they provide momentary, sub-cycle-duration, short-circuiting of two phases. Switching power supplies consist of SCR/thyristor-controlled rectifier bridges which act as three single-phase loads, each connected across two phases of the power system. When the SCR/thyrists are switched on and off a notch in the voltage waveform will occur as a result of an instantaneous phase-phase short-circuit during the commutation of current. A low generator subtransient reactance minimizes the voltage waveform distortion in the presence of such loads. For this reason when the non-linear loads comprise 25 percent or more of the loads served, the generator subtransient reactance should be limited to no more than 0.12.

Delete Subtransient Reactance from the Engine-Generator Parameter Schedule where the genset manufacturer is responsible for sizing the generator breaker and where the non-linear loads served are
less than 25 percent.

Generators are particularly vulnerable to control problems and instability, excessive winding heating, neutral overheating, reduced efficiency, reduced torque, shaft fatigue, accelerated aging, and induced mechanical oscillations when non-linear loads are applied without careful consideration of the generator's capability to supply them. Measures which can be used to mitigate the effects of non-linear loads on generators include: procurement of low impedance generators with special windings to compensate for the additional heating; installation of harmonic filter traps; avoidance of self-excited generators; use of 2/3 pitch factor (rather than 5/6 pitch) generator windings; and generator derating with oversized neutrals.

For large non-linear loads, filter traps which are tuned to the dominant harmonic frequencies of the non-linear loads should be procured/provided with the load component. This approach is normally less costly than procurement of specially designed or derated generators.

For combinations of linear and non-linear loads where the percentage of non-linear loads is small relative to the capacity rating of the generator (25 percent or less), standard generator configurations are normally acceptable.

Provide a list of the non-linear loads in the parameter schedule, either on the drawings (and denoted on the single-line diagram) or in tabular form in the specification section. The list should contain a description of the load including equipment type, whether the rectifier is 6-pulse or 12-pulse, kVA rating, and frequency. Provide a linear load value (kVA @ PF) which represents the maximum linear load demand when non-linear loads will also be in use. The generator manufacturer will be required to meet the total harmonic distortion limits established in IEEE 519. Delete the non-linear load paragraph when non-linear loads are not served from the engine-generator set.

Maximum Step Load Increase. Maximum step load increase is used to account for the addition of block loads. These affect engine-generator set frequency and voltage output and usually initiate governor and regulator response. The change in engine-generator set output and the response of the governor and regulator defines the transient loading response. The designer should provide the actual loads to be applied to the engine-generator set because specification of maximum step load increases of 75 or 100 percent requires significant oversizing of engines and generators and/or addition of mass to fly-wheel, all of which add cost. Additionally,
oversizing of engines causes maintenance problems and increases operating costs. The following percentages may be used when the actual load acquisition rate cannot be determined. A maximum step load increase of 25 percent should be used for prime rated sets, 50 percent for optional standby rated sets with step loading, and 100 percent for legally required standby (emergency) service with no step loading.

Transient Response Criteria (short time duration). Genset-set response and recovery times vary according to the size of the set, the block load, and the controls specified. Normal response to addition of a block load will include dips in either output voltage or frequency or both and possible "overshoot" as the governor and voltage regulator respond to bring the voltage and frequency back within bandwidth. Normal response to loss of a block load will include an upward spike in output voltage or frequency back within bandwidth. The Maximum Voltage and Frequency Deviation apply to undervoltage/underfrequency ("dips") from the addition of block loads and any undershoot resulting from the recovery of an upward spike, as well as overvoltage/overfrequency (upward spikes) from the loss of block loads and any overshoot resulting from the recovery of a dip.

Cost Impact. If stringent transient-response requirements are specified, the manufacturer may select engine and generator models which have nominal rating much larger than the service load; may use an unnecessarily expensive governor; and may use a higher inertia flywheel. The designer should investigate what may actually be provided so that the cost estimate will be reasonably accurate and to confirm the selected transient requirements are not unnecessarily stringent. A maximum size for the engine-generator set may be needed to avoid the problems associated with a small load on a large capacity set.

The designer must determine the cost benefits of providing an uninterruptible power system for transient ride-through versus purchasing a generator with stringent transient response requirements. In determining the allowable voltage and frequency variation and recovery times, analyze the effects on equipment performance and recovery. Consult the NEMA utilization equipment standards to determine the maximum allowable voltage dips/overshoots (excursions).

Maximum Voltage Deviation. Select the 5 percent Maximum Voltage Deviation option only if communication equipment or other sensitive electronic equipment are a critical part of the load, and there is no UPS provided. Fluorescent
lights can tolerate a maximum of 10 percent voltage variation. NEMA induction motors and control relays can tolerate a maximum of 10 percent variation, for 30 cycles and one cycle respectively. Solenoids (brakes, valves, clutches) and ac & dc starter coils can tolerate a maximum of minus 30 percent variation, for 1/2 cycle, 2 cycles (dropout), and 5 - 10 cycles (dropout) respectively. (The times listed in cycles are not given to define the recovery time back to bandwidth, but to assist the designer in defining the maximum allowable voltage deviation.) The designer should realistically assess the need for limiting the transient voltage dip to less than 30 percent.

Maximum Frequency Deviation. Computers can usually tolerate only + 0.5 Hz variation, so an UPS is normally required where computer services should not be interrupted, or where system recovery times are critical. Inverters can tolerate ± 2 Hz variation. NEMA induction motors and control relays can tolerate a maximum of 5 percent frequency variation. (The times listed in cycles are not given to define the recovery time back to bandwidth, but to assist the designer in defining the maximum allowable frequency deviation.) The designer must be realistic in assessing the needs of the facility to be served so that unnecessarily stringent requirements are not specified.

Recovery Time Back to Bandwidth. The designer should determine the required recovery time for the loads served. The recovery time to bandwidth is not critical to operation of most equipment if the voltage and frequency do not deviate from the critical limits, or if momentary interruption is acceptable to the loads being served. The primary importance of this requirement is to ensure that the engine generator set recovers and stabilizes after load changes. Most engine generator sets can respond to 100 percent block loads and return to voltage and frequency bandwidths within 15 - 20 seconds, depending on the size of the machine (RPM, relative mass of the rotating elements, and ambient conditions).

Maximum Step Load Decrease (without shutdown). An engine generator set should be capable of being unloaded in a single step without tripping offline. In these situations the voltage and frequency transients are of no concern because there is no load being served.

Nominal Step Load Decrease. Step load decrease is used to account for dropping of block loads. This affects engine-generator set frequency and voltage output and usually initiates governor and regulator response. The change in engine-generator set output and the response of the governor and regulator
defines the transient loading response. Where the load served may be sensitive to voltage and frequency variation due to significant load decrease, include the items below in the Parameter Schedule. The Nominal Step Load Decrease provides the genset manufacturer with the information necessary to set the governor response for load decreases such than an overspeed (over-frequency) condition does not occur. The cost of engine-generator sets increase by large percentages for smaller frequency and voltage deviations from bandwidth and improved recover times. Carefully analyze the user's need for restrictions on frequency, voltage, and waveform characteristics.

Maximum Time To Start and Assume Load. Choose 10 seconds for emergency-standby applications (critical for life safety). NFPA 70 requires that standby engine-generator sets used in emergency applications start and assume load in 10 seconds. Most commercially available engine generator sets are capable of starting and assuming load within 10 seconds, however, a default value of 20 second is non-restrictive and provides a reasonable maximum value for non-critical applications.

Temperature Management. The designer is responsible for temperature control in the space occupied by the engine generator set. However, because the genset supplier normally provides the engine cooling system (and block heaters where required), the designer must provide ambient conditions under which the engine generator must operate, so that the supplier can size the equipment. Typically, high temperature provides the most restrictive condition, therefore the designer must design air-flow of adequate temperature and sufficient quantity to maintain the temperature of the generator and engine space within acceptable limits. This requires the designer to consult manufacturers literature and/or representatives to determine the nominal heat
rejection to the surroundings at rated genset
capacity (from all heat sources) to determine the
required cooling or air flow through the engine
generator set room or enclosure. In turn the
manufacturer must submit the specific operating data
in order for the contracting officer/designer to
verify that the proposed equipment meets the design
parameters.

**************************************************************************

a. Provide and install each engine-generator set complete and totally
functional, with all necessary ancillary equipment to include: air
filtration; starting system; generator controls, protection, and
isolation; instrumentation; lubrication; fuel system; cooling system;
and engine exhaust system. Each engine-generator set shall satisfy the
requirements specified in the Engine-Generator Parameter Schedule.

b. Each set shall consist of one engine, one generator, and one exciter
mounted, assembled, and aligned on one base; and other necessary
ancillary equipment which may be mounted separately. Sets having a
capacity of 750 kW or smaller shall be assembled and attached to the
base prior to shipping. Sets over 750 kW capacity may be shipped in
sections. Each set component shall be environmentally suitable for the
location shown and shall be the manufacturer's standard product offered
in catalogs for commercial or industrial use. Any nonstandard products
or components and the reason for their use shall be specifically
identified.

2.1.2 Rated Output Capacity

**************************************************************************
NOTE: The service load for each genset should be shown on the Engine-Generator Parameter Schedule. The designer must determine the service load. The Contractor, through the supplier's manufacturer/assembler, determines the efficiency and associated ancillary equipment loads. The designer must examine spare capacity requirements for spinning reserve.
**************************************************************************

Each engine-generator-set shall provide power equal to the sum of Service Load plus the machine's efficiency loss and associated ancillary equipment loads. Rated output capacity shall also consider engine and/or generator oversizing required to meet requirements in paragraph Engine-Generator Parameter Schedule.

2.1.3 Power Ratings

Power ratings shall be in accordance with EGSA 101P.

2.1.4 Transient Response

The engine-generator set governor and voltage regulator shall cause the engine-generator set to respond to the maximum step load changes such that output voltage and frequency recover to and stabilize within the operational bandwidth within the transient recovery time. The engine-generator set shall respond to maximum step load changes such that the maximum voltage and frequency deviations from bandwidth are not exceeded.

2.1.5 Reliability and Durability

**************************************************************************
NOTE: Mean time between overhauls describes the average number of operating hours that the engine will operate satisfactorily without overhaul. Overhaul is a natural consequence of the engine in operation due to worn out parts after the indicated operating hours.
**************************************************************************

[Each prime engine-generator set shall have both an engine and a generator capable of delivering the specified power on a prime basis with an anticipated mean time between overhauls of not less than 10,000 hours operating with a 70 percent load factor. Two like engines and two like generators shall be cited that have performed satisfactorily in a stationary power plant, independent from the physical location of the manufacturer's and assembler's facilities. The engine and generators should have been in operation for a minimum of 8000 actual hours at a minimum load of 70 percent of the rated output capacity. During two consecutive years of service, the units should not have experienced any failure resulting in a downtime in excess of 72 hours. Like engines shall...
be of the same model, speed, bore, stroke, number and configuration of cylinders and rated output capacity. Like generators shall be of the same model, speed, pitch, cooling, exciter, voltage regulator and rated output capacity. Each standby engine-generator set shall have both an engine and a generator capable of delivering the specified power on a standby basis with an anticipated mean time between overhauls of no less than 5,000 hours operating with a load factor of 70 percent. Two like engines and two like generators shall be cited that have performed satisfactorily in a stationary power plant, independent and separate from the physical location of the manufacturer’s and assembler’s facilities, for standby without any failure to start, including all periodic exercise. Each like engine and generator shall have had no failures resulting in downtime for repairs in excess of 72 hours during two consecutive years of service. Like engines shall be of the same model, speed, bore, stroke, number and configuration of cylinders, and rated output capacity. Like generators shall be of the same model, speed, pitch, cooling, exciter, voltage regulator and rated output capacity.

Submit a reliability and durability certification letter from the manufacturer and assembler to prove that existing facilities are and have been successfully utilizing the same components proposed to meet this specification, in similar service. Certification may be based on components, i.e. engines used with different models of generators and generators used with different engines, and does not exclude annual technological improvements made by a manufacturer in the basic standard-model component on which experience was obtained, provided parts interchangeability has not been substantially affected and the current standard model meets the performance requirements specified. Provide a list with the name of the installations, completion dates, and name and telephone number of a point of contact.

2.1.6 Parallel Operation

**************************************************************************
NOTE: Specification of an engine-generator set capable of parallel operation with a utility requires a 2/3 pitch generator winding and special coordination of protective devices with the utility system protection scheme. Do not specify this option without also providing a design for the protective device coordination which has been approved by the utility involved.
**************************************************************************

Each engine-generator set specified for parallel operation shall be configured for [automatic] [manual] parallel operation. Each set shall be capable of parallel operation with [a commercial power source on an infinite bus] [one or more sets on an isolated bus] [a commercial power source on an infinite bus and with one or more sets on an isolated bus].

2.1.7 Load Sharing

**************************************************************************
NOTE: Coordinate with paragraph Engine Generator parameter Schedule.
**************************************************************************

Each engine-generator set specified for parallel operation shall be configured to [manually load share with other sets.] [automatically load
share with other sets by proportional loading. Proportional loading shall load each set to within 5 percent of its fair share. A set’s fair share is its nameplate-rated capacity times the total load, divided by the sum of all nameplate-rated capacities of on-line sets. Load sharing shall incorporate both the real and reactive components of the load.]

2.1.8 Engine-Generator Set Enclosure

**************************************************************************
NOTE: If the engine-generator set is to be installed outdoors include requirements for the weatherproof enclosure in the engine-generator set schedule. Define corrosion resistance and/or material required for the environment. Provide structural loading required for the geographic area (wind loads, snow loads, etc.). A generator set enclosure may also be needed to mitigate excessive noise caused by the engine generator set mechanical components. Delete the reference to mechanical noise limitations if an enclosure is not needed to mitigate sound emissions. If a sound enclosure is not provided, the designer must provide a design to prevent excessive noise (meet OSHA requirements). Delete this paragraph if no engine-generator set enclosure is needed.
**************************************************************************

The engine-generator set enclosure shall be corrosion resistant and fully weather resistant. The enclosure shall contain all set components and provide ventilation to permit operation at Service Load under secured conditions. Doors shall be provided for access to controls and equipment requiring periodic maintenance or adjustment. Removable panels shall be provided for access to components requiring periodic replacement. The enclosure shall be capable of being removed without disassembly of the engine-generator set or removal of components other than the exhaust system. The enclosure shall reduce the noise of the generator set to within the limits specified in the paragraph SOUND LIMITATIONS.

2.1.9 Vibration Isolation

**************************************************************************
NOTE: See UFC 3-450-02, Power Plant Acoustics, and UFC 3-450-01, Noise and Vibration Control For Mechanical Equipment for vibration criteria. Vibration isolation systems should be applied where vibration transmitted through the genset support structure produces (either directly or by resonant frequencies of structural members) annoying or damaging vibration in the surrounding environment. Select the manufacturer’s standard or provide the maximum allowable vibration force where necessary to limit the maximum vibration. Delete the vibration isolation requirement for applications where vibration does not affect the floor or foundation.
**************************************************************************

[A vibration-isolation system shall be installed between the floor and the base. The vibration-isolation system shall limit the maximum vibration transmitted to the floor at all frequencies to a maximum of [_____] (peak...
force).] [The engine-generator set shall be provided with a vibration-isolation system in accordance with the manufacturer's standard recommendation.] Submit vibration isolation system performance data for the range of frequencies generated by the engine-generator set during operation from no load to full load and the maximum vibration transmitted to the floor plus description of seismic qualification of the engine-generator mounting, base, and vibration isolation. Submit torsional analysis including prototype testing or and calculations which certify and demonstrate that no damaging or dangerous torsional vibrations will occur when the prime mover is connected to the generator, at synchronous speeds, + 10 percent. Vibration-isolation systems shall be designed and qualified (as an integral part of the base and mounting system in accordance with the seismic parameters specified. Where the vibration-isolation system does not secure the base to the structure floor or unit foundation, seismic restraints shall be provided in accordance with the seismic parameters specified.

2.1.10 Fuel Consumption

**************************************************************************
NOTE: Delete this paragraph for standby applications. For prime applications the designer should discuss this requirement with the installation to determine if it is required.
**************************************************************************

Engine fuel consumption shall not exceed the following maximum limits based on the conditions listed below.

<table>
<thead>
<tr>
<th>Size Range</th>
<th>Net kW</th>
<th>Percent of Rated Output Capacity</th>
<th>Fuel Usage kg/kWH lbs/kWH</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 - 299</td>

</tbody>
</table>

Conditions:

a. Net kW of the Set corrected for engine auxiliaries that are electrically driven, where kW is electrical kilowatt hours.

b. 45 MJ/kg (19,350 Btu/pound) 19,350 Btu/pound high-heat value for fuel used.

c. Sea level operation.

d. Intake-air temperature not over 32 degrees C 90 degrees F.

e. Barometric pressure of intake air not less than 95.7 kPa 28-1/4 inches of mercury.
2.1.11  Fuel-Consumption Rebates

Fuel consumption rebates shall be assessed for failure of engine generator set to meet guaranteed rates. If the guaranteed fuel-consumption rate for 100 percent rated output capacity is verified in the tests but the rates for 75 or 50 percent rated output capacity are not verified, the appropriate 75 or 50 percent rate differences shall be used in assessing the rebates. If more than one fuel consumption guarantee is not met, rebates shall be computed for 100, 75, and 50 percent rated output capacity, and the highest computed figure shall be used in assessing the rebates.

Rebate = H x C x D x N where:

<table>
<thead>
<tr>
<th></th>

</tbody>
</table>

Adjust fuel costs to the heat value kJ/kg BTU/lb for the fuel used in the test (requires fuel laboratory test) rationed to the 45,000 kJ/kg 19,350 Btu/pound heat value used as the basis of the guarantee.

2.1.12  Harmonic Requirements

Non-linear loads to be served by each engine-generator set are as indicated. The maximum linear load demand (kVA @ PF) when non-linear loads will also be in use is as indicated.

2.1.13  Starting Time Requirements

Upon receipt of a signal to start, each engine generator set will start, reach rated frequency and voltage and be ready to assume load within the time specified. For standby sets used in emergency power applications, each engine generator set will start, reach rated frequency and voltage, and power will be supplied to the load terminals of the automatic transfer switch within the starting time specified.
2.2 NAMEPLATES

******************************************************************************
NOTE: Delete any equipment not applicable to the project.
******************************************************************************

Each major component of this specification shall have the manufacturer's name, type or style, model or serial number and rating on a plate secured to the equipment. As a minimum, nameplates shall be provided for:

Engines                       Relays
Generators                    Transformers (CT & PT)
Regulators                    Day tanks
Pumps and pump motors         Governors
Generator Breaker             Air Starting System
Economizers                   Heat exchangers (other than base mounted)

Where the following equipment is not provided as a standard component by the diesel engine generator set manufacturer, the nameplate information may be provided in the maintenance manual in lieu of nameplates.

Battery charger               Heaters
Switchboards                  Exhaust mufflers
Switchgear                    Silencers
Battery                       Exciters

2.3 SAFETY DEVICES

Exposed moving parts, parts that produce high operating temperatures, parts which may be electrically energized, and parts that may be a hazard to operating personnel shall be insulated, fully enclosed, guarded, or fitted with other types of safety devices. The safety devices shall be installed so that proper operation of the equipment is not impaired.

2.4 MATERIALS AND EQUIPMENT

Submit certification stating that where materials or equipment are specified to comply with requirements of UL, written proof of such compliance has been obtained. The label or listing of the specified agency, or a written certificate from an approved, nationally recognized testing organization equipped to perform such services, stating that the items have been tested and conform to the requirements and testing methods of the specified agency are acceptable as proof.
2.4.1 Filter Elements

Fuel-oil, lubricating-oil, and combustion-air filter elements shall be manufacturer's standard.

2.4.2 Instrument Transformers

NEMA/ANSI C12.11.

2.4.3 Revenue Metering

IEEE C57.13.

2.4.4 Pipe (Fuel/Lube-Oil, Compressed Air, Coolant, and Exhaust)

ASTM A53/A53M, or ASTM A106/A106M steel pipe. Pipe smaller than 50 mm 2 inches shall be Schedule 80. Pipe 50 mm 2 inches and larger shall be Schedule 40.

2.4.4.1 Flanges and Flanged Fittings

ASTM A181/A181M, Class 60, or ASME B16.5, Grade 1, Class 150.

2.4.4.2 Pipe Welding Fittings

ASTM A234/A234M, Grade WPB or WPC, Class 150 or ASME B16.11, 1360.7 kg 3000 lb.

2.4.4.3 Threaded Fittings

ASME B16.3, Class 150.

2.4.4.4 Valves

MSS SP-80, Class 150.

2.4.4.5 Gaskets

Manufacturer's standard.

2.4.5 Pipe Hangers

MSS SP-58.

2.4.6 Electrical Enclosures

NEMA ICS 6.

2.4.6.1 Power Switchgear Assemblies

NEMA SG 6.

2.4.6.2 Switchboards

NEMA PB 2.

2.4.6.3 Panelboards

NEMA PB 1.
2.4.7 Electric Motors

Electric motors shall conform to the requirements of NEMA MG 1. Motors shall have sealed ball bearings and a maximum speed of 1800 rpm. Motors used indoors shall have drip-proof frames; those used outside shall be totally enclosed. Alternating current motors larger than 373 W 1/2 Hp shall be of the squirrel-cage induction type for operation on 208 volts or higher, [50] [60] Hz, and three-phase power. Alternating current motors 373 W 1/2 Hp or smaller, shall be suitable for operation on 120 volts, [50] [60] Hz, and single-phase power. Direct current motors shall be suitable for operation on [125] [_____] volts.

2.4.8 Motor Controllers

Motor controllers and starters shall conform to the requirements of NFPA 70 and NEMA ICS 2.

2.5 ENGINE

**************************************************************************
NOTE: Specify fuel type if different than No. 2 diesel.

If units are required to operate on more than one fuel the designer must edit the components, performance requirements, and testing requirements of this specification to define the requirements for the fuels specified. If full performance is required for the weakest or poorest burning fuels, then the units will be overrated for other fuels.
**************************************************************************

Each engine shall operate on No. 2-D diesel fuel conforming to ASTM D975, shall be designed for stationary applications and shall be complete with ancillaries. The engine shall be a standard production model shown in the manufacturer's catalog describing and depicting each engine-generator set and all ancillary equipment in sufficient detail to demonstrate complete specification compliance. The engine shall be naturally aspirated, supercharged, or turbocharged. The engine shall be 2- or 4-stroke-cycle and compression-ignition type. The engine shall be vertical in-line, V- or opposed-piston type, with a solid cast block or individually cast cylinders. The engine shall have a minimum of two cylinders. Opposed-piston type engines shall have not less than four cylinders. Each block shall have a coolant drain port. Each engine shall be equipped with an overspeed sensor.

2.6 FUEL SYSTEM

The entire fuel system for each engine-generator set shall conform to the requirements of NFPA 30 and NFPA 37 and contain the following elements.

2.6.1 Pumps

2.6.1.1 Main Pump

Each engine shall be provided with an engine driven pump. The pump shall supply fuel at a minimum rate sufficient to provide the amount of fuel required to meet the performance indicated within the parameter schedule.
The fuel flow rate shall be based on meeting the load requirements and all necessary recirculation.

2.6.1.2 Auxiliary Fuel Pump

**************************************************************************

NOTE: The auxiliary fuel pump is required to support the main pump if the length of pipe from the day tank to the main pump is greater than the value recommended by the engine manufacturer. This value may be approximately 12 m 40 feet; however, engine manufacturers should be consulted during design to verify the pumping requirements.
**************************************************************************

Provide auxiliary fuel pumps to maintain the required engine fuel pressure, if either required by the installation or indicated on the drawings. The auxiliary pump shall be driven by a dc electric motor powered by the starting/station batteries. The auxiliary pump shall be automatically actuated by a pressure-detecting device.

2.6.2 Fuel Filter

Provide a minimum of one full-flow fuel filter for each engine. The filter shall be readily accessible and capable of being changed without disconnecting the piping or disturbing other components. The filter shall have inlet and outlet connections plainly marked.

2.6.3 Relief/Bypass Valve

Provide a relief/bypass valve to regulate pressure in the fuel supply line, return excess fuel to a return line and prevent the build-up of excessive pressure in the fuel system.

2.6.4 Integral Main Fuel Storage Tank

**************************************************************************

NOTE: Delete this paragraph if an integral main fuel storage tank is not desired.

An integral main fuel storage tank will be the only fuel source for the engine. These tanks may be useful for applications that require a minimal fuel storage capacity.

Due to the minimal storage capacity, integral main fuel storage tanks are not practical for prime power usage. They are also not practical for standby units that require large fuel quantities. The designer should consider the availability and anticipated frequency of fuel truck deliveries when deciding whether or not to use an integral main fuel storage tank. These tanks should also not be used in locations where a truck fueling hose can not reach the diesel generator set.

See NFPA 99 and NFPA 110 for guidance on fuel tank sizes.
See NFPA 37 restrictions on allowable tank sizes and enclosures. Integral tanks allow for 1 to 8 hours of operation depending on diesel generator size and configuration. Consult generator set manufacturer for the proper hours of operation for the application of integral tanks. Standby applications for use with fire pumps will have tanks sized for 8 hours duration. The tank can be sized by the designer or the Contractor. The size of the tank should be based on a fuel flow rate that is equal to the value of a typical engine manufacturer for the indicated engine generator size. A value of 200 percent of the expected fuel consumption of the engine is not unusual for the flow rate of the main fuel pump. Since the excess fuel will be returned to the tank, the designer should consider the impact of heat buildup when sizing the tank. If a fuel oil cooler is not used, the day tank size may need to be increased to properly dissipate the heat absorbed by the fuel.

**************************************************************************

Provide each engine with an integral main fuel tank. Each tank shall be factory installed and provided as an integral part of the diesel generator manufacturer's product. Each tank shall be provided with connections for fuel supply line, fuel return line, local fuel fill port, gauge, vent line, and float switch assembly. A fuel return line cooler shall be provided as recommended by the manufacturer and assembler. The temperature of the fuel returning to the tank shall be below the flash point of the fuel. Each engine-generator set provided with weatherproof enclosures shall have its tank mounted within the enclosure. The fuel fill line shall be accessible without opening the enclosure.

2.6.4.1 Capacity

Each tank shall have capacity [as shown] [to supply fuel to the engine for an uninterrupted [4-hour] [_____] period] at 100 percent rated load without being refilled.

2.6.4.2 Local Fuel Fill

Each local fuel fill port on the day tank shall be provided with a screw-on cap.

2.6.4.3 Fuel Level Controls

Each tank shall have a float-switch assembly to perform the following functions:

a. Activate the "Low Fuel Level" alarm at 70 percent of the rated tank capacity.

b. Activate the "Overfill Fuel Level" alarm at 95 percent of the rated tank capacity.

2.6.4.4 Arrangement

Integral tanks may allow gravity flow into the engine. Gravity flow tanks and any tank that allows a fuel level above the fuel injectors shall be
provided with an internal or external factory installed valve located as near as possible to the shell of the tank. The valve shall close when the engine is not operating. Integral day tanks shall be provided with any necessary pumps to supply fuel to the engine as recommended by the generator set manufacturer. The fuel supply line from the tank to the manufacturer's standard engine connection shall be welded pipe.

2.6.5 Day Tank

**************************************************************************

NOTE: Delete this paragraph if an integral main fuel storage tank is used.

See NFPA 99 and NFPA 110 for guidance on fuel tank sizes.

See NFPA 37 restrictions on allowable day tank sizes and enclosures. Select either self-supporting or integral day tank. Select the first option below for applications where fuel is returned to the day tank. Select the second option below for applications where fuel is returned to the main tank. Integral day tanks allow for 1 to 8 hours of operation. Consult generator set manufacturer for the proper hours of operation for the application of integral day tanks. Standby applications for use with fire pumps will have day tanks sized for 8 hours duration. Select day tank capacity for either prime or standby application. The day tank can be sized by the designer or the Contractor. The size of the day tank should be based on a fuel flow rate that is equal to the value of a typical engine manufacturer for the indicated engine generator size. A value of 200 percent of the expected fuel consumption of the engine is not unusual for the flow rate of the main fuel pump. The excess fuel may be returned to the day tank or main fuel tank. The designer should also consider the impact of heat buildup when sizing the day tank. If a fuel oil cooler is not used or if fuel is returned to the day tank, the day tank size may need to be increased to properly dissipate the heat absorbed by the fuel.

**************************************************************************

Each engine shall be provided with [a separate self-supporting] [integral] day tank. Submit calculations for the capacity of each day tank, including allowances for recirculated fuel, usable tank capacity, and duration of fuel supply. Each day tank shall be provided with connections for fuel supply line, [fuel return line, fuel overflow line, local fuel fill port, gauge, vent line, drain line, and float switch assembly for control]. A fuel return line cooler shall be provided as recommended by the manufacturer and assembler. The temperature of the fuel returning to the day tank shall be below the flash point of the fuel. A temperature sensing device shall be installed in the fuel supply line], [fuel overflow line, local fuel fill port, gauge, vent line, drain line, and float switch assembly for control]. Each engine-generator set provided with weatherproof enclosures shall have its day tank mounted within the enclosure. The fuel fill line shall be accessible without opening the enclosure.
2.6.5.1 Capacity, Prime

Each day tank shall have capacity [as shown] to supply fuel to the engine for an uninterrupted [8-hour] period at 100 percent rated load without being refilled, plus any fuel which may be returned to the main fuel storage tank. The calculation of the capacity of each day tank shall incorporate the requirement to stop the supply of fuel into the day tank at a "High" level mark of 90 percent of the ultimate volume of the tank.

2.6.5.2 Capacity, Standby

Each day tank shall have capacity [as shown] to supply fuel to the engine for an uninterrupted [4-hour] period at 100 percent rated load without being refilled, plus any fuel which may be returned to the main fuel storage tank. The calculation of the capacity of each day tank shall incorporate the requirement to stop the supply of fuel into the day tank at 90 percent of the ultimate volume of the tank.

2.6.5.3 Drain Line

Each day tank drain line shall be accessible and equipped with a shutoff valve. Self-supporting day tanks shall be arranged to allow drainage into a 305 mm 12 inch tall bucket.

2.6.5.4 Local Fuel Fill

Each local fuel fill port on the day tank shall be provided with a screw-on cap.

2.6.5.5 Fuel Level Controls

Each day tank shall have a float-switch assembly to perform the following functions:

a. [When the main storage tank is located higher than the day tank, open the solenoid valve located on the fuel supply line entering the day tank and start the supply of fuel into the day tank] [Start the supply of fuel into the day tank] when the fuel level is at the "Low" level mark, 75 percent of the rated tank capacity.

b. [When the main storage tank is located higher than the day tank, stop the supply of fuel into the day tank and close the solenoid valve located on the fuel supply line entering the day tank] [Stop the supply of fuel into the day tank] when the fuel level is at 90 percent of the rated tank capacity.

c. Activate the "Overfill Fuel Level" alarm at 95 percent of the rated tank capacity.

d. Activate the "Low Fuel Level" alarm at 70 percent of the rated tank capacity.

e. Activate the automatic fuel supply shut-off valve located on the fill line of the day tank and shut down the fuel pump which supplies fuel to the day tank at 95 percent of the rated tank capacity. The flow of fuel shall be stopped before any fuel can be forced into the fuel overflow line.
2.6.5.6 Arrangement

**************************************************************************
NOTE: Select between integral and self supporting day tanks. Also, select between applications where the main fuel storage tank is located above the day tank and applications where the main fuel storage tank is located below the day tank. The location of all tanks, piping, and valves should also be indicated on the drawings.
**************************************************************************

[Integral day tanks may allow gravity flow into the engine. Gravity flow tanks shall be provided with an internal or external valve located as near as possible to the shell of the tank. The valve shall close when the engine is not operating. Integral day tanks shall be provided with any necessary pumps to supply fuel to the engine as recommended by the generator set manufacturer. The overflow connection and the fuel supply line for integral day tanks which do not rely upon gravity flow shall be arranged so that the highest possible fuel level is below the fuel injectors.] [Self-supporting day tanks shall either be arranged so that the fuel level in the day tank remains above the suction port of the engine driven fuel pump or be provided with a transfer pump to provide fuel to the engine driven pump. The overflow connection and fuel supply line shall be arranged so that the highest possible fuel level is below the fuel injectors.] [When the main fuel storage tanks are located below the day tank, a check valve shall be provided in the fuel supply line entering the day tank.] [When the main fuel storage tanks are located above the day tank, a solenoid valve shall be installed in the fuel supply line entering the day tank. The solenoid valve shall be in addition to the automatic fuel shut off valve.] The fuel supply line from the day tank to the manufacturer's standard engine connection shall be welded pipe.

2.6.6 Fuel Supply System

The fuel supply from the main storage of fuel to the day tank shall be as specified in Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.7 LUBRICATION

**************************************************************************
NOTE: Delete the adjustable requirement for pressure regulation on sets smaller than 1000 kW. Sets larger than 500 kW will utilize a pressure-relief valve on the crankcase. Show crankcase vent piping for indoor installations.
**************************************************************************

Each engine shall have a separate lube-oil system conforming to NFPA 30 and NFPA 37. Each system shall be pressurized by engine-driven pumps. System pressure shall be regulated as recommended by the engine manufacturer. A pressure relief valve shall be provided on the crankcase for closed systems. The crankcase shall be vented in accordance with the manufacturer's recommendation except that it shall not be vented to the engine exhaust system. Crankcase breathers, if provided on engines installed in buildings or enclosures, shall be piped to vent to the outside. The system shall be readily accessible for service such as draining, refilling, etc. Each system shall permit addition of oil and have oil-level indication with the set operating. The system shall utilize
an oil cooler as recommended by the engine manufacturer.

2.7.1 Lube-Oil Filter

Provide one full-flow filter for each pump. The filter shall be readily accessible and capable of being changed without disconnecting the piping or disturbing other components. The filter shall have inlet and outlet connections plainly marked.

2.7.2 Lube-Oil Sensors

Equip each engine with lube-oil pressure sensors located downstream of the filters and provide signals for required indication and alarms. Submit two complete sets of filters, required for maintenance, supplied in a suitable storage box. These filters shall be in addition to filters replaced after testing.

2.7.3 Precirculation Pump

Provide a motor-driven precirculation pump powered by the station battery, complete with motor starter, if recommended by the engine manufacturer.

2.8 COOLING SYSTEM

**************************************************************************
NOTE: Coordinate with paragraph SYSTEM DESCRIPTION.
**************************************************************************

Provide each engine with its own cooling system to operate automatically while its engine is running. The cooling system coolant shall use a combination of water and ethylene-glycol sufficient for freeze protection at the minimum winter outdoor temperature specified. The maximum temperature rise of the coolant across each engine shall not exceed that recommended below. Submit a letter which certifies that the engine-generator set and cooling system function properly in the ambient temperature specified, stating the following values:

a. The maximum allowable inlet temperature of the coolant fluid.
b. The minimum allowable inlet temperature of the coolant fluid.
c. The maximum allowable temperature rise in the coolant fluid through the engine.

2.8.1 Coolant Pumps

**************************************************************************
NOTE: Delete raw-water pump for closed-loop systems.
**************************************************************************

Coolant pumps shall be the centrifugal type. Each engine shall have an engine-driven primary pump. Secondary pumps shall be electric motor driven and have automatic controllers. Raw-water circulating pump shall be controlled by manual-off-automatic controllers and shall be [electric motor] [engine] driven.

2.8.2 Heat Exchanger

Each heat exchanger shall be of a size and capacity to limit the maximum
allowable temperature rise in the coolant across the engine to that recommended and submitted for the maximum summer outdoor design temperature and site elevation. Submit manufacturer's data to quantify heat rejected to the space with the engine generator set at rated capacity. Each heat exchanger shall be corrosion resistant, suitable for service in ambient conditions of application.

2.8.2.1 Fin-Tube-Type Heat Exchanger (Radiator)

**************************************************************************

NOTE: Retain this paragraph and remove the next one as required by the project.
**************************************************************************

Heat exchanger may be factory coated with corrosive resistant film, provided that correction measures are taken to restore the heat rejection capability of the radiator to the initial design requirement via over sizing, or other compensating methods. Internal surfaces shall be compatible with liquid fluid coolant used. Materials and coolant are subject to approval by the Contracting Officer. Heat exchangers shall be pressure type incorporating a pressure valve, vacuum valve and a cap. Caps shall be designed for pressure relief prior to removal. Each heat exchanger and the entire cooling system shall be capable of withstanding a minimum pressure of 48 kPa 7 psi and shall be protected with a strong grille or screen guard. Each heat exchanger shall have at least two tapped holes; one tapped hole shall be equipped with a drain cock, the rest shall be plugged.

2.8.2.2 Shell and U-Tube Type Heat Exchanger

**************************************************************************

NOTE: Retain this paragraph and remove the one above as required by the project.
**************************************************************************

Heat exchanger shall be multiple pass shell and U-tube type. Exchanger shall operate with low temperature water in the shell and high temperature water in the tubes. Exchangers shall be constructed in accordance with ASME BPVC SEC VIII D1 and certified with ASME stamp secured to the unit. U-tube bundles shall be completely removable for cleaning and tube replacement and shall be free to expand with the shell. Shells shall be constructed of seamless steel pipe or welded steel. Tubes shall be cupronickel or inhibited admiralty, constructed in accordance with ASTM B395/B395M, suitable for the temperatures and pressures specified. Tubes shall not be less than 19 mm 3/4 inch unless otherwise indicated. Shell side and tube side shall be designed for 1.03 MPa 150 psig working pressure and factory tested at 2.06 MPa 300 psig. High and low temperature water and pressure relief connections shall be located in accordance with the manufacturers standard practice. Water connections larger than 75 mm 3 inches shall be ASME Class 150 flanged. Water pressure loss through clean tubes shall be as recommended by the engine manufacturer. Minimum water velocity through tubes shall be 300 mm/sec 1 fps and assure turbulent flow. One or more pressure relief valves shall be provided for each heat exchanger in accordance with ASME BPVC SEC VIII D1. The aggregate relieving capacity of the relief valves shall be not less than that required by the above code. Discharge from the valves shall be installed as indicated. The relief valves shall be installed on the heat exchanger shell. A drain connection with 19 mm 3/4 inch hose bib shall be installed at the lowest point in the system near the heat exchanger. Additional
drain connection with threaded cap or plug shall be installed wherever required for thorough draining of the system.

2.8.3 Expansion Tank

**************************************************************************
NOTE: Delete this paragraph if a shell and U-tube type heat exchanger is not needed.
**************************************************************************

The cooling system shall include an air expansion tank which will accommodate the expanded water of the system generated within the normal operating temperature range, limiting the pressure increase at all components in the system to the maximum allowable pressure at those components. The tank shall be suitable for operating temperature of 121 degrees C 250 degrees F and a working pressure of 0.86 MPa 125 psi. The tank shall be constructed of welded steel, tested and stamped in accordance with ASME BPVC SEC VIII D1 for the stated working pressure. A bladder type tank shall not used. The tank shall be supported by steel legs or bases for vertical or steel saddles for horizontal installation.

2.8.4 Thermostatic Control Valve

A modulating type, thermostatic control valve shall be provided in the coolant system to maintain the coolant temperature range submitted in paragraph SUBMITTALS.

2.8.5 Ductwork

Ductwork shall be as specified in Section 23 00 00 AIR SUPPLY, DISTRIBUTION, VENTILATION, AND EXHAUST SYSTEM except that a flexible connection shall be used to connect the duct to the diesel engine radiator. Material for the connection shall be wire-reinforced glass. The connection shall be rendered as airtight as possible.

2.8.6 Temperature Sensors

Each engine shall be equipped with coolant temperature sensors. Temperature sensors shall provide signals for pre-high and high indication and alarms.

2.9 SOUND LIMITATIONS

**************************************************************************
NOTE: The designer must perform an analysis in accordance with UFC 3-450-01 NOISE AND VIBRATION CONTROL and UFC 3-450-02 POWER PLANT ACOUSTICS. The designer must consider air intake, exhaust, and diesel generator casing noise. The designer must also coordinate with the architect for proper material selections for the sound transmittance characteristics of the mechanical equipment room and adjacent areas. The designer should consider sound within the equipment room, adjacent areas and building exterior. Acceptable sound levels will vary depending on the function of the space. As a minimum the design should comply with the following OSHA safety requirements; however, more stringent sound restrictions may be required to met the
Typically, the diesel generator manufacturer can provide information concerning the noise generated by the diesel generator in a free field environment. The manufacturer does not have control over any other building parameters or additional mechanical equipment noise. Therefore the designer should indicate the required sound limits for each of the indicated octave bands for the sound pressure level of the diesel generator set operating at 100 percent load in a free field. The designer should develop these numbers based on the desired sound levels that should exist at various locations after the generator is installed. This information should be based on the values used in the acoustical analysis and verified by coordination with equipment manufacturers during design. In some cases, a sound attenuated enclosure may be needed to achieve the desired result.

The designer should also indicate the desired sound pressure levels that will be measured in the field. The pressure levels should be based on the acoustical analysis and should consider the specified operating conditions of the diesel generator operating in a free field, other mechanical equipment, the building's sound absorption characteristics, OSHA requirements, and the building's functional requirements. The location of the measurement points for the installed diesel generator should be coordinated with the SAFETY RUN TEST paragraph. Modify the radial distance requirement from the engine, exhaust, and air-intake to account for obstructions, variations in site conditions, building configurations or

indicate points on the contract drawings at which measurements are to be made.

Submit sound power level data for the packaged unit operating at 100 percent load in a free field environment. The data should demonstrate compliance with the sound limitation requirements of this specification. Submit certification from the manufacturer stating that the sound emissions meet the specification. The noise generated by the diesel generator set operating at 100 percent load shall not exceed the following sound pressure levels in any of the indicated frequencies when measured in a free field at a radial distance of 22.9 feet 7 meters at 45 degrees apart in all directions.

### 2.10 AIR INTAKE EQUIPMENT

Filters and silencers shall be provided in locations that are convenient for servicing. The silencer shall be of the high-frequency filter type, located in the air intake system as recommended by the engine manufacturer. Silencer shall be capable of reducing the noise level at the air intake so that the indicated pressure levels specified in paragraph SOUND LIMITATIONS will not be exceeded. A combined filter-silencer unit meeting requirements for the separate filter and silencer items may be provided. Expansion elements in air-intake lines shall be [copper] [rubber].

### 2.11 EXHAUST SYSTEM

**************************************************************************
** NOTE: Include on the drawings a detail of the exhaust piping that penetrates construction such as walls or roof. **
**************************************************************************

The system shall be separate and complete for each engine. Piping shall be supported to minimize vibration. Where a V-type engine is provided, a V-type connector, with necessary flexible sections and hardware, shall connect the engine exhaust outlets.

2.11.1 Flexible Sections and Expansion Joints

A flexible section shall be provided at each engine and an expansion joint at each muffler. Flexible sections and expansion joints shall have flanged connections. Flexible sections shall be made of convoluted seamless tube without joints or packing. Expansion joints shall be the bellows type. Expansion and flexible elements shall be stainless steel suitable for diesel-engine exhaust gas at the maximum exhaust temperature that is specified by the engine manufacturer. Expansion and flexible elements shall be capable of absorbing vibration from the engine and compensation for thermal expansion and contraction.

2.11.2 Exhaust Muffler

**************************************************************************
** NOTE: Muffler locations and mountings should be shown on the drawings. **
**************************************************************************

A chamber type exhaust muffler shall be provided. The muffler shall be constructed of welded steel and designed for [outside] [inside] [vertical] [horizontal] mounting. Eyebolts, lugs, flanges, or other items shall be provided as necessary for support in the location and position indicated.
Pressure drop through the muffler shall not exceed the recommendations of the engine manufacturer. Outside mufflers shall be zinc coated or painted with high temperature [_____] degrees resisting paint. The muffler and exhaust piping together shall reduce the noise level to less than the maximum acceptable level listed for sound limitations in paragraph SOUND LIMITATIONS. The muffler shall have a drain valve, nipple, and cap at the low-point of the muffler.

2.11.3 Exhaust Piping

******************************************************************************
NOTE: Exhaust piping will be sized at a gas velocity of less than 25.4 meters per second 5000 fpm.
Show piping on the drawings.
******************************************************************************

Horizontal sections of exhaust piping shall be sloped downward away from the engine to a drip leg for collection of condensate with drain valve and cap. Changes in direction shall be long radius. Exhaust piping, mufflers and silencers installed inside any building shall be insulated in accordance with paragraph THERMAL INSULATION and covered to protect personnel. Vertical exhaust piping shall be provided with a hinged, gravity-operated, self-closing, rain cover.

2.12 PYROMETER

******************************************************************************
NOTE: For sets smaller than 200 kW delete this paragraph. Pyrometers with individual thermocouples are not normally available and should not be specified for units smaller than 1000 kW.
******************************************************************************

A pyrometer, [multi-point selector switch, and individual thermocouples] [and thermocouple] with calibrated leads shall be provided to show the temperature [in each engine cylinder and the combined exhaust] [of the combined exhaust]. For a supercharged engine, additional points, thermocouples and leads shall be provided to show the temperature in the turbocharger exhaust gas outlet and combustion air discharge passages. Graduated scale length shall be not less than 150 mm 6 inches. The selector switch shall be double pole, with an "off" position, one set of points for each thermocouple, and suitable indicating dial. The pyrometer, thermocouples, leads and compensating devices shall be calibrated to show true exhaust temperature within plus or minus 1 percent above the highest temperature encountered at 110 percent load conditions.

2.13 EMISSIONS

******************************************************************************
NOTE: The designer will coordinate emissions requirements with the installation (base/post) environmental office and provide a listing of the requirements. The identification of environmental requirements should be identified at the beginning of the project as a special study effort which requires funding separate from the normal design.
******************************************************************************

The finished installation shall comply with Federal, state, and local
regulations and restrictions regarding the limits of emissions, as listed here: [______]. Submit certification from the engine manufacturer stating that the engine exhaust emissions meet the federal, state, and local regulations and restrictions specified. At a minimum this certification shall include emission factors for criteria pollutants including nitrogen oxides, carbon monoxide, particulate matter, sulfur dioxide, non-methane hydrocarbon, and for hazardous air pollutants (HPAs).

2.14 STARTING SYSTEM

**************************************************************************
NOTE: Either electrical or pneumatic starting system should be used and the other paragraphs deleted. Electrical starting will be used for most applications. Engines up to 750 kW should be equipped for electric starting. See manufacturers literature to determine availability for sizes above 750 kW. For units used in emergency applications, select the first option and delete all other starting system paragraphs.
**************************************************************************

The starting system for [standby engine generator sets used in emergency applications shall be in accordance with NFPA 99 and NFPA 110 and as follows.] [engine generator sets used in non-emergency applications shall be as follows.]

2.14.1 Controls

An engine control switch shall be provided with functions including: run/start (manual), off/reset, and, automatic mode. Start-stop logic shall be provided for adjustable cycle cranking and cooldown operation. The logic shall be arranged for [manual starting] [and] [fully automatic starting in accordance with paragraph AUTOMATIC ENGINE-GENERATOR-SET SYSTEM OPERATION]. Electrical starting systems shall be provided with an adjustable cranking limit device to limit cranking periods from 1 second up to the maximum duration.

2.14.2 Capacity

The starting system shall be of sufficient capacity, at the maximum [outdoor] [indoor] summer temperature specified to crank the engine without damage or overheating. The system shall be capable of providing a minimum of three cranking periods with 15 second intervals between cranks. Each cranking period shall have a maximum duration of 15 seconds.

2.14.3 Electrical Starting

Manufacturers recommended dc system, utilizing a negative circuit ground.

2.14.3.1 Battery

**************************************************************************
NOTE: Select nickel-cadmium only when the battery temperature cannot be maintained above minus 6 degrees C 22 degrees F.
**************************************************************************

A starting battery system shall be provided and shall include the battery,
battery rack, intercell connectors, spacers, automatic battery charger with overcurrent protection, metering and relaying. The battery shall be in accordance with SAE J537. Critical system components (rack, protection, etc.) shall be sized to withstand the seismic acceleration forces specified. The battery shall be [lead-acid] [nickel-cadmium], with sufficient capacity, at the minimum [outdoor] [indoor] and maximum [outdoor] [indoor] temperature specified, to provide the specified cranking periods. Valve-regulated lead-acid batteries are not acceptable.

2.14.3.2 Battery Charger

A current-limiting battery charger, conforming to UL 1236, shall be provided and shall automatically recharge the batteries. Submit battery charger sizing calculations. The charger shall be capable of an equalize-charging rate [for recharging fully depleted batteries within [24] [_____] hours] [which is manually adjustable in a continuous range] and a floating charge rate for maintaining the batteries at fully charged condition. An ammeter shall be provided to indicate charging rate. A voltmeter shall be provided to indicate charging voltage. A timer shall be provided for the equalize-charging-rate setting. A battery is considered to be fully depleted when the output voltage falls to a value which will not operate the engine generator set and its components.

2.14.4 Pneumatic

**************************************************************************
NOTE: Pneumatic starting should be used on sets 750 kW and larger.

The complete compressed air system should be shown on the drawings. Two receivers, redundant piping, and two compressors may be required so that starting capability is not lost when tank maintenance is required. Valve arrangement shall permit any receiver to be removed from service, drained, repaired, or replaced without loss of starting air from the system. The designer must analyze the starting scenarios and determine the necessity to provide a gasoline or diesel-engine-driven compressor for a "black-plant" (no electrical sources available) startup.

Each compressor shall be sized to restore in 15 minutes the air used in one engine start.

Each receiver shall be sized to provide sufficient capacity to crank the largest engine for 60 seconds at an ambient temperature of 21 degrees C 70 degrees F without recharging.

2068.5 kPa (gauge) 300 psig for cylinder injection,
1034.2 kPa (gauge) 150 psig for air-motor starting
is recommended for working pressures.

Either motors or cylinder injection should be used and the other paragraph deleted.
**************************************************************************

Provide a pneumatic starting system. The compressed air system shall be as
specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE, for a working pressure of [2.07 MPa 300 psi] [1.03 MPa 150 psi].

2.14.4.1 Air Driven Motors

Air driven motors shall be complete with solenoid valve, strainer, and lubricator.

2.14.4.2 Cylinder Injection

Starting shall be accomplished by admitting compressed air into two or more engine cylinders through a timing valve, or through a distributor into a sufficient number of cylinders to assure successful starting regardless of piston positions.

2.14.5 Starting Aids

**************************************************************************

NOTE: Jacket coolant and/or lube-oil heaters are normally provided for most applications to aid starting. Some manufacturers may require glow plugs for combustion air temperatures significantly below 0 degrees C 32 degrees F. Consult manufacturers for availability in the application size range.

**************************************************************************

The manufacturer shall provide one or more of other following methods to assist engine starting.

2.14.5.1 Glow Plugs

Glow plugs shall be designed to provide sufficient heat for combustion of fuel within the cylinders to guarantee starting at an ambient temperature of -32 degrees C -25 degrees F.

2.14.5.2 Jacket-Coolant Heaters

A thermostatically controlled electric heater shall be mounted in the engine coolant jacketing to automatically maintain the coolant within plus or minus 1.7 degrees C 3 degrees F of the control temperature. The heater shall operate independently of engine operation so that starting times are minimized. Power for the heaters shall be [_____] volts ac.

2.14.5.2.1 Prime Rated Sets

The control temperature shall be the higher of the manufacturer's recommended temperature or the minimum coolant inlet temperature of the engine recommended in paragraph SUBMITTALS.

2.14.5.2.2 Standby Rated Sets

The control temperature shall be the temperature recommended by the engine manufacturer to meet the starting time specified at the minimum winter outdoor temperature.

2.14.5.3 Lubricating-Oil Heaters

A thermostatically controlled electric heater shall be mounted in the engine lubricating-oil system to automatically maintain the oil temperature
within plus or minus 1.7 degrees C 3 degrees F of the control temperature. The heater shall operate independently of engine operation so that starting times are minimized. Power for the heaters shall be [____] volts ac.

2.14.6 Exerciser

**************************************************************************
NOTE: Coordinate the need for an exerciser with the user. The plant exerciser is required for stand-by rated sets only, so delete this paragraph for prime applications. Ensure that the exerciser is compatible with the automatic transfer scheme (see reset provisions). It is usually desirable to utilize system loads for genset exercise loads. Coordinate requirement with the user. The designer shall ensure that the design provides warning signs in areas where the engine generator can start automatically.
**************************************************************************

The exerciser shall be in accordance with Section 26 36 00.00 10 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.

2.15 GOVERNOR

**************************************************************************
NOTE: Coordinate with paragraph ENGINE GENERATOR PARAMETER SCHEDULE.
**************************************************************************

Each engine shall be provided with a governor which maintains the frequency within a bandwidth of the rated frequency, over a steady-state load range of zero to 100 percent of rated output capacity. The governor shall be configured for safe manual adjustment of the speed/frequency during operation of the engine-generator set, without special tools, from 90 to 110 percent of the rated speed/frequency, over a steady state load range of 0 to 100 percent or rated capacity. Submit two complete sets of special tools required for maintenance (except for electronic governor handset). Special tools are those that only the manufacturer provides, for special purposes, or to reach otherwise inaccessible parts. The tools shall be supplied complete with a suitable tool box. One handset shall be provided for each electronic governor when required to indicate and/or change governor response settings. [Isochronous governors shall maintain the midpoint of the frequency bandwidth at the same value for steady-state loads over the range of zero to 100 percent of rated output capacity.] [Droop governors shall maintain the midpoint of the frequency bandwidth linearly for steady-state loads over the range of zero to 100 percent of rated output capacity, [with 3 percent droop] [configured for safe, manual, external adjustment of the droop from zero to [7] [_____] percent].]

2.16 GENERATOR

**************************************************************************
NOTE: Armature and field winding insulation classes are specified based on the allowable temperature rise (the temperature in the windings above the temperature of the air used to cool the windings). See NEMA MG 1 for a discussion of the classes with respect to size range, elevation, method of
measurement, and ambient temperature. Select the class insulation for each application based on operating conditions. Class F is considered industry standard. If a different class is required for different machines, specify the one for each application in the Parameter Schedule for the respective genset.

********************************************************************************

Each generator shall be of the synchronous type, one or two bearing, conforming to the performance criteria in NEMA MG 1, equipped with winding terminal housings in accordance with NEMA MG 1, equipped with an amortisseur winding, and directly connected to the engine. Submit calculations of the engine and generator output power capability, including efficiency and parasitic load data. Insulation shall be [Class H] [Class F].

a. Generator design shall protect against mechanical, electrical and thermal damage due to vibration, 25 percent overspeeds, or voltages and temperatures at a rated output capacity of 110 percent for prime applications and 100 percent for standby applications.

b. Generator ancillary equipment shall meet the short circuit requirements of NEMA MG 1. Frames shall be the drip-proof type.

c. Submit manufacturer's standard data for each generator (prototype data at the specified rating or above is acceptable), listing the following information:

   (1) Direct-Axis subtransient reactance (per unit).

   (2) The generator kW rating and short circuit current capacity (both symmetric and asymmetric).

2.16.1 Current Balance

At 100 percent rated output capacity, and load impedance equal for each of the 3 phases, the permissible current difference between any 2 phases shall not exceed 2 percent of the largest current on either of the 2 phases. Submit certification stating that the flywheel has been statically and dynamically balanced and is capable of being rotated at 125 percent of rated speed without vibration or damage.

2.16.2 Voltage Balance

At any balanced load between 75 and 100 percent of rated output capacity, the difference in line-to-neutral voltage among the 3 phases shall not exceed 1 percent of the average line-to-neutral voltage. For a single-phase load condition, consisting of 25 percent load at unity power factor placed between any phase and neutral with no load on the other 2 phases, the maximum simultaneous difference in line-to-neutral voltage between the phases shall not exceed 3 percent of rated line to neutral voltage. The single-phase load requirement shall be valid utilizing normal exciter and regulator control. The interpretation of the 25 percent load for single phase load conditions means 25 percent of rated current at rated phase voltage and unity power factor.
2.16.3 Waveform

The deviation factor of the line-to-line voltage at zero load and at balanced rated output capacity shall not exceed 10 percent. The RMS of all harmonics shall be less than 5.0 percent and that of any one harmonic less than 3.0 percent of the fundamental at rated output capacity. Each engine-generator shall be designed and configured to meet the total harmonic distortion limits of IEEE 519.

2.17 EXCITER

The generator exciter shall be of the brushless type. Semiconductor rectifiers shall have a minimum safety factor of 300 percent for peak inverse voltage and forward current ratings for all operating conditions, including 110 percent generator output at 40 degrees C 104 degrees F ambient. The exciter and regulator in combination shall maintain generator-output voltage within the limits specified.

2.18 VOLTAGE REGULATOR

**************************************************************************
NOTE: Delete reactive droop/differential compensation for non-parallel configuration.
**************************************************************************

Each generator shall be provided with a solid-state voltage regulator, separate from the exciter. The regulator shall maintain the voltage within a bandwidth of the rated voltage, over a steady-state load range of zero to 100 percent of rated output capacity. Regulator shall be configured for safe manual adjustment of the engine-generator voltage output without special tools, during operation, from 90 to 110 percent of the rated voltage over the steady state load range of 0 to 100 percent of rated output capacity. Regulation drift shall not exceed plus or minus 0.5 percent for an ambient temperature change of 20 degrees C 68 degrees F. Reactive droop compensation or reactive differential compensation shall load share the reactive load proportionally between sets during parallel operation. The voltage regulator shall have a maximum droop of 2 percent of rated voltage over a load range from 0 to 100 percent of rated output capacity and automatically maintain the generator output voltage within the specified operational bandwidth.

2.19 GENERATOR ISOLATION AND PROTECTION

**************************************************************************
NOTE: Generator protection should be based on the application and size of the generator and should comply with the recommendations of IEEE 242 and IEEE Std 446 for both generator breaker features and protection schemes. See AFMAN 32-1077 for recommended protection schemes for Air Force projects. The designer must perform a power system coordination study (reference UFC 3-520-01, Coordinated Power System Protection) to specify the breaker ratings, breaker trip unit features and settings, relay protection scheme, and relay settings for coordination for each genset installed. The configuration should always include a disconnecting means for isolation of the generator for maintenance purposes. If the scope of
protection is small the designer may elect to incorporate the appropriate Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION, paragraphs in this section. Show panelboard, switchboard, and switchgear ratings on the contract drawings for each genset. Rating information should include voltage, phase, bus continuous capacity (amperes), and bus withstand capacity (amperes) (see NEMA PB 1 and NEMA PB 2 for necessary rating information). Show breaker frame, trip, and interrupting ratings on the contract drawings.

Surge capacitors and surge arresters should be provided when the sets are to be connected to exposed overhead lines directly or through transformers, even though connection may be only for transfer of load without service interruption. Surge arrester protection is not required for separately derived sets which serve single buildings isolated from overhead lines by automatic or manual transfer switches, where provision has been made to prevent simultaneous connection to both sources. The designer will specify the surge arrester rating.

**************************************************************************

Devices necessary for electrical protection and isolation of each engine-generator set and its ancillary equipment shall be provided. The generator circuit breaker (IEEE Device 52) ratings shall be consistent with the generator rated voltage and frequency, with continuous, short circuit withstand, and interrupting current ratings to match the generator capacity. The generator circuit breaker shall be [manually operated] [electrically operated] [operated as indicated]. A set of surge capacitors, to be mounted at the generator terminals shall be provided. Monitoring and control devices shall be as specified in paragraph GENERATOR PANEL.

2.19.1 Switchboards

Switchboards shall be free-standing, metal-enclosed, general purpose, 3-phase, 4-wire, [600] [_____] volt rated, with neutral bus and continuous ground bus, conforming to NEMA PB 2 and UL 891. Neutral bus and ground bus capacity shall be [as shown] [full capacity]. Panelboards shall conform to NEMA PB 1. Enclosure designs, construction, materials and coatings shall be [as indicated] [suitable for the application and environment]. Bus continuous current rating shall be [at least equal to the generator rating and correspond to the UL listed current ratings specified for panelboards and switchboards] [as indicated]. Current withstand (short circuit rating) shall be [equal to the breaker interrupting rating] [as indicated]. Buses shall be copper.

2.19.2 Devices

Switches, circuit breakers, switchgear, fuses, relays, and other protective devices shall be as specified in Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

2.20 SAFETY SYSTEM

Devices, wiring, remote panels, local panels, etc. shall be provided and
installed as a complete system to automatically activate the appropriate signals and initiate the appropriate actions. The safety system shall be provided with a self-test method to verify its operability. Alarm signals shall have manual acknowledgment and reset devices. The alarm signal systems shall reactivate for new signals after acknowledgment is given to any signal. The systems shall be configured so that loss of any monitoring device shall be dealt with as an alarm on that system element.

2.20.1 Audible Signal

**********************************************************************************************************************************************
NOTE: High dB levels are required for alarms located near engine. Specify over 100 dB for engine room application and show alarm location.
**********************************************************************************************************************************************

The audible alarm signal shall sound at a frequency of [70] [_____] Hz at a volume of [_____] [75] dB at 3.1 m 10 feet. The sound shall be continuously activated upon alarm and silenced upon acknowledgment. Signal devices shall be located as shown.

2.20.2 Visual Signal

The visual alarm signal shall be a panel light. The light shall be normally off, activated to be blinking upon alarm. The light shall change to continuously lit upon acknowledgement. If automatic shutdown occurs, the display shall maintain activated status to indicate the cause of failure and shall not be reset until cause of alarm has been cleared and/or restored to normal condition. Shutdown alarms shall be red; all other alarms shall be amber.

2.20.3 Alarms and Action Logic

2.20.3.1 Shutdown

Simultaneous activation of the audible signal, activation of the visual signal, stopping the engine, and opening the generator main circuit breakers shall be accomplished.

2.20.3.2 Problem

Activation of the visual signal shall be accomplished.

2.20.4 Local Alarm Panel

**********************************************************************************************************************************************
NOTE: The designer must provide design features in accordance with the requirements of NFPA 70, and NFPA 99 for medical facilities. The designer must provide design features in accordance with the requirements of NFPA 70 and NFPA 110 for emergency and standby applications. For emergency and standby applications select either Level 1 or Level 2. Level 1 defines the most stringent equipment performance requirements for applications where the failure of the equipment to perform could result in loss of human life or serious injury. Level 2 defines equipment performance where failure of the equipment to operate is less critical to human
life. Edit the table to include all required shutdowns and alarms. Delete optional alarms which are not required. Delete all columns except the first column, the appropriate code reference column, and the column that shows Corps of Engineers required alarms/controls. Add necessary parameters to define critical limits for alarms or shutdown.

The designer should remove all references to day tanks if integral main fuel storage tanks are used.

The designer should remove all references to integral main fuel storage tanks if day tanks are used.

The following alarms are standard offerings of one or more manufacturers (Kohler, Caterpillar, Cummins - Onan, Detroit diesel). They are not required by NFPA but may be added if there is a specific requirement. Please note that some are not typically offered by three or more manufacturers, and may constitute a sole-source requirement.

2.20.5 **Time-Delay on Alarms**

For startup of the engine-generator set, time-delay devices shall be installed bypassing the low lubricating oil pressure alarm during cranking, and the coolant-fluid outlet temperature alarm. Submit the magnitude of monitored values which define alarm or action set points, and the tolerance (plus and/or minus) at which the devices activate the alarm or action for items contained within the alarm panels. The lube-oil time-delay device shall return its alarm to normal status after the engine starts. The coolant time-delay device shall return its alarm to normal status 5 minutes after the engine starts.

2.20.6 **Remote Alarm Panel**

**************************************************************************
NOTE: The Remote Alarm Panel should be shown on the drawings. Delete remote alarm panel where not required. Select the first option if the application is prime power plant. For prime power units provide panel elevations depicting desired configurations, together with a listing of alarms and instruments. Select the second option for engine generator sets utilized on emergency or standby applications. The designer must provide design features in accordance with the requirements of NFPA 70, and NFPA 99 for medical facilities. The designer must provide design features in accordance with the requirements of NFPA 70 and NFPA 110 for emergency and standby applications. A remote panel is required for NFPA 99 and NFPA 110, Level 1 applications. A remote panel is not required for NFPA 110, Level 2 applications. Edit the table to include all required alarms. Delete optional alarms which are not required. Delete all columns except the first column and the appropriate code reference column. Add necessary parameters where required to define critical limits for alarms.
**************************************************************************

Provide a remote alarm panel [as indicated.] [in accordance with [NFPA 99] [NFPA 110] and as follows.

### 2.21 ENGINE GENERATOR SET CONTROLS AND INSTRUMENTATION

Devices, wiring, remote panels, local panels, etc. shall be provided and installed as a complete system to automatically activate the appropriate signals and initiate the appropriate actions.
2.21.1 Controls

******************************************************************************
NOTE: Delete the remote control (control room) panel if the application is not a prime power application. Provide plan and elevation drawings of the remote control panels for prime power applications, depicting specific devices, instrument, and meters, including layouts. Generator circuit breaker controls with position indication may be added if required (Not available for standard molded-case breakers. Use only for power circuit breakers or switchgear.)

Edit the table to include all required devices. Delete all columns except the first column and the appropriate reference columns (always delete the "MFG Offering" column).

A remote stop switch is required by NFPA 37 for 100 hp and above engines, and by NFPA 110 for both Level 1 and Level 2 applications. A remote fuel shutoff switch, and a remote lube-oil shutoff switch are required by NFPA 37 for 100 hp and above engines. Delete the remote fuel shutoff switch, and a remote lube-oil shutoff switch where not required.

******************************************************************************

Provide a local control panel with controls [as indicated] [in accordance with [NFPA 110 level [1] [2]]] [and as follows] mounted [either on or adjacent to the engine generator set] [as indicated]. Provide a remote control panel [with devices as indicated] [fully redundant to the local control panel].

2.21.2 Engine Generator Set Metering and Status Indication

**************************************************************************
NOTE: Delete the remote (control room) panel if the application is not a prime power application. Provide plan and elevation drawings of the remote panels for prime power applications, depicting specific devices, instrument, and meters, including layouts. Edit the table to include all required devices. Delete optional devices that are not required for the application. Delete all columns except the first column and the appropriate reference column (always delete the "MFG. Offering" column). Add any necessary parameters to define devices required. A fuel meter display should be added for prime rated applications. A fuel header pressure display should be added for prime rated applications. Delete the pyrometer devices for sets smaller than 200 kW. kWh, kVAR, power factor,
meters and reverse power indication may be added as required.

The following instruments may be added as required.

Indicating VAR meter. Power-factor meter, indicating. (Specify one of these. They are normally used only for prime applications, however can be specified for standby units as required.)

Indicating wattmeter. (Normally used only for prime applications, however can be specified for standby units as required.)

Totalizing Kilowatt-hour meter with 15 or 30 minute demand register. (Normally used only for prime applications, however can be specified for standby units as required.)

Recording Kilowatt-hour/demand meter. (Normally used only for prime applications, however can be specified for standby units as required.)

The 15-minute demand register is preferred to the 30-minute register in most cases, because it permits more accurate timing of facility peak load occurrence.

Delete Frequency and Volt meters if a Synchronizing Panel is provided.

******************************************************************************

Provide a local panel with devices [as indicated] [in accordance with [NFPA 110 level [1] [2]]] [and as follows] mounted [either on or adjacent to the engine generator set] [as indicated]. A remote control panel shall be provided [with devices as indicated] [fully redundant to the local control panel].

2.22 SYNCHRONIZING PANEL

**************************************************************************
NOTE: Delete the Synchronizing Panel if no parallel service is intended. All panels except the remote panel can be combined into a single panel paragraph.
**************************************************************************

The panel shall be as specified in paragraph PANELS and shall provide controls, gauges, meters, and displays to include:

a. Frequency meters, dial type, with a range of 90 to 110 percent of rated frequency. Vibrating-reed type meters shall not be used. One shall
monitor generator output frequency ("Generator Frequency Meter") and the other shall monitor the frequency of the parallel source ("Bus Frequency Meter").

b. Voltmeters, ac, dial type, 3-phase, with 4-position selector switch for the generator output ("Generator Volt Meter") and for the parallel power source ("Bus volt meter").

c. Automatic synchronizer.

d. Manual synchronizing controls.

e. Indicating lights for supplementary indication of synchronization.

f. Synchroscope.

g. Wattmeter, indicating.

2.23 PANELS

*******************************************************************************
NOTE: All panels except the remote panel can be combined into a single panel paragraph.

Provide a panel-mounting location and detail for panels not mounted on the genset base. The designer may elect other locations such as adjacent to engine-generator set, in the generator enclosure, in or on the exciter-regulator cabinet, or in or on the switchgear enclosure. Provide panel nameplate and instrument nameplate unique identifiers or user preferred identifiers. Provide sizes, materials and attachment preferences.

Delete either the "analog" or "electronic instruments" paragraph.
*******************************************************************************

Each panel shall be of the type and kind necessary to provide specified functions. Panels shall be mounted [on the engine-generator set base by vibration/shock absorbing type mountings] [as shown]. Instruments shall be mounted flush or semiflush. Convenient access to the back of panels shall be provided to facilitate maintenance. Instruments shall be calibrated using recognized industry calibration standards. Each panel shall be provided with a panel identification plate which clearly identifies the panel function. Each instrument and device on the panel shall be provided with a plate which clearly identifies the device and its function as indicated. Switch plates shall clearly identify the switch-position function.

2.23.1 Enclosures

Enclosures shall be designed for the application and environment, conforming to NEMA ICS 6. Locking mechanisms [are optional.] [shall be keyed alike.]

2.23.2 Analog

Analog electrical indicating instruments shall be in accordance with
ANSI C39.1 with semiflush mounting. Switchboard, switchgear, and control-room panel-mounted instruments shall have 250 degree scales with an accuracy of not less than 99 percent. Unit-mounted instruments shall [be the manufacturer's standard] [have 100 degree scales] with an accuracy of not less than 98 percent. The instrument's operating temperature range shall be minus 20 to plus 65 degrees C minus 4 to plus 158 degrees F. Distorted generator output voltage waveform of a crest factor less than 5 shall not affect metering accuracy for phase voltages, hertz and amps.

2.23.3 Electronic

Electronic indicating instruments shall be true RMS indicating instruments, 100 percent solid state, state-of-the-art, microprocessor controlled to provide specified functions. Control, logic, and function devices shall be compatible as a system, sealed, dust and water tight, and shall utilize modular components with metal housings and digital instrumentation. An interface module shall be provided to decode serial link data from the electronic panel and translate alarm, fault and status conditions to set of relay contacts. Instrument accuracy shall be not less than 98 percent for unit mounted devices and 99 percent for control room, panel mounted devices, throughout a temperature range of minus 20 to plus 65 degrees C minus 4 to 158 degrees F. Data display shall utilize LED or back lit LCD. Additionally, the display shall provide indication of cycle programming and diagnostic codes for troubleshooting. Numeral height shall be [13 mm 0.5 inch] [______].

2.23.4 Parameter Display

Indication or readouts of the tachometer, lubricating-oil pressure, ac voltmeter, ac ammeter, frequency meter, and safety system parameters shall be provided. A momentary switch shall be specified for other panels.

2.24 AUTOMATIC ENGINE-GENERATOR-SET SYSTEM OPERATION

**************************************************************************

NOTE: Automatic operation is for standby. For hospital emergency/standby requirements, refer to UFC 3-540-02N. Delete automatic paralleling and loading where not required. Adapt to fit application and provide desired actuation sequence.

**************************************************************************

Fully automatic operation shall be provided for the following operations: engine-generator set starting and load transfer upon loss of [normal] [preferred] source; retransfer upon restoration of the [normal] [preferred] source; sequential starting; paralleling, and load-sharing for multiple engine-generator sets; and stopping of each engine-generator set after cool-down. Devices shall automatically reset after termination of their function.

2.24.1 Automatic Transfer Switch

Automatic transfer switches shall be in accordance with Section 26 36 00.00 10 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.

2.24.2 Monitoring and Transfer

Devices shall be provided to monitor voltage and frequency for the [normal] [preferred] power source and each engine-generator set, and control
transfer from the [normal] [preferred] source and retransfer upon restoration of the [normal] [preferred] source. Functions, actuation, and time delays shall be as described in Section 26 36 00.00 10 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.

2.24.3 Automatic Paralleling and Loading of Engine-Generator Sets

An automatic loading system shall be provided to load and unload engine-generator sets in the sequence indicated. The loading system shall monitor the system load and cause additional engine-generator sets to start, synchronize, and be connected in parallel with the system bus with increasing load. Actuation of the additional engine-generator set start logic shall occur when the load exceeds a percentage setpoint of the operating set's rating for a period of approximately 10 seconds. The device shall provide an adjustable setpoint range from 50 to 100 percent. When the system load falls below the percentage setpoint of the operating set's rating for a period of approximately [______], the controller shall unload and disconnect engine-generator sets from the system, stopping each engine-generator set after cool-down.

2.25 MANUAL ENGINE-GENERATOR-SET SYSTEM OPERATION

**************************************************************************
NOTE: Delete synchronization for non-parallel operation.
**************************************************************************

Complete facilities shall be provided for manual starting and testing of each set without load, loading and unloading of each set, and synchronization of each set with an energized bus.

2.26 STATION BATTERY SYSTEM

**************************************************************************
NOTE: The station battery system should be shown on the drawings.
**************************************************************************

Delete this requirement when not needed. A station battery is required only when dc-operated devices other than engine starting motors are provided. The station battery and starting battery may be combined where all dc-operated devices are the same voltage level and are not affected by the voltage drop caused by engine starting. Because lead calcium batteries are more economical and require less maintenance, nickel cadmium batteries should be specified only where very high discharge rate with constant voltage over a short period of time is required, or for applications where the battery temperature cannot be maintained above minus 6 degrees C 22 degrees F. Slush does not begin to form in lead acid batteries until the temperature reaches minus 29 degrees C minus 20 degrees F, but the battery voltage output and current capacity fall below useful values at minus 6 degrees C 22 degrees F. The designer should provide measures to maintain battery temperature between 16 and 32 degrees C 60 and 90 degrees F; 25 degrees C 77 degrees F is the target temperature for optimum
service life and performance. The engine starting battery for smaller size sets is sufficient for dc requirements and a station battery is not required.

Define loads which are to be served by the station battery.

Calculations of battery capacity utilize a median temperature of 25 degrees C 77 degrees F. If the predominate battery operating temperature varies by more than + 2.5 degrees C + 5 degrees F from 25 degrees C 77 degrees F, specify the median operating temperature.

A station battery system shall be provided to include the battery, battery rack, spacers, automatic battery charger and distribution panelboard with overcurrent protection, metering and relaying. Components shall be sized to withstand the seismic acceleration forces specified. The batteries shall have a rated life of 20 years and a manufacturer's 5-year, no cost replacement guarantee.

2.26.1 Battery

The battery shall be [lead-acid] [nickel-cadmium], sized in accordance with IEEE 485 and conform to the requirements of IEEE 484. Valve-regulated lead-acid batteries are not acceptable. The battery environment temperature shall range between [_____] and [_____] degrees. The battery shall be rated for at least [_____] ampere hours at the 8-hour rate.

2.26.2 Battery Capacity

NOTE: Delete loads which are not to be served from the Station Battery System. Add the following load for gensets 1000 kW and larger: precirculating lube-oil pumps for diesels for [_____] minutes.

The battery shall be rated for at least [_____] ampere hours at the 8-hour rate, and shall have sufficient capacity to serve the following loads without recharging for a period of [_____] hours. At the end of the discharge period, the battery shall have the capacity to simultaneously close and trip all the circuit breakers provided, based on a 1-minute load to final voltage of [_____] volts per cell.

a. Diesel-generator safety circuits.

b. Switchgear indicating lights, control relays, protective relays, and other switchgear dc components as required for 24 hours.

c. Voltage regulator (dc power supplies).

d. Emergency-lighting and power load at [_____] watts for [_____] hours.

2.26.3 Battery Charger

A current-limiting, [_____]-volt battery charger shall be furnished to automatically recharge the batteries. The charger shall be capable of an
equalize charging rate [for recharging fully depleted batteries within [8] [_____] hours] [which is continuously adjustable] and a floating-charge rate for maintaining the batteries in a fully charged condition. The charger shall be equipped with a low-voltage alarm relay, 0- to 24-hour equalizing timer, an ammeter to indicate charging rate, and necessary circuit breakers. The charger shall conform to the requirements of UL 1236. A battery is considered to be fully depleted when the voltage falls to a level incapable of operating the equipment loads served by the battery.

2.27 BASE

The base shall be constructed of steel. The base shall be designed to rigidly support the engine-generator set, ensure permanent alignment of rotating parts, be arranged to provide easy access to allow changing of lube-oil, and ensure that alignment is maintained during shipping and normal operation. The base shall permit skidding in any direction during installation and shall withstand and mitigate the affects of synchronous vibration of the engine and generator. The base shall be provided with [suitable holes for anchor bolts] [_____] diameter holes for anchor bolts] and jacking screws for leveling.

2.28 THERMAL INSULATION

Thermal insulation shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.29 PAINTING AND FINISHING

The engine-generator set shall be cleaned, primed and painted in accordance with the manufacturer's standard color and practice.

2.30 FACTORY INSPECTION AND TESTS

Submit [six] [_____] complete reproducible copies of the factory inspection result on the checklist format specified below. Perform the factory tests on each engine-generator set. The component manufacturer's production line test is acceptable as noted. Each engine-generator set shall be run not less than 1 hour at rated output capacity prior to inspections. Inspections shall be completed and all necessary repairs made, prior to testing. Engine generator controls and protective devices that are provided by the generator set manufacturer as part of the standard package shall be used for factory tests. When controls and switchgear are not provided as part of the generator set manufacturer's standard package, the actual controls and protective devices provided for the project are not required to be used during the factory test. The Contracting Officer may provide one or more representatives to witness inspections and tests.

2.30.1 Factory Inspection

******************************************************************************

NOTE: Delete inapplicable inspection items.
******************************************************************************

Perform inspections prior to beginning and after completion of testing of the assembled engine-generator set. Inspectors shall look for leaks, looseness, defects in components, proper assembly, etc. and note any item found to be in need of correction as a necessary repair. The following checklist shall be used for the inspection:
<table>

2.30.2 **Factory Tests**

*NOTE:* For dual fuel units, choose the fuel type to be used for the factory test. Decision should be based on providing satisfactory operation with the fuel which has the lowest heat value or on the fuel which presents the factors critical to satisfactory operation.

Delete Voltage Waveform tests for general purpose and commercial application categories.

Delete the Frequency and Voltage Stability and Transient Response Test for general-purpose and commercial-type applications. Perform this test either as a factory test or a field test (delete it from either the factory or field testing). This is not a standard manufacturer's test and requires most manufacturers to procure additional equipment (large reactive load banks) to test gensets over 1000 kW. Perform as a field test where required to ensure system operability using project loads. Revise the test steps to delete steps where the Maximum Step Increase is larger than final load to be placed on the genset.

Voltage Unbalance with Unbalanced Load Test is not a standard manufacturer's test. Delete the test for applications where only balanced three phase loads are served.

Delete parallel operation where not required.

**************************************************************************

SECTION 26 32 15.00 10  Page 68
Submit a letter giving notice of the proposed dates of factory inspections and tests at least 14 days prior to beginning tests, including:

a. A detailed description of the manufacturer's procedures for factory tests at least [14] [_____] days prior to beginning tests.

b. [Six] [_____] copies of the Factory Test data described below in 216 by 279 mm 8-1/2 by 11 inch binders having a minimum of 3 rings from which material may readily be removed and replaced, including a separate section for each test. Sections shall be separated by heavy plastic dividers with tabs. Data plots shall be full size (216 by 279 mm 8-1/2 by 11 inch minimum), showing grid lines, with full resolution.

   (1) A detailed description of the procedures for factory tests.
   (2) A list of equipment used, with calibration certifications.
   (3) A copy of measurements taken, with required plots and graphs.
   (4) The date of testing.
   (5) A list of the parameters verified.
   (6) The condition specified for the parameter.
   (7) The test results, signed and dated.
   (8) A description of adjustments made.

On engine-generator set tests where the engine and generator are required to be connected and operated together, the load power factor shall be [the power factor specified in the engine generator set parameter schedule] [([_____] power factor)]. For engine-generator set with dual-fuel operating capability the following tests shall be performed using [the primary fuel type] [([_____] type fuel)]. Electrical measurements shall be performed in accordance with IEEE 120. Definitions of terms are in accordance with IEEE Stds Dictionary. Temperature limits in the rating of electrical equipment and for the evaluation of electrical insulation shall be in accordance with IEEE 1.

In the following tests where measurements are to be recorded after stabilization of an engine-generator set parameter (voltage, frequency, current, temperature, etc.), stabilization is considered to have occurred when measurements are maintained within the specified bandwidths or tolerances, for a minimum of four consecutive readings. Tests specifically for the generator may be performed utilizing any prime mover.

a. Insulation Resistance for Stator and Exciter Test, IEEE 115 and IEEE 43, to the performance criteria in NEMA MG 1, Part 22. Generator manufacturer's production line test is acceptable.

b. High Potential Test, in accordance with IEEE 115 and NEMA MG 1, test voltage in accordance with NEMA MG 1. Generator manufacturer's production line test is acceptable.

c. Winding Resistance Test, Stator and Exciter, in accordance with IEEE 115. Generator manufacturer's production line test is acceptable.

d. Overspeed Vibration Test, in accordance with IEEE 115 to the performance criteria in NEMA MG 1. The test shall be performed at 110
percent of rated speed for 5 minutes. The vibration shall be measured at the end bearings (front and back of engine, outboard end of generator) in the horizontal, vertical, and axial directions. Vibration amplitude and speed shall be recorded at one minute intervals.

e. Phase Balance Voltage Test, to the performance criteria specified in paragraph GENERATOR. This test can be performed with any prime mover. Generator manufacturer's production line test results are acceptable.

(1) Start and operate the generator at no load.

(2) Adjust a regulated phase voltage (line-to-neutral) to rated voltage.

(3) Read and record the generator frequency, line-to-neutral voltages, and the line-to-line voltages.

(4) Apply 75 percent rated load and record the generator frequency, line-to-neutral voltages, and the line-to-line voltages.

(5) Apply rated load and record the generator frequency, line-to-neutral voltages, and the line-to-line voltages.

(6) Calculate average line-neutral voltage and percent deviation of individual line-neutral voltages from average for each load condition.

f. Current Balance on Stator Winding Test, by measuring the current on each phase of the winding with the generator operating at 100 percent of Rated Output Capacity, with the load impedance equal for each of the three phases: to the performance criteria specified in paragraph GENERATOR.

g. Voltage Waveform Deviation and Distortion Test in accordance with IEEE 115 to the performance criteria specified in paragraph GENERATOR. High-speed recording instruments capable of recording voltage waveform deviation and all distortion, including harmonic distortion shall be used. Representation of results shall include appropriate scales to provide a means to measure and interpret results.

h. Voltage and Frequency Droop Test. Verify that the output voltage and frequency are within the specified parameters as follows:

(1) With the generator operating at no load, adjust voltage and frequency to rated voltage and frequency. Record the generator output frequency and line-line and line-neutral voltages.

(2) Increase load to Rated Output Capacity. Record the generator output frequency and line-line and line-neutral voltages.

(3) Calculate the percent droop for voltage and frequency with the following equations:

\[
\text{Voltage droop percent} = \frac{(\text{No-Load Volts}) - (\text{Rated Capacity Volts})}{(\text{Service-Load Volts})} \times 100
\]
Frequency droop percent = \[ \frac{(\text{No-Load Hertz}) - (\text{Rated Capacity Hertz}) \times 100}{(\text{Service-Load Hertz})} \]

(4) Repeat steps 1 through 3 two additional times without making any adjustments.

i. Frequency and Voltage Stability and Transient Response. Verify that the engine-generator set responds to addition and dropping of blocks of load in accordance with the transient response requirements. Document maximum voltage and frequency variation from bandwidth and verify that voltage and frequency return to and stabilize within the specified bandwidth, within the specified response time period. Document results in tabular form and with high resolution, high speed strip chart recorders or comparable digital recorders, as approved by the Contracting Officer. Tabular data shall include the following:

1. Ambient temperature (at 15 minute intervals).
2. Generator output current (before and after load changes).
3. Generator output voltage (before and after load changes).
4. Frequency (before and after load changes).
5. Generator output power (before and after load changes).
6. Graphic representations shall include the actual instrument trace of voltage and frequency showing: charts marked at start of test; observed steady-state band; mean of observed band; momentary overshoot and undershoot (generator terminal voltage and frequency) and recovery time for each load change together with the voltage and frequency maximum and minimum trace excursions for each steady state load condition prior to and immediately following each load change. Generator terminal voltage and frequency transient recovery time for each step load increase and decrease.

(a) Perform and record engine manufacturer's recommended prestarting checks and inspections.

(b) Start the engine, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period and no load. Verify stabilization of voltage and frequency within specified bandwidths.

(c) With the unit at no load, apply the Maximum Step Load Increase.

**************************************************************************
NOTE: For applications where the Maximum Step Load Increase is 100 percent, delete steps 4., 5., and 6.
**************************************************************************

(d) Apply load in steps equal to the Maximum Step Load Increase until the addition of one more step increase will exceed the Service Load.
(e) Decrease load to the unit such that addition of the Maximum Step Load Increase will load the unit to 100 percent of Service Load.

(f) Apply the Maximum Step Load Increase.

(g) Decrease load to zero percent in steps equal to the Maximum Step Load Decrease.

(h) Repeat steps (c) through (g).

j. Test Voltage Unbalance with Unbalanced Load (Line-to-Neutral) to the performance criteria specified in paragraph GENERATOR. Prototype test data is acceptable in lieu of the actual test. Submit manufacturer's standard certification that prototype tests were performed for the generator model proposed. This test may be performed using any prime mover.

(1) Start and operate the generator set at rate voltage, no load, rated frequency, and under control of the voltage regulator. Read and record the generator frequency, line-to-neutral voltages, and the line-to-line voltages.

(2) Apply the specified load between terminals $L_1-L_2$, $L_2-L_0$, and $L_3-L_0$ in turn. Record all instrument readings at each line-neutral condition.

(3) Express the greatest difference between any two of the line-to-line voltages and any two of the line-to-neutral voltages as a percent of rated voltage.

(4) Compare the largest differences expressed in percent with the maximum allowable difference specified.

PART 3 EXECUTION

**************************************************************************
NOTE: Provide an equipment layout on the plans, which provides the clear space for operation and maintenance in accordance with NFPA 70 and IEEE C2. Include requirements for a staging/laydown area for disassembly or removal and replacement of major parts of the genset. Additionally, it is advisable to provide access to remove the unit and/or major parts of equipment from the room and building either through doors/passageways or equipment hatches.
**************************************************************************

3.1 EXAMINATION

After becoming familiar with all details of the job, perform a Site Visit to verify the information shown on the drawings, before performing any work. Submit a letter stating the date the site was visited and listing discrepancies found. Notify the Contracting Officer in writing of any discrepancies.

3.2 GENERAL INSTALLATION

Installation shall provide clear space for operation and maintenance in
accordance with NFPA 70 and IEEE C2. Submit a copy of the manufacturer's installation procedures and a detailed description of the manufacturer's recommended break-in procedure. Installation of pipe, duct, conduit, and ancillary equipment shall be configured to facilitate easy removal and replacement of major components and parts of the engine-generator set.

3.3 PIPING INSTALLATION

Piping shall be welded. Connections at valves shall be flanged. Connections at equipment shall be flanged except that connections to the diesel engine may be threaded if the diesel-engine manufacturer's standard connection is threaded. Except where otherwise specified, welded flanged fittings shall be utilized to allow for complete dismantling and removal of each piping system from the facility without disconnecting or removing any portion of any other system's equipment or piping. Connections to equipment shall be made with vibration-isolation-type flexible connectors. Piping and tubing shall be supported and aligned to prevent stressing of flexible hoses and connectors. Pipes extending through the roof shall be properly flashed. Piping shall be installed clear of windows, doors and openings, to permit thermal expansion and contraction without damage to joints or hangers, and shall be installed with a 13 mm 1/2 inch drain valve with cap at each low point.

3.3.1 Support

Hangers, inserts, and supports shall be of sufficient size to accommodate any insulation and shall conform to MSS SP-58. Supports shall be spaced not more than 2.1 m 7 feet on center for pipes 50 mm 2 inches in diameter or less, not more than 3.6 m 12 feet on center for pipes larger than 50 mm 2 inches but smaller than 100 mm 4 inches in diameter, and not more than 5.2 m 17 feet on center for pipes larger than 100 mm 4 inches in diameter. Supports shall be provided at pipe bends or change of direction.

3.3.1.1 Ceiling and Roof

Exhaust piping shall be supported with appropriately sized Type 41 single pipe roll and threaded rods; all other piping shall be supported with appropriately sized Type 1 clevis and threaded rods.

3.3.1.2 Wall

Wall supports for pipe shall be made by suspending the pipe from appropriately sized Type 33 brackets with the appropriate ceiling and roof pipe supports.

3.3.2 Flanged Joints

Flanges shall be Class 125 type, drilled, and of the proper size and configuration to match the equipment and diesel engine connections. Flanged joints shall be gasketed and made up square and tight.

3.3.3 Cleaning

After fabrication and before assembly, piping interiors shall be manually wiped clean of debris.

3.3.4 Pipe Sleeves

Pipes passing through construction such as ceilings, floors, or walls shall
be fitted with sleeves. Each sleeve shall extend through and be securely fastened in its respective structure and shall be cut flush with each surface. The structure shall be built tightly to the sleeve. The inside diameter of each sleeve shall be minimum 13 mm 1/2 inch, and where pipes pass through combustible materials 25 mm 1 inch larger than the outside diameter of the passing pipe or pipe insulation/covering.

3.4 ELECTRICAL INSTALLATION

Electrical installation shall comply with NFPA 70, IEEE C2, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. For vibration isolation, flexible fittings shall be provided for conduit, cable trays, and raceways attached to engine-generator sets; metallic conductor cables installed on the engine generator set and from the engine generator set to equipment not mounted on the engine generator set shall be flexible stranded conductor; and terminations of conductors on the engine generator set shall be crimp-type terminals or lugs.

3.5 FIELD PAINTING

**************************************************************************
NOTE: For Air Force work, add that the exterior of all equipment shall be finished in the base standard color.
**************************************************************************

Field painting shall be as specified in Section 09 90 00 PAINTS AND COATINGS.

3.6 ONSITE INSPECTION AND TESTS

Submit a letter giving notice of the proposed dates of onsite inspections and tests at least [14] [_____] days prior to beginning tests.

a. Submit a detailed description of the Contractor's procedures for onsite tests including the test plan and a listing of equipment necessary to perform the tests. Submission shall be at least [_____] days prior to beginning tests.

b. Submit [six] [_____] copies of the onsite test data described below in 216 by 279 mm 8-1/2 by 11 inch binders having a minimum of 3 rings from which material may readily be removed and replaced, including a separate section for each test. Sections shall be separated by heavy plastic dividers with tabs. Data plots shall be full size (216 by 279 mm 8-1/2 by 11 inch minimum), showing grid lines, with full resolution.

(1) A detailed description of the procedures for onsite tests.

(2) A list of equipment used, with calibration certifications.

(3) A copy of measurements taken, with required plots and graphs.

(4) The date of testing.

(5) A list of the parameters verified.

(6) The condition specified for the parameter.

(7) The test results, signed and dated.
(8) A description of adjustments made.

3.6.1 Test Conditions

3.6.1.1 Data

Measurements shall be made and recorded of all parameters necessary to verify that each set meets specified parameters. If the results of any test step are not satisfactory, adjustments, replacements, or repairs shall be made and the step repeated until satisfactory results are obtained. Unless otherwise indicated, data shall be recorded in 15 minute intervals during engine-generator set operation and shall include: readings of all engine-generator set meters and gauges for electrical and power parameters; oil pressure; ambient temperature; and engine temperatures available from meters and gauges supplied as permanent equipment on the engine-generator set. Electrical measurements shall be performed in accordance with IEEE 120. Definitions of terms are in accordance with IEEE Stds Dictionary. Temperature limits in the rating of electrical equipment and for the evaluation of electrical insulations shall be in accordance with IEEE 1.

3.6.1.2 Power Factor

Submit the generator capability curve showing generator kVA output capability (kW vs. kvar) for both leading and lagging power factors ranging from 0 to 1.0. For all engine-generator set operating tests the load power factor shall be [the power factor specified in the engine-generator set parameter schedule] [_____] power factor.

3.6.1.3 Contractor Supplied Items

Provide equipment and supplies required for inspections and tests including fuel, test instruments, and loadbanks at the specified power factors.

3.6.1.4 Instruments

Readings of panel gauges, meters, displays, and instruments provided as permanent equipment shall be verified during test runs, using test instruments of greater precision and accuracy. Test instrument accuracy shall be within the following: current plus or minus 1.5 percent, voltage plus or minus 1.5 percent, real power plus or minus 1.5 percent, reactive power plus or minus 1.5 percent, power factor plus or minus 3 percent, frequency plus or minus 0.5 percent. Test instruments shall be calibrated by a recognized standards laboratory within 30 days prior to testing.

3.6.1.5 Sequence

The sequence of testing shall be as specified in the approved testing plan unless variance is authorized by the Contracting Officer. Field testing shall be performed in the presence of the Contracting Officer. Tests may be scheduled and sequenced in order to optimize run-time periods; however, the following general order of testing shall be followed: Construction Tests; Inspections; Pre-operational Tests; Safety Run Tests; Performance Tests; and Final Inspection.

3.6.2 Construction Tests

**********************************************************************

NOTE: Coordinate the construction test requirements
with the other specification sections to eliminate redundant tests and provide additional reference to necessary tests.

Individual component and equipment functional tests for fuel piping, coolant piping, and lubricating-oil piping, electrical circuit continuity, insulation resistance, circuit protective devices, and equipment not provided by the engine-generator set manufacturer shall be performed prior to connection to the engine-generator set.

3.6.2.1 Piping Test

a. Lube-oil and fuel-oil piping shall be flushed with the same type of fluid intended to flow through the piping, until the outflowing fluid has no obvious sediment or emulsion.

b. Fuel piping which is external to the engine-generator set shall be tested in accordance with NFPA 30. All remaining piping which is external to the engine-generator set shall be pressure tested with air pressure at 150 percent of the maximum anticipated working pressure, but not less than 1.03 MPa 150 psi, for a period of 2 hours to prove the piping has no leaks. If piping is to be insulated, the test shall be performed before the insulation is applied.

3.6.2.2 Electrical Equipment Tests

NOTE: Delete ground resistance tests where covered by other project specifications, or where no grounds are installed.

a. Low-voltage cable insulation integrity tests shall be performed for cables connecting the generator breaker to the [automatic transfer switch] [panelboard] [main disconnect switch] [distribution bus] [______]. Low-voltage cable, complete with splices, shall be tested for insulation resistance after the cables are installed, in their final configuration, ready for connection to the equipment, and prior to energization. The test voltage shall be 500 volts dc, applied for one minute between each conductor and ground and between all possible combinations conductors in the same trench, duct, or cable, with all other conductors in the same trench, duct, or conduit. The minimum value of insulation shall be:

\( R \text{ in megohms} = \frac{(\text{rated voltage in kV + 1}) \times 304.8}{\text{length of cable in meters}} \)

\( R \text{ in megohms} = \frac{(\text{rated voltage in kV + 1}) \times 1000}{\text{length of cable in feet}} \)

(3) Each cable failing this test shall be repaired or replaced. The repair cable shall be retested until failures have been eliminated.

b. Medium-voltage cable insulation integrity tests shall be performed for cables connecting the generator breaker to the [generator switchgear] [main disconnect switch] [distribution bus]. After installation and before the operating test or connection to an existing system, the medium-voltage cable system shall be given a high potential test.
Direct-current voltage shall be applied on each phase conductor of the system by connecting conductors as one terminal and connecting grounds of metallic shieldings or sheaths of the cable as the other terminal for each test. Prior to making the test, the cables shall be isolated by opening applicable protective devices and disconnecting equipment. The test shall be conducted with all splices, connectors, and terminations in place. The method, voltage, length of time, and other characteristics of the test for initial installation shall be in accordance with [NEMA WC 74/ICEA S-93-639] for the particular type of cable installed, except that 28kV and 35kV insulation test voltages shall be in accordance with either AEIC CS8 or AEIC CS8 as applicable, and shall not exceed the recommendations of IEEE 404 cable joints and IEEE 48 for cable terminations unless the cable and accessory manufacturers indicate higher voltages are acceptable for testing. Should any cable fail due to a weakness of conductor insulation or due to defects or injuries incidental to the installation or because of improper installation of cable, cable joints, terminations, or other connections, make necessary repairs or replace cables as directed. Repaired or replaced cables shall be retested.

c. Ground-Resistance Tests. The resistance of [each grounding electrode] [each grounding electrode system] [the ground mat] [the ground ring] shall be measured using the fall-of-potential method defined in IEEE 81. Ground resistance measurements shall be made before the electrical distribution system is energized and shall be made in normally dry conditions not less than 48 hours after the last rainfall. Resistance measurements of separate grounding electrode systems shall be made before the systems are bonded together below grade. The combined resistance of separate systems may be used to meet the requirements resistance, but the specified number of electrodes must still be provided as follows:

(2) Multiple rod electrodes - [_____] ohms.

(3) Ground mat - [_____] ohms.

d. Circuit breakers and switchgear shall be examined and tested in accordance with the manufacturer's published instructions for functional testing.

3.6.3 Inspections

Perform the following inspections jointly by the Contracting Officer and the Contractor, after complete installation of each engine-generator set and its associated equipment, and prior to startup of the engine-generator set. Submit a letter certifying that all facilities are complete and functional; that each system is fully functional; and that each item of equipment is complete, free from damage, adjusted, and ready for beneficial use. Checks applicable to the installation shall be performed. The results of those which are physical inspections (I) shall be documented and submitted in accordance with paragraph SUBMITTALS. Present manufacturer's data for the inspections designated (D) at the time of inspection. Inspections shall verify that equipment type, features, accessibility, installation and condition are in accordance with the contract specification. Manufacturer's statements shall certify provision of features which cannot be verified visually.

3.6.4 Pre-operational Tests

**************************************************************************
NOTE: Specify the protective devices to be tested. Devices which shut down the engine because of an abnormal electrical or generator condition should be detailed under Safety Run Tests. Delete current transformer tests when none are to be installed.
**************************************************************************

3.6.4.1 Protective Relays

**************************************************************************
NOTE: Delete the protective devices coordination study reference if the project does not require one. See UFC 3-520-01 and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION, and Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION, for guidance.
**************************************************************************

Protective relays shall be visually and mechanically inspected, adjusted, tested, and calibrated in accordance with the manufacturer's published instructions. Tests shall include pick-up, timing, contact action, restraint, and other aspects necessary to ensure proper calibration and operation. Relay settings shall be implemented in accordance with the installation coordination study. Relay contacts shall be manually or electrically operated to verify that the proper breakers and alarms initiate. Relaying current transformers shall be field tested in
accordance with IEEE C57.13.1.

3.6.4.2 Insulation Test

Generator and exciter circuits insulation resistance shall be tested in accordance with IEEE 43. Stator readings shall be taken at the circuit breaker, to include generator leads to [switchgear] [switchboard]. Results of insulation resistance tests shall be recorded. Readings shall be within limits specified by the manufacturer. Mechanical operation, insulation resistance, protective relay calibration and operation, and wiring continuity of [switchgear] [switchboard] assembly shall be verified. Precautions shall be taken to preclude damaging generator components during test.

3.6.4.3 Engine-Generator Connection Coupling Test

When the generator provided is a two-bearing machine, the engine-generator connection coupling shall be inspected and checked by dial indicator to prove that no misalignment has occurred. The dial indicator shall measure variation in radial positioning and axial clearance between the coupling halves. Readings shall be taken at four points, spaced 90 degrees apart. Solid couplings and pin-type flexible couplings shall be aligned within a total indicator reading of 0.012 to 0.025 mm 0.0005 to 0.001 inch for both parallel and angular misalignment. For gear-type or grid-type couplings, 0.05 mm 0.002 inch will be acceptable.

3.6.5 Safety Run Test

**************************************************************************
NOTE: For the sound level tests, modify the radial distance requirement from the engine intake and exhaust to account for obstructions, variations in site conditions, building configurations, or indicate points on the contract drawings at which measurements are to be made. Add item x. to the list below when a test for over/under frequency alarms are provided. Coordinate the requirement with paragraph Alarm Panels. Item x. should be included as follows:

x. Manually adjust the governor to speed up the engine to a level beyond the over frequency alarm setpoint and record the frequency when the audible alarm sounds. Return the speed to the rated value. Shut down the engine-generator set.
**************************************************************************

For the following tests, if any parts are changed, or adjustments made to the generator set, its controls, or auxiliaries, the associated safety tests shall be repeated.

a. Perform and record engine manufacturer's recommended prestarting checks and inspections.

b. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

c. Activate the manual emergency stop switch and verify that the engine
d. Remove the high and pre-high lubricating oil temperature sensing elements from the engine and temporarily install a temperature gauge in their normal locations on the engine (required for safety, not for recorded data). Where necessary provide temporary wiring harness to connect the sensing elements to their permanent electrical leads.

e. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period. Operate the engine-generator set at no load until the output voltage and frequency stabilize. Monitor the temporarily installed temperature gauges. If either temperature reading exceeds the value required for an alarm condition, activate the manual emergency stop switch.

f. Immerse the elements in a vessel containing controlled-temperature hot oil and record the temperature at which the pre-high alarm activates and the temperature at which the engine shuts down. Remove the temporary temperature gauges and reinstall the temperature sensors on the engine.

g. Remove the high and pre-high coolant temperature sensing elements from the engine and temporarily install a temperature gauge in their normal locations on the engine (required for safety, not for recorded data). Where necessary provide temporary wiring harness to connect the sensing elements to their permanent electrical leads.

h. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period. Operate the engine generator-set at no load until the output voltage and frequency stabilize.

i. Immerse the elements in a vessel containing controlled-temperature hot oil and record the temperature at which the pre-high alarm activates and the temperature at which the engine shuts down. Remove the temporary temperature gauges and reinstall the temperature sensors on the engine.

j. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

k. Operate the engine generator-set for at least 2 hours at 75 percent of Service Load.

l. Verify proper operation and setpoints of gauges and instruments.

m. Verify proper operation of ancillary equipment.

n. Manually adjust the governor to increase engine speed past the overspeed limit. Record the RPM at which the engine shuts down.

o. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 75 percent of Service Load.

p. Manually adjust the governor to increase engine speed to within 2
percent of the overspeed trip speed previously determined and operate at that point for 5 minutes. Manually adjust the governor to the rated frequency.

q. Manually fill the day tank to a level above the overfill limit. Record the level at which the overfill alarm sounds. Verify shutdown of the fuel transfer pump. Drain the day tank down below the overfill limit.

r. Shut down the engine. Remove the time-delay low lube oil pressure alarm bypass and try to start the engine.

s. Attach a manifold to the engine oil system (at the oil pressure sensor port) that contains a shutoff valve in series with a connection for the engine's oil pressure sensor followed by an oil pressure gauge ending with a bleed valve. The engine's oil pressure sensor shall be moved from the engine to the manifold. The manifold shutoff valve shall be open and bleed valve closed.

t. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 75 percent of Service Load.

u. Close the manifold shutoff valve. Slowly allow the pressure in the manifold to bleed off through the bleed valve while watching the pressure gauge. Record the pressure at which the engine shuts down. Catch oil spillage from the bleed valve in a container. Add the oil from the container back to the engine, remove the manifold, and reinstall the engine's oil pressure sensor on the engine.

v. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 100 percent of Service Load. Record the maximum sound level in each frequency band at a distance of \[22.9\] \[\text{m} \text{[75] \text{[_____] feet}}\text{ from the end of the exhaust and air intake piping directly along the path of intake and discharge for horizontal piping; or at a radius of}\ [22.9] \[10.7\] \[\text{[_____] m \text{[75] \text{[35] \text{[_____] feet}}\text{ from the engine at 45 degrees apart in all directions for vertical piping. [If a sound limiting enclosure is provided, the enclosure, the muffler, and intake silencer shall be modified or replaced as required to meet the sound requirements contained within this specification] [If a sound limiting enclosure is not provided, the muffler and air intake silencer shall be modified or replaced as required to meet the sound limitations of this specification. If the sound limitations can not be obtained by modifying or replacing the muffler and air intake silencer, notify the Contracting Officers Representative and provide a recommendation for meeting the sound limitations.]}\]

w. Manually drain off fuel slowly from the day tank to empty it to below the low fuel level limit and record the level at which the audible alarm sounds. Add fuel back to the day tank to fill it above low level alarm limits.

3.6.6 Performance Tests

*********************************************************************************************************************************************
NOTE: The onsite tests have been developed from MIL-STD 705 methods with input from many sources

SECTION 26 32 15.00 10 Page 82
including industry. Each designer must verify the adequacy of the tests that are needed for each application. Modifications to these specifications may be necessary beyond the removal of brackets.

Delete the Frequency and Voltage, Stability and Transient Response Test and the Voltage Regulator and Governor Range Test for general-purpose and commercial-type applications. Perform this test either as a factory test or a field test (delete it from either the factory or field tests). Perform as a field test where required to ensure system operability using project loads. Revise the test steps to delete steps where the Maximum Step Increase is larger than final load to be placed on the genset.

If possible, specify an ambient temperature for the load run test which is typical for the average maximum temperature. This is most strenuous operating condition. Specify a month which typically provides the most restrictive operating condition.

Delete all 110 percent load references from testing requirements for standby applications.

In the following tests, where measurements are to be recorded after stabilization of an engine-generator set parameter (voltage, frequency, current, temperature, etc.), stabilization is considered to have occurred when measurements are maintained within the specified bandwidths or tolerances, for a minimum of four consecutive readings. For the following tests, if any parts are changed, or adjustments made to the generator set, its controls, or auxiliaries, the associated tests shall be repeated.

3.6.6.1 Continuous Engine Load Run Test

Test the engine-generator set and ancillary systems at service load to demonstrate durability; verify that heat of extended operation does not adversely affect or cause failure in any part of the system; and check all parts of the system. If the engine load run test is interrupted for any reason, the entire test shall be repeated. The engine load run test shall be accomplished principally during daylight hours, with an average ambient temperature of [_____] degrees C/F, during the month of [______]. After each change in load in the following test, measure the vibration at the end bearings (front and back of engine, outboard end of generator) in the horizontal, vertical, and axial directions. Verify that the vibration is within the allowable range. Data taken at 15 minute intervals shall include the following:

   Electrical: Output amperes, voltage, real and reactive power, power factor, frequency.

   Pressure: Lube-oil.

   Temperature: Coolant, Lube-oil, Exhaust, Ambient.
a. Perform and record engine manufacturer's recommended prestarting checks and inspections. Include as a minimum checking of coolant fluid, fuel, and lube-oil levels.

b. Start the engine, make and record engine manufacturer's after-starting checks and inspections during a reasonable warmup period.

c. Operate the engine generator-set for 2 hours at 75 percent of Service Load.

d. Increase load to 100 percent of Service Load and operate the engine generator-set for 4 hours.

e. For prime rated units, increase load to 110 percent of Service Load and operate the engine generator-set for 2 hours.

f. Decrease load to 100 percent of Service Load and operate the engine generator-set for 2 hours or until all temperatures have stabilized.

g. Remove load from the engine-generator set.

3.6.6.2 Voltage and Frequency Droop Test

For the following steps, verify that the output voltage and frequency return to and stabilize within the specified bandwidth values following each load change. Record the generator output frequency and line-line and line-neutral voltages following each load change.

a. With the generator operating at no load, adjust voltage and frequency to rated voltage and frequency.

b. Increase load to 100 percent of Rated Output Capacity. Record the generator output frequency and line-line and line-neutral voltages.

c. Calculate the percent droop for voltage and frequency with the following equations.

Voltage droop percent = \( \frac{\text{No-load volts} - \text{rated output capacity volts}}{\text{Rated output capacity volts}} \times 100 \)

Frequency droop percent = \( \frac{\text{No load hertz} - \text{rated output capacity hertz}}{\text{Rated output capacity volts}} \times 100 \)

d. Repeat steps a. through c. two additional times without making any adjustments.

3.6.6.3 Voltage Regulator Range Test

a. While operating at no load, verify that the voltage regulator adjusts from 90 to 110 percent of rated voltage.

b. Increase load to 100 percent of Rated Output Capacity. Verify that the voltage regulator adjusts from 90 to 110 percent of rated voltage.
3.6.6.4 Governor Adjustment Range Test

a. While operating at no load, verify that the governor adjusts from 90 to 110 percent of rated frequency.

b. Increase load to 100 percent of Rated Output Capacity. Verify that the governor adjusts from 90 to 110 percent of rated frequency.

3.6.6.5 Frequency and Voltage Stability and Transient Response

**************************************************************************
NOTE: For applications where the Maximum Step Load Increase is 100 percent, delete steps d, e, and f.
**************************************************************************

Verify that the engine-generator set responds to addition and dropping of blocks of load in accordance with the transient response requirements. Document maximum voltage and frequency variation from bandwidth and verify that voltage and frequency return to and stabilize within the specified bandwidth, within the specified response time period. Document results in tabular form and with high resolution, high speed strip chart recorders or comparable digital recorders, as approved by the Contracting Officer. Tabular data shall include the following:

1. Ambient temperature (at 15 minute intervals).
2. Generator output current (before and after load changes).
3. Generator output voltage (before and after load changes).
4. Frequency (before and after load changes).
5. Generator output power (before and after load changes).
6. Graphic representations shall include the actual instrument trace of voltage and frequency showing:

   a. Charts marked at start of test; observed steady-state band; mean of observed band; momentary overshoot and undershoot (generator terminal voltage and frequency) and recovery time for each load change together with the voltage and frequency maximum and minimum trace excursions for each steady state load condition prior to and immediately following each load change. Generator terminal voltage and frequency transient recovery time for each step load increase and decrease.

   a. Perform and record engine manufacturer's recommended prestarting checks and inspections.
   b. Start the engine, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period and no load. Verify stabilization of voltage and frequency within specified bandwidths.
   c. With the unit at no load, apply the Maximum Step Load Increase.
   d. Apply load in steps equal to the Maximum Step Load Increase until the addition of one more step increase will exceed the Service Load.
   e. Decrease load to the unit such that addition of the Maximum Step Load
Increase will load the unit to 100 percent of Service Load.

f. Apply the Maximum Step Load Increase.

g. Decrease load to zero percent in steps equal to the Maximum Step Load Decrease.

h. Repeat steps c. through g.

3.6.7 Parallel Operation Test

**************************************************************************
NOTE: Delete the generator paralleling/load sharing test if parallel sets are not intended. This test must be performed at a power factor other than unity to verify proportional reactive power sharing.
**************************************************************************

Test the capability of each engine-generator set to parallel and share load with other generator sets, individually and in all combinations. This test must be performed with the voltage regulator and governor adjustment settings used for the Frequency and Voltage Stability and Transient Response test. If settings are changed during the performance of this test, a voltage and frequency stability and transient response test must be performed for each engine generator set using the setting utilized in this test. During operations record load-sharing characteristics of each set in parallel operation. Data taken shall include the following:

1. Ambient temperature (at 15 minute intervals).
2. Generator output current (before and after load changes).
3. Generator output voltage (before and after load changes).
4. Power division and exchange between generator sets.
5. Real power (watts) and reactive power (vars) on each set.

3.6.7.1 Combinations

Connect each set, while operating at no load, parallel with one other set in the system, operating at service load, until all possible two-unit-in-parallel combinations have been achieved. Verify stabilization of voltage and frequency within specified bandwidths and proportional sharing of real and reactive loads. Document stabilization of voltage and frequency within specified bandwidth, the active power division, active power exchange, reactive power division, and voltage and frequency stability and transient response in the following steps for each combination.

a. Divide the load proportionally between the sets and operate in parallel for 15 minutes.

b. Increase the load, in steps equal to the Maximum Step Increase, until each set is loaded to its service load.

c. Decrease the load, in steps equal to the Maximum Step Decrease, until each set is loaded to approximately 25 percent of its service load.
d. Increase the load, in steps equal to the Maximum Step Increase, until each set is loaded to approximately 50 percent of its service load. Verify stabilization of voltage and frequency within specified bandwidths and proportional sharing of real and reactive load.

e. Reduce the sum of the loads on both sets to the output rating of the smaller set.

f. Transfer a load equal to the output rating of the smaller of the 2 sets to and from each set. Verify stabilization of voltage and frequency within specified bandwidths and proportional sharing of real and reactive load.

g. Document the active power division, active power exchange, reactive power division, and voltage and frequency stability and transient response.

3.6.7.2 Multiple Combinations

Connect each set, while operating at no load, parallel with all multiple combinations of all other set in the system, while operating at service load, until all multiple combinations of parallel operations have been achieved.

3.6.8 Parallel Operation Test (Commercial Source)

**************************************************************************
NOTE: Delete the parallel to commercial source test if sets are not to be paralleled with the commercial power source.
**************************************************************************

Connect each set parallel with the commercial power source. Operate in parallel for 15 minutes. Verify stabilization of voltage and frequency within specified bandwidths. Record the output voltage, frequency, and loading to demonstrate ability to synchronize with the commercial power source.

3.6.9 Automatic Operation Tests

**************************************************************************
NOTE: Delete automatic operation test where not required. Adapt this paragraph based on the number of engine-generator sets, the desired starting order, and load sequencing. The designer will provide the sequence of operation (load sequences for load acquisition and load shedding) in the design documents.
**************************************************************************

Test the automatic operating system to demonstrate [automatic starting,] [loading and unloading,] [the response to loss of operating engine-generator sets,] and paralleling of each engine-generator set. The loads for this test shall utilize [load banks at the indicated power factor] [and actual loads to be served], and the loading sequence shall be the indicated sequence. During all operations load-sharing characteristics shall be recorded. Perform this test for a minimum of two successive, successful tests. Data taken shall include the following:
(1) Ambient temperature (at 15 minute intervals).

(2) Generator output current (before and after load changes).

(3) Generator output voltage (before and after load changes).

(4) Generator output frequency (before and after load changes).

(5) Power division and exchange between generator sets.

(6) Real and reactive power on each set.

a. Initiate loss of the preferred power source and verify the specified sequence of operation.

b. Verify resetting of automatic starting and transfer logic.

3.6.10 Automatic Operation Tests for Stand-Alone Operation

**************************************************************************
NOTE: Substitute manual operation and transfer for automatic operation where automatic operation is not required by the project. Delete automatic loading system where not required. The designer will provide the sequence of operation (load sequences for load acquisition and load shedding) in the design documents.
**************************************************************************

Test the automatic loading system to demonstrate [automatic starting,] [and] [loading and unloading] of each engine-generator set. The loads for this test shall utilize the actual loads to be served, and the loading sequence shall be the indicated sequence. Perform this test for a minimum of two successive, successful tests. Data taken shall include the following:

(1) Ambient temperature (at 15 minute intervals).

(2) Generator output current (before and after load changes).

(3) Generator output voltage (before and after load changes).

(4) Generator output frequency (before and after load changes).

a. Initiate loss of the primary power source and verify automatic sequence of operation.

b. Restore the primary power source and verify sequence of operation.

c. Verify resetting of controls to normal.

3.6.11 Fuel Consumption Tests

**************************************************************************
NOTE: Fuel consumption tests and rebates are to be used on prime rated applications only. Delete for standby units.
**************************************************************************
Perform fuel consumption tests to confirm the manufacturer's certified rates on engine generator set and tabulate and average the results. Fuel consumption tests shall be conducted under the direct supervision of the engine manufacturer's representative. Fuel consumption readings shall be taken at 15 minute intervals, over a minimum period of 1 hour at 50 percent Service Load, 1 hour at 75 percent Service Load, and 4 hours at 100 percent Service Load. Fuel consumption data may be taken during the 75 percent load test and 100 percent load tests. Fuel consumption readings at site conditions shall be correlated to the guarantee-baseline conditions. Test report shall contain: readings of the output frequency, voltage, current, power factor, and power; barometric pressure; ambient temperature; intake-air temperature; fuel temperature; the site fuel consumption readings, adjustment calculations, factors, and source references for correlation of actual consumption rate of the guaranteed rate.

a. Start and operate the generator set and allow it to stabilize at rated load, rated voltage and rated frequency. During this period, readings of all instruments including thermal instrumentation shall be recorded at minimum intervals of 10 minutes. If necessary, adjustments to the load, voltage and frequency may be made to maintain rated load at rated voltage and rated frequency. However, adjustments to the voltage and frequency shall be limited to those adjustments available to the operator, specifically adjustments to the voltage or frequency adjust devices. On generator sets utilizing a droop-type speed control system as the prime speed control, the speed and droop portions of the control may be adjusted. No other adjustments to the voltage and frequency control systems shall be made unless permitted by the procurement document. Adjustments to the load, voltage or frequency controls shall be recorded on the data sheet. Unless otherwise specified in the procurement document, stabilization will be considered to have occurred when four consecutive voltage and current recorded readings of the generator (or exciter) field either remain unchanged or have only minor variations about an equilibrium condition with no evident continued increase or decrease in value after the last adjustment to the load, voltage or frequency has been made.

b. Perform one of the following procedures:

BALANCE SCALE PROCEDURE.

(1) Supply fuel from auxiliary container mounted on a balance scale.

(2) After stabilization has occurred, set the balance weights at any convenient value slightly less than the total weight of the fuel and container.

(3) Start the stopwatch when the balance weights fall and record the total weight.

(4) Reduce the balance weight a convenient amount and record the amount of the weights removed.

(5) Stop the stopwatch when the balance weights fall and record the total weight and the elapsed time.

(6) Repeat steps (1) thru (2) above until the timed portion of the test exceeds the 2 hours.

(7) From the total elapsed time and total of the weights removed
calculate the fuel consumption in terms of pounds per hour.

(8) Using the value obtained in step (7) above, compute the rate of fuel consumption per kilowatt hour, as follows:

\[
Pounds \text{ per kWH} = \frac{\text{Fuel Consumption in Pounds per Hour}}{\text{kW Load}}
\]

(9) Repeat the test for each load condition specified.

(10) Determine the capacity of the generator set fuel tank in pounds of fuel.

(11) For each specified load, compute the number of continuous hours the generator set will operate on a full tank of fuel. The following formula shall be used.

\[
\text{Operating hours} = \frac{\text{Fuel Tank Capacity (Pounds)}}{\text{Fuel Consumption (Pounds per hour)}}
\]

ALTERNATE PROCEDURE FOR WEIGHING FUEL

(1) Supply fuel from the auxiliary fuel container, mounted on a platform balance, or other weighing device.

(2) After stabilization has occurred, record weight readings every one-half hour for a period of 2 hours.

(3) Calculate the average hourly fuel consumption rate in pounds per hour.

(4) Using the average hourly fuel consumption rate obtained above, compute the rate of fuel consumption per kilowatt hour, as follows:

\[
Pounds \text{ per kWH} = \frac{\text{Fuel Consumption}}{\text{kW Load}}
\]

(5) Repeat test for each load condition specified.

(6) Determine the capacity of the generator set fuel tank in pounds of fuel.

(7) For each specified load test, compute the number of continuous hours the generator set will operate on a full tank of fuel. The following formula shall be used:

\[
\text{Operating Hours} = \frac{\text{Fuel Tank Capacity (Pounds)}}{\text{Fuel Consumption (Pounds per hour)}}
\]

ALTERNATE PROCEDURE USING FLOWMETER.

Flowmeters may be used to determine the fuel rate. They usually are calibrated in either gallons per hour, or pounds per hour, for a fuel of a definite specific gravity and temperature.

(1) After stabilization has occurred record the fuel consumption rate, and continue to record the fuel consumption rate at one-half hour intervals for 2 hours.
(2) Determine the average of the readings (correct for fuel specific gravity and temperature). This is the fuel consumption rate and should be converted, if necessary, to pounds per hour.

(3) Using the average value obtained above, calculate the rate of fuel consumption per kilowatt hour.

(4) Repeat the test for each load condition specified.

(5) Determine the capacity of the generator set fuel tank in pounds of fuel.

(6) For each specified load test, compute the number of continuous hours the generator set will operate on a full tank of fuel. The following formula shall be used:

\[
\text{Operating Hours} = \frac{\text{Fuel Tank Capacity (Pounds)}}{\text{Fuel Consumption (Pounds per Hour)}}
\]

c. Results. Compare the operating hours or the fuel consumption rate per kWH.

3.7 ONSITE TRAINING

**************************************************************************
NOTE: Delete video taping if not required.
**************************************************************************

Conduct training course for operating staff as designated by the Contracting Officer. The training period shall consist of a total [_____] hours of normal working time and shall start after the system is functionally completed but prior to final acceptance.

a. Submit a letter giving the date proposed for conducting the onsite training course, the agenda of instruction, a description of the video taping service to be provided, and the kind and quality of the tape to be left with the Contracting Officer at the end of the instructional period.

b. The course instructions shall cover pertinent points involved in operating, starting, stopping, servicing the equipment, as well as major elements of the operation and maintenance manuals. Additionally, the course instructions shall demonstrate routine maintenance procedures as described in the operation and maintenance manuals. Two copies of a video tape of the [entire training session] [manufacturers operating and maintenance training course] shall be submitted.

c. Submit [six] [_____] copies of the operation manual (approved prior to commencing onsite tests) in 216 by 279 mm 8-1/2 by 11 inch binders, having a minimum of 3 rings from which material may readily be removed and replaced, including a separate section for each system or subsystem. Sections shall be separated by heavy plastic dividers with tabs which identify the material in the section. Drawings shall be folded blue lines, with the title block visible, and placed in 216 by 279 mm 8-1/2 by 11 inch plastic pockets with reinforced holes.

d. One full size reproducible mylar of each drawing shall accompany the booklets. Mylars shall be rolled and placed in a heavy cardboard tube with threaded caps on each end. The manual shall include:
step-by-step procedures for system startup, operation, and shutdown; drawings, diagrams, and single-line schematics to illustrate and define the electrical, mechanical, and hydraulic systems together with their controls, alarms, and safety systems; the manufacturer's name, model number, and a description of equipment in the system. The instructions shall include procedures for interface and interaction with related systems to include [automatic transfer switches] [fire alarm/suppression systems] [load shedding systems] [uninterruptible power supplies] [_____] . Each booklet shall include a CD containing an ASCII file of the procedures.

e. All operation and maintenance manuals shall be approved and made available for the training course. All posted instructions shall be approved and posted prior to the beginning date of the training course. The training course schedule shall be coordinated with the Using Service's work schedule, and submitted for approval 14 days prior to beginning date of proposed beginning date of training.

f. Submit [six] [_____] copies of the maintenance manual containing the information described below in 216 by 279 mm 8-1/2 by 11 inch binders having a minimum of three rings from which material may readily be removed and replaced, including a separate section for each item listed. Each section shall be separated by a heavy plastic divider with tabs. Drawings shall be folded, with the title block visible, and placed in plastic pockets with reinforced holes.

(1) Procedures for each routine maintenance item.

(2) Procedures for troubleshooting.

(3) Factory-service, take-down overhaul, and repair service manuals, with parts lists.

(4) A copy of the posted instructions.

(5) A component list which includes the manufacturer's name, address, type or style, model or serial number, rating, and catalog number for the major components specified for nameplates.

(6) Submit [six] [_____] complete reproducible copies of the final relay and protective device settings. The settings shall be recorded with the name of the company and individual responsible for their accuracy.

3.8 FINAL TESTING AND INSPECTION

a. Start the engine, record the starting time, make and record all engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

b. Increase the load in steps no greater than the Maximum Step Load Increase to 100 percent of Service Load, and operate the engine-generator set for at least 30 minutes. Measure the vibration at the end bearings (front and back of engine, outboard end of generator) in the horizontal, vertical, and axial directions. Verify that the vibration is within the same range as previous measurements and is within the required range.

c. Remove load and shut down the engine-generator set after the
recommended cool down period.

d. Remove the lube oil filter and have the oil and filter examined by the engine manufacturer for excessive metal, abrasive foreign particles, etc. Any corrective action shall be verified for effectiveness by running the engine for 8 hours at Service Load, then re-examining the oil and filter.

e. Remove the fuel filter and examine the filter for trash, abrasive foreign particles, etc.

f. Visually inspect and check engine and generator mounting bolts for tightness and visible damage.

g. Replace air, oil, and fuel filters with new filters.

3.9 POSTED DATA AND INSTRUCTIONS

**************************************************************************
NOTE: The designer should check with the customer to determine if framed instructions can be placed in the project area (requires wall space), and where they are to be placed. Select the 216 X 279 mm 8 1/2 X 11 inch notebook option where instructions will have to be placed in the genset enclosure or a switchgear cubicle (or other suitable enclosure).
**************************************************************************

Posted Data and Instructions shall be posted prior to field acceptance testing of the engine generator set. [Two sets of instructions/data shall be typed and framed under weatherproof laminated plastic, and posted side-by-side where directed. First set shall include a one-line diagram, wiring and control diagrams and a complete layout of the system. Second set of shall include the condensed operating instructions describing manufacturer's pre-start checklist and precautions; startup procedures for test-mode, manual-start mode, and automatic-start mode (as applicable); running checks, procedures, and precautions; and shutdown procedures, checks, and precautions. Submit posted data including wiring and control diagrams showing the key mechanical and electrical control elements, and a complete layout of the entire system.

a. Instructions shall include procedures for interrelated equipment (such as heat recovery systems, co-generation, load-shedding, and automatic transfer switches).] [Two sets of instructions/data shall be typed in 216 X 279 mm 8-1/2 x 11 inch format, laminated in weatherproof plastic, and placed in three-ring vinyl binders. The binders shall be placed as directed by the Contracting Officer. The instructions shall be in place prior to acceptance of the engine generator set installation.

b. First set shall include a one-line diagram, wiring and control diagrams and a complete layout of the system. Second set shall include the condensed operating instructions describing manufacturer's pre-start checklist and precautions; startup procedures for test-mode, manual-start mode, and automatic-start mode (as applicable); running checks, procedures, and precautions; and shutdown procedures, checks, and precautions. Instructions shall include procedures for interrelated equipment (such as heat recovery systems, co-generation, load-shedding, and automatic transfer switches).]
c. Submit instructions including: the manufacturers pre-start checklist and precautions; startup procedures for test-mode, manual-start mode, and automatic-start mode (as applicable); running checks, procedures, and precautions; and shutdown procedures, checks, and precautions. Instructions shall include procedures for interrelated equipment (such as heat recovery systems, co-generation, load-shedding, and automatic transfer switches). Instructions shall be weatherproof, laminated in plastic, and posted where directed.

### 3.10 ACCEPTANCE

Submit drawings which accurately depict the as-built configuration of the installation, upon acceptance of the diesel-generator set installation. Revise layout drawings to reflect the as-built conditions and submit them with the as-built drawings. Final acceptance of the engine-generator set will not be given until the Contractor has successfully completed all tests and all defects in installation material or operation have been corrected.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for static UPS to provide continuous ac power to critical loads and/or to improve the quality of ac power to critical loads. The specification is intended to cover three-phase systems starting with the smallest unit at 20 kVA. The upper end for a single module is around 750 kVA; however, parallel systems can have a larger total output. This guide specification is intended to be used with individual UPS units which contain a single module, parallel systems of the same size module, and scalable modular UPS systems. Single phase systems are not addressed. This specification covers UPS with electro-chemical batteries. Electro-mechanical (stored energy) UPS are not addressed. White paper TSEWG TP-19 is on Static Uninterruptible Power Supplies and should be reviewed while editing this specification. See https://www.wbdg.org/ffc/dod/supplemental-technical-criteria/tsewg-tp-19

This specification supercedes previous versions of 26 32 33.00 10 Static Uninterruptible Power Supply (UPS) and 26 33 53.00 20 Uninterruptible Power Supply (UPS).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard UFC 1-300-02 when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information. Brackets are used in the text to indicated designer choices or locations where text must be supplied by the designer.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a criteria change request at Criteria Change Request (CCR)
NOTE: For Air Force projects only: UPS specifications, criteria, and purchases are to be approved by the Power Conditioning and Continuation Interfacing Equipment (PCCIE) Group Manager at Ogden Air Logistics Center (OO-ALC/LGHC). Contact the PCCIE Product Group Manager, 500 CBSS/GBLD, Building 1207-N, 6029 Wardleigh Road, Hill AFB, UT 84056-5838. If you have access to the Air Force portal, then search PCCIE.

NOTE: Show the following information on the project drawings:

1. Location of equipment

2. Single-line diagrams, elevations, limiting dimensions, and equipment ratings which are not covered in the specifications

3. Remote indicating requirements.

4. Maintenance bypass switching cabinet and configuration.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE 100.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project. Submittals should be kept to the minimum required for adequate quality control.

A “G” following a submittal item indicates that the submittal requires Government approval. Some submittals are already marked with a “G”. Only delete an existing “G” if the submittal item is not...
complex and can be reviewed through the Contractor’s Quality Control system. Only add a “G” if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 OPERATION AND MAINTENANCE MANUALS

1.4.1 Additions to UPS Operation and Maintenance Manuals

In addition to requirements of SD-10 Data Package 5, include the followings on the actual UPS system provided:

a. An outline drawing, front, top, and side views.

b. Prices for spare parts and supply list.

c. Routine and field acceptance test reports.

d. Date of Purchase.

e. Corrective maintenance procedures.

1.4.2 Spare Parts

**************************************************************************
NOTE: Army Only. Do not provide spare parts for Navy projects.
**************************************************************************

Furnish the following spare parts, of the same material and workmanship, meeting the same requirements, and interchangeable with the corresponding original parts.

a. Fuses: Two of each type and rating.
b. Circuit boards: One circuit board for each critical circuit.

c. Air Filters: One set of filters, when used on the UPS unit.

d. Special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment: One complete set.

1.5 QUALITY ASSURANCE

The manufacturer must have a documented quality assurance program including:

a. Inspections of incoming parts, modular assemblies and final product.

b. Final test procedure for the product including proof of performance specifications.

c. The on-site test procedure includes an inspection of controls and indicators after installation of the equipment.

d. ISO 9001 quality certification.

1.5.1 UPS Drawings

Drawings are to include the following: Detail drawings consisting of a complete list of equipment and materials, manufacturer's descriptive and technical literature, battery sizing calculations per IEEE 485, installation instructions, single-line diagrams, elevations, layout drawings, and details required to demonstrate that the system has been coordinated and will function properly as a unit.

a. One-line diagram.

b. Outline drawings including front elevation, section views, footprints, and overall dimensions.

c. Manufacturer's descriptive and technical literature.

d. Markings and NEMA nameplate data.

e. Battery sizing calculations per IEEE 485.

f. Wiring and control diagrams with terminals identified, and indicating prewired interconnections between items of equipment and interconnection between the items.

g. Complete list of materials and equipment covering major components. Ensure the bill of material and the schematic have a direct correlation between items in order to easily identify the various components.

h. Details required to demonstrate that the system has been coordinated and will function properly as a unit.

1.5.2 UPS Installation

Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Wiring diagrams are to identify circuit
terminals and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Drawings are to indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Submittals include the nameplate data, size, and capacity. Submittals also include applicable federal, military, industry, and technical society publication references.

1.5.3 Work Plan

Submit schedules of dates for factory tests, installation, field tests, and operator training for the UPS system. Furnish a list of instrumentation equipment for factory and field test reports.

1.5.4 Factory Test Plan

Submit factory test plans and procedures at least [21][_____] calendar days prior to the tests being conducted. Provide detailed description of test procedures, including test equipment and setups, to be used to ensure the UPS meets the performance specification and explain the test methods to be used. Provide test procedures that include the test required under the paragraph entitled "Factory Testing."

1.5.5 Factory Test Report

Submit a factory test report within [21][_____] calendar days after completion of tests. Receive approval of test prior to shipping unit. Factory test reports are to be signed by an official authorized to certify on behalf of the UPS manufacturer of that the system meets specified requirements in accordance with the requirements set forth in paragraph entitled "Factory Testing". Provide test reports in booklet form tabulating factory tests and measurements performed, upon completion and testing of the installed system. Reports are to state the Contractor's name and address, the name of the project and location, and list the specific requirements which are being certified.

1.5.6 Performance Test Plan

Submit test plans and procedures at least [15][_____] calendar days prior to the start of field tests. Provide detailed description and dates and times scheduled for performance of tests, and detailed description of test procedures, including test equipment (list make and model and provide functional description of the test instruments and accessories) and setups of the tests to be conducted to ensure the UPS meets the performance specification. Explain the test methods to be used. Provide test procedures that include the tests required under the paragraph entitled "Performance Tests."

1.5.7 Performance Test Report

Submit report of test results as specified by paragraph entitled "Performance Tests" within [15][_____] calendar days after completion of tests. Field test reports are to be signed by an official authorized to certify on behalf of the UPS manufacturer that the system meets specified requirements in accordance with the requirements set forth in paragraph entitled "Performance Tests". Provide test reports in booklet form tabulating factory tests and measurements performed, upon completion and testing of the installed system. Reports are to state the Contractor's name and address, the name of the project and location, and list the specific requirements which are being certified.
1.5.8 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.8.1 Reference Standard Compliance

Where equipment or materials are specified to conform to industry and technical society reference standards of the organizations such as American National Standards Institute (ANSI), American Society for Testing and Materials (ASTM), National Electrical Manufacturers Association (NEMA), Underwriters Laboratories (UL), and Association of Edison Illuminating Companies (AEIC), submit proof of such compliance. The label or listing by the specified organization will be acceptable evidence of compliance.

1.5.8.2 Independent Testing Organization Certificate

In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the Contracting Officer. The certificate is to state that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

1.5.9 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship and:

a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.

c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

d. The service organization is to be, in the opinion of the Contracting Officer, reasonably convenient to the site.

e. Provide new parts and materials comprising the UPS system from the current manufacture, of a high grade and free of defects and imperfections, and has not been in prior service except as required during aging and factory testing.

1.5.9.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable
if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.9.2 Material and Equipment Manufacturing Date

Products manufactured more than 6 months prior to date of delivery to site are not acceptable.

1.6 INSPECTION

Inspection before shipment is required. The manufacturer must notify the Government at least 2 weeks before shipping date so that an inspection can be made.

1.7 DELIVERY AND STORAGE

Protect equipment placed in storage from humidity and temperature variations, moisture, water intrusion, dirt, airborne corrosives, or other contaminants. In harsh environments where temperatures exceed non-operational parameters established within this specification, provide an environmentally controlled equipment storage facility to ensure temperature parameters are within equipment specification. Provide documentation of same to the Government when storage is implemented.

1.8 PROJECT/SITE CONDITIONS

**************************************************************************

NOTE: Army Only. This paragraph and its associated subparagraphs is used by the Army. Delete for other projects.
**************************************************************************

1.8.1 Environmental Conditions

The UPS and battery system must be capable of withstanding any combination of the following external environmental conditions without mechanical or electrical damage or degradation of operating characteristics.

**************************************************************************

NOTE: Designer must show approximate elevation above sea level for project location if it exceeds 1,000 meters 3,300 feet. UPS system including batteries must be derated if 50 degrees C 122 degrees F operating temperature is required.
**************************************************************************

a. Operating altitude: Sea level to 1,000 meters 3,300 ft. (Systems applied at higher altitudes are to be derated in accordance with the manufacturer's instructions).

b. Non-operating altitude: Sea level to 11,000 meters 36,000 ft.

c. Operating ambient temperature range: 0 to 40 degrees C 32 to 104 degrees F. Range for batteries is 20 to 25 degrees C 68 to 77 degrees F. Provide batteries that are capable of operating in a larger ambient temperature range of 10 to 30 degrees C 50 to 86 degrees F, but some degradation of life span is understood when operating outside the range of 20 to 25 degrees C 68 to 77 degrees F.

SECTION 26 33 53 Page 14
d. Non-operating and storage ambient temperature range: Minus 20 to plus 50 degrees C. Minus 4 to plus 122 degrees F. Range for batteries or UPS modules with internal batteries: 10 to 30 degrees C. 50 to 86 degrees F.

e. Operating relative humidity: 0 to 95 percent, without condensation.

1.8.2 Sound Pressure Levels

**************************************************************************

NOTE: UPS modules rated up to 125 kVA should have a dB rating of 65 dBA or lower at 1 meter 39 inches.

UPS modules rated above 125 kVA should have a dB rating of 75 dB or lower at 1.5 meters 5 feet.

**************************************************************************

Sound pressure levels produced by the UPS, when operating under full rated load, at a distance of [1.5 meters 5 feet] [1 meter 39 inches] [_____] in any direction from the perimeter of the unit, must not exceed [75] [65] [_____] dB as measured on the A scale of a Type 1 sound level meter at slow response conforming to ASA S1.4.

1.8.3 Verification of Dimensions

The Contractor is to become familiar with details of the work, verify dimensions in the field, and is to advise the Contracting Officer of any discrepancy before performing the work. Do not proceed until the discrepancy or unsatisfactory condition(s) have been corrected.

PART 2 PRODUCTS

[2.1 SYSTEM DESCRIPTION

**************************************************************************

NOTE: Connect alternate power source to bypass/maintenance bypass for systems requiring dual input. Edit for the configuration used in this project. There are other configurations that the UPS system can be configured, but these are the more common ones.

Note: Delete system cabinet when specifying a single module UPS system.

**************************************************************************

Provide continuous duty, three-phase, solid state, on-line double conversion reverse transfer static UPS(s). The UPS by means of solid state conversion techniques, must provide continuous regulated AC power to its output terminals, while operating from an input power source, cabinet or rack-mounted direct current (DC) storage battery or other approved means. The performance of the UPS must not be degraded when operating without a system battery, provided the input AC source is within tolerance. Provide an UPS system that conforms to UL 1778 and consists of UPS module, battery system, battery protective device, [system cabinet, ] static bypass transfer switch, controls and monitoring, system protective devices, means of isolating the UPS system from the critical load, and remote monitoring interfaces. Connect input ac power the normal source ac input of the UPS module. [Connect alternate power source bypass/maintenance bypass. ]Connect battery to the dc input of the UPS module through the battery protective device. The following configuration is used:
NOTE: Three main choices: Non-Redundant, Redundant System, and Scalable Units. The Redundant system herein is strictly various parallel configurations, where a N+1 as a minimum is to be achieved.

Scalable units are becoming the standard, since they allow modularity and reduce the number of UPS models for a manufacturer. Scalable units in a Redundant configuration would also need to indicate the Redundant System configuration.

[a. Non-Redundant.
(1) Single Module. On-line, single module UPS configuration capable of supplying power to the total load, with bypass availability.
(2) Parallel Multi-Module. Two or more UPS modules, of the same size, on-line, operating in parallel, with enough capacity to supply the total load.

[b. Redundant System.
(1) Isolated Redundant System (Segmented Redundant or Hot Standby). One unit on-line supporting the load, while the other unit is operating to provide the bypass source.
(2) Parallel Redundant System. Two or more UPS modules, of the same size, on-line, operating in parallel, with more capability than is required to support the total load. If any unit fails, the remaining unit or units is able to support the critical load.
(3) Split Bus System. Two parallel redundant systems that may be operated separately or through a tie breaker for increased redundancy. Each UPS system on either side of the split bus is able to support the total critical load.
(4) Distributed Redundant System. Distributed redundant configurations is also called tri-redundant. The basis of this design uses three or more UPS modules with independent input and output feeders. The independent output buses are connected to the critical load via multiple PDUs.

[c. Scalable Units.

NOTE: Scalable units are rack or cabinet mounted UPS power modules of the same size, which have scalable architecture to allow expansion/contraction to a different kVA size within the same vertical rack or cabinet lineup. The kVA is achieved by adding or subtracting power modules to achieve the desired kVA rating. Each power module, depending on the manufacturer, has a rectifier, inverter and battery converter. There is an UPS system module that works with these power modules to form the UPS. Scalable Units can be specified to have be non-redundant or be redundant. An explanation for each configuration is below.
(1) Scalable Unit Non-Redundant. Non-redundant: scalable unit consists of a UPS system module with one or more power modules. The power modules provided are all required to handle the critical load.

(2) Scalable Unit Internal Redundant. Internal Redundant: scalable unit consists of a UPS system module with more than one power module. There is at least one additional power module that is not required to handle the load within the system. The additional power module or power modules can be sized to handle only part of the critical load or all the critical load. This is not a true parallel redundant system since it still uses one UPS system module.

(3) Scalable Unit Redundant. Redundant: scalable unit consists of a UPS system module with one or more power modules. The number of power modules can be to just support the load or also have at least one extra power module to internal redundancy. This UPS system module is parallel with a matching scalable unit previously discussed under "Redundant System".

2.2 MODES OF OPERATION

2.2.1 Normal

The UPS module rectifier/charger must convert the incoming ac input power to dc power for the inverter and for float charging the battery. The inverter continuously converts the dc power to ac power to supply the critical load. The inverter output must synchronize with the bypass ac power source, provided that the bypass ac power source is within the specified voltage and frequency range.

2.2.2 Battery - Emergency Operation (Loss or deviation of AC Input Power)

Whenever the ac input power source deviates from the specified tolerances including complete failure, the inverter must draw power from the battery system and supply AC power to the critical load without any interruption or switching transient. The battery system must supply power to the inverter for the specified protection time or until return of ac input source. Provide an audible alarm to indicate the UPS is on battery and provide provisions for a remote alarm signal to be sent via the communication network and a relay output, allowing startup of a secondary power source or orderly shutdown of the critical load.

2.2.3 Failure of AC Input Power to Return

If the ac input power fail to return before the battery voltage reaches the discharge limit, then the UPS system must disconnect from the critical load to safeguard the battery.

2.2.4 Recharge

Upon restoration of normal power to the UPS unit, the input converter and output inverter must simultaneously recharge the batteries and provide regulated power to the critical load.

2.2.5 Transfer to Static Bypass AC Power Source
NOTE: Choose the first paragraph for non-redundant systems, i.e. single module, parallel multi-module, or scalable unit non-redundant UPS. Choose the second paragraph for redundant systems to include scalable unit internal redundant and scalable unit redundant.

**************************************************************************

When the UPS controller senses an overload, two or more inverter shutdown signals or degradation of the inverter output, the static bypass switch automatically transfers the critical load from the inverter output to the bypass ac power source without an interruption of power. If the static bypass ac power source is outside of specified tolerance limits, the UPS and the critical load shut down. Transfer to static bypass can also be done manually (requested bypass). Transfer to bypass does not take place under these conditions: 100% stepload; and, loss or return of input power, momentary sags, surges or spikes on the input to the UPS.

2.2.6 Transfer to Inverter

Provide a static bypass switch that is capable of automatically transferring the load back to the inverter output after the inverter overload condition has returned to normal conditions. Transfer only occurs once the two sources are synchronized. UPS system logic is to monitor the number of retransfer's within any one-hour period and is to allow 1 to 3 transfers in order to prevent cyclical transfers caused by overloads.

2.2.7 Maintenance Bypass

Provide the system with an external make-before-break maintenance bypass cabinet/panel to electrically isolate the UPS during routine maintenance and service. Manual transfer to the maintenance bypass circuit transfers the critical load from the inverter output to the bypass ac power source without disturbing the critical load bus.

2.2.8 Off-Battery (Battery Maintenance)

Provide a battery protective device which disconnects the battery from the rectifier/charger and inverter for maintenance. The device may be located
external to the UPS cabinet. The UPS module continues to function and meet the performance criteria specified except for the battery back-up time function.

2.2.9 Failure of a Module

NOTE: Delete for non-redundant systems, i.e. single module, parallel multi-module, or scalable unit non-redundant UPS.

In a redundant configuration, failure of one module causes that module to be disconnected from the system critical load bus by its internal protective devices and its individual output protective device. Remaining module(s) are to continue to carry the load.

2.2.10 UPS Module Servicing

NOTE: Delete for non-redundant systems, i.e. single module, parallel multi-module, or scalable unit non-redundant UPS.

Provide a means the manually disconnect the UPS modules from the critical load bus for maintenance without disturbing the critical load bus.

2.2.11 Component Performance

Do not exceed 75% of the working voltage and current ratings as established by the manufacturer on solid-state power components and electronic devices. Do not exceed 75% of the operating temperature of solid-state component sub-assemblies. Use computer grade electrolytic capacitors and operate at no more than 95% of the voltage rating at the rectifier charging voltage.

2.3 GENERAL UPS SYSTEM COMPONENTS AND FABRICATION

2.3.1 Semiconductor Fusing

Protect power semiconductors with fast-acting fuses to prevent cascaded or sequential semiconductor failures. Bolt fuses at both ends to bus bars to ensure mechanical and electrical integrity. Indicator lamp or display panel denoting blown fuse conditions must be readily observable by the operator without removing panels or opening cabinet doors.

2.3.2 EMI/RFI Protection

Provide an UPS that complies with and is labeled compliant, with FCC Part 15, Subclass B, Class A.

2.3.3 Internal Wiring

Wiring practices, materials, and coding must be in accordance with the requirements of NFPA 70, OSHA, UL 1778, and other applicable standards. Protect wire runs in a manner which separates power and control wiring. Provide control cabling that is at least No. 16 AWG extra-flexible stranded copper. Logic-circuit wiring may be smaller. Provide ribbon cables that are at least minimum No. 22 AWG. Provide control wiring with permanently attached wire numbers.
2.3.4 Internal Assembly

The printed circuit board (PCB) subassemblies are to be mounted in pull-out swing-out trays where feasible. Provide cable connections to the trays that are sufficiently long to allow easy access to all components. Where not feasible to mount PCB subassemblies in pull-out or swing-out trays, then mount them firmly mounted inside the enclosure. Monitor every PCB subassembly. Include self-test and diagnostic circuitry in the logic circuits such that a fault can be isolated down to the PCB subassembly level. When used, control logic cards are to have test points or logic indicators on the front edge of the control logic card and be labeled.

2.3.5 Cable Lugs and Terminations

2.3.5.1 Cable Lugs

Provide appropriate compression type lugs or pre-drilled bus bars on all ac and dc power connections to the UPS system and battery as required. Aluminum or bare copper cable lugs are not suitable.

2.3.5.2 Terminations

Supply terminals for making power and control connections. Provide terminal block for field wiring terminals. Provide terminal blocks that are the heavy-duty, strap-screw type or screw terminals that are integrated into removable plugs. Locate terminal blocks for field wiring in one place in each module. Extend control wiring to the terminal block location. Any terminal point is limited to land a maximum of two wires. Where control wiring is attached to the same point as power wiring, provide a separate terminal where control wiring is attached to the same point as power wiring, . If bus duct is used, provide bus stubs where bus duct enters cabinets.

2.3.6 Cabinets

**************************************************************************
NOTE: UPS units are normally made to be handled by a fork lift.
**************************************************************************

Install the UPS system in cabinets of heavy-duty structure meeting the NEMA PE 1 standards for floor mounting. Provide a structurally adequate UPS module that can be forklift handled and lifted. [Provide removable lifting eyes on top of each cabinet.] Provide the UPS module cabinet with hinged and key lockable doors on the front only and with assemblies and components accessible from the front. Provide dead-front construction behind the door for those UPS module cabinets that are not lockable. Operating controls are to be located outside the locked doors. Install input, output, and battery cables through the top or bottom of the cabinet.

[2.3.6.1 Cabinet Finish

**************************************************************************
NOTE: On Army projects choose the bracketed option; otherwise delete. Designer needs to coordinate with the requirements found in UFC 3-560-01 for arc-flash signage requirements.
**************************************************************************

Provide an equipment cabinet that is cleaned, primed and painted in the
manufacturer's standard colors, in accordance with accepted industry
standards. Cabinets are to be labeled in accordance with NFPA 70 and
NFPA 70E.

2.3.6.2 Factory Applied Finish

Provide electrical equipment with a factory-applied painting systems which,
as a minimum, meets the requirements of NEMA 250 corrosion-resistance test.

2.3.6.3 Drawout Assemblies

NOTE: Drawout applies to large units for removing
inverter modules, static switches assemblies, etc.
This is not a standard option even on larger units.
Delete for units smaller than 500 kVA.

Provide a means of lifting, either and overhead device or a hoisting device
for drawout assemblies weighing 23 kg 50 lbs or more. Device can either be
part of the UPS or a separate portable device that can be used to perform
the lifting.

2.3.7 Manufacturer's Nameplates

Provide a nameplate for each item of equipment bearing the manufacturer's
name, address, model number, and serial number securely affixed in a
conspicuous place; the nameplate of the distributing agent will not be
acceptable.

2.3.8 Field Fabricated Nameplates

ASTM D709. Provide laminated plastic nameplates for each equipment
enclosure, relay, switch, and device; as specified or as indicated on the
drawings. Provide an inscription on each nameplate that identifies the
name of the item, calculated short circuit rating with date, and source of
power e.g. 'Panel A in Electrical Room 103'. Provide nameplates that are
made of melamine plastic, 3 mm 0.125 inch thick, white with [black][_____] center core. Provide the nameplate with a surface that is matte finished
and that has square corners. Accurately align lettering and engrave into
the core. Provide nameplates that are at least 25 by 65 mm 1.0 by 2.5
inches with a minimum lettering size of 6.35 mm 0.25 inch high normal block
style.

2.3.9 Safety

Provide UPS with instruction plates including warnings and cautions,
suitably located, and describing any special or important procedures to be
followed in operating and servicing the equipment. Provide control panel
displays, which also provide warning messages prior to performing a
critical function.

2.3.9.1 Maintenance Isolation

All energized terminals, both AC and DC, and control voltage exposed points
are to be insulated or enclosed to ensure the safety of maintenance
personnel. Provide the system with the ability to isolate the static
switch to enable repair when the UPS is bypassed.
2.3.9.2 Remote Emergency Power Off (REPO) Switch

Provide a remote emergency power off switch that is separate from the UPS. Provide a red, pushbutton with a cover with a label indicating "UPS Emergency Power Off". The switch disconnects all breakers or contactors including battery, input, output, and bypass breakers when activated.

2.4 TECHNICAL REQUIREMENTS UPS SYSTEM RATINGS

Unless stated otherwise, the parameters listed are under full output load over the range of 0.9 lagging power factor to 0.9 leading power factor, with batteries fully charged and floating on the dc bus and with nominal input voltage.

2.4.1 UPS SYSTEM LOAD PROFILE

**************************************************************************

NOTE: The UPS may exhibit load interface problems with certain types of ac load. The items which present the greatest problems are motors, transformers, electric discharge lighting, and SCR and mag-amp power supplies. Problems with these loads are caused by either load nonlinearity or inrush currents required for their operation. The Contractor will be better able to accommodate specific applications if well-defined load data is available.

**************************************************************************

Provide an UPS system that is compatible with the load characteristics defined in the LOAD PROFILE below and load configuration. The UPS system is to provide compensation for UPS/load interaction problems resulting from nonlinear loads or transformer and motor inrush.

LOAD PROFILE

Type of load:

Data processing equipment. Size of load: [_____]kVA[kW], [_____]voltage, ([_____]power factor).

**************************************************************************

NOTE: If known, provide the actual nameplate full load amps and the locked rotor code letter. If not known, delete the option.

**************************************************************************

Motors - type [______]. Size of load: [_____]horsepower, [_____]voltage[, [_____] full load amps, [_____] locked rotor code letter].

Electric Discharge Lighting. Size of load: [_____]kVA[kW], [_____]voltage, ([_____]power factor).

**************************************************************************

NOTE: Variable Frequency Drives that are powered from an UPS, need to be specified with input inductors.

**************************************************************************

Variable Frequency Drive(s). Size of load: [_____]horsepower, [_____]voltage
Load switching pattern: [unswitched][cycled daily][cycled hourly][operated by thermostat][building management system control][_____]...

NOTE: Coordinate this with the UPS System Load Profile paragraph. Power factors have been improving and it is becoming common to have 0.9 lagging or higher power factor...

Steady-state characteristics: [0.9 lagging][_____] power factor.

Special factors: [harmonic characteristics - Total Harmonic Distortion [_____] percent][high elevation][nonstandard input and output voltages][_____]...

2.4.2 System Requirements

NOTE: Typical capacities in kVA are 10, 15, 20, 30, 40, 50, 80, 100, 125, 150, 225, 250, 275, 300, 500 and 750.

NOTE: System capacity for single module UPS is same as module capacity. Paralleling can be for capacity or for redundancy. Parallel redundant UPS typically provide on additional module that can be down while still carrying the entire load.

NOTE: Scalable Unit sizes listed can vary from manufacturer to manufacturer as well as the number that can be paralleled. If paralleling more than 4 modules, check with the main manufacturers for availability.

The UPS is to support and maintain full battery charging under the following conditions: indicated environmental conditions, a.c input voltage range, air filters blocked up to 50% and a single failed fan. The UPS size and configuration is indicated below.

[ Single Module (non-redundant). Provide one UPS sized for [_____] kVA and [_____] kW. ]

[ Parallel System is comprised of [_____] UPS system-level redundancy. The parallel system is sized for [_____] kVA and [_____] kW. ]

NOTE: Scalable units are flexible so there are several choices. The power module are the units that provide the load and can provide internal redundancy if desire. The total load is the estimated demand for the critical load. The UPS system module is the overall controlling module. Example: One can have a system module at 60 kVA and have two 20 kVA power modules to allow for future expansion.
2.4.3 Battery Capacity

NOTE: Typical battery discharge times are 5, 10, 12, 15, and 30 minutes. If no emergency source is available, longer battery discharge time may be required.

IEEE 450 defines end of life to be at 80% of the initial capacity. The industry standard is to size an end of life battery for 125% of initial capacity. Choose 125% unless another value is required.

Discharge time to end voltage: [10][15][30][_____] minutes, at 25 degrees C 77 degrees F. Provide a battery that is capable of delivering [125][_____] percent of full rated UPS kW load at 0.9 power factor at initial start-up.

2.4.4 Static Switch

NOTE: The static switch or static disconnect is a solid-state disconnect device used to apply or disconnect ac power. The interrupting capacity requirements must be determined for each project distribution system. Typical interrupting capacities are 30,000 AIC and 50,000 AIC. Interrupting capacities are normally found on the single line diagram or in the short circuit calculations provided with the drawings.

[_____] amperes (continuous duty)

2.4.5 Short Circuit Withstand Rating

Braced for at least [_____] amperes symmetrical interrupting capacity.

2.4.6 AC Input

NOTE: Be certain that units having foreign voltages are clearly specified since they are not standard for U.S. manufactured products.

a. Voltage [208][240][480][_____] volts line-to-line.

NOTE: Scalable unit systems do not come with an output transformer, so the input and output voltage needs to be the same when editing. Transformerless help with the efficiency of the UPS unit and keeps the foot-print smaller. Single unit UPS are still...
available with step-down output transformers

b. Number of phases: Three-phase [+ neutral] + ground configuration.

c. Voltage Range: Plus 10 percent, minus 15 percent nominal (no battery discharge), without affecting battery float voltage or output voltage.

NOTE: Use 50 Hz for units shipped or purchased in Europe.

d. Frequency: [60][50] Hz, plus or minus 5 percent.

NOTE: For scalable units choose the second bracketed option. For other type units, choose the first bracketed option.

e. Power walk-in: [20 percent to 100 percent input current over 10 to 15 seconds.] [0 percent to 100 percent input current over 10 to 15 seconds with an adjustable setting that can be set from 5 seconds to 30 seconds.]

NOTE: Total harmonic current distortion (THD) is usually 5 percent. If UPS will be supplied from a generator, the generator capacity must be at least twice the UPS capacity if THD exceeds 5 percent.

f. Total harmonic current distortion (THD) reflected into the primary line: [5][10] percent maximum at full load.

g. Sub-cycle magnetizing inrush: [2 to 3][_____] times full load current for modules without an isolation transformer.

h. Input surge protection: per IEEE C62.41.1 and IEEE C62.41.2, meeting IEEE C62.41 requirement of Category B3 6kV, 100k Hz ring wave and 6kV, combined wave.

i. Input power factor: Lagging from 1-100 percent load.

NOTE: Delete transformer inrush paragraph if input isolation transformer is not required. For transformer sub-cycle inrush, selecting a lower value like 6 or 4 in lieu of the range (4 to 8) is better for coordination of UPS feeder protection but might add some cost and extra components. If the range is selected than upstream breaker should have instantaneous current adjustment.

[ h. Transformer sub-cycle magnetizing inrush: [5 to 8][_____] times full load current with optional isolation transformer and optional input filter. ]
2.4.7 AC Output

**************************************************************************
NOTE: If the output voltage is 208Y/120 V and the same voltage is not available for the static bypass and maintenance bypass, a transformer will be required in the bypass distribution system.

NOTE: Scalable units do not come with an output transformer, so the input and output voltage needs to be the same when editing. These scalable, expandable module systems are typically 208V, 480V, and 600V. Transformerless designs help with the efficiency of the UPS unit and keeps the foot-print smaller. Single unit UPS are still available with step-down output transformers.

**************************************************************************
a. Voltage [208][220][240][480][_____] volts line-to-line[, [120][127][277][_____] volts line-to-neutral].

b. Number of phases: Three-phase[ + neutral] + ground configuration.

c. Voltage regulation:
   (1) Balanced load: Plus or minus 1.0 percent.
   (2) 50 percent load imbalance, phase-to-phase: Plus or minus 2 percent.
   (3) 100 percent load imbalance, phase-to-phase Plus or minus 3 percent.
   (4) Voltage drift: Plus or minus 1 percent over any 30 day interval (or length of test) at stated ambient conditions found in paragraph Environmental Conditions.

d. Voltage adjustment: Plus or minus 5 percent.

e. Frequency: [60][50] Hz.

f. Frequency regulation: Plus or minus 0.1 percent, when on internal oscillator. Internal oscillator is to be temperature compensated.

g. Frequency drift: Plus or minus 0.1 percent over any 24 hour interval (or length of test) at stated ambient conditions when on internal oscillator.

h. Harmonic content (RMS voltage): Provide a system that meets the following voltage THD levels: maximum of 4% RMS total, 2 percent total with 100 percent on any single harmonic (linear load) and 5 percent RMS total for up to 100 percent nonlinear load.

**************************************************************************
NOTE: The load factor range can vary with the presence of a transformer. Choose the first set of brackets in "[" when the UPS does not have a transformer and choose the second set of brackets when there is a transformer or provide own values. The load factor range is the range the UPS can operate at without derating.

**************************************************************************
i. Load power factor operating range (without derating): [0.9 leading to 0.9 lagging][0.95 leading to 0.9 lagging][______].

j. Phase angle displacement/imbalance:
   (1) Balanced load: 120 degrees plus or minus [0.5][1] degree of bypass input.
   (2) 50 percent load imbalance phase-to-phase: 120 degrees plus or minus 3 degrees of input.

k. Inverter overload capability (at full voltage with plus or minus 2 percent regulation) (excluding battery):

   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************

   NOTE: Designer needs to determine the overload requirements against protection for the load. Any number can be used that falls within the range for each percent overload. Default values are 10 minutes for 125 percent and 60 seconds for 150 percent.

   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************

   (1) 125 percent load for [10 minutes][30 seconds][60 seconds][______].
   (2) 150 percent load for [60 seconds][40 ms].
   (3) Fault clearing. Provide an UPS that is able to maintain output current during a fault condition for 20 cycles if bypass is unavailable or 1 cycle with bypass available. If the fault is not cleared and a bypass is available, the UPS is to transfer to bypass without interruption to clear the fault.

l. Load sharing of parallel modules: Plus or minus 5 percent at full rated system load.

m. Bypass Overload Capability.

   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************

   NOTE: For scalable units choose the second option. Choose the first option for all others.

   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************
   **************************************************************************

   [ 150 percent load for 15 seconds.
   ] [ Expandable units. 125 percent continuous at rated output voltage (phase-to-phase). 1000 percent for 1000 milliseconds.
   ]

2.4.8 Transient Response

2.4.8.1 Voltage Transients
   a. 100 percent load step: Plus or minus 5 percent.
   b. Loss or return of ac input: Plus or minus [1][5] percent.
   c. Automatic transfer of load from UPS to bypass: Plus or minus 1 percent.
   d. Manual retransfer of load from bypass to UPS: Plus or minus 5 percent.
NOTE: The default value is 20 milliseconds unless a faster recovery time is required. For scalable units, use 50 milliseconds.

e. Response time: Recovery to 1 percent of nominal within [20][50][16] milliseconds where there was a maximum deviation from nominal system output of volts plus or minus 5 percent.

2.4.8.2 Frequency

a. Transients: Plus or minus 0.6 Hz maximum.

NOTE: If there is a generator in the project, which will power the UPS during a utility power outage, then choose the second option.

b. Slew Rate: under all conditions of operation, [provide 0.4 to 1.0 Hz per second][0.25 to 0.8 Hz per second].

2.4.9 Efficiency

NOTE: Efficiencies do vary some with the size of the UPS; however, the variance between lower rated UPS and higher rated UPS have narrowed. Almost all sizes in double-conversion mode will meet 94%. The higher double-conversion efficiency is 97%. UPS systems loaded to 50 percent will typically see a reduction of 1-2 percentage in efficiency. Units with a transformer could have a lower efficiency.

Delete system efficiency requirements for single module UPS systems.

Energy Star only covers the battery charging systems and the AC-DC/AC-AC power supplies. Energy Star does not cover all components of the complete UPS System. Energy Star UPSs cannot be one of the following types:

(a) Products that are internal to a computer or other end load.
(b) Industrial UPSs designed to protect critical control, manufacturing or production processes.
(c) Utility UPSs that are part of electrical transmission and distribution
(d) Cable TV UPSs designed to power cable distribution systems.
(e) UPSs designed to comply with specific UL safety standards for safety-related applications e.g. emergency lighting, medical diagnostic equipment
(f) UPSs designed for mobile, ship board, marine or airborne applications.

[ a. Minimum Single-Module Efficiency: [94][_____] percent at full load kW and [92][_____] percent at 50 percent load.]
[b. Minimum System Efficiency: 93 percent at full system load kW.]

c. Provide Energy Star labeled battery charging systems and AC-DC/AC-AC power supplies. Provide proof of Energy Star label for battery charging systems and AC-DC/AC-AC power supply products.

2.4.10 Energy Saving Mode

**************************************************************************
NOTE: The UPS industry has developed various energy saving methods. If this is desired then edit appropriately; otherwise, delete. Smaller units may not have this option available. There are some issues that need to be considered since energy saving methods typically do not regulate the voltage or the frequency, Areas with unstable power may not consider this appropriate. UPS installations that require the double-conversion to filter (clean-up) the incoming power should not enable an energy saving mode that allows facility power to the critical load. If the UPS unit is powering IT equipments (such as a data center), choose 2 milliseconds; otherwise 13 milliseconds is acceptable.
**************************************************************************

Provide the UPS with an energy saving mode that operates by having the inverter charged and batteries on at all times, while the main power to the output is through the static bypass switch. When a power problem is sensed, the system is to operate in double-conversion mode and revert to energy saving mode after a pre-set period of time. Maximum transition time is [2][13] milliseconds.

2.5 UPS MODULE

2.5.1 General Description

**************************************************************************
NOTE: This part is for Scalable units only. If a scalable unit is not desired, then delete this part.
**************************************************************************

UPS module consists of an input converter, output converter, with associated transformers, synchronizing equipment, protective devices, surge suppression, and accessories as required for operation.

2.5.1.1 Interchangeability

The subassemblies in one UPS module are to be interchangeable with the corresponding modules within the same UPS, and from one UPS system to another of identical systems.

2.5.1.2 Rectifier/Charger Unit

Scalable, expandable modular input converts for the system are to be housed within removable power modules. Input converters control the power from the mains input of the system, provide the necessary UPS power for precise regulation of the DC bus voltage, battery charging, and main inverter regulated output power.
2.5.1.2.1 Input Protective Device

NOTE: Calculate/verify AIC on the single line diagram at input of the UPS.

Provide the rectifier/charger unit with an input protective device. Size the protective device to accept simultaneously the full-rated load and the battery recharge current. Provide a protective device that is capable of shunt tripping and has an amperes symmetrical interrupting rating of [____]. Provide the protective device with an under-voltage release to open automatically when the control voltage is lost.

[2.5.1.2.2 Input Isolation Transformer

NOTE: An input isolation transformer is not normally required. Delete unless specifically required to be part of the UPS. Also, delete when requiring scalable, expandable modular UPS systems. Isolation transformers provide isolation of line induced EMI, common mode noise and dc offsets. Some of the UPS manufacturers require a separate cabinet for the transformer.

UPS industry is transitioning away from transformers being part of the UPS. Having the transformer separate can save space, reduce cooling, improve energy efficiency, reduce weight and cost. In general, those unit smaller than 200 kW will benefit more by not having a transformer as part of the UPS. The threshold level of 200 kW is increasing as more manufacturers go to "transformerless" designs.

Transformers rated 500 kVA and higher typically have the transformer connections on the backside.

The rectifier unit is to use a dry-type, isolated-winding power transformer. The transformer’s hottest spot winding temperature must not exceed the temperature limit of the transformer insulation material when operating at full load. Provide a transformer with Class H, 150 degrees C rise insulation. [Transformer connections are to be accessible from the front.] If there is a separate transformer cabinet, it is to match the UPS cabinet and attach to it.[ Provide a Department of Energy CSL-3 transformer.]

]2.5.1.2.3 Power Walk-In

Input convert is to have an adjustable soft-start (either by manufacturer or owner), capable of limiting the input current form 0 percent to 100 percent of the input over a default 10 second period when returning to ac input bus from battery operation. The change in current over time is to be done in a linear manner.

2.5.1.2.4 Sizing

Size the rectifier/charger unit for the following two simultaneous operating conditions:
a. Supplying the full rated load current to the inverter.

b. Recharging a fully-discharged battery to 90 percent of rated ampere-hour capacity within ten times the discharge time after normal ac power is restored.

2.5.1.2.5 AC Input Current Limiting

Provide a circuit to the input converter that controls and limits the current draw from utility to 130 percent of the rated UPS output. During conditions where input current limit is active, the UPS system is to be able to support 100 percent of the load, charge the batteries at 10 percent of the UPS output rating, and provide voltage regulation with mains deviation of +15/-5 percent.

**************************************************************************
NOTE: Delete second step current limiting option if the UPS system will not be supplied with ac power from an auxiliary generator system or if the generator has been sized to accommodate the higher input current.
**************************************************************************

[ Second step current limiting: Provide the rectifier/charger unit with a second-step input current limit. Provide a separately adjustable second-step current limit that is adjustable from 85 percent to 125 percent of the maximum discharge current with initial setting at 100 percent. Activate the second-step current-limit circuit by a dry contact signal from the generator.

]2.5.1.2.6 Battery Charging Current

a. Primary current limiting: Battery-charging current is to be voltage regulated and current limited. Provide a separately adjustable battery-charging current limit that is adjustable from 1 percent to 20 percent of the maximum discharge current. Set the limit at the factory to 10 percent. After the battery is recharged, the rectifier/charger unit maintains the battery at full float charge until the next operation under input power failure. Battery charger is capable of providing equalizing charge to the battery.

**************************************************************************
NOTE: Delete second step current limiting if the UPS system (paragraph below) will not be supplied with ac power from an auxiliary generator system or if the generator has been sized to accommodate the recharge current of the battery. Second step current limit is usually found in larger units of 150kVA and above.
**************************************************************************

b. Second step current limiting: The rectifier/charger unit is also to have a second-step battery current limit. Provide a separately adjustable second-step current limit that is adjustable from 0 percent to 20 percent of the maximum discharge current with initial setting at [1][10]% percent. The second-step current-limit circuit is activated by a dry contact signal from the generator set controls and it will prevent normal rate battery recharging until utility power is restored.
2.5.1.2.7  DC Ripple (Output Filter)

Rectifier/charger unit is to minimize ripple current and voltage supplied to the battery; the ripple voltage into the battery is not to exceed 1 percent RMS of the float voltage. Ensure the AC ripple voltage of the rectifier DC output does not exceed 0.5 percent of the float voltage.

2.5.1.2.8  DC Voltage Adjustment

**************************************************************************
NOTE: Delete this requirement on units smaller than 50 kVA.
**************************************************************************

Provide a manual means at the rectifier/charger unit that allows for adjusting the dc voltage for battery equalization in order to provide voltage within plus 10 percent of nominal float voltage.

2.5.1.2.9  Battery Isolation Protective Device

Provide the module or external battery system with a dc protective device to isolate the module from the battery system. The protective device size and interrupting rating are as required by system capacity and is to incorporate the trip required by circuit design. Provide the protective device with a provision for locking in the "off" position.

2.5.1.2.10  Battery Equalize Charge

**************************************************************************
NOTE: Delete this requirement on units smaller than 50 kVA.
**************************************************************************

Equalize charge timer is to provide an equalizing charge automatically to the battery after a 30 second or longer utility outage. The equalize charging time is to be adjustable from 0-72 hours. Provide a manual override for the automatic equalize circuit.

2.5.2  General Description

**************************************************************************
NOTE: This option applies to single-module and, in some remote cases, multi-module UPS systems that are not specifically required to be scalable. Most applications do not require an isolation transformer as part of the UPS, so delete unless required.
**************************************************************************

UPS module consists of a rectifier/charger unit and a 3-phase inverter unit with their associated transformers, synchronizing equipment, protective devices, surge suppression, [input isolation transformer,] and accessories as required for operation.

2.5.2.1  Interchangeability

The subassemblies in one UPS module are to be interchangeable with the corresponding modules within the same UPS, and from one UPS system to another of identical systems.

2.5.2.2  Rectifier/Charger Unit

Provide a solid state rectifier/charger unit that converts alternating
current to direct current, and provides regulated direct current to the dc bus, supplying power to the inverter and charging the battery plant.

2.5.2.2.1 Input Protective Device

**************************************************************************
NOTE: Calculate/verify AIC on the single line diagram at input of the UPS.
**************************************************************************

Provide the rectifier/charger unit with an input protective device. Size the protective device to accept simultaneously the full-rated load and the battery recharge current. Provide a protective device that is capable of shunt tripping and has an amperes symmetrical interrupting rating of [____]. Provide the protective device with an under-voltage release to open automatically when the control voltage is lost.

2.5.2.2.2 Input Isolation Transformer

**************************************************************************
NOTE: An input isolation transformer is not normally required. Delete unless specifically required to be part of the UPS. Also, delete when requiring scalable, expandable modular UPS systems. Isolation transformers provide isolation of line induced EMI, common mode noise and dc offsets. Some of the UPS manufacturers require a separate cabinet for the transformer.

UPS industry is transitioning away from transformers being part of the UPS. Having the transformer separate can save space, reduce cooling, improve energy efficiency, reduce weight and cost. In general, those unit smaller than 200 kW will benefit more by not having a transformer as part of the UPS. The threshold level of 200 kW is increasing as more manufacturers go to "transformerless" designs.

Transformers rated 500 kVA and higher typically have the transformer connections on the backside.

**************************************************************************

The rectifier unit is to use a dry-type, isolated-winding power transformer. The transformer's hottest spot winding temperature must not exceed the temperature limit of the transformer insulation material when operating at full load. Provide a transformer with Class H, 150 degrees C rise insulation. [Transformer connections are to be accessible from the front.] If there is a separate transformer cabinet, it is to match the UPS cabinet and attach to it. [Provide a Department of Energy CSL-3 transformer.]

2.5.2.2.3 Power Walk-In

Protect the rectifier/charger unit with a power walk-in feature such that when ac power is returned to the ac input bus, the total initial power requirement will not exceed 20 percent of the rated full load current. This demand is to gradually increase to 100 percent of the rated full load current plus the battery charging current over the specified time interval.

2.5.2.2.4 Sizing

Size the rectifier/charger unit for the following two simultaneous
operating conditions:

a. Supplying the full rated load current to the inverter.

b. Recharging a fully-discharged battery to 90 percent of rated ampere-hour capacity within ten times the discharge time after normal ac power is restored.

2.5.2.2.5 AC Input Current Limiting

Provide a circuit on the rectifier/charger to limit AC input current to an adjustable level of 100 percent to 125 percent with a factory setting at 100 percent.

**************************************************************************
NOTE: Delete second step current limiting option if the UPS system will not be supplied with ac power from an auxiliary generator system or if the generator has been sized to accommodate the higher input current.
**************************************************************************

[ Second step current limiting: Provide the rectifier/charger unit with a second-step input current limit. Provide a separately adjustable second-step current limit that is adjustable from 85 percent to 125 percent of the maximum discharge current with initial setting at 100 percent. Activate the second-step current-limit circuit by a dry contact signal from the generator.

]2.5.2.2.6 Battery Charging Current

a. Primary current limiting: Battery-charging current is to be voltage regulated and current limited. Provide a separately adjustable battery-charging current limit that is adjustable from 1 percent to 20 percent of the maximum discharge current. Set the limit at the factory to 10 percent. After the battery is recharged, the rectifier/charger unit maintains the battery at full float charge until the next operation under input power failure. Battery charger is capable of providing equalizing charge to the battery.

**************************************************************************
NOTE: Delete second step current limiting if the UPS system (paragraph below) will not be supplied with ac power from an auxiliary generator system or if the generator has been sized to accommodate the recharge current of the battery. Second step current limit is usually found in larger units of 150kVA and above.
**************************************************************************

b. Second step current limiting: The rectifier/charger unit is also to have a second-step battery current limit. Provide a separately adjustable second-step current limit that is adjustable from 0 percent to 20 percent of the maximum discharge current with initial setting at [10][10][\_] percent. The second-step current-limit circuit is activated by a dry contact signal from the generator set controls and it will prevent normal rate battery recharging until utility power is restored.
2.5.2.2.7  DC Ripple (Output Filter)

Rectifier/charger unit is to minimize ripple current and voltage supplied to the battery; the ripple voltage into the battery is not to exceed 1 percent RMS of the float voltage. Ensure the AC ripple voltage of the rectifier DC output does not exceed 0.5 percent of the float voltage.

2.5.2.2.8  DC Voltage Adjustment

**************************************************************************
NOTE: Delete this requirement on units smaller than 50 kVA.
**************************************************************************

Provide a manual means at the rectifier/charger unit that allows for adjusting the dc voltage for battery equalization in order to provide voltage within plus 10 percent of nominal float voltage.

2.5.2.2.9  Battery Isolation Protective Device

Provide the module or external battery system with a dc protective device to isolate the module from the battery system. The protective device size and interrupting rating are as required by system capacity and is to incorporate the trip required by circuit design. Provide the protective device with a provision for locking in the "off" position.

2.5.2.2.10 Battery Equalize Charge

**************************************************************************
NOTE: Delete this requirement on units smaller than 50 kVA.
**************************************************************************

Equalize charge timer is to provide an equalizing charge automatically to the battery after a 30 second or longer utility outage. The equalize charging time is to be adjustable from 0-72 hours. Provide a manual override for the automatic equalize circuit.

2.5.3  Inverter Unit

**************************************************************************
NOTE: Choose the first option for all systems except for scalable unit UPS systems. Second option is for scalable unit UPS systems.
**************************************************************************

Provide a solid-state inverter with sinusoidal output deriving its power from the dc bus (rectifier or battery source) and providing ac power within specified limits to the critical load. Inverter is to utilize microprocessor controlled solid state Pulse Width Modulation (PWM) controlled insulated gate bipolar transistor (IGBT) power transistor technology to shape the ac output.

[Provide an output converter that constantly develops the UPS output voltage waveform by converting the dc voltage to ac voltage through a set of semiconductor power converters. In both normal operation and battery operation, the output inverters are creating and output voltage independent of the mains input voltage. Input anomalies such as brown-outs, spikes, surges, sags and outages do not affect the amplitude or sinusoidal nature of the output voltage sine wave of the inverters.
]
NOTE: Keep this option/paragraph when there is a generator available to supply power to the UPS.

[ Include a bypass phase synchronization window adjustment to optimize compatibility with local engine-generator-set power source.]

2.5.3.1 Output Overload

NOTE: Choose the first option for all systems except for scalable unit UPS systems. Second option is for scalable unit UPS systems.

[ Provide an inverter that is able to sustain an overload as specified across its output terminals. The inverter is to remain on and continue to operate within rated parameters, with inverse-time overload shutdown protection. If the overload condition persists beyond the rated parameters of the inverter, the load is to be transferred to the bypass source where the inverter disconnects automatically from the critical load bus. If the bypass source is not available and the overload/fault condition continues, the inverter is to current limit for the time as determined by the manufacturer and then shut down to protect the internal components. ]

[ Provide the output inverter with overload capabilities that allows steady state overload conditions of up to 150 percent of system capacity to be sustained by for 30 seconds in normal and battery operation. If the overload condition persists beyond the rated parameters of the inverter, the load is to be transferred to the bypass source where the inverter disconnects automatically from the critical load bus.]

2.5.3.2 Output Protective Device

Provide an output protective device that is capable of opening on an applied control signal and has the proper frame size and trip rating to supply overload current as specified. Provide the external output protective device with provision for locking in the "off" position. The inverter output protective device works in conjunction with the bypass protective device for both manual and automatic load transfers to and from bypass power.

2.5.3.3 Output Transformer

NOTE: Delete the output transformer unless required or when the design output voltage is different than the normal UPS output voltage. Some of the UPS manufacturers require a separate cabinet for the transformer. The preferred option is a harmonic mitigating transformer instead of a K rated transformer.

UPS industry is transitioning to transformerless UPS modules. Having the transformer separate can save space, reduce cooling, improve energy efficiency, reduce weight and cost. In general, those units smaller than 200 kW will benefit more by not having a transformer as part of the UPS. The threshold level of 200 kW is increasing as more manufacturers go to "transformerless" designs.
The inverter output transformer is [harmonic mitigating transformer type.] [or] [capable of handling up to [K-13][_____] nonlinear loads as described in IEEE C57.110]. Provide a transformer that meets the requirements for Department of Energy CSL-3.

2.5.4 External Protection

Provide the UPS module with built-in self-protection against undervoltage, overvoltage, overcurrent and surges introduced on the ac input source and/or the bypass source. Provide the UPS with built-in self-protection against overvoltage and voltage surges introduced at the output terminals by paralleled sources, load switching, or circuit breaker operation in the critical load distribution system.

2.5.5 Internal Protection

Provide the UPS module with the ability to be self-protected against overcurrent, sudden changes in output load and short circuits at the output terminals. Provide the UPS module with output reverse power detection which causes the module to be disconnected from the critical load bus when output reverse power is present. Provide the UPS module with built-in protection against permanent damage to itself and the connected load for predictable types of failure within itself and the connected load. At the end of battery discharge limit, the module shuts down without damage to internal components.

2.5.6 Battery Protection

Provide the inverter with monitoring and controls circuits to protect the battery system from damage due to excessive discharge. Inverter shutdown is be initiated when the battery has reached the end of discharge voltage. Manufacturer is to calculate the end-of-discharge voltage and automatically adjusted for partial load conditions to allow extended operation without damaging the battery. Automatic shutdown based on discharge time is not acceptable.

2.5.7 Modular Inverter Isolation

*[NOTE: Delete for single module UPS system.]*

Provide each inverter in the UPS system with fault sensing and static isolation as well as an output protective device, to remove a faulted module from the system without affecting the critical load bus beyond the stated limits.

2.5.8 Parallel Operation

*[NOTE: Delete for single module UPS system.]*

For parallel operation, ensure the protection system has control logic capable of isolating only the faulted module, and does not shut down the entire UPS system upon a fault in one module. Open protective devices are to be indicated by an alarm and indicator light.

2.6 STATIC BYPASS TRANSFER CIRCUIT

*[NOTE: Delete for single module UPS system.]*
NOTE: Circuit breaker can be fixed or drawout type. In units 500 kVA and larger, the breaker will typically be drawout. 150 kVA or larger units may need to use fuses for the protection of the static switch.

Provide the control logic with an automatic transfer circuit that senses the status of the inverter logic signals and alarm conditions and provides an uninterrupted transfer of the load to the static bypass ac power source, without exceeding the transient limits specified herein, during times when maintenance is required, when a malfunction occurs in the UPS or when an external overload condition occurs. [The power section of the static bypass transfer circuit consists of a plug-in type assembly to facilitate maintenance.] The static bypass transfer circuit is to be used to connect the input bypass ac power source to the critical load when required. Provide the static bypass transfer circuit with the following features:

2.6.1 Construction

Provide a static with a continuous duty rating of at least 100 percent of the UPS output rating. Provide a static bypass transfer circuit as an integral part of the UPS that consists of a static switch, made up of two reverse-paralleled SCRs (silicon-controlled rectifiers) per phase conductor, and a bypass protective device, made up of a [circuit breaker][circuit breaker and fuses]. The bypass protective device is to be in series with the static switch. The inverter output protective device disconnects and isolates the inverter from the bypass transfer circuit. [Provide a static switch that is of a modular design.]

2.6.2 Automatic Uninterrupted Transfer

The static bypass transfer switch automatically causes the bypass ac power source to assume the critical load without interruption when the bypass control logic senses one of the following conditions and the UPS inverter output is synchronized to the bypass ac power source:

a. Inverter overload exceeds unit's rating.

b. Battery protection period is expired and bypass is available.

c. System failure.

d. Inverter output undervoltage or overvoltage.

2.6.3 Interrupted Transfer

If an overload occurs and the UPS inverter output is not synchronized to the bypass ac power source, the UPS inverter output current-limits for 200 milliseconds minimum. The inverter then turns off and an interrupted transfer to the bypass ac power source is made.

If the bypass ac power source is beyond the conditions stated below, an interrupted transfer is made upon detection of a fault condition:
a. Bypass voltage greater than plus or minus 10 percent from the UPS rated output voltage.

b. Bypass frequency greater than plus or minus 0.5 Hz from the UPS rated output frequency.

c. Phase differential of ac bypass voltage to UPS output voltage greater than plus or minus 3 degrees.

2.6.4 Manual Load Transfer

It must be possible to make a manually-initiated static transfer from the system status and control panel by turning the UPS inverter off or by initiating it through the UPS display interface. The transfer is to make-before-break utilizing the UPS output and system bypass circuit breakers. Do not use the static switch for manual transfer unless there isn't a parallel by-pass circuit breaker or contactor.

2.6.5 Automatic Uninterrupted Forward Transfer

Automatic transfer of the load back to the inverter is to take place when the transfer was caused by an overload and only after the load has returned to a level within the inverter source. Provide the ability to allow 1 to 3 transfers within any one-hour period to prevent cyclical transfers caused by overloads.

2.6.6 Forced Transfer

Provide control logic circuitry with the means of making a forced or reverse transfer of the static bypass transfer circuit on an interrupted basis. Minimum interruption is 200 milliseconds when the UPS inverter is not synchronized to the bypass ac power source.

2.6.7 Overload Ratings

**************************************************************************

\[ NOTE: Select choice "c" for scalable unit UPS systems. \]
**************************************************************************

The static bypass transfer switch is to withstand the following overload conditions:

a. 1000 percent of UPS output rating for one cycle.

b. 125 percent of UPS output rating for 1 minute.

[ c. 110 percent of UPS output continuously. ]

2.6.8 System Protection

Incorporate into the static bypass circuit back-feed protection per UL 1778. To achieve back-feed protection, provide a back-feed protection breaker/mechanical contactor upstream and in series with the bypass switch that is controlled by the UPS/static switch, to open immediately upon sensing a condition where back-feeding of the static switch by any source connected to the critical output bus of the system is occurring.

2.6.9 Static Bypass Switch Disconnect

**************************************************************************
NOTE: Delete if the static switch is of the draw-out type or if the UPS module is 30 kVA or smaller.

Delete last option if a maintenance by-pass system is not provided/used.

**************************************************************************
Incorporate a static switch disconnect that can be used to isolate the static bypass transfer switch assembly so it can be removed for servicing. [Equip the device with auxiliary contacts and provisions for padlocking in either the "on" or "off" position.]

2.7 MAINTENANCE BYPASS CIRCUIT

2.7.1 General

**************************************************************************
NOTE: See the TP-19, Static Uninterruptible Power Supply for full discussion on maintenance bypass circuit configurations. UPS units typically come standard with certain internal circuit breakers or switches and these include: one ahead of the rectifier, one on the output of the rectifier, and one ahead of the static switch. In addition, the maintenance bypass switch can be internal to the UPS or external and typically consists of a circuit breaker(s). UPS units up to 500 kVA can have an internal maintenance bypass switch.

Multi-module UPS systems that have UPS modules rated 500 kVA (typically) and higher can have a different configuration. Each module can consist of a rectifier/battery/inverter without an internal maintenance bypass switch or a static switch. In this case, there is a centralized static switch that is sized for the entire load and has its own dedicated feeder. The maintenance by-pass cabinet will typically have two breakers and a single feed. The output of the UPS modules, centralized static switch are in a system control cabinet that connects to the maintenance bypass cabinet. Edit appropriately for multi-module systems.

**************************************************************************
Provide a maintenance bypass switch or arrangement of switch devices [in a matching NEMA 250, type 1 cabinet adjacent to the UPS cabinet] [in a wall-mounted NEMA 250, type 1 enclosure] [in a free-standing floor-mounted NEMA 250, type 1 enclosure]. [Provide a maintenance bypass enclosure configured as indicated.] [Provide a [two] [three] [four] switch maintenance bypass enclosure.] [Provide a two switch maintenance bypass with an input switch for each module.]

2.7.2 Interlock

**************************************************************************
NOTE: Choose the last sentence option for scalable unit UPS systems.

**************************************************************************
Electrically and mechanically interlock the switch(es) to prevent interrupting power to the load when switching to bypass mode. Key interlock requires unlocking bypass/isolating switch before switching from normal position with key that is released only when the UPS is bypassed by the static bypass transfer switch. Lock is designed specifically for mechanical and electrical component interlocking. [Provide auxiliary contacts for the purpose of relaying status information of each circuit breaker/switch actuator to the UPS and static bypass.]

2.7.3 Load Transfer

The maintenance bypass switch provides the capability of transferring the critical load from the UPS static bypass transfer switch to maintenance bypass and then back to the UPS static bypass transfer switch with no interruption to the critical load.

[2.7.4 Load Bank Protection Device

**************************************************************************

NOTE: Delete if the ability to load bank test the UPS system if not required. It is not recommended under normal circumstances for units smaller than 225 kVA.

**************************************************************************

Provide a load bank protective device that allows the UPS system to be tested using a portable load bank. The load bank protective device is connected on the line side of the maintenance bypass switch isolation protective device. Provide a [full system load bank][partial system load bank] sized at[______].

[2.7.5 [Voltage Matching][Isolation Transformer]

**************************************************************************

NOTE: Delete if the input and output voltages are the same and an isolation transformer is not required.

UPS industry is transitioning away from transformers being part of the UPS. Having the transformer separate can save space, reduce cooling, improve energy efficiency, reduce weight and cost. In general, those unit smaller than 200 kW will benefit more by not having a transformer as part of the UPS. The threshold level of 200 kW is increasing as more manufacturers go to "transformer less" designs.

**************************************************************************

The maintenance bypass cabinet contains [a voltage matching transformer][an isolation transformer] as required to match the output voltage requirements. Ensure the transformer and UPS are phase matched.

]2.8 DISPLAY, CONTROLS AND ALARMS

**************************************************************************

NOTE: The first paragraph is for non-redundant systems, i.e. single module, parallel multi-module, or scalable unit non-redundant UPS. The second paragraph is for redundant systems to include scalable unit internal redundant and scalable unit redundant.
[ Provide the UPS module with a microprocessor-controlled display unit located on the hinged door on the front of the system. Provide a LCD color alphanumeric display that operated by touchscreen to access the various information. Controls, meters, alarms and indicators for operation of the UPS module are to be on this panel. Provide a menu driven graphical user interface for browsing the screens. All three-phases of three-phase parameters are to be displayed simultaneously.

][Provide the modules with separate, optically isolated, communication paths to the power and static switch modules. Provide redundant power supplies, each having a separate AC and DC input and output for the logic power for the control modules. Provide a microprocessor-controlled display unit with alphanumeric display with back or side lighting. Controls, meters, alarms and indicators for operation of the UPS module are to be on this panel. Provide a menu driven graphical user interface for browsing the screens. All three-phases of three-phase parameters are to be displayed simultaneously.]

**************************************************************************

NOTE: Delete the output kilowatt hour meter information unless required. This option is rarely available with an UPS and if needed it would be better to consider a separate meter on the load.

**************************************************************************

2.8.1 Module Meters

2.8.1.1 Monitored Functions

Display the actual value along with the ability to show the peak, average and low values over various periods of time. Monitor and display the following functions:

a. Input voltage, phase-to-phase (all three phases).

b. Input current, all three phases.

c. Input frequency.

d. Bypass voltage, phase-to-phase and phase-to-neutral (all three phases).

e. Bypass frequency.

f. Battery voltage.

g. Battery current (charge/discharge).

h. Output voltage, phase-to-phase and phase-to-neutral (all three phases).

i. Output current, all three phases.

j. Output frequency.

k. Input power factor.

l. Maintenance bypass voltage, phase-to-phase and phase-to-ground (all three phases)

m. Output kilowatts or kilovoltamps.
2.8.1.2 Meter Construction

Display alphanumeric parameters based on true RMS metering with 2 percent accuracy at full scale (minimum 4 significant digits) at the display panel.

2.8.2 Module Controls

Provide a module or equivalent features via touchscreen with the following controls:

a. Silence audible alarm.

b. Display or set the date and time.

c. Adjust setpoints on various alarms.

d. Alarm test/reset pushbutton.

e. Battery protective device trip pushbutton[, with guard].

f. Emergency off pushbutton, with guard. Provide a hard-wired pushbutton even if touchscreen system is provided.

g. DC voltage adjustment potentiometer, with locking guard or AC output voltage adjustment potentiometer. Provide potentiometer that is accessible only by authorized personnel.

h. Control power off switch.

i. Transfer load to and from static bypass circuit.

j. Display control pushbuttons: up, down, select.

[ k. UPS/bypass transfer selector switch.]

[ l. Module input protective device trip pushbutton.]

**NOTE:** Module input and output protective device trip pushbuttons are only available when an Emergency Power Off feature is provided.

**NOTE:** Delete UPS/bypass transfer switch reference except for parallel redundant or parallel multi-module systems. The parallel redundant multi-module configuration must also be specified to have a system control cabinet instead of having individual (distributed) bypass parallel system, so only keep if specified and used.

**NOTE:** This option is available on all systems.

[ n. Bypass voltage, phase-to-phase and phase-to-ground (all three phases).]
m. Module output protective device trip pushbutton.

2.8.3 Module or System Alarm Indicators

Provide the module with indicators for the following alarm items. Any one of these conditions is to turn on an audible alarm and the appropriate summary indicator. The system is to register each new alarm without affecting any previous alarm. Provide a processor that time-date stamps each event.

a. Input ac power source failure.
b. Input protective device open.
c. Input power out of tolerance.
d. Overload.
e. Overload shutdown.
f. DC overvoltage/shutdown.
g. DC ground fault.
h. Low battery.
i. Battery discharged.
j. Battery protective device open.
k. Blower fan failure or overtemperature.
l. Overtemperature shutdown.
m. Hardware shutdown.
n. Equipment overtemperature.
o. Fuse blown with annunciation.
p. Control power failure.
q. Charger off/problem.
r. Inverter fault/off.
s. Emergency power off.
t. External shutdown (Remote Emergency Power Off) activated.
u. Output protective device open.
v. Operating on internal oscillator
w. UPS on battery
x. Critical load on static bypass.
y. Static bypass transfer switch disabled/failure.
z. Inverter output overvoltage.

aa. Inverter output undervoltage.

bb. Inverter output overfrequency.

c. Inverter output underfrequency.

dd. Bypass source overvoltage.

ee. Bypass source undervoltage.

ff. Bypass source overfrequency.

gg. Bypass source underfrequency.

hh. Bypass source to inverter out of synchronization.

**************************************************************************

NOTE: The following additional alarms are only required when the system is scalable unit UPS system; otherwise, delete.
**************************************************************************

[ii. Load no longer above alarm threshold.

jj. Intelligent module inserted or removed.

kk. Redundancy restored.

ll. Need battery replacement.

mm. Bad battery module.

nn. Bad power module.

oo. Redundant intelligent module installed and failed.

pp. Load above alarm threshold.

] 2.8.4 Module Emergency OFF Button

Provide an emergency off pushbutton with a protective cover. Pressing the emergency off button causes the module input, output, and battery circuit breakers or contactors to open, completely isolating the UPS system from sources of power and transfer of the load to bypass.

System Mimic Panel

Provide a mimic panel in the format of a single-line diagram that graphically depicts whether the load is supplied from the inverter, bypass, or battery. Provide on status on the following:

a. Module on-line, one per UPS module.

b. UPS output protective device status, one for closed (red), one for open (green), and one for withdrawn (amber).

c. Static bypass protective device status, one for closed (red), one
for open (green), and one for withdrawn (amber).

d. Static switch status, one for connected (red), and one for
disconnected (green).

e. Status on the AC input circuit breaker, battery circuit breaker,
and inverter circuit breaker. Connected (red) and disconnected (green).

[2.9 SYSTEM CONTROL CABINET

**************************************************************************

NOTE: This section is for multi-module UPS systems
that has a system control cabinet that contains a
single bypass static switch that handles the entire
load provided by the multi-modules. Delete for
single module UPS Systems and for scalable unit UPS
systems.

**************************************************************************

2.9.1 General Description

Provide the multi-module UPS system with a separate control cabinet for
system output that contains; bus bar connections to collect the output from
each module, the static switch and its bypass breaker, the UPS system
output protective device, and the UPS output switchgear.

2.9.2 UPS Output Switchgear

The UPS output switchgear consists of a main protective device feeding the
UPS output switchgear critical load bus, a load bank protective device
(connected on the line side of the main protective device), a maintenance
bypass protective device and associated feeder protective devices for the
critical loads.

2.9.2.1 Interlocking

**************************************************************************

NOTE: Delete references to load bank protective
device if not used.

**************************************************************************

[The main protective device and the load bank protective device are
interlocked to prevent both being closed at the same time. ]The
maintenance bypass protective device is interlocked with the UPS system
output protective device and the static bypass switch. The maintenance
bypass protective device is not capable of closing until the static bypass
switch is closed and the UPS system output protective device is open. Once
the maintenance bypass protective device is closed, the UPS output
switchgear main protective device is capable of opening to isolate the
critical loads from the UPS output.[ The load bank protective device as
well as the UPS system output protective device is then capable of closing
to permit load bank testing.]

2.9.2.2 Switchgear

**************************************************************************

NOTE: Army only. This is only used on Army
projects.

**************************************************************************

Provide the UPS output switchgear in accordance with Section 26 28 01.00 10
COORDINATED POWER SYSTEM PROTECTION.
[2.10] SELF-DIAGNOSTIC CIRCUITS

**************************************************************************
NOTE: Delete if self-diagnostic circuits are not required. These circuits are normally required in high reliability applications where it becomes critical to identify the faulty circuit card in the shortest time possible. This option is not normally available in off the shelf UPS units.
**************************************************************************

Provide control logic with status indicators for trouble-shooting the control circuits. These indicators are mounted on the circuit card edge or face such that they will be visible without repositioning the card, and are labeled with the function name.

[2.11] REMOTE MONITORING PANEL

**************************************************************************
NOTE: Delete if a remote monitoring panel is not required.
**************************************************************************

Provide a remote monitoring panel to monitor system status. Wall mount the panel near the critical load or as indicated.

2.11.1 Indicators

Provide indicators for the following (minimum):

a. Load on UPS.
b. Battery discharging.
c. Load on bypass.
d. Low battery.
e. Overload.
e. summary alarm.
f. New alarm (to alert the operator that a second summary alarm condition has occurred).

2.11.2 Audible Alarm

Any single indicator turns on the audible alarm. An audible alarm test/reset button and lamp test/reset button is to be included. The alarm on the module is not affected nor reset by the reset button.

[2.12] COMMUNICATIONS AND DATA ACQUISITION

**************************************************************************
NOTE: Delete the communication and data options that are not required. RS-485 port is not supported by some of the UPS manufacturers.
**************************************************************************
Provide an [RS 232][Internet Protocol (IP)][RS 485] communications and data acquisition port. This port allows the system parameters, status, alarm indication and control panel functions specified to be remotely monitored and controlled.

Additionally, provide additional ports for use with the following:

a. Provide the following Form C contacts for remote indication:
   (1) UPS on battery.
   (2) UPS on-line.
   (3) UPS load on bypass.
   (4) UPS in alarm condition.
   (5) UPS off (maintenance bypass closed).

b. Provide four spare Form C contacts rated at 120V, 0.5A.

c. Provide a SNMP (Simple Network Management Protocol) adapter to communicate UPS monitoring via a network or direct connection to [a personal computer (PC)][MODBUS][BACnet].

d. Provide a standard Web Browser adapter to remotely view and monitor UPS functions over the Internet.

Provide communication ports and contacts that are capable of simultaneous communication.

2.12.1 Emergency Control Contacts

**********************************************************************************************************************************************
NOTE: Include this paragraph only when the UPS will be installed in conjunction with a generator/alternate source.
**********************************************************************************************************************************************
Provide normally open contacts to signal when power is supplied to the UPS from engine generators or alternate source. The signal connects to an automatic transfer switch.

2.13 TEMPERATURE CONTROL

2.13.1 General

**********************************************************************************************************************************************
NOTE: Default is to have the exhaust go out the top. If rack mounted UPS is specified, then choose the option to have a rear exhaust.
**********************************************************************************************************************************************

Ensure cabinet and enclosure ventilation is adequate to operate the components within their ratings. Forced-air cooled rectifier, inverter, and control unit will be acceptable. If UPS input power is lost, then the cooling fans are to continue to operate. Provide redundancy that ensures failure of one fan or associated circuit breaker does not cause an overheat condition. Cooling air is to enter the lower front of the cabinets and exhaust at the [top][rear]. Provide visual and audible alarms on the
control panel that indicate blower power failure. Provide replaceable filters on air inlets, which may be located on the inside of the cabinet doors and are easily accessible for replacement.

2.13.2 Blower Power Source
**************************************************************************
NOTE: Select 'output side' for 10-225kVA; select 'input and output sides' for over 225kVA.
**************************************************************************
Provide a blower power source that is internally derived from the [output side] [input and output sides] of UPS module, with automatic transfer arrangement.

2.13.3 Temperature Sensors

Provide temperature sensors to monitor the air temperature. Provide a sensor or sensors to monitor the temperature of rectifier and inverter heat sinks. [Provide separate sensors to monitor the transformer temperature.] Provide critical equipment over-temperature indication that starts a timer that shuts down the UPS system if the temperature does not return below the setpoint level recommended by the UPS manufacturer.

2.14 BATTERY SYSTEM
**************************************************************************
NOTE: Ventilation of storage battery areas is required by NFPA 70. A safe environment for such areas exists where the concentration of gaseous hydrogen does not exceed 2 percent accumulation per unit volume. Factors used to determine this condition are the size and type of battery to be charged; room volume; maximum volume of hydrogen gas emitted during charging; and ventilation rate. Approximately 0.016 cubic foot per hour of hydrogen gas is produced from each fully charged wet cell per charging ampere. Valve-regulated cells typically produce considerably less. Once sufficient ventilation is produced, no need exists for explosion-proof wiring, vapor-proof fixtures, or other special provisions. Mechanical ventilation (an exhaust fan) should be provided in accordance with the battery manufacturer's recommendations.

Battery Room Temperature. Battery system performance may be affected by battery room temperatures above or below the nominal range of 23 degrees C (74 deg. F) to 27 degrees C (80 deg. F). Battery capacity is reduced at lower temperatures and battery life expectancy is reduced at sustained temperatures greater than 30 degrees C (86 deg. F). Batteries should be derated if battery room temperatures are expected to vary more than plus or minus 2 degrees from the standard 25 degrees C.
**************************************************************************
**************************************************************************
NOTE: Refer to UFC 3-520-01, "Interior Electrical System"s for battery types and selection information. UPS systems either use two basic types: wet cell (also called flooded cell) or
valve-regulated lead-acid (VRLA). There are two types of VRLA: gel and absorbed glass mat (AGM). Provide AGM type for UPS applications when choosing between gel and AGM.

2.14.1 General

NOTE: Valve regulated lead acid (VRLA) batteries are predominately lead calcium and should be chosen for most applications. VRLA batteries that are pure lead have longer life when compared to lead calcium. If considering pure lead, a cost analysis should be performed. Wet cells can be lead calcium, lead antimony or lead selenium with lead calcium the most common. Lead antimony and lead selenium are better for deep cycle applications and should only be considered in areas where there are very frequent power outages e.g. in areas where the battery is normally on a stand-by do not use lead antimony or lead selenium. Lead selenium, or sometimes called low antimony batteries, have a higher cycle capability when compared to lead calcium (5+ times), but not as good a lead antimony batteries (about 70%). Note that lead selenium typically requires less maintenance when compared with lead antimony. If designer wants lead antimony or lead selenium, the choice needs to be added to the wet cell paragraph.

NOTE: Wet cell batteries require a dedicated room. Small UPS units will typically use the valve-regulated lead-acid type battery. Wet cells can last up to 20 years with proper maintenance. There are two "grades" of VRLA: one for 10 years and one for 20 years. Note that 10 yr batteries typically only get 5-6 years of life in UPS application. If a 20 year VRLA is desired, then a life cycle cost analysis should be performed since the cost can be significantly more than a 10 year VRLA. Refer to UFC 3-520-05, "Stationary Battery Areas" for guidance governing the architectural, mechanical, plumbing and electrical requirements for design of stationary secondary battery installations.

NOTE: The last option is for modular, expandable scalable cabinet mounted type UPS unit with their associated battery plant.

Battery system contains the battery cells, [cabinets,] [racks,] battery disconnect, [and battery monitor]. Provide a storage battery with sufficient ampere-hour rating to maintain UPS output at full capacity for the specified duration for each UPS module. Provide a battery that is heavy-duty, industrial design suitable for UPS service. Provide the cells with flame arrestor vents, intercell connectors and cables, cell-lifting straps, cell-numbering sets, and terminal grease. Size intercell connectors.
to maintain terminal voltage within voltage window limits when supplying full load under power failure conditions. Provide cell and connector hardware that is the type of stainless steel capable of resisting corrosion from the electrolyte used. The battery plant is to consist of the following:

[ a. Provide a [lead calcium][pure lead] battery that is of the float-type, absorbed glass mat (AGM) valve-regulated, lead-acid, sealed, non-gassing, recombinant type (VRLA) that is rated for [10][20] years. [Battery is factory assembled in an isolated compartment of the UPS cabinet complete with battery disconnect switch.] [Battery is factory assembled in a separate matching cabinet, complete with battery disconnect switch.]

] b. Provide a [lead calcium][_____] battery that is of the wet cell (flooded) type. Provide heavy-duty industrial units in styrene acrylonitrile containers suitable for rack mounting. Assembly includes battery disconnect switch, hydrometer syringe, and thermometer with specific gravity-correction scales.

]c. Provide a lead calcium battery that is of the float-type, absorbed glass mat (AGM) valve-regulated, lead-acid, sealed, non-gassing, recombinant type (VRLA) that is rated for 10 years. Provide the UPS battery plant of modular construction made up of replaceable, hot-swappable, fused, battery modules.

] 2.14.2 Battery Cabinet

**************************************************************************
NOTE: Delete if a battery cabinet is not required.
Cabinet or rack could be used for VRLA type batteries. Cabinets are the preferred method when VRLA are used. Racks are used for wet cell type batteries.
**************************************************************************

Furnish the battery pack assembly in a battery cabinet matching the UPS cabinet. Design the battery cabinet to allow for checking the torque on the connections in the battery system and to provide adequate access for annual housekeeping chores. Provide an external wiring interface through the bottom or top of the assembly. Provide a high temperature alarm that annunciates detection of high temperature within the battery cabinet.

] 2.14.3 Battery Rack

**************************************************************************
NOTE: Delete if a battery rack is not required.
Three tier racks should be used only where floor space is limited. They increase floor loading and make maintenance more difficult. Use battery rack for wet cell batteries.
**************************************************************************

Provide a suitable number of [two-tier][three-tier] racks to fit the room layout shown for the number of batteries provided. Provide a steel battery rack that is protected with electrolyte-resistant paint. Ship the battery rack unassembled with all necessary hardware for assembly. Provide each rack with a complete set with bus bars to accommodate cables from UPS module. Provide bus bar connectors for battery-to-battery connections and high-flex multi-stranded copper cable (ASTM B173 stranding class H) with
proper cable supports for connecting top row of batteries to bottom row of batteries at rack ends. Cut end sections to length to prevent wasting floor space.

**************************************************************************
NOTE: Cell-terminal covers are only for wet cells.
**************************************************************************

Provide acid-resistant transparent cell-terminal covers not exceeding 1.83 meters 6 feet in length and with vent holes drilled on top where needed.

[2.14.5] Battery Disconnect

Provide each battery string with a [circuit breaker][ or ][fused disconnect switch] provided in a NEMA 250, type 1 enclosure, finished with acid-resistant paint and located in line with the assembly. Provide each switch with line side and load side bus bars for connection to battery cells. Rate each switch [500][_____] V dc, [ampere rating per manufacturer][_____] amperes, 3-pole with interrupting rating as required by system capacity, and provide an external operator that is lockable in the "off" position. [Provide either a wall mounted disconnect or a cabinet mounted disconnecting means for cabinet mounted batteries. Disconnect is allowed to be in the battery cabinet.]

**************************************************************************
NOTE: Paragraph is for scalable unit UPS systems only. For all other delete.
**************************************************************************

Provide battery enclosures that house draw-out battery cartridges. Battery cartridges are to interlock in place within the battery enclosure to ensure proper contact.

**************************************************************************
NOTE: Do not use this paragraph for Navy projects. When directed to meet Seismic Requirements, 13 48 00 SEISMIC PROTECTION FOR MISCELLANEOUS EQUIPMENT and Section 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT must be edited to suit the project and be included in the contract documents. Edit the following paragraph and include it in the project specification. When a Government designer is the Engineer of Record, provide seismic requirements on the drawings.
**************************************************************************

Provide a seismic-restraint design for the battery [racks][cabinets], assemblies, subassemblies, and components to include fasteners, supports, mounting and anchorage devises [that conforms to UFC 3-310-04, Section 13 48 00, SEISMIC PROTECTION FOR MISCELLANEOUS EQUIPMENT and to Section 26 05 48.00 10, SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT][ as indicated].

[2.14.8] Battery Monitor

**************************************************************************
NOTE: Provide a battery internal resistance monitoring system on and temperature-compensated
**************************************************************************
charging only on mission critical systems.

For the scalable units UPS systems choose the battery module in the first sentence and for all other systems choose the "string in the system". Also, for the scalable unit UPS system choose the temperature-compensated charging option.

**************************************************************************

Provide a battery monitor for each battery [string in the system][battery module]. Monitor the following minimum parameters by the device:

a. Total system voltage.
b. Ambient room temperature.
c. Minimum of 120 days activity history.
d. Programmable alarm functions.

e. Battery internal resistance.
f. Temperature-compensated charging. Provide a battery temperature sensing unit to automatically reduce the float charge in response to increases in battery temperature. Set the response per the manufacturer's requirements. Monitor is to only indicate when the temperature compensation circuit is active.

g. Provide a remote monitoring panel.

The monitor is to record the total accumulated discharge minutes and accumulated battery system discharge kW hours.

[2.15 BATTERY MONITOR - DISCHARGE
**************************************************************************

NOTE: This monitoring option is available on units that are 225 kVA and larger. If UPS system is smaller than 225 kVA then delete this option.
**************************************************************************

The UPS is to have a specialized battery monitor system that collects and stores data related to discharging the UPS battery. The information is to be displayed on a separate screen available through a menu selection. The system is to collect and retain (minimum of 50 events) the following information for each discharge cycle:

a. System time and date.
b. Duration of cycle.
c. DC bus voltage range.

d. kW carried by batteries at the start of the event.]

[2.16 HYDROGEN GAS MONITORING SYSTEM
**************************************************************************

NOTE: This system is recommended even when valve-regulated lead-acid batteries are used. These
batteries can release high amounts of hydrogen outside the battery if there is a malfunction to the battery charging system and functions as a backup in case the charger does not take itself off line during a malfunction.

Provide a hydrogen gas monitoring system to monitor the hydrogen levels in the room. The system is to consist of a [remote monitoring panel, hydrogen sensor and monitor/control panel]. Provide a single gas detector/sensor located to be located [near the UPS batteries][as shown]. When a sensor detects hydrogen gas at a level of 1 percent, the system is to initiate an exhaust fan operation and provide a warning on the control panel[ and remote monitoring panel]. When a sensor detects hydrogen gas at a level of 2 percent, the system is to initiate an audible alarm and provide an alarm on the control panel[ and remote monitoring panel].

2.17 FACTORY TESTING

NOTE: Edited as required for a single module system. The designer should carefully evaluate the UPS application and the user's mission to determine critical tests for the UPS that will ensure UPS/load compatibility. These tests should be conducted at the factory and the results validated prior to shipment to the site. The required UPS/load interaction can be achieved by requesting the following tests plus any other tests the designer deems necessary:

a. Tests to ensure that the UPS rated power factor is verified;

b. Tests to ensure that the UPS system will operate in total accord and support the rated load;

c. Tests to ensure that the UPS system can deal with load anomalies (odd harmonics, etc.) associated with the user's equipment load.

Factory test the UPS system to meet the requirements specified using a test battery (not the battery to be supplied with the system) or D.C. simulator. Factory load test the UPS module as an independent assembly with 3-phase ac input power and with battery power for a minimum of 8 hours, with meter readings taken every 30 minutes. Balance the load at rated kVA and rated power factor.

a. Submit a detailed description of proposed factory test and field test procedures, including proposed dates and steps outlining each test, how it is to be performed, what it accomplishes, and its duration, not later than [1][_____] months prior to the date of each test.

b. Run the factory test for each UPS module under full load that is witnessed by the Government. Should a malfunction occur, correct the problem and repeat the test. As a minimum, the factory tests are to include the parameters described in paragraphs ac Input, ac Output, Transient Response and Efficiency. Tests are to encompass all aspects
of operation, such as module failure, static bypass operation, battery failure, input power failure and overload ratings.

c. Notify the Government in writing at least 2 weeks before testing. Do not use factory-test time for system debugging and/or checkout. Perform such work prior to notifying the Government that the system is ready for testing. Perform factory tests during normal business hours. Interconnect and test the system for an additional 8 hours to ensure proper wiring and performance.

d. Submit factory and field test reports in booklet form tabulating factory and field tests and measurements performed, upon completion and testing of the installed system. An official authorized to certify on behalf of the manufacturer of the UPS system that the system meets specified requirements will sign the factory and field test reports. Date each report after the award of this contract, which states the Contractor's name and address, name the project and location, and list the specific requirements, which are being certified.

2.17.1 Transient Tests

Conduct transient tests using high-speed oscillograph type recorders to demonstrate the operation of the components to the satisfaction of the Government. These tests consist of 50 percent to 100 percent load changes, manual transfer, manual retransfer, low dc bus initiated transfer and low ac output bus transfer. Use a recording instrument equipped with an event marker.

2.17.2 Efficiency Tests

Perform testing for efficiency at zero output up to 100 percent of stated kW output in 25 percent steps with battery fully charged and floating on the dc bus, with nominal input voltage, and with module connected to represent actual operating conditions.

PART 3 EXECUTION

3.1 INSTALLATION

Conform electrical installations to IEEE C2, NFPA 70, and to requirements specified herein. Provide new equipment and materials unless indicated or specified otherwise. Set the UPS system in place that is wired and connected in accordance with the approved shop drawings and manufacturer's instructions.

3.1.1 Control Cable

**************************************************************************
NOTE: UPS sizes 200 KVA and above are shipped in sections. Control wiring between module sections will be connected by the UPS manufacturer's technical representative.
**************************************************************************

Install UPS control wiring in individual separate rigid steel conduits, unless connections are made between side by side matching cabinets of UPS. Tag control wires with numeric identification tags corresponding to the terminal strip location to where the wires are connected. In addition to manufacturer's requirements, provide four additional spare conductors between UPS module and remote alarm panel in same conduit. When routing
control cables inside UPS module, maintain a minimum **155 mm 6 inches** separation from power cables.

### 3.1.2 Grounding

#### 3.1.2.1 Grounding Conductor Title

Provide a separate grounding conductor that is separate from the electrical system neutral conductor in feeder and branch circuits. Ground battery racks and battery breaker cabinets with a separate equipment grounding conductor to the UPS cabinet.

#### 3.1.2.2 Separately Derived

If not part of a listed power supply for a data-processing room, comply with **NFPA 70** requirements for connecting to grounding electrodes and for bonding to metallic pipe.

### 3.1.3 UPS Output Conductors

Isolate the UPS output conductors from the UPS cabinet to the critical load panels and from other conductors by installing in separate conduit.

#### 3.1.4 DC Power Conductors

**NOTE: Include this paragraph only when batteries are remote from the UPS cabinet.**

When installed in conduits, place dc power conductors from the UPS cabinet to the battery circuit breaker such that each conduit contains an equal number of positive and negative conductors, for example, two positive and two negative conductors in each conduit. Size conductor for a maximum of 2 percent voltage drop at full discharge.

#### 3.1.5 Seismic Protection

**NOTE: Do not use this paragraph for Navy projects.**

When directed to meet Seismic Requirements, **13 48 00 SEISMIC PROTECTION FOR MISCELLANEOUS EQUIPMENT** and **Section 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT** must be edited to suit the project and be included in the contract documents. Edit the following paragraph and include it in the project specification. When a Government designer is the Engineer of Record, provide seismic requirements on the drawings.

Provide seismic details[ conforming to[ Section 13 48 00, SEISMIC PROTECTION FOR MISCELLANEOUS EQUIPMENT][ and to][ Section 26 05 48.00 10, SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT]][ as indicated].

### 3.1.6 Conduit Entries

Ensure conduit entries use the available conduit areas shown on manufacturer's installation drawings. Do not make conduit entries through the front, side or rear panels of the UPS[ or Maintenance Bypass Cabinet][ or battery cabinet][ or battery disconnect enclosure].
Battery Rack Assembly

NOTE: Choose this paragraph if racks are required for the batteries. This is typically required when the batteries are wet cell type.

Battery racks are typically shipped dismantled in separate rail, frame, and brace packages. Ensure that manufacturer furnished assembly hardware is used to assemble battery racks. Conform battery rack installation to the manufacturer's instructions.

Battery Cabinet Assembly

NOTE: Choose this paragraph when VRLA batteries are required. Battery cabinets are typically factory assembled on units up to 500 kVA. Battery cabinets for larger units may require assembly at the site.

Conform battery rack installation to the manufacturer's instructions.

Battery Installation

NOTE: Delete paragraph and subparagraphs for smaller UPS units that have batteries installed in the unit cabinet by the manufacturer at the factory.

Conform battery cabinet installation to the manufacturer's instructions.

FIELD QUALITY CONTROL

NOTE: The UPS manufacturer's technical representative is required to inspect the completed UPS and battery installation. The representative's visit to the site must be scheduled by the Contractor.

Notify the Contracting Officer in writing at least 30 calendar days prior to completion of the UPS system installation. At this time the Contractor, will schedule the UPS manufacturer's technical representative to inspect the completed installation. Provide instruction for activity personnel by the UPS technical representative as specified in paragraph titled "DEMONSTRATION".

3.2.1 Installation Preparation

Completely install the following items by the Contractor and be operational prior to the arrival of the UPS representative for inspection, unit start-up and testing:

a. Ventilation equipment in the UPS and battery rooms.

NOTE: In subparagraph b. choose the appropriate item based on what was previously specified.
b. Battery [cabinets][racks][modules] and cells.

c. Battery connections including cell-to-cell, tier-to-tier, and rack-to-rack connections, with correct polarity;

d. DC power and control connections between UPS and battery circuit breaker, with correct polarity;

e. DC power connection between battery circuit breaker and battery, with correct polarity;

f. Clockwise phase rotation of ac power connections;

g. AC power to rectifier input bus;

h. AC power to UPS bypass input bus;

i. AC power to UPS maintenance bypass circuit breaker;

j. AC power from UPS output to UPS maintenance bypass output circuit breaker;

k. Remote monitors and control wiring;

l. UPS system and battery system properly grounded;

[ m. Emergency shower and eye wash;

][n. Control connections between UPS and emergency engine generator signal contacts;

]  

NOTE: In subparagraph o. delete the bracketed statement when the project does not require a UPS maintenance bypass cabinet.

o. Control connections between UPS module [and UPS maintenance bypass cabinet];

p. Clean and vacuum UPS and battery room floors, battery cells, and UPS equipment, both inside and outside

q. Ensure that shipping members have been removed.

NOTE: Provide this option for IEEE 450 certification when wet cell ventilated batteries are used.

r. Provide IEEE 450 battery installation certification.

3.2.2 Initial Inspection and Tests

The UPS technical representative and the Contracting Officer, in the presence of the Contractor, will inspect the completed installation. The Contractor is responsible to correct construction or installation deficiencies as directed. Perform acceptance checks in accordance with the
manufacturer's recommendations and include the following visual and mechanical inspections, performed in accordance with NETA ATS.

a. UPS Unit visual and mechanical inspection

(1) Compare equipment nameplate data with drawings, specifications and approved shop drawings.

(2) Inspect physical and mechanical condition. Inspect doors, panels, and sections for paint, dents, scratches, fit, and missing hardware. Inspect the displays for scratches, dark pixels or uneven brightness.

(3) Inspect anchorage, alignment, grounding, and required clearances.

(4) Verify that fuse sizes and types correspond to drawings.

(5) Verify the unit is clean inside and out.

(6) Test all electrical and mechanical interlock systems for correct operation and sequencing.

(7) Inspect bolted electrical connections for high resistance using one of the following methods:
   (a) Use a low-resistance ohmmeter.
   (b) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method.
   (c) Perform thermographic survey.

(8) Verify operation of forced ventilation.

(9) Verify that vents are clear and new clean filters are installed.

(10) Inspect batteries and chargers according to requirements in NETA ATS

b. UPS Batteries visual and mechanical inspection

(1) Compare equipment nameplate data with drawings, specifications and approved shop drawings.

(2) Inspect physical and mechanical condition. Inspect doors, panels, and sections for paint, dents, scratches, fit, and missing hardware. Inspect the displays for scratches, dark pixels or uneven brightness.

(3) Inspect anchorage, alignment, grounding, and required clearances.

(4) Verify that fuse sizes and types correspond to drawings.

(5) Verify the unit is clean inside and out.

(6) Verify the application of an oxide inhibitor on battery terminal connections.

(7) Inspect bolted electrical connections for high resistance using
one of the following methods:

(a) Use a low-resistance ohmmeter.

(b) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method.

(c) Perform thermographic survey.

3.2.3 Performance Tests

Provide equipment, test instruments, power, load bank, materials and labor required for tests. Contracting Officer will witness all tests and the tests are subject to his approval. Perform tests in accordance with the manufacturer's recommendations and include the following electrical tests.

3.2.3.1 UPS Unit Performance Tests

Upon completion of battery activation procedures, Contractor is to connect load bank to UPS output. Size load bank to the full kW rating of the system.

Performance test is to be run under the supervision of the UPS technical representative. Operate UPS unit under full kW load for a minimum of one hour. Operation of the feeder and bypass power feeder breakers during testing of the UPS is the responsibility of the Contractor.

a. Electrical Tests

(1) Test static transfer from inverter to bypass and back. Use normal load, if possible.

(2) Test dc undervoltage trip level on inverter input breaker/relay. Set according to manufacturer's published data.

(3) Test alarm circuits.

(4) Verify synchronizing indicators for static switch and bypass switches.

(5) Perform electrical tests for UPS system breakers.

(6) Perform electrical tests for UPS system batteries.

(a) Measure negative post temperature.

(b) Measure charger float and equalizing voltages.

(c) Verify all charge functions and alarms.

b. Test Values

Verify bolt-torque levels.

c. Maintenance Bypass Panel/Cabinet

Verify interlocks (Kirk-Key or other means) operate properly. Verify that the breaker arrangement operates in the manner required for the number of possible combinations.
[d. Load Test

**************************************************************************

NOTE: Edit as required, depending upon whether a temporary or permanent load bank is to be provided or if a load bank is required. Small UPS systems are normally not required to have a load bank test.

**************************************************************************

[Provide a load bank that stays with the system. ]Load test the installed system for a continuous 24 hour period by means of resistive load banks. Continuously test the system at 1/2 load for 8 hours, 3/4 load for 8 hours and full load for 8 hours. Provide variable load banks sized to the full kW load of system to facilitate startup under load conditions, and to conduct load tests described above. Record instrument readings every half hour for the following:

(1) Input voltage (all three phases).
(2) Input current (all three phases).
(3) Input frequency.
(4) Battery voltage.
(5) Output voltage (all three phases).
(6) Output current (all three phases).
(7) Output kilowatts.
(8) Output frequency.

[e. Full Load Burn In Test

**************************************************************************

NOTE: Delete emergency/alternative source testing requirements if no emergency/alternative source is available. This paragraph may be deleted for small UPS system.

**************************************************************************

Provide an additional full load burn-in period of 24 continuous hours for the installed system. If a failure occurs during the burn-in period, repeat the tests. Record instrument readings every half hour as above. Perform the following tests during the burn-in period:

(1) With the UPS carrying maximum continuous design load and supplied from the normal source, switch [100 percent load][50 percent load] on and off a minimum of three times within [the burn-in period] [______].

[[2] With the UPS carrying maximum continuous design load and supplied from the emergency source, repeat the switching operations described in step (1). Also, verify that the UPS module rectifier charger unit(s) go into the second-step current limit mode.]

(3) With the UPS carrying maximum continuous design load and operating on battery power, repeat the switching operations}
described in step (1) above.

(4) Continue operation on battery power for 1 minute, then restore normal power.

Furnish a high-speed dual trace oscillograph to monitor ten or more cycles of the above tests at the ON and OFF transitions and two typical steady-state periods, one shortly after the load is energized (at 30 to 60 seconds) and one after operation has stabilized (at 8 to 10 minutes). Deliver four copies of the traces to the Contracting Officer.

[f. Battery Discharge Test

NOTE: This paragraph may be deleted for small UPS system.

Allow UPS 24 hrs to recharge batteries and an additional 24 hrs cool down prior to commencing this test, if other tests such as the full load test were performed. With the UPS carrying maximum continuous design load and the battery fully charged, the system is to undergo a complete battery discharge test to full depletion and a recharge to nominal conditions. Record instrument readings every minute during discharge for the following:

(1) Battery voltage.
(2) Battery current.
(3) Output voltage (all three phases).
(4) Output current (all three phases).
(5) Output kilowatts.
(6) Output frequency.

[3.2.3.2 Generator Operation

NOTE: Include this paragraph only when the UPS will be installed in conjunction with a generator.

Test UPS to observe operation with generator service. UPS technical representative is to verify UPS battery current limiting feature functions properly.

[3.2.3.3 Battery Performance Test (Constant kW)

NOTE: This paragraph is applicable for large wet-cell type battery systems. Delete for sealed (valve regulated) battery system.

Furnish all labor, material and test equipment necessary to conduct performance test under the direction of UPS technical representative. Accomplish the following:

a. Install a calibrated voltmeter across the battery terminals to measure
b. Record temperature of pilot cells in battery immediately prior to start of discharge performance test.

c. Read and record total battery voltage and battery current at start of discharge and every minute during discharge test.

d. Record minutes and seconds when battery voltage drops below minimum discharge voltage. On initial discharge test, a battery may be expected to deliver 95 percent of its rated capacity. This will increase to 100 percent after several complete discharge cycles or after 12 months of float charge service.

e. Should battery fail to meet the requirements of the first discharge performance test, place battery on equalizing charge as defined by the specific battery manufacturer's recommendations. Measure and record time and battery voltage. Run a second discharge performance test.

3.3 DEMONSTRATION

**************************************************************************
NOTE: Delete recording references if not required.
**************************************************************************

3.3.1 Instructing Government Personnel

Furnish the services of competent instructors to give full instruction to designated Government personnel in the adjustment, operation, and maintenance of the specified systems and equipment, including pertinent safety requirements as required. Instructors are to be thoroughly familiar with all parts of the installation and be trained in operating theory as well as practical operation and maintenance work. Provide instruction during the first regular work week after the equipment or system has been accepted and turned over to the Government for regular operation. Provide [8][_____] hours of instruction for [_____] personnel.[ When more than 4 man-days of instruction are specified, use approximately half of the time for classroom instruction. Use other time for instruction with equipment or system. When significant changes or modifications in the equipment or system are made under the terms of the contract, provide additional instructions to acquaint the operating personnel with the changes or modifications.][record the field training with the recording left with the Contracting Officer.][ Provide a factory training video or [on-line training] as part of the training materials.]

3.4 FINAL ADJUSTMENTS

a. Remove load bank and reconnect system for normal operation.

b. Equalize battery per manufacturer instructions.

**************************************************************************
NOTE: Delete this paragraph if battery is sealed (valve regulated) type.
**************************************************************************

[c. Bring electrolyte level of all cells up to the bottom of the high level line by adding original filling gravity electrolyte.]

d. Resume charging battery at normal float voltage as defined by battery
manufacturer recommendations.

e. Prior to charging, check battery connections are properly torque to manufacturer's specifications. Take and record, for cell-to-cell and terminal connections, detailed micro-ohm resistance readings. Remake connections having a resistance of more than 10 percent above the average.

f. Deliver all manufacturer's data and operation manuals, which are an integral part of, and shipped with UPS, to Contracting Officer.

3.5 NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.6 FIELD APPLIED PAINTING

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Painting is to comply with Section 09 90 00 PAINTS AND COATINGS.

NOTE: This guide specification covers the requirements for metal-enclosed shunt capacitor equipment. Ensure drawings show voltage and kilovar ratings and mounting and connection details.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: If Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS is not included in the project specification, insert applicable requirements therefore and delete and the following paragraph.

Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS applies to work specified in this section.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in
the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2017; ERTA 1-2 2017; TIA 17-1; TIA 17-2; TIA 17-3; TIA 17-4; TIA 17-5; TIA 17-6;
1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY
REPORTING. Submit the following in accordance with Section 01 33 00
SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Fabrication Drawings; G[,[___]]
   Installation Drawings; G[,[___]]

SD-03 Product Data
   Metal-Enclosed Shunt Capacitor Equipment; G[,[___]]
   Pole Line Capacitors; G[,[___]]

1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory
provisions to be mandatory, as though the word, "shall" had been
substituted for "should" wherever it appears. Interpret references in
these publications to the "authority having jurisdiction," or words of
similar meaning, to mean the Contracting Officer. Ensure equipment,
materials, installation, and workmanship are in accordance with the
mandatory and advisory provisions of NFPA 70, IEEE C2 unless more stringent
requirements are specified or indicated.

1.3.2 Qualifications

Provide materials and equipment that are products of manufacturers
regularly engaged in the production of such products which are of equal
material, design and workmanship. Provide products which have been in
satisfactory commercial or industrial use for 2 years prior to bid
opening. Ensure the 2-year period includes applications of equipment and
materials under similar circumstances and of similar size. Ensure the
product has been on sale on the commercial market through advertisements,
manufacturers' catalogs, or brochures during the 2-year period. Where two
or more items of the same class of equipment are required, these items
must be products of a single manufacturer.

<TAI OPT=RCBEA>1.3.3 Predictive Testing and Inspection Technology
Requirements

******************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I)
tests prescribed in Section 01 86 26.07 40
RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all NASA assets and systems identified as Critical, Configured, or Mission Essential. If the system is non-critical, non-configured, and not mission essential, use sound engineering discretion to assess the value of adding these additional test and acceptance requirements. See Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information regarding cost feasibility of PT&I.

This section contains systems and equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with RCBEA GUIDE to ensure building equipment and systems installed by the Contractor have been installed properly and contain no identifiable defects that shorten the design life of a system and its components. Satisfactory completion of all acceptance requirements is required to obtain Government approval and acceptance of the Contractor's work.

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

</TAI>1.4 DELIVERY, STORAGE, AND HANDLING

Handle and store equipment in accordance with manufacturer's instructions. Deliver materials to site in unopened cartons or bundles as appropriate, clearly identified with manufacturer's name, Underwriter's or other approved label, grade or identifying number.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide Power Factor Correction (PFC) equipment as a self-contained, automatically and manually-controlled self-protecting capacitor bank [in self contained enclosure] [modified for the specified enclosure construction]. Ensure the equipment allows automatic or manual switching of the capacitor bank kilovolt ampere reactive (kVAR) in minimum of [25][50][ ] kVAR per step for a total of [three][twelve][twenty-four][ ] steps when fully expanded to the total capacity from or to the bus for power factor correction. Connect the PFC equipment to the switchgear with cable connection through a separate circuit breaker.

2.2 FABRICATION

2.2.1 Drawings

Submit fabrication drawings for the fabrication and assembly performed in the factory. Ensure drawings show all connections and detail the relations and connections of the equipment by showing the general physical layout of all controls, the interconnection of one system (or portion of system) with another, and internal tubing, wiring, and other devices.

2.2.2 Corrosion Prevention
NOTE: For all outdoor applications and all indoor applications in a harsh environment refer to Sections 09 96 00 HIGH-PERFORMANCE COATINGS or 09 90 00 PAINTS AND COATINGS. High performance coatings are specified for all outdoor applications because ultraviolet radiation will break down most standard coatings, causing a phenomena known as chalking, which is the first stage of the corrosion process. For additional information contact The Coatings Industry Alliance, or specific suppliers such as Keeler and Long and PPG, and NACE International (NACE).

**************************************************************************

Protect metallic materials against corrosion. Ensure equipment has the standard finish by the manufacturer when used for most indoor installations. For harsh indoor environments (any area subjected to chemical and/or abrasive action), and all outdoor installations, refer to Section [09 96 00 HIGH-PERFORMANCE COATINGS][09 90 00 PAINTS AND COATINGS].

2.3 EQUIPMENT

Submit catalog data and equipment and performance data for the following items including life, test, system functional flows, safety features, and mechanical automated details.

[2.3.1 Metal-Enclosed Shunt Capacitor Equipment]

Ensure metal-enclosed shunt capacitor equipment for connection to 2,400-, 6,900-, and 13,200/13,800-volt, three-phase, 60-hertz circuits consists of a complete assembly of capacitor units including buses, connectors, current-limiting fuses, ventilating fans, switching devices, and controls housed in a weatherproof NEMA [3R][4X] metal enclosure in accordance with IEEE 18. Provide control and protective devices in accordance with Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

Provide capacitor units consisting of [self-healing] polypropylene film and aluminum foil sections with series-parallel connections and discharge resistors contained in hermetically sealed welded steel cases with mounting flanges, immersed in a nonflammable liquid dielectric impregnant. Provide capacitor housings constructed with bonded zinc-coated steel that is resistant to corrosion, weather, and abrasion. Seal two insulating bushings with clamp tunnel connectors to the case of each unit, electrically connected to the capacitor section assembly. Ensure capacitors comply with UL 810 and NFPA 70 and characteristics of capacitor bushings are in accordance with IEEE 18. Provide discharge resistors that reduce the residual voltage of the capacitor unit to [50][_____] volts or less within 5 minutes after disconnection from the source of supply. Each capacitor has an individual insulating fuse. Ensure capacitors operate satisfactorily at 135 percent of rated kVAR, 110 percent of rated voltage, and at ambient temperatures between minus 40 degrees to plus 46 degrees C minus 40 degrees to plus 115 degrees F. Ensure voltage and kVAR ratings for enclosed outdoor capacitor units rated at 60-hertz is in accordance with IEEE 18.

Ensure that capacitors for harmonic filter application or systems with high harmonic content have the following characteristics: EXTREME duty rating 55 degree C, 131 degree F temperature rating, 125 percent continuous
over-voltage capability, 15kA fault handling capability, 100KA transient current withstand capability, and meets IEEE 18.

For power entrance compartments, include an insulated phase and neutral bus, a short-circuiting and grounding switch, and provisions for terminating underground cables.

Mechanically interlock short-circuiting and grounding switch with all capacitor compartment doors to prevent access to capacitor units unless phase and neutral buses are short circuited and grounded. Provide a key-interlocked short-circuiting and grounding switch with a remote circuit disconnecting and protective device to ensure the proper sequence of operation.

2.3.2 Pole Line Capacitors

Ensure pole line capacitors are power line, power factor connection type for 2.4 kilovolts (kV), 5 kV, and 13.2/13.8 kV, 60 hertz; located and installed as indicated. Provide pole supporting hardware that is hot-dip galvanized steel designed for NEMA standard capacitor units. Use corrosion resistant attachment hardware. Ensure poles supporting capacitors are greater than 200 millimeter 8 inches in diameter at the point of attachment.

2.3.3 Metal-Enclosed Low-Voltage Capacitors

Provide metal-enclosed capacitors for 600-volt circuits and below consisting of individual enclosed units with insulators, connectors, and hardware housed in a protective enclosure. Ensure individual cells are fused and provided with discharge resistors to reduce voltage to 50 volts or less in 1 minute. Include a current-limiting air-core inductor designed to limit the capacitor in-rush current to a value equal to or less than the capacitor switching rating. Brace inductors to withstand symmetrical short circuit current as indicated.

Ensure capacitor cells are of the self-healing type utilizing a low-loss metalized polypropylene film dielectric system with a UL-recognized pressure sensitive interrupter in each capacitor cell and are impregnated with a nonflammable (PCB-free) dielectric. Ensure capacitors comply with UL 810 and NFPA 70. Provide capacitor units in banks with welded, zinc coated, 1.6 millimeter, 14 gauge, steel. Use steel in accordance with ASTM A1008/A1008M. All other requirements are as required for high-voltage installation.

2.4 COMPONENTS

2.4.1 Enclosure

Place pad-mounted capacitor equipment in weatherproof, self-supporting, ventilated unit sheet metal compartments joined together to form a continuous structure with hinged access doors, base and roof sections, roof seam covers, and end trims. Provide flanged access doors that close against rubber or similar weatherproof gasketing material. Provide ventilated openings with filtered louvers and stainless steel screened vents. Equip doors with latches, stops, and door-locking mechanism. Ensure base section is unit construction and supports capacitor equipment 102 millimeter 4 inches][ 152 millimeter 6 inches] above the concrete foundation. Design the base for jacking and skidding. Provide lifting lugs for unloading and moving equipment.

Construct sheet metal enclosures from [cold-rolled carbon-steel sheets of
commercial quality with stretcher-level flatness not less than two (2.0) millimeter 12 gauge, in accordance with ASTM A1008/A1008M[[304][316] stainless steel in accordance with ASTM A240/A240M and ASTM A480/A480M as applicable]. Reinforce each compartment with structural members and weld members together. Grind welds to a smooth flat surface before painting. Provide capacitor equipment with a ground terminal for grounding the stationary structure and equipment.

Provide capacitor compartments with racks for mounting individual capacitor units in one, two, or three tiers, with not more than two rows of units per tier. Enclosures having one row of units per tier are accessible from one side only.

2.4.2 Buses

Provide phase and neutral buses for the connection to cables and capacitor units are bare rigid solid copper busbar of rectangular cross section, insulated from the enclosure. Ensure busbars are of ASTM B187/B187M solid copper and the contact surfaces of all main bus and cable tap connections are silver plated and bolted together to ensure maximum conductivity.

2.4.3 Fuses

Ensure each capacitor unit is individually fused with current-limiting fuses that have an short-circuit interrupting rating of 200,000 amperes minimum and provide visual indication of fuse operation.

2.4.4 Fans

Provide top of capacity compartments with thermostatically controlled fans for forced-air ventilation of capacitor units. Provide each enclosure section with two cooling fans. Select [115-volt][277-volt], single-phase, 60-hertz current fan motors that are individually fused or thermally protected. Ensure thermostats control the operation of fans within prescribed temperature limits.

2.5 FACTORY TESTING

Factory production tests on capacitor equipment include electrical and mechanical operational tests, capacitance tests, discharge resistor tests, leak tests, and dielectric strength tests. Ensure factory conducts dielectric tests in accordance with Testing Standards of IEEE 18 with 60-hertz withstand voltage rating equal to that of the switching device.

Certified copies of previous tests on similar equipment under actual conditions may be submitted for impulse tests, and short-circuit tests in lieu of factory tests on actual units furnished.

Submit factory test report containing results of all factory production tests.

PART 3 EXECUTION

3.1 INSTALLATION

Install and connect capacitor equipment in accordance with the manufacturer's installation instructions. Ensure proper ventilation is provided around all equipment.
Make ground connections to a driven ground rod or counterpoise, as indicated.

Submit installation drawings for the capacitor equipment. Include in drawings details of equipment [area][room] layout and design.

3.2 FIELD QUALITY CONTROL

3.2.1 Acceptance Testing

**************************************************************************
NOTE: If the specified system is identified as critical, configured, or mission essential, use Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS to establish predictive and acceptance testing criteria, above and beyond that listed below.
**************************************************************************

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

[ Disconnect main bus of high-voltage capacitor equipment from the circuit cables, and ground the capacitors and the equipment enclosure before conducting insulation and high-voltage tests.

] For the main bus of capacitor equipment, conduct an insulation-resistance test with a 5000-volt insulation test set for units 5 kV and above, 2,500-volt insulation-resistance test set for units 2.4 kV to 5 kV, and 1,000 volts for units 600 volts and below.

Apply tests for not less than 5 minutes and until three equal consecutive readings, 1 minute apart, are obtained. Record readings every 30 seconds during the first 2 minutes and every minute thereafter. Minimum acceptable resistance is 100 megohms.[

Upon satisfactory completion of the insulation-resistance test, subject main bus to a high-voltage DC (Hi-pot) test. Use a test voltage is equal to 75 percent of the factory test values and apply for 1 minute.]

Upon satisfactory completion of all bus testing, confirm the capacitor's value by performing a capacitance value test. Discharge the capacitor and measure the capacitance per the manufacturer's instructions. Satisfactory measurement is between 100 percent and 110 percent of nameplate. Values between 90 percent and 100 percent, and 110 percent and 120 percent require investigation. Values outside these limits indicate shorted groups of internal layers and the capacitor is considered defective.

Upon satisfactory completion of the capacitance test, subject the capacitor to a dielectric strength test using a DC voltage of 75 percent of the original factory test voltage. Test voltage should be held for 10 seconds. During application of test voltage listen for any indication of internal arcing. If any arcing is heard the unit is defective.

Upon satisfactory completion of the dielectric test, remeasure the capacitance of the capacitor to insure no damage had occurred during the dielectric test. Results cannot vary more than the manufacturer's IEEE tolerance.
Final acceptance depends upon the satisfactory performance of the PFC equipment under test. Do not energize capacitor equipment until the recorded test data has been approved by the Contracting Officer. Submit acceptance test report to the Contracting Officer containing the results of all acceptance tests.

3.2.2 Operation and Maintenance

Provide operation and maintenance manuals with each assembly and include instruction leaflets, instruction bulletins and renewal parts lists where applicable, for the complete assembly and each major component.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the procurement, installation, and testing of 400 Hz solid state frequency converters.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: These converters are used to supply 400 Hz electrical power to aircraft and ships in shore facility environments. Typical applications include aircraft operating in flight line conditions or in hangars, avionics shops, laboratories, training buildings, flight simulators, and computer rooms. This specification is not to be used for procurement of power converters installed on board aircraft or ships. This specification is not intended for medium-voltage applications.

NOTE: The following information shall be shown on the project drawings:

1. Show location of all equipment including
converter, paralleling panels, remote monitoring and control panel.

2. Provide functional block diagram, single line diagrams, power, and control wiring interconnection diagrams, wiring diagrams, conduit entry diagrams, equipment elevations, limiting dimensions, and equipment ratings which are not covered in the specifications.

3. Design 400 Hz equipment rooms with working spaces as required by NFPA 70. Provide ventilation for equipment rooms based on 400 Hz components heat load generated when operating at 100 percent load. Provide 60 Hz convenience receptacles.

**************************************************************************

NOTE: Ensure that the 400 Hz distribution system is properly coordinated including the ratings of the power cables, ground cables, circuit breakers, transformers, filters, rectifiers, and control equipment. When replacing a motor generator set with a solid state converter ensure that the existing feeders circuit protective devices will operate properly without damage to electrical devices including the solid state converter.

**************************************************************************

1.3 SUBMITTALS

******************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that
the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Frequency Converter Drawings

Furnish scaled drawings of enclosure outline including front, top, side views, and overall dimensions. Provide external power and control wiring and cable connections. Provide single line, schematic, and wiring diagrams. Drawings shall include details of input and output circuit breakers, contactors, rectifiers, surge protectors, and control devices. Drawings shall include conduit entry and exit locations. If parallel operation is included, provide an interconnection diagram.

1.4.2 Qualifications of Manufacturer

**************************************************************************
NOTE: The experience clause in this section has been approved by a Level I Contracting Officer in accordance with the requirements of Naval Facilities Acquisition Supplement (NFAS). NFAS can be found at the following link: https://portal.navfac.navy.mil/portal/page/portal/navfac/navfac_forbusinesses. This clause may be used without further approval or request for waiver.
**************************************************************************

Submit a certification that the manufacturer has a minimum of five (5) years' experience in the design, manufacturing, and testing of 400 Hz solid state frequency converters at the same or equivalent kVA and voltage ratings for direct connection to aircraft electrical loads. When specifications require multiple converters operating in parallel, the manufacturer shall provide specific experience with equal or greater kVA rated converters.

The certification shall state that the manufacturer is experienced in manufacturing and testing solid state converters of an equivalent or greater kVA rating. Experience in manufacturing motor generator sets does not qualify as equivalent. Experience in manufacturing portable engine-driven 400-hertz power units does not qualify as equivalent. The manufacturer shall be experienced in producing units for installation in permanent buildings in environmentally closed spaces or in weatherproof enclosures as applicable. The manufacturer shall also document that converters are designed for connection to non-linear loads typically encountered in the aircraft and shipbuilding industries. The manufacturer shall furnish documented experience with converters in various environmental conditions including exterior flight line, hangar, and environmentally enclosed spaces within buildings.
1.4.3 **Work Plan**

Submit a written schedule of dates of routine and special factory tests, installation, field tests, and operator training for the converter system. Furnish a list of instrumentation equipment for factory and field test reports.

1.4.4 **Routine Factory Test Plan**

Submit 7 copies of test plans and procedures at least [21][_____] calendar days prior to the tests being conducted. Provide detailed description of test procedures, including test equipment and setups, to be used to ensure the converter meets the performance specification and explain the test methods to be used. As a minimum, the test procedures shall include the tests required under the paragraph ROUTINE FACTORY TESTS.

1.4.5 **Special Factory Test Plan**

Submit 7 copies of test plans and procedures with the Routine Factory Test Plan. Provide detailed description of test procedures, including test equipment and setups, used to ensure the converter meets the performance specification and explain the test methods used. As a minimum, the test procedures shall include the tests required under the paragraph SPECIAL FACTORY TESTS.

1.4.6 **Performance Test Plan**

Submit 7 copies of test plans and procedures at least [15][_____] calendar days prior to the start of field tests. Provide detailed description and dates and times scheduled for performance of tests, and detailed description of test procedures, including test equipment (list make and model and provide functional description of the test instruments and accessories) and setups of the tests to be conducted to ensure the converter meets the performance specification. Explain the test methods to be used. As a minimum, the test procedures shall include the tests required under the paragraph FIELD QUALITY CONTROL. Test reports shall include power quality measurement data collected in accordance with IEEE 1159.

1.4.7 **UL Listing**

Submit with the initial submittal to verify qualification of manufacturer. Frequency converter shall be identified with a UL or nationally recognized testing laboratory (NRTL) label prior to shipping.

1.4.7.1 **Currently Listed Products**

Submit UL or NRTL certification or UL file number for the actual frequency converter to be shipped.

1.4.7.2 **Proposed Listed Products**

Submit UL or NRTL certification or UL file number for same or similar rating or product size range of like design unit.

1.4.8 **Routine Factory Tests Report**

Submit within [45][_____] calendar days after completion of tests. Receive
approval of test prior to shipping unit. Certify tests were conducted on each converter in accordance with the requirements set forth in paragraph ROUTINE FACTORY TESTS and certify converter satisfactorily operated within specified limits. Report shall include copies of the test procedures, test data, and results.

1.4.9 **Special Factory Tests Report**

Certify tests were conducted on a converter of the same design, construction and kVA and voltage rating to be provided and in accordance with the requirements set forth in paragraph SPECIAL FACTORY TEST and certify converter operated without malfunctioning within specified limits. Report shall include copies of the test procedures, test data, and results.

1.4.10 **Performance Tests Report**

Submit report of test results as specified by paragraph FIELD QUALITY CONTROL within [15][_____] calendar days after completion of tests. Certify tests were conducted on each converter in accordance with the paragraph FIELD QUALITY CONTROL and certify converter satisfactorily operated within specified limits. Report shall include copies of the test procedures, test data, and results.

1.5 **MAINTENANCE**

1.5.1 **Operation and Maintenance Manuals**

Submit frequency converter operation and maintenance manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.5.1.1 **Additions to Operation and Maintenance Manuals**

In addition to requirements of Data Package 5, include the following on the actual frequency converter provided:

- a. A "one-line diagram" from service entrance to 400 Hz utilization panel or point.

- b. A weatherproof, tear-resistant plastic data sheet with operating instructions for each unit including startup, shutdown[, and paralleling] procedures.

- c. Routine and field acceptance test reports.

- d. UL or NRTL certification or UL file number.

1.5.1.2 **Preliminary Operation and Maintenance Manuals**

Prior to scheduling Field Performance Tests, 2 copies of a Preliminary Operation and Maintenance Manual must be submitted to and approved by the Contracting Officer.

1.5.1.3 **Extra Material**

**************************************************************************

**NOTE: Delete ventilation system filters except for frequency converters located outdoors or in areas subject to a high level of airborne contaminants.**

**************************************************************************
Furnish recommended manufacturer's spare parts list and schedule of prices for each type of converter and other equipment specified in this section. This list shall include the following:

a. Power semi-conductors  
b. Power filter capacitors  
c. Plug-in logic cards  
d. Output switching modules  
e. Fuses  
f. Indicator lamp/LED  
g. Ventilation system filters

PART 2 PRODUCTS

2.1 FREQUENCY CONVERTER

**************************************************************************
NOTE: Do NOT edit this paragraph to specify the type of power supply, rectifier type or switching technology to be utilized. Specifying this type of technology may make this a sole source specification which requires justification and approval per federal contract law.
**************************************************************************

Provide frequency converter consisting of modular construction solid-state components for [50][60] to 400 Hz conversion, input/output devices, and ancillary control devices. Frequency converter shall be a standard product of the manufacturer and shall be the manufacturer's latest design that complies with the specification requirements. The 400 Hz frequency converters provided under this contract shall be products of the same manufacturer. The unit shall have a calculated MTBF exceeding [24,000][_____] hours as calculated when the converter is provided with yearly servicing and maintenance. The converter shall be UL or third party listed to comply with UL 1012. Circuit breakers operating at 400 Hz shall be designed and UL tested for 60 Hz operation and derated for 400 Hz operation. Provide startup and shutdown instructions posted on the front of the unit using engraved plastic plate. Provide a plastic encapsulated schematic diagram attached to the inside of the unit in clear view of maintenance personnel.

2.1.1 Electrical Characteristics

2.1.1.1 Input Voltage

**************************************************************************
NOTE: For units 15 kVA and below the input voltage should be 208 volts and for units over 15 kVA the preferred input voltage is 480 volts. Using input voltage other than 480 volts will increase the cost and weight and decrease the efficiency of the converter. The input voltage shall be shown on the...
construction drawings.

[480Y/277][208Y/120][380Y/220][_____] V, three phase, four wire, grounded, [60][50] Hz. Converter shall provide rated output voltage when input voltage is varied plus or minus [10][_____] percent. Input neutral currents shall not exceed [21][_____] percent of any individual phase current at no load and at full load.

2.1.1.2 Input Power Factor

Between 0.8 lagging and unity, under all conditions of steady state line and load variations specified herein.

2.1.1.3 Surge Protection

**************************************************************************

NOTE: Select Location Category C for outdoor locations only.

**************************************************************************

The converter shall be capable of sustaining an input surge described in and tested in accordance with UL 1449, and IEEE C62.41.1 and IEEE C62.41.2, Location Category [B][C], and continue to operate with no alarms within the specified tolerance.

2.1.1.4 Inrush Current

The inrush current shall not exceed 100 percent of the rated full load input current. Inrush current limitation is based on a frequency converter that does not require a transformer at the input to the unit. Should the contractor choose to provide a frequency converter with a transformer at the input to the unit, the contractor shall be responsible for increasing the size of the upstream feeder breaker(s) and increasing the size of conductors and raceways in accordance with NFPA 70.

2.1.1.5 Input Current Distortion

**************************************************************************

NOTE: Where total connected frequency converter load is a small percentage (less than 40 percent) of the total connected facility load, use 12 percent THD and 8 percent individual. For large frequency converters (i.e. 312 kVA or larger) or where total connected frequency converter load is a significant percentage of the total connected facility load, use 5 percent THD and 3 percent individual. For installation in shipboard environments, use 5 percent THD and 3 percent individual.

**************************************************************************

Input current THD shall not exceed [12][5]-percent of the fundamental with nominal input voltage at full load. Individual harmonic content shall not exceed [8][3]-percent of the fundamental.

2.1.1.6 Output Voltage

**************************************************************************

NOTE: Use MIL-STD-704, when 400 Hz power is
required to power aircraft avionic equipment. Aircraft equipment is normally operated 200Y/115 V, three-phase, 400 Hz, grounded. UFC 3-555-01N, "400 Hertz Medium Voltage Conversion/Distribution and Low Voltage Utilization Systems" contains aircraft electrical demand loads.

Use MIL-STD-1399-300, when 400 Hz power is required to power laboratory test benches simulating shipboard environments. Shipboard equipment in simulated shore laboratory environments normally operated on a 440 V, three-phase, 400 Hz, ungrounded system.

*******************************************************************************
[200Y/115 V, three phase, 400 Hz, grounded] [440 V, three phase, 400 Hz, delta connected ungrounded] system. [Adjustable to plus or minus 10 percent of the rated voltage.] The limits overvoltage and undervoltage shall be [as defined in MIL-STD-704] [as defined in MIL-STD-1399-300 Type [II][III] power] [plus or minus [2] [_____] percent]. The phase rotation of the output voltage shall be clockwise sequence of [A-B-C] [AB-BC-CA]. Converters shall be designed for compatibility with ship and aircraft power monitors complying with MIL-PRF-24021.

2.1.1.7 Power Output

*******************************************************************************
NOTE: Unit that will be used for providing power for aircraft should be sized for the type and number of aircraft to be supplied. The recommended sizes for units supporting aircraft are 45, 60, 90, 120, 150, 180 or 312 kVA for legacy systems.

*******************************************************************************
[_____] kVA at 0.8 power factor lagging.

2.1.1.8 Load Range

Operate into a linear load with a power factor between 0.5 lagging and 0.8 leading and into a non-linear load with not less than 15 percent current THD, composed of not less than 6 percent of the 3rd harmonic and not less than 7 percent of the 5th harmonic.

2.1.1.9 Efficiency

*******************************************************************************
NOTE: Use the table below to fill in the kVA and minimum efficiency.

<table>
<thead>
<tr>
<th>Rating (kVA)</th>
<th>50 Percent Load</th>
<th>100 Percent Load</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 - 14</td>
<td>80</td>
<td>90</td>
</tr>
<tr>
<td>15 - 39</td>
<td>86</td>
<td>90</td>
</tr>
</tbody>
</table>

Minimum Percent Efficiency
### Minimum Percent Efficiency

<table>
<thead>
<tr>
<th>Rating (kVA)</th>
<th>50 Percent Load</th>
<th>100 Percent Load</th>
</tr>
</thead>
<tbody>
<tr>
<td>40 - 99</td>
<td>87</td>
<td>91</td>
</tr>
<tr>
<td>100 - up</td>
<td>89</td>
<td>92</td>
</tr>
</tbody>
</table>

Adding EMI filtering for units with power rating larger than 15 kVA, will reduce the efficiency of the unit. If EMI filtering is specified for units with power rating larger than 15 kVA, reduce minimum efficiency by 2 percent.

The [_____] kVA units shall have a minimum efficiency of [_____] at 50 percent load and [_____] at 100 percent load. For a frequency converter that requires a transformer at the input to the unit, reduce the specified efficiencies by 2 percent.

#### 2.1.1.10 No Load Input Losses

**NOTE:** Above 30 kVA, use 7 percent, below 30 kVA, use 9 percent.

The frequency converter shall have no-load input losses no greater than [7][9][_____] percent of the output kW rating. For a frequency converter that requires a transformer at the input to the unit, increase the specified no load input losses by 2 percent.

#### 2.1.1.11 Overload

Satisfactory overload operating time is based on no more than one overload in any 4 consecutive hours of operation:

<table>
<thead>
<tr>
<th>Percent of Full Load</th>
<th>Satisfactory Operating Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>110 percent</td>
<td>60 minutes</td>
</tr>
<tr>
<td>125 percent</td>
<td>5 minutes</td>
</tr>
<tr>
<td>150 percent</td>
<td>2 minutes</td>
</tr>
<tr>
<td>200 percent</td>
<td>20 seconds</td>
</tr>
</tbody>
</table>

After minimum operating time is achieved, unit shall interrupt output power. Unit shall be capable of sustaining the overload without damage until the protective device interrupts the overload.

#### 2.1.1.12 Short Circuit

When [a bolted line-to-ground fault,] a bolted line-to-line fault, or a bolted three phase fault is applied to the unit, unit shall be capable of
sustaining the short circuit current without damage until the protective device interrupts the fault.

2.1.1.13 Output Voltage THD

a. Balanced load:

(1) Output voltage THD: Not to exceed [3][_____] percent line-to-line and line-to-neutral for linear loads as specified in the paragraph LOAD RANGE.

(2) Output voltage THD: Not to exceed [5][_____] percent line-to-line and line-to-neutral for non-linear loads as specified in the paragraph LOAD RANGE.

(3) Maximum single harmonic distortion: Not to exceed [2][_____] percent of the fundamental at the nominal voltage for linear loads as specified in the paragraph LOAD RANGE.

(4) Maximum single harmonic distortion: Not to exceed [3][_____] percent of the fundamental at the nominal voltage for non-linear loads as specified in the paragraph LOAD RANGE.

b. Unbalanced load: Output voltage THD not to exceed 4 percent, line-to-neutral with 15 percent unbalanced linear load.

2.1.1.14 Output Voltage Amplitude Modulation

Output voltage amplitude modulation shall not exceed 1/2 percent of nominal voltage at no load to full load.

2.1.1.15 Frequency Stability

Control output frequency of the 400 Hz converter within plus or minus 0.5 percent for all operating conditions, including maximum and minimum specified input voltages, ambient temperature and relative humidity. The frequency regulation shall operate independent of supply frequency and load changes.

2.1.1.16 Phase Angle Regulation

Displacement angle between adjacent voltage phases shall be 120 degrees plus or minus 2 degrees with balanced load and plus or minus 4 degrees with three phase 15 percent unbalanced load. A 15 percent unbalanced load is defined as:

a. Phase A at full rated single phase load.

b. Phase B at 85 percent of Phase A.

c. Phase C at 85 percent of Phase A.

2.1.1.17 Transient Output Voltage Recovery

**************************************************************************
NOTE: Use MIL-STD-704, when 400 Hz power is required to power aircraft avionic equipment.

Use MIL-STD-1399-300, when 400 Hz power is required
to power shipboard equipment.

[In accordance with MIL-STD-704.][In accordance with MIL-STD-1399-300 for Type [II][III] power.]

2.1.2 Environmental Rating

NOTE: Select 55 degrees C ambient temperature rating unless in areas subject to extreme temperatures (i.e. Middle East, desert environments, etc.)

The converter shall operate from no load to rated full load under the following conditions:

a. Ambient temperatures ranging from 0 degrees C to [55][60][65] degrees C.

b. Relative humidity from [0 to 95] [%] percent noncondensing.

c. Ambient pressures from sea level to [915] [_____] meters [3,000] [_____] feet.

2.1.3 Monitoring and Control Panel

Provide converter with a control panel that is equipped with the following controls, indicators, instrumentation, data logging, diagnostics, and alarm functions.

2.1.3.1 Controls

a. Start/stop pushbutton.

b. Lamp/light emitting diode (LED) test - A push-to-test button or switch to test indicator lamps/LEDs.

c. Alarm reset.

d. Emergency power off - A separate pushbutton for emergency power off.

e. Circuit breaker.

f. Output contactor ON/OFF

[g. Output voltage adjust.

2.1.3.2 Indicators

a. Input power available - Lamp/LED to indicate that the supply voltage is available.

b. Output power On/Off - Lamp/LED to indicate that the converter output voltage is available.

c. System alarm - Lamp/LED to indicate that a fault has been detected. This indicator shall be latched in the "ON" position whenever an alarm condition described in paragraph ALARM ANNUNCIATOR, is detected and
shall remain "ON" until the alarm reset pushbutton is pressed.

d. Indicating lamp/LED to indicate that the alarm silence switch is in the
disable position.

e. Elapsed time meter (hours)

f. Output contactor "ON".

g. Aircraft interlock bypass - Lamp/LED to indicate that the Aircraft
Interlock has been bypassed.

2.1.3.3  Digital Instrumentation

**************************************************************************
NOTE: For delta output frequency converters, delete
phase-to-neutral voltage and neutral current display
requirements.
**************************************************************************

Provide true rms, plus/minus one percent accuracy, microprocessor-based
meter with a simultaneous three-line LCD display

Provide a digital display that has, at a minimum, the following functions:

a. Output phase-to-phase voltage.
b. Output phase-to-neutral voltage.
c. Output phase current.
d. Output neutral current.
e. Output frequency.

2.1.3.4  Alarm Annunciator

The unit shall be capable of detecting and displaying the following
abnormal conditions:

a. Input overvoltage.
b. Input undervoltage.
c. Output undervoltage.
d. Output overvoltage.
e. Output overload.
f. System alarm.
g. Control logic failure.
h. Overtemperature.
i. Logic power supply failure.
2.1.4 Input/Output Devices

Provide fully-rated, three-pole, UL approved devices for control of 50 Hz input and 400 Hz output from the converter. Devices and cables operating at 400 Hz shall be derated in accordance with IEEE 519.

2.1.4.1 Circuit Breaker

Conform to requirements of UL 489. Units operating at 400 Hz shall be derated for 400 Hz operation.

2.1.4.2 Input Circuit Breaker

Provide converter with a UL listed input circuit breaker as an integral part of the converter. Breaker shall be operable from the front of the converter. Breaker shall have a short-circuit current rating of [_____] amperes symmetrical minimum.

2.1.4.3 Output Contactor

Provide converter output with an automatic magnetically-held contactor with interlock circuit. Output contactor shall be of sufficient capacity to handle rated load, overload, and available short circuit current. Contactor shall open when any circuit identified in the paragraph PROTECTIVE CONTROL causes the system to shut down. Output contactor shall be electrically interlocked with ON/OFF circuitry so that when the frequency converter is shut down, the contactor shall open immediately and remain open. [Conform to the requirements of IEC 60947-4-1.]

2.1.4.4 Output Circuit Breaker

******************************************************************************
NOTE: Add output circuit breaker only if frequency
converter is supplying downstream distribution
panelboard or multiple outputs with distribution
internal to the frequency converter.
******************************************************************************

Provide converter output with a non-automatic manual circuit breaker with appropriate frame size and a shunt trip coil derated for 400 Hz operation. Circuit breaker shall be tripped by the unit's OFF circuit [local or remotely activated] and when any circuit identified in the paragraph PROTECTIVE CONTROL causes the system to shut down. Output breaker shall be operable from the front of the unit.

2.1.4.5 Aircraft Interlock Circuit

******************************************************************************
NOTE: Coordinate with specified aircraft cable assembly.
******************************************************************************

Interlock circuit shall determine the presence or absence of the 28 VDC feedback signal from the aircraft. Interlock circuit shall not allow the output disconnect to close if the 28 VDC signal is not present. If the output disconnect is closed when the 28 VDC is lost, the disconnect shall open within 2 seconds. Converter shall contain terminal block points for the connection of two 12 AWG wire from the aircraft cable assembly for the interlock circuit. Interlock circuit shall not draw more than 20
milliamperes from the aircraft's 28 VDC circuit. For testing purposes, provide a switch inside the converter with two positions:

a. Normal - For aircraft loads.

b. Bypass - For testing with dummy load or no load, or for use with aircraft with no 28 VDC.

2.1.5 Protective Controls

Provide circuitry for the following protective controls.

a. Input undervoltage.

b. Input overvoltage.

c. Loss of phase.

d. Loss of input power.

e. Door interlock - When any access door is opened, the interlock circuitry shall open the [60][50] Hz input device [and 400 Hz output device] and not allow the input [or output] device to close. For maintenance purposes, provide a bypass switch to defeat the interlock circuitry.

f. Output overvoltage - Protect by tripping output devices for instantaneous overvoltage of 30 percent or more and for 10 to 30 percent overvoltage lasting more than 0.25 second.

g. Output undervoltage - Protect by preventing the closing of the output disconnect until the output voltage is 95 percent of the rated output. If, after closing, the voltage decreases to below 90 percent for longer than 5 seconds, provide relaying to trip output devices utilizing a field-adjustable time-delayed circuit with a range of 4 to 10 seconds.

h. Output frequency - Protect by tripping output devices for frequency change in excess of plus or minus 5 percent of the rated output frequency (400 Hz).

i. Output overload.

j. Converter overtemperature protection.

2.1.6 Electromagnetic Interference Limits

**************************************************************************
NOTE: This is an additional cost item and reduces converter efficiency. EMI filtering should not be specified unless specifically requested by the user.
**************************************************************************

Comply with MIL-STD-461 for Class A equipment.

2.1.7 Automatic Line Drop Compensation

Provide automatic line drop compensation - 0 to 7 percent adjustable internally.
[2.1.8] Paralleling

**************************************************************************
NOTE: This is an additional cost item and should not be specified unless specifically requested by the user.
**************************************************************************

Provide frequency converter capable of being paralleled. Paralleled units shall be same manufacturer and model number. Regulate and control units operated in parallel by a master unit. Design controls associated with paralleling of the units such that each frequency converter can operate as a stand alone unit, or as either a slave or master unit in a parallel system. Units shall parallel and synchronize within a 50 millisecond recovery time. Share the total load equally within plus or minus [_____] percent by each unit. [Provide manual paralleling which permits a paralleled unit to be added or removed from the system without interrupting the operation of other units.]

[2.1.9] Auto Restart

**************************************************************************
NOTE: Auto restart should be considered when the converter is installed in a remote location that is not readily accessible to operating personnel and maintaining 400 Hz power is critical to operations. Use of auto restart should be studied carefully to ensure that it does not create a potential personnel safety hazard. This is an additional cost item and should not be specified unless specifically requested by the user.
**************************************************************************

After a total input power outage the unit shall be capable of automatically restarting and re-energizing loads upon restoration of normal power. Provide units with a manual/auto restart switch. If this requirement requires a backup battery power supply this shall be provided. When interlock circuit has been interrupted or when interlock is in the maintenance position manual restart, the system should not restart.

[2.1.10] Built-In Test Equipment

Frequency converter shall include built-in test equipment which monitors both primary circuits and protection circuits of the unit. Provide visual indication to assist diagnosis of unit failures to a modular level. Provide visual indication of converter status using cabinet mounted light emitting diodes.

Provide Class 180 power magnetic transformer and inductors in accordance with NEMA ST 20 and UL 506. The limits of Class 180 shall not be exceeded at the maximum specified ambient temperature and at 100 percent load.

[2.1.12] Acoustical Noise

**************************************************************************
NOTE: The following table serves as a guide for establishing the maximum allowable sound pressure
**************************************************************************

SECTION 26 35 43 Page 21
level for each kVA rating. The designer should take into consideration that converters are inherently noisy when locating the unit. Do not modify these values unless required by the location of the frequency converter and new values have been confirmed by manufacturer as attainable. If values different than shown below are used, include acoustical noise test in Special Factory Tests.

<table>
<thead>
<tr>
<th>Maximum Allowable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rating (kVA)</td>
</tr>
<tr>
<td>5 - 14</td>
</tr>
<tr>
<td>15 - 39</td>
</tr>
<tr>
<td>40 - 99</td>
</tr>
<tr>
<td>100 - 249</td>
</tr>
<tr>
<td>250 - up</td>
</tr>
</tbody>
</table>

Maximum continuous acoustical noise level shall be [_____] dBa (A weighted scale).

2.1.13 Assembly Construction

NOTE: Delete "louvers" when specifying NEMA Type 4X and 12K enclosures.

Provide enclosures suitable for [indoor][outdoor][corrosive][direct spray][____] environments in accordance with NEMA 250, Type [1][3][3R][4X][12K]. Arrange to provide required [louvers,] cooling air, entry and exit provisions for equipment within enclosures. Construct unit(s) so that components, with the exception of control and monitoring components, are totally enclosed within the enclosure. Electronic circuits including power circuits shall be modular construction readily accessible for maintenance, repair and module replacement from the exterior of the enclosure. [For units installed outdoors or in corrosive environments, electronic circuits shall be enclosed in a sealed electronics compartment that is not provided with direct cooling ventilation or forced air cooling. ]Provide permanent identification tags for wiring. Uniquely identify each wire. Use the same identification system in the wiring diagrams in the Operation and Maintenance Manual. Provide each enclosure with a finish coat over a substrate which has been provided with a rust inhibiting treatment. [Provide two finish coats for outdoor enclosures.] Color shall be the manufacturer's standard color.

2.1.14 Nameplates

As specified in Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS.
[2.2 AIRCRAFT POWER CABLE ASSEMBLY]

**************************************************************************
NOTE: Coordinate cable assembly requirements with unit voltage requirements and aircraft requirements. Provide 300 ampere cable for converters 90 kVA and above. Provide 260 amperes cable for converters smaller than 90 kVA.
**************************************************************************

[For 400 Hz wiring at 200Y/115 volts, provide 7-conductor type cable configured as 6 phase conductors (2xA, 2xB, 2xC) tightly wound around the center located neutral, twisted and jacketed in accordance with SAE AS5756/6 rated for [300] [260] amperes.] [For 400 Hz wiring at 575 volts, 3-phase delta, provide 7-conductor type cable configured as 6 phase conductors (2xA, 2xB, 2xC) tightly wound around the center located ground, twisted and jacketed in accordance with SAE AS5756/6.] Cable length must be [27 meters] [_____] [90 feet] [_____] . Provide control cabling included within the jacket for interlock circuit and automatic line drop compensation. Terminate control wiring on accessible terminal blocks in unit. Provide cable assembly with integrally molded 400 Hertz male connector aircraft plug in accordance with MS 25486-17. Cable/connector assembly shall be suitable for severe duty. Contact terminations shall be crimped.

[2.3 REMOTE MONITORING AND CONTROL PANEL]

**************************************************************************
NOTE: Delete this paragraph unless plans clearly indicate requirement for remote monitoring and control panel.
**************************************************************************

Provide remote monitoring and control panel and circuitry. Connect to clearly and permanently labeled terminal blocks located inside the converter's enclosure. Provide the circuitry such that indicator lamp/LED information and control function(s) can be extended from the terminals to a remote location in the future.

a. Pushbutton or switch for de-energizing the output terminals.

b. Indicator lamp/LED showing the unit status (energized or not energized).

c. Indicator lamp/LED showing the output circuit breaker position (open or closed).

d. System alarm.

[2.4 SOURCE QUALITY CONTROL]

2.4.1 Converter Test Schedule

The Government reserves the right to witness tests. Provide frequency converter test schedule for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

Test Instrument Calibration.
a. The manufacturer shall have a calibration program which assures that all applicable test instruments are maintained within rated accuracy.

b. The accuracy shall be directly traceable to the National Institute of Standards and Technology.

c. Instrument calibration frequency schedule shall not exceed 12 months for both test floor instruments and leased specialty equipment.

d. Dated calibration labels shall be visible on all test equipment.

e. Calibrating standard shall be of higher accuracy than that of the instrument tested.

f. Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

(1) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

(2) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

2.4.2 Routine Factory Tests

**************************************************************************
NOTE: Coordinate line drop compensation option with power cable assembly requirements.
**************************************************************************

Routine tests shall be performed by the manufacturer on each of the actual frequency converter(s) prepared for this project to ensure that the design performance is maintained in production. [As an exception, automatic line drop compensation shall be tested on only one unit on multiple unit orders.] Submit test reports, by serial number and receive approval before delivery of equipment to the project site.

For tests which require full load, use 1.0 power factor unless otherwise noted. All measurements shall be true RMS measurements. Measurements shall be obtained in accordance with IEEE 1159. Tests shall include the following:

a. Input current and power factor: Operate converter at low, nominal and high input voltage at full load. Measure and record input voltage, input power factor and input current in each phase [and neutral if the neutral conductor is connected to the converter input.]

b. Output voltage, output voltage THD, output current, output power factor, and voltage regulation: Operate converter at nominal input voltage for:

(1) 50 percent of rated capacity with 0.8 lagging power factor linear load.

(2) 100 percent of rated capacity with 0.5 lagging power factor, 0.8 lagging power factor, 1.0 power factor, and 0.8 leading power
factor linear loads.

(3) 50 percent of rated capacity with the non-linear load as specified in the paragraph LOAD RANGE.

(4) 100 percent of rated capacity at low and high input voltage.

(5) 100 percent of rated capacity with the non-linear load as specified in the paragraph LOAD RANGE.

Operate for not less than 10 minutes at each test condition in (1), (2), (3) and (4) above and not less than 30 minutes at test condition in (5) above. Monitor and record output voltage, output voltage THD, output current, output current waveform, output power factor and frequency at the beginning and end of each test condition. Monitor and record output voltage single harmonic distortion for each test condition in (2) and (5) above at the beginning and end of each test condition. Verify output remains within specified regulation limits.

c. Efficiency: Operate at nominal input voltage at half load and full load at 1.0 power factor. Measure and record input voltage, input current, input power factor, output voltage, output current, and output power factor. Calculate the unit efficiency.

d. No load losses: Operate at no load and nominal input voltage. Measure and record input voltage, input current, input power, input power factor, and output voltage.

e. Burn-in Test: Before delivery, burn-in all units [under full load conditions for at least [24][_____] hours] by cycling units [6][_____] hours "ON" under full load conditions and [3][_____] hours "OFF" at no load conditions for at least [4][_____] complete "ON" cycles. Burn-in test shall be performed with the converter enclosure doors closed and all ventilation in the final operating condition.

f. Include harmonic frequency spectrum analysis depicting Harmonic Order and Harmonic Magnitude at the unit's input and output terminals during full load THD test in test reports.

g. Automatic line drop compensation: Operate converter at nominal voltage at:

(1) No-load.

(2) 50 percent of rated capacity with a 0.8 lagging power factor linear load.

(3) 50 percent of rated capacity with the specified non-linear load.

(4) 100 percent of rated capacity with a 0.8 lagging power factor linear load.

(5) 100 percent of rated capacity with the specified non-linear load.

Loads shall be connected to the converter with the specified aircraft power cable assembly. No adjustments to the frequency converter shall be allowed between load tests. Monitor and record output voltage at the load end of the cable. Verify specified
performance of the line drop compensation.

2.4.3 Special Factory Tests (Design Tests)

**************************************************************************
NOTE: Delete acoustical noise test unless frequency converter is installed in special locations such as test laboratories or other confined spaces.
**************************************************************************

Submit special factory test (design test) reports (complete with test data, explanations, formulas, and results), in the same submittal package as the catalog data and drawings for [each of] the specified frequency converter(s). Tests shall be certified and signed by a registered professional engineer. Tests shall be on file based on a production model of converters of the same design, construction and kVA rating provided.

As an option, the manufacturer shall test [one][_____] unit[s] at the same time scheduled for routine tests, of each rating and size converter to assure compliance with the specification. For all tests which require full load, use 1.0 power factor unless otherwise noted. The tests shall include the following:

**************************************************************************
NOTE: Select Location Category C for outdoor locations only.
**************************************************************************

a. Surge protection: Apply input surges in accordance with IEEE C62.41.1 and C62.41.2, Location Category [B][C] and monitor output. Conduct a minimum of three consecutive successful tests on each unit listed. Confirm there is no interruption to 400 Hz output power and voltage stays within specified regulation tolerances. Surge protection tests shall be applicable on all frequency converter units utilizing same surge protection device by manufacturer and part number regardless of frequency converter kVA size.

b. Inrush current: After applying power to the converter, conduct a minimum of three inrush current tests at full load. Provide copies of waveform and THD analysis in test report.

c. Input current distortion: Operate at nominal input voltage at full load. Measure and record the input current THD for the current in each phase.

d. Overload: Operate at nominal input voltage and output voltage with loads listed below:

<table>
<thead>
<tr>
<th>Percent of Full Load</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>110 percent</td>
<td>60 minutes</td>
</tr>
<tr>
<td>125 percent</td>
<td>5 minutes</td>
</tr>
<tr>
<td>150 percent</td>
<td>2 minutes</td>
</tr>
<tr>
<td>200 percent</td>
<td>20 seconds</td>
</tr>
</tbody>
</table>
Monitor output to confirm there is no 400 Hz power interruption. After minimum operating time is achieved, unit shall interrupt output power.

e. Short-circuit: Apply a [bolted line-to-ground,] bolted line-to-line, and bolted three phase fault directly to the output terminals of the unit. Conduct a minimum of three consecutive successful tests on each unit. Provide unit capable of carrying the fault current until the integral system protective devices interrupts the fault with no damage to the unit. Provide waveforms of short circuit current during short circuit tests.

f. Output voltage THD: Operate at nominal input voltage at full load with balanced and 15 percent unbalanced load. A 15 percent unbalanced load is defined as follows:

(1) Phase A at full rated single phase load.
(2) Phase B at 85 percent of Phase A
(3) Phase C at 85 percent of Phase A

Measure and record the output voltage THD for the line-to-neutral voltage of each phase.

g. Phase angle regulation: Operate at full load with balanced and 15 percent unbalanced loads. Measure and record displacement angle between adjacent output voltage phases. A 15 percent unbalanced load is defined as follows:

(1) Phase A at full rated single phase load.
(2) Phase B at 85 percent of Phase A.
(3) Phase C at 85 percent of Phase A.

h. Transient recovery: Operate at the following load steps: 0 to 100 percent, 0 to 50 percent, 100 to 0 percent and 50 to 0 percent. Measure and record recovery time and output voltage deviation limits. Provide recordings or display of output voltage during transient recovery test.

[ i. Acoustical noise: Operate at no load, 50 percent and 100 percent of full load. Measure continuous steady sound pressure level 1525 mm 5 feet horizontally from the center of each side of the converter at a point 1525 mm 5 feet above the floor. Decibels (dB) are referenced to 20 micropascal.

][j. Electromagnetic interference (EMI) test: [EMI test shall meet the requirements of MIL-STD-461, Part 9, for Class C2 equipment.] [Certified test results on units of the same design shall be acceptable.]

][k. Paralleling: Operate at nominal input voltage at 50 percent and 100 percent of full load at 0.8 lagging power factor. Measure and record the output voltage, output current and power factor provided by each individual unit.
PART 3   EXECUTION

3.1   INSTALLATION

Install products to operate at 400 Hz in the same manner as specified in other sections of this specification for products operating at [50] [60] Hz, unless indicated or specified otherwise. Conform to the requirements of NFPA 70 and IEEE C2 and to manufacturer's instructions and recommendations.

3.1.1   Equipment

3.1.1.1   Floor Mounted

Provide proper floor mounting channels and install in accordance with the manufacturer's drawings and instructions and as indicated. Align, level, and bolt or weld units to channels to allow easy withdrawal or insertion of removable components and to permit proper operation and maintenance of equipment.

3.1.1.2   Wall Mounted

******************************************************************************
NOTE: Wall mount units 5 kVA or less. All other units shall be floor mounted.
******************************************************************************

Bracket mount, but otherwise install as required for floor-mounted units.

3.1.2   Grounding

******************************************************************************
NOTE: Insert appropriate Section number and title in the blanks below using format per UFC 1-300-02.
******************************************************************************

In accordance with NFPA 70 and as specified in [Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM] [______].

3.1.3   Wiring and Conduit

******************************************************************************
NOTE: Conductors, circuit breakers, and devices operating at 400 Hz shall be derated as follows:
******************************************************************************

<table>
<thead>
<tr>
<th>Circuit Breakers</th>
<th>Derating Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>E Frame (100 A)</td>
<td>0.87</td>

3.1.3.1 Building Wiring

**NOTE**: Insert appropriate Section number and title in the blank below using format per UFC 1-300-02.

Provide Type XHHW or THHN with stranded copper conductors wiring for 400 Hz circuits. Provide wiring for 400 Hz circuits in non-magnetic conduit, aluminum or PVC. Provide wiring and conduit for 60 Hz circuits as specified in Section 26 20 00, INTERIOR DISTRIBUTION SYSTEM [____].

3.1.3.2 Conduit

Use aluminum conduit for exposed feeders. Do not install aluminum conduit underground or encased in concrete. Use aluminum fittings and boxes with aluminum conduit. For underground or concrete encasement use PVC.

3.1.4 Manufacturer's Representative

The manufacturer's representative shall place the system in operation and make necessary adjustments to ensure optimum operation of the equipment. The manufacturer's representative shall have at least 2 years of practical experience in the installation and testing of 400 Hz solid state frequency converters.

3.2 FIELD QUALITY CONTROL

3.2.1 Instruments

Provide test instruments capable of measuring and recording or displaying test data at a higher resolution and greater accuracy than specified for the converter's performance. The test instruments used in the field tests shall have current valid calibration stickers issued by an approved calibration laboratory. Verify calibration and adjustments of converter instruments provided prior to field tests. Instruments shall be calibrated for 400 Hz operation when measuring 400 Hz signals.
3.2.2 Performance of Acceptance Checks and Tests

Perform field tests and conduct inspections. Provide labor, equipment tests instruments, and incidentals required for the tests including load banks, except the Government will furnish electricity. For all electrical load tests, use 1.0 power factor.

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests.

3.2.3 Initial Inspection and Tests

a. Compare equipment nameplate information with specifications and approved shop drawings.

b. Inspect physical and mechanical condition.

c. Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

d. Perform specific inspections and mechanical tests as recommended by manufacturer.

e. Verify correct equipment grounding.

f. Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.

3.2.4 Performance Tests

Conduct converter performance tests under the supervision of the manufacturer's representative. Successfully complete the preliminary operation, control and protective devices check prior to performing load and transient tests. If the converter fails to operate within the specified limits during any of the performance tests the Contractor shall discontinue the test and shall make necessary repairs to correct the failure and restart testing of the converter.

3.2.4.1 Preliminary Operation

Inspect the converter and make adjustments necessary to assure proper operation in accordance with the manufacturer's instructions. Operate frequency converter at 0, 25, 50, 75, and 100 percent of rated full load. Measure and record the output voltage, current, frequency, and THD at each load. Calculate output voltage regulation. Verify converter is operating within specified limits at each load level.

3.2.4.2 Control and Protective Device Checks

Operate each control, switch, input/output device that is capable of being operated manually a minimum of three times, demonstrating satisfactory operation each time. Perform operation test on each protective device to ensure that devices functions properly. After each operation measure and record the converter output frequency, voltage and current. Verify converter is operating within specified limits.
3.2.4.3 Load Test

**************************************************************************
NOTE: Delete bracketed option only when the frequency converter will not be connected to aircraft cable assembly when in service.
**************************************************************************
Operate each unit continuously a minimum of 2 hours at 100 percent rated load. Measure and record the converter output frequency, voltage and current. Verify converter is operating within specified limits. Load test shall be performed with the converter doors closed[ and the load connected to the converter with specified aircraft cable assembly].

3.2.4.4 Transient Tests

Transient recovery: Operate at the following load steps: 0 to 100 percent, 0 to 50 percent, 100 to 0 percent, and 50 to 0 percent. Provide recordings or displays of voltage and frequency during each transient test, and indicate on the recordings and displays the time intervals and acceptable limits for voltage and frequency. Repeat each transient test three times, record the results of each test. Verify converter is operating within specified limits.

3.2.4.5 Harmonic Distortion Tests

Perform output voltage harmonic distortion tests at the output of the converter terminals at 0 percent load and 100 percent load at unity power factor. The Contractor shall provide test equipment and instrumentation required for the tests. Tests shall be conducted with a distortion analyzer with test leads within 3 feet of the frequency converter's output terminals. Test data shall include total harmonic distortion amplitudes of all individual harmonics presented in a spectrum analysis format up to the 37th order.

3.2.4.6 Automatic Line Drop Compensation

Conduct automatic line drop compensation tests on each converter with the load connected to the converter with the specified aircraft power cable assembly. Operate each converter at no load, 50 percent and 100 percent of the rated capacity. No adjustments to the frequency converter shall be allowed between load tests. Monitor and record output voltage at the load end of the cable. Verify specified performance of the line drop compensation.

3.2.5 Grounding System

Inspect ground system for compliance with contract plans and specifications.

3.2.6 Follow-up Verification

Upon completion of acceptance checks and tests, the Contractor shall show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. As an exception to requirements stated elsewhere in the contract, the Contracting Officer shall be given 5 working days advance notice of the dates and times of checking and testing.
3.3 DEMONSTRATION

3.3.1 Instructing Government Personnel

Provide field training to Government personnel on the operation and maintenance of the converter provided. Provide field training 2 weeks prior to the scheduled date for field acceptance tests. As a minimum the training shall include [2][_____] hours of instruction on the theory of operation and [4][_____] hours on the repair and maintenance of the converters. The instructor shall be approved by the manufacturer of the unit provided. Submit training syllabus including each topic of training and a brief outline of each topic to the Contracting Officer at least 4 weeks prior to training for approval. Training shall be approved by the Contracting Officer at least 2 weeks in advance. The Government may record, video and audio, the training sessions and use these recordings to train personnel on the operation and maintenance of the converter system. Provide two copies of video or audio tapes, if used in the training sessions, to the Contracting Officer.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the procurement, installation, and testing of 270 VDC converters.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: These converters are used to supply 270 VDC electrical power to aircraft in shore facility environments. Typical applications include aircraft operating in flight line conditions or in hangars, avionics shops, laboratories, training buildings, flight simulators, and computer rooms. This specification is not to be used for procurement of power converters installed on board aircraft or ships. This specification is not intended for medium-voltage applications.

NOTE: The following information must be shown on the project drawings:

1. Show location of all equipment.
2. Provide functional block diagram, single line diagrams, power, and control wiring interconnection diagrams, wiring diagrams, conduit entry diagrams, equipment elevations, limiting dimensions, and equipment ratings which are not covered in the specifications.

3. Design equipment rooms with working spaces as required by NFPA 70. Provide ventilation for equipment rooms based on converter components heat load generated when operating at 100 percent load. Provide 60 Hz convenience receptacles.

**************************************************************************
NOTE: Ensure that the 270 VDC distribution system is properly coordinated including the ratings of the power cables, ground cables, circuit breakers, filters, rectifiers, and control equipment.
**************************************************************************

PART 1 GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, must be as defined in IEEE 100.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship must be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.
1.4.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products must have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period must include applications of equipment and materials under similar circumstances and of similar size. The product must have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.4.2.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.4.2.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site must not be used, unless specified otherwise.

1.4.3 270 VDC Converter Drawings

Furnish scaled drawings of enclosure outline including front, top, side views, and overall dimensions. Provide external power and control wiring and cable connections. Provide single line, schematic, and wiring diagrams. Drawings must include details of input and output circuit breakers, contactors, rectifiers, surge protectors, and control devices. Drawings must include conduit entry and exit locations. Drawings must indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Submittals must include the nameplate data, size, and capacity.

1.4.4 Qualifications Of Manufacturer

Submit a certification that the manufacturer has a minimum of two (2) years' experience in the design, manufacturing, and testing of a 270 VDC Converter at the same or equivalent KW and voltage ratings for direct connection to aircraft electrical loads.

The certification must state that the manufacturer is experienced in manufacturing and testing solid state 270 VDC Converters of an equivalent or greater KW rating. Experience in manufacturing motor generator sets does not qualify as equivalent. Experience in manufacturing portable engine-driven 28VDC power units does not qualify as equivalent. The manufacturer must be experienced in producing units for installation in permanent buildings, in environmentally closed spaces, or in weatherproof enclosures as applicable. The manufacturer must furnish documented experience with converters in various environmental conditions including exterior flight line, hangar, and environmentally enclosed spaces within buildings.
1.4.5 Work Plan

Submit a written schedule of dates of routine and special factory tests, installation, field tests, and operator training for the converter system. Furnish a list of instrumentation equipment for factory and field test reports.

1.4.6 Routine Factory Test Plan

Submit 7 copies of test plans and procedures at least 21 calendar days prior to the tests being conducted. Provide detailed description of test procedures, including test equipment and setups, to be used to ensure the GPU meets the performance specification and explain the test methods to be used. As a minimum, the test procedures must include the tests required under the paragraph ROUTINE FACTORY TESTS.

1.4.7 Special Factory Test Plan

Submit 7 copies of test plans and procedures with the Routine Factory Test Plan. Provide detailed description of test procedures, including test equipment and setups, used to ensure the converter meets the performance specification and explain the test methods used. As a minimum, the test procedures must include the tests required under the paragraph SPECIAL FACTORY TESTS.

1.4.8 Performance Test Plan

Submit 7 copies of test plans and procedures at least 15 calendar days prior to the start of field tests. Provide detailed description and dates and times scheduled for performance of tests, and detailed description of test procedures, including test equipment (list make and model and provide functional description of the test instruments and accessories) and setups of the tests to be conducted to ensure the 270 VDC Converter meets the performance specification. Explain the test methods to be used. As a minimum, the test procedures must include the tests required under the paragraph FIELD QUALITY CONTROL. Test reports must include power quality measurement data collected in accordance with IEEE 1159.

1.4.9 UL Listing

Submit with the initial submittal to verify qualification of manufacturer. 270 VDC Converter must be identified with a UL or nationally recognized testing laboratory (NRTL) label prior to shipping.

1.4.9.1 Currently Listed Products

Submit UL or NRTL certification or UL file number for the actual 270 VDC Converter to be shipped.

1.4.9.2 Proposed Listed Products

Submit UL or NRTL certification or UL file number for same or similar rating or product size range of like design unit.

1.4.10 Routine Factory Tests Report

Submit within 45 calendar days after completion of tests. Receive approval of test prior to shipping unit. Certify tests were conducted on each 270 VDC Converter in accordance with the requirements set forth in paragraph...
ROUTINE FACTORY TESTS and certify converter satisfactorily operated within specified limits. Report must include copies of the test procedures, test data, and results.

1.4.11 Special Factory Tests Report

Certify tests were conducted on a 270 VDC Converter of the same design, construction and KW and voltage rating to be provided and in accordance with the requirements set forth in paragraph SPECIAL FACTORY TEST and certify 270 VDC Converter operated without malfunctioning within specified limits. Report must include copies of the test procedures, test data, and results.

1.4.12 PERFORMANCE TESTS REPORT

Submit report of test results as specified by paragraph FIELD QUALITY CONTROL within 15 calendar days after completion of tests. Certify tests were conducted on each 270 VDC Converter in accordance with the paragraph FIELD QUALITY CONTROL and certify converter satisfactorily operated within specified limits. Report must include copies of the test procedures, test data, and results.

1.5 OPERATION AND MAINTENANCE MANUALS

Submit 270 VDC Converter operation and maintenance manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.5.1 Additions to Operation and Maintenance Manuals

In addition to requirements of Data Package 5, include the following on the actual 270 VDC Converter provided:

a. A "one-line diagram" from service entrance to 270 VDC utilization panel or point.

b. A weatherproof, tear-resistant plastic data sheet with operating instructions for each unit including startup and shutdown procedures.

c. Routine and field acceptance test reports.

d. UL or NRTL certification or UL file number.

1.5.2 Preliminary Operation and Maintenance Manuals

Prior to scheduling Field Performance Tests, 2 copies of a Preliminary Operation and Maintenance Manual must be submitted to and approved by the Contracting Officer.

1.6 EXTRA MATERIAL

Furnish recommended manufacturer's spare parts list and schedule of prices for each type of 270 VDC Converter and other equipment specified in this section. This list must include the following:

a. Power semi-conductors.

b. Power filter capacitors.

c. Plug-in logic cards.
d. Output rectification modules.
e. Fuses.
f. Indicator lamp/LED.

1.7 WARRANTY

The equipment items must be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 2 PRODUCTS

2.1 270 VDC CONVERTER

Provide a 270 VDC Converter consisting of modular construction solid-state components for [60][50] hertz (Hz) to 270 VDC conversion, input/output devices, and ancillary control devices. The 270 VDC Converter must be a standard product of the manufacturer and must be the manufacturer's latest design that complies with the specification requirements. The 270 VDC Converters provided under this contract must be products of the same manufacturer. The unit must have a calculated MTBF exceeding 24,000 hours as calculated when the 270 VDC Converter is provided with yearly servicing and maintenance. The 270 VDC Converter must be UL or third party listed to comply with UL 1012. The 270 VDC Converter must have minimum 12 pulse or active input rectification circuit. Provide startup and shutdown instructions posted on the front of the unit using engraved plastic plate. Provide a plastic encapsulated schematic diagram attached to the inside of the unit in clear view of maintenance personnel.

2.2 ELECTRICAL CHARACTERISTICS

2.2.1 Input Voltage

**************************************************************************
Using input voltage other than 480 volts (US) or 380 volts (European) will increase the cost and weight and decrease the efficiency of the Converter. The input voltage must be shown on the construction drawings.
**************************************************************************

[480Y/277][380Y/220][_____] V, three phase, four wire, grounded, [60][50] Hz. Converter shall provide rated output voltage when input voltage is varied plus or minus [10][_____] percent. Input neutral currents shall not exceed [21][_____] percent of any individual phase current at no load and at full load.

2.2.2 Input Power Factor

Between 0.8 lagging and unity, under all conditions of steady state line and load variations specified herein.

2.2.3 Surge Protection

**************************************************************************
NOTE: Select Location Category C for outdoor locations only.

The 270 VDC Converter must be capable of sustaining an input surge described in and tested in accordance with UL 1449, IEEE C62.41.1 and IEEE C62.41.2, Location Category [B][C], and continue to operate with no alarms within the specified tolerance.

2.2.4 Inrush Current

The inrush current must not exceed 100 percent of the rated full load input current. Inrush current limitation is based on a 270 VDC Converter that does not require a transformer at the input to the unit. Should the contractor choose to provide a 270 VDC Converter with a transformer at the input to the unit, the contractor is responsible for increasing the size of the upstream feeder breaker(s) and increasing the size of conductors and raceways in accordance with NFPA 70.

2.2.5 Input Current Distortion

NOTE: Where total connected converter load is a small percentage (less than 40 percent) of the total connected facility load, use 12 percent THD and 8 percent individual. For large converters, or where total connected converter load is a significant percentage of the total connected facility load, use 5 percent THD and 3 percent individual. For installation in shipboard environments, use 5 percent THD and 3 percent individual.

Input current Total Harmonic Distortion (THD) must not exceed [12][5] percent of the fundamental with nominal input voltage at full load. Individual harmonic content must not exceed [8][3] percent of the fundamental.

2.2.6 Efficiency

The 270 VDC Converter unit(s) must have a minimum efficiency of 89 percent at 50 percent load and 92 percent at 100 percent load.

2.2.7 Acoustical Noise

Maximum continuous acoustical noise level must be 72 dBA (A weighted scale).

2.3 CABLE AND PLUG ASSEMBLY

The 270 VDC performance requirements specified herein must be met when operating with the worst load conditions specified and inclusive of any 270 VDC output cables over any defined length and characteristics.

The 270 VDC output power built cables must be constructed to meet the power requirements of this specification and to minimize cross coupling, especially to meet current demand rates as well as to ensure power regulation, ripple, distortion, and transient voltage recovery, as defined herein, is not exceeded.
2.3.1 Aircraft Servicing Connector

The aircraft servicing connector must be integrally molded on one end of the cable and must be watertight. The connector must engage with the receptacle conforming to JSFC1 2.

2.3.2 28 VDC Interlock

The 28 VDC interlock power will be enabled when the 270 VDC power is verified ok and safe to use. The sensing back of the 28 VDC interlock from the aircraft indicates a proper connection of the receptacle. The 270 VDC output must only be enabled when the 28 VDC interlock is present.

2.3.3 Power Cable

The power cable interface and build must be per 5PTV6002-101 with the following highlighted design criteria:

a. The 270 VDC/28 VDC return must be a twisted pair or similar definition to meet the performance needs.

b. The 28 VDC interlock output positive will be on pin "1" and the wrap around voltage on pin "2".

c. The 270 VDC and 28 VDC returns must be tied together only on the aircraft side of the on-aircraft external power receptacle.

d. Pins "3" and "4" must be internally connected within the cable connector end to provide a "jumper" for interlock control (<0.1 ohms).

e. The contact section of the molded aircraft servicing connector must be capable of being repaired in the field. The contact section must be a one-piece, molded, replacement section or individually replaceable pins and a molded one-piece cover. Installation of the replacement contact section must restore watertight integrity to the molded aircraft servicing connector. Repair must not include replacement of the entire aircraft servicing connector.

The interface between the F-35 External Power receptacle must be per 2ZEU0004-0007.

2.4 ELECTRICAL PERFORMANCE

The 270 VDC output must be controlled to the voltage regulation requirements within this document throughout all loadings defined.

2.5 OUTPUT STEADY-STATE CURRENT RATING

The power source must be equipped with outputs as follows:

a. 270 VDC Output (main power): 267 amperes (72 kW) steady-state at 270 VDC with overload/transient/profile load capability as specified herein.

b. 28 VDC Output (interlock power): 15 amperes (0.42 kW) at 28 VDC with transient capability as specified herein.

2.6 OUTPUT TRANSIENT VOLTAGE RECOVERY TIME AND_THRESHOLDS

a. The 270 VDC output must remain within the range of 220 to 330 VDC for
any step load change from 0 to 54 kW load and from 3 kW to the 150 percent overload capability as well as what is defined in the definitions for the Start-up, Baseline and Profile loading for either a positive or negative 200 amperes/millisecond current rate of change.

b. The 270 VDC output must begin recovery from their worst case transient excursion within 10 milliseconds and must be recovered to within the steady-state operating range specified in paragraph LOAD AND LINE REGULATION within 40 milliseconds per MIL-STD-704 for time durations.

c. The 28 VDC interlock output must remain within a range of 26 to 40 VDC under the worst case step change, under any load step change from 15 to 0 to 15 amperes, and during any defined 270 VDC loading conditions and under any fault current condition that occurs. The voltage must not drop below 26 VDC for more than 50 microseconds.

d. The 28 VDC interlock output must begin recovery from their worst case transient excursion within 15 milliseconds and must be recovered to within the steady-state operating range specified in paragraph LOAD AND LINE REGULATION within 100 milliseconds per MIL-STD-704 for time durations.

2.7 LOAD AND LINE REGULATION

The 270 VDC output must provide 270 VDC +/- 3 VDC under the worst case load variations defined for the Start-up, Baseline and Profile Loadings specified herein.

The 28 VDC interlock output must provide 28 VDC +1/-2 VDC under the worst case combination resistive or constant power load variations from no-load to full-load.

2.8 RIPPLE AMPLITUDE

The 270 VDC output voltage ripple amplitude and distortion factor for the Start-up, Baseline, and Profile Loading must be as defined in Table 1.

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Start-up and Baseline Loading</th>
<th>Typical Profile Loading</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ripple Amplitude</td>
<td>3.0Vpk-pk</td>
<td>12Vpk-pk</td>
</tr>
<tr>
<td>Distortion Factor</td>
<td>0.005 max</td>
<td>0.015 max</td>
</tr>
</tbody>
</table>

The 28 VDC interlock output ripple amplitude must be as defined in MIL-STD-704, Table IV.

2.9 OUTPUT CURRENT DEMAND RATES

The 270 VDC output must remain within the output transient voltage recovery time in paragraph OUTPUT TRANSIENT VOLTAGE RECOVERY TIME AND THRESHOLDS while providing a minimum current demand (at the on-aircraft external power receptacle) rate of 200 amperes/millisecond.

The 28 VDC interlock output must remain within the output transient voltage recovery time in paragraph OUTPUT TRANSIENT VOLTAGE RECOVERY TIME AND
THRESHOLDS while providing a minimum current demand (at the on-aircraft external power receptacle) rate of 60 amperes/millisecond.

Both of these current demand rates will be met over any step load (from no-load to full-load) and transient load in the loading profiles.

2.10 DISTORTION SPECTRUM

The 270 VDC output distortion spectrum must meet the requirements of MIL-STD-704 Figure 18, inclusive of the fundamental voltage ripple component. The 270 VDC distortion factor must be as defined in Table 1 above. The 28 VDC interlock output distortion spectrum must meet the requirements of MIL-STD-704 Figure 15. The 28 VDC distortion factor must meet the requirements of MIL-STD-704 Table IV of 0.035 maximum.

2.11 OUTPUT TRANSIENT RATING

All power source outputs, 270 VDC and 28 VDC, must have transient capability as follows:

a. 150 percent of rated output for 5 seconds.
b. 200 percent of rated output for 1 second.
c. 250 percent of rated output for 50 milliseconds.

2.12 OUTPUT LOAD FAULT

2.12.1 270 VDC Output

The 270 VDC output must coordinate with the trip curve for a 120A contactor per 2ZEU0004-0007 Figure 5. This is to ensure that the 120A contactor will trip prior to the external power source output going off-line due to overcurrent or undervoltage.

2.12.2 Power Source

Upon a short between the aircraft receptacle and aircraft structure the power source must limit the current source on the 270 VDC supply. The power source must limit average current to 480 amperes by detecting the short circuit and maintaining a current threshold regardless of resistance in the current path for a minimum of time duration so that the worst case fault duration is cleared by the aircraft 120 amperes overcurrent device. If the fault condition clears in less than the time allowed per 2ZEU0004-0007 Figure 5, the power source must recover to within the steady-state operating range defined between 250-280 volts within 40 milliseconds in accordance with time durations of MIL-STD-704 Figure 16 and then settling out to the regulated voltage levels defined in paragraph LOAD AND LINE REGULATION within 10 milliseconds.

2.12.3 Overcurrent

During this 270 VDC overcurrent condition, as well as for any high di/dt load or overload condition (e.g. overvoltage, overcurrent, undervoltage, ripple), the 28 VDC interlock power output must not be disrupted and power quality must remain as defined in paragraph LOAD AND LINE REGULATION throughout the fault isolation event.
2.12.4 28 VDC Interlock Output

The 28 VDC interlock output must provide an $I^2t$ protective function to protect a 16 gauge wire during an overcurrent condition.

2.13 LINE DROP COMPENSATION

2.13.1 270 VDC Power Source

The 270 VDC power source must have an automatic compensation function on the main 270 VDC output in order to maintain the minimum voltage input thresholds at the aircraft external power receptacle, effectively canceling out the voltage drop in the 270 VDC output cable.

2.13.2 Testing

The manufacturer must test the unit with different length cables with 25.5 meters 83.5 feet being the longest. If the aircraft minimum voltage thresholds are met then the LDC boost circuit can be a manual setting.

2.13.3 28 VDC Interlock Power Source

The 28 VDC interlock power source must have an automatic line drop compensation function.

2.13.4 Compensation Levels

During this type of compensation control, the level of current loading will be changing and may range from the minimum to maximum transient type of loading, but the maximum voltage allowed must be per paragraph OUTPUT TRANSIENT VOLTAGE RECOVERY TIME AND THRESHOLDS.

2.14 SAFETY FUNCTIONS

2.14.1 270 VDC Power Source

The 270 VDC power source internal 270 VDC buss must automatically discharge to below 12 VDC with 2 seconds after the following:

a. 270 VDC power source has been turned off.

b. Detection of system fault.

2.14.2 270 VDC Output Connector

The 270 VDC must be removed from the output connector within 100 milliseconds after one of the following occurs:

a. Receiving a stop command.

b. Detection of a fault that results in a shut down condition.

c. Loss of 28 VDC interlock power.

2.15 INPUT/OUTPUT DEVICES

The 270 VDC output power contactors must be interlocked with the unit's fault indicators/alarms and the 28 VDC interlock power circuit. When the 28 VDC interlock power source power line is "broken" (e.g. when the power
cord is removed from the aircraft receptacle), the 270 VDC output power source must be disabled.

The 270 VDC output contactors must be rated to handle the power requirements within this specification and for make/break operation into a 2,500 microfarads capacitance without damage to 270 VDC Converter.

2.16 PROTECTIVE FUNCTION COORDINATION

2.16.1 On-Aircraft Power

Coordination with on-aircraft power quality unit protective functions must be met to ensure that the power source protective functions defined below are enabled prior to the on-aircraft protection.

2.16.2 On-Aircraft Protective Function

On the aircraft, the unit which controls the external power provides power quality monitoring protective functions for overvoltage, undervoltage, voltage ripple and voltage reverse polarity. These protective functions, if met, result in the unit not allowing the external power source to be connected to the aircraft. Or if these conditions are met after application, the on-aircraft contactor (which distributes the external power to the aircraft loads) will open in a timely manner. The following is the definition of each on-aircraft protective function with time delays defined:

<table>
<thead>
<tr>
<th>Protective Function</th>
<th>Voltage</th>
<th>Time Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overvoltage</td>
<td>286 +/- 5 VDC with inverse delay with voltage per 22EU0004-0007 Figure 6</td>
<td>N/A</td>
</tr>
<tr>
<td>Undervoltage</td>
<td>246 +/- 6 VDC</td>
<td>for &gt;0.500 second +/- 0.015 second</td>
</tr>
<tr>
<td>DC Ripple</td>
<td>&gt;16.0 +2/- 0Vp-p</td>
<td>for &gt;3.985 seconds +/- 0.015 second</td>
</tr>
<tr>
<td>Reverse Polarity</td>
<td>-12.0 +1/- 0 VDC</td>
<td>for &gt;0.250 second +/- 0.015 second</td>
</tr>
</tbody>
</table>

2.16.3 On-Aircraft External Power Source (EPS) Unit

The external power source performance must be met to not cause any of the protective functions defined above to be "activated" with reference to the on-aircraft external power source receptacle over all of the defined loading requirements defined within this specification.

2.17 START-UP LOADING

The 270 VDC power source must operate within the limits specified herein per paragraph OUTPUT TRANSIENT VOLTAGE RECOVERY TIME AND THRESHOLDS when the following loads are applied a) 0 to 1,500 microfarads of capacitance in parallel with 0 to 54 kW constant power load or b) 0 to 54 kW resistive load.
The 270 VDC power source must be designed to preclude inadvertent trips for inrush currents caused by output load transients. Prevention of oversensitivity to high $di/dt$ or $dv/dt$ loads will be taken into consideration to prevent nuisance trips on start-up and during voltage transient conditions.

The 28 VDC interlock output must be able to source power to a minimum of 100 microfarads equivalent input capacitive load without tripping.

2.18 BASELINE LOADING

For all baseline loading conditions specified in this paragraph and outlined in Table 3, the source must meet the power quality in accordance with paragraph ELECTRICAL CHARACTERISTICS. The load type can be 100 percent resistive or 100 percent constant power or any combination in between.

The 270 VDC output must be designed to operate with a baseline load of 0 to 2,500 microfarads of capacitance in parallel with either of the following conditions listed in Table 3:

<table>
<thead>
<tr>
<th>Table 3: Baseline Load Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition #1</td>
</tr>
<tr>
<td>(0 to 100 percent CONSTANT POWER Loads)</td>
</tr>
<tr>
<td>a</td>
</tr>
<tr>
<td>b</td>
</tr>
</tbody>
</table>

* Baseline Load: 0 to 2,500 microfarads of capacitance in parallel with (a) 0 to 72 kW of constant power +150 percent overload for 5 seconds, +200 percent overload for 1 second and +250 percent overload for 50 milliseconds while meeting the minimum current demand rate of 200 amperes/millisecond; or (b) 0 to 72 kW of resistive load +150 percent overload for 5 seconds, +200 percent overload for 1 second and +250 percent overload for 50 milliseconds while meeting the minimum current demand rate of 200 amperes/millisecond.

The IPP power source is a bi-directional PWM power converter, which can operate as an active load or as a power source. As an active load, the power bridge is a standard configuration 3 phase full wave bridge inverter topology at a switching frequency of 20 KHz. As a power source, the power bridge functions as an active rectifier to condition the power output and its fundamental frequency is 1KHz.

The time duration from when the IPP transitions from an active load to a power source per 2ZEU0004-0007 Figures 12 and 13 can range as short as 1 second to as long as 15 seconds.
The 28 VDC interlock output must operate within the limits specified herein when the following loads are applied: 0 to 100 microfarads of capacitance in parallel with either a resistive or constant power load from 0 to 15 amperes and with a 20 amperes total load level duration of up to 250 milliseconds while meeting the minimum current demand rate of 60 amperes/millisecond.

2.19 TYPICAL PROFILE LOADING

For all profile and transient loading conditions in this section, the power quality will be met in accordance with this specification and per 2ZEU0004-0007. The load type can be 100 percent resistive or 100 percent constant power or any combination in between. (See 2ZEU0004-0007 Figures 8, 9, 10 and 11.)

2.20 ENVIRONMENTAL RATING

The 270 VDC Converter must operate satisfactorily from no load to rated full load under the following conditions:

a. Ambient temperatures ranging from -20 degrees C to 55 degrees C - 4 degrees F to 131 degrees F.

b. Relative humidity 0 to 95 percent non-condensing.

c. Ambient pressures from sea level to 915 meters 3000 feet.

2.21 MONITORING AND CONTROL PANEL

Provide 270 VDC Converter with a control panel that is equipped with the following controls, indicators, instrumentation, data logging, diagnostics, and alarm functions.

2.21.1 Controls

a. Start/stop pushbutton.

b. Lamp/light emitting diode (LED) test - A push-to-test button or switch to test indicator lamps/LEDs.

c. Alarm silence - A switch that must disable the audible alarm.

d. Alarm reset - A pushbutton to silence audible alarms.

e. Emergency power off - A separate pushbutton for emergency power off.

f. Circuit breaker.

g. Output contactor ON/OFF.

h. Output voltage adjust.

2.21.2 Indicators

a. Input power available - Lamp/LED to indicate that the supply voltage is available.

b. Output power On/Off - Lamp/LED to indicate that the 270 VDC Converter output voltage is available.
c. System alarm - Lamp/LED to indicate that a fault has been detected. This indicator must be latched in the "ON" position whenever an alarm condition described in paragraph ALARM ANNUNCIATOR is detected and must remain "ON" until the alarm reset pushbutton is pressed.

d. Indicating lamp/LED to indicate that the alarm silence switch is in the disable position.

e. Audible alarm.

f. Output contactor "ON".

g. Aircraft interlock bypass - Lamp/LED to indicate that the Aircraft Interlock has been bypassed.

2.21.3 Digital Instrumentation

Provide one percent accuracy, microprocessor-based meter with a simultaneous three-line LCD display. Meter must display elapsed time (in hours). Meter must display output voltage and output current for 270 VDC.

2.21.4 Alarm Annunciator

The unit must be capable of detecting and displaying the following abnormal conditions:

a. Input overvoltage.

b. Input undervoltage.

c. Output undervoltage.

d. Output overvoltage.

e. Output overload.

f. System alarm.

g. Control logic failure.

h. Over-temperature.

i. Logic power supply failure.

2.21.5 Input/Output Devices

Provide fully-rated, UL approved devices for control of [60][50] Hz input and DC output from the 270 VDC Converter.

2.21.6 Circuit Breaker

Conform to requirements of UL 489.

2.21.6.1 Input Circuit Breaker

Provide 270 VDC Converter with a UL listed, three-pole input circuit breaker as an integral part of the 270 VDC Converter. Breaker must be operable from the front of the 270 VDC Converter. Breaker must have a
short-circuit current rating of [25,000][_____] amperes symmetrical minimum.

2.21.6.2 Output Contactor

Provide 270 VDC Converter output with an automatic magnetically-held contactor with interlock circuit. Output contactor must be of sufficient capacity to handle rated load, overload, and available short circuit current. Contactor must open when any circuit identified in paragraph PROTECTIVE FUNCTION REQUIREMENTS causes the system to shut down. Output contactor must be electrically interlocked with ON/OFF circuitry, so when the 270 VDC Converter is shutdown, the contactor must open immediately and remain open.

2.21.6.3 Protective Function Requirements

Provide circuitry for the following protective controls.

a. Input undervoltage.

b. Input overvoltage.

c. Loss of phase.

d. Loss of input power.

e. Door interlock - When any access door is opened, the interlock circuitry must open the [60][50] Hz input device and DC output device and not allow the input or output device to close. For maintenance purposes, provide a bypass switch to defeat the interlock circuitry.

f. Output overvoltage - must be in accordance with Table 2.

g. Output undervoltage - must be in accordance with Table 2.

h. Output overload - must be in accordance with Table 2.

i. 270 VDC Converter over temperature protection.

2.21.7 Built-in Test Equipment

270 VDC Converter must include built-in test equipment which monitors both primary circuits and protection circuits of the unit. Provide visual indication to assist diagnosis of unit failures to a modular level. Provide visual indication of 270 VDC Converter status using cabinet mounted light emitting diodes.

2.21.8 Assembly Construction

******************************************************************************
NOTE: Delete "louvers" when specifying NEMA Type 4X and 12K enclosures.
******************************************************************************

Provide enclosures suitable for [indoor][outdoor][corrosive][direct spray][_____] environments in accordance with NEMA 250, Type [1][3][3R][4X][12K]. Arrange to provide required[ louvers,] cooling air, entry and exit provisions for equipment within enclosures. Construct unit(s) so that components, with the exception of control and monitoring components, are totally enclosed within the enclosure. Electronic circuits
including power circuits must be modular construction readily accessible for maintenance, repair and module replacement from the exterior of the enclosure. [For units installed outdoors or in corrosive environments, electronic circuits must be enclosed in a sealed electronics compartment that is not provided with direct cooling ventilation or forced air cooling.] Provide permanent identification tags for wiring. Uniquely identify each wire. Use the same identification system in the wiring diagrams in the Operation and Maintenance Manual. Enclosures must be painted in accordance with paragraph FACTORY APPLIED FINISH and as specified herein. Provide each enclosure with a finish coat over a substrate which has been provided with a rust inhibiting treatment. [Provide two finish coats for outdoor enclosures.]

2.22 SOURCE QUALITY CONTROL

2.22.1 270 VDC Converter Test Schedule

The Government reserves the right to witness tests. Provide 270 VDC Converter test schedule for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

a. Test Instrument Calibration.

(1) The manufacturer must have a calibration program which assures that all applicable test instruments are maintained within rated accuracy.

(2) The accuracy must be directly traceable to the National Institute of Standards and Technology.

(3) Instrument calibration frequency schedule must not exceed 12 months for both test floor instruments and leased specialty equipment.

(4) Dated calibration labels must be visible on all test equipment.

(5) Calibrating standard must be of higher accuracy than that of the instrument tested.

(6) Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

(a) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

(b) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

2.22.2 Routine Factory Tests

Routine tests must be performed by the manufacturer on each of the actual 270 VDC Converter(s) prepared for this project to ensure that the design performance is maintained in production. Submit test reports, by serial number and receive approval before delivery of equipment to the project.
For tests which require full load, use the nameplate full load KW of the unit being tested unless otherwise noted. Tests must include the following:

a. Input current and power factor: Operate 270 VDC Converter at low, nominal and high input voltage at full load. Measure and record input voltage, input power factor and input current in each phase.

b. Output voltage, output current and voltage regulation: Operate converter at nominal input voltage for:
   
   (1) 50 percent of rated capacity.
   
   (2) 100 percent of rated capacity.
   
   (3) 100 percent of rated capacity at low and high input voltage.
   
   (4) Operate for not less than 15 minutes at each test condition above. Monitor and record output voltage, output current, output voltage ripple (peak-to-peak and distortion factor), at the beginning and end of each test condition. Monitor and record output.

c. Burn-in Test: Before delivery, burn-in all units under full load conditions for at least 24 hours. Burn-in test must be performed with the 270 VDC Converter enclosure doors closed and all ventilation in the final operating condition.

d. Automatic line drop compensation: Operate converter at nominal voltage at:
   
   (1) No-load.
   
   (2) 50 percent of rated capacity.
   
   (3) 100 percent of rated capacity.
   
   Loads shall be connected to the converter with the specified aircraft power cable assembly. No adjustments to the converter are allowed between load tests. Monitor and record output voltage at the load end of the cable. Verify specified performance of the line drop compensation.

2.22.2.1 Load Test

Loads must be connected to the 270 VDC Converter with the specified aircraft power cable assembly. Adjustments to the 270 VDC Converter must be allowed between load tests. Monitor and record output voltage at the load end of the cable. Verify specified performance of the line drop compensation as specified herein.

Provide the testing method, required instrumentation and test fixtures to provide compliance data for the following parameters:

a. Load and Line regulation at 270 VDC.

b. Ripple amplitude.
c. Output current demands rates. - this is more of a special test, and more of a test of the load bank than the 270VCDC unit

d. Distortion spectrum. - this is more of a special test

e. Output Transient Voltage Recovery Time and Thresholds.

f. Output Load Fault.

g. Safety functions.

h. Protective Function Requirements and Protective controls.

i. Controls, Test to ensure proper function of each control.

j. Indicators. Test to ensure proper function of each indicator.

k. Digital Instrumentation and Alarm annunciator. Test to ensure proper function of each instrument and annunciator.

l. Built-in Test Equipment. Verify that design codes or test indicate the correct function for a defective or non-operating device.

2.22.3 SPECIAL FACTORY TESTS (DESIGN TESTS)

Submit special factory test (design test) reports (complete with test data, explanations, formulas, and results), in the same submittal package as the catalog data and drawings for each of the specified 270 VDC Converter(s). Tests must be certified and signed by a registered professional engineer. Tests must be on file based on a production model of 270 VDC Converter of the same design, construction and KW rating provided.

2.22.3.1 Power Quality Tests

As an option, the manufacturer must test one unit at the time scheduled for routine tests, of each rating and size 270 VDC Converters to assure compliance with the specification. The tests must include the following:

**************************************************************************
NOTE: Select Location Category C for outdoor locations only.
**************************************************************************

a. Surge protection: Apply input surges in accordance with IEEE C62.41.1 and IEEE C62.41.2, Location Category [B][C] and monitor output. Conduct a minimum of three consecutive successful tests on each unit listed. Confirm there is no interruption to the 270 VDC Converter output power and voltage stays within specified regulation tolerances. Surge protection tests must be applicable on all 270 VDC Converter units utilizing same surge protection device by manufacturer and part number regardless of 270 VDC Converter KW size.

b. Inrush current: After applying power to the 270 VDC Converter, conduct a minimum of three inrush current tests at full load. Provide copies of waveform and THD analysis in test report.

c. Input current distortion: Operate at nominal input voltage at full load. Measure and record the input current THD for the current in each phase.
2.22.3.2 Full Load Tests

For tests which require full load, use the nameplate full load KW of the unit being tested unless otherwise noted. Tests must include the following:

a. Input current and power factor: Operate 270 VDC Converter at low, nominal and high input voltage at full load. Measure and record input voltage, input power factor and input current in each phase and neutral if the neutral conductor is connected to the converter input.

b. Output voltage and voltage regulation: Operate converter at nominal input voltage for:
   (1) 50 percent of rated capacity.
   (2) 100 percent of rated capacity.
   (3) 100 percent of rated capacity at low and high input voltage.
   (4) Operate for not less than 15 minutes at each test condition above. Monitor and record output voltage, output current, output voltage ripple, at the beginning and end of each test condition. Monitor and record output

c. Efficiency: Operate at nominal input voltage at half load and full load. Measure and record input voltage, input current, input power factor, output voltage, output current. Calculate the unit efficiency.

d. No load losses: Operate at no load and nominal input voltage. Measure and record input voltage, input current, input power factor, and output voltage.

e. Burn-in Test: Before delivery, burn-in all units under full load conditions for at least 24 hours by cycling units 6 hours "ON" under full load conditions and 3 hours "OFF" at no load conditions for at least four 270 VDC Converter "ON" cycles. Burn-in test must be performed with the 270 VDC Converter enclosure doors closed and all ventilation in the final operating condition.

f. Include harmonic frequency spectrum analysis depicting Harmonic Order and Harmonic Magnitude at the unit's input terminals during full load THD test in test reports.

g. Automatic line drop compensation: Operate converter at nominal voltage at:
   (1) No-load.
   (2) 50 percent of rated capacity.
   (3) 100 percent of rated capacity.
   (4) Loads must be connected to the 270 VDC Converter with the specified aircraft power cable assembly. No adjustments to the 270 VDC Converter must be allowed between load tests. Monitor and record output voltage at the load end of the cable. Verify specified performance of the line drop compensation as described in paragraph OUTPUT CURRENT DEMAND RATES.
2.22.3.3 Compliance Data

Provide the testing method, required instrumentation and test fixtures to provide compliance data for the following parameters:

a. Load and Line regulation at 270 VDC.

b. Output transient rating.

c. Ripple amplitude.

d. Output current demands rates.

e. Distortion spectrum.

f. Output Transient Voltage Recovery Time and Thresholds.

g. Output Load Fault.

h. Safety functions.

i. Input/Output devices.

j. Protective Function Requirements and Protective controls.

k. Start-up Loading.

l. Baseline Loading.

m. Typical Profile Loading.

n. Controls, Test to ensure proper function of each control.

o. Indicators. Test to ensure proper function of each indicator.

p. Digital Instrumentation and Alarm annunciators. Test to ensure proper function of each instrument and annunciator.

q. Built-in Test Equipment. Verify that design codes or test indicate the correct function for a defective or non-operating device.

2.23 MANUFACTURER’S NAMEPLATE

Each item of equipment must have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.24 FIELD FABRICATED NAMEPLATES

*********************************************************************************************************************************************
NOTE: Use the following paragraph where nameplates are fabricated to identify specific equipment designated on the drawings. Provide note on panelboard schedules to indicate where red labels are required.
*********************************************************************************************************************************************
ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings. Each nameplate inscription must identify the function and, when applicable, the position. Nameplates must be melamine plastic, 3 mm 0.125 inch thick, white with [black] [_____] center core.[ Provide red laminated plastic label with white center core where indicated.] Surface must be matte finish. Corners must be square. Accurately align lettering and engrave into the core. Minimum size of nameplates must be 25 by 65 mm one by 2.5 inches. Lettering must be a minimum of 6.35 mm 0.25 inch high normal block style.

2.25 WARNING SIGNS

Provide warning signs for flash protection in accordance with NFPA 70E and NEMA Z535.4 for the enclosures of electrical equipment that are likely to require examination, adjustment, servicing, or maintenance while energized. Provide field installed signs to warn qualified persons of potential electric arc flash hazards when warning signs are not provided by the manufacturer. The marking must be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

2.26 FACTORY APPLIED FINISH

**************************************************************************
NOTE: This paragraph covers only the basic painting requirements for most electrical equipment. Include any special finishes for high or low temperatures and corrosive atmospheres.
**************************************************************************

Electrical equipment must have factory-applied painting systems which must, as a minimum, meet the requirements of NEMA 250 corrosion-resistance test and the additional requirements as specified herein. Interior and exterior steel surfaces of equipment enclosures must be thoroughly cleaned and then receive a rust-inhibitive phosphatizing or equivalent treatment prior to painting. Exterior surfaces must be free from holes, seams, dents, weld marks, loose scale or other imperfections. Interior surfaces must receive not less than one coat of corrosion-resisting paint in accordance with the manufacturer's standard practice. Exterior surfaces must be primed, filled where necessary, and given not less than two coats baked enamel with semigloss finish.[ Color must be the manufacturer's standard color.][ Equipment located indoors must be ANSI Light Gray,[ and equipment located outdoors must be ANSI[ Light Gray][ Dark Gray].] Provide manufacturer's coatings for touch-up work and as specified in paragraph FIELD APPLIED PAINTING.

PART 3 EXECUTION

3.1 INSTALLATION

Install products to operate at 270 VDC in the same manner as specified in other sections of this specification for products operating at [60][50] Hz, unless indicated or specified otherwise. Electrical installations must conform to the requirements of NFPA 70 and IEEE C2 and to manufacturer's instructions and recommendations.
3.2 EQUIPMENT

3.2.1 Floor Mounted

Provide proper floor mounting channels and install in accordance with the manufacturer's drawings and instructions and as indicated. Align, level, and bolt or weld units to channels to allow easy withdrawal or insertion of removable components and to permit proper operation and maintenance of equipment.

3.2.2 Grounding

In accordance with NFPA 70 and as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.2.3 Wiring and Conduit

In accordance with NFPA 70 and as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.2.4 Manufacturer's Representative

The manufacturer's representative must place the system in operation and make necessary adjustments to ensure optimum operation of the equipment. The manufacturer's representative must have at least 2 years of practical experience in the installation and testing of 270 VDC Converter.

3.3 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.4 WARNING SIGN MOUNTING

Provide the number of signs required to be readable from each accessible side. Space the signs in accordance with NFPA 70E.

3.5 FIELD APPLIED PAINTING

******************************************************************************
NOTE: Use and coordinate paint and coating requirements with Section 09 90 00 PAINTS AND COATINGS when provided in the job. Use the second bracketed option when Section 09 90 00 PAINTS AND COATINGS is not provided or when requirements are beyond what is specified in Section 09 90 00 PAINTS AND COATINGS.
******************************************************************************

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria.[ Painting must be as specified in Section 09 90 00 PAINTS AND COATINGS.][ Where field painting of enclosures is specified to match adjacent surfaces, to correct damage to the manufacturer's factory applied coatings, or to meet the indicated or specified safety criteria, provide manufacturer's recommended coatings and apply in accordance to manufacturer's instructions.]
3.6 FIELD QUALITY CONTROL

3.6.1 Instruments

Provide test instruments capable of measuring and recording or displaying test data at a higher resolution and greater accuracy than specified for the 270 VDC Converter performance. The test instruments used in the field tests must have current valid calibration stickers issued by an approved calibration laboratory. Verify calibration and adjustments of converter instruments provided prior to field tests.

3.6.2 Performance of Acceptance Checks and Tests

Perform field tests and conduct inspections. Provide labor, equipment tests instruments, and incidentals required for the tests including load banks, except the Government will furnish electricity.

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests.

3.6.3 Initial Inspection and Tests

a. Compare equipment nameplate information with specifications and approved shop drawings.

b. Inspect physical and mechanical condition.

c. Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

d. Perform specific inspections and mechanical tests as recommended by manufacturer.

e. Verify correct equipment grounding.

f. Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.

3.6.4 Performance Tests

**************************************************************************
Since the units have been tested for specification compliance, and certification of that testing has been accepted by the contracting officer, and the unit (s) have been factory tested, and the factory test report has been accepted by the contracting officer, field testing will be limited as described in this section of the specification.
**************************************************************************

Conduct 270 VDC Converter performance tests under the supervision of the manufacturer's representative. Successfully complete the preliminary operation, control and protective devices check prior to performing load tests. If the 270 VDC Converter fails to operate within the specified limits during any of the performance tests the Contractor must discontinue the test and must make necessary repairs to correct the failure and restart testing of the 270 VDC Converter.
3.6.4.1 Preliminary Operation

Inspect the 270 VDC Converter and make adjustments necessary to assure proper operation in accordance with the manufacturer's instructions. Operate 270 VDC Converter at 0, 25, 50, 75, and 100 percent of rated full load. Measure and record the output voltage and current. Calculate output voltage regulation. Verify 270 VDC Converter is operating within specified limits at each load level.

3.6.4.2 Control and Protective Device Checks

Operate each control, switch, input/output device that is capable of being operated manually a minimum of three times, demonstrating satisfactory operation each time. Perform operation test on each protective device to ensure that devices functions properly. After each operation measure and record the 270 VDC Converter output voltage and current. Verify 270 VDC Converter is operating within specified limits as defined for controls and output devices.

3.6.4.3 Load Test

Operate each unit continuously a minimum of 2 hours at 100 percent rated load. Measure and record the 270 VDC Converter output voltage and current. Verify 270 VDC Converter is operating within specified limits. Load test must be performed with the 270 VDC Converter doors closed and the load connected to the 270 VDC Converter with specified aircraft cable assembly.

3.6.4.4 Automatic Line Drop Compensation

Conduct automatic line drop compensation tests on each 270 VDC Converter with the load connected to the 270 VDC Converter with the specified aircraft power cable assembly. Operate each 270 VDC Converter at no load, 50 percent and 100 percent of the rated capacity. No adjustments to the 270 VDC Converter must be allowed between load tests. Monitor and record output voltage at the load end of the cable. Verify specified performance of the line drop compensation.

3.6.5 Grounding System

Inspect ground system for compliance with contract plans and specifications.

3.6.6 Follow-up Verification

Upon completion of acceptance checks and tests, the Contractor must show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. As an exception to requirements stated elsewhere in the contract, the Contracting Officer must be given 5 working days advance notice of the dates and times of checking and testing.

3.7 DEMONSTRATION

3.7.1 Instructing Government Personnel

Provide field training to Government personnel on the operation and maintenance of the 270 VDC Converter provided. Provide field training 2 weeks prior to the scheduled date for field acceptance tests. As a minimum
the training must include 2 hours of instruction on the theory of operation and 4 hours on the repair and maintenance of the 270 VDC Converter. The instructor must be approved by the manufacturer of the unit provided. Submit training syllabus including each topic of training and a brief outline of each topic to the Contracting Officer at least 4 weeks prior to training for approval.

Training must be approved by the Contracting Officer at least 2 weeks in advance. The Government may record, video and audio, the training sessions and use these recordings to train personnel on the operation and maintenance of the 270 VDC Converter system. Provide two copies of video or audio tapes, if used in the training sessions, to the Contracting Officer.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for low voltage applications of automatic transfer switches (ATS) and ATS with by-pass/isolation switches.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification is for use when the nature of electrical loads indicates a need for automatic transfer between two power sources. Terminology used depends on the application. "Preferred" and "alternate" should be used when this specification applies to a stand-by generator system as defined in NFPA 70. The same terminology should be used when switching between different sets of service entrance conductors or between feeders supplied by different transformers. "Normal" and "emergency" should be used for the emergency system application described in NFPA 70.

This specification covers conventional, standard,
commercially available equipment appropriate for most Department of Army/Air Force applications. Special applications may require synchronized, closed-transition transfer, or withdrawal features to facilitate rapid maintenance or repair. Manufacturers of standard ATS may be able to provide ATS for special applications. The cost must be compared with the cost of conventional synchronizing equipment and circuit breakers with withdrawal features, as applicable. The decision should be based on life-cycle costs.

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

AUGUST 2019
UPGS
The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Detail Drawings
Equipment
Installation

SD-03 Product Data
Equipment

SD-06 Test Reports
Testing; G[, [______]]

SD-07 Certificates
SD-10 Operation and Maintenance Data

Switching Equipment; G[, [______]]
Instructions; G[, [______]]

1.3 QUALITY ASSURANCE

1.3.1 Detail Drawings

Submit interface equipment connection diagram showing conduit and wiring between ATS and related equipment. Submit schematic, external connection, one-line schematic and wiring diagram of each ATS assembly. Device, nameplate, and item numbers shown in list of equipment and material shall appear on drawings wherever that item appears. Diagrams shall show interlocking provisions and cautionary notes, if any. Operating instructions shall be shown either on one-line diagram or separately. Unless otherwise approved, one-line and elementary or schematic diagrams shall appear on same drawing.

1.3.2 Switching Equipment

Upon request, manufacturer shall provide notarized letter certifying compliance with requirements of this specification, including withstand current rating (WCR). Submit evidence that ATS withstand current rating (WCR) has been coordinated with upstream protective devices as required by UL 1008. Submit an operating manual outlining step-by-step procedures for system startup, operation, and shutdown. Manual shall include manufacturer's name, model number, service manual, parts list, and brief description of equipment and basic operating features. Manufacturer's spare parts data shall be included with supply source and current cost of recommended spare parts. Manual shall include simplified wiring and control diagrams for system as installed.

1.4 SITE CONDITIONS

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-310-04 and Sections 13 48 00, 23 05 48.19 and 26 05 48.00 10, properly edited, must be included with the contract documents.
**************************************************************************

Seismic requirements shall be as specified in UFC 3-310-04 and Sections 13 48 00 [SEISMIC] BRACING FOR MISCELLANEOUS EQUIPMENT, 23 05 48.19 [SEISMIC] BRACING FOR HVAC and 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT [as indicated]. ATS shall be suitable for prolonged performance under following service conditions:

| Altitude | [_____] m feet above mean sea level |

SECTION 26 36 00.00 10 Page 7
Relative Humidity [___] percent maximum, continuous
Temperature Minus [___] to [___] degrees C F
Seismic Parameters [___]

PART 2 PRODUCTS

**************************************************************************
NOTE: Normally, switched poles should be limited to three for three-phase, three- or four-wire systems. Switching of neutral (fourth pole) should only be considered where emergency/alternate power source is a separately derived system; where ground potential at the two voltage sources differs significantly; or where NFPA 70 requires ground fault protection for equipment.

Sizing of neutral bus, pole, contacts, and terminations should consider harmonic currents. Nonlinear loads such as switch mode power supplies, electronic ballasts, personal computers, laser printers, variable frequency motor drives, static uninterruptible power supplies, and other equipment described in IEEE 519 and 1100 will produce harmonic currents with high zero phase sequence components which are additive in neutral circuit. Neutral ampere rating may need to be higher than phase contacts (200 percent is typical for 100 percent harmonic load).

**************************************************************************

2.1 STANDARD PRODUCTS

Provide material and equipment which are standard products of a manufacturer regularly engaged in manufacturing the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Submit list of proposed equipment and material, containing a description of each separate item, and certificates of compliance showing evidence of UL listing and conformance with applicable NEMA standards. Such certificates are not required if manufacturer's published data, submitted and approved, reflect UL listing or conformance with applicable NEMA standards. The experience use shall include applications in similar circumstances and of same design and rating as specified ATS. Equipment shall be capable of being serviced by a manufacturer-authorized and trained organization that is, in the Contracting Officer's opinion, reasonably convenient to the site.

2.2 NAMEPLATE

Nameplate showing manufacturer's name and equipment ratings shall be made of corrosion-resistant material with not less than 3 mm 1/8 inch tall characters. Nameplate shall be mounted to front of enclosure and shall comply with nameplate requirements of NEMA ICS 2.
2.3 AUTOMATIC TRANSFER SWITCH (ATS)

**************************************************************************

NOTE: Calculate short-circuit current available at ATS supply terminals. Caution: emergency source may be capable of supplying larger amount of short-circuit current. Ampere interrupting capacity (AIC) rating of circuit protective devices on ATS supply side should equal or exceed available short-circuit current. Since ATS WCR should be equal to or greater than AIC rating of upstream circuit protective devices, care should be used in determining available AIC to avoid high costs of over-rated ATS. WCRs listed in UL 1008 should be used when fault currents are less than WCR listed. However, in no case should WCR be less than 10,000 amperes.

Where closed-transition transfer is required, coordinate system design requirements with power supplier.

Delete BP/IS requirements if not applicable. Delete reference to IEEE 602 if not applicable.

**************************************************************************

ATS shall be electrically operated and mechanically held in both operating positions. ATS shall be suitable for use in [emergency systems] [standby systems] described in NFPA 70. ATS shall be UL listed. ATS shall be manufactured and tested in accordance with applicable requirements of IEEE C37.90.1, IEEE C37.13, IEEE C62.41.1, IEEE C62.41.2, IEEE 602, NEMA ICS 1, NEMA ICS 2, NEMA ICS 10 Part 2, UL 1008 and UL 1066. ATS shall conform to NFPA 110. To facilitate maintenance, manufacturer's instruction manual shall provide typical maximum contact voltage drop readings under specified conditions for use during periodic maintenance. Manufacturer shall provide instructions for determination of contact integrity. ATS shall be rated for continuous duty at specified continuous current rating. ATS shall be fully compatible and approved for use with BP/IS specified. BP/IS shall be considered part of ATS system. ATS shall have following characteristics:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>[_____] volts [dc] [ac]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Phases</td>
<td>[One] [Two] [Three]</td>
</tr>
<tr>
<td>Number of Wires</td>
<td>[Two] [Three] [Four]</td>
</tr>
<tr>
<td>Frequency</td>
<td>[25] [50] [60] [400] Hz</td>
</tr>
<tr>
<td>Poles</td>
<td>[Two switched] [Three switched] [and solid neutral] [and switched neutral] [_____]</td>
</tr>
<tr>
<td>ATS WCR</td>
<td>Rated to withstand short-circuit current of [_____] amperes, RMS symmetrical.</td>
</tr>
</tbody>
</table>
Nonwelding Contacts | Rated for nonwelding of contacts when used with upstream feeder overcurrent devices shown and with available fault current specified.

[Main] [Main and Neutral] Contacts | Contacts shall have silver alloy composition. [Neutral contacts shall have same continuous current rating as main or phase contacts] [Neutral contact continuous current rating shall be not less than twice the rating of main or phase contacts].

### 2.3.1 Override Time Delay

**************************************************************************

**NOTE:** Consult ATS manufacturers' literature for feature availability, timing interval range, and pickup and dropout settings. Insert proper values. Recommended values for normal applications are shown in brackets but may be changed for other design conditions. Where values are not shown or different settings are required; specify values and settings.

ATS operation should not be initiated during low voltage conditions attributed to a fault or to momentary dips or excursions (transients) in normal or preferred power source. Time delay before monitored source override should exceed associated circuit breaker tripping time and normal system voltage instability periods. Minimum of 1 second is recommended. Where utility type power source is used and application is standard, monitoring devices should drop out at 85 percent of nominal value and pick up at 90 percent. Where precise power is monitored, protection should be specified with monitoring devices set to pick up at 95 and drop out at 90 percent of nominal. In applications requiring closer regulation, solid state or microprocessor arrangement may be used with pickup and dropout response adjusted as close as 2 percent differential. However, for these applications a redundant uninterruptible power supply should be considered.

Delete generator reference if not required.

**************************************************************************

Provide adjustable time delay to override monitored source deviation from [0.5] [_____] to [6] [_____] seconds and factory set at [1] [_____] second[s]. ATS shall monitor phase conductors to detect and respond to sustained voltage drop of [25] [15] [_____] percent of nominal between any two [normal] [preferred] source conductors and initiate transfer action to [alternate] [emergency] source and start engine driven generator after set time period. Pickup voltage shall be adjustable from [85] [_____] to 100 percent of nominal and factory set at [90] [_____] percent. Dropout voltage shall be adjustable from [75] [_____] to [98] [_____] percent of
pickup value and factory set at [85] [_____] percent of nominal.

2.3.2 Transfer Time Delay

******************************************************************************
NOTE: Use nonzero setting where multiple ATS
require staggered application of load steps to
alternate or emergency source.
******************************************************************************

Time delay before transfer to [alternate] [emergency] power source shall be adjustable from [0] [_____] to [5] [_____] minutes and factory set at [0] [_____] minutes. ATS shall monitor frequency and voltage of [alternate] [emergency] power source and transfer when frequency and voltage are stabilized. Pickup voltage shall be adjustable from [85] [_____] to 100 percent of nominal and factory set at [90] [_____] percent. Pickup frequency shall be adjustable from [90] [_____] to 100 percent of nominal and factory set at [90] [_____] percent.

2.3.3 Return Time Delay

Time delay before return transfer to [normal] [preferred] power source shall be adjustable from [0] [_____] to [30] [_____] minutes and factory set at [30] [_____] minutes. Time delay shall be automatically defeated upon loss or sustained undervoltage of [alternate] [emergency] power source, provided that [normal] [preferred] supply has been restored.

2.3.4 Engine Shutdown Time Delay

******************************************************************************
NOTE: Omit this paragraph if there is no generator in transfer scheme. Consult ATS manufacturers' literature for feature availability, timing interval range, and pickup and dropout settings. Insert proper values. Recommended values for normal applications are shown in brackets but may be changed for other design conditions. Where values are not shown or different settings are required, specify values and settings.
******************************************************************************

Time delay shall be adjustable from [0] [_____] to [30] [_____] minutes and shall be factory set at 10 [_____] minutes.

2.3.5 Exerciser

******************************************************************************
NOTE: Use this paragraph when automatic system exercising is required by nature of loads and desired reliability. Automatic system exerciser is recommended when diesel engine driven generator set is used, but only if automatic feature is manually initiated and can be manually overridden during exercise period to return ATS to normal or preferred source. Omit this paragraph if there is no generator in transfer scheme.
******************************************************************************

Consult ATS manufacturers' literature for feature availability, timing interval range, and pickup and
dropout settings. Insert proper values for application.

Provide a generator exerciser timer. Run times shall be user programmable. The generator exerciser shall be selectable between load transfer and engine run only, and shall have a fail-safe feature that will retransfer the ATS to [normal] [preferred] during the exercise period.

2.3.6 Auxiliary Contacts

[Two] [_____] normally open and [two] [_____] normally closed auxiliary contacts rated at [10][15][_____] amperes at [120][480][_____] volts shall operate when ATS is connected to [normal] [preferred] power source, and [two] [_____] normally open and [two] [_____] normally closed contacts shall operate when ATS is connected to [alternate] [emergency] source.

2.3.7 Supplemental Features

**************************************************************************
NOTE: Delete features when not required. Delete in-phase monitor unless required to eliminate or reduce transients during switching of large inductive loads while limiting time delays associated with ATS transfer in both directions.
**************************************************************************

ATS shall be furnished with the following:

a. Engine start contact.

b. [Alternate] [Emergency] source monitor.

c. Test switch to simulate normal power outage.

d. Voltage sensing. Pickup voltage adjustable from 85 to 100 percent of nominal; dropout adjustable from 75 to 98 percent of pickup.

e. Time delay bypass switch to override return time delay to normal.

g. Means shall be provided in the ATS to insure that motor/transformer load inrush currents do not exceed normal starting currents. This shall be accomplished with either in-phase monitoring, time-delay transition, or load voltage decay sensing methods. If manufacturer supplies an in-phase monitoring system, the manufacturer shall indicate under what conditions a transfer cannot be accomplished. If the manufacturer supplies a time-delay transition system, the manufacturer shall supply recommendations for establishing time delay. If load voltage decay sensing is supplied, the load voltage setting shall be user programmable.

2.3.8 Operator

Manual operator conforming to UL 1008 shall be provided, and shall incorporate features to prevent operation by unauthorized personnel. ATS shall be designed for safe manual operation under full load conditions. If manual operation is accomplished by opening the door, then a dead-front
shall be supplied for operator safety.

2.3.9 Override Switch

**************************************************************************
NOTE: Override switch allows operator to switch load from primary source to alternate or emergency source and keep it connected to that source. It is useful for users who prefer alternate or emergency source under certain operating conditions, such as lightning storms or during maintenance on primary source. Override switch will be specified only when nature of mission and operators' expertise make it desirable to control power source. User must ensure that adequate administrative and operational controls exist to prevent load from being inadvertently left in alternate or emergency mode. This paragraph should be omitted for ordinary applications since override switch significantly alters ATS function.
**************************************************************************

Override switch shall bypass automatic transfer controls so ATS will transfer and remain connected to [alternate] [emergency] power source, regardless of condition of [normal] [preferred] source. [If [alternate] [emergency] source fails and [normal] [preferred] source is available, ATS shall automatically retransfer to [normal] [preferred] source.]

2.3.10 Green Indicating Light

A green indicating light shall supervise/provide [normal] [preferred] power source switch position indication and shall have a nameplate engraved [NORMAL] [PREFERRED].

2.3.11 Red Indicating Light

A red indicating light shall supervise/provide [alternate] [emergency] power source switch position indication and shall have a nameplate engraved [ALTERNATE] [EMERGENCY].

2.4 BY-PASS/ISOLATION SWITCH (BP/IS)

**************************************************************************
NOTE: Omit this section if no by-pass/isolation switch is required. Delete reference to generator starting where a generator is not used as alternate source.
**************************************************************************

2.4.1 Design

Bypass/isolation switch (BP/IS) shall permit load by-pass to either [normal] [preferred] or [alternate] [emergency] power source and complete isolation of associated ATS, independent of ATS operating position. BP/IS and associated ATS shall be products of same manufacturer and shall be completely interconnected and tested at factory and at project site as specified. BP/IS shall be manufactured, listed, and tested in accordance with paragraph AUTOMATIC TRANSFER SWITCH (ATS) and shall have electrical ratings that exceed or equal comparable ratings specified for ATS.
Operating handles shall be externally operated and arranged so that one person can perform the bypass and isolation functions through the operation of a maximum of two handles within 5 seconds. The ATS shall have provisions for locking in the isolation position. Handle for manual operation shall be permanently attached to operating mechanism. BP/IS operation shall be accomplished without disconnecting switch load terminal conductors. Isolation handle positions shall be marked with engraved plates or other approved means to indicate position or operating condition of associated ATS, as follows:

a. Indication shall be provided to show that ATS section is providing power to the load.

b. Indication shall be provided of ATS isolation. The ATS controls shall remain functional with the ATS isolated or in bypass mode to permit monitoring of the normal power source [and automatic starting of the generator in the event of a loss of the normal power source]. In the isolated mode, the bypass section shall be capable of functioning as a manual transfer switch to transfer the load to either power source. The ATS shall be capable of undergoing functional operation testing without service interruption. The ATS may also be completely removed from the enclosure, if required for maintenance or repair, while the bypass section continues to power the load.

2.4.2 Switch Construction

Bypass/isolation switch shall be constructed for convenient removal of parts from front of switch enclosure without removal of other parts or disconnection of external power conductors. Contacts shall be as specified for associated ATS, including provisions for inspection of contacts without disassembly of BP/IS or removal of entire contact enclosure. To facilitate maintenance, manufacturer shall provide instructions for determination of contact integrity. BP/IS and associated ATS shall be interconnected with suitably sized copper bus bars silver-plated at each connection point, and braced to withstand magnetic and thermal forces created at WCR specified for associated ATS.

2.5 ENCLOSURE

**************************************************************************
NOTE: Designer must provide normal power source to ATS when specifying enclosure heater.

If ATS assembly is provided, equipment should be installed in free-standing, floor-mounted enclosure as specified, except when manufacturer incorporates switch specified in wall-mounted enclosure as standard construction. However, in some applications it is advisable to specify that ATS or BP/IS components be mounted in separate switchboard, switchgear, motor control center, or other enclosure. Designer shall investigate conditions and options and specify accordingly.
**************************************************************************

ATS and accessories shall be installed in [wall-mounted] [free-standing, floor-mounted], [ventilated] [unventilated] NEMA ICS 6, Type [1] [3R] [4] [12], smooth sheet metal enclosure constructed in accordance with applicable requirements of UL 1066 and/or UL 1008. [Intake vent shall be
screened and filtered. Exhaust vent shall be screened.] [Door shall have suitable hinges, locking handle latch, and gasketed jamb.] [Thermostatically controlled heater shall be provided within enclosure to prevent condensation over temperature range stipulated in paragraph SERVICE CONDITIONS.] Metal gauge shall be not less than No. 14. Enclosure shall be equipped with at least two approved grounding lugs for grounding enclosure to facility ground system using No. [4] AWG copper conductors. Factory wiring within enclosure and field wiring terminating within enclosure shall comply with NFPA 70. If wiring is not color coded, wire shall be permanently tagged or marked near terminal at each end with wire number shown on approved detail drawing. Terminal block shall conform to NEMA ICS 4. Terminals shall be arranged for entrance of external conductors from [top] [bottom] [top and bottom] of enclosure as shown. Main switch terminals, including neutral terminal if used, shall be pressure type suitable for termination of external [copper] [aluminum] conductors shown.

2.5.1 Construction

Enclosure shall be constructed for ease of removal and replacement of ATS components and control devices from front without disconnection of external power conductors or removal or disassembly of major components. Enclosure of ATS with BP/IS shall be constructed to protect personnel from energized BP/IS components during ATS maintenance.

2.5.2 Cleaning and Painting

Both the inside and outside surfaces of an enclosure, including means for fastening, shall be protected against corrosion by enameling, galvanizing, plating, powder coating, or other equivalent means. Protection is not required for metal parts that are inherently resistant to corrosion, bearings, sliding surfaces of hinges, or other parts where such protection is impractical. Finish shall be manufacturer's standard material, process, and color and shall be free from runs, sags, peeling, or other defects. An enclosure marked Type 1, 3R, 4 or 12 shall be acceptable if there is no visible rust at the conclusion of a salt spray (fog) test using the test method in ASTM B117, employing a 5 percent by weight, salt solution for 24 hours. Type 4X enclosures are acceptable following performance of the above test with an exposure time of 200 hours.

2.6 TESTING

Submit a description of proposed field test procedures, including proposed date and steps describing each test, its duration and expected results, not less than [_____] weeks prior to test date. Submit certified factory and field test reports, within 14 days following completion of tests. Reports shall be certified and dated and shall demonstrate that tests were successfully completed prior to shipment of equipment.

2.6.1 Factory Testing

A prototype of specified ATS shall be factory tested in accordance with UL 1008. In addition, factory tests shall be performed on each ATS as follows:

a. Insulation resistance test to ensure integrity and continuity of entire system.

b. Main switch contact resistance test.
c. Visual inspection to verify that each ATS is as specified.

d. Mechanical test to verify that ATS sections are free of mechanical hindrances.

e. Electrical tests to verify complete system electrical operation and to set up time delays and voltage sensing settings.

2.6.2 Factory Test Reports

Manufacturer shall provide three certified copies of factory test reports.

2.7 FACTORY TESTING (MEDICAL FACILITIES)

******************************************************************************
NOTE: The factory tests sequence listed below is required for Medical Facilities only.
******************************************************************************

The factory tests for ATS and By-Pass/Isolation switches used in medical facilities shall be conducted in the following sequence:

a. General
b. Normal
c. Overvoltage
d. Undervoltage
e. Overload
f. Endurance
g. Temperature Rise
h. Dielectric Voltage-Withstand
i. Contact Opening
j. Dielectric Voltage-Withstand (Repeated)
k. Withstand
l. Instrumentation and Calibration of High Capacity
m. Closing
n. Dielectric Voltage-Withstand (Repeated)
o. Strength of Insulating Base and Support

2.7.1 Viewing Ports

ATS and BP/IS switches shall be of draw-out construction. Viewing ports to inspect the contacts without requiring disassembly shall be provided.

2.7.2 Operating Handles

The operating handles shall be externally operated, and designed and constructed not to stop in an intermediate or neutral position during operation, but shall permit load by-pass and transfer switch isolation in no more than two manual operations which can be performed by one person in 5 seconds or less. The transfer speed will be independent of the operational speed of the switch handle or handles.

PART 3 EXECUTION

3.1 INSTALLATION

ATS shall be installed as shown and in accordance with approved manufacturer's instructions. Submit dimensioned plans, sections and
3.2 INSTRUCTIONS

Manufacturer's approved operating instructions shall be permanently secured to cabinet where operator can see them. One-line and elementary or schematic diagram shall be permanently secured to inside of front enclosure door. Submit [6] [_____] copies of operating and [6] [_____] copies of maintenance manuals listing routine maintenance, possible breakdowns, repairs, and troubleshooting guide.

3.3 SITE TESTING

**************************************************************************
NOTE: Design should incorporate ATS testing in overall test of complete emergency system under load, including ATS and generators. Delete BP/IS reference if not required.
**************************************************************************

Following completion of ATS installation and after making proper adjustments and settings, site tests shall be performed in accordance with manufacturer's written instructions to demonstrate that each ATS functions satisfactorily and as specified. Advise Contracting Officer not less than 5 working days prior to scheduled date for site testing, and provide certified field test reports within 2 calendar weeks following successful completion of site tests. Test reports shall describe adjustments and settings made and site tests performed. Minimum operational tests shall include the following:

3.3.1 Insulation Resistance

Insulation resistance shall be tested, both phase-to-phase and phase-to-ground.

3.3.2 Power Failure of Normal Source

Power failure of normal source shall be simulated by opening upstream protective device. This test shall be performed a minimum of five times.

3.3.3 Power Failure of Emergency Source

Power failure of emergency source with normal source available shall be simulated by opening upstream protective device for emergency source. This test shall be performed a minimum of five times.

3.3.4 Low Phase-to-Ground Voltage

Simulate low phase-to-ground voltage for each phase of normal source.

3.3.5 Operation and Settings

Verify operation and settings for specified ATS features, such as override time delay, transfer time delay, return time delay, engine shutdown time delay, exerciser, auxiliary contacts, and supplemental features.
3.3.6 ATS and BP/IS Functions

Verify manual and automatic ATS and BP/IS functions.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for automatic transfer switches intended for use in Emergency Electrical Power Systems meeting requirements of NFPA 70, NFPA 99, and MIL-HDBK-1191.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](mailto:criteria-change-request@usace.army.mil).

NOTE: The following system design requirements shall be adhered to when providing automatic transfer switches:

1. Provide four-pole transfer switches. The neutral conductor for each source of supply, including the neutral on separately derived systems, shall be switched by the transfer switch.

2. Do not install transfer switches on the supply side of service equipment. When the transfer switch is to be located on the supply side of service loads, provide an independent service overcurrent protection device on the supply side of the transfer switch.
3. Do not use open type transfer switches installed in other equipment such as switchboards, or as part of the service equipment.

NOTE: The following information shall be shown on the project drawings:

1. The available fault current at the bus feeding the automatic transfer switch.

2. The rating of the overcurrent device protecting the automatic transfer switch.

3. Identify automatic transfer switches to be provided with By-pass/Isolation Switches, when applicable.

4. Identify control type, i.e., Utility-Generator, Preferred Utility Source, or Generator-Generator, for each automatic transfer switch.

5. Identify automatic transfer switches to be provided with "transfer time delay" and "time delay transition" or "in-phase monitor" features, where applicable.

6. Identify automatic transfer switches to be used for fire pump service, when applicable.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the
1.2 RELATED REQUIREMENTS

Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, and Section 26 08 00 APPARATUS INSPECTION AND TESTING, apply to this section, with the additions and modifications specified herein.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.
The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Automatic Transfer Switch Drawings; G[, [____]]

SD-03 Product Data
Automatic Transfer Switches; G[, [____]]

SD-06 Test Reports
Acceptance Checks and Tests; G[, [____]]
Functional Acceptance Tests; G[, [____]]

SD-07 Certificates
Proof of Listing; G[, [____]]

SD-10 Operation and Maintenance Data
Automatic Transfer Switches, Data Package 5; G[, [____]]
Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.4 QUALITY ASSURANCE

1.4.1 Proof of Listing
Submit proof of listing by UL 1008.

1.4.2 Automatic Transfer Switch Drawings
Drawings shall include outline, arrangement, and detail drawings. Detail drawings shall include manufacturer's name and catalog number, electrical ratings, total system transfer statement, reduced normal supply voltage at
which transfer to the alternate supply is initiated, transfer delay times, short-circuit current rating, wiring diagram, description of interconnections, testing instructions, acceptable conductor type for terminals, tightening torque for each wire connector, and other required UL 1008 markings.

PART 2 PRODUCTS

2.1 AUTOMATIC TRANSFER SWITCHES

**************************************************************************

NOTE: Select the following options for switches to be installed in facilities complying with MIL-HDBK-1191, DOD Medical and Dental Treatment Facilities Design and Construction Guide: (a) "Switches utilizing circuit breakers are not acceptable"; (b) "Automatic Transfer Switches provided with a by-pass/isolation switch shall be mounted on a drawout mechanism so that the automatic transfer switch can be removed from the enclosure".

**************************************************************************

Provide four-pole, automatic transfer switches for use in emergency systems in accordance with UL 1008. Each automatic transfer switch shall be rated for total system transfer and have the current and voltage ratings as indicated. The rating of the switch shall be adequate for withstanding the effects of the indicated RMS symmetrical fault current when protected by the indicated overcurrent device without contact welding. The switch operating mechanism shall be electrically operated from the source to which it is transferring, shall have quick-make, quick-break, load break contacts, and shall be mechanically held in both positions. [Switches utilizing circuit breakers are not acceptable.] Non-fire pump service transfer switches shall have manual operating means provided for maintenance and servicing accessible only by opening the enclosure.

[Transfer switches for fire pump service shall have manual operating means externally operable without opening the enclosure.] The manual operating means shall affect the opening and closing of the switch contacts at the same rate of speed as that caused by the automatic operation of the switch. [Automatic transfer switches provided with by-pass/isolation switches shall be mounted on a drawout mechanism so that the automatic transfer switch can be removed from the enclosure.] [The switch enclosure shall comply with UL 508, NEMA Type [1], [12],[____], and shall be equipped with an equipment ground lug.]

2.1.1 [By-Pass/Isolation Switches]

**************************************************************************

NOTE: Include by-pass/isolation switches only where the nature of the loads make continuance of power essential when the associated ATS switch is disconnected for repairs, preventive maintenance, or testing. Provide by-pass/isolation switches for automatic transfer switches to be installed in facilities complying with MIL-HDBK-1191, DOD Medical and Dental treatment Facilities Design and Construction Guide.

**************************************************************************

Include by-pass/isolation switches for the indicated automatic transfer
switches. Provide by-pass/isolation switches in accordance with UL 1008 that can be used to manually select an available power source to feed load circuits and to permit total isolation of the automatic transfer switch. The by-pass/isolation switch shall be rated for total system transfer and have the same current rating, voltage rating, number of poles, and withstand and closing rating as the associated automatic transfer switch.

2.1.2  Automatic Transfer Switch Controls

2.1.2.1  [Controls for Utility-Generator Automatic Transfer Switch]

******************************************************************************
NOTE: The following paragraph is intended for use when the automatic transfer switch is to be used for transferring loads to an emergency generator upon loss of the normal (utility) source.
******************************************************************************

Provide all necessary controls to start the generator set upon loss of the normal (utility) source, transfer the load to the generator set upon reaching rated voltage and frequency, re-transfer the load when the normal (utility) source returns, and stop the generator set.

The switch shall include the following control features.

a. Three-phase normal source voltage sensing circuit with adjustable dropout, 75-93 percent of nominal, and pickup, 85-100 percent of nominal.

b. Engine starting control contacts with adjustable commit-to-start delay circuit, 0.5-6.0 seconds.

c. Voltage/frequency sensing circuit, set for 80 percent of nominal, for enabling load transfer to emergency source.

******************************************************************************
NOTE: Provide transfer to emergency source time delay for the transfer switches requiring delayed-automatic operation.
******************************************************************************

[d. Transfer to emergency source time delay for transfer switches as indicated, adjustable 0-5 minutes.]

e. Re-transfer to normal source time delay, adjustable 1-30 minutes.

f. Programmable exerciser to allow automatic starting of the generator set and subsequent load transfer. Exercise periods shall be selectable for 1 to 24 hours per day for 0 to 7 days a week.

******************************************************************************
NOTE: When the transferred load includes motors (over 50 HP or over 5 HP without significant resistive loads), select the following option.
******************************************************************************

[g. Adjustable time delay transition or in-phase monitor feature for indicated transfer switches to allow safe transfer of highly inductive loads between two non-synchronized sources.]
2.1.2.2  [Controls for Generator - Generator Source Automatic Transfer Switch]

**************************************************************************
NOTE: The following paragraph is intended for use when a second automatic transfer switch is to be used to select between two generators in a three source (utility-generator-generator) system.
**************************************************************************

Provide all necessary controls to start both generator sets upon loss of the normal utility source, transfer the load to the first generator set to reach rated voltage and frequency, shutdown the second generator set upon transferring the load to the first generator set, restarting and transferring the load to the second generator if at any time the first generator set fails, re-transfer the load when the normal (utility) source returns, and shut down the generator set. The switch shall include the following control features;

a. Engine starting control contacts.

b. Voltage/frequency sensing circuit, set for 80 percent of nominal for enabling load transfer to emergency source.

c. Programmable exerciser time to allow automatic starting of the generator sets and subsequent load transfer to each generator set. Exercise periods shall be selectable for 1 to 24 hours per day for 0 to 7 days a week.

2.1.2.3  [Controls for Preferred Utility Source Automatic Transfer Switch]

**************************************************************************
NOTE: The following paragraph is intended for use when the automatic transfer switch is to be used for selecting between two utility sources (preferred and alternate).
**************************************************************************

Provide all the necessary controls to transfer the load to the alternate utility source upon loss of the preferred utility source and re-transfer the load to the preferred utility source when the preferred utility source returns. The switch shall include the following control features.

a. Three-phase preferred and alternate source voltage sensing circuit with adjustable dropout, 75-98 percent of nominal, and pick-up, 85-100 percent of nominal.

b. Re-transfer to normal source time delay, adjustable 1-30 minutes.

**************************************************************************
NOTE: When the transferred load includes motors (over 50 HP or over 5 HP without significant resistive loads) select the following option.
**************************************************************************

[c. Adjustable time delay transition or in-phase monitor feature for indicated transfer switches to allow safe transfer of highly inductive loads between two non-synchronized sources.]
2.1.2.4  [Controls for Fire Pump Service Automatic Transfer Switch]

**************************************************************************
NOTE: The following paragraph is intended for use when the automatic transfer switch is to be used for fire pump service.
**************************************************************************

Provide the following additional controls features:

a. Phase reversal of the normal source shall initiate transfer to the emergency/alternate source.]

2.1.3  Front Panel Devices

Provide devices mounted on cabinet front consisting of:

a. Mode selector switch with the following positions and associated functions;
   1. TEST - Simulates loss of normal/preferred source system operation.
   2. NORMAL - Transfers system to normal/preferred source bypassing re-transfer time delay.

b. Lamps for indicating connected source and normal/preferred source is available.

c. Auxiliary contacts for indicating connected source and normal/preferred source available.

**************************************************************************
NOTE: Select option for preferred source selector switch when specifying preferred utility source automatic transfer switches.
**************************************************************************

d. Source selector switch with the following positions and associated functions.
   1. Source 1 - Selects Source 1 as the source to which the automatic transfer switch will transfer if that source is available.
   2. Source 2 - Selects source 2 as the source to which the automatic transfer switch will transfer if that source is available.

**************************************************************************
NOTE: Select the following option when specifying by-pass/isolation switches.
**************************************************************************

e. Lamps for indicating that the by-pass/isolation switch is in the "normal by-pass", "alternate by-pass", or "isolated" position.
PART 3   EXECUTION

3.1 INSTALLATION

Installation shall conform to the requirements of NFPA 70 and manufacturer's recommendation.

3.2 PREREQUISITES FOR FUNCTIONAL ACCEPTANCE TESTING

Completion of the following requirements is mandatory prior to scheduling functional acceptance tests for the automatic transfer switch.

3.2.1 Performance of Acceptance Checks and tests

Complete as specified in paragraph entitled "Acceptance Checks and Tests". The Acceptance Checks and Tests shall be accomplished by the Testing organization as described in Section 26 08 00 APPARATUS INSPECTION AND TESTING.

3.2.2 Manufacturers O&M Information

The manufacturers O&M information required by the paragraph entitled "SD-10 Operation and Maintenance Data", shall have been submitted to and approved by the Contracting Officer.

3.2.3 Test Equipment

All test equipment and instruments shall be on hand prior to scheduling field tests, or subject to Contracting Officer's approval, evidence shall be provided to show that arrangements have been made to have the necessary equipment and instruments on site prior to field testing.

3.3 FIELD QUALITY CONTROL

Give Contracting Officer 15 days notice of dates and times scheduled for tests which require the presence of the Contracting Officer. The Contracting Officer will coordinate with the using activity and schedule a time that will eliminate or minimize interruptions and interference with the activity operations. The contractor shall be responsible for costs associated with conducting tests outside of normal working hours and with incorporating special arrangements and procedures, including temporary power conditions. The contractor shall provide labor, equipment, apparatus, including test load, and consumables required for the specified tests. Calibration of all measuring devices and indicating devices shall be certified. The test load shall be a cataloged product in accordance with Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS.

Perform the following field tests in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.3.1 Automatic Transfer Switch Acceptance Checks and Tests

a. Visual and Mechanical Inspection

1. Compare equipment nameplate data with specifications and approved shop drawings.

2. Inspect physical and mechanical condition.
3. Confirm correct application of manufacturer's recommended lubricants.

4. Verify that manual transfer warnings are attached and visible.

5. Verify tightness of all control connections.

6. Verify tightness of accessible bolted connections by calibrated torque-wrench method. Thermographic survey is not required.

7. Perform manual transfer operation.

8. Verify positive mechanical interlocking between normal and alternate sources.

b. Electrical Tests

1. Measure contact-resistance.

2. Perform insulation-resistance on each pole, phase-to-phase and phase-to-ground with switch closed, and across each open pole for one minute. Perform tests in both source positions.

3. Verify settings and operations of control devices.

4. Calibrate and set all relays and timers.

3.3.2 Functional Acceptance Tests

Functional Acceptance Tests shall include simulating power failure and demonstrating the following operations for each automatic transfer switch. Contractor shall show by demonstration in service that the automatic transfer switches are in good operating condition, and function not less than five times.

a. Perform automatic transfer tests:

1. Simulate loss of normal/preferred power.

2. Return to normal/preferred power.

3. Simulate loss of emergency power.

4. Simulate all forms of single-phase conditions.

b. Verify correct operation and timing of the following functions:

1. Normal source voltage-sensing relays.

2. Engine start sequence.

3. Time delay upon transfer.
4. Alternate source voltage-sensing relays.

5. Automatic transfer operation.

6. Interlocks and limit switch function.

7. Time delay and retransfer upon normal power restoration.

3.5.1 Lightning Protection and Grounding System Test

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for lightning protection systems for non-ordnance facilities. Modify this guide specification as needed to address unique requirements for ordnance-related facilities. Follow requirements in UFC 3-575-01, "Lightning and Static Electricity Protection Systems" and contact the service-specific ordnance organization for guidance.

Adhere to **UPC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www.example.com).

NOTE: Show the following information on the project drawings:

1. Location and height of air terminals.
2. Location of down conductors, including locations where down conductors are subject to physical damage and require additional protection.
3. Location of ground rods.
4. Location of ground ring electrodes or alternate
methods for grounding electrodes (if any).

5. Location of test wells.

6. Fence and gate bonding details.

7. For additions to lightning protection systems on existing facilities, show locations of tie-in points.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2017; ERTA 1-2 2017; TIA 17-1; TIA 17-2; TIA 17-3; TIA 17-4; TIA 17-5; TIA 17-6; TIA 17-7; TIA 17-8; TIA 17-9; TIA 17-10; TIA 17-11; TIA 17-12; TIA 17-13; TIA 17-14; TIA 17-15; TIA 17-16; TIA 17-17 ) National Electrical Code

NFPA 780 (2017) Standard for the Installation of Lightning Protection Systems
1.2 RELATED REQUIREMENTS

1.2.1 Verification of Dimensions

Confirm all details of work, verify all dimensions in field, and advise Contracting Officer of any discrepancy before performing work. Obtain prior approval of Contracting Officer before making any departures from the design.

1.2.2 System Requirements

**************************************************************************

NOTE: This specification is based on compliance with NFPA 780 as specified in UFC 3-575-01, "Lightning and Static Electricity Protection Systems".

NFPA 780 requires surge protective devices (SPDs) at all service entrances as part of a lightning protection system. Include Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM to specify SPD requirements.

**************************************************************************

Provide a system furnished under this specification consisting of the latest UL Listed products of a manufacturer regularly engaged in production of lightning protection system components. Comply with NFPA 70, NFPA 780, and UL 96.

1.2.3 Lightning Protection System Installers Documentation

Provide documentation showing that the installer is certified with a commercial third-party inspection company whose sole work is lightning protection, or is a UL Listed Lightning Protection Installer. In either case, the documentation must show that they have completed and passed the requirements for certification or listing, and have a minimum of 2 years documented experience installing lightning protection systems for DoD projects of similar scope and complexity.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only]. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**************************************************************************

NOTE: Modify submittals paragraphs to ensure that an appropriate submittal is required for each item in the project.

**************************************************************************

NOTE: For the Air Force, modify Division 1 paragraphs to require submission of lightning protection shop drawings, test reports and certificates to the Base Civil Engineer and to the Designer of Record via the Contracting Officer for
approval. The Base Civil Engineer retains final site approval authority.

**************************************************************************

1.4 QUALITY ASSURANCE

In each standard referred to herein, consider the advisory provisions to be mandatory, as though the word "shall" or "must" has been substituted for "should" wherever it appears. Interpret references in these standards to "authority having jurisdiction," or words of similar meaning, to mean Contracting Officer.

1.4.1 Installation Drawings

1.4.1.1 Overall System Drawing

Submit installation shop drawing for the overall lightning protection system. Include on the drawings the physical layout of the equipment (plan view and elevations), mounting details, relationship to other parts of the work, and wiring diagrams.

1.4.1.2 Major Components

Submit detail drawings for each major component including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions.

1.4.2 Component UL Listed and Labeled

Submit proof of compliance that components are UL Listed and Labeled. Listing alone in UL Electrical Constructn, which is the UL Electrical Construction Directory, is not acceptable evidence. In lieu of Listed and Labeled, submit written certificate from an approved, nationally recognized testing organization equipped to perform such services, stating that items have been tested and conform to requirements and testing methods of Underwriters Laboratories.
1.4.3 Lightning Protection and Grounding System Test Plan

Provide a lightning protection and grounding system test plan. Detail both the visual inspection and electrical testing of the system and components in the test plan. Identify (number) the system test points/locations along with a listing or description of the item to be tested and the type of test to be conducted. As a minimum, include a sketch of the facility and surrounding lightning protection system as part of the specific test plan for each structure. Include the requirements specified in paragraph, "Testing of Integral Lightning Protection System" in the test plan.

[1.4.4 Lightning Protection System Inspection Certificate

**************************************************************************
NOTE: Select the first bracketed option for Army and Navy facilities.
Select second bracketed option for Air Force facilities.
**************************************************************************

Provide certification from a commercial third-party inspection company whose sole work is lightning protection, stating that the lightning protection system complies with NFPA 780. Third party inspection company cannot be the system installer or the system designer. Alternatively, provide a UL Lightning Protection Inspection Master Label Certificate for each facility indicating compliance to NFPA 780.

[Provide certification from a commercial third-party inspection company whose sole work is lightning protection, stating that the lightning protection system complies with NFPA 780 and AFI 32-1065. Third party inspection company cannot be the system installer or the system designer. Alternatively, provide a UL Lightning Protection Inspection Master Label Certificate for each facility indicating compliance to NFPA 780 and AFI 32-1065. In either case, AFI 32-1065 takes precedence over NFPA 780, whether or not it is more stringent.

Inspection must cover every connection, air terminal, conductor, fastener, accessible grounding point and other components of the lightning protection system to ensure 100% system compliance. This includes witnessing the tests for the resistance measurements for ground rods with test wells, and for continuity measurements for bonds. It also includes verification of proper surge protective devices for power, data and telecommunication systems. Random sampling or partial inspection of a facility is not acceptable.

1.5 SITE CONDITIONS

Confirm all details of work, verify all dimensions in field, and advise Contracting Officer of any discrepancy before performing work. Obtain prior approval of Contracting Officer before changing the design.

PART 2 PRODUCTS

2.1 MATERIALS

Do not use a combination of materials that forms an electrolytic couple of such nature that corrosion is accelerated in the presence of moisture unless moisture is permanently excluded from the junction of such metals.
Where unusual conditions exist which would cause corrosion of conductors, provide conductors with protective coatings, such as tin or lead, or oversize conductors. Where a mechanical hazard is involved, increase conductor size to compensate for the hazard or protect conductors. When metallic conduit or tubing is provided, electrically bond conductor to conduit or tubing at the upper and lower ends by clamp type connectors or welds (including exothermic). All lightning protection components, such as bonding plates, air terminals, air terminal supports and braces, chimney bands, clips, connector fittings, and fasteners are to comply with the requirements of UL 96 classes as applicable.

2.1.1 Main and Bonding Conductors

**************************************************************************

NOTE: NFPA 780 - Class I are ordinary building 23m 75 ft or less in height and Class II are ordinary buildings over 23m 75 ft in height.

**************************************************************************

NFPA 780 and UL 96 Class I, Class II, or Class II modified materials as applicable.

[2.1.2 Copper Only

**************************************************************************

NOTE: Include the optional copper requirement only if established by technical requirements of the project. Otherwise, code requirements will dictate where copper and aluminum can be used.

**************************************************************************

Provide copper conductors, except where aluminum conductors are required for connection to aluminum equipment.

]2.2 COMPONENTS

2.2.1 Air Terminals

Provide solid air terminals with a blunt tip. Tubular air terminals are not permitted. Support air terminals more than 600 mm 24 inches in length by suitable brace, supported at not less than one-half the height of the terminal.

2.2.2 Ground Rods

**************************************************************************

NOTE: The designer will determine the type and number of ground rods to be used based on local conditions and earth resistivity data. NFPA 780 allows copper-clad steel, solid copper, or stainless steel ground rods for multiple ground rod applications.

Specify copper clad steel rods for normal conditions. The use of other materials such as galvanized coated steel will require written authorization in accordance with the MIL-STD-3007F, Paragraph 5.1.7, "Waivers and Exemptions".
In high resistivity soils, 3000 mm 10 foot sectional rods may be used to obtain the required resistance to ground; however, where rock is encountered, additional rods, a ground ring electrode, or ground grid may be necessary. Coordinate and standardize rod selection for individual facilities with other specification sections.

Provide [ground rods made of [copper-clad steel] [solid copper] conforming to conform to UL 467.] Provide ground rods that are not less than 20 mm 3/4 inch in diameter and 3000 mm 10 feet in length. Do not mix ground rods of copper-clad steel or solid copper on the job.

[2.2.3 Grounding Plates

Provide grounding plates made of [copper-clad steel][iron][stainless steel] [solid copper] conforming to UL 96.

[2.2.4 Connections and Terminations

Provide connectors for splicing conductors that conform to UL 96, class as applicable. Conductor connections can be made by clamps or welds (including exothermic). Provide style and size connectors required for the installation.

2.2.5 Connector Fittings

Provide connector fittings for "end-to-end", "Tee", or "Y" splices that conform to NFPA 780 and UL 96.

PART 3 EXECUTION

3.1 INTEGRAL SYSTEM

Provide a lightning protection system that meets the requirements of NFPA 780[, including tie-ins to existing lightning protection systems]. Lightning protection system consists of air terminals, roof conductors, down conductors, ground connections, [and] grounding electrodes[ and ground
ring electrode conductor].  [Expose conductors on the structures except where conductors are required to be in protective sleeves.] Bond secondary conductors with grounded metallic parts within the building. Make interconnections within side-flash distances at or below the level of the grounded metallic parts.

3.1.1 Roof-Mounted Components

Coordinate with the roofing manufacturer and provide certification that the roof manufacturer's warranty is not violated by the installation methods for air terminals and roof conductors.

3.1.1.1 Air Terminals

**************************************************************************

NOTE: Select bracketed options based on roof type and location.
**************************************************************************

[Use adhesive shoes with adhesive approved by the roof manufacturer when installing air terminals on "rubber" (EPDM) type roofs.] [In areas of snow or constant wind, ensure that a section of roofing material (minimum dimensional area of 92,900 square mm (1 square foot) is first glued to the roof and then the air terminal is glued to it unless the roof manufacturer recommends another solution.] [Use a standing seam base for installation of air terminals on a standing seam metal roof that does not produce any roof penetrations.]

3.1.1.2 Roof Conductors

**************************************************************************

NOTE: Select bracketed options based on roof type and location. Delete the last bracketed option for concealing roof conductors for Air Force and Navy projects.
**************************************************************************

[Use adhesive shoes with adhesive approved by the roof manufacturer when installing roof conductors on "rubber" (EPDM) type roofs.] [Use a standing seam base for installation of roof conductors on a standing seam metal roof that does not produce any roof penetrations.] [Roof conductors are to be concealed within the ceiling cavities as much as practicable.]

3.1.2 Down Conductors

**************************************************************************

NOTE: Select bracketed option if down conductors are to be concealed. Delete the bracketed option for Air Force and Navy projects.
**************************************************************************

Protect exposed down conductors from physical damage as required by NFPA 780. Use Schedule 80 PVC to protect down conductors. Paint the Schedule 80 PVC to match the surrounding surface with paint that is approved for use on PVC. [Down conductors are to be concealed within the wall cavities.]

3.1.3 Ground Connections

Attach each down conductor [and ground ring electrode] to ground rods by
welding (including exothermic), brazing, or compression. All connections to ground rods below ground level must be by exothermic weld connection or with a high compression connection using a hydraulic or electric compression tool to provide the correct circumferential pressure. Accessible connections above ground level and in test wells can be accomplished by mechanical clamping.

### 3.1.4 Grounding Electrodes

**NOTE:** Where soil conditions indicate definitely that a ground ring electrode will not be required, all references to a ground ring electrode should be deleted from the specifications.

If required by soil conditions, select an alternate method for grounding electrodes in shallow soil. Utilize NFPA 780 or an alternate method meeting the intent of NFPA 780. Validate by calculations or historical data for site conditions. Modify the wording below as necessary to specify the system design.

Extend driven ground rods vertically into the existing undisturbed earth for a distance of not less than 3000 mm (10 feet). Set ground rods not less than 915 mm (3 feet) nor more than 2440 mm (8 feet), from the structure foundation, and at least beyond the drip line for the facility. After the completed installation, measure the total resistance to ground using the fall-of-potential method described in IEEE 81. Maximum allowed resistance of a driven ground rod is 25 ohms, under normally dry conditions [when a ground ring electrode is not used]. Contact the Contracting Officer for direction on how to proceed when two of any three ground rods, driven not less than 3000 mm (10 feet) into the ground, a minimum of 3000 mm (10 feet) apart, and equally spaced around the perimeter, give a combined value exceeding 50 ohms immediately after having driven. [For ground ring electrode, provide continuous No. 1/0 bare stranded copper cable. Lay ground ring electrode around the perimeter of the structure in a trench not less than 915 mm (3 feet) nor more than 2440 mm (8 feet) from the nearest point of the structure foundation, and at least beyond the drip line for the facility. Install ground ring electrode to a minimum depth of 765 mm (30 inches). Install a ground ring electrode in earth undisturbed by excavation, not earth fill, and do not locate beneath roof overhang, or wholly under paved areas or roadways where rainfall cannot penetrate to keep soil moist in the vicinity of the cable.]

[______]

### 3.1.5 Grounding Plates

**NOTE:** The use of grounding plates is an allowed alternative to ground rods in areas where excessive rock and surface ledge is encountered.

Provide a grounding plate for each down conductor. Set grounding plates not less than 915 mm (3 feet) nor more than 2440 mm (8 feet), from the structure foundation, and at least beyond the drip line for the facility.
Grounding plate is to be buried as deeply in the existing dirt as local conditions allow, without exceeding 3000 mm (10 feet) in depth.

3.2 APPLICATIONS

3.2.1 Nonmetallic Exterior Walls with Metallic Roof

Bond metal roof sections together which are insulated from each other so that they are electrically continuous, having a surface contact of at least 1935 square mm (3 square inches).

3.2.2 Personnel Ramps and Covered Passageways

Place a down conductor and a driven ground at one of the corners where the ramp connects to each building or structure. Connect down conductor and driven ground to the ground ring electrode or nearest ground connection of the building or structure. Where buildings or structures and connecting ramps are clad with metal, separately bond the metal of the buildings and ramps to a down conductor as close to grade as possible.

3.3 INTERFACE WITH OTHER STRUCTURES

3.3.1 Fences

Bond metal fence and gate systems to the lightning protection system whenever the fence or gate is within 1830 mm (6 feet) of any part of the lightning protection system in accordance with ANSI C2.
Bond to the nearest down conductor as close to grade as possible. This includes overhead pipes, conduits, cable trays, or any other metallic objects on the exterior of the building that enter a building. In addition, bond pipes, conduits, and cable trays to any metallic objects (such as steel structural support of air handling units or cooling towers) that are within 1830 mm 6 feet.

3.4 RESTORATION

Where sod has been removed, place sod as soon as possible after completing the backfilling. Restore, to original condition, the areas disturbed by trenching, storing of dirt, cable laying, and other work. Overfill to accommodate for settling. Include necessary topsoil, fertilizing, liming, seeding, sodding, sprigging or mulching in any restoration. Maintain disturbed surfaces and replacements until final acceptance.

3.5 FIELD QUALITY CONTROL

3.5.1 Lightning Protection and Grounding System Test

**************************************************************************
NOTE: Use 25 ohms in the bracketed option unless the specific facility, such as a telecommunications facility, requires a lower value.
**************************************************************************

Test the lightning protection and grounding system to ensure continuity is not in excess of 1 ohm and that resistance to ground is not in excess of [25] [_____] ohms. Provide documentation for the measured values at each test point. Test the ground rod for resistance to ground before making connections to the rod. Tie the grounding system together and test for resistance to ground. Make resistance measurements in dry weather, not earlier than 48 hours after rainfall. Include in the written report: locations of test points, measured values for continuity and ground resistances, and soil conditions at the time that measurements were made. Submit results of each test to the Contracting Officer.

3.4 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for underground piping and buried or submerged structure cathodic protection systems using galvanic anodes systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The requirements for the cathodic protection systems should be determined by a corrosion engineer following the criteria, design, and installation recommendations included in the National Association of Corrosion Engineers (NACE) Standard SP0169 Control of External Corrosion on Underground or Submerged Metallic Piping Systems and others listed in the specification.

NOTE: The following information should be on the drawings:

1. Location of all underground pipes and structures.

2. Locations of all anodes and test stations.
3. Locations of all flanges and unions.

4. Installation details for anodes and test stations.

5. Location of equipment.

6. Single-line diagrams elevations, limiting dimensions, and equipment ratings which are not covered in the specification.

7. Remote indicating or control requirements.

SECTION 26 42 13.00 20 Page 6
1.2 RELATED REQUIREMENTS

Sections 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, [33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION], and, [26 20 00 INTERIOR DISTRIBUTION SYSTEM], apply to this section except as modified herein.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00
SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Insulating flange sets
Anode junction boxes, bonding boxes and test stations
Joint bonds

SD-03 Product Data

Anodes; G[, [____]]
Anode junction boxes, bonding boxes, and test stations
Insulating flange sets
Dielectric unions
Wires
Cable and wire
Casings, insulation, and seals
Shunt resistors
Permanent reference electrodes; G[, [____]]

SD-07 Certificates

Qualifications of Corrosion Engineer; G[, [____]]

SD-10 Operation and Maintenance Data

Cathodic Protection System, Data Package 5; G[, [____]]
Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11, Closeout Submittals

Initial Cathodic Protection System Field Test Report; G[, [____]]
One Year Warranty Period Cathodic Protection System Field Test Report; G[, [____]]
Final Cathodic Protection System Field Test Report; G[, [____]]

1.4 Services of Corrosion Engineer

The Contractor shall obtain the services of a corrosion engineer to supervise, inspect and test the installation of the cathodic protection system(s). Corrosion Engineer refers to a registered professional engineer with certification of licensing that includes education and experience in cathodic protection of buried or submerged metal structures, or a person accredited or certified by the National Association of Corrosion Engineers at the level of Corrosion Specialist or Cathodic Protection Specialist.
Such a person shall have not less than [three] [five] [_____] years experience in the cathodic protection of underground [storage tanks] or submerged structures. The contractor shall submit evidence of the qualifications of corrosion engineer to the Contracting Officer for review and approval.

PART 2 PRODUCTS

2.1 ANODES

[2.1.1 Magnesium]

**************************************************************************
NOTE: The chemical composition listed is for high potential anodes in accordance with ASTM B843. Should standard magnesium anodes be considered suitable, provide appropriate chemical composition. Specify chemical composition which will provide adequate and economical service. Three different grades are generally available.
**************************************************************************

[ASTM B843] Chemical composition as follows:

Anode Weight [_____] kg [_____] pounds not including core.

### 2.1.4 Anode Wires and Core

#### 2.1.4.1 Anode Lead Wires

- UL 83, Type [TW] [THWN] [THHN], [ASTM D1248, Type HMWPE (High Molecular Weight Polyethylene)], [UL 44, Type RHW], [solid] [stranded] copper conductors, not less than [No. 12] [_____] AWG, [3050] [6100] [_____] mm [10] [20] [_____] feet long, [of sufficient length to extend to the accompanying junction box without splicing]. Anode lead wire shall be factory installed. [Silver solder the lead wire to the anode core, and seal the soldered connection and recessed end of the anode with an [asphaltic] [epoxy] dielectric sealing compound.] [Silver solder the lead wire to the protruding anode core, and completely seal the soldered connection with an [asphaltic] [epoxy] dielectric material.] Dielectric material shall extend past the connection and cover the lead wire insulation by not less than 15 mm 1/2 inch. [Cover the connection with heat shrinkable tubing.]

#### 2.1.4.2 Anode Core

### 2.1.5 Anode Backfill

Chemical composition as follows:

<table>
<thead>
<tr>
<th>Component</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hydrated gypsum:</td>
<td>75 percent</td>
</tr>
<tr>
<td>Bentonite clay:</td>

</tr>
</tbody>
</table>

Provide granular backfill with 100 percent passing through a 150 micrometers 100 mesh screen. Provide prepackaged anode in a cloth bag containing the anode and backfill. Center the anode in the firmly packed backfill using spacers. Overall dimensions of the bagged [7.72] [14.53] [_____] kg [17] [32] [_____] pound anode shall be [165 by 432 mm] [203 by 535 mm] [_____] by [_____] mm [6.5 by 17 inches] [8 by 21 inches] [_____] by [_____] inches] with a total minimum weight of [20.4] [33.6] [_____] kg [45] [74] [_____] pounds nominal.
2.2 ANODE JUNCTION BOXES, BONDING BOXES, AND TEST STATIONS

2.2.1 Flush Mounted Type

NEMA ICS 6. Metallic or non-metallic with terminal board, [5] [8] [_____] terminal posts [and lockable lid]. A non-metallic enclosure shall be molded of glass filled polycarbonate and urethane coated or ABS plastic [and mounted on a 500 mm 18 inch length of PVC conduit]. The unit shall be of standard design, manufactured for use as a cathodic protection test station, complete with cover, terminal board, shunts, and brass or Type [304] [316] stainless steel hardware. The terminal board shall be removable for easy access to wires. [Provide traffic valve box capable of withstanding [H-20] [_____] traffic loads.] The cover shall have a cast in legend "CP TEST."

2.2.2 Post Top Mounted Type

NEMA ICS 6. Metallic or non-metallic with terminal board, [5] [8] [_____] terminal posts and lockable lid. A non-metallic enclosure shall be high impact strength molded plastic. The unit shall be of standard design, manufactured for use as a cathodic protection test station, complete with cover, terminal board, shunts, and brass or Type [304] [316] stainless steel hardware. The terminal board shall be removable for easy access to wires. The test station shall be mounted atop 1830 mm 6 foot long polyethylene conduit with anchor.

2.2.3 Wall Mounted Type

NEMA ICS 6, Type [3R] [4X] [_____] enclosure with [clamped cover] [Type [304] [316] stainless steel hinges and [clamped] [latched] cover] [and padlocked hasp]. Enclosure shall be of [galvanized steel] [painted steel] [aluminum] [fiberglass] [non-metallic] construction with terminal board and labeled with nameplate. Provide nameplate in accordance with Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS. Enclosure mounting posts shall be [galvanized steel pipe, schedule [40] [80] [_____]], [wood post, full length pressure treated with pentachlorophenol] [as indicated]. Mount enclosure 1066 mm 42 inches above finished grade [as indicated].

2.2.4 Terminal Boards

Provide terminal boards for anode junction boxes, bonding boxes, and test stations made of phenolic plastic [3] [6] [_____] mm [1/8] [1/4] [_____] inch thick with dimensions as indicated. Insulated terminal boards shall have the required number of terminals (one terminal required for each conductor). Install solderless copper lugs and copper buss bars, shunts, and variable resistors on the terminal board as indicated. Test station terminal connections shall be permanently tagged to identify each termination of conductors (e.g. identify the conductors connected to the protected structure, anodes, and reference electrodes). Conductors shall be permanently identified by means of plastic or metal tags, or plastic sleeves to indicate termination. [Each conductor shall be color coded as follows:

<table>
<thead>
<tr>
<th>Anode lead wire:</th>
<th>black</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structure lead wire:</td>
<td>white</td>
</tr>
</tbody>
</table>
Sodium sulfate: red

2.2.5 Shunt Resistors

[MIL-I-1361.] [0.01] [_____] ohm, [6] [_____] ampere, accuracy plus or minus one percent, manganin wire type.

2.2.6 Pavement Insert

Pavement insert shall be a non-metallic flush type test station without terminal board, and shall allow a copper-copper sulfate reference electrode to contact the electrolyte beneath the pavement surface. [Provide traffic valve box capable of withstanding [H-20] [_____] traffic loads.]

2.2.7 Cast-In-Place Concrete

Flush mount type test stations, bonding boxes, and anode junction boxes shall be centered in a 460 by 460 by 102 mm 18 by 18 by 4 inch concrete slab. Concrete shall be 20 Mpa 3000 psi minimum ultimate 28-day compressive strength with 25 mm one inch minimum aggregate conforming to [ASTM C94/C94M] [Section 03 30 00 CAST-IN-PLACE CONCRETE].

2.3 Permanent Reference Electrodes

Permanent reference electrodes shall be [copper copper-sulfate] [silver silver-chloride] [zinc] specifically manufactured for [underground] [marine] use, [32] [_____] mm [1 1/4] [_____] inch diameter, by [255] [_____] mm [10] [_____] inches long, [plastic [_____] tube with an ion trap to minimize contamination of the cell] [and a minimum surface sensing area of [_____] square centimeters[_____] square inches]. [The cell shall be prepackaged by the manufacturer with a backfill material as recommended by the manufacturer.] Provide cells with No. [10] [12] [_____] AWG, [RHW] [THHN] [_____] cable of sufficient length to extend to the [test station] [junction box] without splicing. Reference electrodes shall have a minimum 15 year life, stability of plus or minus 5 millivolts under 3 microamp load, and an initial accuracy of plus or minus 10 millivolts referenced to a calibrated portable reference electrode.

2.4 Cable and Wire other than Anode Lead Wires

[UL 83, Type [TW] [THWN] [THHN]] [ASTM D1248, Type HMWPE (High Molecular Weight Polyethylene)], [UL 44, Type RHW], [solid] [stranded] copper conductor, color coded and sized (based on AWG). Copper wires shall conform to ASTM B3 and ASTM B8. Lead wires terminating at a junction box or test station shall have a cable identification tag. [Do not use bare copper wire for joint continuity bonds.] Refer to paragraph 2.1.4 [_____] for anode lead wires.

2.5 Cable and Wire Identification Tags

[Laminated plastic material with black letters on a yellow background] [[Brass] [Stainless steel] material with engraved letters]. Print letters and numbers a minimum of 5 mm 3/16 inch in size. Provide identifier legend [in accordance with the drawings] [_____].
2.6 WIRE CONNECTORS

UL 486A-486B. [_____] [Solderless copper lugs]

2.7 UNDERGROUND SPLICES

Provide splices with a compression connector on the conductors, and insulation and waterproofing using one of the following methods which are suitable for continuous submersion in water and comply with ANSI C119.1.

a. Provide cast-type splice insulation by means of molded casting process employing a thermosetting epoxy resin insulating material applied by a gravity poured method or pressure injected method. Provide component materials of the resin insulation in a packaged form ready for convenient mixing without removing from the package.

Gravity poured method shall employ materials and equipment contained in and approved commercial splicing kit which includes a mold suitable for the cables to be spliced. When the mold is in place around the joined conductors, prepare the resin mix and pour into the mold.

b. Provide [heavy wall] heat shrinkable splice insulation by means of a thermoplastic adhesive sealant material which shall be applied by a clean burning propane gas torch.

2.8 CONDUIT

[UL 6, rigid galvanized steel], [Outlet boxes: UL 514A and fittings UL 514B, threaded hubs]. [Metallic conduit and fittings to be PVC coated in accordance with NEMA RN 1, Type A40], [NEMA TC 2, Type EPC-40-PVC].

2.8.1 Buried Cable Warning and Identification Tape

Polyethylene tape, manufactured for warning and identification of buried cable and conduit. Tape shall be [75] [_____] mm [3] [_____] inches wide, [Yellow] [_____] in color and read "Caution Buried Cable Below" or similar. Color and lettering shall be permanent and unaffected by moisture or other substances in backfill materials.

2.9 INSULATING TAPE

UL 510.

2.10 INSULATING FLANGE SETS

******************************************************************************

NOTE: On projects having piping installed by Division 2, SITWORK and/or Division 15, MECHANICAL, coordinate the requirements for flanges and unions with the appropriate section(s).

******************************************************************************

Provide full-faced gaskets, insulating sleeves and washers, and steel washers. Provide insulating flange sets rated for operation at the rated pressure and temperature.

2.10.1 Gaskets

******************************************************************************
NOTE: Do not use asbestos materials.

2.10.2 Insulating Washers and Sleeves

Two sets 3 mm 1/8 inch [laminated phenolic] [_____] for operation at [232] [_____] degrees C [450] [_____] degrees F. Insulating washers shall fit within the bolt facing on the flange over the outside of the fabric reinforced phenolic sleeve.

2.10.3 Washers

Steel, cadmium plated, to fit within the bolt facing on the flange.

2.11 STEEL FLANGES AND BOLTING

2.11.1 Steel Flanges

ASME B16.5, [668 N] [1335 N] [150 lb.] [300 lb.].

2.11.2 Bolting

ASTM A307, Grade B for bolts; ASTM A194/A194M, Grade 2 for nuts. Dimensions: ASME B18.2.1 for bolts, ASME B18.2.2 for nuts. Threads: ASME B1.1, Class 2A fit for bolts, Class 2B fit for nuts. Bolts shall extend completely through the nuts and may have reduced shanks of a diameter not less than the diameter at the roof of threads.

2.12 DIELECTRIC UNIONS

NOTE: On projects having piping installed by Division 2, SITWORK and/or Division 15, MECHANICAL, coordinate the requirements for flanges and unions with the appropriate section(s).

ASME B16.39, Class [1] [2] for dimensional, strength, and pressure requirements. Insulation barrier shall limit galvanic current to one percent of the short-circuit current in a corresponding metallic joint. Provide insulating material impervious to [water] [oil] [gas].

2.13 EXOTHERMIC WELD KITS

Exothermic weld kits specifically designed by the manufacturer for welding the types of materials and shapes provided.

2.14 ELECTRICALLY INSULATING COATINGS

[Heat-shrinkable tape] [Conformable water tight sealant having dielectric strength not less than 15 kV for a 3 mm 1/8 inch thick layer].

2.15 CASING INSULATORS AND SEALS

Casing insulators shall have a minimum [305] [_____] mm [12] [_____] inch
PART 3 EXECUTION

3.1 INSTALLATION

[NFPA 70] [IEEE C2].

3.1.1 Anodes and Lead Wires

Provide [each] anode and lead wires as follows:

a. Excavate hole to a minimum 75 mm 3 inches larger than the packaged anode diameter, [_____] mm [_____] feet deep.

c. Do not lift or support anode by the lead wire. Where applicable, remove manufacturer's plastic wrap/bag from the anode. Exercise care to preclude damaging the cloth bag and the lead wire insulation.

d. Center the packaged anode in the hole with native soil in layers not exceeding 150 millimeters 6 inches. Hand tamp each layer to remove voids taking care not to strike the anode lead wire. When the backfill is 150 millimeters 6 inches above the top of the anode, pour not less than ten gallons of water into the hole to saturate the anode backfill and surrounding soil. Anodes shall not be backfilled prior to inspection and approval by the Contracting Officer.

e. Cover the lead wire trench bottom with a 75 mm 3 inch layer of sand or stone free earth. Center wire on the backfill layer, do not stretch or kink the conductor. Place backfill over wire in layers not exceeding 150 mm six inches deep, compact each layer thoroughly. Do not place tree roots, wood scrap, vegetable matter and refuse in backfill. Place cable warning tape within [450] [_____] mm [18] [_____] inches of finished grade, above cable and conduit.

f. Connect anode lead wire(s) [to the test station terminal board(s)] [directly to the protected structure(s) by use of exothermic weld kit(s)]. Clean the structure surface by scraping, filing or wire brushing to produce a clean, bright surface. Weld connections using exothermic kit(s) in accordance with the kit manufacturer's instructions. Check and verify adherence of the bond to the substrate for mechanical integrity by striking the weld with a 908 gram 2 pound hammer. Cover connections with an electrically insulating coating [which is compatible with the existing coating on the structure]. Allow sufficient slack in the lead wire to compensate for movement during backfilling operation.

g. Connect structure leads to structure by use of exothermic weld kit(s). Clean the structure surface by scraping, filing or wire brushing to produce a clean, bright surface. [Weld connections using exothermic kit(s) in accordance with the kit manufacturer's instructions.] Conform to the safety precautions of paragraph 3.1.2 [_____] when welding around fuel facilities. Check and verify adherence of the bond to the substrate for mechanical integrity by striking the weld with a
3.1.2 Safety Precautions For Welding Around Fuel Facilities

Contractor shall take proper safety precautions prior to and during welding to live fuel pipelines [tanks]. Contractor shall notify the activity Fuel Office via the Contracting Officer a minimum of three days before performing exothermic welding to live fuel lines. Exothermic welding shall be conducted with fuel flowing through the pipeline to eliminate vapor spaces within the pipe and to dissipate the heat on the pipe. Exothermic weld charges for connections to fuel lines shall be limited to a maximum 15 gram charge to prevent burning through the pipe wall. Exothermic weld connections shall be spaced a minimum of 150 millimeters 6 inches apart. In the event of an unsuccessful weld, the new weld location shall be located a minimum of 150 millimeters 6 inches from the unsuccessful weld and any other existing welds. Contractor shall obtain the services of a certified Marine Chemist or Certified Industrial Hygienist [to monitor the construction site during exothermic welding work and certify that the area is free of flammable vapors and otherwise safe for work.] [to approve the contractor's exothermic welding safety procedures. Results of this consultation shall be included in the Contractor's Daily Report.]

3.1.3 Anode Junction Boxes

Provide junction boxes and mark each of the wires terminating in each box.

3.1.4 Bonding Boxes

Provide structure bonding boxes in locations [as indicated] [where the protected structure crosses or comes into close proximity to other metal structures that are unprotected or protected by its own electrically isolated cathodic protection system(s)].

3.1.5 Test Stations [and Permanent Reference Electrodes]

Provide test stations [and permanent reference electrodes] [as indicated.] as follows:

a. At [305] [_____] meters [1000] [_____] foot intervals.

b. At all insulating joints.

c. At both ends of casings.

d. Where the pipe crosses any other metal pipes.

e. Where the pipe connects to an existing piping system.

f. Where the pipe connects to a dissimilar metal pipe.

Do not fill the bottom of the test station with concrete unless otherwise specified. Do not place rubbish, scrap or other debris into the test station.
3.1.5.1 Permanent Reference Electrode Calibration and Installation

Provide [prepackaged] [copper copper-sulfate] [silver-silver chloride] [zinc] reference electrode(s) as indicated in the drawings. Prior to installation, soak the [prepackaged] reference electrode in a container of potable water for 30 minutes. Do not use seawater [except for silver-silver chloride electrodes intended for use in seawater]. Calibrate the permanent reference electrode in the presence of the contracting officer or his approved representative by measuring the potential difference between the permanent reference electrode and an independent (portable) calibrated reference electrode placed in the water adjacent to the permanent reference electrode. [Potential differences between the two electrodes of the same generic type should not exceed [10] [15] millivolts when the [sensing windows of the] two electrodes being compared are not more than 2 mm 1/6 inch apart but not touching.] [Zinc permanent reference electrodes should be within the range of minus 1000 to minus 1150 millivolts when calibrated with an independent (portable) calibrated copper-copper sulfate reference electrode with the two electrodes being not more than 2 mm 1/6 inch apart but not touching.] Permanent reference electrodes not within these potential differences shall be removed from the construction site by the end of the day and replaced at the contractor's expense. [Prior to completely backfilling over reference electrodes, again verify the accuracy of the reference electrode.] The testing provision shall also apply to replacement reference electrodes as well.

3.1.6 Insulating Flange Sets

[Provide insulating flange sets aboveground or within manholes as indicated]. [Locate insulating flanges on lines entering buildings at least 305 mm 12 inches above grade or floor level.] [Cut piping and provide flanges into place. Carefully align flange bolt holes and weld flange to pipe in accordance with ASME B16.25.] [Electrically isolate pipelines entering buildings from the structure wall either below or above ground with an electrically isolating wall sleeve.] Provide insulating flange sets into place without springing or forcing. Carefully install flange bolt sleeves to avoid damage to the sleeves. [Cover insulating flanges with an electrically insulating coating.]

3.1.7 Dielectric Unions

[Cut pipe ends square, remove fins and burrs, cut taper pipe threads in accordance with ASME B1.20.1.] Provide insulating unions as indicated. Work piping into place without springing or forcing. Apply joint compound or thread tape to male threads only. Backing off to permit alignment of threaded joints shall not be permitted. Engage threads so that not more than three threads remain exposed. [Cover unions with an electrically insulating coating.]

3.1.8 Joint Bonds

Provide joint bonds on metallic pipe to and across buried flexible couplings, mechanical joints, flanged joints [except at places where insulating joints are specified] and joints not welded or threaded to provide electrical continuity. Connect bond wire(s) to the structure(s) by use of exothermic weld kit(s). Clean the structure surface by scraping, filing or wire brushing to produce a clean, bright surface. [Weld connections using exothermic kits in accordance with the kit manufacturer's instructions.] Check and verify adherence of the bond to the substrate for mechanical integrity by striking the weld with a 908 gram 2 pound hammer.
Cover connections with an electrically insulating coating [which is compatible with the existing coating on the structure].

3.1.9 **Casings, Insulation, and Seals**

Where the pipeline is installed in a casing under a roadway or railway, insulate the pipeline from the casing, and seal the annular space against intrusion of water.

3.1.10 **Concrete**

Concrete shall be 20 Mpa 3000 psi minimum ultimate 28-day compressive strength with 25 mm one inch minimum aggregate conforming to [ASTM C94/C94M] [Section 03 30 00 CAST-IN-PLACE CONCRETE].

3.1.11 **Reconditioning of Surfaces**

3.1.11.1 **Restoration of Sod**

Restore unpaved surfaces disturbed during the installation of anodes and wires to their original elevation and condition. Preserve sod and topsoil carefully and replace after the backfilling is completed. Where the surface is disturbed in a newly seeded area, re-seed the area with the same quality and formula of seed as that used in the original seeding.

3.1.11.2 **Restoration of Pavement**

Repair pavement, sidewalks, curbs, and gutters where existing surfaces are removed or disturbed for construction. Saw cut pavement edges. Graded aggregate base course shall have a maximum aggregate size of 40 millimeters 1 1/2 inches. Prime base course with [liquid asphalt, ASTM D2028/D2028M, Grade RC-70] [_____] prior to paving. Match base course thickness to existing but shall not be less than 150 millimeters 6 inches. Asphalt aggregate size shall be 15 mm 1/2 inch [_____], asphalt cement shall [conform to ASTM D3381/D3381M, Grade AR-2000] [_____]. Match asphalt concrete thickness to existing but shall not be less than 50 millimeters 2 inches. Repair portland cement concrete pavement, sidewalks, curbs, and gutters using 20.67 MPa 3,000 psi concrete conforming to [ASTM C94/C94M] [Section 03 30 00 CAST-IN-PLACE CONCRETE.] Match existing pavement, sidewalk, curb, and gutter thicknesses.

3.2 **FIELD QUALITY CONTROL**

Field tests shall be witnessed by the Contracting Officer or his designated representative. Advise the Contracting Officer [5] [_____] days prior to performing each field test. Quality control for the cathodic protection system shall consist of the following:

a. Initial field testing by the contractor upon construction.

b. Government Field Testing after Contractor initial field test report submission.

c. Warranty period field testing by the Contractor.

d. Final field testing by the contractor after one year of service.

**************************************************************************
NOTE: Additional testing may be required based upon
the specific project or design. All tests listed below may not be required. Designer should consider the project requirements for selection of test procedures. Specify 30 days notice for large systems to allow the Government corrosion engineer to be on-site during the initial and final field testing of the cathodic protection systems.

3.2.1 Testing

3.2.1.1 Non-Destructive Testing of Anodes

Contractor shall perform the tests in the presence of the Contracting Officer. One anode of each type shall be chosen at random for non-destructive testing and shall be submerged in a container of fresh water for about 30 minutes. Contractor shall then measure the anode-to-water potential difference between a calibrated copper-copper sulfate reference electrode. Potential differences should generally be within the following ranges:

- High potential Magnesium: minus 1.0 to minus 1.15 Volts
- Standard Magnesium: minus 1.65 to minus 1.75 Volts
- Zinc: minus 1.4 to minus 1.5 Volts
- [Failure of the test anode to conform to this specification can be cause for rejecting all anodes from the same lot as the test anode. The contractor shall mark all rejected anodes on the ends with a 150 millimeter 6 inch high "X" using yellow spray paint. Failed anodes shall be removed from the job site by the end of the day. The contractor shall replace any rejected anodes at his expense. The destructive testing provision shall also apply to replacement anodes as well.]

3.2.1.2 Destructive Testing of Anodes

Contractor shall perform the tests in the presence of the Contracting Officer. Contractor shall include the cost of an additional anode [of each different type] with the longest lead wire for the destructive test in his bid. One completed [prepackaged] anode of each type with lead wires shall be chosen at random for destructive testing and shall be submitted to a static pull test. Anode wire connections shall have sufficient strength to withstand a minimum tensile load of [136] [_____] kg [300] [_____] pounds. [The anode shall also be cut into sections and/or broken with a sledge hammer to verify conformance with this specification. Such items as anode-to-wire connection, complete encapsulation of the wire connector, and wire to anode electrical resistance shall be checked.] [Failure of the test anode to conform to this specification can be cause for rejecting all anodes from the same lot as the test anode. The contractor shall mark all rejected anodes on the ends with a 150 millimeter 6 inch high "X" using yellow spray paint. Failed anodes shall be removed from the job site by the end of the day. The contractor shall replace any rejected anodes at his expense. The destructive testing provision shall also apply to replacement anodes as well.]
3.2.1.3 Initial Cathodic Protection System Field Testing

Systems shall be tested and inspected by the Contractor's corrosion engineer in the presence of the Contracting Officer's corrosion protection engineer or an approved representative. Record test data, including date, time, and locations of testing and submit report to the Contracting Officer. Contractor shall correct and retest, at his expense, deficiencies in the materials and installation observed by these tests and inspections. Testing shall include the following measurements.

a. Base potential tests: At least [one week] [24 hours] [_____] after [backfilling of the pipe] [installation of structure to be protected] [initial operation of structures containing fluids] and installation of the anodes, but before connection of anodes to the structure, measure base (native) structure-to-electrolyte potentials of the [pipe [and casings]] [structure]. Perform measurements at anode junction boxes, test stations and other locations suitable for test purposes (such as service risers or valves), at intervals not exceeding [30] [120] [_____] meters [100] [400] [_____] feet [with readings at each end point and the midpoints as a minimum]. The locations of these measurements shall be identical to the locations specified for potential measurements with anodes connected. Use the same measuring equipment that is specified for measuring protected potential measurements.

[For underground storage tanks, take a minimum of three measurements with the reference electrode located as follows:

(1) Directly over the longitudinal and transverse centerlines of the tank at intervals not exceeding the diameter of the tank and to a distance from the tank of two times the tank diameter.

(2) At points directly around the circumference of the tank.]

(b) Permanent reference electrode calibration: Verify calibration of the reference electrode by measuring the potential difference between the permanent reference electrode and an independent (portable) calibrated reference electrode placed in the soil or water adjacent to or as close as practicable to the permanent reference electrode. [Potential differences between the two electrodes of the same generic type should not exceed [10] [15] millivolts.] Zinc permanent reference electrodes should be within the range of minus 1000 to minus 1150 millivolts when calibrated with a copper-copper sulfate reference electrode.] Permanent reference electrodes not within these potential differences shall be removed from the construction site by the end of the day and replaced at the contractor's expense. The testing provision shall also apply to replacement reference electrodes as well.

(b) Insulation joint testing: Perform insulation testing at each insulating joint or fitting [prior to burying the joint or fitting] before and after the connection of anodes to the pipe at [anode junction box] [test station]. Before connection, test using an insulation checker. After connection, test by measuring the potential shift on both sides of the insulating joint. These tests shall demonstrate that no metallic contact or short circuit exists between the two insulated sections of the pipe. Report and repair defective insulating flanges at the Contractor's expense.
(c) Electrical continuity testing: Perform electrical continuity testing for joint bonded pipe prior to backfilling of the pipe. [Circulate current through the pipe and compare the measured resistance to the theoretical resistance of the pipe and bond cables. The resistance measured shall not exceed 150 percent of the theoretical resistance.]

(d) Pipe casing testing: Before final acceptance of the installation, test the electrical insulation of the carrier pipe from casings and correct any short circuits.

(e) Anode-to-soil potential and anode output testing: Measure anode-to-soil potential of each anode with the anode disconnected [through the anode junction box]. After connecting the anodes to the pipe, measure current output of each anode [across the shunt installed].

(f) Protected potential measurement tests: With the entire galvanic protection system put into operation for at least [one week] [24 hours] [______], measure potentials along the [pipeline [and at all casings]] [structure] using a portable [copper-copper sulfate] [silver-silver chloride] [and all permanent] reference electrodes and a voltmeter having an input impedance of not less than 10 megohm. The locations of these measurements shall be identical to the locations used for the base potential measurements.

(g) Interference testing: Perform interference testing with respect to any crossing and nearby foreign pipes in cooperation with the owner of the foreign pipes. The testing shall verify that the cathodic protection system does not have a deleterious effect on the foreign pipelines, and vice versa. Prepare a full report of the tests giving all details including remedial actions taken or recommendations to correct noted interference problems.

3.2.1.4 Initial Cathodic Protection System Field Test Report

The contractor shall submit a field test report of the cathodic protection system. All structure-to-electrolyte measurements, including initial potentials and anode outputs, shall be recorded on applicable forms. Identification of test locations, test station and anode test stations shall coordinate with the as-built drawings and be provided on system drawings included in the report. The contractor shall locate, correct, and report to the Contracting Officer any short circuits encountered during the checkout of the installed cathodic protection system.

**************************************************************************************************************************************************************************************************************

NOTE: The requirements of paragraph entitled "Government Field Testing" are required for cathodic protection projects in the NAVFAC LANT area. The designer should verify their applicability to projects outside the NAVFAC LANT area with the appropriate EFD corrosion program manager.

**************************************************************************************************************************************************************************************************************

3.2.1.5 Government Field Testing

The government corrosion [engineer, NAVFAC LANT Code 404] [program manager,
NAVFAC LANT Code 1614C] shall review the Contractor's initial field testing report. Approximately four weeks after receipt of the Contractor's initial test report, the system will be tested and inspected in the Contractor's presence by the government corrosion [engineer, NAVFAC LANT Code 404] [program manager, NAVFAC LANT Code 1614C]. The Contractor shall correct, at his expense, materials and installations observed by these tests and inspections to not be in conformance with the plans and specifications. The Contractor shall pay for all retesting done by the government engineer made necessary by the correction of deficiencies.

NOTE: For cathodic protection projects in the NAVFAC LANT area, select the appropriate NAVFAC LANT options for paragraphs entitled "One Year Warranty Period Testing" and "Final Field Testing."

3.2.1.6 One Year Warranty Period Testing

The Contractor shall inspect, test, and adjust the cathodic protection system [quarterly] [semi-annually] [_____] for one year, [4] [2] [_____] interim inspections total, to ensure its continued conformance with the criteria outlined below. The performance period for these tests shall commence upon the completion of all cathodic protection work, including changes required to correct deficiencies identified during initial testing, and preliminary acceptance of the cathodic protection system by the Contracting Officer. Copies of the One Year Warranty Period Cathodic Protection System Field Test Report, including field data, and certified by the Contractor's corrosion engineer shall be submitted to the Contracting Officer, the activity, and the geographic Engineering Field Division corrosion [protection program manager] [engineer, NAVFAC LANT Code 404] [protection program manager, NAVFAC LANT Code 1614C].

3.2.1.7 Final Field Testing

Conduct final field testing of the cathodic protection system utilizing the same procedures specified under, "Initial Field Testing of the Galvanic Cathodic Protection Systems". The Contractor shall inspect, test, and adjust the cathodic protection system after one year of operation to ensure its continued conformance with the criteria outlined below. The performance period for these tests shall commence upon preliminary acceptance for the cathodic protection system by the Contracting Officer. Copies of the Final Cathodic Protection System Field Test Report, certified by the Contractor's corrosion engineer shall be submitted to the Contracting Officer and the geographic Engineering Field Division corrosion [protection program manager] [engineer, NAVFAC LANT Code 404] [protection program manager, NAVFAC LANT Code 1614C] for approval, and as an attachment to the operation and maintenance manual in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

3.2.2 Criteria for Cathodic Protection

Conduct in accordance with [NACE SP0169] [NACE SP0285]. Criteria for determining the adequacy of protection shall be selected by the corrosion engineer as applicable:

NOTE: The following criteria are applicable only to iron and steel structures. Refer to NACE SP0169 for
appropriate criteria for other metal structures. Not all criteria may be readily applicable to the type of CP system(s) being designed, and the designer should select only the applicable criteria.

**a.** A negative voltage of at least 0.85 volt (850 millivolts) as measured between the structure surface and a saturated copper-copper sulfate reference electrode contacting the earth [electrolyte]. Determination of this voltage is to be made with the protective current applied to the [structure] [tank] [pipeline] for a minimum of [24] [_____] hours. Voltage drops must be considered for valid interpretation of this voltage measurement. The method of voltage drop consideration shall be identified by the Contractor's corrosion engineer and approved by the Government corrosion engineer.

**b.** A negative polarized potential of at least 0.85 volt (850 millivolts) as measured between the structure surface and a saturated copper-copper sulfate reference electrode contacting the earth [electrolyte]. Determination of this voltage is to be made after the protective current has been applied to the [structure] [tank] [pipeline] for a minimum of [24] [_____] hours.

**c.** A minimum polarization voltage shift of 100 mV measured between the structure surface and a saturated copper-copper sulfate reference electrode contacting the earth [electrolyte]. This voltage shift shall be determined by interrupting the protective current and measuring the polarization decay. At the instant the protective current is interrupted ("instant off"), an immediate voltage shift will occur. The voltage reading just after the immediate shift shall be used as the base reading from which to measure the polarization decay. The polarization decay shall be the difference between the base reading and a voltage measurement made [24] [48] [_____] hours after the interruption of protective current.

3.3 DEMONSTRATION

3.3.1 Instructing Government Personnel

**NOTE:** There are restrictions on the type and extent of training. Training is usually on-site, 2 days or less. Factory representatives or others provide basic instructions to facility maintenance and operation personnel. If more extensive training is required, i.e., student travel, special consultants, etc., consult the Contract Division Director and the head of the Comptroller Department for assistance.

During the warranty testing and at a time designated by the Contracting Officer, make available the services of a technician regularly employed or authorized by the manufacturer of the Cathodic Protection System for instructing Government personnel in the proper operation, maintenance, safety, and emergency procedures of the Cathodic Protection System. The period of instruction shall be not less than [one] [_____] but not more than [two] [_____] 8-hour working day[s]. Conduct the training at the jobsite or at another location mutually satisfactory to the Government and the Contractor. The field instructions shall cover all of the items
contained in the operation and maintenance manual.

3.4 SCHEDULE

Some metric measurements in this section is based on a mathematical conversion of an English unit measurement, and not on metric measurement commonly agreed upon by the manufacturers or other parties. The English and metric units for the measurements shown are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for a cathodic protection system utilizing continuous flow direct current from sacrificial anodes.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification covers a cathodic protection system for metal surfaces against corrosion by producing a continuous flow of direct current from sacrificial anodes to the metal to be protected. The anodes should be of sufficient size and quantity to protect the buried metal items for a specified number of years before replacement. The U.S. Department of Transportation has issued regulations requiring the application of cathodic protection to natural gas pipelines, liquid natural gas pipelines, petroleum pipelines, petroleum products pipelines, liquid petroleum gas pipelines, and petroleum storage facilities. Title 49 of the Code of Federal Regulations, Parts 191, 192, 193 and
195 should be consulted for applicable cathodic protection requirements for specific applications.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of
For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

1.3.1 Services of "Corrosion Expert"

Obtain the services of a "corrosion expert" to supervise, inspect, and test the installation and performance of the cathodic protection system. "Corrosion expert" refers to a person, who by thorough knowledge of the physical sciences and the principles of engineering and mathematics, acquired by professional education and related practical experience, is qualified to engage in the practice of corrosion control of buried or submerged metallic surfaces.

a. Such a person must be accredited or certified by the National Association of Corrosion Engineers (NACE) as a NACE Accredited Corrosion Specialist or a NACE certified Cathodic Protection (CP) Specialist or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control of buried or submerged metallic piping and tank systems, if such certification or licensing includes 5 years experience in corrosion control on underground metallic surfaces of the type under this contract.

b. The "corrosion expert" shall make at least 3 visits to the project site. The first of these visits shall include obtaining soil resistivity data, acknowledging the type of pipeline coatings to be used and reporting to the Contractor the type of cathodic protection required. Once the submittals are approved and the materials delivered, the "corrosion expert" shall revisit the site to ensure the Contractor understands installation practices and laying out the components. The third visit shall involve testing the installed cathodic protection systems and training applicable personnel on proper maintenance techniques. The "corrosion expert" shall supervise installation and testing of all cathodic protection.

c. Submit evidence of qualifications of the "corrosion expert" including its name and qualifications certified in writing to the Contracting Officer prior to the start of construction. Certification shall be submitted giving the name of the firm, the number of years of experience, and a list of not less than five (5) of the firm's installations, three (3) or more years old, that have been tested and found satisfactory.

1.3.2 Isolators

Isolators are required to insulate the indicated pipes from any other structure. Isolators shall be provided with lightning protection and a test station as shown.

1.3.3 Anode and Bond Wires

A minimum of [5] [8] [25] magnesium anodes with an unpackaged weight of [_____] kg pounds shall be provided uniform distances along the metallic pipe lines. A minimum of [3] [5] [10] test stations shall be used for these anodes. These anodes shall be in addition to anodes for the pipe under concrete slab and casing requirements. For each cathodic system, the metallic components and structures to be protected shall be
made electrically continuous. This shall be accomplished by installing bond wires between the various structures. Bonding of existing buried structures may also be required to preclude detrimental stray current effects and safety hazards. Provisions shall be included to return stray current to its source without damaging structures intercepting the stray current. The electrical isolation of underground facilities in accordance with acceptable industry practice shall be included under this section. All tests shall be witnessed by the Contracting Officer.

1.3.4 Surge Protection

Approved zinc grounding cells or sealed weatherproof lightning arrester devices shall be installed across insulated flanges or fittings installed in underground piping as indicated on the drawings. The arrester shall be gapless, self-healing, solid state type. Zinc anode composition shall conform to ASTM B418, Type II. Lead wires shall be number 6 AWG copper with high molecular weight polyethylene (HMWPE) insulation. The zinc grounding cells shall not be prepackaged in backfill but shall be installed as detailed on the drawings. Lightning arrestors or zinc grounding cells are not required for insulated flanges on metallic components used on nonmetallic piping systems.

1.3.5 Nonmetallic Pipe System

In the event pipe other than metallic pipe is approved and used in lieu of metallic pipe, all metallic components of this pipe system shall be protected with cathodic protection. Detailed drawings of cathodic protection for each component shall be submitted to the Contracting Officer for approval within 45 days after date of receipt of notice to proceed, and before commencement of any work.

1.3.5.1 Coatings

Coatings for metallic components shall be as required for metallic fittings. Protective covering (coating and taping) shall be completed and tested on each metallic component (such as valves, hydrants and fillings). This covering shall be as required for underground metallic pipe. Each test shall be witnessed by the Contracting Officer. Coatings shall be selected, applied, and inspected as specified in these specifications. The use of nonmetallic pipe does not change other requirements of the specifications. Any deviations due to the use of nonmetallic pipe shall be submitted for approval.

1.3.5.2 Tracer Wire

When a nonmetallic pipe line is used to extend or add to an existing metallic line, an insulated No. 8 AWG copper wire shall be thermit-welded to the existing metallic line and run the length of the new nonmetallic line. This wire shall be used as a locator tracer wire and to maintain continuity to any future extensions of the pipe line.

1.3.6 Drawings

Submit [six] [_____] copies of detail drawings consisting of a complete list of equipment and material including manufacturer's descriptive and technical literature, catalog cuts, results of system design calculations including soil-resistivity, installation instructions and certified test data showing location of anodes and stating the maximum recommended anode current output density. Include in the detail drawings complete wiring and
schematic diagrams, insulated fittings, test stations, permanent reference cells, and bonding. and any other details required to demonstrate that the system has been coordinated and will function properly as a unit. Locations shall be referenced to two (2) permanent facilities or mark points.

1.4 DELIVERY, STORAGE, AND HANDLING

Storage area for magnesium anodes will be designated by the Contracting Officer. If anodes are not stored in a building, tarps or similar protection should be used to protect anodes from inclement weather. Packaged anodes, damaged as a result of improper handling or being exposed to rain, shall be resacked and the required backfill added.

1.5 EXTRA MATERIALS

After approval of shop drawings, and not later than three (3) months prior to the date of beneficial occupancy, furnish spare parts data for each different item of material and equipment specified, after approval of detail drawings and not later than six (6) months prior to the date of beneficial occupancy. The data shall include a complete list of parts, special tools, and supplies, with current unit prices and source of supply. One (1) spare anode of each type shall be furnished. In addition, supply information for material and equipment replacement for all other components of the complete system, including anodes, cables, splice kits and connectors, corrosion test stations, and any other components not listed above. [Furnish a reference cell on a reel with 120 m 350 feet of conductor, along with other accessories, and a digital voltmeter that can be used in the maintenance of this cathodic protection system. Use of this equipment shall be demonstrated in actual tests during the training course, which shall include a description of the the equipment and measurement of the pipe-to-soil potential, rainfall, and gas company voltages.]

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a complete, operating, sacrificial anode cathodic protection system in complete compliance with NFPA 70, with all applicable Federal, State, and local regulations and with the minimum requirements of this contract.

a. In addition to the minimum requirements of these specifications, [construction of gas pipelines and associated cathodic protection systems shall be in compliance with 49 CFR 192] [and] [construction of hazardous liquid pipelines, including fuel pipelines, and associated cathodic protection systems shall be in compliance with 49 CFR 195] [and] [construction and installation of underground fuel storage tanks and associated cathodic protection system shall be in compliance with 40 CFR 280].

b. The services required include planning, installation, adjusting and testing of a cathodic protection system, using sacrificial anodes for cathodic protection of the [Water] [Fire Protection] [Force Main] [Gas] [_____] lines, their connectors and [lines under the slab or floor foundation.] The cathodic protection system shall include anodes, cables, connectors, corrosion protection test stations, and any other equipment required for a complete operating system providing the NACE criteria of protection as specified.
c. Submit an itemized list of equipment and materials including item number, quantity, and manufacturer of each item, within [30] [_____] days after receipt of notice to proceed. The list shall be accompanied by a description of procedures for each type of testing and adjustments, including testing of coating for thickness and holidays. Installation of materials and equipment shall not commence until this submittal is approved. Insulators are required whenever needed to insulate the pipes from any other structure. Any pipe crossing the [_____] pipe shall have a test station. The cathodic protection shall be provided on [Water] [Fire Protection] [Force Main] [Gas] [_____] pipes.

d. Submit proof that the materials and equipment furnished under this section conform to the specified requirements contained in the referenced standards or publications. The label or listing by the specified agency will be acceptable evidence of such compliance.

e. Before final acceptance of the cathodic protection system, submit [6] [_____] copies of operating manuals outlining the step-by-step procedures required for system startup, operation, adjustment of current flow, and shutdown. The manuals shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.

f. Submit [6] [_____] copies of maintenance manuals, listing routine maintenance procedures, recommendation for maintenance testing, possible breakdowns and repairs, and troubleshooting guides. The manuals shall include single-line diagrams for the system as installed; instructions in making pipe-to-reference cell and tank-to-reference cell potential measurements and frequency of monitoring; instructions for dielectric connections, interference and sacrificial anode bonds; instructions shall include precautions to ensure safe conditions during repair of pipe or other metallic systems. The instructions shall be neatly bound between permanent covers and titled "Operating and Maintenance Instructions." These instructions shall be submitted for the Contracting Officer's approval. The instructions shall include the following:

1. As-built drawings, to scale, of the entire system, showing the locations of the piping, location of all anodes and test stations, locations of all insulating joints, and structure-to-soil potential test points as measured during the tests required by paragraph TESTS AND MEASUREMENTS. Each test point shall be given a unique alphanumeric identification that is cross referenced to the data sheets.

2. Recommendations for maintenance testing, including instructions in making pipe-to-reference cell potential measurements and frequency of testing.

3. All maintenance and operating instructions and nameplate data shall be in English.

4. Instructions shall include precautions to insure safe conditions during repair of pipe system.

2.1.1 Contractor's Modifications

The specified system is based on a complete system with magnesium
sacrificial anodes. The Contractor may modify the cathodic protection system after review of the project, site verification, and analysis, if the proposed modifications include the anodes specified and will provide better overall system performance.

a. Submit [six] [_____] copies of detail drawings showing proposed changes in location, scope of performance indicating any variations from, additions to, or clarifications of contract drawings. Show proposed changes in anode arrangement, anode size and number, anode materials and layout details, conduit size, wire size, mounting details, wiring diagram, method for electrically-isolating each pipe, and any other pertinent information to proper installation and performance of the system. The modifications shall be fully described, shall be approved by the Contracting Officer, and shall meet the following criteria.

b. The proposed system shall achieve a minimum pipe-to-soil "instant off" potential of minus 850 millivolts with reference to a saturated copper-copper sulfate reference cell on the underground components of the piping or other metallic surface. Take resistivity measurements of the soil in the vicinity of the pipes and ground bed sites. Based upon the measurements taken, the current and voltage shall be required to produce a minimum of minus 850 millivolts "instant off" potential between the structure being tested and the reference cell. This potential shall be obtained over 95 percent of the metallic area. The anode system shall be designed for a life of twenty-five (25) years of continuous operation.

c. Submit final report regarding Contractor's modifications. The report shall include pipe-to-soil measurements throughout the affected area, indicating that the modifications improved the overall conditions, and current measurements for anodes. The following special materials and information are required: taping materials and conductors; zinc grounding cell, installation and testing procedures, and equipment; coating material; system design calculations for anode number, life, and parameters to achieve protective potential; backfill shield material and installation details showing waterproofing; bonding and waterproofing details; insulated resistance wire; exothermic weld equipment and material.

2.1.2 Summary of Services Required

The scope of services shall include, but shall not be limited to, the following:

a. Close-interval potential surveys.

b. Cathodic Protection Systems.

c. System testing.

d. Casing corrosion control.

e. Interference testing.

f. Training.

g. Operating and maintenance manual.

h. Insulator testing and bonding testing.
i. Coating and holiday testing to be submitted within 45 days of notice to proceed.

2.1.3 Tests of Components

Perform a minimum of four (4) tests at each metallic component in the piping system. Two (2) measurements shall be made directly over the anodes and the other two (2) tests shall be over the outer edge of the component, but at the farthest point from the anodes. Structure and pipes shall be shown with the cathodic protection equipment. All components of the cathodic protection system shall be shown on drawings, showing their relationship to the protected structure or component. A narrative shall describe how the cathodic protection system will work and provide testing at each component. Components requiring cathodic protection shall include but not be limited to the following:

a. Pipes under the floor slab or foundations.
b. PIV.
c. Shutoff valves.
d. Metallic pipe extended from aboveground locations.
e. Each connector or change-of-direction device.
f. Any metallic pipe component or section.
g. Backflow preventer.
h. Culvert.

2.1.4 Electrical Potential Measurements

All potential tests shall be made at a minimum of 3 m 10 foot intervals witnessed by the Contracting Officer. Submittals shall identify test locations on separate drawing, showing all metal to be protected and all cathodic protection equipment. Test points equipment and protected metal shall be easily distinguished and identified.

2.1.5 Achievement of Criteria for Protection

All conductors, unless otherwise shown, shall be routed to or through the test stations. Each system provided shall achieve a minimum pipe-to-soil "instant off" potential of minus 850 millivolt potentials with reference to a saturated copper-copper-sulfate reference cell on all underground components of the piping. Based upon the measurements taken, the current and voltage of the anodes should be adjusted as required to produce a minimum of minus 850 millivolts "instant off" potential between the structure being tested and the reference cell. This potential should be obtained over 95 percent of the metallic area. This must be achieved without the "instant off" potential exceeding 1150 millivolts. Testing will be witnessed by the Contracting Officer. Provide additional anodes if required to achieve the minus 850 millivolts "instant off". Although acceptance criteria of the cathodic protection systems are defined in NACE SP0169, for this project the "instant off" potential of minus 850 millivolts is the only acceptable criteria.
2.1.6 Metallic Components on Nonmetallic Systems and Typicals

2.1.6.1 Metallic Components

As a minimum, protect each metallic component with two (2) magnesium anodes. This number of anodes is required to achieve minus 850 millivolts "instant off" potential on the metallic area and at the same time not provide overvoltage above 1150 millivolts "instant off." As a minimum, the magnesium anode unpackaged weight shall be $4.1 \text{ kg } [9] \text{ [17]}$ $[_____]$ pounds. The magnesium anodes shall be located on each side of the metallic component and routed through a test station.

2.1.6.2 Fire Hydrants

Fire hydrant pipe components shall have a minimum of two (2) anodes. These magnesium anodes shall have an unpackaged weight of $7.7 \text{ kg } 17 \text{ pounds}$.

2.1.6.3 Pipe Under Concrete Slab

Pipe under concrete slab shall have a minimum of $[2] \text{ [3]} [_____]$ magnesium anodes. These magnesium anodes shall have an unpackaged weight of $[4.1] \text{ [7.7]} [_____] \text{ kg } [9] \text{ [17]} [_____]$ pounds. Pipe under concrete slab shall have $[1] \text{ [2]} [_____]$ permanent reference electrodes located under the slab. One (1) permanent reference electrode shall be located where the pipe enters the concrete slab. All conductors shall be routed to a test station.

2.1.6.4 Valves

Each valve shall be protected with $[1] \text{ [2]} [_____]$ magnesium anodes. The magnesium anode shall have an unpackaged weight of $[4.1] \text{ [7.7]} [_____] \text{ kg } [9] \text{ [17]} [_____]$ pounds.

2.1.6.5 Metallic Pipe Component or Section

Each section of metallic pipe shall be protected with $[2] \text{ [3]} [_____]$ magnesium anodes. The magnesium anodes shall have an unpackaged weight of $[4.1] \text{ [7.7]} [_____] \text{ kg } [9] \text{ [17]} [_____]$ pounds.

2.1.6.6 Connectors or Change-of-Direction Devices

Each change-of-direction device shall be protected with $[2] \text{ [3]} [_____]$ magnesium anodes. The magnesium anode shall have an unpackaged weight of $[4.1] \text{ [7.7]} [_____] \text{ kg } [9] \text{ [17]} [_____]$ pounds.

2.1.7 Metallic Component Coating

Coatings for metallic components shall be as required for metallic fittings as indicated. This will include fire hydrants, T's, elbows, valves, etc. Coatings shall be selected, applied, and inspected as specified in these specifications. All aboveground pipeline shall be coated as indicated or as approved. The coating shall have a minimum thickness of $0.18 \text{ mm } 7 \text{ mil}$. The pipeline coating shall be in accordance with all applicable Federal, State, and local regulations.

2.2 MAGNESIUM ANODES

AND TYPICALS for additional anodes under slab.

2.2.1 Anode Composition

Anodes shall be of high-potential magnesium alloy, made of primary magnesium obtained from sea water or brine, and not made from scrap metal. Magnesium anodes shall conform to ASTM B843 and to the following analysis (in percents) otherwise indicated:

<table>
<thead>
<tr>
<th>Element</th>
<th>Max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aluminum</td>
<td>0.010</td>
</tr>
<tr>
<td>Manganese</td>
<td>0.50 to 1.30</td>

<td>0.05 each or 0.3 max. total</td>
</tr>
<tr>
<td>Magnesium</td>
<td>Remainder</td>
</tr>
</tbody>
</table>

Furnish spectrographic analysis on samples from each heat or batch of anodes used on this project.

2.2.2 Dimensions and Weights

Dimensions and weights of anodes shall be approximately as follows:

<table>
<thead>
<tr>
<th>Nominal Weight (kg) (lbs)</th>
<th>Approx. Size (mm) (inch)</th>
<th>Nominal Gross Weight (kg) (lbs) Packaged in Backfill</th>
<th>Nominal Package Dimensions (mm) (inch)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.43</td>
<td>76 X 76 X 1273 X 3 X 5</td>

</tr>
</tbody>
</table>
2.2.3 Packaged Anodes

Provide anodes in packaged form with the anode surrounded by specially-prepared quick-wetting backfill and contained in a water permeable cloth or paper sack. Anodes shall be centered by means of spacers in the backfill material. The backfill material shall have the following composition, unless otherwise indicated:

<table>
<thead>
<tr>
<th>Material</th>
<th>Approximate Percent by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gypsum</td>
<td>75</td>

</tbody>
</table>

2.2.4 Zinc Anodes

Zinc anodes shall conform to ASTM B418, Type II.

2.2.5 Connecting Wire

**************************************************************************

**NOTE:** Any pinhole, cut, scratch or other damage to the anode cable exposing bare copper to the electrolyte will result in early failure of the cathodic protection system. For this reason, special, extra heavy insulation is used on anode cable. While it is often expedient to use the same type wire for the cathodic (negative) cable in order to avoid a mix-up in the field, the cathode cable is not subject to anodic failure and lesser insulation can be used.

Type RHW-2-USE-2 insulation should be used under hot asphalt.

**************************************************************************

2.2.5.1 Wire Requirements

Wire shall be No. [12] [10] [_____] AWG solid copper wire, not less than 3 m 10 feet long, unspliced, complying with NPPA 70, Type [TW] [RHW-USE] insulation. [Connecting wires for magnesium anodes shall be factory installed with the place or emergence from the anode in a cavity sealed flush with a dielectric sealing compound.] [Connecting wires for zinc anodes shall be factory installed with the place of connection to the protruding steel core completely sealed with a dielectric material.]

2.2.5.2 Anode Header Cable

Cable for anode header and distribution shall be No. [_____] AWG stranded copper wire with type CP high molecular weight polyethylene, 2.8 mm 7/64 inch thick insulation, 600-volt rating.
2.3 MISCELLANEOUS MATERIALS

2.3.1 Electrical Wire

**************************************************************************
NOTE: The cathodic protection system will fail unless full consideration is given to specifications for electrically insulating pipe joints, electrically conductive pipe joints, and casing cradles and seals. Mechanical and electrical specifications should reference paragraphs "Electrically Isolating Pipe Joints" and "Electrically Conductive Couplings."
**************************************************************************

Wire shall be No. [12] [10] [_____] AWG stranded copper wire with NFPA 70, Type [TW] [RHW-USE with outer covering] [RHW-USE] [Polyethylene] [_____] insulation. Polyethylene insulation shall comply with the requirements of ASTM D1248 and shall be of the following types, classes, and grades:

- High-molecular weight polyethylene shall be Type I, Class C, Grade E5.
- High-density polyethylene shall be Type III, Class C, Grade E3.

2.3.1.1 Wire Splicing

**************************************************************************
NOTE: In water tanks, split bolts are used (above the water line only) because working space is limited and the hydraulic or mechanical compression tools may be cumbersome and hazardous to use; since single split-bolt will work loose when the wires it connects are moved, minimum of two split bolts should be used. At ground level or in trenches, compression tools can be used conveniently, and the swaged sleeve connection produced by such tools is more reliable than split bolts.
**************************************************************************

Connecting wire splicing shall be made with copper compression connectors or exothermic welds, following instructions of the manufacturer. Single split-bolt connections shall not be used. Sheaths for encapsulating electrical wire splices to be buried underground shall fit the insulated wires entering the spliced joints and epoxy potting compound shall be as specified below.

2.3.1.2 Test Wires

Test wires shall be AWG No. 12 stranded copper wire with NFPA 70, Type TW or RHW-USE with outer covering or polyethylene insulation.

2.3.1.3 Resistance Wire

Resistance wire shall be AWG No. 16 or No. 22 nickel-chromium wire.

2.3.2 Conduit

Rigid galvanized steel conduit and accessories shall conform to UL 6. Non-metallic conduit shall conform to NEMA TC 2.
2.3.3  Test Boxes and Junctions Boxes

Boxes shall be outdoor type conforming to UL 514A.

2.3.4  Joint, Patch, Seal, and Repair Coating

Sealing and dielectric compound shall be a black, rubber based compound that is soft, permanently pliable, tacky, moldable, and unbacked. Compound shall be applied as recommended by the manufacturer, but not less than 13 mm 1/2-inch thick. Coating compound shall be [cold-applied coal-tar base mastic] [hot-applied coal-tar enamel]. Pressure-sensitive vinyl plastic electrical tape shall conform to UL 510.

2.3.5  Backfill Shields

Shields shall consist of approved pipeline wrapping or fiberglass-reinforced, coal-tar impregnated tape, or plastic weld caps, specifically made for the purpose and installed in accordance with the manufacturer's recommendations. When joint bonds are required, due to the use of mechanical joints, the entire joint shall be protected by the use of a kraft paper joint cover. The joint cover shall be filled with poured-in, hot coat-tar enamel.

2.3.6  Epoxy Potting Compound

Compound for encapsulating electrical wire splices to be buried underground shall be a two package system made for the purpose.

2.3.7  Test Stations

**************************************************************************
NOTE: Retain bracketed sentences only when nonmetallic materials are used in the project.
**************************************************************************

Stations shall be of the [aboveground] [flush-curb-box type] and shall be the standard product of a recognized manufacturer. Test stations shall be complete with an insulated terminal block having the required number of terminals. The test station shall be provided with a lockable cover and shall have an embossed legend, "C.P. Test." A minimum of one (1) test station shall be provided each component of the [pipe] [tank] [____]. A minimum of six (6) terminals shall be provided in each test station. A minimum of two (2) leads are required to the metallic pipe from each test station. Other conductors shall be provided for each anode, other foreign pipe, and reference cells as required. [Test stations may be constructed of nonmetallic materials. However, if nonmetallic materials are utilized, as a minimum, the materials shall be resistant to damage from ultraviolet radiation, contain good color retention qualities, contain high strength qualities, and be resistant to accidental or vandalistic impacts that might be normally encountered in the environment for which they are to be installed. The test stations shall be listed for the particular application for which they are to be utilized].

2.3.8  Joint and Continuity Bonds

Bonds shall be provided across all joints in the metallic [water] [gas] [____] lines, across any electrically discontinuous connections and all other pipes and structures with other than welded or threaded joints that
are included in this cathodic protection system. Unless otherwise specified in the specifications, bonds between structures and across joints in pipe with other than welded or threaded joints shall be No. 8 AWG stranded copper cable with polyethylene insulation. Bonds between structures shall contain sufficient slack for any anticipated movement between structures. Bonds across pipe joints shall contain a minimum of 102 mm 4 inch of slack to allow for pipe movement and soil stress. Bonds shall be attached by exothermic welding. Exothermic weld areas shall be insulated with coating compound and approved, and witnessed by the Contracting Officer. Continuity bonds shall be installed as necessary to reduce stray current interference. Additional joint bondings shall be accomplished where the necessity is discovered during construction or testing or where the Contracting Officer's representative directs that such bonding be done. Joint bonding shall include all associated excavation and backfilling. There shall be a minimum of two (2) continuity bonds between each structure and other than welded or threaded joints. Test for electrical continuity across all joints with other than welded or threaded joints and across all metallic portions or components. Provide bonding as required and as specified above until electrical continuity is achieved. Submit bonding test data for approval.

2.3.9 Resistance Bonds

Resistance bonds should be adjusted as outlined in this specification. Alternate methods may be used if they are approved by the Contracting Officer.

2.3.10 Stray Current Measurements

Stray current measurements should be performed at each test station. Stray currents resulting from lightning or overhead alternating current (AC) power transmission systems shall be mitigated in accordance with NACE SP0177.

2.3.11 Electrical Isolation of Structures

**************************************************************************
NOTE: The cathodic protection system will fail unless full consideration is given to specifications for electrically insulating pipe joints, electrically conductive pipe joints, and casing cradles and seals. Mechanical and electrical specifications should reference paragraphs "Electrically Isolating Pipe Joints" and "Electrically Conductive Couplings."
**************************************************************************

As a minimum, isolating flanges or unions shall be provided at the following locations:

a. Connection of new metallic piping or components to existing piping.

b. Pressure piping under floor slab to a building.

Isolation shall be provided at metallic connection of all lines to existing system and where connecting to a building. Additionally, isolation shall be provided between [water] [_____] and/or [gas] [_____] [forced main] line; and foreign pipes that cross the new lines within 3.05 m 10 feet. Isolation fittings, including isolating flanges and couplings, shall be installed aboveground or in a concrete pit.
2.3.11.1 Electrically Isolating Pipe Joints

Electrically isolating pipe joints shall be of a type that is in regular factory production.

2.3.11.2 Electrically Conductive Couplings

Electrically conductive couplings shall be of a type that has a published maximum electrical resistance rating given in the manufacturer's literature. Cradles and seals shall be of a type that is in regular factory production made for the purpose of electrically insulating the carrier pipe from the casing and preventing the incursion of water into the annular space.

2.3.11.3 Insulating Joint Testing

A Model 601 Insulation Checker, as manufactured by ["Gas Electronics"], [____], [or] [an approved equal], shall be used for insulating joint (flange) electrical testing.

2.3.12 Underground Structure Coating

This coating specification shall take precedence over any other project specification and drawing notes, whether stated or implied, and shall also apply to the pipeline or tank supplier. No variance in coating quality shall be allowed by the Contractor or Base Construction Representative without the written consent of the designer. All underground metallic pipelines and tanks to be cathodically protected shall be afforded a good quality factory-applied coating. This includes all carbon steel, cast-iron and ductile-iron pipelines or vessels. Coatings shall be selected, applied, and inspected as specified. If non-metallic pipelines are installed, all metallic fittings on pipe sections shall be coated in accordance with this specification section.

a. The nominal thickness of the metallic pipe joint or other component coating shall be [0.2] [0.4] [0.6] [1.0] [1.5] [_____] mm [8] [16] [24] [40] [60] [_____] mils, plus or minus 5 percent.

b. Pipe and joint coating for factory applied or field repair material shall be applied as recommended by the manufacturer and shall be one of the following:

(1) Continuously extruded polyethylene and adhesive coating system.
(2) Polyvinyl chloride pressure-sensitive adhesive tape.
(3) High density polyethylene/bituminous rubber compound tape.
(4) Butyl rubber tape.
(5) Coal tar epoxy.

2.3.12.1 Field Joints

All field joints shall be coated with materials compatible with the pipeline coating compound. The joint coating material shall be applied to an equal thickness as the pipeline coating. Unbonded coatings shall not be used on these buried metallic components. This includes the elimination of all unbonded polymer wraps or tubes. Once the pipeline or vessel is set in the trench, an inspection of the coating shall be conducted. This inspection shall include electrical holiday detection. Any damaged areas of the coating shall be properly repaired. The Contracting Officer shall
be asked to witness inspection of the coating and testing using a holiday detector.

2.3.12.2 Inspection of Pipe Coatings

Any damage to the protective covering during transit and handling shall be repaired before installation. After field coating and wrapping has been applied, the entire pipe shall be inspected by an electric holiday detector with impressed current in accordance with NACE SP0188 using a full-ring, spring-type coil electrode. The holiday detector shall be equipped with a bell, buzzer, or other type of audible signal which sounds when a holiday is detected. All holidays in the protective covering shall be repaired immediately upon detection. Occasional checks of holiday detector potential will be made by the Contracting Officer's representative to determine suitability of the detector. All labor, materials, and equipment necessary for conducting the inspection shall be furnished by the Contractor.

2.3.12.2.1 Protective Covering for Aboveground Piping System

Finish painting shall conform to the applicable paragraph of SECTION: 09 90 00 PAINTS AND COATINGS and as follows:

2.3.12.2.2 Ferrous Surfaces

Shop-primed surfaces shall be touched-up with ferrous metal primer. Surfaces that have not been shop-primed shall be solvent-cleaned. Surfaces that contain loose rust, loose mil scale, and other foreign substances shall be mechanically-cleaned by power wire-brushing and primed with ferrous metal primer. Primed surface shall be finished with two (2) coats of exterior oil paint and vinyl paint. Coating for each entire piping service shall be an approved pipe line wrapping having a minimum coating resistance of 50,000 Ohms per 0.0929 square meters square foot.

2.3.13 Resistance Wire

Wire shall be No. 16 or No. 22 nickel-chromium wire with TW insulation.

2.3.14 Electrical Connections

Electrical connections shall be done as follows:

a. Exothermic welds shall be ["Cadweld"], [" Bundy"], ["Thermoweld"], [or] [an approved equal]. Use of this material shall be in strict accordance with the manufacturer's recommendations.

b. Electrical-shielded arc welds shall be approved for use on steel pipe by shop drawing submittal action.

c. Brazing shall be as specified in Paragraph: Lead Wire Connections.

2.3.15 Electrical Tape

Pressure-sensitive vinyl plastic electrical tape shall conform to UL 510.

2.3.16 Permanent Reference Electrodes

Permanent reference electrodes shall be Cu-CuS04 electrodes suitable for direct burial. Electrodes shall be guaranteed by the supplier for 15
years' service in the environment in which they shall be placed. Electrodes shall be installed directly beneath pipe, or metallic component.

2.3.17 Casing

**************************************************************************
NOTE: This paragraph will be deleted if mechanical and electrical specifications include these requirements.
**************************************************************************

Where a pipeline is installed in a casing under a roadway or railway, the pipeline shall be electrically insulated from the casing, and the annular space sealed and filled with an approved corrosion inhibiting product against incursion of water.

PART 3 EXECUTION

3.1 CRITERIA OF PROTECTION

Acceptance criteria for determining the adequacy of protection on a buried underground [pipe] [tank] [metallic component] shall be in accordance with [NACE SP0169] [NACE RP0193] [NACE SP0285] and as specified below.

3.1.1 Iron and Steel

The following method a. shall be used for testing cathodic protection voltages. If more than one method is required, method b. shall be used.

a. A negative voltage of at least minus 850 millivolts as measured between the underground component and a saturated copper-copper sulphate reference electrode connecting the earth (electrolyte) directly over the underground component. Determination of this voltage shall be made with the cathodic protection system in operation. Voltage drops shall be considered for valid interpretation of this voltage measurement. A minimum of minus 850 millivolts "instant off" potential between the underground component being tested and the reference cell shall be achieved over 95 percent of the area of the structure. Adequate number of measurements shall be obtained over the entire structure, pipe, tank, or other metallic component to verify and record achievement of minus 850 millivolts "instant off." This potential shall be obtained over 95 percent of the total metallic area without the "instant off" potential exceeding 1200 millivolts.

b. A minimum polarization voltage shift of 100 millivolts as measured between the underground component and a saturated copper-copper sulphate reference electrode contacting the earth directly over the underground component. This polarization voltage shift shall be determined by interrupting the protective current and measuring the polarization decay. When the protective current is interrupted, an immediate voltage shift will occur. The voltage reading, after the immediate shift, shall be used as the base reading from which to measure polarization decay. Measurements achieving 100 millivolts decay shall be made over 95 percent of the metallic surface being protected.

c. For any metallic component, a minimum of four (4) measurements shall be made using subparagraph a., above, and achieving the "instant off" potential of minus 850 millivolts. Two (2) measurements shall be made
over the anodes and two (2) measurements shall be made at different locations near the component and farthest away from the anode.

3.1.2 Aluminum

Aluminum underground component shall not be protected to a potential more negative than minus 1200 millivolts, measured between the underground component and a saturated copper-copper sulphate reference electrode contacting the earth, directly over the metallic component. Resistance, if required, shall be inserted in the anode circuit within the test station to reduce the potential of the aluminum to a value which will not exceed a potential more negative than minus 1200 millivolts. Voltage shift criterion shall be a minimum negative polarization shift of 100 millivolts measured between the metallic component and a saturated copper-copper sulphate reference electrode contacting the earth, directly over the metallic component. The polarization voltage shift shall be determined as outlined for iron and steel.

3.1.3 Copper Piping

For copper piping, the following criteria shall apply: A minimum of 100 millivolts of cathodic polarization between the structure surface and a stable reference electrode contacting the electrolyte. The polarization voltage shift shall be determined as outlined for iron and steel.

3.2 TRENCHING AND BACKFILLING

Perform trenching and backfilling in accordance with [Section 31 00 00 EARTHWORK] [____]. In the areas of the anode beds, all trees and underbrush shall be cleared and grubbed to the limits shown or indicated. In the event rock is encountered in providing the required depth for anodes, determine an alternate approved location and, if the depth is still not provided, submit an alternate plan to the Contracting Officer. Alternate techniques and depths must be approved prior to implementation.

3.3 INSTALLATION

3.3.1 Anode Installation

Unless otherwise authorized, installation shall not proceed without the presence of the Contracting Officer. Anodes of the size specified shall be installed to the depth indicated and at the locations shown. Locations may be changed to clear obstructions with the approval of the Contracting Officer. Anodes shall be installed in sufficient number and of the required type, size, and spacing to obtain a uniform current distribution over the surface of the structure. The anode system shall be designed for a life of 25 years of continuous operation. Anodes shall be installed as indicated in a dry condition after any plastic or waterproof protective covering has been completely removed from the water permeable, permanent container housing the anode metal. The anode connecting wire shall not be used for lowering the anode into the hole. The annular space around the anode shall be backfilled with fine earth in 150 mm 6 inch layers and each layer shall be hand tamped. Care must be exercised not to strike the anode or connecting wire with the tamper. Approximately 20 L 5 gallons of water shall be applied to each filled hole after anode backfilling and tamping has been completed to a point about 150 mm 6 inch above the anode. After the water has been absorbed by the earth, backfilling shall be completed to the ground surface level.
3.3.1.1 Single Anodes

Single anodes, spaced as shown, shall be connected through a test station to the pipeline, allowing adequate slack in the connecting wire to compensate for movement during backfill operation.

3.3.1.2 Groups of Anodes

Groups of anodes, in quantity and location shown, shall be connected to an anode header cable. The anode header cable shall make contact with the structure to be protected only through a test station. Anode lead connection to the anode header cable shall be made by an approved crimp connector or exothermic weld and splice mold kit with appropriate potting compound.

3.3.1.3 Welding Methods

Connections to ferrous pipe shall be made by exothermic weld methods manufactured for the type of pipe supplied. Electric arc welded connections and other types of welded connections to ferrous pipe and structures shall be approved before use.

3.3.2 Anode Placement - General

Packaged anodes shall be installed completely dry, and shall be lowered into holes by rope sling or by grasping the cloth gather. The anode lead wire shall not be used in lowering the anodes. The hole shall be backfilled with fine soil in 150 mm layers and each layer shall be hand-tamped around the anode. Care must be exercised not to strike the anode or lead wire with the tamper. If immediate testing is to be performed, water shall be added only after backfilling and tamping has been completed to a point 150 mm above the anode. Approximately 8 L of water may be poured into the hole. After the water has been absorbed by the soil, backfilling and tamping may be completed to the top of the hole. Anodes shall be installed as specified or shown. In the event a rock strata is encountered prior to achieving specified augered-hole depth, anodes may be installed horizontally to a depth at least as deep as the bottom of the pipe, with the approval of the Contracting Officer.

3.3.3 Underground Pipeline

Anodes shall be installed at a minimum of 2.5 m and a maximum of 3 m from the line to be protected.

3.3.4 Installation Details

Details shall conform to the requirements of this specification. Details shown on the drawings are indicative of the general type of material required, and are not intended to restrict selection to material of any particular manufacturer.

3.3.5 Lead Wire Connections

3.3.5.1 Underground Pipeline (Metallic)

To facilitate periodic electrical measurements during the life of the sacrificial anode system and to reduce the output current of the anodes, if required, all anode lead wires shall be connected to a test station and
buried a minimum of 610 mm 24 inch in depth. The cable shall be No. 10 AWG, stranded copper, polyethylene or RHW-USE insulated cable. The cable shall make contact with the structure only through a test station. Resistance wire shall be installed between the cable and the pipe cable, in the test station, to reduce the current output, if required. Anode connections, except in the test station, shall be made with exothermic welding process, and shall be insulated by means of at least three (3) layers of electrical tape; and all lead wire connections shall be installed in a moistureproof splice mold kit and filled with epoxy resin. Lead wire-to-structure connections shall be accomplished by an exothermic welding process. All welds shall be in accordance with the manufacturer's recommendations. A backfill shield filled with a pipeline mastic sealant or material compatible with the coating shall be placed over the weld connection and shall be of such diameter as to cover the exposed metal adequately.

3.3.5.2 Resistance Wire Splices

Resistance wire connections shall be accomplished with silver solder and the solder joints wrapped with a minimum of three (3) layers of pressure-sensitive tape. Lead wire connections shall be installed in a moistureproof splice mold kit and filled with epoxy resin.

3.3.6 Location of Test Stations

Test stations shall be of the type and location shown and shall be [curb box] [post] [indoor] mounted. Provide buried insulating joints with test wire connections brought to a test station. Reference all test stations with GPS coordinates. Unless otherwise shown, locate other test stations as follows:

a. At 300 m 1,000-foot intervals or less.

b. Where the pipe or conduit crosses any other metal pipe.

c. At both ends of casings under roadways and railways.

d. Where both sides of an insulating joint are not accessible above ground for testing purposes.

3.3.7 Underground Pipe Joint Bonds

Underground pipe having other than welded or threaded coupling joints shall be made electrically continuous by means of a bonding connection installed across the joint.

3.4 ELECTRICAL ISOLATION OF STRUCTURES

**************************************************************************
NOTE: The cathodic protection system will fail unless full engineering considerations are applied to selection, location and installation of electrically conductive joints and electrically isolating joints including the use of underground type dielectric coatings (not paint).

Adequate electrical conductivity of a pipe joint made by means other than welding should be determined by a "corrosion expert." The "corrosion
expert* must be accredited or certified by the National Association of Corrosion Engineers (NACE) as a NACE Accredited Corrosion Specialist or a NACE certified Cathodic Protection (CP) Specialist or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control. Allowable electrical resistance depends on the cross sectional area of the pipe metal, the resistivity of the pipe metal, and the effectiveness of the coating on the pipe. Effectively coated pipe underground requires only a fraction of the electrical conductivity at joints needed for bare pipe. Shop painted pipe is considered to be the same as bare pipe and is not to be confused with pipe coated with an underground type dielectric coating.

The type of electrical isolating pipe joint to be used requires engineering design consideration. In general, the dielectric parts of an isolating joint will not withstand structural or environmental stresses as well as an all-metal type of joint. If the pipe on the cathodic protected side of the underground electrically isolating pipe joint, including the joint, is not effectively coated, interference type corrosion may occur unless other measures are taken. Factors to be considered include:

a. Deflection stresses
b. Pull-out stresses
c. Expansion-contraction due to temperature changes
d. Is function as a union necessary?
e. Is field assembly of critical parts practical?
f. Hazardous locations to be avoided
g. Accessibility if above ground
h. Location of test box if below ground
i. Importance of coating the adjacent pipe if below ground
j. Vulnerability to short circuiting

Factor of safety on pull-out strength required has to be engineered for the specific conditions involved since no blanket provisions are fully applicable to all cases. The requirement for isolating flanges or couplings should be based on a study of the conditions. If the new piping is a short extension to an existing old piping system not under cathodic protection, an isolating fitting should be installed at the point of connection,
since the new piping will be anodic to the older system. If the older system is under cathodic protection, no isolating fitting should be used.

3.4.1 Isolation Joints and Fittings

Isolating fittings, including main line isolating flanges and couplings, shall be installed aboveground, or within manholes, wherever possible. Where isolating joints must be covered with soil, they shall be fitted with a paper joint cover specifically manufactured for covering the particular joint, and the space within the cover filled with hot coal-tar enamel. Isolating fittings in lines entering buildings shall be located at least 305 mm (12 inch) above grade of floor level, when possible. Isolating joints shall be provided with grounding cells to protect against over-voltage surges or approved surge protection devices. The cells shall provide a low resistance across isolating joint without excessive loss of cathodic current.

3.4.2 Gas Distribution Piping

Electrical isolation shall be provided at each building riser pipe to the pressure regulator, at all points where a short to another structure or to a foreign structure may occur, and at other locations as indicated on the drawings.

3.5 TESTS AND MEASUREMENTS

Submit test reports in booklet form tabulating all field tests and measurements performed, upon completion and testing of the installed system and including close interval potential survey, casing and interference tests, final system test verifying protection, insulated joint and bond tests, and holiday coating test. Submit a certified test report showing that the connecting method has passed a 120-day laboratory test without failure at the place of connection, wherein the anode is subjected to maximum recommended current output while immersed in a three percent sodium chloride solution.

3.5.1 Baseline Potentials

Each test and measurement will be witnessed by the Contracting Officer. Notify the Contracting Officer a minimum of five (5) working days prior to each test. After backfill of the [pipe] [tank], the static potential-to-soil of the [pipe] [tank] shall be measured. The locations of these measurements shall be identical to the locations specified for [pipe]- [tank]- to-reference electrode potential measurements. The initial measurements shall be recorded.

3.5.2 Isolation Testing

Before the anode system is connected to the [pipe] [tank], an isolation test shall be made at each isolating joint or fitting. This test shall demonstrate that no metallic contact, or short circuit exists between the two isolated sections of the [pipe] [tank]. Any isolating fittings installed and found to be defective shall be reported to the Contracting Officer.
3.5.2.1 Insulation Checker

A Model 601 insulation checker, as manufactured by ["Gas Electronics",] ______ [or] [an approved equal], using the continuity check circuit, shall be used for isolating joint (flange) electrical testing. Testing shall conform to the manufacturer's operating instructions. Test shall be witnessed by the Contracting Officer. An isolating joint that is good will read full scale on the meter. If an isolating joint is shorted, the meter pointer will be deflected or near zero on the meter scale. Location of the fault shall be determined from the instructions, and the joint shall be repaired. If an isolating joint is located inside a vault, the pipe shall be sleeved with insulator when entering and leaving the vault.

3.5.2.2 Cathodic Protection Meter

A Model B3A2 cathodic protection meter, as manufactured by ["M.C. Miller",] ______ [or] [an approved equal], using the continuity check circuit, shall be used for isolating joint (flange) electrical testing. This test shall be performed in addition to the Model 601 insulation checker. Continuity is checked across the isolation joint after the test lead wire is shorted together and the meter adjusted to scale. A full-scale deflection indicates the system is shorted at some location. The Model 601 verifies that the particular insulation under test is good and the Model B3A2 verifies that the system is isolated. If the system is shorted, further testing shall be performed to isolate the location of the short.

3.5.3 Anode Output

As the anodes or groups of anodes are connected to the [pipe] [tank] [____], current output shall be measured with an approved clamp-on milliammeter, calibrated shunt with a suitable millivoltmeter or multimeter, or a low resistance ammeter. (Of the three methods, the low-resistance ammeter is the least desirable and most inaccurate. The clamp-on milliammeter is the most accurate.) The values obtained and the date, time, and location shall be recorded.

3.5.4 Reference Electrode Potential Measurements

Upon completion of the installation and with the entire cathodic protection system in operation, electrode potential measurements shall be made using a copper-copper sulphate reference electrode and a potentiometer-voltmeter, or a direct-current voltmeter having an internal resistance (sensitivity) of not less than 10 megohms per volt and a full scale of 10 volts. The locations of these measurements shall be identical to the locations used for baseline potentials. The values obtained and the date, time, and locations of measurements shall be recorded. No less than eight (8) measurements shall be made over any length of line or component. Additional measurements shall be made at each distribution service riser, with the reference electrode placed directly over the service line.

3.5.5 Location of Measurements

3.5.5.1 Piping or Conduit

For coated piping or conduit, measurements shall be taken from the reference electrode located in contact with the earth, directly over the pipe. Connection to the pipe shall be made at service risers, valves, test leads, or by other means suitable for test purposes. Pipe-to-soil potential measurements shall be made at intervals not exceeding [1.5] [3]
[_____] m [5] [10] [_____] feet. The Contractor may use a continuous pipe-to-soil potential profile in lieu of 1.5 m 5 foot interval pipe-to-soil potential measurements. Additional measurements shall be made at each distribution service riser, with the reference electrode placed directly over the service line adjacent to the riser. Potentials shall be plotted versus distance to an approved scale. Locations where potentials do not meet or exceed the criteria shall be identified and reported to the Contracting Officer's representative.

3.5.5.2 Tanks

For underground tanks, at least [6] [_____] measurements shall be taken from the reference electrode located:

a. Directly over the center of the tank.

b. At a point directly over the tank and midway between each pair of anodes.

3.5.5.3 Casing Tests

Before final acceptance of the installation, the electrical separation of carrier pipe from casings shall be tested and any short circuits corrected.

3.5.5.4 Interference Testing

**************************************************************************
NOTE: Adverse effects may be caused by the foreign pipeline.
**************************************************************************

Before final acceptance of the installation, interference tests shall be made with respect to any foreign [pipes] [tanks] in cooperation with the owner of the foreign [pipes] [tanks]. A full report of the tests giving all details shall be made. Stray current measurements shall be performed at all isolating locations and at locations where the new pipeline crosses foreign metallic pipes; results of stray current measurements shall also be submitted for approval. The method of measurements and locations of measurements shall be submitted for approval. As a minimum, stray current measurements shall be performed at the following locations:

a. Connection point of new pipeline to existing pipeline.

b. Crossing points of new pipeline with existing lines.

3.5.5.5 Holiday Test

Any damage to the protective covering during transit and handling shall be repaired before installation. After field-coating and wrapping has been applied, the entire pipe shall be inspected by an electric holiday detector with impressed current in accordance with NACE SP0188 using a full-ring, spring-type coil electrode. The holiday detector shall be equipped with a bell, buzzer, or other type of audible signal which sounds when a holiday is detected. Holidays in the protective covering shall be repaired upon detection. Occasional checks of holiday detector potential will be made by the Contracting Officer to determine suitability of the detector. Labor, materials, and equipment necessary for conducting the inspection shall be furnished by the Contractor. The coating system shall be inspected for holes, voids, cracks, and other damage during installation.
3.5.5.6 Recording Measurements

All [pipe-] [tank-] [_____] to-soil potential measurements, including initial potentials where required, shall be recorded. Locate, correct and report to the Contracting Officer any short circuits to foreign [pipes] [tanks] [_____] encountered during checkout of the installed cathodic protection system. [Pipe-] [Tank-] [_____] to-soil potential measurements shall be taken on as many [pipes] [tanks] [_____] as necessary to determine the extent of protection or to locate short-circuits.

3.6 TRAINING COURSE

Conduct a training course for the operating staff as designated by the Contracting Officer. The training period shall consist of a total of [4] [8] [_____] hours of normal working time and shall start after the system is functionally completed but prior to final acceptance tests. Submit the proposed Training Course Curriculum (including topics and dates of discussion) indicating that all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations, including testing procedures included in the maintenance instructions, are to be covered. The field instructions shall cover all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations, including testing procedures included in the maintenance instructions. At least 14 days prior to date of proposed conduction of the training course, the training course curriculum shall be submitted for approval, along with the proposed training date. Training shall consist of demonstration of test equipment, providing forms for test data and the tolerances which indicate that the system works.

3.7 SYSTEM TESTING

Submit a report including potential measurements taken at adequately-close intervals to establish that minus 850 millivolts potential, "instant-off" potential, is provided, and that the cathodic protection is not providing interference to other foreign pipes causing damage to paint or pipes. The report shall provide a narrative describing how the criteria of protection is achieved without damaging other pipe or structures in the area.

3.8 SEEDING

Seeding shall be done as directed, in all unsurfaced locations disturbed by this construction. In areas where grass cover exists, it is possible that sod can be carefully removed, watered, and stored during construction operations, and replaced after the operations are completed since it is estimated that no section of pipeline should remain uncovered for more than two (2) days. The use of sod in lieu of seeding shall require approval by the Contracting Officer.

3.9 CLEANUP

The Contractor is responsible for cleanup of the construction site. All paper bags, wire clippings, etc., shall be disposed of as directed. Paper bags, wire clippings and other waste shall not be put in bell holes or anodes excavation.

1.2 SUBMITTALS

******************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detail Drawings; G[, [____]]

Submit all detail drawings at one time, as a single submittal, in order to demonstrate that the items have been properly coordinated and will function properly as a unit. Make a notation on each shop drawing submitted as to the item's specific use, either by a particular type number referenced on the drawings or in the specifications, or by a description of its specific location.

1.3 QUALITY ASSURANCE

1.3.1 Services of "Corrosion Expert"

Obtain the services of a "corrosion expert" to supervise and inspect the installation and performance of the cathodic protection system. "Corrosion
"expert" refers to a person, who, by reason of thorough knowledge of the physical sciences and the principles of engineering and mathematics acquired by professional education and related practical experience, is qualified to engage in the practice of corrosion control on steel water tanks.

a. Such a person must be accredited or certified by NACE International, The Corrosion Society, (NACE) as a NACE certified Corrosion Specialist or a NACE certified Cathodic Protection (CP) Specialist or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control on steel water tanks, if such certification or licensing includes 5 years experience in corrosion control on steel water tanks of the type under this contract.

b. The "corrosion expert" shall ensure that the cathodic protection system is installed, tested, and placed into service in accordance with the requirements specified; and shall also design, make calculations, and assure quality control as required.

c. Submit evidence of qualifications of the "corrosion expert". Name and qualifications shall be certified in writing to the Contracting Officer's Representative prior to the start of construction. Submit the certification giving the name of the firm, the number of years of experience, and a list of not less than five of the firm's installations three or more years old that have been tested and found satisfactory.

1.3.2 Detail Drawings

Submit [6] [_____] copies of detail drawings, within 45 days after the date of award of the contract, before commencement of any work and in accordance with SPECIAL CLAUSES, consisting of a complete list of equipment and materials including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions. Provide on the drawings tank dimensions, anode arrangement for both elevated and sectional views of the tank, anode size and number, anode material, anode-suspension details, conduit size, wire size, rectifier size and location, handhole details, wiring diagram, and any other pertinent information considered necessary for the proper installation and performance of the system. Shop drawings shall also contain complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will function as a unit. The list of materials and equipment shall include catalog cuts, diagrams, and other descriptive data required by the Contracting Officer for the following list of material. Partial lists submitted from time to time will not be allowed.

a. Water resistivity and water analysis.

b. Conductors.

c. Anodes and anode mounting details.

d. Coating material in areas where welding and other work is accomplished.

e. Insulated resistance wire.

f. Layout of anodes in tanks, test stations and isolation points, and grounding.
g. Special details.

h. Certified experience data of installing firm.

i. Exothermic weld equipment and material; bonding requirements and details.

j. Test [station][ and ][cabinet].

k. Welding method for electrical connections and steel ring connections.

l. Calculations for:
   (1) Total current required for system
   (2) Life of the anodes
   (3) Anode geometry (showing areas of coverage)

1.4 EXTRA MATERIALS

Submit spare parts data for each different item of material and equipment specified, after approval of the detail drawings and not later than [_____] months prior to the date of beneficial occupancy. The data shall include a complete list of parts, special tools, and supplies with current unit prices and source of supply. One spare anode of each type shall be furnished.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide and install a complete [automatic] [manual] [_____] cathodic protection system, to prevent corrosion on the interior submerged surfaces of the water tank, and all equipment, wiring, and wiring devices, necessary to produce a continuous flow of direct current from anodes in the electrolyte to the metal tank surfaces. Submit, within [30] [45] [_____] days after receipt of notice to proceed, an itemized list of equipment and materials including item number, quantity, and manufacturer of each item. The list shall be accompanied by a description of procedures for each type of testing and adjustment, including testing of coating for thickness and holidays. Also, submit proof that the materials and equipment furnished under this section conform to the specified requirements contained in the referenced standards or publications. The label or listing by the specified agency is acceptable evidence of such compliance. Do not commence installation of materials and equipment until these submittals are approved. The installation shall meet the criteria and protection outlined in paragraph CRITERIA OF PROTECTION for a 20 year life. Place the cathodic protection system in operable status.

a. The purpose of the system is to adequately and efficiently protect the surfaces of the metal against corrosion where the surfaces are in contact with water; this is in addition to the protective coating on the tank. The contract drawings indicate the location and size of the tank. The design of this system is based on an impressed current system.

b. Use this impressed current system, as described, with anodes as found
necessary in calculations and submitted data to meet this specification. Install anodes in sufficient number and of the required type, size and spacing to obtain a uniform current distribution of 3.5 milliamperes per 0.09 square meter to 1 square foot to all submerged surfaces in the tank when filled with water to the over-flow level. Suspend the anodes as approved by the Contracting Officer's Representative, which also shall be in accordance with the methods allowed and specified in this specification. If the anodes are suspended from the tank roof, suspend the anodes from the roof steel with hangers or supporting cables that are electrically isolated from both the metal roof and the water electrolyte. Additionally, locate and install anodes suspended from the tank roof so that the roof door is midway between two adjacent anodes. Hang all anodes, regardless of the suspension method utilized, clear of contact with such items as ladders, heater pipes, and stay rods.

c. **Contractor's Modifications.** The cathodic protection system may be modified after review of the project, site verification and analysis if the proposed modifications include impressed current anodes and rectifiers and will provide equal or better overall system performance. Submit [6] [_____] copies of detail drawings, showing proposed changes in location and scope or performance, indicating any variations from, additions to, or clarifications of contract drawings. The drawings shall show proposed changes in anode arrangement, anode size and number, anode materials and layout details, conduit size, wire size, mounting details, wiring diagram, method for electrically isolating where and as necessary, and any other pertinent information to the proper installation and performance of the system. This modification shall be fully described and submitted for approval to the Contracting Officer's Representative. Modifications or additional anodes shall be no additional cost to the Government and incorporate all requirements of this specification.

d. The proposed system shall achieve a minimum "Instant Off" potential of minus 850 millivolts with reference to a saturated copper-copper sulfate reference cell on the tank components. Take measurements and adjust the current and voltage of the rectifier as required to produce the required "Instant Off" potential between the structure being tested and the reference cell. Obtain this potential over 95 percent of the metallic area without the "Instant Off" potential exceeding 1100 millivolts.

e. All interior submerged metallic surfaces and components of the water storage tank shall be electrically continuous or made by the contractor to be electrically continuous by welding, installation of bonding conductors, or in some other acceptable manner as submitted to and approved by the Contracting Officer's Representative. If any water storage tank provided and installed under this contract is not of welded steel construction but is of construction where the interior submerged steel surfaces are not inherently electrically continuous, such as with bolted steel panel constructed tanks, then it shall be the full responsibility of the contractor to ensure that all interior submerged metallic surfaces and components of the water tank are made electrically continuous and that the cathodic protection system specified herein is provided and installed in order to perform as specified. All panels of bolted steel tanks shall be bonded together in such a fashion as to ensure that all interior submerged surfaces of the tank are electrically continuous.
2.2 IMPRESSED CURRENT ANODES

**************************************************************************
NOTE: Only impressed current anodes selected from the types included in this specification shall be utilized; the application of galvanic type anodes for water storage tanks is not covered by this specification. Seasonal or temporary type impressed current anodes, such as aluminum, are not normally desirable in military projects and, consequently, are not included herein. Long-life anode systems, such as those specified in this specification, are defined, and additional selection criterion are provided, in the NACE and AWWA standards referenced herein.
**************************************************************************

[2.2.1 High Silicon Cast Iron Anodes]

**************************************************************************
NOTE: High silicon cast iron anodes are rugged, long lasting, and commonly used in icing and non-icing climates. The anodes are less vulnerable to damage and loss than other anodes where ice is heavy and the tank level fluctuates over a wide range. They are generally classified as relatively non-sacrificial having a consumption rate between 0.2 to 0.5 kg per ampere year 0.5 to 1.0 pounds per ampere year in most fresh waters.

Although high silicon cast iron anodes are resistant to damage from ice, experience has indicated that their cabling and suspension system is vulnerable to damage from ice when installed inside tanks subject to periodic ice formation. In climates subject to icing, if it is not feasible or possible, during freezing temperatures, to operate the tank in a manner to prevent ice accumulation on the anodes and/or their suspension system, then an impressed current anode installation should be specified that is unaffected by ice accumulation within the tank, as is suggested by NACE SP0388. In tanks subject to ice formation and accumulation, a precious metal type anode system, utilizing a suitable suspension system as specified by this section, should be considered for installation.
**************************************************************************

Cast iron anodes shall be of the size indicated and shall conform to the following requirements:

2.2.1.1 Chemical Composition (Nominal)

2.2.1.4 Anode Connecting Cables

Anodes shall have connecting cables installed at the factory. Submit a certified test report showing that the connecting method has passed a 120-day laboratory test without failure at the place of connection wherein the anode was subjected to maximum recommended current output while immersed in a 3 percent sodium chloride solution.

2.2.2 Precious Metal Anodes

**************************************************************************

NOTE: At installations where icing conditions exist and the scaling index of water is less than 20,000 (i.e., low hardness water), the designer should consider using precious metal anodes, such as platinized niobium, platinized titanium, or mixed metal oxide for cathodic protection systems. The consumption rate of precious metal anodes is less than that of other relatively non-sacrificial anodes. However, precious metal anodes are more vulnerable to damage and loss particularly during cleaning and reconditioning of the tank. When used in tanks subject to icing conditions, anode suspension shall conform to this specification section and AWWA D104.
Selection of the configuration should be left to the designer of the system. Long, continuous wire from lengths of precious metal anodes may have an attenuating effect. This can be overcome by using an anode header cable connected to lengths of precious metal anodes at a common junction box. Such precious metal anode assemblies must be assembled with factory sealed and tested electrical connections to the anodes.

[2.2.2.1 Mixed Metal Oxide (MMO) Coated]

The electrically conductive coating shall contain a mixture consisting of iridium, tantalum, and titanium oxides. The average composition shall be composed of a 50/50 atomic percent mixture of iridium and titanium oxides with an acceptable amount of tantalum. The anode must be inert and the electrically conductive mixed metal oxide coating dimensionally stable. The mixed metal oxide coating shall be applied to the wire anode by a manufacturer that has a minimum 5 years experience in manufacturing and applying mixed metal oxide coating to titanium anode substrates. Sinter the mixed metal oxide to the titanium surface to remain tightly bound to the surface when considerable mechanical stresses are applied to the anode surface. The anodes shall have connecting cables installed at the factory. Make the connection between the anode and lead wire with a solid crimp coupling, or with solder. Seal the connection in cast epoxy.

[2.2.2.2 Platinum Plated]

Provide precious metal anodes, [solid] [composite] [wire] [rod] [expanded mesh] [ribbon] in form. Anode core shall be [niobium] [titanium] with platinum coating with thickness of [_____] millimeters [mils]. Precious metal anode assemblies shall have factory sealed and tested electrical connections to the anodes.

[2.2.2.3 Anode Life Test]

The anode wire material shall sustain current densities of 100 ampere per square meter 10.764 square feet in an oxygen generating electrolyte for a 20 year period. The manufacturer shall certify that a representative sample tested by an independent laboratory meets this criterion.

2.3 RECTIFIERS AND ASSOCIATED EQUIPMENT

2.3.1 Rectifier Unit

**************************************************************************
NOTE: Air-cooled rectifiers will be used for most applications. Where highly corrosive atmospheres exist, the equipment will be oil-immersed in a tank-type housing. For hazardous area applications, oil-immersed equipment will be provided with an explosion-proof or dust-ignition-proof housing, as appropriate. Transformer tap adjusters will be provided in cases where an automatic system is not provided.
**************************************************************************
Rectifier unit shall consist of a transformer, rectifying elements, [transformer tap adjuster,] terminal block, [one dc output voltmeter, one dc output ammeter,] [one combination volt-ammeter,] one toggle switch for each meter, appropriate circuit breakers or fuse holders with fuses for each dc circuit, variable resistors, an ac power-supply circuit breaker, lightning arresters for both input and output; all wired and assembled in a weatherproof cabinet. The overall efficiency of the rectifier shall be not less than 65 percent when operated at nameplate rating and shall be capable of supplying continuous full rated output at an ambient temperature of 44 degrees C 112 degrees F in full sunlight with expected life in excess of 10 years.

2.3.1.1 Transformer

Transformer shall conform to UL 506.

2.3.1.2 Rectifying Elements

**************************************************************************

NOTE: Below about 500 volt-amperes of dc rated output, single phase selenium rectifiers cost less to acquire and operate than silicon rectifiers. Above 1000 volt-amperes silicon rectifiers are more economical for both single phase and three phase. Silicon rectifiers are more economical to repair.

**************************************************************************

Rectifying elements shall be [silicon diodes] [selenium cells] connected to provide full-wave rectification. [Silicon diodes shall be protected by selenium surge cells or varistors against over-voltage surges and by current limiting devices against over-current surges.]

2.3.1.3 Meters

Meters shall be accurate to within plus or minus 2 percent of full scale at 27 degrees C 80 degrees F, and shall possess temperature stability above and below 27 degrees C 80 degrees F of at least 1 percent per 5 degrees C 10 degrees F. Separate meters shall be 63.5 mm 2-1/2 inch nominal size or larger.

2.3.1.4 Circuit Breaker(s)

Install a [single] [double] [three]-pole, flush-mounted, fully magnetic, properly rated nonterminal type circuit breaker in the primary circuit of the rectifier supply transformer. [Install a single-pole, flush-mounted, properly rated nonterminal type circuit breaker in each dc circuit output of the rectifier.]

2.3.1.5 Fuses

In the event that fuses and fuse holders rather than circuit breakers are used, provide cartridge-type fuses conforming to NEMA FU 1 with suitable fuse holders in each leg of the dc circuit.

2.3.1.6 Automatic Cathodic Protection Control

Provide a system capable of maintaining a tank-to-water potential criterion of protection within plus or minus 25 millivolts regardless of changes in water chemistry, temperature, or water level in the tank. Provision shall
be made for readily changing the range and limits of the criterion. The controller shall be either housed integrally with the rectifier or in a separate weatherproof cabinet with provisions for locking. The automatic controller shall be a completely solid-state design, and shall be capable of automatically maintaining the tank-to-water potential at minus 900 millivolts with respect to a copper-copper sulfate reference electrode within an accuracy of 25 millivolts. The tank-to-water potential measured and maintained by the controller shall be free of "IR" drop error.

2.3.1.7 Tank To Water Potential Meter

The controller shall be equipped with a calibrated voltmeter having an internal impedance exceeding 1 megohm which shall be so connected to read, from the system reference cell, the tank-to-water potential being maintained by the cathodic protection system. This voltage reading shall be free of "IR" drop error.

2.3.2 Cabinet

Construct cabinet of [not lighter than 1.56 mm16 gauge [steel] [hot dipped galvanized steel] [stainless steel] [aluminum] [molded fiberglass reinforced polyester], and provided with a full door. The enclosure shall have oil-resistant gasket. The door shall be hinged and have a hasp that will permit the use of a padlock. The cabinet shall be fitted with screened openings of the proper size to provide for adequate cooling. Holes, conduit knockouts, or threaded hubs of sufficient size and number shall be conveniently located.

2.3.2.1 Wiring Diagram

A complete wiring diagram of the power unit showing both the ac supply and the dc connections to anodes shall be on the inside of the cabinet door. All components shall be shown and labeled.

2.3.2.2 Grounding

Grounding provisions shall [be as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.] [comply with NFPA 70 and UL 467 including a ground terminal in the cabinet.] The grounding conductor from the terminal to the earth grounding system shall be solid or stranded copper not smaller than No. 6 AWG. The earth grounding system shall consist of one or more rods. Ground rods shall be [copper-clad steel conforming to UL 467] [zinc-coated steel conforming to IEEE C135.30] [solid stainless steel] not less than [16] [19] mm [5/8] [3/4] inch in diameter by [2.4] [3.1] m [8] [10] feet in length. Rods shall be driven full length into the earth. Sectional type rods may be used.

2.3.2.3 Resistance to Ground

************************************************************************************************************************************************
NOTE: Remove this paragraph if not required in the project
************************************************************************************************************************************************

Measure the resistance to ground using the fall-of-potential method described in IEEE 81. The maximum resistance of driven ground shall not exceed 25 ohms under normally dry conditions. If this resistance cannot be obtained with a single rod, [_____] additional rods not less than 1.8 m 6 feet on centers, or if sectional type rods are used, [_____] additional
sections may be coupled and driven with the first rod. In high-ground-resistance, UL listed chemically charged ground rods may be used. If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, immediately notify the Contracting Officer's Representative. Fusion weld connections below grade. Fusion weld connections above grade or use UL 467 approved connectors.

2.3.2.4 Cabinet Paint System

[The cabinet and mounting support shall be [painted] [hot dipped galvanized] [aluminum] [stainless steel] with the manufacturer's standard paint system.] [The mounting support for the fiberglass cabinet shall be [painted] [hot dipped galvanized] [aluminum] [stainless steel] with the manufacturer's standard painting system.]

2.3.3 Wiring

Wiring shall be installed in accordance with NFPA 70 utilizing type TW or RHW or polyethylene insulation. Fittings for conduit and cable work shall conform to UL 514A. Outlets shall be of the threaded hub type with gasketed covers. Conduit shall be securely fastened at 2.4 m 8 foot intervals or less. Splices shall be made in outlet fittings only. Conductors shall be color coded for identification. Cable for anode header and distribution shall be No. [2] [_____] AWG stranded copper wire with type [cathodic protection high molecular weight polyethylene] [Dular/Halar] insulation.

2.3.4 Oil Immersed Enclosures

******************************************************************************
NOTE: The enclosure should not be used in areas prone to flooding unless required for hazardous locations. Provisions should be made for flooding.
******************************************************************************

Enclosures shall be of 3.1 mm 11 gauge steel or heavier, with an accessible drain plug. The oil level shall be clearly marked. The lid shall be hinged and have quick release clamps to secure it in closed position. A stop shall limit the swing of the lid when opened. A compressible, oil resistant, positive sealing gasket shall be provided. The gasket shall return to its original shape upon release of lid pressure. The gasket shall be attached to the tank or lid and joints shall be free of gaps. Base mounting using 102 mm 4 inch high channels shall be provided. Conduits entering the enclosure shall be internally sealed and shall enter or exit above the oil fill line.

[2.3.5 Remote Monitoring Equipment

******************************************************************************
NOTE: Remote monitoring of the cathodic protection system may be considered in remote and difficult to reach locations. In such locations, remote monitoring equipment can aid in data collection, reduce monitoring costs, and provide data more frequently and over a variety of tank operations. In these cases, the designer may select one of the remote monitoring systems provided under this paragraph. A SCADA-based system should be selected only where an existing operable SCADA system is
available; additional SCADA systems should not be installed. For locations where existing SCADA systems are not readily available or for very remote areas, a cell phone-based system or satellite down linked data system may be more feasible. The choice of whether to select a drive-by system or a cell phone-based system depends on the reliability of the cell phone signal at the particular project location. Regardless of the system selected, the designer must carefully coordinate with designated Installation operation and maintenance personnel in order to interface with the existing SCADA system or to provide another viable remote monitoring system suitable for the particular maintenance program.

**************************************************************************

Provide a complete and operable [SCADA-based] [drive-by] [cell phone-based] [satellite down linked data] type remote monitoring system which is fully compatible, operable, and integratable with the tank cathodic protection system and, if existing, the installation-wide cathodic protection systems' remote monitoring system. All cathodic protection system remote monitoring equipment, wiring, and wiring devices necessary to accurately monitor the cathodic protection system rectifier output voltage, rectifier output amperage, and permanent reference electrode potentials shall be provided in order to have the capability of monitoring from a location remote to the tank as designated by the Contracting Officer's Representative. Provide all remote monitoring unit (RMU) transmitting equipment; system receiving equipment; other equipment and devices, including suitable laptop computers as necessary to complete the system; wiring; wiring devices; software; and all other items necessary to meet the requirements specified herein. House the RMU either integrally with the rectifier or in a separate weatherproof cabinet which meets the specifications of this section and has provisions for locking.[ SCADA-based type remote monitoring systems shall be completely coordinated, compatible, and integrated with the existing installation-wide SCADA system. All SCADA system wiring, wiring devices, and other associated equipment shall be provided and installed as specified in [Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING SYSTEM] [and ] [Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT].] The RMU and associated receiving devices shall be of completely solid-state design. Place the remote monitoring system in operable status. The system provided shall meet the following functional requirements:

a. The water tank cathodic protection system's remote monitoring interrogation/transmission unit shall be capable of delivering system DC voltage, amperage, and instant-off (i.e., free of "IR" drop error) potential measurements and shall come complete with all related software for collection of the data for use in an Excel Spreadsheet format. The Remote Monitoring System shall be capable of monitoring and delivering the potential measurements of all permanent reference electrodes required by this specification and shall identify all reference electrodes that are currently being utilized for automatic control of the rectifier.

b. All data provided by the remote monitoring equipment shall be within 2 percent of the same measurements taken locally at the tank site when utilizing the rectifier ammeter, rectifier voltmeter, and the tank to water potential meter, all of which are specified elsewhere in this specification section. The "Corrosion Expert" shall verify, in the presence of the Contracting Officer's Representative, the accuracy of
the values provided by the remote monitoring system as compared to the same readings provided locally at the tank.

2.4 MISCELLANEOUS MATERIALS

2.4.1 Reference Electrodes

The electrodes shall be copper-copper sulphate type provided with micro-pore diffusion window for water contact and water-tight plug for renewal of copper sulphate crystals and solution. A minimum of four reference electrodes shall be part of this system. Electrodes shall be designed for 15 year life.

2.4.2 Electrical Wire and Associated Materials

2.4.2.1 Anode Connecting Wire

**************************************************************************

NOTE: Any pinhole, cut, scratch or other damage to the anode cable exposing bare copper to the electrolyte will result in early failure of the cathodic protection system. For this reason, special, extra heavy insulation is used on anode cable. While it is often expedient to use the same type wire for the cathodic (negative) cable in order to avoid a mix-up in the field, the cathode cable is not subject to anodic failure and lesser insulation can be used.

**************************************************************************

Anode connecting wire shall be No. [8] [_____] AWG stranded copper wire with type CP high molecular weight polyethylene insulation, 2.8 mm 7/64 inch thick, 600 volt rating. Cable-to-anode contact resistance shall be 0.003 ohms maximum.

2.4.2.2 Anode Header Cable

Cable for anode header and distribution shall be [_____] AWG stranded copper wire with type CP high molecular weight polyethylene, 2.8 mm 7/64 inch thick insulation, 600-volt rating. Cable-to-anode contact resistance shall be 0.003 ohms maximum.

2.4.2.3 Reference Electrode Wire

Reference electrode wire shall be stranded copper wire with NFPA 70 type RHW-USE or polyethylene insulation.

2.4.3 Conduit

Rigid galvanized steel conduit and accessories shall conform to UL 6. Nonmetallic conduit shall conform to NEMA TC 2.

2.4.4 Test Boxes and Junction Boxes

Boxes shall be outdoor type conforming to UL 514A.

2.4.5 Polyethylene Insulation

Polyethylene insulation shall comply with the requirements of ASTM D1248.
and of the following types, classes, and grades:

2.4.5.1 High Molecular Weight Polyethylene

High molecular weight polyethylene shall be Type I, Class C, Grade E5.

2.4.5.2 High Density Polyethylene

High density polyethylene shall be Type III, Class C, Grade E3.

2.4.6 Pressure-Sensitive Vinyl Tape

Tape shall conform to UL 510.

PART 3 EXECUTION

3.1 EXAMINATION

Coordinate and properly relate this work to the work of all trades. The general locations of the structures to receive protection are shown. Visit the premises and after becoming familiar with all details of the work and working conditions, verify existing conditions in the field, determine the exact locations of structures to be protected, and advise the Contracting Officer of any discrepancy before performing any work. Take resistivity measurement of the water and analysis of the water and provide this data with detail drawings of the system for approval.

3.2 CRITERIA OF PROTECTION

Acceptance criteria for determining the adequacy of protection on the internal submerged surfaces of steel water tanks shall be in accordance with NACE SP0388 and as specified below.

3.2.1 Minimum

The criterion of protection is a negative voltage of at least minus 850 millivolts as measured between the tank and a saturated copper-copper-sulphate reference electrode. Determination of this voltage shall be made with the cathodic protection system in operation and after the system has been in operation for a minimum period of 72 hours. Voltage drops shall be considered for valid interpretation of this voltage measurement. A minimum of minus 850 millivolts "instant off" potential between the tank surface being tested and the reference electrode shall be achieved over 95 percent of the area of the structure. Obtain adequate number of measurements over the entire tank surface to verify and record achievement of minus 850 millivolts "instant off". This potential shall be obtained over 95 percent of the total metallic area without the "instant off" potential exceeding the maximum limit indicated below.

3.2.2 Maximum

In order to mitigate disbonding of the interior coating in the tank, potential between a copper-copper-sulphate reference electrode and the tank at any point shall not be more negative than minus 1.1 volt measured with the electrode located between 6 mm 1/4 inch and 13 mm 1/2 inch away from the steel surface but not touching it.
3.3 ANODES

3.3.1 Anode Installation

**************************************************************************
NOTE: In water tanks, split bolts are used (above the waterline only) because working space is limited and hydraulic or mechanical compression tools may be cumbersome and hazardous to use; since a single split-bolt will work loose when the wires it connects are moved, a minimum of two split bolts should be used. At ground level or in trenches, compression tools can be used conveniently, and the swaged sleeve connection produced by such tools is more reliable than split bolts.

For tanks subject to ice formation, select the bracketed text (below) beginning with "For tank interiors subject to icing," otherwise, select the first bracketed text in this paragraph.
**************************************************************************

[For tank interiors not subject to icing, install anodes in accordance with NACE SP0388, AWWA D104, this specification, and the indicated details. Suspend anodes from roof [plate] [structural members] by means of factory installed connecting wire designed to support the anodes in air (before submergence) without failure of the electrical wire insulation or the electrical conductor. Suspend anodes in a manner preventing contact with tank surfaces and hang clear of man-access roof hatches and such items as ladders, heater pipes, and stay rods. Anode hangers shall electrically insulate the anode suspending wire from the tank steel. Provide a handhole having a minimum diameter of 150 mm 6 inches in the tank roof for each anode to permit replacement or inspection of anodes. Certify that the method chosen has been used successfully for similar applications.][For tank interiors subject to icing, install anodes in accordance with AWWA D104, this specification, and the indicated details. Install anodes in a manner preventing contact with tank surfaces and clear of such items as ladders, heater pipes, and stay rods. Certify that the method chosen has been used successfully for similar applications.]

3.3.2 Anode Connections

Where this specification allows the use of header cables, anodes shall be electrically connected to the positive dc header cable with compression connectors or split bolts, or the header cable may terminate in a junction box for connection with all anode cables. Use a minimum of two split bolts for each connection if split bolts are used. Where practical, such as within tanks not subject to ice formation, install header cable on the underside of the roof with electrically insulating hangers and enter the tank near the roof line from an externally mounted junction box. External wiring shall be in conduit. Make all under-roof electric wire splices above the high water line and sealed water tight using a minimum of two 1/2-lap layers of butyl rubber tape followed by two 1/2-lap layers of plastic tape.
3.4 RECTIFIERS

3.4.1 Rectifier and Control/Monitoring Installation

Mounting shall be [of the wall mounted type.] [of the cross-arm mounted type.] [of the floor mounted on stand type.] [as shown.]

3.4.2 Rectifier Grounding

The grounding system for grounding rectifier cabinets shall have a resistance to earth of not more than 25 ohms as determined by an approved method.

3.5 PERMANENT REFERENCE ELECTRODES

3.5.1 Calibration

Calibrate permanent reference electrodes against a standard electrode before installation. Perform calibration in a test tank containing water with the same composition as the tank to be protected. The permanent electrodes shall measure reference voltage agreeing with that measured by the standard electrode within plus or minus 0.005 volt when the sensing windows of the two electrodes being compared are not more than 4 mm 1/6 inch apart but not touching.

3.5.2 Installation

******************************************************************************
NOTE: The requirements for installation of permanent reference electrodes are similar to those for anode installation. See the NOTE in paragraph Anode Installation.
******************************************************************************

Reference electrodes shall be operable under the same icing conditions as the anode system. Installation of permanent reference electrodes shall be made at points in the tank which will monitor minimum and maximum tank-to-water potentials [and as otherwise needed for automatic control system]. Sensing windows of reference electrodes shall be located between 6 mm 1/4 inch and 13 mm 1/2 inch away from the steel surface sensed and shall be fixed in position preventing contact with tank steel.

3.6 TESTING, ADJUSTING, AND PLACING IN SERVICE

Submit test reports in booklet form tabulating all field tests and measurements performed, upon completion and testing of the installed system and including potential survey, final system test verifying protection, and holiday coating test. Each test report shall indicate the final position of controls. Additionally, submit a certified test report showing that the anode connecting method has passed a 120-day laboratory test without failure at the place of connection, wherein the anode is subjected to maximum recommended current output while immersed in a 3 percent sodium chloride solution.

If the cathodic protection system has been modified from the original design, include the Contractor's Modifications shall in the test reports. Submit final report including measurements throughout the tank area, indicating that the addition of any anodes (if it became necessary to add anodes as a result of modifications submitted to and approved by the
Contracting Officer) corrected the conditions which made the additional anodes necessary. The following are required: Installation and testing procedures, anode number, life, and parameters to achieve protective potential.

3.6.1 Electrode Baseline, Instant-Off, and ON Potential Measurements

Upon completion of the installation, fill the tank to maximum working level, and obtain baseline, instant-off, and ON potential measurements as described herein. Obtain baseline potential measurements prior to energizing the cathodic protection system; obtain instant-off and ON potential measurements with the entire cathodic protection system in operation and after it has been in operation for a minimum of 72 hours. Make electrode baseline, instant-off, and ON potential measurements using a copper-copper sulphate reference electrode and a potentiometer-voltmeter, or a direct current voltmeter having an input impedance of not less than 10 megohms per volt and a full scale of 10 volts. Locate these measurements as described in this specification; take baseline, instant-off, and ON potential measurements at each described location. Record the values obtained and the date, time, and locations of measurements.

3.6.1.1 Tank-to-Water Potential Measurements

The following series of tank-to-water potential measurements with a portable reference electrode placed not more than 13 mm 1/2 inch away from but not touching the tank wall shall be performed:

a. On a vertical line midway between two anode strings beginning at a point 300 mm 1 foot below water level and continuing at points 900 mm 3 feet apart until the bottom of the tank is reached. If anodes are attached to floatation assemblies rather than on strings hanging from the tank roof, locate the vertical line of measurements as far as possible from any anode material.

b. On a second vertical line midway between two anode strings on the opposite side of the tank from the first vertical line beginning at a point 300 mm 1 foot below water level and continuing at points 900 mm 3 feet apart until the bottom of the tank is reached. If anodes are attached to floatation assemblies rather than on strings hanging from the tank roof, locate the vertical line of measurements as far as possible from any anode material.

c. Across the bottom of the tank in a line between the two vertical lines at 900 mm 3 foot intervals.

d. In at least four places which are closest to anodes.

3.6.1.2 Reference Electrode Calibration

The portable reference electrode used for the test shall be calibrated against the standard electrode specified in paragraph PERMANENT REFERENCE ELECTRODES.

3.6.1.3 Test Measurement Recording

All test measurements and their locations, as well as measurements made with the permanent electrodes simultaneously with the test measurements, shall be recorded.
### 3.6.2 Adjusting

Final adjustment of the rectifier output current shall be made so that repeated voltage readings taken as specified for testing meet the criteria in paragraph CRITERIA OF PROTECTION.

### 3.7 Cathodic Protection System Operation and Maintenance Manuals

Operating manual outlining the step-by-step procedures required for system startup, operation, adjustment of current flow, and shutdown shall be provided. The manuals shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment, including any remote monitoring equipment, and their basic operating features.

Maintenance manual listing routine maintenance procedures, recommendation for maintenance testing, possible breakdowns and repairs, and troubleshooting guides shall be provided. Include single line diagrams for the system as installed, instructions in making tank-to-reference electrode potential measurements for both permanent and portable electrodes, and describe the frequency of monitoring. If remote monitoring equipment was installed under this contract, then the maintenance manual shall also include maintenance instructions on this equipment to the extent required by this paragraph. The instructions shall include precautions to ensure safe conditions during repair of system.

### 3.8 TRAINING

Conduct a training course for the operating staff as designated by the Contracting Officer's Representative. The training period shall consist of a total of [_____] hours of normal working time and start after the system is functionally complete but prior to final acceptance tests. Submit the proposed Training Course Curriculum (including topics and dates of discussion) indicating that all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations, including testing procedures included in the maintenance instructions, are to be covered. The field instructions shall cover all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations. Notify the Contracting Officer's Representative at least 14 days prior to date of proposed starting of the training course.

### 3.9 PLACING IN SERVICE

After final adjustment, place the cathodic protection system in service and record the condition of the system as left by the Contractor indicating transformer tap settings; voltage readings from reference electrode to tank, readings both horizontal and vertical; automatic control differential setting; final status of any remote monitoring equipment; ac supply voltage; adjusted dc output voltage; and total protective current.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for a cathodic protection system using impressed current anodes.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

1.2 SYSTEM DESCRIPTION

Submit proof that the materials and equipment furnished under this section conform to the specified requirements contained in the referenced standards or publications. The label or listing by the specified agency will be acceptable evidence of such compliance.

1.2.1 General Requirements

a. Provide a complete, operating impressed current cathodic protection system in accordance with NFPA 70, the applicable federal, state and local regulations, and the requirements of this contract. In addition to the minimum requirements of these specifications, [construction of gas pipelines and associated cathodic protection systems shall be in compliance with 49 CFR 192] [and] [construction of hazardous liquid pipelines, and associated cathodic protection system shall be in
compliance with 49 CFR 195] [and] [construction and installation of underground fuel storage tanks and associated cathodic protection system shall be in compliance with 40 CFR 280].

b. The system includes planning, inspecting the installation, adjusting and testing cathodic protection and test system using rectifiers and impressed current anodes, supplemented with sacrificial anodes as needed, for utilities and equipment shown. The cathodic protection system shall also include cables, connectors, splices, corrosion protection test stations, ace power panels, and any other equipment required for a complete operating system providing the specified protection. The cathodic protection system includes (a) calculations for rectifier, anodes, and any recommendations for supplementing or changing the minimum design criteria to provide the specified potentials and (b) equipment, wiring, and wiring devices necessary to produce a continuous flow of direct current from anodes in the soil electrolyte to the pipe surfaces.

c. Submit [6] [_____] copies of Detail Drawings consisting of a complete list of equipment and material including manufacturer's descriptive and technical literature, catalog cuts, results of system design calculations including soil resistivity, installation instructions and certified test data stating the maximum recommended anode current output density and the rate of gaseous production, if any, at that current density. Detail drawings shall contain complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will function properly as a unit. The installation shall meet the specified protection criteria for a 25 year life.

d. Submit [6] [_____] copies of operating manual outlining the step-by-step procedures required for system startup, operation, adjustment of current flow, and shutdown. The manuals shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.

e. Submit [6] [_____] copies of maintenance manual listing routine maintenance procedures, recommendation for maintenance testing, possible breakdowns and repairs, and troubleshooting guides. The manuals shall include single line diagrams for the system as installed; instructions in making [pipe-] [tank-] to-reference cell potential measurements and frequency of monitoring; instructions for dielectric connections, interference and sacrificial anode bonds; instructions shall include precautions to ensure safe conditions during repair of pipe system.

1.2.2 Contractor's Modifications

The specified system is based on an impressed current system supplemented with magnesium anodes. The Contractor may modify the cathodic protection system after review of the project, site verification and analysis if the proposed modifications include the impressed current anodes and rectifiers and will provide better overall system performance.

a. Submit [6] [_____] copies of detail drawings showing proposed changes in location, scope or performance indicating any variations from, additions to, or clarifications of contract drawings. The drawings shall show proposed changes in anode arrangement, anode size and number, anode materials and layout details, conduit size, wire size,
mounting details, wiring diagram, method for electrically isolating each pipe, and any other pertinent information to the proper installation and performance of the system.

b. The modifications shall be fully described, shall be approved by the Contracting Officer and shall meet the following criteria. The proposed system shall achieve a minimum pipe-to-soil "Instant Off" potential of minus 850 millivolts with reference to a saturated copper-copper sulfate reference cell on the underground metallic components of the [piping] [tanks] [____].

c. Take resistivity measurements of the soil in the vicinity of the [pipes] [tanks] [____] and ground bed sites; based upon the measurements taken, adjust current and voltage of the rectifier as required to produce a minimum of minus 850 millivolts "Instant Off" potential between the structure being tested and the reference cell. This potential shall be obtained over 95 percent of the metallic area without the "Instant Off" potential exceeding 1200 millivolts.

d. Submit final report regarding supplemental magnesium anode installation. The report shall include pipe-to-soil measurements throughout the affected area, indicating that the additions corrected the conditions which made the additional anodes necessary, and current measurements for the additional anodes. The following special materials and information are required: Calculations on current and voltage for [100 V] [40 V] [____] rectifier plus rectifier and meter specifications; taping materials and conductors; zinc grounding cell, installation and testing procedures, and equipment; coating material; system design calculations for rectifier, anode number, life, and parameters to achieve protective potential; backfill shield material and installation details showing waterproofing; bonding and waterproofing details; insulated resistance wire; exothermic weld equipment and material.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the
District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Services of "Corrosion Expert"

Obtain the services of a "corrosion expert" to supervise, inspect, and test the installation and performance of the cathodic protection system.
"Corrosion expert" refers to a person, who, by reason of thorough knowledge of the physical sciences and the principles of engineering and mathematics, acquired by professional education and related practical experience, is qualified to engage in the practice of corrosion control of buried metallic piping and tank systems.

a. Such a person shall be accredited or certified by the National Association of Corrosion Engineers (NACE) as a NACE Accredited Corrosion Specialist or a NACE certified Cathodic Protection (CP) Specialist or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control of buried or submerged metallic piping and tank systems, if such certification or licensing includes 5 years experience in corrosion control on underground metallic surfaces of the type under this contract.

b. Submit the "corrosion expert's" name and qualifications certified in writing to the Contracting Officer prior to the start of construction, including the name of the firm, the number of years of experience, and a list of not less than five of the firm's installations three or more years old that have been tested and found satisfactory.

c. The "corrosion expert" shall make at least 3 visits to the project site. The first of these visits shall include obtaining soil resistivity data, acknowledging the type of pipeline coatings to be used and reporting to the Contractor the type of cathodic protection required. Once the submittals are approved and the materials delivered, the "corrosion expert" shall revisit the site to ensure the Contractor understands installation practices and laying out the components. The third visit shall involve testing the installed cathodic protection systems and training applicable personnel on proper maintenance techniques. The "corrosion expert" shall supervise installation and testing of all cathodic protection.

1.4.2 Isolators

Isolators are required to isolate the indicated pipes from any other structure. Isolators shall be provided with lightning protection and a test station as shown.

1.4.3 Anodes and Bond Wires

Install anodes in sufficient number and of the required type, size and spacing to obtain a uniform current distribution of 2.5 milliamperes per 0.09 square meters square foot minimum to underground metal surfaces. For each cathodic protection system, the metallic components and structures to be protected shall be made electrically continuous. This shall be accomplished by installing bond wires between the various structures. Bonding of existing buried structures may also be required to preclude detrimental stray current effects and safety hazards. Provisions shall be included to return stray current to its source without damaging structures intercepting the stray current. The electrical isolation of underground facilities in accordance with acceptable industry practice shall be included under this section.

1.4.4 Surge Protection

Install approved zinc grounding cells or sealed weatherproof lightning arrestor devices across insulated flanges or fittings installed in
The arrestor shall be gapless, self-healing, solid state type. Zinc anode composition shall conform to ASTM B418, Type II. Lead wires shall be number 6 AWG copper with high molecular weight polyethylene (HMWPE) insulation. The zinc grounding cells shall not be prepackaged in backfill but shall be installed as detailed on the drawings. Lightning arrestors or zinc grounding cells are not required for insulated flanges on metallic components used on nonmetallic piping systems.

1.4.5 Sacrificial Anodes

Locate sacrificial high potential magnesium anodes as required to provide localized cathodic protection or supplemental cathodic protection for the impressed current system. Each sacrificial magnesium anode shall be routed through a test station. The magnesium anode shall not be connected to the pipe.

1.4.6 Nonmetallic Pipe Systems

When nonmetallic pipe is approved, direct buried or submerged metallic components of the pipe system shall have cathodic protection. Metallic components are connectors, tees, fire hydrants, valves, short pipes, elbows, tie rods, or other metallic equipment. As a minimum, each metallic component shall be protected with a 4.1 kg 9 lb magnesium anode connected through a test station. The use of nonmetallic pipe does not change other requirements of the specifications such as submittals, testing, or design calculations for each metallic component. Deviations due to the use of nonmetallic pipe shall be approved by the Contracting Officer.

1.4.6.1 Coatings

Coatings for metallic components shall be as required for metallic fittings. Protective covering (coating and taping) shall be completed and tested on each metallic component and shall be as required for underground metallic pipe. Mechanical joints and fittings of either the electrically conductive or insulating type shall be coated with an underground type dielectric coating system. Where external electrical continuity bonds are installed across mechanical joints, bare or exposed metal, welds, bare wire and exposed coupling parts shall be coated with a coating system.

a. Couplings and fittings which have a low profile exterior designed to permit tape coating shall be primed and wrapped with an underground type pipe tape system or two-part epoxy system.

b. Couplings and fittings that cannot be properly taped shall be enclosed in a [spaced mold manufactured for the purpose] [shroud of reinforced kraft paper] and filled with [cold applied dielectric compound] [hot applied bituminous compound not exceeding 135 degrees C 275 degrees F in application temperature].

1.4.6.2 Tracer Wire

When a nonmetallic pipe line is used to extend or add to an existing metallic line, an insulated No. 8 AWG copper wire shall be connected to a terminal in a test station located at each point of transition from metallic pipe to nonmetallic pipe. At each of these test stations, the tracer wire terminal shall be strapped or bonded to the terminal for the negative connection wire to the existing metallic line. The tracer wire shall be run the length of the new nonmetallic line. This wire shall be
used as a locator tracer wire and to maintain continuity to any future extension of the pipe line.

1.5 DELIVERY, STORAGE, AND HANDLING

Storage for magnesium anodes will be designated by the Contracting Officer. If anodes are not stored in a building, protect them from inclement weather. Packaged anodes damaged as result of improper handling or weather exposure shall be resacked and the required backfill added.

1.6 EXTRA MATERIALS

Submit spare parts data for each different item of material and equipment specified, after approval of detail drawings and not later than [_____] months prior to the date of beneficial occupancy. Include in the data a complete list of parts, special tools, and supplies, with current unit prices and source of supply. Furnish one spare anode of each type.

PART 2 PRODUCTS

2.1 IMPRESSED CURRENT ANODES

2.1.1 Bare High Silicon Cast-Iron Anodes

Cast-iron anodes shall be of the size indicated and shall conform to the following requirements:

2.1.1.1 Chemical Composition (Nominal)

2.1.2 Bare Graphite Anodes

Bare graphite anodes shall have a maximum electrical resistivity of 0.0011 ohm-centimeter.

2.1.3 Canister Contained Anodes

Canister contained anodes shall be packed at the factory in sheet metal canisters with calcined petroleum coke breeze. The coke shall have a resistivity of 0.1 ohm-cm tested at 1034 kPa 150 psi. The coke shall be 11244 kg/cubic meter 70 lbs/cubic foot or greater. The maximum particle size shall be 1 mm 0.039 inch and the coke shall be dust-free. The canisters shall be capped with tight fitting end caps secured to the body of the canister. The canister shall provide a minimum annular space of 75 mm 3 inch all around the anode. The connecting cable shall pass through a hole in an end cap designed to be tight fitting with the cable and protected from sharp edges with a plastic or rubber grommet. The anodes shall be centered in the canisters and the annular space filled with coke breeze compacted in place.

2.1.4 Anode Connecting Cables

Anodes shall have connecting cables installed at the factory. For deep ground beds, each anode located in the borehole shall be accompanied by a reel of continuous cable having the length indicated. No spliced connections will be permitted in deep well cables.

2.1.5 Mixed Metal Oxide Anodes

Mixed metal oxide anodes shall be of the size indicated and shall conform to the following requirements.

2.1.5.1 Conductive Material

The electrically conductive coating shall contain a mixture consisting primarily of iridium, tantalum, and titanium oxides. The average composition is generally a 50/50 atomic percent mixture of iridium and titanium oxides, with a small amount of tantalum. The resistivity, as tested by the manufacturer, shall be no more than 0.002 ohm-centimeter, and the bond strength shall be greater than 50 MPa 7.25 ksi to guarantee the current capacity life and the quality of the conductive ceramic coating. The adhesion or bond strength shall be determined by epoxy bonding a 0.1 inch diameter stud to the ceramic coating and measuring the load to failure (about 70 MPa 10.15 ksi) of either the epoxy or the interface between the coating and the substrate. The anode must be inert and the electrically conductive ceramic coating dimensionally stable. The ceramic coated anode shall be capable of sustaining a current density of 100 ampere per square meter 10.764 square feet in an oxygen generating electrolyte at 66 degrees C 150 degrees F for 20 years, to ensure the current capacity life. An accelerated current capacity life test shall be performed by the manufacturer on every lot of anode wire used to construct the anode as described. The mixed metal oxide coating shall be applied to the wire anode by a firm that is regularly engaged in and has a minimum 5 years
experience in manufacturing and applying mixed metal oxide coatings to
titanium anode substrates. The mixed metal oxide must be sintered to the
titanium surface as to remain tightly bound to the surface when bent 180
degrees onto itself.

2.1.5.2 Anode Life Test

The anode wire material shall sustain current densities of 100 ampere per
square meter 10.764 square feet in an oxygen generating electrolyte for 20
years. The manufacturer shall certify that a representative sample taken
from the same lot used to construct the anode, has been tested and meets
the following criteria. The test cell sustains a current density of 10,000
ampere per square meter 10.764 square feet in a 15 weight percent sulfuric
acid electrolyte at 66 degrees C 150 degrees F without an increase in anode
to cathode potential of more than 1 volt. The cell containing the anode
shall be powered with a constant current power supply for the 30 day test
period. The representative sample shall be 125 mm 5 inch in length taken
from the lot of wire that is to be used for the anode.

2.1.5.3 Canister Contained Mixed Metal Oxide Anodes

Canister contained mixed metal oxide anodes shall be packed at the factory
in light weight, light gauge steel uni-body TIG welded canisters with
calcinated petroleum coke breeze. The canisters shall be capped with TIG
welded steel and caps providing a totally encapsulated construction. The
connecting cable shall pass through a hole in an end cap designed to be
tight fitting with a heavy duty strain relief allowing for handling of the
canister by the cable. The anode shall be centered in the canister by
centralizers to maintain rod position.

2.1.5.4 Anode Connecting Cables

Anodes shall have connecting cables installed at the factory. The
connection between the anode rod or ribbon and the lead wire shall be made
with a solid crimp couple with solder. The connection shall be sealed in
cast epoxy.

2.1.5.5 Canister Connection Cables

Canister connecting cables shall consist of an ultra low resistance solder
connection which is a minimum of three times stronger than the cable. For
ceramic coated canister anodes, the cable connection shall consist of two
molded dielectric layers (pressure seals), a flexible backfill resin
encapsulant stabilizer, a schedule 40 PVC pipe Type 1 seal, and Type 1 PVC
pipe end plugs. The seals and end plugs shall resist chlorine gas and acid.

2.1.5.6 Deep Anode Connection Cables

For deep anode beds, each anode located in the borehole shall be
accompanied by a reel of continuous cable having the length indicated. For
deep ceramic coated anode beds, anode connecting cables shall have molded
multiseal solder connections; splices will not be permitted. Chlorine gas
resistant cable and shield shall be used for chlorine environments.

2.2 RECTIFIERS AND ASSOCIATED EQUIPMENT

2.2.1 Rectifier Unit
NOTE: Air-cooled rectifiers will be used for most applications. Where highly corrosive atmospheres exist, the equipment will be oil-immersed in a tank-type housing. For hazardous area applications, oil-immersed equipment will be provided with an explosion-proof or dust-ignition-proof housing, as appropriate. Transformer tap adjusters will be provided in cases where an automatic system is not provided.

Rectifier unit shall consist of a transformer, rectifying elements, transformer tap adjuster, terminal block, [one dc output voltmeter, one dc output ammeter,] [one combination volt-ammeter,] one toggle switch for each meter, fuse holders with fuses for each dc circuit, variable resistors, an ac power-supply circuit breaker, lightning arresters for both input and output, all wired and assembled in a weatherproof cabinet. The overall efficiency of the rectifier shall be not less than 65 percent when operated at nameplate rating and shall be capable of supplying continuous full rated output at an ambient temperature of 44 degrees C 112 degrees F in full sunlight with expected life in excess of 10 years.

2.2.1.1 Transformer

Transformer shall conform to UL 506.

2.2.1.2 Rectifiers

NOTE: Below about 500 volt-amperes of dc rating output, single phase selenium rectifiers cost less to acquire and operate than silicon rectifiers. Above 1000 volt-amperes silicon rectifiers are more economical for both single phase and three phase. Silicon rectifiers are more economical to repair.

Rectifying elements shall be [silicon diodes] [selenium cells] connected to provide full-wave rectification. Silicon diodes shall be protected by selenium surge cells or varistors against over-voltage surges and by current-limiting devices against over-current surges.

2.2.1.3 Meters

Meters shall be accurate to within plus or minus 2 percent of full scale at 27 degrees C 80 degrees F, and shall possess temperature stability above and below 27 degrees C 80 degrees F and shall possess temperature stability above and below 27 degrees C 80 degrees F of at least 1 percent per 5 degrees C 10 degrees F. Separate meters shall be 63.5 mm 2-1/2 inch nominal size or larger.

2.2.1.4 Circuit Breaker

A [single] [double] [three]-pole, flush-mounted, fully magnetic, properly rated non-terminal type circuit breaker shall be installed in the primary circuit of the rectifier supply transformer.
2.2.1.5 Fuses

Cartridge-type fuses with suitable fuse holders shall be provided in each leg of the dc circuit.

2.2.2 Cabinet Construction

Cabinet shall be constructed of [not lighter than 1.56 mm 16 gauge steel] [hot dipped galvanized steel] [stainless steel] [aluminum] [molded fiberglass reinforced polyester], and shall be provided with a full door. The enclosure shall have oil-resistant gasket. The door shall be hinged and have a hasp that will permit the use of a padlock. The cabinet shall be fitted with screened openings of the proper size to provide for adequate cooling. Holes, conduit knockouts, or threaded hubs of sufficient size and number shall be conveniently located.

2.2.2.1 Wiring Diagram

A complete wiring diagram of the power unit showing both the ac supply and the dc connections to anodes shall be on the inside of the cabinet door. All components shall be shown and labeled.

2.2.2.2 Grounding Provisions

Grounding provisions shall [be as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.] [comply with NFPA 70 and UL 467 including a ground terminal in the cabinet.] The grounding conductor from the terminal to the earth grounding system shall be solid or stranded copper not smaller than No. 6 AWG. The earth grounding system shall consist of one or more ground rods. Ground rods shall be of [copper-clad steel conforming to UL 467] [zinc-coated steel conforming to IEEE C135.30] [solid stainless steel] not less than [16] [19] mm [5/8] [3/4] inch in diameter by [2.4] [3.1] m [8] [10] feet in length. Rods shall be driven full length into the earth. Sectional type rods may be used.

2.2.2.3 Resistance to Ground

**************************************************************************
NOTE: Remove this paragraph if not required in the project.
**************************************************************************

The resistance to ground shall be measured using the fall-of-potential method described in IEEE 81. The maximum resistance of driven ground shall not exceed 25 ohms under normally dry conditions. If this resistance cannot be obtained with a single rod, [_____] additional rods not less than 1.8 m 6 feet on centers, or if sectional type rods are used, [_____] additional sections may be coupled and driven with the first rod. In high-ground-resistance, UL listed chemically charged ground rods may be used. If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, the Contracting Officer shall be notified immediately. Connections below grade shall be fusion welded. Connections above grade shall be fusion welded or shall use UL 467 approved connectors.

2.2.2.4 Cabinet Paint System

[The cabinet and mounting support shall be [painted] [hot dipped galvanized] [aluminum] [stainless steel] with the manufacturer's standard painting system.] [The mounting support for the fiberglass cabinet shall
be [painted] [hot dipped galvanized] [aluminum] [stainless steel] with the manufacturer's standard painting system.

2.2.3 Wiring

Wiring shall be installed in accordance with NFPA 70 utilizing type TW or RHW or polyethylene insulation. Fittings for conduit and cable work shall conform to UL 514A. Outlets shall be of the threaded hub type with gasketed covers. Conduit shall be hub type with gasketed covers. Conduit shall be securely fastened at 2.4 m 8 foot intervals or less. Splices shall be made in outlet fittings only. Conductors shall be color coded for identification. Cable for anode header and distribution shall be No. [2] [_____] AWG stranded copper wire with type [cathodic protection high molecular weight polyethylene] [Dular/Halar] insulation.

2.2.4 Oil Immersed Enclosures

**************************************************************************
NOTE: The enclosure should not be used in areas prone to flooding unless required for hazardous locations. Provisions should be made for flooding.
**************************************************************************

Enclosures shall be of 3.1 mm 11 gauge steel or heavier, with an accessible drain plug. The oil level shall be clearly marked. The lid shall be hinged and have quick release clamps to secure it in closed position. A stop shall limit the swing of the lid when opened. A compressible, oil resistant, positive sealing gasket shall be provided. The gasket shall return to its original shape upon release of lid pressure. The gasket shall be attached to the tank or lid and joints shall be free of gaps. Base mounting using 102 mm 4 inch high channels shall be provided. Conduits entering the enclosure shall be internally sealed and shall enter or exit above the oil fill line.

2.3 COKE BREEZE

2.3.1 Calcined Petroleum Coke Breeze (Dry)

Breeze shall conform to the following requirements:

2.3.1.1 Electrical Resistivity

Resistivity shall not exceed 1 milliohm-meter (0.1 ohm-cm) Great Lake Carbon C 12 A Test Method.

2.3.1.2 General Backfill Specifications

Bulk Density - 1044 to 1204 kg/cubic meter 65 to 75 lbs/cubic foot
Fixed Carbon - 99.0 percent or greater
Volatile - 0.2 percent or less
Sizing - 100 percent less than 13 mm 1/2 inch

2.3.2 Metallurgical Coke Breeze (Processed)

Breeze shall conform to the following requirements:

2.3.2.1 Electrical Resistivity (Nominal)

Nominal electrical resistivity shall be:
a. 100 milliohm-meter (10 ohm-centimeter) Max., tightly compacted.

b. 100 milliohm-meter to 150 milliohm-meter, (10 to 15 ohm-centimeter,) lightly compacted.

c. 150 to 200 milliohm-meter, (15 to 20 ohm-centimeter,) loose.

2.3.2.2 General Backfill Specifications

Bulk density - 608 to 672 kg per cubic meter 38 to 42 pounds per cubic foot
Fixed Carbon - 80 percent or greater
Sizing - 100 percent less than 10 mm 3/8 inch

2.4 MISCELLANEOUS MATERIALS

Within [30] [45] [_____] days after receipt of notice to proceed, submit an itemized list of equipment and materials including item number, quantity, and manufacturer of each item. The list shall be accompanied by a description of procedures for each type of testing and adjustment, including testing of coating for thickness and holidays. Installation of materials and equipment shall not commence until this submittal is approved.

2.4.1 Electrical Wire

2.4.1.1 Anode Connecting Wire

**************************************************************************
NOTE: Any pinhole, cut, scratch or other damage to the anode cable exposing bare copper to the electrolyte will result in early failure of the cathodic protection system. For this reason, special, extra heavy insulation is used on anode cable. While it is often expedient to use the same type wire for the cathodic (negative) cable in order to avoid a mix-up in the field, the cathode cable is not subject to anodic failure and lesser insulation can be used.
**************************************************************************

Anode connecting wire shall be No. [8] [_____] AWG stranded copper wire with type CP high molecular weight polyethylene insulation, 2.8 mm 7/64 inch thick, 600 volt rating. Cable-to-anode contact resistance shall be 0.003 ohms maximum. Deep anode ground bed connecting wire shall be No. 8 AWG, stranded copper wire with an inner jacket of 1 mm 40 mils of Halar insulation covered by an outer jacket of 1.6 mm 65 mils CP high molecular weight polyethylene insulation, 600 volt rating. Cable-to-anode contact resistance shall be 0.02 ohms maximum.

2.4.1.2 Anode Header Cable

**************************************************************************
NOTE: The double insulated fluorocopolymer cable is intended for use in very harsh environments such as deep anode bed installations where chlorine and hydrogen gases are generated. This cable can be installed directly in soil or submerged in fresh, brackish, or salt waters. The CP high molecular weight polyethylene cable is also a direct buried
and submersible type cable suitable for harsh environments, but not as quiet as durable as the double insulated cable would be in the toughest of environments.

Cable for anode header and distribution shall be No. [_____] AWG stranded copper wire with type CP high molecular weight polyethylene, 2.8 mm 7/64 inch thick insulation] [HMWPE protective jacketed cable with a fluorocopolymer inner or primary insulation], 600-volt rating.

2.4.1.3 Test Wires

Test wires shall be No. 12 AWG stranded copper wire with NFPA 70 Type TW or RHW or polyethylene insulation.

2.4.1.4 Resistance Wire

Resistance wire shall be AWG No. [16 or No. 22] [_____] nickel-chromium wire.

2.4.2 Deep Anode Ground Bed Casing

NOTE: A metal casing should not be used except for a maximum of 1.5 meter 5 feet at the top for a well cap which also serves as a support for the suspension ropes. The drilling mud on the sides of the hole will usually keep the hole open until the anodes and coke breeze are installed. If a casing must be used, it should be fiberglass reinforced plastic (nonmetallic) and should be located above the anode string.

Casing shall be [_____] mm inch outside diameter, 3 mm 1/8 inch minimum wall thickness black steel pipe, conforming to ASTM A53/A53M, Type E or S, Grade B. The top casing shall be [_____] mm inch outside diameter, 3 mm 1/8 inch minimum wall thickness black steel pipe, conforming to ASTM A53/A53M, Type E or S, Grade B. The metal casing shall extend no more than [1.5] [_____] m [5] [_____] feet below the top of a well cap.

2.4.3 Anode Centering Device for Deep Anode Ground Beds

Anode centering device shall be nonmetallic and capable of maintaining centering in the hole without interfering with other anode lead wiring, until coke breeze is packed in place.

2.4.4 Conduit

Nonmetallic conduit shall conform to NEMA TC 2.

2.4.5 Test Boxes and Junction Boxes

Boxes shall be outdoor type conforming to UL 514A.

2.4.6 Vent Pipes

All deep wells shall be vented in anode zones. Openings in the vent shall
2.4.7 Polyethylene Insulation

Polyethylene insulation shall comply with the requirements of ASTM D1248 and of the following types, classes, and grades:

2.4.7.1 High Molecular Weight Polyethylene

High molecular weight polyethylene shall be Type I, Class C, Grade E5.

2.4.7.2 High Density Polyethylene

High density polyethylene shall be Type III, Class C, Grade E3.

2.4.8 Test Stations

Provide test stations complete with an insulated terminal block having the indicated number of terminals; provided with a lockable cover and have a cast-in legend, "C.P. Test" and complete with an insulated terminal block having the required number of terminals. (One terminal required for each conductor). Provide sufficient test stations to monitor underground isolation points. Test-bond stations (potential measurement and stray current control) shall be provided to monitor pipe to soil potential of proposed underground pipes or existing underground metallic structures which may conduct stray current from the new cathodic protection system. The location of the test-bond stations shall ensure that the pipe to soil potential of metallic pipe not designated to be protected is not made less negative by the energization of the cathodic protection system. Test station terminal connections and the terminal conductor shall be permanently tagged to identify each termination of the conductors (e.g. identify the conductors connected to the protected structures). Conductors shall be permanently identified in the station by means of plastic or metal tags, or plastic sleeves to indicate termination. Each conductor shall be color coded in accordance with the drawings. The station test facility, including permanent Cu-Cu S04 reference cells and test returns shall be installed as indicated. Pavement inserts shall be nonmetallic and shall allow Cu-Cu S04 reference electrode to contact the electrolyte beneath the pavement surface. Abbreviations shall not be used. Welding of electrical connections shall be as follows: Exothermic welds shall be "CADweld", "Thermo-weld", or approved equal. Use and selection of these materials and welding equipment shall be in accordance with the manufacturer's recommendations.

2.4.9 Calibrated Shunts

Install shunts calibrated in current per potential (e.g. mA/V) between the lead or header wire connected to the anode and the current collector lead connected to the structure. The calibration of the shunt shall be clearly marked and installed to be visible.

2.4.10 Sealing and Dielectric Compound

Sealing and dielectric compound shall be a black, rubber based compound that is soft, permanently pliable, tacky, moldable, and unbacked. Apply compound as recommended by the manufacturer, but not less than 3 mm 1/8 inch thick.
2.4.11 Protective Covering

Except as otherwise specified, protective covering for underground metallic components including pipe and fittings shall be applied mechanically in a factory or field plant specially equipped for the purpose. Valves and fittings that cannot be coated and wrapped mechanically shall have the protective covering applied by hand, preferably at the plant applying the covering to the pipe. Joints shall be coated and wrapped by hand. Hand coating and wrapping shall produce a covering equal in thickness to the covering applied mechanically. Piping and components installed in valve boxes or manholes shall also receive the specified protective coating.

2.4.11.1 Pipeline Metallic Components

Underground metallic pipelines and structures shall have a good quality factory applied coating. This includes carbon steel, cast iron and ductile iron pipelines or vessels. If nonmetallic pipelines are installed, metallic fittings or pipe sections shall be coated as follows.

a. The nominal thickness of the metallic pipe joint or other component coating shall be [0.2] [0.4] [0.6] [1.0] [1.5] [_____] mm [8] [16] [24] [40] [60] [_____] mils, plus or minus 5 percent.

b. Pipe and joint coating for factory applied or field repair material shall be applied as recommended by the manufacturer and shall be one of the following:

   (1) Continuously extruded polyethylene and adhesive coating system.
   (2) Polyvinyl chloride pressure-sensitive adhesive tape.
   (3) High density polyethylene/bituminous rubber compound tape.
   (4) Butyl rubber tape.
   (5) Coal tar epoxy.

2.4.11.2 Field Joints

Coat field joints with material compatible with the pipeline coating compound. Apply the joint coating material to an equal thickness as the pipeline coating. Unbonded coatings shall not be used on buried metallic piping. This prohibition includes unbonded polymer wraps or tubes.

2.4.11.3 Inspection of Pipe Coatings

Once the pipeline or vessel is set in the trench, conduct an inspection of the coating including electrical holiday detection as described in paragraph TESTS AND MEASUREMENTS.

2.4.11.4 Above Ground Piping System

Above ground piping shall be given two coats of exterior oil paint. Surface preparation shall be as recommended by paint manufacturer, except as follows: ferrous, shop primed surfaces shall be touched up with ferrous metal primer; surfaces that have not been shop primed shall be solvent cleaned; surfaces that contain loose rust, mil scale, or other foreign substances shall be mechanically cleaned by power wire brushing and primed with ferrous metal primer; and primed surfaces shall be finished with two
coats of exterior oil paint or vinyl paint.

2.4.12 Preformed Sheaths

Preformed sheaths for encapsulating electrical wire splices to be buried underground shall fit the insulated wires entering the spliced joint.

2.4.13 Epoxy Potting Compound

Epoxy potting compound for encapsulating electrical wire splices to be buried underground shall be a two package system made for the purpose.

2.4.14 Backfill Shields

Backfill shields shall consist of approved pipeline wrapping or fiberglass reinforced, coal-tar impregnated tape, or plastic weld caps, specifically made for the purpose.

2.4.15 Electrical Tape

Pressure-sensitive vinyl plastic electrical tape shall conform to UL 510.

2.4.16 Cable Marker Tape

Traceable marker tape shall be manufactured for the purpose and clearly labeled "Cathodic Protection Cable Buried Below".

2.4.17 Electrically Isolating Pipe Joints

**************************************************************************
NOTE: The cathodic protection system will fail unless full consideration is given to specifications for electrically isolating pipe joints, electrically conductive pipe joints, and casing cradles and seals. Mechanical and electrical specifications should reference this paragraph and paragraph "Electrically Conductive Couplings."
**************************************************************************

Electrically isolating pipe joints for above or below ground use shall be [flexible, mechanical pipe couplings of an electrically isolating type consisting of bolted or compression design provided with electrically isolating joint harness if required to provide pull-out strength] [flexible, integral electrically isolating pipe couplings designed for field installation by means of a swaging system and providing pull-out strength with a factor of safety] [nonflexible flanged type electrically isolating pipe joints to be field assembled] [nonflexible factory assembled electrically isolating pipe joints designed with stub ends for installation by welding and providing pull-out strength with a factor of safety].

2.4.17.1 Threaded Fittings

Threaded type electrically isolating pipe joints shall have molded plastic screw threads and be used above ground only. Machined plastic screw threads shall not be used.

2.4.17.2 Electrically Isolating Pipe Joints

Electrically isolating pipe joints shall be of a type that is in regular
factory production.

2.4.18 Electrically Conductive Couplings

Electrically conductive couplings shall be of a type that has a published maximum electrical resistance rating given in the manufacturer's literature. Cradles and seals shall be of a type that is in regular factory production made for the purpose of electrically isolating the carrier pipe from the casing and preventing the incursion of water into the annular space.

2.4.19 Joint and Continuity Bonds

Provide bonds across joints or any electrically discontinuous connections in the piping, and other pipes and structures with other than welded or threaded joints included in this cathodic protection system. Unless otherwise specified, bonds between structures and across joints in pipe with other than welded or threaded joints shall be with No. 4 AWG stranded copper cable with polyethylene insulation. Bonds between structures shall contain sufficient slack for any anticipated movement between structures. Bonds across pipe joints shall contain a minimum of 100 mm 4 inch of slack to allow for pipe movement and soil stress. Bonds shall be attached by exothermic welding. Exothermic weld areas shall be insulated with coating compound and approved by the Contracting Officer. Continuity bonds shall be installed as necessary to reduce stray current interference. Additional joint bonding shall be done where determined during construction or testing or as directed. Joint bonding shall include excavation and backfilling. There shall be a minimum of 2 continuity bonds between each structure and other than welded or threaded joints. Electrical continuity shall be tested across joints with other than welded or threaded joints and across metallic portions of sewage lift stations and water booster stations.

2.4.19.1 Resistance Bonds

Resistance bonds shall be adjusted for minimum interference while achieving the criteria of protection. Alternate methods may be used when approved.

2.4.19.2 Stray Current Measurements

Perform stray current measurements as indicated. Alternate methods may be used when approved. The stray current test report shall indicate location of test, type of pipes tested, method of testing, [____].

2.4.20 Electrical Isolation of Structures

Isolating fittings, including isolating flanges and couplings, shall be installed above ground or in a concrete hand hole. As a minimum, isolating flanges or unions shall be provided at the following locations:

a. Connection of new piping to existing pipes.

b. Pressure piping under floor slab to a building.

Additionally, isolation shall be provided between new pipe lines and foreign pipes that cross the new lines within 3 m 10 feet.

2.5 MAGNESIUM ANODES

Weights and dimensions of magnesium anodes shall be approximately as
follows:

<table>
<thead>
<tr>
<th>Nominal Weight (kg) (lbs)</th>
<th>Approx. Size (mm) (inch)</th>
<th>Nominal Gross Weight (kg) (lbs) Packaged in Backfill</th>
<th>Nominal Package Dimensions (mm) (inch)</th>

<td>45.5100</td>
<td>254 X 61010 X 24</td>
</tr>
</tbody>
</table>

2.5.1 Composition

Anode shall be of high potential magnesium alloy, made of primary magnesium obtained from sea water or brine, and not from scrap metal. Magnesium anodes shall conform to ASTM B843 and to the following analysis unless otherwise indicated:

<table>
<thead>
<tr>
<th>Element</th>
<th>Percent by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aluminum</td>
<td>0.02 maximum</td>

<tr>
<td>Magnesium</td>
<td>Remainder</td>
</tr>
</tbody>
</table>

Furnish spectrographic analyses on samples from each heat or batch of anodes used on this project.
2.5.2 Packaged Anodes

Provide anodes in packaged form with the anode surrounded by specially prepared quick-wetting backfill and contained in a cloth or paper sack. Anodes shall be centered in the backfill material. The backfill material shall have the following composition, unless otherwise indicated.

<table>
<thead>
<tr>
<th>Material</th>
<th>Percent by Weight</th>

2.5.3 Lead Wires

Anode lead wires shall consist of No. 10 solid copper wire, with TW insulation. Lead wires shall be not less than 3 m (10 feet) in length, without splices.

2.5.4 Connection Wires

Wires shall consist of No. 10 solid copper wire with RHW-USE or polyethylene insulation.

2.5.5 Insulation

Type RHW-USE insulation shall comply with NFPA 70. Polyethylene insulation shall comply with ASTM D1248; high molecular weight polyethylene shall be Type I, Class C, Grade E5; high density polyethylene shall be Type III, Class C, Grade E3.

2.5.6 Conduit Steel

Conduit steel shall conform to UL 6 and ANSI C80.1.

2.5.7 Tape

Pressure-sensitive vinyl plastic electrical tape shall conform to UL 510.

2.5.8 Backfill Shields

Provide shields consisting of approved wrapping of reinforced fiberglass coal-tar impregnated tape, or plastic weld caps specifically made for the purpose and installed in accordance with the manufacturer's recommendations. When joint bonds are required, due to the use of mechanical joints, the entire joint shall be protected with kraft paper joint cover. The joint cover shall be filled with poured hot coal-tar enamel.

2.5.9 Electrical Connections

Electrical connections shall be done as follows:

a. Exothermic welds shall be "Cadweld" or Burndy "Thermo-Weld" or approved equal. Use of these materials shall be in accordance with the
manufacturer's recommendations.

b. Electrical shielded arc welds on steel pipe shall be approved via shop drawing action.

c. Other methods of welding shall be specifically approved for use by the pipe manufacturer.

2.5.10 Anode Installation

Anode configuration and size shall be as indicated. A minimum of [one] [two] [three] [ten] [15] [_____] anodes are required to achieve minus 850 millivolts "instant off" potential and shall be required on the [_____] components or structure. Details shown are indicative of the general type of material required and are not intended to restrict selection of materials or of any particular manufacturer. The anode system shall be designed for a life of 25 years of continuous operation.

2.6 LEAD WIRE CONNECTIONS

Lead wire to structure connections shall be by exothermic welding process. Weld charges made specifically for use on cast iron shall be used on cast iron pipe. A backfill shield filled with a pipeline mastic sealant or material compatible with the coating shall be placed over the weld connection and shall cover the exposed metal adequately.

PART 3 EXECUTION

3.1 CRITERIA OF PROTECTION

Acceptance criteria for determining the adequacy of protection on a buried [pipe] [tank] shall be in accordance with [NACE SP0169,] [and] [NACE RP0193,] and as specified below.

3.1.1 Iron and Steel

**************************************************************************
NOTE: If the second method is used, the requirement for obtaining measurements over 95 percent of the entire metallic area is required as in the first method. Verification of the 100 millivolts decay of polarization should be achieved at points over 95 percent of the entire metallic area.
**************************************************************************

Use the following method a. for testing cathodic protection voltages. If more than one method is required, use method b.

a. A negative voltage of at least minus 850 millivolts as measured between the [pipe] [tank] [specified underground component] and a saturated copper-copper sulphate reference electrode contacting the (electrolyte) earth directly over the [pipe] [tank] [specified underground component]. Determination of this voltage shall be made with the cathodic protection system in operation. Voltage drops shall be considered for valid interpretation of this voltage measurement. A minimum of minus 850 millivolts "instant off" potential between the [structure] [pipe] [tank] [specified underground component] being tested and the reference cell shall be achieved over 95 percent of the area of the structure. Obtain adequate number of measurements over the
entire structure, pipe, tank, or other metallic component to verify and record achievement of minus 850 millivolts "instant off". This potential shall be obtained over 95 percent of the total metallic area without the "instant off" potential exceeding 1200 millivolts.

b. A minimum polarization voltage shift of 100 millivolts as measured between the [pipe] [tank] and a saturated copper-copper sulphate reference electrode contacting the earth directly over the [pipe] [tank]. This polarization voltage shift shall be determined by interrupting the protective current and measuring the polarization decay. When the protective current is interrupted, an immediate voltage shift will occur. The voltage reading, after the immediate shift, shall be used as the base reading from which to measure polarization decay. Measurements achieving 100 millivolts shall be made over 95 percent of the metallic surface.

3.1.2 Aluminum

Aluminum [pipes] [tanks] shall not be protected to a potential more negative than minus 1200 millivolts, measured between the [pipe] [tank] and a saturated copper-copper sulphate reference electrode contacting the earth, directly over the [pipe] [tank] [metallic component]. Resistance, if required, shall be inserted in the anode circuit within the test station to reduce the potential of the aluminum [pipe] [tank] to a value which will not exceed a potential more negative than minus 1200 millivolts. Voltage shift criterion shall be a minimum negative polarization shift of 100 millivolts measured between the [pipe] [tank] [metallic component] and a saturated copper-copper sulphate reference electrode contacting the earth, directly over the [pipe] [tank]. The polarization voltage shift shall be determined as outlined for iron and steel.

3.1.3 Copper Piping

For copper piping the following criteria shall apply. A minimum of 100 millivolts of cathodic polarization between the structure surface and a stable reference electrode contacting the electrolyte. The polarization voltage shift shall be determined as outlined for iron and steel.

3.2 GROUND BED INSTALLATION

3.2.1 Shallow Ground Beds

Shallow ground beds shall contain size and quantity of anodes designed to meet performance criteria of the cathodic protection system at an initial operating current output density not exceeding [40] [50] [70] percent of maximum recommended current output density.

3.2.1.1 Horizontally Buried Bare Anodes

Horizontally buried bare anodes shall be bedded on and covered with metallurgical coke breeze in a trench excavated for the purpose at depths, spacing and locations as shown. Anodes shall be completely surrounded by the backfill at bottom, sides, and top for a distance of not less than 100 mm 4 inch. Backfill shall be compacted.

3.2.1.2 Vertically Buried Bare Anodes

Vertically buried bare anodes shall be installed in vertical holes in the ground having a depth, spacing, and location shown. The holes in the
ground shall be sufficiently large to provide an annular space around the anode not less than 100 mm 4 inch. The anodes shall be centered in the hole and backfilled with calcined petroleum coke breeze or metallurgical coke breeze. Backfill shall be compacted.

3.2.1.3 Horizontally Buried Canister-Contained Anodes

Horizontally buried canister-contained anodes shall be buried in a trench excavated for the purpose at depths, spacing, and locations shown.

3.2.1.4 Vertically Buried Canister-Contained Anodes

Vertically buried canister-contained anodes shall be installed in vertical holes in the ground having depth, spacing, and locations shown. The holes in the ground shall be sufficiently larger in diameter than the canisters to facilitate easy lowering into the hole and backfilling. The space between the canister and the wall of the hole shall be completely backfilled with a wet slurry of earth free of stones.

3.2.1.5 Cable Protection

Positive cable to the ground bed and negative cable to the [pipe] [tank] to be protected shall be buried a minimum depth of 750 mm 30 inch except where above ground construction utilizing conduit is used.

3.2.1.6 Multiple Anode Systems

Multiple anode systems shall consist of groups of anodes connected in parallel to a header cable, buried in the ground at depths, spacing, and locations shown. The anodes shall be buried [horizontally] [vertically].

3.2.1.7 Distributed Anode Systems

Distributed anode systems shall consist of a line or row of anodes connected in parallel to a header cable and buried in the ground parallel to the pipeline. The anodes shall be at the pipeline at depths, spacing, and locations shown. The anodes shall be buried [horizontally] [vertically].

3.2.2 Deep Anode Ground Beds

Deep anode ground beds shall consist of an installation of anodes supported one above the other and supported in place by a method that does not suspend the anodes from the connecting cable. Deep anode ground beds shall be installed in accordance with NACE SP0572 and as specified in these specifications.

3.2.2.1 Anode Centering

Anodes shall be centered in the well by means of centering devices.

3.2.2.2 Casing

The casing shall be to a depth and elevation of not more than [_____] m feet.

3.2.2.3 Casing Insulation

The portion of casing above the top anode shall be coated with an electrically insulating underground type coating.
3.2.2.4 Anode Requirements

Anode sizes, spacing, number of anodes, depth of well, and other details shall be as shown.

3.2.2.5 Anode Lead Wire

Each anode shall have a separate, continuous wire extending from the anode to the junction box at the well head.

3.2.2.6 Anode Cables

Anode cables shall terminate in a nearby junction box, equipped with individual anode current shunts. Where full length casing is used, two wire connections from casing shall terminate in the junction box.

3.2.2.7 Anode and Cable Installation

If the method of installation utilizes backfill support for anodes and cable, provide slack in the cable near each anode and increase the cable insulation in thickness from 2.8 to 4.0 mm 7/64 to 5/32 inch utilizing an approved composite of plastic and elastomeric materials.

3.2.2.8 Backfill

Backfill the well with calcined petroleum coke breeze or metallurgical coke breeze surrounding the anodes by a method that does not leave voids or bridging. The recommended method is to pump the backfill from the bottom upward. The well shall be over-filled with coke breeze allowing for settlement so that the settled level after a number of days is as high as the level shown. The number of days allowed for settling of the coke breeze will be determined by the Contracting Officer. If the top level of coke breeze is below the level shown after settlement, put additional coke breeze in the well. The backfill used shall not require tamping. The top portion of the well shall be sealed for 8 m 25 feet to prevent surface water run-off. All vents shall be vented above the high water mark and at a safe height.

3.2.2.9 Cable Marker Tape

Locate traceable marker tape in the same trench above cathodic protection cables including structure leads, anode leads, anode header cables, test station leads, bonding cables, and rectifier electrical power cables.

3.2.2.10 Pavement Inserts

Install pavement inserts at a minimum of 30 m 100 foot intervals for pipelines. The pavement inserts shall be installed directly over the structure being protected and tested.

3.3 MAGNESIUM ANODE INSTALLATION

Installation shall not proceed without the presence of the Contracting Officer, unless otherwise authorized. Anode locations may be changed to clear obstructions when approved. Install anodes in sufficient number and of the required type, size, and spacing to obtain a uniform current distribution surface on the structure. Prepackaged anodes shall be installed as shown on the drawings.
3.3.1 Installation of Packaged Anodes

Install packaged anodes completely dry, lower them into holes by rope sling or by grasping the cloth gather. The anode lead wire shall not be used in lowering the anodes. Backfill the hole with fine soil in 150 mm 6 inch layers and each layer shall be hand-tamped around the anode. The tamper shall not strike the anode or lead wire. If immediate testing is to be performed, add water only after backfilling and tamping has been completed to a point 150 mm 6 inch above the anode. Approximately 8 L 2 gallons of water shall be poured into the hole; after the water is absorbed by the soil, backfilling and tamping shall be completed to the top of the hole. Anodes shall be installed as shown. When rock is found prior to achieving specified depth, anode may be installed horizontally to a depth at least as deep as the bottom of the pipe, with the approval of the Contracting Officer.

3.3.2 Underground Metal Pipe Line

Install anodes 610 mm 2 feet below the line to be protected unless otherwise noted on the drawings. To facilitate periodic electrical measurements during the life of the sacrificial anode system and to reduce the output current of the anodes if required, anode lead wires in a single group of anodes shall be buried a minimum of 610 mm 2 feet and each anode lead wire shall be connected to an individual terminal in a test station. The anode lead cable shall make contact with the structure only through a test station. Resistance wire shall be installed between the anode lead cable and the pipe cable in the test station to reduce the current output, if required.

3.3.3 Lead and Resistance Wire Splices

Lead wire splicing, when necessary, shall be made with copper split bolt connectors of proper size. The joint shall be carefully wrapped with at least 3 layers of electrical tape. Resistance wire connections shall be done with silver solder and the solder joints wrapped with a minimum of 3 layers of pressure-sensitive tape.

3.3.4 Magnesium Anodes for Metallic Components

As a minimum, each metallic component shall be protected with [2] [_____] [4.1] [7.7] [_____] kg [9] [17] [_____] lb magnesium anodes located on each side of the metallic component and routed through a test station. Fire hydrant pipe component shall have a minimum of [2] [3] [_____] [4.1] [7.7] [_____] kg [9] [17] [_____] lb magnesium anodes routed through a test station for each hydrant. Pipe under concrete slab shall have a minimum of [5] [_____] [7.7] [_____] kg [17] [_____] lb anodes for each location where metal pipe enters the building under the slab. A permanent reference cell shall be provided adjacent to the pipe entrance to the slab. Conductors shall be routed to a test station. Each valve shall have a minimum of [2] [_____] [4.1] [_____] kg [9] [_____] lb magnesium anodes routed through a test station. Sections of metallic pipe 6.1 m 20 foot long, when used where force mains are within 3 m 10 feet of the water pipe, shall have a minimum of [4] [_____] 7.7 kg 17 lb anodes.

3.4 MISCELLANEOUS INSTALLATION

**************************************************************************

NOTE: The cathodic protection system will fail

SECTION 26 42 17.00 10  Page 31
unless full engineering considerations are applied to selection, location and installation of electrically conductive joints and electrically isolating joints including the use of underground type dielectric coatings (not paint).

Adequate electrical conductivity of a pipe joint made by means other than welding should be determined by the "corrosion expert". Allowable electrical resistance depends on the cross sectional area of the pipe metal, the resistivity of the pipe metal, and the effectiveness of the coating on the pipe. Effectively coated pipe underground requires only a fraction of the electrical conductivity at joints needed for bare pipe. Shop painted pipe is considered to be the same as bare pipe and is not to be confused with pipe coated with an underground type dielectric coating.

The type of electrical isolating pipe joint to be used requires engineering design consideration. In general, the dielectric parts of an isolating joint will not withstand structural or environmental stresses as well as an all-metal type of joint. If the pipe on the cathodic protected side of the underground electrically isolating pipe joint, including the joint, is not effectively coated, interference type corrosion may occur unless other measures are taken. Factors to be considered include:

a. Deflection stresses
b. Pull-out stresses
c. Expansion-contraction due to temperature changes
d. Is function as a union necessary?
e. Is field assembly of critical parts practical?
f. Hazardous locations to be avoided
g. Accessibility if above ground
h. Location of test box if below ground
i. Importance of coating the adjacent pipe if below ground
j. Vulnerability to short circuiting

Factor of safety on pull-out strength required has to be engineered for the specific conditions involved since no blanket provisions are fully applicable to all cases. The requirement for isolating flanges or couplings should be based on a study of the conditions. If the new piping is a short extension to an existing old piping system not
under cathodic protection, an isolating fitting should be installed at the point of connection, since the new piping will be anodic to the older system. If the older system is under cathodic protection, no isolating fitting should be used.

3.4.1 Rectifier Installation

Mounting shall be as shown. [Pole or wall mounting shall be equipped with a channel bracket, lifting eyes, and a keyhole at the top.] [Cross-arm brackets shall accommodate a 102 by 102 mm 4 by 4 inch cross-arm.]

3.4.2 Wire Connections

3.4.2.1 Wire Splicing

NOTE: In water tanks, split bolts are used (above the water line only) because working space is limited and the hydraulic or mechanical compression tools may be cumbersome and hazardous to use; since a single split-bolt will work loose when the wires it connects are moved, a minimum of two split bolts should be used. At ground level or in trenches, compression tools can be used conveniently, and the swaged sleeve connection produced by such tools is more reliable than split bolts.

Connecting wire splicing shall be made with copper compression connectors or exothermic welds, following instructions of the manufacturer. Split-bolt type connectors shall not be used.

3.4.2.2 Steel Surfaces

Connections to [ferrous pipe] [metal tanks] shall be made by exothermic weld methods as manufactured by an approved manufacturer for the type of [pipe] [tank]. Electric arc welded connections and other types of welded connections to ferrous pipe and structures shall be approved before use.

3.4.3 Pipe Joints

NOTE: This paragraph will be coordinated with and referenced in mechanical and electrical specifications.

3.4.3.1 Electrical Continuity

Underground pipe shall be electrically continuous except at places where electrically isolating joints are specified. Pipe joined by means other than welding shall meet the following electrical continuity requirements:

a. Mechanical joints that are not factory designed to provide electrical continuity shall be bonded by installing a metallic bond across the joint. The bonding connections shall be made by the exothermic welding process.
b. Mechanical joints designed to provide electrical continuity may be used.

3.4.3.2 Electrical Isolation of Structures

Perform electrical isolation of structures as follows:

3.4.3.2.1 Isolating Fittings

Install isolating flanges and couplings aboveground, or within manholes, wherever possible, but an isolating device that electrically separates a pipeline shall not be installed in a confined area where a combustible atmosphere may collect unless precautions are taken to prevent arcing such as by means of externally located surge arresters, grounding cells, or other means. Isolating flanges and couplings in lines entering buildings shall be located at least 300 mm 12 inch above grade or floor level. Pipelines entering buildings either below or above ground shall be electrically isolated from the structure wall with an electrically isolating [gas tight wall sleeve.] [wall sleeve.]

3.4.3.2.2 Gas Distribution Piping

Provide electrical isolation at each building riser pipe to the pressure regulator, at all points where a short circuit to another structure or to a foreign structure may occur, and at other locations as indicated.

3.4.3.2.3 [Steam] [High Temperature] [Chilled] [Water] [Line Supply and Return Piping] [Line Conduit]

Provide electrical isolation at each building entrance, and at other locations as indicated.

3.4.3.2.4 [Fuel] [Gasoline] [Storage Tanks] [Fire Suppression] [______]

Provide electrical isolation in each pipe [at the building] [at the tank] as indicated.

3.4.3.2.5 Copper Piping

Copper piping shall be [electrically isolated at both ends of the pipe run] [wrapped with pipeline tape and electrically isolated at both ends].

3.4.3.2.6 Underground Storage Tanks (UST)

Electrically isolate tanks from other metallic structures. Bond components protected with the tank such as pipes, vents, anchors, and fill pipes to the tank.

3.4.4 Dissimilar Metals

**************************************************************
NOTE: This paragraph will be coordinated with and referenced in mechanical and electrical specifications.
**************************************************************

Buried piping of dissimilar metals including new and old steel piping, excepting valves, shall be electrically separated by means of electrically insulating joints at every place of connection. The insulating joint,
including the pipes, shall be coated with an underground type dielectric coating for a minimum distance of 10 diameters on each side of the joint.

3.4.5 Ferrous Valves

Dissimilar ferrous valves in a buried ferrous pipeline, including the pipe, shall be coated with an underground type dielectric coating for a minimum distance of 10 diameters on each side of the valve.

3.4.6 Brass or Bronze Valves

Brass or bronze valves shall not be used in a buried ferrous pipeline.

3.4.7 Metal Pipe Junction

If the dissimilar metal pipe junction, including valves, is not buried and is exposed to atmosphere only, the connection or valve, including the pipe, shall be coated with an underground type dielectric coating for a minimum distance of 3 diameters on each side of the junction.

3.4.8 Casing

******************************************************************************

NOTE: This paragraph will be deleted if mechanical and electrical specifications include these requirements.
******************************************************************************

Where a pipeline is installed in a casing under a roadway or railway, the pipeline shall be electrically isolated from the casing, and the annular space sealed against incursion of water.

3.4.9 Test Stations

Test stations shall be of the type and location shown and shall be [curb box] [post] mounted. Buried electrically isolating joints shall be provided with test wire connections brought to a test station. Changes in designated location shall have prior approval. Unless otherwise shown, other test stations shall be located as follows:

a. At 300 m 1,000 foot intervals or less.

b. Where the pipe or conduit crosses any other metal pipe.

c. At both ends of casings under roadways and railways.

d. Where both ends of an insulating joint are not accessible above ground for testing purposes.

3.5 TRAINING COURSE

Conduct a training course for the operating staff as designated by the Contracting Officer. The training period shall consist of a total of [16] [_____] hours of normal working time and shall start after the system is functionally completed but prior to final acceptance tests. Submit the proposed Training Course Curriculum (including topics and dates of discussion) indicating that all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations, including testing procedures included in the maintenance
instructions, are to be covered. The field instructions shall cover all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations, including testing procedures included in the maintenance instructions. At least 14 days prior to date of proposed conduction of the training course, submit the training course curriculum for approval, along with the proposed training date. Training shall consist of demonstration of test equipment, providing forms for test data and the tolerances which indicate that the system works satisfactorily.

3.6 TESTS AND MEASUREMENTS

Submit test reports in booklet form tabulating field tests and measurements performed, upon completion and testing of the installed system and including close interval potential survey, casing and interference tests, final system test verifying protection, insulated joint and bond tests, and holiday coating test. Submit a certified test report showing that the connecting method has passed a 120-day laboratory test without failure at the place of connection, wherein the anode is subjected to maximum recommended current output while immersed in a 3 percent sodium chloride solution. Each test report shall indicate the final position of controls.

3.6.1 Baseline Potentials

Each test and measurement will be witnessed by the Contracting Officer. Notify the Contracting Officer a minimum of 5 working days prior to each test. After backfill of the [pipe] [tank] [_____] and anodes is completed, but before the anodes are connected to the [pipe] [tank] [______], the static potential-to-soil of the [pipe] [tank] [_____] shall be measured. The locations of these measurements shall be identical to the locations specified for [pipe-] [tank-] [_____] to-reference electrode potential measurements.

3.6.2 Isolation Testing

Before the anode system is connected to the [pipe] [tank] [______], an isolation test shall be made at each isolating joint or fitting. This test shall demonstrate that no metallic contact, or short circuit exists between the two isolated sections of the [pipe] [tank]. Any isolating fittings installed and found to be defective shall be reported to the Contracting Officer.

3.6.2.1 Insulation Checker

Use a Model 601 insulation checker, as manufactured by "Gas Electronics" [_____] [or] [an approved equal], for isolating joint (flange) electrical testing in accordance with manufacturer’s operating instructions. An isolating joint that is good will read full scale on the meter; if an isolating joint is shorted, the meter pointer will be deflected at near zero on the meter scale. Location of the fault shall be determined from the instructions and the joint shall be repaired. If an isolating joint is located inside a vault, the pipe shall be sleeved with insulator when entering and leaving the vault.

3.6.2.2 Cathodic Protection Meter

Use a Model B3A2 cathodic protection meter, as manufactured by "M. C. Miller" [_____] [or] [an approved equal] using the continuity check circuit for isolating joint (flange) electrical testing. Perform this test
in addition to the Model 601 insulation checker. Continuity is checked across the isolated joint after the test lead wire is shorted together and the meter adjusted to scale. A full scale deflection indicates the system is shorted at some location. The Model 601 verifies that the particular insulation under test is good and the Model B3A2 verifies that the system is isolated. If the system is shorted, further testing shall be performed to isolate the location of the short.

3.6.3 Anode Output

After the rectifier is energized, the current output of the individual anode leads shall be measured by using an approved method. This may be done with a shunt and MV meter, a low-resistance ammeter, or a clamp-on milliammeter. The total current shall be measured and compared to the sum of all anode currents and to the rectifier output current. If an individual anode output current meets or exceeds the recommended output for that anode, the system shall be turned down or balancing resistors installed. Calculation of the wattage of the resistors shall be sufficient to handle the maximum load which will be encountered on the anode lead. All measurements obtained, the date, time, and locations of all measurements shall be recorded.

3.6.4 Electrode Potential Measurements

Upon completion of the installation and with the entire cathodic protection system in operation, electrode potential measurements shall be made using a copper-copper sulphate reference electrode and a potentiometer-voltmeter, or a direct current voltmeter having an internal resistance (sensitivity) of not less than 10 megohms per volt and a full scale of 10 volts. The locations of these measurements shall be identical to the locations used for baseline potentials. The values obtained and the date, time, and locations of measurements shall be recorded. No less than 8 measurements shall be made over any length of line or component. Additional measurements shall be made at each distribution service riser, with the reference electrode placed directly over the service line.

3.6.5 Location of Measurements

3.6.5.1 Coated Piping or Conduit

For coated piping or conduit, take measurements from the reference electrode located in contact with the earth, directly over the pipe. Connection to the pipe shall be made at service risers, valves, test leads, or by other means suitable for test purposes. Pipe to soil potential measurements shall be made at intervals not exceeding [0.75] [1.5] [122] [_____] m [2.5] [5] [400] [_____] feet. The Contractor may use a continuous pipe to soil potential profile in lieu of 0.75 m 2.5 ft interval pipe to soil potential measurements. Additional measurements shall be made at each distribution service riser, with the reference electrode placed directly over the service line adjacent to the riser. Potentials shall be plotted versus distance to an approved scale. Locations where potentials do not meet or exceed the criteria shall be identified and reported to the Contracting Officer.

3.6.5.2 Underground Tanks

For underground tanks, make a minimum of three measurements taken from the reference electrode located:
a. Directly over the center of the tank.
b. At a point directly over the tank and midway between each pair of anodes.
c. At each end of the tank.

3.6.6 Casing Tests

Before final acceptance of the installation, the electrical separation of carrier pipe from casings shall be tested and any short circuits corrected.

3.6.7 Interference Testing

**********************************************************************************
NOTE: Adverse effects may be caused by the foreign pipeline.
**********************************************************************************

Before final acceptance of the installation, interference tests shall be made with respect to any foreign [pipes] [tanks] in cooperation with the owner of the foreign [pipes] [tanks]. A full report of the tests giving all details shall be made.

3.6.8 Holiday Test

Repair any damage to the protective covering, during transit and handling, before installation. After field coating and wrapping has been applied, inspect the entire pipe by an electric holiday detector with impressed current in accordance with NACE SP0188 using a full ring, spring type coil electrode. The holiday detector shall be equipped with a bell, buzzer, or other type of audible signal which sounds when a holiday is detected. Holidays in the protective covering shall be repaired upon detection. Occasional checks of holiday detector potential will be made by the Contracting Officer to determine suitability of the detector. Furnish labor, materials, and equipment necessary for conducting the inspection. Inspect the coating system for holes, voids, cracks, and other damage during installation.

3.6.9 Recording Measurements

Record all [pipe-] [tank-] to-soil potential measurements including initial potentials where required. Locate, correct and report to Contracting Officer any short circuits to foreign [pipes] [tanks] [_____] encountered during checkout of the installed cathodic protection system. [Pipe-] [Tank-] [_____] to-soil potential measurements are required on as many [pipes] [tanks] [_____] as necessary to determine the extent of protection or to locate short-circuits.

3.4 SCHEDULE

-- End of Section Table of Contents --
**NOTE:** This guide specification covers the requirements for underground piping and buried or submerged structure cathodic protection systems using impressed current systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**NOTE:** The requirements for the cathodic protection systems should be determined by a corrosion engineer following the criteria, design, and installation recommendations included in the National Association of Corrosion Engineers (NACE) Standard SP0169, Control of External Corrosion on Underground or Submerged Metallic Piping Systems and others listed in the specification.

**NOTE:** The following information should be on the drawings:

1. Locations of the subject pipe or structure and all crossing and nearby underground pipes and structures.
2. Locations of all anodes, rectifiers, power sources and test stations.

3. Locations of all insulating flanges and unions.

4. Installation details of anodes, rectifiers and bond cables.

5. Locations of nearby cathodic protection systems.

6. Electrical single-line diagrams, elevations, limiting dimensions, and equipment ratings which are not covered in the specification.

7. Remote indicating or control requirements.

PART 1 GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

[1.2 Related Requirements

Sections 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, [33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION], and, [26 20 00 INTERIOR DISTRIBUTION SYSTEM], apply to this section except as modified herein.

]1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes
following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 SERVICES OF CORROSION ENGINEER

The Contractor shall obtain the services of a Corrosion Engineer to supervise, inspect and test the installation of the cathodic protection system(s). Corrosion Engineer refers to a registered professional engineer with certification or licensing that includes education and experience in cathodic protection of buried or submerged metal structures, or a person certified by the National Association or Corrosion Engineers at the level of Corrosion Specialist or Cathodic Protection Specialist. Such a person shall have not less than [three] [five] [_____] years experience in the cathodic protection of underground [storage tanks] or submerged structures. The contractor shall submit evidence of the qualifications of corrosion engineer to the Contracting Officer for review and approval.

PART 2 PRODUCTS

2.1 ANODES

**********************************************************************************************************************************************
NOTE: The chemical compositions listed are examples only. The actual compositions required shall be determined to provide adequate and economical service.
**********************************************************************************************************************************************
NOTE: Options for anode materials include "High-Silicon Chromium Bearing Cast Iron," "Graphite," and "Mixed Metal Oxide Coated" anodes. Selection of material should be based upon the conditions and operating parameters for the intended use. Precious metal or other anode materials, packaging or connections may also be appropriate for use, as determined by the engineer. These materials, packaging, or connections must also be submitted for approval in accordance with "Submittals Procedures."

[2.1.1  High-Silicon Chromium Bearing Cast Iron

[ASTM A518/A518M], Grade 3. [Chemical composition as follows:

### Mixed Metal Oxide Anodes

Mixed metal oxide anodes shall be provided by a firm that is regularly engaged in and has a minimum 5 years experience in manufacturing and applying mixed metal oxide coatings to titanium anode substrates. The mixed metal oxide anodes shall be of the size indicated and shall conform to the following requirements.

#### 2.1.3.1 Conductive Material

Titanium substrate coated with an inert, dimensionally stable, electrically conductive coating [with average composition of a 50/50 atomic percent] mixture of iridium and titanium oxides with a small amount of tantalum and ruthenium, 0.002 ohm-centimeter maximum resistivity, 50 MPa minimum adhesion or bond strength, and capable of sustaining a current density of 100 ampere per square meter in an oxygen generating electrolyte at 66 degrees C 150 degrees F for 20 years. Sinter the mixed metal oxide coating to the titanium surface as to remain tightly bound to the surface when bent 180 degrees onto itself.

#### 2.1.3.2 Anode Life Test

Perform an accelerated current capacity life test on every lot of anode wire used to construct the anode as described. The anode wire material shall sustain current densities of 100 ampere per square meter in an oxygen generating electrolyte for 20 years. The manufacturer shall certify that a representative sample taken from the same lot used to construct the anode, has been tested and meets the following criteria.

a. The representative sample shall be 125 mm 5 inch in length and be taken from the lot of wire that is to be used for the anode.

b. The cell containing the anode shall be powered with a constant current power supply for the 30 day test period.

c. The test cell sustains a current density of 10,000 ampere per square meter in a 15 weight percent sulfuric acid electrolyte at 66 degrees C 150 degrees F without an increase in anode to cathode potential of more than 1 volt.

#### 2.1.3.3 Adhesion or Bond Strength Test

Determine the adhesion or bond strength by epoxy bonding a 2.54 mm 100 mils diameter stud to the ceramic coating and measuring the load to failure of either the epoxy or the interface between the coating and the substrate.
2.1.4 Anode Lead Wires

Not less than [No. 8] [No. 6] [_____] AWG stranded copper conductor with [2.8 mm][10 mils [_____] thick ASTM D1248, high molecular weight polyethylene (HMWPE) insulation] [an inner jacket of one mm 40 mils [_____] of ethylene chlorotrifluoroethylene insulation covered by an outer jacket of 1.6 m 65 mils [_____] of ASTM D1248, high molecular weight polyethylene (HMWPE)] [a primary insulation of ethylene propylene rubber and an outer jacket of chloro sulphonated polyethylene], [3050] [6100] [_____] mm [10] [20] [_____] feet in length [of sufficient length to extend to junction box without splicing].

2.1.5 Attachment of Anode Lead Wire

Anode lead wires shall be factory installed.

2.1.5.1 End Connected Anode

[Drill] [Cast] a recess [150] [_____] mm [6] [_____] inches deep in one end of the anode. Attach the lead wire to the anode with an anchor device. Not more than 10 mm 1/2 inch of bare wire shall protrude from the anchor device. Attachment shall withstand a 1446 Newton 325 pound pull without loosening the wire or anchor device. Fill the recess with an [asphalt] [epoxy] sealing compound [, leaving sufficient space for a plug]. [Provide non-metallic plug flush with the anode end surface.] [Install a heat shrinkable anode cap over the attachment, cap shall extend not less than 65 mm 2 1/2 inches on the lead wire and 75 mm 3 inches on the anode.] Cable to anode contact resistance shall be 0.02 ohms maximum.

2.1.5.2 Center Connected Anode

Attach the lead wire to the center of the anode with an anchor device suitably fastened to the wire. Not more than 20 mm one inch of bare wire shall protrude from the anchor device. Encapsulate [each side of] the connection point with a minimum of 152 mm 6 inches [_____] of high voltage insulating compound mastic [and 102 mm 4 inches [_____] of epoxy resin]. Attachment shall withstand [4000] [6675] [_____] N [900] [1500] [_____] pounds pull without loosening the wire or anchor device. Provide a non-metallic [plug flush with the anode end] [end cap] to prevent chaffing of the anode lead wire. Cable to anode contact resistance shall be 0.02 ohms maximum.

2.1.5.3 Mixed Metal Oxide Anode Lead Wires

[[Solidly crimp] [and solder] the connection between the anode rod or ribbon and the lead wire. Seal the connection [with two layers of half lapped mastic tape covered with a heat shrinkable sleeve] [in cast epoxy].] [Tin and anneal the copper wire and hydraulically swage the tubular anode onto copper bushings in contact with the wire. Place a 28 mm 1 1/8 inch long copper sleeve, inner diameter slightly larger than the tubular anode outer diameter, over the tube prior to swaging.] Cable to anode contact resistance shall be 0.02 ohms maximum.

2.1.6 Anode Backfill

**************************************************************************

NOTE: The chemical composition listed is for example only. The actual type and composition required shall be determined by the design engineer.
to provide adequate and economical service.

Calcined petroleum [metallurgical] coal coke breeze having the following analysis:

a. Chemical composition

<table>

b. Weight: [1045] [768] [1184] [_____] kg per cubic meter [65] [48] [74] lbs per cubic foot

c. Size: 6 mm 1/4 inch maximum diameter [85 percent to pass a 9.5 mm 3/8 inch mesh,] [100 percent to pass 12.5 mm 1/2 inch mesh.]

d. Electrical resistivity: [1] [10] [20] [50] [_____] ohm-cm [maximum] [loose] [tightly compacted]

2.1.7 Gravel

100 percent to pass a 25 mm one inch mesh.

[2.1.8 Anode Centering Device for Deep Anode Ground Beds

Centering device shall be [non-metallic] and capable of maintaining centering in the hole without interfering with other anode lead wiring until completion of backfilling operations.

2.1.9 Deep Anode Ground Bed Casing

NOTE: A metal casing should not be used except for a maximum of 1.5 meter 5 feet at the top for a well cap which also serves as a support for the suspension ropes. The drilling mud on the sides of the hole will usually keep the hole open until the anodes and coke breeze are installed. If a casing must be used, it should be fiberglass reinforced plastic (non-metallic), should be located above the anode string and must be perforated to allow contact between the coke breeze and the surrounding electrolyte.

Casing shall be [_____] mm inch outside diameter, 3.2 mm 1/8 inch minimum wall thickness black steel pipe, conforming to ASTM A53/A53M, Type E or S, Grade B. The top casing shall be [_____] mm inch outside diameter, 3.2 mm 1/8 inch minimum wall thickness black steel pipe, conforming to
ASTM A53/A53M, Type E or S, Grade B. The metal casing shall extend no more than 1.5 meters 5 feet below the top of a well cap.

2.2 ANODE VENT PIPE

NEMA TC 2, Type [EPC-80-PE] [EPC-80-PVC], [38] [_____] mm [1 1/2] [_____] inches in diameter and having [3/16 inch 5 mm diameter holes located 150 mm 6 inch apart and at 1.57 rad 90 degrees around the vent pipe] [vertical slits parallel to the pipe longitudinal centerline, 38 mm 1.5 inches long, 0.15 mm 0.006 inch wide, spaced 152 mm 6 inches apart longitudinally and 25 mm one inch apart circumferentially around the vent pipe] along the length of vent tube which is in the coke breeze backfill.

2.3 RECTIFIERS

**************************************************************************
NOTE: Air-cooled rectifiers will be used for most applications in non-corrosive atmospheres. Where highly corrosive atmosphere exist, the equipment will be oil-immersed in a tank type housing. For hazardous area applications, oil-immersed equipment will be provided with an explosion-proof or dust-ignition-proof housing, as appropriate. Transformer tap adjusters will be provided in cases where an automatic system is not provided. Variacs should not be used where subjected to corrosive or marine air atmospheres.
**************************************************************************

2.3.1 Transformer

UL 506 and NEMA ST 1, as applicable.

2.3.2 Electrical Ratings

Electrical ratings as follows: input voltage at 60 Hz: [[115] [208] [230] volts single phase] [[208] [230] [460] volts three phase].

a. Output voltage, dc: [9] [12] [18] [24] [_____] volts [As indicated].

b. Output current, dc: [8] [16] [24] [32] [_____] amperes [As indicated]

The rectifier shall be capable of supplying continuous full rated output at an ambient temperature of 44 degrees C 112 degrees F in full sunlight with expected life of 10 years minimum.

2.3.3 Rectifier Stacks

[Silicon] [_____] connected in such a manner as to provide full wave rectification. [Silicon diodes shall be protected by selenium cells or varistors against overvoltage surges and by current limiting devices against overcurrent surges.]

2.3.4 Enclosure

**************************************************************************
NOTE: Choose this paragraph for air-cooled rectifier enclosures or the paragraph below entitled "Oil Immersed Enclosures." Oil immersed enclosures
**************************************************************************
shall be used where highly corrosive atmosphere exist. When locating oil immersed rectifiers near buildings, consult with paragraph 3.2.3 of MIL-HDBK 1008C for fire safety requirements.

**NEMA ICS 6**, Type [3] [3X] [4] [4X] [7] [_____] suitable for [wall] [post] [pad] mounting. Enclosure shall include hinged door with [padlock hasp] [key lock, provide [three] [_____] keys]. [Enclosure locks shall be keyed alike.] Fit enclosure with screened openings to provide for cooling by natural convection. Provide holes, conduit knockouts and threaded hubs of sufficient size and location. The cabinet and mounting support shall be [painted] [hot-dipped galvanized] [stainless] steel [according to the manufacturer's standards].

*[2.3.5 Oil Immersed Enclosures]*

Provide enclosures of 11-gage steel or heavier, with an accessible drain plug. The oil level shall be clearly marked. Provide a hinged lid with quick release clamps to secure it in a closed position. Provide a compressive, oil resistant, positive sealing gasket. Base mounting shall have 100 mm 4 inch high channels. Provide an internal terminal board and connections above oil level for monitoring and adjustment. The cabinet and mounting support shall be [painted] [hot-dipped galvanized] [stainless] steel [according to the manufacturer's standards].

*[2.3.6 Overload and Short Circuit Protection]*

UL 489, Molded case circuit breaker, [magnetic] [thermal-magnetic] type.

*[2.3.7 D.C. Output Control]*

**NOTE: A minimum of five coarse and five fine taps is recommended to provide sufficient voltage adjustment. Variacs should not be used where subjected to corrosive or marine air atmospheres.**

*[2.3.8 Output Voltage and Current Metering]*

Provide separate panel voltmeter and ammeter, not less than 63.5 mm 2 1/2 inch [rectangular] [round], two percent full scale accuracy [at 30 degrees C 80 degrees F, temperature stability above and below 30 degrees C 80 degrees F of at least one percent per 5 degrees C 10 degrees F]. Provide an "ON-OFF" toggle switch for each meter.

*[2.3.9 Surge Protection]*

Protect silicon diodes by use of AC and DC lightning arresters or metal oxide varistors against overvoltage surges and by current-limiting device against overcurrent surges.

*[2.3.10 Efficiency]*

Overall efficiency of [65 percent] [90 percent] [_____] minimum when
operated at full output.

2.3.11 Grounding Provisions

NFPA 70 and UL 467 including a grounding terminal in the cabinet. Grounding conductor from terminal to earth grounding system shall be solid or stranded copper not smaller than No. 6 AWG. Earth grounding system shall consist of one or more [copper] [copper clad steel] rods. Ground rods shall be a minimum of 2435 mm 8 feet long.

2.3.12 Shunt Resistors

MIL-I-1361. Resistors shall be located on the rectifier front panel and clearly marked with current and voltage for verification of panel ammeter.

2.3.13 Wiring Diagram

Provide complete wiring diagram of the power unit showing both A.C. supply and D.C. connections to anodes on the inside of the cabinet door. Show and label components.

2.3.14 Rectifier Replacement/Spare Parts List

Provide identification and coverage for all parts of each component, assembly, and accessory of the items subject to replacement in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

2.4 CONDUIT AND CABLE FOR POWER SERVICE AT 600 VOLTS OR LESS

2.4.1 Conduit

[UL 6, rigid galvanized steel] [Outlet boxes: UL 514A and, Fittings: UL 514B, threaded hubs.] [Metallic conduit and fittings to be polyvinylchloride coated in accordance with NEMA RN 1, Type A40.] [NEMA TC 2, Type EPC-40-PVC.]

2.4.2 Cable and Wire Other Than Anode Lead Wires

**************************************************************************
NOTE: Type THW insulation can only be obtained in large quantity. Use of this type insulation is not recommended for small project.
**************************************************************************

Copper conductors conforming to ASTM B3 and ASTM B8. Wires terminating at a rectifier, junction box, or test station shall have cable identification tags. Refer to the paragraph entitled "Anode Lead Wires" [_____] for anode lead wires.

2.4.2.1 AC Power Supply Wiring

[UL 83, Type [THW] [THWN] [TW]] [UL 44, Type RHW,] [UL 854, Type USE], stranded [solid] copper conductors, gage (AWG) as indicated.

2.4.2.2 Rectifier DC Negative (Structure) Cable(s)

ASTM D1248, High Molecular Weight Polyethylene (HMWPE) insulation, stranded copper conductors, gage (AWG) as indicated.
2.4.2.3 Rectifier DC Positive (Anode) Header Cable(s)

ASTM D1248, High Molecular Weight Polyethylene (HMWPE) insulation, stranded copper conductors, gage (AWG) as indicated. Refer to the paragraph entitled "Anode Lead Wires" [_____] for anode lead wires.

2.4.2.4 Continuity Bond Cables

ASTM D1248, High Molecular Weight Polyethylene (HMWPE) insulation, stranded copper conductors, gage (AWG) as indicated. Do not use bare copper wire for joint continuity bonds.

2.4.3 Cable and Wire Identification Tags

[Laminated plastic material with black letters on a yellow background] [[Brass] [Stainless steel] material with stamped or engraved letters]. Print letters and numbers a minimum of 5 mm 3/16 inch in size. Provide identifier legend [in accordance with the drawings] [____] .

2.4.4 Wire Connectors

[UL 486A-486B.] [Solderless copper crimp connections.] [Exothermic weld.]

2.4.5 Insulating Tape

UL 510.

2.4.6 Underground Splices

**************************************************************************
NOTE: Splices and damaged anode lead wire insulation are a common cause of premature failure. Splices are not normally allowed except under certain circumstances. If splices are allowed, select the appropriate option.
**************************************************************************

[Splices are not permitted in buried sections of anode header cable.] Provide splices with a compression connector on the conductors, and insulation and waterproofing using one of the following methods which are suitable for continuous submersion in water and comply with ANSI C119.1.

a. Provide cast-type splice insulation by means of molded casting process employing a thermosetting epoxy resin insulating material applied by a gravity poured method or pressure injected method. Provide component materials of the resin insulation in a packaged form ready for convenient mixing without removing from the package.

Gravity poured method shall employ materials and equipment contained in and approved commercial splicing kit which includes a mold suitable for the cables to be spliced. When the mold is in place around the joined conductors, prepare the resin mix and pour into the mold.

b. Provide [heavy wall] heat shrinkable splice insulation by means of a thermoplastic adhesive sealant material which shall be applied by a clean burning propane gas torch.
2.4.7 Buried Cable Warning and Identification Tape

Polyethylene tape, manufactured for warning and identification of buried cable and conduit. Tape shall be [75] [_____] mm [3] [_____] inches wide, [Yellow] [_____] in color and read "Caution Buried Cable Below" or similar. Color and lettering shall be permanent and unaffected by moisture or other substances in backfilling.

2.5 ANODE JUNCTION BOXES AND TEST STATIONS

2.5.1 Flush Mounted Type

NEMA ICS 6. Metallic or non-metallic with terminal board, [5] [8] [_____] terminal posts [and lockable lid]. A non-metallic enclosure shall be molded of glass filled polycarbonate and urethane coated or ABS plastic [and mounted on a 500 mm 18 inch length of PVC conduit]. The unit shall be of standard design, manufactured for use as a cathodic protection test station, complete with cover, terminal board, shunts, and brass or Type [304] [316] stainless steel hardware. The terminal board shall be removable for easy access to wires. [Provide traffic valve box capable of withstanding [H-20] [_____] traffic loads.] The cover shall have a cast in legend "CP TEST."

2.5.2 Post Top Mounted Type

NEMA ICS 6. Metallic or non-metallic with terminal board, [5] [8] [_____] terminal posts and lockable lid. A non-metallic enclosure shall be high impact strength molded plastic. The unit shall be of standard design, manufactured for use as a cathodic protection test station, complete with cover, terminal board, shunts, and brass or Type [304] [316] stainless steel hardware. The terminal board shall be removable for easy access to wires. The test station shall be mounted atop 1830 mm 6 foot long polyethylene conduit with anchor.

2.5.3 Wall Mounted Type

NEMA ICS 6, Type [3R] [4X] [_____] enclosure with [clamped cover] [Type [304] [316] stainless steel hinges and [clamped] [latched] cover] [and padlocked hasp]. Enclosure shall be of [galvanized steel] [painted steel] [aluminum] [fiberglass] [non-metallic] construction with terminal board and labeled with nameplate. Provide nameplate in accordance with Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS. Enclosure mounting posts shall be [galvanized steel pipe, schedule [40] [80] [_____]],[wood post, full length pressure treated with pentachlorophenol] [as indicated]. Mount enclosure 1066 mm 42 inches above finished grade [as indicated].

2.5.4 Terminal Boards

Provide terminal boards for anode junction boxes, bonding boxes, and test stations made of phenolic plastic [3] [6] [_____] mm [1/8] [1/4] [_____] inch thick with dimensions as indicated. Insulated terminal boards shall have the required number of terminals (one terminal required for each conductor). Install solderless copper lugs and copper buss bars, shunts, and variable resistors on the terminal board as indicated. Test station terminal connections shall be permanently tagged to identify each termination of conductors (e.g. identify the conductors connected to the protected structure, anodes, and reference electrodes). Conductors shall be permanently identified by means of plastic or metal tags, or plastic sleeves to indicate termination. [Each conductor shall be color coded as
follows:

<table>
<thead>
<tr>
<th>Anode lead wire:</th>
<th>black</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structure lead wire:</td>
<td>white</td>
</tr>
<tr>
<td>Sodium sulfate:</td>
<td>red</td>
</tr>
</tbody>
</table>

2.5.5  **Shunt Resistors**

[MIL-I-1361.] [0.01] [_____] ohm, [6] [_____] ampere, accuracy plus or minus one percent, [manganin wire] [_____] type.

2.5.6  **Pavement Insert**

Pavement insert shall be a non-metallic flush type test station without terminal board, and shall allow a copper-copper sulfate reference electrode to contact the electrolyte beneath the pavement surface. [Provide traffic valve box capable of withstanding [H-20] [_____] traffic loads.]

2.5.7  **Cast-In-Place Concrete**

Flush mount type test stations, bonding boxes, and anode junction boxes shall be centered in a 460 by 460 by 102 mm 18 by 18 by 4 inch concrete slab. Concrete shall be 20 Mpa 3000 psi minimum ultimate 28-day compressive strength with 25 mm 1-inch minimum aggregate conforming to [ASTM C94/C94M] [Section 03 30 00 CAST-IN-PLACE CONCRETE].

2.6  **INSULATING FLANGE SETS**

**************************************************************************
NOTE: On projects having piping installed by DIVISION 2, SITE WORK and/or DIVISION 15, MECHANICAL, coordinate the requirements for flanges and unions with the appropriate section(s).
**************************************************************************

Provide full-faced gaskets, insulating sleeves and washers, and steel washers. Provide flange sets rated for operation at the rated pressure and temperature of the flanges.

2.6.1  **Gaskets**

**************************************************************************
NOTE: Do not use asbestos materials.
**************************************************************************

2.6.2  **Insulating Washers and Sleeves**

Two sets 3 mm 1/8 inch [laminated phenolic] [_____] for operation at [232] [_____] degrees C [450] [_____] degrees F. Insulating washers shall fit
within the bolt facing on the flange over the outside of the fabric reinforced sleeves.

2.6.3 Washers
Steel, cadmium plated, to fit within the bolt facing on the flange.

2.7 DIELECTRIC UNIONS

**************************************************************************
NOTE: On projects having piping installed by DIVISION 2, SITE WORK and/or DIVISION 15, MECHANICAL, coordinate the requirements for flanges and unions with the appropriate section(s).
**************************************************************************

ASME B16.39, Class [1] [2] for dimensional, strength, and pressure requirements. Insulation barrier shall limit galvanic current to one percent of the short-circuit current in a corresponding metallic joint. Provide insulating material impervious to [water] [oil] [gas].

2.8 BONDING AND GROUNDING EQUIPMENT
UL 467.

2.9 ELECTRICAL INSULATING COATINGS

[Heat-shrinkable tape] [Conformable water tight sealant having dielectric strength not less than 15 kV for a 3 mm 1/8 inch thick layer].

**************************************************************************
NOTE: Rectifiers shall be pad or post mounted.
Select the appropriate paragraph.
**************************************************************************

[2.10 CONCRETE RECTIFIER PAD

**************************************************************************
NOTE: Provide detail on the drawings.
**************************************************************************

Dimensions, conduit locations, and anchor bolt location [as indicated] [in accordance with] the manufacturer's drawings for the equipment furnished.

2.10.1 Concrete

20.67 MPa 3000 psi concrete conforming to [ASTM C94/C94M] [Section 03 30 00 CAST-IN-PLACE CONCRETE.]

2.11 RECTIFIER MOUNTING POST

[Galvanized steel pipe, Schedule [40] [80]], [wood post, full length pressure treated with pentachlorophenol].

2.12 CASING INSULATORS AND SEALS

Casing insulators shall have a minimum [305] [_____] mm [12] [_____] inch band width, [constructed of heat fused plastic coated steel] [_____] and multi-segmented to attach firmly around the pipe. Casing end seals shall
be S-shaped rubber seals with stainless steel straps.

2.13 PERMANENT REFERENCE ELECTRODES

Permanent reference electrodes shall be [copper copper-sulfate] [silver silver-chloride] [zinc] specifically manufactured for [underground] [marine] use, [31.75] [_____] mm [1 1/4] [_____] inch diameter, by [255] [_____] mm [10] [_____] inches long, [plastic [_____] tube with an ion trap to minimize contamination of the cell] [, and a minimum surface sensing area of [_____] square centimeters[_____] square inches]. [The cell shall be prepackaged by the manufacturer with a backfill material as recommended by the manufacturer.] Provide cells with No. [10] [12] [_____] AWG, [THHN] [_____] cable of sufficient length to extend to the [test station] [junction box] without splicing. Reference electrodes shall have a minimum 15 year life, stability of plus or minus 5 millivolts under 3 microamp load, and an initial accuracy of plus or minus 10 millivolts referenced to a calibrated portable reference electrode.

2.14 STEEL FLANGES AND BOLTING

2.14.1 Steel Flanges

ASME B16.5 [667.5] [1335] [_____] N [150] [300] [_____] lb.

2.14.2 Bolting

ASTM A307, Grade B for bolts: ASTM A194/A194M, Grade 2 for nuts. Dimensions ASME B18.2.1 for bolts, ASME B18.2.2 for nuts. Threads: ASME B1.1, Class 2A fit for bolts, Class 2B fit for nuts. Bolts shall extend completely through the nuts and may have reduced shanks of a diameter not less than the diameter at the roof of the threads.

2.15 EXOTHERMIC WELD KITS

Exothermic weld kits specifically designed by the manufacturer for welding the types of materials and shapes provided.

PART 3 EXECUTION

3.1 ANODE INSTALLATION

[IEEE C2] [NFPA 70].

3.1.1 Anodes and Lead Wires

Provide anodes and lead wires as follows [and in accordance with NACE SP0572 ].

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following dependent upon selection of vertical or horizontal anodes. Deep well anode beds may also be used. Designer shall select anode and installation procedures for specific site. Provide detail on the drawings.
**************************************************************************
**3.1.1.1 Vertical Anodes**

a. Excavation for anodes: Excavate hole to [a minimum 75 mm 3 inches larger than the packaged anode diameter.] [the diameter indicated.] [1220 mm 4 feet deeper than the anode length.] [the depth indicated.]

b. Excavation for wire trench: Excavate lead [and main feeder] wire trenches to [the depth indicated] [not less than [455] [610] mm [24] inches deep], [(150) [_____] mm [6] [_____] inches width] [width as indicated].

c. Lifting anodes: Do not lift or support anode by the lead wire. Exercise care to preclude damaging the anode and the lead wire insulation.

d. Installing anodes: [Place 305 mm 12 inches of coke breeze in the hole and tamp well. Center the anode in the hole and place 305 mm 12 inches of additional coke breeze and tamp well taking care not to strike and damage the anode lead wire. Repeat sequence until coke breeze is 305 mm 12 inches above the anode.] [Center the canister anode in the hole. Completely fill the annular space between the canister and the wall of the hole with a slurry of stone free earth.] [Place a vent pipe vertically above the anode. Cut the pipe to sufficient length to extend from 75 mm 3 inches within the coke breeze to 75 mm 3 inches below finish grade. Place gravel around the vent pipe to a level 150 mm 6 inches below finish grade.] Fill the remaining excavation with soil and tamp.

e. Installing lead wires: Provide anodes with lead wires of sufficient length to extend to the anode junction box without splicing. Cover the lead [and main feeder] wire trench bottom with a 75 mm 3 inch layer of sand or stone free earth. Center wire on the backfill layer. Handle to eliminate damage to the cable and insulation, do not stretch or kink the conductor. Place backfill over wire in layers not exceeding 150 mm 6 inches deep, compact each layer thoroughly. Do not place tree roots, wood scrap, vegetable matter and refuse in the backfill.

******************************************************************************
NOTE: Splices and damaged anode lead wire insulation are a common cause of premature failure. Splices are not normally allowed except under certain circumstances. If splices are allowed, select the "Anode lead to main feeder connections" option.
******************************************************************************

f. Splices not allowed: Splices, or repairs to damaged anode lead wire insulation are not allowed. Install anode lead wires back to the anode junction box as indicated in the drawings. [Anode lead to main feeder connections: Make connections as follows:

******************************************************************************
NOTE: Choose one of the following options.
******************************************************************************

[(1) Remove insulation to expose approximately 50 mm 2 inches of each conductor.

(2) Make connection between conductors using solderless crimp
connector or exothermic weld.

(3) Cover connection with uncured butyl rubber tape to provide filler wrap.

(4) Apply four layers of half-lapped neoprene tape, extend the tape over the cable insulation.

(5) Apply two layers of half-lapped pressure sensitive polyethylene or polyvinyl chloride tape.]

[(1) Remove insulation to expose approximately 50 mm 2 inches of each conductor.

(2) Make connection between conductors using solderless crimp connector or exothermic weld.

(3) Cover connection with pre-manufactured splice kit.]

---

g. Anode junction box. Mark each of the wires terminating in the junction box. Install anode junction box as shown in the drawings [prior to pouring the concrete slab].

h. Installing lead wires. Connect anode lead wires to the appropriate terminals in the anode junction box.

---

[3.1.1.2 Horizontal Anodes

a. Excavation for anodes: Excavate anode trenches to [the depth indicated, 610 mm two feet longer than the anode, 305 mm one foot wide] [the depth, length, and width indicated].

b. Excavation for wire trench: Excavate lead [and main feeder] wire trenches to [the depth indicated] [not less than 455 [610] mm [18] [24] inches deep], [150 [_____] mm[6] [_____] inches wide] [width as indicated].

c. Lifting anodes: Do not lift or support anode by the lead wire. Exercise care to preclude damaging the anode and the lead wire insulation.

d. Installing anodes: Place [100] [_____] mm [4] [_____] inches of coke breeze in the anode trench and tamp well. Center the anode in the trench and cover with coke breeze to provide a minimum [100] [_____] mm [4] [_____] inch cover over the anode. Tamp the coke breeze firm taking care not to strike and damage the anode lead wire. [Place a vent pipe vertically above the anode. Cut the pipe to sufficient length to extend from 75 mm 3 inches within the coke breeze to 75 mm 3 inches below finish grade. Place gravel around the vent pipe to a level 150 mm 6 inches below finish grade.] Fill the remaining excavation with soil and tamp.

e. Installing lead wires: Provide anodes with lead wires of sufficient length to extend to the anode junction box without splicing. Cover the lead [and main feeder] wire trench bottom with a 75 mm 3 inch layer of sand or stone free earth. Center wire on the backfill layer. Handle to prevent damage to the cable and insulation, do not stretch or kink the conductor. Place backfill over wire in layers not exceeding 150 mm 6 inches deep, compacting each layer thoroughly. Do not place tree
roots, wood scrap, vegetable matter, and refuse in the backfill. Place cable warning tape, within [455] [___] mm [18] [___] inches of finished grade, above buried cable and conduit.

**************************************************************************

NOTE: Splices and damaged anode lead wire insulation are a common cause of premature failure. Splices are not normally allowed except under certain circumstances. If splices are allowed, select the "Anode lead to main feeder connections" option.

**************************************************************************

f. Splices not allowed: Splices, or repairs to damaged anode lead wire insulation are not allowed. Install anode lead wires back to the anode junction box as indicated in the drawings. [Anode lead to main feeder connections: Make connectors as follows:

**************************************************************************

NOTE: Choose one of the following options.

**************************************************************************

[(1) Remove insulation to expose approximately 50 mm 2 inches of each conductor.
(2) Make connection between conductors using solderless crimp connector or exothermic weld.
(3) Cover connection with uncured butyl rubber type to provide filler wrap.
(4) Apply four layers of half-lapped neoprene tape, extend the tape over the cable insulation.
(5) Apply two layers of half-lapped pressure sensitive polyethylene or polyvinyl chloride tape.]

[(1) Remove insulation to expose approximately 50 mm 2 inches of each conductor.
(2) Make connection between conductors using solderless crimp connector or exothermic weld.
(3) Cover connection with pre-manufactured splice kit.]]

g. Anode junction box. Mark each of the wires terminating in the junction box. Install anode junction box as shown in the drawings [prior to pouring the concrete slab].

h. Installing lead wires. Connect anode lead wires to the appropriate terminals in the anode junction box.

][3.1.1.3 Deep Well Anode Ground beds

a. Drilling of anode well. Drilling of the anode well shall be accomplished by a qualified well driller. Submit documentation of experience to the Contracting Officer. Drill a hole [254] [305] [_____] mm [10] [12] [_____] inches in diameter to the depth indicated using rotary bit equipment designed specifically for this purpose.
Select the type and consistency of drilling fluids to be consistent with soil characteristics. The use of temporary well casings may be necessary. Remove all temporary casings upon completion of the installation.

b. Excavation for wire trench. Excavate anode header cable [_____] wire trenches to [the depth indicated] [not less than [455] [610] mm [18] [24] inches deep], [[150] [_____] mm[16] [_____] inches wide] [width as indicated].

c. Installing anodes. Do not lift or support anode by the lead wire. Exercise care to preclude damaging the anode and the lead wire insulation. Attach the anode centralizers to the anodes. [Place the vent pipe in the hole as indicated prior to installing the anodes. Install the anodes in the hole at the depths indicated and supported in place using a method that does not suspend the anodes by the lead wire.] [Strap the [anodes] [anode assembly] to the vent pipe spaced as indicated on the drawings. Lower the anode/vent pipe assembly into the hole.] [Label and coil the excess anode lead wire at the top of the casing].

d. Coke backfill. Pump the coke back fill into the hole through a separate removable tube with the tip at the bottom of the hole. Pumping operations shall be continuous. Maintain a continuous supply of fluidized coke at the pump suction until coke is filled to the top of the hole. Allow the coke to settle for [24] [_____] hours. Verify the level of coke and provide additional as necessary until the level of coke is not lower than that indicated in the drawings.

e. [Casing. Install well head casing as indicated. Seal the annular space between the casing and earth with cement grout. Seal the top of the anode well as shown on the drawings.]

f. Anode well access box. Place the anode well access box around the top of the casing, and pour the concrete slab around the box as indicated.

g. Anode junction box. Install anode junction box as shown in the drawings [prior to pouring the concrete slab].

h. Installing lead wires. Provide anodes with lead wires of sufficient length to extend to the anode junction box without splicing. Splices, or repairs to damaged anode lead wire insulation are not allowed. Mark each of the wires terminating in the junction box. Connect anode lead wires to the appropriate terminals in the anode junction box.

i. Anode header cable. Provide anodes header cable of sufficient length to extend to the anode junction box without splicing. Splices, or repairs to damaged anode header cable wire insulation are not allowed. Cover the anode header cable trench bottom with a 75 mm 3 inch layer of sand or stone free earth. Center wire on the backfill layer. Handle cable to prevent damage to the cable and insulation, do not stretch or kink the conductor. Place backfill over wire in layers not exceeding 150 mm 6 inches deep, compact each layer thoroughly. Do not place tree roots, wood scrap, vegetable matter and refuse in the backfill. Connect the anode header cable to the appropriate terminal in the anode junction box.
3.1.2  Wire-To-Structure Connections

Connect wire to [pipe] [tank] structure [_____] [by use of a exothermic weld kit] [by brazing]. Clean the structure surface by scraping, filing or wire brushing to produce a clean, bright surface. [Weld connections using the exothermic weld kits in accordance with the kit manufacturer's instructions.] Test the integrity of the weld, prior to coating, by striking with a 908 gram two pound hammer. Cover connections and exposed structures with an electrically insulating coating, compatible with existing coating.

3.1.2.1  Safety Precautions Around Fuel Facilities

Contractor shall take proper safety precautions prior to and during welding to live fuel pipelines [tanks]. Contractor shall notify the activity Fuel Office via the Contracting Officer a minimum of three days before performing exothermic welding to live fuel lines. Exothermic welding shall be conducted with fuel flowing through the pipeline to eliminate vapor spaces within the pipe and to dissipate the heat on the pipe. Exothermic weld charges for connections to fuel lines shall be limited to a maximum 15 gram charge to prevent burning through the pipe wall. Exothermic weld connections shall be spaced a minimum of 150 mm 6 inches apart. In the event of an unsuccessful weld, the new weld location shall be located a minimum of 6 inches from the unsuccessful weld and any other existing welds. Contractor shall obtain the services of a certified Marine Chemist or Certified Industrial Hygienist [to monitor the construction site during exothermic welding work and certify that the area is free of flammable vapors and otherwise safe for work.] [to approve the contractor's exothermic welding safety procedures. Results of this consultation shall be included in the Contractor's Daily Report.]

3.1.3  Rectifiers

Location and mounting as indicated. Assemble and attach equipment enclosures to [wall] [post] [pad] in accordance with the manufacturer's instructions. Handle wires to prevent stretching or kinking the conductors or damaging the insulation. Use lubricants when pulling wires into conduits. Bond the equipment enclosures to a grounding electrode.

3.1.4  Test Stations [and Permanent Reference Electrodes]

Locate test stations [and permanent reference electrodes] [as indicated.] as follows:

a. At [305] [_____] meters [1000] [_____] foot intervals.

b. At insulating joints.

c. At both ends of casings.

d. Where the pipe crosses any other metal pipes.

e. Where the pipe connects to an existing old piping system not under cathodic protection.

f. Where the pipe connects to a dissimilar metal pipe.

Do not fill the bottom of the test station with concrete unless otherwise specified. Do not place rubbish, scrap or other debris into the test
3.1.4.1 Permanent Reference Electrode Calibration and Installation

Provide [prepackaged] [copper copper-sulfate] [silver-silver chloride] [zinc] reference electrode(s) as indicated in the drawings. Prior to installation, soak the [prepackaged] reference electrode in a container of potable water for 30 minutes. Do not use seawater [except for silver-silver chloride electrodes intended for use in seawater]. Calibrate the permanent reference electrode in the presence of the contracting officer or his approved representative by measuring the potential difference between the permanent reference electrode and an independent (portable) calibrated reference electrode placed in the water adjacent to the permanent reference electrode. [Potential differences between the two electrodes of the same generic type should not exceed [10] [15] millivolts when the [sensing windows of the] two electrodes being compared are not more than \( \frac{2 \text{ mm}}{1/6 \text{ inch}} \) apart but not touching.] [Zinc permanent reference electrodes should be within the range of minus 1000 to minus 1150 millivolts when calibrated with an independent (portable) calibrated copper-copper sulfate reference electrode with the two electrodes being not more than \( \frac{2 \text{ mm}}{1/6 \text{ inch}} \) apart but not touching.] Permanent reference electrodes not within these potential differences shall be removed from the construction site by the end of the day and replaced at the contractor's expense. [Prior to completely backfilling over reference electrodes, again verify the accuracy of the reference electrode.] The testing provision shall also apply to replacement reference electrodes as well.

3.1.5 Bonding Boxes

Provide structure bonding boxes in locations [as indicated] [where the protected structure crosses or comes into close proximity to other metal structures that are unprotected or protected by its own electrically isolated cathodic protection system(s)].

3.1.6 Insulating Flange Sets

[Provide insulating flange sets aboveground or within manholes as indicated.] [Locate insulating flanges on lines entering buildings at least 305 mm [12 inches] above grade or floor level.] [Cut piping and provide flanges into place. Carefully align flange bolt holes and weld flange to pipe in accordance with ASME B16.25.] [Electrically isolate pipelines entering buildings from the structure wall either below or above ground with an electrically isolating wall sleeve.] Provide insulating flange sets into place without springing or forcing. Carefully install flange bolt sleeves to avoid damage to the sleeves. [Cover insulating flanges with an electrically insulating coating.]

3.1.7 Dielectric Unions

Provide insulating unions aboveground or within manholes as indicated. [Cut pipe ends square, remove fins and burrs, cut taper pipe threads in accordance with ASME B1.20.1.] Work piping into place without springing or forcing. Apply joint compound or thread tape to male threads only. Backing off to permit alignment of threaded joints shall not be permitted. Engage threads so that not more than three threads remain exposed.

3.1.8 Joint Bonds

Provide joint bonds on metallic pipe to and across buried flexible
couplings, mechanical joints, flanged joints [except at places where insulating joints are specified] and at joints not welded or threaded to provide electrical continuity. Conform to the safety precautions of paragraph [_____] when welding around fuel facilities. Check and verify adherence of the bond to the substrate for mechanical integrity by striking the weld with a 908 gram 2 pound hammer.

3.1.9 Casings, Insulation, and Seals

Where the pipeline is installed in a casing under a roadway or railway, insulate the pipeline from the casing, and seal the annular space against intrusion of water.

3.1.10 Reconditioning of Surfaces

**************************************************************************
NOTE: On projects having site work provided by DIVISION 2, coordinate the requirements for reconditioning of surfaces with the appropriate section(s).
**************************************************************************

3.1.10.1 Restoration of Sod

Restore unpaved surfaces disturbed during the installation of anodes and wires to their original elevation and condition. Preserve sod and topsoil carefully and replace after the backfilling is completed. Where the surface is disturbed in a newly seeded area, re-seed the area with the same quality and formula of seed as that used in the original seeding.

3.1.10.2 Restoration of Pavement

Patch pavement, sidewalks, curbs and gutters where existing surfaces are removed for construction. Saw cut pavement edges. Graded aggregate base course shall have a maximum aggregate size of 35 mm 1 1/2 inches. Prime base course with [liquid asphalt, ASTM D2028/D2028M, Grade RC-70] [_____] prior to paving. Match base course thickness to existing but shall not be less than 150 mm 6 inches. Asphalt aggregate size shall be 12.7 mm 1/2 inch, asphalt cement shall [conform to ASTM D3381/D3381M, Grade AR-2000] [_____] and asphalt concrete thickness to existing but shall not be less than 50 mm 2 inches. Repair portland cement concrete pavement, sidewalks, curbs, and gutters using 20.67 MPa 3,000 psi concrete conforming to [ASTM C94/C94M] [Section 03 30 00 CAST-IN-PLACE CONCRETE]. Match existing pavement, sidewalk, curb, and gutter thicknesses.

3.2 FIELD QUALITY CONTROL

Field tests shall be witnessed by the Contracting Officer or his designated representative. Advise the Contracting Officer [5] [_____] days prior to performing each field test. Quality control for the cathodic protection system shall consist of the following:

a. Initial field testing by the contractor upon construction.

b. Government Field Testing after Contractor initial field test report submission.

c. Warranty period field testing by the Contractor.
d. Final field testing by the contractor after one year of service.

**************************************************************************
NOTE: Additional testing may be required, based upon the specific project or design. All tests listed below may not be required. Designer should consider the project requirements for selection of test procedures.
**************************************************************************

### 3.2.1 Testing

#### 3.2.1.1 Destructive Testing

Contractor shall perform the tests in the presence of the Contracting Officer. Contractor shall include the cost of an additional anode [of each different type] with the longest lead wire for the destructive test in his bid. One completed [prepackaged] anode of each type with lead wires shall be chosen at random for destructive testing and shall be submitted to a static pull test. Anode lead wire connections of anodes shall have sufficient strength to withstand a minimum tensile load of [1335] [_____] N [300] [_____] pounds. [The anode shall also be cut into sections and/or broken with a sledge hammer to verify conformance with this specification. Such items as anode-to-wire connection, complete encapsulation of the wire connector, and wire to anode electrical resistance shall be checked.] [Failure of the test anode to conform to this specification can be cause for rejecting all anodes from the same lot as the test anode. The contractor shall mark all rejected anodes on the ends with a 150 mm 6 inches high "X" using yellow spray paint. Failed anodes shall be removed from the job site by the end of the day. The contractor shall replace any rejected anodes at his expense. The destructive testing provision shall also apply to replacement anodes as well.]

#### 3.2.1.2 Wire for Power Service

Test wire for power service at 600 volts or less to determine that the wiring system and equipment are free from short circuits and grounds [by a minimum of two megohms]. Perform the test with a megohm meter having a 500-volt rating.

#### 3.2.1.3 Initial Cathodic Protection System Field Testing

The systems shall be tested and inspected by the Contractor's corrosion engineer in the presence of the Contracting Officer's corrosion protection engineer or an approved representative. Record test data, including date, time, and locations of testing and submit report to the Contracting Officer. Contractor shall correct, at his expense, all deficiencies in the materials and installation observed by these tests and inspections. Contractor shall pay for retests made necessary by the corrections. Testing shall include the following measurements:

- **a. Base potential tests:** At least [one week] [24 hours] [_____] after [backfilling of the pipe] [installation of the structure to be protected] [initial operation of structures containing fluids] [_____] , but before energizing of the cathodic protection system, measure the base (native) [structure-to-electrolyte] [pipe-to-soil] potentials of the [pipe and the casings] [structure]. Perform measurements at anode junction boxes, test stations and other locations suitable for test purposes (such as service risers or valves) at intervals not
exceeding [30] [122] [_____] meters [100] [400] [_____] feet with readings at each end point and the midpoint as a minimum. The locations of these measurements shall be identical to the locations specified for measuring energized [structure-to-electrolyte] potentials. Use the same measuring equipment that is specified for measuring protected potential measurements.

[For underground storage tanks, take a minimum of three measurements with the reference electrode located as follows:

(1) Directly over the longitudinal and transverse centerlines of the tank at intervals not exceeding the diameter of the tank and to a distance from the tank of two times the tank diameter.

(2) At points directly around the circumference of the tank.]

b. Permanent reference electrode calibration: Verify calibration of the reference electrode by measuring the potential difference between the permanent reference electrode and an independent (portable) calibrated reference electrode placed in the soil or water adjacent to or as close as practicable to the permanent reference electrode. [Potential differences between the two electrodes of the same generic type should not exceed [10] [15] millivolts.] [Zinc permanent reference electrodes should be within the range of minus 1000 to minus 1150 millivolts when calibrated with a copper-copper sulfate reference electrode.] Permanent reference electrodes not within these potential differences shall be removed from the construction site by the end of the day and replaced at the contractor's expense. The testing provision shall also apply to replacement reference electrodes as well.

c. Insulation joint testing: Perform insulation testing at each insulating joint or fitting [prior to burying the joint or fitting] before and after the cathodic protection system is energized. Before energizing, test using an insulation checker. After energizing, test the insulation by measuring the potential shift on both sides of the insulating joint. This testing shall demonstrate that no metallic contact or short circuit exists between the two insulated sections of the pipe. Report and repair defective insulating fitting at the Contractor's expense.

d. Electrical continuity testing: Perform electrical continuity testing for joint bonded pipe prior to backfilling of the pipe. [Circulate current through the pipe and compare the measured resistance to the theoretical resistance of the pipe and bond cables. The resistance measured shall not exceed 150 percent of the theoretical resistance.]

e. Rectifier system testing: Upon completion of the installation, "Baseline Potential Tests", "Insulation Joint Tests", and "Electrical Continuity Tests", energize and adjust each rectifier. Measure D.C. outputs of the rectifier and current outputs [of each anode] [of associated ground bed] at different rectifier settings. Measure the current outputs across the installed shunts. Verify these readings using portable, calibrated meters and shunts. This testing shall demonstrate if the rectifier system is capable of functioning properly as required to provide effective cathodic protection.

f. Pipe casing testing: Before final acceptance of the installation, test the electrical insulation of the carrier pipe from casings and correct any short circuits.
g. Energized potential tests: With the entire cathodic protection system put into operation for at least [one week] [24 hours] [______], measure pipe-to-soil potentials along the [pipeline [and at all casings]] [structure] using a portable [copper/copper sulfate] [silver silver-chloride] [and all permanent] reference electrode(s) and a voltmeter having an input impedance of not less than 10 megohms. The locations of these measurements shall be identical to the locations used for the base potential measurements.

h. Interference testing: Perform interference testing with respect to any crossing and nearby foreign pipelines in cooperation with the owner of the related pipelines. The testing shall verify that the subject cathodic protection system does not have a deleterious effect on the foreign pipelines, and vice versa. Prepare a full report of the tests, giving all details including remedial actions taken or recommendations to correct noted interference problems.

3.2.1.4 Initial Cathodic Protection System Field Test Report

The contractor shall submit a field test report of the cathodic protection system. All structure-to-electrolyte measurements, including initial potentials and anode outputs, shall be recorded on applicable forms. Identification of test locations, test station and anode test stations shall coordinate with the as-built drawings and be provided on system drawings included in the report. The contractor shall locate, correct, and report to the Contracting Officer any short circuits encountered during the checkout of the installed cathodic protection system.

**************************************************************************
NOTE: The requirements of paragraph entitled "Government Field Testing" are required for cathodic protection projects in the NAVFAC LANT area. The designer should verify their applicability to projects outside the NAVFAC LANT area with the appropriate EFD corrosion program manager.
**************************************************************************

3.2.1.5 Government Field Testing

The government corrosion [engineer, NAVFAC LANT Code 404] [program manager, NAVFAC LANT Code 1614C] shall review the Contractor's initial field testing report. Approximately four weeks after receipt of the Contractor's initial test report, the system will be tested and inspected in the Contractor's presence by the government corrosion [engineer, NAVFAC LANT Code 404] [program manager, NAVFAC LANT Code 1614C]. The Contractor shall correct, at his expense, materials and installations observed by these tests and inspections to not be in conformance with the plans and specifications. The Contractor shall pay for all retesting done by the government engineer made necessary by the correction of deficiencies.

**************************************************************************
NOTE: For cathodic protection projects in the NAVFAC LANT area, select the appropriate NAVFAC LANT6 options for paragraphs entitled "One Year Warranty Period Testing" and "Final Field Testing."
**************************************************************************
3.2.1.6 One Year Warranty Period Testing

The Contractor shall inspect, test, and adjust the cathodic protection system [quarterly] [semi-annually] [_____] for one year, [4] [2] [_____] interim inspections total, to ensure its continued conformance with the criteria outlined below. The performance period for these tests shall commence upon the completion of all cathodic protection work, including changes required to correct deficiencies identified during initial testing, and preliminary acceptance of the cathodic protection system by the Contracting Officer. Copies of the One Year Warranty Period Cathodic Protection System Field Test Report, including field data, and certified by the Contractor's corrosion engineer shall be submitted to the Contracting Officer, the activity, and the geographic Engineering Field Division corrosion [protection program manager] [engineer, NAVFAC LANT Code 404] [protection program manager, NAVFAC LANT Code 1614C].

3.2.1.7 Final Field Testing

Conduct final field testing of the cathodic protection system utilizing the same procedures specified under, "Initial Field Testing of the Galvanic Cathodic Protection Systems". The Contractor shall inspect, test, and adjust the cathodic protection system after one year of operation to ensure its continued conformance with the criteria outlined below. The performance period for these tests shall commence upon the completion of all cathodic protection work, including changes required to correct deficiencies identified during initial testing, and preliminary acceptance of the cathodic protection system by the Contracting Officer. Copies of the Final Cathodic Protection System Field Test Report, certified by the Contractor's corrosion engineer shall be submitted to the Contracting Officer and the geographic Engineering Field Division corrosion [protection program manager] [engineer, NAVFAC LANT Code 404] [protection program manager, NAVFAC LANT Code 1614C] for approval, and as an attachment to the operation and maintenance manual in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

3.2.2 Criteria for Cathodic Protection

Conduct in accordance with [NACE SP0169] [NACE SP0285]. Criteria for determining the adequacy of protection shall be selected by the corrosion engineer as applicable:

******************************************************************************
NOTE: The following criteria are applicable only to iron and steel structures. Refer to NACE SP0169 for appropriate criteria for other metal structures. Not all criteria may be readily applicable to the type of CP system(s) being designed, and the designer should select only the applicable criteria.
******************************************************************************

a. A negative voltage of at least 0.85 volt (850 millivolts) as measured between the structure surface and a saturated copper-copper sulfate reference electrode contacting the earth [electrolyte]. Determination of this voltage is to be made with the protective current applied to the [structure] [tank] [pipeline] for a minimum of [24] [_____] hours. Voltage drops must be considered for valid interpretation of this voltage measurement. The method of voltage drop consideration shall be identified by the Contractor's corrosion engineer and approved by the Government corrosion engineer.
b. A negative polarized potential of at least 0.85 volt (850 millivolts) as measured between the structure surface and a saturated copper-copper sulfate reference electrode contacting the earth [electrolyte]. Determination of this voltage is to be made after the protective current has been applied to the [structure] [tank] [pipeline] for a minimum of [24] [_____] hours.

c. A minimum polarization voltage shift of 100 mV measured between the structure surface and a saturated copper-copper sulfate reference electrode contacting the earth [electrolyte]. This voltage shift shall be determined by interrupting the protective current and measuring the polarization decay. At the instant the protective current is interrupted ("instant off"), an immediate voltage shift will occur. The voltage reading just after the immediate shift shall be used as the base reading from which to measure the polarization decay. The polarization decay shall be the difference between the base reading and a voltage measurement made [24] [48] [_____] hours after the interruption of protective current.

3.3 DEMONSTRATION

3.3.1 Instructing Government Personnel

**************************************************************************
** NOTE: There are restrictions on the type and extent of training. Training is usually on-site, 2 days or less. Factory representatives or others provide basic instructions to facility maintenance and operation personnel. If more extensive training is required, i.e. student travel, special consultants, etc., consult the Contract Division Director and the head of the Comptroller Department for assistance. **
**************************************************************************

During the warranty testing and at a time designated by the Contracting Officer, make available the services of a technician regularly employed or authorized by the manufacturer of the Cathodic Protection System for instructing Government personnel in the proper operation, maintenance, safety, and emergency procedures of the Cathodic Protection System. The period of instruction shall be not less than [one] [_____] but not more than [two] [_____] 8-hour working day[s]. Conduct the training at the jobsite or at another location mutually satisfactory to the Government and the Contractor. The field instructions shall cover all of the items contained in the operation and maintenance manual.

3.4 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of English unit measurements, and not on metric measurement commonly agreed to by the manufacturers or other parties. The English and metric units for the measurements shown are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for cathodic protection systems for lock miter gates. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com/).

**PART 1 GENERAL**

NOTE: Cathodic Protection should be installed on those portions of the gates submerged at normal pool levels. The faces of the gates should be protected to upper pool stages, except that the downstream face of the lower gates must be protected to the lower pool level.

This guide specification includes the technical requirements for the types of equipment normally provided in a cathodic protection system, and is based upon the premise that the system is designed by a qualified engineering firm hired by the Government to provide a complete cathodic protection system design, including detailed specifications.
(which contain performance criteria) and drawings which the successful Contractor can then use to construct the system. The engineering firm must provide the design services of a Corrosion Expert(s) to design, supervise, and inspect system installation and test, energize, and adjust the completed system installation. The Corrosion Expert is a person, who by reason of thorough knowledge of the physical sciences and the principles of engineering and mathematics, acquired by professional education and related practical experience, is qualified to engage in the practice of corrosion control of Lock & Dam Miter and Tainter Gates and other submerged metallic appurtenances. Such person(s) must be accredited or certified by NACE International (formerly the National Association of Corrosion Engineers) as a Corrosion or Cathodic Protection (CP) Specialist or be a register professional engineer who has certification or licensing that includes education and experience in corrosion control of Lock & Dam Miter and Tainter Gates and other submerged metallic appurtenances. The names and qualifications of the Corrosion Expert(s) must be certified and submitted in writing to the Contracting Officer prior to the start of the cathodic protection system design.

It is the intent of these guide specification to require the Contractor to design, furnish, install, test and place into service the complete cathodic protection system for the lock miter gates. The system is to consist of all equipment, wiring, and wiring devices necessary to produce a continuous flow of direct current from the anodes in the water electrolyte to the gate surfaces to adequately and efficiently protect the surfaces of the metal structures against corrosion where the surfaces are in contact with the water. The metallic surfaces of the gates need only be protected to upper pool stages, except that the downstream side of the lower gate shall be protected to lower pool level. This is in addition to the protective coating on the gates. The Contractor will provide, prior to system installation, detailed design calculations, bill of materials lists and drawings of the cathodic protection system. The drawings will detail the system installation including arrangement and locations of all anodes, terminal boxes, conduit routing and test facilities to be installed for corrosion control on the submerged surfaces of the gates. The Contractor furnished materials list, design calculations and drawings must be approved by the Contracting Officer prior to purchasing, delivering or installing any of the cathodic protection system. These specifications together with the approved materials list, design calculations and drawings provide the minimum requirements of this contract. The cathodic protection system will be furnished complete and in
operating condition as further defined later in this specification.

1.1 UNIT PRICES

Measurement and payment requirements will be specified for work subject to extreme variation in estimated quantity when unit price bidding is required.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

If the Contractor desires, for any reason, to deviate from or utilize publications other than those designated below, submit to the Contracting Officer, for review and approval, the requested deviation and/or the publication proposed for use. This submission shall clearly state the requested deviation and the reasons for it, including a complete comparison and cross-reference in sufficient detail to prove compliance to the applicable portions of the publications referred to herein and listed below.

1.3 SYSTEM DESCRIPTION

1.3.1 General Description

Furnish, install, test and place in service a complete cathodic protection system for the lock miter gates consisting of all equipment, wiring, and wiring devices necessary to produce a continuous flow of direct current from the anodes in the water electrolyte to the gate surfaces to, adequately and efficiently, protect the surfaces of the metal structures against corrosion where the surfaces are in contact with the water. The metallic surfaces of the gates need only be protected to upper pool stages, except that the downstream side of the lower gate shall be protected to lower pool level. This is in addition to the protective coating on the gates.

a. Provide, prior to system installation, detailed design calculations, bill of materials lists and drawings of the cathodic protection system. The detailed drawings shall show the system installation including arrangement and locations of all anodes, terminal boxes, conduit routing and test facilities to be installed for corrosion control on the submerged surfaces of the gates. Six copies each of detail drawings of the proposed cathodic protection system installation, proposed bill of materials, and Contractor design calculations within [30] [45] [90] [_____] days after receipt of notice to proceed, and before commencement of any work. The drawings shall provide dimensions and show anode arrangement for both elevated and sectional views of the gates, rectifier details and locations, terminal box details and locations, mounting details, wiring diagram, conduit layout locations, types and transitions and any other pertinent information considered necessary for the proper installation and performance of the system.

b. The Contractor's furnished materials list, design calculations and drawings shall be approved by the Contracting Officer prior to purchasing, delivering or installing any of the cathodic protection system. These specifications together with the approved materials list, design calculations and drawings shall provide the minimum requirements of this contract.

c. The cathodic protection system shall be furnished complete and in operating condition as further defined later in this specification.

1.3.2 Performance Requirements

Final test and adjust the system such that the cathodic protection system is providing corrosion control for the submerged surfaces of the lock miter gates in accordance with the following paragraphs taken from Section 6 of NACE SP0169.

1.3.2.1 First Criterion

A negative (cathodic) voltage of at least a minus 850 millivolts "instant-off" potential, as measured with respect to a calibrated, saturated copper-copper sulfate reference electrode (CSE) over 90 percent of each gate leaf face, and at least minus 800 millivolts "instant-off" at all other locations. These requirements do not necessarily include those areas within 0.61 m 2 ft of the sill, quoin and miter of each gate (refer to Paragraph 1.3.3.2 of NACE SP0169). The above criteria shall be achieved without the "instant-off" potential exceeding minus 1100 millivolts at any
location. Determination of this voltage shall be made with the cathodic protection system in operation. Correction shall be made for IR drop using "instant-off" potential measurements (all operating cathodic protection systems shall be simultaneously interrupted). If digital meters are used to obtain these measurements, the second reading displayed on the digital voltmeter after interruption of the rectifier current shall be interpreted as the "instant-off" reading.

1.3.2.2 Second Criterion

A second criterion may be used for those gate submerged surfaces within 0.61 m 2 ft of each gate sill, quoin, and miter to ensure that the operating conditions are providing cathodic protection. This criterion is a minimum cathodic polarization voltage decay of 100 millivolts provided that a potential of at least minus 750 millivolts "instant-off" potential as measured with respect to a calibrated, saturated copper-copper sulfate reference electrode (CSE) is also obtained. Polarization shift measurements shall be made within 0.305 m 1 ft of the sill plate at the quoin, at 0.61 m 2 ft intervals along the gate bottom, and at the miter on each gate leaf face. This criterion cannot be used until the criterion in paragraph 1.3.3.1 of NACE SP0169 for the remaining gate submerged surfaces have been maintained for a minimum 1-week period. This allows time for the cathodic protection system to polarize the gate metal. The "instant-off" potential shall be measured between the structure surface and a saturated copper-copper sulfate reference cell immersed in the electrolyte directly adjacent to the structure. Interrupting the protective current and measuring the polarization decay thereafter shall determine this polarization voltage shift. When the protective current is initially interrupted, an immediate voltage shift will occur. The second voltage reading observed after the immediate voltage shift shall be recorded and used as the base reading from which to measure polarization decay. Readings shall then be taken each 10 minutes thereafter and the voltage readings and time intervals recorded. The total time for achieving this decay shall be 4 hours or less.

1.3.3 Contractor Quality Control

1.3.3.1 General

Establish and maintain quality control for all operations to assure compliance with contract requirements and maintain records of this quality control for all construction operations, including, but not limited to, the following:

a. Design
b. Materials
c. Assembly and workmanship
d. Installation
e. Testing

1.3.3.2 Reporting

The original and two copies of these records and tests, as well as corrective action taken, shall be furnished [daily] [_____] to the Contracting Officer.

1.3.4 Modification of Design

No modifications of the design of the cathodic protection system as
specified and shown on the Contractor's approved drawings shall be made except with the express written approval of the Contracting Officer. Submit all Contractor identified discrepancies in the design or any change proposals with sufficient details for complete evaluation by the Contracting Officer. The minimum design requirements specified herein shall be met. All such proposed modifications shall be fully described and submitted to the Contracting Officer for approval. The Contractor is responsible for the satisfactory performance of the furnished complete systems. Modifications or changes proposed shall be identified as a "MODIFICATION" or "CHANGE" and shall be submitted to the Contracting Officer for approval within 15 days after the need for such modification or change is determined.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G"
designates the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detailed Drawings; G[, [______]]

SD-03 Product Data

Materials and Equipment; G[, [______]]
Training Course; G[, [______]]

Factory Test Data
System Commissioning; G[, [______]]

SD-07 Certificates

Qualifications; G[, [______]]

SD-10 Operation and Maintenance Data

Operation and Maintenance Instructions; G[, [______]]

1.5 QUALITY ASSURANCE

1.5.1 Qualifications

The cathodic protection system installation, including all testing, energizing and placing of system in service, shall be performed by an organization that has had a minimum of 5 years' experience in this type of work. The Corrosion Expert whose credentials meet or exceed those provided for below shall supervise the installation and testing of this system. Submit certified Corrosion Expert(s) qualifications for all personnel who may be used to fulfill this position on the project. Installation of the cathodic protection system will also be witnessed by the Contracting Officer. Provide certified information with their submittals evidencing their compliance with this organization experience requirement.

1.5.2 Contractor's Responsibilities

Provide the services of a Corrosion Expert to design, supervise installation, test and final adjust the miter gate cathodic protection system for operation in accordance with these specifications. Inspect all work associated with the system installation, certify all work prior to system energization and be present and participate in all system testing and final adjusting.

1.5.3 Corrosion Expert

"Corrosion expert," as used in this specification, is a person, who, by reason of thorough knowledge of the physical sciences and the principles of engineering and mathematics, acquired by professional education and related
practical experience, is qualified to engage in the practice of corrosion control of submerged metal structures. Such a person shall be accredited or certified by the National Association of Corrosion Engineers (NACE) as a NACE Accredited Corrosion Specialist or a NACE certified Cathodic Protection (CP) Specialist or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control submerged metallic structures, if such certification or licensing includes 5 years' experience in corrosion control on metallic structures of the type under this contract.

1.5.4 Pre-Installation Meeting

A pre-installation meeting shall be conducted at the project site office which shall be attended by the Contractor's project superintendent and corrosion expert. This meeting shall be held after all pre-construction submittals have been made and approved by the Contracting Officer prior to the start of any work on this project. The meeting shall include discussions of Safety, Communication and Work Plans, as well as any other issues which may have risen as a result of the submittal review.

1.6 DELIVERY, STORAGE, AND HANDLING

The Contracting Officer will arrange to provide an unsecured area onsite for the Contractor to store the system materials and installation equipment. The area's size will be limited to approximately [_____] square meters square feet. Provide storage means to secure the equipment against loss due to theft and/or weather, fire or floods.

1.7 PROJECT/SITE CONDITIONS

Coordinate and properly relate the work to the site and to all trades. The location and dimensions of the gate structures to receive protection are available from the Contracting Officer. The cathodic protection system design is based on a water resistivity of [____], a total area, in square meters feet, of [____], a minimum coating efficiency of 50 percent, a minimum current density requirement for effective cathodic protection of [_____] amperes/bare square meter foot of submerged steel and a 20-year life expectancy.

1.8 WARRANTY

The materials, equipment, and workmanship furnished under this section of the specifications shall be guaranteed for a period of 1 year from the date of acceptance. Prior to expiration of the warranty period, the Government will conduct a System voltage and current output test of the cathodic protection system including each anode output installed on the lock gate structure as well as detailed "On" and "Instant-Off" structure to electrolyte potential measurements to determine if the system and equipment are performing in accordance with the plans and specifications and that no significant deterioration of the system or components therein has occurred during the first year of operation. Acknowledge responsibility under these guarantee provisions by letter, stating that the equipment, materials, and workmanship referred to herein are guaranteed to continue to perform as installed and to continue to provide effective corrosion control in accordance with the criteria elsewhere in these specifications and specifically indicating the inclusive dates of the guarantee period starting at the date of final acceptance of the correctly working system approved by the government and for a period of 1 year thereafter.
1.9  SYSTEM COMMISSIONING

1.9.1  General

The Contractor's Corrosion Expert shall perform the following system energizing and commissioning tests. Perform all energizing and commissioning tests in the presence of the Project Corrosion Engineer, recorded and submitted to the Contracting Officer within [_____] days following completion of the test. Submit all installation and energization measurements and test data in tabulated form. Notify the Contracting Officer 30 days in advance of the date of the test so that a representative can be present. All instruments used in conducting the tests shall have been calibrated by an accredited testing laboratory within 1 year prior to the test. Certification shall be provided to the Contracting Officer for approval.

1.9.2  Insulation Testing

After installation of the button anode on the gate, but prior to connection to the rectifier and submergence, an insulation test shall be made to demonstrate that no metallic contact or short circuit exists between the anode and the structure. These tests shall be made using a Megger apparatus or other device specifically designed for this purpose. Any insulation found to be shorted shall be replaced. Each button anode shall have a minimum resistance of 500,000 ohms isolation from the gate. If the button anode fails to indicate 500,000 ohms isolation, make the necessary corrections and/or modifications to the anode installation to achieve the minimum reading.

1.10  EXTRA MATERIALS

a. Furnish spare rod, sausage and button-type anodes (the type used in the original installation) to the Contracting Officer with a minimum of five of each type installation component required for the original installation of the sausage and button anodes. Sufficient neoprene gaskets, mounting hardware, and epoxy cement shall be furnished for installation of the silicon button anodes. Supply a minimum of two of each type of anode rod or string assemblies each for the upstream and downstream gates (anode assembly complete with factory attached 30.48 m 100 ft anode lead cable and a minimum of five disk or button anodes with 30.48 m 100 ft of factory attached cable). Cement, epoxy, polychloroprene gaskets, etc. and any other material needed for installation shall be supplied in sufficient quantity to install these spare components.

b. Furnish a complete set of special tools, provided in a steel or plastic toolbox, for use in installing all types of anodes used in the installation. Tools used in making the original installation, provided they are in good working condition, will be acceptable. One tool shall be a torque wrench device capable of 275.79 kPa 40 psi.

PART 2   PRODUCTS

2.1  MATERIALS AND EQUIPMENT

All cathodic protection system materials and equipment furnished shall be designed for a minimum 20-year service life when operating at the system maximum rated output. The components to be used shall be based on the Contractor's Cathodic Protection System Specialist's design which shall be
a. Water resistivity as measured on site.

b. Complete system design calculations which, as a minimum, shall be as provided in Appendix "K" of CERL Tech Rep FM-95/05 including calculations for total current required for each gate side, each anode circuit resistance, rectifier current and voltage output requirements and life of each anode type and location within the system.

c. Complete list of materials for all cathodic protection system components including all replaceable components in the rectifier units, terminal boxes and anodes materials with mounting equipment including part numbers and source name, address and phone number for each component.

d. Conductor types and sizes including copper grade, number of strands, insulation, and resistance for each wire type and size to be used.

e. Anodes, layout of anodes, and detailed description of anode installation procedure.

f. Layout of rectifiers and anode terminal boxes, rectifier and terminal box details including method of control including wiring diagram and schematic, output measurement means, cabinet materials and construction, ammeters and voltmeters, shunt resistors, variable resistors, and AC & DC lightning and surge protection.

g. All connections, supports, and seals for conductors, conduit, and plastic and steel protector pipes, pipe caps, angle iron, [____].

h. All watertight connections and connection protection means.

i. Resistor and anode terminal cabinet details and mounting locations. Identified connections and conductors in the terminal cabinet shall be shown on a drawing.

j. Certified experience and qualification data of installing firm, as specified in paragraph QUALIFICATIONS.

2.1.1 Direct Current Cables

**************************************************************************
NOTE: Low-density, high-molecular-weight, polyethylene (HMPE) insulation conforming to ASTM D1248, Type I, Class C, Grade 5, Grades E-5 and J-1, should be specified for all exposed cable or cable to be installed in conjunction with rod or string anode protective conduit. High-density polyethylene is not recommended because it is subject to stress cracking. Polyvinyl chloride (PVC) insulation is not recommended because it is a relatively soft and easily damaged insulation and does not have the
required tight fit on the wire, which can provide a path for moisture ingress and corrosion attack on the wire

2.1.1.1 Anode Lead Cables

Direct current cable from the terminal cabinet to each anode disk, ribbon, button or rod assembly shall consist of 7-strand No. 8 AWG stranded copper wire with type CP high molecular weight polyethylene insulation (HMPE), 2.78 mm 7/64 inch thick, 600-volt rating, in accordance with ASTM D1248, Type I, Class C, Grades E-5 and J-1. Each anode lead shall be continuous without splices from its point of connection in the terminal cabinet to the anode disk, ribbon, button, or rod assembly. The cable-to-anode connection shall be assembled by the manufacturer and the area shall be sealed with a waterproof epoxy. Cable-to-anode contact resistance shall be 0.003 ohm maximum. HSCI string anode assemblies (assembled in link sausage manner to the anode cable lead) shall also be assembled by the manufacturer. The conductor for the HSCI sausage strings only shall be 7-strand, No. 4 AWG copper wire with CP high molecular weight polyethylene insulation (HMPE), 2.78 mm 7/64 inch thick, 600-volt rating, in accordance with ASTM D1248, Type I, Class C, Grades E-5 and J-1, and shall not be cut or spliced within the anode or assembly and shall be routed without splicing to the anode terminal box. The cable HMPE insulation does not adhere well to some epoxies and shall be roughed in the sealant area prior to application of the sealant to the anode connections. Anode leads, terminal board connections, and corresponding jumpers on the front of the terminal board shall be marked with the anode number, as specified.

2.1.1.2 Rectifier and Terminal Cabinets Connection Cables

Conductors shall be soft drawn copper and shall have the number of conductors as shown on the drawings. Cables connecting the terminal cabinet to the lock wall outlet and cables between the lock wall outlet and the rectifier dc terminals shall be No. 10 AWG insulated copper wire, and have a neoprene jacket. Cables between the resistor and anode terminal cabinets on each gate shall consist of 7-strand No. 8 AWG stranded copper wire with type CP HMPE, 2.78 mm 7/64 inch thick, 600-volt rating, in accordance with ASTM D1248, Type I, Class C, Grades E-5 and J-1. One conductor shall be included for each dc plus (+) circuit and one conductor for each negative (-) connection. Each cable shall be continuous without splices from its point of connection in one terminal cabinet to its point of connection in the other terminal cabinet.

2.1.2 Cable in Conduit

Cathodic protection cables shall consist of soft drawn copper conductors with Class B stranding and a [low-density, high-molecular-weight black polyethylene] [RHW-USE Style RR Hypalon] covering serving as both insulation and jacket. Cables shall meet or exceed the requirements specified above. Flexible cable connections between the ac power outlet on the lock wall and the ac input terminals of the rectifier shall be made with No. 10 AWG copper conductors in flexible portable power cables, UL type SO.
2.2 RECTIFIERS AND AUXILIARY EQUIPMENT

2.2.1 General

Provide a rectifier unit for [each upstream and downstream face of each gate leaf] [each of the four gate leaves of the lock]. The cathodic protection system power circuit shall consist of a step-down transformer with secondary taps for output adjustment, primary circuit breaker, rectifier transformer, rectifier, secondary fuses, and rectifier terminal panel. The rectifier units shall be located [in the control houses] [outside at the specified locations]. They shall be designed [for removal during periods when flood waters overtop the lock wall] [to be free-standing].

2.2.2 Cabinets

**************************************************************************

NOTE: Air-cooled rectifiers are used for most applications. Oil immersion cooled units are normally used in highly corrosion atmospheres.

The rectifier cabinet may be located in the control house to avoid problems caused by moisture, insects, dust, vandalism, etc., when these are a factor. When outside placement of the rectifier is indicated, the rectifier must be securely mounted or fastened to the structure (see Alternate 2 below). When high-water flooding is likely, the rectifier should be mounted on wheels for easy removal (see Alternate 1 below). It is left to the designer to provide detailed drawings for either type rectifier installation. Adequate drainage must be provided in all terminal cabinets since flooding will in most cases cause sand and water to accumulate in the terminal cabinet. Eventually, this will cause the appearance that anodes are failing when, in fact, contacts in the terminal cabinets, or rectifier contacts, are causing failure and outages to the cathodic protection systems. Alternatively, watertight sealed terminal cabinets can be used.

The rectifier cabinet referenced in these documents is for the air-cooled type transformer and rectifier unit. If the designer selects the oil-immersed type unit, then the specifications will have to be revised accordingly.

**************************************************************************

The rectifier cabinet shall house the rectifier transformer, rectifier stacks, circuit breaker, terminals, and the control and instrument panel. In installations requiring the use of a step-down transformer, the cabinet shall be designed such that the rectifier equipment specified above can be installed in the lower section of the cabinet with the step-down transformer in the upper portion. Cabinets shall be [convection air cooled] [oil immersed cooled] constructed of 1.894 mm 14-gauge minimum sheet stainless steel, ASTM grade 304. The cabinets shall be designed for use outdoors; NEMA 250, enclosure 3R, and appropriate structural shapes shall be used in the construction of the cabinet to provide rigidity and to prevent bending or flexing of the cabinet while being transported. Louvers for air-cooled units shall be provided in the hinged doors and on the sides.
of the cabinets for ventilation. All ventilation openings shall be covered with ASTM grade 304 stainless steel insect screen arranged so as to be easily replaceable. All doors shall be hinged using post hinges designed to allow easy removal of all doors for unit servicing and shall be provided with a hasp and lock for padlocking. Locks used shall be keyed alike such that all cabinets can be opened with one key. Furnish the keys and turn them over to the Contracting Officer.

2.2.3 Wheeled Rectifier Cabinets (Alternate 1)

The rectifier cabinet shall be mounted on wheels and provided with handles for moving during floods. The wheels, axles, and bearings shall have sufficient capacity to support a weight of at least three times the weight of the complete rectifier. Studs for the clamps to be used for securing the rectifier to the pipe rail, as shown on the drawings, shall be welded to a reinforced back section of the cabinet at the factory before finishing. All components shall be ASTM grade 304 SS or equal.

2.2.4 Stationary Cabinets (Alternate 2)

The rectifier cabinet shall be mounted on structures as shown on the drawings. Welding of ASTM grade 304 SS or equal clamps, brackets, or cabinet-back reinforcement, shall be accomplished at the factory before finishing.

2.2.5 Circuit Breakers

A 120/240-volt, [10] [_____] ampere-interrupting-capacity, double-pole, molded-case circuit breaker conforming to UL 489 shall be installed in the primary circuit of the rectifier transformer and shall disconnect both conductors. The breaker shall be provided with instantaneous and inverse time trips. [10] [_____] ampere cartridge-type fuses conforming to NEMA FU 1 with suitable fuse holders shall be provided in each leg of the dc circuit.

2.2.6 Step-down Transformers

Step-down transformers shall be of the two-winding, insulating dry type conforming to NEMA ST 20 and shall be rated for 480-120/240 volts, single-phase, 60-Hertz. Transformers shall be provided with 2 to 5 percent full capacity primary taps below rated voltage. Transformers shall be rated for not less than a temperature rise of 80 degrees C 176 degrees F above a 40 degrees C 104 degrees F ambient and shall be provided with Class B or H insulation.

2.2.7 Rectifier Transformers

The rectifier transformer shall be two-winding, [convection air-cooled] [oil immersed cooled], with a primary operating voltage of 120/240 volts, single phase, and shall conform to the requirements of NEMA ST 1. The transformer secondary shall be provided with five "coarse" and five "fine" taps on each dc circuit, to permit variations of the dc output voltage in 25 uniform increments of the rated output voltage, from zero to a maximum rated voltage of [_____] volts. Voltage steps shall be adjustable by rotating solid brass tap bars. Each control shall be identified by suitable permanent, engraved marking such as "coarse" or "fine" and shall have an arrow to indicate the type and direction of adjustment. Individual steps of adjustment shall be marked with numbers in consecutive order for fine control and with letters in alphabetical order for coarse control.
All primary alternating current terminals shall be mounted behind the panel. The coils of all transformers manufactured for cathodic protection use shall be dipped in preheated varnish and baked dry for maximum moisture and corrosion resistance.

2.2.8 Rectifiers

**************************************************************************
NOTE: Silicon rectifier stacks are usually recommended for the rectifier and these specifications reflect their use; however, the designer has the option to select either selenium or silicon stacks. When the specification writer selects selenium, the specifications should be revised accordingly. The advantages and disadvantages for the two types of rectifier stacks are as follows:

Silicon stacks (diodes): These stacks are more economical in higher voltage output circuits and in higher current circuits.

Advantages:

a. Cost-effective in high current ratings.
b. More efficient in higher voltage ratings.
c. Replacement cells are easily stocked.
d. Higher efficiency

Disadvantages:

a. Must be surge protected with selenium.
b. Cannot withstand extreme surges.

Selenium stacks (cells): These stacks may be more economical in lower voltage output circuits where current requirements are lower.

Advantages:

a. Can withstand surges caused by lightning much better than silicon without additional protecting devices.
b. Are cost-effective in lower voltage and lower current ratings.
c. Can withstand severe short-term overloads

Disadvantages:

a. Expensive in high voltage and high current ratings.
b. Cannot be easily replaced
c. May be difficult to obtain.
d. Replacement stacks can be expensive to stock.
e. Relatively low efficiency

Recent studies by the US Army Corps of Engineers indicate that remote monitor of these systems can greatly improve the reliability of effective monitor
and maintenance of these systems and eliminate the need for meters in the units:

The designer should investigate the cost, reliability and availability of these remote monitoring systems.

******************************************************************************

Rectifier stacks shall be [air-cooled] [oil-immersed] units, consisting of silicon stacks to provide full-wave, bridge-type rectification, within the manufacturer's ratings. The rectifier shall be suitable for operation over an ambient temperature range of -18 to 49 degrees C 0 to 120 degrees F. Output ratings shall be as designed by the Corrosion Expert and shall be for continuous duty operation.

2.2.9 Ammeter and Voltmeter

A dc ammeter and voltmeter of the semi flush, 89 mm 3-1/2 inch round or rectangular panel board type, conforming to the applicable requirements of ANSI C39.1, shall be provided in each dc circuit, or as otherwise indicated on the drawings. Instruments shall be of the sealed, taught band type have a guaranteed accuracy of 1 percent of full-scale deflection, zero adjustment, and a minimum scale length of 61 mm 2.4 inch. Full load reading shall be indicated by means of a red mark on the meter scale and shall incorporate at least 80 percent of the meter scale length. Each meter shall be provided with a momentary contact switch, either integral with the meter or separately mounted, for momentary reading. A single meter having dual scales may be furnished in lieu of separate meters, provided that the scales are distinct and easily read, and that a switch is provided to select the desired function and to prevent simultaneously energizing more than one function.

2.2.10 Current Monitoring Shunt

A separate current monitoring shunt resistor shall be provided on the rectifier unit face plate to facilitate using an external digital milli-voltmeter to confirm the current output displayed by the unit ammeter. This shunt resistor shall have a calibrated accuracy of plus or minus 1 percent and shall have a 1 ampere/millivolt drop rating.
2.2.11 Ammeter and Voltmeter Switches

The switches used for switching the meters in and out of the dc circuit shall be lever action sealed toggle, quick make-or-break type switches. The switches shall be [single-pole] [double-throw] [double-pole] and shall be wired so that do not interrupt the output circuit.

2.2.12 Control and Instrument Panel

The control and instrument panel shall be of the dead-front type and shall be installed in the rectifier cabinet. Primary connection shall be made by means of a panel-mounted terminal block with screw connection protected by a removable metal or molded plastic cover. Incoming power lines shall be terminated in such a manner as to prevent accidental contact by personnel using the rectifier.

2.2.12.1 Tap Bars

Tap bars serving the rectifier transformer secondary adjustment shall be permanently identified by means of engraving on the non-metallic control panel face plate denoted "coarse" and "fine" and shall have the individual tap positions identified by letters, "A," "B," "C," etc., and numerals, "1," "2," "3," etc., respectively.

2.2.12.2 DC Output Terminals

Rectifier dc output terminals shall be identified by means of engraving on the non-metallic control panel face plate indicating polarity of the terminal and point of connection to the system, i.e., "+ANODES" and "-STRUCTURE."

2.2.12.3 Components Identification

All other components on the rectifier panel face plate shall be identified by means of engraving on the non-metallic control panel face plate.

2.2.13 Anode Cable Leads

Anode cable leads shall be identified at the resistor and anode terminal cabinet by means of plastic sleeves or tags showing the anode lead number as indicated on the drawings. They shall be of sufficient length so that splicing between the anode and the anode terminal box is not necessary. No splices of the anode lead wires will be permitted between the anode and the anode terminal box.

2.2.14 Surge Arresters

MOV surge arresters shall be provided for all AC & DC power circuits. In addition, for AC voltages above 120-volt, a single pole valve-type surge arrester shall be used for each input line. It shall be located ahead of the ac breaker feeding the rectifier transformer. Surge arresters shall be rated for continuous load currents up to [10] [_____] amps minimum and shall limit the voltage to 200 volts peak. The response clamping activation time shall be 5 nanoseconds maximum.

2.2.15 Wiring Diagram

A complete wiring diagram of the rectifier unit showing both the ac supply
and the dc outputs to the resistor and anode terminal cabinets shall be encased in clear rigid plastic and mounted on the inside of the rectifier cabinet door. All components shall be shown and labeled.

2.2.16 Resistor and Anode Terminal Cabinet Wiring Diagram

A complete wiring diagram showing the anode numbers in the terminal cabinets and a complete wiring diagram of the entire cathodic protection system shall be provided. Each conductor and each termination shall be identified.

2.3 CONDUIT AND FITTINGS

2.3.1 Nonmetallic Conduit

Nonmetallic conduit shall be type 80, extra heavy-wall, PVC, rigid-plastic conduit. Conduit shall conform to the requirements of NEMA TC 2. PVC conduit utilized as rod or string anode protective pipe is the only PVC conduit allowed by these specifications. The Contractor's designer shall design the plastic pipe such that its inside diameter (I.D.) is at least 51 mm greater than the anode outside diameter (O.D.). The Pipe shall be perforated on the side opposite the angle iron protective channel except for the area within 51 mm of the pipe couplings at each girder web which shall not be perforated. The total open area provided by these perforations shall be at least equal to the surface area of the anode material contained within the PVC pipe.

2.3.2 Rigid Metal Conduit

Rigid metal conduit shall conform to the requirements of ANSI C80.1, and shall be of the size indicated on the drawings. The conduit shall be galvanized both inside and outside using the hot-dip method.

2.3.3 Conduit Fittings and Outlets

Conduit fittings and outlets for rigid metal conduit shall conform to the requirements of NEMA FB 1.

2.4 RESISTOR AND ANODE TERMINAL CABINETS

Terminal cabinets shall be provided for each rectifier output circuit. Cabinets shall be NEMA type 4X, weather-resistant construction. Cabinets shall be constructed of ASTM grade 304 stainless steel. Cabinets shall be of ample size to accommodate all anode and power input lead wires and standard brass or copper heavy duty screw terminals to facilitate individual connection of each anode assembly lead wire through a 0.01 ohm type RS shunt resistor to a common copper bus bar. All terminals, bus bars, shunts, and other DC conducting components shall be mounted to an extra strong, non-metallic panel. All conductors shall be identified in the cabinet by means of plastic or metal tags or plastic sleeves to indicate the anode number. Each terminal shall be identified with permanent engraved identification of the anode number, or other corresponding conductor numbers, or function. Cabinets shall be securely mounted on the top of the corresponding gate in the manner proposed by the Contractor and approved by the Contracting Officer. A removable, hinged front door facing a direction after installation that is easily accessible shall be provided.
2.5 IMPRESSED CURRENT ANODES AND MATERIALS

2.5.1 General Requirements

For details on various types of anodes, anode designs and typical anode configurations for preparation of project drawings, the Corrosion Expert designing the system shall refer to CERL Tech Rep FM-95/05.

2.5.2 Ceramic Precious Metal Oxide Coated Anodes

Ceramic Precious Metal Oxide Coated Anodes shall conform to the following requirements:

2.5.2.1 Conductive Precious Metal Oxide Ceramic Coating

The electrically conductive ceramic coating shall contain a mixture consisting primarily of iridium, tantalum, and titanium oxides. Although the exact composition of the conducting layer can vary, the average composition shall generally be a 50/50 atomic percent mixture of iridium and titanium oxides with small amounts of tantalum. The coating resistivity shall be certified by the manufacturer to have an electrical resistivity of less than 0.002 ohm-centimeters, a bond strength to the substrate metal greater than 50 MPa, and a current capacity of 100 DC amperes per square meter of anode surface area when operated in an oxygen-generating electrolyte at 65.5 degrees C 150 degrees F for 20 years.

2.5.2.2 Anode Substrate Material

The anode substrate shall be fabricated from high purity alloy titanium.

2.5.3 Hi-Silicon Cast-Iron Anodes

Hi-Silicon Cast-Iron Anodes shall conform to the following requirements:

2.5.3.1 Chemical Composition (Nominal)

2.5.4 Ceramic Coated Titanium Anodes (Disk Type)

2.5.4.1 General

Ceramic coated titanium disk anodes shall be conductive ceramic coated titanium disks similar to that shown in Figure 2, "Typical Ceramic Coated Flat Disk Anode" of CERL Tech Rep FM-95/05, November, 1994. Anodes shall conform to the requirements in Section 2.6.1 and shall be suitable for cathodic protection use, shall be highly resistant to corrosion, and shall have good electrical properties. Anodes disk shall be at least 127 mm 5 inch diameter factory mounted in a 305 mm 12 inch diameter FRP reinforced Polyurethane protective shield to prevent shorting of the anode to the skin plate and over voltage damage to the adjacent coating. It shall be provided with a integral titanium mounting rod with gold plated connector socket. Each disk anode shall be provided with a gold plated connector plug and PVC cable connector that shall be assembled by the manufacturer. Submit certified Factory Test Data on anode connections showing anode-to-contact resistance. This test data shall provide a measured resistance of less than 0.003 ohm (or the connection shall be redone). Provide a certified report on these factory tests within two weeks after fabrication by the manufacturer.

2.5.4.2 Impact Protection for Disk Anode Cables

A 152.4 mm 6 inch diameter by 203.2 mm 8 inch long steel schedule-40 pipe with threaded pipe cap shall be welded to the gate in back of each disk anode. A hole shall be drilled in the side of this pipe and a thread-o-let fitting shall be welded to the 152.4 mm 6 inch diameter pipe at this point to receive the anode lead wire and conduit routed to the anode terminal box at the top of the gate leaf. The pipe and conduit are provided for impact protection of the anode cables and the anode bolt. The pipes shall be galvanized and painted with 0.1778 mm 7 mil of paint.

2.5.4.3 Number of Ceramic Coated Titanium Disk Anodes

The actual number of ceramic coated titanium disk anodes shall be in accordance with the corrosion engineer's approved design calculations based on the system circuit resistance, current requirements ,current
distribution and anode life, in accordance with EM 1110-2-2704 and Appendix "A" in CERL Tech Rep FM-95/05, "Detailed Cathodic Protection Design Procedures for Pike Island Auxiliary Lock" as long as the minimum number of button anodes provided shall equal or exceed one each for every \textbf{18.58 square meters 200 square feet} of submerged steel surface area (for some typical anode configurations, refer to Figures 4, 5, 6, 7, C3, and F2 in CERL Tech Rep FM-95/05). The minimum number of anodes and an indication of their mounting locations should be shown in the design drawings.

2.5.5 Hi-Silicon Cast Iron Button Anodes

2.5.5.1 General

Anodes shall be high-silicon cast iron conforming to ASTM A518/A518M.

2.5.5.2 High-Silicon, Cast-Iron Anodes (Button Type)

High-silicon, cast-iron "button-type" anodes shall be an alloy of silicon, carbon, manganese, and iron. Anodes shall be similar in all respect to the Button anode design shown in Figure 1, "HSCBCI "Sausage" and "Button" Anode Designs of CERL Tech Rep FM-95/05. Anodes shall conform to the requirements in paragraph IMPACT PROTECTION FOR RODS AND SAUSAGE-STRING ANODES and shall be suitable for cathodic protection use, shall be highly resistant to corrosion, and shall have good electrical properties. Anodes button castings shall have a nominal weight of \textbf{8.16 kg 18 lb} and shall be \textbf{152.4 mm 6 inch} diameter by \textbf{76.2 mm 3 inch} deep and shall be provided with a \textbf{19.05 mm 3/4 inch} diameter by \textbf{50.8 mm 2 inch} deep conical terminal connection cavity in the back of the anode and \textbf{25.4 by 50.8 mm 1 by 2 inch} stepped mounting hole provision through the center of the anode as shown in above referenced Figure 1. A polychloroprene or neoprene gasket material to be installed behind the button anode shall be not less than \textbf{3.175 mm 1/8 inch} thick by \textbf{203.2 mm 8 inch} diameter. The gasket adhesive shall be 100 percent silicone waterproof caulking material similar to GE 100 percent Silicone Caulk suitable for continuous immersion service. Plastic seal plugs shall be molded or fabricated from an approved polystyrene. The flanged sleeve shall be fabricated from nascent oxygen and chlorine resistant rigid plastic material. Button anodes and cable shall be assembled by the manufacturer.

2.5.5.3 Anodes Number

The actual number high-silicon, cast-iron "button-type" anodes shall be in accordance with the corrosion engineer's approved design calculations based on the system circuit resistance, current requirements, current distribution and anode life, in accordance with EM 1110-2-2704 and Appendix "A" in CERL Tech Rep FM-95/05, "Detailed Cathodic Protection Design Procedures for Pike Island Auxiliary Lock" as long as the minimum number of button anodes provided shall equal or exceed one each for every \textbf{18.58 square meters 200 square feet} of submerged steel surface area (for some typical anode configurations, refer to Figures 4, 5, 6, 7, C3, and F2 in CERL Tech Rep FM-95/05). The minimum number of anodes and an indication of their mounting locations should be shown in the design drawings.

2.5.5.4 Assembly

The manufacturer shall be responsible for assembling the conductor to the anode after the conductor has been tinned. Connections shall be made with caulked tellurium lead, and then sealed with epoxy around the connection. All tinned wire shall be completely covered by lead. Reference Figure 1,
"HSCBCI "Sausage" and "Button" Anode Designs of CERL Tech Rep FM-95/05 for mounting component details.

2.5.5.5 Impact Protection for Button Anode Cables

**************************************************************************
NOTE: In areas with the problem of floating ice and/or driftwood, consideration should be given to the use of the more flexible ceramic coated titanium rod installed in PVC schedule 80 pipes with holes drilled in the pipe. These anodes should be used on the compartment side of the gate leaf, which is usually downstream. Alternatively, in areas subject to substantial floating ice and/or excessive driftwood, either Ceramic Coated Disk Anodes or High Silicon, Cast-Iron Button anodes may be used exclusively on both sides of the gate although this is usually a more expensive option.
**************************************************************************

A 152.4 mm 6 inch diameter by 203.2 8 inch long steel schedule-40 pipe with threaded pipe cap shall be welded to the gate in back of each button anode. A hole shall be drilled in the side of this pipe and a thread-o-let fitting shall be welded to the 152.4 mm 6 inch diameter pipe at this point to receive the anode lead wire and conduit routed to the anode terminal box at the top of the gate leaf. The pipe and conduit are provided for impact protection of the anode cables and the anode bolt. The pipes shall be galvanized and painted with 0.1778 mm 7 mil of paint.

2.5.6 Ceramic Coated Titanium Segmented Rod Anodes

a. Ceramic coated titanium segmented rod anodes shall be conductive ceramic coated titanium rods similar to that shown in Figure 3, "Typical Ceramic Coated Flat Disk Anode" of CERL Tech Rep FM-95/05. Anodes shall conform to the requirements in Section 2.6.1 and shall be suitable for cathodic protection use, shall be highly resistant to corrosion, and shall have good electrical properties. Each anode rod shall be solid titanium and at least 3.175 mm 1/8 inch diameter by 1.2192 m 48 inch long with integral factory fabricated 12.7 mm 1/2 inch diameter ceramic coated titanium screw couplings at each end. One anode for each assembled length shall be provided with a screw coupled sealed PVC cable connector which shall be assembled by the manufacturer. Each such connector/cable assembly shall be provided with sufficient lead length so that no splices are necessary between the anode/cable connector and the anode terminal box.

b. The actual number of segmented rod assemblies and the number of strings per chamber shall be in accordance with the corrosion engineer’s approved design calculations based on the current required for protection in accordance with EM 1110-2-2704 and Appendix "A" in CERL Tech Rep FM-95/05, "Detailed Cathodic Protection Design Procedures for Pike Island Auxiliary Lock" as long as the number of segmented rod anode assemblies provided shall equal or exceed 305 mm 1 linear foot of 3.175 mm 1/8 inch diameter (minimum) ceramic coated titanium rod material for each 9.29 square meters 100 square feet of submerged steel surface area and at least one full height assembly in each chamber (for some typical anode configurations, refer to Figures 4, 5, 6, 7, C3, and F2 in CERL Tech Rep FM-95/05). Each assembly shall extend at least 152.4 mm 6 inch above the normal highest water line to within 152.4 -
2.5.7 Hi-Silicon Cast Iron Sausage Anode Strings

a. High-silicon, cast-iron anodes shall be an alloy of silicon, carbon, manganese, and iron conforming to ASTM A518/A518M. Anodes shall be similar in all respect to the "Sausage" anode design shown in Figure 1, "HSCBCI "Sausage" and "Button" Anode Designs of CERL Tech Rep FM-95/05. Anodes shall be suitable for cathodic protection use, shall be highly resistant to corrosion, and shall have good electrical properties. "Sausage" anode castings shall have a nominal weight of 2.95 kg 6-1/2 lb each and shall with an irregular surface terminal connection cavity in the center interior of the tubular shaped anode as in CERL Tech Rep FM-95/05. Anodes shall be 52.39 mm 2-3/16 inches in diameter by 305 mm 12 inch long, designed for tandem mounting in "link-sausage" manner on the anode lead cable. Cable and anodes shall be connected all in a manner similar to the "Sausage" anode design shown in the above referenced Figure 1. Anode strings shall be assembled by the manufacturer and the anode lead cable shall not be spliced in the anode. The anode shall be assembled by removing insulation from the anode cable and connecting the anode to the cable inside the anode.

b. The actual number and spacing of the individual "sausage" segments and the number of strings per chamber shall be in accordance with the corrosion engineer's approved design calculations based on the current required for protection in accordance with EM 1110-2-2704 and Appendix "A" in CERL Tech Rep FM-95/05, "Detailed Cathodic Protection Design Procedures for Pike Island Auxiliary Lock" as long as the number of "sausage" anodes provided shall equal or exceed one each for every 18.59 square meters 200 square feet of submerged steel surface area and at least one string in each chamber (for some typical anode configurations, refer to Figures 4, 5, 6, 7, C3, and F2 in CERL Tech Rep FM-95/05). Each assembly shall extend from 152.4 mm 6 inch above the normal highest water line to within 152.4 - 304.8 mm 6 - 12 inches of the bottom most girder plate.

2.6 IMPACT PROTECTION FOR RODS AND SAUSAGE-STRING ANODES

2.6.1 PVC Pipe and Metal Couplings

PVC pipe, to be used for protection of the rod and sausage-string anodes, shall be installed through each girder web in the center of each chamber which shall have an inside diameter (I.D.) that is at least 38.1 mm 1-1/2 inch greater than the anode outside diameter (O.D.). The Pipe shall be Schedule 80 PVC minimum and perforated on the side opposite the angle iron except for the area within 50.8 mm2 inch of the pipe couplings at each girder web. The total open area provided by these perforations shall be at least equal to the surface area of the anode material contained within the PVC pipe. Metal couplings shall be installed through the girder webs on the compartment side of the gate (and where compartments are used on the skin plate side), where the PVC pipe penetrates the web. The steel coupling selected should have an I.D. that will allow the plastic pipe and its associated couplings to pass through the coupling. These steel couplings shall be aligned vertically for each anode string to serve as vertical troughs for the plastic pipes. The full sections of the plastic pipe shall be solvent welded together end to end. The plastic pipe shall have holes drilled in it as shown on the drawings. The steel coupling, angle iron, channel iron and all areas affected by the welding shall be
prepared for painting and coated with the same paint system as the adjacent gate surfaces, in accordance with Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

2.6.2 Protective Angle Irons

Submit anode disk, button, strip, rod and string details including ice and debris damage protection means for each anode type and alternative location.

2.6.2.1 PVC Piping

The protective PVC piping is subject to damage from floating ice and/or driftwood. Therefore, protective angle irons shall be installed in front of the protective PVC pipe. These angle iron sections shall be at least 6.35 mm 1/4 inch thick with angle legs whose height equal to at least 75 percent but not more than 100 percent of the plastic pipe coupling outside diameter. This angle iron shall be welded to each girder passage pipe coupling from the top of the highest girder to the bottom most girder plate. At each girder, which is penetrated by the PVC pipe, the angle irons shall also be welded to the girder to reduce stress concentrations in the girder web caused by this penetration. The entire assembly, consisting of the perforated PVC pipe containing the sausage anodes and the angle irons, shall be installed as shown on the drawings. When plastic pipes only are used for sausage anode protection, the girder penetration shall be the same, but the angle iron shall be installed in the impact area only.

2.6.2.2 Painting

The steel couplings, angle iron, and channel iron shall be prepared for painting and coated with the same paint system as the adjacent gate surfaces, in accordance with Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES. Each component shall have the same minimum mil thickness (where 1 mil = 0.0254 mm 0.001 inch) of paint after couplings, angle irons, and channels are welded to the structure. The welded area shall be cleaned to bare metal and painted in this same manner. The paint shall be of the same type used on the lock gate.

2.7 MARKINGS

2.7.1 General

Markings, when required by the drawings and when specified herein, shall be accomplished by means of metal or plastic sleeves as specified, stamped or engraved as indicated herein or on the drawings.

2.7.2 Rectifier Cabinets

Rectifier cabinets shall be identified by means of suitable stainless steel plates attached to the outside of the rectifier cabinet by means of bolts or screws.

PART 3 EXECUTION

3.1 EXAMINATION

Visit the premises and thoroughly become familiar with all details of the work and working conditions, verify existing conditions in the field, note the exact locations for materials and equipment to be installed on the gates for cathodic protection, and advise the Contracting Officer of any
discrepancies before performing any work.

3.2 INSTALLATION

Furnish all materials, equipment, and labor necessary to provide a complete and workable cathodic protection system conforming to the drawings and specifications. All electrical work and materials shall conform to NFPA 70 and requirements specified herein. Pipe shall be 150 mm 6 inch diameter Schedule 40 steel pipe. Fittings for rigid metal conduit shall conform to NEMA FB 1. Conduit used shall be straight; no kinks or bends will be permitted. All conduit shall be RGS except the 152.4 mm 6 inch pipe required for protecting the HSCI button anodes and PVC schedule-80 perforated protective pipe used to protect the ceramic rod and HSCI sausage string anodes.

3.3 WIRING

3.3.1 Gate Structure at Control Room

Cables, of the type specified in paragraph DIRECT CURRENT CABLES, shall be installed between the rectifier cabinet located in the control room and the dc receptacle located adjacent to each lock gate. This cable shall be installed in conduit conforming to the requirements of paragraph CONDUIT AND FITTINGS.

3.3.2 Rectifier on the Lock Wall

Type SO cable shall be run exposed from the ac receptacle on the lock wall to the rectifier cabinet and from this cabinet to the dc receptacle. Type SO cable shall also be run exposed from the dc receptacle to the watertight bushing on the gate. Watertight insulating bushings shall have a cable seal fitting that makes a watertight conduit connection and a watertight seal between the cable jacket or insulation and the fitting. At all locations at which a conduit penetrates a watertight member, a watertight packing gland constructed as shown on the drawings shall be installed.

3.3.3 Wiring on the Gate Structure

All dc circuit wiring and anode lead wiring on the gate structures shall be installed in rigid galvanized steel conduit, except for sausage anode strings, which shall be installed as shown on the drawings, and as specified. Conduit installed on the gate structure shall be installed, where possible, in the recesses of the gate and flush with the wall skin plate to reduce the probability of physical damage from floating debris. Each anode shall be provided with sufficient lead length, without splice, to reach the terminal cabinets located on the top of each gate leaf. Watertight insulating bushings shall have a cable seal fitting that seals between the cable jacket or insulation and the fitting. At all locations at which a conduit penetrates a watertight member, a watertight packing gland constructed as shown on the drawings shall be installed.

3.4 ROD AND SAUSAGE ANODE INSTALLATION

3.4.1 Metal Pipe Couplings for PVC Pipee

Metal pipe couplings (guides for PVC pipe used with sausage anodes) shall be permanently welded on the gate structure. Rod or Sausage-type anodes shall not be used without these PVC pipe guides. PVC schedule-80 pipe (with holes) containing the sausage anode strings shall be installed.
through the couplings with the holes oriented away from the protective steel angle channel (toward the back of the chambers). Anode rod or string assemblies shall be capable of being withdrawn at any time for inspection and repair. The metal pipe couplings used for PVC pipe guides shall be installed plumb, with an alignment tolerance of plus or minus 6.35 mm 1/4 inch over the entire height of the gate. When in place, the metal pipe couplings shall be welded to the girder. Protective angle irons shall be positioned at the previously specified locations to protect the PVC pipe and anode strings contained therein, exposing as much anode surface area as possible.

3.4.2 Assembly of Titanium Rod Anode

The ceramic coated titanium rod anode shall be sequentially assembled as it is lowered into the PVC pipe by screw coupling each to the next anode element. The coupling shall be tightened to a torque equal to that specified by the anode manufacture. The topmost element shall have the factory fabricated anode-to-cable connector attached in a similar manner. The HSCI sausage anode assemblies are lowered into place inside the plastic pipe. Take care in handling these HSCI anode strings since the material is very brittle and subject to cracking if dropped or bounced against a hard surface. If any single anode element in the HSCI "sausage" string is cracked, replace the entire string with a new string. No cracked anodes shall be installed in the system. Anode centering devices shall be installed on each rod or string anode element to assure that the anode is maintained in a centered position within the pipe in a manner so that no portion of the anode is closer than 12.7 mm 1/2 inch of the pipe interior surface. Each anode lead shall be continuous without splices from its point of connection to the anode to the terminal cabinet on the gate structure. Anode leads shall be marked with anode string or anode number at the point of connection to the terminal box. A minimum of 152.4 mm 6 inch of excess cable shall be coiled in the anode terminal box before cutting and connection the cable to the corresponding anode terminal in the terminal box. This connection shall then be coated with a suitable oxidation preventing electrical contact paste.

3.4.3 Suspension of Anode Rod or String Assemblies

Support means for each anode rod or string shall be done in a manner to permit easy raising, lowering, removal and/or reinstallation of the anode strings in the anode guides. The anode assemblies shall be suspended from anode connecting cables using "Kellum" or equal grips to provide uniform and non-deforming gripping of the wire insulation.

3.5 DISK AND BUTTON ANODE INSTALLATION

3.5.1 General

Install the Disk or Button-type anodes at the locations shown on the approved Contractor's corrosion engineer design drawings.

3.5.2 Impact Protection Pipes Installation

The impact protection pipes for the disk or button anode connection cables shall be installed prior to installation of the anodes. A 152.4 mm 6 inch diameter by 203.2 mm 8 inch long galvanized steel schedule-40 pipe with threaded pipe cap shall be fully seal welded to the gate in back of each button anode. A hole shall be drilled in the side of this pipe and a thread-o-let fitting welded to the 152.4 mm 6 inch diameter pipe at this
point to receive the anode lead wire and conduit routed to the anode terminal box at the top of the gate leaf. The pipe and conduit provide impact protection of the anode cables and the anode support means. The pipes shall be prepared for painting and coated with the same paint system as adjacent gate surfaces, in accordance with Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.5.3 Disk Anode Installation

Deleiver the disk anode as a complete assembly by the manufacturer. A 28.58 mm 1-1/8 inch diameter hole shall be drilled through the skin plate at each disk anode location shown on the approved system design drawings. Remove the FRP nut and washer from the disk support shaft. Apply 100 percent silicone waterproof caulk to the skin plate side of the anode composite shield in sufficient quantity to completely seal the shield at its outer perimeter and adjacent to the shaft where it passes through the skin plate. The disk shall then be inserted through the gate skin plate and held firmly in place while the washer and then nut are placed on the support shaft from the opposite side of the gate and tightened using an automatic torque wrench set to 33.9 N-m 25 ft-lb of torque. The cable connector shall then be attached to the integral threaded socket on the end of the anode support shaft and tightened to the torque specified by the manufacturer. This cable shall then be routed through the pipe protecting thread-o-let fitting and then via conduit to the anode terminal box. Each disk anode lead shall be continuous without splices from its point of connection to the anode to the terminal cabinet on the gate structure. Anode leads shall be marked with anode string or anode number at the point of connection to the terminal box. A minimum of 152.4 mm 6 inch of excess cable shall be coiled in the anode terminal box before cutting and connection of the cable to the corresponding anode terminal in the terminal box. This connection shall then be coated with a suitable oxidation preventing electrical contact paste.

3.5.4 Button Anode Installation

a. The polychloroprene or neoprene gasket material shall be not less than 3 mm 1/8 inch in thickness and shall provide a minimum of 500,000 ohms of resistance between the button anode and gate. Plastic plugs, molded or fabricated from an approved polystyrene to fit securely in the anode opening, shall be furnished and installed in accordance with the approved submittal drawings. After assembly, the anode support bolt shall be completely insulated on the button side of the gate by forcing epoxy cement through a passage provided for that purpose, around the insulating sleeve, into the bolt-head cavity, and out the vent hole in the plastic plug. The plastic plug shall be placed in the bolt-head cavity such that the vent hole is at the highest point.

b. Epoxy cement shall be of an approved type, shall have a suitable dielectric strength, shall be water-resistant, and shall not generate enough heat to damage or react with the plastic plug, the insulating bushings, or the gaskets. The epoxy shall provide a minimum electrical resistance of 10 megohms between the anode and the gate.

c. The flanged sleeves shall be fabricated from nylon conforming to the requirements of ASTM D789, or a similar approved rigid plastic material. It shall be of proper size and length so that it will penetrate the skin plate enough to provide electrical isolation between the anode and skin plate. The sleeve shall enter the skin plate at least 1.59 mm 3/16 inch. Refer to CERL Tech Rep FM-95/05 - Figure 1,
"HSCBCI "Sausage" and "Button" Anode Designs for mounting component details.

d. Also isolate the bolt from the anode and skin plate. A metal washer shall be used behind the skin plate to connect the bolt to the gate so that the bolt will receive cathodic protection and not corrode. Apply the epoxy cement (resin) to provide a watertight seal in all areas of the bolt and anode bolt cavity. This will isolate the anode from the gate.

e. The surfaces of the gates to be covered by the polychloroprene or neoprene gasket and the anode shall be sandblasted to clean metal to provide a bonding surface for the epoxy cement. The metal washer shall not exceed the flange diameter of the nylon sleeve and the nylon flanges shall be at least 3 mm 1/8 inch in diameter smaller than the diameter of the button anode hole bolt-head cavity. The anchoring bolt shall have slots that are large enough and adequate to transfer epoxy. Bolts shall be machined and holes drilled to transfer epoxy. The bolt shall be of sufficient length to allow threads to be visible past the nut. Structural thickness shall be considered. The neoprene gasket shall be attached to the gate and the anode using an approved cement to make a watertight seal. The bolt shall be used to torque the anode to a watertight seal on the gate. The bolt shall not be over-torqued, causing the metal anode to contact the gate or the polychloroprene gasket to turn out from the skin plate. The anodes shall not be handled or carried by the conductor. Each anode lead shall be continuous without splices from its point of connection to the anode to the terminal cabinet on the gate structure. Anode leads shall be marked with anode string or anode number at the point of connection to the terminal box. A minimum of 152.4 mm 6 inch of excess cable shall be coiled in the anode terminal box before cutting and connection of the cable to the corresponding anode terminal in the terminal box. This connection shall then be coated with a suitable oxidation preventing electrical contact paste.

3.6 RECTIFIER CABINET INSTALLATION

Secure wheeled rectifier cabinets, when provided, to the lock wall pipe rails using the clamp provided as a part of the rectifier. Secure stationary rectifier cabinets to the structures as shown on the approved submittal drawings.

3.7 RESISTOR AND ANODE TERMINAL CABINETS INSTALLATION

Install resistor and anode terminal cabinets at locations convenient for maintenance and testing purposes and to provide ready access to the terminals therein. Securely mount the cabinets to the gate structure with welded angle iron supports holding the cabinet in place.

3.8 REPAIR OF EXISTING WORK

The work shall be carefully laid out in advance, and where cutting, channeling, chasing, or drilling of the gate structure or girder web, or other surfaces is necessary for the proper installation, support, or anchorage of the cabinets, conduit, raceways, or other electrical work, this work shall be carefully done, and any damage to the gate structure or equipment shall be repaired by skilled mechanics of the trades involved, at no additional cost to the Government.
3.9 SYSTEM COMPONENT CIRCUIT RESISTANCE MEASUREMENT

Within 1 week following the filling of the lock, the resistance of each anode, reference electrode, system ground, and reference ground shall again be measured and recorded using four separate test lead wires and a Nilsson Model 400 AC impedance meter or other similar AC impedance instrument acceptable to the Contracting Officer. The measurement shall be made by disconnecting the component lead at the appropriate terminal in the terminal box and connecting two of the four AC impedance test leads individually to the lead wire. The other two AC impedance test leads shall be individually connected to the structure component to which the component is mounted or connected. Should the resistance between the lead wire and the structure (immerse anode and reference elements in water) be less than 50 percent or more than 200 percent of the calculated (expected) resistance, make the necessary corrections and/or modifications necessary to achieve the anticipated value(s).

3.10 STRUCTURE-TO-REFERENCE CELL POTENTIAL MEASUREMENTS

Following completion of the installation of the cathodic protection system and prior to placing the impressed current cathodic protection system in operation, structure-to-reference cell potential measurements shall be made. The testing equipment shall be a calibrated copper-copper sulfate reference electrode with waterproof connector to insulated test lead wire suitable for immersion testing and of suitable length so that no splices are necessary in the test lead wire and a high-resistance digital voltmeter, Fluke Models 865 or 867 or equal. The copper-copper sulfate reference electrodes shall contain a saturated reagent copper sulfate in distilled water. Prior to first system energization, native "OFF" potential measurement shall be recorded using the same meter and calibrated reference electrode to be used during system energization and adjustment. These native "OFF" potentials shall be measured and recorded at all the specified locations.

3.11 RECTIFIER ADJUSTMENT

Rectifier adjustment shall be accomplished as follows:

a. Adjust the output of the rectifier so that the gate-to-water potential measured using a reference cell indicates that the negative potential has stabilized and is at least minus 0.85 volt and not more than 1.2 volts. These measurements shall be made with current applied. Corrections for IR drop shall be made. This shall be accomplished by adjusting the rectifier to obtain the aforementioned "instant-off" potentials. This IR drop correction shall be made by interrupting the current output of the rectifier either manually or automatically using a 90 percent minimum "ON" and 10 percent maximum "OFF". If more than one rectifier is energized at the same time, all such rectifiers shall be interrupted simultaneously. The "OFF" time period shall not exceed 1 second. During this "OFF" period, the Fluke 865/867 meter shall be used to automatically read the minimum DC voltage that is the polarized protective potential on the gate.

b. Perform a complete structure-to-water potential survey of the gate leaf face.

3.11.1 Locations of Structure-to-Reference Cell

Locate the reference cell in the water, 12.7 to 76.2 mm 0.5 to 3 inch from
the gate structures. The reference cell shall be connected with a waterproof screw coupled connector to a conductor on a reel. The cell shall be lowered to depths in the water as indicated below. The reference cell conductor shall be connected to the positive terminal of the digital voltmeter. A second conductor shall be connected from the gate structure to the voltmeter negative terminal. The measurement procedure shall be repeated and recorded for each measurement location. Measurements shall be made every 0.91 m (minimum) from normal pool elevation to the bottom of the gate. These same measurements shall be made at a minimum of five locations across the width of the gates on both the skin plate and chamber sides. In addition, one set of measurements shall be made at the quoin end and one at the miter end on both sides of the gate. All measurement positions should be permanently marked on the handrail of the gates directly above where the measurement is made.

3.11.2 Polarization Decay

a. Polarization decay measurements are only necessary if the gate surfaces adjacent to the sill plate, quoin and miter fail to meet the above criteria of providing negative protection potential of at least minus 0.85 volts.

b. A minimum negative (cathodic) polarization voltage shift of 100 millivolts shall be measured between the structure surface and the reference electrode cell above contacting the electrolyte. This polarization voltage shift is to be determined by interrupting the protective current and measuring the polarization decay. When the current is initially interrupted, an immediate voltage shift will occur. The second voltage reading displayed after the immediate shift shall be used as the base reading from which to measure polarization decay. Polarization measurements shall be made at minimum 10-minute intervals for a maximum of 4 hours. This measurement cannot be made until the gate has had a chance to become polarized.

c. Location of the structure with respect to the reference cell for polarization decay measurements shall be 0.305 m (1 ft) from the bottom gate at the quoin, miter, and at 0.61 m (2 ft) intervals along the bottom of the gate. Measurements shall be made on each gate leaf face.

3.12 RECORDING OF MEASUREMENTS

All system component circuit resistances, structure-to-water potential measurements, including native potentials, shall be assembled in computer generated tabular form using Microsoft Excel or similar approved spreadsheet and submitted in six copies together with a copy of the data disk (3-1/2 inch floppy disks), with each location identified on the as-built drawings. Locate, correct, and report to the Contracting Officer any unusual data or problems encountered during checkout of the installed cathodic protection system. Structure-to-water potential measurements are required on structures as necessary to affirm that protection has been achieved on all submerged surface of the lock gates. All tests shall be witnessed by the Contracting Officer and the completed test measurements data shall be submitted to him for his review and approval.

3.13 OPERATION AND MAINTENANCE INSTRUCTIONS

Submit Weekly, Monthly and Annual Test Procedure to be part of the operations and maintenance instruction manual. This test plan shall conform to all applicable NACE International Recommended Practices.
3.13.1 Operating Instructions

Furnish to the Contracting Officer twelve (12) complete copies of operating instructions detailing the step-by-step procedures required for system start-up and adjustment of the rectifier to achieve the criteria of protection. This shall include native system and component test data (data before system energization), test set up, test equipment diagrams showing voltmeter and reference cell connections, test locations, and a description of the procedure for measuring "on" and "off" potentials. Detailed steps shall show use of the equipment used in the training course and cover test and measurement of the cathodic protection systems for the gate leafs. Submit the Operation and Maintenance manual to the Contracting Officer for approval 30 days prior to the training course. Information on the equipment shall include the manufacturer's name, model number, service manual, parts list, and a brief description of all equipment and its basic operating features.

3.13.2 Maintenance Instructions

Furnish to the Contracting Officer eight complete copies of maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and trouble-shooting guides. The instructions shall include diagrams for the system as installed, instructions in making gate-to-reference electrode measurements, and frequency of monitoring.

3.14 TRAINING COURSE

Conduct a training course for operating staff, as designated by the Contracting Officer, on the cathodic protection system. The training period shall consist of a total of 8 hours of training and shall start after the system is functionally complete, but prior to final acceptance tests. Provide course material, including testing data and records, for a minimum of [12] [___] Government attendees. Submit this course material to the Contracting Officer for approval 30 days prior to the scheduled start of the training course. Submit life of the anodes and outline of course and handout sheets with testing and measurements from the instruction manual and description of the use of equipment for completing test and measurements for students. The training course shall include demonstrations of the procedure for measuring the minus 850 millivolts "off" potentials and NACE International protection criteria of a minimum negative (cathodic) polarization voltage shift of 100 millivolts. Provide a digital voltmeter (Fluke 865 or similar and approved equal) and an insulated cable (minimum 30.48 m 100 ft length) on a reel with a saturated copper-copper sulfate reference cell attached by a factory assembled waterproof connector for these demonstrations. This equipment will become the property of the Government and shall be turned over to the Contracting Officer upon completion of the training course.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steel water tank cathodic protection systems using impressed current systems and galvanic anodes.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

The Preparing Activity, NAVFAC LANT, has significant experience and technical expertise in the area of field testing and commissioning of new systems. If reach-back support is required, the technical representative (electrical engineer) editing this document for a specific project shall contact the NAVFAC Atlantic Capital Improvements Electrical Engineering (CIEE) office for consultation during the design stage of the project and include the bracketed option in the 'Submittals' section.

NOTE: One of the major factors influencing selection of the type of cathodic protection system is the resistivity of the water involved. When the water resistivity is higher than 10,000 ohm-cm,
impressed current systems are usually used. Other considerations include availability of electric power and the costs of installation, operation and maintenance. Where relatively small amounts of current are required or where energy is not readily available and water resistivity is low, galvanic anodes may be applied. Where relatively large currents are required and reasonable access to power is available, the impressed current system will generally be found to be more economical. The requirements for the cathodic protection systems should be determined by a corrosion engineer following the criteria, design, and installation recommendations included in the National Association of Corrosion Engineers Standard; RPO-388, "Impressed Current Cathodic Protection of Internal Submerged Surfaces of Steel Water Tanks", and RP0-196, "Galvanic Anode Cathodic Protection of Internal Submerged Surfaces of Steel Water Tanks."

**************************************************************************

NOTE: The following information should be shown on the drawings:

1. Dimensions of tank, including riser (if tank is elevated), structural supports and overflow.

2. Locations of all anodes, reference electrodes, junction boxes, test boxes, rectifiers, power connections, wire and conduit.

3. Installation details for anodes and rectifiers.

4. Electrical single-line diagrams, elevations, limiting dimensions, and equipment ratings which are not covered in the specification.

5. Remote indicating or control requirements.

1.2 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, shall be as defined in IEEE 100.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the
submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
**************************************************************************
NOTE: If submittal review by NAVFAC LANT is specifically desired, the responsible Field Engineering Command shall coordinate with Code CIEE during the design process. Include bracketed option and add appropriate information in Section 01 33 00 "SUBMITTAL PROCEDURES" to coordinate with the special requirements.
**************************************************************************
**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.][Code CIEE, NAVFAC LANT, will review and approve all][the "Field Quality Control"] submittals requiring Government approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Rectifier installation
Anode installation
Wiring and schematic diagram
Anode junction boxes

SD-03 Product Data

[ Rectifiers; G[, [____]]]
[ Impressed current anodes; G[, [____]]]
[ Galvanic anodes; G[, [____]]]
Permanent reference electrodes; G[, [____]]
Shunt resistors

Include certified test data for the impressed current anodes stating the maximum recommended anode current output density and the rate of gaseous production if any at that current density.

SD-07, Certificates

Qualifications of Corrosion Engineer; G[, [____]]
Icing Climate Requirements; G[, [____]]
Submit certification from the manufacturer indicating conformance with the paragraph entitled "Icing Climate Requirements."

SD-09, Manufacturer's Field Reports

Initial Cathodic Protection System Field Test Report; G[, [_____]]

One Year Warranty Period Cathodic Protection System Field Test Report; G[, [_____]]

Final Cathodic Protection System Field Test Report; G[, [_____]}

SD-10 Operation and Maintenance Data

Cathodic Protection System, Data Package 5; G[, [_____]}

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.4 SERVICES OF CORROSION ENGINEER

Obtain the services of a Corrosion Engineer to supervise, inspect and test the installation of the cathodic protection system(s). Corrosion Engineer refers to a registered professional engineer with certification or licensing that includes education and experience in cathodic protection of buried or submerged metal structures, or a person certified by the National Association or Corrosion Engineers at the level of Corrosion Specialist or Cathodic Protection Specialist. Such a person shall have not less than [three] [five] [_____] years experience in the cathodic protection of water [storage tanks] or submerged structures. Submit evidence of the qualifications of corrosion engineer to the Contracting Officer for review and approval.

1.5 QUALITY ASSURANCE

1.5.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship shall be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products shall have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period shall include applications of equipment and materials under similar circumstances and of similar size. The product shall have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items shall be products of a single
manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.2.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.2.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site shall not be used, unless specified otherwise.

1.6 WARRANTY

The equipment items shall be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

1.7 VERIFICATION OF SITE CONDITIONS

Coordinate and properly relate this work to the work of all trades. Verify that the general locations of the structures to receive protection are shown. Visit the premises and become familiar with all details of the work and working conditions, verify existing conditions in the field, determine the exact locations of structures to be protected, and advise the Contracting Officer of any discrepancy before performing any work. Take resistivity measurement of the water and analysis of the water and provide this data with shop drawings of the system for approval.

PART 2 PRODUCTS

**************************************************************************
NOTE: Anode materials, as well as all cathodic protection equipment to be installed in the tank, should be chosen such that there is no contamination of potable water. The type of system to be used, either impressed current or galvanic, must be determined. Select the paragraphs entitled "Impressed Current Anodes" or "Galvanic Anodes" below.
**************************************************************************

2.1 [IMPRESSED CURRENT ANODES]

**************************************************************************
NOTE: Choose from anodes listed below. The chemical composition listed are examples only. The actual compositions required shall be determined to provide adequate and economical service, and conform to the standards established by NACE.
**************************************************************************

[2.1.1 High-Silicon Chromium Bearing Cast Iron]
NOTE: High-silicon cast iron anodes are rugged, long lasting, and commonly used in icing and non-icing climates. They are generally classified as relatively non-sacrificial having a consumption rate between 227 to 454 grams 0.5 to 1.0 pounds per ampere-year in most fresh waters.

**ASTM A518/A518M.** Provide cast iron anodes with the following characteristics:

a. Electrical resistivity: 72 micro-ohm-centimeter at minus 6.6 degrees C 20 degrees F (maximum).

b. Physical properties (nominal):

][2.1.2 Aluminum Anodes

NOTE: Aluminum anodes are used in cases where annual or frequent replacement is required due to ice damage, and routine cleaning of the tank makes it possible to remove any expended or broken pieces of anode stock from the tank before they accumulate. Also, see the technical note for "Precious Metal Anodes" regarding alternative anode systems for icing conditions. The designer must consider system maintainability impacts when selecting the anode system.

Provide aluminum anodes with composition and size conforming to NACE mandated requirements.

][2.1.3 Precious Metal Anodes

NOTE: At installations where icing conditions exist and the scaling index of water is less than 20,000 (i.e., low hardness water), the designer should consider using precious metal anodes, such as platinized niobium, platinized titanium, or mixed metal oxide for cathodic protection systems. The consumption rate of precious metal anodes is less
than that of other relatively non-sacrificial anodes. However, precious metal anodes are more vulnerable to damage and loss particularly during cleaning and reconditioning of the tank.

Selection of the configuration should be left to the designer of the system. Long, continuous wire from lengths of precious metal anodes may have an attenuating effect. This can be overcome by using an anode header cable connected to lengths of precious metal anodes at a common junction box. Such precious metal anode assemblies must be assembled with factory sealed and tested electrical connections to the anodes.

Provide [precious metal anodes] [_______], [solid] [composite] [wire] [rod] [expanded mesh] [ribbon] in form. Anode core shall be [copper] [niobium] [titanium] with [platinum] [mixed metal oxide] [_______] coating with thickness of [_______] millimeters [mils]. Precious metal anode assemblies shall have factory sealed and tested electrical connections to the anodes.) Size and length as indicated.

]2.2  [GALVANIC ANODES

2.2.1  Magnesium Anodes

[ASTM B843] Chemical composition as mandated by NACE.

Bare anode weight: [4.1] [7.72] [14.53] [_______] kg [9] [17] [32] [_______] pounds (not including core).

]2.3  ANODE LEAD WIRES

**************************************************************************
NOTE: Any pinhole, cut, scratch or other damage to the anode cable exposing bare copper to the electrolyte will result in early failure of the impressed current cathodic protection system. For this reason, special, extra heavy insulation is used on anode cable.
**************************************************************************

No. [8] [_______] AWG, stranded copper wire conforming to ASTM B3 and ASTM B8. Provide wires with [2.8 mm110 mils [_______] thick, ASTM D1248, high molecular weight polyethylene (HMWPE) insulation] [a primary insulation of ethylene propylene rubber and an outer jacket of chloro sulphonated polyethylene insulation]. Wires shall be [3050] [6100] [_______] mm [10] [20] [_______] feet in length [of sufficient length to extend to the anode header cable [junction box] without splicing].

2.3.1  Attachment of Anode Lead Wire

Install anode lead wires at factory.

2.3.1.1  End Connected Anode

[Drill] [Cast] a recess [150] [_______] mm [6] [_______] inches deep in one end of the anode. Attach the lead wire to the anode with an anchor device.
Not more than 10 mm 1/2 inch of bare wire shall protrude from the anchor device. Attachment shall withstand a 1446 Newton 325 pound pull without loosening the wire or anchor device. Fill the recess with an epoxy sealing compound [, leaving sufficient space for a plug]. [Provide non-metallic plug flush with the anode end surface.] [Install a heat shrinkable anode cap over the attachment, cap shall extend not less than 65 mm 2 1/2 inches on the lead wire and 75 mm 3 inches on the anode.] Cable to anode contact resistance shall not exceed 0.02 ohms.

2.3.1.2 Center Connected Anode

Attach the lead wire to the center of the anode with an anchor device suitably fastened to the wire. Not more than 20 mm one inch of bare wire shall protrude from the anchor device. Encapsulate [each side of] the connection point with [a minimum of 152 mm 6 inches _____] of high voltage insulating compound mastic and 102 mm 4 inches _____ of epoxy resin. Attachment shall withstand [4000] [6675] [_____] N [900] [1500] [_____] pounds pull without loosening the wire or anchor device. Provide a non-metallic [plug flush with the anode end] [end cap] to prevent chaffing of the anode lead wire. Cable to anode contact resistance shall not exceed 0.02 ohms.

2.3.1.3 Mixed Metal Oxide Anode Lead Wires

[[Solidly crimp] [and solder] the connection between the anode rod or ribbon and the lead wire. Seal the connection [with two layers of half lapped mastic tape covered with a heat shrinkable sleeve] [in cast epoxy].] [Tin and anneal the copper wire and hydraulically swage the tubular anode onto copper bushings in contact with the wire. Place a 28 mm 1 1/8 inch long copper sleeve, inner diameter slightly larger than the tubular anode outer diameter, over the tube prior to swaging.] Cable to anode contact resistance shall not exceed 0.02 ohms.

2.4 RECTIFIERS

**************************************************************************
NOTE: FOR USE ONLY WITH IMPRESSED CURRENT SYSTEMS.
Air-cooled rectifiers will be used for most applications. Where highly corrosive atmosphere exist, the equipment will be oil-immersed in a tank type housing. For hazardous area applications, oil-immersed equipment will be provided with an explosion-proof or dust-ignition-proof housing, as appropriate. Transformer tap adjusters will be provided in cases where an automatic system is not provided. Variacs should not be used where subjected to corrosive or marine air atmospheres.
**************************************************************************

2.4.1 Transformers

UL 506 and NEMA ST 1, as applicable.

2.4.2 Electrical Ratings

Electrical ratings as follows: Input voltage at 60 Hz: [[115] [208] [230] volts single phase] [[208] [230] [460] volts three phase]

a. Output voltage, dc: [9] [12] [18] [24] [_____] volts [as indicated].
b. Output current, dc: [8] [16] [24] [32] [_____] amperes [as indicated].

The rectifier shall be capable of supplying continuous full rated output at an ambient temperature of 44 degrees C 112 degrees F in full sunlight with expected life of 10 years minimum.

2.4.3 Rectifying Elements

Provide silicon diode rectifying elements, connected in such manner as to provide full-wave rectification. [Protect silicon diodes with selenium cells or varistors against overvoltage surges and by current limiting devices against overcurrent surges.]

2.4.4 Enclosure

**************************************************************************
NOTE: Choose this paragraph for air cooled rectifier enclosures or the paragraph below entitled "Oil Immersed Enclosures." Oil immersed enclosures shall be used where highly corrosive atmospheres exist. When locating oil immersed rectifiers near buildings, consult with paragraph 6-28.2 of UFC 3-600-01, "Fire Protection Engineering For Facilities", for fire safety requirements.
**************************************************************************

NEMA ICS 6, Type [3][3X][4X][7][____], suitable for [wall][post][pad] mounting. Enclosure shall include hinged door with [padlock hasp] [key lock, provide [three][_____] keys.][locks keyed alike.] Fit enclosure with screened openings to provide for cooling by natural convection. Provide holes, conduit knockouts and threaded hubs of sufficient size and location. The cabinet and mounting support must be [painted] [hot-dipped galvanized][aluminum][stainless] steel [according to the manufacturer's standards].

2.4.5 Oil Immersed Enclosures

Provide enclosures of 11-gage steel or heavier, with an accessible drain plug. Provide a hinged lid with quick release clamps to secure it in a closed position. Clearly mark the oil level. Provide a compressive, oil resistance, positive sealing gasket. Based mounting shall have 100 mm 4 inch high channels. Provide an internal terminal board and connections above oil level for monitoring and adjustment. The cabinet and mounting support shall be [painted] [hot-dipped galvanized] [stainless] steel [according to the manufacturer's standards].

2.4.6 Wiring and Schematic Diagram

Provide a complete wiring and schematic diagram of the power unit showing both the ac and the dc connections to anodes on the inside of the cabinet door. Show and label components.

2.4.7 Overload and Short Circuit Protection

Provide UL 489, single-pole, flush-mounted molded case circuit breaker, [magnetic] [thermal-magnetic] type, in the primary circuit of the rectifier supply transformer.
2.4.8 DC Output Control

Provide adjustable dc output voltage by [transformer taps] [automatic controls].

2.4.8.1 [Transformer Taps]

******************************************************************************

NOTE: A minimum of five coarse and five fine taps is recommended to provide sufficient voltage adjustment. Variacs should not be used where subjected to corrosive or marine air atmospheres.

******************************************************************************

2.4.8.2 [Automatic Controls]

Provide control system capable of maintaining a preselected tank-to-water potential, within plus or minus 0.025 volt regardless of changes in water chemistry, temperature, or water level in the tank. [Provide separate dc output circuits, means of adjustment, reference electrodes, and metering for the tank bowl and riser pipe.] Make provisions for readily changing the range and limits of the operating potential.

2.4.9 Output Voltage and Current Meters

Provide separate panel voltmeter and ammeter, not less than 63.5 mm 2 1/2 inch [round] [rectangular] 2 percent full scale accuracy at 30 degrees C 80 degrees F, temperature stability above and below 30 degrees C 80 degrees F of at least 1 percent per 5 degrees C 10 degrees F. Provide toggle switch for each meter.

2.4.10 Grounding Provisions

Grounding provisions shall [be as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.] [comply with NFPA 70 and UL 467 including a ground terminal in the cabinet.] The grounding conductor from the terminal to the earth grounding system shall be solid or stranded copper not smaller than No. 6 AWG. Provide an earth grounding system consisting of one or more rods. Ground rods shall be [copper-clad steel conforming to UL 467] [zinc-coated steel conforming to IEEE C135.30] [solid stainless steel] not less than [16] [19] mm [5/8] [3/4] inch in diameter by [2.4] [3.1] m [8] [10] feet in length. Drive rods full length into the earth. Sectional type rods may be used.

2.4.11 Resistance to Ground

******************************************************************************

NOTE: Remove this paragraph if not required in the project
******************************************************************************

Measure the resistance to ground using the fall-of-potential method described in IEEE 81. The maximum resistance of driven ground shall not exceed 25 ohms under normally dry conditions. If this resistance cannot be obtained with a single rod, [_____] additional rods not less than 1.8 m 6 feet on centers, or if sectional type rods are used, [_____] additional
couples sections and drive with the first rod. In high-ground-resistance, use UL listed chemically charged ground rods. If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, notify the Contracting Officer immediately. Exothermically weld all connections below grade. Exothermically weld connections above grade or use UL 467 approved connectors.

2.4.12 Fuses

Cartridge-type fuses conforming to NEMA FU 1. Provide suitable fuse holders in each leg of the D.C. circuit.

2.4.13 Surge Protection

Protect silicon diodes by use of ac and dc lightning arresters or metal oxide varistors against overvoltage surges and by current-limiting device against overcurrent surges.

2.4.14 Efficiency

Overall efficiency of [65 percent] [90 percent] [_____] minimum when operated at full output.

2.4.15 Rectifier Replacement/Spare Parts List

Provide identification and coverage for all parts of each component, assembly, and accessory of the items subject to replacement in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

2.5 REFERENCE ELECTRODES

[Zinc][copper-copper sulfate] type provided with micro-pore diffusion window for water contact and water-tight plug. Provide cells with No. [10] [12] [_____] AWG, stranded copper conductor with 2.8 mm 110 mils [_____] thick ASTM D1248, high molecular weight polyethylene (HMWPE) insulation cable of sufficient length to extend to the [test station] [junction box] without splicing. Reference electrodes shall have a minimum 15 year life, stability of plus or minus 5 millivolts under 3 micro-amp load, and an initial accuracy of plus or minus 10 millivolts referenced to a calibrated portable reference electrode.

2.6 SHUNT RESISTORS

[0.01] [_____] ohm, [6] [_____] amp, with an accuracy of plus or minus one percent. [Shunts shall conform to MIL-I-1361 [rating as shown]].

2.7 CONDUIT

[UL 6, rigid galvanized steel.] [Outlet boxes: UL 514A and Fitting: UL 514B, threaded hubs.] [Metallic conduit and fittings to be polyvinyl-chloride coated in accordance with [NEMA RN 1, Type A40] [NEMA TC 2, Type EPC-40-PVC]]. Provide nonmetallic conduit conforming to NEMA TC 2. Provide conduit support in accordance with NFPA 70.

2.8 CABLE OTHER THAN ANODE LEAD WIRES

************************************************************
NOTE: Any pinhole, cut, scratch or other damage to the anode cable exposing bare copper to the
electrolyte will result in early failure of the impressed current cathodic protection system. For this reason, special, extra heavy insulation is used on anode cable.

Provide copper wire conforming to ASTM B3 and ASTM B8. Wires terminating in a rectifier, junction box or test station shall have a cable identification tag. Refer to paragraph 2.1.4 [_____] for anode lead wires.

2.8.1 AC Power Supply Wiring

[UL 83, Type [THW] [THWN] [TW]] [UL 44, Type RHW,] [UL 854, Type USE], stranded [solid] copper conductors, gage (AWG) and color coded as indicated.

2.8.2 Anode Wire

Type CP [ASTM D1248, High Molecular Weight Polyethylene (HMWPE)] [cross linked polyethylene (XLPE)] insulation, stranded copper conductors, gage (AWG) as indicated.

The anode wire material shall sustain current densities of 100 ampere per square meter 10.764 square feet in an oxygen generating electrolyte for 20 years. The manufacturer shall certify that a representative sample taken from the same lot used to construct the anode, has been tested and meets the following criteria:

a. The test cell sustains a current density of 10,000 ampere per square meter 10.764 square feet in a 15 weight percent sulfuric acid electrolyte at 66 degrees C 150 degrees F without an increase in anode to cathode potential of more than 1 volt.

b. The cell containing the anode shall be powered with a constant current power supply for the 30 day test period.

c. The representative sample shall be 125 mm 5 inch in length taken from the lot of wire that is to be used for the anode.

2.8.3 Rectifier DC Positive (Anode) Header Cable

Type CP [ASTM D1248, High Molecular Weight Polyethylene (HMWPE)] [cross linked polyethylene (XLPE)] insulation, stranded copper conductors, gage (AWG) as indicated. Refer to paragraph 2.1.4 [_____] for anode lead wires.

2.8.4 Cable Identification Tags

[Laminated plastic material with black letters on a yellow background] [[Brass] [Stainless steel] material with stamped or engraved letters.] Print letters and numbers a minimum 5 mm 3/16 inch in size. Provide identifier legend [in accordance with the drawings] [______].

2.8.5 Wire Connectors

UL 486A-486B.

2.8.6 Insulating Tape

UL 510.
2.8.7 Splices

[Splices are not permitted in submerged sections of anode lead wire or anode header cable.] Provide splices with a compression connector on the conductor, and insulation and waterproofing using one of the following methods which are suitable for continuous submersion in water and comply with ANSI C119.1.

a. Provide cast-type splice insulation by means of molded casting process employing a thermosetting epoxy resin insulating material applied by a gravity poured method or pressure injected method. Provide component materials of the resin insulation in a packaged form ready for convenient mixing without removing from the package.

(1) Gravity poured method shall employ materials and equipment contained in and approved commercial splicing kit which includes a mold suitable for the cables to be spliced. When the mold is in place around the joined conductors, prepare the resin mix and pour into the mold.

b. Provide [heavy wall] heat shrinkable splice insulation by means of a thermoplastic adhesive sealant material which shall be applied with a clean burning propane gas torch per manufacturer's instructions.

2.9 ANODE JUNCTION BOXES

2.9.1 Post Top Mounted Type

NEMA ICS 6. Metallic or non-metallic with terminal board, [5] [8] [_____] terminal posts and lockable lid. A non-metallic enclosure shall be high impact strength molded plastic. The unit shall be of standard design, manufactured for use as a cathodic protection test station, complete with cover, terminal board, shunts, and brass or Type [304] [316] stainless steel hardware. Provide removable terminal board for easy access to wires. Mount the test station atop 1830 mm 6 foot long polyethylene conduit with anchor.

2.9.2 Wall Mounted Type

NEMA ICS 6, Type [3R] [4X] [_____] enclosure with [clamped cover] [Type 304] [316] stainless steel hinges and [clamped] [latched] cover [and padlocked hasp]. Provide enclosure constructed of [galvanized steel] [aluminum] [fiberglass] [non-metallic] construction with terminal board and labeled with nameplate. Enclosure mounting posts shall be [galvanized steel pipe, schedule [40] [80] [_____]], [wood post, full length pressure treated with pentachlorophenol] [as indicated]. Mount enclosure 1066 mm 42 inches above finished grade [as indicated].

2.9.3 Terminal Boards

Provide terminal boards for anode junction boxes, bonding boxes, and test stations made of phenolic plastic [3] [6] [_____] mm [1/8] [1/4] [_____] inch thick with dimensions as indicated. Provide insulated terminal boards with the required number of terminals (one terminal required for each conductor). Install solderless copper lugs and copper buss bars, shunts, and variable resistors on the terminal board as indicated. Permanently tag test station terminal connections to identify each termination of conductors (e.g. identify the conductors connected to the protected structure, anodes, and reference electrodes). Permanently identify conductors by means of plastic or metal tags, or plastic sleeves
to indicate termination.  [Color code each conductor as follows:
  
  Anode lead wire: black
  Structure lead wire: white
  Reference electrode lead wire: red]

2.10 CLEVIS ASSEMBLIES

Provide clevis assemblies, 6.35 mm 1/4 inch flat steel with a spool opening of 53.975 mm 2 1/8 inch, 114.3 mm 4 1/2 inch long to the centerline of the spindle.  Provide porcelain spools, with an outside diameter of 57.15 mm 2 1/4 inch and an overall height of 53.975 mm 2 1/8 inch.

2.11 PIN INSULATORS

Provide pin insulator assemblies, 100 mm 4 inches long overall and 6.35 mm 1/4 inch diameter aluminum bolt 19 mm 3/4 inch long attached to the flat end with a aluminum nut and lock washer.  Provide porcelain insulator of non-conducting material with hard glazed finish.  Provide insulator with a hole through the bottom no smaller than 13 mm 1/2 inch diameter.

2.12 HANDHOLE ASSEMBLIES

Provide aluminum handhole covers, 175 mm 7 inches in diameter and 1.588 mm 1/16 inch thick and connected to insulating rubber gasket, 175 mm 7 inches in diameter and 3.175 mm 1/8 inch thick.  Cut handholes 150 mm 6 inches in diameter.  Provide handhole assemblies with 12.7 mm 1/2 inch bolts and 6.35 mm 1/4 inch plate clamping bars.

2.13 EXOTHERMIC WELD KITS

Provide exothermic weld kits specifically designed by the manufacturer for welding the types of materials and shapes provided.

2.14 MANUFACTURER'S NAMEPLATE

Each item of equipment shall have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.15 FIELD FABRICATED NAMEPLATES

**************************************************************************
**NOTE:  Use the following paragraph where nameplates are fabricated to identify specific equipment designated on the drawings.**
**************************************************************************

ASTM D709.  Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings.  Each nameplate inscription shall identify the function and, when applicable, the position.  Nameplates shall be melamine plastic, 3 mm 0.125 inch thick, white with [black] [_____] center core.  Surface shall be matte finish.  Corners shall be square.  Accurately align lettering and engrave into the core.  Minimum size of nameplates shall be 25 by 65 mm one by 2.5 inches.  Lettering shall be a minimum of 6.35 mm 0.25 inch high normal block style.
PART 3 EXECUTION

3.1 INSTALLATION

Electrical installations shall conform to IEEE C2, NFPA 70, and to the requirements specified herein.

3.1.1 Anode Installation

**********************************************************************************

NOTE: Proprietary systems of anode installations are available for areas where icing is expected. For such areas paragraph entitled "Icing Climates" below should be included.

**********************************************************************************

[IEEE C2] [NFPA 70].

3.1.1.1 Icing Climate Requirements

Suspend anodes in a manner similar to that in non-icing climates, except provisions shall be made to prevent the anodes and suspending cables from being damaged by freezing or falling ice.

3.1.1.2 Anode Placement

Arrange anodes in the tank [and riser pipe] as shown in the drawings [so that protection can be provided to surfaces without exceeding potentials [in the vicinity of the anodes] that will be detrimental to coatings]. Suspend anodes from roof [plate] [structure] by means of factory-installed connecting wire designed to support the anodes in air [before submergence] without failure of the electrical wire insulation or the electrical conductors. Prevent contact between anode and tank surfaces such as man-access hatches, ladders, heater pipes, and stay rods.

3.1.1.3 Anode Hangers

Anode hangers shall electrically insulate the anode suspending wire from the tank steel.

3.1.1.4 Handholes

Provide a handhole having a diameter of 150 mm 6 inches in the tank roof for each anode string to permit replacement or inspection of anodes.

3.1.2 Anode Connection

**********************************************************************************

NOTE: A single split-bolt will work loose when wires it connects are moved. Minimum of two split bolts will prevent this from happening. In water tanks, split bolts are used (above water line only) because working space is limited and hydraulic or mechanical compression tools may be cumbersome and hazardous to use. At ground level or in trenches, compression tools can be used conveniently, and swedged sleeve connection produced by such tools is more reliable than split bolts.

**********************************************************************************
3.1.2.1 Anode Lead Wires

Electrically connect anodes to the positive D.C. header cable with compression connectors or split bolts, or the header cable may terminate in a junction box for connection with all anodes cables. Use a minimum of two split bolts for each connection if split bolts are used. Mark each of the wires terminating in the junction box.

3.1.2.2 Anode Header Cable

Provide header cable on the [underside of the roof] [wall] with electrically insulating hangers which enter the tank near the roof line from an externally mounted junction box. External wiring shall be in conduit. Mark each of the wires terminating in the junction box.

3.1.2.3 Splices

**************************************************************************
NOTE: Splices are not allowed below water level.
**************************************************************************

Locate under-roof electric wire splices above the high water line and seal water-tight using a minimum of two 1/2-lap layers of butyl rubber tape followed by two 1/2-lap layers of plastic tape.

3.1.3 Rectifiers

**************************************************************************
NOTE: For impressed current systems only.
**************************************************************************

3.1.3.1 Rectifier Installation

Location and mounting as indicated. Assemble and attach equipment enclosures to [wall] [post] [pad] in accordance with the manufacturer's instructions. Handle wires to prevent stretching or kinking the conductors or damaging the insulation. Use lubricants when pulling wires into conduits. Bond the equipment enclosures to a grounding electrode.

3.1.3.2 Wire-To-Tank Connections

Connect the structure wire to the tank [_____] [by use of an exothermic weld kit] [by brazing]. Clean the structure surface by scraping, filing, or wire brushing to produce a clean, bright surface. [Weld connections using the exothermic weld kits in accordance with the manufacturer's instructions. Test the integrity of the weld, prior to coating, by striking with a 908 gram two pound hammer.] [Cover connections and surrounding cleaned surface with an electrically insulating coating compatible with the existing coating.]

3.1.4 Permanent Reference Electrodes

3.1.4.1 Permanent Reference Electrode Calibration

Calibrate permanent reference electrodes against a portable electrode in the presence of the Contracting Officer or his approved representative before installation. Calibrate in a test tank containing water with the same composition as the tank to be protected. Permanent electrode shall
measure a reference potential agreeing with that measured by the portable electrode within plus or minus 0.010 volt when the sensing windows of the two electrodes being compared are not more than 2 mm 1/6 inch apart but not touching. Remove permanent reference electrodes not within this potential range from the construction site by the end of the day and replace at the Contractor's expense. The testing provision applies to replacement reference electrodes as well.

3.1.4.2 Installation

Provide permanent reference electrodes at points in the tank [and riser pipe] which monitor minimum and maximum tank[/riser]-to-water potentials[, regulate the automatic control system] [____], and maintain continuous immersion. Sensing windows of reference electrodes shall be equidistant to and located within 25 mm one inch of the steel tank[/rise pipe] surface and be fixed in position, preventing contact with tank wall or appurtenances.

3.2 BOLTED AND RIVETED TANKS

Ensure electrical continuity of joining components.

3.3 GASEOUS EVOLUTION

Provide for possible evolution of gases from anode reaction and ventilation requirements.

3.4 CRITERIA FOR CATHODIC PROTECTION

Conduct in accordance with [NACE SP0388] and [NACE SP0196].

3.4.1 Minimum

The criterion for cathodic protection shall be a negative potential of at least 0.85 volt as measured between the tank[/riser pipe] and a copper-copper sulfate reference electrode across the tank[/riser pipe] to water interface. Determination of this potential shall be made with the protective current applied to the tank [and riser] for a minimum of [24] [_____] hours. Voltage drops must be considered for valid interpretation of this voltage measurement. The method of voltage drop consideration shall be identified by the Contractor's corrosion engineer.

3.4.2 Maximum

The potential between a copper-copper sulfate reference electrode and the tank[/riser pipe] at any point shall not be more negative than a negative 1.1 volt potential taken with the [electrode located within 25 mm one inch of the tank[/riser pipe] surface but not touching it] [protective current interrupted instantaneously or modulated] to minimize the voltage drop effect.

3.5 FIELD QUALITY CONTROL

The Government reserves the right to witness tests. Notify the Contracting Officer [5] [_____] days prior to performing each field test. Quality control for the cathodic protection system shall consist of the following:

a. Initial field testing by the contractor upon construction.

b. Warranty period field testing by the Contractor.
c. Final field testing by the contractor after one year of service.

**************************************************************************
NOTE: Additional testing may be required, based upon the specific project or design. All tests listed below may not be required. Designer should consider the project requirements for selection of test procedures.
**************************************************************************

3.5.1 Destructive Testing

Perform the tests in the presence of the Contracting Officer. Include the cost of an additional anode with the longest lead wire for the destructive test in his bid. Choose one completed anode of each type with lead wires at random for destructive testing and submit to a static pull test. Conduct a lead wire pull test to confirm the minimum lead wire tensile load capacity indicated in paragraph entitled "Attachment of Anode Lead Wire" and following subparagraphs. [The anode shall also be cut into sections to verify conformance with this specification. Check such items as anode-to-wire connection, complete encapsulation of the wire connector, and wire to anode electrical resistance.] [Failure of the test anode to conform to this specification can be cause for rejecting all anodes from the same lot as the test anode. Mark all rejected anodes on the ends with a 6" high "X" using yellow spray paint. Remove all failed anodes from the job site by the end of the day. Replace any rejected anodes at contractor's expense. The destructive testing provision also applies to replacement anodes as well.]

**************************************************************************
NOTE: Paragraph entitled "Wire for Power Service" for impressed current systems only.
**************************************************************************

[3.5.2 Wire for Power Service

Test wire for power service at 600 volts or less to determine that the wiring system and equipment are free from short circuits and grounds [by a minimum of two megohms]. Perform the test with a megohmmeter having a 500-volt rating.

]3.5.3 Initial Cathodic Protection System Field Testing

Upon completion of the installation, fill tank to maximum working level, and the Contractor's corrosion engineer shall test and inspect the cathodic protection system in the presence of the Contracting Officer or his designated representative. Record test data, including date, time, and location of testing and submit to the Contracting Officer. Contractor shall correct and retest, at his expense, deficiencies in the materials and installation observed during the tests and inspections. Take measurements with voltmeters having input impedance not less than 10 megohms. Testing shall include the following:

a. Base potential tests: At least [one week] [24 hours] [_____] after the tank has been filled, but before energizing of the cathodic protection system, measure the base (native) structure-to-water potentials of the tank [and riser]. The locations of these measurements shall be identical to the locations specified for measuring energized
structure-to-water potentials.

b. Permanent reference electrode tests: Verify proper operation and calibration of the reference electrode (s) including the entire reference electrode wiring circuit. Verify calibration of the reference electrode in accordance with the paragraph entitled "Permanent Reference Electrode Calibration". [Potential differences between the two electrodes of the same generic type should not exceed [10] [15] millivolts.] [Zinc permanent reference electrodes should be within the range of minus 1000 to minus 1150 millivolts when calibrated with a copper-copper sulfate reference electrode.] Remove permanent reference electrodes not within these potential differences from the construction site by the end of the day and replace at the contractor's expense. The testing provision also applies to replacement reference electrodes as well.

******************************************************************************
NOTE: For impressed current systems only.
******************************************************************************

c. Rectifier testing: Upon completion of the installation, "Base Potential" tests, and "Permanent Reference Electrode" tests, energize and adjust the rectifier to provide current to the anode at a level that will protect the tank[/riser pipe] in accordance with the NACE criteria listed in this specification. Measure dc output of the rectifier and current output of each anode at different rectifier settings. Measure the current outputs across the installed shunts. Verify these readings using portable, calibrated meters and shunts. Testing shall demonstrate if the rectifier system is capable of functioning properly as required to provide effective cathodic protection.]

******************************************************************************
NOTE: For galvanic systems only.
******************************************************************************

d. Anode-to-water potential and anode output current tests: Upon completion of the installation, "Base Potential" tests, and "Permanent Reference Electrode" tests, measure anode-to-water potential of each anode or each anode string with the anodes disconnected. After connecting the anodes to the tank [through junction box], measure current output of each anode or anode string across the calibrated shunt.]

******************************************************************************
NOTE: For all types of cathodic protection systems.
******************************************************************************
e. Energized tank[/riser pipe]-to-water potential tests: After operation of the cathodic protection system for at least 24 hours [one week] [____], perform the tank[/riser pipe]-to-water measurements listed in the following five paragraphs with a portable reference electrode placed within 25 mm one inch of, but not touching, the tank[/riser pipe] wall and bottom surfaces and appurtenances.

(1) On a vertical line midway between two anode strings beginning at a point 305 mm one foot below water level and continuing at point 915 mm 3 feet apart until the bottom of the tank is reached.
(2) On a second vertical line midway between two anode strings on the opposite side of the tank from the first vertical line beginning at a point 305 mm one foot below water level and continuing at points 915 mm 3 feet apart until the bottom of the tank is reached.

(3) Across the bottom of the tank in a line between the two vertical lines at [915] [_____] mm [3] [_____] foot intervals.

(4) In at least [4] [_____] places which are close to anodes.

(5) On a vertical line in the riser pipe beginning at the top of the riser and continuing at [915] [_____] mm [3] [_____] foot intervals until the bottom of the riser is reached.

3.5.4 Initial Cathodic Protection System Field Test Report

Submit a field test report of the cathodic protection system. Record on applicable forms all rectifier measurements, anode output current measurements, and structure-to-electrolyte measurements, including initial potentials. Coordinate identification of rectifiers, anode junction boxes, test locations, and test stations with the as-built drawings and provide on system drawings in the report. Locate, correct, and report to the Contracting Officer any short circuits encountered during the checkout of the installed cathodic protection system.

3.5.5 One Year Warranty Period Testing

Inspect, test, and adjust the cathodic protection system [quarterly] [semi-annually] [_____] for one year, [4] [2] [_____] interim inspections total, to ensure its continued conformance with the criteria outlined below. Commence the performance period for these tests upon the completion of all cathodic protection work, including changes required to correct deficiencies identified during initial testing, and preliminary acceptance of the cathodic protection system by the Contracting Officer. The One Year Warranty Period Cathodic Protection System Field Test Report, including field data, shall be certified by the Contractor's corrosion engineer.

3.5.6 Final Field Testing

Conduct final field testing of the cathodic protection system utilizing the same procedures specified under, "Initial Cathodic Protection System Field Testing". Inspect, test, and adjust the cathodic protection system after one year of operation to ensure its continued conformance with the criteria outlined below. Commence the performance period for these tests upon the completion of all cathodic protection work, including changes required to correct deficiencies identified during initial testing, and preliminary acceptance of the cathodic protection system by the Contracting Officer. The Final Cathodic Protection System Field Test Report shall be certified by the Contractor's corrosion engineer and included as an attachment to the operation and maintenance manual in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

3.6 DEMONSTRATION

3.6.1 Instruction to Government Personnel

**************************************************************************

NOTE: There are restrictions on the type and extent of training. Training is usually on-site, 2 days or
less. Factory representatives or others provide basic instructions to facility maintenance and operation personnel. If more extensive training is required, i.e., student travel, special consultants, etc., consult the Contract Division Director and the head of the Comptroller Department for assistance.

Furnish the services of competent instructors to give full instruction to designated Government personnel in the adjustment, operation, and maintenance of the specified systems and equipment, including pertinent safety requirements as required. Instructors shall be thoroughly familiar with all parts of the installation and shall be trained in operating theory as well as practical operation and maintenance work. Instruction shall be given during the first regular work week after the equipment or system has been accepted and turned over to the Government for regular operation. Provide [8] [_____] hours of instruction for [_____] personnel.

  3.1.1 Light Sources
  3.1.2 Luminaires
  3.1.3 Suspended Luminaires
  3.1.4 Ballasts, Generators and Power Supplies
  3.1.5 Exit Signs and Emergency Lighting Units
    3.1.5.1 Exit Signs
    3.1.5.2 Emergency Lighting from Central Emergency System
  3.1.6 Photocell Switch Aiming
  3.1.7 Occupancy/Vacancy Sensors
  3.1.8 Daylight or Ambient Light Level Sensor
3.2 FIELD APPLIED PAINTING

-- End of Section Table of Contents --
NOTE: This guide specification covers lighting and lighting control system requirements for interior installations.

This specification does not cover all possible methods or requirements for interior lighting; therefore, designer should add special information required to suit a specific project. Industry publications and web sites exist to aid the designer in choosing the best lighting system for the project. These include, but are not limited to, the Illuminating Engineering Society (IES) 'HB-10-LIGHTING HANDBOOK' and 'RP-1-12 - AMERICAN NATIONAL STANDARD PRACTICE FOR OFFICE LIGHTING', NFPA 101 - 'LIFE SAFETY CODE', the DESIGNLIGHTS CONSORTIUM, US Department of Energy's FEDERAL ENERGY MANAGEMENT PROGRAM (FEMP) and ENERGY STAR program.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: In recent years, various federal energy conservation legislative requirements have been enacted which are affecting lighting design and...
luminaire specifications. The Energy Policy Act (EPACT, 2005), Executive Order 13243 (2007), and the Energy Independence and Security Act (EISA, 2007) are the most applicable examples. Also, the Federal Acquisition Regulations (FAR) Section 23 states that where life cycle cost-effective and available, Energy Star-qualified or FEMP-designated products must be specified and purchased. These energy conserving requirements and industry trends are pushing the lighting industry towards the development and use of more energy efficient technologies like solid state (or LED). While incumbent technologies like fluorescent, induction and HID are all still valid choices, LED has now been included for consideration. The designer must use his or her knowledge of light source applicability and life cycle cost-effectiveness to determine the most suitable luminaire to utilize.

NOTE: TO DOWNLOAD UFGS GRAPHICS

Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms

**************************************************************************
NOTE: This section contains the following sketches (details or plates) and are available in metric (SI) and U.S. Customary (IP) system dimensions. Sketch titles and style numbers are unchanged for both types. Do not include list of sketches, or sketches themselves, in project specifications. Use luminaire sketches as details on drawings whenever possible. If special features are required for a project, do not modify sketches, but indicate these changes on notes in luminaire schedule. The "NL" style numbers and dates must remain on the drawing details. If additional luminaire types are needed that are not covered in sketches, provide additional sketches or details on drawings, but do not label as NL sketch type.

Fixture list is now divided into 2004 sketches and 2016 sketches. Use the 2016 sketches instead of the 2004 when appropriate. Indicate on Fixture Schedule if the fixture is from the 2016 or 2004 list if the same sketch number is used.

NOTE: Do not include this index in project specification.

**************************************************************************
**************************************************************************

NOTE: Include the following information on the project drawings:

1. Luminaire schedule indicating luminaire symbol (type), NL plate and type designation, light source type and quantity, voltage, input watts, output lumens, efficacy or efficiency, BUG rating if applicable, mounting type and height, and any applicable options or notes.

2. Location and mounting height of normal lighting and emergency lighting luminaires and lighting controls for each given area or room.

3. Control strategy description for each given area or room.

4. Referenced NL plate or detail (if no NL plate is available) for each luminaire type provided.
5. All accessories required, such as mounting hardware, emergency battery back-up inverters, remote ballasts or drivers, sensors and control equipment, and central emergency system components.

6. Where wire for humid areas, rods, or straps are used (if more than one type of hanger is used).

7. EMI filters, surge suppression or shielding required.

8. Occupancy, vacancy or daylight sensor locations, mounting, and sensor technology type used.

**************************************************************************
**************************************************************************
NOTE: Demolition work that involves disposal of fluorescent and HID lamps and ballasts will require the use of Section 02 84 16 HANDLING OF LIGHTING BALLASTS AND LAMPS CONTAINING PCBs AND MERCURY.

1.2 RELATED REQUIREMENTS

Materials not considered to be luminaires or luminaire accessories are specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Luminaires and accessories mounted on exterior surfaces of buildings are specified in Section 26 56 00 EXTERIOR LIGHTING.
1.3 DEFINITIONS

a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, must be as defined in IEEE 100 and IES RP-16.

b. For fluorescent, HID and induction luminaire light sources, "Average Rated Life" is the time after which 50 percent of a large group of light sources will have failed and 50 percent will have survived under normal conditions.

c. For LED luminaire light sources, "Useful Life" is the operating hours before reaching 70 percent of the initial rated lumen output (L70) with no catastrophic failures under normal operating conditions. This is also know as 70 percent "Rated Lumen Maintenance Life" as defined in IES LM-80.

d. For fluorescent, HID and induction luminaires, "Luminaire Efficacy Rating" (LER) is the appropriate measure of energy efficiency, measured in lumens/watt. Specifically it is the luminaire's efficiency multiplied by the total rated light source lumens and the ballast factor, divided by the luminaire input watts.

e. For LED luminaires, "Luminaire Efficacy" (LE) is the appropriate measure of energy efficiency, measured in lumens/watt. This is gathered from LM-79 data for the luminaire, in which absolute photometry is used to measure the lumen output of the luminaire as one entity, not the source separately and then the source and housing together.

f. Total harmonic distortion (THD) is the root mean square (RMS) of all the harmonic components divided by the total fundamental current.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Data, drawings, and reports must employ the terminology, classifications and methods prescribed by the IES HB-10 as applicable, for the lighting system specified. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 QUALITY CONTROL

1.5.1 Luminaire Drawings
Include dimensions, accessories, and installation and construction details. Photometric data, including zonal lumen data, average and minimum ratio, aiming diagram, and computerized candlepower distribution data must accompany shop drawings.

1.5.2 Occupancy/Vacancy Sensor Coverage Layout
Provide floor plans showing coverage layouts of all devices using manufacturer's product information.

1.5.3 LED Driver and Dimming Switch Compatibility Certificate
Submit certification from the luminaire, driver, or dimmer switch manufacturer that ensures compatibility and operability between devices.
1.5.4  Luminaire Design Data

a. Provide safety certification and file number for the luminaire family that must be listed, labeled, or identified per the NFPA 70 (NEC). Applicable testing bodies are determined by the US Occupational Safety Health Administration (OSHA) as Nationally Recognized Testing Laboratories (NRTL) and include: CSA (Canadian Standards Association), ETL (Edison Testing Laboratory), and UL (Underwriters Laboratories).

b. Provide long term lumen maintenance projections for each LED luminaire in accordance with IES TM-21. Data used for projections must be obtained from testing in accordance with IES LM-80.

1.5.5  LED Luminaire - IES LM-79 Test Report

Submit test report on manufacturer's standard production model luminaire. Include all applicable and required data as outlined under "14.0 Test Report" in IES LM-79.

1.5.6  LED Light Source - IES LM-80 Test Report

Submit report on manufacturer's standard production LED light source (package, array, or module). Include all applicable and required data as outlined under "8.0 Test Report" in IES LM-80.

1.5.7  LED Light Source - IES TM-21 Test Report

Submit test report on manufacturer's standard production LED light source (package, array or module). Include all applicable and required data, as well as required interpolation information as outlined under "7.0 Report" in IES TM-21.

1.5.8  Occupancy/Vacancy Sensor Verification Tests

Submit test report outlining post-installation coverage and operation of sensors.

1.5.9  Test Laboratories

Test laboratories for the IES LM-79 and IES LM-80 test reports must be one of the following:

a. National Voluntary Laboratory Accreditation Program (NVLAP) accredited for solid-state lighting testing as part of the Energy-Efficient Lighting Products laboratory accreditation program for both LM-79 and LM-80 testing.

b. One of the qualified labs listed on the Department of Energy - LED Lighting Facts Approved Testing Laboratories List at for LM-79 testing.

c. One of the EPA-Recognized Laboratories listed at for LM-80 testing.

1.5.10  Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials,
installation, and workmanship must be in accordance with the mandatory and advisory provisions of NFPA 70, unless more stringent requirements are specified or indicated.

1.5.11 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products must have been in satisfactory commercial or industrial use for two years prior to bid opening. The two-year period must include applications of equipment and materials under similar circumstances and of similar size. The product must have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the two-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.11.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.11.2 Material and Equipment Manufacturing Date

Products manufactured more than six months prior to date of delivery to site must not be used, unless specified otherwise.

1.5.11.3 Energy Efficiency

**************************************************************************
NOTE: Meet Energy Star requirements for all lighting per EO 13123.
**************************************************************************

**************************************************************************
NOTE: The Energy Policy Act of 2005 requires new buildings to use 30 percent less energy than the 2007 ASHRAE 90.1 baseline level, or 12 percent less energy than the 2010 ASHRAE 90.1 baseline level. Efficient lighting equipment contributes to the following LEED credits: EA Prerequisite 2; EA1.
**************************************************************************

Submit data indicating lumens per watt efficacy and color rendering index of light source.

1.6 WARRANTY

Support all equipment items by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

1.6.1 LED Luminaire Warranty

a. Provide a written 5 year on-site replacement warranty for material,
fixture finish, and workmanship. On-site replacement includes transportation, removal, and installation of new products.

(1) Include finish warranty to include failure and substantial deterioration such as blistering, cracking, peeling, chalking, or fading.

(2) Material warranty must include:
   (a) All drivers.
   (b) Replacement when more than 10 percent of LED sources in any lightbar or subassembly(s) are defective or non-starting.

b. Warranty period must begin on date of beneficial occupancy. Provide the Contracting Officer with signed warranty certificates prior to final payment.

1.6.1.1 Provide Luminaire Useful Life Certificate

Submit certification from the manufacturer indicating the expected useful life of the luminaires provided. The useful life must be directly correlated from the IES LM-80 test data using procedures outlined in IES TM-21. Thermal properties of the specific luminaire and local ambient operating temperature and conditions must be taken into consideration.

PART 2 PRODUCTS

2.1 PRODUCT COORDINATION

**************************************************************************
NOTE: For the purpose of this document, interior luminaires only include those in the interior portion of buildings or facilities. Those luminaires intended to illuminate exterior areas, including those mounted on exterior walls of buildings and facilities are considered to be exterior luminaires.
**************************************************************************

Products and materials not considered to be luminaires, luminaire controls, or associated equipment are specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Luminaires, luminaire controls, and associated equipment for exterior applications are specified in Section 26 56 00 EXTERIOR LIGHTING.

2.2 LUMINAIRES

UL 1598, NEMA C82.77, and UL 8750. Provide luminaires as indicated in luminaire schedule and NL plates or details on project plans. Provide luminaires complete with light sources of quantity, type, and wattage indicated. Provide all luminaires of the same type by the same manufacturer. Luminaires must be specifically designed for use with the driver, ballast or generator and light source provided.

2.2.1 LED Luminaires

**************************************************************************
NOTE: Minimum performance requirements for LED
**************************************************************************
Luminaires meet or exceed data taken from Energy Star Program Requirements and Designlights Consortium Product Qualification Criteria.

Provide luminaires complete with power supplies (drivers) and light sources. Provide design information including lumen output and design life in luminaire schedule on project plans for LED luminaires. LED luminaires must meet the minimum requirements in the following table:

<table>
<thead>
<tr>
<th>LUMINAIRE TYPE</th>
<th>MINIMUM LUMINAIRE EFFICACY (LE)</th>
<th>MINIMUM COLOR RENDERING INDEX (CRI)</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED TROFFER -</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1 x 4300 x 1200</td>
<td>90 LPW</td>
<td>80</td>
</tr>
<tr>
<td>2 x 2600 x 600</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2 x 4600 x 1200</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LED Downlight</td>
<td>50 LPW</td>
<td>90</td>
</tr>
<tr>
<td>LED Track or Accent</td>
<td>40 LPW</td>
<td>80</td>
</tr>
<tr>
<td>LED Low Bay/High Bay</td>
<td>80 LPW</td>
<td>70</td>
</tr>
<tr>
<td>LED Linear Ambient</td>
<td>80 LPW</td>
<td>80</td>
</tr>
</tbody>
</table>

LED luminaires must also meet the following minimum requirements:

a. Luminaires must have a minimum 5 year manufacturer's warranty.

b. Luminaires must have a minimum L70[_____] lumen maintenance value of 50,000[_____] hours as calculated by IES TM-21, with data obtained per IES LM-80 requirements.

c. Luminaire drive current value must be identical to that provided by test data for luminaire in question.

d. Luminaires must be tested to IES LM-79 and IES LM-80 standards, with the results provided as required in the Submittals paragraph of this specification.

e. Luminaires must be listed with the DesignLights Consortium 'Qualified Products List' when falling into category of "General Application" luminaires, i.e. Interior Directional, Display Case, Troffer, Linear Ambient, or Low/High Bay. Requirements are shown in the Designlights Consortium "Technical Requirements Table" at https://data.energystar.gov/dataset/EPA-Recognized-Laboratories-For-Lighting-Products/jgwf-7qrr.

f. Provide Department of Energy 'Lighting Facts' label for each luminaire.

2.2.2 Fluorescent Luminaires

UL 1598. Provide linear and compact fluorescent luminaires complete with housing, ballast and light source. All fluorescent luminaires must be
equipped with electronic ballasts.

2.2.3 High Intensity Discharge (HID) Luminaires

UL 1598. Provide HID luminaires complete with housing, ballast and light source.

2.2.4 Induction Luminaires

UL 1598. Provide induction luminaires complete with housing, generator and light source.

2.2.5 Luminaires for Hazardous Locations

In addition to requirements stated herein, provide [LED,][fluorescent,][HID,][induction] luminaires for hazardous locations which conform to UL 844 or which have Factory Mutual certification for the class and division indicated.

2.3 DRIVERS, BALLASTS and GENERATORS

**************************************************************************
NOTE: Choose "drivers for LED, "ballasts" for fluorescent and HID, and "generators" for induction luminaire applications.
**************************************************************************

2.3.1 LED Drivers

NEMA SSL 1, UL 8750. LED drivers must be electronic, UL Class 1, constant-current type and comply with the following requirements:

a. Output power (watts) and luminous flux (lumens) as shown in luminaire schedule for each luminaire type to meet minimum luminaire efficacy (LE) value provided.

b. Power Factor (PF) greater than or equal to 0.9 over the full dimming range when provided.

c. Current draw Total Harmonic Distortion (THD) of less than 20 percent.

d. Class A sound rating.

e. Operable at input voltage of 120-277 volts at 60 hertz.

f. Minimum 5 year manufacturer's warranty.

g. RoHS compliant.

h. Integral thermal protection that reduces or eliminates the output power if case temperature exceeds a value detrimental to the driver.

i. UL listed for dry or damp locations typical of interior installations.

j. [Non-dimmable], [step-dimmable to 50 percent output], or fully-dimmable using 0-10V control as indicated in luminaire schedule.

**************************************************************************
NOTE: Dimmable LED drivers should usually be
specified unless specifically providing a luminaire for step-dimming only, such as in hallways or corridors. Only specify non-dimmable drivers when luminaire will be installed in an area that is specifically not going to be dimmed, such as an electrical or telecommunications room.

2.3.2 Fluorescent Electronic Ballasts

NEMA ANSLG C82.11, UL 935, CEC Title 24. Fluorescent ballasts must not contain any magnetic core and coil components, and must meet the following requirements:

a. Provide with transient protection as recommended by IEEE C62.41.1 and IEEE C62.41.2.

b. Provide UL listed Class P, "A" sound rating, with minimum power factor rating of 0.98 and minimum ballast factor rating of 0.95.

c. Be designed for the wattage and type of light source provided in the luminaire specified, and have circuit diagrams and light source connection information printed on the exterior of the ballast housing.

d. Contain no PCB's and be RoHS compliant.

e. Be manufactured in an ISO 9001 certified facility.

f. Operate at a frequency greater than 20 kHz, and have a Lamp Current Crest Factor less than 1.7.

g. Have a light regulation of plus or minus 10 percent of lumen output when operating within a plus or minus 10 percent range of input voltage.

h. Have a full replacement warranty of five years from date of manufacture.

i. Provide all fluorescent ballasts as NEMA Premium type.

NOTE: NEMA Premium ballasts should be specified when the highest-efficiency ballast is desired, and the increased cost to the project is not an issue. Initial cost increase is approximately $0.05 per square foot. These type ballasts are only available for F32/T8 light sources.

2.3.2.1 T8 Programmed[Instant]-Start Fluorescent Ballasts

NOTE: Typically, programmed-start ballasts are preferred for their longer life when switching on and off frequently compared to instant-start type. Specify instant-start type only when specifically desired by the designer.

Provide programmed[ instant]-start T8 electronic fluorescent ballasts with the following characteristics:
NOTE: Total harmonic distortion of 20 percent is acceptable for most applications.

a. Total harmonic distortion (THD): Must be [20 percent]([____ percent]) (maximum).

b. Input wattage at 120/277 volts.

[ (1) 29/28 watts (maximum) when operating one F32T8 light source
][ (2) 55/54 watts (maximum) when operating two F32T8 light sources
][ (3) 84/82 watts (maximum) when operating three F32T8 light sources
][ (4) 109/107 watts (maximum) when operating four F32T8 light sources
]

NOTE: Multilevel switching for light control is recommended for locations such as classrooms and conference rooms where multiple lighting levels are desired.

[ d. Where indicated on project drawings, provide multi-light source luminaires with two or more ballasts to accomplish the switching scenario indicated.
]

NOTE: To avoid potential maintenance problems, use following bracketed option only when requested by the activity.

[ e. A single ballast may be used to serve multiple luminaires if they are continuously mounted and factory manufactured for that installation with an integral wireway.
]

2.3.2.2 T5 (long twin tube) and T5HO Fluorescent Ballasts

a. Total harmonic distortion (THD): Not greater than[ 25 percent when operating one light source,][ 15 percent when operating two light sources,][ and][ 20 percent when operating three light sources].

b. Input wattage:

[ (1) 45 watts (maximum) when operating one F40 T-5 light source
][ (2) 74 watts (maximum) when operating two F40 T-5 light sources
][ (3) 105 watts (maximum) when operating three F40 T-5 light sources
]

NOTE: Multilevel switching for light control is recommended for some locations such as classrooms and conference rooms where multiple lighting levels are desired.
c. Provide three[ and four] light source luminaires with two ballasts per luminaire where multilevel switching is indicated.

NOTE: To avoid potential maintenance problems, use following bracketed option only when requested by the activity. Also, serving multiple luminaires from a single ballast may alter the minimum starting and operating temperature for the luminaire. Design accordingly.

[ d. A single ballast may be used to serve multiple fixtures if they are continuously mounted and factory manufactured for that installation with an integral wireway.

2.3.2.3 Compact Fluorescent Ballasts

Provide programmed-start ballasts for compact fluorescent luminaires.

2.3.2.4 Fluorescent Electronic Dimming Ballasts

NOTE: When possible, lighting designer should consider LED solid state lighting when dimming is desired. Overall cost and performance of LED dimming has become favorable over fluorescent in recent years.

Electronic dimming ballast may have the same system compatibility problems as normal light output electronic ballast when installed in certain environments. The problems mainly concern the radiated and conducted EMI due to the relatively high switching frequencies inherent in electronic ballast and possibly due to utilization of the same power source for lighting and other equipment. Environments where electronic ballasts have the potential for EMI are listed in the criteria note for electronic ballasts.

Electronic dimming ballasts as specified in the following paragraph, are for general workplace dimming and daylight harvesting for energy conservation. For architectural dimming applications with very low light levels, 100 percent to 1 percent, the specifier must review all parameters of this paragraph and ensure competitive sources.

Electronic dimming ballasts can be controlled by a number of devices: manual dimmers, occupancy sensors, light level sensor, photosensors, and timers, or with energy management systems. All control types are not specified here and the specifier must ensure system compatibility between ballast and controls.
If dimming ballast and non-dimming ballast are used in the same area, designer and specifier may need to coordinate the ballast factors at full light output.

Provide fluorescent electronic dimming ballasts with the following characteristics:

a. Comply with NEMA ANSLG C82.11, UL 935, and NFPA 70, unless specified otherwise. Provide ballast with transient immunity as recommended by IEEE C62.41.1 and IEEE C62.41.2. Provide dimming capability range from 100 to 5 percent (minimum range) of light output, flicker free. Ballast must start lamp at any preset light output setting without first having to go to full light output. Provide ballasts designed for the wattage of the light sources used in the indicated application. Provide ballasts designed to operate on the voltage system to which they are connected.

b. Provide power factor of 0.95 (minimum) at full light output, and 0.90 (minimum) over the entire dimming range.

c. Provide ballasts designed to operate at a frequency of 20,000 Hertz (minimum). Ballast must be compatible with and not cause interference with the operation of occupancy sensors or other infrared control systems. When available, provide higher operating frequency of 40,000 hertz or above.

d. Ballast factor at full light output must be between 0.85 (minimum) and 1.00 (maximum). Current crest factor must be a maximum of 1.7.

e. Provide ballast with Class P UL listing and with a sound rating of "A".

f. Provide ballast with circuit diagrams displayed on the ballast exterior.

h. Ballast must be capable of starting and maintaining operation at a minimum of minus 17 degrees C 0 degrees F unless otherwise indicated.

i. Provide ballast with total harmonic distortion (THD) of 20 percent (maximum) over the entire dimming range.

j. Ballasts for T-5 and smaller light sources must have end-of-life protection circuits as required by NEMA ANSLG C78.81 and ANSI C78.901 as applicable.

2.3.2.4.1 T-8 Lamp Ballast

Input wattage:
a. 35 watts (maximum) when operating one F32T8 light source.
b. 70 watts (maximum) when operating two F32T8 light sources.
c. 104 watts (maximum) when operating three F32T8 light sources.

2.3.3  HID Ballasts

UL 1029, NEMA ANSI/ULC C82.9, and ANSI C82.2. Provide ballast to serve one single light source.

2.3.3.1  Metal Halide Ballasts

******************************************************************************
NOTE: Provide electronic metal halide ballasts when available. Otherwise, specify constant wattage autotransformer (CWA) or high reactance/high power factor (HX/HPF), pulse-start magnetic type.
******************************************************************************

Provide ballasts designed to operate on the voltage system they are connected and in a normal ambient temperature of 40 [_____] degrees C.

2.3.3.1.1  Electronic Metal Halide Ballasts

NEMA ANSI/ULC C82.14. Electronic metal halide ballasts must meet the following minimum requirements:

a. Power factor greater than 90 percent.
b. Input voltage of 120-277 volts, plus or minus 10 percent.
c. Provide end-of-life circuitry to prevent ballast from operating if light source is inoperable, and thermal protection to prevent overheating.
d. Sound rating of A, with lamp current crest factor less than 1.5.
e. Input current total harmonic distortion less than 15 percent.
f. Minimum starting temperature of minus 22 degrees F.
g. UL listed and Restriction of Hazardous Substances Directive (RoHS) compliant.

2.3.3.1.2  Magnetic Metal Halide Ballasts

ANSI C82.4. Pulse-start constant wattage autotransformer (CWA) type must be used when available. Probe-start CWA, high reactance/high power factor (HX/HPF) or regulator type must be used when pulse-start is not available. Ballasts must meet the following minimum requirements:

a. Class H insulation rating.
b. Designed for 60,000 hours of operation at maximum rated temperature.
c. Minimum starting temperature of minus 22 degrees F.
d. Nominal ballast factor of 1.0.
e. Capacitors must have self-contained bleeder resistor as required by UL 1029.

f. House oil-filled capacitors in an aluminum or corrosion-resistant steel can and provide with quick disconnect terminals.

g. Capacitor maximum case temperature must be 194 degrees F for oil-filled and 221 degrees F for dry film type.

h. Starter/igniter must provide six months of light source open circuit operation without failure and be designed to withstand 10,000 hours of continuous pulsing.

2.3.4 Induction Generators

Generator must be connected, and operate in conjunction with an inductive power coupler or coil(s). Provide solid-state, high-frequency (200 kHz - 2.67 MHz) type, with power factor greater than 0.95, Class A sound rating, maximum input current THD of 15 percent, operating voltage of 120-277V, and a minimum starting temperature of minus 30 degrees F. Provide generator dimmable to a minimum of 50 percent light output.

2.4 LIGHT SOURCES

**************************************************************************
NOTE: The term 'light sources' is now used in place of the previously used term 'lamps' in this specification.
**************************************************************************

NEMA ANSLG C78.377, NEMA SSL 3. Provide type and wattage as indicated in luminaire schedule on project plans.

2.4.1 LED Light Sources

**************************************************************************
NOTE: A color temperature of 3500 K is standard for most applications. Make cooler or warmer selection only when specifically desired by the designer.
**************************************************************************
a. Correlated Color Temperature (CCT) of [3000]3500[4000][_____] degrees K.

b. Minimum Color Rendering Index (CRI) R9 value of 80.

**************************************************************************
NOTE: Red, green, and blue (RGB) LED technology produces an even higher CRI value than phosphor conversion (PC), and is typically more expensive.
**************************************************************************

c. High power, white light output utilizing phosphor conversion (PC) process[ or mixed system of colored LEDs, typically red, green and blue (RGB)].

d. RoHS compliant.

e. Provide light source color consistency by utilizing a binning tolerance
within a 4[_____] step McAdam ellipse.

2.4.1.1 LED Retrofit T8 Tubes

**************************************************************************
NOTE: Lighting designer must verify that ballasts in existing luminaires are either instant-start or programmed-start and that they will be compatible with replacement LED light sources being specified.
**************************************************************************

Provide linear T8 tubular LED light sources to replace fluorescent light sources in renovation or energy conservation projects. Provide only where entire luminaires are not being replaced. Light sources must be compatible with existing instant-start or programmed-start ballasts and have the following requirements:

a. Correlated Color Temperature (CCT) of [3000][3500][4000] degrees K.
b. Total Harmonic Distortion (THD) less than 20 percent, with Power Factor (PF) greater than 90 percent.
c. Minimum lumen per watt efficacy greater than 120.
d. Minimum beam angle of 180 degrees.
e. Minimum 5 year warranty.
f. Minimum Color Rendering Index (CRI) of 80.

2.4.2 Fluorescent Light Sources

**************************************************************************
NOTE: For linear luminaires, T8 light sources with CRI of 85 and CCT of 3500 degrees K are recommended for most applications.
**************************************************************************

NEMA C78.376. Fluorescent light sources must be low-mercury, energy-savings type and be compliant with the most current TCLP test procedure per ANSI/NEMA C78.LL 1256 at the time of manufacture.

2.4.2.1 Linear Fluorescent Light Sources

NEMA ANSLG C78.81. Provide linear fluorescent light sources with minimum CRI of 85[_____] and CCT of 3500[_____] degrees K.

2.4.2.1.1 T8 Linear Fluorescent Light Sources

Provide T8 light sources with medium bi-pin base, rated [17][25][32][_____] watts (maximum), [1450][2250][3100][_____] initial lumens (minimum), and with an average rated life of 30,000[_____] hours using a average three hour burn time and programmed-start ballast.

2.4.2.1.2 T5HO (High-Output) Linear Fluorescent Light Sources

Provide T5HO light sources with miniature bi-pin base, rated [24][39][54][_____] watts (maximum), [2000][3500][5000][_____] initial lumens (minimum), and with an average rated life of 30,000[_____] hours
using a three hour burn time and programmed start ballast.

2.4.2.2  Compact Fluorescent (CFL) Light Sources

**ANSI C78.901.** Provide compact fluorescent (CFL) light sources with minimum CRI of 82[_____] and CCT of 3500[_____] degrees K.

2.4.2.2.1  T5 Long Twin Tube CFL Light Source

Provide T5 Long Twin Tube CFL light sources with four pin, 2G11 base, rated [40][55][_____] watts (maximum), [3150][4000][_____] initial lumens (minimum), and with an average rated life of 20,000 [_____] hours.

2.4.2.2.2  T4 Twin Tube CFL Light Source

Provide T4 Twin Tube CFL light sources with four pin, G24q base, rated [18][26][_____] watts (maximum), [1250][1800][_____] initial lumens (minimum), and with an average rated life of 17,000 [_____] hours.

2.4.2.2.3  T4 Triple Tube CFL Light Source

Provide T4 Triple Tube CFL light sources with four pin, GX24q base, rated [32][42][_____] watts (maximum), [2400][3200][_____] initial lumens (minimum), and with an average rated life of 17,000 [_____] hours.

2.4.2.2.4  T4 Quad Tube CFL Light Source

Provide T4 Quad Tube CFL light sources with four pin, GX24q base, rated [57][70][_____] watts (maximum), [4300][5200][_____] initial lumens (minimum), and with an average rated life of 17,000 [_____] hours.

2.4.3  HID Light Sources

**ANSI C78.389.** Light sources must be compliant with the most current TCLP test procedure per NEMA C78.LL 3 at the time of manufacture.

2.4.3.1  Metal Halide Light Sources

**************************************************************************
NOTE: Metal halide light sources are available in a wide variety of configurations and wattages. Pulse start technology now covers most interior applications. Utilize ceramic light sources when available and when better color rendering is critical. Be aware that some sources are rated for only enclosed luminaires, and rated for horizontal or vertical use only. Consider re-strike time as a factor, especially when considering life safety requirements. PAR envelopes are an efficient choice for lower wattage applications, but must be specified with beam type and angle. Only the most common, higher wattage sources for interior applications are included in this specification.
**************************************************************************

**************************************************************************
NOTE: The Energy Independence and Security Act (EISA) of 2007, Title III, Subtitle B, Section 3241 limits the use of certain metal halide light sources.
and ballasts. Do not specify any of those devices in this specification.

ANSI ANSLG C78.43. Utilize only protected type light sources in open luminaires. Light sources must be specifically suited to operate in the burning position which they are installed, and have the following requirements:

a. Pulse-start, quartz metal halide light sources utilizing an [ED17] [ED28] [ED37] [_____] type, clear glass envelope; [E26 medium] [E39 mogul] [_____] base; rated at [175] [250] [350] [400] [_____] watts; minimum initial lumen value of [16,000] [23,700] [36,000] [40,000] [_____] lumens; minimum CRI of 62[_____] ; CCT of 3500[4000] [_____] degrees K; with a minimum average rated life of 15,000[20,000] [_____] hours.

b. Pulse-start, ceramic metal halide light sources utilizing a (an) [ED17] [ED23.5] [_____] type, clear[coated] glass envelope; [E26] [E39] [_____] base; rated at [70] [100] [150] [_____] watts; minimum initial lumen value of [6100] [10,000] [12,000] [_____]; minimum CRI of 80[90] [_____] ; CCT of 3000[4000] [_____] degrees K; with minimum rated life of [12,000] [10,000] [12,000] [15,000] [24,00] [_____] hours.

2.4.4 Induction Light Sources

Provide induction light sources consisting of an electrodeless, inductively-coupled, phosphor-coated fluorescent envelope, with an average rated life of 100,000 hours minimum rated using three hours operation per start. Light sources must be compliant with the most current TCLP test procedure per ANSI/NEMA C78.LL 1256 at the time of manufacture.

2.4.4.1 Circular or Rectangular Tube Style Induction Light Sources

Rated at [40] [70] [100] [150] [200] watts, with a CCT of 3500 [4100] degrees K, a minimum CRI of 80, and an initial output at 25 degrees C of [2800] [6800] [8600] [13,000] [15400] lumens.

2.4.4.2 Globe or 'A' Lamp Style Induction Light Sources

Rated at [55] [85] [165] watts, with a CCT of [2700] 3000[4000] degrees K, a minimum CRI of 80, and a Luminous Lamp Efficacy (LLE) of 78[86] lumens per watt for 3000 degrees K source.

2.5 LIGHTING CONTROLS

ASHRAE 90.1 - IP ASHRAE 189.1. Provide network certification for all networked lighting control systems and devices per requirements of DOD 8500.01 and DOD 8510.01.

2.5.1 Toggle Switches

Provide line-voltage toggle switches as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.5.2 Dimming Controllers (Dimmers)

NOTE: The majority of dimmers use either pulse width modulation (PWM) or constant current reduction.
(CCR) technology to dim light sources. PWM type dimmers are a better choice when levels lower than 40 percent are needed, because of the more precise color control. CCR type dimmers are more applicable when used with luminaires requiring UL Class 2 rated output and when stricter EMI emission requirements are required. Specify 0-10V dimming switches only when using 0-10V fluorescent ballasts and LED drivers specifically designed for, and compatible with their use.

UL 1472, UL 20, IEEE C62.41, NEMA SSL 7A. 120/277 V[0-10 V] dimmers must provide flicker-free, continuously variable light output throughout the dimming range. Provide radio frequency interference suppression integral to device. Provide dimmers utilizing [pulse width modulation (PWM)] [constant current reduction (CCR) technology]. Provide device with a vertical slider, paddle, rotary button, or toggle (with adjacent vertical slider) type control, with finish to match switches and outlets in same area. Provide back box in wall with sufficient depth to accommodate body of switch and wiring. Devices must be capable of operating at their full rated capacity regardless of being single or ganged-mounted, and be compatible with three-way and four-way switching scenarios. Dimmers must be capable of controlling [two-wire] [three-wire][0-10 volt] fluorescent ballasts or LED drivers. Ensure compatibility of dimmer with separate power packs when utilized for lighting control. Dimmers and the ballasts or drivers they control, must be provided from the same manufacturer, or tested and certified as compatible for use together. Provide NEMA SSL 7A -compliant devices.

2.5.3 Sensors for Lighting Control

NOTE: Utilize occupancy sensors when automatic turn-on and turn-off is desired. Vacancy sensors require human activation to turn on, and turn off automatically. Occupancy sensors turn on automatically when sensing movement or noise, and also turn off automatically. In general, use wallbox or ceiling-mounted sensors for most interior applications. Keep in mind wallbox mounted sensors may be ineffective when obstructions such as partitioned workstations and storage shelving exist. Use wall-mounted sensors for areas with ceilings higher than 3.6 meters 12 feet. Use high-bay sensors for areas with ceilings higher than 3.6 meters 12 feet. Where ceiling-mounted sensors are utilized, mount no closer than 1.8 meters 6 feet to the nearest HVAC supply or return diffuser. Dual technology sensors are a better choice for most applications, with PIR sensors used in small, line-of-sight spaces such as single toilets, and ultrasonic sensors used in multi-person toilets and corridors.
2.5.3.1  **Occupancy Sensors**

Provide occupancy sensors with coverage patterns as indicated on project plans. Provide no less quantity of sensors as shown on plans, but add additional sensors when required to fulfill coverage requirement for the specific model sensor provided. Sensor must be provided with an adaptive learning function that automatically sets sensor in optimum calibration in a set period of time after installation and a non-volatile memory that saves settings after a power outage. Provide sensors designed for ceiling, wall or wall-box installation as indicated. Operating voltage must be 120[277] volts.[ Operating voltage must be 24V in conjunction with a control system or separate power pack which interacts with luminaire being controlled.] Provide housing of high-impact, injection-molded thermoplastic with a multi-segmented lens for PIR and dual technology sensors. Sensor operation requires movement to activate luminaires controlled, and turns luminaires off after a set time of inactivity.[ Provide integral photocell mounted in occupancy sensor housing when indicated.]

2.5.3.1.1 Passive Infrared (PIR) Sensors

Provide ceiling or wall-mounted PIR sensors meeting the following requirements:

a. Temperature compensated, dual element sensor and a multi-element fresnel lens (Poly IR4 material).

b. Technology to optimize automatic time delay to fit occupant usage patterns.

c. No minimum load requirement for line voltage sensors and be capable of switching from zero to 800 W at 120 VAC, 50/60 Hz and from zero to 1200 W at 277 VAC, 50/60 Hz. Control voltage sensors must not exceed a maximum load requirement of 20 mA at 24VDC.

d. Time delay of five to 30 minutes in increments of five minutes with a walk through and test mode set by DIP switch.

e. LED indicator that remains active during occupancy.

f. Built-in light level sensor that is operational from 0.8 to 18 lux 8 to 180 foot-candles.

g. Coverage pattern tested to NEMA WD 7 standards.

h. Standard five year warranty and be UL listed

i. No leakage current to load when in the off mode.

2.5.3.1.2 Ultrasonic Sensors

Provide ceiling-mounted ultrasonic sensors meeting the following requirements:

a. Operate at an ultrasonic frequency of 25 kHz[40 kHz][____].

b. LED on exterior of device to indicate occupant detection.

c. Adjustable time delay period of 15 seconds to 15 minutes [____].
d. UL listed with minimum five year warranty.

[ e. Provide with isolated relay for integrating control of HVAC or other automated systems.

]2.5.3.1.3 Dual Technology Sensors

Provide dual technology sensors that meet the requirements for PIR sensors and ultrasonic sensors indicated above. If either the passive infrared or ultrasonic sensing registers occupancy, the luminaires must remain on.

2.5.3.1.4 High/Low-Bay Sensors

Provide occupancy sensors specifically designed for high/low-bay mounting application using passive infrared (PIR) technology, with the following characteristics:

a. Input voltage of 120/277 volts, at 50/60 hertz.

b. High-impact, injection-molded thermoplastic housing with interchangeable lenses for 360 degree open area coverage or narrow rectangular, warehouse aisle coverage.

c. Utilize zero-crossing circuitry to prevent damage from high inrush current and to promote long life operation.

d. Be designed to mount directly to or adjacent to high or low-bay luminaires.

e. UL listed, CEC Title 24 and ASHRAE 90.1 - IP compliant.

2.5.3.1.5 Power Packs for Sensors

UL 2043, CEC Title 24, ASHRAE 90.1 - IP. Power packs used to provide power to one or more lighting control sensors must meet the following requirements:

a. Input voltage - 120-277 VAC; output voltage - 24 VDC at 225 mA.

b. Plenum-rated, high-impact thermoplastic enclosure.

c. Utilizes zero-crossing circuitry to prevent damage from inrush current.

d. Maximum load rating of 16[_____] amps for electronic[_____] lighting loads.

e. RoHS compliant.

2.5.3.2 Vacancy Sensors

Provide vacancy sensors as indicated above under paragraph OCCUPANCY SENSORS, but with requirement of a manual operation to activate luminaires controlled. Provide automatic operation to turn luminaires off after a set period of inactivity.

2.5.4 [Lighting Contactor

NEMA ICS 2. Provide an electrically[mechanically]-held lighting contactor
housed in a NEMA 1[12][3R][4][4X][_____] enclosure conforming to NEMA ICS 6. Provide contactor with one[_____] normally-open (NO) [normally closed (NC)], single [double] pole contacts, rated 600 volts, 30 amps. Provide coil operating voltage of [24][120][277][480][_____] volts.)

2.5.5 Timeswitch

UL 917. [Provide electromechanical type timeswitch with a [24 hour][7 day][astronomic] dial [that changes on/off settings according to seasonal variations of sunset and sunrise]. Provide power to switch from integral synchronous motor with a maximum three watt rating. Rate contacts at 40 amps at 120-277 volts for general purpose loads. Provide contacts in a SPST[DPST][SPDT], [normally-open (NO)][normally-closed (NC)] configuration. [Provide switch with an automatic spring mechanism to maintain accurate time for up to 16 hours.] [Provide switch with function that allows automatic control to be skipped on certain selected days of the week.] [Provide switch with manual bypass[remote override] control function.]

[Provide electronic type timeswitch with a [24 hour][7 day][astronomic] programming function [that changes on/off settings according to seasonal variations of sunset and sunrise], providing a total of 56[_____] on/off set points. Provide [12 hour AM/PM][24 hour] type digital clock display format. Provide power outage back-up for switch for a minimum of [seven][_____] days. Provide switch capable of controlling a minimum of [1][2][4][_____] channels or loads. Rate contacts at [30][_____] amps at 120/277 volts for general purpose loads. Provide contacts in a SPST[DPST][SPDT], [normally-open (NO)][normally-closed (NC)] configuration. [Provide switch with [function that allows automatic control to be skipped on certain selected days of the week][manual bypass or remote override control][daylight savings time adjustment][additional memory module][momentary function for output contacts][ability for photosensor input].]

House timeswitch in a surface-mounted, lockable, NEMA 1[3R] enclosure constructed of painted steel or plastic polymer conforming to NEMA ICS 6.

2.5.6 Bi-Level HID Controller

UL 1598. Provide device to switch full lumen output of HID luminaires to 50 percent output upon receiving 24 VDC signal from motion sensor, photocell, or control system circuit. Provide device compatible with constant wattage autotransformer (CWA) ballasts and have maximum load rating of 1000[_____] watts. Provide controller in a NEMA 1 enclosure and mount to luminaire or adjacent ceiling structure.

2.5.7 Lighting Control Panel

**************************************************************************
NOTE: When providing a control panel that interfaces with the building automated control system, reference IES Technical Memorandum IES TM-23-11 for technical information on various protocols, architectures and topologies for such systems.
**************************************************************************

Provide an electronic, programmable lighting control panel, capable of providing lighting control with input from internal programming, digital
switches, time clocks, and other low-voltage control devices.

Enclose panel hardware in a surface-mount, NEMA 1[3R], painted, steel enclosure, with hinged, lockable access door and ventilation openings. Internal low-voltage compartment must be separated from line-voltage compartment of enclosure with only low-voltage compartment accessible upon opening of door. [Provide additional remote cabinets that communicate back to main control panel.]

Input voltage - 120/277 V, 60 Hz, with internal 24 VDC power supply.

Provide 8[16][32] single-pole latching [return to close] relays rated at [20][30] amps, [120][277] volts. [Provide provision for relays to close upon power failure that meets UL 924.]

Relay control module must operate at 24 VDC and be rated to control a minimum of 8[16][32] relays.

2.5.8 Local Area Lighting Controller

CEC Title 24 and ASHRAE 90.1 - IP compliant. Provide controller designed for single area or room with the following requirements:

a. [120][277] volt input, designed for fluorescent or LED lighting loads.

b. 2[_____] zone, with 1[2][_____] relay[s] rated 20 amps[each].

c. Provide daylight harvesting capability with full-range dimming control.

d. Inputs for occupancy sensor, photocell, and low-voltage wall switch.

[ e. Provide capability for receptacle load control.

][f. Provide full 'OFF' function with input from external time clock input.

]2.6 EXIT AND EMERGENCY LIGHTING EQUIPMENT

UL 924, NFPA 101, and NFPA 70 compliant.

2.6.1 Exit Signs

**************************************************************************
NOTE: For NAVFAC projects, provide LED type self-powered exit signs (battery backup) unless specifically instructed otherwise. Normal mode of power to these signs must be the branch circuit serving normal lighting in the same area, ahead of any local switching. The emergency mode of power is the exit sign's self-contained emergency battery pack. Provide remote-powered exit signs only when providing centrally distributed AC or DC emergency power system.
**************************************************************************

Provide exit signs consuming a maximum of five watts total.

2.6.1.1 LED Self-Powered Exit Signs

Provide in [UV-stable, thermo-plastic] [painted, die-cast aluminum] [painted
steel] housing with [UL damp label][UL wet label][using clear polycarbonate housing], configured for ceiling[wall][end] mounting. [Provide edge-lit type with clear acrylic, edge-lit face and aluminum trim having clear aluminum[white][chrome][brass][_____] finish.] Provide 150 mm 6 inch high, 19 mm 3/4 inch stroke red[green][_____] lettering on face of sign. Provide chevrons on either side of lettering to indicate direction. Provide single[double] face. Equip with automatic power failure device, test switch, and pilot light, and fully automatic high/low trickle charger in a self-contained power pack. Battery must be sealed, maintenance free nickel-cadmium type, and must operate unattended for a period of not less than five years. Emergency run time must be a minimum of 1 1/2 hours. LEDs must have a minimum rated life of 10 years. [Provide self-diagnostic circuitry integral to emergency LED driver.]

2.6.1.2 LED Remote-Powered Exit Signs

Provide as indicated above for self-powered type, but without battery and charger. Exit sign must contain provision for 120/277 VAC or 6-48 VDC input from remote source.

2.6.2 Emergency Lighting Unit (EBU)

Provide in [UV-stable, thermo-plastic][painted, die-cast aluminum][painted steel] housing with [UL damp label][UL wet label] as indicated. Emergency lighting units must be rated for 12 volts, except units having no remote-mounted lamps and having no more than two unit-mounted light sources may be rated six volts. Equip units with brown-out sensitive circuit to activate battery when input voltage falls to 75 percent of normal. Equip with two[_____] LED, MR-16[_____] type light sources, automatic power failure device, test switch, and pilot light, and fully automatic high/low trickle charger in a self-contained power pack. Battery must be sealed, maintenance free [lead-calcium][nickel-cadmium][_____] type, and must operate unattended for a period of not less than five years. Emergency run time must be a minimum of 1 1/2 hours. LEDs must have a minimum rated life of 10 years. [Provide self-diagnostic circuitry integral to emergency LED driver.]

2.6.3 LED Emergency Drivers

**************************************************************************
NOTE: Provide information on minimum total power in watts of LED(s) in emergency mode to satisfy requirements of NFPA 101, Life Safety Code.
**************************************************************************

Provide LED emergency driver with automatic power failure detection, test switch and LED indicator (or combination switch/indicator) located on luminaire exterior, and fully-automatic solid-state charger, battery and inverter integral to a self-contained housing. [Provide self-diagnostic function integral to emergency driver.] Integral nickel-cadmium[lead-calcium][_____] battery is required to supply a minimum of 90 minutes of emergency power at [5][7][10][_____] watts, [10-50][_____] VDC[compatible with LED forward voltage requirements], constant output. Driver must be RoHS compliant, rated for installation in plenum-rated spaces and damp locations, and be warranted for a minimum of five years.

2.6.4 Fluorescent Emergency Ballasts

Provide each 'system' with an automatic power failure device, test switch
operable from the exterior of the luminaire (or remotely), a pilot light visible from the exterior of the luminaire, and fully automatic solid-state charger, battery, and inverter integral to a self-contained housing.

[Provide self-diagnostic function integral to emergency ballast.] Integral nickel-cadmium[lead-calcium][_____] battery is required to supply a minimum of 90 minutes of emergency power to one[two][_____] light source[s] within luminaire at a minimum of [500][700][1200][_____] lumens output[each]. Provide open-circuit protection and time-delay function to counteract 'end-of-life' circuitry in normal power ballast from interfering with emergency ballast operation. Ballast must be RoHS compliant, rated for installation in plenum-rated spaces and damp locations, and be warranted for a minimum of five years.

[2.6.5 Self-Diagnostic Circuitry for LED and Fluorescent Emergency Drivers/Ballasts]

Provide emergency lighting unit with fully-automatic, integral self-testing/diagnostic electronic circuitry. Circuitry must provide for a one minute diagnostic test every 28 days, and a 30 minute diagnostic test every six months, minimum. Any malfunction of the unit must be indicated by LED(s) visible from the exterior of the luminaire. A manual test switch must also be provided to perform a diagnostic test at any given time.

[2.6.6 Central Emergency Lighting System]

**************************************************************************
NOTE: Show clearly on project drawings extent and zoning of central emergency system.
**************************************************************************

Provide integrally-housed emergency system rated at [_____] VA/watts, 120[277] volts (input and output), for a minimum period of 90 minutes. Output frequency must be a pure sine wave at 60 hertz, with maximum 5 percent total harmonic distortion. Provide system with minimum short circuit rating required for protection against available fault current.

2.6.6.1 System Operation

During normal power operation, system charges batteries as needed and allows normal power to pass through to load. Upon loss of normal power, system automatically transfers to emergency mode without interruption of connected loads. Internal batteries provide a minimum of 90 minutes of emergency power at this time. Upon normal power being restored, system switches back to normal power mode and fully charges batteries within UL-approved time period.

2.6.6.2 Battery Charger

Solid state, monitored, three step float charging type, keeping batteries in a fully charged state. Provide circuitry to prevent deep discharge of batteries in prolonged power outage conditions.

2.6.6.3 Batteries

Provide sealed, lead calcium type, designed to operated unattended without maintenance, for a minimum of 10 years.
2.6.6.4 Enclosure

2.6.6.5 Accessories

Provide [_____] single pole, [_____] ampere output circuit breakers. [Voltmeter and ammeter for battery[load].]

2.7 LUMINAIRE SUPPORT HARDWARE

2.7.1 Wire

ASTM A641/A641M; Galvanized, soft tempered steel, minimum 2.7 mm 0.11 inches in diameter, or galvanized, braided steel, minimum 2 mm 0.08 inches in diameter.

2.7.2 Wire for Humid Spaces

**************************************************************************
NOTE: Select stainless steel or nickel copper alloy wire for facilities where high humidity can be expected such as large kitchens, dishwashing areas, etc. Use nickel copper alloy when hangars are used in indoor pool environments. When spacing of hangar wires exceeds 1200 mm 4 feet or when heavy luminaires are supported, specify eight or 10 gauge wire.
**************************************************************************

ASTM A580/A580M; Composition 302 or 304, annealed stainless steel, minimum 2.7 mm 0.11 inches in diameter.

ASTM B164; UNS NO4400, annealed nickel-copper alloy, minimum 2.7 mm 0.11 inches in diameter.

2.7.3 Threaded Rods

Threaded steel rods, 4.76 mm 3/16 inch diameter, zinc or cadmium coated.

2.7.4 Straps

Galvanized steel, 25 by 4.76 mm one by 3/16 inch, conforming to ASTM A653/A653M, with a light commercial zinc coating or ASTM A1008/A1008M with an electrodeposited zinc coating conforming to ASTM B633, Type RS.

2.8 POWER HOOK LUMINAIRE HANGERS

UL 1598 Provide an assembly consisting of through-wired power hook housing, interlocking plug and receptacle, power cord, and luminaire support loop. Power hook housing must be cast aluminum having two 19 mm 3/4 inch threaded hubs. Support hook must have safety screw. Fixture support loop must be cast aluminum with provisions for accepting 19 mm 3/4 inch threaded stems. Power cord must include 410 mm 16 inches of 3 conductor No. 16 Type S0 cord. Assembly must be rated 120 volts or 277 volts, 15 amperes.
2.9 EQUIPMENT IDENTIFICATION

2.9.1 Manufacturer's Nameplate

Each item of equipment must have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.9.2 Labels

**************************************************************************

NOTE: Labeling of lighting components is an inexpensive and effective method for helping facilities personnel properly operate and maintain the lighting systems. The labels must be easy to read when standing next to the equipment, and durable to match the life of the equipment to which they are attached.

**************************************************************************

Provide labeled luminaires in accordance with UL 1598 requirements. All luminaires must be clearly marked for operation of specific light sources and ballasts, generators or drivers. Note the following light source characteristics in the format "Use Only _____":

a. Light source diameter code (T-4, T-5, T-8), tube configuration (twin, quad, triple), base type, and nominal wattage for fluorescent and compact fluorescent luminaires.

b. Light source type, wattage, envelope type (ED17, BD56, etc.) and coating (clear or coated) for HID luminaires.

c. Start type (programmed start, instant start) for fluorescent and compact fluorescent luminaires.

d. ANSI ballast type (M98, M57, etc.) for HID luminaires.

e. Correlated color temperature (CCT) and color rendering index (CRI) for all luminaires.

All markings related to light source type must be clear and located to be readily visible to service personnel, but unseen from normal viewing angles when light sources are in place. Ballasts, generators or drivers must have clear markings indicating multi-level outputs and indicate proper terminals for the various outputs.

2.10 FACTORY APPLIED FINISH

**************************************************************************

NOTE: This paragraph covers only the basic painting requirements for most electrical equipment. Include any special finishes for high or low temperatures and corrosive atmospheres.

**************************************************************************

Provide all luminaires and lighting equipment with factory-applied painting system that as a minimum, meets requirements of NEMA 250 corrosion-resistance test.
2.11 RECESS- AND FLUSH-MOUNTED LUMINAIRES

Provide access to lamp and ballast from bottom of luminaire. Provide trim (and lenses) for the exposed surface of flush-mounted luminaires as indicated on project drawings and specifications.

2.12 SUSPENDED LUMINAIRES

**************************************************************************
NOTE: Coordinate pendant sway bracing details with the architect. The architect may prefer to provide pendant sway bracing details in locations where appearance is important. Specify shock absorbing hangers for luminaires in certain hazardous locations if indicated. Specify swivel hangers to satisfy antiterrorist/force protection requirements.
**************************************************************************

Provide hangers capable of supporting twice the combined weight of luminaires supported by hangers. Provide with swivel hangers to ensure a plumb installation. Provide cadmium-plated steel with a swivel-ball tapped for the conduit size indicated. Hangers must allow fixtures to swing within an angle of 0.79 rad 45 degrees. Brace pendants 1219 mm 4 feet or longer to limit swinging. Single-unit suspended luminaires must have twin-stem hangers. Multiple-unit or continuous row luminaires must have a tubing or stem for wiring at one point and a tubing or rod suspension provided for each unit length of chassis, including one at each end. Provide rods in minimum 4.57 mm 0.18 inch diameter.

PART 3 EXECUTION

3.1 INSTALLATION

Electrical installations must conform to IEEE C2, NFPA 70, and to the requirements specified herein. Install luminaires and lighting controls to meet the requirements of ASHRAE 90.1 - IP and ASHRAE 189.1. To encourage consistency and uniformity, install luminaires of the same manufacture and model number when residing in the same facility or building.

3.1.1 Light Sources

**************************************************************************
NOTE: Indicate all light source descriptive information in the luminaire schedule on the project drawings.
**************************************************************************

When light sources are not provided as an integral part of the luminaire, deliver light sources of the type, wattage, lumen output, color temperature, color rendering index, and voltage rating indicated to the project site and install just prior to project completion, if not already installed in the luminaires from the factory.

3.1.2 Luminaires

**************************************************************************
NOTE: The electrical designer must coordinate these requirements with architectural plans and
**************************************************************************
specifications. Ensure requirements for antiterrorism/force protection for luminaires in suspended ceilings are included in and coordinated with Section 09 51 00 ACOUSTICAL CEILINGS by referencing ASTM E580 seismic requirements in that section.

Luminaires for facilities located in earthquake zones must have additional supports and restraining devices as described in UFC 1-200-01, "General Building Requirements, with Change 1" and UFC 3-310-04, "Seismic Design for Buildings".

Set luminaires plumb, square, and level with ceiling and walls, in alignment with adjacent luminaires and secure in accordance with manufacturers' directions and approved drawings. Installation must meet requirements of NFPA 70. Mounting heights specified or indicated must be to the bottom of the luminaire for ceiling-mounted luminaires and to center of luminaire for wall-mounted luminaires. Obtain approval of the exact mounting height on the job before commencing installation and, where applicable, after coordinating with the type, style, and pattern of the ceiling being installed. Recessed and semi-recessed luminaires must be independently supported from the building structure by a minimum of four wires, straps or rods per luminaire and located near each corner of the luminaire. Ceiling grid clips are not allowed as an alternative to independently supported luminaires. Round luminaires or luminaires smaller in size than the ceiling grid must be independently supported from the building structure by a minimum of four wires, straps or rods per luminaire, spaced approximately equidistant around. Do not support luminaires by acoustical tile ceiling panels. Where luminaires of sizes less than the ceiling grid are indicated to be centered in the acoustical panel, support each independently and provide at least two 19 mm 3/4 inch metal channels spanning, and secured to, the ceiling tees for centering and aligning the luminaire. Provide wires, straps, or rods for luminaire support in this section. Luminaires installed in suspended ceilings must also comply with the requirements of Section 09 51 00 ACOUSTICAL CEILINGS.

3.1.3 Suspended Luminaires

NOTE: Coordinate pendant sway bracing details with the architect. The architect may prefer to provide pendant sway bracing details in locations where appearance is important.

Provide suspended luminaires with 0.79 rad 45 degree swivel hangers so that they hang plumb and level. Locate so that there are no obstructions within the 0.79 rad 45 degree range in all directions. The stem, canopy and luminaire must be capable of 0.79 rad 45 degree swing. Pendants, rods, or chains 1.2 meters 4 feet or longer excluding luminaire must be braced to prevent swaying using three cables at 2.09 rad 120 degree separation. Suspended luminaires in continuous rows must have internal wireway systems for end to end wiring and must be properly aligned to provide a straight and continuous row without bends, gaps, light leaks or filler pieces. Utilize aligning splines on extruded aluminum luminaires to assure minimal hairline joints. Support steel luminaires to prevent "oil-canning" effects. Luminaire finishes must be free of scratches, nicks, dents, and
warps, and must match the color and gloss specified. Match supporting pendants with supported luminaire. Aircraft cable must be stainless steel. Canopies must be finished to match the ceiling and must be low profile unless otherwise shown. Maximum distance between suspension points must be 3.1 meters 10 feet or as recommended by the manufacturer, whichever is less.

3.1.4 Ballasts, Generators and Power Supplies

Typically, provide ballasts, generators, and power supplies (drivers) integral to luminaire as constructed by the manufacturer.

3.1.5 Exit Signs and Emergency Lighting Units

******************************************************************************
NOTE: Use this paragraph for most projects.
The bracketed subparagraphs must only be used in special cases such as where energy monitoring systems are used, where facilities use breakers as switches, and where central emergency systems are used. In these cases emergency lighting may have to be on separate circuits rather than connected ahead of the local switching.
******************************************************************************

Wire exit signs and emergency lighting units ahead of the local switch, to the normal lighting circuit located in the same room or area.

[3.1.5.1 Exit Signs

******************************************************************************
NOTE: Use this subparagraph only in special cases and as indicated in the above referenced note.
******************************************************************************

Connect exit signs on separate circuits and serve from [an emergency panel][a separate circuit breaker][a fused disconnect switch]. Provide only one source of control, which would be [the circuit breaker in the emergency panel][the separate circuit breaker][the fused disconnect switch]. Paint source of control red and provide lockout capability.

][3.1.5.2 Emergency Lighting from Central Emergency System

******************************************************************************
NOTE: Use this subparagraph only for projects utilizing a central emergency system. Include zone control details of emergency system on project drawings when used.
******************************************************************************

Connect emergency lighting from a central emergency system as indicated on the project drawings.

]3.1.6 Photocell Switch Aiming

Aim switch according to manufacturer's recommendations.
3.1.7 Occupancy/Vacancy Sensors

**************************************************************************
NOTE: Include sensor testing requirement here when project does not include a separate commissioning specification. When it does, provide sensor testing requirements in the commissioning specification.
**************************************************************************

Provide testing of sensor coverage in all spaces where sensors are placed. This should be done only after all furnishings (carpet, furniture, workstations, etc.) have been installed. Provide quantity of sensor units indicated as a minimum. Provide additional units to give full coverage over controlled area. Full coverage must provide hand and arm motion detection for office and administration type areas and walking motion for industrial areas, warehouses, storage rooms and hallways. Locate the sensor(s) as indicated and in accordance with the manufacturer's recommendations to maximize energy savings and to avoid nuisance activation and deactivation due to sudden temperature or airflow changes and usage.

3.1.8 Daylight or Ambient Light Level Sensor

Locate sensor as indicated and in accordance with the manufacturer's recommendations. Adjust sensor for 300 lux 30 foot-candles or for the indicated light level measured at the work plane for that particular area.

3.2 FIELD APPLIED PAINTING

**************************************************************************
NOTE: Use and coordinate paint and coating requirements with Section 09 90 00 PAINTS AND COATINGS when provided in the job. If Section 09 90 00 PAINTS AND COATINGS is not provided or when requirements are beyond what is specified in Section 09 90 00 PAINTS AND COATINGS, specify the requirements in this paragraph.
**************************************************************************

Paint lighting equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Provide painting as specified in Section 09 90 00 PAINTS AND COATINGS.

-- End of Section Table of Contents --
NOTE: This guide specification covers requirements for interior lighting installations. Requirements for materials and procedures for special or unusual design should be added as necessary to fit specific projects.

Emergency lighting and exit signs are covered in Section 26 52 00.00 40 EMERGENCY LIGHTING. Lighting control devices are covered in the Section 26 09 23.00 40 LIGHTING CONTROL DEVICES.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: In compliance with Executive Order 12902 and FAR 23.704 Electronic Products Environmental Assessment Tool, which directs federal agencies to purchase products in the upper 25 percent of energy efficiency, the following products specified in this section meet or exceed the U.S. Department of Energy, Federal Energy Management Program (DOE/FEMP) Product Energy Efficiency Recommendations (PEER) for the Recommended energy efficiency levels.
This specification contains products recommended by FEMP. The following recommendations are currently on the FEMP site on the internet. Additional recommendations may be added or existing recommendations updated at any time.

To view the latest on-line information about buying energy efficient products go to the FEMP home page at:
http://www1.eere.energy.gov/femp/technologies/procuring_eeproducts.html

**************************************************************************

**NOTE: TO DOWNLOAD UFGS GRAPHICS**

Go to

**************************************************************************

**NOTE: This site contains lighting fixture sketches (Graphics) and are available in metric (SI) and U.S. Customary (IP) system dimensions. Sketch titles and style numbers are unchanged for both types. The metric values indicated are a conversion of the IP system dimensions.**

Do not include list of sketches, or sketches themselves, in project specifications. Use lighting fixture sketches as details on drawings whenever possible. If special features are required for a project, do not modify sketches, but indicate these changes on notes in fixture schedule. The "NL" style numbers and dates should remain on the drawing details.

**************************************************************************

**NOTE: Show the following information on project drawings:**

1. Type, style, mounting, and lamp arrangement
2. Location of fixtures
3. Wattage, voltage, and frequency rating required
4. Type of reflector, diffuser required
5. Glass/plastic lens
6. Accessories required, such as photocell, time switches, sensors, and auxiliary lamps

7. Mounting height above floor or grade to bottom of fixture

8. Where wire for humid areas, rods, or straps are used (if more than one type of hanger is used)

9. Reflecting or nonreflecting surface finish

10. Shielding required

11. Referenced sketch

12. NEMA distribution type (when applicable)

13. Occupancy sensor location, mounting, and sensor detection type

**************************************************************************

NOTE: Demolition work that involves disposal of fluorescent and HID lamps and ballasts requires the use of Section 02 84 16 HANDLING OF LIGHTING BALLASTS AND LAMPS CONTAINING PCBs AND MERCURY.

**************************************************************************

PART 1 GENERAL

Lighting fixtures and accessories mounted on exterior surfaces of buildings are specified in this section.

Materials not considered to be lighting equipment or lighting fixture accessories are specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************
The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM B633 (20152019) Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel

CALIFORNIA ENERGY COMMISSION (CEC)

CEC Title 24 (2016) Building Energy Efficiency Standards For Residential and Nonresidential Buildings
ILLUMINATING ENGINEERING SOCIETY (IES)

IES HB-10 (2011; Errata 2015) IES Lighting Handbook

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

ANSI ANSLG C78.41 (2016) Electric Lamps--Guidelines for Low-Pressure Sodium Lamps

ANSI ANSLG C78.42 (2009; R 2016) For Electric Lamps: High-Pressure Sodium Lamps

ANSI C78.901 (2016) Electric Lamps - Single Base Fluorescent Lamps--Dimensional and Electrical Characteristics

ANSI C82.4 (2017) Lamp Ballasts - Ballasts for High-Intensity-Discharge and Low-Pressure Sodium Lamps

NEMA 250 (2018) Enclosures for Electrical Equipment (1000 Volts Maximum)
1.2 DEFINITIONS

a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE Stds Dictionary.

b. Average life is the time after which 50 percent has failed and 50 percent has survived under normal conditions.

c. Total harmonic distortion (THD) is the root mean square (RMS) of all the harmonic components divided by the total fundamental current.

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Pre-Installation Meetings

Within [30] [_____] days of Contract Award, the Contracting Officer may schedule a Pre-Installation meeting. Submit the following for review and approval:
a. Local/Regional Materials Documentation
b. Environmental Data
c. Energy Efficiency Data
d. Operational Service

Submit documentation that includes contact information, summary of procedures, and the limitations and conditions applicable to the project. Indicate manufacturer's commitment to reclaim materials for recycling and/or reuse.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only or as
otherwise designated. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Employ the terminology, classifications, and methods prescribed by the IES HB-10, as applicable, for the lighting system specified in data, drawings, and reports.

**SD-02 Shop Drawings**

- **Commercial Incandescent Lighting Fixtures** [G,[___]]
- **Industrial Incandescent Lighting Fixtures** [G,[___]]

SD-04 Samples

**************************************************************************
NOTE: Samples involve additional shipping cost. Use only for special fixtures on a project. If samples are not essential to the specific application, delete them.
**************************************************************************

Lighting Fixtures

SD-07 Certificates

Energy Star Documentation

SD-10 Operation and Maintenance Data

Operational Service

1.5 QUALITY ASSURANCE

1.5.1 Lighting Fixtures, Complete with Lamps and Ballasts

**************************************************************************
NOTE: Delete this paragraph if samples are not required.
**************************************************************************

Delete bracketed options if samples are required for all fixture types. Choose bracketed options only if samples of some fixtures are required. Indicate in the fixture schedule on the drawings which fixture types require samples or specify using the last bracketed sentence.

**************************************************************************
Submit one sample of each indicated fixture type complete with lamps and ballast, for inspection, review, and approval. Retain the sample for comparison against the remainder of the fixtures. The sample may be used in the final fixture installation. Provide samples for the following fixture types indicated on the drawings: [____].

]1.5.2 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.3 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal
material, design and workmanship, which have been in satisfactory commercial or industrial use for 2-years prior to bid opening. The 2-year period includes applications of equipment and materials under similar circumstances and of similar size, on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.3.1 Alternative Qualifications

Products having less than a 2-year field service record are acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.3.2 Material and Equipment Manufacturing Date

Do not use products manufactured more than 3-years prior to date of delivery to site, unless specified otherwise.

1.5.4 Sustainable Design Requirements

[1.5.4.1 Local/Regional Materials Documentation

**************************************************************************

NOTE: Using local materials can help minimize transportation impacts, including fossil fuel consumption, air pollution, and labor.

This is optional for Army projects.

**************************************************************************

[ Use materials or products extracted, harvested, or recovered, as well as manufactured, within a [800][_____] kilometer [500][_____]-mile radius from the project site, if available from a minimum of three sources.

] Submit documentation indicating distance between manufacturing facility and the project site. Indicate distance of raw material origin from the project site. Indicate relative dollar value of local/regional materials to total dollar value of products included in project.

][1.5.4.2 Environmental Data

**************************************************************************

NOTE: ASTM E2129 provides for detailed documentation of the sustainability aspects of products used in the project. This level of detail may be useful to the Contractor, Government, building occupants, or the public in assessing the sustainability of these products.

This is optional for Army projects.

**************************************************************************

Submit Table 1 of ASTM E2129 for the following products: [____].
1.5.5 Energy Efficiency Data

**************************************************************************
NOTE: Meet Energy Star requirements for all lighting per EO 13123.
**************************************************************************

**************************************************************************
NOTE: The Energy Policy Act of 2005 requires new buildings to use 30 percent less energy than the ASHRAE 90.1 level. Efficient lighting equipment contributes to the following LEED credits: EA Prerequisite 2; EA1.
**************************************************************************

Comply with National Energy Policy Act and Energy Star requirements for lighting products. [Submit Energy Star documentation for qualifying equipment. ]Include data indicating lumens per watt efficiency and color rendition index of light source.

Ensure lighting designs utilize Spectrally Enhanced Lighting (SEL) in designs for application in which the IES Illuminance Category is P or Higher. In this application the lamp color is a minimum 82 CRI and 5000K CCT for fluorescent lamps. For the purpose of these calculations, the reference S/P value is 1.4. Submit a sample calculation utilizing the S/P value for the specified lamps to provide a factor for lighting reduction below IES recommendations. Light levels can not go below the IES recommended levels.

Submit equipment and performance data for incandescent lighting fixtures.

1.6 WARRANTY

Support the equipment items with service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

1.6.1 Electronic Ballast Warranty

**************************************************************************
NOTE: The warranty clause in this section has been approved by a Level 1 Contracting Officer, and may be used without further approval or request for waiver.
**************************************************************************

Furnish the electronic ballast manufacturer's warranty, for not less than 5-years from the date of manufacture of the electronic ballast. Ballast assembly in the lighting fixture, transportation, and on-site storage is not to exceed 12-months, thereby permitting 4-years of the ballast 5-year warranty to be in service and energized. State in the warranty that the manufacturer agrees to exchange a malfunctioning ballast and promptly ship the replacement to the using Government facility, said replacement ballast being identical to, or an improvement upon, the original design of the malfunctioning ballast.
PART 2 PRODUCTS

2.1 DESIGN REQUIREMENTS

Furnish lighting fixtures completely assembled with wiring and mounting devices and ready for installation at the locations noted. Design and equip recessed fixtures in suspended ceilings for installation in the type of ceiling in which the fixture is installed. Design fixtures to be supported independent of the ceiling. Equip fixtures with the lamps required.

Ensure lighting fixtures conform to UL 1598. Ensure fixtures in hazardous areas conform to UL 844.

2.2 COMPONENTS

2.2.1 Fluorescent Lighting Fixtures

2.2.1.1 Fluorescent Lamp Electronic Ballasts

**************************************************************************
NOTE: Electronic ballasts may have system compatibility problems when installed in certain environments. The problems mainly concern the radiated and conducted EMI due to the relatively high switching frequencies inherent in electronic ballasts and possibly due to utilization of the same power source for lighting and other equipment. Shielding technologies today can prevent interference with surroundings, and therefore this is rarely an issue. Environments where electronic ballasts have the potential for EMI are:

1. Libraries or other facilities which utilize magnetic detectors to prevent theft or inventory control. However, it has been reported that electronic ballasts have no impact on the magnetic detectors if the separation distance is greater than 3050 to 4575 mm 10 to 15 feet. This includes distances in all directions through floors, ceilings, and walls.

2. Facilities using high frequency power line carrier (PLC) control systems, such as a central clock system. These PLC systems usually have a 50,000 Hz to 200 kHz carrier frequency which may be affected by the harmonics generated by the electronic ballasts.

3. Areas where sensitive electronic equipment is installed such as hospital critical care units, other areas utilizing sensitive electronic equipment based life support systems, and electronic testing facilities.

With proper design considerations, electronic ballasts should provide satisfactory performance even in these and other sensitive areas. The designer must consider fixture location, fixture
performance characteristics, manufacturers' recommendations, environmental constraints, etc. in the lighting design. Edit this specification as required to solve specific design problems.

Submit fluorescent electronic ballasts catalog data. As an option, submit the fluorescent fixture manufacturer's electronic ballast specification information in lieu of the actual ballast manufacturer's catalog data. Include published specifications and sketches. This information may be supplemented by catalog data if required, containing a list of vendors with vendor part numbers.

Provide electronic ballasts, meeting as a minimum, the following characteristics:

a. Provide ballasts complying with UL 935, NEMA ANSI C82.11, NFPA 70, and CEC Title 24 unless specified otherwise. Ensure transient immunity as recommended by IEEE C62.41.1 and IEEE C62.41.2 by providing 100 percent electronic high frequency type ballasts with no magnetic core and coil components. Design ballast for the wattage of the lamps used in the indicated application. Design ballasts to operate on the voltage system to which they are connected.

b. A power factor of 0.95 (minimum).

c. Operates at a frequency of 20,000 Hertz (minimum), and is compatible with and not cause interference with the operation of occupancy sensors or other infrared control systems. Provide ballasts operating at or above 40,000 Hertz where available.

d. Light regulation of plus or minus 10 percent lumen output with a plus or minus 10 percent input voltage regulation. Ensure ballasts have 10 percent flicker (maximum) using any compatible lamp.

e. A ballast factor between 0.77 (minimum) and 1.00 (maximum). Current crest factor - 1.7 (maximum).

f. UL listed Class P with a sound rating of "A."

g. Include circuit diagrams and lamp connections displayed on the ballast.

**************************************************************************

NOTE: Choose the bracketed option and require programmed start ballasts for Army and Air Force projects.

For Navy projects, provide instant start ballasts for areas not subject to frequent switching (i.e., more than once every three hours). Provide programmed start ballasts for areas subject to frequent switching, including all areas controlled by occupancy sensors. Identify fixtures requiring each type on the drawings.

**************************************************************************

h. Provide instant start ballasts unless otherwise indicated, with programmed start where indicated. Provide instant start ballasts which operate lamps in a parallel circuit configuration that permits...
the operation of remaining lamps if one or more lamps fail or are
removed.][  Provide programmed start ballast unless otherwise
indicated.][  Programmed start ballasts may operate lamps in a series
circuit configuration. Provide series/parallel wiring for programmed
start ballasts where available.

i. Provide programmed start ballasts for compact fluorescent fixtures.

j. Provide ballasts for T-5 and smaller lamps with end-of-life protection
circuits as required by NEMA ANSI C78.81 and ANSI C78.901 as
applicable.

**************************************************************************

NOTE: A source of light other than fluorescent is
recommended for areas subject to temperatures below
-17 degrees C, 0 degrees F.
**************************************************************************

k. Provide ballasts capable of starting and maintaining operation at a
minimum of -17 degrees C 0 degrees F unless otherwise indicated.

l. Provide electronic ballasts with a full replacement warranty of 5 years
from date of manufacture as specified in paragraph ELECTRONIC BALLAST
WARRANTY," of this section.

Provide T-8 Lamp Ballast with the following characteristics:

**************************************************************************

NOTE: Total harmonic distortion of 20 percent is
acceptable for most applications.
**************************************************************************

a. Provide T-8 electronic ballasts compatible with the specific amp
wattages being driven.

b. For T-8 lamps with 30 watts or lower, provide ballasts with
anti-striation technology.

c. Total harmonic distortion (THD):  [20 percent][[____] percent]
(maximum).

d. Input wattage.

[  (1) 32 watts (maximum) when operating one F32T8 lamp
][  (2) 62 watts (maximum) when operating two F32T8 lamps
][  (3) 92 watts (maximum) when operating three F32T8 lamps
][  (4) 114 watts (maximum) when operating four F32T8 lamps
]

**************************************************************************

NOTE: Multilevel switching for light control is
recommended for some locations, such as classrooms
and conference rooms where multilevel switching is
desired.
**************************************************************************

e. Ballast efficacy factor.
(1) 2.54 (minimum) when operating one F32T8 lamp

(2) 1.44 (minimum) when operating two F32T8 lamps

(3) 0.93 (minimum) when operating three F32T8 lamps

(4) 0.73 (minimum) when operating four F32T8 lamps

[f. Provide three[ and four] lamp fixtures with two ballasts per fixture where multilevel switching is indicated.

**************************************************************************
NOTE: To avoid potential maintenance problems, use following bracketed option only when requested by the activity.
**************************************************************************

g. A single ballast may be used to serve multiple fixtures if they are continuously mounted and factory manufactured for that installation with an integral wireway.

] Provide F17T8 Lamp Ballast with a total harmonic distortion (THD) of 25 percent (maximum).

Provide T-5 and T-5 HO Ballast compatible with the specific amp wattages being driven. Ensure total harmonic distortion (THD) is 15 percent (maximum).

a. Input wattage:

(1) 45 watts (maximum) when operating one F40 T-5 lamps

(2) 74 watts (maximum) when operating two F40 T-5 lamps

(3) 105 watts (maximum) when operating three F40 T-5 lamps

2.2.1.2 Fluorescent Lamp Electronic Dimming Ballast

**************************************************************************
NOTE: Electronic dimming ballast may have the same system compatibility problems as normal light output electronic ballast when installed in certain environments. The problems mainly concern the radiated and conducted EMI due to the relatively high switching frequencies inherent in electronic ballast and possibly due to utilization of the same power source for lighting and other equipment. Environments where electronic ballast have the potential for EMI are listed in the criteria note for electronic ballast.

Electronic dimming ballasts as specified in the following paragraph, are for general workplace dimming and daylight harvesting for energy conservation. For architectural dimming applications with very low light levels, 100 percent to 1 percent, review all parameters of this paragraph and ensure competitive sources.
Electronic dimming ballasts can be controlled by a number of devices: manual dimmers, occupancy sensors, light level sensor, photosensors, and timers, or with energy management systems. All control types are not specified here; ensure system compatibility between ballast and controls.

If dimming ballast and non-dimming ballast are used in the same area, designer and specifier may need to coordinate the ballast factors at full light output.

**************************************************************************

Provide electronic ballasts meeting the following minimum characteristics:

a. Ensure compliance with NEMA ANSLG C82.11, UL 935, and NFPA 70, unless specified otherwise. Provide transient immunity as recommended by IEEE C62.41.1 and IEEE C62.41.2. Ballast dimming capability range - from 100 to 5 percent (minimum range) of light output, flicker free, and starts lamp at any preset light output setting without first having to go to full light output. Design ballast for the wattage of the lamps used in the indicated application. Design ballasts to operate on the voltage system to which they are connected.

b. Power factor of 0.95 (minimum) at full light output, and 0.90 (minimum) over the entire dimming range.

c. Ballast operates at a frequency of 20,000 Hertz (minimum). Ballast is compatible with and not cause interference with the operation of occupancy sensors or other infrared control systems. Provide ballasts operating at or above 40,000 Hertz where available.

d. Ballast factor at full light output is between 0.85 (minimum) and 1.00 (maximum). Current crest factor is 1.7 (maximum).

e. UL listed Class P with a sound rating of "A".

f. Display circuit diagrams and lamp connections on the ballast.

g. Provide dimming ballast compatible with specified lighting control system.

**************************************************************************

NOTE: A source of light other than fluorescent is recommended for areas subject to temperatures below -17 degrees C, 0 degrees F.

**************************************************************************

h. Ballast is capable of starting and maintaining operation at a minimum of 17 degrees C 0 degrees F unless otherwise indicated.

i. Total harmonic distortion (THD): 20 percent (maximum) over the entire dimming range.

j. Provide ballasts for T-5 and smaller lamps with end-of-life protection circuits as required by NEMA ANSLG C78.81 and ANSI C78.901 as applicable.

For T-8 Lamp Ballast, the input wattage for the indicated lamp quantity is:
a. 35 watts (maximum) when operating one F32T8 lamp.

b. 70 watts (maximum) when operating two F32T8 lamps.

c. 104 watts (maximum) when operating three F32T8 lamps.

[2.2.1.3 Fluorescent Electromagnetic Ballasts

**************************************************************************

NOTE: Generally, electromagnetic ballasts should not be specified. Include this paragraph only for specific project requirements. Include this paragraph if any of the optional subparagraphs are used. Delete last two sentences when only compact fluorescent fixtures paragraph is used.

**************************************************************************

Ensure ballasts conform to UL 935. Provide high power factor type ballasts (0.9 minimum), unless indicated otherwise, designed to operate on the voltage system to which they are connected. Ensure ballasts are Class P and have sound rating "A" unless otherwise noted. Design and construct fixtures and ballasts to limit the ballast case temperature to 90 degrees C 195 degrees F when installed in an ambient temperature of 40 degrees C 105 degrees F. Provide energy saving electromagnetic ballasts for T-8 and T-12 lamps. Provide three lamp fixtures with two ballasts per fixture.

a. Electromagnetic Energy-Saving Ballasts

**************************************************************************

NOTE: Energy-saving ballasts are generally not available for low temperature applications (below 10 degrees C 50 degrees F). Additionally, the combination of energy-saving ballasts and energy-saving lamps are not recommended below 15 degrees C 60 degrees F.

**************************************************************************

NOTE: Include last bracketed sentence and use 123 input wattage in lieu of 136, when required by the Post or Base or Activity involved.

**************************************************************************

Ensure ballasts conform to ANSI C82.1. Provide energy-saving fluorescent ballasts of the CBM certified full light output type, except where fixtures are provided with low temperature ballasts, with an average input wattage of 40 or less when operating one 32-watt F32T8 lamp or 109 or less when operating two 32-watt F32T8 lamps or 59-watt F96T8 lamps or less when operating two lamps tested in accordance with ANSI C82.2 methods. Provide ballasts which are compatible with energy-saving lamps.

b. Provide electromagnetic ballasts for compact fluorescent lamps.

c. Electromagnetic Low Temperature Ballasts

**************************************************************************
NOTE: A source of light other than fluorescent is recommended for areas subject to temperatures below -17 degrees C, 0 degrees F. If fluorescent fixtures are required, low temperature ballasts should be indicated and specified where ambient temperatures may normally drop below 10 degrees C 50 degrees F if required by the design. Low temperature ballasts are not CBM certified and do not conform to ANSI C82.1.

Provide fluorescent ballasts having a minimum starting temperature of [minus 17 degrees C][ minus 28 degrees C][ zero degrees F][ minus 20 degrees F] for 800 milliampere, high output (HO) lamps in fixtures mounted[ in cold rooms,][ outdoors,][ in unheated buildings,][ and as indicated].

2.2.1.4 Fluorescent Lamps

NOTE: Fluorescent lamps with minimum CRI of 82 and correlated color temperature of 5000 K are recommended for most applications.

Low mercury lamps must be specified on projects that use 1220 mm 4-foot lamps and are located in the continental United States. For other locations or lamp types, the specifier must ensure availability of the low mercury lamps.

[ a. Provide T-8 rapid start[ low mercury] lamps rated 32 watts (maximum), 2800 initial lumens (minimum), CRI of 82 (minimum), correlated color temperature of [5000 K][______], with an average rated life of 20,000 hours.[ Provide low mercury lamps which have passed the EPA Toxicity Characteristic Leachate Procedure (TCLP) for mercury by using the lamp sample preparation procedure described in ANSI/NEMA C78.LL 1256.]

] [b. Provide T-8 rapid start lamp, 17 watt (maximum), nominal length of 610 mm 24 inches, 1300 initial lumens, CRI of 82 (minimum), correlated color temperature of [5000 K][______], and an average rated life of 20,000 hours.

] [c. Provide T-8 instant start lamp, 59 watts (maximum), nominal length of 2438 mm 96 inches, minimum CRI of 82, 5700 initial lumens, correlated color temperature of [5000 K][______], and average rated life of 15,000 hours.

] [d. Provide T-12 slim line lamps rated 60 watts (maximum), 5750 initial lumens (minimum), 12,000 hours average rated life.

] [e. Provide T-8, U shaped fluorescent lamp, 31 watts maximum, 2600 initial lumens (minimum), [5000 K][______], 82 CRI (minimum), 20,000 hours average rated life,[ 41.29 mm][______] mm ([______] inch)] [1.625][______] inch leg spacing.

] [f. Provide compact fluorescent lamps: CRI 82, minimum, [5000 K][______], 10,000 hours average rated life, and as follows:

(1) T-4, twin tube, rated[ 5 watt, 250 initial lumens (minimum)][ 7
watts, 400 initial lumens (minimum),][ 9 watts, 600 initial lumens (minimum),][ and][ 13 watts, 825 initial lumens (minimum),][ as indicated].

(2) T-4, double twin tube, rated[ 13 watts, 900 initial lumens (minimum),][ 18 watts, 1200 initial lumens (minimum),][ and][ 26 watts, 1800 initial lumens (minimum),][ as indicated].

] Average rated life is based on 3 hours operating per start.

2.2.1.5 Compact Fluorescent Fixtures

Provide compact fluorescent fixtures manufactured specifically for compact fluorescent lamps with ballasts integral to the fixture. Providing assemblies designed to retrofit incandescent fixtures is prohibited except when specifically indicated for renovation of existing fixtures. Provide fixtures using lamps as indicated, with a minimum CRI of 80.

a. Bare Bulb Retrofits

Replace 40-watt incandescent bulbs (495 plus lumens) with 11- to 14-watt compact fluorescent bulbs (45 plus lumens per watt). Replace 60-watt incandescent bulbs (900 plus lumens) with 15- to 19-watt compact fluorescent bulbs (60 plus lumens per watt). Replace 75-watt incandescent bulbs (1200 plus lumens) with 20- to 25-watt compact fluorescent bulbs (60 plus lumens per watt). Replace 100-watt incandescent bulbs (1750 plus lumens) with 29-watt or greater compact fluorescent bulbs (60 plus lumens per watt).

b. Reflector Type Bulb Retrofits

Replace 50-watt incandescent bulbs (550 plus lumens) with 17- to 19-watt compact fluorescent bulbs (33 plus lumens per watt). Replace 60-watt incandescent bulbs (675 plus lumens) with 20- to 21-watt compact fluorescent bulbs (40 plus lumens per watt). Replace 75-watt incandescent bulbs (875 plus lumens) with 22-watt or greater compact fluorescent bulbs (40 plus lumens per watt).

2.2.1.6 Open-Tube Fluorescent Fixtures

******************************************************************************
NOTE: Select one of bracketed options where lamp breakage is detrimental, such as above food counters.
******************************************************************************

Provide with self-locking sockets, or lamp retainers (two per lamp).[ Provide lamps with shatter resistant coating, non-yellowing, nominal thickness of 0.38 mm 15-mils, and with 97 percent (minimum) light transmission.][ Provide a clear polycarbonate protective sleeve with end caps, over lamp, with 95 percent (minimum) light transmission. Rate the sleeve to withstand the thermal profile of the lamp and ballast.]

2.2.1.7 Air Handling Fixtures

Provide fixtures used as air handling registers conforming to the requirements of NFPA 90A. Ensure that T8 lamps used in air handling fixtures are a minimum of 32 watts.
[2.2.1.8  Electromagnetic Interference Filters]

**************************************************************************
NOTE: Use filters only when specifically required by activity. Filters available for mounting within lighting fixtures provide only basic interference suppression. For shielded enclosures and secure facilities, provide power line filters in the circuits serving the lighting.
**************************************************************************

Provide filters in each fluorescent fixture mounted in shielded enclosures where indicated. Provide filters integral to the fixture assembly with one filter per ballast and suppress electromagnetic interference in the AM radio band from 500 to 1700 kHz. Install filters in the circuit serving the lighting fixtures mounted where indicated.

2.2.2  High-Intensity-Discharge (Hid) Lighting Fixtures

Ensure conformance with UL 1598. Provide HID fixtures with tempered glass lenses when using metal-halide lamps.

2.2.2.1  HID Ballasts

Provide HID ballasts conforming to UL 1029 and ANSI C82.4, with a constant wattage autotransformer (CWA) or regulator, high power factor type (minimum 90 percent). Provide single-lamp ballasts which have a minimum starting temperature of minus 30 degrees C minus 22 degrees F. Provide ballasts:

a. Designed to operate on the voltage system to which they are connected.

b. Designed for installation in a normal ambient temperature of [40][_____] degrees C [105][_____] degrees F.

c. Constructed so that open circuit operation does not reduce the average life.

Provide high-pressure sodium (HPS) ballasts with a solid-state igniter/starter with an average life in the pulsing mode of 3500 hours at the intended ambient temperature. Igniter case temperature is not to exceed 90 degrees C 195 degrees F in any mode.

2.2.2.2  High-Pressure Sodium (HPS) Lamps

ANSI ANSLG C78.42 wattage as indicated. 150 watt lamps, if required, are 55 volt type.

[ a. Standby HPS Lamps

**************************************************************************
NOTE: Dual ARC tube HPS Lamps may, under certain conditions be used as auxiliary stand-by lighting when momentary power interruptions are anticipated.
**************************************************************************

Provide standby HPS lamps with two arc tubes and an average rated life of 40,000 hours (minimum), and hot restart instant lumen output of 8 percent, minimum, of total light output.
b. Luminaire Efficiency Rating (LER)

(1) Upward efficiency of 0 percent

(a) 150-399 watts: Minimum 58 LER for closed fixture; minimum 68 for open fixture

(b) 400-999 watts: Minimum 63 LER for closed fixture; minimum 84 for open fixture

(2) Upward efficiency of 1 percent-10 percent

(a) 150-399 watts: Minimum 64 LER for closed fixture; minimum 63 for open fixture

(b) 400-999 watts: Minimum 82 LER for closed fixture; minimum 89 for open fixture

(c) 1000 plus watts: Minimum 109 LER for open fixture

(3) Upward efficiency of 11 percent to 20 percent

(a) 150-399 watts: Minimum 78 LER for open fixture

(b) 400-999 watts: Minimum 94 LER for open fixture

(4) Upward efficiency greater than 20 percent

(a) 150-399 watts: Minimum 75 LER for closed fixture; minimum 77 for open fixture

2.2.2.3 Low-Pressure Sodium Lamps

**************************************************************************
NOTE: Use low-pressure sodium where color rendition is not a factor, but high lamp efficiency is.
**************************************************************************

Ensure LPS lamps conform to ANSI ANSLG C78.41.

2.2.2.4 Metal-Halide Lamps

**************************************************************************
NOTE: Metal-halide lamp safe operation requires lamps to be turned off at least 15 minutes per week or lamp may rupture near the end of its expected life. Lamp rupture may discharge glass and extremely hot quartz (greater than 900 degrees C) into the surrounding area. Therefore, designs for metal-halide lamps include weekly turnoff instructions when continuously operated, 24 hours per day, 7 days per week. Detail these instructions on the drawings for posting at the control locations. For indoor use, color rendition index (CRI) and color temperature (CCT) may need to be specified.
**************************************************************************

[ Provide double-ended, 70 watt lamps, conforming to ANSI C78.1381.]
2.2.3 Incandescent Lighting Fixtures

Use of incandescent lamps and fixtures is prohibited, unless specifically indicated otherwise. Ensure fixtures conform to UL 1598.

2.2.3.1 Incandescent Lamps

Provide the number, type, and wattage indicated.

2.2.4 Commercial Incandescent Lighting Fixtures

Submit manufacturer's catalog data for commercial incandescent lighting fixtures.

Commercial incandescent lighting fixtures include recessed, surface mounted, and pendant-mounted luminaires.

Provide [corrosion-resistant nonferrous metal] [sheet steel with corrosion-resistant finish] metal parts of fixtures. Do not use solder or self-threading sheet metal screws in the construction of the fixture enclosure.

Equip fixtures rated up to and including 300 watts with medium screw-base lampholders. Equip fixtures rated in excess of 300 watts but not more than 1,500 watts with mogul screw-base lampholders. Provide screw shells of lampholders, which are electrically connected to the metal part of lighting fixtures, or equipment grounding-circuit conductor.
2.2.4.1 Surface-Mounted Fixtures

Design the surface-mounted fixtures to be fastened to wall or ceiling flush-mounted outlet boxes. Do not subject combustible ceiling materials to temperatures in excess of 90 degrees C 195 degrees F.

2.2.4.2 Recessed Fixtures

Design recessed fixtures in suspended ceilings for the type of ceiling construction in which the fixture is installed. Do not subject combustible ceiling materials to temperatures in excess of 90 degrees C 195 degrees F. Where recessed fixtures are supported on suspended ceilings, provide a minimum of four support rods per fixture with no support further than [150] [_____] millimeter [6] [_____] inches from the edge of the fixture. Do not support fixtures by acoustic panels.

2.2.4.3 Pendant-Mounted Fixtures

2.2.5 Industrial Incandescent Lighting Fixtures

Submit manufacturer's catalog data for industrial incandescent lighting fixtures.

Provide industrial incandescent lighting fixtures with industrial porcelain-enameled seamless dome reflectors. Use ventilated necks and hoods tapped for 15 millimeter 1/2 inch conduit for swivel suspension pendant mounting. Provide lampholders with medium or mogul bases as applicable, furnished with incandescent lamps having the wattage rating indicated. Ensure lampholders meet the requirements of UL 1598. Provide reflectors and sockets as a unit, that are detachable without the use of tools, but arranged so that they cannot inadvertently come loose.

2.2.6 Enclosed And Gasketed Vapor-Tight Fixtures

Submit manufacturer's catalog data for enclosed and gasketed vapor-tight fixtures.

Provide enclosed and gasketed vapor-tight fixtures suitable for wet or damp locations consisting of a cast-aluminum body, cap or matching outlet box, porcelain lampholder, glass enclosing globe, cork gaskets, and cast-aluminum guards for wall, ceiling, or pendant mounting in accordance with UL 1598 and NFPA 70.

Furnish exposed cast aluminum outlet boxes for wall- and ceiling-mounted fixtures with four tapped hubs, 90 degrees apart circumferentially, with three cast-aluminum threaded pipe plugs to fit the tapped holes. Provide boxes with ears or lugs for surface mounting to wall or ceiling. Provide body with mounting screws and gasket to ensure a vapor-tight joint between the body and outlet box.

Concealed outlet boxes for wall- and ceiling-mounted fixtures may be standard sheet metal boxes. Provide fixture body with mounting screws and
gasket to ensure a vapor-tight joint between the body and outlet box.

Seal body and cap for pendant-mounted fixtures with a gasket at the joint. Provide cast aluminum cap with top hub tapped for 15 millimeter 1/2-inch tapered iron pipe threads.

Furnish cast aluminum exposed outlet boxes for pendant-mounted fixtures with the fixtures with four tapped hubs, 90 degrees apart circumferentially, with three cast-aluminum threaded pipe plugs to fit the tapped holes. Supply boxes with ears or lugs for surface mounting to the ceiling. Provide cast aluminum outlet-box covers for concealed and exposed outlet boxes with the center hub tapped for 15 millimeter 1/2-inch tapered iron pipe threads. Provide cover and outlet box with mounting screws and gasket to ensure a vapor-tight joint between the cover and outlet box. Provide 15 millimeter 1/2-inch galvanized rigid steel conduit stem.

Provide clear nondiffusing heat-resistant glass enclosing globe, molded in one piece into a cylindrical shape, with a closed bowl-shaped bottom and an open molded top bead or thread. Make edges of the open end either ground or molded to a smooth, true surface that ensures a vapor-tight joint when the globe is fastened to the gasketed body.

Provide a cast-aluminum guard of the same shape as the glass enclosing globe which is affixed to the fixture body with threads or setscrews.

2.2.7 Incandescent Lamps

Submit manufacturer's catalog data for incandescent lamps.

Provide [clear] [frosted inside] general-purpose lamps. Provide lamps with wattage ratings up to and including 300 watts with medium brass screw bases. Provide lamps with wattage ratings in excess of 300 watts with mogul brass screw bases.

Special-purpose lamps include PAR and R lamps. Provide PAR lamps with clear, molded, heat-resistant, hard-glass bulbs with a parabolic, aluminized, inner-bulb wall reflector for spot- or flood-lighting applications. Provide R lamps with clear, soft, blown-glass bulbs with silver-deposited, inner-bulb wall reflector for spot or floodlighting applications. Design lamps for operation on 120 volts.

2.2.8 Recess- And Flush-Mounted Fixtures

Provide type that can be relamped from the bottom, with access to ballast from the bottom, with trim for the exposed surface of flush-mounted fixtures as indicated.

2.2.9 Suspended Fixtures

**************************************************************************

NOTE: Coordinate pendant sway bracing details with the architect. The architect may prefer to provide pendant sway bracing details in locations where appearance is important. Specify shock absorbing hangers for fixtures in certain hazardous locations if indicated. Specify swivel hangers to satisfy antiterrorist/force protection requirements.

**************************************************************************
Install hangers capable of supporting twice the combined weight of fixtures supported by hangers. Provide with swivel hangers to ensure a plumb installation. Use cadmium-plated steel hangers with a swivel-ball tapped for the conduit size indicated. Provide shock-absorbing type hangers where indicated. Provide hangers which allow fixtures to swing within an angle of 0.79 rad (45 degrees). Brace pendants 1219 mm (4-feet) or longer[ provided in shops or hangers] to limit swinging. Provide single-unit suspended[ fluorescent] fixtures with twin-stem hangers. Provide multiple-unit or continuous row fluorescent fixtures with tubing or stem for wiring at one point and a tubing or rod suspension provided for each unit length of chassis, including one at each end. Provide rods with a minimum 4.57 mm (0.18-inch) diameter.

[2.2.10 Fixtures For Hazardous Locations]

Provide[ fluorescent][ HID][ incandescent] fixtures for hazardous locations which conform to UL 844 or which have Factory Mutual certification for the class and division indicated. Ensure fixtures conform to UL 1598 for marine environments as indicated.

2.3 EQUIPMENT

2.3.1 Equipment Identification

2.3.1.1 Manufacturer's Nameplate

Provide each item of equipment with a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place. The nameplate of the distributing agent is not acceptable.

2.3.1.2 Labels

**************************************************************************
NOTE: Labeling of lighting components is an inexpensive and effective method for helping facilities personnel properly operate and maintain the lighting systems. Provide easily readable labels when standing next to the equipment, and durable to match the life of the equipment to which they are attached. Refer to the FEMP guidelines for lighting at http://www1.eere.energy.gov/femp/regulations/notices_rules.html
**************************************************************************

Provide labeled luminaires in accordance with UL 1598 requirements. Clearly mark all luminaires for operation of specific lamps and ballasts according to proper lamp type. Note the following lamp characteristics in the format "Use Only [____]":

a. Lamp diameter code (T-4, T-5, T-8, T-12), tube configuration (twin, quad, triple), base type, and nominal wattage for fluorescent and compact fluorescent luminaires.

b. Lamp type, wattage, bulb type (ED17, BD56, etc.) and coating (clear or coated) for HID luminaires.

c. Start type (preheat, rapid start, instant start) for fluorescent and compact fluorescent luminaires.
d. ANSI ballast type (M98, M57, etc.) for HID luminaires.

e. Correlated color temperature (CCT) and color rendering index (CRI) for all luminaires.

Ensure all markings related to lamp type are clear and located where they are readily visible to service personnel, but unseen from normal viewing angles when lamps are in place. Clearly mark ballasts indicating multi-level outputs and indicate proper terminals for the various outputs.

2.3.2 Power Hook Fixture Hangers

Provide UL listed assembly including through-wired power hook housing, interlocking plug and receptacle, power cord, and fixture support loop. Provide power hook housing of cast aluminum having two 19 mm 3/4-inch threaded hubs, including support hook with safety screw. Provide fixture support loop of cast aluminum with provisions for accepting 19 mm 3/4-inch threaded fixture stems. Include with a power cord 410 mm 16-inches of 3 conductor No. 16 Type SO cord. Provide complete assembly rated[ 120 volts or 277 volts, 15 amperes][ 480 volts, 20 amperes].

2.3.3 Auxiliary Instant-On System

**************************************************************************
NOTE: Specify auxiliary quartz or compact fluorescent system for luminaries where extinguishing of HID lamps caused by momentary power interruptions is unacceptable for safety or security reasons, and inclusion of a central emergency system is beyond the project scope.
**************************************************************************

Provide an UL listed, automatically switched, instant-on [____][150][250] watt[ quartz][ compact fluorescent] lamp. [Quartz][Compact fluorescent] lamp is to come on when the luminaire is initially energized and following a momentary power outage. The lamp is to remain on until the HID lamp reaches approximately 60 percent light output. Design wiring for[ quartz][compact fluorescent] lamp internal to the ballast and independent of the incoming line voltage to the ballast.[ Provide instant-on[ quartz][compact fluorescent] system for each HID fixture.][ Provide instant-on[quartz][compact fluorescent] system as indicated.]

2.3.4 Support Hangers for Lighting Fixtures in Suspended Ceilings

2.3.4.1 Wires

**************************************************************************
NOTE: Select zinc-coated steel wire for all locations except those listed in the note in paragraph WIRES, FOR HUMID SPACES. When spacing of hanger wires exceeds 1219 mm 4 feet or when heavy lighting fixtures are supported, 8 or 10 gage wire should be specified.
**************************************************************************

Use wires that are: galvanized regular coating, soft temper, [2.68 mm ][____] mm ([____] inches) [0.1055][____]-inches in diameter ([12][____] gage). Ensure wires conform to ASTM A641/A641M.
[2.3.4.2 Wires, for Humid Spaces

NOTE: Select stainless steel or nickel copper alloy wire for facilities where high humidity can be expected such as large kitchens, dishwashing areas, etc. Select nickel copper alloy when hangers are used in an indoor pool environment. When spacing of hanger wires exceeds 1219 mm 4 feet or when heavy lighting fixtures are supported, 8 or 10 gage wire should be specified.

[ Ensure wires conform to ASTM A580/A580M, with composition 302 or 304 steel, and annealed stainless steel [2.68 mm][[_____] mm] [0.1055][_____]-inches in diameter ([12][_____] gage).

][Ensure wires conform to ASTM B164, with UNS NO4400, annealed nickel-copper alloy [2.68 mm][[_____] mm] [0.1055][_____]-inches in diameter ([12][_____] gage).

][2.3.4.3 Straps

NOTE: Normally wire hangers should be used. If the project is in an area subject to violent storms, steel strap or rod hangers should be specified. Check with area Engineering Office to determine if straps or rods are needed.

Provide galvanized steel, 25 by 4.76 mm 1 X 3/16-inch straps, conforming to ASTM A653/A653M, with a light commercial zinc coating, or conform to ASTM A1008/A1008M with an electrodeposited zinc coating conforming to ASTM B633, Type RS.

][2.3.4.4 Rods

NOTE: Normally wire hangers should be used. If the project is in an area subject to violent storms, steel straps or rod hangers should be specified. Check with area Engineering Office to determine if straps or rods are needed.

Provide zinc or cadmium coated, threaded, steel rods, 4.76 mm 3/16-inch diameter.

][2.3.5 Factory Applied Finish

NOTE: This paragraph covers only the basic painting requirements for most electrical equipment. Include any special finishes for high or low temperatures and corrosive atmospheres.
Provide electrical equipment with factory-applied painting systems which, as a minimum, meet the requirements of the NEMA 250 corrosion-resistance test.

2.4 ACCESSORIES

2.4.1 Lowering Devices For High-Bay Lighting Fixtures

Submit manufacturer's catalog data for lowering devices for high-bay lighting fixtures.

Provide lowering devices for high-bay lighting fixtures consisting of a hand-operated mechanism that connects, disconnects, raises and lowers the lighting fixture to permit the servicing and maintenance of fixtures and equipment at floor level. Include with the lowering device: hangers, pulleys, beam clamps or suspension fittings, operating cable, hand chain, and cable and chain fittings.

Provide open face pulleys with cast-aluminum alloy housings and deep-grooved pulley wheels closely shrouded to prevent lines from becoming wedged between wheel and housing. Design pulleys to be straight through for top and bottom mounted operating cables and corner type as required. Hinge top mounted pulleys with mounting lugs. Provide fixed bottom mounted pulleys with mounting lugs. Bolt all pulleys to the supporting structure. Support horizontal runs of operating cable with pulleys located not more than 10700 [_____] millimeter [35] [_____]-feet apart.

Provide cast-aluminum-alloy housings conforming to ASTM B26/B26M.

Provide malleable-iron fittings conforming to ASTM A47/A47M, and hot-dip galvanized coatings conforming to ASTM A123/A123M.

2.4.1.1 Contact Assembly

Provide hangers consisting of a two-piece latching spring-loaded mechanism with an upper and lower separable contact assembly and stem and guide assembly, with cast-aluminum protective housings. Provide contacts for two-pole, single 2-wire circuits, and four-pole for 3- and 4-wire circuits rated 15 amperes at 600 volts and 30 amperes at 250 volts ac.

Include with upper contact assembly an integrally mounted corner pulley with threaded hub for electrical-conduit connections and a top flange with [lugs] [ears] for mounting.

Include with lower contact assembly fixture adapters and swivel end fittings for anchoring operating cable in the stem of the hanger, with adapters of hot-dip galvanized malleable iron.

2.4.1.2 Lockbox

Include with terminal fittings an enclosed lockbox with hub, tapped for 20 millimeter 3/4-inch conduit, flared conduit end fitting, pulley wheel, locking hooks, and hinged cover with provisions for padlocking.

Provide cast-aluminum alloy lockbox and cover, with the flared conduit end fitting of hot-dip galvanized malleable iron.

Mount wall mounted lockbox not less than 1100 [_____] millimeter and not more than 1370 [_____] millimeter [43] [_____]-inches and not more than
2.4.1.3 Cable/Chain

Provide 3 millimeter 1/8-inch diameter operating cable, 7 by 19 stranded, heat- and corrosion-resistant steel aircraft cable with link, cable loops, and serving sleeves. Preform cable with detachable fittings designed for connection to the terminal fittings. Ensure cable conforms to ASTM A368.

Provide hand chains which are separate detachable hand lines to provide means for disconnecting, lowering, raising, and reconnecting fixtures. Provide hand chain equal in length to the mounting height of the fixture and equipped with a snap hook for connection to the terminal end of the operating cable, size 4, hot-dip galvanized steel, conforming to ASTM A467/A467M, Class MS machine, straight link, steel chain.

PART 3   EXECUTION

3.1 PREPARATION

3.1.1 Field Applied Painting

******************************************************************************
NOTE: Use and coordinate paint and coating requirements with Section 09 90 00 PAINTS AND COATINGS when provided in the job. If Section 09 90 00 PAINTS AND COATINGS is not provided or when requirements are beyond what is specified in Section 09 90 00 PAINTS AND COATINGS, specify the requirements in this paragraph.
******************************************************************************

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Specify painting in Section 09 90 00 PAINTS AND COATINGS.

3.2 INSTALLATION

Ensure all electrical installations conform to IEEE C2, NFPA 70, and to the requirements specified herein.

3.2.1 Lamps

******************************************************************************
NOTE: Indicate all lamp types and colors on the lighting fixture schedule.
******************************************************************************

Deliver lamps to the project in the original cartons. Install just prior to project completion. Replace lamps installed and used for working light during construction prior to turnover to the Government if more than 15 percent of their rated life has been used. Test the lamps for proper operation prior to turn-over and replace if necessary with new lamps from the original manufacturer. Provide 10 percent spare lamps of each type from the original manufacturer.
3.2.2 Lighting Fixtures

NOTE: Coordinate these requirements with architectural plans and specifications. Ensure requirements for antiterrorism/force protection for fixtures in suspended ceilings are included in and coordinated with Section 09 51 00 ACOUSTICAL CEILINGS by referencing ASTM E580/E580M seismic requirements in that section.

Design lighting fixtures for facilities located in earthquake zones with additional supports and restraining devices as described in Army TI809-04, "Seismic Design for Buildings."

Set lighting fixtures plumb, square, and level with ceiling and walls, in alignment with adjacent lighting fixtures. Secure fixtures in accordance with manufacturers' directions and approved drawings, in conformance with the requirements of NFPA 70. Mounting heights specified or indicated are to the bottom of fixture for ceiling-mounted fixtures and to center of fixture for wall-mounted fixtures. Obtain approval of the exact mounting for lighting fixtures on the job before commencing installation and, where applicable, after coordinating with the type, style, and pattern of the ceiling being installed. Independently support recessed and semi-recessed fixtures from the building structure by a minimum of four wires[ or straps][ or rods] per fixture and locate near each corner of each fixture. Ceiling grid clips are not allowed as an alternative to independently supported light fixtures. Independently support round fixtures smaller in size than the ceiling grid from the building structure by a minimum of four wires[ or straps][ or rods] per fixture spaced approximately equidistant around the fixture. Do not support fixtures by ceiling acoustical panels. Where fixtures of sizes less than the ceiling grid are indicated to be centered in the acoustical panel, support such fixtures independently and provide at least two 19 mm 3/4 inch metal channels spanning, and secured to, the ceiling tees for centering and aligning the fixture. Provide wires[ or straps][ or rods] for lighting fixture support in this section. Lighting fixtures installed in suspended ceilings are to comply with the requirements of Section 09 51 00 ACOUSTICAL CEILINGS.

3.2.3 Suspended Fixtures

NOTE: Coordinate pendant sway bracing details with the architect. The architect may prefer to provide pendant sway bracing details in locations where appearance is important.

Provide suspended fixtures with 0.79 rad 45 degree swivel hangers so that they hang plumb and locate with no obstructions within the 0.79 rad 45 degree range in all directions. Provide the stem, canopy and fixture capable of a 0.79 rad 45 degree swing. Brace pendants, rods, or chains 1.2 meters 4-feet or longer excluding fixture, to prevent swaying, using three cables at 2.09 rad 120 degree separation. Provide suspended fixtures in continuous rows with internal wireway systems for end to end wiring and properly aligned to provide a straight and continuous row without bends, gaps, light leaks or filler pieces. Use aligning splines on extruded
aluminum fixtures to assure hairline joints. Support steel fixtures to prevent "oil-canning" effects. Ensure fixture finishes are free of scratches, nicks, dents, and warps, and matching the color and gloss specified. Finish pendants to match furniture. Select aircraft cable made from stainless steel. Install canopies finished to match the ceiling and are low profile unless otherwise shown. Ensure maximum distance between suspension points is 3.1 meters 10-feet or as recommended by the manufacturer, whichever is less.

[3.2.4] Ballasts

[3.2.4.1] Remote Ballasts

Mount remote type ballasts or transformers, where indicated, in a well ventilated, easily accessible location, within the maximum operating distance from the lamp, as designated by the manufacturer.

[3.2.4.2] Electronic Dimming Ballasts

Provide all electronic dimming ballasts, controlled by the same controller, from the same manufacturer. Season or burn in all fluorescent lamps on electronic dimming ballast control at full light output for 100 hours before dimming.

[3.3] FIELD QUALITY CONTROL

Upon completion of installation, verify that equipment is properly installed, connected, and adjusted. Conduct an operating test to show that equipment operates in accordance with requirements of this section.

3.3.1 Electronic Dimming Ballast

Test for full range of dimming capability. Observe for visually detectable flicker over full dimming range.

3.4 FIELD TESTING

Demonstrate that all incandescent lighting fixtures and their accessories, including lowering devices, operate satisfactorily in the presence of the Contracting Officer.

Perform operational tests in the presence of the Contracting Officer and in accordance with referenced standards in this section.

3.5 MAINTENANCE

**************************************************************************
NOTE: Require O&M manuals for lighting control systems that use low voltage control circuits. Example: Light level sensors used with dimming ballast, or occupancy sensors used with power packs.
**************************************************************************

Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA and as specified herein, showing all light fixtures, control modules, control zones, occupancy sensors, light level sensors, power packs, dimming ballasts, schematic diagrams and all interconnecting control wire, conduit, and associated hardware.
Submit documentation that includes contact information, summary of procedures, and the limitations and conditions applicable to the project. Indicate manufacturer's commitment to reclaim materials for recycling and/or reuse.

3.5.1 Operational Service

**************************************************************************
NOTE: Maintenance agreements are standard practice in the building industry. Take-back programs refer to programs in which the product manufacturer "takes-back" scrap material and/or packaging associated with its product. Under a green lease, when the customer no longer requires the use of the particular product or requires an updated model, the manufacturer is obligated to reclaim it and refurbish it or disassemble it for recycling as appropriate. Using one of these manufacturer's services contributes to the following LEED credit: MR2.
**************************************************************************

Coordinate with manufacturer for [maintenance agreement] [take-back program] for services which reclaim materials for recycling and/or reuse. Collect information from the manufacturer about [maintenance agreement] [green lease] options, and submit to Contracting Officer. Placement into landfills or burning of reclaimed materials is not allowed. Indicate procedures for compliance with regulations governing disposal of mercury. When such a service is not available, seek out local recyclers to reclaim the materials.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for battery-operated incandescent and emergency lighting units and lamps. Special systems requirements such as lamp-in fluorescent fixtures, battery or central systems are also covered in this section.

Design the number and location of units to provide a minimum of 10 lux 1 foot-candle in compliance with OSHA; otherwise modify mounting and field-testing requirements.

Show on the drawings a three-dimensional detail of each fixture with letter designation keyed to the drawings and electrical symbols describing the type, style, class, kind, and size of fixture.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: If Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS is not included in the project specification, insert applicable requirements.
therefrom and delete the following paragraph.

Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS applies to work specified in this section.

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2017; ERTA 1-2 2017; TIA 17-1; TIA 17-2; TIA 17-3; TIA 17-4; TIA 17-5; TIA 17-6; TIA 17-7; TIA 17-8; TIA 17-9; TIA 17-10; TIA 17-11; TIA 17-12; TIA 17-13; TIA 17-14; TIA 17-15; TIA 17-16; TIA 17-17 ) National Electrical Code

NFPA 101 (2018; TIA 18-1; TIA 18-2; TIA 18-3) Life Safety Code

UNDERWRITERS LABORATORIES (UL)

UL 924 (2016; Reprint May 2018) UL Standard for Safety Emergency Lighting and Power Equipment

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Preinstallation Meetings

No later than [30] [_____] days after contract award, submit installation drawings for the Central Emergency Lighting Systems, indicating the location of installed fixtures.
Submit material, equipment, and fixture lists showing the manufacturer's style or catalog numbers, specification and drawing reference numbers, and a sample warranty. Also submit the manufacturer's catalog data and certificates of conformance for the following items:

a. Emergency Lighting Egress Units
b. Emergency Fluorescent Lighting
c. Central Emergency Lighting Systems
d. Accessories

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the
"G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Furnish emergency lighting units completely assembled with wiring and mounting devices, ready for installation at the locations indicated. Equip fixtures with lamps. Ensure that emergency lighting units are suitable for operation on the ac supply circuit to which they are to be electrically connected.

2.1.1 Performance Requirements

Provide emergency lighting units conforming to UL 924 and NFPA 101.

2.2 MANUFACTURED UNITS

2.2.1 Emergency Lighting Egress Units

Provide a complete self-contained emergency lighting unit with batteries, battery charger, one or more local or remote lamp heads with lamps, undervoltage relay, indicator lights, on/off switch, and test switch, in accordance with UL 924 for Type I (emergency light set), Class I [rechargeable storage-battery-powered unit] [____], Style D [nonrefillable
nickel-cadmium battery], as indicated.

2.2.1.1 Batteries

Provide batteries rated [6-12] [_____] volts. Provide batteries with the capacity and rating to supply the lamp load while maintaining a minimum [87.5] [_____] - percent power for [1.5] [_____] hours, or the battery-lamp combination maintaining [60] [_____] - percent, minimum, illumination. Provide maintenance-free [lead-acid] [nickel-cadmium] type batteries, with a minimum normal life of [10] [_____] years.

2.2.1.2 Battery Charger

Provide a battery charger with a dry full-wave rectifier with two charging rates: one to automatically maintain the battery in a fully charged state under normal conditions and the other to automatically recharge the battery to a fully charged state within [12] [_____] hours after a continuous discharge of [1-1/2] [_____] hours through the connected lamp load.

2.2.1.3 Unit Enclosure

Fabricate the unit enclosure with at least [18] [_____] - gage sheet steel. Design the cover to provide access to the battery and battery-charger compartments and to have a full-length piano hinge and a latching device. Protect component parts within the enclosure from dust, moisture, and oxidizing fumes from the battery. Coat the interior and exterior surfaces of the enclosure with a corrosion-resistant gray baked-enamel finish.

2.2.1.4 Lamp Heads, Lamps, and Indicating Lights

Mount the lamp heads on the top of the unit enclosure, or wall-mount the lamp heads. Except where otherwise indicated, ensure that the lamp heads are fully adjustable in the horizontal and vertical planes. Provide a steel lamp head assembly with [nickel] [chromium] plating. Form the exterior housing of the lamp from [nickel] [cadmium] - plated sheet steel.

Provide sealed-beam lamps, [PAR-36] [halogen], rated not less than [12] [_____] watts at the specified dc voltage.

Mount an amber "ready-for-use on alternating current" indicating light, a red "recharging on alternating current" indicating light, and a momentary-contact pushbutton test switch on the cover of the unit enclosure. The amber light, when illuminated, indicates that the unit is electrically connected to the normal ac supply source and that the battery is fully charged. The red light, when illuminated, indicates that the battery is being recharged. The momentary-contact pushbutton test switch transfers the unit from normal supply to battery supply and tests operation of equipment under simulated ac source power failure.

2.2.1.5 Relays and Switches

Provide a self-cleaning undervoltage relay that automatically connects the lampload to the battery supply upon failure of the ac supply. Mount an on-off toggle switch inside the unit enclosure to disconnect the battery from the lamp load when the unit is taken out of service. The relay energizes when the ac supply falls to [70] [_____] percent of normal voltage.
2.2.1.6 Mounting Shelves

Provide the emergency lighting units with [angle iron] [_____] mounting shelves[ and with a protective screen designed by the equipment manufacturer for this purpose]. Coat the mounting shelf[ and screen] with a corrosion-resistant finish in accordance with the manufacturer's standard practice.

2.2.2 Emergency Fluorescent Lighting

Provide each unit with an automatic power failure device, test switch, pilot light, and fully automatic high/low trickle charger in a self-contained solid-state, temperature-compensated power pack. Provide a [sealed-wet] [gelled-electrolyte] battery with sufficient capacity to supply power to provide a minimum of [6500] [_____] lumens per square meter [600] [_____] lumens using a [40] [_____]-watt rapid-start lamp. Provide a sealed and maintenance-free battery, with an active life of not less than [10] [_____] years under normal operating conditions.

2.2.3 Central Emergency Lighting Systems

Provide a central power system providing emergency power at [277] [120] volts, 60 hertz, for a minimum period of [90] [_____] minutes. Design the system to handle surges during loss and recovery of the voltage, and to deliver its full rated output to the designated lamp load. Provide [batteries] [backup ac source] for power.

2.2.3.1 Operation

Ensure that, when the system loses normal supply voltage, it automatically disengages itself from the normal input line, and switches to a self-contained inverter with built-in protection when the output is shorted or overloaded. Ensure that, when normal line voltage resumes, the emergency system automatically switches back to normal operation. Size the transfer switch for this function to handle [125] [_____] percent of full load. Provide the battery system with self-contained inverters with overload protection.

2.2.3.2 Charger

Provide a completely automatic battery charger that maintains the batteries in a fully charged condition and recharges the batteries to full capacity within [24] [_____] hours after full discharge in accordance with UL 924.

2.2.3.3 Batteries

Provide sealed [lead-acid] [nickel-cadmium] batteries, maintenance-free for a period of not less than [10] [_____] years under normal operating conditions.

2.2.3.4 Accessories

Provide visual indicators to indicate normal power, inverter power, and battery-charger operation. Provide a low-voltage test switch to simulate power failure by interrupting the input line, voltage meter, electrolyte level detector to automatically disable the charging circuit in the event of a fault, and low-voltage cutoff to prevent extreme battery power dissipation.
2.2.3.5 Enclosure

2.2.4 Self-Testing Module

**************************************************************************
NOTE: Activity and designer are to decide on appropriate usage of self-testing module. The self-testing module can significantly increase emergency lighting pricing. If a self-testing module is not used, perform testing in accordance with references cited in this section.
**************************************************************************

Provide a self-testing module for the emergency lighting equipment that performs the following functions:

a. Continuous monitoring of charger operation and battery voltage with visual indication of normal operation and of malfunction.

b. Monthly discharge cycling of battery with monitoring of transfer circuit function, battery capacity, and emergency lamp operation with visual indication of malfunction. Conduct the battery capacity test using a synthetic load.

c. Manual test switch to simulate a discharge test cycle.

d. Low-voltage battery disconnect (LVD) and brown-out protection circuit.

PART 3 EXECUTION

3.1 INSTALLATION

Permanently fix in place the emergency lighting unit and install wiring for each unit in accordance with NFPA 70. Use the same panel bus or branch circuit as that serving the normal lighting in the area for the branch circuit feeding the unit equipment, and connect ahead of the area switches. Keep remotely connected emergency lighting circuit wiring independent of all other wiring and equipment, and do not enter the same conduit, cable, box, or cabinet with other wiring unless the fixture is supplied from two sources.

Mount emergency lighting units and remote lamps at a minimum of [2100] [_____] millimeter [7] [_____]-feet above the finished floor.

3.2 FIELD QUALITY CONTROL

Demonstrate emergency lighting units to operate satisfactorily in the presence of the Contracting Officer.

Perform and submit System Operational Tests in accordance with referenced standards in this section.

3.3 WARRANTY
Submit [[_____] copies of ]warranty, signed by an authorized representative, designating the Government as warrantee, to the Contracting Officer, [5] [_____] days before project closeout.

NOTE: This guide specification covers the requirements for exit lighting fixtures and lamps.

Drawings should show a three-dimensional detail of each fixture with letter designation keyed to the drawings and electrical symbols describing the type, style, class, kind, and size of fixture.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](mailto:).
1.1 REFERENCES

******************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 101 (2018; TIA 18-1; TIA 18-2; TIA 18-3) Life Safety Code

U.S. DEPARTMENT OF ENERGY (DOE)

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

29 CFR 1910 Occupational Safety and Health Standards

UNDERWRITERS LABORATORIES (UL)

UL 924 (2016; Reprint May 2018) UL Standard for Safety Emergency Lighting and Power Equipment

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Pre-Installation Meetings

No more than [30] [_____] days after Contract Award, the Contracting Officer will schedule a Pre-Installation Meeting. Submit material, equipment, and fixture lists for the following showing manufacturer's product data, including style or catalog numbers, specification and drawing reference numbers, warranty information, and fabrication site:

a. Exit Lighting Units
b. Contemporary Fixtures

c. Accessories

Submit exit lighting units outline drawings indicating overall physical features, dimensions, ratings, service requirements, and weights of equipment.

1.3 SUBMITTALS

**********************************************************************************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**********************************************************************************************************************************************

Government approval is required for submittals with a "G" designation;
submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
   Material, Equipment, and Fixture Lists[, G[, [____]]]

SD-02 Shop Drawings
   Exit Lighting Units[, G[, [____]]]
   Exit Lighting Units Outline Drawings[, G[, [____]]]

SD-06 Test Reports
   Operational Tests[, G[, [____]]]

SD-07 Certificates
   Energy Efficiencies[, G[, [____]]]

1.4 WARRANTY

Provide a [five] [____] year warranty for all components.

PART 2    PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide emergency exit lighting fixtures conforming to UL 924, NFPA 101, and as specified.

Provide exit lighting fixtures completely assembled with wiring and mounting devices, ready for installation at the locations indicated. Ensure ceiling-mounted fixtures are designed to be supported independent of the ceiling and equipped with lamps.

Provide exit lighting fixtures having efficiencies in accordance with the recommended levels specified in DOE LT-4.

2.2 COMPONENTS

2.2.1 Contemporary Fixtures

Provide contemporary exit lighting fixtures having a fixture body with edge-lighted plastic exit-sign panels, face trims, lamps, lampholders, and
mounting brackets for top, back, and end mounting to walls and ceilings in accordance with NFPA 101, as indicated.

Provide [anodized sheet aluminum with a matte finish] [_____] wireway cover and plastic sign backup plate, with face trims formed from [sheet aluminum and shall have a brushed-satin finish] [_____] . [Ensure fixture bodies formed from sheet steel are not less than [1] [_____] millimeter[20] [_____] gage and painted.]

Provide plastic sign panels which are edge-lighted from the top with at least two low-voltage miniature incandescent lamps that will illuminate the plastic sign panels and floor. Wire exit signs for two-circuit service at [120] [277]-volts and include a diode circuit that provides a minimum of [50,000] [_____] hours of lamp life.

Provide mounting plates and brackets formed from sheet aluminum or plate with a brushed-satin finish, not less than [115] [_____] millimeter [4-1/2] [_____]-inches square and designed to secure the fixture to a [100] [_____] millimeter [4] [_____]-inch square outlet box.

2.2.2 Emergency Power Loss Exit Lighting Units

Provide each self-contained unit with an automatic power failure device, test switch, pilot light, and fully automatic high/low solid-state trickle charger in a self-contained power pack. Provide with [sealed-wet] [gelled-electrolyte] type battery, maintenance-free for a period of not less than [10] [_____]-years under normal operating conditions. Ensure normal operation is with [120] [277]-volts. [Connect to Emergency lighting panel.]

2.2.3 Light Emitting Diodes (LEDs) Exit Lighting Fixtures

Provide [single] [double] faced exit lighting fixtures with sheet metal enclosures, including frames, battery charger, batteries, [green] [red] light emitting diodes (LEDs), and mounting brackets with mounting plates suitable for securing the fixture to a 100 millimeter 4-inch outlet box. Ensure fixture features include:

a. Continuous charging
b. Automatic switching to standby batteries upon loss of power
c. Overload protection
d. Short circuit protection
e. Test switch
f. Low voltage disconnect
g. Switch controlled left and right LED directional arrows
h. Field connectable to operate from [115] [277] volts
i. Brightness not less than ten (10) candela candlepower

Provide unit battery system with minimum operating time of three (3) hours for double faced fixtures and seven (7) hours for single faced fixtures.

2.2.4 Self Luminous Exit Signs

Provide internally illuminated non-electric (light source is independent of electrical power and is generated by the action of tritium gas on a phosphorescent material) units, conforming to UL 924, 29 CFR 1910, Section 37, Part (G), Subparts (6) and (7), and NFPA 101, Section 5-10.3.3..

Ensure signs are licensed by the United States Nuclear Regulatory Commission with a 20 year normal use guarantee for integrity and performance.

2.2.4.1 Enclosure

Provide units with [3 millimeter 1/8-inch high impact ABS plastic][0.5 millimeter 0.20-inch thickness metal], assembled tamperproof enclosure, framed with 1.3 millimeter 0.50-inch thick extruded aluminum.

Ensure each sign has a permanently attached [metal] [plastic] nameplate bearing the Manufacturer's Name and Address and Date of Manufacture (in addition to information required by listed authorities).

2.2.4.2 Face

Ensure each face of the sign has a non-colored translucent panel covered by an opaque 3 millimeter 1/8 inch red ABS plastic stencil bearing the word "EXIT" in 150 by 20 millimeter 6 by 3/4-inch letters and including a universal directional arrow which indicates the direction of the exit (left, right or both ways).

2.2.4.3 Illumination

Provide sign which has illumination by means of sealed glass tubes, internally phosphor coated and filled with tritium gas, with tubes securely bonded to the enclosure and cushioned against mechanical shock. Ensure luminous areas have a minimum initial brightness of 0.51 candela per square meter 0.15-foot lamberts and a guaranteed minimum brightness after ten years of 0.27 candela per square meter 0.080-foot lamberts.

2.2.4.4 Mounting Accessories

Supply each sign with tamperproof hardware for wall mounting; edge on for double face, flat for single face or double face for ceiling mount.
PART 3 EXECUTION

3.1 INSTALLATION

Connect fixtures to the main panel bus through overcurrent protection. Use emergency lighting panel where available.

3.2 FIELD QUALITY CONTROL

3.2.1 Tests

Field test exit lighting to demonstrate satisfactory operation in the presence of the Contracting Officer.

Perform and submit operational tests in accordance with referenced standards in this section.

-- End of Section --

3.4 CLOSEOUT ACTIVITIES
  3.4.1 Operations and Maintenance Manuals
  3.4.2 Record Drawings

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for lighting for security and closed circuit television (CCTV) area illumination.

Use and coordinate UFGS Section 26 09 23.00 40 LIGHTING CONTROL DEVICES for control devices (includes tailoring for exterior lighting) with this section.

Use and coordinate UFGS Section 26 56 13.00 40 LIGHTING POLES AND STANDARDS for pole or standard, including mounting and base accessories of exterior fixtures with this section.

Use and coordinate UFGS Section 26 56 19.00 40 ROADWAY LIGHTING for roadway and street lighting with this section.

Use UFGS Section 26 56 36.00 40 FLOOD LIGHTING for facility and grounds flood lighting.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************
NOTE: This guide specification does not include provision for high-mast roadway and parking lot lighting (poles over 18.3 meters (60 feet)). Requirements for materials and procedures for special or unusual design will be added as necessary for specific projects. Standard details, and quality of illumination will conform to HREF=https://www.wbdg.org/ccb/DOD/UFC/ufc_3_550_01.pdf>UFC 3-550-01, "Exterior Electrical Power Distribution" and may be modified to suit project conditions.

Do not use Incandescent lamps, Fluorescent lamps, and Mercury Vapor Lamps for CCTV area illumination, nor tungsten lamps other than infrared lamps.

Two types of infrared luminaires are currently available: fixtures with special lamps utilizing optical dichroic mirror coatings that produce only infrared light, and fixtures that use conventional lamps that pass the light output through infrared filters. Special lamps have the advantage of operating cooler and not requiring a cooling fan, thus operating quieter and requiring less maintenance.

The major disadvantages are high lamp replacement cost due to short bulb life (2000 to 4000 hours) and special lamp design. The 2000 hour lamps produce more infrared light energy and are preferred over the 4000 hour lamps. Another disadvantage is the limited variety of wattages available, but this is normally resolved by fixture placement during site lighting system design. Conventional lamps utilizing special power supplies and infrared filters have the advantages of low bulb replacement cost and bulb life ranging from 1700 to 18000 hours. (Note: Special power supplies reduce current flow to the bulb and allow it to operate at a lower filament temperature to shift light output more into the near infrared (NIR) light spectrum and requires less filtering. This has the additional advantage of extending bulb life.) A variety of bulb sizes are available and no special bulbs are required. The main disadvantage of using a conventional bulb is the heat generated utilizing an infrared filter which requires cooling by a cooling fan. Fans require maintenance and the loss of the fan will destroy the filter. Filters are expensive.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in
the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a “G.” Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Record Drawings[; G[, [___]]]

1.3 QUALITY CONTROL

1.3.1 Standard Products

Provide materials and equipment which are the standard products of manufacturer regularly engaged in the manufacture of such products, and which essentially duplicate equipment that has been in satisfactory use at least two years prior to bid opening.

1.4 PROJECT/SITE CONDITIONS

Lighting equipment that is usable in their original configuration without modification may be reused with Government approval. Perform a field survey, including testing and inspection of existing lighting equipment and control lines intended to be incorporated into the lighting system, and furnish a report to the Government. For those items considered nonfunctioning, provide specification sheets, or written functional requirements to support the findings and the estimated cost to correct the deficiency with the report. As part of the report, include the scheduled need date for connection to all existing equipment.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Lighting System

Configure the lighting system as specified and shown. Include all fixtures, hardware, poles, cables, connectors, adapters and appurtenances needed to provide a fully functional lighting system.
NOTE: Coordinate the type of CCTV light fixture used with the spectral sensitivity of the CCTV camera installed at each assessment zone. Provide a sufficient lighting level to meet the minimum faceplate illumination requirements of each camera. Provide a light ratio of not greater than 6 to 1 (highlight to shadow) between the perimeter fences or in the CCTV assessment zone. In addition, the security at some sites may require lighting in areas not normally viewed by the CCTV cameras.

Omit this paragraph if the lighting system is not used for CCTV assessment.

Configure the CCTV Assessment Lighting system as specified and shown. Ensure equipment conforms to NFPA 70 and IEEE C2. Provide sufficient light for optimum CCTV assessment of each zone in the configuration. Include all fixtures, hardware, poles, cables, connectors, adapters, and appurtenances needed to provide a fully functional lighting system.

2.1.1.1 Electrical Requirements

Provide equipment which operates from a voltage source as shown; plus or minus 10 percent, and at 60 Hz, plus or minus 2 percent.

a. Power Line Surge Protection

NOTE: Indicate circuits requiring additional transient voltage surge suppression. Provide requirements on the drawings or in a table.

Provide transient voltage surge suppressors for all electronic equipment, meeting the requirements of IEEE C62.41.1 and IEEE C62.41.2, and UL listed as tested in accordance with UL 1449. Select surge suppressor ratings [as indicated] [[_____] volts rms, operating voltage; [50] [60] Hz; [1-phase] [3-phase]; [2] [3] [4] wire with ground; transient suppression voltage (peak let-through-voltage) of [_____] volts]. Do not use fuses as surge suppression.

b. Interface CCTV Lighting and CCTV System

NOTE: Delete this paragraph if infrared lights are not used for CCTV assessment.

Interface infrared lights to the CCTV system and provide automatic, alarm actuated call-up of the light associated with the alarm zone.

2.1.1.2 Unusual Service Conditions

NOTE: If normal service conditions prevail, omit
this subparagraph. Unusual service conditions for altitude start above 1 kilometer (3300 feet) for most apparatus. Ambient temperature is generally 40 degrees C, although in some cases 30 degrees C applies. Frequency is generally 60 Hz, although 50 Hz may also be standard. Take any unusual service conditions or atmospheres into consideration and adjust the specifications accordingly.

**************************************************************************
Provide equipment and materials furnished under this section suitable for the following unusual service conditions: altitude [_____] m feet, ambient temperature [_____] degrees C F.

][2.1.1.3 Hazardous Locations

**************************************************************************
NOTE: Designer identifies hazardous areas and shows them on the drawings. Delete this paragraph if there are no hazardous issues involved in the project.

**************************************************************************
[Provide wiring conforming to NFPA 70 for Class [I] [II] [III], Division [1] [2] hazardous locations, and suitable equipment for [Group [_____]][operating temperature of [_____] degrees C F].] [Provide wiring and equipment of the classes, groups, divisions indicated, and suitable for the indicated operating temperature.]

]2.1.2 System Design

Submit detail drawings for the complete system and for [poles,] [lighting fixtures,] [bracket arms,] [cable boxes,] [handholes,] [transformers,] [controllers,] [and] [_____] [Detail drawings for precast handholes include a design analysis to determine that strength is equivalent to indicated cast-in-place concrete handholes.] [Indicate in drawings bonding method for concrete encasement.] [Include in drawings design calculations showing adequate strength of screw foundations.] [For CCTV lighting, include in date:

a. Infrared light call-up response time.

b. Lamp strike and restrike times.

c. System startup and shutdown operations.

d. Manuals for CCTV Assessment Lighting equipment.

e. A typical zone layout showing light locations, isolux patterns, and lighting ratios.]

Submit data published by the manufacturer of each item on the list of equipment and material, to permit verification that the item proposed is of the correct size, properly rated or applied, or is otherwise suitable for the application and fully conforms to the requirements specified.
2.2 EQUIPMENT

2.2.1 Interface Lighting System and Power Distribution

**************************************************************************
NOTE: Include the secondary power panel only for a backup generator as specified in another section. Determine the site requirements for a backup generator.
**************************************************************************

Provide conductors [including all conductors extending from the load side of the primary and secondary power panels that serve assessment lighting equipment] [and] [ as indicated].

2.2.2 Aerial Cable Hardware

**************************************************************************
NOTE: Include this paragraph only when aerial cable is being used.
**************************************************************************

Provide zinc coated aerial cable hardware conforming to IEEE C135.1, with steel hardware material conforming to ASTM A575 and ASTM A576, hot-dip galvanized in accordance with ASTM A153/A153M.

2.2.3 Cable Splices and Connectors

Provide cable splices and connectors conforming to UL 486A-486B. Provide underground splices and connectors conforming to the requirements of ANSI C119.1.

2.2.4 Cable Boxes

Provide cable boxes and covers made of cast iron with zinc coated or aluminized finish, of the sizes indicated on drawings. Provide minimum inside dimensions of not less than 304.8 mm 12 inches square by 152.4 mm 6 inches deep and not less than required to house the cable splice. Install a suitable gasket between the box and cover for a watertight seal. Install a sufficient number of screws to hold the cover in place along the entire surface of contact. Provide grounding lugs.

2.2.5 Manholes, Handholes, and Pullboxes

**************************************************************************
NOTE: Actual strength figures may need to be adjusted to accommodate various manufacturers of glass reinforced polymer boxes.
**************************************************************************

Cast iron will generally be specified for wheel loadings up to 7,258 kPa (16,000 pounds); cast steel may be used at the Contractor's option. Handhole covers and frames will generally conform to the details of HREF=http://www.wbdg.org/ccb/DOD/UFC/ufc_3_550_01.pdf>UFC 3-550-01, "Exterior Electrical Power Distribution"

Specify cast steel for areas that require heavier loadings, such as airports or other concentrated load applications. When cast steel is required,
revise the specification to indicate the wheel load, tire or wheel contact area, and tire pressure.

Use tamperproof bolts for handholes that are in a non-secure area but serve security and CCTV lighting systems.

Provide manholes, handholes, pullboxes, and related frames and covers as indicated, with strengths conforming to the requirements of IEEE C2. Provide precast concrete manholes with the required strength established by ASTM C478. Provide frames and covers for manholes made of [gray cast iron] [or] [cast steel]. Provide a machine-finished seat to ensure a matching joint between frame and cover. Cast iron is to comply with ASTM A48/A48M, Class 30B, minimum. Provide handholes for low voltage cables installed in parking lots, sidewalks, and turf areas made from an aggregate consisting of sand and with continuous woven glass strands having an overall compressive strength of at least [69] [_____] MPa [10,000] [_____] psi and a flexural strength of at least [34.5] [_____] MPa [5,000] [_____] psi. Provide pullbox and handhole covers in parking lots, sidewalks, and turf areas of the same material as the box. [Provide concrete pullboxes consisting of precast reinforced concrete boxes, extensions, bases, and covers.] [Install a sufficient number of tamperproof bolts to hold the cover firmly in place along the entire surface of contact; and include a tool for the tamperproof bolts.]

2.2.6 Conduit, Ducts and Fittings

2.2.6.1 Conduit, Rigid Steel

Provide rigid steel conduit conforming to ANSI C80.1 and UL 6.

2.2.6.2 Conduit Coatings

Coat underground metallic conduit and fittings with a plastic resin system conforming to NEMA RN 1, Type 40. Epoxy systems may also be used.

2.2.6.3 Conduit Fittings and Outlets

a. Boxes, Metallic Outlets
   ANSI/NEMA OS 1 and UL 514A.

b. Boxes, Nonmetallic, Outlet and Flush-Device Boxes and Covers
   ANSI/NEMA OS 1 and UL 514C.

c. Boxes, Outlet for Use in Hazardous (Classified) Locations
   UL 1203.

d. Boxes, Switch (Enclosed), Surface Mounted
   UL 98.

e. Fittings for Conduit and Outlet Boxes
   UL 514B.
f. Fittings for Use in Hazardous (Classified) Locations

UL 1203.

g. Fittings, PVC, for Use with Rigid PVC Conduit and Tubing

UL 514B.

2.2.6.4 Non-Metallic Duct

**************************************************************************
NOTE: Only polyvinyl chloride and high-density polyethylene conduits are presently covered by UL 651, which includes a temperature rating clause. Other plastic materials are covered by NEMA Standards, which do not provide a temperature rating clause. All options will be permitted and the temperature certification required until these materials are covered by an industry temperature rating clause.
**************************************************************************

Provide non-metallic duct lines and fittings utilized for underground installation suitable for the application, consisting of thick-wall, single, round-bore type, using material of one type. Provide acrylonitrile-butadiene-styrene (ABS) duct conforming to NEMA TC 6 & 8 and NEMA TC 9, with high-density conduit conforming to UL 651A. Provide Schedule 40 polyvinyl chloride (PVC) conforming to UL 651. Provide schedule 40 polyvinyl chloride (PVC) conforming to UL 651.

Provide all plastic utility duct and fittings manufactured without a UL label or listing with a certification as follows: "The materials are suitable for use with 75 degree C 167 degree F wiring. No reduction of properties in excess of that specified for materials with a UL label or listing will be experienced if samples of the finished product are operated continuously under the normal conditions that produce the highest temperature in the duct."

2.2.7 Fixtures

**************************************************************************
NOTE: Carefully review and select fixtures from Standard Detail No. 40-06-04. Then enter sheet numbers which show the fixture types selected in this paragraph.
**************************************************************************

Provide standard fixtures as detailed on [Standard Detail No. 40-06-04, Sheet Nos. [_____]][_____] which accompany and form a part of this specification. Provide special fixtures as indicated on the drawings. Illustrations shown on these sheets or on the drawings are indicative of the general type desired and are not intended to restrict selection to fixtures of any particular manufacturer. Fixtures of similar design, equivalent light distribution and brightness characteristics, equal finish and quality is acceptable as approved.

2.2.7.1 Accessories

Provide accessories such as straps, mounting plates, nipples, or brackets
for proper installation.

2.2.7.2 Special Fixtures

The types of special fixtures are designated by letters and numbers. For example, SP-1 denotes special Type 1.

2.2.7.3 In-Line Fuse

Provide an in-line fuse for each fixture, consisting of a fuse and a UL approved waterproof fuse holder rated [at 30 amperes, 600 volts] [as indicated], with insulated boots. Provide a fuse rating of [600 volts] [as indicated].

2.2.8 Transformers

******************************************************************************
NOTE: In corrosive atmospheres, specify transformers with PVC coating on exterior metallic surfaces. Consult transformer manufacturers about derating that might result from the application of additional protective coatings.
******************************************************************************

Provide transformers conforming to UL 506. Provide rust-inhibiting treatment and standard finish by the manufacturer on all exterior transformer cases.

2.2.8.1 Outdoor Dry-Type Lighting Transformers

******************************************************************************
NOTE: Provide transformers in the security lighting system to serve 120 volt incandescent or quartz lamps from distribution systems of higher voltages.
******************************************************************************

Provide single phase, 60 Hz, two winding, with two wire secondary and with a [240] [480] [_____] volt primary to 120 volt secondary, [1] [_____] kVA transformers.

2.2.8.2 Buck-Boost Transformers

******************************************************************************
NOTE: Select a kVA rating for the buck-boost transformer of not less than 125 percent of the required load (as determined by multiplying the current by the boost voltage). In order to keep conductor size to a minimum, use buck-boost transformers in security and CCTV lighting circuits that have excessive voltage drop due to the circuit lengths. See American Electrician's Handbook, Ninth Edition, for diagrams.
******************************************************************************

Provide transformers suitable for outdoor installation, with a 150 degree C 302 degree F insulation system for an 80 degree C 176 degree F rise; 60 Hz with 4 windings, 2 for primary and 2 for secondary, with all leads brought out to permit parallel or series connections of primary and secondary windings. Provide voltage ratings, kVA ratings, percent of boost and/or...
buck, and connections as indicated on drawings.

2.2.9 Wireway, Raintight, Support

2.2.10 Nameplates

Provide each major component of equipment with a nonferrous metal or engraved plastic nameplate which shows, as a minimum, the manufacturer's name and address, the catalog or style number, the electrical rating in volts, and the capacity in amperes or watts.

2.2.11 Spare Parts

Submit spare parts data for each different item of material and equipment specified, after approval of detail drawings for materials and equipment, and not later than 4 months before the date of beneficial occupancy. Include in data a complete list of parts, special tools, and supplies, with current unit prices and sources of supply.

2.3 COMPONENTS

2.3.1 Protection of Security Lighting System Components

2.3.1.1 Components and Conductors

**************************************************************************
NOTE: Bury Security and CCTV lighting system conductors in areas where the likelihood of damage to the conductors is slight. In areas where subsurface utilities are congested and in areas where the chance of accidental or intentional damage is great, place the security and CCTV lighting system conductors in ducts.
**************************************************************************

Protect Security lighting system conductors from damage. Install lighting system conductors in raceways or by means of direct burial, as shown. Where the conductors leave the underground systems, encase the conductors in rigid steel conduit of the indicated size. Provide wire guards to protect security lighting luminaries mounted below 6.1 m 20 feet. House exterior group-located electrical equipment such as time switches, safety switches, and magnetic contactors in a NEMA ICS 6, Type 4 enclosure. Provide an individual enclosure where only one piece of equipment is provided at a location.

[2.3.1.2 Tamper Provisions

**************************************************************************
NOTE: When an Intrusion Detection System (IDS) is to be provided or is already in place, tamper switches or welded covers are required. When an IDS is not required, this paragraph will be deleted.
**************************************************************************
Provide enclosures, cabinets, housings (other than luminaire housings), boxes, raceways, conduits, and fittings having hinged doors or removable covers, and which contain any part of the security lighting system (including power sources), with corrosion-resistant tamper switches, connected to an Intrusion Detection System (IDS), that initiates an alarm signal when the door or cover is opened or moved. Make tamper switches inaccessible until the switch is activated. Conceal switch leads and mounting hardware from the exterior of the enclosure. For pull or junction boxes which contain no splices or connections the covers may be protected by 6.4 mm1/4 inch tack welds on four sides of each cover rather than by tamper switches. Affix labels to indicate they contain no connections. Do not indicate on labels that the box is part of the security system.

2.3.2 Cable

Provide all wire and cable not indicated as government furnished equipment, capable of withstanding the jobsite environment for a minimum of 20 years.

2.3.2.1 Insulated Cable

******************************************************************************
NOTE: Select insulation thickness of column B when approximately 0.381 to 0.508 mm 15 to 20 mils more insulation is desired and column A when even thicker insulation is necessary. Do not specify for small installations or for limited amounts of one AWG size on large installations, since cable is manufactured to order.
******************************************************************************

Provide USE type cable conforming to UL 854, with copper conductors and type RHW or XHHW insulation conforming to UL 44, including green ground conductor. Provide cable with insulation of a thickness not less than that given in column [A] [B] of TABLE 15.1 of UL 854, rated 600 volts. Provide parts of the cable system, such as splices and terminations, rated not less than 600 volts. The size and number of conductors and the number of cables are as indicated. Strand conductors larger than No. 8 AWG.

2.3.2.2 Messenger Cable

******************************************************************************
NOTE: Include this paragraph only for aerial cable. Coordinate with the site to determine acceptable locations and heights for aerial cables. For security reasons, aerial cables do not cross perimeter fencing.
******************************************************************************

Provide a messenger cable system to support aerial cable, including guys, hardware and appurtenances needed to install the messenger cable, and capable of supporting the weight of the lighting system cable with the required messenger cable tensioning without exceeding 30 percent of its breaking strength under 16 degrees C 60 degrees F conditions of no ice and no wind. Size the messenger so that ice and wind loading normally encountered at the site does not cause the messenger to exceed 50 percent of its breaking strength. Size appurtenances, guys, and hardware to exceed the rated breaking strength of the messenger cable. Provide galvanized zinc coated steel or aluminum clad steel messenger cables.
2.3.2.3  Bare Copper Conductors

2.3.3  Electrical Enclosures

******************************************************************************
NOTE: Show on the drawings which specific type of enclosure is needed.
******************************************************************************

Provide metallic enclosures as needed to house the [security] [and] [CCTV] lighting equipment conforming to NEMA ICS 6 and NEMA 250. Provide enclosures with lockable or padlock handles. Deliver keys for lockable enclosures to the Contracting Officer. Provide enclosures as specified or as shown on the drawings.

[2.3.3.1  Interior Enclosures

Provide enclosures to house lighting equipment in an interior environment meeting the requirements of a NEMA 12 enclosure as defined in NEMA 250.

[2.3.3.2  Exposed-to-Weather Enclosures

Provide enclosures to house lighting equipment in an outdoor environment meeting the requirements of a NEMA 4 enclosure as defined in NEMA 250.

[2.3.3.3  Corrosion Resistant Enclosures

Provide enclosures to house lighting equipment in a corrosive environment meeting the requirements of a NEMA 4X enclosure as defined in NEMA 250.

[2.3.3.4  Hazardous Environment Enclosures

Install equipment within a hazardous environment as described in paragraph Hazardous Locations.

2.3.4  Illumination

******************************************************************************
NOTE: Insert appropriate sheets from CE Standard Detail 40-06-04 into these specifications. Add references used in 40-06-04 to paragraph REFERENCES. Delete paragraphs not required.
******************************************************************************

2.3.4.1  General Lighting

Provide luminaires, ballasts, lamps, and control devices required for [general area] [and] [_____] lighting [, including floodlighting] in accordance with [sheet] [sheets] [_____] of Standard Detail No. 40-06-04, attached to these specifications.

2.3.4.2  Roadway Lighting

Provide luminaires, ballasts, lamps, and control devices required for roadway lighting in accordance with [sheet] [sheets] [_____] of Standard Detail No. 40-06-04, attached to these specifications.
2.3.5 Lamps and Ballasts, High Intensity Discharge (Hid) Sources

**************************************************************************
NOTE: Production of required lumen output within 3 minutes after primary or emergency power is applied is required of lighting system.

Incandescent lamps may be used to provide required light output during periods of restart.
**************************************************************************

2.3.5.1 High-Pressure Sodium

Provide lamps conforming to ANSI ANSLG C78.42, and ballasts conforming to ANSI C82.4, or UL 1029. Provide clear high-pressure sodium lamps.

2.3.5.2 Mercury Vapor

**************************************************************************
NOTE: To save energy, only use mercury vapor fixtures when matching existing fixtures.
**************************************************************************

Provide lamps conforming to ANSI C78.40, and ballasts conforming to ANSI C82.4.

2.3.5.3 Metal-Halide

Provide lamps made by a manufacturer with not less than 5 years experience in making metal-halide lamps, conforming to ANSI/ANSLG C78.43, with ballasts conforming to ANSI C82.4 or UL 1029.

2.3.6 Lamps, Incandescent

Provide incandescent lamps conforming to UL 1598 and rated for 120 volt operation unless otherwise specified.

2.3.7 Lamps, Fluorescent

Provide fluorescent lamps with standard cool-white color characteristics which do not require starter switches. Provide rapid-start type lamps.

[2.3.8 Luminaire Components

**************************************************************************
NOTE: Include the following paragraph if UFGS Section 26 56 19.00 40 ROADWAY LIGHTING is not included in the project.
**************************************************************************

Provide luminaire components conforming to the following:

a. Attachments, ANSI C136.3;

b. Voltage classification, ANSI C136.2;

c. Field identification marking, ANSI C136.15;
d. Interchangeability, ANSI C136.6 and ANSI C136.9; and  
e. Sockets, ANSI C136.11.

2.3.9 Photometric Distribution Classification

Provide photometrics conforming to IES RP-8.

2.3.10 Luminaires, Floodlighting

2.3.10.1 HID and Incandescent

Provide HID lighting fixtures conforming to UL 1598. Provide incandescent lighting fixtures conforming to UL 1598.

2.3.10.2 Fluorescent

Provide fluorescent lamps conforming to [_____].

2.3.11 Searchlights

Provide special type [_____] searchlights [304.8 mm 12-inch] [457.2 mm 18-inch] [609.6 mm 24-inch] nominal size, and built with weatherproof, dust-tight, corrosion-resistant construction. Include with each searchlight a housing and hinged door, two reflectors, a receptacle, a trunnion, and a base. Provide searchlights which operate at [120 Vac] [_____] Vdc.

Provide each searchlight with a range for observing objects the size of an automobile at [243.8] [365.8] [457.2] [609.6] m [800] [1200] [1500] [2000]-feet on a clear night. Searchlights are to be [hand-controlled, with pedestal base and slip rings] [pilot-house controlled, with low base and slip rings]. Provide with housing and hinged door made of nonferrous metal. Provide gaskets and mount, to form a weatherproof seal, a heat-resistant, clear, smooth cover glass tempered to withstand sudden changes in temperature to the door. Mount a parabolic reflector of silver-mirrored glass or aluminum approximately 6.4 mm 1/4-inch thick at the back of the housing, and also mount a spherical auxiliary reflector designed to permit relamping in front of the lamp, with a permanent, non-tarnishing, nonabsorptive aluminum oxide reflecting surface. Provide receptacle of proper size to receive the lamp and install in a manner to ensure accurate positioning of the light center. Arrange searchlights for horizontal and vertical adjustment. Provide standard, two-conductor, weatherproof, flexible cable out of the housing through a weatherproof entrance bushing. Optically arrange searchlights to provide a horizontal and vertical beam spread of [2.5] [3.5] [4.5] [5.5] [6.5] [7.5] [8.5] [_____] degrees. Make provisions for tilting searchlights to any position within 45 degrees above and below the horizontal. Provide the searchlights with slip rings to permit continuous horizontal rotation. [Include with each searchlight installation a [_____] 12 volt [_____] kVA transformer conforming to UL 506.]

[ Searchlight installation on guard towers Nos. [_____] is also to include a manually operated, two-pole, enclosed transfer switch, a 200 ampere-hour, 12 volt, lead-acid, flat pasted positive plate design storage battery, and an automatic battery charger. Provide a silicon type, full wave battery charger, with high and low charging rate, arranged to go on high rate after resumption of power and emergency discharge, and return to low rate automatically when battery has reached full charge. Provide an ammeter in...
the charging circuit to indicate rate of charge.

2.3.12 Fresnel-Lens Luminaires

Provide special type [_____] luminaires consisting of mounting bracket, head, socket, reflector, and fresnel-lens assembly for multiple circuit, with weatherproof, dust tight, and insect proof luminaire. Provide a mounting bracket for [crossarm] [[38.1] [50.8] mm [1-1/2] [2] in slip fitter] [wood-pole] [pipe] mounting. Provide readily accessible means to permit horizontal adjustment and locking of the luminaire within a 30 degree arc each side of the center, and tilting and locking the luminaire within a 30 degree arc each side of vertical. Make the length of the mounting bracket such that the center of the luminaire, when hanging vertically, is not less than 200 mm 8-inches nor more than 600 mm 2-feet from the surface of the pole or cross-arm. [Provide luminaire with a 300 watt incandescent lamp that produces an average candela not less than 3000.] [Provide luminaire with a 500 watt incandescent lamp that produces an average candela of not less than 5000.] Provide the unit with an auxiliary reflector of white glossy-type porcelain enamel or aluminum reflecting surface. Provide a completed assembly, consisting of a 180 degree cylindrical fresnel lens and a semicylindrical reflector housing, which produces a horizontal beam spread of approximately 180 degrees, and a vertical beam spread of approximately 15 to 25 degrees.

2.4 MATERIALS

2.4.1 Corrosion Protection

2.4.1.1 Aluminum Materials

[Do not use aluminum material if in contact with earth or concrete. Where aluminum conductors are connected to dissimilar metal, use fittings conforming to UL 486A-486B.] [Do not use aluminum.]

2.4.1.2 Ferrous Metal Materials

a. Hardware

Provide hot-dip galvanized ferrous metal hardware in accordance with ASTM A153/A153M and ASTM A123/A123M.

b. Equipment

**************************************************************************
NOTE: Specify a 120 hour test in a non-corrosive environment and a 480 hour test in a corrosive environment.
**************************************************************************

Provide equipment and component items, including but not limited to metal poles and ferrous metal luminaires not hot-dip galvanized or porcelain enamel finished, with corrosion-resistant finishes which withstand [120] [480] hours of exposure to the salt spray test specified in ASTM B117 without loss of paint or release of adhesion of the paint primer coat to the metal surface in excess of 1.6 mm 1/16-inch from the test mark, with a scribed test mark and test evaluation rated not less than 7 in accordance with TABLE 1, (procedure A) of ASTM D1654.

Coat cut edges or otherwise damaged surfaces of hot-dip galvanized sheet
steel or mill galvanized sheet steel with a zinc rich paint conforming to the manufacturer's standard.

2.4.1.3 Finishing

Painting required for surfaces not otherwise specified and finish painting of items only primed at the factory, are as specified in Section 09 90 00 PAINTS AND COATINGS.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Current Site Conditions

Verify that site conditions are in agreement with the design package. Report all changes to the site or conditions that will affect performance of the system to the Government. Do not take any corrective action without written permission from the Government.

3.1.2 Existing Equipment

Connect to and utilize existing lighting equipment and devices as shown. Make written requests and obtain approval prior to disconnecting any control lines and equipment, and creating equipment downtime. Proceed with such work only after receiving Government approval of these requests. If any device fails after work has commenced on that device, diagnose the failure and perform any necessary corrections to the equipment. The Government is responsible for maintenance and repair of Government equipment.

3.2 INSTALLATION

Install all system components, including government furnished equipment, and appurtenances in accordance with the manufacturer's instructions, IEEE C2, and contract documents. Furnish necessary hardware, fixtures, cables, wire, connectors, interconnections, services, and adjustments required for a complete and operable system.

3.2.1 Enclosure Penetrations

Make enclosure penetrations from the bottom unless the system design requires penetrations from other directions. Seal all penetrations of interior enclosures involving transitions of conduit from interior to exterior, and penetrations on exterior enclosures with rubber silicone sealant to preclude the entry of water. Terminate the conduit riser in a hot-dipped galvanized metal cable terminator. Fill the terminator with an approved sealant as recommended by the cable manufacturer, and in such a manner that the cable is not damaged.

3.2.2 Prevention of Corrosion

3.2.2.1 Aluminum

Do not use aluminum in contact with earth or concrete, and where connected to dissimilar metal, protect with approved fittings and treatment.
3.2.2.2 Steel Conduits

Do not install steel conduits within concrete slabs-on-grade. Field wrap steel conduits installed underground or under slabs-on-grade, or penetrating slabs-on-grade, with 254 micrometers (0.010 inch) thick pipe-wrapping plastic tape applied with a 50 percent overlap, or provide with a factory-applied plastic resin, epoxy coating. Zinc coating may be omitted from steel conduit which has a factory-applied epoxy coating.

3.2.2.3 Cold Galvanizing

Coat field welds and/or brazing on factory galvanized boxes, enclosures, conduits, etc. with a cold galvanized paint containing at least 95 percent zinc by weight.

3.2.3 Cable Installation

**************************************************************************

NOTE: Bury security and CCTV lighting system conductors in areas where the likelihood of damage to the conductors is slight. In areas where subsurface utilities are congested and in areas where the chance of accidental or intentional damage is great, place the security and CCTV lighting system conductors in ducts.

**************************************************************************

Provide cable and all parts of the cable system, such as splices and terminations, rated not less than 600 volts, with the size and number of conductors and the number of cables as indicated. Provide stranded conductors if larger than No. 8 AWG. Identify each circuit by means of fiber or nonferrous metal tags, or approved equal, in each [handhole] [and] [junction box,] and at each terminal.

3.2.3.1 Splices

Make splices below grade with nonpressure-filled resin systems using transparent, interlocking, self-venting, longitudinally split plastic molds. Make splices above grade with sealed insulated pressure connectors and provide insulation and jacket equal to that of the cable. In order to prevent moisture from entering the splice, cut back jackets to expose the required length of insulation between the jacket and the tapered end of the insulation.

3.2.3.2 Installation in Duct Lines

Install [ground] [ground and neutral] conductors in duct with the associated phase conductors. Make cable splices in handholes only.

3.2.4 Direct Burial

Provide minimum cover depth from top of cable to finished grade 750 mm (30-inches) for direct buried cable, but not less than the depth of the frost line.

3.2.4.1 Trenching

**************************************************************************

NOTE: Where soil does not contain rocks or abrasive

**************************************************************************
material, delete the requirements for placing protection over the cable. Delete planks if not required.

**************************************************************************

Excavate trenches to the depths required to provide the minimum cable cover, with the bottom of the trench smooth and free of stones and sharp objects. Where the bottom of the trench consists of material other than sand or earth, remove an additional 75 mm 3-inch layer and replace with a 75 mm 3-inch layer of sand or stone-free earth compacted to the approximate density of the surrounding firm soil. Unreel the cables unreeled in place along the side of or in the trench and carefully placed on the sand or earth bottom. Pulling cables into a direct-burial trench from a fixed reel position is not permitted. Where cables cross, provide a separation of at least 75 mm 3-inches, unless the cables are protected by nonmetallic conduit sleeves at the crossing. Make the radius of bends in cables not less than 12 times the diameter of the cable. Do not leave the cables under longitudinal tension. Install the first layer of backfill, 150 mm 6-inches thick, consisting of sand or stone-free earth. Place one-inch untreated planks, not less than 200 mm 8-inches in width, or approved equal protection, end to end along the cable run, approximately 75 mm 3 inches above the cable. Place a 0.127 mm 5-mil, brightly colored plastic tape not less than 75 mm 3-inches in width and suitably inscribed at not more than 3 m 10-feet on centers, or other approved dig-in warning indication, approximately 300 mm 12-inches below finished grade levels of trenches. Provide selected backfill of sand or stone-free earth to a minimum depth of 75 mm 3-inches above cables.

3.2.4.2 Requirements for Installation in Duct

Where indicated on drawing, install cable in duct lines. Install ground and neutral conductors in duct with the associated phase conductors. Install segments of direct-burial cable that cross under new railroad tracks, roads, or paving exceeding 1.5 m 5 feet in width, in plastic, or rubber duct encased in concrete in accordance with paragraph DUCT LINES. Pulling of cable into conduit from a fixed reel position is not permitted. At interfaces with direct-burial cable, center the direct-burial cable in the entrance to the duct, using an approved waterproof, nonhardening mastic compound to facilitate the centering. Where crossing existing railroad tracks, install coated rigid steel conduit under the tracks, in lieu of concrete-encased duct, in accordance with paragraph DUCT LINES in accordance with NFPA 70 and the regulations of the railroad.

3.2.4.3 Location of Cable Splices

Splices in direct-burial cable are not permitted in runs of 150 m 500 feet or less or at intervals of less than 150 m 500 feet in longer runs except as required for taps. Where cable splices in shorter intervals are required to avoid obstructions or damage to the cable, the location is as approved. Install cable splices in cable boxes or concrete handholes.

3.2.4.4 Markers

**************************************************************************

NOTE: Markers will be detailed on drawings in accordance with HREF=http://www.wbdg.org/ccb/DOD/UFC/ufc_3_550_01.pdf>UFC 3-550-01, "Exterior Electrical Power Distribution".

**************************************************************************
Locate cable and cable splice markers near the ends of cables, at each cable splice, approximately every 120 m 400 feet along the cable run, and at changes in direction of the cable run. Markers need not be placed along cables laid in relatively straight lines between lighting poles that are spaced less than 120 m 400 feet apart. Place markers approximately 600 mm 2 feet to the right of the cable or cable splice when facing the longitudinal axis of the cable in the direction of the electrical load. Provide concrete markers with a 28 day compressive strength of 17 MPa 2500 psi in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Impress the letter "C" in the top of each marker.

3.2.4.5 Warning Tape

Place direct burial cable below a plastic warning tape buried in the same trench or slot. Place a 0.127 mm 5 mil brightly colored plastic tape, not less than 75 mm 3 inches in width and suitably inscribed at not more than 3 m 10 feet on centers with a continuous metallic backing and a corrosion-resistant 0.0254 mm 1 mil metallic foil core to permit easy location of the buried cable, approximately 300 mm 12 inches below finished grade.

3.2.5 Messenger Cable

3.2.5.1 Installation

**************************************************************************
**NOTE: Verify local electrical installation requirements to determine if new grounding conductors and electrodes are required at each messenger cable ground connection.**
**************************************************************************

Attach messenger to poles with approved clamps, with not less than 15.9 mm 5/8 inch through bolts. Do not exceed 30 percent of messenger cable rated tensile strength under 16 degrees C 60 degrees F conditions of no ice and no wind. Stress messengers to a tension higher than the final tension in order to prestretch the cable, so that when the messenger is dead-ended under its final tension and sag, there is minimum variation from the calculated values.

3.2.5.2 Grounding and Bonding Connections

Ground messengers and guy at corners, dead-ends, and entrances to each facility. Ground at intervals not exceeding 300 m 1000 feet. [Provide new grounding conductors and electrodes at each ground connection.] [Where grounding connections are made in the vicinity of existing grounding conductors and electrodes, the grounding connection may be made by a bolted or welded connection to the existing grounding conductor.] Fusion weld connections below grade. Fusion weld connections above grade or use UL 467 approved connectors.

3.2.5.3 Grounding Conductors and Electrodes

Provide soft drawn copper ground conductors, having a current capacity of at least 20 percent of that of the messenger to which it is connected, no smaller than No. 6 AWG. Connect the ground conductor to a ground rod of [copper clad steel conforming to UL 467] [zinc coated steel conforming to IEEE C135.30] [solid stainless steel] not less than [15.9] [19.1] mm [5/8]
3.2.5.4 Ground Resistance Testing

Measure the resistance to ground using the fall-of-potential method described in IEEE 81. Do not exceed 25 ohms maximum resistance under normally dry conditions. Whenever the required ground resistance is not met, provide additional electrodes, [interconnected with grounding conductors] [as indicated], to achieve the specified ground resistance. Provide additional electrodes [up to three [(2.4) [3] m [8] [10] feet] long spaced a minimum of 3 m 10 feet apart] [as a single extension type rod, ([15.9] [19.1] mm [5/8] [3/4] inch) in diameter, up to 9.1 m 30 feet long [driven perpendicular to grade] [coupled and driven with the first rod]]. In high ground resistance, UL listed chemically charged ground rods may be used. If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, notify the Contracting Officer immediately.

3.2.6 Aerial Cable Splices

Make splices in aerial cable within 900 mm 3 feet of a pole and place inside a watertight enclosure. Form drip loops at the cable entrance to the enclosure. Place lashing clamps within 300 mm 12 inches of the enclosure.

3.2.7 Lashing Wire

Wind lashing wire tightly around both the communication cable and the messenger cable by machine methods, with a minimum of one turn per 355.6 linear inch 14 linear inches and not less than the number of turns per linear foot that is recommended by the cable manufacturer for the distance between cable support points and the combined ice and wind loading and extreme wind loading shown or normally encountered for the installed location. Place lashing clamps at all poles and splices.

3.2.8 Stress Loops

Form loops in the aerial cable at all points of connection and at all poles to prevent damage from thermal stress and wind loading. Protect aerial cable from chafing and physical damage with the use of spiral cut tubing and PVC tape, or plastic sleeves.

3.2.9 Connections to Buildings

******************************************************************************
NOTE: Where this guide specification is used for installation of a security and CCTV lighting system in an existing facility, delete the reference to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and incorporate pertinent paragraphs from the referenced guide specification.
******************************************************************************

Extend cables into the various buildings as indicated and properly connect to the indicated equipment. [Provide empty] [Empty] conduits to the indicated equipment from a point 1.5 m 5 feet outside the building wall and
600 mm 2 feet below finished grade [are specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM]. After installation of cables, seal conduits to prevent moisture or gases from entering the building.

3.2.10 Duct Lines

3.2.10.1 Requirements

Provide the numbers and size of ducts as indicated, laying duct lines with a minimum slope of 100 mm/30 m 4 inches/100 feet. Depending on the contour of the finished grade, the high point may be at a terminal, a manhole, a handhole, or between manholes or handholes. Short radius manufactured 90 degree duct bends may be used only for pole or equipment risers, unless specifically indicated as acceptable. The minimum manufactured bend radius is 450 mm 18 inches for ducts of less than 80 mm 3 inches in diameter, and 900 mm 36 inches for duct 80 mm 3 inches or greater in diameter; for long sweep bends use a minimum radius of 7.6 m 25 feet for a change of direction of more than 5 degrees, either horizontally or vertically. Both curved and straight sections may be used to form long sweep bends, with a maximum curve of 30 degrees using manufactured bends. Provide ducts with end bells when duct lines terminate in manholes or handholes.

3.2.10.2 Treatment

Keep ducts clean of concrete, dirt, or foreign substances during construction. Make field cuts requiring tapers with proper tools and match factory tapers. Use a coupling recommended by the duct manufacturer when an existing duct is connected to a duct of different material or shape. Store ducts to avoid warping and deterioration with ends sufficiently plugged to prevent entry of any water or solid substances. Thoroughly clean ducts before installation. Store plastic ducts on a flat surface and protected from the direct rays of the sun.

3.2.10.3 Concrete Encasement

**************************************************************************
NOTE: For crossings of existing railroads and airfield pavements greater than 15.2 m 50 feet in length, use the pre-drilling method or the jack-and-sleeve method.
**************************************************************************

Provide ducts requiring concrete encasements in compliance with NFPA 70, except for electrical duct bank configurations for ducts 150 mm 6 inches in diameter, which are determined by calculation and as shown on the drawings. Provide monolithic construction of duct line encasements. Where a connection is made to a previously poured encasement, bond or dowel the new encasement to the existing encasement. At any point, except railroad and airfield crossings, make tops of concrete encasements not less than the cover requirements listed in NFPA 70. At railroad and airfield crossings, encase duct lines with concrete and reinforce as indicated to withstand specified surface landings. Make tops of concrete encasement not less than 1.5 m 5 feet below tops of rails or airfield paving unless otherwise indicated. Where ducts are jacked under existing pavement, install rigid steel conduit. To protect the corrosion-resistant conduit coating, pre-drilling or installing conduit inside a larger iron pipe sleeve (jack-and-sleeve) is required. For crossings of existing railroads and airfield pavements greater than 15 m 50 feet in length, use the pre-drilling method or the jack-and-sleeve method. Use separators or
spacing blocks of steel, concrete, plastic, or a combination of these materials placed not more than 1.2 m 4 foot on centers. Securely anchor ducts to prevent movement during the placement of concrete, and stagger joints at least 150 mm 6 inches vertically.

3.2.10.4 Non-encased Direct-Burial

**************************************************************************

NOTE: Specify cover requirements in accordance with NFPA 70 and ANSI C2. Specify frost line depth.
**************************************************************************

Install top of duct lines below the frost line depth of [_____] mm inches, but not less than [_____] mm inches below finished grade and install with a minimum of 75 mm 3 inches of earth around each duct, except that between adjacent electric power and communication ducts, 300 mm 12 inches of earth is required. Grade bottom of trenches toward manholes or handholes, smooth and free of stones, soft spots, and sharp objects. Where bottoms of trenches are comprised of materials other than sand, place a 75 mm 3 inch layer of sand first and compact to approximate densities of surrounding firm soil before installing ducts. Vertically stagger joints in adjacent tiers of duct at least 150 mm 6 inches, with the first 150 mm 6 inch layer of backfill cover of compacted sand as previously specified. Backfill and compact the rest of the excavation in 75 to 150 mm3 to 6 inch layers. Hold duct banks in alignment with earth; however, use a wooden frame or equivalent forms to hold ducts in alignment prior to backfilling for high tiered banks.

3.2.10.5 Installation of Couplings

Make joints in each type of duct in accordance with the manufacturer's recommendation for the particular type of duct and coupling selected and as approved. Make duct joints by brushing a plastic solvent on insides of plastic coupling fittings and on outsides of duct ends, then slip each duct and fitting together with a quick 1/4 turn to set the joint tightly.

3.2.10.6 Concrete

Provide concrete work as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE, with plain concrete strength of, 17 MPa 2500 psi at 28 days, and reinforced concrete strength of 21 MPa 3000 psi at 28 days. Provide monolithic duct line encasement construction. Where a connection is made to an existing duct line, bond the concrete encasement or dowel to the existing encasement.

3.2.10.7 Duct Line Markers

Provide duct line markers [as indicated] [at the ends of long duct line stubouts or for other duct locations that are indeterminate because of duct curvature or terminations at completely below-grade structures]. In addition to markers, place a 0.127 mm 5 mil brightly colored plastic tape, not less than 75 mm 3 inches in width and suitably inscribed at not more than 3 m 10 feet on centers with a continuous metallic backing and a corrosion-resistant 0.0254 mm 1 mil metallic foil core to permit easy location of the duct line, approximately 300 mm 12 inches below finished grade levels of such lines.
3.2.11 Handholes

Determine the exact locations after carefully considering the locations of other utilities, grading, and paving. Secure approval of exact before construction is started.

3.2.11.1 Construction

Construct handholes as indicated on drawings, including appurtenances, with top, walls, and bottom consisting of reinforced concrete. Provide monolithic walls and bottom. Provide 21 MPa 3000 psi concrete at 28 days. Precast concrete handholes having the same strength and inside dimensions as cast-in-place concrete handholes may be used. In paved areas, make the top of entrance covers flush with the finished surface of the paving. In unpaved areas, set the top of entrance covers approximately 13 mm 1/2 inch above the finished grade. Where finished grades are in cut areas, install unmortared brick between the top of handhole and entrance frame to temporarily elevate the entrance cover to existing grade level. Where duct lines enter walls, the sections of duct may be cast in the concrete or may enter the wall through a suitable opening. Caulk the openings around entering duct lines tight with lead wool or other approved material.

3.2.11.2 Appurtenances

Provide the following appurtenances for each handhole.

3.2.11.3 Cable Pulling-in Irons

Install a cable pulling-in iron in the wall opposite each duct line entrance.

3.2.11.4 Ground Rods

In each handhole, at a convenient point close to the wall, drive a ground rod conforming to paragraph GROUNDING CONDUCTORS AND ELECTRODES, into the earth before the floor is poured; with approximately 100 mm 4 inches of the ground rod extending above the floor after pouring. When precast concrete units are used, the top of the ground rod may be below the floor; bring a No. 1/0 AWG copper ground conductor inside through a watertight sleeve in the wall.

3.2.12 Lighting

******************************************************************************
NOTE: Following a power outage, a minimum of 10.8 lux (1 foot candle) at grade within 30 seconds is required. Requirement may be met by including dual re-strike element lamps for instant re-strike, using incandescent fixtures for backup lighting or by 5 minute UPS to allow standby power to pickup lighting loads. When the asset being protected justifies the additional cost, interleaving of power circuits should be considered for additional security and reliability. When interleaving is used, the loss of any one circuit should not significantly reduce the visual detection of intruders. Interleaving may also be useful in reducing the power demand for backup power sources.
******************************************************************************
3.2.12.1 Lamps

Deliver lamps of the proper type, wattage, and voltage rating to the project in the original containers and install in the fixtures just before completion of the project.

3.2.12.2 Fixture Installation

Install standard fixtures as detailed on Standard Detail No. 40-06-04, Sheet Nos. [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____] [_____]
3.3 FIELD QUALITY CONTROL

3.3.1 Test for CCTV Assessment Lighting

**************************************************************************
NOTE: Omit this paragraph if the lighting is not used for CCTV Assessment.
**************************************************************************

Submit CCTV assessment lighting test procedures and reports. After receipt by the Contractor of written approval of the test procedures, schedule the tests. Deliver the final test procedures report after completion of the tests.

Perform site testing and adjustment of the completed CCTV lighting, in conjunction with Section 28 10 05 ELECTRONIC SECURITY SYSTEM ACCEPTANCE TESTING. Provide personnel, equipment, instrumentation, and supplies necessary to perform testing. Give written notification of planned testing to the Government at least 14 days prior to the test. In the test procedures, explain, in detail, step-by-step actions and expected results demonstrating compliance with the requirements of the specification. Do not give notice until after receiving written approval of the specific test procedures. Use the test reports to document results of the tests. Deliver the reports to the Government within 7 days after completion of each test.

3.3.2 Operating Test

Submit operating test procedures and reports for the operating test to the Contracting Officer for approval. After receipt of written approval of the test procedures, schedule the tests. Deliver the final Operating Test procedures report after completion of the tests.

After the installation is completed and at such time as the Contracting Officer may direct, conduct an operating test for approval, in the presence of the Contracting Officer. Demonstrate that the equipment operates in accordance with the requirements specified. Furnish instruments and personnel required for the test. The Government will furnish the necessary electric power.

3.3.3 Ground Resistance Measurements

Submit the measured resistance to ground of each separate grounding installation, in writing, indicating the location of the rods, the resistance of the soil in ohms per millimeter and the soil conditions at the time the measurements were made.

Measure the resistance to ground by the fall-of-potential method described in IEEE 81.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Operations and Maintenance Manuals

Submit a draft copy of the operation and maintenance manuals, prior to beginning the tests for use during site testing. Submit final copies of the manuals as specified bound in hardback, loose-leaf binders, within 30 days after completing the field test. Update the draft copy used during
site testing with any changes required, prior to final delivery of the manuals. Identify each manual's contents on the cover. Include names, addresses, and telephone numbers of each subcontractor installing equipment and systems, and nearest service representatives for each item of equipment for each system. Provide the manuals with a table of contents and tab sheets. Place tab sheets at the beginning of each chapter or section and at the beginning of each appendix. Include, upon delivery of the final copies, modifications made during installation checkout and acceptance.

3.4.2 Record Drawings

Maintain and keep up to date, a separate set of drawings, elementary diagrams and wiring diagrams of the lighting to be used for "record" drawings, showing all changes and additions to the lighting system. In addition to being complete and accurate, keep this set of drawings separate and do not use for installation purposes. Upon completion of the record drawings, a representative of the Government will review the as-built work with the Contractor. If the as-built work is not complete, the Contractor will be so advised and complete the work as required.

NOTE: This guide specification covers the requirements for surgical lighting fixtures and similar related specialties.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification shall be used in conjunction with additional design guidance supplied for that particular project.

NOTE: The following information shall be shown on the project drawings:

1. Lighting fixture schedule.

2. Lighting fixture wiring diagram.
PART 1   GENERAL

1.1 REFERENCES

******************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM E308 (2017) Standard Practice for Computing the Colors of Objects by Using the CIE System

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

NEMA ST 20 (1992; R 19972014) Standard for Dry-Type Transformers for General Applications

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2017; ERTA 1-2 2017; TIA 17-1; TIA 17-2; TIA 17-3; TIA 17-4; TIA 17-5; TIA 17-6; TIA 17-7; TIA 17-8; TIA 17-9; TIA 17-10; TIA 17-11; TIA 17-12; TIA 17-13; TIA 17-14; TIA 17-15; TIA 17-16; TIA 17-17 ) National Electrical Code

UNDERWRITERS LABORATORIES (UL)

UL 544 (1998; R 1999) Standard for Medical and Dental Equipment

1.2 RELATED REQUIREMENTS

Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT, Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS, Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, apply to this section with the additions and modifications specified herein.
1.3 DESIGN REQUIREMENTS

1.3.1 Lighthead Illumination Level

Lighthead shall produce a minimum of [80,000 lux] [7440 footcandles] of illumination when measured at 1070 mm 42 inches from the face of the light.

1.3.2 Color Temperature

Correlated color of the lightbeam shall be between 3,500 degrees and 6,700 degrees Kelvin after filtration, as measured on the ASTM E308 chromaticity diagram.

1.3.3 Shadow Reduction

Lighting system shall provide a minimum level of 10 percent of the unshadowed level when measured inside and at the bottom of a tube 50 mm 2 inch in diameter, and 76 mm 3 inch long, from a distance of 1070 mm 42 inches when the beam is obstructed by a disk 254 mm 10 inch in diameter, 580 mm 23 inches above the operating table, and normal to the axis of the tube. Paint inside of tube with flat black.

1.3.4 Beam Temperature

Radiant heat energy in the light beam 1070 mm 42 inches below the lighthead shall not exceed 25,000 microwatts per square centimeter at maximum intensity in the light pattern.

1.3.5 Pattern Size

Smallest pattern size in the focal range shall be a minimum of 150 mm 6 inches. Pattern size shall be adjustable by either raising and lowering the unit or through operation of a focus control which changes the pattern size without movement of the unit.

1.3.6 Current Leakage

A maximum of 0.1 milliampere, as measured between the metal parts and ground.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions
in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list to reflect only the submittals
required for the project.

The Guide Specification technical editors have
designated those items that require Government
approval, due to their complexity or criticality,
with a "G." Generally, other submittal items can be
reviewed by the Contractor's Quality Control
System. Only add a "G" to an item, if the submittal
is sufficiently important or complex in context of
the project.
For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Installation Drawings; G[, [_____]]

SD-03 Product Data

Light Fixtures; G[, [_____]]

Controls; G[, [_____]]

Surgical Light Transformer; G[, [_____]]

SD-07 Certificates

Installation Report

Design Requirements

Certify that the equipment has been properly installed, adjusted, and tested, and that each surgical light fixture meets the provisions of the paragraph entitled "Design Requirements."

SD-10 Operation and Maintenance Data
Light Fixtures, Data Package 5

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.5 QUALITY ASSURANCE

1.5.1 Installation drawings

Submit shop drawing for each specified lighting fixture to include the following:

b. Wiring diagrams indicating the internal wiring for each item of equipment, the interconnections between the items of equipment and connections to normal and emergency power in the building. Manufacturer's catalog data may be submitted for internal wiring description.

1.6 DELIVERY, STORAGE, AND HANDLING

Package each lighting fixture and protect in accordance with the manufacturer's instructions.

PART 2 PRODUCTS

2.1 LIGHT FIXTURES

2.1.1 One Lighthead

One lighthead, ceiling mounted on a single extension arm assembly. Lighthead shall rotate within a clearance circle of 4720 mm 15 1/2 feet and the lighthead center describes a circle 3810 mm 12 1/2 feet when fully extended. Center of lighthead adjustable vertically from 1190 mm 3 feet 11 inches to 2250 mm 7 feet 4 1/2 inches above the floor.

2.1.2 Two Lightheads

Two lightheads, ceiling mounted on a dual extension arm assembly. One lighthead mounted on the shorter arm and the other lighthead mounted on the longer arm to enable the outer lighthead to pass by the inner lighthead without interference. Outer lighthead shall rotate within a clearance circle of 4720 mm 15 1/2 feet and the lighthead center describes a circle 3810 mm 12 1/2 feet when fully extended. Center of the lighthead shall be adjustable vertically from 1190 mm 3 feet 11 inches to 2250 mm 7 feet 4 1/2 inches above the floor.

2.1.3 Track Mounted Light Fixtures

[Single-track system with one or more lightheads] [or] [dual-track system with one or more lightheads] per track. Lightheads are suspended from a carriage which rides in track [or tracks] mounted in the ceiling. Steel suspension tube shall have sufficient length for cutting to the proper length at installation.
2.1.3.1 Light Ceiling Tracks

Ceiling tracks shall have end closures finished to match the fixture and shall have an opening in bottom a maximum of 50 mm 2 inches wide extending the entire length of track to receive the part of the carriage that moves inside the track. Provide each track with insulated duct enclosing two copper bus bars, and a grounding path. Provide tracks with all the necessary components for mounting, and provide for sliding, nonsparking electrical contacts and current-conducting components within the track.

2.1.3.2 [One] [and] [Two] Lighthead[s]

Lighthead shall rotate within a clearance circle of 2800 mm 9 feet 2 inches and the lighthead center describes a circle 1900 mm 3 feet when fully extended. Lighthead center shall be adjustable vertically from 1200 mm 3 feet 11 inches to 2200 mm 7 feet 2 inches above the floor.

2.1.3.3 Fixture on Two Parallel Tracks

Two lightheads; twin track mounted; including two parallel, 2745 mm 9 foot long, surface-mounted fixed tracks, each with a lighthead and carriage.

2.1.3.4 Fixture on Single Lighthead Track

Single lighthead; short track mounted; including a 1370 mm 54 inch long, surface-mounted fixed track with a lighthead, and carriage.

2.1.4 Components

UL 544; The surgical lighting fixtures shall be specifically designed for use in surgical operating rooms.

2.1.5 Electrical Characteristics

120 volts, 60 Hz, single-phase, three-wire grounded circuits.

2.1.6 Lamp

[Quartz halogen][LED][_____] enclosed by heat-absorbing filter. Lamp shall be color corrected and heat filtered and shall have a minimum lifespan of 500 hours. Furnish one spare lamp with each lighthead.

2.1.7 Suspension Systems

Mount each lighthead on a counterbalanced arm that can rotate 6.28 rad 360 degrees horizontally and can provide both vertical and horizontal adjustments. Fixture shall be controllable from both inside and outside the sterile field and shall move in a free, smooth, and silent manner throughout its range of maneuverability without drifting, regardless of position. [In systems with multiple arms attached to the same mount, each individual arm and lighthead shall operate independently and shall be mounted so that each individual arm and lighthead can be positioned outside the sterile area, can bypass each other and be raised, and can be lowered and rotated.]

2.1.8 Movement Limits

**************************************************************************

NOTE: Include this paragraph where flammable

SECTION 26 55 80.00 20 Page 8
anesthetics are used.

Provide lighthouse with stops which shall prevent surgical light from being lowered less than 1520 mm 5 feet above the finished floor.

2.2 CONTROLS

NOTE: Designer should coordinate with User for the number of controllers required and indicate this information on the drawing.

[Recessed] [or] [Surfaced] mounted. Include circuit breaker, an on/off switch located outside the sterile field, and a pilot light. Controls shall have a continuously variable intensity control range from the maximum lux footcandle rating of the lighting fixture to a minimum of 60 percent of the maximum lux footcandle rating of the lighting fixture. Include a radio frequency suppressor. Provide time-of-use meter to determine when to replace the lamp. Provide control units with electrical plug connections designed to allow ease of service or replacement.

2.3 SURGICAL LIGHT TRANSFORMER

NEMA ST 20, [_____] VA, 120 V, 60 Hz primary, 22.8 V - 24 V, 60 Hz secondary.

PART 3 EXECUTION

3.1 INSTALLATION

Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT, and NFPA 70. Install lighthouse in accordance with the approved installation drawings and submit installation report for each lighthouse.

3.1.1 Wiring Methods

Provide conduit and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.1.1.1 [Outlet Box]

NOTE: Delete this paragraph if lighthouse intensity control is surface mounted.

Provide three-gang outlet box 75 mm 3 inches depth for recessed mounted intensity control. Install box 1525 mm 5 feet from finished floor to center line of box.

3.1.2 Surgical Light Transformer

NOTE: Locate transformer so that the maximum length of wires shall not exceed 9144 mm 30 feet from transformer to the lighthouse.
Provide [mounting bracket] [seismic anchoring] for the transformer. Mount transformer on the [ceiling] [wall, 1525 mm 5 feet, minimum, from finished floor].

3.2 FIELD QUALITY CONTROL

3.2.1 Inspection

Examine each item visually for conformance to the requirements of this section.

3.2.2 Tests

Upon completion of installation, conduct an operating test to demonstrate that each surgical lighting fixture meets the requirements of this section.

-- End of Section Table of Contents --
NOTE: This guide specification covers lighting system requirements for exterior installations.

This specification does not cover all possible methods or requirements for exterior lighting; therefore, designer should add special information required to suit a specific project. Industry publications exist to aid the designer in choosing the best lighting system for the project. Publications include, but are not limited to, the Illuminating Engineering Society (IES) HB-10, LIGHTING HANDBOOK and RP-8, RECOMMENDED PRACTICE FOR ROADWAY LIGHTING.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: TO DOWNLOAD UFGS GRAPHICS
Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms

NOTE: This section contains the following sketches
(plates) and are available in metric (SI) and U.S. Customary (IP) system dimensions. Sketch titles and style numbers are unchanged for both types.

Do not include list of sketches, or sketches themselves, in project specifications. Use luminaire sketches as details (plates) on drawings whenever possible. If special features are required, do not modify sketches, but indicate these changes as notes in luminaire schedule. The "XL" style numbers and dates should remain on the drawing details. If additional luminaire types are needed that are not covered in sketches, provide additional sketches or details on drawings, but do not label as XL sketch type.

NOTE: Do not include this index in project specification.

**************************************************************************
**************************************************************************

NOTE: The following information shall be shown on the project drawings or specified in the project specifications:

a. Luminaire schedule indicating luminaire type, mounting, and light source type and quantity;

b. Accessories required, such as photocell, mounting brackets or arms and pole type;

c. Wattage, operating voltage and frequency;

d. Location and mounting height of poles or standards;

e. Referenced XL sketch or detail;
f. NEMA distribution type and BUG rating when applicable; and

g. Extent and location of the work to be accomplished with wiring and equipment necessary for a complete installation.

**************************************************************************

NOTE: Demolition work that involves disposal of fluorescent and HID light sources and ballasts will require the use of Section 02 84 16 HANDLING OF LIGHTING BALLASTS AND LAMPS CONTAINING PCBs AND MERCURY.

**************************************************************************

PART 1  GENERAL

1.1  REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 RELATED REQUIREMENTS

**************************************************************************

NOTE: Select applicable tri-service, Army, Navy, Air Force or NASA specification section reference(s).
**************************************************************************

Materials not considered to be luminaires or lighting equipment are specified in Section(s) [33.71.02 UNDERGROUND ELECTRICAL DISTRIBUTION] [33.71.01.00 40 OVERHEAD TRANSMISSION AND DISTRIBUTION] [33.71.01 OVERHEAD TRANSMISSION AND DISTRIBUTION]. Luminaires and accessories installed in interior of buildings are specified in Section [26.51.00 INTERIOR LIGHTING] [26.51.00.00 40 INTERIOR LIGHTING].

1.3 DEFINITIONS

**************************************************************************

NOTE: Delete definitions that are not applicable to project.
**************************************************************************

a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings shall be as defined in IEEE 100 and IES RP-16.

[ b. For HID, fluorescent, and induction luminaire light sources, "Average Rated Life" is the time after which 50 percent of a large group of light sources will have failed and 50 percent will have survived under normal operating conditions.]

[ c. For LED luminaire light sources, "Useful Life" is the operating hours before reaching 70 percent of the initial rated lumen output (L70) with no catastrophic failures under normal operating conditions. This is also known as 70 percent "Rated Lumen Maintenance Life" as defined in IES LM-80.]

[ d. The "Groundline Section" of wood poles is that portion of the pole between 305 mm one foot above, and 610 mm 2 feet below the groundline.]

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01.33.00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.
**************************************************************************

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of
the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-01 Preconstruction Submittals**

**NOTE:** Required for all area and roadway designs. Contractor shall provide calculations to verify luminaires and design layout meet required illumination and photometric values of the design. This requirement has been added as a quality assurance step. Absolute photometry of LED luminaires provided by IES LM-79 data should provide accurate values to assure contractor's luminaires meet the standards of the initial design.

]
Operating Test
Submit operating test results as stated in paragraph entitled "Field Quality Control."

SD-07 Certificates

Luminaire Useful Life Certificate; G[, [____]]
Submit certification from the manufacturer indicating the expected useful life of the luminaires provided. The useful life shall be directly correlated from the IES LM-80 test data using procedures outlined in IES TM-21. Thermal properties of the specific luminaire and local ambient operating temperature and conditions shall be taken into consideration.

SD-08 Manufacturer's Instructions

Concrete Poles
Submit instructions prior to installation.
Fiberglass Poles
Submit instructions prior to installation.

SD-10 Operation and Maintenance Data

Electronic Ballast Warranty
Operational Service
Submit documentation that includes contact information, summary of procedures, and the limitations and conditions applicable to the project. Indicate manufacturer's commitment to reclaim materials for recycling and/or reuse.

1.5 QUALITY ASSURANCE

1.5.1 Drawing Requirements

1.5.1.1 Luminaire Drawings
Include dimensions, effective projected area (EPA), accessories, and
installation and construction details. Photometric data, including zonal lumen data, average and minimum ratio, aiming diagram, and [computerized] candlepower distribution data shall accompany shop drawings.

1.5.1.2 Poles

Include dimensions, wind load determined in accordance with AASHTO LTS, pole deflection, pole class, and other applicable information. [For concrete poles, include: section and details to indicate quantities and position of prestressing steel, spiral steel, inserts, and through holes; initial prestressing steel tension; and concrete strengths at release and at 28 days.]

1.5.2 Pressure Treated Wood Pole Quality

Ensure the quality of pressure treated wood poles. Furnish an inspection report (for wood poles) of an independent inspection agency, approved by the Contracting Officer, stating that offered products comply with AWPA U1 and RUS Bull 1728F-700 standards. The RUS approved Quality Mark "WQC" on each pole will be accepted, in lieu of inspection reports, as evidence of compliance with applicable AWPA treatment standards.

1.5.3 Photometric Plan

For LED luminaires, include computer-generated photometric analysis of the "designed to" values for the "end of useful life" of the luminaire installation using a light loss factor of 0.7. For LED and all other types of luminaires, the submittal shall include the following:

Horizontal illuminance measurements at finished grade, taken at a maximum of every 3050 mm 10 feet.

Vertical illuminance measurements at 1500 mm 5 feet above finished grade.

Minimum and maximum lux footcandle levels.

Average maintained lux footcandle level.

Maximum to minimum ratio for horizontal illuminance only.

1.5.4 Design Data for Luminaires

a. Provide distribution data according to IES classification type as defined in IES HB-10.

b. Shielding as defined by IES RP-8 or B.U.G. rating for the installed position as defined by IES TM-15.

c. Provide safety certification and file number for the luminaire family. Include listing, labeling and identification per NFPA 70 (NEC). Applicable testing bodies are determined by the US Occupational Safety Health Administration (OSHA) as Nationally Recognized Testing Laboratories (NRTL) and include: CSA (Canadian Standards Association), ETL (Edison Testing Laboratory), and UL (Underwriters Laboratories).

d. Provide long term lumen maintenance projections for each LED luminaire in accordance with IES TM-21. Data used for projections shall be obtained from testing in accordance with IES LM-80.
e. Provide wind loading calculations for luminaires mounted on poles. Weight and effective projected area (EPA) of luminaires and mounting brackets shall not exceed maximum rating of pole as installed in particular wind zone area.

1.5.5 LED Luminaire - IES LM-79 Test Report

Submit test report on manufacturer's standard production model luminaire. Submittal shall include all photometric and electrical measurements, as well as all other pertinent data outlined under "14.0 Test Report" in IES LM-79.

1.5.6 LED Light Source - IES LM-80 Test Report

Submit report on manufacturer's standard production LED package, array, or module. Submittal shall include:

a. Testing agency, report number, date, type of equipment, and LED light source being tested.

b. All data required by IES LM-80.

1.5.6.1 Test Laboratories

Test laboratories for the IES LM-79 and IES LM-80 test reports shall be one of the following:

a. National Voluntary Laboratory Accreditation Program (NVLAP) accredited for solid-state lighting testing as part of the Energy-Efficient Lighting Products laboratory accreditation program.

c. A manufacturer's in-house lab that meets the following criteria:

1. Manufacturer has been regularly engaged in the design and production of high intensity discharge roadway and area luminaires and the manufacturer's lab has been successfully certifying these fixtures for a minimum of 15 years.

2. Annual equipment calibration including photometer calibration in accordance with National Institute of Standards and Technology.

[1.5.7 Tests for Fiberglass Poles

a. Ultraviolet resistance tests: Perform according to ASTM G154 using a UV-B light source having a 313 nanometer wavelength, operated at 54 degrees C 130 degrees F, cycling the light source on for 4 hours and off for 4 hours for a total test period of 1500 hours minimum with the following results:

<table>
<thead>
<tr>
<th>Fiber exposure:</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crazing:</td>
<td>None</td>
</tr>
<tr>
<td>Checking:</td>
<td>None</td>
</tr>
</tbody>
</table>
b. Flexural strength and deflection test: Test loading shall be as a cantilever beam with pole butt as fixed end and a force simulating wind load at the free end.

1.5.8 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship shall be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.9 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products shall have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period shall include applications of equipment and materials under similar circumstances and of similar size. The product shall have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items shall be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.9.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if the manufacturer has been regularly engaged in the design and production of high intensity discharge roadway and area luminaires for a minimum of 15 years. Products shall have been in satisfactory commercial or industrial use for 15 years prior to bid opening. The product shall have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 15-year period.

1.5.9.2 Material and Equipment Manufacturing Date

Products manufactured more than 1 year prior to date of delivery to site shall not be used, unless specified otherwise.

[1.6 DELIVERY, STORAGE, AND HANDLING OF POLES

[1.6.1 Wood Poles

Do not store poles on ground. Stack poles stored for more than 2 weeks on decay-resisting skids arranged to support the poles without producing noticeable distortion. Store poles to permit free circulation of air; the bottom poles in the stack shall be at least 305 mm one foot above ground level and growing vegetation. Do not permit decayed or decaying wood to remain underneath stored poles. Do not drag treated poles along the ground.
ground. Do not use pole tongs, cant hooks, and other pointed tools capable of producing indentation more than 25 mm one inch in depth in handling the poles. Do not apply tools to the groundline section of any pole.

[1.6.2 Concrete Poles]

Do not store poles on ground. Support poles so they are at least 305 mm one foot above ground level and growing vegetation.

[1.6.3 [Fiberglass] [Aluminum] [Steel] Poles]

Do not store poles on ground. Support poles so they are at least 305 mm one foot above ground level and growing vegetation. Do not remove factory-applied pole wrappings until just before installing pole.

[1.7 WARRANTY]

The equipment items shall be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

[1.7.1 LED Luminaire Warranty]

**************************************************************************
NOTE: Choose this paragraph for LED applications.
**************************************************************************

Provide Luminaire Useful Life Certificate.

The equipment items shall be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

a. Provide a written five year on-site replacement warranty for material, fixture finish, and workmanship. On-site replacement includes transportation, removal, and installation of new products.

1. Finish warranty shall include warranty against failure and against substantial deterioration such as blistering, cracking, peeling, chalking, or fading.

2. Material warranty shall include:

   (a) All power supply units (drivers).

   (b) Replacement when more than 10 percent of LED sources in any lightbar or subassembly(s) are defective or non-starting.

b. Warranty period must begin on date of beneficial occupancy. Contractor shall provide the Contracting Officer signed warranty certificates prior to final payment.

[1.7.2 Electronic Ballast Warranty]

**************************************************************************
NOTE: Choose this paragraph for HID, LPS, and fluorescent applications.
**************************************************************************
Furnish the electronic ballasts manufacturer's warranty. The warranty period shall not be less than five (5) years from the date of manufacture. Ballast assembly in the lighting fixture, transportation, and on-site storage shall not exceed twelve (12) months, thereby permitting four (4) years of the five (5) year warranty to be in service and energized. The warranty shall state that the malfunctioning ballast shall be exchanged by the manufacturer and promptly shipped to the using Government facility. The replacement ballast shall be identical to, or an improvement upon, the original design of the malfunctioning ballast.

1.8 OPERATIONAL SERVICE

NOTE: Maintenance agreements are standard practice in the building industry. Take-back programs refer to programs in which the product manufacturer "takes-back" scrap material and/or packaging associated with its product. Under a green lease, when the customer no longer requires the use of the particular product or requires an updated model, the manufacturer is obligated to reclaim it and refurbish it or disassemble it for recycling as appropriate. Using one of these manufacturer's services may contribute to achievement of sustainability requirements.

NOTE: This is optional for Army Projects.

Coordinate with manufacturer for [maintenance agreement] [take-back program]. Collect information from the manufacturer about [maintenance agreement] [green lease] options, and submit to Contracting Officer. Services shall reclaim materials for recycling and/or reuse. Services shall not deposit materials in landfills or burn reclaimed materials. Indicate procedures for compliance with regulations governing disposal of mercury. When such a service is not available, local recyclers shall be sought after to reclaim the materials.

PART 2 PRODUCTS

2.1 PRODUCT COORDINATION

NOTE: Choose bracketed options as applicable for Army, Navy or Air Force project.

Products and materials not considered to be luminaires, equipment or accessories are specified in [Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION,][ Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION,][ and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.] Luminaires and associated equipment and accessories for interior applications are specified in Section 26 51 00 INTERIOR LIGHTING.

2.2 [LED, ] [HID,] [LPS,] [FLUORESCENT,][ AND] [INDUCTION] LUMINAIRES
NOTE: XL series luminaire plates and details shown on project plans are provided for a visual perspective of the luminaire desired. Shapes, dimensions and other requirements shown are not intended to restrict selection to luminaires of a specific manufacturer. Luminaires producing comparable or competitive photometric results on a given plan area, and of similar or equal material, finish and craftsmanship will be considered for approval.

Choose appropriate bracketed options for type of luminaires being used.

NOTE: Designer may include Energy Star label for LED luminaire if it is confirmed that adequate availability exists of Energy Star products that are appropriate for the project.

**************************************************************************

UL 1598, NEMA C82.77 and UL 8750. Provide luminaires as indicated in luminaire schedule and XL plates or details on project plans. Provide luminaires complete with light sources of quantity, type, and wattage indicated. All luminaires of the same type shall be provided by the same manufacturer.[ Provide Energy Star labeled LED luminaire product. Provide proof of Energy Star label for LED luminaire product.]

2.2.1 General Requirements

a. [ LED luminaire housings shall be die cast or extruded aluminum.][ 
Housings for luminaires other than LED shall be die cast, extruded, or fabricated aluminum. Fabricated aluminum housings shall have all seams and corners internally welded to resist weathering, moisture and dust.]

**************************************************************************

NOTE: 40 degrees C 104 degrees F is "standard" upper level rating of most LED luminaires. Choose higher 50 degrees C 122 degrees F rating when an installation location warrants a higher ambient temperature rating and the additional cost it incurs.

**************************************************************************

[ b. LED luminaires shall be rated for operation within an ambient temperature range of minus 30 degrees C minus 22 degrees F to[ 40 degrees C 104 degrees F][ 50 degrees C 122 degrees F].

] c. Luminaires shall be UL listed for wet locations per UL 1598.[ Optical compartment for LED luminaires shall be sealed and rated a minimum of IP65 per NEMA IEC 60529.]

[ d. LED luminaires shall produce a minimum efficacy as shown in the following table, tested per IES LM-79. Theoretical models of initial raw LED lumens per watt are not acceptable.

<table>
<thead>
<tr>
<th>Application</th>
<th>Luminaire Efficacy in Lumens per Watt</th>
</tr>
</thead>
</table>

SECTION 26 56 00 Page 21
] e. Luminaires shall have IES distribution and NEMA field angle classifications as indicated in luminaire schedule on project plans per IES HB-10.

f. Housing finish shall be baked-on enamel, anodized, or baked-on powder coat paint. Finish shall be capable of surviving ASTM B117 salt fog environment testing for 2500 hours minimum without blistering or peeling.

**************************************************************************
NOTE: Lighting zones referenced below are taken from the joint IDA/IES Model Lighting Ordinance, published in 2011. Zones included range from LZ-0 through LZ-4, and outline requirements for minimal to very high ambient light levels respectively.
**************************************************************************

g. Luminaires shall not exceed the following IES TM-15 Backlight, Uplight and Glare (B.U.G.) ratings:

1. Maximum Backlight (B) rating shall be determined by lighting zone in which luminaire is placed.

2. Maximum Uplight (U) rating shall be U0.

3. Maximum Glare (G) rating shall be determined by lighting zone in which luminaire is placed.

h. Luminaires shall be fully assembled and electrically tested prior to shipment from factory.

i. The finish color shall be as indicated in the luminaire schedule or detail on the project plans.

] j. Luminaire arm bolts shall be 304 stainless steel or zinc-plated steel.

] k. Luminaire lenses shall be constructed of [clear][ frosted] tempered glass or UV-resistant acrylic. [ Provide polycarbonate vandal-resistant lenses as indicated.]

] l. The wiring compartment on pole-mounted, street and area luminaires must be accessible without the use of hand tools to manipulate small screws, bolts, or hardware.

] m. Incorporate modular electrical connections, and construct luminaires to allow replacement of all or any part of the optics, heat sinks, power...
supply units, ballasts, surge suppressors and other electrical components using only a simple tool, such as a manual or cordless electric screwdriver.

n. Luminaires shall have a nameplate bearing the manufacturer's name, address, model number, date of manufacture, and serial number securely affixed in a conspicuous place. The nameplate of the distributing agent will not be acceptable.

[ o. Roadway and area luminaires shall have an integral tilt adjustment of plus or minus 5 degrees to allow the unit to be leveled in accordance with ANSI C136.3.

] p. Luminaire must pass 3G vibration testing in accordance with NEMA C136.31.

q. All factory electrical connections shall be made using crimp, locking, or latching style connectors. Twist-style wire nuts are not acceptable.

2.2.2 Luminaire Light Sources

**************************************************************************
NOTE: The Energy Independence and Security Act (EISA) of 2007, Title III, Subtitle B, Section 324 limits the use of certain metal halide light sources and ballasts. Do not specify any of the light sources listed in that document.
**************************************************************************

[2.2.2.1 High Pressure Sodium (HPS) Light Sources

**************************************************************************
NOTE: For Army and Navy projects, high pressure sodium light sources are not recommended for new installations, but can be used where existing conditions and continuity of source type make their use necessary. For Air Force projects, high pressure sodium light sources should be avoided for new installations if possible and considered only when a more energy efficient alternative is not available to meet photometric and performance requirements.
**************************************************************************

ANSI ANSLG C78.42 and NEMA ANSLG C78.380. HPS light sources shall have a minimum average rated life of 24,000 hours, minimum color rendering index (CRI) of 21, and a minimum correlated color temperature (CCT) of 1900 degrees K. Provide type and wattage as indicated in luminaire schedule on project plans. Light sources shall be compliant with the most current TCLP test procedure per NEMA C78.LL 3 at the time of manufacture.

][2.2.2.2 Metal Halide (MH) Light Sources

**************************************************************************
NOTE: Metal halide light sources are available in a wide variety of configurations and wattages. Only a few typical examples are shown below. Utilize pulse-start technology for all wattages as they become available. They have longer life and better lumen maintenance. Some are rated for vertical use
only, so be wary of light source orientation. Like other HID sources, re-strike time is a factor to consider. PAR envelopes are an efficient choice for lower wattage applications, but must be specified with beam type and angle. In most cases, choose light sources rated for use in an enclosed luminaire. Typically, choose sources with highest CRI and longest life, and closest CCT to match LED temperature of no greater than 4300 degrees K.

ANSI/ANSLG C78.43, NEMA ANSLG C78.44, ANSI C78.1381, and NEMA ANSLG C78.380. Provide type and wattage as indicated in luminaire schedule on project plans. Open fixtures are prohibited unless provided with a mechanism to utilize only Type O light sources and prohibit the use of Type E or S light sources. Light sources shall be specifically suited to operate in the burning position which they are installed, and shall be compliant with the most current TCLP test procedure per NEMA C78.LL 3 at the time of manufacture.

[a.  All probe-start metal halide light sources shall utilize [a] [an] BT [ED][BT]-type envelope, with an E-39[_____] screw base. The arc tube shall be a ceramic-[fused quartz]-type, with a rating of [400][1000][_____] watts, having a minimum initial output of [35,000][105,000][_____] lumens. The correlated color temperature (CCT) shall be [3000][_____] degrees K, with a minimum color rendering index (CRI) of [65][_____] The minimum average rated life shall be [15,000][12,000] hours, based on 10 hours operation per start.

b. All pulse-start metal halide light sources shall utilize [a] [an] [Tube][PAR][ED][ET][BD]-type envelope, [G-12][E-26 Medium][E-39][mogul] base, ceramic-[fused quartz] arc tube type, rated at [70][100][250][_____] watts, with a minimum initial output of [6300][6200][21,000][_____] lumens. Correlated color temperature (CCT) shall be [3000][_____] degrees K, minimum color rendering index (CRI) shall be [80][____], with a minimum average rated life of [12,000] hours, based on 10 hours operation per start.

2.2.2.4 Fluorescent Light Sources

[ a. T5HO fluorescent light sources shall have miniature bi-pin bases, be low-mercury type, in nominal length(s) of 1170 mm 46 in 1475 mm 58 in, rated at [54][80] watts, with minimum initial output of [4450][6150] lumens. Light source correlated color temperature (CCT) shall be
[3500] [4100] degrees K, with a minimum CRI value of 75, and a minimum average rated life of [25,000][_____] hours, based on 3 hours operation per start. Light sources shall be compliant with the most current TCLP test procedure per ANSI/NEMA C78.LL 1256 at time of manufacture.

[b. T8 fluorescent light sources shall have medium bi-pin bases, be low-mercury type, in nominal length(s) of 1220 mm 48 in 2438 mm 96 in, rated at [32] [59] watts, with minimum initial output of [2800] [5700] lumens. Light source correlated color temperature (CCT) shall be [3500] [4100] degrees K, with a minimum CRI value of 75, and a minimum average rated life of [30,000][_____] hours, based on 3 hours operation per start. Light sources shall be compliant with the most current TCLP test procedure per ANSI/NEMA C78.LL 1256 at time of manufacture.

[c. Compact fluorescent (CFL) light sources shall be 4-pin base, low-mercury, programmed-start, energy-savings type, rated at [26] [32] [42] [57] [70] watts, correlated color temperature of [3500] [4100] degrees K, minimum CRI of 82, with an average rated life of [16,000][_____] hours minimum. Light sources shall be compliant with the most current TCLP test procedure per ANSI/NEMA C78.LL 1256 at time of manufacture.

] [2.2.2.5  Induction Light Sources

******************************************************************************
NOTE:  Induction light sources have high efficiencies, superior color rendering, instant on/off switching ability, and extremely long lives. Relamping is typically in the 60,000 plus hour range and because of this, savings in maintenance make these a viable solution to certain outdoor applications.  Typically select CCT of 4000 degrees K to match LED and other exterior light sources.
******************************************************************************

Induction light sources shall consist of an electrodeless, inductively-coupled, phosphor-coated fluorescent envelope rated at [55] [85] [100] [150] [165] watts, color temperature of [3000/3500] [4000/4100] [5000] degrees K, minimum CRI of 80, with an average rated life of 100,000 hours minimum based on 3 hours operation per start.

] [2.2.2.6  LED Light Sources

******************************************************************************
NOTE: Typically, select a CCT in the range of 4000 degrees K. Some studies have shown that luminaires with higher CCT values approaching 6500 degrees K attribute to skyglow, cause erratic behavior in some animals, and possibly cause circadium rhythm abnormalities. Although all of these issues have not been fully documented, a lower color temperature is recommended.
******************************************************************************

a. Correlated Color Temperature (CCT) shall be in accordance with NEMA ANSLG C78.377:

[ Nominal CCT: 4000 degrees K: 3985 plus or minus 275 degrees K
b. Color Rendering Index (CRI) shall be:

Greater than or equal to [70] [_____] for 4000 degrees K light sources.

c. Color Consistency:

Manufacturer shall utilize a maximum 4-step MacAdam ellipse binning tolerance for color consistency of LEDs used in luminaires.

2.2.3 Luminaire[ Ballasts,][ Generators][ and][ Power Supply Units (Drivers)]

******************************************************************************
NOTE: Choose "Ballasts" for HID, LPS and fluorescent; "Generators" for induction; and "Power Supply Units (Drivers)" for LED applications.
******************************************************************************

2.2.3.1 HID Ballasts

2.2.3.1.1 Electronic HID Ballasts

NEMA ANSLG C82.14, IEEE C62.41, 47 CFR 18 and shall meet the following requirements:

a. Minimum power factor shall be greater than 90 percent.

b. Input voltage shall be 120-277 volts plus or minus 10 percent.

c. Shall have end of life circuitry to prevent ballast from operating if light source is inoperable.

d. Shall have a sound rating of A and a lamp current crest factor less than 1.5.

e. Input current total harmonic distortion shall be less than 15 percent.

f. Minimum starting temperature shall be minus 30 degrees C minus 22 degrees F.

g. Shall be thermally protected to prevent overheating.

h. Shall be UL listed and RoHS compliant.

2.2.3.1.2 Magnetic HID and LPS Ballasts

******************************************************************************
NOTE: For metal halide luminaires, provide electronic ballasts whenever available. Otherwise, constant wattage autotransformer (CWA) or high reactance/high power factor (HX-HPF), pulse-start magnetic ballasts should be specified.
******************************************************************************

ANSI C82.4. Pulse-start constant wattage autotransformer (CWA) type shall be used when available. Probe-start constant wattage autotransformer (CWA), high reactance/high power factor (HX-HPF) or regulator type shall be used for metal halide light sources when pulse-start is not available, and
for high and low pressure sodium light sources. Ballasts shall meet the following requirements:

a. Shall have minimum Class "H" insulation rating.

b. Shall be designed for 60,000 hours of operation at maximum rated temperature.

c. Shall have minimum starting temperature for high and low pressure sodium shall be \(\text{minus 40 degrees C}\) \(\text{minus 40 degrees F}\), and for metal halide \(\text{minus 30 degrees C}\) \(\text{minus 22 degrees F}\).

d. Nominal ballast factor shall be 1.0.

e. Capacitors shall have a self-contained bleeder resistor as required by UL 1029.

f. Oil-filled capacitors shall be housed in an aluminum or corrosion-resistant steel can and be provided with \(6 \text{ mm}\) \(0.25 \text{ in}\) quick disconnect terminals.

g. Capacitor maximum case temperature shall be \(90 \text{ degrees C}\) \(194 \text{ degrees F}\) for oil-filled and \(105 \text{ degrees C}\) \(221 \text{ degrees F}\) for dry film type.

h. Starter/igniter shall provide six months of light source open circuit operation without failure and be designed to withstand 10,000 hours of continuous pulsing (not applicable for LPS).

[2.2.3.2] Fluorescent Ballasts

**************************************************************************
NOTE: CEC Title 24 should only be included for projects located in California.
**************************************************************************

UL 935, NEMA ANSI C82.11, [and ]NFPA 70[ and CEC Title 24], with no magnetic core and coil components, and shall meet the following requirements:

a. Shall provide transient protection as recommended by IEEE C62.41.1 and IEEE C62.41.2.

b. Shall be programmed-start or instant-start type as indicated in luminaire schedule on project drawings elsewhere in this specification.

c. Shall be UL listed Class P, have a Class A sound rating, and have a minimum power factor of 0.98.

d. Shall be designed for the wattage and quantity of light sources powered in the luminaire specified, and have circuit diagrams and lamp connection information printed on the exterior of the ballast housing.

e. Shall contain no PCBs and be RoHS compliant.

f. Shall be manufactured in an ISO 9001-certified facility.

g. Shall operate at a frequency greater than 20 kHz minimum, preferably greater than 40 kHz, and shall have a Lamp Current Crest Factor less than 1.7.
h. Shall have a light regulation of plus or minus 10 percent of lumen output when operated within a plus or minus 10 percent range of input voltage.

i. Shall have a full replacement warranty of 5 years from date of manufacture for a maximum case temperature of 70 degrees C 158 degrees F and 3 years for a maximum case temperature of 90 degrees C 194 degrees F.

j. All ballasts provided to operate 1220 mm 48 in T8 light sources shall be NEMA Premium type.

2.2.3.2.1 T5HO Electronic Fluorescent Ballasts

Shall be programmed-start type with nominal ballast factor of 1.0, maximum input current THD of 10 percent, lamp end of life protection circuitry, and have a minimum starting temperature of minus 18 degrees C 0 degrees F.

Ballast efficacy factor (BEF), rated at 120 volts shall be:

\[
\text{Minimum 3.66 for one 24W light source.} \\
\text{Minimum 1.83 for two 24W light sources.} \\
\text{Minimum 2.23 for one 39W light source.} \\
\text{Minimum 1.11 for two 39W light sources.} \\
\text{Minimum 1.62 for one 54W light source.} \\
\text{Minimum 0.83 for two 54W light sources.} \\
\text{Minimum 0.57 for three 54W light sources.} \\
\text{Minimum 0.42 for four 54W light sources.} 
\]

Input power shall be:

\[
\text{Maximum 30 watts for one 24W light source.} \\
\text{Maximum 59 watts for two 24W light sources.} \\
\text{Maximum 47 watts for one 39W light source.} \\
\text{Maximum 90 watts for two 39W light sources.} \\
\text{Maximum 63 watts for one 54W light source.} \\
\text{Maximum 120 watts for two 54W light sources.} \\
\text{Maximum 184 watts for three 54W light sources.} \\
\text{Maximum 240 watts for four 54W light sources.} 
\]

2.2.3.2.2 T8 Electronic Fluorescent Ballasts

Shall be[ programmed-start][ instant-start] type, with minimum ballast factor of 0.87, maximum current THD of 10 percent, and have a minimum starting temperature of minus 18 degrees C 0 degrees F.

[ For programmed-start ballasts:

Ballast efficacy factor (BEF), rated at 120 volts shall be:

\[
\text{Minimum 2.9 for one 32 W, 1220 mm 48 in light source (NEMA Premium).} \\
\text{Minimum 1.49 for two 32 W, 1220 mm 48 in light sources (NEMA Premium).} \\
\text{Minimum 1.03 for three 32 W, 1220 mm 48 in light sources (NEMA Premium).} 
\]
Minimum 0.8 for four 32 W, 1220 mm 48 in light sources (NEMA Premium).

Input power shall be:

- Maximum 35 watts for one 32 W, 1220 mm 48 in light source (NEMA Premium).
- Maximum 59 watts for two 32 W, 1220 mm 48 in light sources (NEMA Premium).
- Maximum 85 watts for three 32 W, 1220 mm 48 in light sources (NEMA Premium).
- Maximum 112 watts for four 32 W, 1220 mm 48 in light sources (NEMA Premium).

For instant-start ballasts:

Ballast efficacy factor (BEF), rated at 120 volts shall be:

- Minimum 2.9 for one 32 W, 1220 mm 48 in light source (NEMA Premium).
- Minimum 1.49 for two 32 W, 1220 mm 48 in light sources (NEMA Premium).
- Minimum 1.03 for three 32 W, 1220 mm 48 in light sources (NEMA Premium).
- Minimum 0.8 for four 32 W, 1220 mm 48 in light sources (NEMA Premium).
- Minimum 1.36 for one 59 W, 2438 mm 96 in light source.
- Minimum 0.77 for two 59 W, 2438 mm 96 in light sources.

Input power shall be:

- Maximum 35 watts for one 32 W, 1220 mm 48 in light source (NEMA Premium).
- Maximum 59 watts for two 32 W, 1220 mm 48 in light sources (NEMA Premium).
- Maximum 85 watts for three 32 W, 1220 mm 48 in light sources (NEMA Premium).
- Maximum 112 watts for four 32 W, 1220 mm 48 in light sources (NEMA Premium).
- Maximum 72 watts for one 59 W, 2438 mm 96 in light source.
- Maximum 113 watts for two 59 W, 2438 mm 96 in light sources.

2.2.3.2.3 Compact Fluorescent (CFL) Electronic Ballasts

Shall be programmed start type with ballast factor greater than or equal to 0.98, maximum input current THD of 10 percent, lamp end of life protection circuitry, and have a minimum starting temperature of minus 18 degrees C 0 degrees F for primary light source(s).

The ballast efficacy factor rated at 120 volts shall be:

- Minimum 3.64 for one 26W CFL light source.
- Minimum 2.72 for one 32W CFL light source.
- Minimum 2.13 for one 42W CFL light source.
- Minimum 1.56 for one 57W CFL light source.
- Minimum 1.28 for one 70W CFL light source.

The input power shall be:
2.2.3.3 Induction Generators

Generator shall be connected to, and operate in conjunction with, an inductive power coupler or coil(s). These in turn activate a glass light source enclosure from either inside or outside of the enclosure. The generator shall be solid-state, high-frequency (200kHz - 2.67MHz) type, with a power factor greater than 0.9, a Class A sound rating, a maximum input current THD of 15 percent, an operating voltage of 120-277V and a minimum starting temperature of \( -40 \text{ degrees C} \). Generator shall be dimmable to 50 percent of lumen output and be UL, CSA, and RoHS compliant.

2.2.3.4 LED Power Supply Units (Drivers)

UL 1310. LED Power Supply Units (Drivers) shall meet the following requirements:

a. Minimum efficiency shall be 85 percent.

b. Drive current to each individual LED shall not exceed 600 mA, plus or minus 10 percent.

**************************************************************************
NOTE: 40 degrees C 104 degrees F is "standard" upper level rating of most LED luminaires. Choose higher 50 degrees C 122 degrees F rating when an installation location warrants a higher ambient temperature rating and the additional cost it incurs.
**************************************************************************

c. Shall be rated to operate between ambient temperatures of \( -30 \text{ degrees C} \) and 40 degrees C 104 degrees F[ 50 degrees C 122 degrees F].

d. Shall be designed to operate on the voltage system to which they are connected, typically ranging from 120 V to 480 V nominal.

e. Operating frequency shall be: 50 or 60 Hz.

f. Power Factor (PF) shall be greater than or equal to 0.90.

g. Total Harmonic Distortion (THD) current shall be less than or equal to 20 percent.

h. Shall meet requirements of 47 CFR 15, Class B.

i. Shall be RoHS-compliant.

j. Shall be mounted integral to luminaire. Remote mounting of power supply is not allowed.

k. Power supplies in luminaires mounted under a covered structure, such as
a canopy, or where otherwise appropriate shall be UL listed with a sound rating of A.

[1. Shall be dimmable, and compatible with a standard dimming control circuit of 0 - 10V or other approved dimming system.

]m. Shall be equipped with over-temperature protection circuit that turns light source off until normal operating temperature is achieved.

2.2.4 LED Luminaire Surge Protection

Provide surge protection integral to luminaire to meet C Low waveforms as defined by IEEE C62.41.2, Scenario 1, Location Category C.

2.3 OBSTRUCTION MARKER LUMINAIRES

**************************************************************************

NOTE: If no other airfield lighting is required in project, cut and paste required paragraph on obstruction marker luminaires in this paragraph. If other airfield lighting is required, include entire section in project specifications as noted below. Designer shall also be aware of a conflict between LED obstruction luminaires and pilots using night vision goggles (NVG). The output wavelength and low heat signature of LED luminaires render them invisible for pilots using NVG.

**************************************************************************

Provide obstruction marker luminaires for facilities as required by the FAA and in accordance with Section 26 56 20 AIRFIELD AND HELIPORT LIGHTING AND VISUAL NAVIGATION AIDS.

2.4 EXTERIOR LUMINAIRES CONTROLS

**************************************************************************

NOTE: Currently, policy for networked control of lighting systems are still being developed. Issues such as security and standard protocols need further review and certification. So, lighting control "systems" at this point shall be limited to stand-alone type, and wireless control strategies shall not be employed at this time.

Typically, controls shall be provided to turn luminaires on at dusk and off after a certain time period, when sufficient daylight is available, or when illumination is not required.

Provide control at each individual luminaire or by a single device or system controlling a group of luminaires.
Use reference to ASHRAE 189.1 in lieu of ASHRAE 90.1 for Army projects.

**************************************************************************

Controls shall comply with [Section 9 of ASHRAE 90.1 - SI ASHRAE 90.1 - IP, ASHRAE 189.1]. Provide a control system interface within each luminaire that is compatible with the energy management or control system used by the utility department in charge of the project area for control of site lighting.

[2.4.1  Photocell]

**************************************************************************

NOTE: Cadmium sulfide is the older of the two technologies. Silicon diode sensors are a solid state device and more resistant to higher temperatures and environmental contamination. Silicon diode type are usually specified when mounting directly to luminaires, but both types are proven, reliable technologies. Select last bracketed option for LED fixtures.

**************************************************************************

UL 773 or UL 773A. Photocells shall be hermetically sealed, cadmium sulfide silicon diode light sensor type, rated at [_____] watts, [_____] volts, 50/60 Hz with single-pole, [single][double]-throw contacts. Photocell shall be designed to fail to the ON position. Housing shall be constructed of [polycarbonate] [die cast aluminum] [UV stabilized polypropylene], rated to operate within a temperature range of minus 40 to 70 degrees C minus 40 to 158 degrees F. Photocell shall have a 13 mm 1/2 in threaded base for mounting to a junction box or conduit. Provide [fixed][swivel] base type housing. Photocell shall be twist-lock receptacle type conforming to NEMA C136.10. Provide with solid brass prongs and voltage markings and color coding on exterior of housing. Photocell shall turn on at 10-30 lux 1-3 footcandles and turn off at 30 to 150 lux 3 to 15 footcandles. A time delay shall prevent accidental switching from transient light sources. Provide a directional lens in front of the cell to prevent fixed light sources from creating a turnoff condition. Provide photocell with metal oxide varistor (MOV) type surge protection. Photocell shall be designed for 20-year service to match life expectancy of long-life LED fixtures and exceeds 15,000 operations at full load. Provide photocell with zero-cross technology to withstand severe in-rush current and extend relay life.

[2.4.2  Timeswitch]

[Timeswitch shall be electromechanical type with a[ 24 hour][ 7 day] [astronomic] dial that changes on/off settings according to seasonal variations of sunset and sunrise]. Switch shall be powered by an enclosed synchronous motor with a maximum 3 watt operating rating. Timeswitch contacts shall be rated for [40][_____] amps at 120-277 VAC resistive load in a [SPST] [DPST] [SPDT] [DPDT] [normally open (NO)] [normally closed (NC)] configuration. Switch shall have an automatic spring mechanism to maintain accurate time for up to 16 hours during a power failure. Provide switch with function that allows automatic control to be skipped on certain selected days of the week. Provide switch with manual bypass or remote override control.

[Timeswitch shall be an electronic type with a[ 24 hour][ 7 day]
[astronomic] programming function [that changes on/off settings according to seasonal variations of sunset and sunrise], providing a total of [56][____] on/off set points. Digital clock display format shall be AM/PM 12 hour [24 hour] type. Provide power outage backup for switch utilizing a [capacitor] [alkaline batteries] [lithium battery] which provides coverage for a minimum of [7 days] [3 years] [8 years]. Timeswitch shall provide control to [1] [2] [4] [_____] channels or loads. Contacts shall be rated for [30] [_____] amps at 120-277 VAC resistive load in a [SPST] [DPST] [SPDT] [DPST] [normally open (NO)] [normally closed (NC)] configuration. [Provide switch with [function that allows automatic control to be skipped on certain selected days of the week] [manual bypass or remote override control] [daylight savings time automatic adjustment] [EEPROM memory module] [momentary function for output contacts] [ability for photosensor input]].

] Timeswitch shall be housed in a surface-mounted, lockable NEMA [1] [3R] enclosure constructed of painted steel or plastic polymer conforming to NEMA ICS 6.

][2.4.3 Lighting Contactor

][2.4.4 Lighting Control Relay Panel

**************************************************************************
NOTE: When providing a control panel that interfaces with the building automated control system, reference IES Technical Memorandum IES TM-23-11 for technical information on various protocols, architectures and topologies for such systems.
**************************************************************************
**************************************************************************
NOTE: CEC Title 24 should only be included for projects located in California.
**************************************************************************

Panel shall consist of a single NEMA [1] [3R] [flush] [surface]-mounted enclosure with two separate interior sections; one for Class 1 (branch circuit) and one for Class 2 (low voltage) wiring. Provide panel with [8] [16] [32] [_____] relays. Panel shall be designed as [a stand alone] [an automated control system interface] type. The Class 1 section shall contain the load side of all relays and the incoming branch circuit wiring. The Class 2 section shall contain the control power transformer (24 volt output), relays, relay control modules, and control wiring[; and
native BACnet [LONworks] field-programmable application controller for panels connected to the facility automated control system. Panel enclosure shall be constructed of [16][14] gauge cold-rolled steel with baked-on enamel finish. Panel shall meet requirements of UL 916, ASHRAE 90.1 - SI ASHRAE 90.1 - IP,[ CEC Title 24] and 47 CFR 15.

Relays shall be [1][2]-pole, rated at 20 amperes [300][480] VAC with rated life of 120,000 mechanical operations minimum.

Relay control module shall be 24 volt, electronic type and control up to 16 separate relays (16 channel) or programmed groups of relays. Provide with inputs for signals from devices such as photocells, timeclocks, and motion sensors. [Relay control module with integral timeclock function shall be 24 volt, electronic type with LCD display and control up to 8 separate relays (8 channel)].

}[2.4.5 Motion Sensor

NEMA WD 7, UL 773A. Provide [passive infrared][microwave][dual technology passive infrared/microwave] type sensors with [270][_____] degree coverage, time delay that can be adjusted from 15 seconds to 15 minutes, and "fail to ON position" default state. Sensors shall be located to achieve coverage of areas as indicated on project plans. Coverage patterns shall be derated as recommended by manufacturer based on mounting height of sensor and any obstructions such as trees. Do not use gross rated coverage in manufacturer's product literature. Sensors installed integral to the luminaire must be provided by the luminaire manufacturer. Sensors shall have an integral light level sensor that does not allow luminaires to operate during daylight hours and shall be designed to operate on a voltage of [120/277 VAC][24 VDC]. [Provide sensors to operate in conjunction with bi-level controllers that lower HID or LED luminaires to a 50 percent output.] Sensor shall be [equipped with a threaded base for mounting to a weatherproof junction box][mounted directly to luminaire].

}[2.4.6 Bi-level HID Controller

UL 1598. Provide device to switch full lumen output of HID luminaires to 50 percent output upon receiving 24 VDC signal from motion sensor, photocell or control system circuit. Device shall be compatible with constant wattage autotransformer (CWA) ballasts only and have maximum load rating of 1000 watts. Provide controller in a weatherproof housing and mount adjacent to luminaire on pole or luminaire mounting structure. Controller requires separate bi-level capacitor[, supplied with luminaire][, supplied with controller] to operate.

}[2.5 POLES

**************************************************************************
NOTE: This specification does not cover decorative poles or high-mast lighting systems. Poles, luminaire mounting assemblies, and lowering mechanisms for high-mast lighting are specially fabricated and should be individually designed to suit a specific project. Pole specifications for high-mast system should, as a minimum, include wind loading and ultimate strength meeting the loading requirements of AASHTO LTS. Do not specify embedded type metal poles for Army facilities.
**************************************************************************
Provide poles designed for wind loading of \([161\text{km/hr}][100\text{miles/hr}]\) determined in accordance with AASHTO LTS while supporting luminaires and all other appurtenances indicated. The effective projected areas of luminaires and appurtenances used in calculations shall be specific for the actual products provided on each pole. Poles shall be{ embedded| anchor}-base type designed for use with{ underground| overhead} supply conductors. Poles, other than wood poles, shall have oval-shaped handhole having a minimum clear opening of \(65\text{ by }130\text{ mm} \text{ or }2.5\text{ by }5\text{ inches}\). Handhole cover shall be secured by stainless steel captive screws. Metal poles shall have an internal grounding connection accessible from the handhole near the bottom of each pole. Scratched, stained, chipped, or dented poles shall not be installed.

### 2.5.1 Concrete Poles

Provide concrete poles conforming to ASTM C1089. Cross-sectional shape shall be{ round| or| multi-sided}.

#### 2.5.1.1 Steel Reinforcing

Prestressed concrete pole shafts shall be reinforced with steel prestressing members. Design shall provide internal longitudinal loading by either pretensioning or post tensioning of longitudinal reinforcing members.

#### 2.5.1.2 Tensioned Reinforcing

Primary reinforcement steel used for a prestressed concrete pole shaft shall be tensioned between 60 to 70 percent of its ultimate strength. The amount of reinforcement shall be such that when reinforcement is tensioned to 70 percent of its ultimate strength, the total resultant tensile force does not exceed the minimum section compressive strength of the concrete.

#### 2.5.1.3 Coating and Sleeves for Reinforcing Members

Where minimum internal coverage cannot be maintained next to required core openings, such as handhole and wiring inlet, reinforcing shall be protected with a vaporproof noncorrosive sleeve over the length without the \(13\text{ mm}1/2\text{ inch}\) concrete coverage. Each steel reinforcing member which is to be post-tensioned shall have a nonmigrating slipper coating applied prior to the addition of concrete to ensure uniformity of stress throughout the length of such member.

#### 2.5.1.4 Strength Requirement

As an exception to the requirements of ASTM C1089, poles shall be naturally cured to achieve a 28-day compressive strength of \(48.23\text{ MPa} 7000\text{ psi}\). Poles shall not be subjected to severe temperature changes during the curing period.

#### 2.5.1.5 Shaft Preparation

Completed prestressed concrete pole shaft shall have a hard, smooth, nonporous surface that is resistant to soil acids, road salts, and attacks of water and frost, and shall be clean, smooth, and free of surface voids and internal honeycombing. Poles shall not be installed for at least 15 days after manufacture.
[2.5.2 Aluminum Poles]

Provide aluminum poles manufactured of corrosion resistant aluminum alloys conforming to AASHTO LTS for Alloy 6063-T6 or Alloy 6005-T5 for wrought alloys and Alloy 356-T4 (3,5) for cast alloys. Poles shall be seamless extruded or spun seamless type with minimum 4.8 mm 0.188 inch wall thickness. Provide a pole grounding connection designed to prevent electrolysis when used with copper ground wire. Tops of shafts shall be fitted with a round or tapered cover. Base shall be anchor bolt mounted, made of cast 356-T6 aluminum alloy in accordance with ASTM B108/B108M and shall be machined to receive the lower end of shaft. Joint between shaft and base shall be welded. Base cover shall be cast 356-T6 aluminum alloy in accordance with ASTM B108/B108M. Hardware, except anchor bolts, shall be either 2024-T4 anodized aluminum alloy or stainless steel.[ Aluminum poles and brackets for [walkway][_____] lighting shall have a[ uniform satin][ dark anodic bronze][_____] finish to match fixtures and shall not be painted. ] Manufacturer's standard provision shall be made for protecting the finish during shipment and installation. Minimum protection shall consist ofspirally wrapping each pole shaft with protective paper secured with tape, and shipping small parts in boxes.

[2.5.3 Steel Poles]

AASHTO LTS. Provide steel poles having minimum 11-gage steel with minimum yield/strength of 331 MPa 48,000 psi and[ hot-dipped galvanized in accordance with ASTM A123/A123M][ iron-oxide primed] factory finish. Provide a pole grounding connection designed to prevent electrolysis when used with copper ground wire. Pole shall be[ direct set][ anchor bolt mounted] type. Poles shall have tapered tubular members, either round in cross section or polygonal.[ Pole shafts shall be one piece. Poles shall be welded construction with no bolts, rivets, or other means of fastening except as specifically approved. ] Pole markings shall be approximately 900 to 1270 mm 3 to 4 feet above grade and shall include manufacturer, year of manufacture, top and bottom diameters, and length.[ Base covers for steel poles shall be structural quality hot-rolled carbon steel plate having a minimum yield of 248 MPa 36,000 psi.]

[2.5.4 Wood Poles]

******************************************************************************
NOTE: Other wood species which are covered by ATIS ANSI 05.1 and AWPA may be specified, provided they are available at the project location. Indicate pole class and height on the drawings.
******************************************************************************

ATIS ANSI 05.1 and RUS Bull 1728F-700 of[ Southern Yellow Pine][ Douglas Fir][____]. Poles shall be gained, bored, and roofed before treatment. Poles shall be treated full length with chromated copper arsenate (CCA) or ammonical copper arsenate (ACA) according to AWPA U1 as referenced in RUS Bull 1728F-700. Poles shall be branded by manufacturer with manufacturer's mark and date of treatment, height and class of pole, wood species, preservation code, and retention. Place the brand so that the bottom of the brand or disc is 3050 mm 10 feet from the pole butt for poles up to 15250 mm 50 feet long[ and 4270 mm 14 feet from the butt for poles over 15250 mm 50 feet long].
2.5.5 Fiberglass Poles

NEMA C136.20. Designed specifically for supporting luminaires and having factory-formed cable entrance and handhole. Resin color shall be [dark bronze] as indicated, and pigment shall provide uniform coloration throughout entire wall thickness. Finish surface shall be pigmented polyurethane having a minimum dry film thickness of 0.038 mm (1.5 mils). Polyurethane may be omitted if the surface layer of the pole is inherently ultraviolet inhibited. Minimum fiberglass content shall be 65 percent with resin and pigment comprising the other 35 percent material content.

2.6 BRACKETS AND SUPPORTS

ANSI C136.3, ANSI C136.13, and ANSI C136.21, as applicable. Pole brackets shall be not less than 31.75 mm (1 1/4 inch) galvanized steel pipe [aluminum] secured to pole. Slip-fitter or pipe-threaded brackets may be used, but brackets shall be coordinated to luminaires provided, and brackets for use with one type of luminaire shall be identical. Brackets for pole-mounted street lights shall correctly position luminaire no lower than mounting height indicated. Mount brackets not less than 7320 mm (24 feet) above street. Special mountings or brackets shall be as indicated and shall be of metal which will not promote galvanic reaction with luminaire head.

2.7 POLE FOUNDATIONS

Anchor bolts shall be steel rod having a minimum yield strength of 344.5 MPa (50,000 psi); the top 305 mm (12 inches) of the rod shall be galvanized in accordance with ASTM A153/A153M. Concrete shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.8 EQUIPMENT IDENTIFICATION

2.8.1 Manufacturer's Nameplate

Each item of equipment shall have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.8.2 Labels

**************************************************************************
NOTE: Labeling of lighting components is an inexpensive and effective method for helping facilities personnel properly operate and maintain the lighting systems. The labels shall be easy to read when standing next to the equipment, and durable to match the life of the equipment to which they are attached. Refer to the FEMP guidelines for lighting at http://www.eere.energy.gov/femp/technologies/EEP_lighting_guidance.cfm.
**************************************************************************

Provide labeled luminaires in accordance with UL 1598 requirements. Luminaires shall be clearly marked for operation of specific light sources and ballasts according to proper light source type. The following light source characteristics shall be noted in the format "Use Only _____":

SECTION 26 56 00 Page 37
NOTE: Choose requirements as applicable for project.

[ a. Light source tube diameter code (e.g. T-5, T-8), tube quantity configuration (e.g. twin, quad, triple), base type (e.g. G24q-2, GX 24 q-4), and nominal wattage for fluorescent and compact fluorescent luminaires.

]b. Light source type, wattage, bulb type (e.g. ED17, BD56) and coating (clear or coated) for HID luminaires.

c. Start type (e.g. programmed-start, rapid-start, instant-start) for fluorescent and compact fluorescent luminaires.

d. ANSI ballast type (e.g. M98, M57) for HID luminaires.

e. Correlated color temperature (CCT) and color rendering index (CRI) for all luminaires.

Markings related to lamp type shall be clear and located to be readily visible to service personnel, but unseen from normal viewing angles when lamps are in place. Ballasts shall have clear markings indicating multi-level outputs and indicate proper terminals for the various outputs.

2.9 FACTORY APPLIED FINISH

NOTE: This paragraph covers only the basic painting requirements for most electrical equipment. Include any special finishes for high or low temperatures and corrosive atmospheres.

Electrical equipment shall have factory-applied painting systems which shall, as a minimum, meet the requirements of NEMA 250 corrosion-resistance test.

PART 3 EXECUTION

3.1 INSTALLATION

Electrical installations shall conform to IEEE C2, NFPA 70, and to the requirements specified herein.

[3.1.1 Wood Poles

NOTE: Poles set in swampy or rocky soil will require different settings or foundations than those set in average bearing soils. Consult pole manufacturer and structural engineer for proper setting or foundation requirements for these and other unusual soil conditions.

Pole holes shall be at least as large at the top as at the bottom and shall be large enough to provide 100 mm 4 inches of clearance between the pole and the side of the hole.
NOTE: At the text below, delete setting information for pole lengths not required.

a. Setting depth: Pole setting depths shall be as follows:

<table>
<thead>
<tr>
<th>Length of Pole (mm)</th>
<th>Setting in Soil (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6100</td>
<td>1575</td>
</tr>
<tr>
<td>7625</td>
<td>1575</td>
</tr>
<tr>
<td>9150</td>
<td>1575</td>

</tr>
<tr>
<td>60</td>
<td>8.0</td>
</tr>
</tbody>
</table>

b. Soil setting: "Setting in Soil" depths shall apply where pole holes are in soil, sand, or gravel or any combination of these. [At corners, dead ends and other points of extra strain, poles 12,200 mm 40 feet long or more shall be set 150 mm 6 inches deeper.]

c. Setting on sloping ground: On sloping ground, measure the depth of the hole from the low side of the hole.
d. Backfill: Tamp pole backfill for the full depth of the hole and mound the excess fill around the pole.

][3.1.2  Concrete Poles

**************************************************************************
NOTE: Poles set in swampy or rocky soil will require different settings or foundations than those set in average bearing soils. Consult pole manufacturer and structural engineer for proper setting or foundation requirements for these and other unusual soil conditions.
**************************************************************************

Install according to pole manufacturer's instructions.

][3.1.3  Fiberglass Poles

**************************************************************************
NOTE: Poles set in swampy or rocky soil will require different settings or foundations than those set in average bearing soils. Consult pole manufacturer and structural engineer for proper setting or foundation requirements for these and other unusual soil conditions.
**************************************************************************

Install according to pole manufacturer's instructions.

][3.1.4  [Aluminum][Steel] Poles

**************************************************************************
NOTE: Poles set in swampy or rocky soil will require different settings or foundations than those set in average bearing soils. Consult pole manufacturer and structural engineer for proper setting or foundation requirements for these and other unusual soil conditions.
**************************************************************************

Provide pole foundations with galvanized steel anchor bolts, threaded at the top end and bent 1.57 rad 90 degrees at the bottom end. Provide ornamental covers to match pole and galvanized nuts and washers for anchor bolts. Concrete for anchor bases, polyvinyl chloride (PVC) conduit ells, and ground rods shall be as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Thoroughly compact backfill with compacting arranged to prevent pressure between conductor, jacket, or sheath and the end of conduit ell. Adjust poles as necessary to provide a permanent vertical position with the bracket arm in proper position for luminaire location. [ After installation, paint exposed surfaces of steel poles with two finish coats of exterior oil paint of a color as indicated][ aluminum paint]. Install according to pole manufacturer's instructions. Alterations to poles after fabrication will void manufacturer's warranty and shall not be allowed.

][3.1.5  Pole Setting

[Depth shall be as indicated. ][Poles in straight runs shall be in a
straight line. Dig holes large enough to permit the proper use of tampers to the full depth of the hole. Place backfill in the hole in 150 mm 6 inch maximum layers and thoroughly tamp. Place surplus earth around the pole in a conical shape and pack tightly to drain water away.]

[3.1.6 Photocell Switch Aiming

Aim switch according to manufacturer's recommendations.[ Mount switch on or beside each luminaire when switch is provided in cast weatherproof aluminum housing with swivel arm.][ Set adjustable window slide for [_____] lux [_____] footcandles photocell turn-on.]

]3.1.7 GROUNDING

Ground noncurrent-carrying parts of equipment including[ metal poles,] luminaires, mounting arms, brackets, and metallic enclosures as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Where copper grounding conductor is connected to a metal other than copper, provide specially treated or lined connectors suitable for this purpose.

3.1.8 FIELD APPLIED PAINTING

**************************************************************************
NOTE: Use and coordinate paint and coating requirements with Section 09 90 00 PAINTS AND COATINGS when provided in the job. When requirements are beyond what is specified in Section 09 90 00, specify the requirements in this paragraph.
**************************************************************************

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Painting shall be as specified in Section 09 90 00 PAINTS AND COATINGS.

3.2 FIELD QUALITY CONTROL

Upon completion of installation, verify that equipment is properly installed, connected, and adjusted. Conduct an operating test after 100 hours of burn-in time to show that the equipment operates in accordance with the requirements of this section.

NOTE: This guide specification covers the requirements for lighting poles, standards, and related mounting accessories for exterior lighting, including, but not limited to, area lighting, flood lighting, roadway lighting, and security lighting systems.

Use UFGS Section 26 09 23.00 40 LIGHTING CONTROL DEVICES for control devices (includes tailoring for exterior lighting).

Use UFGS Section 26 55 53.00 40 SECURITY LIGHTING for security and closed circuit television (CCTV) special lighting.

Use UFGS Section 26 56 19.00 40 ROADWAY LIGHTING for roadway and street lighting.

Use UFGS Section 26 56 36.00 40 FLOOD LIGHTING for specific facility exterior illumination requirements.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: TO DOWNLOAD UFGS GRAPHICS

********************************************************************

NOTE: This section contains the following sketches (Graphics) and are available in metric (SI) and U.S. Customary (IP) system dimensions. Sketch titles and style numbers are unchanged for both types. The metric values indicated are a conversion of U.S. Customary (IP) system dimensions.

Do not include list of sketches, or sketches themselves, in project specifications. Use luminaire sketches as details on drawings whenever possible. If special features are required, do not modify sketches, but indicate these changes as notes in fixture schedule. The "XL" style numbers and dates should remain on the drawing details.

NOTE: Do not include this index in project specification.

********************************************************************

NOTE: Show the following information on the drawings or specify in the project specifications:

a. Luminaire schedule and indicate pertinent information; i.e., mounting, lamps, ballasts, and voltage.

1. Type of luminaire;

2. Voltage, wattage, and frequency rating required;

3. Accessories required, such as photocell, time switches, and auxiliary lamps;
4. Location of poles or standards;

5. Referenced sketch; and

6. Extent and location of the work to be accomplished and wiring and equipment necessary for a complete installation.

********************************************************************************

NOTE: Demolition work that involves disposal of fluorescent and HID lamps and ballasts will require the use of Section 02 84 16 HANDLING OF LIGHTING BALLASTS AND LAMPS CONTAINING PCBs AND MERCURY.

********************************************************************************

1.2 DEFINITIONS

Groundline section is that portion between 305 mm one foot above and 610 mm 2 feet below the groundline. Refer to IEEE Stds Dictionary for additional related definitions and terminology.

1.3 ADMINISTRATIVE REQUIREMENTS

**************************************************************************

NOTE: Include the following paragraph and related information if required by applicable state or agency sustainable regulations.
**************************************************************************

1.3.1 Sustainable Design Requirements

Use materials or products extracted, harvested, or recovered, as well as manufactured, within a [800][_____] kilometer [500][_____] mile radius from the project site, if available from a minimum of three sources.

[ Submit documentation indicating distance between manufacturing facility and the project site. Indicate distance of raw material origin from the project site. Indicate relative dollar value of local/regional materials to total dollar value of products included in project.

a. Local/Regional Materials

b. Sustainable acquisition

c. Environmental Data

[ Submit Table 1 of ASTM E2129 for the following products:

a. [_____]  
b. [_____]  
]
Submit documentation that includes contact information, summary of procedures, and the limitations and conditions applicable to the project. Indicate manufacturer's commitment to reclaim materials for recycling and/or reuse.

a. **Operational Service**

Coordinate with manufacturer for [maintenance agreement] [take-back program]. Collect information from the manufacturer about [maintenance agreement] [green lease] options, and submit to the Contracting Officer. [Maintenance agreement] [Green lease] for services to reclaim materials for recycling and/or reuse may not be used for landfill or burned. Indicate procedures for compliance with regulations governing disposal of mercury. When such a service is not available, seek local recyclers to reclaim the materials.

1.3.2 **Pre-Installation Meetings**

Within [30] [_____] calendar days after [date of award] [date of receipt by him of notice of award], submit for the approval of the Contracting Officer [six (6)] [_____] copies of specified drawings of all equipment to be furnished under this contract, together with weights and overall dimensions. Submit the following data and drawings:

a. **Poles**

   [c. **Concrete poles**

   ]d. **Aluminum poles**

   ]e. **Steel poles**

   ]f. **Fiberglass poles**

   ]g. **Pressure treated wood pole quality**

   h. **Brackets**

i. **Anchorage systems**

After submittals are received and approved the Contracting Officer will hold a pre-work conference to review the following:

a. The drawings, including poles, showing complete Installation Details, and specifications. Include details for the following for review:

   (1) **Foundation requirements**

   (2) **Anchorage systems**

   (3) **Manufacturer's catalog data** including mounting and bracket details

   [4. **Factory color finish**

b. **Finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.**

c. **Methods and procedures related to pole and luminaire installation, including manufacturer's written instructions and verification of pole**
system assembly wind load classification listings.

d. Governing regulations and requirements for insurance, certificates, tests and inspections if applicable. Include certification for sustainable acquisition and pole system assembly wind load rating classification. Safety plan review includes applicable Safety Data Sheets.

e. Temporary protection requirements for pole assembly during and after installation.

f. Pole system observation and repair procedures after complete installation. Include review of sample [Galvanizing Repair Paint][Enamel Repair Paint][Aluminized Steel Repair Paint].

g. Sample [20 year "No-Dollar-Limit" warranty][Warranty].

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-08 Manufacturer's Instructions
1.5 QUALITY CONTROL

1.5.1 Drawing Requirements

1.5.1.1 Poles

Include dimensions, wind load determined in accordance with AASHTO LTS, pole deflection, pole class, and other applicable information conforming to IES HB-10. [For concrete poles, include: section and details to indicate quantities and position of prestressing steel, spiral steel, inserts, and through holes; initial prestressing steel tension; and concrete strengths at release and at 28 days.]

[Include seismic design data and calculations for earthquake zone [_____] projects.]

Submit soil tests to the Contracting Officer prior to the commencement of work.

1.5.2 Pressure Treated Wood Pole Quality

**************************************************************************
NOTE: Select the appropriate bracketed reference based on environmental requirements and the type of preservative treatment selected.
**************************************************************************

Ensure the quality of pressure treated wood poles. Furnish an inspection report (for wood poles) of an independent inspection agency, approved by the Contracting Officer, stating that offered products comply with AWPA M6, [AWPA P1/P13] [AWPA P8] and RUS Bull 345-67 standards. The RUS approved Quality Mark "WQC" on each pole will be accepted, in lieu of inspection reports, as evidence of compliance with applicable AWPA treatment standards.

1.5.2.1 Wood Crossarms

Provide Douglas fir or dense southern pine of sizes specified or indicated, with pressure treatment conforming to AWPA C25.
[1.5.3] **Tests for Fiberglass Poles**

**************************************************************************

**NOTE: Whenever fiberglass poles are required for a project, include the following test.**
**************************************************************************

**a. Ultraviolet resistance tests:** Perform according to ASTM G154 using a UV-B lamp having a 313 nanometer wavelength, operated at 54 degrees C (130 degrees F), cycling the lamp on for 4 hours and off for 4 hours for a total test period of 1500 hours minimum with the following results:

- Fiber exposure: None
- Crazing: None
- Checking: None
- Chalking: None
- Color: May dull slightly

**b. Flexural strength and deflection test:** Test load as a cantilever beam with pole butt as fixed end and a force simulating wind load at the free end.

[1.5.4] **Regulatory Requirements**

In each of the publications referred to herein, consider the advisory provisions to be mandatory, for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

[1.5.5] **Alternative Qualifications**

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

[1.5.5.1] **Material and Equipment Manufacturing Date**

Products manufactured more than [3] [_____] years prior to date of delivery to site are not allowed, unless specified otherwise.

[1.5.6] **Manufacturer's Color Charts and Chips**

Submit manufacturer's color charts and chips, approximately 10 by 10 cm (4 by 4 inches), showing full range of colors, textures and patterns available for [aluminum] [fiberglass] poles with factory applied finishes.

[1.6] **DELIVERY, STORAGE, AND HANDLING**

Deliver, store, and handle poles[ and] [standards], and all related accessories and other manufactured items in a manner to prevent damage or deformation.

**************************************************************************

**NOTE: Select the applicable paragraph(s) from the following.**
1.6.1 Wood Poles

Stack poles stored for more than [2 weeks]_[_ -days] on decay-resisting skids arranged to support the poles without producing noticeable distortion. Store poles to permit free circulation of air, such that the bottom poles in the stack are at least 305 mm one foot above ground level and growing vegetation. Do not permit decayed or decaying wood to remain underneath stored poles. Do not drag treated poles along the ground. Do not use pole tongs, cant hooks, and other pointed tools capable of producing indentation more than 25 mm one inch in depth in handling the poles. Do not apply tools to the groundline section of any pole.

1.6.2 Concrete Poles

Do not store poles on ground. Support poles so they are at least 305 mm one foot above ground level and growing vegetation.

1.6.3 Fiberglass Poles

Do not store poles on ground. Support poles so they are at least 305 mm one foot above ground level and growing vegetation. Do not remove factory-applied pole wrappings until just before installing pole.

1.6.4 [Aluminum ][Steel ]Poles

Do not store poles on ground. Support poles so they are at least 305 mm one foot above ground level and growing vegetation. Do not remove factory-applied pole wrappings until just before installing pole.

1.7 WARRANTY

Provide support for the equipment items by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship, which have been in satisfactory commercial or industrial use for 2 years prior to bid opening under similar circumstances and of similar size, and have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section. Submit [_____] copies of all mounting details.

Products and materials not considered to be lighting equipment or lighting fixture accessories are specified in[ Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION,] Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION,[ and] Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.[ Lighting fixtures and accessories mounted on exterior surfaces of buildings
are specified in Section 26 51 00 INTERIOR LIGHTING.

2.2 COMPONENTS

2.2.1 Lighting Standards

Lighting standard, includes pole, anchor base, transformer base, brackets, and accessories, designed to withstand vertical and horizontal loading on the entire structure and supported equipment without damage or permanent deformation to any component of the lighting standard.

2.2.2 Poles

**************************************************************************
NOTE: This guide specification does not cover decorative poles or high-mast lighting systems. Poles, luminaire mounting assemblies, and lowering mechanisms for high-mast lighting are specially fabricated and should be individually designed to suit a specific project. Pole specifications for high-mast system should, as a minimum, include wind loading and ultimate strength meeting the loading requirements of AASHTO LTS-5. Do not specify embedded type metal poles for Army facilities.
**************************************************************************

Provide poles designed for wind loading of [161][_____] km/hr [100][_____] miles per hour determined in accordance with AASHTO LTS while supporting luminaires and all other appurtenances indicated. Provide effective projected areas of luminaires and appurtenances used in calculations specific to the actual products provided on each pole. Provide[ embedded][ anchor] type bases designed for use with[ underground][ overhead] supply conductors.[ Provide[, in other than wood poles,] an oval-shaped handhole having a minimum clear opening of 65 by 130 mm (2.5 by 5 inches) 2.5 by 5-inches. Secure handhole cover with stainless steel captive screws.][ Provide metal poles with an internal grounding connection accessible from the handhole near the bottom of each pole.] Do not install scratched, stained, chipped, or dented poles.

[2.2.2.1 Concrete Poles

**************************************************************************
NOTE: If other than round pole is chosen, revise Sketch XL-22 and XL-23 to suit the cross-sectional shape selected.
**************************************************************************

Provide concrete poles conforming to ASTM C1089, with[ round][ or][ multi-sided] cross-sectional shape, preformed, prestressed, and centrifugally cast, with the base cast as an integral part of the standard. Provide poles with a smooth hollow core not less than 300 millimeter 12-inches in diameter, suitable as a raceway for electrical wiring.

[ Provide black and light gray color standards with a ground smooth, water-polished terrazzo finish.

] [Provide light gray color standards with a natural smooth finish as obtained from the metal mold.

SECTION 26 56 13.00 40 Page 15
a. Steel Reinforcing

Reinforce prestressed concrete pole shafts with steel prestressing members, designed to provide internal longitudinal loading by either pretensioning or post tensioning of longitudinal reinforcing members.

b. Tensioned Reinforcing

Tension primary reinforcement steel used for a prestressed concrete pole shaft between 60 to 70 percent of its ultimate strength, with the amount of reinforcement being such that when reinforcement is tensioned to 70 percent of its ultimate strength, the total resultant tensile force does not exceed the minimum section compressive strength of the concrete.

c. Coating and Sleeves for Reinforcing Members

Where minimum internal coverage cannot be maintained next to required core openings, such as handhole and wiring inlet, protect reinforcing with a vapor proof non-corrosive sleeve over the length without the $13\text{ mm }1/2\text{-inch}$ concrete coverage. Provide each steel reinforcing member which is to be post-tensioned with a non-migrating slipper coating applied prior to the addition of concrete to ensure uniformity of stress throughout the length of such member.

d. Strength Requirement

As an exception to the requirements of ASTM C1089, allow poles to cure naturally to achieve a 28-day compressive strength of $48.23\text{ MPa }7000\text{ psi}$. Do not allow poles to be subjected to severe temperature changes during the curing period.

e. Shaft Preparation

Provide completed prestressed concrete pole shafts with a hard, smooth, nonporous surface that is resistant to soil acids, road salts, and attacks of water and frost, clean, smooth, and free of surface voids and internal honeycombing. Do not install poles for at least 15 days after manufacture.

}[2.2.2.2 Aluminum Poles

a. Finish

Provide aluminum poles with a [brushed satin] [uniform satin] [dark anodic bronze] [_____] finish, manufactured of corrosion resistant aluminum alloys conforming to AASHTO LTS for Alloy 6063-T6 or Alloy 6005-T5 for wrought alloys and Alloy 356-T4 (3,5) for cast alloys. Do not paint.

Provide aluminum castings conforming to ASTM B108/B108M. Provide seamless extruded or spun seamless type poles with minimum $4.8\text{ mm }0.188\text{-inch}$ wall thickness, with tenon end to support luminaire indicated.

b. Grounding Connection Provisions

Provide a pole grounding connection designed to prevent electrolysis when used with copper ground wire. Provide aluminum standard with a M18 x 2 as specified in ISO 261 and ISO 262 1/2-inch square nut, 13 threads per inch, as specified in ISO 263, welded to the inside of the pole for ground connections.
c. Ground Rods

**************************************************************************

NOTE: Determine the size, type, and number of ground rods to be used, based on local conditions, earth resistively data, and on the size and type of the electrical installation. Copper clad steel rods will be specified for normal conditions. Zinc coated steel or stainless steel rods will be used where low soil resistivities are encountered and galvanic corrosion may occur between adjacent underground metallic masses and the copper clad rods. Stainless steel rods have a longer life than zinc coated steel, but use of stainless steel should be justified based on the higher cost. Rods 15.9 mm 5/8 inch in diameter and 2.4 m 8 feet in length are generally acceptable; however in rocky soils specify 19.1 mm 3/4 inch rods. In high Resistivity soils, 3.1 m 10 feet or sectional rods may be used to obtain the required resistance to ground; however, where rock is encountered, additional rods, a counterpoise, or ground grid may be necessary.

Coordinate and standardize rod selection for individual facilities with other specification sections.
**************************************************************************

Provide ground rods made of [copper clad steel conforming to UL 467] [zinc coated steel conforming to IEEE C135.30] [solid stainless steel] not less than 15.9 mm 5/8 inch in diameter and 2.4 m 8 feet in length of the sectional type driven full length into earth.

d. Top Cover and Bases

Fit tops of shafts with a round or tapered cover. Mount bases with anchor bolts, made of cast 356-T6 aluminum alloy in accordance with ASTM B 108, machined to receive the lower end of shaft. Weld the joint between shaft and base. Provide cast 356-T6 aluminum alloy base cover in accordance with ASTM B 108. Provide hardware, except anchor bolts, made with either 2024-T4 anodized aluminum alloy or stainless steel.

e. Transformer Base

Include one-piece cast-aluminum alloy transformer base, with a removable cast-aluminum flanged access cover secured with bolts or screws. Predrill anchor bolt holes in base for connection to anchor bolts in the foundation.

Equip standards without transformer bases with an oval-shaped handhole, covered with a removable reinforced sheet aluminum frame and sheet centered 450 millimeter 18-inches above the foundation.

f. Transport and Handling Protection

Ensure manufacturer's standard provision is made for protecting the finish during shipment and installation. Minimum protection consists of spirally wrapping each pole shaft with protective paper secured with tape, and shipping small parts in boxes.
Steel Poles

Provide continuously tapered and seam welded steel lighting standards, conforming to AASHTO LTS. Provide steel poles having minimum 11-gage steel with minimum yield/strength of 331 MPa (48,000 psi) and hot-dipped galvanized in accordance with ASTM A123/A123M. Steel poles having minimum 11-gage steel with minimum yield/strength of 331 MPa (48,000 psi) and hot-dipped galvanized in accordance with ASTM A123/A123M.

a. Pole Mounting

Provide anchor bolt mounted type pole, with tapered tubular members, either round in cross section or polygonal. Provide one piece pole shafts, of welded construction with no bolts, rivets, or other means of fastening except as specifically approved.

b. Accessories

Provide accessories, including cast-steel ornamental pole-top cap, pole-top tenons, galvanized nuts, bolts, and washers, and galvanized sheet metal leveling shims.

c. Pole Markings

Provide pole markings approximately 900 to 1270 mm (3 to 4-feet) above grade, to include manufacturer, year of manufacture, top and bottom diameters, and length.

d. Steel Standard Finish

Clean all exposed metal surfaces of steel lighting standards, including anchor bases, transformer bases, brackets, and other uncoated steel component parts, and apply a prime coat and two finish coats of paint as follows:

1. Clean prior to the application of paint in conformance with SSPC SP 10/NACE No. 2.
2. Apply prime coat of zinc chromate in an alkyd vehicle conforming to FS TT-P-645.
3. Apply ready-mix aluminum paint finish coats in conformance with FS TT-P-38.

Wood Poles

NOTE: Other wood species which are covered by ANSI 05.1, REA, and AWPA may be specified, provided they are available at the project location. Indicate pole class and height on the drawings.

SECTION 26 56 13.00 40  Page 18
Provide wood poles conforming to ATIS ANSI O5.1 and RUS Bull 345-67 of [Southern Yellow Pine] [Douglas Fir] [_____]. Gain, bore, and roof poles before treatment, and treat full length with chromated copper arsenate (CCA) or ammoniacal copper arsenate (ACA) according to AWPA C1 and AWPA C4 as referenced in RUS Bull 345-67. Provide poles branded by manufacturer with manufacturer’s mark and date of treatment, height and class of pole, wood species, preservation code, and retention. Place the brand so that the bottom of the brand or disc is 3050 mm 10-feet from the pole butt for poles up to 15250 mm 50-feet long[ and 4270 mm 14-feet from the butt for poles over 15250 mm 50-feet long].

2.2.2.5 Fiberglass Poles

Provide fiberglass poles conforming to NEMA C136.20, designed specifically for supporting luminaires and having factory-formed cable entrance and handhole, with [dark bronze] [as indicated] [_____] resin color, uniformly pigmented for coloration throughout entire wall thickness. Provide pigmented polyurethane finish surface having a minimum dry film thickness of 0.038 mm 1.5 mils. Polyurethane may be omitted if the surface layer of the pole is inherently ultraviolet inhibited. Provide minimum fiberglass content of 65 percent with resin and pigment comprising the other 35 percent material content.

2.2.3 Brackets And Supports

**************************************************************************
NOTE: Include bracketed reference for wood poles only.
**************************************************************************

Provide brackets and supports conforming to ANSI C136.3, [ANSI C136.13,] and ANSI C136.21, as applicable, with pole brackets not less than 31.75 mm 1 1/4-inch [galvanized steel pipe] [aluminum] secured to pole. Slip-fitter or pipe-threaded brackets may be used, if brackets are coordinated to luminaires provided. Provide identical brackets for use with one type of luminaire. Provide brackets for pole-mounted street lights which correctly position luminaire no lower than mounting height indicated. Mount brackets not less than 7320 mm 24-feet above street. Provide special mountings or brackets as indicated of metal which do not promote galvanic reaction with luminaire head.

[2.2.3.1 Concrete Standard Detachable Brackets

Provide detachable brackets, with fabricated steel clamps, including galvanized welded bracket and clamp assembly in accordance with ASTM A123/A123M. Provide with all necessary corrosion-resistant steel or silicon bronze nuts and bolts. Accommodate luminaire indicated at tenon end of the bracket.

Provide accessories including: cast-aluminum or hot-dip-galvanized ornamental pole-top cap, pole-top adapters and access covers, aluminum-alloy or corrosion-resistant steel nuts, bolts, and washers, and galvanized sheet metal leveling shims.

2.2.4 Pole Line Hardware

Provide zinc coated hardware conforming to IEEE C135.1, and steel hardware material conforming to ASTM A575 and ASTM A576. Provide hot-dip galvanize hardware in accordance with ASTM A153/A153M.
2.2.4.1 Series Roadway Lighting Insulators

**************************************************************************
NOTE: Delete this paragraph when series roadway lighting is not required.
**************************************************************************

Provide Class 55-5 pin insulators. Provide Class 57-1 or 57-11 line-post insulators.

2.2.5 Foundations for Lighting Standards

Provide foundations for lighting standards in accordance with manufacturer's recommendations. Submit Equipment Foundation Data in accordance with referenced standards in this section.

2.2.5.1 Concrete Foundations

**************************************************************************
NOTE: Select one of the following bracketed statements and delete the other.
**************************************************************************

[ Proportion, mix, and place concrete materials to provide a minimum 28-day compressive strength of 21,000 kilopascal 3,000 pounds per square inch.

][Provide concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

a. Anchor Bolts

Provide galvanized high strength steel rod anchor bolts, with a lower deformed 90 degree bend and threaded top conforming to ASTM A36/A36M, having a minimum yield strength of 344.5 MPa (50,000 psi) 50,000 psi; with the top 305 mm 12-inches of the rod galvanized in accordance with ASTM A153/A153M.

PART 3 EXECUTION

3.1 INSTALLATION

Provide electrical installations conforming to IEEE C2, NFPA 70, and to the requirements specified herein.

3.1.1 Wood Poles

**************************************************************************
NOTE: Poles set in swampy or rocky soil will require different settings or foundations than those set in average bearing soils. Consult pole manufacturer and structural engineer for proper setting or foundation requirements for these and other unusual soil conditions.
**************************************************************************

Make pole holes at least as large at the top as at the bottom and large enough to provide 100 mm 4-inches of clearance between the pole and the side of the hole.
NOTE: At the text below, delete setting information for pole lengths not required.

a. Setting depth: Pole setting depths are as follows:

<table>
<thead>
<tr>
<th>Length of Pole (feet)</th>
<th>Setting in Soil (feet)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6100</td>
<td>1575</td>
</tr>
<tr>
<td>7625</td>
<td>1575</td>

</tbody>
</table>

b. Soil setting: "Setting in Soil" depths applies where pole holes are in soil, sand, or gravel or any combination of these. [At corners, dead ends and other points of extra strain, set poles 12,200 mm 40-feet long or more, 150 mm 6-inches deeper.]

c. Setting on sloping ground: On sloping ground, measure the depth of the hole from the low side of the hole.
d. Backfill: Tamp pole backfill for the full depth of the hole and mound the excess fill around the pole.

][3.1.2 Concrete Poles

**************************************************************************
NOTE: Poles set in swampy or rocky soil will require different settings or foundations than those set in average bearing soils. Consult pole manufacturer and structural engineer for proper setting or foundation requirements for these and other unusual soil conditions.
**************************************************************************

Install according to pole manufacturer's instructions.

][3.1.3 Fiberglass Poles

**************************************************************************
NOTE: Poles set in swampy or rocky soil will require different settings or foundations than those set in average bearing soils. Consult pole manufacturer and structural engineer for proper setting or foundation requirements for these and other unusual soil conditions.
**************************************************************************

Install according to pole manufacturer's instructions.

][3.1.4 [Aluminum][Steel] Poles

**************************************************************************
NOTE: Poles set in swampy or rocky soil will require different settings or foundations than those set in average bearing soils. Consult pole manufacturer and structural engineer for proper setting or foundation requirements for these and other unusual soil conditions.
**************************************************************************

Provide pole foundations with galvanized steel anchor bolts, threaded at the top end and bent $1.57 \text{ rad } 90 \text{ degrees}$ at the bottom end. Provide ornamental covers to match pole and galvanized nuts and washers for anchor bolts. Concrete for anchor bases, polyvinyl chloride (PVC) conduit ells, and ground rods are as specified in Section[ 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION][____]. Thoroughly compact backfill with compacting arranged to prevent pressure between conductor, jacket, or sheath and the end of conduit ell. Adjust poles as necessary to provide a permanent vertical position with the bracket arm in proper position for luminaire location. [ After installation, paint exposed surfaces of steel poles with two finish coats of[ exterior oil paint of a color as indicated][ aluminum paint].]

][3.1.5 Standard Foundations

3.1.5.1 Excavation

Restrict excavation in size to that which provides sufficient working space for installation of concrete forms. Should soil conditions at the bottom
of the excavation be unsuitable as a foundation, as determined by the
Contracting Officer, take the excavation down to firm soil and fill to
required grade with concrete or satisfactory soil materials as directed.

Perform excavations in a manner to prevent surface, subsurface, and ground
water from flowing into the excavation. Use pumps or other dewatering
methods necessary to convey the water away from the excavation work below
ground-water level.

[ Depth is as indicated [on the drawings] [in the table above]. Dig holes
large enough to permit the proper use of tampers to the full depth of the
hole. Place backfill in the hole in 150 mm 6-inch maximum layers and
thoroughly tamp. Place surplus earth around the pole in a conical shape
and pack tightly to drain water away.

]3.1.5.2 Formwork

Construct forms of wood, plywood, steel, or other acceptable materials
fabricated to conform to the configuration, line, and grade required.
Reinforce formwork to prevent deformation while concrete is being placed
and consolidated. Wet or coat formwork with a parting agent before placing
concrete.

3.1.5.3 Setting of Anchor Bolts

Set anchor bolts or rods with exposed threaded ends vertically positioned
in the concrete [using a template supplied by the pole manufacturer] [in
accordance with the lighting standard manufacturer's recommendations.]

3.1.5.4 Concrete Placement

Level and steel trowel concrete bearing surface to a smooth, hard, dense
finish surface. After form work is removed, protect the exposed concrete
with impervious paper or burlap material and keep wet for the full curing
period.

][3.1.6 Special Foundations

3.1.6.1 Power-Installed Screw Foundations

Power-installed screw foundations having the required strength mounting
bolt and top plate dimensions may be utilized. Provide screw foundations
of at least 6.4 mm 1/4-inch thick structural steel conforming to
ASTM A36/A36M, hot-dip galvanized in accordance with ASTM A123/A123M.
Clearly mark conduit slots in screw foundation shafts and top plates to
indicate orientation. Secure approval of design calculations indicating
adequate strength before installation of any screw foundation

3.1.7 Standard Setting

Install standards, with their bases level so that standards are plumb.
Once the concrete has cured, set the pole on the foundation, level on the
foundation bolts, and secure with the holding nuts. Grout the space
between the foundation and the pole base. Conform concrete and grout work
to Section03 30 00 CAST-IN-PLACE CONCRETE. Provide concrete strength of
21 MPa 3000 psi at 28 days.
3.1.8 Grounding

NOTE: Butt grounds are not be permitted as an option in dry desert areas. See HREF=http://www.wbdg.org/ccb/DOD/UFC/ufc_3_550_01.pdf>UFC 3-550-01, "Exterior Electrical Power Distribution".

Provide grounding conforming to NFPA 70, the contract drawings, and the following:

a. Provide soft-drawn, stranded copper grounding conductors.

b. Drive ground rods into the earth so that after the installation is complete, the top of the ground rod is approximately 300 mm 1-foot below finished grade, except in handholes.

c. Use butt grounds made of at least 4 m 13-feet of No. 6 bare copper wire stapled to the butts of wood poles in spirals where a ground resistance of 25 ohms or less can be obtained by this method.

d. Butt grounds are not allowed.

3.1.8.1 Ground Rods and Pole Butt Electrodes

NOTE: Designer is to determine the size, type, and number of ground rods to be used, based on local conditions, earth resistively data, and on the size and type of the electrical installation. Specify copper clad steel rods for normal conditions. Use zinc coated steel or stainless steel rods where low soil resistivities are encountered and galvanic corrosion may occur between adjacent underground metallic masses and the copper clad rods. Stainless steel rods have a longer life than the zinc coated steel; use only if the use of stainless steel is justified based on the higher cost. Rods 15.9 mm 5/8 inch in diameter and 2.4 m 8 feet in length are generally acceptable; however in rocky soils specify 19.1 mm 3/4 inch rods. In high resistively soils, use 3.1 m 10 feet or sectional rods to obtain the required resistance to ground; however where rock is encountered, additional rods, a counterpoise, or ground grid may be necessary.

Measure the resistance to ground using the fall-of-potential method described in IEEE 81. The maximum resistance of a [driven ground rod] [pole butt electrode] is not to exceed 25 ohms under normally dry conditions. Whenever the required ground resistance is not met, provide additional electrodes [interconnected with grounding conductors] [as indicated], to achieve the specified ground resistance. Provide additional electrodes [up to three, [2.4] [3] m [8] [10]-feet long rods spaced a minimum of 3 m 10-feet apart] [a single extension-type rod, [15.9] [19.1] mm [ 5/8] [3/4]-inch] in diameter, up to 9.1 m 30-feet long, [driven perpendicular to grade] [coupled and driven with the first rod]. In high ground resistance, UL listed chemically charged ground rods may be used.
If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, notify the Contracting Officer immediately. Fusion weld connections below grade. Fusion weld or use UL 467 approved connectors for above grade connections.

3.1.8.2 Items to be Grounded

Ground all ground conductors, metallic conduits, junction boxes, and noncurrent-carrying metallic parts of equipment. Make connections above grade with solderless connectors, and fusion weld those below grade.

3.1.8.3 Lighting Pole

Provide one ground rod at each pole. Connect bases of metal or concrete lighting poles to ground rods by means of No. 8 AWG bare copper wire. Ground the lighting fixture brackets on wood and concrete poles to a No. 6 AWG bare copper grounding conductor connected to the ground rod.

3.1.8.4 Handhole

In each handhole, at a convenient point close to the wall, drive a ground rod into the earth before the floor is poured. Make provision for approximately 100 mm 4 inches of the ground rod to extend above the floor after pouring. When precast concrete units are used, the top of the ground rod may be below the floor, and bring a No. 1/0 AWG copper ground conductor inside through a watertight sleeve in the wall. Make connection to ground rods by means of bolted-clamp terminals or by an approved fusion-welding process. Neatly and firmly attach ground wires to handhole walls, holding the amount of exposed bare wire to a minimum.

3.1.8.5 Metal Cable Boxes

Connect metal cable boxes for direct-burial cable to adjacent ground rods by wires with current-carrying capacities of at least 20 percent of the spliced phase conductors, but not less than No. 6 AWG.

3.2 FIELD QUALITY CONTROL

3.2.1 Ground Resistance Measurements

Measure the resistance to ground by the fall-of-potential method described in IEEE 81.

3.3 CLOSEOUT ACTIVITIES

3.3.1 Record Drawings

Maintain and keep up to date, a separate set of drawings, elementary diagrams and wiring diagrams of the lighting to be used for "record" drawings, showing all changes and additions to the lighting system. In addition to being complete and accurate, keep this set of drawings separate and do not use for installation purposes. Upon completion of the record drawings, a representative of the Government will review the as-built work with the Contractor. If the as-built work is not complete, the Contractor will be so advised and complete the work as required.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for highway and roadway lighting luminaires.

Roadway lighting fixtures including luminaires for IES are listed in IES RP-8, "Lighting Distribution Patterns."

Coordinate this section with UFGS Section 26 09 23.00 40 LIGHTING CONTROL DEVICES and Section 26 56 13.00 40 LIGHTING POLES AND STANDARDS.

Roadway-lighting standards and fixture details on drawings should describe, in plan and elevation, the type and kind of pole, bracket, luminaire, base, and foundation required for installation at the location indicated. Elevation details should indicate height of pole, bracket-spread length, luminaire, depth of foundation, anchor bolts, underground conduit connections, ground rods, and ground connections. Plan views should indicate foundation configuration, conduit stub-ups, base dimensions, and bolt circles. Foundation detail drawings should accurately describe the nature and properties of soil surrounding foundations for the support of lighting standards.

Foundations for installation of area, flood lighting, roadway lighting, and security lighting standards and fixtures in filled locations may require modification to resist horizontal movement without permanent set under stipulated wind loads.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.
Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************
NOTE: TO DOWNLOAD UFGS GRAPHICS
Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms
**************************************************************************

NOTE: The following sketches (Graphics) and are available in metric (SI) and U.S. Customary (IP) system dimensions. Sketch titles and style numbers are unchanged for both types. The metric values indicated are a conversion of U.S. Customary (IP) system dimensions.

Do not include list of sketches, or sketches themselves, in project specifications. Use luminaire sketches as details on drawings. If special features are required, do not modify sketches, but indicate these changes as notes in fixture schedule. The "XL" style numbers and dates should remain on the drawing details.

Sketch No.       Title                  
XL-1             Roadway and Area Light 
XL-4             Roadway and Area Light 
XL-6             Area and Street Lighting Cutoff Luminaire 
XL-13 thru 19    Reserved for Future Exterior Luminaires 

NOTE: Do not include this index in project specification.

**************************************************************************
NOTE: Show the following information on the drawings or specify in the project specifications:

a. Luminaire schedule and indicate pertinent information; i.e., mounting, lamps, ballasts, and voltage.

1. Type of luminaire;
2. Voltage, wattage, and frequency rating required;
3. Accessories required, such as photocell, time switches, and auxiliary lamps;
4. Location of poles or standards;

5. Referenced sketch; and

6. Extent and location of the work to be accomplished and wiring and equipment necessary for a complete installation.

**************************************************************************

NOTE: Demolition work that involves disposal of fluorescent and HID lamps and ballasts requires the use of Section 02 84 16 HANDLING OF LIGHTING BALLASTS AND LAMPS CONTAINING PCBs AND MERCURY.

**************************************************************************

PART 1 GENERAL

**************************************************************************

NOTE: If Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS is not included in the project specification, applicable requirements therefrom should be inserted and the following paragraph deleted.

**************************************************************************

Section 26 00 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS applies to work specified in this section.

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ILLUMINATING ENGINEERING SOCIETY (IES)

Measurements of Solid-State Lighting Products

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

ANSI ANSLG C78.42 (2009; R 2016) For Electric Lamps: High-Pressure Sodium Lamps

ANSI C82.4 (2017) Lamp Ballasts - Ballasts for High-Intensity-Discharge and Low-Pressure Sodium Lamps

ANSI C136.11 (2011; R 2016) Roadway Lighting Equipment - Multiple Parallel Wired Sockets

NEMA ANSLG C82.9 (2010) American National Standard for Lamp Ballasts - High-Intensity Discharge and Low-Pressure Sodium Lamps - Definitions

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

21 CFR 1040 Performance Standards for Light-Emitting Products

1.2 ADMINISTRATIVE REQUIREMENTS

Submit the following information at the Preconstruction Meeting:
a. **Material, equipment, and fixture lists** for highway and roadway lighting fixtures including manufacturer's style or catalog numbers, specification and drawing reference numbers, warranty information, and fabrication site information

b. **Equipment and performance data** for highway and roadway lighting systems consisting of life test, system functional flows, safety features, mechanical automated details, automatic interlocks, and such features as electrical system protective device ratings

c. **Lighting-distribution certificates** showing compliance with the following requirement: lighting-distribution curves for each type of fixture prepared, utilizing the fixture manufacturer's own facilities or those of an independent nationally recognized laboratory, in accordance with the standard procedure developed by the Illuminating Engineering Society.

1.3 **SUBMITTALS**

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Material, Equipment, and Fixture Lists; G[, [____]]
Equipment and Performance Data; G[, [____]]

SD-02 Shop Drawings

Street-Lighting Luminaires; G[, [____]]
Installation Drawings; G[, [____]]

SD-03 Product Data

Street-Lighting Fixtures; G[, [____]]
Street-Lighting Luminaires; G[, [____]]

SD-06 Test Reports

Operational Tests

SD-07 Certificates

Lighting-Distribution Certificates

SD-11 Closeout Submittals

Warranty

1.4 WARRANTY

Provide a {five}[____] year Limited Warranty on entire system, including finish.

PART 2 PRODUCTS

**************************************************************************
NOTE: Revise as necessary to meet project requirements.
**************************************************************************

2.1 SYSTEM DESCRIPTION

Provide street-lighting fixtures, equipped with lamps. Furnish fixtures complete with wiring and mounting devices ready for installation at the locations indicated.
2.2 STREET-LIGHTING LUMINAIRES

Provide enclosed and gasketed vapor tight street-lighting luminaires in accordance with IES RP-8 for Types I, II, III, IV, and V lighting-distribution patterns.

**************************************************************************

NOTE: Select street-lighting luminaires, ballasts, and lamps from the following parts to suit project requirements.

Factors affecting the selection of luminaire types include the following:

Fixture efficiency is the percent of available lumens from the light source that emits from the fixture. The most efficient fixture should be selected commensurate with the other design requirements.

The spacing to mounting height ratio (S/MH) indicates how far apart the fixtures can be placed in relation to their mounting height. This ratio should be available in the fixture manufacturer's literature. A medium-to-wide distribution of light from the fixture should be selected. Fewer fixtures are required using the larger, more efficient light sources. Overlapping light patterns provide greater uniformity of illumination and increase light on vertical surfaces.

High power factor ballasts should be selected.

**************************************************************************

2.2.1 Roadway Luminaire Components

Provide roadway luminaire components conforming to the following standards:

a. Attachments, ANSI C136.3
b. Voltage classification, ANSI C136.2
c. Field identification marking, ANSI C136.15
d. Interchangeability, ANSI C136.6 and ANSI C136.9
e. Sockets, ANSI C136.11

2.2.2 End-Mounted High-Intensity-Discharge (HID) Luminaires

Provide end-mounted HID luminaires with a horizontal lamp-burning position. Include with the luminaire; a hinged two- or three-piece housing, reflector, refractor, refractor holding ring, lamp holder, fuses, fuseholders, terminal block, ballast, and lamp in a completely sealed optical system for end-mounting to street-lighting standards. Ensure wiring is concealed in street-lighting standards and luminaires.

Provide with cast aluminum upper housing with fixture-leveling pad, integral slip fitter, pipe stop, and clamps with provision for vertical
adjustments of plus or minus 3 degrees for leveling purposes.

Provide a reflector formed from anodized sheet aluminum with a specular finish. Provide molded prismatic heat-resistant borosilicate glass refractor. Ensure the design generates the lighting-distribution pattern indicated. Ensure the reflector cover allows for expansion and contraction of the refractor for ambient temperature changes between 0 to 105 degrees F.

Provide a cast aluminum refractor holding ring and ballast cover which forms the lower housing. Equip lower housing with corrosion-resistant steel hinge and hinge pin, spring-loaded safety catch, and refractor latching mechanism.

2.2.3 Side-Mounted (HID) Luminaires

Provide side-mounted (HID) luminaires with base-up vertical lamp-burning position. Include a universal head with built-in ballast, lamp, porcelain lamp holder, and reflector assembly in a completely sealed optical system for bracket mounting to street-lighting standards. Conceal wiring in street-lighting standards and luminaires.

Provide cast aluminum universal head with integral side-mounting slip fitter, pipe stop, and clamps with provisions for vertical adjustments of plus or minus 3 degrees for leveling purposes.

Include in reflector assembly a reflector, refractor, and clamping band. Form reflector from anodized sheet aluminum with a specular finish. Include molded prismatic heat-resistant borosilicate glass refractor designed to provide the lighting-distribution pattern indicated. Provide clamping band formed from sheet aluminum or corrosion-resistant steel.

Provide a complete assembly which latches the reflector directly to the universal head with aluminum or corrosion-resistant steel latches. Include a seating flange to provide a seal against moisture, dirt, and insects.

2.2.4 Lamp Ballasts

2.2.4.1 Multiple-Circuit Ballasts

**************************************************************************
NOTE: Select solid-state ballasts, if available and most efficient.
**************************************************************************

Multiple-circuit ballasts include a two-winding core-and-coil assembly with a saturated-iron regulating element and capacitors impregnated with an insulating material in accordance with ANSI C82.4 and NEMA ANSLG C82.9.

Provide ballasts which maintain correct lamp operation over a voltage-input range of plus or minus 13 percent of rated voltage. Include capacitors providing a power factor lamp load of not less than 95 percent.

Provide ballasts with a voltage rated for operation on 120- or 277-volt, single-phase, 60-hertz lighting-distribution systems as indicated.

Design ballasts for a minimum lamp starting temperature of minus 29 degrees C 20 degrees F and a maximum ambient temperature of 41 degrees C 105 degrees F.
2.2.4.2 Series Circuit Transformers

Provide series transformers with a two-winding core-and-coil assembly designed for connection to constant-current supply circuits in accordance with NEMA ANSLG C82.9.

Design the primary winding of the transformer for connection to 6.6-or 20-ampere constant-current street-lighting circuits, providing the proper starting voltage and operating current for the lamp indicated.

Design transformers for a maximum ambient temperature of 41 degrees C 105 degrees F.

2.2.5 Lamps

Provide lamps, if used in a populated area, certified to be automatically self-extinguishing, conforming to 21 CFR 1040, Section 30.

**************************************************************************
NOTE: Select one of the following two paragraphs.
Add watt requirements on the drawings.
**************************************************************************

2.2.5.1 (HID) Lamps and Ballasts

Furnish compatible (HID) lamps and ballasts, as specified on drawings. Provide high pressure sodium lamps in compliance with the following industry standards:

- 1,000 watts ANSI ANSLG C78.42
- 400 watts ANSI ANSLG C78.42
- 150 watts ANSI ANSLG C78.42
- 70 watts ANSI ANSLG C78.42

2.2.5.2 Low Pressure Sodium

Provide lamps certified by manufacturer as meeting the requirements defined by the drawings.

2.2.6 Side-Mounted Incandescent Luminaires

Provide side-mounted incandescent-lamp luminaires with base-up vertical lamp-burning position including a universal head with lamp and porcelain lamp holders. Ensure the reflector assembly is in a completely sealed optical system suitable for bracket mounting to street-lighting standards.

Provide cast aluminum universal head with integral side-mounting slip fitter, pipe stop, and clamps with provision for vertical adjustments of plus or minus 3 degrees for leveling purposes.

Include in reflector assembly a reflector, refractor, and clamping band. Form reflector from anodized sheet aluminum with a specular finish. Provide a molded prismatic heat-resistant borosilicate glass refractor. Ensure the design generates the type of lighting-distribution pattern indicated. Form a clamping band from sheet aluminum or corrosion-resistant steel to completely seal the joint between reflector and refractor.
Provide reflector assembly which latches directly to the universal bead with aluminum or corrosion-resistant steel latches, with latches and seating flange to provide a seal against moisture, dirt, and insects.

2.2.7 Incandescent Lamps

Provide the following incandescent lamps:

a. General-purpose incandescent lamps - clear or inside frosted.

b. Lamps with wattage ratings up to and including 300 watts - medium brass screw bases.

c. Lamps with wattage ratings in excess of 300 watts - mogul brass screw bases.

Provide special-purpose lamps, including PAR and R lamps as follows:

a. PAR lamps - clear molded heat-resistant hard-glass bulbs with parabolic aluminized inner-bulb wall reflectors for spotlighting or floodlighting applications.

b. R lamps - clear soft blown-glass bulbs with silver-deposited, inner-bulb wall reflector for spotlighting or floodlighting applications.

Provide lamps designed for operation on 120-volt, 60-hertz circuits unless otherwise specified.

2.2.8 LED Luminaires

Provide luminaires that are UL [and DesignLights Consortium (DLC)] listed and are compliant with IES LM-79 and IES LM-80 with the following attributes:

a. Provide IP 65 type housing. Provide LED light engines constructed of heavy-duty, die-cast aluminum, with external heat radiating fins.

b. Provide a driver housing constructed of extruded aluminum, with cast aluminum end covers and stainless steel fasteners; for easy access to the LED driver(s); allowing for cooler operation and longer driver life. Use one-piece gasketing throughout the fixture for weather-tight operation.

2.2.8.1 Thermal Management

*************************************************************
NOTE: The L70 test determines the point in a LED's life when it reaches 70 percent of its initial output.
*************************************************************

Provide LEDs that are determined to last a minimum of 75,000 hours in 25 degree C 77 degree F environments when driven at 530 mA.

2.2.8.2 Optical System

Provide LED light engines that work with Amber color with a wavelength

SECTION 26 56 19.00 40 Page 12
higher than 560 nm.

2.2.8.3 Finish

The finish is textured and chemically pretreated through a multiple-stage washer, electrostatically applied, thermoset polyester powder coat finish, with a minimum of 3-5 millimeter inches thickness. The finish is oven-baked at 204.4 degrees C 400 degrees F to promote maximum adherence and finish hardness. Finish is guaranteed for five (5) years.

2.2.8.4 Mounting

An adjustable knuckle slip that fits over a 6 centimeter 2-3/8 inch Tenon, and allows for up to 90 degrees of vertical adjustment in 10 degree increments (minimum) from horizontal, as well as full side to side adjustment with the knuckle mount. A round extruded aluminum, Bolt-On Arm with an in-pole nut plate. A Round Pole Plate Adaptor is required for mounting to round poles.

2.2.8.5 Electrical Assembly

The LED drivers accept 120v thru 480v, 50 Hz to 60 Hz input. Power factor of 95 percent. Rated for minus 40 degrees operations. Built-in 10 kV surge protector (minimum).

2.2.8.6 Options

a. Photocell and Receptacle

b. Photo receptacle

c. Round pole plate adaptor

PART 3 EXECUTION

3.1 INSTALLATION

submit installation drawings for the highway and roadway lighting systems. Indicate on drawings overall physical features, dimensions, ratings, service requirements, and weight of equipment.

Install a street-lighting fixture at each location indicated, with lamps of the designated type, voltage, and wattage in each fixture.

Install new lamps immediately prior to completion of the project. Install lamps with the light center at the focal point of the reflector and in the proper burning position.

3.1.1 End-Mounted High-Intensity-Discharge (HID) Luminaires

Conceal wiring in street-lighting standards and luminaires. Mount porcelain lamp holder on an adjustable supporting bracket that permits vertical and horizontal positioning of the lamp. Ensure the upper housing
overlaps the lower housing with a heat-resistant gasket providing a seal against moisture, dirt, and insects.

3.1.2 Side-Mounted (HID) Luminaires

Conceal wiring in street-lighting standards and luminaires. Install clamping band to completely seal the joint between reflector and refractor against moisture, dirt, and insects.

3.1.3 Side-Mounted Incandescent Luminaires

Conceal wiring in street-lighting standards and luminaires. Install clamping band to completely seal the joint between reflector and refractor against moisture, dirt, and insects.

3.2 FIELD QUALITY CONTROL

3.2.1 Tests

Perform Operational Tests in accordance with referenced standards within this section[, in the presence of the Contracting Officer]..

Perform demonstration to verify street lighting operates satisfactorily in the presence of the Contracting Officer, after sunset.

3.3 CLOSEOUT ACTIVITIES

No less than [30] days prior to project close out, submit the fixtures warranty to the Contracting Officer.

NOTE: This guide specification covers the requirements for lighting and visual navigation aids for airfields and heliports. When editing this specification, follow the requirements of UFC 3-535-01. For Navy projects NAVAIR 51-50AAA-2 is the governing design document and is referenced in UFC 3-535-01.

Adhere to **UPC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

**NOTE:** Show locations of all lights, signs, markers, and other visual navigation aids on the contract drawings.

**NOTE:** Depending on the specific application, additional technical sections will probably have to be added to the project specification. The construction drawings and specifications establish the scope for the construction project.
drawings must include: a legend dedicated to the airfield lighting fixtures; an airfield map depicting runways, and electrical vaults; demolition plans, single line electrical riser diagrams, schematic diagrams for fixture wiring, conduit and duct bank schedules; cable schedule, and a fixture schedule; and construction installation details for each airfield lighting fixture. Where an option is given for military and FAA specifications, the electrical designer of the specific project must determine if the project requires a military specification component without option for the FAA specification. Where the words "as indicated," "as specified," "unless specified otherwise," "when specified," or similar words are used, the designer must ensure that the appropriate requirements are included in the project drawings or specifications. The drawings should show new portions of the work on existing airfields and should indicate clearly the existing wires, cables, ducts, and equipment as applicable. For Navy or Marine Corps airfields the designer should refer to the NAVAIR 51-50AAA-2, "General Requirements for Shore Based Airfield Marking and Lighting." Electrical Designer must specify Primary type I or Secondary type II Class A or Class B electrical cable system. Designer must specify FAA style for the cable/receptacle system. Connectors must be certified by ETL.

PART 1   GENERAL

1.1   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

**************************************************************************
NOTE: Provide definitions for specific project related terms not included in this guide specification.
**************************************************************************

[______].

1.3 SYSTEM DESCRIPTION

Provide airfield [and heliport] lighting and visual navigation aids as indicated.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00

SECTION 26 56 20 Page 12
SUBMITTAL PROCEDURES:

**************************************************************************
NOTE: Modify submittals paragraphs to ensure that an appropriate submittal is required for each item in the project.

SD-03 Product Data

When equipment or materials are specified to conform to the standards or publications and requirements of AASHTO, ANSI, ASTM, ABIC, ETL, IEEE, IES, NEMA, NFPA, or UL, or to an FAA, FS, or MS, include proof that the items furnished under this section conform to the specified requirements. The label or listing in UL Electrical Constructn or ETL or the manufacturer's certification or published catalog specification data statement that the items comply with applicable specifications, standards, or publications and with the manufacturer's standards will be acceptable evidence of such compliance. Provide manufacturer prepared certificates when the manufacturer's published data or drawings do not indicate conformance with other requirements of these specifications.

Constant current regulators, Data Package 5; G
Airfield rotating beacon, Data Package 3; G
Approach lighting systems components, Data Package 3; G

Wave-off system, Data Package 5; G]

Maintenance and repair instructions; G

Instructions necessary to check out, troubleshoot, repair, and replace components of the systems, as specified.

Posted operations and maintenance instructions

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals

As-built drawings

1.5 MAINTENANCE MATERIAL SUBMITTALS

1.5.1 Spare Parts

Provide spare parts as indicated in this specification as part of this contract. The spare parts must be provided at the end of construction. They must be in addition to any items consumed during construction or in testing.

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

In each standard referred to herein, consider the advisory provisions to be mandatory, as though the word "must" has been substituted for "shall" or "should" wherever it appears. Interpret references in these standards to "authority having jurisdiction," or words of similar meaning, to mean Contracting Officer.
1.6.1.1 Code Compliance

Comply with the requirements and recommendations of NFPA 70 and IEEE C2 and local codes where required.

1.6.2 Standard Products

**************************************************************************

NOTE: For a monthly listing of approved equipment (by manufacturer) go to website and refer to the latest Addendum to AC 150/5345-53, Airport Lighting Equipment Certification Program

**************************************************************************

a. Use only approved equipment listed in FAA AC 150/5345-53 with addendum for the date of delivery the exception of Air Force threshold lights and Army heliport fixture colors and intensities. Inspect wire and cable for date of manufacture. Materials must be certified and listed as "Approved Airport Lighting Equipment" downloadable from: http://www.faa.gov/arp/pdf/534553ad.pdf. Do not use wire and cable manufactured more than one year before delivery to job site.

b. Provide materials and equipment listed by FAA, UL, or ETL, when such equipment is listed or approved. Do not use askarel, tetrachlorethylene and insulating liquids containing polychlorinated biphenyls (PCBs) in equipment.

c. Material and equipment must be a standard product of a manufacturer regularly engaged in the manufacture of the product and essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening.

d. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be products of the same manufacturer unless stated in this section.

1.6.3 Qualifications of Contractor

a. Provide documentation that the aviation lighting equipment contractor and installation electricians are experienced in installing, testing and maintaining aviation lighting systems of a similar complexity. Similar complexity, in increasing complexity, are the following: elevated edge lights and signs, in-pavement lights, and approach light systems. Include a list of government projects and 3 years of experience in constructing similar projects. Include written certification that systems have performed satisfactorily for not less than 18 months. Provide a list of airfield lighting schools or seminars attended in the last 5 years.

b. Submit certification containing the names and the qualifications of persons recommended to perform the splicing and termination of medium-voltage cables approved for installation under this contract. Indicate that any person recommended to perform actual splicing and termination has been adequately trained in the proper techniques and has had at least 3 recent years of experience in splicing and terminating the same or similar types of cables approved for installation. Any person recommended by the Contractor may be required
to perform a dummy or practice splice and termination, in the presence of the Contracting Officer, before being approved as a qualified installer of medium-voltage power or series lighting cables. If that additional requirement is imposed, provide short sections of the approved types of cables with the approved type of splice and termination kits, and detailed manufacturer's instruction for the proper splicing and termination of the approved cable types.

[1.6.4 Qualifications of Photometric Tester]

**************************************************************************

NOTE: Photometric testing is highly recommended for all runway lighting construction. The designer should verify with the airfield manager that the cost of testing has been included in project funding.

Photometric testing is not required for Navy projects.
**************************************************************************

Submit [three] copies of certification containing the names and the qualifications of persons recommended to perform Field Photometric Testing of Airfield Lighting Fixtures. The general goal of the field photometric testing is to test the airfield lighting fixtures in the field as constructed with respect to FAA AC 150/5345-46. Perform testing utilizing an independent, third-party firm unaffiliated with any lighting manufacturer or construction contractor. This firm must have demonstrated capability for the field measurement of the photometric performance of airfield lighting fixtures in comparison to FAA and UFC standards by having performed work similar to this contract successfully at no less than ten (10) air carrier airports (in the United States) in the past five (5) years.

Submit a list of equipment to be used for the photometric testing with a record of experience of similar projects with references for contact. Additionally, submit a list of equipment used to calibrate the photometric sensors as well as proof of the last date of calibration. The equipment must be calibrated within six months prior to commencement of testing.

]1.6.5 Protection Plan

Submit detailed procedures to prevent damage to existing facilities or infrastructures. If damage does occur, the procedures must address repair and replacement of damaged property at the Contractor's expense.

1.6.6 Prevention of Corrosion

1.6.6.1 Metallic Materials

Protect metallic materials against corrosion as specified. Do not use aluminum in contact with earth or concrete. Do not use aluminum conductors.

1.6.6.2 Ferrous Metal Hardware

Ferrous metal hardware must be hot-dip galvanized in accordance with ASTM A123/A123M and ASTM A153/A153M.
1.7 DELIVERY, STORAGE, AND HANDLING

The Contractor must deliver, store and secure all airfield lighting materials and equipment in accordance with the manufacturers' requirements.

1.8 PROJECT/SITE CONDITIONS

Items furnished under this section must be specifically suitable for the following unusual service conditions:

1.8.1 Altitude

Any equipment must be suitable for operation up to an altitude of 3,000 m (10,000 feet).

1.8.2 Other

Material or equipment to be installed (underground); (in handholes, manholes, or underground vaults); (or) (in light bases), must be suitable for submerged operation.

1.8.3 Environmental Requirements

The airfield for this project has the following requirements:

Location - ____
Altitude - ____ m(____) feet above mean sea level.
Maximum Exterior Temperature - ____ degrees C(____) degrees F.
Minimum Exterior Temperature - ____ degrees C(____) degrees F.
Maximum Relative Humidity - ____ percent non-condensing.
Maximum Indoor Temperature - ____ degrees C(____) degrees F.
Minimum Indoor Temperature - ____ degrees C(____) degrees F.

1.8.4 Existing Airfield Lighting Systems

**************************************************************************
NOTE: When modification, additions, or any other work is be performed on an existing airfield lighting system, the designer must add a carefully worded paragraph to cover maintenance of airfield lighting circuits and operations. Local conditions and the specifics of the Contract will affect this paragraph. An example of this paragraph follows:

"Existing airfield lighting systems must remain in operating condition and interruptions must be held to a minimum. Where interruptions are necessary, they must be scheduled as approved in writing by the Contracting Officer. Prior to the scheduled time for each interruption, all necessary materials and a sufficient labor force must be assembled to permit completing the work within the scheduled time interval. Under no circumstances must any of the existing airfield lighting circuits be left inoperative without making provisions for suitable temporary connections in the affected area or areas. All airfield lighting circuits covered under this Contract must be replaced in such a manner that they will be operational at dusk each day. The

SECTION 26 56 20 Page 19
Contractor must submit to the Contracting Officer a plan for outages and maintaining lighting and lighting control."

**************************************************************************

[____].

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide airfield lighting and visual navigation aids as indicated on contract drawings.

2.1.1 Design Requirements

**************************************************************************

NOTE: Various FAA requirements are described in this specification and are a part of the requirements of this project.

**************************************************************************

2.2 AIRFIELD LIGHTING CONTROL AND MONITORING SYSTEM (AFLCMS)

**************************************************************************

NOTE: For Navy projects, coordinate with Activity and Space and Naval Warfare Systems Command (SPAWAR). If SPAWAR system is used delete the following paragraph. Normally, airfield lighting control systems are provided by SPAWAR Charleston. Designer must indicate on drawings for contractor and Construction Manager to coordinate with SPAWAR.

**************************************************************************

NOTE: For conventional control systems refer to FAA AC 150/5345-3 for type, class, and style. For PC or PLC based control and monitoring systems refer to FAA AC 150/5345-56B for type. Edit and retain one of the following paragraphs.

Provide security clearance requirements of certified installers for termination to DoD networks.

**************************************************************************

The FAA has determined that acceptable airfield lighting control and monitoring systems can be configured in three levels of features. They include personal computer (PC) based systems, programmable logic controller (PLC) based systems, and systems configured with pilot relay panels or basic PLC systems.

2.2.1 Pilot Relay Panel

**************************************************************************

NOTE: Type I pilot relay panel has 24 double-pole, single-throw relays and is used for systems including the approach lighting systems. Specify a Type II relay panel if 16 double-pole, single-throw...
relays and 8 double-pole, double-throw relays are required for a system. Specify L-841 panel only if 48 V dc control is required.

**************************************************************************

[Utilize one of more pilot relay panels as indicated or compliant with NEMA 250, NEMA ICS 2, and NEMA PB 1 for 120-volt control systems;] or [ FAA AC 150/5345-13, Type L-841, for 48-V dc control systems.]

2.2.2 Control Transfer Panel

[Transfer panel, 120-volt, 60 Hz, with eight-pole, double-throw, continuous-duty, industrial control type relays, in NEMA Type 1 enclosure. Provide relay contacts with a rating of not less than 10 amp for continuous non-inductive loads.] [Transfer panel, 48-volt, dc, with double-pole, double throw relays in accordance with FAA AC 150/5345-13, Type L-841.]

2.2.3 Control Panel

**************************************************************************

NOTE: Specify class for airfield lighting systems indicated as follows: Class I covers basic airfield lighting systems including beacons, obstruction lighting, wind direction indicators, approach, runway, and taxiway lights; Class II includes Class I plus runway centerline, touchdown zone, and taxiway centerline lighting; and Class III includes Class II plus optical landing system and approach flash monitor lights. Use Type I for conventional panels, Type II for facsimile panels and Type III for mimic or PLC based panels. Use Class F for flush mounted panels, Class S for surface mounted panels or Class W for a wall mounted panel. Use Style 1 for an unlighted panel, Style 2 for a backlighted panel and Style 3 for a touchscreen. Refer to FAA AC 150/5345-3 for type, class, and style.

**************************************************************************

[FAA AC 150/5345-3, Type L-821, Type [], Class [], Style []]. Quantity and color of lenses must conform to FAA AC 150/5345-3 and must correspond to the actual circuits indicated.

2.2.4 Airfield Lighting Control and Monitoring System

2.2.4.1 Computer Based (PC) Technology

Utilize computer based (PC) technology control systems as indicated on the drawings, compliant with FAA AC 150/5345-56B, L-890 Type []. Include touchscreen type control panel. For the essential system PCs provide the following characteristics: 483 mm19 inch rack mount form factor, fully enclosed metal housing, redundant hot-swappable solid state software and data storage devices, redundant hot-swappable cooling system, redundant hot-swappable power supplies. Incorporate uninterruptible power supplies (UPS) for primary power to all system components required for normal operation for a duration of fifteen minutes.
2.2.4.2 Programmable Logic Controller (PLC) Technology

[Utilize Programmable Logic Controller (PLC) technology, compliant with FAA AC 150/5345-56B, L-890, Type [____]. Include touchscreen type control panel.]

2.3 APPROACH LIGHTING SYSTEMS

**************************************************************************

NOTE: Design the Approach Lighting System to include an emergency power supply to transfer lighting load within fifteen seconds of a power outage for a CAT I runway and one second for a CAT II runway.

**************************************************************************

2.3.1 High Intensity Approach Lighting System

**************************************************************************

NOTE: High-intensity approach systems may be either ALSF-1, ALSF-2, SALS or SSALSR lights.

**************************************************************************

Provide approach, centerline, crossbar, threshold bar, side row barrette, centerline barrette, bar lights, sequenced flashing lights, approach lighting frangible towers, and associated equipment and interconnecting wiring to provide a complete system as indicated on construction drawings.

2.3.1.1 Elevated High-Intensity Steady Burning Fixtures

**************************************************************************

NOTE: Light Plane Elevation Limits for the slope of this plane must not exceed 2 percent up or 1.5 percent down.

**************************************************************************

Provide FAA E-982 unidirectional frangible mounted lights with PAR-56 [200 W] [300 W] [and] [500 W] lamps, and [without] [with aviation red] filters at cross bar, centerline bars, and side row barrettes.

2.3.1.2 In-Pavement, High-Intensity Steady Burning Approach Lights

Use in-pavement, high-intensity, base-mounted lights in the overrun area and paved areas with traffic. Use fixtures conforming to FAA AC 150/5345-46 [Type L-850E for unidirectional quartz lights with lamps,] [Type L-850E(L) for unidirectional LED lights] with filters and transformers as indicated. Mounting must conform to the details indicated. Mount bases level and recess as required by thickness of fixture to provide installation in accordance with manufacturer's instructions.

2.3.1.3 Hook Resistant Lights for Simulated Carrier Deck Lighting System

Provide fixtures as required for simulated carrier deck lighting system as specified except with 65-watt lamps and green filters.

2.3.1.4 Voltage[Current] Powered Sequenced Flashing Light (SFL) for High Intensity Approach Light System

FAA E-2628. Provide as a complete and integrated part of the approach
system including individual power supply units, elevated flashing units, master timer, remote control and monitor units, interconnecting wiring, and support structures. Include master timer cabinet that provides timed flashing signals to 21-lamp power supplies. System must monitor individual lamp flashes and report via normally open contacts a condition of two, three, or more malfunctioning lamps or power supplies. The master timer cabinet can be a solid-state type. Provide the system with major components that are the product of a single manufacturer. Install junction boxes as indicated on concrete foundations and on the platform of elevated structures. Install conduit tappings in the bottom and top of the junction boxes as required to accommodate the incoming and outgoing power and control circuits for the flashing lights. Provide terminal strips in each junction box as indicated for termination and connection of the power and control circuits. Provide signal and monitor cables as recommended by the system manufacturer. [Provide current transformers for current powered system.]

2.3.1.5 Economy Approach REIL

FAA AC 150/5345-51 [Type L-849V voltage powered] [Type L-849V current powered].

2.3.2 Medium-Intensity Approach Lighting Systems with Runway Alignment Indicator Lights (MALSR)

2.3.2.1 Elevated, Medium-Intensity, Steady-Burning Fixtures

Utilize FAA E-2325 PAR 38 lampholders with [150 watt] [_____] PAR-38 spotlight lamps frangibly mounted on [light bases] [steel stakes] [and/or] [low-impact-resistant supports] [frangible supports]. The peak intensity of the main beam, at 120V input, must not be less than 5,000 candelas and the intensity must not be less than 1,000 candelas at any angle up to 15 degrees from the beam axis.

2.3.2.2 In-Pavement, Medium-Intensity, Steady-Burning Fixtures

**************************************************************************
NOTE: In-pavement fixtures are only authorized for installation in pavement subject to aircraft operations.
**************************************************************************

The peak intensity must be not less than 5,000 candelas within the main beam, and not less than 2500 candelas +/-5 degrees horizontally and +/-3.5 degrees vertically from the main beam axis, and not less than 500 candelas at +/-7 degrees horizontally and +/-5.5 degrees vertically from the main beam axis.

2.3.2.3 Encapsulated Stepdown Transformer

Provide 200-watt, 240-volt/30.3-volt transformer approved by the fixture manufacturer. Use connectors that comply with Type L-823 as indicated.

2.3.2.4 Voltage Powered Sequence Flashing Lights (SFL) for Medium Intensity Lights

These elevated SFL fixtures (RAIL) must meet the requirements of [FAA E-2159 ] [FAA AC 150/5345-51, Type L-849] with [eight] [_____] lights and must be as indicated on the contract drawings as an integrated part of the approach.
The SFL system must include the fixtures, the individual power supplies, master timer and power supply, remote control [and monitor] [support structures], and interconnecting wiring. The SFL must flash twice per second in sequence towards the runway threshold.

2.3.3 Omnidirectional Approach Lighting System (ODALS)

The ODALS fixtures must meet the requirements of FAA AC 150/5345-51, Type L-859 Style F. The ODALS must include the [7] [_____] fixtures, the individual power supplies, the master timer and power supply, remote control, [support structures] and interconnecting wiring. The ODALS must flash twice per second in sequence towards the runway threshold.

2.3.4 Glide Slope Indicator System

[ Consists of four light units mounted in the area of the ground point of intercept of the glide slope and aimed in the direction of the approach. ]

2.3.4.1 Precision Approach Path Indicator System (PAPI)

FAA AC 150/5345-28 [Type L-880 non-LED][Type L-880(L) LED]. Connect the four light units to [6.6 ampere series current circuit (Style B) via appropriate isolation transformers][240 volts ac constant voltage circuit (Style A)]. Provide tilt switches and relays to de-energize all light units when one unit exceeds tilt requirements.

2.3.4.2 Chase Helicopter Approach Path Indicator System (CHAPI)

FAA AC 150/5345-28 [Type L-881 non-LED][Type L-881(L) LED] with a filter that will provide a two-degree wide green sector in the center of the white over red beam. Connect the two light units to [6.6 ampere series current circuit (Style B) via appropriate isolation transformers][240 volts ac constant voltage circuit (Style A)]. Provide tilt switches and relays to de-energize all light units when one unit exceeds tilt requirements.

2.3.5 Low-Impact-Resistant (LIR) Frangible Supports

**************************************************************************
NOTE: Designer to provide structural foundation design by registered professional engineer.
**************************************************************************
Fiberglass reinforced conforming to [FAA E-2702] [FAA AC 150/5345-45]. Provide anchor bolts, lowering devices and fixture mounting accessories as required by tower manufacturer.

2.4 RUNWAY LIGHTING SYSTEM

**************************************************************************
NOTE: The designer must insure compatibility if FAA listed LED type fixtures are to be served by existing regulators. In such cases, indicate the existing regulator manufacturer and model number on the drawings.
**************************************************************************
